ACKNOWLEDGMENT AND PLAN APPROVAL

The information and procedures in this Plan must be treated as guidelines only. The user should determine to what extent it is practical and advisable to follow them. This decision may involve considerations not discussed in this Plan.

The information and procedures contained herein are considered to be accurate as of this date and are consistent with the National Contingency Plan (NCP) and applicable Area Contingency Plans (ACP) as detailed in Section 1.5.

CERTIFICATION OF QUALIFIED INDIVIDUAL AND ALTERNATE QUALIFIED INDIVIDUAL

Kinder Morgan Energy Partners, L.P. hereby certifies that the individuals identified as Qualified Individual and Alternate Qualified Individual in this Plan have the full authority in accordance with the applicable federal and state regulations and as detailed in this Plan to:

1. Activate and engage in contracting with oil spill removal organizations.

2. Act as a liaison with the pre-designated Federal On-Scene Coordinate (OSC), and

3. Obligate funds required to carry out response activities.

Plan Approved:

_____ Date:_____

Wayne G. Simmons
V.P. of Operations
Kinder Morgan Energy Partners, L.P.

1.0 INTRODUCTION

1.1 OPERATOR NAME, ADDRESS AND PHONE NUMBER

Kinder Morgan Energy Partners, L.P.
1001 Louisiana Street, Suite 1000 Phone: (713) 369-9454
Houston, Texas 77002

Qualified Individual and Alternate Qualified Individual

The Area Managers, identified in Figures 2.3a and 2.3b, are designated as the Qualified Individuals. The Operations Managers, also identified in Figures 2.3a and 2.3b, are designated as the Alternate Qualified Individuals.

For the purposes of this Plan, the Kinder Morgan Energy Partners, L.P. Incident Commander serves as the Qualified Individual (QI). In the event where the ICP is activated, the Operations Manager may serve as the Qualified Individual.

1.2 OPERATING ASSETS COVERED BY THIS PLAN

This Integrated Contingency Plan (ICP) is intended to guide emergency response activities throughout the Kinder Morgan Energy Partner's, L.P. - Pacific Operations (Company). The pipeline and terminal operations covered by this Plan are located in the following seven (7) regions (each further defined in their respective Volume 2 documents). For the Department of Transportation (DOT) purposes, regions are also defined as response zones.

Region	State	County
Southern Region - West ● Carson Area ● Watson Area	California	Los Angeles, Orange, San Diego
Southern Region - Central ● Mission Valley - Orange Area ● Colton Area ● Barstow Area ● Las Vegas Area	California Nevada	Los Angeles, San Bernardino, Kern, Riverside Clark
Southern Region - East ● Imperial Area ● Phoenix Area ● Tucson Area ● El Paso Area	California Arizona New Mexico Texas	Imperial, Riverside Pima, Yuma, Cochise, Maricopa, Hidalgo, Grant, Luna, Dona Ana El Paso
Northern Region - Bay ● Richmond Terminal ● Richmond/Brisbane Area ● San Jose Area ● Concord Area	California	Contra Costa, Santa Clara, Alameda, San Mateo, Solano, San Joaquin,
Northern Region - California Nevada ● Sacramento Area ● Chico Rocklin Area ● Reno Area	California Nevada	Contra Costa, Sacramento, Butte, Placer, Yuba, Solano, Yolo, Nevada, Sierra, San Joaquin, Sutter, Storey, Churchill, Washoe, Lyon
Northern Region – Central ● Fresno Area	California	Merced, Madera, Fresno, Kings,
Northern Region - Northwest ● Oregon Pipelines Area ● Linnton-Willbridge Area	Oregon	Multnomah, Washington, Clackamas, Lane, Linn, Marion

1.2 OPERATING ASSETS COVERED BY THIS PLAN (Cont'd)

Some of the facilities identified in this ICP were formerly owned or operated by the following:

- CalNev Pipeline
- GATX Terminals
- SFPP, L.P.

Some of the documents, drawings and other records referenced throughout the plan may still show the name of these previous entities. Various of the operations may also continue to utilize these organizational names.

1.3 SUBSTANTIAL THREAT OF A WCD

49 CFR 194.115(a) requires the operator to identify events that pose a substantial threat of a worst case discharge to mitigate the threat or prevent a worst case discharge. Such events and actions to identify and respond to a "substantial threat" are incorporated by reference in the Products Pipelines Liquids – Operations and Maintenance (L O&M) Manual.

1.4 PLAN PURPOSE/OBJECTIVES

The purpose of this ICP is to establish a predetermined mode of operation for response to any incident that could adversely impact the safe operation of KMEP facilities. Actions identified in this Plan include:

- Internal and external notification procedures
- Initial Response Actions
- Application of the Incident Command System (ICS) and Unified Command Structure (UCS)
- Description and availability of resources
- References to facility-specific emergency response information

KMEP's response strategies are based on the principles of the Incident Command System. Section 4.0 of this Plan addresses the Incident Command System and Unified Command that would be implemented by KMEP during emergency responses.

Specific objectives of the Plan are to:

- Effectively establish Response Organization to provide prompt action for any incident.

1.4 PLAN PURPOSE / OBJECTIVES (Cont'd)

- Define notification, activation and mobilization procedures to be followed when an incident occurs.
- Define organizational lines of responsibility to be adhered to during a response.
- Ensure compliance with applicable federal, state and local regulatory requirements.
- Ensure consistency with the National Contingency Plan (NCP) and any Area Contingency Plans (ACP's) for the areas involved.

1.5 SCOPE

The scope of this plan is to comply with federal, state and local contingency planning requirements including (where applicable):

- U.S. DOT –Transportation Related On-Shore Facility Response Planning Rule (49 CFR 194 and 195)
- U.S. EPA - Non-Transportation Related On-Shore Facility Response Planning Rule (40 CFR 112.20)
- U.S.C.G. – Marine Transportation Related Facility Response Planning Rule (33 CFR 154)
- California State Lands Commission (CCR Title 2, Division 3, Chapter 1, Article 5 § 2395)
- California Department of Fish and Wildlife/Office of Oil Spill Prevention and Response (CCR Title 14, Division 1)
- Oregon Department of Environmental Quality – Oil Spill Contingency Planning and Fees(Oregon Administrative Rules 340-141)
- California Codes Government Code Section 51010 – 51019.1

KMEP does hereby certify that this ICP is consistent with current drafts of the National Contingency Plan (NCP) and each applicable Area Contingency Plan (ACP). The ACP's which apply are:

Area Contingency Plans	Effective Date
Northwest Area (http://www.rrt10nwac.com/NWACP/Default.aspx)	January 2013
San Francisco (http://www.dfg.ca.gov/ospr/san_francisco_plan.aspx)	October 2011
Los Angeles / Long Beach (http://www.dfg.ca.gov/ospr/los_angeles_plan.aspx)	October 2011
San Diego (http://www.dfg.ca.gov/ospr/san_diego_plan.aspx)	October 2011

1.5 SCOPE (Cont'd)

EPA Region IX Inland (http://www.dfg.ca.gov/ospr/fed_region_9.aspx) October 2011

EPA Region X Inland (http://www.rrt10nwac.com/NWACP/Default.aspx) January 2013

EPA Region VI Inland (http://www.epaosc.org/site/doc_list.aspx?site_id=5087) May 2010

Lower Columbia River GRP November 2003
(http://www.ecy.wa.gov/programs/spills/preparedness/GRP/ColumbiaRiver/LowerColumbiaRiver.htm)

1.6 PLAN DISTRIBUTION PROCEDURES

The Manager – Emergency Response Programs shall have the responsibility for distribution of the Plan. Distribution will be handled in the following manner:

- Distribution of the Plan is controlled by the number on the binder cover. A Distribution List is provided in the Foreword to facilitate control.
- Company personnel who may be called upon to provide assistance during emergency response activities will have access to a copy of the plan for their use and training.
- It is the responsibility of any person holding a copy of the Plan to ensure that the copy is transferred to their replacement in the event of reassignment or change in responsibility.
- The most current plans are available on the Company intranet at: http://kmonline.kindermorgan.com/operations/products/pacific_icp/pacific_icp.html
- Various regulatory agencies may also be distributed a copy of the Plan. The list of agencies is provided in the Distribution List.

1.7 PLAN REVIEW AND UPDATE PROCEDURES

Annual Review/Update

The Manager – Emergency Response Programs will coordinate the following plan review and update procedures with Facility Management.

- At least once each year review and make appropriate revisions as required by operational or organizational changes.
- At least once each year review and make appropriate revisions as required by changes in the names and telephone numbers detailed in Volumes 1 and 2.
- The Manager – Emergency Response Programs will coordinate the word processing, publication, and distribution efforts of completing the revisions and maintaining the Plan.
- Plan review opportunities may occur during response team tabletop exercises or actual emergency responses.

1.7 PLAN REVIEW AND UPDATE PROCEDURES (Cont'd)

Agency Review/Revision Requirements

AGENCY TIMING REQUIREMENTS	EPA	USCG		
Timing for Plan reviews.	Periodically but not to exceed five (5) years.	Within one (1) month of the anniversary of COTP approval letter. If NO CHANGES are required, the Facility should submit a letter to the USCG stating "NO CHANGES REQUIRED."	At least every five (5) years from the date of approval.	At least every five (5) years from the date of approval.
Timing for submission of significant Plan revisions as detailed in the following table.	60 days	30 days	30 days	24 hours
When submitting revisions to the applicable agencies always include the Facility identification number (see Figure 8.1 of Volume 2) with the revisions.				

The Company will revise and resubmit revised portions of the Plan to the applicable agency for each change that may materially affect the response to a Worst Case Discharge, including:

CONDITIONS REQUIRING CHANGES	EPA	USCG	DOT	CA. OSPR
Relocation or replacement of portions of the Facility (including the pipeline) which in any way substantially affect the information included in this Plan, such as a change to the Worst Case Discharge volume.	✓	✓	✓	✓
Emergency response procedures.		✓	✓	
A change in Qualified Individual.			✓	
A change in the NCP or ACP that has significant impact on the equipment appropriate for response activities.			✓	
A change in the listings of economically important or environmentally sensitive areas identified in the applicable ACP in effect six (6) months prior to the plan review.		✓	✓	
Change in the Facility's configuration that materially alters the information included in the Plan.	✓	✓	✓	
Change in the type of oil handled, stored, or transferred that materially alters the required response resources.	✓	✓	✓	
A change in the name of the Oil Spill Removal Organization (OSRO).	✓	✓	✓	
Material change in capabilities of the Oil Spill Removal Organization(s) (OSROs) that provide equipment and personnel.	✓	✓	✓	
Material change in the Facility's spill prevention and response procedures.	✓	✓		
Any other changes that materially affect the implementation of the Plan.	✓	✓		✓

NOTE: Any agency may require revisions to this Plan at any time if deficiencies are found under their applicable regulations or during an actual response.

1.7 PLAN REVIEW AND UPDATE PROCEDURES (Cont'd)

Incorporation of Plan Revisions

The **plan holder**, immediately upon receipt of any revisions, shall:

- Review and insert the revised pages into the Plan.
- Discard the obsolete pages.

1.8 TRAINING AND DRILL PROGRAMS

Drill and Exercise Program

The KMEP spill drill program is consistent with the National Preparedness for Response Exercise Program (NPREP) which is summarized below. The program is to be conducted for each Region (Response Zone) and Terminal. The drill program includes internal and external drills conducted at the specific frequencies over a three (3) year cycle. Procedures for maintaining drill documentation and ensuring the availability of drill records for agency review are in place.

TRIENNIAL CYCLE		
Total Number	**Frequency**	**Exercise Type/Description**
12	Quarterly	QI Notification Exercise**
6 (EPA/USCG) 3 (DOT)	Semi-Annual Annual	Equipment Deployment Exercise *(Facility-owned equipment)*
3	Annual	Response Team Tabletop Exercise
3	Annual	Equipment Deployment Exercise *(facilities with OSRO-owned equipment)*
3	Annual	Unannounced Exercise *(Emergency procedures, tabletop, or equipment deployment, not a separate exercise)* Actual response can be considered as an unannounced exercise. **For facilities without equipment to deploy, an unannounced exercise could be accomplished during the QI Notification by randomly asking the QI what he/she would initiate in response to a particular scenario and then document the scenario and response.
NOTE: All response plan components must be exercised at least once in the Cycle.		

Quarterly QI Notification Exercise

- **Scope:** Exercise communication between facility personnel and the QI(s) and/or designated alternate(s). At least once each year, one of the notification exercises should be conducted during non-business hours.
- **Objective:** Contact must be made with a QI or designated alternate, as identified in the Plan.
- **General:** Quarterly QI Notification Exercises will be documented on the Notification Drill Form in the Forms and Documents tab of this Plan. All personnel receiving notification shall respond to the notification and verify their receipt of the notification. Personnel who do not respond should be contacted to determine whether or not they received the notification.

1.8 TRAINING AND DRILL PROGRAMS (Cont'd)

***Quarterly QI Notification Exercise* (Cont'd)**

An ERL notification may be used in place of a notification exercise provided it is documented on the Notification Drill Form. In this case only notification of the QI and Alternate need to be documented.

Semi-Annual Equipment Deployment Exercise (for facilities with equipment)

- **Scope:** Deploy and operate facility response equipment identified in the response plan. The equipment to be deployed must include the following, at a minimum:
  - 1,000 feet of representative type of boom and one of each type of skimming system; or
  - the equipment necessary to respond to the facility's Small/Average Most Probable Discharge (AMPD); whichever is less.
- **Objective:** Demonstrate personnel's ability to deploy and operate response equipment. Ensure that the response equipment is in proper working order.
- **General:** The Facility may take credit for actual equipment deployment to a spill, or for training sessions, as long as the activities are properly documented.

***Annual Equipment Deployment Exercise* (OSRO-owned equipment)**

- **Review:** The Facility should verify that the OSRO(s) has completed the equipment deployment exercise requirements and has maintained the necessary documentation. The OSRO may deploy equipment at any location, so long as it occurs within an operating environment similar to the Facility's.
- **Scope:** OSRO must deploy and operate response equipment identified in the response plan. The equipment to be deployed must include the following, at a minimum:
  - 1,000 feet of representative type of boom.
  - One of each type of skimming system.
- **Objective:** OSRO must demonstrate the ability of the personnel (OSRO) to deploy and operate response equipment (OSRO). Ensure that the response equipment (OSRO) is in proper working order.

Annual Response Team Tabletop Exercise

- **Scope:** Exercise the response team's organization, communication, and decision- making in managing a spill response. Each team identified within the plan must conduct an annual Response Team Tabletop Exercise.
- **Objective:** Exercise the response team in a review of the following:
  - Knowledge of the Plan.
  - Proper notifications.
  - Communications system.
  - Ability to access an OSRO.
  - Coordination of internal spill response personnel.

1.8 TRAINING AND DRILL PROGRAMS (Cont'd)

Annual Response Team Tabletop Exercise (Cont'd)

- Review of the transition from a local team to a regional team.
- Ability to effectively coordinate response activity with the National Response System (NRS) Infrastructure.
- Ability to access information in the Area Contingency Plan (see Subsection 1.5).

- **General:** A minimum of one Response Team Tabletop Exercise in a triennial cycle will involve a Worst-Case Discharge scenario.

Government-Initiated Unannounced Exercise

- **Scope:** The Facility is required to participate in only one unannounced exercise every 36 months from the date of the last government-initiated unannounced exercise.

  - Exercises are limited to approximately four hours in duration.
  - Exercises would involve response to a Small/Average Most Probable Discharge scenario.
  - Exercise would involve equipment deployment to respond to a spill scenario.

- **Objective:** Conduct proper notifications to respond to unannounced scenario of a Small/Average Most Probable Discharge.

  - Demonstrate that the response is timely, conducted with an adequate amount of equipment for the scenario, and properly conducted.

- **General:** This exercise is only applicable to those facilities which are randomly chosen.

Area Exercises

- **Objective:** The purpose of the area exercise is to exercise the entire response community in a particular area. An area is defined as "that geographic area for which a separate and distinct Area Contingency Plan has been prepared, as described in OPA 90." The response community includes the federal, state, and local government and industry. The area exercises are designed to exercise the government and industry interface for spill response.

- **General:** The goal is to ensure that all areas of the country are exercised triennially. All of the area exercises will be developed by an exercise design team. The exercise design team is comprised of representatives from the federal, state, and local government and industry. A lead plan holder would lead each area exercise. The lead plan holder is the organization (government or industry) that holds the primary plan that is exercised in the area exercise. The lead plan holder would have the final word on designing the scope and scenario of the exercise.

1.8 TRAINING AND DRILL PROGRAMS (Cont'd)

Exercise Documentation

- All exercises should be documented in an After Action Report and maintained at the facility; documentation should specify:
  - The type of exercise
  - Date and time of the exercise
  - A description of the exercise
  - The objectives met in the exercise
  - The components of the response plan exercised
  - Lessons learned

- Exercise documentation should be kept on file for the required length of time depending on the regulating agency (three (3) years for CA OSPR, U.S. Coast Guard and PHMSA, and five (5) years for the U.S. Environmental Protection Agency).

- The Manager – Emergency Response Programs will coordinate drill and exercise notification, scheduling and reporting with federal, state and local agencies in accordance with the applicable regulations.

- The Manager Emergency Response Program is responsible for following up comments and recommendations (Lessons Learned) received during the Post Drill Debriefing and in the After Action Report. The Manager, Emergency Response Programs, Operations Manager, and EHS Representative will review the comments to determine the appropriate actions and timing. . Where revision to the ICP is warranted, The Manager Emergency Response Program will initiate the changes following the standard ICP MOC/ADC revision process. Deficiencies identified as training issues will be addressed by the local management and/or EHS Training Representatives appropriate. Recommendations regarding the drill itself will be taken under advisement and discussed with local Manager. The Manager Emergency Response Program should keep documentation to substantiate that the appropriate actions were taken

Training Program

The Regional Director is responsible for implementing the Plan and must ensure that managers provide necessary training to KMEP emergency response personnel. The managers must ensure that the emergency response personnel are trained to respond as instructed, that equipment and personnel are available and adequate, and reliable communications and documentation systems are established. The Area Manager must ensure that all personnel receive appropriate training so that

<u>All personnel will be trained on</u>:

- Their responsibilities under the plan
- Procedures for contacting the Orange Control Center on a 24 Hr. basis
- Name of, and procedures for contacting the Area Manager on a 24 Hr. basis

All reporting personnel will be trained on:

- The content of the operating assets covered by the Plan (see Volume 1; Section 1.2)
- The telephone number of the National Response Center **(800-424-8802)**
- The notification process

All response personnel will be trained on:

- Their responsibilities as outlined by this Plan.

1.8 TRAINING AND DRILL PROGRAMS (Cont'd)

Training Program (Cont'd)

HAZWOPER Training

Emergency Response Personnel are trained in Hazardous Waste Operations and Emergency Response (HAZWOPER) per requirements of 29 CFR 1910.120.

Emergency Response Personnel receive appropriate HAZWOPER training based on the expectation of their role in emergency response and receive the appropriate certification upon completion of the HAZWOPER Training. Annual refresher training must be done to maintain certification.

- Awareness Level
- Operations Awareness Level
- Technician Level
- Incident Commander Level

Training records are maintained for all Company employees. Records of instructors and training organizations are maintained by the Company. The Training or Safety Meeting Attendance form (L-OM100-20) is maintained in the L O&M. The Company has contractual agreements with Oil Spill Response Organizations that include meeting training requirements of 49 CFR 194.117(b) and OSHA 29 CFR 1910.120.

Response Equipment Inspection Log

Inspector	Date	Comments

2.0 NOTIFICATION PROCEDURES

The notification procedures detailed in this section are to be implemented immediately after becoming aware of an emergency situation or release. Awareness of an emergency can come in the form of a phone call from a third party or self-discovery. In either case, it is imperative to initiate the notification process. Effective 6/20/05, Internal and External notification procedures for California are different than for other states within the Pacific Region. Accordingly, please refer to the flowcharts in Section 2.1 which define internal and external reporting procedures for California differently than for neighboring states.

- Company phone numbers contained herein are considered confidential and are for internal use only.

2.0.1 DETECTION OF RELEASES

There are several means available to assist personnel to detect and recognize a release. In many cases, detection of a release will generally be by visual observation as most facilities are manned 24 hours, seven days per week. In addition, tanks are equipped with automatic high level alarms. In the event of an impending overfill situation, an initial high level alarm will sound. If unanswered, a second high-high level alarm will sound just prior to overfill. Some facilities are equipped with various kinds of detection and alarm equipment. In addition, many facilities are equipped with computerized control systems that monitor operations and can detect abnormal conditions which may result in an emergency situation. (b) (7)(F), (b) (3) [redacted]

2.0.2 ESTIMATING SPILL VOLUMES

Initial Estimations

Initial estimations of the amount of released product should be based on visual observation. Use visual observations and the appropriate method described in L O&M 159 Attachment 5 to compute an initial volume estimate. When reporting initial volume, use the word “approximately” when describing the volume, unless the exact volume is known.

Subsequent Estimation

Later in the response, the volume of released product may be determined by utilizing tank gauges and/or pumping rates. For pipeline incidents the volume of released product may be determined by considering the calculation of flow rates in the affected pipeline multiplied by the maximum time to detect the spill and shut off pumps plus an estimated line drain down volume. Company Policy provides that all estimates are reviewed and approved by management before being released.

2.1 NOTIFICATIONS

In the event of an emergency, in all non-California locations, the notification process begins when a KM employee or agent is notified of or becomes aware of a release or threatened release.

In the event of an emergency within California locations and locations monitoring or controlling California pipeline sections, the notification process begins when a KM employee or agent is notified of or becomes aware of a release or threatened release. In this event, notifications must be made in strict accordance with "California Only" flowcharts.

The following flowcharts have been provided to ensure essential internal and external notification procedures are implemented and all levels of management are notified of the situation, as appropriate. **With the exception of notification to 911 and/or local fire/police agencies, Environmental, Health and Safety (EHS-Remediation) and/or Compliance Codes and Standards (CCS) is responsible for making all regulatory required external notifications in all states other than in California. Field personnel have the responsibility for making all regulatory required external notifications in California.** The flowcharts are intended to simplify the process by designating what position of employee is required to make certain notifications. The flowcharts include notification processes for:

- ***KM Employee or Agent Notification Process - California Only (Figure 2.1a)***
- ***Operator Notification Process - Non-California (Figure 2.1b)***
- ***Company Employee Other Than Operator Notification Process - Non-California (Figure 2.1c)***
- ***Controller - Orange, CA Notification Process - California Only (Figure 2.1d-1)***
- ***Controller - Orange, CA Notification Process - Non-California (Figure 2.1d-2)***
- ***Controller - Houston, TX Notification Process (Figure 2.1e)***
- ***Managers Internal Notification Process (Figure 2.1f)***

When sufficient information has been gathered, the "Initial Reporting Details" form must be completed and faxed to the Orange Control Center and the appropriate regional office. Fax numbers are provided at the bottom of the form. ***The "Initial Reporting Details" form and instructions on its use are provided in Figure 2.2.***

For notifications **inside California,** all verbal external notifications must be made immediately according to the California flow chart. After verbal notifications have been made, the "Initial Reporting Details" form must be completed and faxed to Orange Control Center and regional office.

For notifications **outside California,** immediate verbal notification must be made to Orange Control Center according to the Non-California flow chart(s). After verbal notifications have been made, the "Initial Reporting Details" form must be completed and faxed to Orange Control Center and regional office.

2.1 NOTIFICATIONS (Cont'd)

FOR NOTIFICATIONS OF OSRO

For Notifications of KMEP Oil Spill Removal Organization the designated individual shall refer to the appropriate Volume 2, Figure 2.1 Regional Contractors Services.

Guidelines For Considerations When Initiating Notifications

The following are guidelines to be considered when initiating notifications:

- Do not report information that has not been verified or confirmed, usually by field personnel.
- Do not speculate as to the cause on an incident or make any statements about liability.
- Do not delay notifications because of incomplete information.
- When making notifications, document:
  - Agency notified, including telephone number
  - Date and time of notification
  - Person notified
  - Content of message
  - Incident number, if applicable

Periodic Follow-up Notification during Emergency Response

Periodic follow-up notification must be made within KMEP as well as to federal, state, and local agencies. Responsibility for periodic follow-up notifications remains with each individual as initially assigned within the notification process flowcharts provided in Figure 2.1, unless that responsibility has been transferred based on the magnitude of the response.

KMEP Company contact numbers are provided as follows:

- ***Northern Region Internal Notifications References (Figure 2.3a)***
- ***Southern Region Internal Notifications References (Figure 2.3b)***
- ***Crisis Support Team Internal Notifications References (Figure 2.3c)***

FIGURE 2.1a

KM EMPLOYEE OR AGENT NOTIFICATION PROCESS – CALIFORNIA ONLY

KM Employee or Agent
becomes aware of a release or threatened release

Document all notifications on the **California Field Notification Form**
(Refer to Figure 2.4 – California)

Call 911, as appropriate

Initiate Shutdown of source, if possible
- If shutdown takes longer than 5 minutes, make notifications first.

Area Manager/Qualified Individual (QI)*
- **Area Manager** must notify the OSRO (oil spill contractor), within the first 30 minutes, whenever CA F&G-OSPR jurisdiction is involved.

***If Area Manager is not immediately available contact Operations Manager, Director of Operations or VP of Operations**

Call CEMA (See Figure 2.4 - California)

Call NRC (See Figure 2.4 - Federal)

Call CUPAs (See Figure 2.4 - California)

Call Bureau of Reclamation (if reservoir impacted) (See Figure 2.4 - California)

Call Orange Control Center (ORCC) (714) 560-4839
- Initiate **ERL** or **ERL+** internal notifications as appropriate.

(**ERL** = Emergency Response Line)

Call Project Managers on project related issues

Call Local Agencies required by **Special Agreement** (See Figure 2.4 - California)

FIGURE 2.1b

OPERATOR NOTIFICATION PROCESS – NON - CALIFORNIA

This flowchart shows the appropriate notifications an Operator is required to make ***immediately*** in the event of an actual or suspected release. This process is to ensure all levels of management are notified of the situation, as appropriate.

Internal notification references are provided in Figure 2.3a, b, c.

Operator is notified by telephone or becomes aware of a release or threatened release.

↓

Notify 911 – Fire Department/Police as necessary.
NOTE: If emergency warrants, notify 911 first.

↓

If Operator is at an **input station**, shutdown the pipeline.
If Operator is at a **non-input station**, call Operator at input station to shutdown the pipeline.

↓

Call Orange Pipeline Control Center.
NOTE: Control Center initiates ERL or ERL+ notifications

↓

Notify Supervisor or Area Manager, if not available, proceed until first notification is made to:

- Operations Manager
- Director of Operations
- V.P. of Operations
- KM Project Manager

↓

Obtain information and complete Initial Reporting Details Form

*ERL = Emergency Response Line. Initiated per External Notification References (see Fig. 2.4).
*ERL+ = Emergency Response Line Plus – Notification for any major event associated with the Company, such as: major disruption or operations shutdown, death of employee(s) or contract employee(s), or any fatality or injury to member of public.

FIGURE 2.1c

COMPANY EMPLOYEE OTHER THAN OPERATOR - NON-CALIFORNIA NOTIFICATION PROCESS

This flowchart shows the appropriate notifications a company employee **other than an operator** is required to make ***immediately*** in the event of an actual or suspected release. This process is to ensure all levels of management are notified of the situation, as appropriate.

Internal notification references are provided in Figure 2.3a, b, c.

Company employee **other than an operator** is notified by telephone or becomes aware of a release or threatened release.

↓

Call Orange Pipeline Control Center.
NOTE: Control Center initiates ERL or ERL+ notifications

↓

Obtain information and complete Initial Reporting Details form
(See Figure 2.2)

↓

Notify 911 - Fire Department/Police as necessary.
NOTE: If emergency warrants, notify 911 first.

↓

Notify Area Manager. If Area Manager is not available, proceed until first notification is made to:

- Operations Manager
- Director of Operations
- V.P. of Operations

*ERL = Emergency Response Line. Initiated per External Notification References (see Fig. 2.4).
*ERL+ = Emergency Response Line Plus – Notification for any major event associated with the Company, such as: major disruption or operations shutdown, death of employee(s) or contract employee(s), or any fatality or injury to member of public.

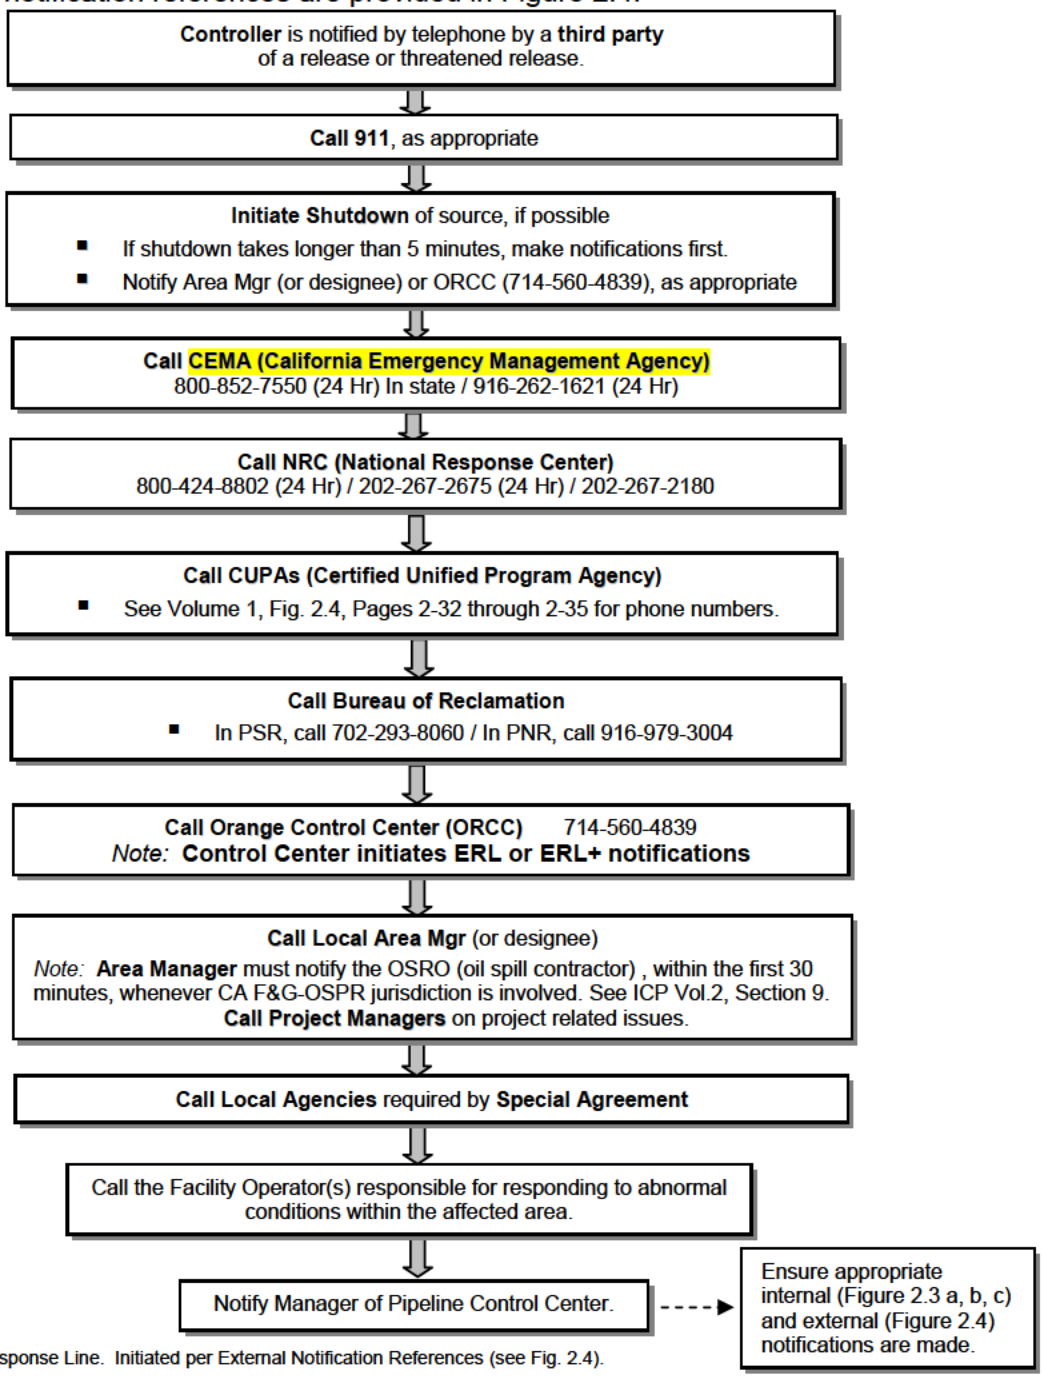
COMPANY EMPLOYEE OTHER THAN OPERATOR - NON-CALIFORNIA

FIGURE 2.1d-1

CONTROLLER - ORANGE, CA - CALIFORNIA ONLY NOTIFICATION PROCESS

This flowchart shows the appropriate notifications an Orange Controller is required to make ***immediately*** in the event of an actual or suspected release if he is first to be notified by a third party.

- Internal notification references are provided in Figure 2.3a, b, c.
- External notification references are provided in Figure 2.4.



*ERL = Emergency Response Line. Initiated per External Notification References (see Fig. 2.4).

*ERL+ = Emergency Response Line Plus — Notification for any major event associated with the Company, such as: major disruption or operations shutdown, death of employee(s) or contract employee(s), or any

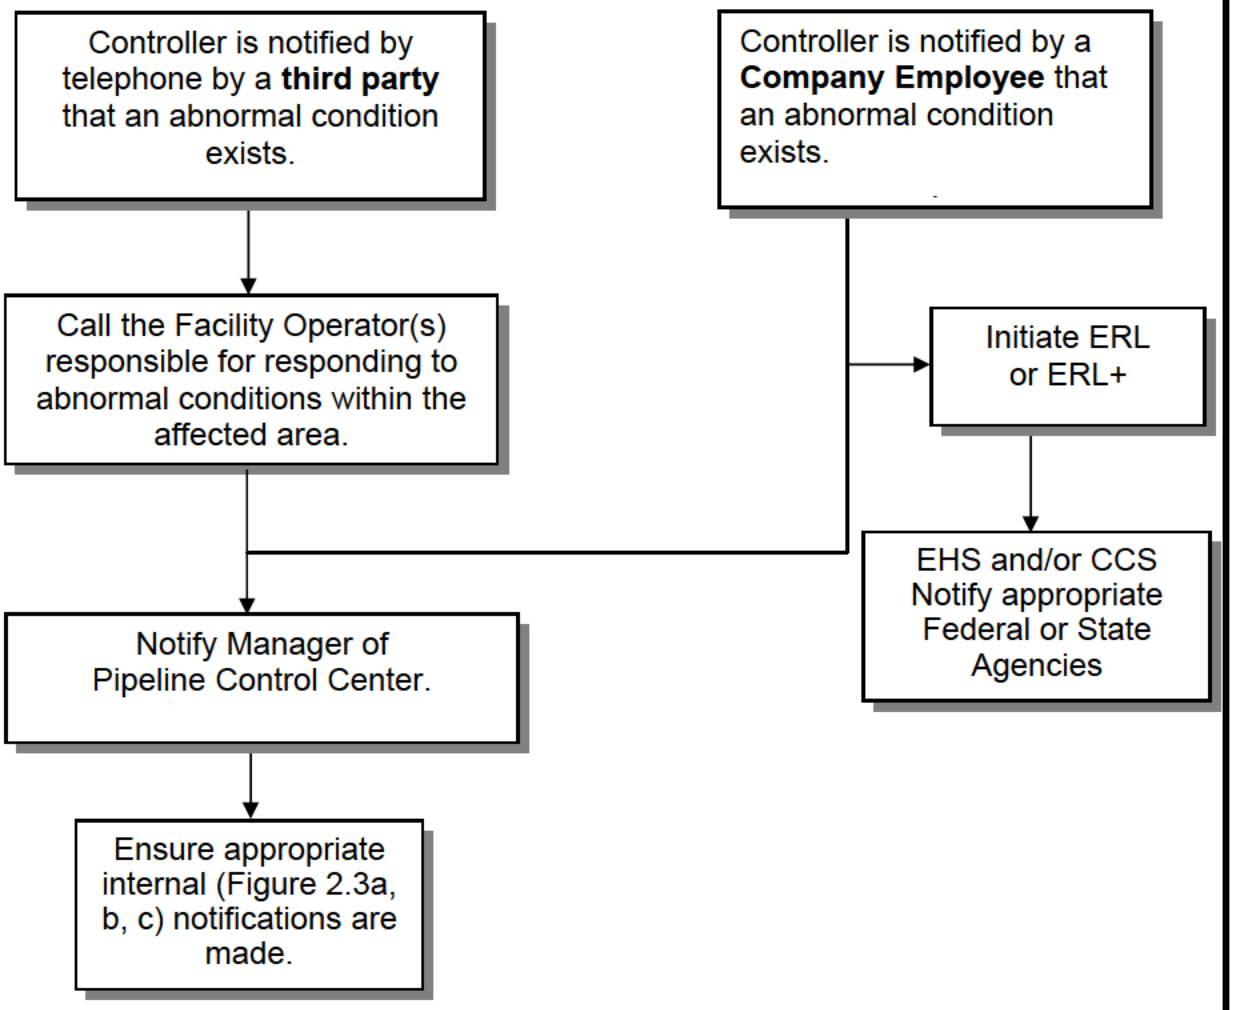
CONTROLLER-ORANGE, CA - CALIFORNIA ONLY

FIGURE 2.1d-2

CONTROLLER - ORANGE, CA - NON-CALIFORNIA NOTIFICATION PROCESS

This flowchart shows the appropriate notifications an Orange Controller is required to make ***immediately*** in the event of an actual or suspected release.

- Internal notification references are provided in Figure 2.3a, b, c.
- External notification references are provided in Figure 2.4.



*ERL = Emergency Response Line. Initiated per External Notification References (see Fig. 2.4).
*ERL+ = Emergency Response Line Plus – Notification for any major event associated with the Company, such as: major disruption or operations shutdown, death of employee(s) or contract employee(s), or any fatality or injury to member of public.

CONTROLLER-ORANGE, CA - NON-CALIFORNIA

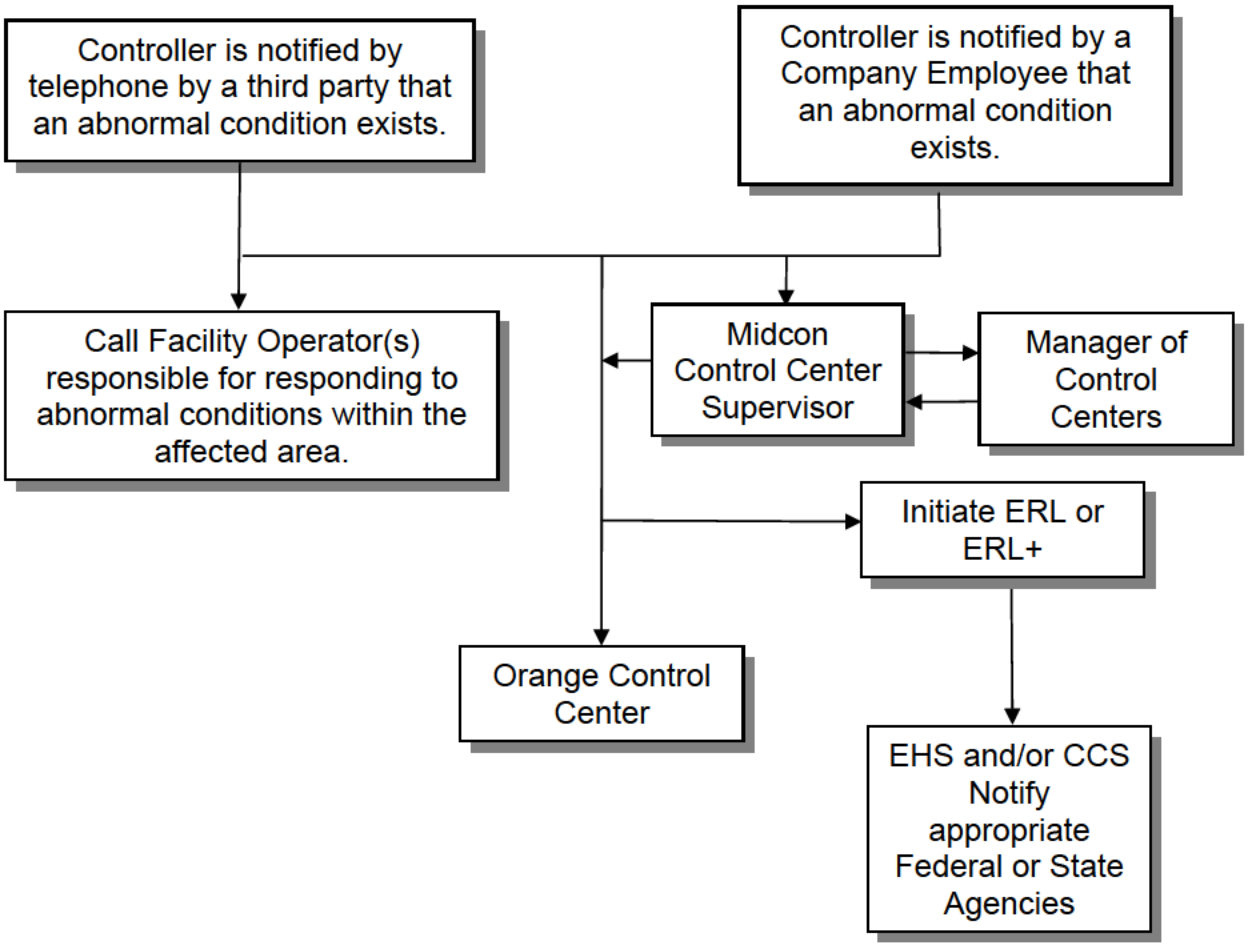
CONTROLLER - HOUSTON, TX

FIGURE 2.1e

CONTROLLER - HOUSTON, TX NOTIFICATION PROCESS

The Orange Control Center is the single point of contact for all "regulatory required" notifications for the Mid-Continent and the Pacific operations. This flowchart shows the appropriate notifications a Houston Controller is required to make ***immediately*** in the event of an actual or suspected release.

- Internal notification references are provided in Figure 2.3a, b, c.
- External notification references are provided in Figure 2.4.



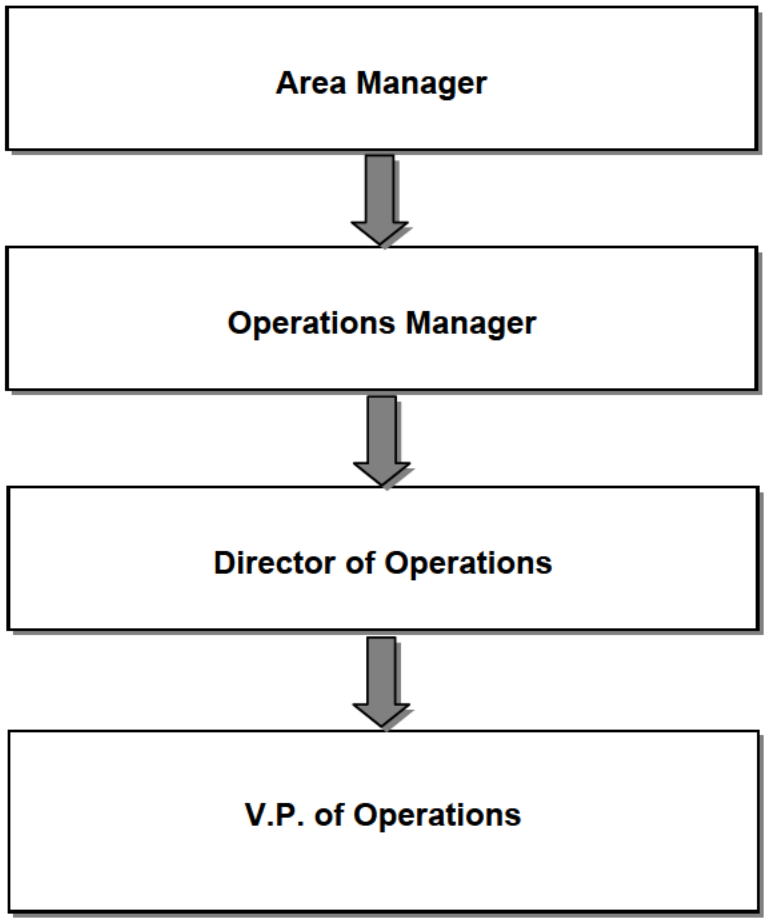
Note: It is deemed extremely unlikely that the Houston Controller would receive any initial notifications of abnormal conditions on California facilities and pipelines.
*ERL = Emergency Response Line. Initiated per External Notification References (see Fig. 2.4).
*ERL+ = Emergency Response Line Plus – Notification for any major event associated with the Company, such as: major disruption or operations shutdown, death of employee(s) or contract employee(s), or any fatality or injury to member of public.

FIGURE 2.1f

MANAGERS
INTERNAL NOTIFICATION PROCESS

This flowchart shows the appropriate notifications a Manager is required to make ***immediately*** in the event of an actual or suspected release. Notifications will generally come from an Operator, Company Employee, or a Controller.

- **If the person you are required to notify is not available, proceed until notification is made to the next management level**.
- Internal notification references are provided in Figure 2.3a, b, c.



MANAGERS

FIGURE 2.2

It is not necessary to wait for all information before calling the NRC.
National Response Center - 800-424-8802.

INITIAL REPORTING DETAILS

Incident Name:_____ **Data Base Record #**_____

Date Event Occurred:_____ Time Event Occurred: _____ Time Reported to ORCC: _____

Reported by: _____ Area of Responsibility: _____

Contact #'s: _____

Address where incident occurred: _____

_____ County: _____

Location of Event relative to railways, highways, roads, residents, etc. _____

Incident occurred at:

- ❑ Terminal Name: _____
- ❑ Breakout Facility (*) Name: _____
- ❑ Pump Station/Booster Name: _____
- ❑ Pipeline LS _____ PLMP _____ Line Size _____
- ❑ Other _____

Did the event cause any of the following?

- Fire or Explosion ❑ Yes ❑ No
- Death or injury ❑ Yes ❑ No # of employees _____ # of non-employees _____
- Product into the Water ❑ Yes ❑ No
- Damage Greater than $50,000 ❑ Yes ❑ No

If yes to any of the above, describe weather conditions: _____

Did the Incident occur during:

- ❑ Maintenance
- ❑ Operational Activity
- ❑ Failure of Equipment/Non-pipe component (valve, seals, gasket, piping, etc.)
- ❑ Terminal Loading ❑ Dome out (release to atmosphere) ❑ Dome out (contained in truck)

Additional Description

Size of Wet Area Type of Product

Description of Event:

Local Agencies Notified/Time: (Fire, Police, 911, etc.)

Reporting Requirements (To be determined by ORCC)

- ❑ Non-Reportable ❑ CEMA (Calif.)
- ❑ Railroad ❑ Other _____
- ❑ NRC ❑ State Agency _____
- ❑ Initiate Leak Wheel Call-out

(*) Breakout Facility Definition: Facility that uses tanks and equipment for input into a pipeline i.e., Concord, Watson, Rocklin (portions of Colton & Tucson

Prepared by: _____ Date: _____

ORCC Fax 714/541-3682 Northern Region Fax 707/424-6089 Southern Region Fax 909/877-9036

NOTE: Completing this form does not satisfy the need to enter this information in the Leak Database.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS

The initial reporting detail form is used by the Control Center to document the necessary information for reporting to governmental agencies and the initial entry into the leak database. The initial responder and the Area Manger should use the form as a guideline to insure that the necessary information is available to the Control Center. However, reporting should not be delayed due to incomplete information. Some of this information will be collected as the emergency response continues or after repairs are completed. Area Managers, Maintenance Managers and the Manager of Control Centers are responsible for completing or coordinating the answers to this form. This form should be retained in the official leak file.

Instructions for completion of this form are as follows:

Incident Name — Document the name of the leak. It is typical for a given leak to be named. This name is used in subsequent discussion and documentation.

Database Number — This is the number automatically assigned in the leak database.

General Information Section

The Initial Responder is responsible for the answers to this section.

Date event occurred — This is the date of the month the incident is reported to the Control Center. This should be the date that there is evidence of a suspected leak. It may be different from the date the leak is confirmed or sufficient information is collected to indicate governmental reportability. However, if there are differences in the dates, the reason for differences should be documented.

Time event occurred — This is the time that evidence of a suspected leak is discovered. Time should be reported using the 2400 clock. The local time zone should be designated. It may be different from the time the leak is confirmed or determination that the incident is determined to be reportable to a government agency. However if the time is different, the reason for differences should be documented.

Time Reported to OCC — This is the time the event was reported to the Orange Control Center.

Reported by — This is the person who is reporting the suspected leak to the Orange Control Center.

Area of Responsibility — This is the name of the Area office where the suspected leak occurred.

Contact number — This is the telephone number that the control center (or others) will use to get further information, if needed.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS	
Address where incident occurred	This is the actual address or closest cross street address where the event occurred. It will be used to locate the incident site on maps and to communicate to others where event occurred.
County	This is County where incident occurred.
Location of event relative to Railways, highways, roads, residents, etc.	Give detail relative to other significant assets. This may be used to determine other emergency response action.

Facility Type Section

The Initial Responder is responsible for the answers to this section. Check the appropriate facility type.

Terminal	Refers to Truck Loading facilities, truck racks and associated storage. Document the name of the facility.
Breakout Facility	Refers to storage, piping, and equipment associated with pipeline transportation. There are two types of Breakout Tanks. Storage – where product comes from pipeline and then is reinjected back into pipeline for further transportation. Breakout also includes tanks associated with pipeline overpressure protection. Document the name of the facility.
Pump Station/Booster	This refers to pump stations associated with pipeline transportation. Document the name of the facility.
Pipeline	This refers to line pipe in the pipeline right-of-way. Document the Line Section number (LS), pipeline mile post (PLMP), and line size.
Other	This refers to valve sites, measurements stations and other facilities, such as gravitometer sites, in the pipeline right of way that is not at a breakout facility, pump station or line pipe. Document the name of the facility.

Consequence Section

The Initial Responder is responsible for the answers to this section. Check the consequence of the event. This is used to determine whether the event is reportable to DOT.

Fire or Explosion	If possible, denote whether fire or explosion was a result of the event or caused the event.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS	
Death or Injury	If possible, differentiate the number of employees and non-employees affected.
Product into the water	Denote if product resulted in pollution of any stream, river, lake, reservoir, or other similar body of water that violated applicable water quality standards, caused a discoloration of the surface of the water or adjoining shoreline, or deposited a sludge or emulsion beneath the surface of the water or upon adjoining shorelines.
Damage greater than $50,000	This includes cost of cleanup and recovery, value of lost product, and damage to the property of the operator or others, or both. In many cases this may not be known in the early stages of the incident, however leaks involving breakout tanks should be considered as having met this requirement.
Describe weather conditions	Document temperature, rain, and wind conditions (direction and estimated speed) if the incident involved a fire, explosion, death, injury requiring hospitalization, water, or damage greater than $50,000.
Activity Section	
The Initial Responder is responsible for the answers to this section. Document the activity of the system at the time the evidence of the incident was discovered.	
Maintenance	Check if maintenance activities are involved.
Operation Activity	This applies to normal operations, such as start up and shut down of pump(s) or pipeline, filling or emptying tanks.
Failure of Equipment	Check if failure of equipment was involved. Examples of "failure of equipment" includes malfunction of control or leak equipment, failure of components, seal failures etc.
Terminal Loading	This pertains to the actual loading transports.
Dome out	Dome outs should be documented. Only Dome outs released to the atmosphere should be reported to the Control Center and documented on this form.
Additional Descriptions Section	
The Initial Responder is responsible for the answers to this section.	
Size of Wet Area	This is useful to assist in the estimation of released product and determine appropriate emergency response.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS

Type of Product	This pertains to the product that was released from the pipeline. Document the product that is in the pipeline at point of incident at the time of the incident.
Description of Event	Give narrative description of incident. This will help others understand the facts and circumstances surrounding the incidents.
Local Agencies Notified / Time	Document local agencies and emergency response organizations contacted and the time of notification.

External Reporting Section

The Control Center is responsible for determining the external notifications to be made. However, if the Incident Commander requests the Control Center to assist in making other notifications, they may do so. The Manager of Control Centers is responsible for determination of the "reportability" of an incident. If there are questions, or the Manager of Control Centers needs assistance in determining whether or not a given incident is reportable, the Director Pipeline Safety will be consulted.

Non- Reportable	Check if the incident was determined to be non-reportable to State or Federal Agencies.
Initiate Leak Wheel	Check if the pipeline wheel is notified. The pipeline wheel is a predetermined list of pipeline operators that operate in the area of Kinder Morgan's pipeline. Document the date, time, and person (s) receiving notification.
CEMA	Check if the California's Emergency Management Agency (CEMA) was notified. Document the date, time, and person receiving notification and the CEMA number.
Other	Check if other external notifications were made that are not included elsewhere in this section. Document the date, time, and person receiving notification.
State Agency	Check, if other state agencies are notified. Document the date, time, and person receiving notification and State ID number.
NRC	Check if the National Response Center (NRC) is notified. Document the date, time, and person receiving notification and NRC number.

Leak Control & Remediation

The Incident Commander is responsible for determining the answers to this section. However times may be coordinated with others.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS	
Time Leak Stopped:	Document the time the leak was stopped. Use the 2400 hour clock.
Time Product was contained:	Document the time the leak was contained. Use the 2400 hour clock.
How was product contained:	Document the method that the product was contained.

Type of Repair Section

The Area Manager or Maintenance Manager is responsible for completing this section. Check the type of repair used.

Replaced	Replace means that the affected segment was cut out or the affected component removed and replaced.
Sleeve – Type A, Type B, Clock Spring	Sleeve means that the affected pipe was left in place and a pressure containing sleeve, non-pressure containing sleeve or a composite wrap was used as the repair method.
Torqued	Torque means to tighten the fitting or nut used as repair method to stop the leak. This typically refers to repairs on components.
Other: Describe	Check if a repair method other than the ones previously listed were used. Describe type of repair.

Method of Clean-up Section

The Area Manager or Maintenance Manager is responsible for completing this section. Check who was responsible for the clean up and the method used.

HQ Remediation	Check if the EHS Remediation Department was responsible for cleanup.
Local Environmental Contractor	Check if a local environmental contractor was responsible for cleanup.
Local Field Personnel	Check if local field personnel were responsible for cleanup.
Describe Cleanup:	Document the method of Cleanup.

Terminal Dome-out Section

The Area Manager is responsible for completing this section. If Equipment Failure was involved designate ownership of equipment or if it was Driver Error, check apparent cause of driver error.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS	
KMEP Equipment:	
Scully System Failure	Check if cause of event was due to failure of the Scully System. List the root cause of the failure.
Brodie Hung Open	Check if cause of event was due to failure of the Brodie Valve. List the root cause of the failure.
TMS Failure to Shutdown or Problem	Check if cause of event was due to failure of the TMS System. List the root cause of the failure.
Other	Check if cause of event was due to cause not otherwise listed. List the root cause of the failure.
Carrier Equipment:	
Sensors set too high	Check if cause of event was due to the failure of the Carriers sensors. List the root cause of the failure.
Other	Check if the cause of event was due to failure of the Carrier's equipment and not otherwise listed. List the root cause of the failure.
Driver Error:	
Retain on Truck	Check if cause of event was due to the driver was not aware of residual volumes on truck. List the root cause of the failure.
Two Compartments Opened	Check if cause of event was due to two compartments of the truck being opened. List the root cause of the failure.
Incorrect Preset	Check if cause of event was due to the incorrect volume being set by the Operator. List the root cause of the failure.
Other	Check if the cause of event was due to driver's error and not otherwise listed in this section. List the root cause of the failure.

FIGURE 2.3a

NORTHERN REGION INTERNAL NOTIFICATION REFERENCES

The following notification references are inserted in this Plan from other, consistently maintained, sources. The references will be updated when Plan updates are conducted. The most current references are frequently distributed and are available on the Company Intranet.

In all cases KMEP considers the Area Manager to be the Qualified Individual (QI).

Pacific Southern Region Satellite Contact List

GlobaFone

Iridium satellite phone calling instructions

Satellites need to 'see' your phone to carry your calls; therefore the phones are best used outdoors. Keep in mind that anything that obstructs the satellites' view of your phone will impede your ability to make calls.

Simply turn on the phone, rotate the antenna and dial.

HOW TO MAKE CALLS TO AND FROM AN IRIDIUM SATELLITE PHONE			
CALLING FROM	**TO**	**DIAL**	**EXAMPLE**
LAND PHONES	IRIDIUM PHONES	011 then iridium number	011-8816-555-12345
CELL PHONES	IRIDIUM PHONES	011 then iridium number	011-8816-555-12345
LAND PHONES	IRIDIUM 2-STAGE	1-480-768-2500-wait for recording	then enter 12 digit iridium #
CELL PHONES	IRIDIUM 2-STAGE	619-285-5706	then enter 12 digit iridium #
IRIDIUM PHONES	U.S. LAND PHONES	+ or 00 then 1 then area code and number	+1-555-123-4567 or 00-1-555-123-4567
IRIDIUM PHONES	U.S. CELL PHONES	+ or 00 then 1 then area code and number	+1-555-123-4567 or 00-1-555-123-4567
IRIDIUM PHONES	IRIDIUM PHONES	00 or + then iridium number	+8816-555-12345 or 00-8816-555-12345
IRIDIUM PHONES	BGAN TERMINAL	760-254-2446	+8816-555-12345 or 00-8816-555-12345
IN CASE OF PERSONAL EMERGENCY IN THE US DIAL 911 FROM YOUR SATELLITE PHONE

KINDER MORGAN ENERGY PARTNERS, L.P.

Revised March 2010

California Field Notification Form

- Below are variations of the questions you will be asked when making notifications.
- **Have this information readily available during the notifications.**
- To ensure KM reports uniform information when calling multiple agencies, write down the information and report it consistently.

Name and phone number of KM caller:
Name and phone number of designated KM employee for follow-up calls (Area Manager or Designee):
Company Name and Mailing Address: *Mailing address for reports: Kinder Morgan Energy Partners L.P. 1100 Town & Country Rd. Orange, CA 92868*
Date and Time of Incident:
Product Type:
Location of Release or Threatened Release (see facility address list as needed): ☐ Terminal _____ ☐ Breakout Facility _____ ☐ Pump Station/ Booster _____ ☐ Pipeline: LS _____ / PLMP _____ Line size _____ Cross Street / Landmark _____
County:
Weather Conditions:
Description of what happened:
Amount Released (area dimensions not quantity); estimate size of release area (i.e. 5ft by 5ft): **Approximately = by**
Water Affected or Threatened, if any:
Measures taken or plans to abate, contain and cleanup the spill:
Death or Injuries, if any:
Other Agencies Notified, if any:
Information provided in follow-up calls:

If the answer to any question is unknown, tell the agency the information is "unknown at this time"; then document the response to the agencies was "unknown at this time".

Fax copies to ORCC and appropriate Regional Office. Area Manager retains original copy for files.
• ORCC fax# 714-541-3682 • Southern Region fax # 909-877-9036 • Northern Region fax# 707-424-6089

REQUIRED NOTIFICATIONS (FOR DOT JURISDICTIONAL FACILITIES)		
DEPARTMENT OF TRANSPORTATION		
US Dept. of Transportation Information Resources Manager Office of Pipeline Safety Pipeline & Hazardous Materials Safety Administration 1200 New Jersey Avenue SE-E-22-321 Washington, DC 20590 Fax Filing: (202) 366-4566	(800) 424-8802* (202) 267-2675*	**REPORTING REQUIREMENTS** TYPE: In addition to the reporting of accidents to the NRC, a written accident report (DOT Form PHMSA F 7000-1) must be submitted for releases resulting in any of the following: 1. Explosion or fire not intentionally set by the operator. 2. Release of 5 gallons or more of hazardous liquid or carbon dioxide, except that no report is required for a release of less than 5 barrels resulting from a pipeline maintenance activity if the release is: a. Not one described under the NRC's reporting conditions. b. Confined to Company property or pipeline right-of-way; and c. Cleaned up promptly. 3. Death of any person. 4. Personal injury necessitating hospitalization. 5. Estimated property damage, including cost of cleanup and recovery, value of lost product, and damage to the property of the operator or others, or both, exceeding $50,000. VERBAL: Call to the NRC meets the required verbal notification under DOT reporting requirement. WRITTEN: As soon as practicable, an accident meeting any of the above criteria must be reported on DOT Form PHMSA F 7000-1. The report must be sent to DOT no later than 30 days after the release. A supplemental report must filed within 30 days for changes or additions to the original report.

SPILL/RELEASE REPORT

DEQ
State of Oregon Department of Environmental Quality

1 - GENERAL INFORMATION **OERS No. _____**

a. Company/Individual Name: _____

b. Address: _____

_____

c. Company Contact Person: _____

d. Phone Number(s): _____

e. Specific on-site location of the release (and address if different from above):

_____

_____

_____

Please provide a map of the site showing area(s) where the release occurred, any sample collection locations, location of roads/ditches/surface water bodies, etc.

2 - RELEASE INFORMATION

a. Date/Time Release started:_____ Date/Time stopped:_____

b. Release was reported to (specify Date/Time/Name of Person contacted where applicable):

ODEQ _____

OERS _____

NRC _____

Other (describe):_____

c. Person(s) reporting release:_____

d. Name, quantity and physical state (gas, liquid, solid or semi-solid) of material(s) released:

_____

_____

Please attach copies of material safety data sheets (MSDS) for released material(s).

e. The release affected: ____Air ____Groundwater ____Surface Water ____Soil ____Sediment

f. Name and distance to nearest surface water body(s), even if unaffected (include locations of creeks, streams, rivers and ditches that discharge to surface water on maps):

_____

Has the release reached the surface water identified above?: ____Yes ____No

Could the release potentially reach the surface water identified above? ____Yes ____No

Explain:_____

_____

g. Depth to nearest aquifer/groundwater:_____

Is nearest aquifer/groundwater potable (drinkable)? ____Yes ____No

Has the release reached the nearest aquifer/groundwater? ____Yes ____No

Explain:_____

_____

h. Release or potential release to the air occurred? ____Yes ____No
Explain:_____

_____

i. Was there a threat to public safety? ____Yes ____No
j. Is there potential for future releases? ____Yes ____No
Explain:_____

_____

k. Describe other effects/impacts from release (emergency evacuation, fish kills, etc.):

_____

_____

_____

l. Describe how the release occurred. Include details such as the release source, cause, contributing weather factors, activities occurring prior to or during the release, dates and times of various activities, first responders involved in containment activities, etc.:

_____

_____

3 - SITE INFORMATION

a. Adjacent land uses include (check all that apply and depict on site maps):
____Residential ____Commercial ____Light Industrial ____Heavy Industrial
____Agricultural ____Other (describe):_____
b. What is the population density surrounding the site:_____
c. Is the site and/or release area secured by fencing or other means? ____Yes ____No
d. Soil types (check all that apply): ____alluvial ____ bedrock ____ clay ____sandy
____silt ____ silty loam ____artificial surface (cement/asphalt/etc.)
e. Describe site topography:_____

_____

_____

4 - CLEANUP INFORMATION

a. Was site cleanup performed? ____Yes ____No

If No, explain:_____

_____

b. Who performed the site cleanup?

Company Name:_____

Address: _____

_____

Cleanup Supervisor:_____

Phone Number(s): _____

c. Has all contamination been removed from the site? ____Yes ____No

If No, explain:_____

_____

d. Estimated volume of contaminated soil removed:_____

e. Estimated volume of contaminated soil left in place:_____

f. Was a hazardous waste determination made for cleanup materials? ____Yes ____No

g. Based on the determination, are the cleanup materials hazardous wastes?

____Yes ____No If Yes, list all waste codes:_____

h. Was contaminated soil or water disposed of at an off-site location? ____Yes ____No

If yes, attach copies of receipts/manifests/etc., and provide the following information:

Facility Name: _____

Address: _____

_____

Facility Contact: _____

Phone Number(s): _____

i. Is contaminated soil or water being stored and/or treated on-site? ____Yes ____No
If yes, please describe the material(s), storage and/or treatment area, and methods utilized (attach additional sheets if necessary):

_____

_____

_____

_____

j. Describe cleanup activities including what actions were taken, dates and times actions were initiated and completed, volumes of contaminated materials that were removed, etc. (attach additional sheets or contractor reports if necessary or more convenient):

_____

_____

_____

_____

5 - SAMPLING INFORMATION

Attach copies of all sample data and indicate locations of sample collection on maps.

a. Were samples of contaminated soil collected? ____Yes ____No ____N/A
b. Were samples of contaminated water collected? ____Yes ____No ____N/A
c. Were samples collected to show that all contamination had been removed? ____Yes ____No ____N/A
d. Describe sampling activities, results and discuss rationale for sampling methods:

_____

_____

_____

_____

_____

_____

_____

_____

_____

_____

_____

_____

_____

_____

_____

_____

6 - SPILL REPORT CHECKLIST

To ensure that you have gathered all the information requested by the Department in this Spill/Release Report, please complete the following checklist:

____ Map(s) of the site showing buildings, roads, surface water bodies, ditches, waterways, point of the release, extent of contamination, areas of excavation and sample collection locations attached.

____ Material Safety Data Sheet (MSDS) for released material(s) attached.

____ Sampling data/analytical results attached.

____ Receipts/manifests (if any) for disposal of cleanup materials attached.

____ Contractor reports (if any) attached.

Address: _____
City: _____ State/Zip: _____

Release reported by: (if different from above)

Contact Person: _____ Phone: _____
Company: _____
Address: _____
City: _____ State/Zip: _____

The RP is the: ☐ tank owner ☐ tank operator ☐ land owner ☐ other (specify):

Release Information Release is: ☐ Confirmed ☐ Suspected Date of discovery: _____

Check all that apply:

Discovery
- ☐ Routine tank closure or site assessment
- ☐ Laboratory analytical results
- ☐ Free product or sheen
- ☐ Odors
- ☐ Automatic tank gauge
- ☐ Probe or sensor
- ☐ Inventory records
- ☐ 1-mo. SIR failure or 'inconclusive'
- ☐ 2-mo. inventory control discrepancy
- ☐ Tank tightness test failure
- ☐ Line tightness test failure
- ☐ Groundwater monitoring well
- ☐ Vapor detector (auto or manual)
- ☐ Water supply contamination

Substance
- ☐ Gasoline (Leaded/Non-leaded/Unknown)
- ☐ Diesel/Fuel oil
- ☐ Waste oil
- ☐ Hydraulic/transmission/mineral oil
- ☐ Jet fuel/kerosene
- ☐ Petroleum - unknown type
- ☐ Hazardous substance: _____
- ☐ Unknown
- ☐ Other (describe): _____

Impact
- ☐ Groundwater
- ☐ Surface water
- ☐ Soil
- ☐ Air

Cause
- ☐ Spill
- ☐ Overfill
- ☐ Human error
- ☐ Faulty installation
- ☐ Corrosion
- ☐ Unknown
- ☐ Other (describe):

Location
- ☐ Tankhold
- ☐ Dispenser area
- ☐ Pipe chase
- ☐ Remote fill port
- ☐ Other (describe):

Tank system has/had: ☐ pressurized piping ☐ suction piping ☐ unknown ☐ N/A

Other parties notified (Fire, police, etc. - list):

Free product present? ☐ Yes ☐ No Describe steps taken to control and abate release (system repairs, free product removal, etc.), and/or actions taken to mitigate any fire, explosion, or vapor hazard:

Additional comments (add pages as needed):

<<< TCEQ USE ONLY >>> **PM** - complete this form when a report of a suspected/confirmed release from a regulated storage tank is received & provide to Admin staff. Information received by ☐ phone ☐ fax ☐ e-mail (print out & attach) ☐ other (explain on additional pages or on back).
Date release was reported to TCEQ: _____. Initial here if new LPST ID No. should be assigned: _____**PM** _____**TL**.

TCEQ-20097 (December 2003)

Texas Commission on Environmental Quality

PETROLEUM STORAGE TANK PROGRAM
RELEASE DETERMINATION REPORT FORM

FORM INSTRUCTIONS: Use this form to report the results of investigating a suspected or confirmed release or to report the results of permanent removal from service of a UST. The form should also be used to report the results of routine removal of an AST from service and/or for any routine environmental site assessment (ESA) at PST sites where a 'no further action' letter from TCEQ is desired (routine AST removals and routine ESAs are not specifically regulated by TCEQ). Please note that leaking PST sites reported to the agency on or after September 1, 2003 are potentially subject to 30 TAC 350 ("TRRP") as well as to 30 TAC 334. Refer to *Investigating and Reporting Releases from Petroleum Storage Tanks* (RG-411) for more information. Please also note that initial (w/in 24 hours) reporting of all suspected or confirmed releases should be made using the ***PST Program Incident Report (IR) form*** **(TCEQ-20097)**. Submit completed forms to the PST-RPR, TCEQ, MC 137, P.O. Box 13087, Austin, Texas 78711-3087. **DO NOT MODIFY THIS FORM IN ANY WAY. Complete all applicable blanks.** Incomplete forms, including forms missing relevant attachments, will be returned without review.

RDR FORM CHECKLIST

PLEASE NOTE: The following documents are required to be attached to this form upon submittal. Complete the checklist and attach each listed document to the back of the form, or provide a written statement explaining why a particular item on the checklist is not applicable/not available:

☐ Copy of original Construction Notification form filed with the TCEQ regional office for the field construction activity

☐ Scaled site diagram(s) showing location & layout of tank system(s) including pipe chases, dispensers, and any remote fill ports; all sampling points, North arrow, scale, nearest intersection of main roads. Previously removed tank systems should also be indicated.

☐ Written description of tank removal activities, including removal of substances from tanks, tank cleaning/purging/inerting activities, and tank condition (corrosion holes, tears, rust, etc.). Include description of piping and dispenser equipment condition.

☐ Written description of site sampling activities, including sample equipment used, decontamination procedures, sample collection and handling methods, sampling locations and summary of overall sampling rationale.

☐ Copies of signed laboratory reports, complete chain-of-custody and laboratory check-in sheet documentation including sample receipt temperature, sample preservation methods, date and time of sample collection, laboratory QA/QC etc.

☐ Waste disposal, treatment, recycling or reuse documentation, including waste manifests signed and dated by all relevant parties. Manifests should have all required signatures and dates, and show waste type, quantities and units.

☐ Photographs (originals or high resolution color copies) of the site showing all parts of tank system (tanks, dispensers, piping, etc.), all excavated areas including excavation bottoms, stockpiles, etc. See Eco Checklist comments below.

☐ Tank destruction documentation (no. of tanks, size(s), former contents, tank composition [e.g., steel, fiberglass, etc.]) including date of disposal and facility name, address and contact information.

☐ Copy of amended *UST* or *AST Registration and Self-Certification form* (TCEQ-0724 or TCEQ-0659, respectively)as applicable. Originals should be sent to the PST Registration Team (MC-138), TCEQ, P.O. Box 13087, Austin, TX 78711-3087.

☐ Boring logs and well completion diagrams/well reports, as applicable. Logs should include field screening.

☐ Completed TRRP Tier 1 Ecological Exclusion Checklist (available at www.tnrcc.state.tx.us/permitting/forms/eco.pdf_____)
NOTE: The Eco Checklist is mandatory for all sites which (a) report a PST release to TCEQ on or after September 1, 2003, (b) have chemicals of concern (COCs) present above the method quantitation limits (MQLs), and (c) desire to not be subject to TRRP assessment/remediation requirements. Persons planning on going directly into TRRP with their sites may submit the Eco Checklist later, as part of the APAR form (TCEQ-10325). See *Investigating and Reporting Releases from PSTs* (RG-411) for more information. Please note that the Eco Checklist itself also has required attachments - Part I, Item 1 requires one of the following to be attached "...to depict the affected property and surrounding area": USGS topographic map, aerial photographs, or "other affected property photographs". If photographs other than aerial are used, ensure that the entire photographic package submitted with this form depicts the tank systems & excavation bottoms as well as all site features pertinent to ecological evaluation.

☐ RCAS/CAPM and/or LOSS signatures are required on page 7 of this form.

TCEQ-0621 (revised 12/10/2003) - previous versions obsolete **Page 1 of 8**

SUMMARY
Based on the information obtained during this release determination and by comparing the contaminant levels to the laboratory method quantitation limits (MQLs) and to the PST Program action levels, check all that apply: ☐ No contaminants were detected above the greater of MQLs or background. ☐ Contaminants were detected above MQLs/background, but below action levels. ☐ Contaminant levels were above action levels. ☐ Tank pit water was present. If present, sampled? ☐ Yes ☐No ☐ A groundwater sample representative of the first water-bearing zone was collected and analyzed (i.e., monitoring well installed). ☐ A representative groundwater sample was collected and analyzed and one or more COCs exceeded action levels. ☐ The site does not pass the TRRP Tier 1 Ecological Exclusion Checklist. ☐ This site is a new LPST site (reported to the agency on or after September 1, 2003), and therefore is subject to 30 TAC 350. ☐ This site will enter TRRP and an Affected Property Assessment Report form (TCEQ-10325) is the next submittal. ☐ This site was initially reported to _____ (name, TCEQ office) on _____ (date prior to September 1, 2003) and therefore is subject to 30 TAC 334 only. ☐ This site is an existing LPST case, there is no new release, and this Release Determination Report is being submitted as the tank removal-from-service documentation.
Is the responsible party financially able to complete the next appropriate step? ☐ **YES** ☐ **NO** If no, and an LPST number is assigned to this case, you may contact the PST-RPR Section at 512/239-2200 to request information on the State-Lead option. Pursuit of this option requires submittal of detailed financial information including recent tax returns and other IRS documentation. Please note that pursuit of this option is only possible once an LPST number has been assigned.
Answer the following question if this is an LPST case subject to 30 TAC 334 only (i.e., originally reported to agency prior to September 1, 2003, and no new release occurred after that date). Is this case eligible for reimbursement of necessary corrective actions? ☐ **YES** ☐ **NO** If not, appropriate corrective action in accordance with applicable rules and guidance may continue without specific direction or approval from the PST-RPR Section, however, coordination with PST-RPR is recommended. If the site is eligible for reimbursement, all corrective action activities, with the exception of initial NAPL recovery and emergency abatement activities, must be preapproved prior to initiation.

TCEQ-0621 (revised 12/10/2003) - previous versions obsolete **Page 2 of 8**

A. GENERAL INFORMATION

Pre-existing LPST ID No.? ☐ NO ☐ YES :_____ (LPST no[s].) TCEQ Region:_____

Facility ID No.:_____ Required unless one of the following applies:

☐ Check here if tank registration is not required for this site (per 30 TAC §334.7), **and** check one of the following as applicable:

- ☐ the tank(s) are partially excluded or exempted from jurisdiction under 30 TAC Chapter 334. Specify type or usage of tank(s):_____
- ☐ the tank(s) were permanently removed from the ground before May 8, 1986 (provide date of removal_____);
- ☐ the tank(s) remained in the ground but were emptied, cleaned, and filled with inert substance before January 1, 1974 (provide date of activities:_____);
- ☐ the tank(s) were out of operation, their existence was unknown (i.e., "ghost tank"), and they were permanently removed from service within 60 days of their discovery (provide date of discovery:_____. Describe method of discovery:_____)

Tank Owner:_____

Tank Owner Mailing Address:_____

Tank Owner City:_____ State:_____ Zip:_____

Tank Owner Contact Person:_____ Phone:_____ Fax no.:_____

Tank Operator (if different from tank owner):_____

Tank Operator Mailing Address:_____

Tank Operator City:_____ State:_____ Zip:_____

Tank Operator Contact Person:_____ Phone:_____ Fax no.:_____

Land Owner (if different from tank owner and operator):_____

Land Owner Mailing Address:_____

Land Owner City:_____ State:_____ Zip:_____

Land Owner Contact Person:_____ Phone:_____ Fax no.:_____

If this site is a pre-existing LPST site with no new release or is a new LPST site which will be subject to TRRP (30 TAC 350), which of these parties will oversee the corrective actions at this site?

☐ **Tank Owner** ☐ **Tank Operator** ☐ **Land Owner**

☐ **Other (not the contractor or consultant):** Name:_____

Address:_____

City:_____ State:_____ Zip:_____ Contact person:_____

Phone:_____ Fax:_____

Please note that no matter which party conducts corrective action, the tank owner and the tank operator are jointly responsible for the necessary corrective actions.

Facility Name:_____

Facility Physical Address:_____

Facility City:_____ County:_____ County Code (see p. 8):_____

TCEQ-0621 (revised 12/10/2003) - previous versions obsolete **Page 3 of 8**

A. GENERAL INFORMATION (continued)

Indicate ALL tanks **currently and formerly** located at this site (attach pages as necessary):

	Type (UST/AST)	Product Type	Size (approx. gal)	Date Removed from Service
Current:				
Former:				

B. SUSPECTED RELEASE INFORMATION

Complete only this section and sections E through G as appropriate when the situation of a suspected release has occurred and it was documented that a release had not occurred.

Date suspected release discovered:_____ Reason release suspected:_____

Date suspected release reported to TCEQ: _____ Reported to:_____

Possible source(s) of release: (check all that apply) Tanks: ☐ USTs ☐ ASTs ☐ Piping ☐ Overfills/spills ☐ Unknown
☐ Other:_____

Type of substance(s) suspected released: (check all that apply) ☐ Gasoline ☐ Diesel ☐ Used Oil ☐ Aviation Gasoline
☐ Jet Fuel (type:_____) ☐ Alcohol-blended fuel (Type and percentage of alcohol:_____)
☐ Other: (be specific)_____

Were UST/AST system tank and/or line tightness tests performed? ☐ **YES** or ☐ **NO** (check one) If yes, attach test data and results.
Did the tests indicate that all tanks and piping were tight? ☐ **YES** or ☐ **NO** (check one) If No, specify the portion of the tank system(s) that were found not to be tight:_____

Were any repairs conducted on the tank system(s)? ☐ **YES** or ☐ **NO** (check one) If yes, describe type(s) and location of repairs:
_____

Were tightness tests performed after repairs were conducted? ☐ **YES** or ☐ **NO** (check one) If yes, attach test data and results.
Did the tests indicate that the repaired items were tight? ☐ **YES** or ☐ **NO** If No, specify the portion of the tank system(s) that were found not to be tight:_____

Were any soil confirmation samples collected? ☐ **YES** or ☐ **NO** (check one) If yes, were all potential source areas investigated?
☐ **YES** or ☐ **NO** If samples were collected, attach descriptions of sample locations, collection methods, and laboratory results.

Were any groundwater confirmation samples collected? ☐ **YES** or ☐ **NO** (check one) If yes, were all potential source areas investigated? ☐ **YES** or ☐ **NO** If samples were collected, attach descriptions of sample locations, collection methods, aquifer name, and laboratory results. (Groundwater sampling is not required at this point unless there is reasonable suspicion of impact.)

TCEQ-0621 (revised 12/10/2003) - previous versions obsolete **Page 4 of 8**

C. CONFIRMED RELEASE INFORMATION

Complete this section only if a release was confirmed; i.e., contaminant levels exceeded MQLs

Date release confirmed:_____ Date release reported to TCEQ:_____ Reported to:_____

Is this the first release from a UST or AST discovered at this site? ☐ **YES** ☐ **NO**

Is there any other contamination or potential impacts to human health from any source other than the tank systems at this site?
☐ **YES** ☐ **NO** If yes, indicate type and location of contamination:_____

Reported to TCEQ by:_____ Representing:_____

Method of release discovery:

- ☐ Samples collected during tank removal-from-service activities
- ☐ Samples collected during other tank system construction activities
- ☐ Samples collected during release determination investigation
- ☐ Other:_____
- ☐ Impact to utility line
- ☐ Impact to surface water
- ☐ Impact to water well

Method of release confirmation: (check all that apply)
☐ Soil samples ☐ Groundwater samples ☐ Surface water samples ☐ Documentation of presence of NAPL

Source(s) of release: (check all that apply) Tanks: ☐ USTs ☐ ASTs ☐ Piping ☐ Overfills/spills ☐ Unknown
☐ Other:_____

Substance(s) released: (check all that apply) ☐ Gasoline ☐ Diesel ☐ Used Oil ☐ Aviation Gasoline
☐ Alcohol-blended fuel (Type and percentage of alcohol:_____)
☐ Jet Fuel (type:_____) ☐ Other: (be specific)_____
Amount of product released:_____ Chemical Abstract Service registry #:_____ (for hazardous substances)

Were any soil samples collected? ☐ **YES** or ☐ **NO** (check one) If yes, attach descriptions of sample locations, collection methods and laboratory results.

Type of native soil: (check one) ☐ Clay or silt ☐ Sand, gravel or rock

Were any groundwater confirmation samples collected? ☐ **YES** or ☐ **NO** (check one) If yes, attach descriptions of sample locations, collection methods, aquifer name, and laboratory results.

Known Impact(s): (check all that apply) ☐ Soil ☐ GW ☐ Surface Water ☐ Subsurface Utilities - type:_____
☐ Buildings ☐ Water wells ☐ Other sensitive receptors:_____

Was the land owner (if different from the tank owner) notified of the contamination? ☐ **YES** or ☐ **NO** (check one) If Yes, attach copy of the letter which provided the notification. If No, documentation that notification was provided must be submitted within 30 days from the date the impact is discovered.

Possibly Threatened: (check all that apply) ☐ GW ☐ Surface Water ☐ Subsurface Utilities - type:_____
☐ Buildings ☐ Water wells ☐ Other sensitive receptors:_____

Was NAPL detected (greater than 0.01 feet)? ☐ **YES** or ☐ **NO** (check one) If yes, describe how and where it was detected, the thickness detected, and the recovery actions taken: _____

TCEQ-0621 (revised 12/10/2003) - previous versions obsolete **Page 5 of 8**

D. ABATEMENT MEASURES

Were abatement measures initiated to stop the release or to recover the released substance? ☐ YES or ☐ NO (check one) If yes, describe the abatement and/or recovery measures taken and the dates and duration of the activities: _____

Were UST/AST system tank and/or line tightness tests performed? ☐ YES or ☐ NO (check one) If yes, attach test results.
Did the tests indicate that all tanks and piping were tight? ☐ YES or ☐ NO If No, specify the portion(s) of the tank system(s) that were found not to be tight: _____

Were any repairs conducted on the tank system(s)? ☐ YES or ☐ NO (check one) If yes, describe type(s) and location of repairs: _____

Were tightness tests performed after repairs were conducted? ☐ YES or ☐ NO (check one) If yes, attach test results.
Did the tests indicate that the repaired items were tight? ☐ YES or ☐ NO If No, specify the portion of the tank system(s) that were found not to be tight: _____

E. FIRE/TCEQ/OTHER OFFICIALS NOTIFIED

Were any other officials notified? ☐ YES ☐ NO (check one) If Yes, indicate:

Name	Representing	Phone number	Date(s) Notified

Were any directives issued by the fire or other officials? ☐ YES ☐ NO If Yes, describe directives and actions taken in response to the directive: _____

F. WASTE DISPOSITION

Indicate the status of all wastes and other materials generated:

Type of waste (soil, water, product)	Quantity and Units	Method and location of disposal or treatment

G. REPORT PREPARATION

A Licensed On-Site Supervisor may complete and sign this form when the supervisor is acting in an approved capacity for tank removal-from-service or tank system repair activities.

Licensed On-Site Supervisor:_____ ILP Reg. No.:_____ Exp. Date:_____

Company:_____

Telephone No.:_____ FAX No.:_____

Based on the results of the site investigation and the additional information presented herein, I certify that the site investigation activities performed either by me, or under my direct supervision, including subcontracted work, were conducted in accordance with accepted industry standards/practices and further, that all such tasks were conducted in compliance with applicable TCEQ published rules, guidelines and the laws of the State of Texas. I have reviewed the information included within this report, and consider it to be complete, accurate and representative of the conditions discovered during the site investigation. I acknowledge that if I intentionally or knowingly make false statements, representations, or certifications in this report, I may be subject to administrative, civil, and/or criminal penalties.

Signature:_____ Date:_____

OR

Project Manager:_____ PM Reg. No.:_____ Exp. Date:_____

Company:_____

Telephone No.:_____ FAX No.:_____

RAILROAD COMMISSION OF TEXAS
OIL AND GAS DIVISION

Form H-8
(Eff. 6/4/70)

CRUDE OIL, GAS WELL LIQUIDS, OR ASSOCIATED PRODUCTS LOSS REPORT

1. Field Name (as per current proration schedule, including reservoir, if applicable)		2. RRC District
3. Company	Check appropriate block(s): ☐ Producer ☐ Transporter ☐ Other _____	4. County
5. Lease Name(s) and RCC Lease Number(s) (if applicable)		
6. Location where Liquid Hydrocarbon (crude oil, gas well liquids, or associated products) Loss occurred (Section, Block, & Survey)		
7. Description of Facility from which Liquid Hydrocarbon Loss Occurred		
8. Name of Landowner where Liquid Hydrocarbon Loss Occurred	9. Type of Liquid Hydrocarbon Loss ☐ Crude Oil ☐ Gas Well Liquid ☐ Other _____	
10. Date Liquid Hydrocarbon Loss Occurred	11. Date Liquid Hydrocarbon Loss Reported to RRC District Office by Telephone or Telegraph	
12. Total Barrels of Liquid Hydrocarbon Lost in Lost in Leak or Spill	13. Total Barrels of Liquid Hydrocarbon Recovered	14. Barrels of Liquid Hydrocarbon Unrecovered (Net Loss)
15. Did Liquid Hydrocarbon Loss Affect Inland or Coastal Water? (If yes, explain.)		
16. Cause of Liquid Hydrocarbon Loss (Explain.) (If additional space is required, attach page(s).)		
17. Remedial Measures Taken and How Successful (Explain.)		
18. Remarks		

I declare under penalties prescribed in Article 6036c, R. C. S., that I am authorized to make this report, that this report was prepared by me or under my supervision and direction, and that data and facts stated therein are true, correct, and complete, to the best of my knowledge.

Date _____ Signature _____

Company _____ Name of Person (type or Print) _____

Street Address or P.O. Box _____ Title of Person _____

City, State _____ Zip Code _____ Telephone _____ Area Code _____ Number _____

(COMPANY MUST COMPLY WITH THE INSTRUCTIONS ON THE REVERSE SIDE HEREOF.) (OVER)

-INSTRUCTIONS-

1. File the *original* and *one copy* of this form in the Railroad Commission District Office.

2. *Immediate notification* shall be given first by *telephone* or *telegraph* to the Commission District Office of a fire, leak, spill, or break in facilities causing a loss of more than five (5) barrels of crude oil, gas well liquids, or associated products and then followed by the filing of this form when appropriate measures have been taken.

3. This form complies with *Statewide Rules 20 and 71* which require notification to the Commission of all fires, leaks, spills, or breaks of facilities which cause a loss of more than five (5) barrels of crude oil, gas well liquids, or associated products.

4. This form is for the *emergency written notification* of all fires, leaks, spills, or breaks in facilities causing a loss of more than five (5) barrels and is not a substitute for the monthly loss report required of common carrier pipelines by Statewide Rule 71.

5. The use of *liquid hydrocarbon* in this form refers to crude oil, gas well liquids, or associated products.

SECTION 3.0 RESPONSE ACTIONS

This section addresses initial response actions at an incident site. These initial response actions will transition response efforts from initial "Notifications" as required in Section 2 to the Incident Command System that is addressed in Section 4. This section is divided into the following sub-sections:

Section

- Recognizing An Emergency 3.1
- Initial Protective Measures 3.2
- Assessing The Site 3.3
- Initial Response Actions 3.4
  - General Response Actions
  - Incident Specific Response Actions (Figures 3.1a - d)
  - First Employee On Site (Figure 3.2a)
  - Pipeline Controller (Figure 3.2b)
- Mobilization Of Resources 3.5
  - Area Manager (Figure 3.3a)
  - Operations Manager (Figure 3.3b)
  - Director of Operations (Figure 3.3c)
  - V. P. of Operations (Figure 3.3d)
- Local Response Team 3.6
- Crisis Support Team 3.7
  - Kinder Morgan Crisis Support Team (Figure 3.4)
- Response Levels 3.8
- Response Strategies 3.9
  - Response Level Chart (Figure 3.5)
- On Water Spill Containment and Recovery 3.10
  - On Water Response Flowchart (Figure 3.6)
- Shoreline Spill Containment and Recovery 3.11
- Other Emergency Equipment and Contractor Resources 3.12
- Site Specific Health & Safety Plan 3.13
  - Site Specific Health & Safety Plan (Figure 3.7)
- Material Safety Data Sheets 3.14
- Post Incident Review/Investigation 3.15

3.1 RECOGNIZING AN EMERGENCY

Definition of an Emergency

An emergency is defined as any uncontrolled release, occurrence, or incident which requires the response of persons outside of the immediate area, including KMEP employees or response agencies. These may include leaks, spills, fires or explosions; or natural disasters or terror threats which could result in any of these situations.

3.1 RECOGNIZING AN EMERGENCY (Cont'd)

Product Release

KMEP handles crude oil and refined petroleum products, vegetable/tropical oils, chemicals, and other petroleum additives.

Refined petroleum fuels comprise a majority of the products KMEP handles and transports. A refined petroleum product release is recognized by any visual signs of liquid hydrocarbons the ground or water. Other signs may include:

- Staining of soil
- Dead or discolored vegetation near pipeline or right-of-way areas
- Product sheen on water
- Distinct odors of petroleum or hydrocarbons
- (b) (7)(F), (b) (3)

3.1.1 Fire/Explosion

Any unplanned fire is considered an emergency and requires some level of response action. If the fire is small enough and personnel are trained they may attempt to extinguish the fire prior to notifications. See KMEP Safety Manual, for more detail. Larger fires should be reported immediately and this ICP should be implemented.

3.1.2 Natural Disasters

Natural disasters may include the following:

- Earthquakes
- Floods
- Severe storms
- Tornados

Natural disasters may not necessarily constitute an emergency response. However, if the natural disaster results in a release or fire, as described above, implementation of this plan may be required.

3.1.3 Bomb or Terrorist Threats

(b) (7)(F), (b) (3)

3.2 INITIAL PROTECTIVE MEASURES

Recognizing an emergency allows an initial responder to effectively determine protective measures. Protective measures are necessary to ensure the safety of personnel, environment and property. These measures may include:

- Evacuation of persons exposed to immediate hazards. Move personnel in an up-wind or cross-wind direction.

NEVER ALLOW PERSONS TO ENTER THE VAPOR AREA DURING AN EMERGENCY

- Restrict access of the immediate area
- Eliminate and controlling ignition sources
- Shut down system to control release

Once these initial, protective measures are taken, the first employee on site should perform a site Risk Assessment.

3.3 ASSESSING THE SITE

Assessing the site involves the determination of risk (safety) associated with the incident. This is necessary in order to begin the preparation of a larger response effort. The key component in conducting an organized site assessment is the use of the "Site Specific Health and Safety Plan" (Section 3.13). This plan will help guide the "first person" through the process effectively performing a site assessment.

Initial risk assessment elements should determine the following:

- Wind direction
- Preliminary hazard zones
- Product involved
- Proximity to sensitive receptors (residences, businesses, schools, water ways, etc.)
- Chemical, physical and health hazards

Current forecasts and other weather information is available through the NWS Interactive Weather Information Network at: http://iwin.nws.noaa.gov/iwin/main.html.

All of the weather data gathered for the U.S. can be found through NOAA's National Climatic Data Center in Asheville, NC ((828) 271-4800).

Note: These initial site assessment elements will be described in more detail in the Section 3.13 - Site Specific Health & Safety Plan.

3.4 INITIAL RESPONSE ACTIONS

3.4.1 General Response Actions

For the purposes of this plan, this Initial Response Action section includes the actions taken by the First Employee On-site (Figure 3.2a) and the Pipeline Controller (Figure 3.2b). The First Employee On-site must be able to recognize an emergency, implement protective measures, assess the site and perform internal notifications. The Pipeline Controller is responsible for initial response actions associated with pipeline shutdown procedures and external notifications.

3.4.2 Incident Specific Response Actions

The following information provides guidelines when responding to varying types of incidents. These include:

- ***Product Release (Figure 3.1a)***
- ***Fire / Explosion (Figure 3.1b)***
- ***Natural Disasters (Figure 3.1c)***
- ***Bomb/Terror Threats (Figure 3.1d)***

The first employee functions as the IC until relieved of that responsibility.

NOTE: The following tables (Figure 3.1) provides general guidelines only for responding to various incidents. More detailed procedures may be available in other Company documents such as abnormal operating procedures.

FIGURE 3.1a

INCIDENT SPECIFIC RESPONSE ACTIONS
PRODUCT RELEASE

Incident Type	Mitigation Actions
Flange, Valve, or Hose Leak	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Shut off flow to line ❑ Move to safe area ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify local management ❑ Secure area and eliminate ignition sources ❑ Tighten connection, if possible ❑ Initiate spill containment (if outside containment area) ❑ Block and purge affected equipment ❑ Initiate recovery/clean-up action as required.

Incident Type	Mitigation Actions
Tank Truck or Rack Valve Leak	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Stop transfer operation ❑ Move to safe area ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify local management ❑ Secure area and eliminate ignition sources ❑ Tighten connection, if possible ❑ Offload the leaking compartment ❑ Flush area into containment drains or other containment ❑ Initiate other cleanup action as required

Incident Type	Mitigation Actions
Pipeline Leak or Rupture	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Shut down system to control release ❑ Move to safe area ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify local management ❑ Secure area and eliminate ignition sources ❑ If possible, place containment under the leak ❑ Initiate spill containment (if outside containment area) ❑ Initiate other recovery/cleanup action as required

FIGURE 3.1a

INCIDENT SPECIFIC RESPONSE ACTIONS
PRODUCT RELEASE (Cont'd)

Incident Type	Mitigation Actions
Tank Leak or Rupture	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Stop flow into the tank ❑ Ensure dike drains are closed ❑ Move to safe area ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify local management ❑ Secure area and eliminate ignition sources ❑ Begin transferring contents to available tankage to reduce level ❑ Organize temporary tank patch and begin repair ❑ Initiate other response actions as required

Incident Type	Mitigation Actions
Tank Overfill	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Shut off transfer or flow to tank ❑ Ensure dike drains are closed ❑ Move to safe area ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify local management ❑ Secure area and eliminate ignition sources ❑ Begin transferring contents to available tankage to reduce level ❑ Initiate other response actions as required

FIGURE 3.1b

INCIDENT SPECIFIC RESPONSE ACTIONS
FIRE/EXPLOSION

Incident Type	Initial Response Actions
Fire/Explosion	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Alert personnel ❑ Move to safe area ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify local management ❑ Activate alarm as required ❑ Notify local fire department ❑ Evacuate non-essential individuals ❑ Identify cause/source/materials involved ❑ Contain fire/spill material released ❑ Consider potential for escalation ❑ Protect exposures

FIGURE 3.1c

INCIDENT SPECIFIC RESPONSE ACTIONS
NATURAL DISASTERS

Incident Type	Response Action
Earthquake	Earthquakes may damage pipeline and terminal equipment. Damage may result in an emergency situation. The following are response actions that should be taken only when it is deemed safe to do so: During Earthquake ❑ If indoors, stay inside and take refuge ❑ Stay away from windows, glass, bookcases, heavy objects etc. ❑ If outdoors, move to open area ❑ If driving a vehicle, pull over and remain in car ❑ Avoid parking near power lines or other overhead hazards After Earthquake ❑ Identify immediate hazards ❑ Evacuation building if impending collapse ❑ Check for product releases ❑ Check for injuries ❑ Notify local authorities as appropriate ❑ Be prepared for after-shocks ❑ Use portable radios for news reports

FIGURE 3.1c

INCIDENT SPECIFIC RESPONSE ACTIONS
NATURAL DISASTERS (Cont'd)

Incident Type	Mitigation Actions
Severe Storm	Severe storms can hit west coast locations. Historically, severe storms have been documented on numerous occasions. They can involve high winds and tides, severe rainstorms and lightning and flooding. ❑ Listen to local and national news of impending storm ❑ Verify adequate emergency supplies ❑ Shut down non-essential operations ❑ Review evacuation plan ❑ Provide alerting information to employees, contractors and others ❑ Conduct planning meetings with appropriate personnel ❑ Assess available emergency equipment: ❑ Back-up generators ❑ Portable water pumps ❑ Earth moving equipment ❑ Water, food provisions ❑ Relocate important records ❑ Safe guard hazardous materials ❑ Prior to evacuation, turn off gas, water and electrical ❑ Prepare to account for employees ❑ Prepare for expected media coverage ❑ Contact fire departments as necessary ❑ Prepare vehicles for possible evacuation ❑ Open tank roof drains ❑ Verify that tank dikes are closed

FIGURE 3.1d

INCIDENT SPECIFIC RESPONSE ACTIONS
BOMB/TERROR THREATS

(b) (7)(F), (b) (3)

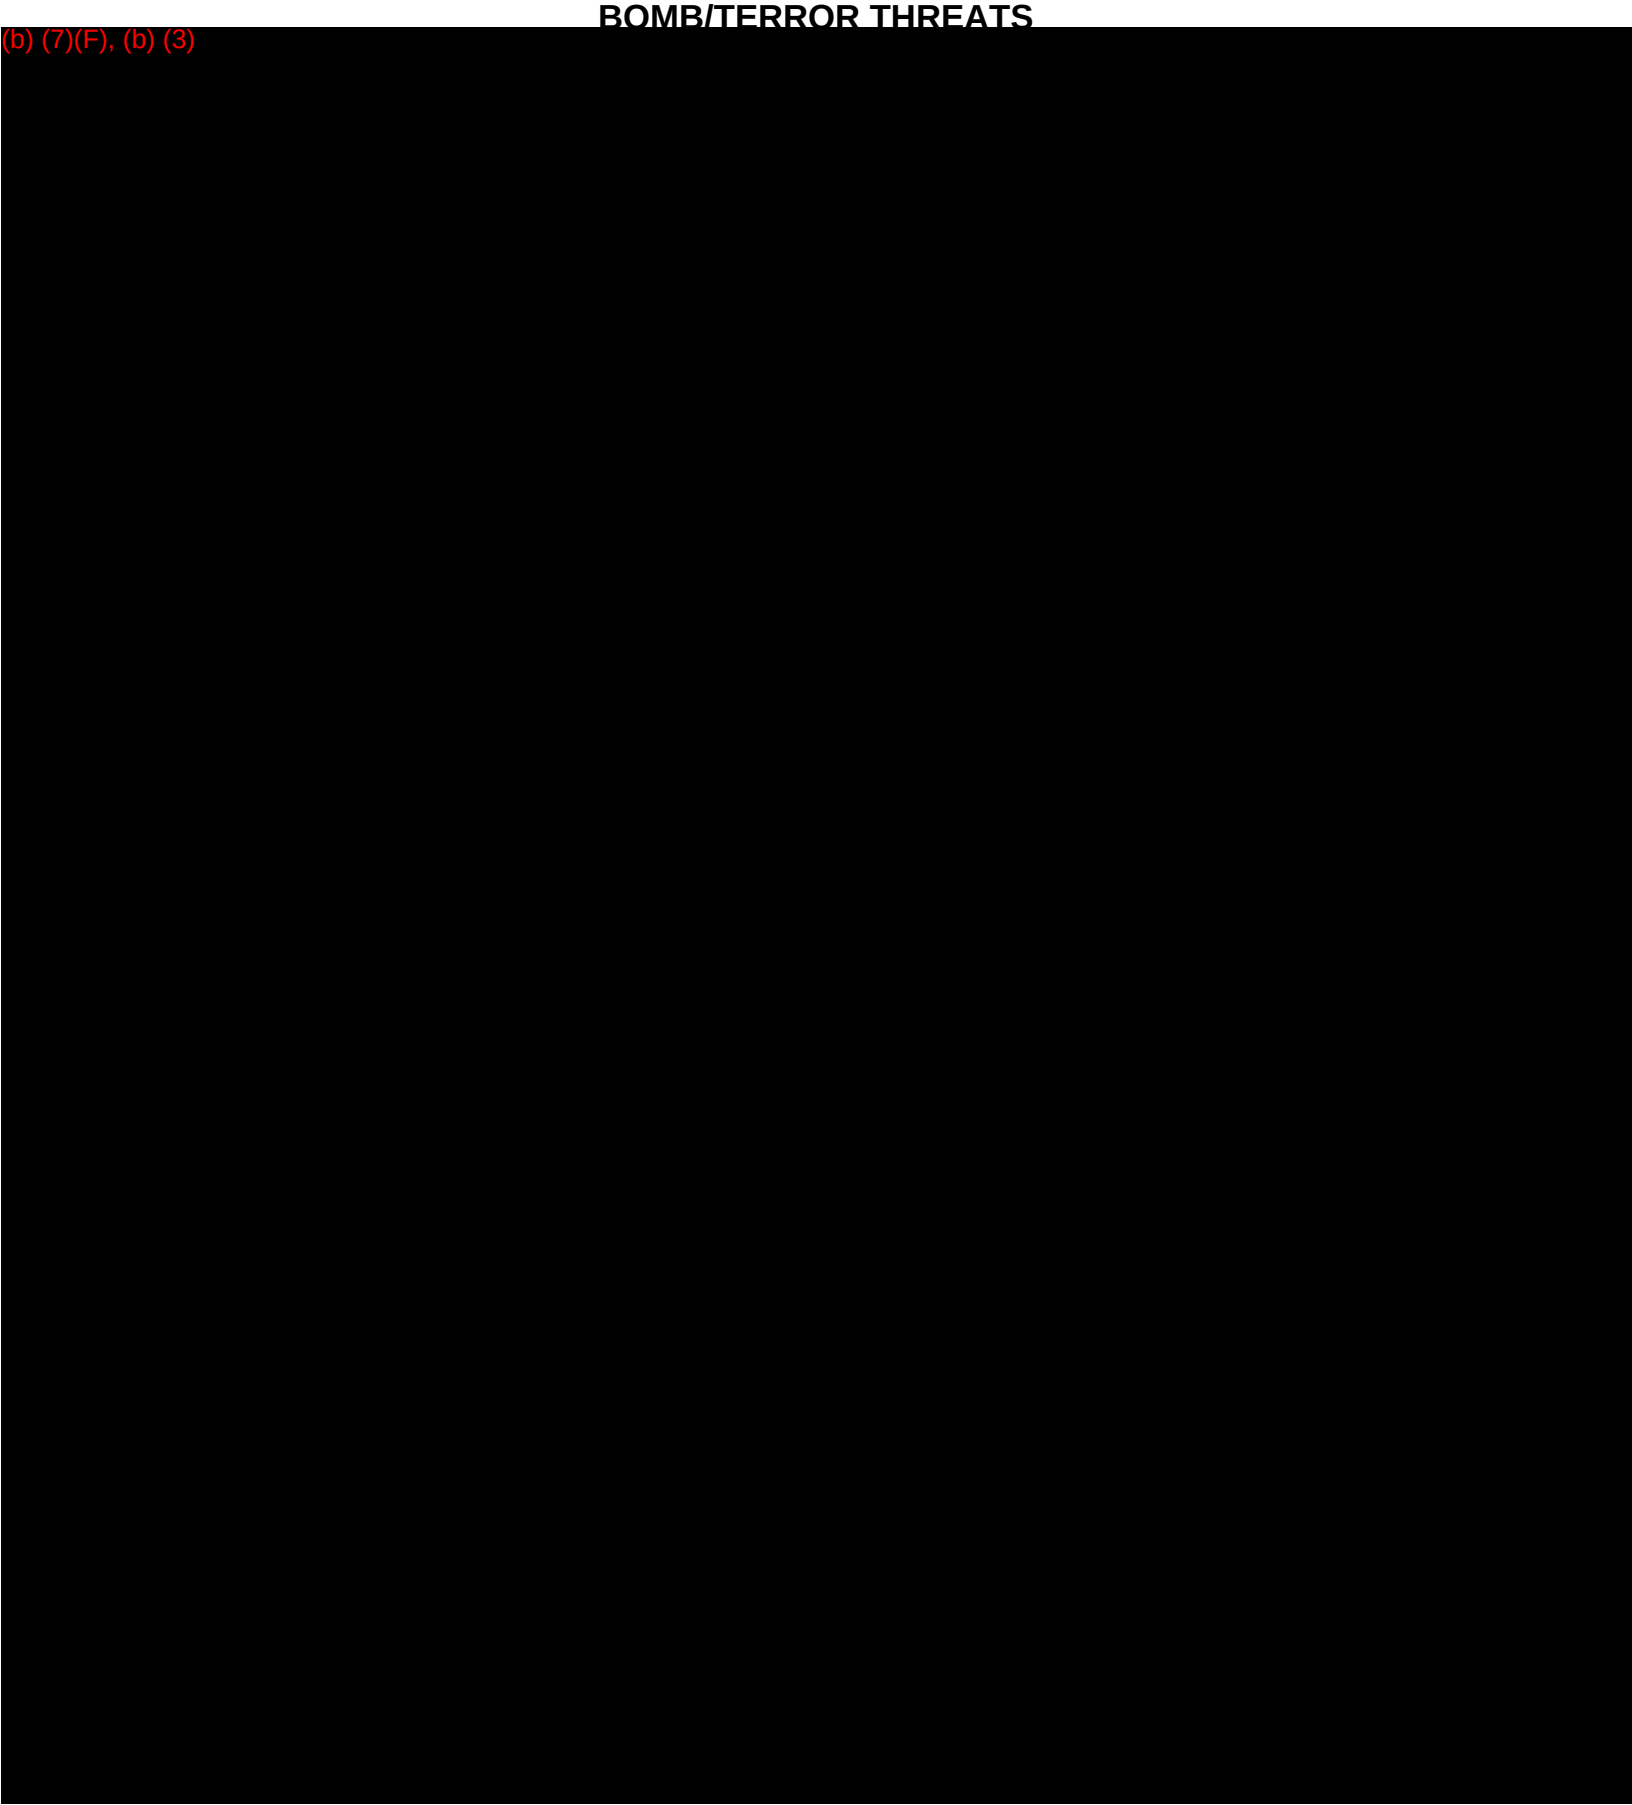

FIGURE 3.2a

INITIAL RESPONSE ACTIONS

First Employee On Site

First employee on site is the KMEP Incident Commander until relieved by a more senior Company employee. The Incident Commander has the authority to make decisions and to take steps necessary to control the emergency. The following list will aid this person in establishing safe initial response actions in preparation of a larger response effort.

- ❑ Evacuate yourself and all persons exposed to immediate hazards. Move personnel in an up-wind or cross-wind direction.

  NEVER ALLOW PERSONS TO ENTER
  THE VAPOR AREA DURING AN EMERGENCY

- ❑ Perform initial notifications (Section 2.1)
  - ❍ Pipeline Control Center
  - ❍ 911
  - ❍ Manager
  - ❍ Verify external notifications (via Pipeline Control Center)
- ❑ Shut down system to control release, as appropriate
- ❑ Restrict access to the immediate area of the emergency
- ❑ Eliminate and control ignition sources
- ❑ Initiate Incident Command System (ICS)
- ❑ Establish Central Command Post
- ❑ Use Site Health and Safety Plan to conduct site assessment (Figure 3.7)
- ❑ Meet with arriving response authorities (fire department, police, etc.).
  - ❍ Introduce yourself as the KMEP Incident Commander.
  - ❍ Communicate critical incident information
    - Type of incident (fire, spill, release)
    - Product involved
    - Equipment involved
    - Location of personnel in immediate area
    - Known hazards
    - Wind direction
- ❑ Advise the federal, state and local authorities (Unified Command) of a safe place to locate the Command Post (See Volume 1, Section 4, IC Tab for Tab “Guidelines for Establishing an Incident Command Post”).
- ❑ Initial Reporting Details Form (Figure 2.2)

FIGURE 3.2a

INITIAL RESPONSE ACTIONS (Cont'd)

First Employee On Site (Cont'd)

- ❑ Designate additional IC positions as the situation dictates and/or the availability of additional personnel: _____
- ❑ Note number of injuries if any: _____
- ❑ Ambulance/emergency medical service needed: _____
- ❑ Consider need for road closures: _____
- ❑ Consider hazards to trains: _____
- ❑ Call Control Center to contact RR dispatcher - Time called: _____
- ❑ Consider extent of release (estimate area impacted, i.e. 50'x100'): _____
- ❑ Consider if product is in water, sewers, canals etc.: _____
- ❑ Consider if structures are in danger: _____
- ❑ Product still flowing: _____
- ❑ All appropriate valves closed? Valves closed: _____
- ❑ Agencies on site (note who, when): _____
- ❑ News media on-site: _____

FIGURE 3.2b

INITIAL RESPONSE ACTIONS

Pipeline Controller (Control Center)

(b) (7)(F), (b) (3) [redacted]

- ❑ Coordinate with appropriate field operations personnel to develop a valve closing plan
- ❑ Plan should be reviewed by Manager of Pipeline Control
- ❑ Implement valve closing plan with field operations
- ❑ Document the times of the following actions and notifications

	Time
❍ Line Shutdown	
❍ Notification of Scheduler	
❍ Notification of Manager of Logistics	
❍ Pipeline Wheel notification	
❍ Notification of Railroad Dispatcher	

❍ Valve Closures / Re-opening

Valve	Time Closed	Time Re-Opened

	Time
❍ Leak Located	
❍ Turned over to field operations for repair	
❍ Repairs completed	
❍ All valves re-opened	
❍ Pressure tests	
- Started:	
- Completed:	
❍ Line re-start:	

- ❑ Coordinate with Manager of Pipeline Control to ensure appropriate external notifications have been made (see Section 2.1).

3.5 MOBILIZATION OF RESOURCES

This section describes how response resources are mobilized to the emergency scene. Resources may include:

- Company ICS (includes local/regional personnel and Crisis Support Team as needed)
- Appropriate agencies (fire departments, law enforcements, etc.)
- Contractors to support emergency response efforts
- Response equipment (containment of product and equipment repair)

To assess the need for adequate response resources, the Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. The tier requirements for high volume areas are for response in 6 hours (Tier 1), 30 hours (Tier 2), and 54 hours (Tier 3). High volume areas are listed in 49 CFR 194. The tier requirements for all other areas are for response in 12 hours (Tier 1), 36 hours (Tier 2), and 60 hours (Tier 3).

Once initial notifications are made, mobilization of resources is usually coordinated by management (Area Managers, Operations Managers, Pipeline Maintenance Manager, etc.).

These General Mobilization Actions should serve as general guidelines only. Additional actions may be required as the situation dictates. General Mobilization Actions for the various managers are detailed in the following checklists:

- ***Area Manager (Figure 3.3a)***
- ***Operations Manager (Figure 3.3b)***
- ***Director of Operations (Figure 3.3c)***
- ***V. P. of Operations (Figure 3.3d)***

FIGURE 3.3a

MOBILIZATION OF RESOURCES

Area Manager

The Area Manager will usually, but not always, be the first person called by the First Employee on-site. After receipt of the initial call, the Area Manager will evaluate the information and initiate appropriate mobilization of resources. In addition, the Area Manager will verify the level of the response and the appropriate response resources.

- ❑ Evaluate incident information
- ❑ Verify the level of the response (Level 1, 2 or 3; see Section 3.8)
- ❑ Notification of the following:
  - ❍ Local/regional response personnel
  - ❍ Operations Manager
- ❑ Verify that the following personnel have been notified
  - ❍ Pipeline Control Center (usually called by First Employee On-site)
  - ❍ Pipeline Maintenance Manager (usually called by Operations Manager)
  - ❍ Director of Operations (usually called by Operations Manager)
- ❑ Verify that external notifications have been made (usually completed by Pipeline Controller)
- ❑ Consider notifying the following response support groups, as appropriate
  - ❍ Crisis Support Team (See Section 2.1 and Figure 2.3c - KMEP Contact Numbers.)
  - ❍ On-water response contractors (See Section 3.10 of this Volume 1 and Section 2 of the applicable Volume 2.)
  - ❍ On land response contractors (See Section 2 of the applicable Volume 2.)
  - ❍ Pipeline repair contractors (See Section 2 of the applicable Volume 2.)

FIGURE 3.3b

MOBILIZATION OF RESOURCES

Operations Manager

The Operations Manager will usually be contacted by the Area Manager. After communicating with the Area Manager, the Operations Manager will evaluate the information and assist with appropriate mobilization of resources. In addition, the Operations Manager will assist with determining the level of the response and the appropriate response resources.

- ❑ Evaluate incident information
- ❑ Work with the Area Manager to determine the level of the response (Level 1, 2 or 3; see Section 3.8)
- ❑ Consider notification to Corporate Communications
- ❑ Notification of the following:
  - ❍ Director of Operations
  - ❍ Pipeline Maintenance Manager, as needed
- ❑ Verify that the following personnel have been notified
  - ❍ Pipeline Control Center (usually called by First Employee On-site)
  - ❍ Local/regional response personnel (usually called by Area Manager)
  - ❍ V. P. of Operations
- ❑ Verify with Area Manager that external notifications have been made (usually completed by Pipeline Controller)
- ❑ Coordinate with Area Manager to ensure the following response support groups have been notified, as appropriate:
  - ❍ Crisis Support Team (See Section 2.1 and Figure 2.3c - KMEP Contact Numbers.)
  - ❍ On-water response contractors (See Section 3.10 of this Volume 1 and Section 2 of the applicable Volume 2.)
  - ❍ On land response contractors (See Section 2 of the applicable Volume 2.)
  - ❍ Pipeline repair contractors (See Section 2 of the applicable Volume 2.)

FIGURE 3.3c

MOBILIZATION OF RESOURCES

Director of Operations

The Director of Operations will usually be contacted by the Operations Manager. After communicating with the Operations Manager, the Director of Operations will evaluate the information and assist with appropriate mobilization of resources. In addition, the Director of Operations will assist with determining the level of the response and the appropriate response resources.

- ❑ Evaluate incident information
- ❑ Evaluates whether the appropriate level of response (Level 1, 2 or 3; see Section 3.8) has been declared
- ❑ Notification of the following:
  - ❍ V. P. of Operations
  - ❍ Consider notification to Corporate Communications
- ❑ Verify that the following personnel have been notified
  - ❍ Pipeline Control Center (usually called by First Employee On-site)
  - ❍ Pipeline Maintenance Manager, as needed (usually called by Operations Manager)
- ❑ Verify with Operations Manager that external notifications have been made (usually completed by Pipeline Controller)
- ❑ Coordinate with Operations Manager that the following response support groups have been notified as appropriate:
  - ❍ Crisis Support Team (See Section 2.1 and Figure 2.3c - KMEP Contact Numbers.)
  - ❍ On-water response contractors (See Section 3.10 of this Volume 1 and Section 2 of the applicable Volume 2.)
  - ❍ On land response contractors (See Section 2 of the applicable Volume 2.)
  - ❍ Pipeline repair contractors (See Section 2 of the applicable Volume 2.)

FIGURE 3.3d

MOBILIZATION OF RESOURCES

V. P. of Operations

The V. P. of Operations will usually be contacted by the Director of Operations. After communicating with the Director of Operations, the VP of Operations will evaluate the information and notify personnel at the corporate level, as appropriate.

- ❑ Evaluate incident information
- ❑ Evaluate whether the appropriate level of response (Level 1, 2 or 3; see Section 3.8) has been declared
- ❑ Notification of the following:
  - ❍ Corporate level management, as appropriate
  - ❍ Consider notification to Corporate Communications
- ❑ Verify with Director of Operations that external notifications have been made (usually completed by Pipeline Controller)
- ❑ Coordinate with Director of Operations to determine if Crisis Support Team should be initiated
- ❑ If Crisis Support Team is deemed necessary:
  - ❍ Mobilize appropriate members of the Crisis Support Team
  - ❍ Establish corporate Emergency Operations Centers "EOC" as necessary
  - ❍ Coordinate with local city, county, state EOC, as appropriate

3.6 LOCAL RESPONSE TEAM

The first Company person on scene will function as the Incident Commander and person-in-charge until relieved by an authorized supervisor who will then assume the position of Incident Commander (IC). Transfer of command will take place as more senior management respond to the incident. For response operations within the control of the Local Response Team (LRT), the role of IC will typically be assumed and retained by Area Management. The various KMEP operating areas can work together to supplement their LRT capabilities.

The number of positions/personnel required to staff the Local Response Team will depend on the size and complexity of the incident. The duties of each position may be performed by the IC directly or delegated as the situation demands. The IC is always responsible for directing the response activities and will assume the duties of all the primary positions until the duties can be delegated to other qualified personnel.

A complete functional ICS organization is provided in Section 4. The LRT should try to fill the necessary positions and request additional support from the Crisis Support Team to fill/back up all the positions as the incident may dictate. Detailed job description checklists for primary response team positions are provided in Section 4.

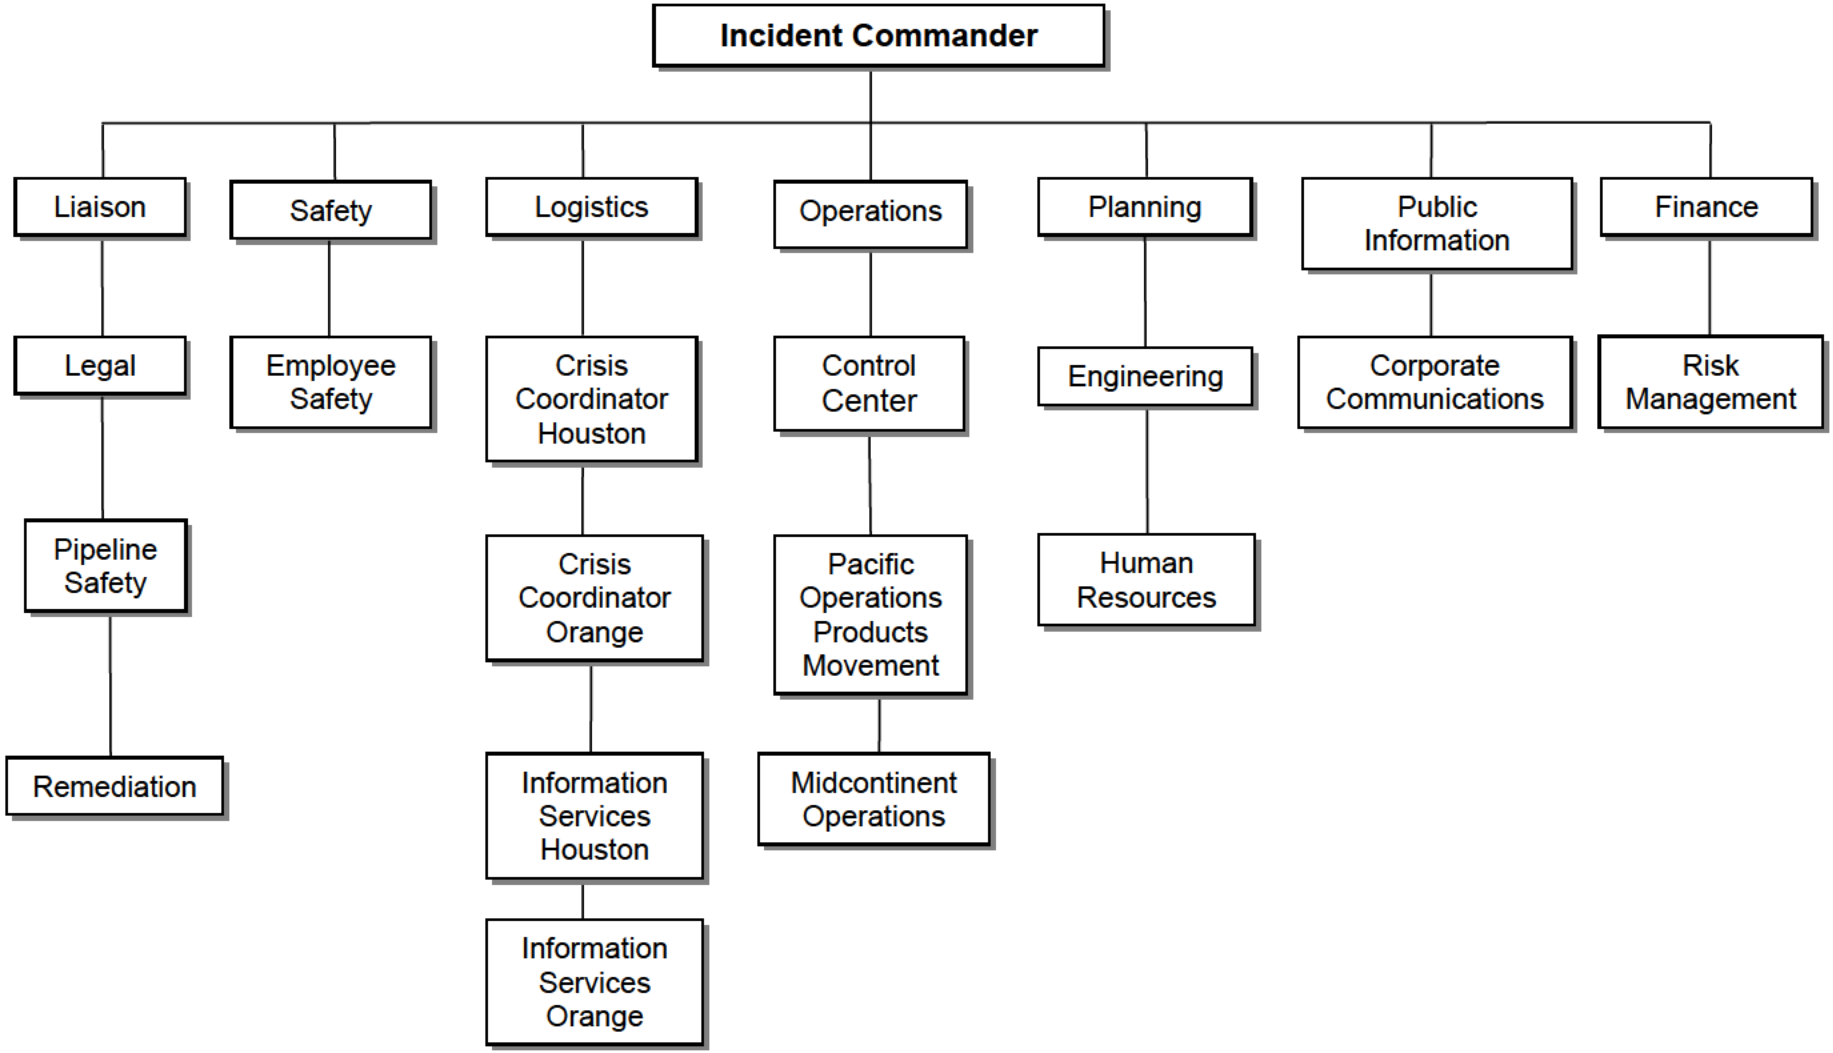
3.7 CRISIS SUPPORT TEAM

KMEP is prepared to implement a Crisis Support Plan when needed. The Crisis Support Plan designates members of the Crisis Support Team (see Figure 3.4: Crisis Support Team organization). The intent of the Crisis Support Team is to support local responders in the implementation of this Plan. Support can include additional resources, equipment, and crisis response planning at the KMEP management level in Orange, CA and/or Houston, TX offices.

The Crisis Support Team does not assume the local responders' responsibilities during an incident. In most cases, incidents will be managed by local responders with little direct involvement from Crisis Support Team members. However in the event of a major incident, the Company may activate all or a portion of the Crisis Support Plan, as needed.

FIGURE 3.4

KINDER MORGAN CRISIS SUPPORT TEAM



3.8 RESPONSE LEVELS

The following Response Levels and corresponding chart (see Figure 3.5 Response Level Chart) have been adopted from the Crisis Support Plan to assist local responders in determining if the Crisis Support Team should be activated. Every incident will be classified in one of three categories based on the specific nature and seriousness of the event.

3.8.1 Level 1 Response

A Level 1 response is an event that:

- Requires immediate response by the local field team but does not result in any injuries
- Involves little or no property damage
- Has little or no environmental impact
- Attracts no media attention
- Requires only routine or no reporting to regulatory agencies
- Is easily handled by the regional team and control center

A Level 1 response however, could develop into a Level 2 or Level 3 response if not immediately controlled (see Figure 3.5: Response Level Chart).

3.8.2 Level 2 Response

A Level 2 response is a more significant event that may:

- Involve injuries to an employee, contractor or the general public
- Result in significant property damage
- Involve a fire, explosion or significant environmental impact
- Involve local media attention
- Likely be reportable to some federal, state or local agencies

For the most part, Level 2 responses are within the capability of Operations, but may require certain Crisis Support Team resources to help mitigate the problem or conduct subsequent investigations. A "DOT Reportable Accident" is in a Level 2 response. A Level 2 response can quickly escalate to a Level 3 response if not mitigated (see Figure 3.5: Response Level Chart).

3.8.3 Level 3 Response

A Level 3 response is a major event that may include:

- Fatalities or serious injuries to employees or the public
- Extensive property damage or environmental impact
- Regional or national media attention
- Involvement of federal regulatory agencies.

Response to a Level 3 response requires significant additional resources/support beyond what may be locally available. A Level 3 will in most cases result in activation of the KMEP Crisis Support Center and mobilization of the Crisis Support Response Team (see Figure 3.5: Response Level Chart).

3.9 RESPONSE STRATEGIES

General Response Strategies

The general procedure for Company response is summarized as follows:

3.9.1 Response Action Plan:

Section 4.0 of this Plan includes specific duties for all personnel involved in a spill incident and utilizes the Incident Command System for Company personnel as well as the Unified Command System for the entire response structure including governmental and other agency representatives.

3.9.2 Notifications:

In the event of a spill, employees are trained to shut down the pipeline and then make notifications as shown in Section 2.0 of this Plan for regulatory required notifications and Section 2.0 of the appropriate Volume 2 plan for assistance/advisory notifications. The initial report would be from the Operator to the Area Manager and the local emergency responders (police and fire) and the Orange Control Center.

3.9.3 Actions:

Company response personnel would take actions to locate the spill, such as closing remotely operated block valves and monitoring the pressure, arranging for aerial and/or ground inspection of the pipeline, etc. If spill location is known, response personnel will be dispatched to the site, block valves will be closed as appropriate, and notification of company maintenance crews and response contractors will begin. The first person at the leak site will take the immediate actions detailed in this Section 3.0.

To assess the need for adequate response resources, the Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. The tier requirements for high volume areas are for response in 6 hours (Tier 1), 30 hours (Tier 2), and 54 hours (Tier 3). High volume areas are listed in 49 CFR 194. The tier requirements for all other areas are for response in 12 hours (Tier 1), 36 hours (Tier 2), and 60 hours (Tier 3).

FIGURE 3.5

RESPONSE LEVEL CHART

CLASSIFICATION	Level 1	Level 2	Level 3
BODILY INJURY			
No bodily injury	●		
KMEP Employee or contractor employee injured; no hospitalization		●	
KMEP Employee or contractor employee injured; hospital admittance required		●	
General public; hospital admittance required		●	
General public, three or more injured			●
Fatality (any)			●
PROPERTY DAMAGE			
Insignificant	●		
Significant damage to property		●	
Extensive			●
ENVIRONMENTAL INCIDENTS			
Insignificant on site and no off-site impact	●		
Minor, but significant on-site or any off-site impact		●	
Extensive on-site and/or off-site impact			●
NEWS MEDIA COVERAGE			
No immediate attention	●		
Local attention only		●	
Regional or national attention			●
REGULATORY REPORTING			
No notification or routine or local level only (local emergency planning committee)	●		
State or Federal level		●	
OTHER (as example, strikes, riots, demonstrations, bomb threats, etc.)			
Incidents handled and corrected by local management only	●		
Complaints or actions by individuals or groups which could damage the Company's reputation but not threaten employees, property, or operations		●	
Actions taken by individuals or groups which threaten Company, employees, property, or operations			●
ECONOMIC IMPACT			
Insignificant	●		
Significant		●	
Extensive			●
REPORT ALL INSURANCE CLAIMS IN ACCORDANCE WITH ESTABLISHED PROCEDURES. CRISIS NOTIFICATION DOES NOT REPLACE INSURANCE CLAIMS REPORTING REQUIREMENTS AND REGULATORY REPORTING REQUIREMENTS.			

FOOTNOTE: Property damage and economic impact levels will be defined by Business Unit Management.

3.9 RESPONSE STRATEGIES (Cont'd)

General Response Strategies (Cont'd)

SAFETY of all people, including the public as well as the responders, is the single most important item to keep before all people during all activities of the response and clean-up of a spill.

The Incident Commander (IC) is the Qualified Individual (QI) in the Kinder Morgan plan for emergency response. Typically the IC position would progress from the first person on site to the Area Manager to the Director of Operations. All responders in the company have the authority to commit necessary resources to deal with the emergency situation.

As more company personnel arrive at the site, the Incident Command System would go into action. The Incident Commander (IC) would appoint various persons to fill roles such as Safety, Operations, Logistics, Information Officer, Liaison, and Planning, Section 4.0 contains more information on both the Incident and Unified Command Systems (ICS and UCS).

3.9.4 Procedures To Stop The Discharge:

The IC would have a reconnaissance of the area done with appropriate safety precautions taken including personal protective equipment (PPE), if required, and would formulate a plan of action with the ICs of agencies on site. Stopping the flow of product by closing valves, starting downstream pumps if appropriate, etc. and containing the product by constructing dikes, berms, pits, etc. would take place.

3.9.5 Managing The Leak Site:

The Kinder Morgan IC acting with agency ICs would secure the area using local police and fire departments to keep all but required people out of the area and to take fire prevention actions as necessary. After recon, Kinder Morgan IC meeting with Operations, Planning, and Federal and State ICs would agree on a plan of action to build dikes, deploy booms, vacuum trucks, and other equipment to contain and pick up the product.

All notifications would have been made by this time and agencies would continue to arrive at the site. Examples: U. S. Coast Guard, State Fire Marshal, Dept. of Fish and Game, Office of Oil Spill Prevention and Response, local water resources agency, etc. Periodic internal and external follow-up status reports will be made during the emergency response. The process will be repeated periodically.

Response contractors and Kinder Morgan maintenance personnel working under the direction of the Operations Section Chief would be working to contain the spill and clean it up. Staging and De-contamination areas would be set up. The planning section would be working to develop incident strategies, plan required resources for the next 12 hour period, as well as longer (several days or weeks) periods.

3.9 RESPONSE STRATEGIES (Cont'd)

General Response Strategies (Cont'd)

Safety would be monitoring all actions to assure that nothing was being done that might endanger the health or safety of any persons in the area. Other support areas acting under the Incident Command System would be set up including the Information Officer, Logistics section, and the Liaison section.

In addition, the Kinder Morgan Crisis Support Team may be activated to provide assistance, such as engineering information, drawings, calculations, drafting news releases, assisting in financial/accounting paperwork, insurance contacts, logistics assistance etc.

3.9.6 Extended Response Activities:

In all scenarios the extended response activities would be similar. After the initial situation has been stabilized and there is no threat of fire or significant health and safety problems, the Incident Command System would be fully in place and operational. The planning function would propose appropriate human and equipment resources to staff the continuing clean up and remediation efforts as appropriate. This would all be discussed and approved by the Unified Command System representatives. In the case of Company personnel, personnel would be brought in from other operating regions and/or HQ and would be supplemented by contract and/or consulting personnel.

Contractor personnel would be arranged for by the contractor under the direction of the Company IC acting in concert with the Unified ICs.

The following strategies explain more specifically the likely plans for the five strategies that might be encountered in the Company's total response area.

The following are representative of possible response strategies which may be utilized throughout the Pacific Region.

- **Strategy No. 1: Pipeline Failure in Wetlands Area**
- **Strategy No. 2: Pipeline Failure in Small Creek**
- **Strategy No. 3: Pipeline Failure in Desert Area near Seasonal River**
- **Strategy No. 4: Pipeline Failure in River**
- **Strategy No. 5: Tank Failures**
- **Strategy No. 6: Geographic Specific Response Activities**

3.9 RESPONSE STRATEGIES (Cont'd)

General Response Strategies (Cont'd)

Strategy No 1: Pipeline Failure in Wetlands Area

A key response strategy in a wetlands area is to contain the product in as small an area as possible while minimizing damage to sensitive plants and animals. Depending on the amount spilled, it may be possible to make small containment dikes/berms by hand using available soil (or sandbags) or by using small equipment. If the wetland area is affected by tidal water movements, containing the area on three sides and installing absorbent booms and pads on the outflow side should be considered. Realizing that movement of machinery and people tends to silt up the water as well as destroy the plant life, care should be taken as much as possible to minimize human and machine movements in the affected area.

Some wetlands areas border on larger bays or major bodies of water which have Oil Spill Response Organizations (OSROs) that should be called for assistance.

Often wetlands areas are populated with birds of various types who would normally fly into and/or nest in the contaminated area. Wildlife hazing actions, such as loud noises, may be necessary to prevent wildlife from landing and becoming contaminated. Spills in wetlands are usually attended by governmental agencies such as Fish and Game, who will assist in administrating such wildlife hazing.

Some wetlands areas are specifically mentioned in the Area Contingency Plans, and should be checked for special situations.

Strategy No 2: Pipeline Failure in Small Creek

Product entering a flowing creek will move with the velocity of the surface of the water with some of the product "hanging up" on the creek banks and any vegetation that might be present. The basic strategy is to go downstream a head of the product and install one or more dams, depending on the volume of the spill and the volume and velocity of the creek. Dams could be from native soil or by sandbags. Usually underflow pipes are installed to approximate the flow volume of the creek thus containing the water with the product floating on it while allowing the uncontaminated water to flow through the underflow pipes. Product may then be picked up by vacuum truck, and/or absorbent pads and booms. In some cases siphon hoses or pipes can be installed to assist in regulating the flow around/over the dam.

Depending on the flow and configuration of the creek, the same holding and skimming operation may be accomplished by using several short sections of containment boom.

As previously noted, the downstream area must be surveyed to determine if any drinking water or industrial water intakes exist. If so, notifications must be made.

Product/water mixture that is picked up by vacuum truck can then be taken to the water treatment system at a company terminal, or otherwise disposed of at a properly licensed disposal facility.

3.9 RESPONSE STRATEGIES (Cont'd)

General Response Strategies (Cont'd)

Strategy No. 3: Pipeline Failure in Desert Area near Seasonal River

The response strategy in a desert area is to contain the product by building containment berms or dikes ahead of the direction of flow and along the leading perimeters of the flow. Usually the native soil in the area is suited for such berms; however, in hard rocky areas soil from another area may be required to be brought in. Often seasonal rivers in the desert have sandy or silty bottoms and are good places to obtain soil to contain the flow or to fill sandbags.

If the river is flowing and product gets into the river, the strategy would be as in Scenario No. 4. Soil conditions will largely determine if the product flows or primarily soaks into the ground. Picking up as much free product as possible with vacuum trucks, in the shortest amount of time possible, will help minimize the impact.

Strategy No. 4: Pipeline Failure in River

If product is spilled into a river several strategies may be pursued depending on the size and flow and gradient of the river and the amount of product spilled. In slow moving rivers that are not wide, floating booms may be installed at an angle to the flow of the river thus "directing" the floating product primarily to one side of the river for skimming and pick-up. This method will work for river flow velocities up to approximately 1.2 meters/sec. If flow exceeds this velocity, the boom becomes unmanageable. Usually two or three booms would be installed in order to form a primary and a back up system, with a redundant boom in case an upstream boom becomes ineffective.

The product can then be picked up using various available types of skimmers and or absorbent booms and pads.

In a river spill it is important to look well downstream and identify any critical water supply inlets such as inlets for municipal water districts or industrial or agricultural water inlets (additional information is provided in Volume 2). These should be immediately notified and where possible, install a boom barrier around the inlet of the supply to divert any floating product away from the inlet.

In some cases rivers with a steep gradient or rapid flow may be impossible to boom. Aerial reconnaissance of the river should then be made to determine if there are any areas where the river widens or where slower flows exist, or natural currents might form a holding area where product might be picked up.

There might be areas where because of inaccessibility and/or steep gradients additional portable pumps might be required to pump the skimmed product from the water to the vacuum truck or other holding tank.

3.9 RESPONSE STRATEGIES (Cont'd)

General Response Strategies (Cont'd)

Strategy No. 5: Tank Failures

The strategy for a tank failure is the same as all other failures, i.e. to concentrate on safety first and containment. Facility tank farms operate with valves from the tank diked areas closed. Thus product would be contained in the diked area, unless specifically released because of unique circumstances (Example: to drain into a more secure separator system or holding pond, etc.). After eliminating all sources of ignition and securing the area, the local IC with the fire department responders would determine if a foam blanket was to be applied. If possible, transferring of remaining product in the tank to another tank should be started. Picking up of the product in the tank dike area would begin with vacuum trucks, or portable pumps into the facility oily water system or sump system as appropriate. Once all free product has been removed, the remediation plans for removal and/or treatment of contaminated soil can begin. Disposal must be in accordance with all relevant regulations.

Strategy No. 6: Geographic Specific Response Activities

To identify specific spill response and protection strategies for the applicable region/area, Area Contingency Plan (ACP) and Geographic Response Plan information can be found at*:*
http://kmonline.kindermorgan.com/operations/products/pacific_icp/rmaplan.html .
Responders can navigate through the site to locate the region/area of interest and the appropriate response resources needed for the operation.

For all controlled copies of the Integrated Contingency Plan distributed to non-Company plan holders, a CD-ROM containing the same information as referenced above will be included in a CD-sleeve in Volume 1 or in a separate folder in electronic copies.

3.10 ON WATER SPILL CONTAINMENT AND RECOVERY

Any product spill on water will be immediately subject to a number of natural processes that will alter the product's physical and chemical properties. Depending on the type of product, the magnitude of the spill, and the nature of the environment, these physical and chemical changes will effect how to best approach containment and recovery operations. Every spill situation is different, and throughout a spill, the conditions affecting the selection of a response mode are constantly changing.

The flow chart in Figure 3.6 provides some basic guidelines when responding to on water releases.

On Water Spill Clean up Techniques

The following section provides a general overview of on water spill cleanup techniques and types of equipment:

- **Booms for Containment and Protection**

  Spill containment booms may be used to contain the spill and they may also be deployed between the spill and environmentally sensitive areas. Booms may also be used in area of strong currents to deflect or guide the spill to locations where it can more effectively be cleaned up using skimmers, vacuum trucks, or sorbent material.

3.10 ON WATER SPILL CONTAINMENT AND RECOVERY (Cont'd)

On Water Spill Clean up Techniques (Cont'd)

A boom is a device that may be used to contain or deflect product that may float upon the surface of water. While there are a great many different kinds of boom, almost all share the following four components:

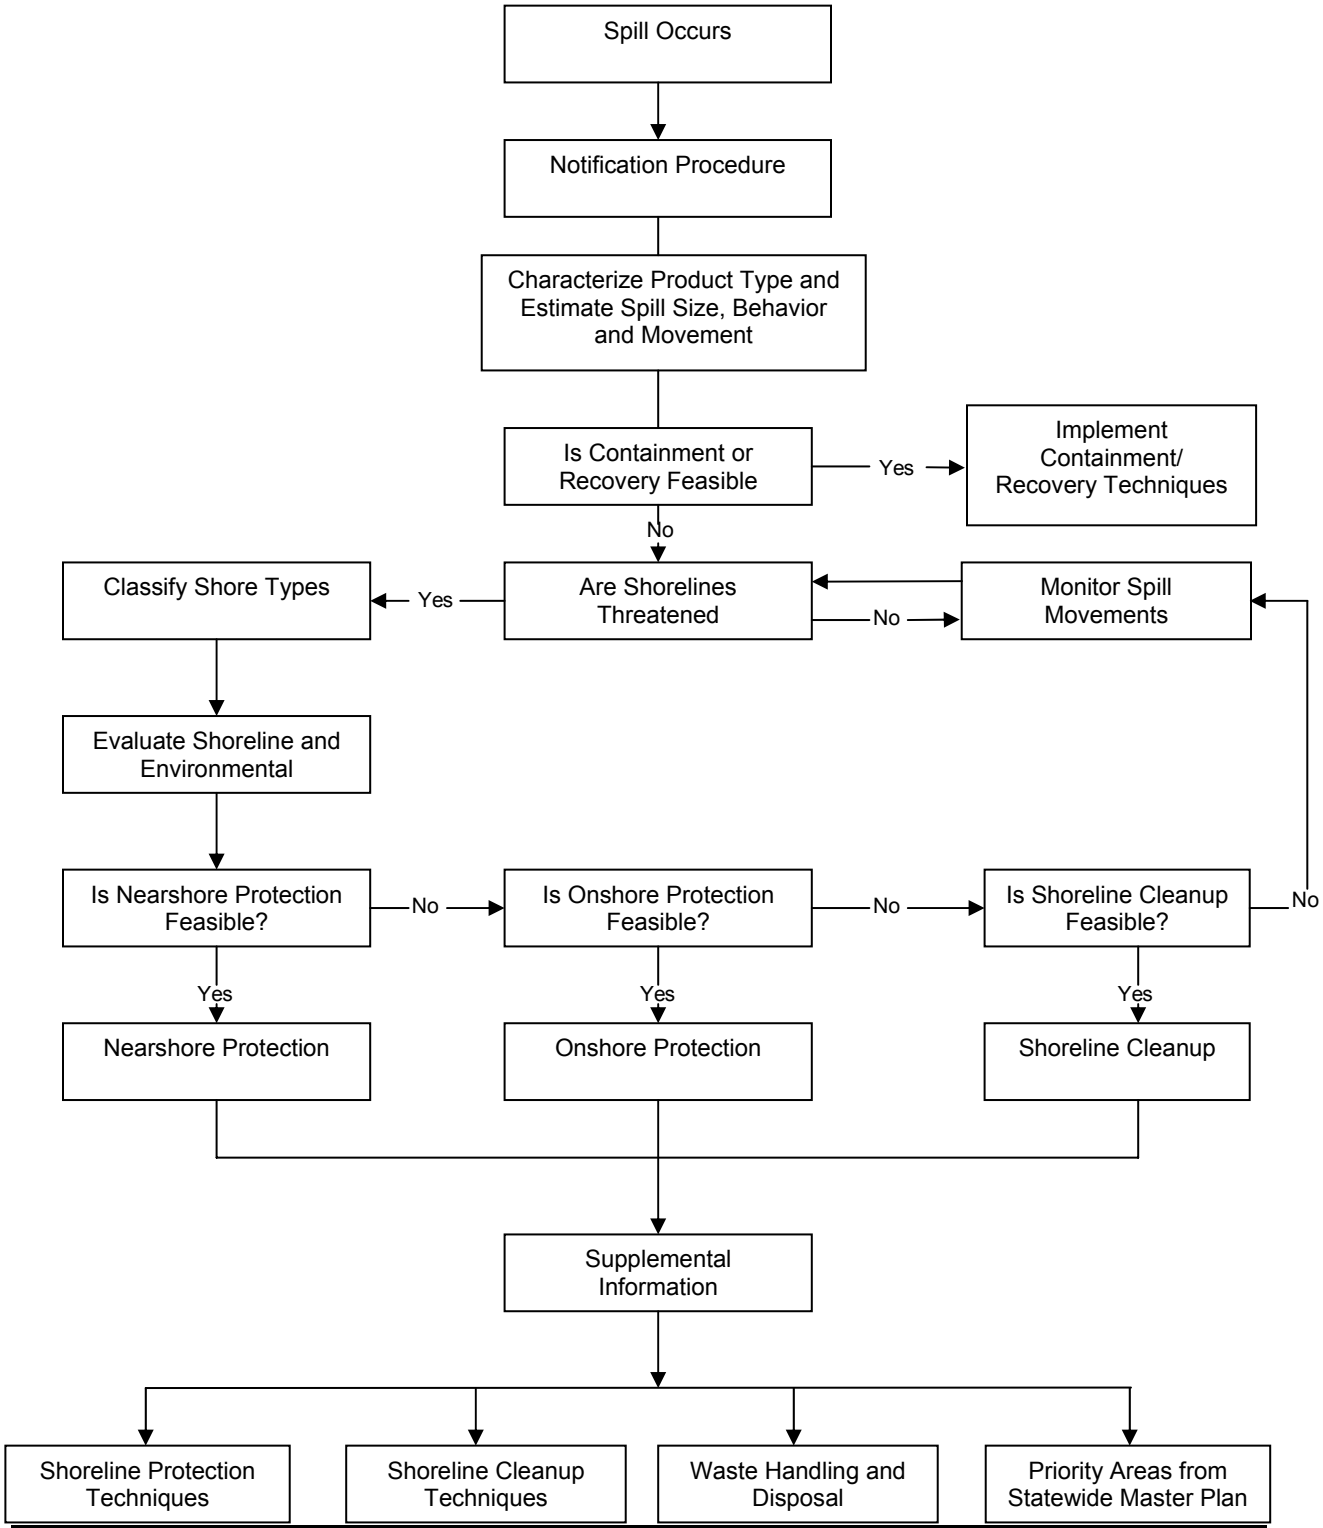
1. A flotation unit or freeboard designed to contain or divert the product as well as to resist product splashing over the top.
2. A skirt or curtain to prevent product from being carried beneath the boom.
3. A longitudinal strength member (usually cable, chain, or high tensile strength fabric) that serves to join boom sections and provide anchoring points.
4. A ballast unit or weight designed to hold the skirt perpendicular to the current flow.

Boom Types/Classifications

Traditionally, booms have been classified either according to their physical appearance (round, fence, or inflatable) or according to size with respect to the location of application (inland, harbor, and open sea).

FIGURE 3.6

ON WATER RESPONSE FLOWCHART



3.10 ON WATER SPILL CONTAINMENT AND RECOVERY (Cont'd)

Boom Deployment

Most authorities recognize three modes of boom deployment for:

1. Containment booming is an action designed to encircle or otherwise entrap floating product so that it might be accumulated and recovered.
2. Deflection booming is performed to intercept, deflect, or shunt a slick towards a more desirable recovery site. Deflection booming is a desirable option when swift currents render containment booming ineffective.
3. Exclusion booming is largely a protective measure. It is used to protect sensitive areas such as marshlands, water intakes, and shorelines by keeping product out of the area.

- **Skimming Devices**

Once a product slick has been contained, the next logical response tactic is to remove the spilled product. A commercial product skimmer, if properly selected and operated, provides one of the best means of product recovery available. Most skimmers are designed to recover product floating on the surface of water without altering the floating product's chemical or physical properties. Skimmers come in a variety of designs and sizes. Small skimming units can be used successfully on spills ranging from minor in-plant spills to major offshore disasters. Large self-propelled skimming vessels are much more expensive to purchase and maintain. Such large units are often purchased by spill cooperatives or leased from contractors.

While there are many different manufacturers' brands of skimmers, most fall into one of four basic categories:

1. Suction Heads are usually connected by quick couplers to suction hoses from vacuum trucks or intake lines from pumps. The floating suction head recovers a mixture of both product and water through its intake ports.
2. Floating Weirs operate at the product/water interface skimming the floating product selectively off the top of the water. As product is skimmed off the top of the water, it accumulates in a collection well or tank.
3. Oleophilic Surface Units include skimmers that employ oleophilic ropes, discs, plates, and belts. The unit relies on adsorbent material (e.g. a rotating drum, disc or rope) that passes through the slick and selectively sorbs the product onto its surface. The oleophilic plate or rope is then scraped or squeezed clean of the product it carries and is rotated through the slick again to adsorb more product.
4. Hydrodynamic Devices (includes vortex and inclined plane units). These rely upon a vortex or centrifuge effect, a dynamic inclined plane principle, or a water jet system. These units function more as product collectors than actual skimmers.

3.10 ON WATER SPILL CONTAINMENT AND RECOVERY (Cont'd)

- **Transfer Pumps**

  During a spill clean-up operation, pumps may be needed to transfer product from: 1) a recovery device to a storage container, and 2) the storage container to a treatment or disposal center. Pumps are also needed to handle water for flushing product off contaminated shorelines.

  The following three types of pumps may be used:

  1. Centrifugal Pumps have open impellers that enable them to handle fluids containing small debris and solids. They are also useful for herding product to locations where it can be easily recovered.
  2. Diaphragm Pumps are positive displacement pumps that use pushing action to force fluids through pipes or hoses. They are ideally suited for transferring fluids recovered by weir or rope mop skimmers.
  3 Screw Pumping Systems can handle viscous or weathered product and product/water emulsions. These pumps can be totally submerged in the fluid that must be transferred.

- **Dispersants**

  There are no pre-approved response options for inland spills within the United States. Any plans to use dispersants or in situ burn by the Company will be submitted to the Federal On-Scene Coordinator for Regional Response Team approval prior to such action being taken.

{This space left blank intentionally.}

3.11 SHORELINE SPILL CONTAINMENT AND RECOVERY

The ACP lists natural resources for each segment of shoreline. Environmental sensitivity rankings are often presented on the maps to help prioritize response efforts.

Product penetration depends primarily on the permeability of the sediment and the viscosity of the product. Gravel beaches, for example, have high permeability and are easily penetrated by light to heavy weight products. On the other hand, fine sandy beaches and mud flats are not easily penetrated by many products. This is especially true if these beaches are wet prior to contact with product.

Product retention is governed by the rate at which environmental factors remove product from a given shoreline. These factors include wave energy, natural erosion, tidal action, evaporation, and biodegradation. Areas which experience high wave energy or high natural erosion should be given a lower priority for response because these processes will eventually force the product into the water column where it will undergo biodegradation. By comparison, product retention will be high in calm shoreline areas that do not experience high wave energy.

- **Shoreline Clean-Up Techniques**

  In sensitive shoreline areas where the clean-up operation will do more damage to the environment than the product, it may be prudent to take limited or no action. However, this decision should be based on input from government agencies, the landowner, and the local government that has jurisdiction over the area.

3.11 SHORELINE SPILL CONTAINMENT AND RECOVERY (Cont'd)

- **Shoreline Clean-Up Techniques (Cont'd)**

  Sand, gravel, or marsh areas can be flooded with water to allow product to float to the surface. Afterwards, the product can be recovered with portable product skimmers and sorbents. If properly implemented, this technique should allow efficient recovery with minimal impact to the environment.

  For marshes and shorelines with heavy vegetation, a low-pressure water spray from a hand-held hose can be used to herd product to a convenient location where it can be contained and recovered with portable skimmers and sorbents. High-pressure water spray can be used to remove product from the hulls of vessels, rocky shorelines, or man-made structures. High or low pressure flushing is an efficient means for onshore spill cleanup. However, this technique must be used with a skimmer or sorbent material to recover the product.

  Heavy equipment is recommended for cleaning sandy beaches. Motorized graders can be used to scrape up thin layers of affected sand. Front-end loaders can be used to pick up affected material that has been pushed together by motorized graders. They can also scrape affected beach sediment when the product penetration is too deep to be removed by motorized graders. Bulldozers are effective for cleaning shorelines that are not firm enough to support graders or front-end loaders.

3.12 OTHER EMERGENCY EQUIPMENT AND CONTRACTOR RESOURCES

Each Volume 2 (one for each of seven (7) regions) contains additional detail on the contract resources, as well as proprietary KMEP resources, available for response. Contracted OSROs operating in each region shall have determined the appropriate and suitable equipment for use in those areas taking into account the local environmental conditions.

3.13 SITE SPECIFIC HEALTH AND SAFETY PLAN

Health and Safety

It is the Company's policy that the health and safety of all personnel will be given the absolute highest priority. To insure this, all response decisions/actions should be based on the following three Incident Commander priorities:

- Safety of Company personnel
- Safety of surrounding community
- Safety/protection of environment

The Kinder Morgan Site Specific Health and Safety Plan (H&S Plan) was created to address these priorities. The H&S Plan is intended to guide company personnel through an assessment of the risk(s) associated with the emergency. Development of the H&S Plan, particularly the first six boxes, should take precedence during the initial stages of an emergency.

Examples of safety issues addressed in the H&S Plan include:

- Chemical Involved
- Specific and general hazards
- PPE
- Evacuation
- Hospital locations
- Air monitoring
- Hazard zones
- MSDS

3.13 SITE SPECIFIC HEALTH & SAFETY PLAN (Cont'd)

Site Specific Health & Safety Plan

The Site Specific Health & Safety Plan (H&S Plan) is an integral part of the KMEP emergency response effort. The H&S Plan is required, prior to and during all emergency response operations. Completion of the H&S Plan should occur within the first hour of a response. The first six boxes, at a minimum, should be completed as soon as possible. The information in these boxes will guide KMEP responders through an initial site assessment.

The H&S Plan serves several purposes:

- Assist in performing an initial risk assessment
- Gather critical incident information into an easy-to-read document (e.g. incident details, product involved, hazards, etc.)
- Establishes hazard zones
- Designates which responders are allowed to go where (e.g. KMEP vs. FD)
- Prompts responders to initiate the Incident Command System
- Once completed, the H&S Plan will be utilized to:
- Brief KMEP response personnel
- Coordinate initial response efforts with Fire Department and law enforcement
- Provide regulatory agency representatives and/or visitors with a concise and consistent overview of the incident
- Ensure that anyone that arrives onsite will receive a site-specific health & safety briefing before entering the emergency site
- Demonstrate KMEP's ability to respond to an emergency in a safe and organized manner

The Health and Safety Plan is a dynamic and ever-changing plan that requires continuous updating.

It is important to communicate significant changes to the H&S plan to the appropriate responders.

This is best accomplished by scheduling regular safety meetings.

Table 3. Secondary Hazards

Hazards	Recommended Precaution(s)
❑ Fire (potential)	• Remain safe distance away • Eliminate ignition sources • Keep upwind of vapor/smoke • Provide vapor suppression (if safe) • Do not impede Fire Dept. efforts
❑ Heavy Equipment	• Qualified operators only • Hardhats and safety boots needed around heavy equip. • Minimum 10ft. clearance from power lines • Make "one call" if excavating • Proper machine guarding in place
❑ Excavations	• Trenches/excavations equal to or greater than 5ft. deep must meet OSHA requirements • No one allowed to enter excavation > 5ft. unless shored, sloped or protected • Excavations < 5ft. and judged by competent person as cave-in hazard must also follow OSHA requirements
❑ Noise	• Portable generators & heavy equip. can generate potentially high noise levels • Hearing protection available to workers • Hearing protection must be worn in area with noise levels above 85dBA.
❑ Confined Spaces	• Site Safety Officer will determine whether confined space will be entered • All confined space entries must meet OSHA requirements (permits, atmospheric monitoring, attendants, etc.)
❑ Heat Stress	• Potential hazard when temp >80°F • Workers should take more breaks and drink plenty of appropriate liquids • More PPE = higher risk • Be aware of heat cramps (stomach cramps), heat exhaustion (excessive sweating, flushed/clammy skin) – treat with rest and liquids. Heat stroke (dry, hot, pale skin; no sweating) can be deadly – get medical help immediately, reduce core body temp by applying cold water to body & fanning.
❑ Cold Stress	• Skin takes on gray-glossy look • Appendages become non-responsive • Blisters or sores may appear • Do not rub • Submerse affected areas in warm water or wrap in warm cloth.
❑ Rain / Lightning	• Stop excavation activities during excessive rainfall • Avoid shock hazards by stopping work during thunderstorm or lightening • Prevent & control erosion & transport of soils out of incident area.
❑ General	• Slip, trip & fall hazards • Keep work area clear of debris • Smoking not permitted in work areas • Use hand tools safely
❑ Other:	

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS

KMEP employees who have received HAZWOPER training are familiar with how to complete and implement the H&S Plan. The following instructions are provided for those persons who have not received the same level of training.

The first 6 boxes of the H&S Plan are priority for filling out during the initial stages of an emergency.

BOX #1: Incident Information

This section is intended to provide general information about the incident.

Location can be a KMEP facility name, pipeline section, address with cross streets, etc.

Note the **date** (including year) and **approximate time** the incident occurred.

The "**Incident Name**" can be left blank until an appropriate name has been determined. Generally the name refers to the piece of equipment involved, location along the pipeline or some other way which will allow for easy recognition in the future. Fire Department responders may refer to the incident as the "Kinder Morgan Incident". However, avoid using this as the incident name because it is too generic and will not provide KMEP with adequate detail for future reference.

A description of **weather conditions** should be provided. Use simple and straightforward language (e.g. light rain, strong winds, sunny, etc.)

Check the appropriate "Incident Type" based on what has occurred. Some emergencies may involve one or more incident types. Check all that apply.

BOX #2: Chemical Hazards Involved

Most emergencies will involve the release of product. This section is intended to communicate what product involved in the particular incident. Most of the products KMEP handles or transports are listed. Place a check next to the products involved. Check "Other" if additional, unlisted chemicals are involved. In general, refined products pose a very low health risk. The first concern should be physical hazards (flash/fire/explosions).

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

There is a note referring to Table 1: Chemical & Physical Properties provided on the backside of the H&S Plan. This table lists the chemical and physical properties for several of KMEP products. Properties for some chemicals, such as fuel additive or DRA, are not provided because the products vary significantly in composition. In these cases, refer to the products Material Safety Data Sheet (MSDS).

Material Safety Data Sheet

A Material Safety Data Sheet (MSDS) is required for each chemical involved in the incident. Ensure that a copy of the MSDS is readily available. Later in the response effort, the MSDS can be attached to the H&S Plan. Check "Yes" once a MSDS has been made available.

Note: Table 1: Chemical & Physical Properties is intended as a reference but does not replace the need for a Material Safety Data Sheet (MSDS).

BOX #3: Physical / Health Hazards

The section is intended to inform responders or visitors of the **primary** physical or health hazards posed by the emergency situation. In general, refined products pose a very low health risk. The first concern should be physical hazards (flash/fire/explosions). Secondary hazards will be address in another part of the H&S Plan.

Physical Hazards	
Fire -	Check if the incident actually entails a fully involved fire.
Vapor -	Check if incident involves or has the likely potential to involve a vapor release and potential fire flashback.

Health Hazards	
Respiratory -	Check if incident involves a vapor release or if chemical involved poses specific inhalation hazard.
Skin -	Check if incident involves a splash hazard or if chemical involved poses specific skin hazard.

BOX #4: Personal Protective Equipment

The section is intended to designate what personal protective equipment (PPE) or what levels of PPE will be required within the various defined areas ("hazard zones") of the emergency site. It is important that the hazards zones are communicated to all responders so they understand the PPE requirements.

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

There is a note referring to Table 2: PPE Classes provided on the backside of the H&S Plan. This table describes the various levels of PPE. It should be used as a guideline when choosing PPE for personnel based on where they will be responding. KMEP's policy is that company employees may only respond in Level C or Level D. Mutual aid responders or emergency response contractors are permitted to don Level B or higher, according to their own SOP's.

All contractors shall wear the level of PPE required by the H&S Plan. It is the responsibility of the contractor to supply their personnel with the required PPE and ensure they are knowledgeable and skilled in its use. KMEP has the right to request proof of training, if deemed necessary.

The Table 2: PPE Classes is based on Appendix "B" of the HAZWOPER Standard. Therefore, it should be used as a guideline. All the pieces of PPE listed under a particular level may not be required (e.g. inner chemical resistant gloves, chemical resistant safety boots, etc.). However, the proper choice of respiratory protection is essential and should be used as a deciding factor when choosing between the different levels of PPE.

The following discussion will describe the different levels of PPE in greater detail:

Level A

KMEP personnel do not respond in Level A.

Level A is intended to provide the highest level of skin, eye and respiratory protection. It requires the use of a totally encapsulating chemical suit and SCBA. The product KMEP transports do not warrant the use of Level A. Should an incident involve such chemicals (e.g. train derailment), KMEP personnel are to remove themselves from the immediate area and assist in a defensive mode only.

Level B

KMEP personnel do not respond in Level B.

Level B is intended to provide the highest level of respiratory protection but a lower level of skin and eye protection than Level A. Respiratory protection can include an SCBA or airline. Skin protection will normally include fire resistant (Nomex) or Tyvex (splash resistant) coveralls. Nomex should be worn if the potential for ignition is greater than the potential for splashes. Tyvex, or equivalent, should be worn if the potential for splashes is greater than the potential for ignition. It is not recommended to wear both Nomex and Tyvex coveralls together.

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

Level B may also include the following PPE, as needed:

- Inner gloves and outer, chemical resistant (nitrile) gloves
- Safety boots (possibly chemical resistant)
- Hard hat
- Face shield / safety glasses
- Hearing Protection

Level C

Level C is the highest level of PPE KMEP personnel are permitted to wear.

Level C is a significant reduction in respiratory protection. Full- or half-face respirators should be selected when the type and concentration of the chemical(s) involved are known. Air monitoring is required to determine the amount of airborne chemical responders may be exposed to.

Once air monitoring is conducted, the appropriate respirator must be chosen. If the chemical hazard is in a gas/vapor form, the proper respirator cartridge must be identified. If the chemical poses a particulate/dust hazard, then a high efficiency particulate air (HEPA) filter is recommended. Cartridges and filters are universally color-coded:

Chemical Hazard	Universal Color Code
Organic vapors (petroleum products)	Black
Acid gases	Yellow
Particulate / dust (HEPA rated)	Bright Pink

If fitted properly, most full- and half-face respirators will provide protection up to 10 times (10x) the permissible exposure limit (PEL).

No person shall be required to wear a respirator or other PPE without proper training in its use and limitations. In the case of respiratory equipment, personnel must have:

Completed an annual, qualitative fit test (e.g. with irritant smoke)

Been trained on how to properly put on a respirator (e.g. field fit check)

Complete a medical evaluation form

Access to a new or properly cleaned and inspected respirator.

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

Level C skin protection may include fire resistant (Nomex) or Tyvex (splash resistant) coveralls. Do not enter Flash Area

Level C may also include the following PPE, as needed:

- Inner gloves and outer, chemical resistant (nitrile) gloves
- Safety boots (possibly chemical resistant)
- Hard hat
- Face shield / safety glasses
- Hearing Protection

BOX #5: Hot Zone Authorized Entrants

The intent of this section is to determine who is permitted to enter the Hot Zone. All other responders are not allowed to enter the Hot Zone without express permission from the Incident Commander. Place a check next to the responders permitted to enter the Hot Zone.

BOX #6: Site Map

The Site Map plays a key role in communicating essential incident information set forth in the H&S Plan. The open space in the center of the H&S Plan is intended for a hand-drawn version of the incident area. In the event the emergency occurs at a facility, a pre-printed facility plot plan can be used.

At a minimum, a Site Map should include:

Wind direction – Draw an arrow indicating wind direction. Include the actual bearing of the wind (N, S, E or W) and speed, if available

Hazard Zones

Hazard zones include the hot, warm and cold zones. These zones are utilized during an emergency to:

Outline the location of the greatest hazards, as well as, areas considered safe.

Communicate areas where certain personnel are (and are not) permitted to respond.

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

- Communicate areas where visitors are (and are not) permitted to access.
- Provide a means to control the "flow" of response personnel into and out of the hot zone.
- Contain the released product within the smallest area possible.

In the initial stages of an emergency, the hazard zones may only be established through the use of landmarks (e.g. trees, fences, roads, etc.). However, this process is important because it creates a visual "foot print" of the hazardous areas, which can be communicated to responding agencies or personnel.

Hot Zone

Only personnel with proper HAZWOPER training are allowed to enter the hot zone. The Hot zone is an established area that encircles the released product or primary hazard of emergency. The size of the hot zone will depend on product involved, wind direction, terrain, etc. During early stages of an emergency, the hot zone will be an estimate. When doing so, estimate a much larger are to include a margin of safety. You can always move closer, but it is difficult to pull responders back. Upon arrival at the scene, Fire Departments will often consider an entire facility as the hot zone. This is to ensure all personnel are evacuated and site reconnaissance can begin.

Warm Zone

Only personnel who have been HAZWOPER train are allowed to enter the warm zone. The warm zone is the area between the hot and cold zones. Like the hot zone, the size on the area depends on product involved, wind direction, terrain, etc. The warm zone should completely surround the hot zone. It acts as a buffer and transition area from the cold zone into the hot zone and visa versa. Whenever possible, the warm zone should be delineated with tape or barrier.

Cold Zone

The cold zone is a non-hazardous area where emergency management and support services are stationed. It is located beyond the Warm zone and does necessarily need to be delineated with tape or signs. The cold zone generally contains the Staging area and the Command Post. If the emergency warrants, the cold zone will also support a liaison area and a media area.

- **Staging** - The Staging Area is located within the cold zone and will serve as the first control point into the emergency. Although the Staging Area may not be established in the initial phase of the response, it is important for it to be included on the Site Map once it is established. Indicate the location of the Staging Area on the Site Map.

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

- **Command Post** - The Command Post is also located within the cold zone. It will serve as the main communication and action planning post for the duration of the emergency. Although the Command Post may not be established in the initial phase of the response, it is important for it to be included on the Site Map once it is established. More details regarding the Command Post and its role in the Incident Command System are provided. Indicate the location of the Command Post on the Site Map.

- **Decon** - A decontamination corridor ("decon area") is established at the edge of the hot zones and extends into the warm zone. Whenever possible, the decon area should be located upwind of the incident. Decontamination will be discussed further.

- **Cross Streets** - Identification of cross streets will provide a point of reference, particularly if the incident occurs along the pipeline.

- **Sensitive Receptors** - Sensitive receptors include creeks, storm channels, schools or any vulnerable conditions that could be impacted by the incident. Include the location of any sensitive receptors on the Site Map.

BOX #7: Secondary Hazards

This section is intended to communicate possible hazards that are secondary to the hazards directly posed by the incident. There is a note referring to Table 3: Secondary Hazards provided on the backside of the H&S Plan. This table lists possible secondary hazards that may deserve additional attention by the KMEP Safety Officer and provides some recommended precautions. Put a check next to all the secondary hazards that apply. Take the necessary precautions as they apply to each hazard. Use the "Other" box to describe additional secondary hazards, as necessary.

BOX #8: Evacuation Plan

This section is intended to clearly communicate where responders and/or visitors are to assemble in the event of an unexpected emergency or evacuation occurred during the response. The evacuation signal may be an existing facility alarm, three blasts of an air horn or any other easily identifiable and audible signal.

If the incident occurred at a facility and the existing evacuation areas are safe and appropriate (based on the established hazard zones), indicate these primary and secondary evacuation areas on the H&S Plan.

If the incident occurred outside a facility or along the pipeline, designate primary and secondary evacuation areas on the H&S Plan. These areas may be a simple as the Staging area or the corner of an intersection.

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

BOX #9: Nearest Hospital

Provide the address, phone number and driving directions for the hospital nearest to the incident area. It is advisable to contact the hospital and ask if they have an emergency room.

BOX #10: PROP 65 Notices

This section applies to incident occurring in California only. PROP 65 notices are required to warn people of potential toxicological effects of released products. At a minimum, PROP 65 notices are to be posted at the entrance to the incident (e.g. facility entrance or Staging area). PROP 65 notices do not need to be posted if they are already posted at facility entrances. Efforts also should be made to post them along the incident perimeter.

Check to appropriate box according to the incident location and posting needs.

BOX #11: KMEP ICS Organization

Fill-in and update the KMEP organization chart as responders arrive at the scene and assume ICS positions. See Section 4.0 for more details on ICS.

BOX #12: Enforcement / Regulatory Agencies (On-Site)

This section is intended to communicate what enforcement / regulatory agencies are on the scene. Include type of agency, representative's name and time of arrival. The KMEP Safety Officer may wish to coordinate with the KMEP Liaison Officer to complete and update this section.

BOX #13: Contractors (On Site)

This section is intended to keep track of the various contractors on site. The KMEP Safety Officer may wish to coordinate with the KMEP Operations and/or Logistics Officer(s) to complete and update this section. Check the type of contractor and fill-in the company name.

BOX #14: Hot Zone Entry Objectives

This section is intended to answer the following questions:

Why are "Hot Zone Authorized Entrants" (Box # 5) entering the Hot Zone?

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

- What are they planning to do?
- Are the benefits of accomplishing objectives worth the risk of entering the Hot Zone?

Write the answer to the questions in the space provided. Use simple, straightforward language.

BOX #15: Decon Procedures

This section is to be used to develop decontamination procedures. Procedures need to be appropriate for the hazard involved.

During a response to a release, personnel and equipment may come into contact with the product. The purpose of decontamination is to minimize the spread of product. In order to accomplish this, it is important to practice effective decontamination that is appropriate to the hazards of the product. Decontamination includes the removal or neutralization of product from personnel and response equipment. The following are consideration for establishing an in-the-field decon system:

- Decon systems should be located up-wind of the Hot Zone. The decon system should extend from the edge of the Hot Zone into the Warm Zone.
- The decon system should be considered the entrance and exit (control point for personnel) into the Hot Zone.
- A secondary decon system should be considered for response equipment such as backhoes, vacuum trucks etc. Likewise, the "equipment" decon system should be used as the control point for response equipment.
- Design decon systems appropriate for the hazards involved. Refined petroleum products present a low health hazard. The approved Company decon system for refined petroleum products consists of the following components:

FIGURE 3.7 (Cont'd)

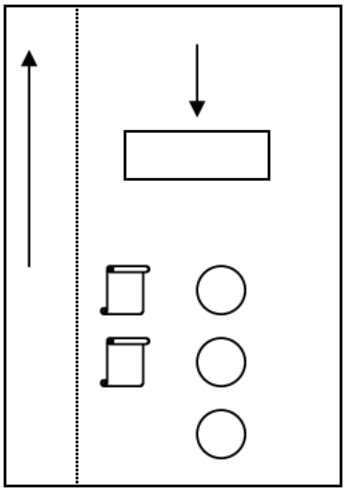
SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

- Plastic tarp floor to contain product
- Tub of kitty litter absorbent
- Boot brush
- Folding chairs
- Large plastic trash bags
- Entrant log and supervision

A sample decon system includes:

= Container with 4" of absorbent material (i.e. kitty litter) and a boot brush.

= Several folding chairs lined up with trash bags in front.



BOX #16: Atmospheric Monitoring

Air monitoring should be conducted to ensure that appropriate hazard zone areas have been designed. KMEP, fire department or contractor personnel may perform air monitoring to establish levels where appropriate. These times include:

- Ensure warm/cold zones free of vapor
- Need for respiratory protection
- Determine safe levels for confined space entry and hot work

Air monitoring to establish the hot zone perimeter should be delegated to the lead agencies (Fire Dept., HazMat teams, etc).

BOX # 17: Authorization Signatures

Once completed, have the KMEP Incident Commander and Safety Officer sign the H&S Plan.

3.14 MATERIAL SAFETY DATA SHEETS

Product Specific Response Considerations for the major products are provided in Figure 3.8. Each Facility maintains a more detailed and all-inclusive list of MSDS. MSDSs for all products handled are available at:

http://www.actiocms.com/msdsvaultx_language/alphasort_clientside.cfm?sectionname=MAIN

FIGURE 3.8

FLAMMABLE LIQUIDS (Polar/Water-Miscible)

The following information is intended to provide the initial responder(s) with data that may be useful in making quick decisions and executing prompt response actions. The information is intended for guideline purposes only.

PRODUCTS **Ethanol and Ethanol Solutions**

HAZARD IDENTIFICATION / RECOGNITION

GUIDE NO. 127

DANGERS

- HIGHLY FLAMMABLE: Will be easily ignited by heat, sparks or flames.
- Vapors may form explosive mixtures with air.
- Vapors may travel to source of ignition and flash back.
- Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks).
- Vapor explosion hazard indoors, outdoors or in sewers.
- Those substances designated with a "P" may polymerize explosively when heated or involved in a fire.
- Runoff to sewer may create fire or explosion hazard.
- Containers may explode when heated.
- Many liquids are lighter than water.

HEALTH

- Move victim to fresh air. Call 911 or emergency medical service.
- Apply artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult.
- Remove and isolate contaminated clothing and shoes.
- In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes.
- Wash skin with soap and water.
- Keep victim warm and quiet.
- Ensure that medical personnel are aware of the material(s) involved, and take precautions.

PUBLIC SAFETY

- Isolate spill or leak area immediately for at least 25 to 50 meters (80 to 160 feet) in all directions.
- Keep unauthorized personnel away.
- Stay upwind.
- Keep out of low areas.
- Ventilate closed spaces before entering.

EVACUATION

Large Spill

- Consider initial downwind evacuation for at least 300 meters (1,000 feet).

Fire

- If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 meters (1/2 mile) in all directions; also, consider initial evacuation for 800 meters (1/2 mile) in all directions.

Information provided by the Emergency Response Guidebook 2008.

FIGURE 3.8 (Cont'd)

FLAMMABLE LIQUIDS (Non-Polar/Water-Immiscible)

The following information is intended to provide the initial responder(s) with data that may be useful in making quick decisions and executing prompt response actions. The information is intended for guideline purposes only.

PRODUCTS **Diesel Fuel** **Gasoline** **Fuel Oils (#1- #6)** **Jet Fuel**

HAZARD IDENTIFICATION / RECOGNITION

GUIDE NO. 128

DANGERS

- HIGHLY FLAMMABLE: Will be easily ignited by heat, sparks or flames.
- Vapors may form explosive mixtures with air.
- Vapors may travel to source of ignition and flash back.
- Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks).
- Vapor explosion hazard indoors, outdoors or in sewers.
- Those substances designated with a "P" may polymerize explosively when heated or involved in a fire.
- Runoff to sewer may create fire or explosion hazard.
- Containers may explode when heated.
- Many liquids are lighter than water.
- Substance may be transported hot.

HEALTH

- Move victim to fresh air. Call 911 or emergency medical service.
- Apply artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult.
- Remove and isolate contaminated clothing and shoes.
- In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes.
- Wash skin with soap and water.
- Keep victim warm and quiet.
- Ensure that medical personnel are aware of the material(s) involved, and take precautions.

PUBLIC SAFETY

- Isolate spill or leak area immediately for at least 25 to 50 meters (80 to 160 feet) in all directions.
- Keep unauthorized personnel away.
- Stay upwind.
- Keep out of low areas.
- Ventilate closed spaces before entering.

EVACUATION

Large Spill

- Consider initial downwind evacuation for at least 300 meters (1,000 feet).

Fire

- If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 meters (1/2 mile) in all directions; also, consider initial evacuation for 800 meters (1/2 mile) in all directions.

Information provided by the Emergency Response Guidebook 2008.

3.15 POST INCIDENT REVIEW/INVESTIGATION

Post incident reviews/investigations will be conducted in accordance with Liquids O & M Procedure 159 by either local management or an assigned investigation team. Input will be sought from Federal, State, Local and Tribal On-Scene Coordinators; other responding agencies and contractors as well as KM employees. Revisions to this ICP as well as operations manuals, procedures and response actions will be made as necessary. A summary of lessons learned and revisions will be provided to various agencies as required by applicable regulations.

4.0 RESPONSE TEAMS

4.1 INTRODUCTION

This section describes organizational features and duties of the Local Response Team and the broader Company Incident Management Team.

The key to an effective emergency response is a rapid, coordinated, tiered response by the affected facility and the Incident Management Team, consistent with the magnitude of the incident.

First response to an incident at the Facility will be provided by the Local Response Team (LRT). The Incident Management Team will respond, to the degree necessary, to incidents exceeding local capability. If a response exceeds the Local Response Team's capabilities, the Local Incident Commander will activate the Incident Management Team.

These response teams will use the NIMS Incident Command System (ICS) to manage the emergency response activities. Because ICS is a management tool that is readily adaptable to incidents of varying magnitude, it will typically be used for all emergency incidents. Staffing levels will be adjusted to meet specific response team needs based on incident size, severity, and type of emergency.

An explanation of ICS and the roles and responsibilities for primary members of the response teams are provided in Section 4.9. The USCG Incident Management Handbook (IMH) can be referenced for an in-depth description of all ICS positions, ICS development, response objectives and strategies, command responsibilities, ICS specific glossary/acronyms, resource typing, the IAP process, and meetings (http://www.uscg.mil/hq/nsfweb/docs/FinalIMH18AUG2006.pdf).

Another important aspect of the ICS system is that individuals working on specific response tasks complete standard ICS forms. Accurate and complete documentation of a response activity using these standard forms is vital to the communication of information during any transition phase of responsibilities as well as post-incident assessments and follow-up. Standard ICS forms are included in Section 5.

4.2 QUALIFIED INDIVIDUAL

It is the responsibility of the Qualified Individual (QI) or his/her designee to coordinate with the Federal On-Scene Coordinator (FOSC) and State On-Scene Coordinator (SOSC) throughout the response.

Vital duties of the Qualified Individual (QI) include:

- Activate internal alarms and hazard communication systems to notify all Facility personnel.
- Notify all response personnel, as needed.
- Identify the character, exact source, amount, and extent of the release, as well as the other items needed for notification.

4.2 QUALIFIED INDIVIDUAL (Cont'd)

- Notify and provide necessary information to the appropriate Federal, State, and Local authorities with designated response roles, including the National Response Center (NRC), State Emergency Response Commission (SERC), and local response agencies.

- Assess the interaction of the spilled substance with water and/or other substances stored at the Facility and notify response personnel at the scene of that assessment.

- Assess the possible hazards to human health and the environment due to the release. This assessment must consider both the direct and indirect effects of the release (i.e., the effects of any toxic, irritating, or asphyxiating gases that may be generated, or the effects of any hazardous surface water runoffs from water or chemical agents used to control fire and heat-induced explosion).

- Assess and implement prompt removal actions to contain and remove the substance released.

- Coordinate rescue and response actions as previously arranged with all response personnel.

- Activate and engage in contracting with oil spill removal organizations.

- Use authority to immediately access company funding to initiate cleanup activities.

- Direct cleanup activities until properly relieved of this responsibility.

- Arrangements will be made to ensure that the Qualified Individual (QI) or the Alternate Qualified Individual (AQI) is available on a 24-hour basis and is able to arrive at the Facility in a reasonable time.

- The AQI shall replace the QI in the event of his/her absence and have the same responsibilities and authority.

4.3 LOCAL RESPONSE TEAM

The first Company person on scene will function as the Incident Commander (IC) and person-in-charge until relieved by an authorized supervisor who will then assume the position of Incident Commander. Transfer of command will take place as more senior management respond to the incident. For response operations within the control of the Local Response Team, the role of IC will typically be assumed and retained by Terminal Management.

The number of positions/personnel required to staff the Local Response Team will depend on the size and complexity of the incident. The duties of each position may be performed by the IC directly or delegated as the situation demands. The IC is always responsible for directing the response activities and will assume the duties of all the primary positions until the duties can be delegated to other qualified personnel.

4.3 LOCAL RESPONSE TEAM (Cont'd)

A complete functional ICS organization is shown in Figure 4.1. The LRT should try to fill the necessary positions and request additional support from the Incident Management Team to fill/back up the positions necessitated by the incident may dictate. Detailed job descriptions of the primary response team positions are provided in Section 4.9.

4.4 INCIDENT MANAGEMENT TEAM

For spill response operations outside the capabilities of the Local Response Team (LRT), the QI/AQI or IC will determine the need for mobilization of the Incident Management Team (IMT). The members of the LRT will typically become members of the IMT.

The Incident Management Team (IMT), once fully staffed, is designed to cover all aspects of a comprehensive and prolonged incident response. The number of positions/ personnel required to staff the IMT will depend on the size and complexity of the incident. During a prolonged response, additional personnel may be cascaded in, and more than one level within the Team may be involved to sustain 24-hour operations.

The IMT is basically organized according to the NIMS Incident Command System principles (Figure 4.2). Led by the Incident Commander, the team is composed of the following principal components:

- Command
- Planning
- Finance/Administration
- Operations
- Logistics

The Incident Management Team is staffed by specially trained personnel from various facility/corporate locations, and by various contract resources as the situation requires (IMT organization chart is provided in Figure 4.2; telephone reference is provided in Figure 2.2.). Command and Unit Leader responsibilities are described in Section 4.9.

4.5 KM CRISIS SUPPORT TEAM (CST)

Kinder Morgan (KM) has established a Crisis Support Plan (CSP) to assist local field groups in responding to crises in their areas. In addition to typical emergencies such as releases, fires, and explosions, the plan may be used to address the response to less obvious crises such as negative media, national security threats and natural disasters that affect the overall well being of KM.

During most emergencies and crises, the local facility response plan provides the appropriate immediate response. If the situation warrants, the Crisis Support Plan would be implemented to supplement local response activities by using personnel (called the Crisis Support Team (CST)) in the Houston, Texas; Orange, California; Lakewood, Colorado; and/or Alpharetta, Georgia offices – all of which can operate 24 hours per day when activated.

The focus of the KM Crisis Support Team (CST) is to augment the company's various existing emergency response plans and capabilities with additional resources, equipment, and crisis response planning, at the KM management level. The CSP provides the mechanism for activating the KM CST and affiliated Crisis Support Center.

4.6 INCIDENT COMMAND SYSTEM

The Incident Command System is intended to be used as an emergency management tool to aid in mitigating all types of emergency incidents. This system is readily adaptable to very small emergency incidents as well as more significant or complex emergencies. The Incident Command System utilizes the following criteria as key operational factors:

- Assigns overall authority to one individual
- Provides structured authority, roles and responsibilities during emergencies
- The system is simple and familiar, and is used routinely at all incidents
- Communications are structured
- The system for response and assignment of resources is structured
- The system provides for expansion, escalation, and transfer/transition of roles and responsibilities
- The system allows for "Unified Command" where agency involvement at the command level is required

Effective establishment and utilization of the Incident Command System during response to all types of emergencies can:

- Provide for increased safety
- Shorten emergency mitigation time by providing more effective and organized mitigation
- Cause increased confidence and support from local, state, and federal public sector emergency response personnel
- Provide a solid cornerstone for emergency planning efforts

Section 4.9 provides a comprehensive list of every response team member's duty assignment.

4.7 UNIFIED COMMAND

As a component of an ICS, the Unified Command (UC) is a structure that brings together the Incident Commanders of all major organizations involved in the incident to coordinate an effective response while still meeting their own responsibilities. The UC links the organizations responding to the incident and provides a forum for the Responsible Party and responding agencies to make consensus decisions. Under the UC, the various jurisdictions and/or agencies and responders may blend together throughout the organization to create an integrated response team. The ICS process requires the UC to set clear objectives to guide the on-scene response resources.

4.7 UNIFIED COMMAND (Cont'd)

Multiple jurisdictions may be involved in a response effort utilizing Unified Command. These jurisdictions could be represented by any combination of:

- Geographic boundaries
- Government levels
- Functional responsibilities
- Statutory responsibilities

The participants of Unified Command for a specific incident will be determined taking into account the specifics of the incident and existing response plans and/or decisions reached during the initial meeting of the UC. The UC may change as an incident progresses, in order to account for changes in the situation.

The UC is responsible for overall management of an incident. The UC directs incident activities and approves and releases resources. The UC structure is a vehicle for coordination, cooperation and communication which is essential to an effective response.

UC representatives must be able to:

- Agree on common incident objectives and priorities
- Have the capability to sustain a 24-hour-7-day-per-week commitment to the incident
- Have the authority to commit agency or company resources to the incident
- Have the authority to spend agency or company funds
- Agree on an incident response organization
- Agree on the appropriate Command and General Staff assignments
- Commit to speak with "one voice" through the Information Officer or Joint Information Center
- Agree on logistical support procedures
- Agree on cost-sharing procedures

4.8 DISCHARGE/INCIDENT CLASSIFICATION

The severity of a discharge/incident will have a bearing on the level of management involvement necessary and the extent of resource mobilization. The following definitions provide guidance in the early classification of discharges:

TIER I EVENT
Incident Command will normally be assumed by Terminal Management. Regional and Head Office support will be utilized on an as needed basis.
Exposure
The potential public and environmental exposure is moderate. The type and quantity of material released, while considering the overall nature of the incident (e.g. fire, proximity to private dwellings, etc.), will have moderate impact on the public and/or the environment.
Degree of Control
The incident can be controlled in a short period of time through implementation of the local resources available to the Facility (including contract resources).
Governmental Involvement
Government involvement will be moderate and generally restricted to State and local levels.
Media Involvement
Media interest will be moderate and generally restricted to State and Local levels.

4.8 DISCHARGE/INCIDENT CLASSIFICATION (Cont'd)

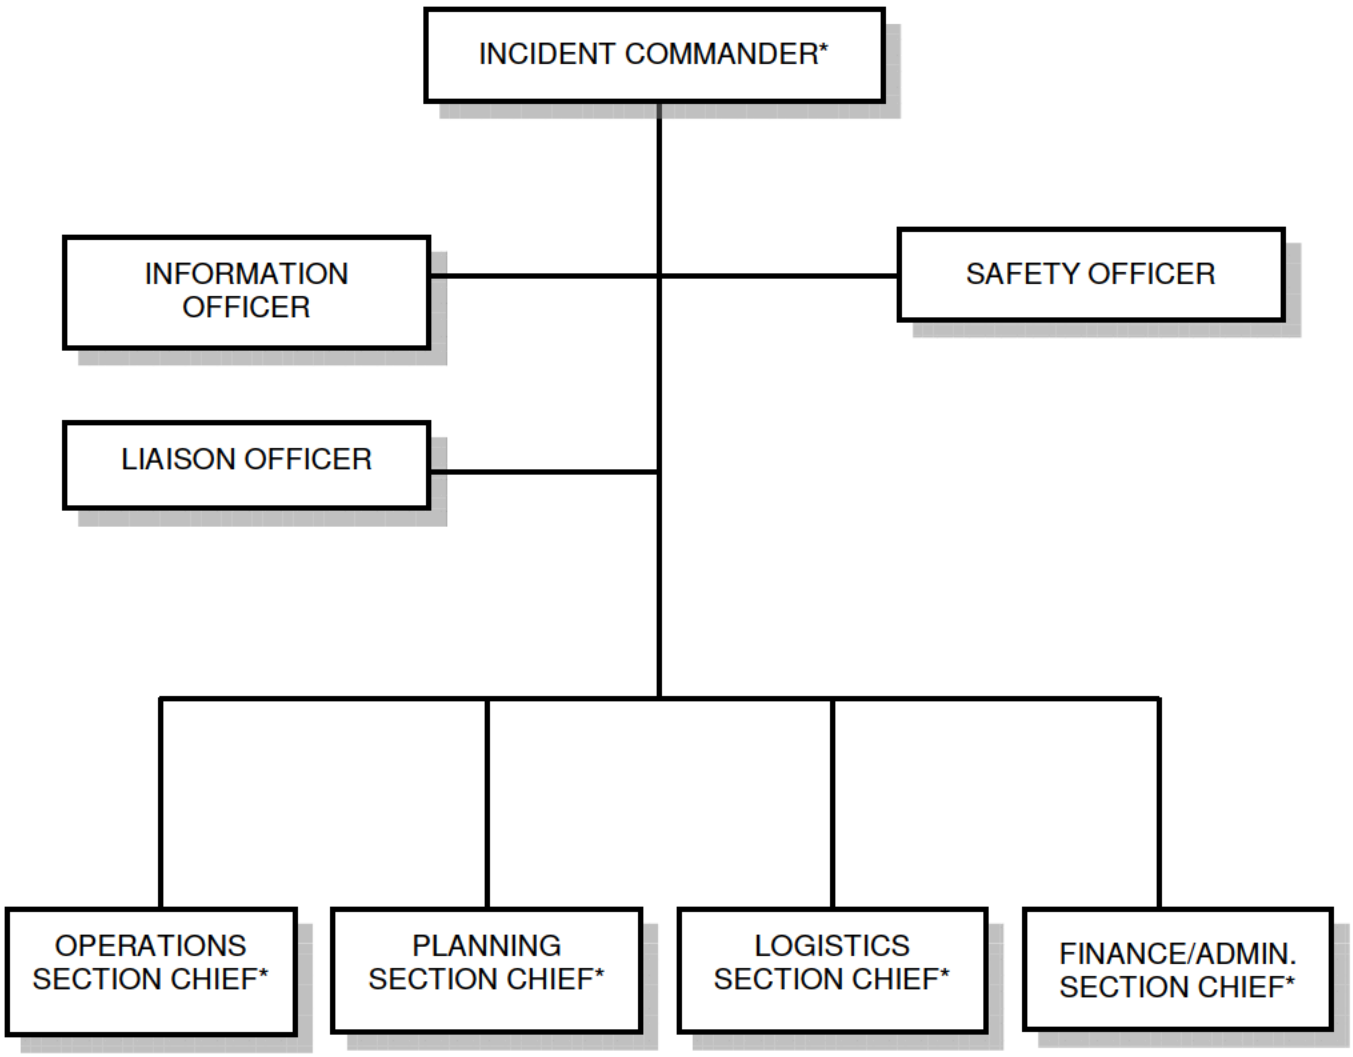
TIER II EVENT
Local Company resources may have to be supplemented with Head Office and external resources to manage the spill incident.
Exposure
The potential public and environmental exposure is moderately high. The type and quantity of material released, while considering the overall nature of the incident (e.g. fire, proximity to private dwellings, etc.), will have moderately high impact on the public and/or the environment.
Degree of Control
The incident can be brought under control in a moderate period of time through implementation of local resources available to the Facility (including contract resources) with possible implementation of regional resources.
Governmental Involvement
Government involvement will be moderately high and generally restricted to Regional levels.
Media Involvement
Media interest will be moderately high and generally restricted to Regional levels.

TIER III EVENT
Maximum Company and external resources must be implemented to respond to the spill incident. Activation of the Crisis Management Team would be anticipated during a Tier III incident.
Exposure
The potential public and environmental exposure is significant. The type and quantity of material released, while considering the overall nature of the incident (e.g. fire, proximity to private dwellings, etc.), will have significant impact on the public and/or the environment.
Degree of Control
Maximum Company and third party resources must be implemented in order to gain control of the incident.
Governmental Involvement
Government involvement will be high.
Media Involvement
Media interest will be high.

FIGURE 4.1

LOCAL RESPONSE TEAM

(For Initial Response and Tier I & II Incidents)

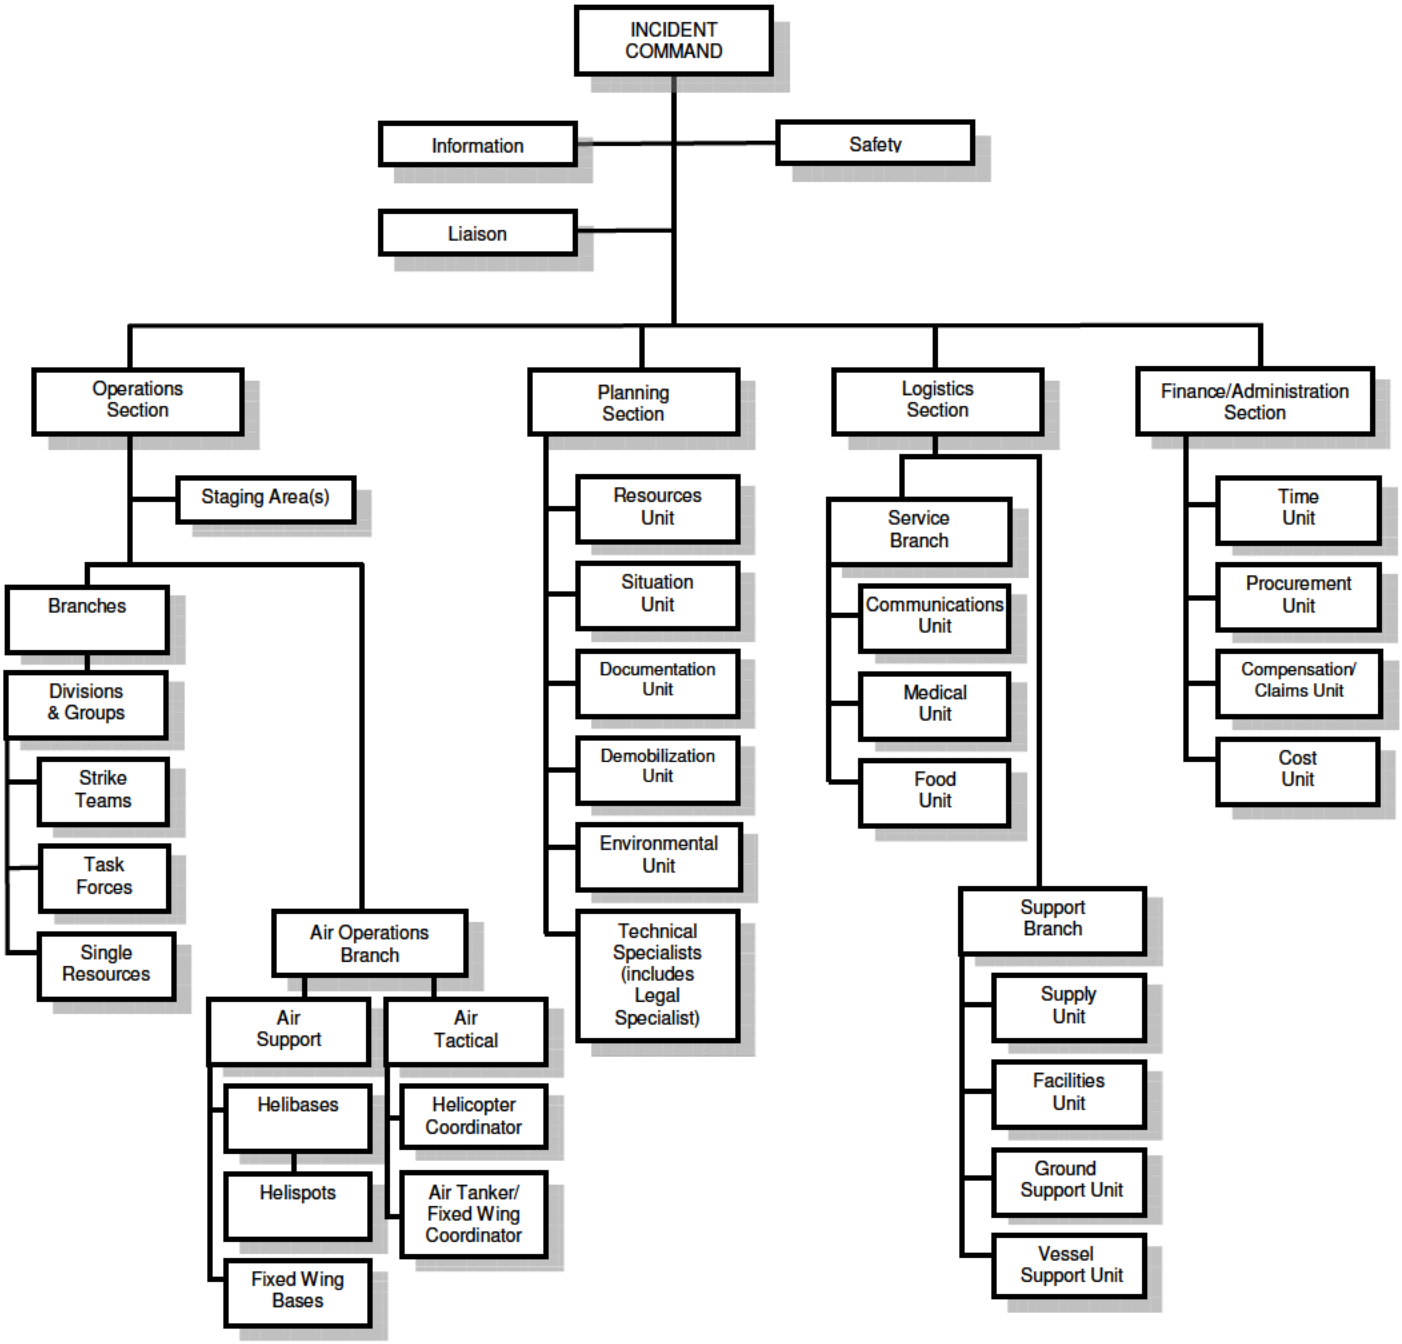


* NOTE: Local Response Team (LRT) personnel can assume any of these positions as necessary.

FIGURE 4.2

INCIDENT MANAGEMENT TEAM

(For incidents beyond the response capability of the Local Response Team)



4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

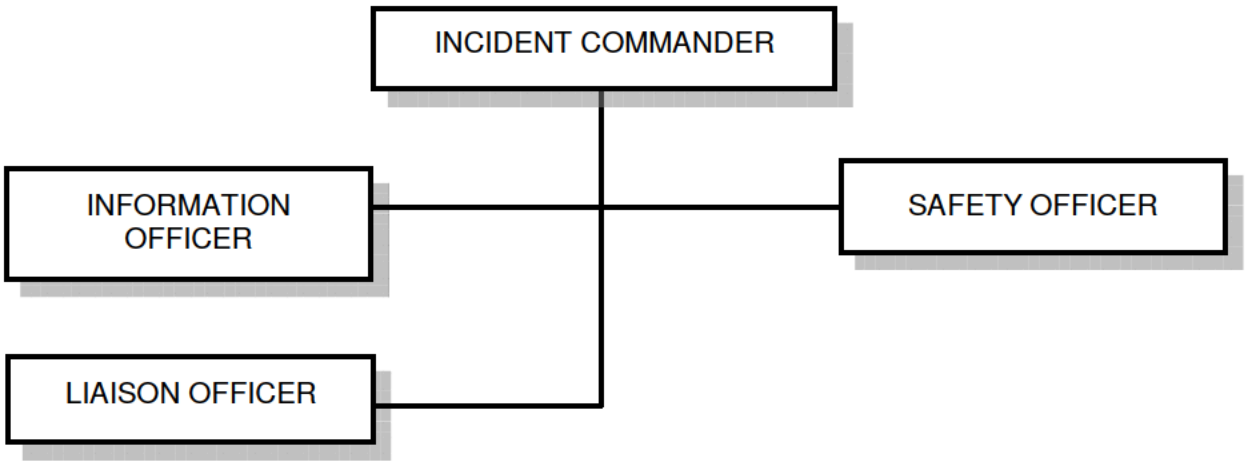
COMMAND

Incident Commander 4-12

Safety Officer 4-15

Liaison Officer 4-17

Information Officer 4-18



INCIDENT COMMANDER

The Incident Commander (IC) has responsibility for overall management of the incident. The KM IC has the authority to approve the use of a contractor even if no "open-end" contract exists, as well as the authority to commit monies to initiate response and clean-up activities. The first employee on-site will assume the responsibilities of IC until properly relieved. Generally, the most senior employee on-site will assume the IC position. The IC also has overall responsibility for the health and safety of responders.

KM Initial IC Responsibilities (During the first few hours):

- Make internal Company notifications
- Conduct initial site assessment
- Initiate Incident Command System (assign ICS roles & complete org. chart)
- Ensure Site Specific Health & Safety plan is being developed within the first hour
- Maintain site control (establish hazard zones and appropriate corridors)
- Request Unified Command with lead agencies as appropriate
- Establish immediate priorities (i.e. control the discharge, initiate containment, ensure safety, etc.)

Overall IC Responsibilities:

- Assess the situation and/or obtain a briefing from the prior IC.
- Determine Incident Objectives and strategy.
  Objectives and strategies should be documented on ICS form 201or 202 and used to communicate Unified Command's expectations for the next operational period
- Establish the immediate priorities.
- Establish an Incident Command Post.
- Brief Command Staff and Section Chiefs.
- Review meetings and briefings.
- Establish an appropriate organization.
  The organization should be documented on ICS forms 201, 203 or 207, depending on the level of response.
- Ensure planning meetings are scheduled as required.
- Approve and authorize the implementation of an IAP.
- Ensure that adequate safety measures are in place.
- Coordinate activity for all Command and General Staff.
- Coordinate with key people and officials.
- Approve requests for additional resources or for the release of resources.
  This is usually accomplished through the approval of the Incident Action Plan.
- Keep corporate offices and agency administrator(s) informed of incident status.
- Approve the use of trainees, volunteers, and auxiliary personnel.
- Authorize release of information to the news media.
- Ensure incident Status Summary (ICS Form 209) is completed and forwarded to appropriate higher authority.
- Order the demobilization of the incident when appropriate.

INCIDENT COMMANDER (Cont'd)

OIL SPILL

The IC for oil discharges will, whenever possible and practical, be organized under the Unified Command (UC) Structure that includes, but is not limited to:

- The pre-designated Federal On-Scene Incident Commander (FOSC)
- The pre-designated State On-Scene Incident Commander (SOSC)
- The representative of the Responsible Party (RP) IC

The UC is responsible for the overall management of the incident. The UC directs incident activities including the development and implementation of strategic decisions and approves the ordering and releasing of resources. The UC may assign a Deputy IC to assist in carrying out IC responsibilities. IC tasks specific to oil spill events are:

- Be cognizant of the primary objectives for oil spill response activities.
  - Ensure the safety of citizens and response personnel.
  - Control the source of the spill.
  - Manage a coordinated response effort.
  - Maximize protection of environmentally sensitive areas.
  - Contain and recover spilled material.
  - Recover and rehabilitate injured wildlife.
  - Remove oil from impacted areas.
  - Minimize economic impacts.
  - Keep stakeholders informed of response activities.
  - Keep the public informed of response activities.
  - Ensure that the source of a discharge is designated and that procedures by which claims may be presented are advertised.
  - All removal and damage claims must be handled appropriately.

HAZARDOUS SUBSTANCE RELEASE

Incident Commander and Safety Officer - The IC and SO for a hazardous substance incident will use the following guidance when preparing the Site Safety Plan:

- Assign site safety responsibility.
- Establish perimeter and restrict access.
- Characterize site hazards:
  - Identity pollutant
  - Obtain Material Safety Data Sheets
  - Conduct air monitoring
  - Identify physical and biological hazards i.e., slips, trips, falls, confined spaces, noise, weather conditions, poisonous insects, reptiles, plants and biological waste
- Establish control zones:
  - Exclusion zone
  - Contamination reduction zone
  - Support zone

INCIDENT COMMANDER (Cont'd)

***HAZARDOUS SUBSTANCE RELEASE** (Cont'd)*

- Assess training requirements:
  - Check HAZWOPER cards
  - Insure safety briefings
- Select personal protective equipment (PPE) Level A, B, C, or D.
- Establish decontamination stations.
- Establish Emergency Medical Plan Locate hospital, EMT(S) and first-aid stations; and List emergency numbers: fire, police, and ambulance.

TERRORISM INCIDENT

(b) (7)(F), (b) (3)

[redacted]

SAFETY OFFICER

The Safety Officer's (SO) function is to develop and recommend measures for assuring personnel safety, and to assess and/or anticipate hazardous and unsafe situations. Only one SO will be assigned for each incident; however, there may be assistants.

Overall SO Responsibilities:

- Participate in planning meetings.
- Identify hazardous situations associated with the incident.
- Review the IAP for safety implications.
- Exercise emergency authority to stop and prevent unsafe acts.
- Investigate accidents that have occurred within the incident area.
  Ensure information is relayed to the Situation Unit Leader in order to update incident status information (ICS form 209) on the display board.
- Review and approve the medical plan (ICS form 206).
- Develop the Site Safety Plan and publish Site Safety Plan summary (ICS Form 208) as required.
  This plan may be more detailed than the KM Site Specific Health and Safety Plan.

Additional KM Required SO Responsibilities:

- Ensure all initial response personnel are located in a safe location
- Complete the KM Site Specific Health and Safety Plan (**within the first hour**)
- Conduct initial briefing of the KM Site Specific Health and Safety Plan
- Establish regularly scheduled safety meetings
  - Ensure that an "attendance roster" is maintained during these meetings
  - Work with Staging Officer to conduct H&S Plan briefings with arriving response personnel
- Assess need for atmospheric monitoring – coordinate as needed
  - Ensure air monitoring results are accurately documented; use map of area to record results if necessary
- Coordinate with appropriate agencies to assess need for triage; suggest possible locations
- Establish smoking areas; communicate clearly
- Post "Proposition 65" signs (California only)
- Establish Emergency Medical Plan Locate hospital, EMT(S) and first-aid stations; and List emergency numbers: fire, police, and ambulance.
- Control access to an offsite incident site by working within the Unified Command Structure to effect the necessary control measures for air, (FAA), marine(USCG) and ground (local law enforcement) traffic.
- In the event of a need to control traffic before the arrival of local, state, or federal authorities, the following methods of traffic control may be considered:
  - Vehicular and/or pedestrian access to an offsite incident should be controlled to the extent possible prior to the arrival of local law enforcement or other agency personnel trained to handle traffic control.
  - Until agencies respond to the scene and take control of access and traffic, vehicles can be used to block traffic flow on streets leading to the spill site, if it is safe to do so. Do not operate vehicles at the scene of a gasoline or other light hydrocarbon spill where a flammable vapor cloud may be present.
  - For an on water spill, control of marine traffic may be attempted prior to the arrival of the US Coast Guard response vessel by alerting vessel operators of the spill hazard by radio where possible.
  - Control of air traffic may be necessary due to operations aircraft. The local Federal Aviation Administration (FAA) office can be contacted by the Incident Commander, or coordinated with local authorities, to establish safe operations.

SAFETY OFFICER (Cont'd)

HAZARDOUS SUBSTANCE RELEASE

Incident Commander and Safety Officer - The IC and SO for a hazardous substance incident will use the following guidance when preparing the Site Safety Plan:

- Assign site safety responsibility.
- Establish perimeter and restrict access.
- Characterize site hazards:
  - Identity pollutant
  - Obtain Material Safety Data Sheets
  - Conduct air monitoring
  - Identify physical and biological hazards i.e., slips, trips, falls, confined spaces, noise, weather conditions, poisonous insects, reptiles, plants and biological waste
- Establish control zones:
  - Exclusion zone
  - Contamination reduction zone
  - Support zone
- Assess training requirements:
  - Check HAZWOPER cards
  - Insure safety briefings
- Select personal protective equipment (PPE) Level A, B, C, or D.
- Establish decontamination stations.
- Establish Emergency Medical Plan Locate hospital, EMT(S) and first-aid stations; and List emergency numbers: fire, police, and ambulance.

LIAISON OFFICER

The Liaison Officer (LO) serves as a "go-between" linking the IC to various agencies. These are agencies that do not have a direct tactical assignment within the Unified Command however, have an interest in the response activities or wish to offer assistance.

The Liaison Officer intercepts, greets and briefs agency representatives as they arrive on scene. It is the responsibility of the Liaison Officer to notify the IC before escorting anyone to the Command Post. A separate Liaison Area may need to be established to accommodate agency representatives not directly involved in the Unified Command.

Overall LO Responsibilities:

- Be a contact point for Agency Representatives.
  Agency Representatives are agency personnel who do not have direct tactical assignment but are present to assist in response efforts and have authority to make decision on matters affecting that agency's participation.

- Maintain a list of assisting and cooperating agencies and Agency Representatives.
  Obtain business cards or any other means of collecting contact information.

- Monitor check-in sheets daily to ensure that all Agency Representatives are identified.

- Assist in establishing and coordinating interagency contacts.
  Determine if there are any agencies that could assist in the response effort. Locate the contact information and make contact with the agencies.

- Keep agencies supporting the incident aware of incident status.

- Monitor incident operations to identify current or potential inter-organizational problems.
  Report any problems/conflicts to the IC.

- Participate in planning meetings, providing current resource status, including limitations and capability of assisting agency resources.

- Coordinate response resource needs for Natural Resource Damage Assessment and Restoration (NRDAR) activities with the OPS during oil and HAZMAT responses.
  This generally involves working with agencies to evaluate the impact the incident had on the environment and wildlife.

- Coordinate response resource needs for incident investigation activities with the OPS.

- Ensure that all required agency forms, reports and documents are completed prior to demobilization.

- Coordinate activities of visiting dignitaries.

- Have a debriefing session with the IC prior to departure.

INFORMATION OFFICER

The Information Officer (IO) is responsible for developing and releasing information about the incident to the news media, incident personnel, and other appropriate agencies and organizations.

Only one IO will be assigned for each incident. The IO may have assistants as necessary. The assistants may represent assisting agencies, companies, or jurisdictions. The IO and assistants will establish a Joint Information Center to assist with developing information releases.

Overall IO Responsibilities:

- Determine from the IC if there are any limits on information release.
- Develop material for use in media briefings.
- Obtain IC approval of media releases.
- Inform media and conduct media briefings.
- Arrange for tours and other interviews or briefings that may be required.
- Obtain media information that may be useful to incident planning.
- Maintain current information summaries and/or displays on the incident and provide information on the status of the incident to assigned personnel.

Additional KM Required IO Responsibilities:

- Receive briefing of incident
- Anticipate need for and establish a Media Area
- Coordinate with the KMEP Corporate Communications Office for development and release of appropriate media information
- Maintain a log of agency IOs, news media, news releases, etc.

TERRORISM INCIDENT

(b) (7)(F), (b) (3)

[redacted]

INFORMATION OFFICER (Cont'd)

(b) (7)(F), (b) (3)

OPERATIONS

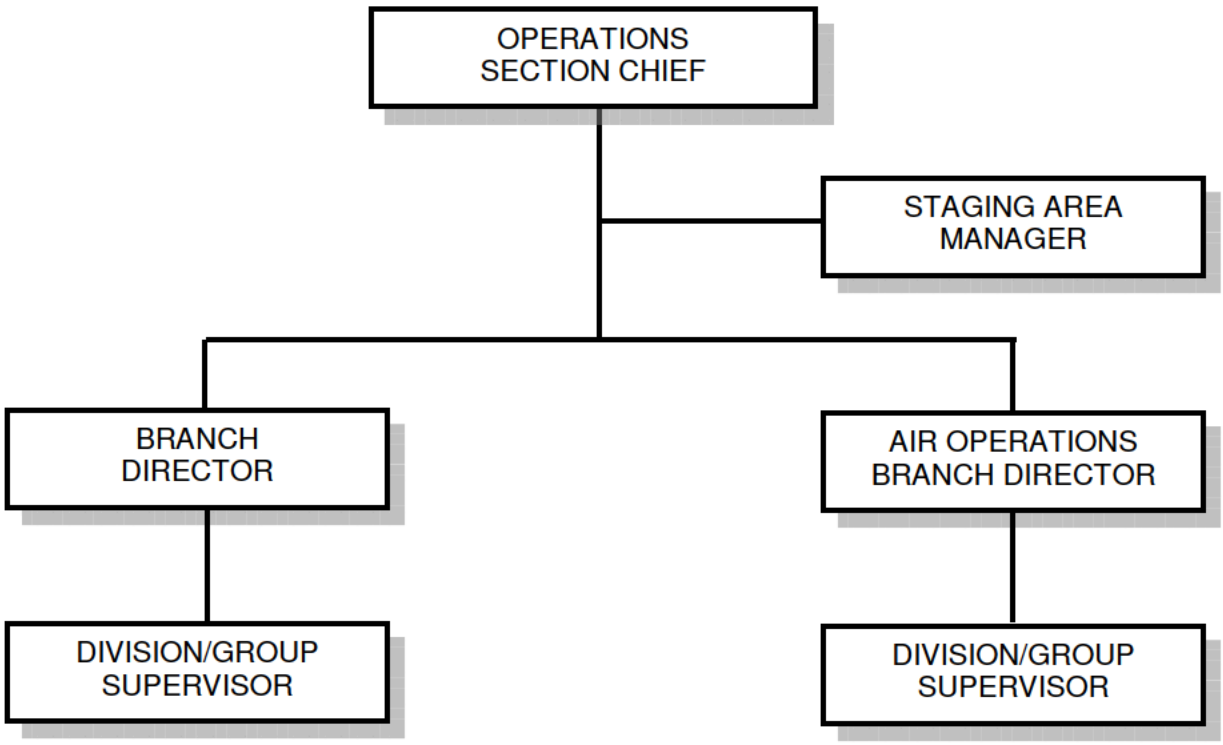
Operations Section Chief 4-21

Air Operations Branch Director 4-21

Staging Area Manager 4-25

Branch Director 4-25

Division/Group Supervisor 4-29



OPERATIONS SECTION CHIEF

The Operations Section Chief (OPS) is responsible for the management of all operations directly applicable to the primary mission (i.e. clean-up, recovery etc.). The OPS activates and supervises tactical response elements in accordance with the Incident Action Plan (IAP) and directs its execution. The OPS also requests or releases resources, makes expedient changes to the IAP, as necessary; and reports these actions to the IC.

Overall OPS Responsibilities

- Develop operations portion of IAP.
  This generally includes the designation of branches, divisions and groups, as well as input on required resources.
- Brief and assign Operations Section personnel in accordance with the IAP.
- Supervise Operations Section.
- Determine need and request additional resources.
- Review suggested list of resources to be released and initiate recommendation for release of resources.
- Assemble and disassemble strike teams assigned to the Operations Section.
- Report information about special activities, events, and occurrences to the IC.
- Respond to resource requests in support of NRDAR activities.

Additional KM Required OPS Responsibilities

- Directs KM personnel and emergency response contractors performing operations activities
- Review and ensure communication of the Site Specific H&S Plan to KM personnel and emergency response contractors performing operations activities
- Supervise the decontamination system
  - Ensure decontamination system is set-up and functional prior to Hot Zone entry
  - Request input from the Safety Officer, as necessary

AIR OPERATIONS BRANCH DIRECTOR

The Air Operations Branch Director (AIROPS), who is ground-based, is primarily responsible for preparing the air operations portion of the IAP. The plan will reflect agency restrictions that have an impact on the operational capability or utilization of resources (e.g., night flying, hours per pilot). After the plan is approved, the AIROPS is responsible for implementing its strategic aspects, which are those that relate to the overall incident strategy as opposed to those that pertain to tactical operations (specific target selection). Additionally, the AIROPS is responsible for providing logistical support to helicopters operating on the incident. The Air Tactical Group Supervisor, working in conjunction with ground and air resources, normally performs specific tactical activities, such as target selection and suggested modifications to specific tactical actions in the IAP.

Overall AIROPS Responsibilities:

- Organize preliminary air operations.
- Request declaration (or cancellation) of restricted air space
- Participate in preparation of the IAP through the OPS. Insure that the air operations portion of the IAP takes into consideration the Air Traffic Control requirements of assigned aircraft.
- Perform operational planning for air operations.

AIR OPERATIONS BRANCH DIRECTOR (Cont'd)

Overall AIROPS Responsibilities (Cont'd):

- Prepare and provide Air Operations Summary Worksheet (ICS Form 220) to the Air Support Group and Fixed-Wing Bases.
- Determine coordination procedures for use by air organization with ground Branches, Divisions, or Groups.
- Coordinate with appropriate Operations Section personnel.
- Supervise all air operations activities associated with the incident.
- Evaluate helibase locations.
- Establish procedures for emergency reassignment of aircraft.
- Schedule approved flights of non-incident aircraft in the restricted air space area.
- Coordinate with the Operations Coordination Center (OCC) through normal channels on incident air operations activities.
- Inform the Air Tactical Group Supervisor of the air traffic situation external to the incident.
- Consider requests for non-tactical use of incident aircraft.
- Resolve conflicts concerning non-incident aircraft.
- Coordinate with FAA.
- Update air operations plans.
- Report to the OPS on air operations activities.
- Report special incidents/accidents.
- Arrange for an accident investigation team when warranted.

Air Tactical Group Supervisor - The Air Tactical Group Supervisor is primarily responsible for the coordination of aircraft operations when fixed and/or rotary-wing aircraft are operating on an incident. These coordination activities are performed by the Air Tactical Group Supervisor while airborne. The Air Tactical Group Supervisor reports to the AIROPS.

Overall Air Tactical Group Supervisor Responsibilities:

- Determine what aircraft (air tankers and helicopters) are operating within the area of assignment.
- Manage air tactical activities based upon the IAP.
- Establish and maintain communications and Air Traffic Control, with pilots, Air Operations, Helicopter Coordinator, Air Tanker/Fixed Wing Coordinator, Air Support Group (usually Helibase Manager), and fixed-wing Support Bases.
- Coordinate approved flights of non-incident aircraft or non-tactical flights in restricted air space area.
- Obtain information about air traffic external to the incident.
- Receive reports of non-incident aircraft violating restricted air space area (OPS, Branch Director, or Division/Group Supervisor).
- Make tactical recommendations to approved ground contact.
- Inform AIROPS of tactical recommendations affecting the air operations portion of the IAP.
- Report on air operations activities to the AIROPS. Advise air operations immediately if aircraft mission assignments are causing conflicts in the Air Traffic Control System.
- Report on incidents/accidents.

AIR OPERATIONS BRANCH DIRECTOR (Cont'd)

Air Support Group Supervisor - The Air Support Group Supervisor is primarily responsible for supporting and managing helibase and helispot operations and maintaining liaison with fixed-wing air bases. This includes providing: 1) fuel and other supplies; 2) maintenance and repair of helicopters; 3) retardant mixing and loading; 4) keeping records of helicopter activity, and 5) providing enforcement of safety regulations. These major functions are performed at helibases and helispots. Helicopters during landing and take-off and while on the ground are under the control of the Air Support Groups Helibase or Helispot Managers. The Air Support Group Supervisor reports to the AIROPS.

Overall Air Support Group Supervisor Responsibilities:

- Obtain a copy of the IAP from the AIROPS including Air Operations Summary Worksheet (ICS Form 220).
- Participate in AIROPS planning activities.
- Inform AIROPS of group activities.
- Identify resources/supplies dispatched for the Air Support Group.
- Request special air support items from appropriate sources through Logistics Section.
- Identify helibase and helispot locations (from IAP) or from AIROPS.
- Determine need for assignment of personnel and equipment at each helibase and helispot.
- Coordinate special requests for air logistics.
- Maintain coordination with airbases supporting the incident.
- Coordinate activities with AIROPS.
- Obtain assigned ground-to-air frequency for helibase operations from the Communications Unit Leader (CUL) or Incident Radio Communications Plan (ICS Form 205).
- Inform AIROPS of capability to provide night flying service.
- Ensure compliance with each agency's operations checklist for day and night operations.
- Ensure dust abatement procedures are implemented at helibases and helispots.
- Provide crash-rescue service for helibases and helispots.
- Ensure that Air Traffic Control procedures are established between helibases and helispots and the Air Tactical Group Supervisor, the Helicopter Coordinator or the Air Tanker/Fixed-Wing Coordinator.

OIL SPILL

Air Tactical Group Supervisor - The coordination and scheduling of aircraft operations intended to locate, observe, track, surveil, support dispersant applications, or to be used for other deliverable response application techniques, or report on the incident situation when fixed and/or rotary-wing aircraft are airborne at an incident. These coordination activities are normally performed by the Air Tactical Group Supervisor while airborne.

Overall Air Tactical Group Supervisor Responsibilities:

- Obtain a briefing from the Air Operations Branch Director or the OPS.
- Coordinate dispersant, in-situ burning, and bioremediation application through the Air Operations Branch Director.

AIR OPERATIONS BRANCH DIRECTOR (Cont'd)

OIL SPILL (Cont'd)

- Coordinate air surveillance mission scheduling and observer assignments with the SUL.
- Identify remote sensing technology that may enhance surveillance capabilities.
- Coordinate air surveillance observations and provide reports by the most direct methods available.
- Report on air surveillance and operations activities to the Air Operations Branch Director.
- Coordinate application-monitoring requirements with the Helicopter and Fixed-Wing Coordinators and the Situation Unit.
- Report on air application activities to the Air Operation Branch Director.

STAGING AREA MANAGER

The Staging Area Manager works for the Operations Section Chief and is responsible for managing all activities within a Staging Area or areas. Since there may be more than one Staging Area for an incident, all personnel and equipment should check-in at one of these Staging Areas (sometimes referred to as a "base camp").

Overall Staging Area Manager Responsibilities:

- Proceed to Staging Area.
- Establish Staging Area layout.
- Consider assigning Assistant Staging Managers at each area.
- Determine any support needs for equipment, feeding, sanitation and security.
- Establish check-in function as appropriate.
- Post areas for identification and traffic control.
- Request maintenance service for equipment at Staging Area as appropriate.
- Respond to request for resource assignments.
  (Utilize ICS Forms 211, 211p, 211e)
- Obtain and issue receipts for radio equipment and other supplies distributed and received at Staging Area.
- Track resources distributed from the Staging Area(s) and resources received at the Staging Area(s).
- Determine required resource levels from the OPS.
- Advise the OPS when reserve levels reach minimums.
- Maintain and provide status to Resource Unit of all resources in Staging Area.
- Demobilize Staging Area in accordance with the Incident Demobilization Plan.

Additional KM Required Staging Area Manager Responsibilities:

- Determine whether multiple Staging Areas will be required
- Consider assigning Assistant Staging Managers at each area
- Ensure Staging Area(s) are maintained in orderly condition.
- Work with KM Safety Officer to conduct H&S Plan briefings with arriving response personnel.

BRANCH DIRECTOR

The Branch Directors when activated, are under the direction of the OPS, and are responsible for the implementation of the portion of the IAP appropriate to the Branches.

Overall Branch Director Responsibilities:

- Develop with subordinates alternatives for Branch control operations.
- Attend planning meetings at the request of the OPS.
- Review Division/Group Assignment Lists (ICS Form 204) for Divisions/Groups within the Branch. Modify lists based on effectiveness of current operations.
- Assign specific work tasks to Division/Group Supervisors.
- Supervise Branch operations.
- Resolve logistic problems reported by subordinates.

BRANCH DIRECTOR (Cont'd)

Overall Branch Director Responsibilities (Cont'd):

- Report to OPS when: the IAP is to be modified; additional resources are needed; surplus resources are available; or hazardous situations or significant events occur.
- Approve accident and medial reports originating within the Branch.

OIL SPILL

Recovery and Protection Branch Director - The Recovery and Protection Branch Director is responsible for overseeing and implementing the protection, containment and cleanup activities established in the IAP.

Emergency Response Branch Director - The Emergency Response Branch Director is primarily responsible for overseeing and implementing emergency measures to protect life, mitigate further damage to the environment, and stabilize the situation.

Wildlife Branch Director - The Wildlife Branch Director is responsible for minimizing wildlife injuries during spill responses; coordinating early aerial and ground reconnaissance of the wildlife at the spill site and reporting results to the SUL; advising on wildlife protection strategies, including diversionary booming placements, in-situ burning, and chemical countermeasures; removing of oiled carcasses, employing wildlife hazing measures as authorized in the IAP; and recovering and rehabilitating impacted wildlife. A central Wildlife Processing Center should be identified and maintained for, evidence tagging, transportation, veterinary services, treatment and rehabilitation storage, and other support needs. The activities of private wildlife care groups, including those employed by the RP, will be overseen and coordinated by the Wildlife Branch Director.

Overall Wildlife Branch Director Responsibilities:

- Review Branch Director Responsibilities.
- Develop the Wildlife Branch portion of the IAP.
- Supervise Wildlife Branch operations.
- Determine resource needs.
- Review the suggested list of resources to be released and initiate recommendation for release of resources.
- Assemble and disassemble teams/task forces assigned to the Wildlife Branch.
- Report information about special activities, events, and occurrences to the OPS.
- Assist the Volunteer Coordinator in determining training needs of wildlife recovery volunteers.

TERRORISM INCIDENT

(b) (7)(F), (b) (3)

[redacted]

BRANCH DIRECTOR (Cont'd)

(b) (7)(F), (b) (3)

[redacted]

MULTI-CASUALTY

Multi-Casualty Branch Director - The Multi-Casualty Branch Director is responsible for the implementation of the IAP within the Branch. This includes the direction and execution of branch planning for the assignment of resources within the Branch.

Overall Multi-Casualty Branch Director Responsibilities:

- Review Group/Division Assignments for effectiveness of current operations and modify as needed.
- Provide input to OPS for the IAP.
- Supervise Branch Activities.

Family Assistance Branch – The Family assistance Branch provides services to the victims' family members; coordinates activities, lodging, food, spiritual and emotional needs, and transportation to special events (press conferences, memorial services to the scene of the incident when authorized, etc.), and any special needs that arise during the incident that may assist the victims' family members.

NOTE: The National Transportation Safety Board (NTSB) provides this assistance for aircraft disasters.

BRANCH DIRECTOR (Cont'd)

Overall Family Assistance Branch Responsibilities:

- Coordinate with local and state authorities, to include the medical examiner, local law enforcement, emergency management, hospitals, and other emergency support personnel.
- Conduct daily coordination meetings with the local and Federal government representatives to review daily activities, resolve problem areas, and synchronize future family support operations and activities.
- Coordinate and provide briefings to families at the site and those who decide not to be at the site.

Overall Family Assistance Branch Responsibilities:

- Ensure adequate number of Family Assistance Team members present at all times to allow for rest, exercise and proper rotation.
- Establish and maintain working relationship with the CERT and CISM teams to cross-reference needs of the victims' families.
- Attend all staff briefings and planning meetings as required.
- Request necessary equipment and supplies through LSC.
- Ensure adequate lodging and/or sleeping arrangements.
- Ensure that security needs for the victims' family members are addressed.
- Ensure that all communications are centrally coordinated.
- Ensure that all transportation scheduling is centrally coordinated.
- The following agencies provide similar assistance during emergencies and may be of assistance:
  - American Red Cross (ARC)
  - Department of Health and Human Services (DHHS)
  - Federal Emergency Management Agency (FEMA)
  - NTSB
- Maintain Unit/Activity Log (ICS Form 214).

DIVISION/GROUP SUPERVISOR

The Division/Group Supervisor reports to the OPS (or Branch Director when activated). The Supervisor is responsible for the implementation of the assigned portion of the IAP, assignment of resources within the Division/Group, and reporting on the progress of control operations and status of resources within the Division/Group.

Overall Division/Group Supervisor Responsibilities:

- Implement IAP for Division/Group.
- Provide the IAP to Strike Team Leaders, when available.
- Identify increments assigned to the Division/Group.
- Review Division/Group assignments and incident activities with subordinates and assign tasks.
- Ensure that the IC and/or Resources Unit is advised of all changes in the status of resources assigned to the Division/Group.
- Coordinate activities with adjacent Division/Group.
- Determine need for assistance on assigned tasks.
- Submit situation and resources status information to the Branch Director or the OPS.
- Report hazardous situations, special occurrences, or significant events (e.g., accidents, sickness, discovery of unanticipated sensitive resources) to the immediate supervisor.
- Ensure that assigned personnel and equipment get to and from assignments in a timely and orderly manner.
- Resolve logistics problems within the Division/Group.
- Participate in the development of Branch plans for the next operational period.

OIL SPILL

Protection Group Supervisor - Group Supervisor is responsible for the deployment of containment, diversion, and adsorbent/absorbent materials in designated locations. Depending on the size of the incident, the Protection Group may be further divided into Teams, Task Forces and Single Resources.

Overall Protection Group Supervisor Responsibilities:

- Implement Protection Strategies in the IAP
- Direct, coordinate, and assess the effectiveness of protective actions.
- Modify protective actions, as needed.

On-water Recovery Group Supervisor - The On Water Recovery Group Supervisor is responsible for managing on water recovery operations in compliance with the IAP. The Group may be further divided into Teams, Task Forces and Single Resources.

Overall On-water Recovery Group Supervisor Responsibilities:

- Implement Recovery Strategies in the IAP.
- Direct, coordinate, and assess the effectiveness of on water recovery actions.
- Modify recovery actions as needed.

DIVISION/GROUP SUPERVISOR (Cont'd)

OIL SPILL (Cont'd)

Dispersant Operations Group Supervisor - The Dispersants Operations Group Supervisor is responsible for coordinating all aspects of a dispersant operation. For aerial applications, the Group works closely with the Air Tactical Group Supervisor.

Overall Dispersant Operations Group Supervisor Responsibilities:

- Determine resource needs.
- Assist the Planning Section in the development of dispersant operations and monitoring plans.
- Implement approved dispersant operations and monitoring plans.
- Manage dedicated dispersant resources and coordinate required monitoring.
- Coordinate required monitoring.

In-situ Burn Operations Group Supervisor - The In-Situ Burn Operations Group Supervisor is responsible for coordinating all aspects of an in-situ burn operation. For aerial ignition, the Group works closely with the Air Tactical Group Supervisor.

Overall In-situ Burn Operations Group Supervisors Responsibilities:

- Determine resource needs.
- Assist the Planning Section in the development of in-situ burn operations and monitoring plans.
- Implement approved in-situ burn operations and monitoring plans.

- Manage dedicated in-situ burning resources.
- Coordinate required monitoring.

Shoreside Recovery Group Supervisor - The Shoreside Recovery Group Supervisor is responsible for managing shoreside cleanup operations in compliance with the IAP. The Group may be further divided into Strike Teams, Task Forces, and Single Resources.

Overall Shoreside Recovery Group Supervisor Responsibilities:

- Implement Recovery Strategies in the IAP.
- Direct, coordinate, and assess effectiveness of shoreside recovery actions.
- Modify protective actions, as needed.

DIVISION/GROUP SUPERVISOR (Cont'd)

OIL SPILL (Cont'd)

Disposal Group Supervisor - The Disposal Group Supervisor is responsible for coordinating the on-site activities of personnel engaged in collecting, storing, transporting, and disposing of waste materials. Depending on the size and location of the spill, the Disposal Group may be further divided into Teams, Task Forces, and Single Resources.

Overall Disposal Group Supervisor Responsibilities:

- Implement the Disposal Portion of the IAP.
- Ensure compliance with all hazardous waste laws and regulations.
- Maintain accurate records of recovered material.

Decontamination Group Supervisor – The Decontamination Group Supervisor is responsible for decontamination of personnel and response equipment in compliance with approved statutes.

Overall Decontamination Group Supervisor Responsibilities:

- Implement Decontamination Plan.
- Determine resource needs.
- Direct and coordinate decontamination activities.
- Brief Site SO on conditions.

Salvage/Source Control Group Supervisor - Under the direction of the Emergency Response Branch Director, the Salvage/Source Control Group Supervisor is responsible for coordinating and directing all salvage/source control activities related to the incident.

Overall Salvage/Source Control Group Supervisor Responsibilities:

- Coordinate the development of Salvage/Source Control Plan.
- Determine Salvage/Source Control resource needs.
- Direct and coordinate implementation of the Salvage/Source Control Plan.
- Manage dedicated salvage/Source Control resources.

Wildlife Recovery Group Supervisor – The Wildlife Recovery Group Supervisor is responsible for coordinating the search for collection and field tagging of dead and live impacted wildlife and transporting them to the processing center(s). This group should coordinate with the Planning Situation Unit in conducting aerial and group surveys of wildlife population in the vicinity of the spill. They should also deploy acoustic and visual wildlife hazing equipment, as needed.

Overall Wildlife Recovery Group Supervisor Responsibilities:

- Determine resource needs.
- Establish and implement protocols for collection and logging of impacted wildlife.
- Coordinate transportation of wildlife to processing stations(s).

DIVISION/GROUP SUPERVISOR (Cont'd)

HAZARDOUS SUBSTANCE RELEASE

Decontamination Group Supervisor – The Decontamination Group Supervisor is responsible for the operations of the decontamination element and for providing decontamination, as required by the ICP.

Overall Decontamination Group Supervisor Responsibilities:

- Establish the Contamination Reduction Corridor(s).
- Identify contaminated people and equipment.
- Supervise the operations of the decontamination element in the process of decontaminating people and equipment.
- Maintain control of movement of people and equipment within the Contamination Reduction Zone.
- Maintain communications and coordinate operations with the Entry Leader.
- Maintain communications and coordinate operations with the Site Access Control Leader and the Safe Refuge Area Manager (if activated).
- Coordinate the transfer of contaminated patients requiring medical attention (after decontamination) to the Medical Group.
- Coordinate handling, storage, and transfer of contaminants within the Contamination Reduction Zone.

DIVISION/GROUP SUPERVISOR (Cont'd)

HAZARDOUS SUBSTANCE RELEASE (Cont'd)

Sampling Group Supervisor - The Sampling Group is assigned to the Operations Section because of the immediate communication and coordination they must have with the other field groups. The Field Sampling Group will normally include an Air Monitoring Team, Water Sampling Team, and a Soil Sampling Team. They will normally be responsible for perimeter monitoring and sampling, and will either coordinate sampling within the hot zone and warm zones with the Entry Group, or if properly trained and outfitted with PPE, they may take samples within the hot/warm zones themselves.

Overall Sampling Group Supervisor Responsibilities:

- Conducting all sampling required for immediate operation activity and communicating sampling data, such as results of routine air monitoring to on-site operational and safety personnel.
- Conducting air, water, and soil sampling as directed by the regulatory agencies and other interested parties through the Sampling Protocol Team.
- Ensuring that all samples are obtained following appropriate sample protocol and other special instructions they may obtain.
- Ensuring that all samples taken are properly documented and following the chain of custody procedures.
- Ensuring that the samples are properly transferred to the Sample Documentation and Tracking Teams for proper documentation, analysis, and final dissemination.

Technical Specialist Group Supervisor - There are a number of specialist positions that will be required for hazardous substance response operations. Because of their field locations and requirement for close coordination with the Operations Section Field Personnel, they are assigned to the Technical Group. The Technical Specialist Group Supervisor is responsible for coordinating the activities of these various specialists and ensuring that their services and information are made available to the appropriate field and command post activities.

Overall Technical Specialist Group Supervisor Responsibilities:

- Will oversee the activities of the following identified specialists.
  - Hazardous Substance/Materials Reference
  - Toxicologist
  - Industrial Hygienist
  - Chemical Engineer
  - Product Specialist
  - Marine Chemist

DIVISION/GROUP SUPERVISOR (Cont'd)

TERRORISM INCIDENT

(b) (7)(F), (b) (3)

[redacted]

DIVISION/GROUP SUPERVISOR (Cont'd)

(b) (7)(F), (b) (3)

[redacted]

MULTI-CASUALTY

Medical Group/Division Supervisor – The Medical Group/Division Supervisor supervises the Triage Team Leader, Treatment Team Leader and Medical Supply Coordinator. The Medical Group/Division Supervisor establishes command and controls the activities within a Medical Group/Division, in order to assure the best possible emergency medical care to patients during a multi-casualty incident.

Overall Medical Group/Division Supervisor Responsibilities:

- Participate in Multi-Casualty Branch/Operations Section Planning Activities.
- Establish Medical Group/Division with assigned personnel. Request additional personnel and resources sufficient to handle the magnitude of the incident.
- Designate Treatment Team Leaders and treatment area locations as appropriate.
- Isolate Morgue and Minor Treatment Area from Immediate and Delayed Treatment Areas.
- Request law enforcement/coroner involvement as needed.
- Determine amount and types of additional medical resources and supplies needed to handle the magnitude of the incident (medical caches, backboards, litters, cots).
- Establish communications and coordination with the Patient Transportation Group Supervisor.
- Ensure activation of hospital alert system, local EMS/health agencies.
- Direct and/or supervise on-scene personnel from agencies such as Coroner's Office, Red Cross, law enforcement, ambulance companies, county health agencies, and hospital volunteers.
- Ensure proper security, traffic control, and access for the Medical Group/Division area.
- Direct medically trained personnel to the appropriate team leader.

DIVISION/GROUP SUPERVISOR (Cont'd)

MULTI-CASUALTY (Cont'd)

Patient Transportation Group Supervisor - The Patient Transportation Group Supervisor supervises the Medical Communications Coordinator and the Air and Ground Ambulance Coordinators. The Patient Transportation Group Supervisor is responsible for the coordination of patient transportation and maintenance of records relating to patient identification, injuries, mode of off-incident transportation and destination.

Overall Patient Transportation Group Supervisor Responsibilities:

- Establish communications with hospital(s).
- Designate ambulance staging area(s).
- Direct the transportation of patients as determined by Treatment Team Leaders.
- Assure that patient information and destination is recorded.
- Establish communications with Ambulance Coordinator(s).
- Request additional ambulances, as required.
- Notify Ambulance Coordinator(s) of ambulance requests.
- Coordinate requests for air ambulance transportation through the Air Operations Director.
- Establish Air Ambulance Helispot with the Multi- Casualty Branch Director and Air Operation Director.

PLANNING

Planning Section Chief 4-38

Resources Unit Leader 4-38

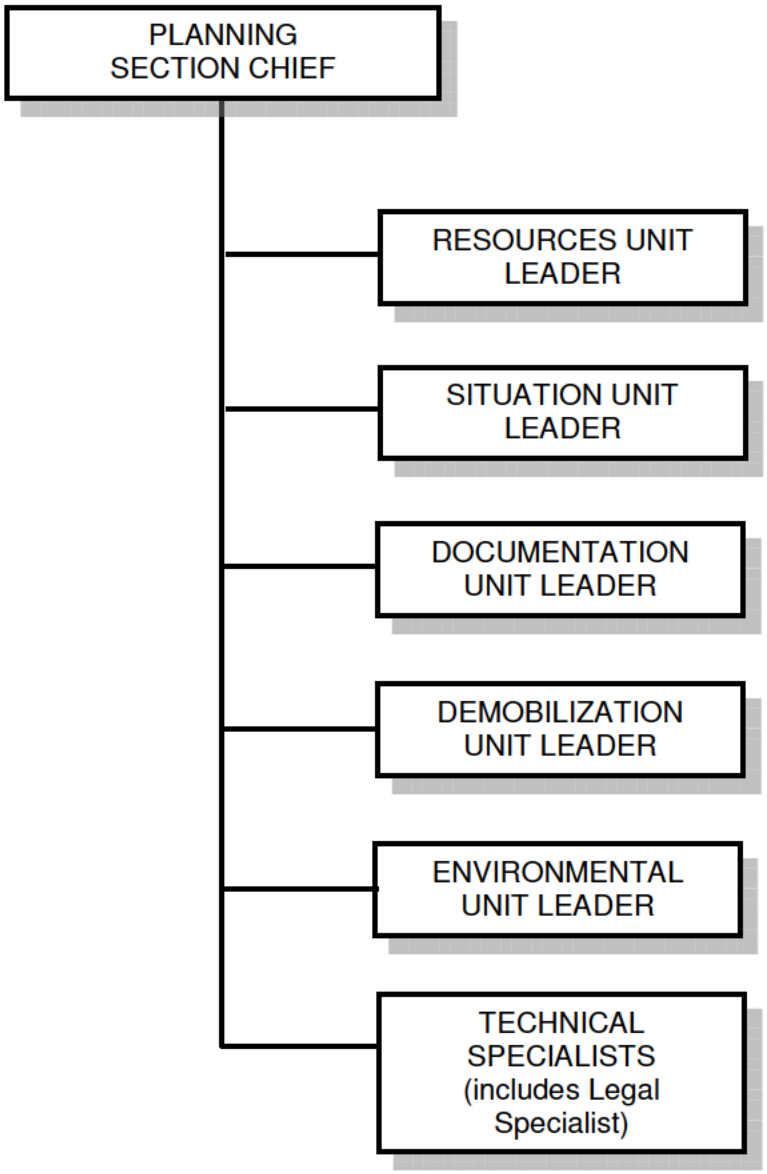
Situation Unit Leader 4-39

Documentation Unit Leader 4-40

Demobilization Unit Leader 4-41

Environmental Unit Leader 4-42

Technical Specialists 4-42



PLANNING SECTION CHIEF

The Planning Section Chief (PSC) is responsible for the collection, evaluation, dissemination and use of information; particularly with regard to the development of the incident and the status resources. This information is needed to: 1) understand the current situation, 2) predict the probable course of incident events; and 3) prepare alternative strategies for the incident.

Overall PSC Responsibilities:

- Collect and process situation information about the incident.
- Supervise preparation of the IAP.
- Provide input to the IC and the OPS in preparing the IAP.
- Chair planning meetings and participate in other meetings as required.
- Reassign out-of-service personnel already on-site to ICS organizational positions as appropriate.
- Establish information requirements and reporting schedules for Planning Section Units (e.g., Resources, Situation Units).
- Determine the need for any specialized resources in support of the incident.
- If requested, assemble and disassemble Strike Teams and Task Forces not assigned to Operations.
- Establish special information collection activities as necessary (e.g., weather, environmental, toxics, etc.).
- Assemble information on alternative strategies.
- Provide periodic predictions on incident potential.
- Report any significant changes in incident status.
- Compile and display incident status information.
- Oversee preparation and implementation of the Incident Demobilization Plan.
- Incorporate plans (e.g., Traffic, Medical, Communications, Site Safety) into the IAP.

RESOURCES UNIT LEADER

The Resource Unit Leader (RUL) works within the Planning Section and is responsible for maintaining the status of all assigned resources (primary and support) at an incident. This is achieved by overseeing the check in/out of all resources, maintaining a status-keeping system indicating current location and status of all resources, and maintenance of a master list of all resources (e.g. key supervisory personnel, primary and support resources, etc.).

Overall RUL Responsibilities:

- Establish the check-in function at incident locations.
  The Staging Area Manager may already be tracking this on ICS Form 211-p and 211-e. However, the RUL should verify that tracking is being conducted and is accurate. Additionally, the RUL should determine how to gather this resource information from Staging Areas.
- Prepare Organization Assignment List (ICS Form 203) and Organization Chart (ICS Form 207).
- Prepare appropriate parts of Division Assignment Lists (ICS Form 204).
- Prepare and maintain the ICP display (to include organization chart and resource allocation and deployment).

RESOURCES UNIT LEADER (Cont'd)

Overall RUL Responsibilities (Cont'd):

- Maintain and post the current status and location of all resources.
  The RUL is responsible for developing a system to best track the resource status. Ensure information is relayed to the Situation Unit Leader in order to update incident status information on the display board (ICS Form 209)
- Maintain master roster of all resources checked in at the incident.
- Assign an additional person to fill the "Check-in/status Recorder" position to assist with the accounting of all resources assigned to the incident.
  If a Check-in/status Recorder is not assigned, the RUL is responsible for all functions.

SITUATION UNIT LEADER

The Situation Unit Leader (SUL) works within the Planning Section and is responsible for collecting, processing and organizing all incident information. The SUL may prepare future projections of incident growth and maps.

Overall SUL Responsibilities:

- Begin collection and analysis of incident data as soon as possible.
- Prepare, post, or disseminate resource and situation status information as required, including special requests.
  Establish location for situation status boards and displays. This is where maps, charts, and other incident information will be posted for responders to view.
- Prepare periodic predictions or as requested by the PSC.
- Prepare the Incident Status Summary Form (ICS Form 209).
  Acquire the information from various Command and General ICS Staff.
- Provide photographic services and maps if required.

The SUL may have a Display Processor and Field Observer reporting to him/her. However, if not assigned, the SUL will be responsible for their functions

Display Processor - The Display Processor is responsible for the display of incident status information obtained from Field Observers, resource status reports, aerial and other photographs, and infrared data.

Overall Display Processor Responsibilities:

- Determine:
  - Location of work assignment
  - Numbers, types and locations of displays required
  - Priorities
  - Map requirements for the IAP
  - Time limits for completion
  - Field Observer assignments and communications means
- Obtain necessary equipment and supplies.
- Obtain a copy of the IAP for each operational period.
- Assist SUL in analyzing and evaluating field reports.
- Develop required displays in accordance with time limits for completion.

SITUATION UNIT LEADER (Cont'd)

Field Observer - The Display Processor is responsible for the display of incident status information obtained from Field Observers, resource status reports, aerial and other photographs, and infrared data.

Overall Field Observer Responsibilities:

- Determine:
  - Location of assignment
  - Type of information required
  - Priorities
  - Time limits for completion
  - Method of communication.
  - Method of transportation.
- Obtain a copy of the IAP for the Operational Period.
- Obtain necessary equipment and supplies.
- Perform Field Observer responsibilities to include but not limited to the following:
  - Perimeters of incident
  - Locations of hot spots
  - Unburned islands
  - Rates of spread
  - Weather conditions
  - Hazards including escape routes and safe areas
  - Progress of operations resources
- Be prepared to identify all facility locations (e.g., Helispots, Division and Branch boundaries).
- Report information to the SUL by established procedure.
- Report immediately any condition observed that may cause danger and a safety hazard to personnel.
- Gather intelligence that will lead to accurate predictions.

DOCUMENTATION UNIT LEADER

The Documentation Unit Leader (DUL) works within the Planning Section and is responsible for the maintenance of accurate, up-to-date incident files. The DUL should ensure that each section is maintaining and providing appropriate documents. The DUL will provide duplication and copying services for all other sections. The DUL will store incident files for legal, analytical and historical purposes.

Overall DUL Responsibilities

- Set up work area; begin organization of incident files.
- Establish duplication service; respond to requests.
- File all official forms and reports.
- Review records for accuracy and completeness; inform appropriate units of errors or omissions.
  Ensure ICS forms and documentation are dated and signed, as necessary.
- Provide incident documentation as requested.
- Store files for post-incident use.

DEMOBILIZATION UNIT LEADER

The Demobilization Unit Leader works with the Planning Section and is responsible for developing the Incident Demobilization Plan. This position will be activated in order to ensure that resources are effectively demobilized when they are no longer required.

Overall Demobilization Unit Leader Responsibilities:

- Participate in planning meetings as required.
- Review incident resource records to determine the likely size and extent of demobilization effort.
- Based on the above analysis, add additional personnel, workspace, and supplies as needed.
- Coordinate demobilization with Agency Representatives.
- Monitor the on-going Operations Section resource needs.
- Identify surplus resources and probable release time.
- Develop incident check-out function for all units.
- Evaluate logistics and transportation capabilities to support demobilization.
  Ensure that there is sufficient transportation to effectively demobilize resources.
- Establish communications with off-incident facilities, as necessary.
  Off-incident facilities can include locations where resources will be returned to and off-site locations that are assisting the response (i.e. laboratories, oiled wildlife care facilities, etc.). These facilities will eventually be demobilized as well.
- Develop an Incident Demobilization Plan detailing specific responsibilities and release priorities and procedures.
- Prepare appropriate directories (e.g., maps, instructions, etc.) for inclusion in the demobilization plan.
- Distribute demobilization plan (on and off-site).
- Provide status reports to appropriate requestors.
- Ensure that all Sections/Units understand their specific demobilization responsibilities.
- Supervise execution of the Incident Demobilization Plan.
- Brief the PSC on demobilization progress.

ENVIRONMENTAL UNIT LEADER

The Environmental Unit Leader (EUL) works with the Planning Section and is responsible for environmental matters associated with the response, including strategic assessment, modeling, surveillance, and environmental monitoring and permitting . The EUL prepares environmental data for the situation unit.

Overall Environmental Unit Leader Responsibilities:

- Obtain a briefing and special instructions from the PSC.
- Participate in Planning Section meetings.
- Identify sensitive areas and recommend response priorities.
  Utilize ICS Form 232.
- Following consultation with natural resource trustees, provide input on wildlife protection strategies (e.g., removing oiled carcasses, pre-emptive capture, hazing, and/or capture and treatment).
- Determine the extent, fate and effects of contamination.
- Acquire, distribute and provide analysis of weather forecasts.
- Monitor the environmental consequences of cleanup actions.
- Develop shoreline cleanup and assessment plans. Identify the need for, and prepare any special advisories or orders.
- Identify the need for, and obtain, permits, consultations, and other authorizations including Endangered Species Act (ESA) provisions.
- Following consultation with the FOSC's Historical/Cultural Resources Technical Specialist identify and develop plans for protection of affected historical/cultural resources.
- Evaluate the opportunities to use various response technologies.
- Develop disposal plans.
- Develop a plan for collecting, transporting, and analyzing samples.

TECHNICAL SPECIALISTS

Certain incidents or events may require the use of Technical Specialists who have specialized knowledge and expertise. Technical Specialists may function within the Planning Section, or be assigned wherever their services are required.

An example of a Technical Specialist is:

LEGAL SPECIALIST:

The Legal Specialist will act in an advisory capacity within the Planning Section.

Overall Legal Specialist Responsibilities:

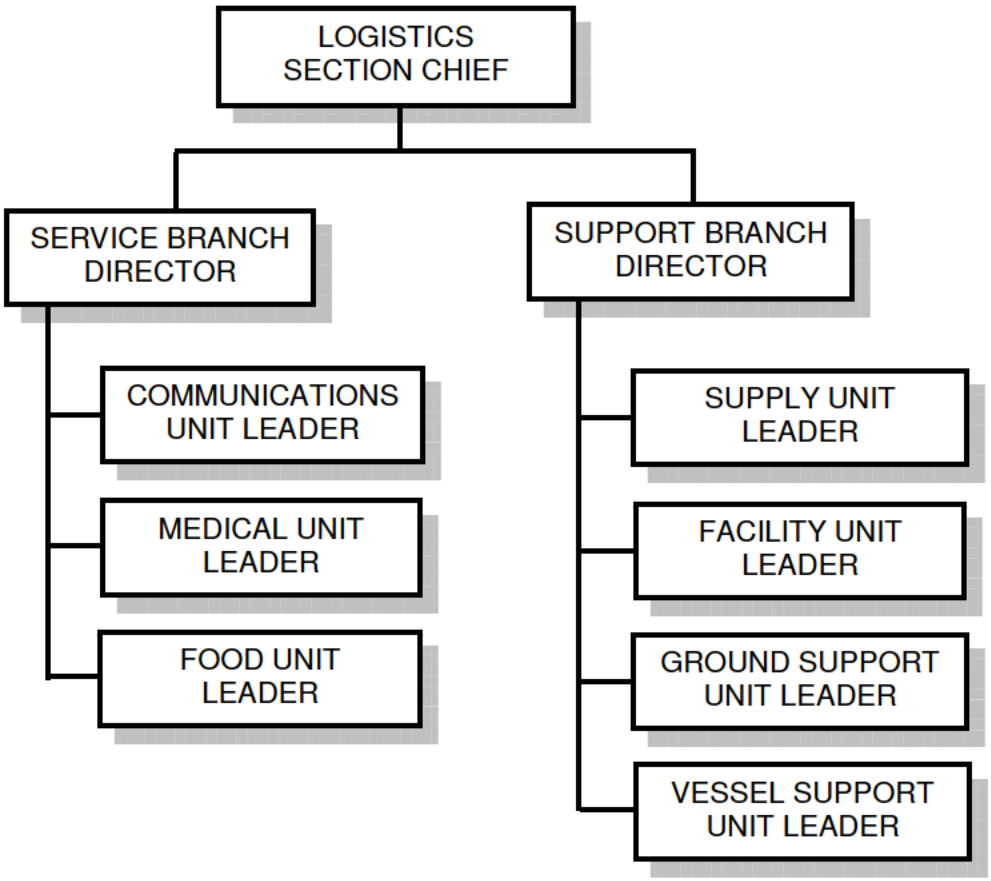
- Participate in planning meetings, if requested.
- Advise on legal issues relating to in-situ burning, use of dispersants, and other alternative response technologies.
- Advise on legal issues relating to differences between Natural Resource Damage Assessment Restoration (NRDAR) and response activities.
- Advise on legal issues relating to investigations.
- Advise on legal issues relating to finance and claims.
- Advise on legal issues relating to response.
- Utilize ICS Form 214.

LOGISTICS

Logistics Section Chief 4-44

Service Branch Director 4-44
- Communications Unit Leader 4-45
- Medical Unit Leader 4-45
- Food Unit Leader 4-46
- Hospital Coordination Unit 4-46

Support Branch Director 4-47
- Supply Unit Leader 4-47
- Facilities Unit Leader 4-47
- Ground Support Unit Leader 4-48
- Vessel Support Unit Leader 4-49



LOGISTICS SECTION CHIEF

The Logistics Section Chief (LSC) is responsible for providing facilities, services, and material in support of the incident. The LSC participates in the development and implementation of the Incident Action Plan (IAP). The LSC activates and supervises the Branches and Units within the Logistics Section.

Resources are divided into Support and Services. Support resources are used in support of the IAP (i.e. boom, vacuum trucks, skimmers etc.). Service resources include food/water, communication and medical resources.

Overall LSC Responsibilities:

- Plan the organization of the Logistics Section.
- Assign work locations and preliminary work tasks to Section personnel.
- Notify the Resources Unit of the Logistics Section units activated including names and locations of assigned personnel.
- Assemble and brief Branch Directors and Unit Leaders.
- Participate in preparation of the IAP.
- Identify service and support requirements for planned and expected operations.
- Provide input to and review the Communications Plan (ICS Form 205), Medical Plan (ICS Form 206) and Traffic Plan.
- Coordinate and process requests for additional resources.
- Review the IAP and estimate Section needs for the next operational period.
- Advise on current service and support capabilities.
- Prepare service and support elements of the IAP.
- Estimate future service and support requirements.
- Receive Incident Demobilization Plan from Planning Section.
- Recommend release of Unit resources in conformity with Incident Demobilization Plan.
- Ensure the general welfare and safety of Logistics Section personnel.

SERVICE BRANCH DIRECTOR

The Service Branch Director, when activated, is under the supervision of the LSC, and is responsible for the management of all service activities at the incident. The Branch Director supervises the operations of the Communications, Medical and Food Units.

Overall Service Branch Director Responsibilities:

- Determine the level of service required to support operations.
- Confirm dispatch of Branch personnel.
- Participate in planning meetings of Logistics Section personnel.
- Review the IAP.
- Organize and prepare assignments for Service Branch personnel.
- Coordinate activities of Branch Units.
- Inform the LSC of Branch activities.
- Resolve Service Branch problems.

SERVICE BRANCH DIRECTOR (Cont'd)

Communications Unit Leader – The Communications Unit Leader is responsible for developing plans for the effective use of incident communications equipment and facilities; installing and testing of communications equipment; supervision of the Incident Communications Center; distribution of communications equipment to incident personnel; and the maintenance and repair of communications equipment.

Overall Communications Unit Leader Responsibilities:

- Prepare and implement the Incident Radio Communications Plan (ICS Form 205).
- Ensure the Incident Communications Center and the Message Center is established.
- Establish appropriate communications distribution/maintenance locations within the Base/Camp(s).
- Ensure communications systems are installed and tested.
- Ensure an equipment accountability system is established.
- Ensure personal portable radio equipment from cache is distributed per Incident Radio Communications Plan.
- Provide technical information as required on:
  - Adequacy of communications systems currently in operation.
  - Geographic limitation on communications systems.
  - Equipment capabilities/limitations.
  - Amount and types of equipment available.
  - Anticipated problems in the use of communications equipment.
- Supervise Communications Unit activities.
- Maintain records on all communications equipment as appropriate.
- Ensure equipment is tested and repaired.
- Recover equipment from Units being demobilized.

Medical Unit Leader - The Medical Unit Leader, under the direction of the Service Branch Director or Logistics Section Chief, is primarily responsible for the development of the Medical Plan, obtaining medical aid and transportation for injured and ill incident personnel, and preparation of reports and records.

Overall Medical Unit Leader Responsibilities:

- Participate in Logistics Section/Service Branch planning activities.
- Prepare the Medical Plan (ICS Form 206).
- Prepare procedures for major medical emergency.
- Declare major emergency as appropriate.
- Respond to requests for medical aid, medical transportation, and medical supplies.
- Prepare and submit necessary documentation.

SERVICE BRANCH DIRECTOR (Cont'd)

Food Unit Leader - The Food Unit Leader is responsible for supplying the food needs for the entire incident, including all remote locations (e.g., Camps, Staging Areas), as well as providing food for personnel unable to leave tactical field assignments.

Overall Food Unit Leader Responsibilities:

- Determine food and water requirements.
- Determine the method of feeding to best fit each facility or situation.
- Obtain necessary equipment and supplies and establish cooking facilities.
- Ensure that well-balanced menus are provided.
- Order sufficient food and potable water from the Supply Unit.
- Maintain an inventory of food and water.
- Maintain food service areas, ensuring that all appropriate health and safety measures are being followed.
- Supervise caterers, cooks, and other Food Unit personnel as appropriate.

TERRORISM INCIDENT

(b) (7)(F), (b) (3)

[redacted]

SUPPORT BRANCH DIRECTOR

The Support Branch Director, when activated, is under the direction of the LSC, and is responsible for the development and implementation of logistics plans in support of the Incident Action Plan. The Support Branch Director supervises the operations of the Supply, Facilities and Ground Support Units.

Overall Support Branch Director Responsibilities:

- Obtain work materials.
- Identify Support Branch personnel dispatched to the incident.
- Determine initial support operations in coordination with the LSC and Service Branch Director.
- Prepare initial organization and assignments for support operations.
- Assemble and brief Support Branch personnel.
- Determine if assigned Branch resources are sufficient.
- Maintain surveillance of assigned units work progress and inform the LSC of their activities.
- Resolve problems associated with requests from the Operations Section.

Supply Unit Leader - The Supply Unit Leader is primarily responsible for ordering personnel, equipment and supplies; receiving and storing all supplies for the incident; maintaining an inventory of supplies; and servicing non-expendable supplies and equipment.

Overall Supply Unit Leader Responsibilities:

- Participate in Logistics Section/Support Branch planning activities.
- Determine the type and amount of supplies en route.
- Review the IAP for information on operations of the Supply Unit.
- Develop and implement safety and security requirements.
- Order, receive, distribute, and store supplies and equipment.
- Receive and respond to requests for personnel, supplies, and equipment.
- Maintain an inventory of supplies and equipment.
- Service reusable equipment.
- Submit reports to the Support Branch Director.

Facilities Unit Leader - The Facilities Unit Leader is primarily responsible for the layout and activation of incident facilities, (e.g., Base, Camp(s), and ICP). The Facilities Unit Leader provides sleeping and sanitation facilities for incident personnel and manages Base and Camp(s) operations. Each facility (Base, Camp) is assigned a manager who reports to the Facilities Unit Leader and is responsible for managing the operation of the facility. The basic functions or activities of the Base and Camp Managers are to provide security service and general maintenance. The Facility Unit Leader reports to the Support Branch Director.

SUPPORT BRANCH DIRECTOR (Cont'd)

Overall Facilities Unit Leader Responsibilities:

- Obtain a briefing from the Support Branch Director or the LSC.
- Receive and review a copy of the IAP.
- Participate in Logistics Section/Support Branch planning activities.
- Determine requirements for each facility, including the ICP.
- Prepare layouts of incident facilities.
- Notify Unit Leaders of facility layout.
- Activate incident facilities.
- Provide Base and Camp Managers and personnel to operate facilities.
- Provide sleeping facilities.
- Provide security services.
- Provide facility maintenance services (e.g., sanitation, lighting, clean up).
- Demobilize Base and Camp facilities.
- Maintain facility records

Ground Support Unit Leader - The Ground Support Unit Leader is primarily responsible for: 1) support out-of-service resources; 2) transportation of personnel, supplies, food, and equipment 3) fueling, service, maintenance, and repair of vehicles and other ground support equipment; and 4) implementing the Traffic Plan for the incident.

Overall Ground Support Unit Leader Responsibilities:

- Participate in Support Branch/Logistics Section planning activities.
- Develop and implement the Traffic Plan.
- Support out-of-service resources.
- Notify the Resources Unit of all status changes on support and transportation vehicles.
- Arrange for and activate fueling, maintenance, and repair of ground resources.
- Maintain Support Vehicle Inventory and transportation vehicles (ICS Form 218).
- Provide transportation services, IAW requests from the LSC or Support Branch Director.
- Collect information on rented equipment.
- Requisition maintenance and repair supplies (e.g., fuel, spare parts).
- Maintain incident roads.
- Submit reports to Support Branch Director as directed.

SUPPORT BRANCH DIRECTOR (Cont'd)

Vessel Support Unit Leader - The Vessel Support Unit Leader is responsible for implementing the Vessel Routing Plan for the incident and coordinating transportation on the water and between shore resources. Since most vessels will be supported by their own infrastructure, the Vessel Support Unit may be requested to arrange fueling, dockage, maintenance, and repair of vessels on a case-by-case basis.

Overall Vessel Support Unit Leader Responsibilities:

- Obtain a briefing from the Support Branch Director or the LSC.
- Participate in Support Branch/Logistics Section planning activities.
- Coordinate development of the Vessel Routing Plan.
- Coordinate vessel transportation assignments with the Protection and Recovery Branch or other sources of vessel transportation.
- Coordinate water-to-land transportation with the Ground Support Unit, as necessary.
- Maintain a prioritized list of transportation requirements that need to be scheduled with the transportation source.
- Support out-of-service vessel resources, as requested.
- Arrange for fueling, dockage, maintenance and repair of vessel resources, as requested.
- Maintain inventory of support and transportation vessels.

FINANCE/ADMINISTRATION

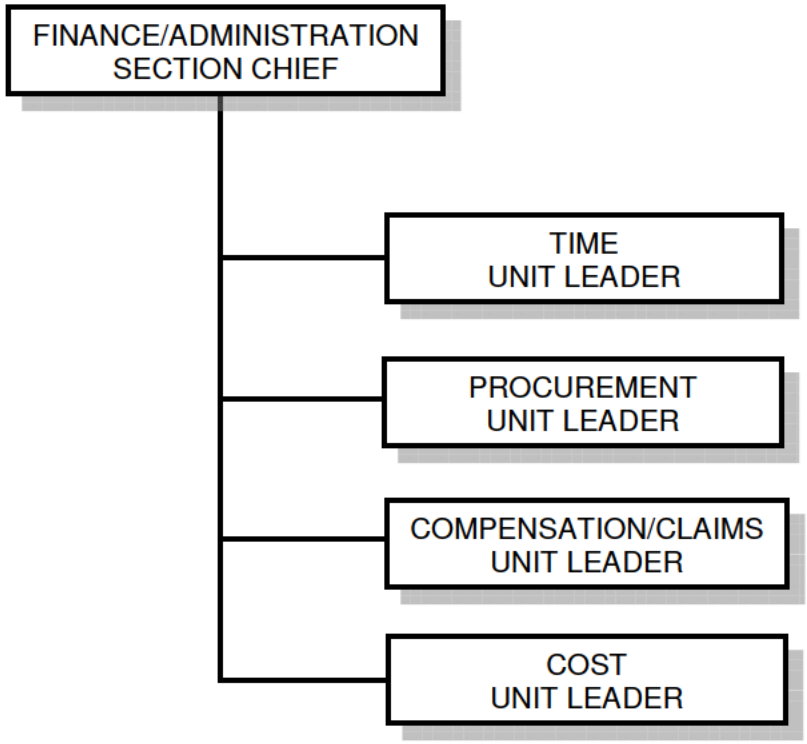
Finance/Administration Section Chief 4-51

Time Unit Leader 4-52

Procurement Unit Leader 4-52

Compensation/Claims Unit Leader 4-53

Cost Unit Leader 4-53



FINANCE/ADMINISTRATION SECTION CHIEF

The Finance/Administration Section Chief (FASC) is responsible for all financial, administrative, and cost analysis aspects of the incident and for supervising members of the Finance/Administration Section. Depending on the incident, the FASC position may or may not be assigned. Agencies within the Unified Command may require and staff the FASC position. In either case, it is always beneficial to establish a system to oversee financial aspects of an incident.

Overall FASC Responsibilities:

- Attend planning meetings as required.
- Manage all financial aspects of an incident.
- Provide financial and cost analysis information as requested.
- Gather pertinent information from briefings with responsible agencies.
- Develop an operating plan for the Finance/Administration Section; fill supply and support needs.
- Determine the need to set up and operate an incident commissary.
- Meet with Assisting and Cooperating Agency Representatives, as needed.
- Maintain daily contact with agency(s) administrative headquarters on Finance/Administration matters.
- Ensure that all personnel time records are accurately completed and transmitted, according to policy.
- Provide financial input to demobilization planning.
- Ensure that all obligation documents initiated at the incident are properly prepared and completed.
- Brief administrative personnel on all incident-related financial issues needing attention or follow-up prior to leaving incident.

Additional KM Required FASC Responsibilities:

- Ensure compensation/claims are being managed for the incident.
  If necessary or required by the agencies, establish a claims telephone number.
- Arrange on-site legal counsel.
- Work with insurance adjusters.
- Track and assess charges related to the related effort.
- Coordinating activities with other Section Chiefs
- Providing cost authorization.
- Supervising daily activities of the Finance Section.
- Analyzing contract bids, management and payroll.

The FASC may have a Time Unit Leader, Procurement Unit Leader, Compensation/Claim Unit Leader, and Cost Unit Leader reporting to him/her. However if not assigned, the FASC will be responsible for their functions.

TIME UNIT LEADER

The Time Unit Leader is responsible for equipment and personnel time recording and for managing the commissary operations.

Overall Time Unit Leader Responsibilities:

- Determine incident requirements for time recording function.
- Determine resource needs.
- Contact appropriate agency personnel/representatives.
- Ensure that daily personnel time recording documents are prepared and in compliance with policy.
- Establish time unit objectives.
- Maintain separate logs for overtime hours.
- Establish commissary operation on larger or long-term incidents as needed.
- Submit cost estimate data forms to the Cost Unit, as required.
- Maintain records security.
- Ensure that all records are current and complete prior to demobilization.
- Release time reports from assisting agency personnel to the respective Agency Representatives prior to demobilization.
- Brief the Finance/Administration Section Chief on current problems and recommendations, outstanding issues, and follow-up requirements.

PROCUREMENT UNIT LEADER

The Procurement Unit Leader is responsible for administering all financial matters pertaining to vendor contracts, leases, and fiscal agreements.

Overall Procurement Unit Leader Responsibilities:

- Review incident needs and any special procedures with Unit Leaders, as needed.
- Coordinate with local jurisdiction on plans and supply sources.
- Obtain the Incident Procurement Plan.
- Prepare and authorize contracts and land-use agreements.
- Draft memoranda of understanding as necessary.
- Establish contracts and agreements with supply vendors.
- Provide for coordination between the Ordering Manager, agency dispatch, and all other procurement organizations supporting the incident.
- Ensure that a system is in place that meets agency property management requirements. Ensure proper accounting for all new property.
- Interpret contracts and agreements; resolve disputes within delegated authority.
- Coordinate with the Compensation/Claims Unit for processing claims.
- Coordinate use of impress funds, as required.
- Complete final processing of contracts and send documents for payment.
- Coordinate cost data in contracts with the Cost Unit Leader.
- Brief the Finance/Administration Section Chief on current problems and recommendations, outstanding issues, and follow-up requirements.

COMPENSATION/CLAIMS UNIT LEADER

The Compensation/Claims Unit Leader is responsible for the overall management and direction of all administrative matters pertaining to compensation for injury and claims related activities (other than injury) for an incident.

Overall Compensation/Claims Unit Leader Responsibilities:

- Obtain a briefing from the Finance/Administration Section Chief.
- Establish contact with the incident SO and LO (or Agency Representatives if no LO is assigned).
- Determine the need for Compensation for Injury and Claims Specialists and order personnel as needed.
- Establish a Compensation for Injury work area within or as close as possible to the Medical Unit.
- Review Incident Medical Plan (ICS Form 206).
- Ensure that Compensation/Claims Specialists have adequate workspace and supplies.
- Review and coordinate procedures for handling claims with the Procurement Unit.
- Brief the Compensation/Claims Specialists on incident activity.
- Periodically review logs and forms produced by the Compensation/Claims Specialists to ensure that they are complete, entries are timely and accurate and that they are in compliance with agency requirements and policies.
- Ensure that all Compensation for Injury and Claims logs and forms are complete and routed appropriately for post-incident processing prior to demobilization.
- Keep the Finance/Administration Section Chief briefed on Unit status and activity.
- Demobilize unit in accordance with the Incident Demobilization Plan.

COST UNIT LEADER

The Cost Unit Leader is responsible for collecting all cost data, performing cost effectiveness analyses and providing cost estimates and cost saving recommendations for the incident.

Overall Cost Unit Leader Responsibilities:

- Obtain a briefing from the Finance/Administration Section Chief.
- Coordinate cost reporting procedures.
- Collect and record all cost data.
- Develop incident cost summaries.
- Prepare resources-use cost estimates for the Planning Section.
- Make cost-saving recommendations to the Finance/Administration Section Chief.
- Ensure all cost documents are accurately prepared.
- Maintain cumulative incident cost records.
- Complete all records prior to demobilization.
- Provide reports to the Finance/Administration Section Chief.

5.0 NIMS INCIDENT COMMAND SYSTEM

5.1 INTRODUCTION

Section 4.0 described the typical NIMS response structure that KMEP would follow. This Section describes the planning cycle and Incident Action Plan forms necessary for properly documenting an incident response within that structure.

Relatively few KMEP facilities have the potential to release a significant amount of product to navigable waters. Such facilities include terminals which receive or deliver to sea-going barges or vessels. Several sections of product pipelines are also located adjacent to or are in close proximity to navigable waters (definition provided in the "Glossary of Terms" at the end of this Plan.

Section 5.2 and 5.3 provide the basic guidance and framework to preparing, facilitating executing, assessing and documenting the response activities associated with the incident. Section 5.2 explains the Operational Period Planning Cycle toward assembling an Incident Action Plan (IAP). Section 5.3 assembles the necessary standard ICS forms for completion during the incident so that the incident lifespan is captured and communicated in written form.

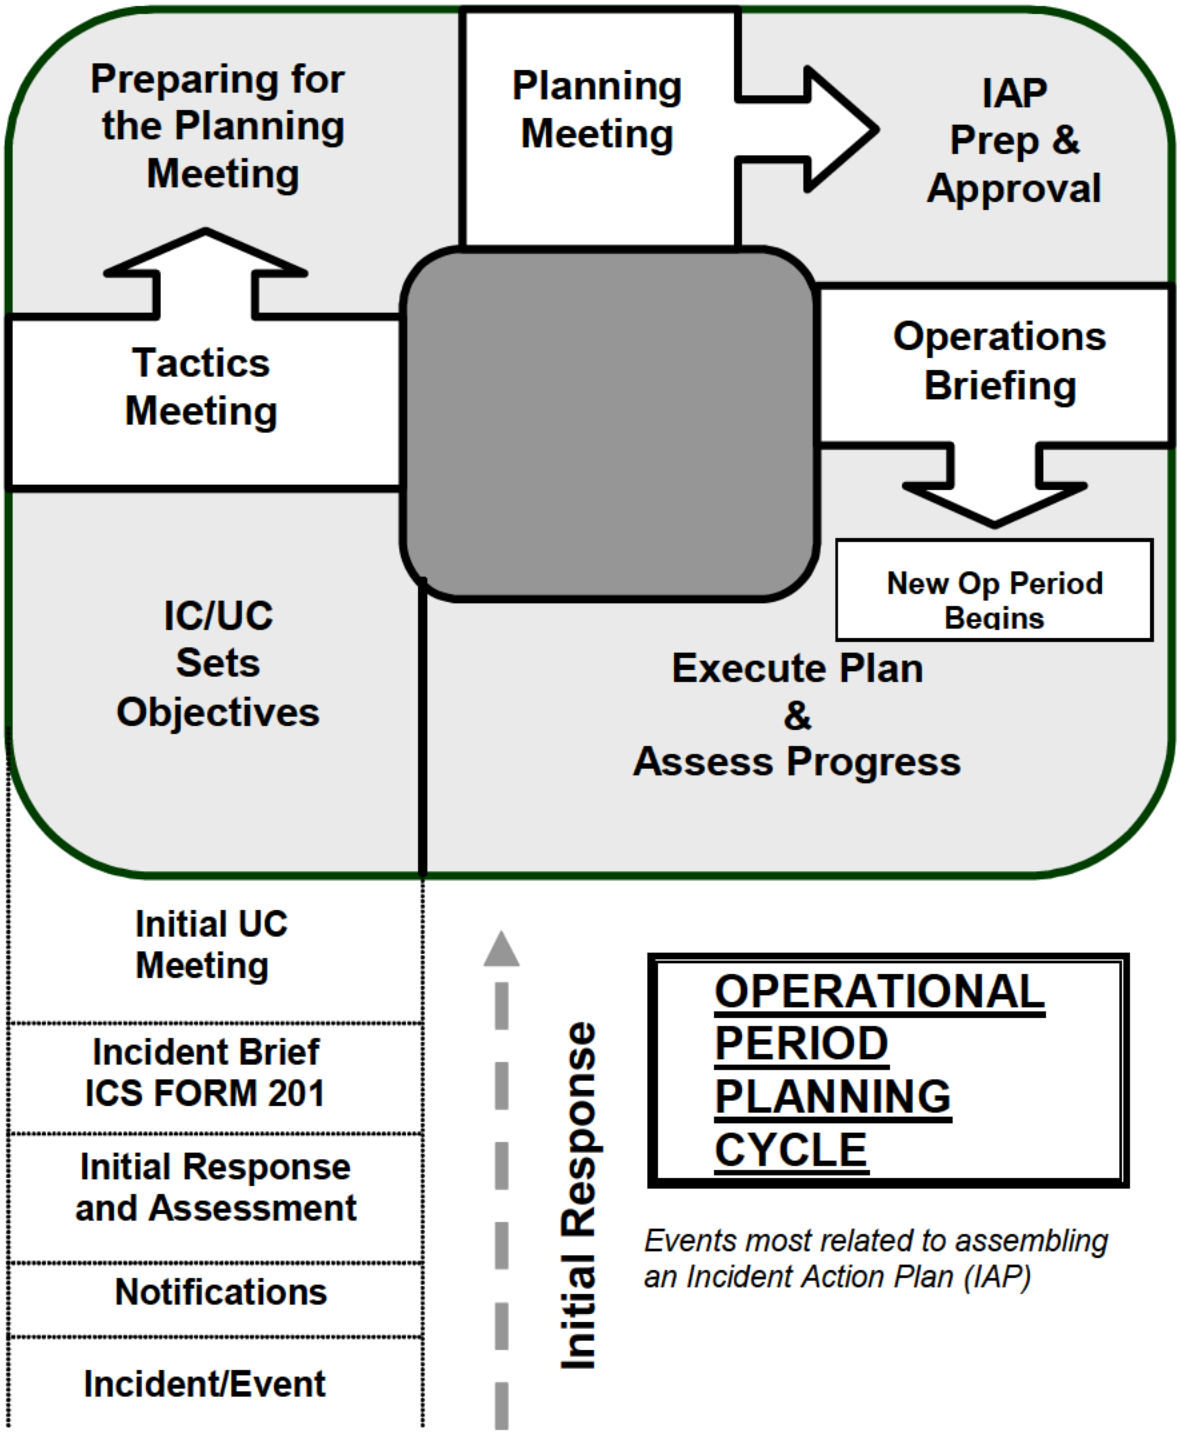
5.2 PLANNING CYCLE, MEETINGS, BRIEFINGS, AND THE PLANNING CHART

The Operational Period Planning Cycle delineates those events most related to assembling an Incident Action Plan (IAP). The explanation of the planning cycle, meetings, briefing and the planning chart provides the guidance for effective facilitation of the meeting process to establish goals and objectives, develop strategies and responses, prioritize assignments and responsibilities, assign available resources, execute plans and assess outcomes.

5.3 NIMS ICS FORMS

When responding to an incident, the accurate and complete documentation of a response activity is vital for the communication of information during the incident itself, during any transition phase of responsibilities and at the post incident assessments and follow-ups. This section provides the most common NIMS ICS Standard Forms to be used by KMEP to comply with NIMS ICS documentation guidelines during an on-water release. Regulator response agencies will expect KMEP to recognize and apply NIMS ICS forms.

PLANNING CYCLE, MEETINGS, BRIEFINGS, AND THE PLANNING CHART



INITIAL RESPONSE AND ASSESSMENT

The period of **Initial Response and Assessment** occurs in all incidents. Short-term responses, which are small in scope and/or duration (e.g., a few resources working one operational period) can often be coordinated using only ICS Form 201 (Incident Briefing Form).

INCIDENT BRIEFING (ICS Form 201) - During the transfer-of-command process, an ICS Form 201-formatted briefing provides the incoming Incident Commander (IC)/Unified Commander (UC) with basic information regarding the incident situation and the resources allotted to the incident. Most importantly it functions as the Incident Action Plan (IAP) for the initial response and remains in force and continues to develop until the response ends or the Planning Section generates the incident's first IAP. It is also suitable for briefing individuals newly assigned to the Command and General Staff as well as needed assessment briefings for the staff.

ICS Form 201 facilitates documentation of response objectives, situational awareness, resource employment and deployment, and significant actions taken. This form is essential for future planning and the effective management of initial response activities.

When:	New IC/UC; staff briefing as required
Facilitator:	Current IC/UC
Attendees:	Prospective IC/UC; Command and General Staff, as required

General Tasks

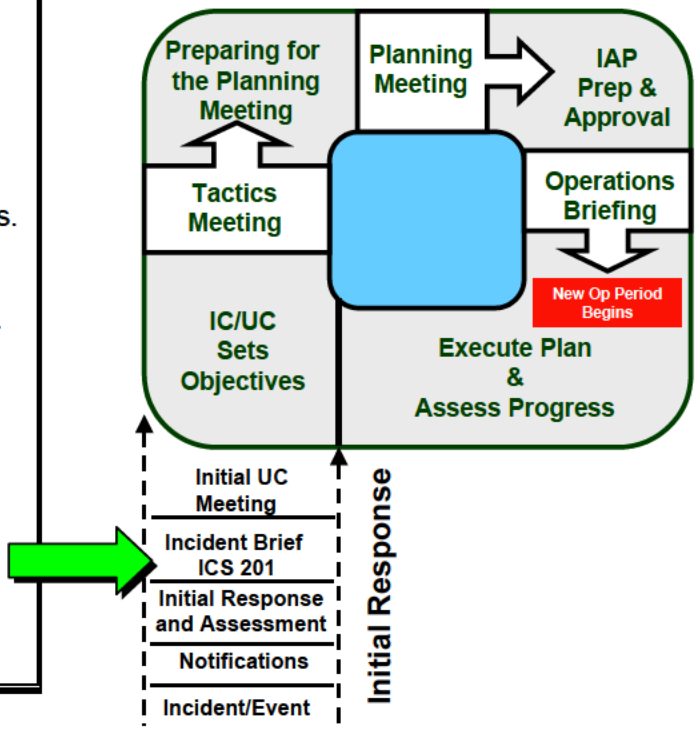
Incident Commander (IC)
- ❑ Obtain incident brief using ICS-201.
- ❑ Assess operational requirements.
- ❑ Determine organizational and response requirements and objectives.

Operations (OPS)
- ❑ Obtain briefing from IC.
- ❑ Consider available Contingency Plan.
- ❑ Develop strategies and tactics.
- ❑ Assemble resources.
- ❑ Conduct response using ICS-201.

Planning
- ❑ If/when activated orders staff.

Logistics
- ❑ If/when activated orders staff.

Finance/Admin
- ❑ If/when activated orders staff.



Agenda:

Using ICS Form 201 as an outline, include:

1. Situation (note territory, exposures, safety concerns, etc.; use map/charts).
2. Current priorities.
3. Strategy(s) and tactics.
4. Current organization.
5. Resource assignments.
6. Resources en-route and/or ordered.
7. Facilities established.

INITIAL UNIFIED COMMAND MEETING - Provides UC officials with an opportunity to discuss and concur on important issues prior to joint incident action planning. The meeting should be brief and important points documented. Prior to the meeting, parties should have an opportunity to review and prepare to address the agenda items. Planning meeting participants will use the results of this meeting to guide the operational efforts prior to the first tactics meeting.

When: The UC is formed prior to the first meeting
Facilitator: UC member
Attendees: Only ICs that will comprise the UC

General Tasks

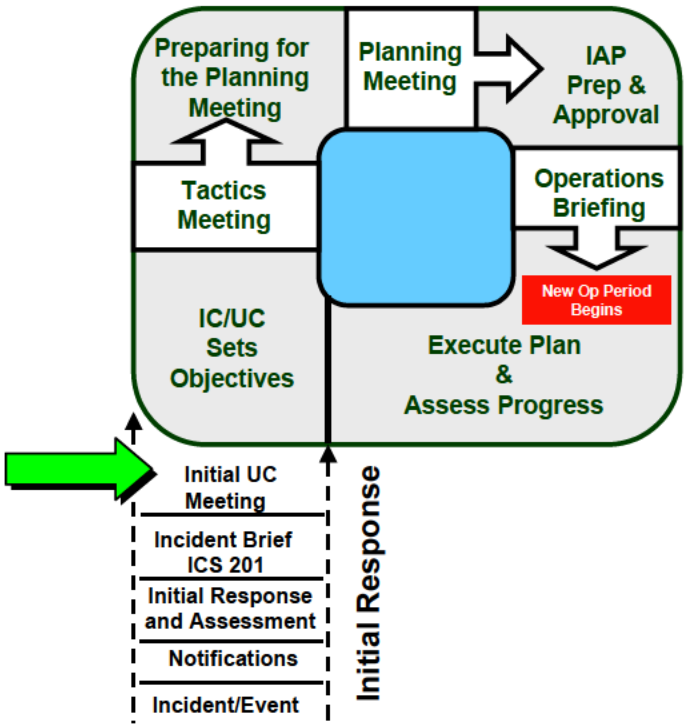
Incident Commander (IC)
- ❑ Determine need for UC.
- ❑ Negotiate/facilitate UC participation.
- ❑ Clarify UC roles & responsibilities.
- ❑ Negotiate and agree on response organization, facilities, and support.
- ❑ Determine Op Period length/start time.

Operations (OPS)
- ❑ Brief UC members on current operations.

Planning
- ❑ If activated, contact UC members as directed by IC.

Logistics
- ❑ May not be activated at this time.

Finance/Admin
- ❑ May not be activated at this time.



Agenda:

1. Identify UC, based on Chapter 6 criteria.
2. Identify jurisdictional priorities and objectives.
3. Present jurisdictional limitations, concerns and restrictions.
4. Develop a collective set of incident objectives.
5. Establish and agree on acceptable priorities.
6. Agree on basic organization structure.
7. Designate the best-qualified and acceptable Operations Section Chief (OPS).
8. Agree on General Staff personnel designations and planning, logistical, and financial agreements and procedures.
9. Agree on resource ordering procedures to follow.
10. Agree on cost-sharing procedures.
11. Agree on informational matters.
12. Designate a Unified Command Information Officer.

UNIFIED COMMAND OBJECTIVES MEETING - The IC/UC will identify/review and prioritize objectives for the next operational period on the ICS Form 202. Objectives from the previous operational period are reviewed and any new objectives are identified.

When: Prior to tactics meeting.
Facilitator: UC Member
Attendees: UC Members; Command and General Staff as appropriate

General Tasks

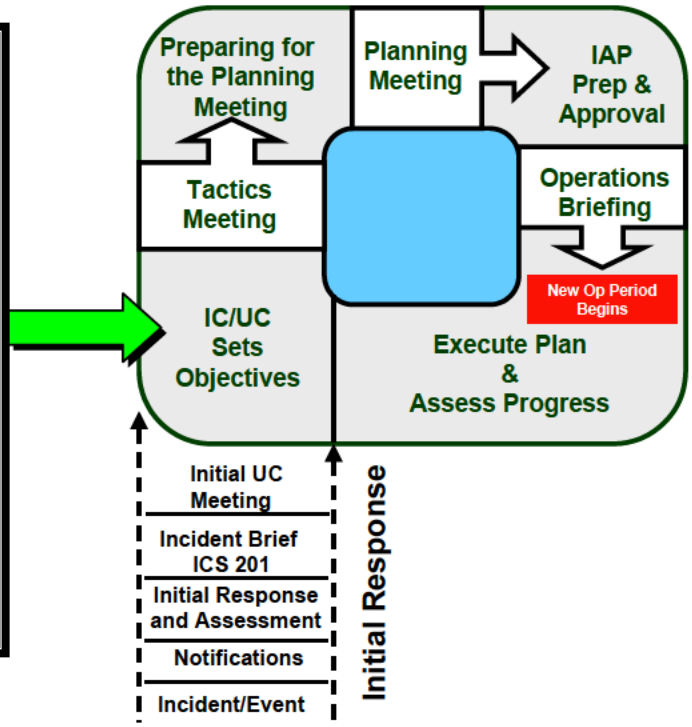
Incident Commander (IC/UC)
- ❑ Develop SMART incident objectives.
- ❑ Consider "Best Response".
- ❑ Delegate and provide guidance to Command and General Staff.

Operations (OPS)
- ❑ May be present if invited.

Planning
- ❑ May be present if invited.
- ❑ Propose draft SMART objectives to IC/UC.

Logistics
- ❑ May be present if invited.

Finance/Admin
- ❑ May be present if invited.



Agenda:

1. Review/identify objectives for the next operational period (Clearly stated and attainable with the resources available, yet flexible enough to allow members to choose tactics).
2. Review any open agenda items from initial/previous meetings.

TACTICS MEETING - This 30-minute meeting creates the blueprint for tactical deployment during the next operational period. In preparation for the Tactics Meeting, the Planning Section Chief (PSC), and OPS review the first stage of response operations or the current IAP situation status information as provided by the Situation Unit to assess work progress against IAP objectives. The OPS/PSC will jointly develop primary and alternate strategies to meet objectives for consideration at the next Planning Meeting.

When: Prior to Planning Meeting.
Facilitator: PSC
Attendees: PSC, OPS, Logistics Section Chief (LSC), and Resources Unit Leader (RUL)

General Tasks

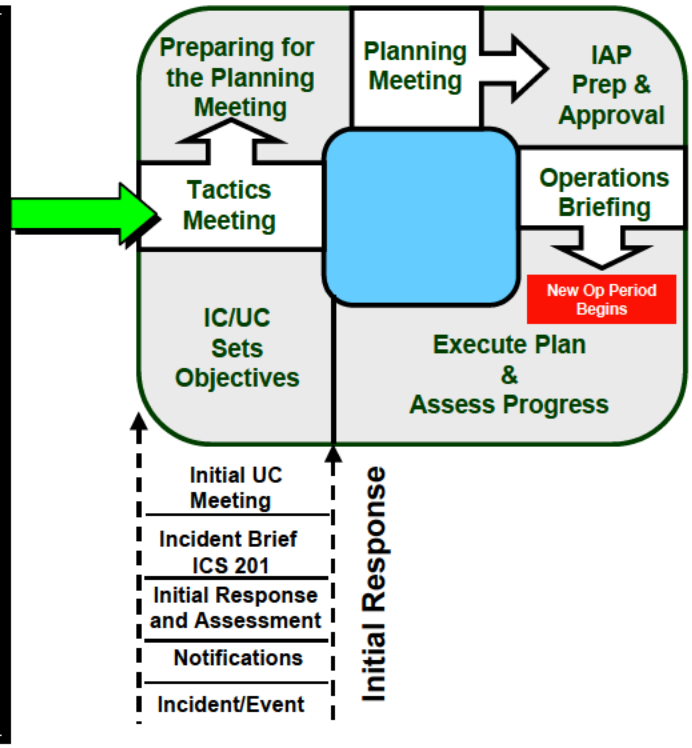
Incident Commander (IC/UC)
- ❑ Provide guidance/clarification.

Operations:
- ❑ Be prepared!
- ❑ Brief current operations.
- ❑ Develop strategies, tactics, and resource needs using ICS-215.

Planning
- ❑ Facilitate meeting.
- ❑ Determine support requirements for ICS-215.
- ❑ Consider alternative strategies.

Logistics
- ❑ Participate/contribute logistics information as necessary.
- ❑ Verify support requirements.

Finance/Admin
- ❑ Not normally present.



Agenda:

1. Review the objectives for the next operational period and develop strategies (primary and alternatives).
2. Prepare a draft of ICS Form 215 (used in planning meeting) to identify resources that should be ordered through Logistics.

PREPARE FOR THE PLANNING MEETING - During this phase of the Planning Cycle, the Section Chiefs and their associated staff members begin the work of preparing for the upcoming Planning Meeting. Each Section Chief is responsible for ensuring that his/her planning Meeting responsibilities are met. The PSC should facilitate this to the greatest extent possible to ensure that the material, information, resources, etc., to be used or discussed in the Planning Meeting is organized and prepared. There are to be no surprises in the Planning Meeting.

When: After the Tactics Meetings
Facilitator: PSC

General Tasks

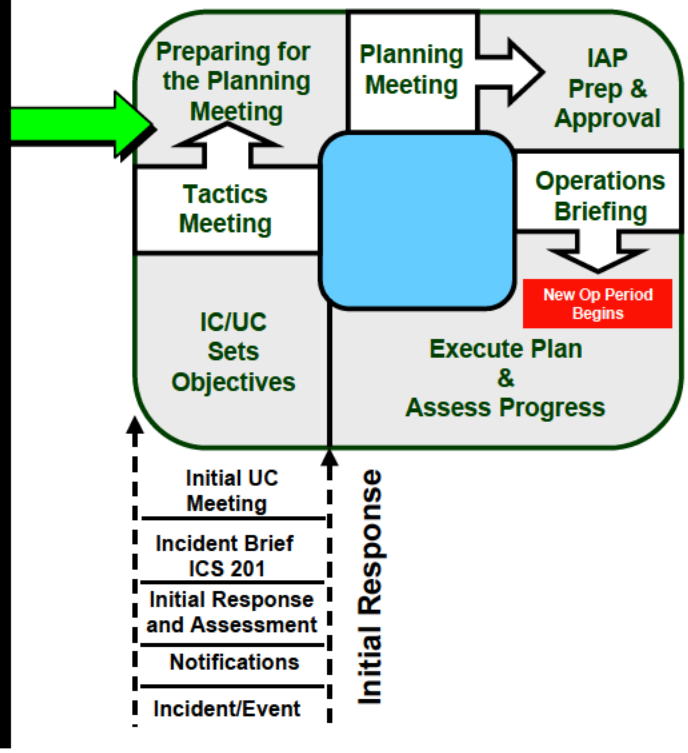
Incident Commander (IC/UC)
- ❑ Provide guidance/clarification.
- ❑ Monitor on-going operations.

Operations (OPS)
- ❑ Continue Operations.
- ❑ Prepare for Planning Meeting

Planning
- ❑ Facilitate General Staff and attendees' preparations for Planning Meeting.
- ❑ Publish/distribute meeting schedule and ensure attendees know roles.
- ❑ Allow no surprises.

Logistics
- ❑ Prepare for Planning Meeting.
- ❑ Verify support requirements.

Finance/Admin
- ❑ Prepare for Planning Meeting.
- ❑ Verify financial and administrative requirements.



PLANNING MEETING - This meeting defines incident objectives, strategies, and tactics and identifies resource needs for the next operational period. Depending on incident complexity, this meeting should last no longer than 45 minutes. This meeting fine tunes objectives and priorities, identifies and solves problems, and defines work assignments and responsibilities on a completed ICS Form 215 (Operations Planning Worksheet). Displays in the meeting room should include Objectives ICS Form 202 for the next period, large sketch maps or charts clearly dated and timed, a poster-sized ICS Form 215, a current resource inventory prepared by the Resource Unit, and current situation status displays prepared by the Situation Unit.

After the meeting, ICS Form 215 is used by the LSC to prepare the off incident tactical and logistical resource orders, and used by the PSC to develop IAP assignment lists.

When:	After the UC and Tactics Meetings
Facilitator:	PSC
Attendees:	Determined by IC/UC, generally IC/UC, Command Staff, General Staff, Air Operations Branch Director (Air Ops), the RUL, Safety Officer (SO), and Technical Specialists, as required.

General Tasks

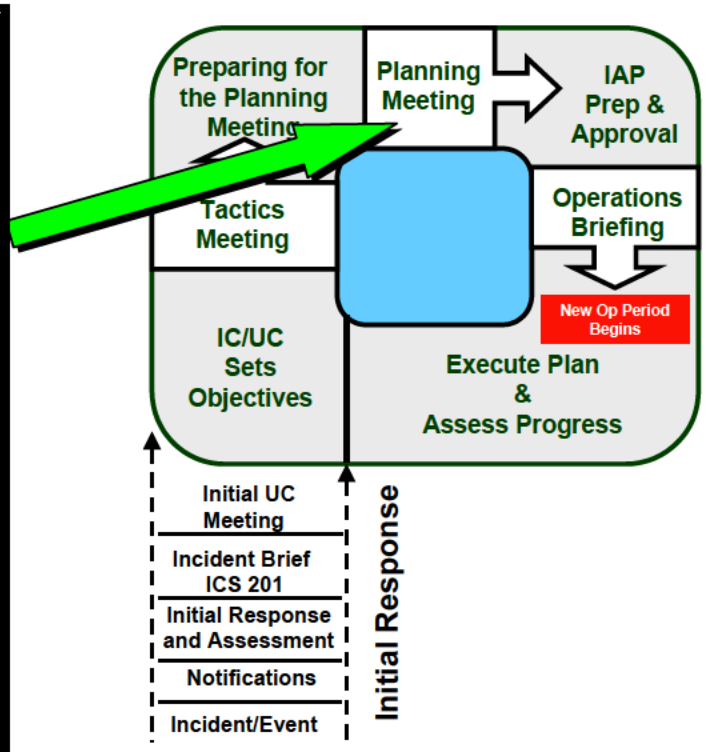
Incident Commander (IC/UC)
- ❑ Provide appropriate leadership.
- ❑ Brief incident objectives.

Operations (OPS)
- ❑ Brief operational strategies, and tactics using ICS-215, maps, charts, etc.
- ❑ Brief Branch/Division/Group functions and boundaries

Planning
- ❑ Facilitate Planning Meeting agenda.
- ❑ Brief present situation.
- ❑ Address/resolve response coordination issues as needed, gain consensus.

Logistics
- ❑ Brief logistical support and resource ordering status.

Finance/Admin
- ❑ Brief administrative and financial status/projections, etc.



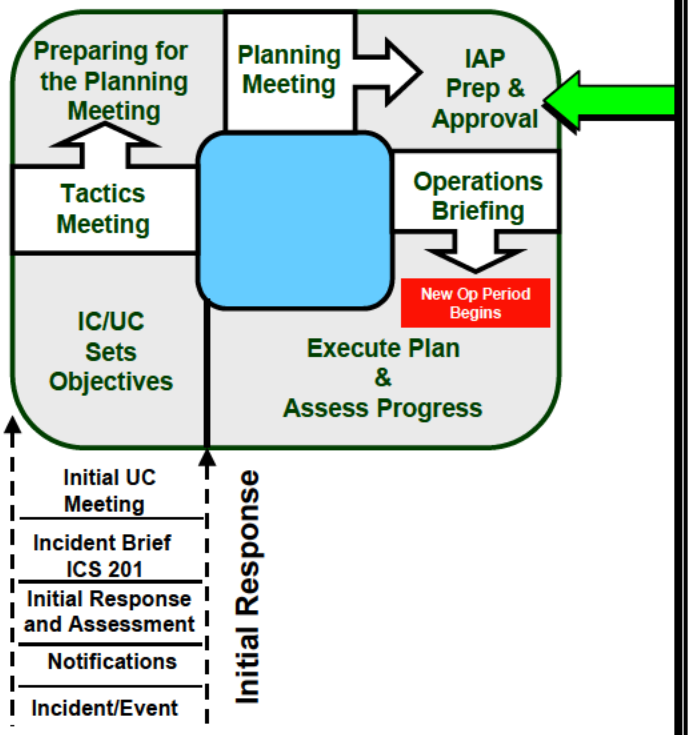
PLANNING MEETING (Cont'd)

	Agenda:	**Primary Responsibility**
1.	State incident objectives and Policy issues.	IC/UC
2.	Briefing of situation, critical and sensitive areas, weather/sea forecast, and resource status/availability.	SUL
3.	State primary and alternative strategies to meet objectives.	OPS
4.	Designate Branch, Division, and Group boundaries and functions as appropriate, use maps and ICS form 215.	OPS
5.	Specify tactics for each Division, note limitations.	OPS
6	Specify resources needed by Divisions/Groups.	OPS
7.	Specify operations facilities and reporting locations and plot on map.	OPS/LSC
8.	Develop resources, support, and overhead order (orders).	LSC
9.	Consider support: communications, traffic, safety, medical, etc.	LSC
10.	Contributing organization/agency considerations regarding work plan.	LO
11	Safety considerations regarding work plan.	SO
12	Media considerations regarding work plan.	IO
13.	Report on expenditures and claims.	F/ASC
14.	Finalize and approve work plan for the next operational period.	IC/UC

INCIDENT ACTION PLAN (IAP) PREPARATION - Attendees immediately prepare their assignments for the IAP to meet the PSC deadline for assembling the IAP components. The deadline will be early enough to permit timely IC/UC approval and duplication of sufficient copies for the Operations Briefing and for overhead.

When: Immediately following the Planning Meeting, the PSC assigns the deadline

Facilitator: PSC



General Tasks

Incident Commander (IC/UC)
- ❑ Review, approve and sign IAP

Operations (OPS)
- ❑ Provide required information for inclusion into IAP.
- ❑ Communicate incident status changes.

Planning
- ❑ Facilitate General Staff's IAP input.
- ❑ Ensure assignments and expectations are clear.
- ❑ Provide completed IAP to IC/UC for review/approval.
- ❑ Distribute completed IAP.

Logistics
- ❑ Provide logistics information for IAP.
- ❑ Verify resources ordered.

Finance/Admin
- ❑ Verify financial and administrative requirements for IAP.

Common Components	Primary Responsibility
1. Incident Objectives (ICS form 202).	Resources Unit
2. Organization List/Chart (ICS FORMS 203/207).	Resources Unit
3. Assignment List (ICS form 204).	Resources Unit
4. Communication Plan (ICS form 205).	Communications Unit
5. Medical Plan (ICS form 206).	Medical Unit
6. Incident Map.	Situation Unit
7. Safety Plan.	Safety Officer
8. Decontamination Plan.	Technical Unit
9. Waste Management or Disposal Plan.	Technical Unit

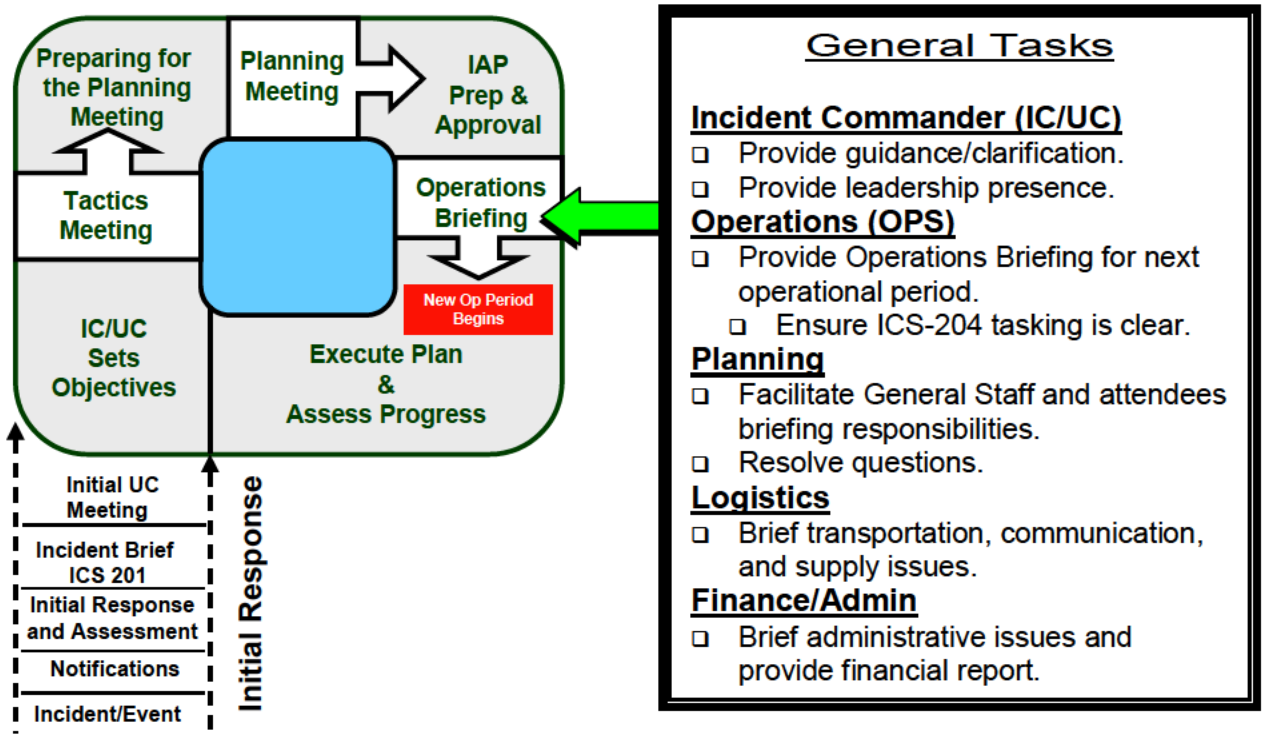
INCIDENT ACTION PLAN (IAP) PREPARATION (Cont'd)

Optional Components (use as pertinent):

1. Air Operations Summary (ICS form 220).	Air Operations Branch Director
2. Traffic Plan.	Ground Support Unit
3. Demobilization Plan.	Demobilization Unit

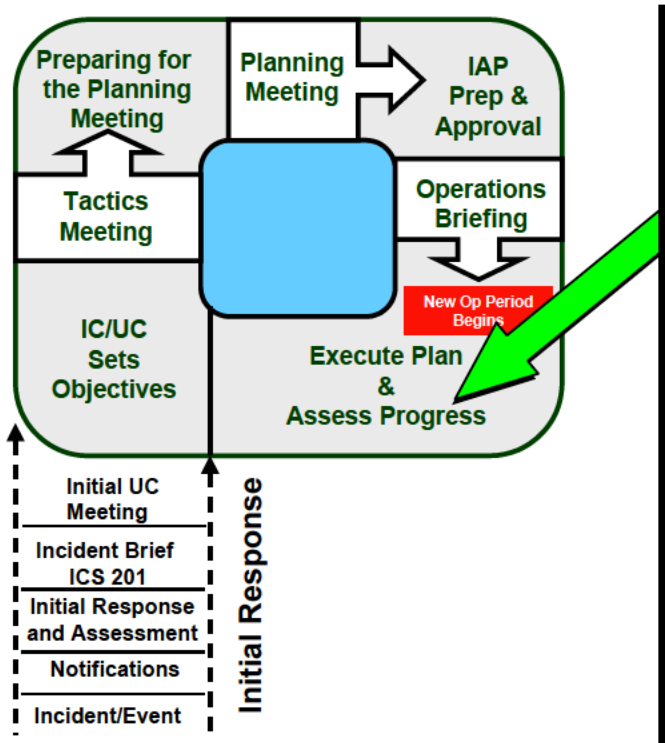
OPERATIONS BRIEFING - This 30-minute, or less, meeting presents the IAP to the oncoming shift of the response organization. After this meeting, off-going supervisors should be interviewed by their relief and by OPS in order to further confirm or adjust the course of the oncoming shift's IAP. Shifts in tactics may be made by the Division/Group supervisor in whose purview they are. Similarly, a supervisor may reallocate resources within that division to adapt to changing conditions.

When: About an hour prior to each shift change
Facilitator: PSC
Attendees: IC/UC, Command Staff, General Staff, Branch Directors, Division/Group Supervisors, Task Force/Strike Team Leaders (if possible), Unit Leaders, others as appropriate.



Agenda:	Primary Responsible
1. Review IC/UC objectives and changes to IAP.	PSC
2. Discuss current response actions and last shift's accomplishments.	OPS
3. Review weather and sea conditions forecast.	SUL
4. Division/Group and Air Operations assignment.	OPS
5. Trajectory analysis.	SUL
6. Transport, communications, and supply updates.	LSC
7. Safety message.	SO
8. Incident Action Plan (IAP) approval and motivational remarks.	IC/UC

ASSESS PROGRESS - Following the operation brief, all Section Chiefs will review the incident response progress and make recommendations to the IC/UC in preparation for the next UC Objective Meeting for the next operational period. This feedback/information is gathered from various sources, including Field Observers, responder debriefs, stakeholders, etc.



General Tasks

Incident Commander (IC/UC)
- ❑ Monitor on-going operations.
- ❑ Measure progress against stated objectives.
- ❑ Consider "Best Response."

Operations (OPS)
- ❑ Monitor on-going operations and make tactical changes as necessary.
- ❑ Measure/ensure progress against stated objectives.

Planning
- ❑ Facilitate General Staff's effectiveness and efficiency as appropriate.
- ❑ Provide response objectives recommendations to IC/UC.

Logistics
- ❑ Verify resources, resolve logistical problems.

Finance/Admin
- ❑ Facilitate smooth administrative and financial reporting.

SPECIAL PURPOSE MEETINGS

The **Special Purpose** meetings are most applicable to larger incidents requiring an **Operational Period Planning Cycle**, but may be useful during **Initial Response and Assessment**.

COMMAND STAFF MEETING - Coordinate Command Staff functions, responsibilities, and objectives. It is held before the Tactical Meeting. Command Staff (IC/UC, SO, LO, IO) attend.

COMMAND & GENERAL STAFF MEETING - An opportunity for the Command & General staffs to gather under informal conditions (breakfast/dinner) to discuss developing issues.

BUSINESS MANAGEMENT MEETING - This under-30-minute meeting develops and updates the operating plan for finance and logistical support. The agenda could include: documentation issues, cost sharing, cost analysis, finance requirements, resource procurement, and financial summary data. Attendees include: F/ASC, Cost Unit Leader (CUL), LSC, SUL, DUL.

AGENCY REPRESENTATIVE MEETING - This meeting is held to update Agency Representatives and ensure that they can support the IAP. It is conducted by the LO, and attended by Agency Representatives. It is most appropriately held after the Planning Meeting in order to announce plans for the next operational period. It allows for changes should the plan not meet the expectations of the Agency Representatives.

NEWS BRIEFING - This meeting briefs media and the public on the most current and accurate facts. It is set up by the IO, moderated by a UC spokesperson, and features selected spokespersons. This brief must be held away from the ICP. Spokespersons should be prepared by the IO to address anticipated issues. The briefing should be well-planned, organized, and scheduled to meet the media's needs.

NIMS ICS Forms

Another important aspect when implementing NIMS ICS during releases is the use of NIMS ICS forms. Regulatory response agencies will expect KMEP to recognize and apply NIMS ICS and forms during on water emergencies. Some of these response agencies may include:

- US Coast Guard
- Environmental Protection Agency
- Department of Ecology (Washington)
- Department of Fish and Game/Oil Spill Prevention and Response (California)
- Department of Environmental Quality (Oregon)
- Texas General Land Office (Texas)
- Texas Railroad Commission (Texas)

The following table provides a list of NIMS ICS forms to be used during an on-water release. Copies of these forms are also included.

NIMS ICS Forms		
ICS Form #	**Form Title**	**Prepared By**
ICS-201-OS	Incident Briefing	Incident Commander (IC)
ICS-202-OS	Response Objectives	Planning Section Chief (Planning)
ICS-203-OS	Organization Assignment List	Resources Unit Leader (Planning)
ICS-204-OS	Assignment List	Resources Unit Leader (Planning)
ICS-204a-OS	Assignment List Attachment	Resources Unit Leader (Planning)
ICS-205-OS	Incident Radio Communications Plan	Communications Unit Leader (Logistics)
ICS-205A-OS	Communications List	Communications Unit Leader (Logistics)
ICS-206-OS	Medical Plan	Medical Unit Leader (Logistics)
ICS-207-OS	Incident Organization Chart	Resources Unit (Planning)
ICS-209-OS	Incident Status Summary	Situation Unit Leader (Planning)
ICS-210-OS	Status Change Card	Communications Center (Logistics)
ICS-211	Check-In List	Resources Unit (Planning)
ICS-211e-OS	Check-In List (Equipment)	Resources Unit (Planning)
ICS211-p-OS	Check-In List (Personnel)	Resources Unit (Planning)
ICS-213-OS	General Message	Any message originator
ICS-214-OS	Unit Log	All sections and units
ICS-214a-OS	Individual Log	All sections and units
ICS-215-OS	Operational Planning Worksheet	Operations Section Chief (Operations)
ICS-216	Radio Requirements Worksheet	Communications Unit (Logistics)
ICS-217	Radio Frequency Assignment Worksheet	Communications Unit (Logistics)
ICS-218	Support Vehicle Inventory	Ground Support Unit (Logistics)
ICS-220-OS	Air Operations Summary	Operations Section Chief or Air Branch Director (Operations)
ICS-221 -OS	Demobilization Check-Out	Demobilization Unit (Planning)
ICS-230-OS	Daily Meeting Schedule	All sections and units
ICS-231-OS	Meeting Summary	All sections and units
ICS-232	Resources at Risk Summary	Situation Unit Leader (Planning)
ICS-232a-OS	ACP Site Index	Situation Unit Leader (Planning)

INCIDENT BRIEFING June 2000 ICS 201-OS (pg 4 of 4)

INSTRUCTIONS FOR COMPLETING THE INCIDENT BRIEFING (ICS FORM 201).

ITEM #	ITEM TITLE	INSTRUCTIONS
1.	Incident Name	Print the name assigned to the incident.
2.	Prepared By	Enter the name and position of the person completing the form and date time prepared (month, day, year).
3.	Map Sketch	Show perimeter and control lines, resources assignments, incident facilities, and other special information on a sketch map or attached to the topographic or orthophoto map.
4.	Initial Incident Objectives	Enter the initial incident objectives.
5.	Summary of Current Actions	Enter the strategy and tactics used on the incident and note any specific problem areas.
6.	Current Organization	Enter on the organization chart the names of the individuals assigned to each position. Modify the chart as necessary.
7.	Resources Summary	Enter the following information about the resources allocated to the incident.
	Resources Needed	Enter the number and type of resource needed.
	Time Ordered	Enter the time the resources needed were ordered.
	Resource Identification	Enter the agency three letter designator, S/T, Kind/Type and resource designator.
	ETA/On Scene	Enter the estimated arrival time and place the arrival time or a checkmark in the “on scene” column upon arrival.
	NOTES: (Location/ Assignment/Status)	Enter the assigned location of the resource and/or the actual assignment.
* NOTE		Additional pages may be added to ICS Form 201 if needed.

INCIDENT OBJECTIVES June 2000 ICS 202-OS

INSTRUCTIONS FOR COMPLETING THE INCIDENT OBJECTIVES (ICS FORM 202).

ITEM #	ITEM TITLE	INSTRUCTIONS
		NOTE: ICS Form 202, Incident Objectives, serves only as a cover sheet and is not considered complete until attachments are included.
1.	Incident Name	Print the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies. Record the start time and end time and include date(s).
3.	Overall Incident Objective(s)	Enter short, clear, and concise statements of the objectives for managing the incident including alternatives.
4.	Objectives for Specified Operation Period	Enter short, clear, and concise statements of the objectives for the operational period.
5.	Safety Message for Specified Operation Period	Enter information such as known safety hazards and specific precautions to be observed during this operational period. If available, a safety message should be referenced and attached.
6.	Weather Forecast for Operational Period	Enter weather prediction information for the specified operational period.
7.	Tides/Currents	Enter tidal/current information for the specified operational period.
8.	Time of Sunrise/Sunset	Enter time of sunrise/sunset for the specified operational period.
9	Attachments	The form is ready for distribution when appropriate attachments are completed and attached to the form.
10.	Prepared By	Enter the name and position of the person (usually the Planning Section Chief) completing the form and the date/time prepared.

ORGANIZATION ASSIGNMENT LIST June 2000 ICS 203-OS

INSTRUCTIONS FOR COMPLETING THE ORGANIZATION ASSIGNMENT LIST (ICS FORM 203).

ITEM #	ITEM TITLE	INSTRUCTIONS
		An Organization Assignment List may be completed any time the number of personnel assigned to the incident increase or decrease or a change in assignment occurs.
1.	Incident Name	Print the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies. Record the start time and end time and include date(s).
3. thru 8.		Enter the names of personnel staffing each of the listed positions. Use at least first initial and last name. For Units indicate Unit Leader and for Divisions/Groups indicate Division/Group Supervisor. Use an additional page if more than three branches are activated.
9.	Prepared By	Enter the name of the Resources Unit member preparing the form and the date/time prepared. Attach form to the Incident Objectives.

1. Incident Name	2. Operational Period (Date/Time) From: To:	Assignment List ICS 204-OS

ASSIGNMENT LIST ATTACHMENT June 2000 ICS 204a-OS

INSTRUCTIONS FOR COMPLETING THE ASSIGNMENT LIST (ICS FORM 204).

ITEM #	ITEM TITLE	INSTRUCTIONS
		A separate sheet is used for each Division or Group. The identification letter of the Division is entered in the form title. Also enter the number (roman numeral) assigned to the Branch.
1.	Incident Name	Print the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies. Record the start time and end time and include date(s).
3.	Branch	Enter the number (roman numeral) assigned to the Branch.
4.	Division/Group	Enter the identification letter of the Division and division/group name.
5.	Operations Personnel	Enter the name of the Operations Chief, applicable Branch.
6.	Resources Assigned Strike Team/Task Force/Resource Designator	List resource designators, leader name, and total number of personnel for strike teams, task forces, or single resources assigned.
7.	Assignments	Provide a statement of the tactical objectives to be achieved within the operational period. Include any special instructions for individual resources.
8.	Special Instructions	Enter statement calling attention to any safety problems or specific precautions to be exercised or other important information.
9.	Communications	The Communications Unit provides this information on the form for radios, phone and pager numbers. Also include Emergency numbers in this section.
9.	Prepared By	Enter the name and position of the person completing the form (usually the Planning Section Chief) and date/time prepared.
10.	Approved By	Enter the name and position of the person approving the form (usually the Incident Commander) and date/time approved.

1. Incident Name	2. Operational Period (Date / Time) From: To:	INCIDENT RADIO COMMUNICATIONS PLAN ICS 205-OS

3. BASIC RADIO CHANNEL USE

SYSTEM / CACHE	CHANNEL	FUNCTION	FREQUENCY	ASSIGNMENT	REMAKRS

4. Prepared by: (Communications Unit) **Date / Time**

INCIDENT RADIO COMMUNICATIONS PLAN June 2000 ICS 205-OS

1. Incident Name	2. Operational Period (Date / Time) From: To:	COMMUNICATIONS LIST ICS 205A-OS

3. Basic Local Communications Information

Assignment	Name	Method(s) of contact (radio frequency, phone, pager, cell #(s), etc.)

4. Prepared by: (Communications Unit) **Date / Time**

COMMUNICATIONS LIST June 2000 ICS 205a-OS

INSTRUCTIONS FOR COMPLETING THE INCIDENT RADIO COMMUNICATIONS PLAN (ICS FORM 205).

ITEM #	ITEM TITLE	INSTRUCTIONS
		A separate sheet is used for each Division or Group. The identification letter of the Division is entered in the form title. Also enter the number (roman numeral) assigned to the Branch.
1.	Incident Name	Print the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies. Record the start time and end time and include date(s).
3.	Basic Radio Channel Utilization System/Cache	Enter the radio cache system(s) assigned and used on the incident (e.g., Boise Cache, FIREMARS, Region 5 Emergency Cache, etc.).
	Channel Number	Enter the radio channel numbers assigned.
	Function	Enter the function each channel number is assigned (i.e., command, support, division tactical, and ground-to-air).
	Frequency	Enter the radio frequency tone number assigned to each specified function (e.g., 153.400).
	Assignment	Enter the ICS organization assigned to each of the designated frequencies (e.g., Branch I, Division A).
	Remarks	This section should include narrative information regarding special situations.
4.	Prepared By	Enter the name and position of the person completing the form (usually the Communication Unit Leader) and date/time prepared.

1. Incident Name	2. Operational Period (Date / Time) From: To:	MEDICAL PLAN ICS 206-OS

3. Medical Aid Stations

MEDICAL PLAN June 2000 ICS 206-OS

INSTRUCTIONS FOR COMPLETING THE MEDICAL PLAN (ICS FORM 206).

ITEM #	ITEM TITLE	INSTRUCTIONS
1.	Incident Name	Print the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies. Record the start time and end time and include date(s).
3.	Medical Aid Stations	Enter name and location of incident medical aid stations and indicate if paramedics are located at the site.
4.	Transportation	List name and address of ambulance services. Provide phone number and indicate if ambulance company has paramedics.
5.	Hospitals	List hospitals which could serve this incident. Incident name, address, the travel time by air and ground from the incident to the hospital, phone number, and indicate with an X if the hospital is a burn center and has a helipad.
6.	Medical Emergency Procedures	Note any special emergency instructions for use by incident personnel.
9.	Prepared By	Enter the name of the Medical Unit Leader preparing the form and date/time prepared.
10.	Reviewed By	Obtain the name of the Safety Officer who must review the plan (usually the Incident Commander) and date/time reviewed.

1. Incident Name	2. Operational Period (Date/Time) From: To:	INCIDENT ORGANIZATION CHART ICS 207-OS

CHECK-IN LIST (Personnel) June 2000 ICS 211p-OS

INSTRUCTIONS FOR COMPLETING THE CHECK-IN LIST (ICS FORM 211).

ITEM #	ITEM TITLE	INSTRUCTIONS
		Incident Dispatchers, upon receipt of a check-in message by radio, record the information on the Check-in List (ICS Form 211) and then give the information to the Resources Unit.
		Resources Unit Recorders, upon receipt of information on an in-person check in, record the information directly onto the Check-in List form.
1.	Incident Name	Print the name assigned to the incident.
2.	Check-in Location	Place a check mark in the appropriate box indicating where the resource or person checked in at the incident.
3.	Date/Time Prepared	Enter date (month, day, year) and time prepared (24-hour clock).
4.	List Personnel (Overhead) by Agency & Name	Use this section to list agency three-letter designator and individual names for all overhead (supervisory) personnel. When listing equipment, use three-letter designator, indicate if resource is a single resource, task force or strike team; enter kind or resource (letter for single resources, Number 1-3 for Strike Team); enter type of resource (1-4), and designated identification number.
5.	Order/Request Number	Order number will be assigned by Agency dispatching the resources or personnel to the incident.
6.	Date/Time Check In	Self explanatory.
7.	Leader's Name	Self explanatory.
8.	Total Number Personnel	Enter total number of personnel in strike teams, task forces or manning single resources. Include leaders.
9.	Manifest	Indicate if a manifest was prepared.
10.	Crew Weight or Individual's Weight	Self Explanatory.
11.	Home Base	Location at which the resource/individual is normally assigned. (May not be departure location.)
12.	Departure Point	Location from which resource/individual departed for this incident.
13.	Method of Travel	Means of travel to incident (bus, truck, engine, personal vehicle, etc.)
14.	Incident Assignment	Assignment at time of dispatch.
15.	Other Qualifications	List any other ICS position the individual has been trained to fill.
16.	Sent to	Enter initials and time that the information pertaining to that entry was sent to the Resources Unit.
17.	Page	Indicate page number and number of pages being used for Check-In at this location.
18.	Prepared By	Enter name of Check-In Recorder.

INSTRUCTIONS FOR COMPLETING THE GENERAL MESSAGE (ICS FORM 213)

ITEM #	ITEM TITLE	INSTRUCTIONS
1.	Incident Name	Print the name assigned to the incident.
2.	Date	List the date and time.
3.	To	Indicate Unit/Person the General Message is intended for. Be specific.
4.	From	Indicate appropriate designation and location of sender.
5.	Subject	Fill in if applicable.
6.	Message	Briefly complete. Think through your message before writing it down. Try to be as concise as possible.
7.	Reply	This section is intended to be used by the Unit/Person who receives the message to reply to your message.
8.	Signature/Position	Record signature and title of person replying.
9.	Date	Record the date and time of reply.
	White Copy/Pink Copy	Both copies are sent by person who initiates the message.
	Yellow Copy	Retained by the person who initiates the message.
	Pink Copy	May be returned to the person who initiates the message.

OPERATIONAL PLANNING WORKSHEET June 2000 ICS 215-OS

INSTRUCTIONS FOR COMPLETING THE OPERATIONAL PLANNING WORKSHEET (ICS FORM 215)

ITEM#	ITEM TITLE	INSTRUCTIONS
1.	Incident Name	Print the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies. Record the start time and end time and include date(s).
3.	Division/Group or Location	Enter the Division letter or location of the work assignment for the resources.
4.	Work Assignments	Enter the specific work assignments given to each of the Divisions.
5.	Resource	Complete resource headings, both for kind and type appropriate for the incident. Enter, for the appropriate resources, the number of resources by type (engines, crew, etc.) required "REQ", and the number of resources available "HAVE" to perform the work assignment. Then record the number of resources needed "NEED" by subtracting the number in the "HAVE" row from the number in the "REQ" row.
6.	Notes/Remarks	Enter any special information.
7.	Reporting Location	Enter the specific location the "needed" resources are to report for the work assignment (staging area, location on the fire line, etc.)
8.	Requested Arrival Time	Enter time resources are requested to arrive at the reporting location.
9.	204a needed	Enter "X" if a 204a is needed for the resource.
10. thru 12.	Total Resources Required, On Hand, Ordered	Enter the total number of resources by type (engines, crews, dozers, etc.) required, on hand, and ordered.
13	Prepared By	Record the name and position of the person completing the form and the date/time completed.

INSTRUCTIONS FOR COMPLETING THE RADIO REQUIREMENTS WORKSHEET (ICS FORM 216)

ITEM#	ITEM TITLE	INSTRUCTIONS
1.	Incident Name	Print the name assigned to the incident.
2.	Date	Enter date (month, day, year) prepared.
3.	Time Prepared	Enter time prepared (24-hour clock).
4.	Branch	Enter the Branch number (I, II, etc.) for which radio requirements are being prepared.
5.	Agency	Enter the three-letter designator of the agency staffing the Branch Director position (e.g., VNC, CDF, ANF, LFD, etc.)
6.	Operational Period	Enter the time interval for which the assignment applies. Record the start date/time and end date/time.
7.	Tactical Frequency	Enter the radio frequency to be used by the Branch Director to communicate with each Division/Group Supervisor in the Branch.
8.	Division/Group	Enter for each Division/Group in the Branch the Division/Group identifier (A, B, etc.) and the agency assigned (e.g., LAC, VNC, etc.)
9.	Agency/ID No./Radio Requirements	List all units assigned to each Division/Group. Record the agency designator, unit or resource identification, and total number of radios needed for each unit or resource.
10.	Prepared By	Enter the name and position of the person completing the worksheet.

AIR OPERATIONS SUMMARY June 2000 ICS 220-OS

Instructions for Completing Air Operations Summary Worksheet (ICS Form 220)

ITEM#	ITEM TITLE	INSTRUCTIONS
1.	Incident Name	Print the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the assignment applies. Record the start date/time and end date/time.
3.	Distribution	Check the block and enter the time and date when ICS Form 220 and attachments were sent to all fixed-wing bases and helibases supporting the incident.
4.	Personnel and Communications	Enter the name of the individuals in Air Operations and the primary air/air and air/ground (if applicable) radio frequencies to be used.
5.	Remarks	Enter special instructions or information, including safety notes, hazards, and priorities for Air Operations personnel.
6.	Location/Function	Enter area on incident where air resources will be assigned (i.e., Div. A, Branch II, Standby) or function (i.e., Air Tactical Group Supervisor, Situation Unit, MEDIVAC, etc.) to which they will be assigned.
7.	Assignment	Enter the specific assignment (e.g., water or retardant drops, logistical support, or availability status for a specific purpose, support backup, recon, MEDIVAC, etc.). If applicable, enter the primary air/air and air/ground radio frequency to be used.
8.	Fixed-Wing	Enter the number and type (1, 2, or 3) of air tankers allocated to the location/function.
9.	Helicopters	Enter the number and type of helicopters allocated to the location/function.
10.	Time Available/Commence	As applicable, enter the time (24-hour clock), when allocated air resources should be available and when they should commence their assignment.
11.	Aircraft Assigned	Enter the designators of the aircraft assigned. Gather information from Resources Unit, helibases, and fixed- wing bases.
12.	Operating Base	Enter the base (helibase, helispot, fixed-wing base) that each air resource is expected to initiate operations from.
13.	Totals	Enter the total number of fixed-wing and helicopters assigned to the incident in the number columns. Enter the total number of each type air tanker and helicopter assigned in Type column.
14.	Air Operations Support	Enter the designators and location of other support resources (i.e., helicopter support units, engines, IR, etc.) assigned to Air Operations.
15.	Prepared By	Enter the name of the person in Air Operations completing the form. Enter the date and time form was completed.

1. Incident Name	2. Operational Period (Date / Time) From: To:	DEMOB. CHECK-OUT ICS 221-OS

DEMOB. CHECK-OUT June 2000 ICS 221-OS

INSTRUCTIONS FOR COMPLETING THE DEMOBILIZATION CHECKOUT (ICS FORM 221).

ITEM#	ITEM TITLE	INSTRUCTIONS
1.	Incident Name/No.	Print the name and/or number assigned to the incident.
2.	Date/Time	Enter date and time prepared.
3.	Unit/Personnel Released	Enter appropriate vehicle or Strike Team/Task Force ID. Number(s) and Leader's name or individual overhead or staff personnel being released.
4.	Release Date/Time	Enter date time of appropriate vehicle or Strike Team/Task Force ID. Number(s) and Leader's name or individual overhead or staff personnel being released.
5.	Unit/Personnel	Demobilization Unit Leader will identify with a check in the box to the left of those units requiring check-out. Identified Unit Leaders are to initial to the right to indicate release. Blank boxes are provided for any additional check (unit requirements as needed), i.e., Safety Officer, Agency Representative, etc.
6.	Remarks	Any additional information pertaining to demobilization or release.
7.	Prepared by:	Enter the name of the person completing the form. Enter the date and time form was completed.

1. Incident Name	2. Operational Period (Date/Time) From: To:	DAILY MEETING SCHEDULE ICS 230-OS

3. Meeting Schedule (Commonly-held meetings are included)

Date/ Time	Meeting Name	Purpose	Attendees	Location
	Tactics Meeting	Develop primary and alternate Strategies to meet Incident Objectives for the next Operational Period.	PSC, OPS, LSC, EUL, RUL & SUL	
	Planning Meeting	Review status and finalize strategies and assignments to meet Incident Objectives for the next Operational Period.	Determined by the IC/UC	
	Operations Briefing	Present IAP and assignments to the Supervisors / Leaders for the next Operational Period.	IC/UC, Command Staff, General Staff, Branch Directors, Div. Sups., Task Force/Strike Team Leaders and Unit Leaders	
	Unified Command Objectives Meeting	Review/ identify objectives for the next operational period.	Unified Command members	

4. Prepared by: (Situation Unit Leader) **Date/Time**

DAILY MEETING SCHEDULE June 2000 ICS 230-OS

INSTRUCTIONS FOR COMPLETING THE DAILY MEETING SCHEDULE (ICS FORM 230-OS)

ITEM#	ITEM TITLE	INSTRUCTIONS
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Meeting Schedule	For each scheduled meeting, enter the date/time, meeting name, purpose, attendees, and location. Note: Commonly-held meetings are included in the form. Additional meetings, as needed, can be entered onto the form in the spaces provided. Time and location for each meeting must be entered. If any of the standard meetings are not scheduled, they should be deleted from the form (normally the Situation Unit Leader).
4.	Prepared By Date/Time	Enter name and title of the person preparing the form. Enter date (month, day, year) and time prepared (24-hour clock).

1. Incident Name	2. Meeting Date/Time	MEETING SUMMARY ICS 231-OS
3. Meeting Name		
4. Meeting Location		
5. Facilitator		
6. Attendees		
7. Notes (with summary of decisions and action items)		
8. Prepared by:	Date/Time	

MEETING SUMMARY June 2000 ICS 231-OS

INSTRUCTIONS FOR COMPLETING THE MEETING SUMMARY (ICS FORM 231-OS)

ITEM#	ITEM TITLE	INSTRUCTIONS
1.	Incident Name	Enter the name assigned to the incident.
2.	Meeting Date/Time	Enter date and time of meeting.
3.	Meeting Name	Enter name of meeting.
4.	Meeting Location	Enter location of meeting.
5.	Facilitator	Enter the name and position of the meeting facilitator.
6.	Attendees	List the personnel who need to attend the meeting.
7.	Notes	List a summary of decisions and action items addressed in the meeting.
8.	Prepared By Date/Time	Enter name and title of the person preparing the form. Enter date (month, day, year) and time prepared (24-hour clock).

1. Incident Name	2. Operational Period (Date/Time) From: To:	RESOURCES AT RISK SUMMARY ICS 232-OS

3. Environmentally-Sensitive Areas and Wildlife Issues

Site #	Priority	Site Name and/or Physical Location	Site Issues

Narrative

4. Archaeo-cultural and Socio-economic Issues

Site #	Priority	Site Name and/or Physical Location	Site Issues

Narrative

5. Prepared by: (Environmental Unit Leader) **Date/Time**

RESOURCES AT RISK SUMMARY June 2000 ICS 232-OS

Electronic version: NOAA 1.0 June 1, 2000

1. Incident Name	2. Operational Period (Date/Time) From: To:	ACP Site Index ICS 232a-OS

3. Index to ACP/GRP sites shown on Situation Map

Site #	Priority	Site Name and/or Physical Location	Action	Status

Note: This form is designed to be posted next to the situation map. Use additional sheets, as needed.

4. Prepared by: **Date/Time**

ACP Site Index June 2000 ICS 232a-OS

INSTRUCTIONS FOR COMPLETING THE RESOURCES AT RISK SUMMARY (ICS FORM 232-OS)

ITEM#	ITEM TITLE	INSTRUCTIONS
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Environmentally-Sensitive Area and Wildlife Issues Site Number	Enter site number, priority as it is related to degree of sensitivity, site location, and description. Use the Narrative section to clarify any issues.
	Priority Site Name and/or Physical Location Site Issues	Can come from an Area Contingency Plan (ACP) or Geographic Response Plan (GRP) or can be created during an incident. Priority specific to this incident.
4.	Archaeo-cultural and Socio-economic Issues	Name of the site (e.g., Marsh Pt., Glacier Creek, etc.) and/or physical location (e.g., address, lat/long, landmarks, etc.). Environmental concerns associated with this site and season. Enter name and position of person preparing form, and the date and time prepared. Normally would be the Environmental Unit Leader.
	Site Number Priority Site Name and/or Physical Location Site Issues	Can come from an ACP/GRP or can be created during an incident. Priority specific to this incident. Name of the site (e.g., Marsh Pt., Glacier Creek, etc.) and/or physical location (e.g., address, lat/long, landmarks, etc.). Archaeo-cultural or socio-economic concerns associated with this site and season.
5.	Prepared By Date/Time	Enter name and title of the person preparing the form. Enter date (month, day, year) and time prepared (24-hour clock).

DOT/PHMSA 49 CFR Part 194 Final Rule - January 5, 1993		
§ 194.105	**BRIEF DESCRIPTION**	**SECTION**
(a)	... determine the worst case discharge ... provide methodology, including calculations, used to arrive at the volume.	V2: § 6.0, 7.0
(b)	The worst case discharge is the largest volume, in barrels, of the following:	-----
(b)(1)	... maximum release time in hours, plus the maximum shutdown response time in hours, multiplied by the maximum flow rate expressed in barrels per hour, plus the largest line drainage volume after shutdown of the line section(s) ...	V2: § 6.0
(b)(2)	The largest foreseeable discharge for the line section(s) within a response zone, expressed in barrels, based on the maximum historic discharge, if one exists, adjusted for any subsequent corrective or preventative action taken.	V2: § 6.0
(b)(3)	If the response zone contains one or more breakout tanks, the capacity of the single largest tank or battery of tanks within a single secondary containment system, adjusted for the capacity or size of the secondary containment system, expressed in barrels.	V2: § 6.0, 7.0
§ 194.107	**BRIEF DESCRIPTION**	**SECTION**
(a)	Each response plan must plan for resources for responding, to the maximum extent practicable, to a worst case discharge, and to a substantial threat of such a discharge.	V1: §§ 3.5, 3.9; V2: § 3.0, 6.0, 7.0
(b)	Each response plan must be written in English ...	-----
8	Each response plan must be consistent with the NCP and each applicable ACP. An operator must certify that it has reviewed the NCP and each applicable ACP and that the response plan is consistent with the existing NCP and each existing applicable ACP.	V1: § 1.5
(d)	Each response plan must include:	-----
(d)(1)	A core plan consisting of --	-----
(d)(1)(i)	An information summary as required in ' 194.113.	V1: § 1.1, 1.2
(d)(1)(ii)	Immediate notification procedures.	V1: § 2.0
(d)(1)(iii)	Spill detection and mitigation procedures.	V1: § 2.0.1, 3.4, 3.9
(d)(1)(iv)	The name, address, and telephone number of the oil spill response organization, if appropriate.	V2: § 2.2, Figure 2.1
(d)(1)(v)	Response activities and response resources.	V1: § 3.4; V2: § 3.0, Figures 3.1, 3.2, 3.3
(d)(1)(vi)	Names and telephone numbers of Federal, state, and local agencies which the operator expects to have pollution control responsibilities or support.	V1: § 2.0; V2: § 2.0
(d)(1)(vii)	Training procedures.	V1: § 1.8
(d)(1)(viii)	Equipment testing.	V2: § 3.1, 3.2, 3.3, Figure 3.3
(d)(1)(ix)	Drill types, schedules, and procedures.	V1: § 1.8
(d)(1)(x)	Plan review and update procedures.	V1: § 1.7
(d)(2)	An appendix for each response zone. Each response zone appendix must include the information required in paragraph (d)(1)(i) to (ix) of this section that is specific to the response zone and the worst case discharge calculations.	V1: § 1.0, 2.0, 3.0; V2: § 1.3, 6.0

DOT/ PHMSA 49 CFR Part 194 (Cont'd) Final Rule - January 5, 1993		
§ 194.113	**BRIEF DESCRIPTION**	**SECTION**
(a)	The information summary for the core plan, required by ' 194.107, must include:	-----
(a)(1)	The name and address of the operator.	V1: § 1.1; V2: § 1.1
(a)(2)	For each response zone which contains one or more line sections that meet the criteria for determining significant and substantial harm as described in ' 194.103, a listing and description of the response zones, including county(s) and state(s).	V1: § 1.2; V2: § 1.2
(b)	The information summary for the response zone appendix, required in ' 194.107, must include:	-----
(b)(1)	The information summary for the core plan.	V2: § 1.1, 1.2
(b)(2)	The name and telephone number of the qualified individual available on a 24-hour basis.	V1: § 1.1, Figures 2.3a, 2.3b
(b)(3)	The description of the response zone, including county(s) and state(s), for those zones in which a worst case discharge could cause substantial harm to the environment.	V2: § 1.1, 1.2
(b)(4)	A list of line sections for each pipeline contained in the response zone, identified by milepost or survey station number, or other operator designation.	V2: § 1.2
(b)(5)	The basis for the operator's determination of significant and substantial harm.	V2: § 1.3
(b)(6)	The type of oil and volume of the worst case discharge.	V2: § 1.3
§ 194.115	**BRIEF DESCRIPTION**	**SECTION**
(a)	Each operator shall identify and ensure, by contract or other approved means, the resources necessary to remove, to the maximum extent practicable, a worst case discharge and to mitigate or prevent a substantial threat of a worst case discharge.	V2: § 3.0, Figures 3.1, 3.2
(b)	An operator shall identify in the response plan the response resources which are available to respond within the time specified, after discovery of a worst case discharge, or to mitigate the substantial threat of such a discharge.	V2: § 3.0, Figures 3.1, 3.2
§ 194.117	**BRIEF DESCRIPTION**	**SECTION**
(a)	Each operator shall conduct training to ensure that:	-----
(a)(1)	All personnel know --	-----
(a)(1)(I)	Their responsibilities under the response plan	V1: § 1.8
(a)(1)(ii)	The name and address of, and the procedure for contacting, the operator on a 24-hour basis	V1: § 2.1
(a)(1)(iii)	The name of, and procedures for contacting, the qualified individual on a 24-hour basis	V1: § 2.1
(a)(2)	Reporting personnel know --	-----
(a)(2)(I)	The content of the information summary of the response plan.	V1: § 2.1
(a)(2)(ii)	The toll-free telephone number of the National Response Center	V1: Figure 2.4
(a)(2)(iii)	The notification process	V1: § 2.1
(a)(3)	Personnel engaged in response activities know --	-----
(a)(3)(I)	The characteristics and hazards of the oil discharged	V1: § 3.1, 3.14

DOT/ PHMSA 49 CFR Part 194 (Cont'd) Final Rule - January 5, 1993		
§ 194.117	**BRIEF DESCRIPTION**	**SECTION**
(a)(3)(ii)	The conditions that are likely to worsen emergencies, including the consequences of facility malfunctions or failures, and the appropriate corrective actions.	V1: § 3.8
(a)(3)(iii)	The steps necessary to control any accidental discharge of oil and to minimize the potential for fire, explosion, toxicity, or environmental damage	V1: § 3.9
(a)(3)(iv)	The proper firefighting procedures and use of equipment, fire suits, and breathing apparatus	V1: § 3.1, 3.4
(b)	Each operator shall maintain a training record for each individual that has been trained as required by this section. Theses records must be maintained in the following manner as long as the individual is assigned duties under the response plan	-----
(b)(1)	Records for operator personnel must be maintained at the operator's headquarters	V1: § 1.8
(b)(2)	Records for personnel engaged in response, other than operator personnel, shall be maintained as determined by the operator.	V1: § 1.8
(b)(3)	Nothing in this section relieves an operator from the responsibility to ensure that all response personnel are trained to meet the OSHA standards for emergency response operations in 29 CFR 1910.120 ...	V1: § 1.8

(a)	1.8.2	Develop a training and drill program that satisfies the requirements of this section	V1: § 1.8
(b)	1.8.3	Develop a facility response training program to train personnel involved in response activities.	V1: § 1.8
(b)(1)	1.8.3	Proper instruction of facility personnel in the procedures to respond to discharges of oil and in applicable oil spill response laws, rules, and regulations`	V1: § 1.8
(b)(2)	1.8.3	Training shall be functional in nature according to job tasks for both supervisory and non-supervisory operational personnel	V1: § 1.8
(b)(3)	1.8.2	Trainers shall develop specific lesson plans on subject areas relevant to facility personnel involved in oil spill response and cleanup	V1: § 1.8
(c)	1.8.2	Develop a program of facility response drills/exercises, including evaluation procedures. Can follow PREP.	V1: § 1.8

U.S. COAST GUARD 33 CFR 154 *FINAL RULE – July 1, 2010*		
§ 154.1030	**BRIEF DESCRIPTION**	**SECTION**
(a)	The plan must be written in English.	Entire Plan
(b)	A response plan must be divided into sections	---
(b)(1)	Introduction and plan contents.	V1 & V2: § 1.0
(b)(2)	Emergency response action plan:	---
(b)(2)(i)	Notification procedures.	V1 & V2: § 2.0
(b)(2)(ii)	Facility's spill mitigation procedures.	V1: § 3.4
(b)(2)(iii)	Facility's response activities.	V1: § 3.4
(b)(2)(iv)	Fish and wildlife and sensitive environments.	V2: § 3.4, 8.2.3
(b)(2)(v)	Disposal plan.	V2: § 5.0
(b)(3)	Training and Exercises:	---
(b)(3)(i)	Training procedures.	V1: § 1.8
(b)(3)(ii)	Exercise procedures.	V1: § 1.8
(b)(4)	Plan review and update procedures.	V1: § 1.7
(b)(5)	Appendices.	---
(b)(5)(i)	Facility-specific information.	V2: § 8.0, Figure 8.1
(b)(5)(ii)	List of contacts.	V1: Figures 2.3a, 2.3b, 2.3c, 2.4; V2: Figure 2.1
(b)(5)(iii)	Equipment lists and records.	V2: § 3.0
(b)(5)(iv)	Communications plan	V2: § 3.8
(b)(5)(v)	Site-specific safety and health plan.	V1: § 3.13, Figure 3.7
(b)(5)(vi)	List of acronyms and definitions.	Glossary of Terms/Acronyms
(b)(5)(vii)	A geographic-specific appendix ... mobile facility operates.	---
(c)	... contained in § 154.1035, 154.1040, and 154.1041, as appropriate.	---
(d)	...information required in § 154.1035, 154.1040, and 154.1041...	---
(e)	... cross-reference ...	V1: Cross Reference
(f)	... be consistent with the NCP and ACP ...	V1: § 1.5
§154.1035	**BRIEF DESCRIPTION**	**SECTION**
	Introduction and plan content.	V1 & V2: § 1.0
	The Facility's name, street address, city, county, state, ZIP code, Facility telephone number, and tele-facsimile number, if so equipped...	V2: Figure 8.1
	The Facility's location ...	V2: Figures 8.1, 8.2
	... name, address, and procedures ... owner or operator ... 24-hour basis.	V2: Figure 8.1
	A table of contents.	V1 & V2: Table of Contents
	... cross index	V1: Cross Reference
	A record of change(s) to record information and plan updates.	V1 & V2: Revision Record
(b)	Emergency Response Action Plan...	---
(b)(1)	Notification procedures.	V1 & V2: § 2.0

U.S. COAST GUARD 33 CFR 154 *FINAL RULE – July 1, 2010 (Cont'd)*		
§154.1035	**BRIEF DESCRIPTION**	**SECTION**
(b)(1)(i)	... a prioritized list identifying the person(s) ... to be notified of a discharge or substantial threat of a discharge of oil ...	V1: Figures 2.1a thru 2.1e, 2.3a, 2.3b, 2.3c, 2.4; V2: Figure 8.1
(b)(1)(i)(A)	Facility response personnel, and spill management team, oil spill removal organizations, and the qualified individual(s) ...	V1: Figures 2.3a, 2.3b, 2.3c; V2: Figure 8.1
(b)(1)(i)(B)	Federal, State, or local agencies, as required.	V1: Figure 2.4; V2: Figure 2.1
(b)(1)(ii)	... a form, ... which contains information to be provided in the initial and follow-up notifications to Federal, State, and local agencies ...	V1: Figure 2.2
(b)(2)	Facility's spill mitigation procedures.	V1: § 3.4, V2: § 8.3
(b)(2)(i)	..describe the volume(s) and oil groups..	V2: § 8.3
(b)(2)(i)(A)...(D)	...discharges from the MTR Facility ... non-transportation related...	V2: § 8.3
(b)(2)(ii)	... must contain prioritized procedures for Facility personnel to mitigate or prevent any discharge or substantial threat of a discharge of oil ...	V1: V2: § 8.3 2.1, Figure 2.1, 3.4, V2: § 8.3
(b)(2)(ii) (A)..(G)	... Typical scenarios....	V2: § 8.3
(b)(2)(iii)	... a listing of equipment and the responsibilities of Facility personnel to mitigate an average most probable discharge.	V1: § 3.4; V2: § 3.0, Figures 3.1, 3.2, 3.3
(b)(3)	Facility's response activities.	---
(b)(3)(i)	... a description of the Facility personnel's responsibilities ... pending the arrival of the qualified individual.	V1: Figure 3.2a
(b)(3)(ii)	... a description of the responsibilities and authority of the qualified individual and alternate as required in § 154.1026.	V1: Figure 4.1
(b)(3)(iii)	... describe the organizational structure that will be used to manage the response actions, including ...	V1: Figures 3.3a, 3.3b, 3.3c, 3.3d
(b)(3)(iii)(A)..(H)	Command and control...Public Information...Safety... Liaison...Operations...Planning...Logistics...Finance.	V1: Figures 4.1 through 4.9
(b)(3)(iv)	... identify the oil spill removal organization(s) and the spill management team ...	V1: Figures 2.3a, 2.3b, 2.3c; V2: Figure 2.1, Figure 3.3, Figure 8.1
(b)(3)(iv)(A)	Be capable of providing the following response resources:	---
(b)(3)(iv)(A)(1)	Equipment and supplies to meet...§154.1045, §154.1047 or...	V2: Figure 2.1, § 3.1
(b)(3)(iv)(A)(2)	Trained personnel necessary to continue operation...first 7 days of the response.	V1: Figures 2.3a, 2.3b, 2.3c, 2.4; V2: Figure 2.1, Figure 3.3, Figure 8.1
(b)(3)(v)	...job descriptions for each spill management team member...	V1: § 4.3
(b)(3)(vi) (b)(3)(vi)(A) through (D)	For facilities that handle, store or transport Group II through IV petroleum oils and that operate in waters where dispersant use is pre-authorized ...	N/A
(b)(3)(vii)	This subsection of the plan must also separately list resource providers and separate resources necessary to provide aerial oil tracking capabilities required in this subpart…	---
(b)(3)(vii)(A)	The identification of a resource provider; and	V2: Figures 2.1 and 3.3
(b)(3)(vii)(B)	Type and location of aerial surveillance aircraft that are ensured available, through contract or other approved means, to meet the oil tracking requirements of 33 CFR 154.1045(j).	V2: Figure 3.3

U.S. COAST GUARD 33 CFR 154 *FINAL RULE – July 1, 2010 (Cont'd)*		
§154.1035	**BRIEF DESCRIPTION**	**SECTION**
(b)(3)(viii)	For mobile facilities that operate in more than one COTP zone …	N/A
(b)(3)(ix)	For mobile facilities that operate in more than one COTP zone …	N/A
(b)(4)	Fish and wildlife and sensitive environments.	---
(b)(4)(i)	This section of the plan must identify areas of economic importance and environmental sensitivity, as identified in the ACP, which are potentially impacted by a worst case discharge. ACPs are required under section 311(j)(4) of the FWPCA to identify fish and wildlife and sensitive environments. The applicable ACP shall be used to designate fish and wildlife and sensitive environments in the plan. Changes to the ACP regarding fish and wildlife and sensitive environments shall be included in the annual update of the response plan, when available.	V2: § 3.4, 4.0, 8.2.3
(b)(4)(ii)	For a worst case discharge from the facility, this section of the plan must—	---
(b)(4)(ii)(A)	List all fish and wildlife and sensitive environments identified in the ACP which are potentially impacted by a discharge of persistent oils, non-persistent oils, or non-petroleum oils.	V2: § 3.4, 4.0, 8.2.3
(b)(4)(ii)(B)	Describe all the response actions that the facility anticipates taking to protect these fish and wildlife and sensitive environments.	V2: § 3.4, 8.2.3
(b)(4)(ii)(C)	Contain a map or chart showing the location of those fish and wildlife and sensitive environments ...	V2: § 3.4
(b)(4)(iii)	For a worst case discharge, ... identify appropriate equipment and required personnel to protect these areas...	V2: § 8.3
(b)(4)(iii)(A)	Identify the appropriate equipment and required personnel to protect all fish and wildlife and sensitive environments ...	V2: § 4.0, § 6.0
(b)(4)(iii)(B)	Calculate the distances required by paragraph (b)(4)(iii)(A) of this section by selecting one of the methods described in this paragraph; (*1*) Distances may be calculated as follows:	V2 NR-Bay & SR-West: § 8.6 V2 NR-NW: § 8.4
(b)(4)(iii)(B)(2)	A spill trajectory or model may be substituted for distances...	---
(b)(4)(iii)(B)(3)	The procedures contained in the Environmental Protection Agency's regulations...may be substituted for distances...	---
(b)(4)(iii)(C)	Based on historical information or a spill trajectory or model, the COTP may require the additional fish and wildlife and sensitive environments also be protected.	---
(b)(5)	*Disposal Plan.* This subsection must describe any actions to be taken or procedures to be used to ensure that all recovered oil and oil contaminated debris produced as a result of any discharge are disposed according to Federal, state, or local requirements.	V2: § 5.0
(c)	*Training and exercises. To be divided into the following subsections:*	---
(c)(1)	*Training procedures. ..must describe the training procedures …*	V1: § 1.8
(c)(2)	*Exercise procedures. ... must describe the exercise program ...*	V1: § 1.8

U.S. COAST GUARD 33 CFR 154 *FINAL RULE – July 1, 2010 (Cont'd)*		
§154.1035	**BRIEF DESCRIPTION**	**SECTION**
(d)	Plan review and update procedures. ... address the procedures ...	V1: § 1.7
(e)	Appendices. ...must include appendices described...	---
(e)(1)	Facility-specific information.. ... principal characteristics ...	---
(e)(1)(i)	There must be a physical description of the Facility...	V2: Figure 8.1
(e)(1)(ii)	...must identify the sizes, types, and number of vessels...	V2: Figure 8.1
(e)(1)(iii)	...must identify the first valve(s) ...inside the secondary containment...	V2: Figure 8.3
(e)(1)(iv)	...must contain information on the oil(s) and hazardous material...	V1: § 3.14
(e)(1)(iv)(A)	The generic or chemical name	V1: Figure 3.8
(e)(1)(iv)(B)	A description of the appearance and odor	V1: Figure 3.8
(e)(1)(iv)(C)	The physical and chemical characteristics	V1: Figure 3.8
(e)(1)(iv)(D)	The hazards involved in handling the oil(s) and hazardous...	V1: Figure 3.8
(e)(1)(iv)(E)	A list of firefighting procedures and extinguishing agents...	V1: Figure 3.8
(e)(1)(v)	The appendix may contain any other information which the Facility owner or operator determines to be pertinent...	---
(e)(2)	List of contacts...	---
(e)(2)(i)	The primary and alternate qualified individual(s) for the Facility;	V1: § 1.1, Figures 2.3a, 2.3b, V2: Figure 8.1
(e)(2)(ii)	The contact(s) ... for activation of the response resources; and	V1: § 2.1; V2: § 2.2, Figure 8.1
(e)(2)(iii)	Appropriate Federal, State, and local officials.	V1: § 2.2; V2: § 2.1
(e)(3)	Equipment list and records. ... must include ...	---
(e)(3)(i)	...list of equipment ... average most probable	V2: § 3.1. § 8.3
(e)(3)(ii)	...detailed listing of all the major equipment identified in the plan as belonging to an oil spill removal organization(s)...	V2: Figure 3.3
(e)(3)(iii)	It is not necessary to list response equipment from oil spill removal organization(s) ... classified by the Coast Guard ... When it is necessary ... the list must include for each piece of equipment -	---
(e)(3)(iii)(A)	The type, make, model, and year of manufacture ... of the equipment;	V2: Figure 3.3
(e)(3)(iii)(B)	For oil recovery devices, the effective daily recovery rate ...	V2: Figure 3.3
(e)(3)(iii)(C)	For containment boom, ...height and type of end connectors;	V2: Figure 3.3
(e)(3)(iii)(D)	The spill scenario in which the equipment will be used ...	V2: Figure 3.3
(e)(3)(iii)(E)	The total daily capacity for storage and disposal of recovered oil;	V2: Figure 3.3
(e)(3)(iii)(F)	For communication equipment, the type and amount of equipment ...	V2: Figure 3.3
(e)(3)(iii)(G)	Location of the equipment; and	V2: Figure 3.3
(e)(3)(iii)(H)	The date of the last inspection by the oil spill removal organization(s).	V2: Figure 3.3
(e)(4)	Communications plan ...	V2: § 3.8
(e)(5)	Site-specific safety and health plan ...	V1: § 3.13, Figure 3.7
(e)(6)	List of acronyms and definitions ...	Glossary of Terms/ Acronyms

(a)(2)(i)...(v)	Ice conditions; Debris; ... other appropriate....	---
(a)(3(i)..(ii)	The COTP may reclassify a specific body of water or location	---
(b)(1)...(3)	Response equipment must ---	
(c)	...identify response resources...average most probable discharge...	V2: § 3.0, § 8.3
(c)(1)	1,000 feet of containment boom or two times the length of the largest vessel ... and the means of deploying and anchoring the boom ... within 1 hour of the detection of a spill;	V2: § 3.0, § 8.3
(c)(2)	...recovery devices and oil storage capacity ... within 2 hours ...	V2: § 3.0, § 8.3
(d)	... identify response resources ... maximum most probable discharge...	V2: § 3.0, § 8.3
(d)(1)	... include sufficient containment boom, oil recovery devices, and storage capacity for any recovery of up to the maximum most probable discharge planning volume...	V2: § 3.0, § 8.3
(d)(2)	... resources must be appropriate for each group of oil ...	V2: § 3.0, § 8.3
(d)(3)	... must be positioned ... arrive ... scene of a discharge ...	V2: § 3.0, § 8.3
(d)(3)(i)	... within the specified times ...	V2: § 3.0, § 8.3
(d)(3)(ii)	In higher volume port areas ... within 6 hours ...	V2: § 3.0, § 8.3
(d)(3)(iii)	In all other locations, ... within 12 hours ...	V2: § 3.0, § 8.3
(d)(4)	... COTP may impose additional operational restrictions ...	V2: § 3.0, § 8.3
(e)	... identify the response resources ... worst case discharge ...	V2: § 3.0, § 8.3
(e)(2)(i)	The volume of the Facility's worst case discharge;	V2: § 3.0, § 8.3
(e)(2)(ii)	Group(s) of oil...handled, stored or transported by the Facility; and	V2: § 3.0, § 8.3
(e)(2)(iii)	The geographic area(s) in which the Facility operates.	V1: § 1.2, Figure 1.1; V2: Figures 8.2
(e)(3)	... sufficient boom, oil recovery devices, and storage capacity to recover the worst case discharge planning volumes.	V2: § 3.0, § 8.3
(e)(4)	... quantity of response resources ... to respond ... to the worst case discharge to the maximum extent practicable.	V2: § 3.0, § 8.3
(e)(5)	... The following percentages of the response equipment ... must be capable of operating in waters of 6 feet or less depth.	V2: § 3.0, § 8.3
(e)(5)(i)	Offshore - 10 percent.	V2: § 3.0, § 8.3
(e)(5)(ii)	Nearshore/inland/Great Lakes/rivers and canals - 20 percent.	V2: § 3.0, § 8.3
(e)(6)	... COTP may impose additional operational restrictions ...	V2: § 3.0, § 8.3
(f)	Response equipment ... must be capable of arriving on scene within the times specified in this paragraph ...	V2: § 3.0, § 8.3
(g)	... response equipment identified for Tier 1 plan credit must be capable of being mobilized and en route to the scene of a discharge within 2 hours of notification ...	V2: § 3.0, § 8.3
(g)(1)	Either directly or through the qualified individual; and	V2: § 3.0, § 8.3
(g)(2)	Within 30 minutes of a discovery ...	V2: § 3.0, § 8.3

U.S. COAST GUARD 33 CFR 154 *FINAL RULE –July 1, 2010 (Cont'd)*		
§154.1045	**BRIEF DESCRIPTION**	**SECTION**
(h)	Response resources identified for Tier 2 and Tier 3 plan credit must be capable of arriving on scene within the time specified ...	V2: § 3.0, § 8.3
(i), (i)(1), (i)(2)(i) – (iv), (i)(3)	The owner or operator of a facility that handles, stores, or transports groups II through IV petroleum oils within the inland, nearshore, or offshore areas where pre-authorization for dispersant use exists must identify in their response plan, and ensure the availability of, through contract or other approved means, response resources capable of conducting dispersant operations within those areas.	N/A
(j)	The owner or operator of a facility handling Groups I through IV petroleum oil as a primary cargo must identify in the response plan, and ensure the availability through contract or other approved means, of response resources necessary to provide aerial oil tracking to support oil spill assessment and cleanup activities. Facilities operating exclusively on inland rivers are not required to comply with this paragraph. Aerial oil tracking resources must:	V2: Figures 2.1 and 3.3 (As applicable)
(j)(1)	Be capable of arriving at the site of a discharge in advance of the arrival of response resources identified in the plan for tiers 1, 2, and 3 Worst-Case Discharge response times, and for a distance up to 50 nautical miles from shore (excluding inland rivers);	V2: Figures 2.1 and 3.3 (As applicable)
(j)(2)	Be capable of supporting oil spill removal operations continuously for three 10-hour operational periods during the initial 72 hours of the discharge;	V2: Figures 2.1 and 3.3 (As applicable)
(j)(3)	Include appropriately located aircraft and personnel capable of meeting the response time requirement for oil tracking from paragraph (j)(1) of this section; and	V2: Figures 2.1 and 3.3 (As applicable)
(j)(4)	Include sufficient numbers of aircraft, pilots, and trained observation personnel to support oil spill removal operations, commencing upon initial assessment, and capable of coordinating on-scene cleanup operations, including dispersant and mechanical recovery operations. Observation personnel must be trained in: (i) The protocols of oil-spill reporting and assessment, including estimation of slick size, thickness, and quantity; and (ii) The use of assessment techniques in ASTM F1779–08 (incorporated by reference, *see* § 154.106), and familiar with the use of other guides, such as NOAA's "Open Water Oil Identification Job Aid for Aerial Observation," and NOAA's "Characteristic Coastal Habitats" guide (available on the Internet at *http://response.restoration.noaa.gov/*use the following links in the order presented: Home| Emergency Response| Responding to Oil Spills).	V2: Figures 2.1 and 3.3 (As applicable)
(k)	A response plan for a facility that handles, stores, or transports Group I through Group IV petroleum oils must identify response resources with firefighting capability…	V2: § 3.0, § 8.3

U.S. COAST GUARD 33 CFR 154 *FINAL RULE – July 1, 2010 (Cont'd)*		
§154.1045	**BRIEF DESCRIPTION**	**SECTION**
(l)	... identify equipment and required personnel ... to protect fish and wildlife and sensitive environments.	V2: § 3.0, § 8.3
(l)(1)	... the identified response resources must include the quantities of boom sufficient to protect	V2: § 3.0, § 8.3
(l)(2)	... resources and response methods ... must be consistent with the ... ACP in effect 6 months prior to initial plan submission or the annual plan review ...	V1: § 1.5; V2: § 3.4
(m)	The response plan for a Facility that handles, stores, or transports Groups I through IV petroleum oils must identify an oil spill removal organization(s) with response resources that are available...	V2: § 3.0, § 8.3
(m)(1)	Except as required in paragraph (l)(2) ... shoreline clean-up response resources required must be determined as described in Appendix C of this part.	V2: § 3.0, § 4.0, § 8.3
(m)(2)	... resources and response methods ... must be consistent with the ... ACP in effect 6 months prior to initial plan submission or the annual plan review ...	V1: § 1.5; V2: § 3.0
(n)	Appendix C ... quantity of response resources ... for the maximum most probable discharge volume, and for each worst case discharge response tier.	V1: § 1.5; V2: § 3.0
(n)(1)	Included in Appendix C of this part is a cap that recognizes the practical and technical limits of response capabilities ...	V1: § 1.5; V2: § 3.0
(n)(2)	... Appendix C of this part lists the caps that will apply in ... February 18, 1998. ...Facility whose estimated recovery capacity exceeds ... caps ... shall identify sources of additional equipment equal to twice the cap ... or the amount necessary to reach the calculated planning volume, whichever is lower.	V1: § 1.5; V2: § 3.0
(o)(1)...(2)	The Coast Guard will initiate a review of cap increases and other requirements contained within this subpart ...	---

STATE OF OREGON *OAR-340-141* CROSS REFERENCE		
OAR 340-141-0140	**BRIEF DESCRIPTION**	**SECTION**
1	Submittal Agreement	Vol. 1 FWD-ii
1 (a)	Includes the name, address, and phone number of the submitting party;	Vol. 1 §1.1, Vol. 2 §1.1
1 (b)	Verifies acceptance of the plan…	Vol. 1 FWD-ii
1 (c)	Commits to execution of the plan…	Vol. 1 FWD-ii
1 (d)	Includes:	-----
1 (d)(A)	In the case of a facility, the name, location including latitude, longitude and river mile, and address of the facility, type of facility, starting date of operations, types of oils (see definition of oil) handled, volume of oil stored and maximum volume of oil capable of being stored.	Vol. 2, Fig. 8.1
1 (d)(B)	In the case of a covered vessel…	NA
1 (d)(C)	In the case of a covered vessel enrolled in a cooperative…	NA
2	Amendments….include a log sheet to record amendments....must be place at the front of the plan….a record of the section amended, the date that the old section was replaced with the amended section, verification that the Department was notified…the initials of the individual making the change. A description of the amendment and its purpose must also be included in the log sheet…	Vol. 1 and Vol. 2 Revision Record
3	Table of Contents….If the plan is an integrated plan…a cross reference must be included.	Vol. 1 and Vol. 2 Table of Contents, Vol. 1 Cross Reference
4	Purpose and Scope…including:	Vol. 1 § 1.4, § 1.5, Vol. 2 § 1.4
4 (a)	The region of operation covered by the plan;	Vol. 1 § 1.2, Vol. 2 § 1.2
4 (b)	The onshore facility, offshore facility or covered vessel operations covered by the plan; and	Vol. 2 § 8.0
4 (c)	The size and type of the average most probable spill and the worst case spill from the facility or covered vessel.	Vol. 2 § 1.3, § 8.3
5	Updates….describe the events or time periods that will trigger updates of the plan.	Vol. 1 § 1.7
6	Implementation Strategy….must present a strategy for ensuring use of the plan for spill response and cleanup operations as required by OAR 340-141-0210	Vol. 1 FWD-ii, Vol. 2 § 8.3
7	Spill Response System….must describe the organization of the spill response system…all task assignments anticipated by the end of the first full operational period, or necessary to manage the resources required by the 12 hour planning standard….must use a…(NIMS) type of incident management system…	Vol. 1 § 4.0, § 5.0
8	Contractor Identification….must identify the primary response contractor and subcontractors…	Vol. 2, Fig. 2.1, Fig. 3.2, Fig 3.3
8(a)	If a plan holder is a member of an oil spill response cooperative…state the cooperative's name, address, phone number and response capability….must also include proof of cooperative membership; or	Vol. 2 Fig 2.1, Fig 3.3

STATE OF OREGON *OAR-340-141* CROSS REFERENCE (Cont'd)		
OAR 340-141-0140	**BRIEF DESCRIPTION**	**SECTION**
8 (b)	If a plan holder is not a member of an oil spill response cooperative, for each contractor,…state that contractor's name, address, phone number or other means of contact at any time of the day, and response capability….must include a letter of intent signed by the contractor….Copies of written contracts or agreements with contractors must be available for inspection, if requested by the Department.	Vol. 2, Fig. 2.1, Fig. 3.3
9	Relationship to Other Plans….briefly describe its relations to all applicable local, state, regional and federal government spill response plans….describe how the plan holder's response organization will be integrated into the Northwest Area Contingency Plan.	Vol. 2 § 1.5
10	Spill Detection….list procedures that will be used to detect and document the presence and size of a spill, including methods which are effective during low visibility conditions….describe the use of mechanical or electronic monitoring or alarm systems (including threshold sensitivities) used to detect oil discharges into adjacent land or water from tanks, pipes, manifolds and other transfer or storage equipment.	Vol. 1 § 2.0.1, § 2.0.2 Vol 2. § 8.2
11	Notifications….describe procedures that will be taken to immediately notify appropriate parties that a spill has occurred.	Vol. 1 § 2.0, Vol. 2 § 2.0
11 (a)	…maintain a notification call out list that must be available for inspection upon the request of the Department, and that:	Vol. 1 § 2.0, Vol. 2 § 2.0
11 (a)(A)	Provides a contact at any time of the day for all spill response personnel identified under section (7) of this rule, including the contact's name, position title, phone number or other means of contact for any time of the day, and an alternate contact in the event the individual is unavailable;	Vol. 1 Figures 2.3a, 2.3b and 2.3c, Vol. 2 Fig. 2.2
11 (a)(B)	Lists the name and phone number of all government agencies that must be notified in the event of an oil spill…	Vol. 1 Fig. 2.4, Vol. 2 Fig. 2.1
11 (a)(C)	Establishes a clear order of priority for immediate notifications.	Vol. 1 Figures 2.1a, 2.1b, 2.1c, 2.1d, 2.1e, 2.1f
11 (b)	…identify a central reporting office or individual who is responsible for implementing the call out process.	Vol. 1 § 2.1, Vol. 2 § 2.2
12	Response Personnel….describe the personnel, including contract personnel available, to respond to an oil spill, including;	Vol. 1 Figures 2.3a, 2.3b and 2.3c, § 4.0, Vol. 2 Fig. 2.1, Fig. 3.3
12 (a)	A job description for each type of spill response position needed…	Vol. 1 § 4.0
12 (b)	The number of personnel available to perform the duties of each type of spill response position;	Vol. 1 Figures 2.3a, 2.3b and 2.3c, § 4.0, Vol. 2 Fig. 2.1, Fig. 3.3

STATE OF OREGON *OAR-340-141-0140* CROSS REFERENCE (Cont'd)		
OAR 340-141-0140	**BRIEF DESCRIPTION**	**SECTION**
12 (b)(A)	This number must be equal or greater than the number of persons necessary to sustain a response to the worst case spill…	Vol. 1 Figures 2.3a, 2.3b and 2.3c, § 4.0, Vol. 2 Fig. 2.1, Fig. 3.3
12 (b)(B)	If 24 hour operations are expected, the number of persons available to staff the ICS must be multiplied by the proposed number of operations periods (shifts).	Vol. 1 Figures 2.3a, 2.3b and 2.3c, § 4.0, Vol. 2 Fig. 2.1, Fig. 3.3
12 (c)	Arrangements of pre-positioning personnel at strategic locations…	Vol. 1 Figures 2.3a, 2.3b and 2.3c, § 4.0, Vol. 2 Fig. 2.1, Fig. 3.3
12 (d)	The type and frequency of spill response operations and safety training…	Vol. 1 § 1.8
13	Equipment and spill response resources….describe equipment and spill resources as follows:	-----
13 (a)	…list all resident equipment and resident dedicated response vessels used for oil containment, recovery, removal….list all relied upon communication tools.	Vol. 2 Figures 3.1 and 3.3
13 (b)	For resident equipment and vessels listed under subsection (a)…that are not owned by or available exclusively to the plan holder…estimate the extent that other contingency plans rely on the same equipment.	-----
13 (c)	For all resident oil containment and recovery equipment…include equipment make and model, the manufacturer's nameplate capacity of the response equipment, the EDRC (in barrels per day) an applicable design limits…	Vol. 2 Figures 3.1 and 3.3
13 (d)	…the plan must state the maximum amount of oil that could be recovered…per 24-hour period with the equipment used as it is designed.	Vol. 2 § 8.3
13 (e)	For purposes of determining plan adequacy under OAR 340-141-0190, and to assess realistic capabilities based on potential limitations…the Department will use the data presented in subsections (c) and (d) of this section to apply a higher efficiency factor for equipment listed in a plan if that plan holder provides adequate evidence that the higher efficiency factor is warranted for particular equipment or if the United States Coast Guard has approved a higher efficiency rating.	-----
13 (f)	…provide arrangements for pre-positioning of oil spill response equipment…	Vol. 2 § 3.0, § 4.4, § 8.3
13 (g)	When calculating the delivery time of equipment to a spill staging area…use travel speeds consistent with federal speed predictions for the equipment being moved.	Vol. 2 § 8.3

STATE OF OREGON *OAR-340-141* CROSS REFERENCE (Cont'd)		
OAR 340-141-0140	**BRIEF DESCRIPTION**	**SECTION**
14	Communications….describe the communication systems used for spill notification and response operations, including:	Vol. 2 § 3.8
14 (a)	Communication procedures that identify who will be responsible for the function, to whom and from whom communication will be established and any special instructions;	Vol. 1 § 4.0
14 (b)	The communication function(e.g. ground-to-air) assigned to each channel or frequency used;	Vol. 2 § 3.8
14 (c)	The maximum geographic range for each type of communications equipment used; and	Vol. 2 § 3.8
14 (d)	The communication system compatibility with key spill response agencies.	Vol. 2 § 3.8
15	Response Operation Sites….describe the process used by the plan holder to establish sites needed for spill response operations, including location or location selection criteria for an incident command post, a communications center if located away from the command post and equipment and personnel staging areas.	Vol. 1 § 3.0
16	Response Flow Chart or Timeline….describe the response process by:	-----
16 (a)	Presenting a flowchart or decision tree…	Vol. 1 § 3.0
16 (b)	Describing all key spill response operations in checklist forms…	Vol. 1 § 3.0, § 4.0
17	Authorities….describe responsible authorities by:	Vol. 1 § 2.0, § 4.0, Vol. 2 § 2.0
17 (a)	Listing the local, state and other government authorities responsible for the emergency procedures peripheral to spill containment and cleanup; and	Vol. 1 § 2.0, Vol. 2 § 2.0
17 (b)	Describing the plan holder's role in these emergency operations procedures before the proper authorities arrive…	Vol. 1 § 3.0, § 4.0
18	Damage Control….describe equipment and procedures…to minimize the magnitude of the spill and minimize structural damage that could increase the quantity of oil spilled.	Vol. 1 § 3.0
18 (a)	For facilities, damage control procedures must include methods to slow or stop pipeline, storage tank, and other leaks, and methods to achieve immediate emergency shutdown.	Vol. 1 § 3.0
18 (b)	For tank vessels, damage control procedures must include methods…	NA
18 (c)	For other covered vessels, damage control procedures must address methods…	NA
19	Containment….describe, in detail, any nonstandard methods specific to the plan to contain spilled oil and recover it from the environment. When a plan calls for the use of methods that have not been expressly approved by the Department, the description of the proposed options must include:	Vol. 1 § 3.0
19 (a)	The surveillance methods expected to be used to detect and track the extent and movement of the spill; and	Vol. 2
19 (b)	A description of methods to be used to contain and remove oil that will be effective for environmentally sensitive locations included in the Zone, or Zones, for which the plan is written.	Vol. 1 § 3.9, § 3.10, § 3.11, Vol. 2 Fig. 8.9

STATE OF OREGON *OAR-340-141* CROSS REFERENCE (Cont'd)		
OAR 340-141-0140	**BRIEF DESCRIPTION**	**SECTION**
20	Response Time….briefly describe initial equipment and personnel deployment activities that will accomplish the response…and provide:	Vol. 2 § 8.3
20 (a)	An estimate of the actual execution time;	Vol. 2 § 8.3
20 (b)	The specific location in the Zone where the resident required response equipment is stored; and	Vol. 2 Figures 3.1 and 3.3
20 (c)	The source and management of personnel to deploy the initial response equipment.	Vol. 1 Figures 2.3a-c, § 3.4-§ 3.12, Vol. 2 §2.0, § 3.0
21	Chemical Agents. If the plan holder proposed to use dispersants, coagulants, bioremediants or other chemical agents for response operations under certain conditions, the plan must describe:	N/A KMEP does not operate in areas where chemical agent use is appropriate.
21 (a)	Type and toxicity of chemicals, supplemented with material safety data sheets (MSDS) for each product;	N/A
21 (b)	The conditions under which the chemicals will be applied…	N/A
21 (c)	Methods of deployment; and	N/A
21 (d)	Location and accessibility of supplies and deployment equipment.	N/A
22	In Situ Burning. If the plan holder proposes to use in-situ burning for response operations, the plan must describe:	N/A KMEP does not operate in areas where In Situ Burning is appropriate.
22 (a)	Type of burning operations;	N/A
22 (b)	Conditions under which burning will be applied…	N/A
22 (c)	Methods of application; and	N/A
22 (d)	Location and accessibility of supplies and deployment equipment.	N/A
23	Environmental Protection….describe how environmental protection will be achieved, including:	-----
23 (a)	Protection of sensitive shoreline and island habitat by diverting or blocking oil movement;	Vol. 1 § 3.0, Vol. 2 § 4.0
23 (b)	Priorities of sensitive area protection in the region of operation covered by the plan as provided in a Geographic Response Strategy of the Northwest Area Contingency Plan, or designated by the Department;	Vol. 2 § 4.1
23 (c)	Rescue and rehabilitation of birds, marine mammals and other wildlife contaminated or otherwise affected by the oil spill; and	Vol. 2 § 4.3
23 (d)	Measures taken to reduce damages to the environment caused by shoreline and adjacent land cleanup operations.	Vol. 1 § 3.11

STATE OF OREGON *OAR-340-141* CROSS REFERENCE (Cont'd)		
OAR 340-141-0140	**BRIEF DESCRIPTION**	**SECTION**
24	Interim Storage. Each plan that has identified that oil will be recovered must plan for storage of the oil and combined oily waste material potentially created.	Vol. 2 § 5.4
24 (a)	Each plan must describe site criteria and methods used for interim storage of oil recovered…including sites available within the facility….	Vol. 2 § 5.4
24 (b)	If use of interim storage sites will require approval by local, state or federal officials…include information that could expedite the approval process, including a list of appropriate contacts and a brief description of procedures to follow for each applicable approval process.	Vol. 2 § 5.4
24 (c)	Interim storage and permanent disposal methods and sites must be sufficient to sustain support for oil recovery operations and manage the entire volume of oil recovered and oily wastes generated.	Vol. 2 § 5.4
24 (d)	Interim storage and permanent disposal methods and sites must comply with all applicable local, state and federal requirements.	Vol. 2 § 5.4
25	Health and Safety….describe procedures to protect the health and safety of oil spill response workers, and other individuals on-site. Provisions for training, decontamination facilities, safety gear and a safety officer position must be addressed.	Vol. 1 § 3.13
26	Post Spill Review….explain post-spill review procedures, including methods to review both the effectiveness of the plan and the need for plan amendments. Post-spill procedures must provide for a debriefing with the Department that will include any newly recognized need to amend the plan and list of any other lessons learned.	Vol. 1 § 3.15
27	Drills and Exercises….describe the schedule and type of drills and other exercised that will be practiced to ensure readiness of the plan elements…	Vol. 1 § 1.8
27 (a)	The plan holder must test and document internal call out procedures at least once every 90 calendar days….retain records…for at least three years and make them available for Department review upon request.	Vol. 1 § 1.8
27 (b)	The plan holder must notify the Department of drills and exercises at least 60 days before full deployment and tabletop drills, and 10 days prior to equipment exercises. Prior notice to the Department is not required before notification drills and internal phone number verification exercises.	Vol. 1 § 1.8
27 (c)	The plan holder must send post drill reports for all tabletop exercises and deployment drills to the Department no later than 60 days after the completion of the drill or exercise.	Vol. 1 § 1.8
28	Risk Variables. Each plan must list the spill risk variables within the region of operation covered by the plan, including:	Vol. 2 § 8.2
28 (a)	Each plan for a facility must list the following:	-----
28 (a)(A)	Types, physical properties and amounts of oil handled;	Vol. 1 Fig 3.8, Vol. 2, § 6.1, Fig 6.1a-i, Fig 8.1

STATE OF OREGON *OAR-340-141* CROSS REFERENCE (Cont'd)		
OAR 340-141-0140	**BRIEF DESCRIPTION**	**SECTION**
28 (a)(B)	A written description and map indicating site topography, stormwater and other drainage systems, mooring areas, pipelines, tanks, and other oil processing, storage and transfer sites and operations;	Vol. 2 § 6.0, § 7.0, § 8.1
28 (a)(C)	A written description of sites or operations with a history or high potential for oil spills, including key areas that pose significant navigation risk within the region of operation covered by the plan; and	Vol. 2 § 8.2
28 (a)(D)	Methods to reduce spills during transfer operations, including overfill protection.	Vol. 2 § 8.2
28 (b)	Each plan for a covered vessel must list the following:	NA
28 (b)(A)	Types, physical properties and amounts of oil handled;	NA
28 (b)(B)	A written description and diagram showing cargo, fuel, ballast tanks…	NA
28 (b)(C)	A written description of operations with a history of high potential for oil spills…	NA
29	Environmental Variables….list the environmental variables within the region of operation covered by the plan. Facility plans required to include river or coastal areas must identify the environmental variables from the probable point of release to the point the oil could travel in 24 hours in a current of four knots….	Vol. 2 § 4.0, ACP/GRP CD, Vol. 2 § 8.3, Vol. 2 § 9.2 and § 9.3
29 (a)	Natural resources, including coastal and aquatic habitat types and sensitivity by season, breeding sites, presence of state and federally listed endangered or threatened species and presence of commercial and recreational species;	Vol. 2 § 4.0, ACP/GRP CD Vol. 2 § 9.2 and § 9.3
29 (b)	Public resources, including public beached, water intakes, drinking water supplies and marinas;	Vol. 2 § 4.0, ACP/GRP CD
29 (c)	Seasonal hydrographic and climatic conditions; and	Vol. 2 § 4.0, ACP/GRP CD
29 (d)	Physical geographic features, including relative isolation of coastal regions, beach types, and other geological characteristics….	Vol. 2 § 4.0, ACP/GRP CD
30	Logistical Resources….list the logistical resources…including facilities for fire services, medical services and accommodations; and shoreline access areas, including boat launches.	Vol. 2 § 2.0
31	Response Strategy Outline….include a statement of the intended response activities.	Vol. 2 § 8.3, § 9.3
31 (a)	Deployment of resources and estimates of response times;	Vol. 2 § 8.3, § 9.3
31 (b)	The intended result of the activity of each person listed in section (7) and (12) of this section;	Vol. 2 § 8.3, § 9.3
31 (c)	Command and control arrangements;	Vol. 2 § 8.3, § 9.3
31 (d)	Required coordination; and	
31 (e)	Probable obstacles and an estimate of oil movement during the first 72 hours.	Vol. 2 § 8.3, § 9.3
32	Financial Responsibility….provide evidence that the facility or vessel is in compliance with federal financial responsibility requirements…	-----
33	Technical Terms Glossary….include a glossary of technical terms and abbreviations used in the plan.	Glossary of Terms/Acronyms

Note: This Regulatory Cross Reference refers to the Integrated Contingency Plan (ICP) as well as other documents prepared to address other regulatory requirements that have not been incorporated into the ICP. These documents will be made available for review at the facility upon request.

OAR 340-141-0160	BRIEF DESCRIPTION	SECTION
(1)	The owner or operator of each onshore and offshore facility must develop spill prevention strategies that will, when implemented, provide the best achievable protection from damages caused by the discharge of oil into the waters of the state. The strategies may be in the form of:	-----
(a)	Appendices to oil spill prevention and emergency response plans required under this chapter; or	-----
(b)	A stand alone prevention plan that meets all the requirements of OAR 340-141-0100 to 340-141-0230.	-----
(2)	Spill Prevention Countermeasure and Control Plans (SPCC), Operations Manuals and other prevention documents prepared to meet federal requirements under 33 CFR 154, 33 CFR 156, 40 CFR 109, 40 CFR 112, or the Federal Oil Pollution Act of 1990 or plans prepared to meet the requirements of other states may be submitted to satisfy requirements under this chapter if the Department deems that such requirements equal or exceed those of the department, or if the plans are modified or appended to satisfy the requirements of this Division.	Vol. 1 Agency Correspondence, Linnton SPCC, Willbridge SPCC, Oregon Pipelines Area § 9.0
(3)	Spill prevention strategies must at a minimum provide all the following:	-----
(a)	Documentation of types and frequency of spill prevention training provided to applicable personnel;	SPCC § 3.1, Vol. 2 § 9.0
(b)	Evidence that the facility has an operations manual;	Vol. 1 Agency Correspondence
(c)	A description of a drug and alcohol awareness program that provides training and information materials to all employees on recognition of alcohol and drug abuse treatment opportunities, and applicable company policies;	Vol. 2 § 9.0
(d)	Evidence of a maintenance and inspection program that includes:	-----
(A)	Summary of the frequency and type of all regularly scheduled inspection and preventative maintenance procedures for tanks, pipelines, key storage, transfer, or production equipment including associated pumps, valves, and flanges, and overpressure safety devices and other spill prevention equipment;	SPCC § 3.2, Vol. 2 § 9.0
(B)	Description of integrity testing of storage tanks and pipelines using such techniques as hydrostatic testing and visual inspection, including but not limited to the frequency of tests, means of identifying that a leak has occurred and measures to reduce spill risk if test material is product;	SPCC § 3.2, Vol. 2 § 9.0

STATE OF OREGON *OAR-340-141* CROSS REFERENCE (Cont'd)		
OAR 340-141-0160	**BRIEF DESCRIPTION**	**SECTION**
(C)	External and internal corrosion detection and repair;	SPCC § 3.2, Vol. 2 § 9.0
(D)	Damage criteria for equipment repair or replacement;	SPCC § 3.2, Vol. 2 § 9.0
(E)	Maintenance and inspection records of the storage and transfer facilities and related equipment will be made available to the Department upon request; and	-----
(F)	Documentation required by 40 CFR 112.7(e) or 33 CFR 154, Subparts C and D may be used to address elements of this subsection.	-----
(3)(e)	A description of the use of containment boom at facilities transferring persistent oil, including:	Vol. 2 Figures 3.1 and 8.9
(A)	Type(s) of boom used based upon varied conditions within the region(s) of operation; and	Vol. 2 Figures 3.1 and 8.9
(B)	Methods of boom placement and anchoring.	Vol. 2 Figures 3.1 and 8.9
(f)	Identification of spill prevention technology currently in use, including if applicable:	-----
(A)	Tank and pipeline materials and design;	SPCC § 5.1, § 6.1; Vol. 2 § 9.0
(B)	Storage tank overflow alarms, tank overflow cutoff switches, low level alarms and automatic transfer shutdown systems, including methods to alert operators, system accuracy and tank fill margin remaining at time of alarm activation before overflow would occur at maximum pumping rate (documentation required under 40CFR 112.7(e)(3) or 33 CFR 154.310(a)(12-13) may be used to address some or all of these elements);	SPCC § 5.0, Vol. 2 § 9.0
(C)	Leak detection systems for both active and non-active pipeline conditions including thresholds in terms of duration and percentage of pipeline flow limitations on system performance due to normal pipeline events, and procedures for operator response to leak alarms (documentation required under 40 CFR 112.7(e)(3) may be used to address some or all of these elements).	SPCC § 6.0 Vol. 2 § 9.0
(D)	Rapid pump and valve shutdown procedures, including means of ensuring that surge and overpressure conditions do not occur, rates of valve closure, sequence and time duration (average and maximum) for entire procedure, automatic and remote control capabilities utilized and visual displays of system status for operator use (documentation required under 40 CFR 112.7(e)(3) may be used to address some or all of these elements);	SPCC § 6.0, Vol. 2 § 9.0
(E)	Minimization of post-shutdown residual drainout from pipes, including criteria for locating valves, identification of all valves (including types and means of operation) that may be open during a transfer process, and any other techniques for reducing drain out;	SPCC § 6.0, Vol. 2 § 9.0

STATE OF OREGON *OAR-340-141* CROSS REFERENCE (Cont'd)		
OAR 340-141-0160	**BRIEF DESCRIPTION**	**SECTION**
(F)	Means of relieving pressure due to thermal expansion of liquid in pipes during periods of nonuse;	L O&M Procedure 700 (Series)
(G)	Secondary containment, including contents of the largest tank plus space for precipitation, and material design and permeability of the secondary containment area (documentation required under 40 CFR 112.7(e)(1) and (2)(ii)-(iv) may be used to address some or all of these elements);	SPCC § 5.1
(H)	Surge control systems;	Vol. 2 § 9.0
(I)	Internal and external corrosion control coatings or wrappings and instruments;	SPCC § 5.1, § 6.1; Vol. 2 § 9.0
(J)	Storm water and other drainage retention, treatment and discharge systems, including maximum storage capabilities and identification of any applicable discharge permits (documentation required under 40 CFR 112.7(e)(1) and (2)(iii) and (ix) may be used to address some or all of these elements); and	SPCC § 4.0, Vol. 2 § 9.0
(K)	Criteria for suspension of operations while leak detection or other spill control systems are inoperative.	SPCC, Vol. 2 § 9.0
(3)(g)	A description of facility site security systems, including:	SPCC, Vol. 2 § 9.0
(A)	Procedures for controlling and monitoring facility access;	SPCC, Vol. 2 § 9.0
(B)	Lighting (documentation required under 33 CFR 154.570 may be used to address some or all of this element);	SPCC, Vol. 2 § 9.0
(C)	Signage; and	SPCC, Vol. 2 § 9.0
(D)	Right of way identification or other measures to prevent third party damage (documentation required under 40 CFR 122.7(e)(3)(v) and (9) may be used to address some or all of this element)	Vol. 2 § 9.0
(h)	History of any discharges of oil to land or waters of the state in excess of 25 barrels (1,050 gallons) which occurred during the five year period prior to plan submittal date. For each discharge, describe:	Vol. 2 § 8.2.5, § 9.4 KM Intranet Database
(A)	Quantity;	Vol. 2 § 8.2.5, § 9.4 KM Intranet Database
(B)	Type of oil;	Vol. 2 § 8.2.5, § 9.4 KM Intranet Database
(C)	Geographic area;	Vol. 2 § 8.2.5, § 9.4 KM Intranet Database
(D)	Analysis of cause, including sources (s) of discharged oil and contributing factors (e.g., equipment failure, employee error, adverse weather, etc.); and	Vol. 2 § 8.2.5, § 9.4 KM Intranet Database
(E)	Measures taken to remedy the cause and prevent reoccurrence.	Vol. 2 § 8.2.5, § 9.4 KM Intranet Database

STATE OF OREGON *OAR-340-141* CROSS REFERENCE (Cont'd)		
OAR 340-141-0160	**BRIEF DESCRIPTION**	**SECTION**
(i)	A detailed and comprehensive site risk analysis that:	-----
(A)	Evaluates construction, age, corrosion, inspection and maintenance, operation and oil spill risk of the transfer, production and storage system including piping, tanks, pumps, valves and associated equipment;	SPCC, VOL 2 § 9.5
(B)	Evaluates spill minimization and containment systems;	SPCC, VOL 2 § 9.5
(C)	Incorporates information required in subsection (f) of this section;	SPCC, VOL 2 § 9.5
(D)	Is prepared under the supervision of (and bears the seal of) a licensed professional engineer; and	SPCC, VOL 2 § 9.5
(E)	Includes documentation required under 40 CFR 112.7(b) and (e) may be used to address some or all of the elements in this subsection.	-----
(j)	A description of how the facility will incorporate those measures that will provide best achievable protection to address spill risks identified in the risk analyses required in subsection (i) of this section. (Information documented pursuant to 40 CFR 112.7(e) and 33 CFR 154.310 may be used to address some or all of the elements of this subsection.)	SPCC, VOL 2 § 9.5

GLOSSARY OF TERMS/ACRONYMS

Page

Glossary of Terms.....Glossary/Acronyms-2

Acronyms.....Glossary/Acronyms-12

This glossary contains definitions of terms that will be used frequently during the course of response operations.

Abandon Pipeline: A pipeline or pipeline segment which has met the criteria of an Out-Of-Service pipeline (purged, sealed and disconnected from an operating system) but will not be maintained to minimum USDOT inspection and maintenance standards.

Activate: The process of mobilizing personnel and/or equipment within the response organization to engage in response operations.

Active Pipeline: A pipeline or pipeline segment which is in service whether or not the pipeline is fully operational. This includes pipelines which may have been utilized to transport hazardous liquids but are currently static or unused.

Adverse Weather: The weather conditions that will be considered when identifying response systems and equipment in a response plan for the applicable operating environment. Factors to consider include significant wave height, ice, temperature, weather - related visibility, and currents within the Captain of the Port (COTP) zone in which the systems or equipment are intended to function.

Agency Representative: Individual assigned to an incident from an agency who has been delegated full authority to make decisions on all matters affecting that agency's participation in response operations.

Alert: Means an incident has occurred at the terminal which has the potential to affect off-site locations.

Area Committee: As defined by Sections 311(a)(18) and (j)(4) of CWA, as amended by OPA, means the entity appointed by the President consisting of members from Federal, State, and local agencies with responsibilities that include preparing an Area Contingency Plan for the area designated by the President. The Area Committee may include ex-officio (i.e., non-voting) members (e.g., industry and local interest groups).

Area Contingency Plan: As defined by Sections 311(a)(19) and (j)(4) of CWA, as amended by OPA, means the plan prepared by an Area Committee, that in conjunction with the NCP, shall address the removal of a discharge including a worst-case discharge and the mitigation or prevention of a substantial threat of such a discharge from a vessel, offshore facility, or onshore facility operating in or near an area designated by the President.

Average Most Probable Discharge: A discharge of the lesser of 50 barrels or 1% of the volume of the worst case discharge.

Barrel (bbl): Measure of space occupied by 42 U.S. gallons at 60 degrees Fahrenheit.

Bioremediation Agents: Means microbiological cultures, enzyme additives, or nutrient additives that are deliberately introduced into an oil discharge and that will significantly increase the rate of biodegradation to mitigate the effects of the discharge.

Boom: A piece of equipment or a strategy used to either contain free floating oil to a confined area or protect an uncontaminated area from intrusion by oil.

Booming Strategies: Strategic techniques which identify the location and quantity of boom required to protect certain areas. These techniques are generated by identifying a potential spill source and assuming certain conditions which would affect spill movement on water.

Breakout Tank: Means a tank used to (a) relieve surges in a hazardous liquid pipeline system or (b) receive and store hazardous liquid transported by a pipeline for reinjection and continued transportation by pipeline.

Bulk: Material that is stored or transported in a loose, unpackaged liquid, powder, or granular form capable of being conveyed by a pipe, bucket, chute, or belt system.

Captain of the Port Zone (COTP): Means a zone specified in 33 CFR Part 3 and the seaward extension of that zone to the outer boundary of the exclusive economic zone (EEZ).

CERCLA: Means the Comprehensive Environmental Response, Compensation Liability Act regarding hazardous substance releases into the environment and the cleanup of inactive hazardous waste disposal sites.

Chemical Agents: Means those elements, compounds, or mixtures that coagulate, disperse, dissolve, emulsify, foam, neutralize, precipitate, reduce, solubilize, oxidize, concentrate, congeal, entrap, fix, make the pollutant mass more rigid or viscous, or otherwise facilitate the mitigation of deleterious effects or the removal of the oil pollutant from the water. Chemical agents include biological additives, dispersants, sinking agents, miscellaneous oil spill control agents, and burning agents, but do not include solvents.

CHEMTREC: Means the Chemical Transportation Emergency Center operated by Chemical Manufacturers Association. Provides information and/or assistance to emergency responders. Can be reached 24 hours a day by calling 800-424-9300.

Clean-up Contractor: Persons contracted to undertake a response action to clean up a spill.

Cleanup: For the purposes of this document, cleanup refers to the removal and/or treatment of oil, hazardous substances, and/or the waste or contaminated materials generated by the incident. Cleanup includes restoration of the site and its natural resources.

Coastal Waters: For the purpose of classifying the size of discharges, means the waters of the coastal zone except for the Great Lakes and specified ports and harbors on inland rivers.

Coastal Zone: As defined for the purpose of the NCP, means all United States waters subject to the tide, United States waters of the Great Lakes, specified ports and harbors on inland rivers, waters of the contiguous zone, other waters of the high seas subject to the NCP, and the land surface or land substrata, ground waters, and ambient air proximal to those waters. The term coastal zone delineates an area of federal responsibility for response action. Precise boundaries are determined by EPA/USCG agreements and identified in federal regional contingency plans.

Coast Guard District Response Group (DRG): As provided for by CWA sections 311(a)(20) and (j)(3), means the entity established by the Secretary of the department in which the USCG is operating within each USCG district and shall consist of: the combined USCG personnel and equipment, including firefighting equipment, of each port within the district; additional prepositioned response equipment; and a district response advisory team.

Command: The act of controlling manpower and equipment resources by virtue of explicit or delegated authority.

Command Post: A site located at a safe distance form the spill site where response decisions are made, equipment and manpower deployed, and communications handled. The Incident Commander and the On-Scene Coordinators may direct the on-scene response from this location.

Communications Equipment: Equipment that will be utilized during response operations to maintain communication between the Company employees, contractors, Federal/State/Local agencies. (Radio/ telephone equipment and links)

Containment Boom: A flotation/freeboard device, made with a skirt/curtain, longitudinal strength member, and ballast unit/weight designed to entrap and contain the product for recovery.

Contingency Plan: A document used by (1) federal, state, and local agencies to guide their planning and response procedures regarding spills of oil, hazardous substances, or other emergencies; (2) a document used by industry as a response plan to spills of oil, hazardous substances, or other emergencies occurring upon their vessels or at their facilities.

Contract or Other Approved Means: For OPA 90, a written contract with a response contractor; certification by the facility owner or operator that personnel and equipment are owned, operated, or under the direct control of the facility, and available within the stipulated times; active membership in a local or regional oil spill removal organization; and/or the facility's own equipment.

Critical Areas to Monitor: Areas which if impacted by spilled oil may result in threats to public safety or health.

Cultural Resources: Current, historic, prehistoric and archaeological resources which include deposits, structures, ruins, sites, buildings, graves, artifacts, fossils, or other objects of antiquity which provide information pertaining to the historical or prehistorical culture of people in the state as well as to the natural history of the state.

Damage Assessment: The process of determining and measuring damages and injury to the human environment and natural resources, including cultural resources. Damages include differences between the conditions and use of natural resources and the human environment that would have occurred without the incident, and the conditions and use that ensued following the incident. Damage assessment includes planning for restoration and determining the costs of restoration.

Decontamination: The removal of hazardous substances from personnel and their equipment necessary to prevent adverse health effects.

Discharge: Any spilling, leaking, pumping, pouring, emitting, emptying, or dumping.

Dispersants: Means those chemical agents that emulsify, disperse, or solubilize oil into the water column or promote the surface spreading of oil slicks to facilitate dispersal of the oil into the water column.

Diversion Boom: A floatation/freeboard device, made with a skirt/curtain, longitudinal strength member, and ballast unit/weight designed to deflect or divert the product towards a pick up point, or away from certain areas.

Drinking Water Supply: As defined by Section 101(7) of CERCLA, means any raw or finished water source that is or may be used by a public water system (as defined in the Safe Drinking Water Act) or as drinking water by one or more individuals.

Economically Sensitive Areas: Those areas of explicit economic importance to the public that due to their proximity to potential spill sources may require special protection and include, but are not limited to: potable and industrial water intakes; locks and dams; and public and private marinas.

Emergency Planning Zone: Means the area designated by the jurisdiction boundaries of those communities which are within a radial distance of one-half mile from the terminal.

Emergency Response: Means the response to any occurrence which results, or is likely to result in a release of a hazardous substance due to an event.

Emergency Service: Those activities provided by state and local government to prepare for and carry out any activity to prevent, minimize, respond to, or recover from an emergency.

Environmentally Sensitive Areas: Streams and water bodies, aquifer recharge zones, springs, wetlands, agricultural areas, bird rookeries, endangered or threatened species (flora and fauna) habitat, wildlife preserves or conservation areas, parks, beaches, dunes, or any other area protected or managed for its natural resource value.

Exclusive Economic Zone: Means the zone contiguous to the territorial sea of the United States extending to a distance up to 200 nautical miles from the baseline from which the breadth of the territorial sea is measured.

Facility (DOT): Means new and existing pipe, rights-of-way and any equipment, facility, or building used in the transportation of hazardous liquids or carbon dioxide.

Facility (EPA/USCG): Either an onshore facility or an offshore facility and includes, but is not limited to structures, equipment, and appurtenances thereto, used or capable of being used to transfer oil to or from a vessel or a public vessel. A facility includes federal, state, municipal, and private facilities.

Facility That Could Reasonably Be Expected To Cause Significant And Substantial Harm: Means any fixed MTR on-shore facility (including piping and any structures that are used for the transfer of oil between a vessel and a facility) that is capable of transferring oil, in bulk, to or from a vessel of 250 barrels or more, and a deepwater port. This also includes any facility specifically identified by the COTP.

Facility That Could Reasonably Be Expected To Cause Substantial Harm: Means any mobile MTR facility that is capable of transferring oil to or from a vessel with a capacity of 250 barrels or more. This also includes any facility specifically identified by the COTP.

Facility Operator: The person who owns, operates, or is responsible for the operation of the facility.

Federal Fund: The spill liability trust fund established under OPA.

Federal Regional Response Team: The federal response organization (consisting of representatives from selected federal and state agencies) which acts as a regional body responsible for planning and preparedness before an oil spill occurs and providing advice to the FOSC in the event of a major or substantial spill.

Federal Response Plan (FRP): Means the agreement signed by 25 federal departments and agencies in April 1987 and developed under the authorities of the Earthquake Hazards Reduction Act of 1977 and the Disaster Relief Act of 1974, as amended by the Stafford Disaster Relief Act of 1988.

First Responders, First Response Agency: A public health or safety agency (e.g., fire service or police department) charged with responding to a spill during the emergency phase and alleviating immediate danger to human life, health, safety, or property.

General Emergency: Means an incident has occurred and the affected community is implementing protective actions.

Handle: To transfer, transport, pump, treat, process, store, dispose of, drill for, or produce.

Harmful Quantity Of Oil: The presence of oil from an unauthorized discharge in a quantity sufficient either to create a visible film or sheen upon or discoloration of the surface of the water or a shoreline, tidal flat, beach, or marsh, or to cause a sludge or emulsion to be deposited beneath the surface of the water or on a shoreline, tidal flat, beach, or marsh.

Hazardous Chemicals: Means all chemicals which constitute a physical hazard or a health hazard as defined by 29 CFR 1910.1200, with the exceptions listed in section 311(e). This term comprises approximately 90 percent of all chemicals.

Hazardous Material: Any nonradioactive solid, liquid, or gaseous substance which, when uncontrolled, may be harmful to humans, animals, or the environment. Including but not limited to substances otherwise defined as hazardous wastes, dangerous wastes, extremely hazardous wastes, oil, or pollutants.

Hazardous Substance: Any substance designed as such by the Administrator of the EPA pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act; regulated pursuant to Section 311 of the Federal Water Pollution Control Act, or discharged by the SERC.

Hazardous Waste: Any solid waste identified or listed as a hazardous waste by the Administrator of the EPA pursuant to the federal Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act (RCRA), 42 U.S.C., Section 6901, et seq as amended. The EPA Administrator has identified the characteristics of hazardous wastes and listed certain wastes as hazardous in Title 40 of the Code of Federal Regulations, Part 261, Subparts C and D respectively.

HAZMAT: Hazardous materials or hazardous substances, exposure to which may result in adverse effects on health or safety of employees.

HAZWOPER: Hazardous Waste Operations and Emergency Response Regulations published by OSHA to cover worker safety and health aspects of

Health Hazard: Means a chemical for which there is statistically significant evidence based on at least one study conducted in accordance with established scientific principals that acute or chronic health effects may occur in exposed employees.

Heat Stress: Dangerous physical condition caused by over exposure to extremely high temperatures.

Hypothermia: Dangerous physical condition caused by over exposure to freezing temperatures.

Incident: Any event that results in a spill or release of oil or hazardous materials. Action by emergency service personnel may be required to prevent or minimize loss of life or damage to property and/or natural resources.

Incident Briefing Meeting: Held to develop a comprehensive, accurate, and up-to-date understanding of the incident, nature of status of control operations, and nature and status of response operations; ensure the adequacy of control and response operations; begin to organize control and response operations; and prepare for interactions with outside world.

Incident Command Post (ICP): That location at which all primary command functions are executed.

Incident Command System (ICS): The combination of facilities, equipment, personnel, procedures, and communications operating within a common organizational structure, with responsibility for the management of assigned resources at an incident.

Incident Commander (IC): The one individual in charge at any given time of an incident. The Incident Commander will be responsible for establishing a unified command with all on-scene coordinators.

Indian Tribe: As defined in OPA section 1001, means any Indian tribe, band, nation, or other organized group or community, but not including any Alaska Native regional or village corporation, which is recognized as eligible for the special programs and services provided by the United States to Indians because of their status as Indians and has governmental authority over lands belonging to or controlled by the Tribe.

Initial Cleanup: Remedial action at a site to eliminate acute hazards associated with a spill. An initial clean-up action is implemented at a site when a spill of material is an actual or potentially imminent threat to public health or the environment, or difficulty of cleanup increases significantly without timely remedial action. All sites must be evaluated to determine whether initial cleanup is total cleanup, however, this will not be possible in all cases due to site conditions (i.e., a site where overland transport or flooding may occur).

Initial Notification: The process of notifying the necessary Company personnel and Federal/ State/Local agencies that a spill has occurred, including all pertinent available information surrounding the incident.

Initial Response Actions: The immediate actions that are to be taken by the spill observer after detection of a spill.

Inland Area means the area shoreward of the boundary lines defined in 46 CFR part 7, except that in the Gulf of Mexico, it means the area shoreward of the lines of demarcation (COLREG lines) as defined in §80.740 through 80.850 of this chapter. The inland area does not include the Great Lakes.

Inland Waters: State waters not considered coastal waters; lakes, rivers, ponds, streams, underground water, et. al.

Inland Zone: Means the environment inland of the coastal zone excluding the Great Lakes, and specified ports and harbors on inland rivers. The term inland zone delineates an area of federal responsibility for response action. Precise boundaries are determined by EPA/USCG agreements and identified in federal regional contingency plans.

Interim Storage Site: A site used to temporarily store recovered oil or oily waste until the recovered oil or oily waste is disposed of at a permanent disposal site. Interim storage sites include trucks, barges, and other vehicles, used to store waste until the transport begins.

Internally Reported Event: Means an incident has occurred that does not meet the reporting criteria established for notification of off-site authorities. No evacuation has occurred.

Lead Agency: The government agency that assumes the lead for directing response activities.

Lead Federal Agency: The agency which coordinates the federal response to incident on navigable waters. The lead federal agencies are:

- **U.S. Coast Guard:** Oil and chemically hazardous materials incidents on navigable waters.
- **Environmental Protection Agency:** Oil and chemically hazardous materials incidents on inland waters.

Lead State Agency: The agency which coordinates state support to federal and/or local governments or assumes the lead in the absence of federal response.

Line Section: Means a continuous run of pipe between adjacent pressure pump stations, between a pressure pump station and terminal or breakout tanks, between a pressure pump station and a block valve, or between adjacent block valves.

Light Oil Terminal Operations: Means the storage and distribution of gasoline and diesel fuel to wholesale customers.

Loading: Transfer from Facility to vehicle.

Local Emergency Planning Committee (LEPC): A group of local representatives appointed by the State Emergency Response Commission (SERC) to prepare a comprehensive emergency plan for the local emergency planning district, as required by the Emergency Planning and Community Right-to-know Act (EPCRA).

Local Response Team: Designated Facility individuals who will fulfill the roles determined in the oil spill response plan in the event of an oil or hazardous substance spill. They will supervise and control all response and clean-up operations.

Lower Explosive Limit: Air measurement utilized to determine the lowest concentration of vapors that support combustion. This measurement must be made prior to entry into a spill area.

Marinas: Small harbors with docks, services, etc. for pleasure craft.

Marine Transportation Related Facility (MTR FACILITY): Means an on-shore facility, including piping and any structure used to transfer oil to or from a vessel, subject to regulation under 33 CFR Part 154 and any deepwater port subject to regulation under 33 CFR Part 150.

Maximum Extent Practicable: Means the planning values derived from the planning criteria used to evaluate the response described in the response plan to provide the on-water recovery capability and the shoreline protection and cleanup capability to conduct response activities for a worst case discharge from a facility in adverse weather.

Maximum Most Probable Discharge: Means a discharge of the lesser of 1,200 barrels or 10 percent of the volume of a worst case discharge.

Medium Discharge: Means a discharge greater than 2,100 gallons (50 Bbls) and less than or equal to 36,000 gallons (85+ Bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD.

National Contingency Plan: The plan prepared under the Federal Water Pollution Control Act (33 United State Code §1321 et seq) and the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (42 United State Code § 9601 et seq), as revised from time to time.

National Pollution Funds Center (NPFC): Means the entity established by the Secretary of Transportation whose function is the administration of the Oil Spill Liability Trust Fund (OSLTF). Among the NPFC's duties are: providing appropriate access to the OSLTF for federal agencies and states for removal actions and for federal trustees to initiate the assessment of natural resource damages; providing appropriate access to the OSLTF for claims; and coordinating cost recovery efforts.

National Response System (NRS): Is the mechanism for coordinating response actions by all levels of government in support of the OSC. The NRS is composed of the NRT, RRTs, OSC, Area Committees, and Special Teams and related support entities.

National Strike Force (NSF): Is a special team established by the USCG, including the three USCG Strike Teams, the Public Information Assist Team (PIAT), and the National Strike Force Coordination Center. The NSF is available to assist OSCs in their preparedness and response duties.

National Strike Force Coordination Center (NSFCC): Authorized as the National Response Unit by CWA section 311(a)(23) and (j)(2), means the entity established by the Secretary of the department in which the USCG is operating at Elizabeth City, North Carolina, with responsibilities that include administration of the USCG Strike Teams, maintenance of response equipment inventories and logistic networks, and conducting a national exercise program.

Natural Resource: Land, fish, wildlife, biota, air, water, ground water, drinking water supplies, and other such resources belonging to, managed by, held in trust by, appertaining to or otherwise controlled by the state, federal government, private parties, or a municipality.

Navigable Waters: As defined by 40 CFR 110.1 means the waters of the United States, including the territorial seas. The term includes:

All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters that are subject to the ebb and flow of the tide;

Interstate waters, including interstate wetlands;

All other waters such as interstate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, and wetlands, the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters;

That are or could be used by interstate or foreign travelers for recreational or other purposes;

From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; and

That are used or could be used for industrial purposes by industries in interstate commerce. All impoundments of waters otherwise defined as navigable waters under this section;

Tributaries of waters identified in paragraphs (a) through (d) of this definition, including adjacent wetlands; and

Wetlands adjacent to waters identified in paragraphs (a) through (e) of this definition: Provided, that waste treatment systems (other than cooling ponds meeting the criteria of this paragraph) are not waters of the United States.

Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the Clean Water Act jurisdiction remains with EPA.

Nearshore Area: For OPA 90, the area extending seaward 12 miles from the boundary lines defined in 46 CFR Part 7, except in the Gulf of Mexico. In the Gulf of Mexico, it means the area extending seaward 12 miles from the line of demarcation defined in §80.740 - 80.850 of title 33 of the CFR.

Non-persistent or Group I Oil: A petroleum-based oil that, at the time of shipment, consists of hydrocarbon fractions:

1. At lease 50% of which by volume, distill at a temperature of 340 degrees C (645 degrees F);
2. At least 95% of which volume, distill at a temperature of 370 degrees C (700 degrees F).

Ocean: The open ocean, offshore area, and nearshore area as defined in this subpart.

Offshore area: The area up to 38 nautical miles seaward of the outer boundary of the nearshore area.

Oil or Oils: Naturally occurring liquid hydrocarbons at atmospheric temperature and pressure coming from the earth, including condensate and natural gasoline, and any fractionation thereof, including, but not limited to, crude oil, petroleum gasoline, fuel oil, diesel oil, oil sludge, oil refuse, and oil mixed with wastes other than dredged spoil. Oil does not include any substance listed in Table 302.4 of 40 CFR Part 302 adopted August 14, 1989, under Section 101(14) of the federal comprehensive environmental response, compensation, and liability act of 1980, as amended by P. L. 99-499.

Oil Spill Liability Trust Fund: Means the fund established under section 9509 of the Internal Revenue Code of 1986 (26 U.S.C. 9509).

Oil Spill Removal Organization: Means an entity that provides response resources.

Oily Waste: Product contaminated waste resulting from a spill or spill response operations.

On-Scene Coordinator (OSC): Means the federal official predesignated by the EPA or the USCG to coordinate and direct response under subpart D.

On-site: Means the areal extent of contamination and all suitable areas in very close proximity to the contamination necessary for implementation of a response action.

Open Ocean: means the area from 38 nautical miles seaward of the outer boundary of the nearshore area, to the seaward boundary of the exclusive economic zone.

Operating Area: Refers to the Rivers and Canals, Inland, Nearshore, Great Lakes, or Offshore geographic location(s) in which a facility is handling, storing, or transporting oil.

Operating Environment: Refers to Rivers and Canals, Inland, Great Lakes, or Ocean. These terms are used to define the conditions in which response equipment is designed to function.

Out of Service (OOS) Pipeline: A pipeline or pipeline segment which has been effectively cleaned of all hazardous liquids, filled with water or inert gas and blinded or otherwise isolated from an active pipeline system.

Owner or Operator: Any person, individual, partnership, corporation, association, governmental unit, or public or private organization of any character.

Persistent Oil: A petroleum-based oil that does not meet the distillation criteria for a non-persistent oil. For the purposes of this Appendix, persistent oils are further classified based on specific gravity as follows:

1. Group II specific gravity less than .85
2. Group III specific gravity between .85 and less than .95
3. Group IV specific gravity .95 and including 1.0
4. Group V specific gravity greater than 1.0

Pipeline System: Means all parts of a pipeline facility through which a hazardous liquid or carbon dioxide moves in transportation, including but not limited to, line pipe, valves, and other appurtenances connected to line pipe, pumping units, fabricated assemblies associated with pumping units, metering and delivery stations and fabricated assemblies therein, and breakout tanks.

Plan Holder: The plan holder is the industry transportation related facility for which a response plan is required by federal regulation to be submitted by a vessel or facility's owner or operator.

Post Emergency Response: The portion of a response performed after the immediate threat of a release has been stabilized or eliminated and cleanup of the sites has begun.

Post Emergency: The phase of response operations conducted after the immediate threat of the release has been stabilized, and cleanup operations have begun.

Primary Response Contractors or Contractors: An individual, company, or cooperative that has contracted directly with the plan holder to provide equipment and/or personnel for the containment or cleanup of spilled oil.

Qualified Individual (QI): That person or entity who has authority to activate a spill cleanup contractors, act as liaison with the "On-Scene Coordinator" and obligate funds required to effectuate response activities.

Recreation Areas: Publicly accessible locations where social/sporting events take place.

Regional Response Team (RRT): The Federal response organization (consisting of representatives from selected Federal and State agencies) which acts as a regional body responsible for overall planning and preparedness for oil and hazardous materials releases and for providing advice to the OSC in the event of a major or substantial spill.

Remove or Removal: As defined by section 311(a)(8) of the CWA, refers to containment and removal of oil or hazardous substances from the water and shorelines or the taking of such other actions as may be necessary to minimize or mitigate damage to the public health or welfare (including, but not limited to, fish, shellfish, wildlife, public and private property, and shorelines and beaches) or to the environment. For the purpose of the NCP, the term also includes monitoring of action to remove discharge.

Response Activities: The containment and removal of oil from the water and shorelines, the temporary storage and disposal of recovered oil, or the taking of other actions as necessary to minimize or mitigate damage to public health or welfare, or the environment.

Response Contractors: Persons/companies contracted to undertake a response action to contain and/or clean up a spill.

Response Guidelines: Guidelines for initial response that are based on the type of product involved in the spill, these guidelines are utilized to determine clean-up methods and equipment.

Response Plan: A practical manual used by industry for responding to a spill. Its features include: (1) identifying the notifications sequence, responsibilities, response techniques, etc. in a easy to use format; (2) using decision trees, flowcharts, and checklists to ensure the proper response for spills with varying characteristics; and (3) segregating information needed during the response from data required by regulatory agencies to prevent confusion during a spill incident.

Response Priorities: Mechanism used to maximize the effective use of manpower and equipment resources based upon their availability during an operational period.

Response Resources: All personnel and major items of equipment available, or potentially available, for assignment to incident tasks on which status is maintained.

Responsible Party: Any person, owner/operator, or facility that has control over an oil or hazardous substance immediately before entry of the oil or hazardous substance into the atmosphere or in or upon the water, surface, or subsurface land of the state.

Restoration: The actions involved in returning a site to its former condition.

Rivers and Canals: A body of water confined within the inland area that has a project depth of 12 feet or less, including the Intracoastal Waterway and other waterways artificially created for navigation.

Securing the Source: Steps that must be taken to stop discharge of oil at the source of the spill.

Sinking Agents: Means those additives applied to oil discharges to sink floating pollutants below the water surface.

Site Characterization: An evaluation of a cleanup site to determine the appropriate safety and health procedures needed to protect employees from identified hazards.

Site Conditions: Details of the area surrounding the facility, including shoreline descriptions, typical weather conditions, socioeconomic breakdowns, etc.

Site Emergency: Means an incident has occurred and the entire terminal, with the exception of critical employees has been sheltered on-site or evacuated.

Site Safety and Health Plan: A site specific plan developed at the time of an incident that addresses:

- Safety and health hazard analysis for each operation.
- Personal protective equipment to be used.
- Training requirements for site workers.
- Medical surveillance requirements.
- Air monitoring requirements.
- Site control measures.
- Decontamination procedures.
- Emergency response procedures.
- Confined space entry procedures.

Site Security and Control: Steps that must be taken to provide safeguards needed to protect personnel and property, as well as the general public, to ensure an efficient clean-up operation.

Skimmers: Mechanical devices used to skim the surface of the water and recover floating oil. Skimmers fall into four basic categories (suction heads, floating weirs, oleophilic surface units, and hydrodynamic devices) which vary in efficiency depending on the type of oil and size of spill.

Snare Boom: Oil will adhere to the material of which this boom is made of and thus collect it.

Sorbents: Materials ranging from natural products to synthetic polymeric foams placed in confined areas to soak up small quantities of oil. Sorbents are very effective in protecting walkways, boat decks, working areas, and previously uncontaminated or cleaned areas.

Spill: An unauthorized discharge of oil or hazardous substance into the waters of the state.

Spill Observer: The first Facility individual who discovers a spill. This individual must function as the first responder and person-in-charge until relieved by an authorized supervisor.

Spill of National Significance (SONS): Means a spill which due to its severity, size, location, actual or potential impact on the public health and welfare or the environment, or the necessary response effort, is so complex that it requires extraordinary coordination of federal, state, local, and responsible party resources to contain and cleanup the discharge.

Spill Management Team: The personnel identified to staff the organizational structure identified in a response plan to manage response plan implementation.

Spill Response: All actions taken in responding to spills of oil and hazardous materials, e.g.: receiving and making notifications; information gathering and technical advisory phone calls; preparation for and travel to and from spill sites; direction of clean-up activities; damage assessments; report writing, enforcement investigations and actions; cost recovery; and program development.

Spill Response Personnel: Federal, state, local agency, and industry personnel responsible for participating in or otherwise involved in spill response. All spill response personnel will be pre-approved on a list maintained in each region.

Staging Areas: Designated areas near the spill site accessible for gathering and deploying equipment and/or personnel.

State Emergency Response Commission (SERC): A group of officials appointed by the Governor to implement the provisions of Title III of the Federal Superfund Amendments and Re-authorization Act of 1986 (SARA). The SERC approves the State Oil and Hazardous Substance Discharge Prevention and Contingency Plan and Local Emergency Response Plans.

Substantial Threat of a Discharge: Means any incident or condition involving a facility that may create a risk of discharge of fuel or cargo oil. Such incidents include, but are not limited to storage tank or piping failures, above ground or underground leak, fires, explosions, flooding spills contained within the facility, or other similar occurrences.

Surface Collecting Agents: Means those chemical agents that form a surface film to control the layer thickness of oil.

Surface Washing Agent: Is any product that removes oil from solid surfaces, such as beaches and rocks, through a detergency mechanism and does not involve dispersing or solubilizing the oil into the water column.

Tanker: A self-propelled tank vessel constructed or adapted primarily to carry or hazardous material in bulk in the cargo spaces.

Tidal Current Tables: Tables which contain the predicted times and heights of the high and low waters for each day of the year for designated areas.

Toxic Substances: Means any substances which have the capacity to produce personal injury or illness to man through ingestion, inhalation, or absorption through any body surface.

Trajectory Analysis: Estimates made concerning spill size, location, and movement through aerial surveillance or computer models.

Transfer: Any movement of oil to, from, or within a vessel by means of pumping, gravitation, or displacement.

Trustee: Means an official of a federal natural resources management agency designated in subpart G of the NCP or a designated state official or Indian tribe or, in the case of discharges covered by the OPA, a foreign government official, who may pursue claims for damages under section 1006 of the OPA.

Underwriter: An insurer, a surety company, a guarantor, or any other person, other than an owner or operator of a vessel or facility, that undertakes to pay all or part of the liability of an owner or operator.

Unified Command: The method by which local, state, and federal agencies and the responsible party will work with the Incident Commander to:

- Determine their roles and responsibilities for a given incident.
- Determine their overall objectives for management of an incident.
- Select a strategy to achieve agreed-upon objectives.
- Deploy resources to achieve agreed-upon objectives.

Unified or Coordinated Command Meeting: Held to obtain agreement on strategic objectives and response priorities; review tactical strategies; engage in joint planning, integrate response operations; maximize use of resources; and minimize resolve conflicts.

Unusual Event: Means an incident has occurred which is noticeable and dramatic from the Terminal perimeter, however, no outside assistance is required and no evacuation outside the incident scene has occurred.

Volunteers: An individual who donates their services or time without receiving monetary compensation.

Waste: Oil or contaminated soil, debris, and other substances removed from coastal waters and adjacent waters, shorelines, estuaries, tidal flats, beaches, or marshes in response to an unauthorized discharge. Waste means any solid, liquid, or other material intended to be disposed of or discarded and generated as a result of an unauthorized discharge of oil. Waste does not include substances intended to be recycled if they are in fact recycled within 90 days of their generation or if they are brought to a recycling facility within that time.

Waters of the U.S. - See Navigable Waters, page Glossary / Acronyms-7.

Wetlands: Those areas that are inundated or saturated by surface or groundwater at a frequency or duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include playa lakes, swamps, marshes, bogs, and similar areas such as sloughs, prairie potholes, wet meadows, prairie river overflows, mudflats, and natural ponds (40 CFR 112.2(y)).

Wildlife Rescue: Efforts made in conjunction with Federal and State agencies to retrieve, clean, and rehabilitate birds and wildlife affected by an oil spill.

Worst Case Discharge: The largest foreseeable discharge under adverse weather conditions. For facilities located above the high water line of coastal waters, a worst case discharge includes those weather conditions most likely to cause oil discharged from the facility to enter coastal waters.

AC	-	Area Committee
ACP	-	Area Contingency Plan
ADAPTS	-	Air Deliverable Anti-Pollution Transport
AFFF	-	Aqueous Film Forming Foam
AGT	-	Any Gross Tonnage (TONS)
AOR	-	Area of Responsibility
API	-	American Petroleum Institute

559 Core Plan
1585 Southern Region-Central
1586 Northern Region-Northwest
1587 Northern Region-Central
1588 Northern Region-California/Nevada
1589 Northern Region-Bay
1590 Southern Region-East
1591 Southern Region-West

Dear Mr. Fant,

The Office of Pipeline Safety (OPS), Pipeline and Hazardous Materials Safety Administration (PHMSA) reviewed the proposed December 2005 plan revision to address our plan review findings in our 25 January 2005 letter as discussed between the representatives of your company and OPS on 2 February 2005. We have determined that the proposed revision will address satisfactorily the findings in our referenced letter.

We also reviewed the January 2005 revisions for the plan. Note that there are several findings for these revisions because of certain modified information in the revisions. The results of the review of the proposed December 2005 and the January 2005 plan revisions are enclosed. OPS will approve the plan when we receive the reissued plan on or before 31 January 2006, provided the reissued plan addresses satisfactorily the findings in the enclosure.

Kinder Morgan Energy Partners, LP still has temporary approval for the plan as provided in our letter dated June 12, 2000. Note that as shown above, OPS is now part of a new U.S. Department of Transportation administration, PHMSA. The Research and Special Programs Administration (RSPA) no longer exists in the department. We bring this to your attention for your future consideration because your plan still refers to RSPA.

If the revisions are sent via the United States Postal Service, please send to:
L. E. Herrick
Response Plans Officer (PHP-80)
US DOT Office of Pipeline Safety
P.O. Box 267
Alexandria, VA 22313-0267

If the revisions are sent via any other carrier, please send to:
L. E. Herrick
Response Plans Officer (PHP-80)
US DOT Office of Pipeline Safety
400 Seventh Street, S.W., Room 2103
Washington, D.C. 20590

Please refer to the "OPS Plan Sequence Numbers" listed above in all plan-related correspondence, including e-mails. E-mail is the preferred method for submitting inquiries, questions and comments to me at le.herrick@dot.gov. You can also telephone me at (202) 366-5523 or fax me at (202) 366-4566. Thank you for your cooperation.

Sincerely,

L. E. Herrick
Response Plans Officer

Re: Kinder Morgan Energy Partners, L.P./Pacific Region
Integrated Contingency Plan Update
(OPS Sequence Numbers: 559 and 1585 through 1591)

Dear Ms Barber;

Enclosed are two (2) CD's containing electronic copies of the Pacific Region Integrated Contingency Plan for your review and approval in accordance with 49 CFR 194.121 (a) (2). A copy of the Facility Response Plan questionnaire is included on each CD. A printed copy of the questionnaire has been included as well.

The Integrated Contingency Plan has been updated through January 2011 to address changes in company personnel and contractors as well as recent terminal expansions in Phoenix, Reno and Tucson.

If you have any questions, comments or need further information, please contact me at (713) 369-8530.

Sincerely,

Charles V. Mathis

Mr. Steve Marositz
Kinder Morgan Energy Partners, L.P.
c/o Manager, Codes and Standards,
Pacific Region, 2319 S. Riverside Ave.
Bloomington, California 92316

Dear Mr. Marositz,

Your California Facility Oil Spill Contingency Plan submittal, dated May 23, 2008, has been reviewed for compliance with the California Code of Regulations Title 14, Subchapter 3, Sections 815, 816, and 817. Based on this review the following plan is approved:

Kinder Morgan Energy Partners, LP **Control #** **P2-07-175A, P2-07-175B, P2-07-175C**

A copy of this letter should be kept aboard each vessel covered by this contingency plan and must be presented to a bunkering company prior to transferring oil in California Marine Waters. **This approval expires on March 31, 2013.**

Your California Facility Oil Spill Contingency Plan must be kept current at all times. Promptly send plan revisions to all plan recipients. When submitting plan revisions, use the letterhead address, with "Attention: Marine Safety Branch".

The current California regulations regarding Oil Spill Contingency Plans can be located through the internet at:

http://www.dfg.ca.gov/ospr/index.html

Printed regulations can be obtained by contacting Barclay's Publishing House at telephone number (800) 888-3600.

We appreciate your efforts to improve the safety of California's marine environment. If you have any questions regarding this approval, contact Mr. Dave Blurton, Marine Safety Branch, at telephone number (707) 864-4975, or by e-mail at Dblurton@ospr.dfg.ca.gov.

Sincerely,

T.L. Mar

Dear Mr. Hosler:

The Coast Guard has completed a final review of your Facility Response Plan submitted May 25, 2007 to meet the requirements of the Oil Pollution Act of 1990 (OPA 90). Your plan is hereby approved. **The expiration date of this approval is August 01, 2012.**

As a reminder, in accordance with Title 33 Code of Federal Regulations (CFR), Parts 154.1030(f) and 154.1065, you shall review this plan annually and submit any revisions to the Captain of the Port and any other plan holders for information or approval as appropriate. Plans submitted for re-approval must be consistent with the National Contingency Plan (NCP) and the applicable Area Contingency Plan (ACP) covering the area in which the facility operates and that are in effect at the time of plan submission. If the NCP and ACP have been revised within 6 months prior to the date of submission, the plan may be based on the prior NCP or ACP.

If you have any question, please contact our Facilities Division at (310) 732-7388.

Kinder Morgan Willbridge
Attn: Mr. Greg Westling
11400 NW St. Helens RD
Portland, OR 97213

Dear Sir:

This office has completed a final review of the Kinder Morgan Willbridge facility response plan that was submitted to meet the requirements of the Oil Pollution Act of 1990 (OPA 90). No deficiencies were noted, and the plan is hereby approved. The expiration date of this approval is five years from the date of this letter. You must resubmit the plan to the Coast Guard for re-approval six months prior to expiration as required by Title 33 Code of Federal Regulations (CFR) Section 154.1065.

You are reminded to review your response plan annually as required in 33 CFR Section 154.1065 (a). If revisions are necessary, then you must submit the revisions to the Captain of the Port (COTP) and all other plan holders for information or approval, as appropriate. Changes at the facility that significantly affect the implementation of your plan must be submitted to the COTP within 30 days of the change.

I commend your efforts in developing a response plan that reflects your company's operating procedures and organizational structure. I remind you that your plan is a vital working document and that implementing the plan will help ensure effective oil spill response and mitigation. Please ensure that all parties with responsibilities under the plan are familiar with the plan's procedures and requirements.

Please keep in mind that Kinder Morgan Willbridge is prohibited from handling, storing, transporting, transferring, or lightering oil unless it is operating in full compliance with this plan.

A copy of this letter shall be kept with your approved Facility Response Plan.

If you have any questions, please contact the Facilities Inspection Branch at (503) 240-2333.

August 17th, 2011

Mr. Andrew Holbrook
Kinder Morgan Energy Partners
5880 NW St Helens Rd
Portland, OR 97210

RE: Approval of Oil Spill Contingency Plan

Dear Mr. Holbrook :

Based upon our review, the Department of Environmental Quality grants conditional approval to your submitted integrated contingency plan pursuant to Oregon Revised Statutes 468B.300-500 and Oregon Administrative Rules 340-141. Conditional approval is valid from August 17th, 2011 and is set to expire after August 16th, 2016. Your integrated contingency plan covers the following Oregon facilities and pipelines:

1) Kinder Morgan Linnton Terminal: 11400 NW St Helens Rd. Portland, OR 97231
2) Kinder Morgan Willbridge Terminal: 5880 NW St Helens Rd. Portland, OR 97210
3) Aviation Fuel Pipeline which runs from the Kinder Morgan Willbridge Terminal to ASIG terminal at the Portland International Airport.
4) Refined products pipeline which runs from the Kinder Morgan Willbridge Terminal to the Kinder Morgan Eugene Terminal.
5) Various inter-facility pipelines as outlined in the pipelines section of the Kinder Morgan Integrated Contingency Plan, Volume 2 § 6.0.

The conditional approval of the Kinder Morgan Integrated Contingency plan is dependent on Kinder Morgan Energy Partner's successful cooperation with annual unannounced notification and deployment exercises. The first unannounced notification and deployment exercise must be completed by Feburary 1, 2012.

If Kinder Morgan Energy Partners fails to meet state standards you will have 30 calendar days to correct any deficiencies or submit any required changes to the Oregon Department of Environmental Quality. Failure to meet state standards after 30 calendar days can result in the requirement for precautionary measures as allowed in OAR 340-141-0190(8) such as required deployment of containment boom prior to transfer operations, reduction of oil transfer rates, restriction of operations to daylight hours, or increasing personel levels, or the revocation of contingency plan approval.

Approval does not constitute an express assurance regarding the adequacy of this plan nor does it constitute a defense to liability imposed under state law. Further, in accordance with OAR 340-141-0220, the Department of Environmental Quality must be notified as soon as possible and within 24 hours of any

significant change which could affect implementation of the plan, including a substantial decrease in available spill response equipment or personnel. The plan holder shall also provide a schedule for the prompt return of the plan to full operational status. An e-mail or facsimile will be considered written notice for the purposes of this subsection.

Congratulations in developing an excellent plan. We look forward to working with Kinder Morgan Energy Partners in the future. Please do not hesitate to contact Scott A. Smith of my staff at (503) 229-5370 or smith.scott@deq.state.or.us with any questions or concerns.

Sincerely,

Jeff Christensen, Manager

RE: 5-Year Review of Facility Response Plan FRP 16

Dear Mr. Mathis and Ms. Johnson:

Pursuant to the Clean Water Act, 33 U.S.C. Section 1321(j)(5), as amended by the Oil Pollution Act of 1990, the United States Environmental Protection Agency (U.S. EPA) has reviewed your Facility Response Plan (FRP) and finds that it meets the requirements of Section 311(j)(5) of the Clean Water Act and 40 CFR 112.20(c)(4). The next 5 year plan will be due January 14, 2018.

Note that, pursuant to 40 CFR 112.20(d)(1), the owner or operator of a facility for which a response plan is required shall revise and resubmit revised portions of the response plan to U.S. EPA within 60 days of each facility change that may materially affect the response to a worst-case discharge. Changes which may require revisions to a response plan include:

- a change in the facility's configuration;
- a change in the type of oil handled, stored or transferred;
- a change in the capabilities of the oil spill response organization;
- a change in the facility's spill prevention and response equipment or emergency response procedures; and
- any other change that materially affect the implementation of the response plan.

In addition, 40 CFR Section 112.20(d)(2) provides that changes in personnel and telephone number lists included in an FRP do not require U.S. EPA approval, but should be supplied to U.S. EPA as the revisions occur.

If you have questions regarding this correspondence, please contact me at (206) 553-1886 or Janet Wien at 206-553-8634 or wien.janet@epa.gov.

RE: Facility Response Plan FRP 6A

Dear Mr. Mathis:

Pursuant to the Clean Water Act, 33 U.S.C. Section 1321(j)(5), as amended by the Oil Pollution Act of 1990, the United States Environmental Protection Agency (U.S. EPA) has reviewed your Facility Response Plan (FRP) and finds that it meets the requirements of Section 311(j)(5) of the Clean Water Act and 40 CFR 112.20(c)(4). The next 5 year plan will be due February 28, 2018.

Note that, pursuant to 40 CFR 112.20(d)(1), the owner or operator of a facility for which a response plan is required shall revise and resubmit revised portions of the response plan to U.S. EPA within 60 days of each facility change that may materially affect the response to a worst-case discharge. Changes which may require revisions to a response plan include:

- a change in the facility's configuration;
- a change in the type of oil handled, stored or transferred;
- a change in the capabilities of the oil spill response organization;
- a change in the facility's spill prevention and response equipment or emergency response procedures; and
- any other change that materially affect the implementation of the response plan.

In addition, 40 CFR Section 112.20(d)(2) provides that changes in personnel and telephone number lists included in an FRP do not require U.S. EPA approval, but should be supplied to U.S. EPA as the revisions occur.

If you have questions regarding this correspondence, please contact me at (206) 553-1886 or Janet Wien at 206-553-8634 or wien.janet@epa.gov.

Sincerely,

Michael I Sibley II

EDMUND G. BROWN JR., Governor
CHARLTON H. BONHAM, Director

March 11, 2013

Mr. Grant McClellan
Kinder Morgan
1550 Solano Way
Concord, California 94520

Dear Mr. McClellan:

Your California Facility Oil Spill Contingency Plan has been reviewed for compliance with the California Code of Regulations Title 14, Subchapter 3, Sections 815, 816, and 817. Based on this review the following plan is approved:

Kinder Morgan Pipeline **P2-01-0175**

A copy of this letter should be kept on the facility covered by this contingency plan. **This approval expires on March 31, 2018.**

Your California Facility Oil Spill Contingency Plan must be kept current at all times. Promptly send plan revisions to all plan recipients. When submitting plan revisions to OSPR, use the letterhead address, with "attention: Marine Safety Branch."

The current California regulations regarding Oil Spill Contingency Plans can be located through the internet at:

http://www.wildlife.ca.gov

We appreciate your efforts to improve the safety of California's marine environment. If you have any questions regarding this approval, contact Vincent Jeffries, Oil Spill Prevention Specialist, at 707-864-4904 or by e-mail at vincent.jeffries@wildlife.ca.gov.

Sincerely,

Roy Mathur
Field Supervisor, Marine Safety Branch
Office of Spill Prevention and Response

EMERGENCY RESPONSE ACTION PLAN (ERAP)

The users of this Plan carry and maintain the complete Volume 1 and Volume 2 documents and the Plan has been designed for quick reference. Accordingly, the Emergency Response Action Plan (ERAP) for this Integrated Contingency Plan is addressed by cross-reference as follows:

● Qualified Individual	Volume 1 Figure 2.3; Volume 2 § 8.1.2
● Emergency Notification Phone List	Volume 1 §§ 2.1, 2.2; Volume 2 §§ 2.1, 2.2
● Spill Response Notification Form	Volume 1 Figure 2.2
● Response Equipment List and Location	Volume 2 § 3.1 and Figure 3.2
● Response Equipment Testing and Deployment	Volume 2 §§ 3.1, 3.2, 3.3, Figure 3.4
● Facility Response Team	Volume 1 § 2.0; Volume 2 § 2.0
● Evacuation Plan	Volume 2 § 8.4
● Immediate Actions	Volume 1 § 3.4
● Facility Diagram	Volume 2 § 8.1.2, Figure 8.3

REVISION RECORD

1.2 OPERATING ASSETS COVERED BY THIS PLAN

The following tables provide a general information summary for the pipeline sections, pipeline facilities, breakout stations and terminals in each of the Areas in this Region. Specific detail can be located in the following sections for the applicable area.

- Section 6 – Area Pipeline Sections (for DOT jurisdiction)
- Section 7 – Area Breakout Stations (for DOT jurisdiction)
- Section 8 – Area Terminals (for EPA, USCG and OSPR jurisdiction)
- Section 9 – Regional OSPR Line Segments (for OSPR jurisdiction)

1.3 SUBSTANTIAL HARM

It is Kinder Morgan Energy Partners, L.P. (KMEP)'s goal to respond as quickly as possible to all uncontrolled releases of petroleum product, regardless of the source point location along the system. Based upon this goal, and the overbreadth of the definitions provided in each of the applicable regulations, KMEP is compelled to consider all of the Facility's breakout stations, and active line sections listed above in this Section as capable of a release potentially causing "significant and substantial harm". A summary of the Worst Case Discharge scenarios for these facilities is provided as follows:

NORTHERN REGION-BAY WORST CASE DISCHARGE DOT JURISDICTION	
Discharge Scenario	Planning Volume
(b) (7)(F), (b) (3)	

* DOT Worst Case Discharge volumes are based on 50% of the tank maximum storage capacity and for pipelines based on an annual Integrity Management Program study, as follows:

Release volume prior to line shutdown and valve closures (Initial Loss):

- Full flow release due to rupture. This is computed at the maximum pumping rate the line segment.
- Detection time, analysis and pump shutdown in adverse weather conditions. This is based on a maximum of fifteen (15) minutes in the event of a full flow rupture, which would cause an instant alarm (unless otherwise noted in the line segment information).
- Line segment valve closures. All line segments are equipped with remote activating isolation valves. Adverse weather would have no impact on line segment isolation, as isolation valves are not dependent on manual closure.

Line drainage following pump shutdown (Stabilization Loss) is computed the maximum potential line drainage between adjacent isolation or check valves, and incorporated pipeline elevation profiles to estimate how much of that total volume would escape at any release point along the line. The historic discharges have not approached either the breakout tank WCD volume or the pipeline WCD in the area.

1.3 SUBSTANTIAL HARM (Cont'd)

NORTHERN REGION-BAY DISCHARGE SCENARIOS EPA JURISDICTION	
Discharge Scenario	**Planning Volume**
Small Discharge	
• Brisbane Terminal	50 Bbls
• Richmond Terminal	50 Bbls
• San Jose Terminal	50 Bbls
Medium Discharge	
• Brisbane Terminal	857 Bbls
• Richmond Terminal	857 Bbls
• San Jose Terminal	857 Bbls
Worst Case Discharge	
(b) (7)(F), (b) (3)	

Note: EPA Worst Case Discharge is based on the maximum storage capacity of the largest tank at each facility.

NORTHERN REGION-BAY DISCHARGE SCENARIOS USCG JURISDICTION	
Discharge Scenario	**Planning Volume**
(b) (7)(F), (b) (3)	

NORTHERN REGION BAY WORST CASE DISCHARGE CALIFORNIA OSPR JURISDICTION
The Reasonable Worst Case Spill (RWCS) for the California OSPR jurisdictional Terminal (Richmond) is equal to the volume depicted in the prior USCG table and is further detailed in the Richmond Area Section 8.3. The RWCS for the California OSPR jurisdictional pipeline segments are detailed in Section 9.3.

These Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three-tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. Sections 6, 7, 8 and 9 of this Plan demonstrate a series of calculations and planning volume determinations based on guidance provided by all applicable regulations. The inclusion of these calculations is for demonstration of the response planning volumes and response capability necessary for on-water and on-shore recovery requirements as the result of the discharge scenarios detailed in the table above.

1.4 FORMAT AND SCOPE OF PLAN

This Volume 2 of the Integrated Contingency Plan (ICP) is intended to guide emergency response activities throughout KMEPs Pacific Operations Northern Region - Bay. This Region is divided into four (4) Areas (see Figure 1.1) each of which has its own tab in this document. These Areas are as follows:

- Richmond/Brisbane Area
- Concord Area
- Richmond Terminal
- San Jose Area

Each of the Volume 2 plans in this ICP has identical Sections 1 through 5. Section 6 of each Area details the Pipeline Sections in the respective area, Section 7 of each Area details the Breakout Stations (DOT-jurisdictional) in the respective Area, Sections 8 of each Area details the Terminals (multi-jurisdictional) in the respective Area, and Section 9 through the end of each Plan details the OSPR Jurisdictional Lines in the Region. The Region covered by this Plan is identified on the front cover of this Plan and on the footer of each page and on the maps provided in Figure 1.1.

Volume 1 of the Integrated Contingency Plan provides guidance which is consistent across the Pacific Operations. The two (2) documents are intended to work together as one seamless Integrated Contingency Plan for the various facilities/operations and agency jurisdictions in Pacific Operations.

2.0 NOTIFICATIONS

2.1 INTERNAL NOTIFICATIONS

Specific reference to all internal notifications is detailed in **Volume 1** Section 2.1 which provides the following:

- KM Employee or Agent Notification Process - California Only (Figure 2.1a)
- Operator Notification Process - Non-California (Figure 2.1b)
- Company Employee Other Than Operator Notification Process - Non-California (Figure 2.1c)
- Controller - Orange, CA Notification Process - California Only (Figure 2.1d-1)
- Controller - Orange, CA Notification Process - Non-California (Figure 2.1d-2)
- Controller - Houston, TX Notification Process (Figure 2.1e)
- Managers Internal Notification Process (Figure 2.1f)
- Initial Reporting Details Form (Figure 2.2)
- Northern Region Internal Notifications References (Figure 2.3a)
- Southern Region Internal Notifications References (Figure 2.3b)
- Crisis Support Team Internal Notifications References (Figure 2.3c)

2.2 EXTERNAL NOTIFICATIONS

Specific reference to all **"Regulatory Required"** external notifications is detailed in Volume 1, Section 2.2 and Figure 2.4. **With the exception of notification to 911 and/or local fire/police agencies which are handled by local area operations, the Environmental, Health and Safety (EHS) and/or Compliance, Codes and Standards is responsible for making all regulatory required external notifications in all states other than in California. In California and locations monitoring or controlling, pipeline sections in California, refer to Volume 1, Section 2.2 and Figure 2.4.**

The locally required notifications and additional external notification references which are detailed in the following Volume 2, Figure 2.1 provide for assistance/advisory notifications. Specific notifications for contacting OSROs is found in Volume 2, Figure, 2.1, "_____ Terminal Response Contractors".

3.0 RESPONSE RESOURCES

The following sections outline the various response equipment/resources available from the Facility, other Company facilities, and other outside resources.

3.1 AREA RESPONSE EQUIPMENT

This Area of the KMEP operations maintains response equipment readily available for spill response as detailed on the "Facility Response Equipment" lists provided in Figure 3.1 and the "Pipeline Repair Equipment" lists provided in Figure 3.2. The equipment is stored at locations in the Area as detailed on the equipment lists.

The preventative maintenance schedule requires a monthly inventory and visual inspection of spill response equipment. Maintenance and repair is performed as needed, following manufacturers recommended procedures. The equipment will be exercised as semi-annually (terminal equipment) or annually (pipeline equipment) as required (PREP Guidelines). A sample form for documenting these Equipment Deployment Exercises is provided in Figure 3.4.

KMEP has contracts in place with Oil Spill Removal Organizations and other clean-up and response contractors that are capable of responding to all discharges within the Area and supplementing Area KMEP resources.

The Qualified Individual has the authority to activate these and other KMEP resources or that of private contractors and other experts and consultants as the situation demands.

3.2 OTHER COMPANY RESOURCES

Neighboring KMEP Areas have response resources similar to those provided in this Area (Figures 3.1 and 3.2). These resources as well as additional Company spill response equipment and manpower resources may be available to supplement the response operation.

3.3 CONTRACT RESOURCES

In the event of a discharge which is beyond the initial response capabilities of the Local Response Team, contract manpower and equipment resources can be obtained through Oil Spill Removal Organization(s) (OSRO). These OSROs can provide manpower and containment/clean-up equipment for the response operation. *The Company will ensure that each OSRO has a comprehensive maintenance program and applicable training / drills programs in place at contract renewal.*

Response resources will be secured from a Company approved contractor. Facility Management will typically handle notification/implementation of these resources. Section 2 of this Volume provides a quick reference to the OSROs and additional clean-up and response contract organizations. A detailed list of the "Pacific Region Open End and On-Call Contractors" is provided in Figure 2.2. Specific reference to their response capability (UCSG OSRO classification) is provided in Figure 3.3.

3.3 CONTRACT RESOURCES (Cont'd)

These OSRO's have adequate equipment and personnel resources available within the Area to respond to the applicable regulatory planning volumes in the required time frames.

OSROs have the expertise to conduct and lead on water and shoreline containment and recovery efforts. KMEP personnel will oversee and coordinate with the OSRO to ensure their actions conform with overall incident objectives and established incident action plans.

OSROs also have extensive experience in using the Area Contingency Plans (ACPs) as a resource when responding to an incident that has affected a navigable waterway. The KMEP Incident Commander, Planning Officer and Operations Chief will employ the OSRO's experience to integrate applicable local ACPs into the overall incident action plans.

3.4 AREA CONTINGENCY PLANS (ACP)

Area Committees comprised of Federal, state and local agencies develop ACPs. Response efforts performed within a certain "area" should reference the ACPs for that specific area. ACPs include clean-up strategies and information on environmentally sensitive areas within a particular region. Some of the ACPs include maps, shoreline characteristics and booming strategies for specific areas while other ACPs offer priority lists of environmentally sensitive areas.

ACPs generally contain the following information:

- Physical features
- Seasonal concerns
- Resources of primary concern
- Containment, and cleanup strategies, including recommended techniques
- Equipment considerations
- Incident Command System Roles and Responsibilities (NIMS)

To identify specific spill response and protection strategies for the applicable region/area, ACP and Geographic Response Plan information can be found at: http://kmonline.kindermorgan.com/operations/products/pacific_icp/pacific_icp.html Responders can navigate through the site to locate the region/area of interest and the appropriate response resources needed for the operation.

For all controlled copies of the Integrated Contingency Plan distributed to non-KMEP plan holders, a CD-ROM containing the same information as referenced above will be included in a CD-sleeve in Volume 1 (inside front cover) or in a separate folder in electronic copies and is referenced in Figure 4.2.

To determine adequate response resources, the Worst Case Discharge volumes are used in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three (3) tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. The tier requirements for high volume areas are for response in six (6) hours (Tier 1), 30 hours (Tier 2), and 54 hours (Tier 3). High volume areas are listed in 49 CFR 194. The tier requirements for all other areas are for response in 12 hours (Tier 1), 36 hours (Tier 2), and 60 hours (Tier 3).

3.5 COOPERATIVE/MUTUAL AID RESOURCES

Cooperative/mutual aid resources will be utilized when available and/or necessary.

3.6 EXPERTS AND CONSULTANTS

KMEP maintains a relationship with various environmental and technical consultants that can provide support in the event of an emergency incident. These consultants can provide expertise and support in the areas of emergency response management, environmental services, site assessment, permitting, waste treatment, recycling, dewatering, hazardous waste disposal, and remediation.

3.7 VOLUNTEERS

Volunteers will not be utilized by KMEP for the response operations. All volunteers will be referred to the state or Federal On-Scene Coordinator (EPA).

3.8 COMMUNICATIONS

Effective and efficient communications systems are essential for emergency response at every level. The communications system will be utilized to gather information and current status reports as well as to provide coordination and direction to widely separated work groups involved in search, containment/diversion, repair, traffic control, public control or evacuation, and restoration.

Communication of the overall spill response operation between KMEP and the responsible government agencies in the Federal Regional Response Team (RRT) will occur between the Incident Commander and the Federal On-Scene Coordinator.

3.8.1 Central Communications System

Prearranged communication channels are of the utmost importance in dealing with KMEP emergencies. The notification procedures and telephone contacts documented in Section 2 of Volume 1 and Volume 2 will be reviewed in accordance with the earlier documented updating procedures. The predetermined communications channels include the following:

- A list of required Federal and state emergency telephone numbers for the Orange Control Center and emergency response personnel (Volume 1; Section 2).
- A list of emergency telephone numbers for various external resources such as the fire and police department, medical, and regulatory agencies (Volume 2; Figure 2.1).
- A list of emergency telephone numbers for contract response resources (Volume 2; Figure 2.1).

3.8 COMMUNICATIONS (Cont'd)

3.8.2 Communications Equipment

Field communications during a spill response to a small or medium discharge will be handled via the existing KMEP communications network. This network will utilize existing radios, telephones, beepers, fax machines, and computers and will be maintained by KMEP personnel. In the event of a Worst Case Discharge, field communications will be enhanced with other KMEP and contract resources as the situation demands.

Each KMEP responder has, at a minimum, a cellular telephone. All KMEP response personnel also have access to other telephones, radios and satellite communications equipment that may be needed for effective response operations. Additionally, communications equipment is maintained in the KMEP spill response trailers. The Logistics Officer would create a communications plan based on the equipment immediately available and would identify the need for any additional equipment that may be needed throughout the response effort.

3.8.3 Communication Types

Radios - Handheld and vehicle mounted radio sets are the most effective means of communication for the field response operation. The units are battery operated, multi-channeled and have a typical range that will cover the area of the response operation. Each location maintains a minimum of 4 radio sets, functionally maintained per manufacturer's specifications and kept in designated KMEP response trailers. In addition, KMEP also utilizes radio sets provided by contract resources. Additional radio sets and battery packs/charges will be necessary in the event of a prolonged response operation.

Telephone (Conventional) - Conventional land line telephones are the most effective means of communication for regulatory and advisory notifications during a spill response operation. Additional telephone lines can be installed in the event of a prolonged response operation.

Telephone (Cellular) - Cellular telephones allow for added mobility and response effectiveness. Cellular phones are commonly maintained by certain KMEP personnel. Additional cellular phones can be secured in the event of a prolonged response operation.

Pagers - Pagers are used for rapid notification to field personnel when radio and telephone resources are limited. Most response team members carry a pager.

FAX Machines - FAX machines allow for a rapid transfer of information/ documentation such as status reports/updates, written notifications, and purchase orders.

Computers - Computers are commonly used in networks which allow access to various other locations and KMEP personnel. Computers also speed the consolidation of information and preparation of written reports.

Re: Aerial Oil Tracking Resources

Dear Customer:

On February 22, 2011, the Aerial Oil Tracking requirements of 33 CFR Part 154.1035 (b)(3)(vii) for MTR Facility Response Plans (FRPs) and 33 CFR Part 155.1035(i)(11), 33 CFR Part 155.1040(j)(11), and 33 CFR Part 155.1050(l) for Vessel Response Plans (VRPs) go into effect.

For planning purposes under these regulations, the Aerial Oil Tracking resources must be capable of supporting all response operations, including: mechanical recovery, dispersant application, and in situ burning. The Marine Spill Response Corporation (MSRC) has developed the following capability in conjunction with this new regulatory requirement that our plan holder customers may cite in their response plans, along with their citation of MSRC as the resource provider:

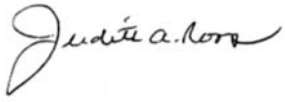
- Aerial surveillance aircraft;
- Along with the aircraft, the pilots and trained personnel to support oil spill response operations;
- For planning purposes, these resources are capable of arriving at the site of the discharge in advance of the arrival of response resources identified for Tiers 1, 2 and 3 planning timeframes; and
- Observation personnel trained in the protocols of oil spill reporting and assessment.

Observation personnel are primarily trained MSRC employees. The other resources are available through contracts or other approved means (specifically Letters of Intent ("LOIs") or other agreements with various aircraft providers. These services are subject to availability of aircraft and personnel. Multiple aircraft providers are listed for each geographic Captain of the Port ("COTP") Zone.

MSRC will maintain lists of the potentially available aircraft providers, along with other documentation, by COTP zones within the respective MSRC Regional Response Center. These records will be made available upon request. MSRC will periodically review this capability by COTP zone and update the documentation as appropriate.

MSRC has provided a copy of this letter to US Coast Guard Headquarters personnel responsible for VRP compliance and to COTPs within MSRC's Operations Area for their information. Customers may use this letter in their FRP or VRP as they deem appropriate.

Sincerely,



Marine Preservation Association

To: **Heidi Dyer**
Subject: **Kinder Morgan Energy Partners' Transitional Membership in MPA**
Date: **December 22, 2005**
Re: **Membership Status**

MPA has recently received dues payment by Kinder Morgan Energy Partners for the First Quarter Dues Call. This payment ensures that Kinder Morgan Energy Partners remains an MPA member in good standing under its CB Transitional Membership Agreement dated as of December 31, 2003, and thus can continue to cite and call-out MSRC for spill response services in the Northern California Operations Area, as defined.

As you may recall, the period covering the CB Transitional Membership is 10 years from the date of MSRC/Clean Bay Incorporated merger, or December 31, 2003. So long as Kinder Morgan Energy Partners continues to pay its quarterly dues during this period, it will remain a member in good standing. Kinder Morgan may at any time decide to become a national member of MPA, in which case the Kinder Morgan Energy Partners' assets in the Operational Area currently covered by the CB Transitional Membership would be included.

I hope this has addressed your concerns. If you should have any questions regarding this information, please contact me.

Best Regards,

Brett G. Drewry

President and Chief Executive Officer

January 21, 2004

Mr. Mike Sudheimer
Kinder Morgan Liquid Terminals (Kinder Morgan Energy Partners)
1140 Canal Blvd
Richmond, CA 94804 USA

Dear Mr. Sudheimer,

It is my pleasure to welcome Kinder Morgan Liquid Terminals (Kinder Morgan Energy Partners) as a Clean Bay Transitional Member resulting from the merger between the Marine Spill Response Corporation (MSRC) and Clean Bay Incorporated. Kinder Morgan LT's Clean Bay Transitional Membership Effective Date is **December 31, 2003.**

MPA has received and accepted Kinder Morgan LT's Clean Bay Transitional Membership Application and Initial Membership Dues of **$19,750.** MPA has also received two copies of the signed Clean Bay Transitional Membership Agreement. A fully executed copy of this Membership Agreement is enclosed for your records.

As you know, Kinder Morgan LT's Clean Bay Transitional Membership has entitled Kinder Morgan LT to sign a Service Agreement with MSRC for spill response services in the Northern California Operational Area. Upon execution of the Service Agreement Kinder Morgan LT will be entitled to cite and have access to the combined resources of MSRC and the former Clean Bay Incorporated in the area.

MPA looks forward to working with Kinder Morgan LT, and MPA also looks forward to Kinder Morgan LT further considering the benefits of joining MPA as a national member.

Please contact myself or Brett Drewry at (480) 991-5500 if you have any questions or concerns regarding MPA or Kinder Morgan LT's CB Transitional Membership.

Yours very truly,

RA:lds

cc: Judith Norell, MSRC

CB TRANSITIONAL MEMBERSHIP AGREEMENT

(Lower-Maryland Clearing Partners)

This CB TRANSITIONAL MEMBERSHIP AGREEMENT dated as of December 31, 2003 (this "Agreement") between [illegible] (the "Company") and MARINE PRESERVATION ASSOCIATION, a nonprofit membership corporation organized under the laws of the State of Arizona (the "Association").

WITNESSETH:

WHEREAS, the Association was organized exclusively to promote the welfare and interests of the petroleum transportation, petroleum, and energy industries by addressing the problems caused by spills of oil and petroleum products on water; and

WHEREAS, the Association raises funds through the collection of Annual Dues from its Members and grants the funds to nonprofit oil spill response service entities, such as Marine Spill Response Corporation, a nonprofit membership Tennessee corporation ("MSRC"); and

WHEREAS, with the Association's approval, MSRC has agreed to acquire by merger Clean Bay Incorporated ("CB"), a nonprofit Delaware membership corporation engaged in providing oil spill response services in the Northern California Operational Area hereinafter referred to, and CB has also entered into an Agreement with the Association (the "MPA Agreement") governing, inter alia, the non-voting membership rights of the former CB members (the "Former CB Members") in the Association during a transitional period; and

WHEREAS, the Company was heretofore a Former CB Member and now desires to become a non-voting CB Transitional Member of the Association; and

WHEREAS, capitalized terms used herein and not otherwise defined herein shall have the meanings ascribed thereto in Schedule A.

NOW, THEREFORE, in consideration of the premises and the mutual covenants contained herein, the Association and the Company agree as follows:

1. Initial Membership Dues; Admission Effective Date. The Company will become a CB Transitional Member on its Admission Effective Date, which is the later of the date the Company has (i) executed and delivered this Agreement (together with any other documents required by the Association) and (ii) the Effective Time of the merger of CB with MSRC. The Company agrees that, on or before its Admission Effective Date, it shall pay Initial Membership Dues equal in amount to that quarterly or other portion of its estimated Annual Dues for 2004 as shall be initially assessed by MPA.

2. Annual Dues.

(a) Dues to be Paid. The Company acknowledges and agrees that, throughout its Membership Period, it shall pay Annual Dues as a CB Transitional Member computed as follows:

(i) An amount of dues equal to (y) the MPA national rate per Qualified Barrel, as such national rate is determined from time to time by MPA, multiplied by (z) the Company's number of Qualified Barrels in the Northern California Operational Area as reported to MPA (pursuant to MPA procedures for the reporting of Qualified Barrels); provided, however, that such amount of such annual dues may not be less than the amount of the Company's 2002 budgeted annual dues to CB as a Former CB Member; and provided further that the MPA national rate per Qualified Barrel utilized for this computation shall not include any amount in respect of any costs or liabilities of MSRC with respect to its operations in Northern California prior to the Closing Date of the Merger.

(ii) The Company shall be obligated to pay such Annual Dues, as and when assessed by the MPA Board, for each of the ten years after the Closing Date of the Merger that it remains a CB Transitional Member; provided, however, that the dues for the first and last calendar years of the Company's Membership shall be pro-rated for the actual number of days the Company is a CB Transitional Member of MPA.

(iii) The Company shall be entitled to a dues credit, in accordance with MPA Dues Procedures, but only with respect to vessels, equipment or personnel located in the Northern California Operational Area (and not with respect to any vessels, equipment or personnel that may be 'cascaded' into that area to assist in a spill response).

(iv) The Company shall also be responsible, severally (but not jointly) and on a Pro Rata Basis, for any additional dues assessed pursuant to Section 2.6(b) of the MPA Agreement for any unpaid liabilities of CB with respect to periods prior to the merger with MPA. For purposes of computing any such additional dues assessment, the Company's "Pro Rata Basis" shall be calculated by (y) computing the percentage resulting from dividing the amount of the Company's 2002 budgeted annual dues obligations to CB by the aggregate amount of all members 2002 budgeted annual dues obligations to CB, and (z) grossing up such percentage by the proportional amount necessary to cover any amount that has not been paid by any other prior members of CB.

(b) Annual Dues Information Report. The Company acknowledges and agrees that, throughout its Membership Period, on or before the due date established each year by the Board of Directors, the Company shall provide to the Association an Annual Dues Information Report (which will primarily provide information as to the Company's Qualified Barrels in the Northern California Operational Area in the preceding year), in the form prescribed by the Board of Directors from time to time, so as to allow the Association to make a final determination of the Company's Annual Dues for the prior year with any adjustments applied as set forth in the Dues Procedures, estimate the Company's Annual Dues for the then current year and/or other periods relating to a Cash Dues Call, and determine whether the Company meets the criteria established for a CB Transitional Member. In addition, the Company hereby agrees to submit to the Association, on or before June 30th of each year, a report, in the form prescribed by the Board of Directors from time to time, of an independent accountant engaged by the Company, attesting to the completion of the Agreed-Upon Procedures.

(c) Removal for Failure to Perform. The Company acknowledges and agrees that the failure of the Company to (i) pay its Annual Dues on a timely basis, as required by the

Board of Directors pursuant to the By-laws, and/or (ii) provide the information required pursuant to Section 2(b), will be "cause" for the Association immediately to remove the Company as a Member of the Association, provided that such removal of the Company shall not relieve the Company of its obligation to pay the Annual Dues or other obligations owing at the time of its removal.

3. Resignation. The Company may resign as a CB Transitional Member of the Association only by giving the Association written notice of such resignation. Resignation shall be effective on the Resignation Effective Date. Resignation of the Company shall not relieve the Company of its obligation to (i) pay the Annual Dues or other obligations owing at the time of its removal or (ii) comply with certain reporting requirements specified in the Dues Procedures. The Company may, as of the effective date of any such resignation, apply to become a Standard Member of the Association.

4. Merger, Consolidation and Reorganization or Sale of Certain Assets. If the Company is a party to a merger, consolidation, reorganization or other change in operations (including, but not limited to, a sale of all its facilities in the Northern California Operational Area) which results in the Company no longer meeting the criteria established for CB Transitional Members, the Company shall promptly (and in any event not later than the fifth (5th) business day prior to such event) notify the Association. The effective date of such event shall be deemed to be the Resignation Notice Date of the Company pursuant to Section 3.

5. Failure to Qualify as a CB Transitional Member. If the Association determines that the Company no longer meets, or will no longer meet at a future point in time, the criteria of a CB Transitional Member (as described in the MPA Agreement), it shall give written notice thereof to the Company. This Agreement shall terminate on the thirtieth (30th) day after such notice, unless the Company promptly provides additional information and evidence reasonably acceptable to the Association demonstrating that the Company continues to meet the criteria established for a CB Transitional Member. The Company may, during such 30-day notice period, apply for membership in the Association as a Standard Member by executing a Standard Member Dues Agreement with the Association and complying with its provisions and any other requirements established for Standard Members of the Association.

6. Severability. It is expressly understood and agreed that the provisions of this Agreement are severable from each other and from the rest of this Agreement and shall be fully effective, operative and enforceable even though the remainder or any part of this Agreement shall be held to be invalid or unenforceable by a court of competent jurisdiction.

7. Limitation of Membership Rights.

(a) The Company understands and acknowledges that, as a CB Transitional Member, it will have no voting rights whatsoever in the Association.

(b) The Company further understands and acknowledges that its CB Transitional Membership (i) will only extend to facilities owned or operated by it (and actually enrolled in CB for coverage) at the Effective Time; (ii) will terminate in the event it sells all such facilities in the Northern California Operational Area; (iii) is subject to the other requirements

and limitations set forth in Section 2.3 of the MPA Agreement; and (iv) will in any event terminate at the latest on the tenth anniversary of the Effective Time.

8. Successors; No Assignment. Successors by operation of law (by merger, consolidation, reorganization or otherwise) shall be bound by this Agreement. However, neither the Association nor the Company may otherwise assign this Agreement.

9. Term of Agreement. Unless otherwise terminated pursuant to Section 3, 4, 5 or 7 this Agreement shall remain in full force and effect until the Resignation Effective Date of the Company.

10. Amendments. No provision of any Section of this Agreement may be amended or waived, without the prior written consent of the Association and the Company.

11. Severalty; Release; Waiver. The obligations of the Company under this Agreement are not joint and several with the obligations of any other Member of the Association pursuant to the terms of any other Membership Agreement or any agreement of any nature. None of the Association or any other Person shall at any time be entitled to assert that such obligations are joint and several or that this Agreement is evidence of any joint venture or partnership among the Members of the Association. To the fullest extent permitted by law, neither failure nor delay by the Association to exercise any right or remedy provided herein or by statute or at law or in equity shall operate as a waiver thereof, nor shall any single or partial exercise of any such right or remedy preclude any other or further exercise thereof or the exercise of any other right or remedy.

12. Representations and Warranties. The Company represents and warrants to the Association on the date hereof that:

(a) It will be a Former CB Member as of the Effective Time, and it is not currently an MPA Member.

(b) It is duly organized and validly existing and in good standing under the laws of the jurisdiction of its organization and has all requisite power and authority to enter into this Agreement and to carry out the terms and provisions hereof and this Agreement has been duly authorized, executed and delivered by the Company and constitutes the legal, valid and binding obligation of the Company enforceable in accordance with the terms of this Agreement except as such enforceability may be limited by bankruptcy, insolvency or other similar laws of general application relating to or affecting the enforcement of creditors' rights or by general equitable principles.

(c) There is no action, proceeding or investigation pending or, so far as the Company is advised, threatened, and no term or provision of any charter, by-law or other organizational document, mortgage, indenture, contract, agreement, instrument, judgment, decree, order, statute, rule or regulation, which action, proceeding or investigation or term or provision would have a material adverse effect on the entering into by it of this Agreement, or the validity of this Agreement as to it or the carrying out by it of any of the terms or provisions of this Agreement.

(d) No approval of any governmental body is required for it entering into or carrying out the terms of this Agreement.

13. GOVERNING LAW. THIS AGREEMENT SHALL BE GOVERNED BY, AND CONSTRUED IN ACCORDANCE WITH, THE LAWS OF THE STATE OF NEW YORK.

14. Usage. All accounting terms not specifically defined herein shall be construed in accordance with GAAP. In this Agreement, the singular includes the plural and the plural the singular; "hereof," "herein," "hereto," "hereunder" and the like mean and refer to this Agreement as a whole and not merely to the specific section or clause in which the respective word appears; words importing any gender include the other genders; references to statutes are to be construed as including all statutory provisions consolidating, amending or replacing the statutes referred to; and references to "writing" include printing, typing, lithography and other means of reproducing words in a tangible visible form.

15. Notices. All notices, requests, consents, demands, certificates and other documents and communications required or permitted to be given hereunder shall be in writing ("Written Communications") and shall conform to, and be effective as provided in, the definition of Written Communication set forth in Schedule A hereto.

16. Counterparts. This Agreement may be executed in two counterparts which together shall constitute one and the same instrument and may be executed by either party on either counterpart.

17. Costs and Expenses of Enforcement. The Company agrees to pay on demand all reasonable costs and expenses of the Association, if any (including reasonable counsel fees and disbursements), in connection with the successful enforcement against the Company of this Agreement.

18. No Third Party Beneficiaries. Nothing in this Agreement is intended or shall be construed to give any Person, other than the parties hereto, any legal or equitable right, remedy or claim under or in respect of this Agreement or any provision contained herein or to impose any obligation on the Company other than the obligations specifically set forth herein.

19. Confidentiality. The Association agrees on behalf of itself, its agents and employees that all information not publicly available that is designated in writing as confidential and is provided to it by the Company in connection with this Agreement shall be considered confidential and proprietary in nature, and, therefore, shall not be used for any purpose other than as contemplated by this Agreement. The Association may, after providing, where not expressly prohibited by applicable law, prompt written notice to the entity to which the information applies, disclose such information (i) pursuant to subpoena or other court process; (ii) when required to do so in accordance with the provisions of any applicable law; (iii) at the express direction of any agency of any State of the United States of America or of any other jurisdiction in which the Association conducts its business; and (iv) to the Association's independent auditors and other professional advisors; provided that the Association agrees to furnish to such third parties a copy of this provision and request that such third parties keep such information confidential.

IN WITNESS WHEREOF, the parties hereunto have each caused this Agreement to be duly executed.

SCHEDULE A

to the

CB TRANSITIONAL MEMBERSHIP AGREEMENT

Definitions and Interpretations

The following terms (not otherwise defined) shall have the following meanings (references herein to Sections shall, unless otherwise indicated, be a reference to such Section in the CB Transitional Membership Agreement):

"Admission Effective Date" means the date on which a Person becomes a Member of the Association in accordance with Section 1 and the By-laws.

"Agreed-Upon Procedures" means the procedures, prescribed from time to time by the Board of Directors, to be performed by independent accountants in providing the attestation report with respect to the information contained in the Annual Dues Information Report, as described in Section 2(b).

"Agreement" means the CB Transitional Membership Agreement to which this Schedule is attached, as such agreement may be amended, supplemented, restated or otherwise modified from time to time.

"Annual Dues" means the annual dues assessed to the Members of the Association (including the CB Transitional Members) from time to time by the Board of Directors.

"Annual Dues Information Report" means, with respect to the Company, that certain annual report of the Company required pursuant to Section 2(b).

"Board of Directors" means the board of directors of the Association, as such body might be constituted from time to time pursuant to the terms of the By-laws.

"By-laws" means the by-laws of the Association, as such by-laws may be amended from time to time.

"Cash Dues Call" means the periodic call by the Association of dues payable by Members on a specific date as determined by the Board of Directors and as set forth in the Dues Procedures.

"Closing Date" means the actual Closing Date under the Merger Agreement.

"Debt Service Dues" means the amount of dues necessary to fund payments of principal and interest on debt obligations of MSRC, supported by the Association, as set forth in the Dues Procedures.

"Dues Agreement" means that certain dues agreement between the Association and all other Members which are responsible for dues as set forth in the Dues Procedures.

"Dues Procedures" means those certain Dues Procedures adopted and/or amended from time to time by the Board of Directors with respect to, the payment procedures for Annual Dues for Members and other related matters.

"Effective Time" means the Effective Time under the Merger Agreement.

"GAAP" means generally accepted accounting principles in the United States or in the case of a Person to which generally accepted accounting principles of the United States are not customarily applied, generally accepted accounting principles of the country that would be customarily applied to such Person.

"Initial Membership Dues" means the initial dues (as specified in Section 1) assessed to each Member of the Association at the time such Person becomes a Member of the Association.

"Member" or "Members" (as the context may require) means a Member of the Association, as defined by the By-laws, and shall include voting Members of the Association as well as the non-voting CB Transitional Members.

"Membership Period" means the period during which a Person is a Member of the Association in accordance with the terms of the By-laws and the Agreement, commencing with the Admission Effective Date.

"Merger Agreement" means the Merger Agreement between MSRC and CB.

"Northern California Operational area" means the operational area referred to in the Merger Agreement.

"Person" means any individual, corporation, company, voluntary association, partnership, joint venture trust, unincorporated organization or government (or any agency, instrumentality or political subdivision thereof).

"Pro Rata Basis" has the meaning specified in Section 3(a)(14).

"Qualified Barrels" has the meaning specified in the Dues Procedures.

"Resignation Effective Date" means (i) with respect to a resigning Member, the day which is thirty (30) days after the Resignation Notice Date of such Member, and (ii) with respect to a Member being removed, the date when the Member is actually removed as a Member of the Association.

"Resignation Notice Date" means (i) with respect to a resigning Member, the date on which the Association receives notice in writing of such resignation from such Member, and (ii) with respect to a Member being removed, the Resignation Effective Date for such Member.

"Standard Member" means, at any time during the calendar year, a Member who pays Annual Dues based upon Qualified Barrels or Minimum Dues and which Member is not responsible for Debt Service Dues relating to prior supported debt.

"Written Communication" has the meaning set forth in Section 14. All Written Communications shall be addressed to the party for whom intended at its address specified under its signature hereto, or such other address as such party may specify by written notice. Written Communications shall be either delivered personally or sent by mail (first-class mail, postage prepaid in the case of a notice to and from a party with an address in the United States and air mail, postage prepaid in the case of notice to or from a party with an address not in the United States), overnight courier or facsimile transmission (in the case of facsimile transmission, promptly confirmed by mail). All Written Communications shall be effective only when actually received during the recipient's normal business hours. The receiving party of any facsimile transmission shall provide the sending party with acknowledgment of receipt if requested by the sending party; provided, however, that the failure of the sending party to request such acknowledgment or the receiving party to provide such acknowledgment shall not in any way affect the fact the facsimile transmission was effective when actually received during the recipient's normal business hours.

All other defined capitalized terms shall have the meanings ascribed in the Merger Agreement.

AMENDMENT ONE
TO
MARINE SPILL RESPONSE CORPORATION
SERVICE AGREEMENT
FOR CB TRANSITIONAL MEMBERS

The MSRC SERVICE AGREEMENT FOR CB TRANSITIONAL MEMBERS by and between Kinder Morgan (the "COMPANY") and MARINE SPILL RESPONSE CORPORATION ("MSRC"), a standard form of agreement dated as of December 31, 2003 (the "Agreement"), is hereby amended as follows:

1. Section 2.01(a) is hereby amended in its entirety as follows:

2.01(a). Oil Spill Event outside Northern California Operational Area or Not Involving a Covered Facility or Covered Vessel. MSRC will not provide any Resources for a Spill Event occurring outside the Northern California Operational Area (which for the purposes of this Section 2.01(a) includes the area of California inland from the Northern California Operational Area) or not involving a Covered Facility or Covered Vessel. However, if MSRC becomes involved in a response outside the Northern California Operational Area (due to spill migration or any other reason), or involving a non-Covered Facility or non-Covered Vessel, that response will be governed by the terms and conditions of this Agreement.

2. The parties agree this Amendment shall be effective December 31, 2003.

3. Any MSRC response in inland areas of the Northern California Operational Area shall be subject to and in accordance with an Inland (Non-Responder Immunity) Addendum to the Agreement to be executed and maintained by the COMPANY.

IN WITNESS WHEREOF, the parties hereto each have caused this Amendment to be duly executed and effective as set forth above.

ADDENDUM
SERVICE AGREEMENT
(NON-RESPONDER IMMUNITY OIL SPILL RESPONSE)

THIS ADDENDUM TO SERVICE AGREEMENT (this "Addendum"), entered into as of December 31, 2003, modifies and supplements the Service Agreement (the "Service Agreement") by and between Marine Spill Response Corporation ("MSRC") and Kinder Morgan Energy Partners ("Kinder Morgan"), as set forth below. Notwithstanding anything to the contrary set forth in the Service Agreement, this Addendum shall control in the event of a conflict between any provision of this Addendum and any other provision of the Service Agreement.

In consideration of the promises and the mutual covenants of this Addendum, MSRC and Kinder Morgan agree as follows:

1. Kinder Morgan has requested Resources for a Spill Events in a state (California) which has not adopted Responder Immunity.

2. Kinder Morgan and MSRC acknowledge and agree that the lack of Responder Immunity potentially exposes MSRC to additional liabilities. In other states with Responder Immunity, MSRC would not have this exposure, but rather this potential liability would be transferred to the responsible party by the Responder Immunity statute. The intent of this Addendum is to place MSRC and Kinder Morgan in the same respective positions they would be had [state] adopted Responder Immunity.

3. Section 9.03(b) of the Service Agreement is hereby amended in its entirety as follows for this Such Spill Event (with changes underlined):

9.03(b) COVER INDEMNIFICATION. SUBJECT TO THE PROVISIONS OF SECTIONS 9.03(d) AND (e) BELOW, IT IS AGREED THAT THE COVERED ENTITY (Kinder Morgan) WILL DEFEND, INDEMNIFY AND HOLD HARMLESS THE INDEMNITEES AND EACH OF THEM, AGAINST AND FROM ANY AND ALL LOSSES, LIABILITIES, DAMAGES, COSTS AND EXPENSES OF ANY SUCH INDEMNITEES RELATED TO ANY CLAIM ARISING OUT OF, OR IN ANY MANNER CONNECTED WITH, MSRC'S PERFORMANCE OF OR ALLEGED FAILURE TO PERFORM ITS OBLIGATIONS UNDER THIS AGREEMENT AS A RESULT OF A SPILL EVENT WHERE THE INDEMNITEE DEMONSTRATES THAT THE COMPANY, OR ANY APPLICABLE COVERED ENTITY, COULD HAVE BEEN LIABLE IF SUED DIRECTLY OR DID OR DOES HAVE A LIABILITY FOR OR WITH RESPECT TO SUCH CLAIM UNDER OPA OR ANY OTHER APPLICABLE FOREIGN, FEDERAL, STATE OR LOCAL LAW (WHETHER STATUTORY OR COMMON) (OR WOULD HAVE HAD SUCH LIABILITY IF [STATE] HAD ADOPTED RESPONDER IMMUNITY) AND IRRESPECTIVE AS TO WHETHER SUCH LIABILITY WOULD BE CONSIDERED DIRECT, INDIRECT, CONCURRENT, JOINT, PRIMARY, SECONDARY, VICARIOUS OR DERIVATIVE

OF THE LIABILITY OF ANY INDEMNITEE WITH RESPECT TO SUCH CLAIM. IF THE COVERED ENTITY PROVIDING AN INITIAL CALL-OUT NOTICE IS NOT THE "RESPONSIBLE PARTY" FOR THE APPLICABLE DISCHARGE AS DEFINED IN OPA, THE LIABILITY OF THE COVERED ENTITY FOR THE PURPOSES OF THIS SECTION 9.03(b) SHALL INCLUDE THE LIABILITY OF SUCH "RESPONSIBLE PARTY".

4. Section 9.03(d) of the Service Agreement is hereby amended in its entirety as follows for this Such Spill Event (with changes underlined):

9.03(d) Excluded Obligations. The obligations of the Covered Entity under Sections 9.03(b) and (c) shall not include and shall not apply to:

(i) the extent (but only to the extent) that applicable law would render such indemnity or hold harmless agreement void or unenforceable;

(ii) the extent that any Claim is caused by any Indemnitee's gross negligence or willful, reckless, or criminal misconduct;

(iii) the portion of any Claim for which an insurer of MSRC recognizes or otherwise has an obligation to pay under the applicable policy or cover;

(iv) any portion of a Claim arising from or related to services or equipment provided by MSRC to a Spill Event other than pursuant to this Agreement including services or equipment provided by MSRC to a Spill Event after the Covered Entity has, pursuant to this Agreement, terminated the services of MSRC under this Agreement at such Spill Event;

(v) any Claim for personal injury or wrongful death of Persons who are employees of MSRC or MSRC Integral Subcontractors;

(vi) any portion of a Claim with respect to a Spill Event where the payment of such portion of the Claim would cause the aggregate of (i) the amount of any payments actually made by or on behalf of the COMPANY or the Covered Entity to or on behalf of any Indemnitees under this Agreement or any MSRC Subcontractors pursuant to Section 9.03(i) with respect to such Spill Event and (ii) the amount of any payments made by or on behalf of the COMPANY or the Covered Entity for removal costs or damages under OPA with respect to such Spill Event, to exceed the Cap with respect to such Spill Event, whether or not under OPA or any other applicable law or regulation or in any proceeding the Cap can be maintained by the COMPANY or the Covered Entity; provided that the restrictions of this Section 9.03(d)(vi) shall not apply to any Claim for which (A) the COMPANY or the Covered Entity has previously assumed the defense of such Claim under Section 9.03(e), or (B) the Indemnitee would have been entitled to immunity if [state] had in effect Responder Immunity; or

(vii) any portion of a Claim with respect to which an Indemnitee has successfully maintained an immunity from liability under any applicable provision of OPA or other foreign, Federal or state law; provided, however, that the exclusion under this Section 9.03(d)(vii) shall not apply to costs (including attorneys' fees) incurred by the Indemnitee in asserting said immunity.

IN WITNESS WHEREOF, the undersigned have executed this Addendum as of the date first above written.

MARINE SPILL RESPONSE CORPORATION
SERVICE AGREEMENT

STANDARD FORM OF AGREEMENT

Parties and Background

This is a SERVICE AGREEMENT with attached signature pages (the "Agreement") between the COMPANY and MARINE SPILL RESPONSE CORPORATION, a nonprofit corporation organized under the laws of Tennessee ("MSRC").

For convenience and simplicity, as between the COMPANY and Covered Entity (if any), references to the party for performance are made to a "Covered Entity," but the COMPANY can exercise the rights and will guarantee the performance of a Covered Entity as set forth more fully in this Agreement.

In consideration of the promises and the mutual covenants of this Agreement, MSRC and the COMPANY agree as follows:

Articles

ARTICLE I CALLOUT

1.01. Call-Out of Resources

1.01(a). Alert. A Covered Entity may alert MSRC of the possibility of a call-out under this Agreement. Upon receipt of an alert MSRC will review its readiness to respond in the event of a call-out under Section 1.01(b). Such alert does not (i) obligate the Covered Entity to pay MSRC's rates or any costs incurred by MSRC, (ii) obligate MSRC to Mobilize any Resources, or (iii) give the Covered Entity any rights to obtain any particular Resources, unless and until MSRC is called out in accordance with this Agreement.

1.01(b). Call Out Process. An Authorized Representative, or an individual MSRC reasonably believes is acting on behalf of a Covered Entity, may obtain and MSRC will provide any of the Resources available under this Agreement by calling an MSRC response manager through one of the telephone call-out numbers provided by MSRC from time to time by notice to the COMPANY. This Initial Callout Notice shall consist of a specific request for desired Resources to be provided from the list on Schedule 3 (or as otherwise made available by MSRC at the time of callout), in consultation with one of MSRC's response managers. The Authorized Representative or the Incident Commander of a Covered Entity may add to or discontinue use of any Resources, in consultation with MSRC's response manager, at any time. The Covered Entity and MSRC will document the Resources requested and provided. If MSRC Subcontractors are required to provide the requested Resources, MSRC will call out and supervise those MSRC Subcontractors, unless and until other arrangements are made as described in Section 3.04. Part II of Schedule 3 contains the special terms and conditions and call out procedures for MSRC support for transfer operations requiring "Average Most Probable Discharge" response capability under OPA.

1.02. Deleted.

1.03. Mobilizing MSRC Response Resources. As soon as practicable under the circumstances after MSRC receives an Initial Call-Out Notice or subsequent change to a request, MSRC will Mobilize the

requested Resources including MSRC Subcontractors.

ARTICLE II. CAPABILITIES

2.01. Resource Availability. Except as otherwise directed by governmental authorities, agreed by mutual consent or as described below, Resources are provided to the COMPANY and others on a first-come/first-served basis. Any of the Resources can be requested for any Spill Event, subject to the following restrictions and qualifications, as applicable:

2.01(a). Oil Spill Event outside Northern California Operational Area or Not Involving a Covered Facility or Covered Vessel. MSRC will not provide any Resources for a Spill Event occurring outside the Northern California Operational Area or not involving a Covered Facility or Covered Vessel. However, if MSRC becomes involved in a response outside the Northern California Operational Area (due to spill migration or any other reason), or involving a non-Covered Facility or non-Covered Vessel, that response will be governed by the terms and conditions of this Agreement.

2.01(b). Responder Immunity. If at any time Responder Immunity is not available for a Spill Event, MSRC may withdraw, or decline to provide, MSRC Response Personnel or any Resources requiring such MSRC Response Personnel, unless other arrangements acceptable to MSRC in its sole discretion are made to offset any additional legal and financial risk that may result.

2.01(c). Discharges of substances other than Oil. MSRC may offer from time to time to provide Resources under this Agreement to Spill Events involving substances other than Oil (including Hazardous Substances) as permitted and in accordance with MSRC's policies and procedures adopted from time to time. Any additional or different terms and conditions applicable to the provision of Resources for such non-Oil Spill Events will be set forth in an addendum to this Agreement executed by MSRC and the COMPANY in advance or at the time of callout for the Spill Event.

2.01(d). Conflicting Requests. If the Covered Entity and some other person with whom MSRC has a contract both desire the same Resources or otherwise have conflicting requests, MSRC will immediately notify and consult with each of the respective incident commanders regarding the conflict. MSRC will continue to follow a first-come/first-served approach unless and until it receives timely non-conflicting directions from the incident commanders to redirect Resources or activities. If, after such notice and consultation the conflicting parties still do not agree, MSRC will follow the relevant FOSC(s)' non-conflicting directions, if any.

2.02. Changes in Resources Offered. MSRC will periodically update Schedule 3 to reflect changes in the Resources offered under this Agreement, and will give prompt notice to the COMPANY in advance where practicable of any significant reduction in response capability.

ARTICLE III ROLES AND PROCEDURES FOR RESPONSE PERFORMANCE

3.01 Responsibilities of the COMPANY and Covered Entity

3.01(a). **General Management and Overall Direction.** Subject to the power and authority of Governmental Bodies, the Covered Entity will provide general management and overall direction and control of all Response Activities under this Agreement. The Covered Entity shall designate an Incident Commander, who shall be in frequent communication with MSRC while MSRC is providing Resources under this Agreement. The designated Incident Commander will advise MSRC in writing of any non-apparent limitations and restrictions on the authority of the Covered Entity's employees, contractors, and agents to authorize and direct Response Activities of MSRC and MSRC Subcontractors. The Incident Commander will also advise MSRC of any directions or pertinent concerns of Governmental Bodies or the Unified Command that affect, or that may reasonably be expected to affect, any Resources or activities under this Agreement. All activities of MSRC under this Section 3.01(a) will be subject to the overall direction and control of the Covered Entity.

3.01(b) **Care of Resources.** The Covered Entity will use its best efforts to operate, maintain, and store any MSRC Response Equipment provided without associated MSRC Response Personnel in a careful and proper manner under the circumstances and in accordance with applicable law.

3.02. Responsibilities of MSRC

3.02(a). **Operational Supervision.** MSRC will, within the limits of its available resources, at the Covered Entity's cost and expense, and in accordance with applicable law, provide operational supervision and coordination (i) for Resources, including any MSRC Subcontractor called out by MSRC prior to assignment under Section 3.04, and (ii) upon request of the Covered Entity, for any subcontractors called out by or assigned to the Covered Entity. Such supervision shall be in accordance with and subject to the overall direction and control of the Covered Entity's Incident Commander, as described in Section 3.01(a).

3.02(b). **Initial Coordination and Communication.** MSRC will, upon request, provide an on-scene point of coordination and communication between the Covered Entity and the FOSC and other response officials until the first to occur of: (i) 24 hours after initial callout; or (ii) the Covered Entity's response management team (as contemplated by 33 CFR 155.1035(d)) arrives on-scene and assumes direct management and control.

3.02(c). **Governmental Directions.** MSRC will immediately notify the Covered Entity's Incident Commander of any directions MSRC receives from any Governmental Body which MSRC believes may conflict with previous guidance or direction MSRC may have received from the Covered Entity. If the FOSC or SOSC gives directions to MSRC and MSRC does not receive timely directions from the Incident Commander, MSRC will follow those FOSC or SOSC directions. In any event, MSRC will immediately act on directions from any Governmental Body that relate to personnel safety, alleged violations of law or regulations, immediate endangerment of public health or the environment, or directions that constitute an order or command of a Governmental Body with apparent legal authority. MSRC will notify the Incident Commander of those

STANDARD FORM RESPONSE PLAN CITATION OF MSRC FOR CB TRANSITIONAL MEMBERS

The Marine Spill Response Corporation ("MSRC") is a mutual benefit corporation organized exclusively to promote the welfare of the public by mitigating the environmental damage caused by spills of oil and other substances. MSRC has in place four regional response centers and various prepositioned equipment sites.

Because the owner or operator of the vessel or facility to which this Response Plan relates ("Plan Holder") is entitled to the benefits of membership as a CB Transitional Member in the Marine Preservation Association (MPA), the Plan Holder has entered into a standard form agreement for CB Transitional Members ("MSRC Service Agreement") with MSRC. The MSRC Service Agreement for CB Transitional Members permits the Plan Holder to cite MSRC Resources (personnel, equipment and/or subcontractor resources) as "contracted" resources in the Plan Holder's response plans for designated vessels and facilities owned or operated by the Plan Holder that are operated in MSRC's defined Northern California Operational Area, described below. These Resources may be cited, called out and used only in accordance with the terms and conditions of the MSRC Service Agreement for CB Transitional Members.

Information on the type, amount, storage location, and other details regarding MSRC's Resources made available under the MSRC Service Agreement appear in MSRC's Oil Spill Removal Organization (OSRO) Classification Response Resource Inventory ("RRI") submitted to the U.S. Coast Guard, as well as any application submitted by MSRC for similar purposes of state law, as amended from time to time by MSRC. A Copy of the OSRO classification RRI is available upon request from MSRC. The U.S. Coast Guard RRI Bulletin Board System contains a description of MSRC resources available to meet U.S. Coast Guard response planning requirements.

A CB Transitional Member Plan Holder who has executed a MSRC Service Agreement with MSRC may obtain available MSRC equipment, MSRC response personnel, and MSRC subcontractor personnel, equipment, goods and services for a spill in the Northern California Operational Area. MSRC offers "core" response resources for on-water containment and recovery, shoreline protection and associated activities and, as arranged through MSRC Subcontractors, shoreline cleanup capabilities. In addition, as arranged through MSRC as determined appropriate by the Plan Holder, appropriate resources can be provided to satisfy the planning requirements of Average Most Probable Discharge ("AMPD") on an as needed/as-requested basis. To obtain stand-by resources for AMPD for a given transfer operation, the Plan Holder must make a written request to MSRC at least 24 hours in advance, unless the AMPD is for an ocean area where transit time is allowed in lieu of on-scene standby. With regard to firefighting, salvage and lightering services and

wildlife hazing, rescue and rehabilitation, MSRC can only assist the Plan Holder in identifying an appropriate contractor with whom the Plan Holder can contract.

During a response, the Plan Holder will provide the overall management, control and direction of MSRC resources. In providing these resources, MSRC is obligated to use commercially reasonable efforts, consistent with applicable spill response industry practices considering available information and available resources under circumstances, conditions (including weather and sea conditions), and factors existing at any relevant time.

MSRC services do not include: (1) disposal of waste, including recovered oil, oily waste or any hazardous substance, (2) source control, (3) wreck removal, (4) natural resources damage assessment, (5) third party damage claims evaluation or adjustment, (6) acting as overall incident commander, (7) development or preparation of individual response plans; or (8) shoreline remediation performed in conjunction with the Natural Resource Trustees to restore the shoreline to its pre-spill condition, rather than as part of the cleaning process carried out under the oversight of the FOSC.

With certain exceptions, MSRC can generally respond with any available resources to spills occurring in the Northern California Operational Area. This area extends from the California/Oregon border, to the north, to Morro Bay, California to the south. Similarly, MSRC can be cited for contracted resources for purposes of individual response plans only in MSRC's defined Northern California Operational Area.

Upon request, MSRC can verify to the appropriate regulatory authority whether specific facilities or areas of vessel transit are within MSRC's Northern California Operational Area, and whether the Plan Holder's specific vessels or facilities are entitled to cite MSRC as "contracted" resources in the Plan Holder's response plans.

According to the MSRC Service Agreement, if federal responder immunity; and state or other applicable jurisdiction responder immunity with the same or similar effect as the federal immunity standard, are not available in a spill event, then MSRC may withdraw, or decline to provide, response personnel or equipment requiring response personnel, unless other arrangements acceptable to MSRC in its sole discretion are made to offset any additional legal and financial risk that may result. Also the provision of MSRC resources requires that the Plan Holder not be in default under the MSRC Service Agreement.

MSRC resources will be available to many entities other than the Plan Holder. MSRC will provide the resources on a first-come, first-served basis without maintaining a specific reserve. However, the resources can be redeployed in the event of conflicting requests where agreement can be reached among the parties requesting

the services, or, in the absence of such consensus, from nonconflicting directions of the relevant FOSCs.

Under the MSRC Service Agreement, as between MSRC and the Plan Holder, the Plan Holder bears all responsibility for and must perform or otherwise satisfy all duties and obligations and pay all charges associated with the management of Recovered Product or Waste (i.e., recovered oil, oily waste, or hazardous substances). The Plan Holder must provide MSRC the necessary documentation for MSRC to deliver Recovered Product or Waste for transportation by others to selected facilities, as well as instructions for the management of Recovered Product or Waste. The Plan Holder also must provide access to facilities, vessels or other receptacles for receipt or disposal of recovered product or waste. MSRC's operations depend upon these activities.

MSRC will rely on certain subcontractors in assisting a customer response. Upon request of the Plan Holder and consent of the subcontractors, these subcontractors will be assigned to the Plan Holder.

Under the MSRC Service Agreement, MSRC's obligation to provide equipment and/or personnel is subject to compliance by its customers with certain obligations. For example, each customer must demonstrate appropriate financial responsibility, promptly pay for all equipment and personnel provided, and meet its other financial obligations under the agreement. MSRC's obligations terminate, and MSRC may cease all operations, upon the occurrence of certain events of default by a customer. MSRC may suspend performance of affected activities upon the occurrence of certain events, including if MSRC is prevented from performance by a Force Majeure event, a subcontractor is unavailable to provide essential services, or responder immunity is unavailable. The Plan Holder can terminate all or any portion of MSRC's resources at any time.

Upon request from a Plan Holder and subject to availability, MSRC may provide an on-scene point of coordination and communication between the Plan Holder and the FOSC. This assistance may be provided only until the Plan Holder's spill response management team arrives on-scene, or 24 hours after initial callout, whichever occurs first.

MSRC has not reviewed or determined what response resources are needed to meet the Plan Holder's response plan requirements, and, as between the Plan Holder and MSRC, the Plan Holder has the sole responsibility for the content, accuracy and adequacy of any response plan. MSRC has not advised on or approved the adequacy of any response plan.

MARINE SPILL RESPONSE CORPORATION
SERVICE AGREEMENT
FOR CB TRANSITIONAL MEMBERS

EXECUTION INSTRUMENT

The MSRC SERVICE AGREEMENT FOR CB TRANSITIONAL MEMBERS attached hereto (together with this execution instrument, the "Agreement"), a standard form of agreement dated as of December 31, 2003, is hereby entered into by and between

SFPP-LP (KINDER MORGAN ENERGY PARTNERS)
[Name of COMPANY]

a PIPELINE (PETROLEUM PRODUCTS) OPERATOR
[Type of entity and place of organization]

with its prinoipal offices located at 100 CEMENT HILL RD. SUITE 500 FAIRFIELD, CA 94533 (the "COMPANY"), and MARINE SPILL RESPONSE CORPORATION, a nonprofit corporation organized under the laws of Tennessee ("MSRC"), and shall be identified as

SERVICE AGREEMENT No. _____ [This is to be provided by MSRC.]

IN WITNESS WHEREOF, the parties hereto each have caused this Agreement to be duly executed and effective as of 01-01-04, 2004.

SFPP-LP (KINDER MORGAN E.P.) [COMPANY]

By: _____ [signature]

FINANCIAL RESPONSIBILITY CERTIFICATION

In accordance with Section 2.01(a) of Schedule 2 to the MSRC Service Agreement, the undersigned, being a duly authorized officer of SEPP-LP (KINDER MORGAN EP) *[insert name of the "COMPANY" that is the party to the Service Agreement]* ("COMPANY"), does hereby certify to the best knowledge and belief of the undersigned, that the COMPANY meets the requirements of Schedule 2 and:

(i) the method relied on by the COMPANY to establish financial responsibility for each Vessel and Facility owned or operated within the Operational Area by the COMPANY or its affiliates is as follows *(see Section 2.02 (a) through (c) of Schedule 2 for the available methods)*:

SEE ATTACHED CERTIFICATE OF FINANCIAL RESPONSIBILITY

[Attach additional sheets if necessary]

(ii) the applicable Financial Responsibility Amount for each Vessel and Facility owned or operated within the Operational Area by the COMPANY or its affiliates is as follows *(see the definitions in Section 2.03 of Schedule 2 for the proper calculation of Financial Responsibility Amount)*:

SEE ATTACHED RENEWAL APPLICATION AND RULES OF 6919 BBLS

[Attach additional sheets if necessary]

Capitalized terms used in this Certificate and not defined have the meaning ascribed to such terms under the Service Agreement.

IN WITNESS WHEREOF, the undersigned has executed this Certificate in the name and on behalf of the COMPANY as of 12-16, 2003.

4.0 SPILL IMPACT CONSIDERATIONS

4.1 CRITICAL AREAS TO PROTECT

The critical areas to protect are classified as high, moderate, and low sensitivity to oil. The Federal, state, and local authorities will further clarify these categories at the time of the response. The categories are defined as follows:

HIGH SENSITIVITY

- Areas which are high in productivity, abundant in many species, extremely sensitive, difficult to rehabilitate, or inhabited by threatened/endangered species.
- Areas which consist of vegetated low banks, freshwater/saltwater marshes, swamps, scrub-shrub wetlands and impact to threatened/endangered species.

MODERATE SENSITIVITY

- Areas of moderate productivity, somewhat resistant to the effects of oiling.
- Areas which consist of mixed sand, gravel beaches, bars, gently sloping banks, and no impact to threatened/endangered species.

LOW SENSITIVITY

- Areas of low productivity, man-made structures, and/or high energy.
- Areas which consist of gravel, sand, or clay material, barren/rocky shores or banks, man-made structures, concrete/compacted earthen drainage ditches and no impact to threatened/endangered species.

4.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES

Environmental/socio-economic sensitivities are of extreme importance when planning a response effort. The health and safety of the public and the environment, as well as the protection of the various socio-economic sensitivities, must be promptly addressed in order to mitigate the extent of damage and minimize the cost of the clean-up effort.

To determine adequate response resources, the Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three (3) tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. The tier requirements for high volume areas are for response in six (6) hours (Tier 1), 30 hours (Tier 2), and 54 hours (Tier 3). High volume areas are listed in 49 CFR 194. The tier requirements for all other areas are for response in 12 hours (Tier 1), 36 hours (Tier 2), and 60 hours (Tier 3).

4.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES (Cont'd)

All environmental/socio-economic sensitivities are worthy of protection, but must be prioritized during a response effort. When making decisions on which areas to designate as collection areas and which to protect, the following sources may be consulted:

- U.S. Fish and Wildlife Service and related state agencies
- Applicable Area Contingency Plans (see CD affixed to inside front cover of Volume 1 and the CD Navigation Summary in Figure 4.2)
- Other industry and private experts

The environmental and socio-economic sensitivities in the area have been broken down into specific categories and identified in this section.

4.3 WILDLIFE PROTECTION AND REHABILITATION

The Company will work with Federal, State, and local agency personnel to provide labor and transportation to retrieve, clean, and rehabilitate birds and wildlife affected by an oil spill, as necessary. Oversight of the Company's wildlife preservation activities and coordination with Federal, State, and local agencies during an oil spill is the responsibility of the Incident Commander.

Special consideration should be given to the protection and rehabilitation of endangered species and other wildlife and their habitat in the event of an oil spill and subsequent response. Jurisdictional authorities should be notified and worked with closely on all response/clean-up actions related to wildlife protection and rehabilitation. Laws with significant penalties are in place to ensure appropriate protection of these species.

4.3.1 Endangered/Threatened Species

The U.S. Fish and Wildlife Service (USFWS) and related state agencies classify the status of various wildlife species in the potentially effected states. A summary of critical birds, reptiles, mammals, and plant species status as related to the Facility's operating areas (area of highest oil spill potential) is presented in Figure 4.1.

4.3.2 Wildlife Rescue

The Company will work with Federal, State, and local agency personnel to provide labor and transportation to retrieve, clean, and rehabilitate wildlife affected by an oil spill, as the situation demands.

4.3 WILDLIFE PROTECTION AND REHABILITATION (Cont'd)

4.3.2 Wildlife Rescue (Cont'd)

The following are items which should be considered for wildlife rescue and rehabilitation during a spill response:

- Bird relocation can be accomplished using a variety of deterrents, encouraging birds to avoid areas of spilled oil. Bird relocation can be accomplished by utilizing deterrent methods including:
  - Use of visual stimuli, such as inflatable bodies, owls, stationary figures, or helium balloons, etc.
  - Use of auditory stimuli, such as propane cannons, recorded sounds, or shell crackers.
  - Use of herding with aircraft, boats, vehicles, or people (as appropriate).
  - Use of capture and relocation.

4.3.3 Search and Rescue - Points to Consider

- **The Company's involvement should be limited to offering assistance as needed or requested by the agencies.**
- Prior to initiating any organized search and rescue plan, **authorization must be obtained from the appropriate federal/state agency.**
- **Initial search and rescue efforts, if needed, should be left up to the appropriate agencies.** They have the personnel, equipment, and training to immediately begin capturing contaminated wildlife.
- With or without authorization it must be anticipated that volunteer citizens will aid distressed/contaminated wildlife of their own. It is important to communicate that it may be illegal to handle wildlife without express authority from appropriate agencies. Provisions should be made to support an appropriate rehabilitator, however, **no support should be given to any unauthorized volunteer rescue efforts.**
- The regulatory agencies and response personnel should be provided the name and location of a qualified rehabilitator in the event contaminated wildlife is captured.
- Resources and contacts that can assist with wildlife rescue and rehabilitation are provided in Section 2.0. This list includes:
  - Outside rehabilitation organizations
  - Local regulatory agencies
  - Other resources

4.4 STAGING AREAS

When establishing personnel and equipment staging areas for a response to a Facility discharge, the following criteria should be evaluated:

- Access to waterborne equipment launching facilities and/or land equipment.
- Access to open space for staging/deployment of heavy equipment and personnel.
- Access to public services utilities (electricity, potable water, public phone, restroom and washroom facilities, etc.)
- Access to the environmental and socio-economically sensitive areas which are projected for impact.

4.5 TRAJECTORY ANALYSIS

Oil spilled on water will react primarily to the effects of wind and current. The oil will tend to spread to a thin layer under the influence of gravity (primary) and chemical (secondary) forces. The following describes the behavior of oil on water:

- Oil will move in the direction and at the rate of the current under negligible wind conditions.
- Oil will move in the direction and at approximately 3.4 % of the velocity of the wind under negligible current conditions.
- The combined effects of wind and current on the oil should be carefully analyzed. A method of vector analysis can be performed to determine the net direction of movement (wind forces can work in addition to, against, or in many other combinations with the current).
- The primary method of surveillance for the Facility will be visual. Visual surveillance is not effective however in rain, fog, darkness, or heavy cloud cover. It is difficult to observe a slick on the water from a boat, dock or land due to the angle of observation. Aerial surveillance is the preferred method of visual surveillance because of the elevated view and the ability to cover a large area in a short period.

FIGURE 4.1

ENDANGERED/THREATENED SPECIES LISTING

The following is a list of endangered and threatened species with known or possible occurrence in the State of California by county (listed alphabetically by the Scientific Name).

ANIMALS	
Common Name	**Scientific Name**
Alameda County	
Shrimp, Longhorn Fairy	Branchinecta Longiantenna
Shrimp, Vernal Pool Fairy	Branchinecta Lynchi
Plover, Western Snowy	Charadrius Alexandrinus Nivosus
Plover, Mountain	Charadrius Montanus
Goby, Tidewater	Eucyclogobius Newberryi
Butterfly, Bay Checkerspot	Euphydryas Editha Bayensis
Salmon, Chinook (Sacramento River Winter Run)	Oncorhynchus Tshawytscha
Pelican, Brown	Pelicanus Occidentalis
Rail, California Clapper	Rallus Longirostris Obsoletus
Mouse, Salt Marsh Harvest	Reithrodontomys Raviventris
Fox, San Joaquin Kit	Vulpes Macrotis Mutica
Contra Costa County	
Butterfly, Lange's Metalmark	Apodemia Mormo Langei
Shrimp, Longhorn Fairy	Branchinecta Longiantenna
Shrimp, Vernal Pool Fairy	Branchinecta Lynchi
Plover, Mountain	Charadrius Montanus
Goby, Tidewater	Eucyclogobius Newberryi
Butterfly, Bay Checkerspot	Euphydryas Editha Bayensis
Salmon, Chinook (Central Valley Spring Run)	Oncorhynchus Tshawytscha
Salmon, Chinook (Sacramento River Winter Run)	Oncorhynchus Tshawytscha
Pelican, Brown	Pelicanus Occidentalis
Rail, California Clapper	Rallus Longirostris Obsoletus
Mouse, Salt Marsh Harvest	Reithrodontomys Raviventris
Fox, San Joaquin Kit	Vulpes Macrotis Mutica
San Joaquin County	
Shrimp, Vernal Pool Fairy	Branchinecta Lynchi
Plover, Mountain	Charadrius Montanus
Beetle, Valley Elderberry Longhorn	Desmocerus Californicus Dimorphus
Eagle, Bald	Haliaeetus Leucocephalus
Smelt, Delta	Hypomesus Transpacificus
Shrimp, Vernal Pool Tadpole	Lepidurus Packardi
Rabbit, Riparian Brush	Sylvilagus Bachmani Riparius
Snake, Giant Garter	Thamnophis Gigas
Fox, San Joaquin Kit	Vulpes Macrotis Mutica
San Mateo County	
Murrelet, Marbled	Brachyramphus Marmoratus
Butterfly, San Bruno Elfin	Callophrys Mossii Bayensis
Plover, Western Snowy	Charadrius Alexandrinus Nivosus
Goby, Tidewater	Eucyclogobius Newberryi
Butterfly, Bay Checkerspot	Euphydryas Editha Bayensis
Eagle, Bald	Haliaeetus Leucocephalus
Butterfly, Mission Blue	Icaricia Icarioides Missionensis
Salmon, Coho (Central California Coast Pop)	Oncorhyncgus Kisutch

ACP/GRP CD
NAVIGATION INSTRUCTIONS
(Excerpt from CD affixed to inside front cover of Volume 1)

KINDER MORGAN

The information contained herein is provided to identify specific spill response and protection strategies for the applicable Kinder Morgan Pacific Operations Regions. Navigating through the bookmark links provided on the CD will take you to the Environmentally Sensitive Sites and the Economically Significant Sites provided in the applicable Area Contingency Plans and Geographic Response Plans.

INSTRUCTIONS FOR USE

1. From the screen on the left, click on region of interest. The different regions are identified by the red font.
2. Once the appropriate region is accessed, click on the "+" to the left of the region name to display the various areas within each region. These are identified with blue font.
3. Once the appropriate area is accessed, the links to the Environmentally Sensitive Sites and the Economically Significant Sites will be available for selection.
   - ➢ It is important to note that once each Environmentally Sensitive Site and Economically Significant Site is accessed, the user will have to scroll to the desired location.
   - ➢ Use the zoom icon to zoom into each page for easier reading.

NOTES:

1. In those areas where the statement "No ACP Information Available" is made, it indicates that there is no ACP or GRP information which is specific to the particular region or area of interest.
2. EPA REGION IX: For areas without specific ACP/GRP information, the Region IX Contingency Plan (RCP) is used as the response guidance; however, this RCP is currently in revision.
3. EPA REGION X: Region X is covered by the Northwest Area Contingency Plan; however, inland facilities are not addressed.
4. Thus, the following areas are covered by specific area contingency or geographic response plans on this CD:
   - Northern Region—Northwest: Linnton-Willbridge, Washington Area
   - Northern Region—Bay: Brisbane, Concord, Richmond, San Jose
   - Southern Region—Central: Mission Valley-Orange
   - Southern Region—West: Carson, Watson
5. And, the following areas do not have specific area contingency or geographic response plans on this CD:
   - Northern Region—Northwest: Oregon Pipelines (inland)
   - Northern Region—Central: Fresno
   - Northern Region—CalNev: Sacramento, Rocklin, Reno
   - Southern Region—East: Imperial, Phoenix, Tucson
   - Southern Region—Central: Colton, Barstow, Las Vegas

5.0 DISPOSAL PLAN

5.1 OVERVIEW

A major oil spill response would generate significant quantities of waste materials ranging from oily debris and sorbent materials to sanitation water and used batteries. All these wastes need to be classified and separated (i.e., oily, liquid, etc.), transported from the site, and treated and/or disposed of at approved disposal sites. Each of these activities demands that certain health and safety precautions be taken, which are strictly controlled by federal and state laws and regulations. This section provides an overview of the applicable state regulations governing waste disposal, and a discussion of various waste classification, handling, transfer, storage, and disposal techniques. It is the responsibility of the Environmental Manager or their designee to manage the following:

- Coordinates waste disposal activities;
- Identifies appropriate interim storage methods and locations;
- Coordinates permitting activities needed to ensure proper disposal; and
- Documents compliance with appropriate local, State, and Federal handling of hazardous materials and/or wastes.

Material will be containerized or stored in a manner complying with applicable environmental regulations pertaining to the known or suspected materials characteristics. Upon characterization, waste, recyclable materials, or contaminated materials will be treated on-site, recycled, or transported and disposed of at an appropriate KMEP approved facility after appropriate regulatory approval.

5.2 WASTE CLASSIFICATION

Oily - Liquid Wastes

Oily liquid wastes (i.e., oily water and emulsions) that would be handled, stored, and disposed of during response operations are very similar to those handled during routine storage and transfer operations. The largest volume of oily liquid wastes would be produced by recovery operations (e.g., through the use of vacuum devices or skimmers). In addition, oily water and emulsions would be generated by vehicle operations (e.g., spent motor oils, lubricants, etc.), and equipment cleaning operations.

Non-Oily - Liquid Wastes

Response operations would also produce considerable quantities of non-oily liquid wastes. Water and other non-oily liquid wastes would be generated by the storage area and stormwater collection systems, vessel and equipment cleaning (i.e., water contaminated with cleaning agents), and office and field operations (i.e., sewage, construction activities).

Solid Wastes

A solid waste is defined as any discarded material provided that it is not specifically excluded under the regulations. These exclusions cover materials such as domestic sewage and mixtures of sewage discharged through a sewer system or industrial wastewater point source discharges.

A discarded material is any material which is abandoned (disposed of, burned or incinerated) or accumulated, stored or treated prior to being abandoned. A discarded material is also any material recycled or any material considered inherently wastelike. Recycled material is considered solid waste when used in a manner constituting disposal, placed on land or burned for energy recovery.

5.2 WASTE CLASSIFICATION (Cont'd)

Solid Wastes (Cont'd)

A solid waste may be considered a hazardous waste. A solid waste, as defined above, may be a hazardous waste if it is not excluded from regulation and is either a listed hazardous waste or exhibits the characteristics of a hazardous waste. A solid waste exhibits the characteristics of a hazardous waste if it exceeds the thresholds established in determining the following:

1) ignitability
2) corrosivity
3) reactivity
4) toxicity

A solid waste may also become a hazardous waste if it is mixed with a listed hazardous waste or, in the case of any other waste (including mixtures), when the waste exhibits any of the characteristics identified above.

Oily - Solid/Semi-Solid Wastes

Oily solid/semi-solid wastes that would be generated by containment and recovery operations include damaged or worn-out booms, disposable/soiled equipment, used sorbent materials, saturated soils, contaminated beach sediments, driftwood, and other debris.

Non-Oily - Solid/Semi-Solid Wastes

Non-oily solid/semi-solid wastes would be generated by emergency construction operations (e.g., scrap, wood, pipe, and wiring) and office and field operations (i.e., refuse). Vessel, vehicle, and aircraft operations also produce solid wastes.

5.3 WASTE HANDLING

A primary concern in the handling of recovered oil and oily debris is contaminating unaffected areas or recontaminating already cleaned areas. Oily wastes generated during the response operations would need to be separated by type and transferred to temporary storage areas and/or transported to incineration or disposal sites. Proper handling of oil and oily wastes is imperative to ensure personnel health and safety.

Safety Considerations

Care would be taken to avoid or minimize direct contact with oily wastes. All personnel handling or coming into contact with oily wastes would wear protective clothing. A barrier cream can be applied prior to putting on gloves to further reduce the possibility of oily waste absorption. Safety goggles would be worn by personnel involved in waste handling activities where splashing might occur. Any portion of the skin exposed to oily waste would be washed with soap and water as soon as possible. Decontamination zones would be set up during response operations to ensure personnel are treated for oil exposure.

5.3 WASTE HANDLING (Cont'd)

Waste Transfer

During response operations, it may be necessary to transfer recovered oil and oily debris from one point to another several times before the oil and oily debris are ultimately recycled, incinerated or disposed of at an appropriate disposal site. Depending on the location of response operations, any or all of the following transfer operations may occur:

- From portable or vessel-mounted skimmers into flexible bladder tanks, storage tanks of the skimming vessel itself, or a barge.
- Directly into the storage tank of a vacuum device.
- From a skimming vessel or flexible bladder to a barge.
- From a vacuum device storage tank to a barge.
- From a barge to a tank truck.
- From a tank truck to a processing system (e.g., oil/water separator).
- From a processing system to a recovery system and/or incinerator.
- Directly into impermeable bags that, in turn, are placed in impermeable containers.
- From containers to trucks.

There are four general classes of transfer systems that may be employed to affect oily waste transfer operations:

- **Pumps:** Rotary pumps, such as centrifugal pumps, may be used when transferring large volumes of oil, but they may not be appropriate for pumping mixtures of oil and water. The extreme shearing action of centrifugal pumps tends to emulsify oil and water, thereby increasing the viscosity of the mixture and causing low, inefficient transfer rates. The resultant emulsion would also be more difficult to separate into oil and water fractions. Lobe or "positive displacement" pumps work well on heavy, viscous oils, and do not emulsify the oil/water mixture. Double-acting piston and double acting diaphragm pumps are reciprocating pumps that may also be used to pump oily wastes.

- **Vacuum Systems**: A vacuum truck may be used to transfer viscous oils but they usually pick up a very high water/oil ratio.

- **Belt/Screw Conveyors:** Conveyors may be used to transfer oily wastes containing a large amount of debris. These systems can transfer weathered debris laden oil either horizontally or vertically for short distances (i.e., 10 feet) but are bulky and difficult to set up and operate.

- **Wheeled Vehicles:** Wheeled vehicles may be used to transfer liquid wastes or oily debris to storage or disposal sites. These vehicles have a limited transfer volume (i.e., 100 barrels) and require good site access.

Figure 5.1 provides a comparative evaluation of 16 types of transfer systems that could be available for transfer operations.

5.4 WASTE STORAGE

Interim storage of recovered oil, oily and non-oily waste would be considered to be an available means of holding the wastes until a final management method is selected. In addition, the segregation of wastes according to type would facilitate the appropriate method of disposal. The storage method used would depend upon:

- The type and volume of material to be stored.
- The duration of storage.
- Access.

During an oil spill incident, the volume of oil that can be recovered and dealt with effectively depends upon the available storage capacity. Typical short-term storage options are summarized in Figure 5.2. The majority of these options can be used either onshore or offshore.

If storage containers such as bags or drums are used, the container must be clearly marked and/or color-coded to indicate the type of material/waste contained and/or the ultimate disposal option. Bladder or pillow tanks would be acceptable, if the available space can support the weight of both the container and the product.

Fuel barges may be the best option for temporary storage of oil recovered in open waters. Depending on size, these vessels may be able to hold up to 6,000 barrels of oil and water. The barge deck can be used as a platform for operating oil spill clean-up equipment and storing containment boom.

Empty barges have four to six feet draft which would increase when these barges are filled with oil or loaded with cargo. Consequently, they may not be able to enter shallow, nearshore waters.

It may be difficult to offload recovered oil stored inside barges. Due to natural forces which affect spilled oil, recovered oil may be very viscous or emulsified, rather than free-flowing. It may be necessary to use steam to heat viscous oil before pumping it from the barge.

Steel or rubber tanks can be used to store oil recovered near the shoreline. To facilitate offloading, demulsifiers may be used to break emulsions prior to placing the recovered substance into the barges or storage tanks.

Use of any site for storage is dependent on the approval of the local authorities. The following elements affect the choice of a potential storage site:

- Geology.
- Ground water.
- Soil.
- Flooding.
- Surface water.
- Slope.
- Covered material.
- Capacity.
- Climatic factors.
- Land use.
- Toxic air emissions.
- Security.
- Access.
- Public contact.

5.4 WASTE STORAGE (Cont'd)

Temporary storage sites should use the best achievable technology to protect the environment and human health. They should be set up to prevent leakage, contact, and subsequent absorption of oil by the soil. The sites should be bermed (1 to 1.5 meters high) and double lined with plastic or visqueen sheets 6-10 mils or greater in thickness, without joints, prior to receiving loose and bagged debris. The edges of the sheet should be weighted with stones or earth to prevent damage by wind, and the sheet should be placed on a sand layer or an underfelt thick enough to prevent piercing. A reinforced access area for vehicles at the edge of the site should be provided. In addition, the oily debris should be covered by secured visqueen or tarps and an adequate stormwater runoff collection system for the size and location of the site would be utilized. Additionally, the sites should be at least three (3) meters above mean sea level.

Oily debris can be hauled to approved temporary storage sites in visqueen lined trucks or other vehicles. Burnable, non-burnable, treatable and re-usable materials can be placed in well defined separate areas at temporary storage sites.

When the last of the oily debris leaves a temporary storage site, the ground protection would be removed and disposed of with the rest of the oily debris. Any surrounding soil which has become contaminated with oil would also be removed for disposal or treatment. If the soils were removed for treatment, they may be replaced if testing proves acceptable levels have been achieved. Treatment and remediation is encouraged when feasible. The temporary storage should be returned to its original condition.

5.5 WASTE DISPOSAL

Techniques for Disposal of Recovered Oil

Recovery, reuse, and recycling are the best choices for remediation of a spill, thereby reducing the amount of oily debris to be bermed onsite or disposed of at a solid waste landfill. Treatment is the next best alternative, but incineration and burning for energy recovery have more options within the state. There are some limitations and considerations in incinerating for disposal. Environmental quality of incineration varies with the type and age of the Facility. Therefore, when incineration becomes an option during an event, local air quality authorities would be contacted for advice about efficiency and emissions of facilities within their authority. Approval of the local air authorities is a requirement for any incineration option. Landfilling is the last option. Final disposal at a solid or dangerous waste landfill is the least environmentally sound method of dealing with a waste problem such as oily debris.

During an oil spill incident, KMEP would consult with the Federal and state On Scene Coordinator (OSC) to identify the acceptable disposal methods and sites appropriately authorized to receive such wastes. KMEP maintains a list of approved disposal sites that satisfy local, state, and Federal regulations and KMEP requirements. This identification of suitable waste treatment and disposal sites would be prepared by the Environmental Manager or their designee in the form of an Incident Disposal Plan which must be authorized by the U.S. Coast Guard and/or the EPA. An Incident Disposal Plan would include predesignated interim storage sites, segregation strategies, methods of treatment and disposal for various types of debris, and the locations/contacts of all treatment and disposal site selections. Onsite treatment/disposal will be preferred.

5.5 WASTE DISPOSAL (Cont'd)

Techniques for Disposal of Recovered Oil (Cont'd)

In order to obtain the best overall Incident Disposal Plan, a combination of methods should be used. There is no template or combination of methods that can be used in every spill situation. Each incident should be reviewed carefully to ensure an appropriate combination of disposal methods are employed.

The different types of wastes generated during response operations would require different disposal methods. To facilitate the disposal of wastes, they should be separated by type for temporary storage, transport and disposal. Figure 5.3 lists some of the options that would be available to segregate oily wastes. The table also depicts methods that may be employed to separate free and/or emulsified water from the oily liquid waste.

The following is a brief discussion of some disposal techniques available for recovered oil and oily debris.

Recycling

This technique entails removing water from the oil and blending the oil with uncontaminated oil. Recovered oil can be shipped to refineries provided that it is exempt from hazardous waste regulations. There it can be treated to remove water and debris, and then blended and sold as a commercial product.

The Environmental Manager or their designee is responsible for ensuring that all waste materials be disposed of at an internally approved disposal site.

Incineration

This technique entails the complete destruction of the recovered oil by high temperature thermal oxidation reactions. There are licensed incineration facilities as well as portable incinerators that may be brought to a spill site. Incineration may require the approval of the local Air Pollution Control Authority. Factors to consider when selecting an appropriate site for onsite incineration would include:

- Proximity to recovery locations.
- Access to recovery locations.
- Adequate fire control.
- Approval of the local air pollution control authorities.

In Situ Burning/Open Burning

Burning techniques entail igniting oil or oiled debris and allowing it to burn under ambient conditions. These disposal techniques are subject to restrictions and permit requirements established by federal, state and local laws. They would not be used to burn PCBs, waste oil containing more than 1,000 parts per million of halogenated solvents, or other substances regulated by the EPA. Permission for *in situ* burning may be difficult to obtain when the burn takes place near populated areas.

5.5 WASTE DISPOSAL (Cont'd)

In Situ Burning/Open Burning (Cont'd)

As a general rule, *in situ* burning would be appropriate only when atmospheric conditions will allow the smoke to rise several hundred feet and rapidly dissipate. Smoke from burning oil will normally rise until its temperature drops to equal the ambient temperature. Afterwards, it will travel in a horizontal direction under the influence of prevailing winds.

Landfill Disposal

This technique entails burying the recovered oil in an approved landfill in accordance with regulatory procedures. Landfill disposal of free liquids is prohibited by federal law in the United States.

With local health department approval, non-burnable debris which consists of oiled plastics, gravel and oiled seaweed, kelp, and other organic material may be transported to a licensed, lined, approved municipal or private landfill and disposed of in accordance with the landfill guidelines and regulations. Landfill designation would be planned only for those wastes that have been found to be unacceptable by each of the other disposal options (e.g., waste reduction, recycling, energy recovery). Wastes would be disposed of only at Company-approved disposal facilities. The Environmental Manager or their designee is responsible for ensuring that all waste materials are disposed of at a Company internally approved disposal site. Disposal at a non-approved facility would require approval by the Environmental Manager or their designee prior to sending any waste to such a facility.

5.6 REGULATORY REQUIREMENT AND PERMITS

The management of oil and oily wastes must comply with the standards set forth in.:

- Code of Federal Regulations (CFR) Parts 261 and 265 as mandated by the Resource Conservation and Recovery Act (RCRA).
- California Code of Regulations (CCR) Title 22, Division 4, Chapter 30.
- CCR, Title 14, Division 1, Subdivision 4, Chapter 7, Subchapter 2, Determining Amount of Petroleum Hydrocarbons Recovered.

To expedite removal of spilled oil, refined products, and contaminated material from marine waters during an emergency response, temporary storage sites may be erected at appropriate shore locations (22 CCR 66270.1(c)(3)). The transportation of oil and contaminated material to temporary storage sites during emergency response is exempt from handling and permitting requirements (22 CCR 66263.30 and/or 66263.43). The onsite California Environmental Protection Agency, Department of Toxic Substance Control (DTSC) representative or duty officer should be contacted for approval. If a Unified Command is established, OSPR will facilitate the contact with DTSC through their liaison function.

Kinder Morgan will maintain responsibility for recovered oil and oily wastes generated during recovery operations. A temporary storage site may require an emergency permit from the San Francisco Bay Conservation & Development Commission (BCDC) or the California Coastal Commission (CCC).

5.6 REGULATORY REQUIREMENT AND PERMITS (Cont'd)

Citing of the temporary facility must be done with the concurrence of the USCG and State OSC, DTSC, the local RQQCB, and the local health, fire and emergency services. If a Unified Command is established, OSPR will facilitate the contact of the state and local agencies through their liaison function.

The San Francisco Bay Conservation and Commission and the California Coastal Commission have created the Joint CCC/BCDC Oil Spill Program to respond to oil-spill-related matters in the San Francisco Bay area and along the coast. This program acts as the single point of contact, and requests for emergency permits (including waste management) should be directed to the following Joint CCC/BCDC Oil Spill Program staff:

Joint CCC/BCDC Oil Spill Program (415) 904-5250 (phone)
45 Fremont Street, Suite 2000 (415) 904-5400 (fax)
San Francisco, CA 94105-2291

The Incident Commander will coordinate activities to obtain the necessary permits to ensure proper disposal or recycling of recovered oil and debris.

KEY TO RATINGS: 5 = Best; 1 = Worst

KEY TO COMMENTS:

A. Normally require remote power sources, thus are safe around flammable fluids.
B. Should have a relief valve in the outlet line to prevent bursting hoses.
C. Air powered units tend to freeze up in sub-freezing temperatures.
D. Units with work ball valves are difficult to prime.
E. Some remotely powered types are designed to fit in a tanker's butterworth hatch.
F. Can also pump air at low pressure.
G. Transfer is batch-wise rather than continuous.
H. Waste must be in separate container for efficient transfer.
I. Transportable with its own prime mover.
J. High shear action tends to emulsify oil and water mixtures.

FIGURE 5.2

TEMPORARY STORAGE METHODS

CONTAINER	ONSHORE	OFFSHORE	SOLIDS	LIQUIDS	NOTES
Barrels	x	x	x	x	May require handling devices. Covered and clearly marked.
Tank Trucks	x	x		x	Consider road access. Barge-mounted offshore.
Dump/Flat Bed Trucks	x		x		May require impermeable liner and cover. Consider flammability of vapors at mufflers.
Barges		x	x	x	Liquids only in tanks. Consider venting of tanks.
Oil Storage Tanks	x	x		x	Consider problems of large volumes of water in oil.
Bladders	x	x		x	May require special hoses or pumps for oil transfer.

FIGURE 5.3

OILY WASTE SEPARATION AND DISPOSAL METHODS

TYPE OF MATERIAL	SEPARATION METHODS	DISPOSAL METHODS
LIQUIDS		
Non-emulsified oils	Gravity separation of free water	Incineration Use of recovered oil as refinery/production facility feedstock
Emulsified oils	Emulsion broken to release water by: ● heat treatment ● emulsion breaking chemicals ● mixing with sand ● centrifuge ● filter/belt press	Use of recovered oil as refinery/production facility feedstock
SOLIDS		
Oil mixed with sand	Collection of liquid oil leaching from sand during temporary storage Extraction of oil from sand by washing with water or solvent Removal of solid oils by sieving	Incineration Use of recovered oil as refinery/production facility feedstock Direct disposal Stabilization with inorganic material Degradation through land farming or composting
Oil mixed with cobbles or pebbles	Screening Collection of liquid oil leaching from materials during temporary storage Extraction of oil from materials by washing with water or solvent	Incineration Direct Disposal Use of recovered oil as refinery/production facility feedstock
Oil mixed with wood, seaweed and sorbents	Screening Collection of liquid oil leaching from debris during temporary storage Flushing of oil from debris with water	Incineration Direct disposal Degradation through land farming or composting for oil mixed with seaweed or natural sorbents
Tar balls	Separation from sand by sieving	Incineration Direct disposal

meets the financial responsibility requirements specified in Government Code Section 8670.37.53 as it applies to the operation of

NAME AND LOCATION: Northern Region- Bay Line No. 38, 41,42,8,9,16,27,33,47,68,72,88,90,36,37,41,42,46,69,71,74,75,76,89,95,99,103 104, 130

CERTIFICATE #: 2-0310-00-012 CONTROL #: FA077

ISSUE DATE: 01/01/2012 EXPIRATION DATE: 12/31/2013

The holder of this document named above is subject to the provisions of California Code of Regulations, Title 14, Sections 791-797, implementing the financial responsibility requirements set forth in the Lempert-Keene-Seastrand Oil Spill Prevention and Response Act (Act). This certificate holder has provided the necessary evidence of financial responsibility mandated by these requirements.

For the purpose of determining liability pursuant to the Act, this Certificate of Financial Responsibility is conclusive evidence that the person or entity holding the certificate is the party responsible for the specific Marine Facility.

No alterations of this certificate are permitted after issuance by the Administrator of OSPR. If there is a change in the name or ownership of the Marine Facility, the certificate holder must notify the Office of Spill Prevention and Response (OSPR) immediately. If the certificate expires, a new certificate will be required.

This certificate remains valid as long as the current method for demonstrating financial responsibility is maintained (eg. insurance). Any changes in this status must be reported to OSPR immediately.

It is the owner or operator's responsibility to ensure that this certificate number is also included in the owner or operator's marine oil spill contingency plan, which must be submitted to this office for approval, before operating in a location where a spill could impact California marine waters.

If you have any questions, please contact Farina Khan at 916-327-9937.

Sincerely,

Farina A. Khan

9.1.3 INTRODUCTION

KMEP, in compliance with CCR Title 14, Division 1, Sections 815-819, has elected to substitute its approved DOT Oil Spill Response Plan for a blanket California OSPR Contingency Plan supplemented by this section. A complete Cross Reference of OSPR Regulations to this substitute plan are included in Volume 1.

This OSPR section for the Northern Region – Bay Areas provides additional spill planning and response information appropriate for use along identified OSPR line segments of the KMEP pipeline system in these Areas.

The line segments referenced in Figure 9.1 have been identified as subject to OSPR jurisdiction based on the likelihood of a worst case pipeline rupture potentially resulting in impact to California marine waters. Figure 9.1 lists valve or control point locations, distances to marine waters, and reasonable worst case spill (RCWS) volumes.

This Section 9 is provided in order to document the following OSPR pipeline segment-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- OSPR Pipeline Segment Information (Figure 9.1)
- HCA Index Map (Figure 9.2)
- Discharge Scenarios (Section 9.3)
- Reportable Oil Discharge History (Section 9.4)
- Risk Analysis Summary (Section 9.5)
- Offsite Consequence Analysis (Section 9.6)
- Risk Reduction Incentive Programs (Section 9.7)
- Drug and Alcohol Policies (Section 9.8)

9.2 OSPR LINE SEGMENTS

The pipeline segments identified in Figure 9.1 for this area have been identified as subject to OSPR contingency plan requirements. The segments were selected based on the likelihood of a worst case pipeline release potentially resulting in impacts to California marine waters. Some minor ephemeral drainage crossed at substantial distances from coastal waters are not included due to the sufficient time to respond and avoid marine water impacts.

Design Details:	The design details of these line segments are provided on large-scale, alignment sheets which are revised and updated as needed. Detailed procedures for operating the pipeline system are contained within KMEP's Operations Manuals.
Products Handled:	Gasoline, Diesel and Jet Fuel

FIGURE 9.1

OSPR JURISDICTIONAL PIPELINE SEGMENTS (Cont'd)

GENERAL INFORMATION (Cont'd)

Seasonal Weather Conditions:

Air Temperature:	Ranges from 30° to 95°F
Water Temperature:	Ranges from 52° to 54°F
Winds:	Generally southwest at 15 to 25 mph in afternoons from April to September; calm in other months except during storms.
Rain:	Generally 18 to 20 inches per year during October to May.
Marine Tide/Current:	The tidal range is generally from 0 feet to +5 feet MLLW, with the extremes being -2.5 feet and +7.5 feet.

Site Descriptions:

Richmond/Brisbane Area: The pipeline segments within the Richmond/Brisbane Area include crossings of the Carquinez Strait and San Francisco Bay as well as segments located adjacent to San Pablo Bay and approaches along or crossings of nearby sloughs, lagoons and creeks in the Berkeley, Brisbane, Oakland, Pinole, and Richmond areas. Topography is very flat. Land uses include primarily railroad rights of way, industrial and commercial developments. Figure 9.2 depicts the location of the line segments and general terrain/drainage channels in the area.

Concord Area: The pipeline segments within the Concord Area include crossings of the Carquinez Strait, and other drainages leading to Suisun Bay and the Sacramento/ San Joaquin River Delta. Many of these crossings represent multiple crossings of the same drainages, all in very flat terrain. Land uses include marshlands in the Delta area, commercial, urban, residential, and industrial land uses around Concord, Pittsburg, and Martinez. Figure 9.2 depicts the location of the line segments and general terrain/drainage channels in the area.

FIGURE 9.1

Note[1]: This identifies the location of the segment of line within OSPR jurisdiction.

Note[2]: B = Block Valve, M = MOV, A = Automatic Pressure Valve, C = Check Valve.

Note[3]: Reasonable worst case spill volume based on annual Liquid Volume Release Modeling which takes into account maximum pumping rate, discovery/shutdown times and drainage volumes based on elevation changes between isolation points (EFRDs and/or endpoint block valves).

FIGURE 9.1 OSPR JURISDICTIONAL PIPELINE SEGMENTS (Cont'd)

PREVENTION MEASURES

KMEP Operations and Maintenance Manuals

KMEP facilities are built and maintained in accordance with all applicable codes and regulations as well as relevant API (American Petroleum Institute) standards. Pipelines are coated and cathodically protected. Any abnormalities found by periodic maintenance inspections and/or internal inspections are promptly repaired. The Company's operating practices meet or exceed industry standards.

KMEP Operations and Maintenance Manuals have been developed in accordance with DOT 49 CFR 195 and various aspects of the operations, inspection, and maintenance procedures have been summarized below for reference. The design and installation details of KMEP's pipelines are provided on large-scale alignment sheets which are revised and updated as needed.

Integrity testing of pipelines and leak detection equipment

Pipelines are hydrostatically pressure tested, in accordance with DOT Part 195 when installed. In addition, KMEP performs integrity testing of OSPR pipelines by utilizing internal inspection tools or pressure test every five years. The internal inspection log produces data which is read and interpreted by third party experts and KMEP designs its verification and repair program utilizing these results.

Line monitoring and leak detection is described in the Operations Manual.

Damage criteria for equipment repair or replacement.

Damage criteria for pipelines (which would require action to be taken, such as reducing the maximum operating pressure, pipeline repair or replacement) is included in the Maintenance Manual (and generally follows ASME B31G).

Protection measures for areas subject to flooding.

Certain sections of the pipeline cross streams, rivers and bays. Other areas may be subject to periodic flooding during periods of high rainfall.

During initial pipeline construction, streambed profiles and pipe profiles are designed and installed to withstand or be protected from the effects of flooding. In addition, major waterway crossings are inspected periodically. For example, pipeline crossings are inspected every 5 years. If necessary, rip-rap or other protective covering is installed.

Describe any leak detection, spill prevention safety and alarm systems, devices, equipment or procedures.

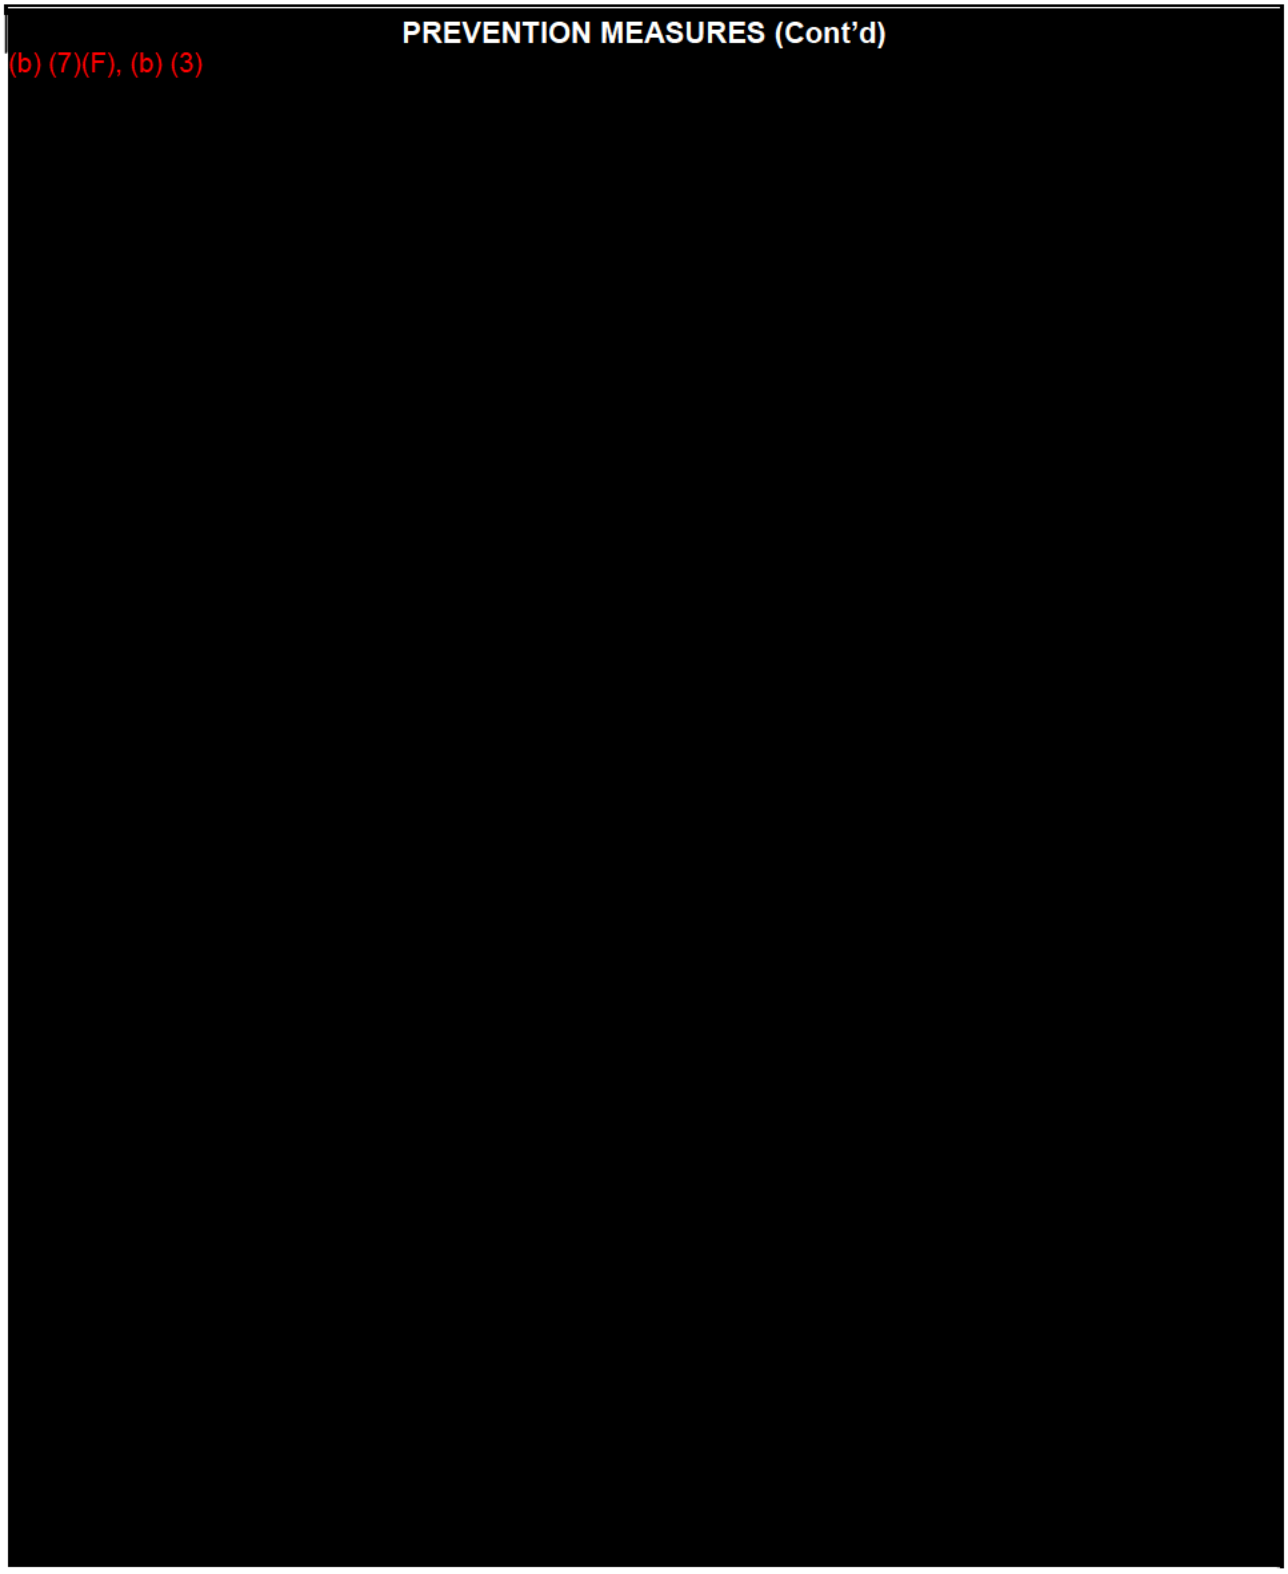

FIGURE 9.2

HCA INDEX MAP

NOTE: The locations of these OSPR jurisdictional line segments are represented on these maps for relative location/informational purposes only. The length of the segments are represented as centered on the water crossing when in fact the actual location of the segment will shift according to slopes, valve location and other RWCS limiting factors.

The following Index Map shows all corresponding Line Segments for Figure 9.2.

Detailed HCA Maps are contained in the CD inside the front cover of Volume 2 (or in a separate folder on electronic copy CD).

The specific HCA Maps for this region are:

9.3 DISCHARGE SCENARIOS

Reasonable worst case spill (RWCS) volumes were calculated for each OSPR Line Segment to determine the segments which had the largest potential spill volumes and impacts to marine waters. OSPR Line Segments are defined by the valve or control points on either side of drainage crossings. In parallel approaches along marine waters, the segment of the line with the longest distance between valves was used to calculate spill volumes, although in long approaches many valves may be present.

Drain down after a pipeline rupture generally contributes most of the spill volume from a significant pipeline rupture, since computer and operator monitoring normally shuts off all pumping within a reasonably brief time following a release. Precise predictions of drain down volumes is a function of the size of the pipe, topography, elevation of the break, and other variables. Motor operated remote valves and check valves effectively prevent drain down where present. Conservative assumptions were used to calculate reasonable worst case spill volumes.

Note: The quantity associated with "the loss of the entire capacity of all in-line, break-out and portable storage tank(s)…" is excluded from the RWCS volume calculation since these tanks are under SPCC jurisdiction (i.e., tanks are subject to Chapter 6.67 or Chapter 6.7 of Div. 20, CA health and Safety Code and thus, exempt from this calculation.)

The Reasonable Worst Case Spill (RWCS) volumes are consistent with the OSPR criteria as described below.

CALIFORNIA OSPR Discharge Volume Calculation

- **Reasonable Worst Case Spill (RWCS)**
  The largest volume (bbls) at the following:
  - *The pipeline's maximum release time in hours (i.e., the time between pipeline rupture and discovery, plus the maximum shut-down response time in hours based on historic discharge data or in the absence of such historic data, the operator's best estimate), multiplied by the maximum flow rate expressed in barrels per hour (based on the maximum daily capacity of the pipeline), plus the largest line drainage volume after a shutdown of the line section(s) in the response zone expressed in barrels. (As used in this subsection: line section means a continuous run of pipe that is contained between adjacent pressure pump stations, between a pressure pump station and a Facility or break-out tank, between a pressure pump station and block valve, or between adjacent block valves; response zone means a geographic area either along a length of pipeline or including multiple pipelines, containing one or more adjacent line sections, for which the operator must plan for the deployment of, and provide spill response capabilities. The size of the zone is determined by the operator after considering available capabilities, resources, and geographic characteristics); or*
  - *The largest foreseeable discharge for the line section(s) within a response zone, expressed in barrels, based on the maximum historic discharge, if one exists, adjusted for any subsequent corrective or preventive action taken.*

OSPR PERSISTENCE FACTORS

Oil Group	Group 1	Group 2	Group 3	Group 4

OSPR DAILY RECOVERY RATES (Cap) FACILITY/TRANSFER AREAS AND SANTA BARBARA CHANNEL AREA	
Delivery Time (Hrs)	(b) (7)(F), (b) (3)
Bbls/Day Capability	

Realistic worst case spill volume based on 3 minute pumping plus 60% of volume between isolation points (EFRDs and/or endpoint block valves). The RWCS for each OSPR Line Segment is referenced in Figure 9.1 and the largest RWCS for this Region is as follows:

- (b) (7)(F), (b) (3)

The planning volumes based on the largest RWCS for the OSPR pipeline segments in this Region are provided below, based on a nearshore/inland environment and an emulsification factor of 1.8 for Group 2 Oil discharges of gasoline, diesel and jet fuel.

OSPR – RESPONSE PLANNING VOLUME CALCULATIONS
(b) (7)(F), (b) (3)

9.4 REPORTABLE OIL DISCHARGE HISTORY

A summary of significant spills that occurred prior to KMEP ownership is provided in Section 9.5. A summary of significant OSPR Line Segment spills that have been recorded in this Region is provided in the following table. (Note: A significant spill is a spill of one barrel or greater reported within control points of each OSPR line segment.)

Line Section	Pipeline Milepost	Date	Volume	Product	Cause
47	4.05	11/07/04	(b) (7)(F), (b) (3)	Jet JP-8	Third party damage
16	8.48	11/09/04		Gasoline	Third party damage
42	13.805	02/07/05		Jet/turbine	Third party damage
95		08/23/99		Jet/turbine	Third party damage

9.5 RISK ANALYSIS SUMMARY

A summary of the Risk Analysis and the Offsite Consequence Analysis developed during October through December 2007 to address updated Company policies and procedures, and account for additional line segments and facilities not considered in previous efforts, is presented on pages 9-15 through 9-38.

A full version of this document is available on request.

9.6 OFFSITE CONSEQUENCE ANALYSIS

Refer to pages 9-15 through 9-38.

OSPR PIPELINE SEGMENTS – RISK ANALYSIS SUMMARY

Risk Analysis Summary

A Risk Analysis was conducted on segments of the Kinder Morgan Pacific Region Pipeline and some fixed facilities within California that are jurisdictional to OSPR regulations. The method used for the Risk Analysis consisted of both a "checklist" and "what if" scenarios. The Risk Analysis team consisted of various Subject Matter Experts (SMEs) as well as others knowledgeable as to the risk analysis process. During numerous SME sessions, the SMEs were asked to provide technical information within their field of knowledge or experience directly relating to specific risk issues. The information gathered from the various SMEs was presented to the Risk Analysis Team during team meetings conducted over an approximate two (2) month period, and compiled to gauge the level of risk facing the OSPR jurisdictional pipeline segments and facilities.

2.0 RISK ANALYSIS TEAM CONSENSUS REPORT

2.1 DIRECT IMPACT ISSUES:

The team has concluded policies, practices and procedures that are currently in place are adequate with respect to those issues having a direct affect on safe pipeline operations.

2.2 INDIRECT IMPACT ISSUES

The team has identified some opportunities for improvement with respect to the following issues in the categories that indirectly impact safe operations:

- Reinforce the procedures that are followed for updating alignment sheets to assure that revision submittals have been completed (Issues AM-1 and AM-2).

- Proceed with the program for "Continuing Risk Analysis to Identify Preventative and Mitigative Measures" (Procedure L-O&M 275) for the OSPR-jurisdictional pipelines in the Pacific Region (Issue AM-9).

- Proceed with the program to complete the Emergency Flow Restriction Device studies for the OSPR-jurisdictional pipelines in the Pacific Region, when those pipeline segments are next integrity inspected (Issue O-6).

- When reviewing some of the forms placed in use in recent months there was some uncertainty as to what data might be needed and what data might not be required under some circumstances. Updated instructions for preparation of these forms have been drafted. All locations should proceed to implement these instructions (Issue M-7).

The above summary of conclusions and the detailed conclusions of the several integrity issues addressed in Section 3.0 of this report represent a consensus of the following Subject Matter Experts participating in the analysis:

Edward (Buzz) Fant
Phil Vasquez
Larry Hosler
Ed Hahn
Bob Cote
Mike Outlaw
Mike Ortiz

3.0 SUBJECT MATTER EXPERT EVALUATIONS

The Risk Analysis Team, upon reviewing the comments by team SMEs developed in both group sessions and one-on-one with the Risk Analysis Coordinator, has reached consensus on the following conclusions and recommendations.

3.1 PIPELINE RISK ISSUES

ADMINISTRATIVE AND MANAGEMENT ISSUES	
The following two issues are related and were reviewed as a single issue by the SMEs.	
AM-1	Maps and drawings accuracy: Do pipeline maps and drawings reflect accurate pipeline and related information? Are pipeline locations based on GPS data? Have the drawings been digitized for reliable database reference?
AM-2	Maps and drawings current: Are procedures in place to insure that maps and drawing have up-to-date information? Are field drawings 'red-lined" pending engineering revisions?

Primary SMEs: Phil Vasquez, Larry Hosler, Bob Cote
Others offering comments: Steve Marositz, Curtis Parker, Pete Murphy, Grant McClellan

Comments: The current process for maintaining maps and records is reasonably good. Some areas maintain their master set of alignment sheets current by "red-lining" changes until revisions have been completed, while other locations do not. There is currently a substantial delay in getting revisions back, and no current procedure for confirming that revisions submitted by field personnel have been completed.

New procedures implemented in recent months have been reinforced to better assure accuracy and should improve revision turnaround time. The process for managing the preparation of all alignment sheets, which includes having all revision data entered electronically and having all current alignment sheets available to all users on line, is currently a "work-in progress".

Recommendation: There should be a procedure established to follow up on pending revisions to confirm they have been accurately made, and are received back on a timely basis. When the electronic version of the alignment sheet maintenance process has been completed the procedures that guide the process should be reviewed to confirm applicability; and they should include a procedure for the personnel submitting revisions to confirm that the electronic updating has been completed.

The following two issues are related and were reviewed as a single issue by the SMEs.	
AM-3	Qualified personnel for operations: Are all personnel involved in pipeline operations qualified? How is qualification determined?
AM-4	Qualified personnel for maintenance: Are all personnel involved in pipeline maintenance efforts qualified? How is qualification determined?

Primary SMEs: Buzz Fant, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: The OQ program as set forth in API 1162 is the guidance for this issue. It is monitored on a continuing basis to assure compliance. The SMEs that addressed this issue confirmed that regional personnel having oversight of the OQ program are knowledgeable in the OQ program requirements and follow them when covered tasks are being performed.

Recommendations: None

AM-5	Qualified personnel for line locates: Are all personnel involved in one call responses and line locates familiar with locate requirement, marking, pipe locator usage, documentation and follow-up?

Primary SMEs: Phil Vasquez, Larry Hosler, Buzz Fant
Others offering comments: Steve Marositz, Curtis Parker

Comments: The SMEs that addressed this issue have confirmed that all personnel associated with line locates are qualified under the OQ program and are thoroughly trained in line locate and marking requirements; and are adequately trained in the use of line locate equipment.

Recommendations: None

AM-6	Qualified contractor personnel: Are all contractor personnel involved in pipeline maintenance efforts qualified? How is qualification determined?

Primary SMEs: Phil Vasquez, Larry Hosler, Bob Cote
Others offering comments: Steve Marositz, Curtis Parker

Comments: We have a firm requirement in our contracts with contractors requiring them to fully comply with OQ guidelines. All contract personnel that may perform covered tasks must be pre-identified by name and must be in the ISNetworld database. The SMEs that addressed this issue confirmed that regional personnel having oversight of contractors performing covered tasks are knowledgeable in the OQ program requirements as they apply to contract personnel, and they follow them when contract work us being performed.

Recommendations: None

AM-7	Contractor supervision: Are all contractor personnel adequately supervised when performing maintenance work on or adjacent to pipeline facilities? Who determines level of supervision required? How is contractor performance verified?

Primary SMEs: Phil Vasquez, Larry Hosler, Bob Cote
Others offering comments: Steve Marositz, Curtis Parker

Comments: We have a firm requirement in our contracts that require full time supervision of all maintenance personnel by qualified contractor supervisors. The SMEs that addressed this issue confirmed that regional personnel having oversight of contract work are knowledgeable in this requirement. The KM contract inspector assigned to oversee the contract work determines the level of contrast supervision that the work may require. The KM contract inspectors enforce this requirement.

Recommendations: None

AM-8	Relief personnel: What is the source of relief personnel for routine operating and maintenance positions? Is there adequate depth of trained/qualified relief personnel?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: We have adequate qualified personnel to fill in as may be required for routine operations tasks and for maintenance work. Personnel are cross-trained in multiple disciplines so they can back stop any short time gaps that may develop. The SMEs that addressed this issue confirmed that all relief personnel that may be required to perform covered tasks have the requisite qualifications.

Recommendations: None

AM-9	Integrity Management Program (IMP): Has the operator established an Integrity Management Program for the pipeline systems that are subject to the PHMSA IMP program? Is it being followed at all locations where required? Are all elements of the program being adequately documented?

Primary SMEs: Mike Outlaw
Others offering comments: Buzz Fant

Comments: The IMP has been in place as required by the pipeline regulations. The SME that addressed this issue confirmed that baseline integrity assessments have been performed throughout the Pacific Region based on a priority schedule that was identified at the inception of the program. The baseline and follow-up inspections are administered by a risk management person in the Pacific Region.

The SME confirms that they have a program in place to conduct annual reviews of the risks associated with each segment. The follow up throughout the Pacific Region to address any corrective or mitigative efforts that may be required as a result of the annual reviews will be initiated in 2008.

Recommendations: Proceed with the program to follow up on any corrective or mitigative efforts required based on the annual reviews of Pacific Region pipeline segments.

AM-10	Management of Change: Has the operator adopted the "Management of Change" concept or something similar? If so, how has it been conveyed to all personnel? If no, what process is used to convey operating and procedural change information to personnel?

Primary SMEs: Buzz Fant, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: An extensive MOC procedure is in place and it is used to address all variety of changes. The SMEs that addressed this issue confirmed that regional personnel having responsibility for MOC initiation and processing are knowledgeable in the MOC requirements, and they follow them whenever any applicable change is being considered.

Recommendations: None

The following two issues are related and were reviewed as a single issue by the SMEs.

AM-11	Operations and Maintenance (O/M) Manual: Is the manual complete, used by all, relevant to current operations.
AM-12	Procedure amendments: Is there a process for amending operating and maintenance procedures when needed and conveying these changes to all personnel?

Primary SME: Buzz Fant

Comments: The L-O&M Manual is an extensive compilation of procedures that are relevant to all phases of operations and maintenance. It is accessible on-line for all personnel that have a need to refer to it. It is maintained current by a rigorous amendment process. Changes are made available to all personnel. The SMEs that addressed this issue confirmed that regional personnel are familiar with the on-line set of procedures and have ready access to them whenever necessary.

Recommendations: None

AM-13	Reference materials: Do all locations have copies of applicable regulations, standards, recommended practices that are applicable to those areas of operation? Are personnel sufficiently familiar with those documents?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Curtis Parker, Buzz Fant

Comments: All such references are available on-line. The SMEs that addressed this issue confirmed that regional personnel having a need to access such documents know where to obtain them.

Recommendations: None

OPERATIONS ISSUES

The following two issues are related and were reviewed as a single issue by the SMEs.

O-1	Segment MOP: Has the MOP for each segment of line been determined? Is it recorded and clearly identified for operators and controllers? Is it consistent with the pressure relief and pressure control settings?
O-2	Overpressure relief: Are the overpressure relief systems set at the appropriate level above MOP? Are they adequately sized? Are they tested and tagged as required?

Primary SMEs: Bob Cote

Comments: The MOP for each line segment has been established. It is known by those that have to apply the MOP in operations. (b) (7)(F), (b) (3) [redacted]

The SMEs that addressed this issue confirmed that the controllers and others responsible for pipeline operations understand the MOP and the MAOP of each line segment. The SMEs also confirmed that the relief pressure settings are properly set to assure that the MAOP is never exceeded in any portion of the line segment.

Recommendations: None

O-3	Personnel work hours: Are operator and controller work shifts designed to assure minimization of fatigue?

Primary SMEs: Phil Vasquez, Larry Hosler, Ed Hahn
Others offering comments: Gary Yates, Steve Marositz, Curtis Parker

Comments: The work shifts of all personnel (field personnel, station operators and controllers) are managed in a manner that the fatigue factor is controlled. The SME responsible for controller personnel emphasized that fatigue awareness and fatigue management is emphasized. Actions or incidents that may suggest fatigue could have been a contributing factor are investigated. Job performance is monitored to assure that if it appears to be an impending concern for any individual or group follow-up investigation would be conducted.

Recommendations: None

O-4	Fail-safe operations: Are line segments designed to fail safe in case of communications failure between the segment and the controllers?

Primary SME: Ed Hahn
Others offering comments: Gary Yates

Comments: (b) (7)(F), (b) (3) [redacted]. Once communications has been restored the segment is restarted in accordance with normal start-up procedures.

Recommendations: None

O-5	Backup operations: Are personnel available to staff remote facilities in case of prolonged communications failures or other situations where remote monitoring may be inadequate? Are these personnel sufficiently trained to operate such facilities?

Primary SMEs: Ed Hahn, Phil Vasquez, Larry Hosler

Comments: The SMEs that addressed this issue confirmed that the standard practice is to shut down remotely operated facilities when prolonged communications failures persist, rather than arrange for remote staffing.

Recommendations: None

O-6	Has the EFRD evaluation been conducted on this segment? Were EFRD recommendations implemented? If not, was the rationale for not following the recommendations documented?

Primary SMEs: Mike Outlaw, Mike Ortiz

Comments: The program for EFRD evaluations in conjunction with the Integrity Management Program is currently in progress. It has not yet been initiated for the Pacific Region Pipelines. The SMEs that addressed this issue have confirmed that the EFRD studies are being programmed in conjunction with integrity inspections..

Recommendation: Perform the EFRD analyses for the Pacific Region segments when those segments are next integrity inspected.

MAINTENANCE ISSUES

The following five issues are related and were reviewed as a single issue by the SMEs.

M-1	Rights-of-Way visibility: Does the segment have adequate right-of-way visibility to assure effective aerial patrol surveillance?
M-2	Aerial Markers: Are they adequate, properly spaced, in good condition, visible from air?
M-6	Line marker maintenance: Are all markers maintained in good condition, with current operator information?
P-5	Line marker adequacy: Are line markers located at all appropriate locations (as required by regulations plus other locations where they may be needed to insure location awareness)?
P-6	Line marker alternatives: In areas where typical post type markers cannot be situated or kept, what alternatives are used?

Primary SMEs: Phil Vasquez, Larry Hosler

Comments: All rights-of-way that are covered by aerial patrol are adequately cleared for surveillance. We have a routine program for monitoring the condition of line and aerial markers and replace them as necessary. Where appropriate we have surface markers that can be used in place of post markers.

Recommendations: None

The following three issues are related and were reviewed as a single issue by the SMEs.	
M-3	Cathodic Protection: Does the line have cathodic protection? If not, what is the rationale?
M-4	Cathodic protection annual surveys: Have annual surveys been done on each line segment? If not, what is the survey frequency? Is the frequency deemed adequate?
M-5	Cathodic protection close interval surveys: Have CIS been done on each segment? What was the rationale for doing or not doing? Are alternatives to CIS being used and if so, what is rationale?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering Comments: CP technicians

Comments: Annual surveys are done regularly and the resulting data is reviewed by NACE certified CP technicians. The SMEs that addressed this issue confirmed that the decision to conduct a CIS would depend on the results of the annual survey; and where warranted a CIS would be performed.

Recommendations: None

M-7	Maintenance records: Are all records (routine and abnormal) that may be required to confirm and support routine maintenance retained and available as may be required by management and regulatory agencies?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Buzz Fant

Comments: All records required to confirm compliance and to assure continued compliance with the routine maintenance programs are being developed. The SMEs that addressed this issue advised that in recent months several forms that address routine inspection and maintenance information have been updated to include more comprehensive information. Revised procedures for completing the forms have been drafted.

Recommendation: Finalize the draft procedures.

M-8	Safety-related condition reports: Are these records being prepared and retained as may be required to meet agency requirements and to support corrective actions?

Primary SMEs: Buzz Fant, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: We have a program in place to address conditions that might warrant a safety-related condition report and procedures are in place to support corrective actions.

Recommendations: None

M-9	Pipe integrity discoveries: Are procedures adequate to identify and record instances of potential lack of pipe integrity, to meet agency requirements and to support corrective actions and future review?

Primary SMEs: Mike Outlaw, Mike Ortiz, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: The region SMEs advised that the Risk Management group addressed such issues. The Risk Management Group SMEs confirmed this, and advised that integrity discoveries stemming from the integrity inspections are handled on a timely basis as required by the regulations, and that any discoveries that might require a temporary reduction in segment MAOP or other temporary mitigative measures would be immediately addressed by the project managers that oversee the integrity inspection program.

Recommendations: None

PREVENTION ISSUES

The following two issues are related and were reviewed as a single issue by the SMEs.

P-1	Internal corrosion detection: Does the segment have test coupons for checking internal corrosion rates? Is there a routine monitoring program to confirm effectiveness?
P-2	Internal corrosion inhibition: Are inhibitors being used to prevent internal corrosion? Is there a routine monitoring program to confirm effectiveness?

Issues P-1 and P-2 (continued)	
Primary SMEs: Phil Vasquez, Larry Hosler Others offering comments: Steve Marositz, Buzz Fant, Curtis Parker Comments: There have been no apparent indications of internal corrosion concerns on the OSPR-jurisdictional systems. If such conditions were to appear as a result of internal inspections, action would be taken to identify and mitigate the problem. Recommendations: None	
P-3	Adjacent utilities awareness: Is operator pro-active in knowing exact location of all adjacent underground utilities in pipeline vicinity?
Primary SMEs: Phil Vasquez, Larry Hosler Others offering comments: Steve Marositz, Buzz Fant, Curtis Parker Comments: To the extent possible these are noted on our alignment sheets. The SMEs that addressed this issue confirmed that our line riders are instructed to be alert to any indication of adjacent utilities, and to arrange to have them included on our alignment sheets when they are discovered. Recommendations: None	
The following two issues are related and were reviewed as a single issue by the SMEs.	
P-4	Foreign excavation monitoring: Is operator representative always present when foreign excavations are made over or near pipelines? How is this requirement conveyed to operator personnel? To excavator personnel?
P-7	Excavation in close proximity to pipeline: Does operator demand hand excavation when opening ditch within close proximity to pipeline? How is this controlled?
Primary SMEs: Phil Vasquez, Larry Hosler Others offering comments: Steve Marositz, Buzz Fant, Curtis Parker Comments: Our personnel are to be on site whenever any subsurface work is being done on or around our lines. We have definite requirements that at any time an excavation is to be within 24 inches of the pipe it must be done by hand only. Recommendations: None	

P-8	Line locating instruments: Are all pipe locators calibrated as required by manufacture? Have all operators been trained in proper use of the instrument and been made aware of performance limitations?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Buzz Fant, Curtis Parker

Comments: Our personnel are trained in the use of this equipment. The SMEs that addressed this issue advised that the accuracy of the unit is verified at least daily by testing against a known section of buried pipe.

Recommendations: None

P-9	Post-Incident Review: Are such reviews conducted in manner that will identify and trigger corrective measures?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Buzz Fant

Comments: We have a formal procedure for conducting post-incident reviews, including where appropriate a root cause analysis; and follow through with corrective measures as necessary. The SMEs that addressed this issue advised that there is a rigorous procedure involving several staff personnel to discuss all aspect of the incident.

Recommendations: None

MONITORING AND CONTROL ISSUES

The following three issues are related and were reviewed as a single issue by the SMEs.

MC-1	Aerial patrol familiarity: Are the pilots sufficiently familiar with the exact line locations to insure proper surveillance?
MC-2	Local staff familiarity: Does local staff fly with aerial patrol periodically to insure pilots are adequately familiar with the line locations and to keep local staff familiar with line location and surface conditions?
MC-6	Are pilots directed to observe conditions beyond the pipeline right-of-way that suggest potential pending impact to the right-of-way? How is this information reported?

Issues MC-1; MC-2, MC-6 (Cont'd)

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Buzz Fant

Comments: Our patrol pilots are familiar with precise line locations; and we confirm this by having local personnel periodically fly with them. Pilots are directed to look beyond the right-of-way and report any signs of potential concern along with their other reporting priorities.

Recommendations: None

The following three issues are related and were reviewed as a single issue by the SMEs.

MC-3	Aerial patrol priorities: Have pilots been advised on notification priorities? Some may require immediate notice to local staff, while others may permit routine reporting. Do the pilots understand and follow any expedited reporting requirements?
MC-4	Aerial patrol routine notices: Are procedures set up to insure that routine reporting of patrol surveillance information goes to the right personnel? Is a log maintained of this? How is it used to follow up on potential problems?
MC-5	Aerial patrol reporting items: Do the pilots report only abnormal conditions, or do they also advise of the need for routine maintenance work (sign painting, marker repairs etc.)?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Buzz Fant

Comments: Our reporting priorities are clearly given to the patrol pilots. They have the ability to immediately contact our field personnel as necessary. The SMEs that addressed this issue confirmed that their line coverage records are thorough as to details that they report and this includes any situation where maintenance or potential encroachment should been evaluated.

Recommendations: None

The following four issues are related and were reviewed as a single issue by the SMEs.	
MC-7	Volume balance: Does this segment have adequate volume measurements for effective real time balance data?
MC-8	Volume deviations: Are volume balance deviation limits set to reflect the minimum possible deviations within reliable tolerances?
MC-9	Slack lines: Is the system designed and operated to eliminate slack line conditions for adequate volume balance? It is maintained packed to insure good balance during start-up?
MC-10	(b) (7)(F), (b) (3) [redacted]

Primary SMEs: Ed Hahn, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Gary Yates

Comments: All line segments have volume balance measurements and volume deviation alarm set points. The SMEs that reviewed these issues confirmed that:

- deviation tolerances are set sufficiently close to maximize the controller's ability promptly react to potential adverse conditions.
- Lines are maintained packed when shut down, thus slack line conditions are not experienced.
- (b) (7)(F), (b) (3) [redacted]

Recommendations: None

PUBLIC AWARENESS ISSUES	
The following three issues are related and were reviewed as a single issue by the SMEs.	
PA-1	Public awareness programs, conducted: Does operator have, or contract for an active awareness program?
PA-2	Public awareness programs, active participation: Does operator have local personnel actively participate in public awareness efforts? To what degree?
PA-3	Public awareness, excavator contacts: Is operator pro-active in making system known to excavators (area contractors, other utilities, private back-hoe operators)?

PA-1, PA-2, PA-3 (Cont'd)

Primary SMEs: Buzz Fant, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: Our public awareness is consistent with API 1162 guidelines. The region SMEs confirmed that area personnel participate in the programs involving local agencies, excavators and the public in close proximity to our pipelines, and they document this participation.

Recommendations: None

The following three issues are related and were reviewed as a single issue by the SMEs.

PA-4	One call systems, who are they forwarded to (local personnel or a central location)?
PA-5	One call systems, follow-up: How are calls followed up on by local personnel?
PA-6	Damage prevention program formalized: Is there a written program? Is it clearly conveyed to all applicable personnel? Is it followed by all personnel? Does it have clear support and mandate from upper management?

Primary SMEs: Buzz Fant, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: All locations participate in one-call programs at the local level. Information typically comes in by computer linkage with the one-call system, and can be followed by fax or phone as necessary. Local personnel follow up on all one call notices and evaluate the potential for impact to our systems. We have an active written damage prevention program with full support of upper management.

Recommendations: None

3.2 FIXED FACILITY RISK ASSESSMENT

Facility: **Richmond Terminal** Date: 12/19/2007

Subject Matter Expert: Mike Sudheimer

Recorder: Vern Grimshaw

Facility Operations:

The terminal handles vegetable oils and some petroleum products. Operations include marine vessel receipts and deliveries; and loading to tank trucks and rail cars. There are no pipeline movements of petroleum products into or out of the facility.

Potential Product Releases:

The two possible sources of a release of petroleum products from the facility would be:

- During marine transfer operations, and
- From facility storage facilities and related piping.

In the event of a product release during vessel transfer operations, or if any release from facility tanks or piping were to escape containment, an Integrated Contingency Plan (ICP) is in place to address the situation. The ICP addresses the potential off-site consequences of a release and the response capabilities of KM and contractor resources.

Marine Transfer Operations:

Vessel transfers typically occur at a maximum flow rate of approximately 1,900 barrels per hour. All transfers are constantly monitored by dock and vessel personnel. In the event of a major transfer line or hose failure the maximum probable worst case discharge has been calculated to be 1,647 barrels.

All vessel transfer operations are performed in accordance with USCG and applicable state regulations. KM personnel responsible for transfer operations are familiar with the Dock Operations Manual and applicable regulations; and are trained in the response requirements of the ICP.

Facility Storage Facilities:

Spill prevention from any of the facility's tanks and related piping is addressed in the facility SPCC plan.

(b) (7)(F), (b) (3)

[redacted]

Facility Storage Facilities (Cont'd):

All petroleum piping within the facility (except dock piping that is utilized during vessel transfer operations) is contained within curbing that would direct piping releases to a controlled area on site.

Surface drainage from areas that have the potential to contain petroleum is controlled on site and checked for potential petroleum contaminants before being released.

There is no buried piping within the facility. The tank bottoms are protected from corrosion by means of a cathodic protection system. There has been no indication of internal corrosion of any of the petroleum piping.

Release History:

There have been no petroleum releases from this facility in the past ten years.

Risk Assessment Conclusions:

Based on the information provided above, it can be concluded that all appropriate preventative and mitigative efforts for spill prevention are in place for this facility.

Facility: **Los Angeles Harbor Terminal** Date: 12/19/2007

Subject Matter Expert: Tom Hosler

Recorder: Vern Grimshaw

Facility Operations:

The terminal handles refined petroleum products and crude oil. Operations include marine vessel receipts and deliveries, loading to tank trucks, and pipeline movements of petroleum products out of the facility.

Potential Product Releases:

The two possible sources of a release of petroleum products from the facility would be:

- During marine transfer operations, and
- from facility storage facilities and related piping.

In the event of a product release during vessel transfer operations, or if any release from facility tanks or piping were to escape containment, an Integrated Contingency Plan (ICP) is in place to address the situation. The ICP addresses the potential off-site consequences of a release and the response capabilities of KM and contractor resources.

Marine Transfer Operations:

Vessel transfers typically occur at maximum flow rates of approximately 10,000 barrels per hour (offloading) and 7,000 barrels per hour (loading). All transfers are constantly monitored by dock and vessel personnel. In the event of a major transfer line or hose failure the maximum probable worst case discharge has been calculated to be (b) (7)(F), [redacted].

All vessel transfer operations are performed in accordance with USCG and applicable state regulations. KM personnel responsible for transfer operations are familiar with the Dock Operations Manual and applicable regulations; and are trained in the response requirements of the ICP.

Facility Storage Facilities:

Spill prevention from any of the facility's tanks and related piping is addressed in the facility SPCC plan.

(b) (7)(F), (b) (3) [redacted]

Facility Storage Facilities (Cont'd):

All above ground petroleum piping within the facility (except dock piping that is utilized during vessel transfer operations) is contained within curbing that would direct piping releases to a controlled area on site.

Surface drainage from areas that have the potential to contain petroleum is controlled on site and checked for potential petroleum contaminants before being released.

The buried piping within the facility and the tank bottoms are protected from corrosion by means of a cathodic protection system. There has been no indication of internal corrosion of any of the petroleum piping.

Release History:

There have been six petroleum releases from this facility in the past ten years:

- A one barrel release was the result of a tank spill-over during an earthquake. This was contained within the tank block.
- A release of less than one gallon that reached the water was the result of a leak in a dock pan drain line.
- Four others, reported as too small to measure (a few drops or less), resulted in minor stains on the ground surface or minor sheens on the water.

All releases were cleaned up in a timely manner.

Risk Assessment Conclusions:

Based on the information provided above, it can be concluded that all appropriate preventative and mitigative efforts for spill prevention are in place for this facility.

Appendix D

(Includes only events with a release amount of at least 42 gallons)

Line Section ID	Event Date	Event Description	Product	Cause	Amount Released (gallons)
95	8/23/1999	Outside Force Damage: Third Party: Cost: A foreign pipeline company was excavating their pipeline, which parallels and is in close proximity to Kinder Morgan's pipeline - L.S. 95. The trench was being backfilled.	Jet/turbine fuel	Excavation	(b) (7)(F), (b) (3)
25	5/17/2000	Failure in original seam defect combined with external corrosion.	Diesel Fuel	Material and Welds	
25	12/12/2000	Approximately 22:58 Concord personnel contacted the ORCC regarding the discovery of product in a slough next to the Carquinez Straight approximately 3.09 miles west of the Concord Station	Gasoline	Other	
	7/27/2001	Approximately 1300, Contra Costa personnel contacted ORCC regarding the release of Diesel. A 10'x10' stain on gravel had a diesel odor. Stain originated at HOV-3.	Diesel Fuel	Other	
45	12/7/2002	Approximately 1104 on 12/7/02 Stockton personnel contacted ORCC regarding a dripping Bypass Valve on the Rough & Ready Manifold.	Mix/Transmix	Equipment and Operations	
25	4/27/2004	At 1832 on 4/27/04 an abnormal operating condition was observed on LS 25 and the line was shut down and field personnel started conducting field surveys. Approximately at 1406 on 04/28/04 the field contacted ORCC confirming that a pipeline release had occurred.	Diesel Fuel	Corrosion	
47	11/7/2004	Approximately 1650 on 11/07/04 Concord personnel contacted ORCC regarding a release that occurred from third party mechanical damage. OES was advised at 1742, case number 04-5795 was given. NRC was contacted at 1750, case number 740716 was assigned.	Jet/turbine fuel	Excavation	
16	11/9/2004	Approximately 1326 on 11/09/04 Concord personnel contacted ORCC regarding a possible line hit on LS 16 between PLMP 7 and 11. Pressure Loss was observed and reports of possible explosion and fire in area of hit. NRC was advised at 1352, case number 740-9	Gasoline	Excavation	

Line Section ID	Event Date	Event Description	Product	Cause	Amount Released (gallons)
42	2/7/2005	On the evening of 02/07/05 PNR personnel contacted ORCC regarding a mysterious sheen and odor in the San Francisco Bay downstream of Oakland Tank that the USCG was investigating and had pre-determined that it was coming from LS 42.	Jet/turbine fuel	Other Outside Force	(b) (7)(F), (b) (3)
	8/2/2005	Approximately 1557 on 08/02/05 Concord personnel contacted ORCC regarding a stain observed near Travis Line. OES, NRC, CUPA, and US BOR were notified.	Jet/turbine fuel		
Richmond Terminal	10/24/2007	Wax Kettle overflowed onto the ground resulting in reportable spill	Wax	Incorrect Operation	
123	6/17/2002	Approximately 1410 on 06/17/02 Mission Valley personnel contacted ORCC regarding a release that occurred from a weeping hole found on MOV 101. Advised OES (case # 02-3331).	Mix/Transmix	Equipment and Operations	
1	7/11/2003	Approximately 1958 on 07/11/03 Watson personnel contacted ORCC regarding a turbine release from third party damage on LS 1. OES and NRC were advised.	Jet/turbine fuel	Other Outside Force	
120	5/2/2005	Approximately 0650 on 05/02/05 Watson personnel contacted ORCC regarding the LA River West Block Valve leaking in valve box within Nursery. OES was advised at 0658, case number 05-2619 was assigned. NRC was advised at 0825, case number 757427 was given.	Diesel Fuel	Material and Welds	
108	12/8/2005	Approximately 0921 on 12/08/05 Carson personnel contacted ORCC regarding a release that occurred. The seal failed on pump 63. OES, NRC, CUPA, and the US BOR were also notified.	Diesel Fuel		

9.7 RISK REDUCTION INCENTIVE PROGRAMS

The Facility participates in an annual safety awareness program which is administered at the Corporate level. The Facility has evaluated workplace hazards and how to prevent or mitigate them under workplace illness and injury prevention guidelines. The Facility conducts monthly safety meetings to discuss conditions, which could cause accidents or spills, and how to mitigate or prevent them from occurring. The Facility (through the Operations Review Committee) also conducts quarterly meetings for continuously improving the quality and effectiveness of operating practices and procedures.

9.8 DRUG AND ALCOHOL POLICIES

Kinder Morgan, Inc. and Kinder Morgan Energy Partners, L.P. Human Resources Policy Manual

Drugs and Alcohol in the Workplace

(Effective 01/01/2000)
(Revised 01/01/2003)

Purpose

The purpose of this Policy is to maintain a safe and productive work environment for all employees, applicants, and the public by ensuring that employees on Company property, while conducting Company business, operating Company property, or during their employment with the Company may not possess or use illegal or unauthorized drugs. The Policy is also intended to promote worker and public safety, to comply with the Drug-Free Workplace Act of 1988, and to provide procedures for workplace-related searches of persons and property and the lawful drug and alcohol testing of employees. Kinder Morgan maintains a "Zero Tolerance" policy.

Scope

This Policy applies to all Company employees, applicants, contract workers, and employees of third-party contractors, including employees and contract workers who perform functions covered by regulations promulgated by the Department of Transportation (DOT). In the event of a contradiction between this Policy and the Company's Anti-Drug Plan and Alcohol Misuse Prevention Plan, the Company's Anti- Drug Plan and Alcohol Misuse Prevention Plan shall govern.

This Policy is broader in scope than the Company's Anti-Drug Plan and Alcohol Misuse Prevention Plan. For additional information refer to the Anti-Drug Plan and Alcohol Misuse Prevention Plan. This Policy shall be administered in accordance with all applicable federal, state, and local laws and regulations.

Responsibilities and Prohibitions

Employees

All applicants and employees are reminded that the following actions are included as violations of this Policy: (1) use, possession, sale, distribution of illegal or unauthorized drugs on Company property, while operating any Company vehicle or equipment, or while conducting Company business; (2) use, possession, sale, and distribution of alcohol on Company property. while operating any Company vehicle or equipment, or while conducting Company business, with the exception that use and possession of alcohol during Company sponsored business or social functions, where the use of alcohol remains moderate, will not be considered a violation of this Policy; (3) use of any drug, including prescribed drugs, which is unsafe to use while operating Company vehicles or equipment; (4) possession, sale or distribution of paraphernalia and equipment related to illegal or unauthorized drug use; and (5) refusal to test in any testable situation.

As a condition of employment, any employee whose work directly relates to the performance of a federal contract and who is or has been convicted of a criminal drug offense occurring in the workplace during employment must notify his/her supervisor and Human Resources representative in writing within five days of such conviction. Similarly, as a condition of employment, any employee that is required to possess a valid driver's license as a pre-requisite of their position, must notify his/her supervisor and Human Resources representative in writing within five days of either a drug and/or alcohol related criminal offense. Failure to provide notification will result in disciplinary action being taken, up to and including termination.

All employees while operating any Company vehicle or equipment, or while conducting Company business (either during or after regular business hours), cannot refuse to submit to drug and/or alcohol testing administered or ordered by the Company or a lawful authority. Refusal to submit to the testing will result in disciplinary action being taken, up to and including termination.

All employees taking a prescription or over-the-counter medication that could adversely affect performance of job-related functions or pose a direct threat to the health and safety of the employee or others in the workplace are responsible for notifying their supervisor. It is not the intent of the Company to interfere with the use of drugs legitimately prescribed by a physician. The Company's designated physician will be the sole person that the Company uses in making determinations concerning employees' fitness to perform the job.

All employees should notify a supervisor or Human Resources Representative of any behavior of co-workers or contract workers that may indicate a violation of this Policy.

Definitions

"Alcohol" means ethyl alcohol, an intoxicating element in fermented or distilled liquor or in any other compound, or other low molecular weight alcohol, including but not limited to, methyl and isopropyl alcohol, and including without limitation, beer, wine, and distilled liquors.

"Company property" is used in the broadest sense and includes, but is not limited to, all property, equipment, land, onshore and offshore platforms, buildings, structures, installations, facilities, locations, boats, aircraft, and vehicles which are owned, leased, used or operated by or on behalf of the Company for any purpose, or which are located on Company property, and any personal effects or items located thereon or therein. This includes, among other items, desks, lockers, and workstations, as well as privately owned vehicles and other personal belongings located on or in Company property,

"Possess" or "possession" means having any amount of illegal or unauthorized drugs or alcohol on one's person or belongings at any time during employment; on Company property; while conducting Company business; operating Company property; in one's personal belongings or vehicle while on Company property; in a vehicle or any mode of transportation owned or leased, or rented for Company use; or at any location used by the Company to conduct business.

"Drugs" means prescription drugs, inhalants, and other illegal, controlled, or unauthorized substances that may cause addiction and/or affect coordination of memory, or a drug that federal and state law makes illegal to distribute, use or possess.

"Use" with regard to drugs is defined as having any trace amount of drugs in the applicant's or employee's system, or physical consumption of drugs, "Use" with regard to alcohol is defined as the physical consumption of alcohol. "Use" with regard to drugs and alcohol is also defined as being under the influence of drugs or alcohol at any time during working hours.

"Zero Tolerance" means that if an employee tests positive for drugs or alcohol, as defined by this Policy, the resulting disciplinary action will be termination of employment for cause.

Testing for Types of Drugs/Alcohol and their Cutoff Levels

Drug/Alcohol tests will be conducted in a confidential manner according to procedures adopted by the Company and in compliance with applicable law. Below are the examples of illegal and unauthorized drugs for which Kinder Morgan tests and the levels at which an employee will be considered as "testing positive for drugs": Employees who test at a alcohol concentration level of .04 or greater will be considered as "testing positive" for alcohol.

1. Marijuana	15 ng/ml
2. Cocaine	150 ng/ml
3. Amphetamines and Methamphetamines	500 ng/ml
4. Opiates (codeine, heroin, morphine)	2000 ng/ml
5. Phencyclidine (PCP or Angel Dust)	25 ng/ml

Types of Drug and Alcohol Testing

Kinder Morgan conducts the following types of drug and alcohol testing:

Drug Testing	Alcohol Testing
1. Pre-employment	1. Reasonable cause
2. Reasonable cause	2. Random (as permitted by federal and state law)
3. Random (as permitted by federal and state law)	3. Return to duty
4. Return to duty	4. Post-Accident
5. Post-Accident	

Searches and Tests

The Company reserves the right to have authorized personnel conduct searches of our employees, contract workers, and employees of third-party contractors without prior notice to determine if this Policy is being violated. Accordingly, all areas of Company property may be searched, including employee work locations, stations, areas, offices, desks, files, lockers, etc.; employees and their personal belongings, vehicles, etc. may also be searched if on or within Company property. Employee searches will be conducted in compliance with applicable law.

The Company reserves the right, at all times, to have authorized personnel conduct urinalyses, blood tests, or other types of tests of our applicants, employees, contract workers, and employees of third-party contractors for the purposes of determining if any such persons are in violation of this Policy. A urinalysis, blood test, or other type of test may be used in the following situations: (a) pre-employment testing, (b) testing based on reasonable cause or suspicion, (c) random or periodic testing, (d) testing following an accident or incident involving injury or property damage, and (e) testing that is consistent with the enforcement of this Policy.

The Company reserves the right to inspect and search Company property at any time without the presence or consent of any employee. An employee who, as a result of a search, has been found in violation of this Policy or other Company Policy will be subject to corrective action as described in the Corrective Action Policy.

Violations of Policy

Any violation of the Drugs and Alcohol in the Workplace Policy will result in disciplinary action being taken, up to and including termination.

Employee Assistance Program

The Employee Assistance Program (EAP) is available to all Company employees. Employees are encouraged to obtain professional help when needed by using the EAP. Employees may contact their supervisor or Human Resources for information about the EAP. The EAP is strictly confidential and available for use by telephoning:

- Magellan Behavioral Health 1-800-424-5654

Use of the EAP does not exempt or excuse a violation of this Policy.

Voluntary Rehabilitation

Any employee who voluntarily seeks counseling or rehabilitation in advance of failing any of the tests or who would otherwise be in violation of this policy must provide certification, in accordance with any applicable governmental requirements, of the credentials of the attending physician, psychologist, or psychiatrist, who is trained in substance abuse disorders.

When the employee successfully completes or is participating in a supervised substance-abuse or alcohol-related rehabilitation program and is no longer engaging in the use of illegal drugs or unauthorized alcohol, the Company requires certification from the substance abuse professional that the employee is fit to return to duty and perform the essential functions of his or her job.

An employee described in the paragraph above will be tested on a random basis by the Medical Review Officer and/or Substance Abuse Professional to ensure such employee is no longer engaging in the illegal use of drugs or unauthorized alcohol.

Interpretation and Exceptions

Questions regarding this Policy should be referred to the Vice President, Human Resources. Requests for exceptions should be submitted to Human Resources for review by Human Resources and the Legal Department to ensure regulatory requirements and appropriate test protocols and standards are met. The President and Chief Operating Officer must approve all exceptions.

This Policy does not constitute or imply a contract between the Company and its employees. This Policy creates no Company obligation nor any individual obligation, right, privilege, term, or condition of employment not otherwise established by law. The Company has voluntarily adopted this Policy for its sole and exclusive and may amend or withdraw it at any time without prior notice.

TABLE OF CONTENTS

Regulatory Cross-References are provided at the end of Volume 1.

6.0 AREA PIPELINE SECTIONS

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Richmond/Brisbane Area Lines	
• Richmond Station - Christi Road 8”	8
• Richmond Station - Oakland Terminal 12”/10”	36
• Amorco Junction - Richmond 12”	37
• Brisbane - SFO Airport Junction 12”	38
• Oakland Terminal - Brisbane Terminal 8”/10”	41
• Oakland Terminal - Brisbane Terminal 12”	42
• Richmond Station - Oakland Terminal 8”/10”	46
• Chevron Refinery #1 – Richmond Station 8”	69
• LS-89 - Richmond Station 8”	71
• Richmond Station - ARCO 8”	74
• IMTT/Plains – Richmond Station 8”	75
• Plains All American - LS-75/76 Junction 8”	76
• ARCO - LS-71 8”	89
• Valero - Amorco 10”	95
• Chevron Refinery #3 - Richmond 10”	99
• Chevron Refinery #2 - Richmond 10”	104
Pipeline Facilities (Non-Storage)	
• Amorco Pump Station (booster)	
• Jefferson Junction – piping manifold only	
• OAK Airport Junction – piping manifold only	
• Richmond Pump Station (booster)	
• SFO Airport Junction - Piping Manifold Only	
• Unit 80 Line Section 37	
• Benecia Refinery - Launcher	

- Figures 6.1a through 6.1p on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled “Worst Case Discharge Data” of the applicable Line Segment.

- The specific information summary for these pipeline sections is provided as follows:

  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps

- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in Sections 7 and 8 in this Volume.

- Northern and Southern pipeline schematic diagrams are provided in Volume 1, Figures 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

RICHMOND - CHRISTI ROAD 8" (8)		
Pipe and Operational Data		
• Section Length:	14.09 Miles	74,378 Feet
• Line Diameter:	8.625 in., O.D.	8.025 in., I.D. (note 1)
• Line Capacity:	339 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	2,600 bph or 62,400 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Contra Costa, CA	
• Location Description:	From Richmond Station on Castro near Richmond Boulevard north to Pinole then generally east through Franklin Canyon to Christi Road near Rodeo Creek.	

FIGURE 6.1b

PIPELINE SECTION INFORMATION SUMMARY

RICHMOND STATION – OAKLAND TERMINAL 12"/10" (36)		
Pipe and Operational Data		
• Section Length:	12.64 Miles	66,729 Feet
• Line Diameter:	12.75 in., O.D. 10.75 in., O.D.	12.312 in., I.D. (note 1) 10.312 in., I.D. (note 1)
• Line Capacity:	777 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	3,550 bph or 85,200 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Contra Costa, CA	
• Location Description:	From Richmond Station generally south adjacent to the San Francisco Bay to Oakland Terminal, near Maritime Street and Navy Roadway, adjacent to Oakland Outer Harbor.	

FIGURE 6.1c

PIPELINE SECTION INFORMATION SUMMARY

AMORCO – RICHMOND 12" (37)		
Pipe and Operational Data		
• Section Length:	20.79 Miles	109,790 Feet
• Line Diameter:	12.75 in., O.D.	12.312 in., I.D. (note 1)
• Line Capacity:	777 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	4,000 bph or 96,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Contra Costa, CA	
• Location Description:	Near Marina Vista Avenue west of I-680 adjacent to Carquinez Strait generally west adjacent to Suisun Bay to Pinole, then south to Richmond Station on Castro near Richmond Boulevard.	

FIGURE 6.1d

PIPELINE SECTION INFORMATION SUMMARY

BRISBANE - SFO AIRPORT JUNCTION 12" (38)		
Pipe and Operational Data		
• Section Length:	5.39 Miles	28,461 Feet
• Line Diameter:	12.75 in., O.D.	12.312 in., I.D. (note 1)
• Line Capacity:	777 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	3,800 bph or 91,200 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Mateo, CA	
• Location Description:	From Brisbane Terminal south adjacent to San Francisco Bay to San Francisco Airport Junction adjacent to SFO Airport.	

FIGURE 6.1e

PIPELINE SECTION INFORMATION SUMMARY

OAKLAND TERMINAL – BRISBANE TERMINAL 10" (41)	
Pipe and Operational Data	
• Section Length:	24.92 Miles 131,578 Feet
• Line Diameter:	10.75 in., O.D. 10.312 in., I.D. (note 1)
• Line Capacity:	545 bbls/mile (note 2)
• Capacity of entire line section:	(b) (7)(F),
• Maximum flow rate:	2,900 bph or 69,600 bpd
Note 1:	The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.
Note 2:	The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.
Location Description	
• County(s)/State(s) Traversed:	San Mateo, CA Alameda, CA
• Location Description:	From Oakland Terminal near Maritime Street and Navy Roadway, generally parallel to I-880 to the Oakland Airport Junction to the south boundary of Oakland Airport then west across San Francisco Bay to Brisbane Terminal. .

FIGURE 6.1f

PIPELINE SECTION INFORMATION SUMMARY

OAKLAND TERMINAL – BRISBANE TERMINAL 12" (42)

Pipe and Operational Data

• Section Length:	24.88 Miles	131,424 Feet
• Line Diameter:	12.75 in., O.D.	12.312 in., I.D. (note 1)
• Line Capacity:	777 bbls/mile (note 2)	
• Product types:	CARB ULSD, Gas, Turbine, Ethanol	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	3,550 bph or 85,200 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections

Location Description

• County(s)/State(s) Traversed:	San Mateo, CA Alameda, CA
• Location Description:	From Oakland Terminal near Maritime Street and Navy Roadway, generally parallel to I-880 to the south boundary of Oakland Airport then west across San Francisco Bay to Brisbane Terminal.

PIPELINE SECTION INFORMATION SUMMARY

CHEVRON REFINERY #2 – RICHMOND 10" (104)		
Pipe and Operational Data		
• Section Length:	1.22 Miles	6,429 Feet
• Line Diameter:	10.75 in., O.D.	10.25 in., I.D. (note 1)
• Line Capacity:	539 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7) (F) (b)	
• Maximum flow rate:	2,600 bph or 62,400 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Contra Costa, CA	
• Location Description:	From Chevron Terminal on Richmond Boulevard near Castro Point generally east to Richmond Station on Castro near Richmond Boulevard.	

FIGURE 6.2

HCA INDEX

Refer to Figure 6.1a through Figure 6.1p for specific information on line segments.

The following Index Map shows all the corresponding Line Segments for Figure 6.1.

Detailed HCA Maps are contained in the CD inside the front cover of Volume 2 (or in a separate folder on electronic copy CD).

The specific HCA maps for this area are:

6.0 AREA PIPELINE SECTIONS

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Concord Incoming Lines	
• Christie Road - Concord 8”	8
• Martinez - Concord 12”	27
• Mococo - Concord 12”	33
• Amorco - Martinez 10”	68
• Union - Concord 8”	72
• Amorco - Benecia 10”	88
• Exxon - Mococo 10”/12”	103
Concord Outgoing Lines	
• Concord - Brentwood Junction 10”	9
• Concord - Dougherty 10”	16
• Stockton - Arco 8”	43
• Rough & Ready Junction 8”	45
• Concord - Suisun 8”	47
(b) (3), (b) (7)(F)	
• Stockton Junction - Stockton 8”	62
•	
Concord - Hay Road 14”/20”	130
• Travis Junction – Travis Station 16”	147
• Travis Station – Travis Terminal 10”	148
Pipeline Facilities (Non-Storage)	
(b) (3), (b) (7)(F)	

6.1 SCOPE (Cont'd)

- Figures 6.1a through 6.1s on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for each this Area is provided under the section entitled "Worst Case Discharge Data" of the applicable Line Segment.

- The specific information summary for these pipeline sections is provided as follows:

  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps

- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.

- Northern and Southern pipeline schematic diagrams are provided in Volume 1, Figures 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

EXXON - MOCOCO 10" (103)		
Pipe and Operational Data		
• Section Length:	3.16 Miles	16,701 Feet
• Line Diameter:	10.75 in., O.D.	10.312 in., I.D. (note 1)
• Line Capacity:	545.42 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	5,200 bph or 124,800 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description		
• County(s)/State(s) Traversed:	Contra Costa, CA Solano, CA	
• Location Description:	From Valero Benecia Refinery to Mococo Junction, Crossing the Carquinez Strait.	

FIGURE 6.1b

PIPELINE SECTION INFORMATION SUMMARY

MOCOCO - CONCORD 12" (33)		
Pipe and Operational Data		
• Section Length:	3.14 Miles	16,601 Feet
• Line Diameter:	12.75 in., O.D.	12.312 in., I.D. (note 1)
• Line Capacity:	754.18 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	5,200 bph or 124,800 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Contra Costa, CA	
• Location Description:	From Martinez to Mococo (Mococo Road and Marina Vista Road).	

FIGURE 6.1d

PIPELINE SECTION INFORMATION SUMMARY

UNION - CONCORD 8" (72)		
Pipe and Operational Data		
• Section Length:	13.08 Miles	69,054 Feet
• Line Diameter:	8.625 in., O.D.	8.125 in., I.D. (note 1)
• Line Capacity:	338.60 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	3,000 bph or 72,000 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
• County(s)/State(s) Traversed:	Contra Costa, CA
• Location Description:	From Tosco Refinery near Rodeo, generally east along the edge of the Carquinez Strait to the vicinity of Marina Vista Way and I-680, then generally southeast to Concord Station at Solano Way and Highway 4.

FIGURE 6.1e

PIPELINE SECTION INFORMATION SUMMARY

MARTINEZ - CONCORD 12" (27)		
Pipe and Operational Data		
• Section Length:	5.36 Miles	28,308 Feet
• Line Diameter:	12.75 in., O.D.	12.00 in., I.D. (note 1)
• Line Capacity:	738.59 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	4,400 bph or 105,600 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Contra Costa, CA	
• Location Description:	From Martinez Booster on Marina Vista Way west of I-680, east along Marina Vista Way to Solano Way, then south to Concord Station near Highway 4.	

FIGURE 6.1f

PIPELINE SECTION INFORMATION SUMMARY

AMORCO - MARTINEZ 8" (68)		
Pipe and Operational Data		
• Section Length:	1.16 Miles	6,125 Feet
• Line Diameter:	10.75 in., O.D.	10.02 in., I.D. (note 1)
• Line Capacity:	514.96 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7) (F) (b)	
• Maximum flow rate:	2,350 bph or 56,400 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Contra Costa, CA	
• Location Description:	From Martinez Booster on Marina Vista Way west of I-680, east along Marina Vista Way to Amorco Junction east of I-680.	

FIGURE 6.1g

PIPELINE SECTION INFORMATION SUMMARY

AMORCO - BENECIA 10" (88)		
Pipe and Operational Data		
• Section Length:	0.38 Miles	2,006 Feet
• Line Diameter:	10.75 in., O.D.	10.312 in., I.D. (note 1)
• Line Capacity:	545 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7) (F) (b)	
• Maximum flow rate:	2,350 bph or 56,400 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Contra Costa, CA	
• Location Description:	From Amorco Junction east adjacent to Carquinez Strait to a connection with a Valero Pipeline.	

FIGURE 6.1h

PIPELINE SECTION INFORMATION SUMMARY

CHRISTI ROAD - CONCORD 8" (8)		
Pipe and Operational Data		
• Section Length:	9.09 Miles	48,010 Feet
• Line Diameter:	8.625 in., O.D.	8.125 in., I.D. (note 1)
• Line Capacity:	339 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	2,600 bph or 62,400 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Contra Costa, CA	
• Location Description:	From Christi Road in Franklin Canyon east to Concord Station at Solano Way and Highway 4.	

FIGURE 6.1i

PIPELINE SECTION INFORMATION SUMMARY

CONCORD - TRAVIS 8" (47)		
Pipe and Operational Data		
• Section Length:	20.45 Miles	107,956 Feet
• Line Diameter:	8.625 in., O.D.	8.249 in., I.D. (note 1)
• Line Capacity:	349.01 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	1,000 bph or 24,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Contra Costa, CA Solano, CA	
• Location Description:	From Concord Station north across Suisun Bay to near Suisun City, where it connects to a line owned by others for delivery to Travis AFB.	

FIGURE 6.1j

PIPELINE SECTION INFORMATION SUMMARY

CONCORD – SAN JOAQUIN RIVER-WEST BV 10" (9)		
Pipe and Operational Data		
• Section Length:	45.1 Miles	23,831 Feet
• Line Diameter:	10.75 in., O.D.	10.25 in., I.D. (note 1)
• Line Capacity:	538.88 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F), (b)	
• Maximum flow rate:	4,250 bph or 102,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Contra Costa, CA	
• Location Description:	From Concord Station east through Marsh Creek and the San Joaquin River Lowlands(b) (3), (b) (7)(F)	

FIGURE 6.1k

PIPELINE SECTION INFORMATION SUMMARY

CONCORD – (b) (3), (b) (7)(F))		
Pipe and Operational Data		
• Section Length:	25.89 Miles	136,713 Feet
• Line Diameter:	12.75 in., O.D.	12.312 in., I.D. (note 1)
• Line Capacity:	777.50 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	4,500 bph or 108,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Contra Costa, CA	
• Location Description:	From Concord Station east along the edge of Carquinez Strait then across the San Joaquin River Lowlands to the Connection with Line 50 in the Brentwood area.	

FIGURE 6.1I

PIPELINE SECTION INFORMATION SUMMARY

CONCORD - DOUGHERTY STATION 10" (16)		
Pipe and Operational Data		
• Section Length:	23.67 Miles	125,009 Feet
• Line Diameter:	10.75 in., O.D.	10.374 in., I.D. (note 1)
• Line Capacity:	551.99 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	4,500 bph or 108,000 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
• County(s)/State(s) Traversed:	Contra Costa, CA
• Location Description:	From Concord Station south to Dougherty Booster Station, in the vicinity of Dublin north of I-580.

FIGURE 6.1m

PIPELINE SECTION INFORMATION SUMMARY

CONCORD – HAY ROAD 14”/20” (130)		
Pipe and Operational Data		
• Section Length:	35.00 Miles	184,800 Feet
• Line Diameter:	14.0 in., O.D. 20.0 in., O.D.	13.25 in., I.D. (note 1) (14,467 ft) 19.25 in., I.D (note 1) (170,333 ft)
• Line Capacity:	2,029 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	8,333 bph or 200,000 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
• County(s)/State(s) Traversed:	Contra Costa, CA Solano, CA
• Location Description:	From Concord Station north across the Carquinez Strait then generally northeast along Interstate 80 to Hay Road near Vacaville.

TRAVIS JUNCTION – TRAVIS SATION 16" (147)		
Pipe and Operational Data		
• Section Length:	1.33 Miles	7,022.4 Feet
• Line Diameter:	16.0 in., O.D.	15.00 to 15.25 in., I.D. (note 1)
• Line Capacity:	1,222 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F), (b)	
• Maximum flow rate:	8,000 bph or 192,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Solano, CA	
• Location Description:	From Travis Junction generally east southeast along Travis AFB railroad to Travis Station.	

FIGURE 6.1o

PIPELINE SECTION INFORMATION SUMMARY

TRAVIS STATION – TRAVIS TERMINAL 10" (148)		
Pipe and Operational Data		
• Section Length:	0.48 Miles	2,534.4 Feet
• Line Diameter:	10.75 in., O.D.	10.02 in., I.D. (note 1)
• Line Capacity:	551.9 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	2,000 bph or 48,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Solano, CA	
• Location Description:	From Travis Station north then east and southeast along Hangar Avenue then south to Travis AFB Terminal.	

FIGURE 6.1p

PIPELINE SECTION INFORMATION SUMMARY

STOCKTON JUNCTION – STOCKTON 8" (62)		
Pipe and Operational Data		
• Section Length:	4.11 Miles	21,701 Feet
• Line Diameter:	8.625 in., O.D.	8.249 in., I.D. (note 1)
• Line Capacity:	349 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	4,000 bph or 96,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Joaquin, CA	
• Location Description:	From Stockton Junction, west of the San Joaquin River in west Stockton, southeast along the River to Stockton terminal, where it connects to lines 43 and 45.	

FIGURE 6.1q

PIPELINE SECTION INFORMATION SUMMARY

(b) (3), (b) (7)(F) – (b) (3), (b) (7)(F))

Pipe and Operational Data

• Section Length:	69.7 Miles 386,016 Feet
• Line Diameter:	12.75 in., O.D. 12.312 in., I.D. (note 1)
• Line Capacity:	777 bbls/mile (note 2)
• Product types:	CARB ULSD, Gas, Turbine, Ethanol
• Capacity of entire line section:	(b) (7)(F), (b)
• Maximum flow rate:	4,500 bph or 108,000 bpd

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line

Location Description

• County(s)/State(s) Traversed:	San Joaquin, Stanislaus, Merced, CA
• Location Description:	From the Brentwood Junction connection with line 90, generally southeast parallel to I-5 to Patterson, then east to near Highway 99, then paralleling to Highway 99 to (b) (3), (b) (7)(F)

Worst Case Discharge Data

(b) (7)(F), (b) (3)

FIGURE 6.1r

PIPELINE SECTION INFORMATION SUMMARY

ROUGH & READY JUNCTION 8" (45)		
Pipe and Operational Data		
• Section Length:	0.94 Miles	4,968 Feet
• Line Diameter:	8.625 in., O.D.	8.249 in., I.D. (note 1)
• Line Capacity:	349 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7) (F) (b)	
• Maximum flow rate:	4,000 bph or 96,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Joaquin, CA	
• Location Description:	From Stockton Terminal west to a pipeline manifold that connects to others pipelines that lead to terminals across the San Joaquin River on Rough and Ready Island.	

FIGURE 6.1s

PIPELINE SECTION INFORMATION SUMMARY

STOCKTON – ARCO 8" (43)		
Pipe and Operational Data		
• Section Length:	0.21 Miles	1,089 Feet
• Line Diameter:	8.625 in., O.D.	8.125 in., I.D.
• Line Capacity:	338 bbls/mile	
• Capacity of entire line section:	(b) (7) (F) (b)	
• Maximum flow rate:	4,200 bph or 100,800 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
• County(s)/State(s) Traversed:	San Joaquin, CA
• Location Description:	From Stockton Terminal northwest to a connection with an Arco pipeline.

FIGURE 6.2

HCA INDEX

Refer to Figure 6.1a through Figure 6.1s for specific information on line segments.

The following Index Map shows all the corresponding Line Segments for Figure 6.1.

Detailed HCA Maps are contained in the CD inside the front cover of Volume 2 (or in a separate folder on electronic copy CD).

The specific HCA maps for this area are:

6.0 AREA PIPELINE SECTIONS

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.	WCD (BBLS)
Richmond Incoming Lines		
• TIME 8"	76	(b) (7)(F), (b) (3)
• IMTT 8"	75	
• ARCO - Richmond 8"	74	
• ARCO - Richmond 8"	71	
• Union Junction - ARCO 8"	89	
• Chevron - Richmond 8"	69	
• Chevron - Richmond 10"	104	
• Chevron - Richmond 10"	99	
• Amorco - Richmond 12"	37	
Richmond Outgoing Lines		
• Richmond - Christi Road 8"	8	
• Richmond - Oakland 12"	36	
• Richmond - Oakland 8" / 10"	46	
• Oakland - Brisbane 10"	41	
• Oakland - Airport Junction 12"	42	
Other Richmond Lines		
• Valero - Amorco 10"	95	
Pipeline Facilities (Non-Storage)		
• Amorco Pump Station (booster)		
• Richmond Pump Station (booster)		
• Jefferson Junction – piping manifold only		
• Airport Junction – piping manifold only		

- Figures 6.1a through 6.1o on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for each segment is provided under the section entitled "Operational and Worst Case Discharge Data". The derivation of the WCD, based on a recent third party Integrity Management Program study, is as follows:

  Release volume prior to line shutdown and valve closures:

  - O Full flow release due to rupture. This is computed at the maximum pumping rate for each line segment.
  - O Detection time, analysis and pump shutdown in adverse weather conditions. This is based on a maximum of two (2) minutes in the event of a full flow rupture, which would cause an instant alarm.
  - O Line segment valve closures. All line segments are equipped with remote activating isolation valves. Adverse weather would have no impact on line segment isolation, as isolation valves are not dependent on manual closure.

6.1 SCOPE (Cont'd)

Line drainage following pump shutdown:

- O The Integrity Management Program study computed the maximum potential line drainage between adjacent isolation or check valves and incorporated pipeline elevation profiles to estimate how much of that total volume would escape at any release point along the line.

- The specific information summary for these pipeline sections is provided as follows:

  - O Pipeline Section Information Summary (one per section)
  - O Pipeline High Contingency Area Maps

- Breakout stations or terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.

- Northern and southern pipeline schematic diagrams are provided in Volume 1, Figure 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

TIME 8" (76)		
Pipe Data		
• Section Length:	2.21 Miles	11,695 Feet
• Line Diameter:	8.625 in., O.D.	8.187 in., I.D. (note 1)
• Line Capacity:	344 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7) (F) (b)	
Location Description		
• County(s)/State(s) Traversed:	Contra Costa, CA	
• Location Description:	From Time Terminal near 4th Street and Wright Avenue, adjacent to the Santa Fe Channel of the Richmond Inner Harbor to a connection with Line 75 near 1st Street and Cutting Boulevard.	
Operational and Worst Case Discharge Data		
(b) (7)(F), (b) (3)

6.0 AREA PIPELINE SECTIONS

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
San Jose Area Lines	
• Concord - San Jose 10"	16
Pipeline Facilities (Non-Storage)	
• Dougherty Pump Station (Booster)	

- Figure 6.1a on the following page provides specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled "Worst Case Discharge Data" of the applicable Line Segment.

- The specific information summary for these pipeline sections is provided as follows:

  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps

- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.

- Northern and Southern pipeline schematic diagrams are provided in Volume 1, Figures 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

DOUGHERTY - SAN JOSE 10" (16)		
Pipe and Operational Data		
• Section Length:	51.38 Miles	271,286 Feet
• Line Diameter:	10.75 in., O.D.	10.374 in., I.D. (note 1)
• Line Capacity:	552 bbls/mile (note 2)	
• Product types:	CARB ULSD, Gas, Turbine, Ethanol	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	4,500 bph or 108,000 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections

Location Description	
• County(s)/State(s) Traversed:	Alameda, CA Santa Clara, CA
• Location Description:	From Dougherty Station, north of I-580 in Dublin area, generally south paralleling I-680 to San Jose Terminal.

Worst Case Discharge Data

7.0 BREAKOUT STATIONS/TERMINALS

7.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the breakout stations and/or terminals that have storage (breakout tanks) connected to the pipeline sections described in the previous Section of this Volume. The data is summarized as follows:

BREAKOUT STATION	LARGEST TANK (BBLS)	WCD (BBLS)
Brisbane Terminal	(b) (7)(F), (b) (3)	
Oakland Terminal		

- The largest Worst Case Discharge (WCD) for the breakout stations/terminals within this Area of Operation has been determined to be as follows:

(b) (7)(F), (b) (3)

[redacted]

- The specific information summary for these breakout stations/terminals is provided in this Section as follows:
  - Breakout Station/Terminal Tank Information Summary (one per station)
  - Facility Diagram
- Pipeline sections or terminaling operations associated with this Area of Operation are detailed in other Sections of this Volume.

7.0 BREAKOUT STATIONS/TERMINALS

FIGURE 7.1a

BRISBANE BREAKOUT STATION/TERMINAL				
TANK #	**TYPICAL PRODUCT**	**MAX. CAPACITY (BBLS)***	**DIAMETER**	**HEIGHT**
BT-06	OOS	(b) (7)(F), (b) (3)		
BT-07	OOS			
BT-08	Transmix			
BT-09	Transmix			
BT-15	Turbine			
BT-18	OOS			

LOCATION DESCRIPTION

- County/State: San Mateo, CA
- Location: Brisbane Terminal

WORST CASE DISCHARGE

(b) (7)(F), (b) (3)

* The maximum capacity is calculated using the indicated diameter and height of the tank. The actual maximum storage capacity to overflow would typically be less than the calculated number.

7.0 BREAKOUT STATIONS

7.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the breakout stations that have storage (breakout tanks) connected to the pipeline sections described in the previous section of this Volume 2. The data is summarized as follows:

BREAKOUT STATION	LARGEST TANK (BBLS)	WCD (BBLS)
Concord Station	(b) (7)(F), (b) (3)	
Travis Station		
Stockton Terminal		

- The largest Worst Case Discharge (WCD) for the breakout stations within this Area of Operation has been determined to be as follows:

(b) (7)(F), (b) (3)

- The specific information summary for these breakout stations is provided in this Section as follows:
  - Breakout Station Tank Information Summary (one per station)
  - Facility Diagrams

- Pipeline sections or terminaling operations associated with this Area of Operation are detailed in other sections of this Volume 2.

8.11 Specific Logistical Resources

8.11.1 FIRST AID AND MEDICAL SERVICES

First Aid

First Aid supplies are maintained in the Facility offices. KMEP field emergency responders have received First Aid and CPR training and will provide first response within the limits of their training. After first aid treatment, the injury will be evaluated for reference to, or transport to, medical professionals.

Emergency Medical Care

Emergency medical care will be secured from medical professionals. Possible resources for this service include but are not limited to, these listed above plus the following:

DIAL 911 - REQUEST ASSISTANCE FROM PARAMEDICS

Kaiser Permanente Hospital
901 Nevin Ave.
Richmond, CA 94801
(510) 307-1500

Richmond Health Center
100 38th Street
Richmond, CA 94805
(510) 231-1200

Additional telephone references are provided in Figure 2.2 of this volume.

8.11.2 FIRE SERVICES

Support from fire fighting professionals will be secured as needed. The services will be activated either by a call through 911 or directly to the nearest fire fighting resource. Possible resources for this service include but are not limited to, the following:

Richmond Fire Dept
1401 Marina Way South
Richmond, CA 94804
(510) 307-8031

Contra Costa Fire Dept
2010 Geary Road
Richmond, CA 94801
(510) 215-4450

Additional telephone references are provided in Figure 2.2 of this volume.

8.11.3 LODGING SERVICES

Lodging will be secured for responders as appropriate. The following Figure provides an overview of the lodging services in the immediate vicinity of the Terminal. KM may select these or other Lodging Services as appropriate.

FIGURE 8.9

TACTICAL PLAN

The following Tactical Plan has been provided to assist initial response to a spill incident from this Facility. The plan includes the following:

- Driving directions
- General pictures of the site and tactical response strategy
- General response equipment and personnel recommendations

Note: This Tactical Plan is provided as a general guidance tool for response to an incident emanating from this Facility. The selection of response strategy equipment, manpower and deployment site may vary based on actual field conditions (e.g. terrain, weather conditions, product type/volume) and incident details.

8.1.1 CERTIFICATION OF SUBSTANTIAL HARM

CERTIFICATION OF THE APPLICABILITY OF THE SUBSTANTIAL HARM CRITERIA

Facility Name and Address: SFPP, L.P. Brisbane Terminal
950 Tunnel Avenue
Brisbane, CA 94005

(Detailed Facility information, including data required for the Response Plan Cover Sheet, is provided in Figure 8.1)

1. Does the facility transfer oil over water to or from vessels ***and*** does the facility have a total oil storage capacity greater than or equal to 42,000 gallons?	**Yes:**	**No: X**
2. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area?	**Yes:**	**No: X**
3. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix (40 CFR 112 Appendix C) or a comparable formula[1]) such that a discharge from the facility could cause injury (as defined in 40 CFR 112.2) to fish an wildlife and sensitive environments?	**Yes: X**	**No:**
4. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix (40 CFR 112 Appendix C) or a comparable formula[1]) such that a discharge from the facility would shut down a public drinking water intake[2]?	**Yes:**	**No: X**
5. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the past five (5) years?	**Yes:**	**No: X**

[1] If a comparable formula is used, documentation of the reliability and analytical soundness of the comparable formula must be attached to this form.

[2] For the purposes of 40 CFR part 112, public drinking water intakes are analogous to public water systems as described at 40 CFR 143.2(c).

CERTIFICATION

I hereby certify the following:

- Under penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe the submitted information is true, accurate and complete.
- The information and procedures contained herein are considered to be accurate as of this date and are consistent with the National Contingency Plan (NCP) and applicable Area Contingency Plans (ACP) as detailed in Volume 1, Section 1.5.

Signature: _____ Date: 3/4/11

Nicole Stewart, Area Manager

8.1.2 INTRODUCTION

This Facility is a bulk distribution facility for refined petroleum products. Product is received via the Company's pipelines #41and #42 into above ground storage. The product is transported out of the Facility by tanker trucks. Offloading of products at the Facility occurs infrequently, since essentially all product is received via pipeline. Gasoline additives and ethanol are received via truck into aboveground tanks. The additives are blended into the product as it is loaded into trucks. The following Figure 8.1 provides Facility specific information, Figure 8.2 provides an Area Map for the Facility, and Figure 8.3 provides a Facility Diagram.

This Section 8 is provided in order to document the following Facility-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- Facility Information (Figure 8.1)
- Area Map (Figure 8.2)
- Hazard Identification including Tank Tables (Section 8.2)
- Inspections (Section 8.2.2)
- Vulnerability Analysis (Section 8.2.3)
- Discharge Scenarios (Section 8.3)
- Evacuation (Section 8.4)

Area Map:	Provided in Figure 8.2
Facility Diagram:	Provided in Figure 8.3
Wellhead Protection Area:	None
Facility Distance to Navigable Water:	Less than one quarter mile
Landside Directions:	At the intersection of San Bruno Avenue and Santa Clara Street, start out going northwest on San Bruno Avenue towards Alvarado Street. Go 0.31 miles and turn slight right onto Old County Road. Proceed 0.30 miles and turn left onto Tunnel Avenue. Go 0.44 miles to the Facility.
Waterside Directions:	There is no water access to this Facility.
Seasonal Weather Conditions:	
Air Temperature:	Ranges from 30° to 95°F
Water Temperature:	Ranges from 52° to 54°F
Winds:	Generally southwest at 15 to 25 mph in afternoons from April to September; calm in other months except during storms.
Rain:	Generally 18 to 20 inches per year during October to May.
Marine Tide/Current:	The tidal range is generally from 0 feet to +5 feet MLLW, with the extremes being -2.5 feet and +7.5 feet. Currents in the Santa Fe Channel are generally about 0.5 knot at flood and ebb, with the maximums somewhat above this.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL

Description of Operation:

- This Facility is a bulk storage and distribution facility for refined petroleum products. The stored product arrives through the main Company pipeline to aboveground storage tanks, transfers to fueling racks through pipelines, and moves out of the Facility by tanker trucks. All tanker trucks are owned by other companies.

- The aboveground storage tanks are contained in a bermed secondary containment area that, at a minimum, provides secondary containment for 110 percent of the largest tank. The tanks are filled or drawn down through a system of aboveground and underground pipes that connect this Facility into the Company distribution network.

(b) (7)(F), (b) (3) [redacted]

- The Facility normally operates 24 hours a day 7 days a week.

- The Facility's Worst Case Discharge amount is (b) (7)(F), (b) (3) [redacted]

Products Handled:

- Gasoline
- Diesel
- Jet Fuel
- Transmix
- Ethanol
- Additives

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - LOADING RACK

Description of Operation:

- The Facility is equipped with three (3) loading spots two (2) unloading spots which handle various refined petroleum products.
- A maximum of eight (8) tank trucks may load/unload simultaneously.
- The loading/unloading operations are conducted 24 hours a day 7 days a week.
- The Facility handles an average of 150 trucks per day.

Loading Rate: 600 gpm (*per truck*)

Truck Capacity: 9,000 gallons (*maximum*)

Discharge Prevention:

- The curbed concrete slab drains directly to a sump & oil water separator.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS

- The majority of the Facility was constructed in the 1968. In 1970 tanks BT-16 thru BT-21 were added. The maximum capacity of the newer tanks (non-EPA jurisdictional) is also 3,150,000 gallons each.

MAPS AND DIAGRAMS

8.1.1 FACILITY EXECUTABILITY STATEMENT

KINDER MORGAN
ENERGY PARTNERS, L.P.

FACILITY EXECUTABILITY STATEMENT

I certify, to the best of my knowledge and belief, under penalty of perjury under the laws of the State of California, that the information contained in this contingency plan is true and correct and that the plan is both feasible and executable.

MICHAEL G. SUDHEIMER
Name

AREA MANAGER
Title

NOVEMBER 18, 2004
Date

The above certification statement, required by California Code of Regulations Title 14, Division 1, subdivision 4, Chapter 3, subchapter 3, §817.02(a)(1)(D), has been signed by an executive within the plan holder's management. The signer has training, knowledge, and experience in the area of oil spill prevention and response, has the authority to fully implement the oil spill contingency plan written within this Integrated Contingency Plan, and will review this Plan for accuracy, feasibility, and executability.

8.1.2 CERTIFICATE OF FINANCIAL RESPONSIBILITY

The following Certificate of Financial Responsibility is presented on the following page:

COFR Number: 2-0044-01-002

CALIFORNIA CERTIFICATE OF FINANCIAL RESPONSIBILITY (CA COFR)

OWNER OR OPERATOR:
KINDER MORGAN LIQUID TERMINALS, LLC
meets the financial responsibility requirements set forth in the Government Code Sections 8670.37.53 as it applies to the operation of

NAME:
RICHMOND MARINE TERMINAL

LOCATION:
1140 CANAL BOULEVARD, RICHMOND, CALIFORNIA

CERTIFICATE: 2-0044-01-002 **CONTROL #:** FB018

ISSUED DATE: April 01, 2013 **EXPIRATION DATE:** March 31, 2015

The holder of this document named above is subject to the provisions of California Code of Regulations, Title 14, Sections 791-797, implementing the financial responsibility requirements set forth in the Lempert-Keene-Seastrand Oil Spill Prevention and Response Act (Act). This certificate holder has provided the necessary evidence of financial responsibility mandated by these requirements.

For the purpose of determining liability pursuant to the Act, this Certificate of Financial Responsibility is conclusive evidence that the person or entity holding the certificate is the party responsible for the specific Marine Facility.

No alterations of this certificate are permitted after issuance by the Administrator of OSPR. If there is a change in the name or ownership of the Marine Facility, the certificate holder must notify the Office of Spill Prevention and Response (OSPR) immediately. If the certificate expires, a new certificate will be required.

This certificate remains valid as long as the current method for demonstrating financial responsibility is maintained (eg. insurance). Any changes in this status must be reported to OSPR immediately.

It is the owner or operator's responsibility to ensure that this certificate number is also included in the owner or operator's marine oil spill contingency plan, which must be submitted to this office for approval, before operating in a location where a spill could impact California marine waters.

If you have any questions, please contact
Farina A. Khan
916-327-9937

Sincerely,
Farina A. Khan

Financial Analyst

8.1.3 CERTIFICATION OF SUBSTANTIAL HARM

CERTIFICATION OF THE APPLICABILITY OF THE SUBSTANTIAL HARM CRITERIA

FACILITY NAME: Kinder Morgan Liquids Terminals, LLC Richmond Terminal
FACILITY ADDRESS: 1140 Canal Boulevard
Richmond, CA 94804

(Detailed Facility information, including data required for the Response Plan Cover Sheet, is provided in Figure 1.3)

1. Does the facility transfer oil over water to or from vessels ***and*** does the facility have a total oil storage capacity greater than or equal to 42,000 gallons?	Yes	✓	No	
2. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area?	Yes		No	✓
3. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix or a comparable formula[1]) such that a discharge from the facility could cause injury to fish and wildlife and sensitive environments? For further description of fish and wildlife and sensitive environments, see Appendices I, II, and III to DOC/NOAA's "Guidance for Facility and Vessel Response Plans: Fish and Wildlife and Sensitive Environments" (59 FR 14713, March 29, 1994) and the applicable Area Contingency Plan.	Yes	✓	No	
4. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix or a comparable formula[1]) such that a discharge from the facility would shut down a public drinking water intake[2]?	Yes		No	✓
5. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the last 5 years?	Yes		No	✓

[1] If a comparable formula is used, documentation of the reliability and analytical soundness of the comparable formula must be attached to this form.

[2] For the purposes of 40 CFR part 112, public drinking water intakes are analogous to public water systems as described at 40 CFR 143.2(c).

CERTIFICATION

I hereby certify the following:

- Under penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe that the submitted information is true, accurate, and complete.
- The information and procedures contained herein are considered to be accurate as of this date and are consistent with the National Contingency Plan (NCP) and applicable Area Contingency Plans (ACP) as detailed in Section 1.5.

NOTE: The information and procedures in this Plan must be treated as guidelines only. The user should determine to what extent it is practical and advisable to follow them. This decision may involve considerations not discussed in this Plan. Response Management Associates, Inc. (RMA) provided consulting and plan development services in the preparation of this plan utilizing data provided by the owner/operator and/or the Facility. RMA assumes no liability for injury, loss, or damage of any kind resulting directly or indirectly from the use of the regulatory interpretation, response planning, or information contained in this plan.

8.1.4 INTRODUCTION

This Facility is a bulk liquid storage and distribution point for various vegetable oils, petroleum products and chemicals. The Facility contains 124 storage tanks, 59 of which can be served by vessel from Conoco/Phillips' dock facility located south of the Facility and adjacent to the Harbor Channel. The Facility also has the capability to ship and receive products by tank truck and/or railcar. The following Figure 8.1 provides Facility specific information, Figure 8.2 provides an Area Map for the Facility, and Figure 8.3 provides a Facility Diagram.

This Section 8 is provided in order to document the following Facility-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- Facility Information (Figure 8.1)
- Area Map (Figure 8.2)
- Hazard Identification including Tank Tables (Section 8.2)
- Inspections (Section 8.2.2)
- Vulnerability Analysis (Section 8.2.3)
- Discharge Scenarios (Section 8.3)
- Evacuation (Section 8.4)
- Risk and Hazard Analysis (Section 8.5)
- Offsite Consequence Analysis (Section 8.6)
- Risk Reduction Incentive Program (Section 8.7)
- Drug and Alcohol Policies (Section 8.8)
- Vessel Loading Procedures (Section 8.9)

Telephone/FAX:	Additional telephone references, including 24 hour numbers, for the Facility, Owner, and QI/AQI are provided in Section 2 of Volume 1.
FACILITY LOCATION	
County:	Contra Costa County, CA
Latitude:	(b) (7)(F), (b) (3)
Longitude:	
Area Map:	Provided in Figure 8.2
Facility Diagram:	Provided in Figure 8.3
Wellhead Protection Area:	None
Facility Distance to Navigable Water:	The Facility is bounded on the east by the Richmond Inner Harbor Channel.
Landside Directions:	From Interstate 580, take the Canal Boulevard exit. Turn south onto Canal Boulevard and go 0.90 miles to the Facility entrance.
Waterside Directions:	From San Francisco Bay to Richmond Inner Harbor Channel to Conoco/Phillips' Dock.
Seasonal Weather Conditions:	
Air Temperature:	Ranges from 30° to 95°F
Water Temperature:	Ranges from 52° to 54°F
Winds:	Generally southwest at 15 to 25 mph in afternoons from April to September; calm in other months except during storms.
Rain:	Generally 18 to 20 inches per year during October to May.
Marine Tide/Current:	The tidal range is generally from 0 feet to +5 feet MLLW, with the extremes being -2.5 feet and +7.5 feet. Currents in the Santa Fe Channel are generally about 0.5 knot at flood and ebb, with the maximums somewhat above this.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION – GENERAL (Cont'd)

Description of Operation:

- This Facility is a bulk distribution facility for various vegetable oil, petroleum products, and chemicals.

(b) (7)(F), (b) (3)

- Vessels supplying the Facility are third party owned.
- The Facility normally operates Monday 0100 - Saturday 1600 hours, and as required for marine transfers.

The Facility's Worst Case Discharge amount is (b) (7)(F), (b) (3)

Products Handled:

- Vegetable Oils
- Petroleum Products
- Chemicals

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

PHYSICAL DESCRIPTION – MARINE OPERATIONS

Description of Operation:

- The Facility operates 23 pipelines at Conoco/Phillips' dock Facility. Five (5) 8" diameter, seventeen 6" diameter, and one (1) 2" diameter pipelines.
- Of the total 134 storage tanks, 59 can be served by vessels from Conoco/Phillips' dock facility located south of the Facility and adjacent to the Harbor Channel.

Type:	Tank Ships:	7,000 - 105,000 DWT
	Barges:	11,000 DWT

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION – MARINE OPERATIONS (Cont'd)		
Tow Quantity:	One (1)	
Length:	Tank Ships:	Maximum 805 ft. length, 37 ft. maximum draft
	Barges:	350 ft.
Average Shipment Size:	25,000 - 35,000 bbls	
Discharging Rates:	Approximately 650 to 1,900 bph	
Amount of Transfer:	30,000 bbls *(typical)*	
Frequency of Transfer:	Five (5) transfers per month *(typical)*	
Duration of Transfer:	12 to 36 Hours *(typical)*	

Discharge Prevention:

- Each transfer at the dock is closely monitored by one (1) TPIC, one (1) operator and one (1) fire watch. Radio communication is maintained between the operators and fire watch to assure a safe product transfer.
- The loading/unloading lines are equipped with drip pans under the pump header connections.

PHYSICAL DESCRIPTION - TRUCK RACK

Description of Operation:

- The Facility is equipped with up to 20 loading spots which handle various products.
- A maximum of 7 tank trucks may load simultaneously.
- The Facility handles an average of 60 trucks per day.

Loading Rate: Up to 450 gpm (*per truck*)

Truck Capacity: 7,000 gallons (*maximum*)

Discharge Prevention:

- The curbed concrete slabs drain directly to a central location on the eastern side of Facility, Tank S-5001.
- Truck drivers and operators that conduct loading/unloading operations are qualified to perform their required tasks.
- Safe operating procedures are posted.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION – RAIL CAR RACK

Description of Operation:

- The Facility is equipped with two (2) rail car racks that have two (2) loading/ unloading spots each.
- The Facility handles an average of 6 tank cars per day.

Loading Rate: 500 gpm *(typical)*

Railcar Capacity: 15,000 - 25,000 gallons

Discharge Prevention:

- The curbed concrete slabs drain directly to a central location on the eastern side of Facility, Tank S-5001.
- Loading and unloading events are only performed by qualified Company personnel.

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS

1985 Tanks 3011, 4010 through 4013, and 5001 through 5004 were relocated from a GATX facility in San Pedro, CA in 1983.

1987 Tanks 3012 through 3031, 4014 through 4016, 4020 and 4021 were built and Tanks 2001 through 2004, 4018, 4019, 8001, 3-1 through 3-3, 4-1, 5-7 through 5-18, 7-4, 8-1, 10-13 through 10-15, 20-1 through 20-3, 30-1, and S3032 were relocated from former terminals.

1988 Tanks 5-19 through 5-22, 7-5 and 7-6 were erected on site and Tanks 2-1, 3-4, and 3-5 were relocated from former terminals.

1990 Tank 20-1 was demolished and replaced with a new tank.

MAPS AND DIAGRAMS

The following Maps and Diagrams follow:

8.1.2 INTRODUCTION

This Facility is a bulk distribution facility for refined petroleum products. Product is received via the Company's pipeline #16 into aboveground storage tanks. The product is transported out of the Facility by tanker trucks, which are owned and operated by others. Offloading of products at the Facility occurs infrequently, since essentially all product is received via pipeline. Gasoline additives are received via truck into aboveground storage tanks. The additives are blended into the product as it is loaded into trucks. The following Figure 8.1 provides Facility specific information, Figure 8.2 provides an Area Map for the Facility, and Figure 8.3 provides a Facility Diagram.

This Section 8 is provided in order to document the following Facility-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- Facility Information (Figure 8.1)
- Area Map (Figure 8.2)
- Hazard Identification including Tank Tables (Section 8.2)
- Inspections (Section 8.2.2)
- Vulnerability Analysis (Section 8.2.3)
- Discharge Scenarios (Section 8.3)
- Evacuation (Section 8.4)

Facility Distance to Navigable Water:	Less than one mile
Landside Directions:	At the intersection of I-880 and Montague Expressway take Montague Expressway southwest 0.78 miles. Turn left onto E. Trimble Road to Junction. Turn left on Junction to Brennan Ave. At Brennan Ave turn left. Brennan will dead end at Kruse Dr. Turn right at Kruse Dr. The Facility is located at the end of Kruse Dr.
Waterside Directions:	There is no water access to this Facility.

PHYSICAL DESCRIPTION - GENERAL

Description of Operation:

- This Facility is a bulk storage and distribution facility for refined petroleum products. The stored product arrives through the main Company pipeline to aboveground storage tanks, transfers to fueling racks through pipelines, and moves out of the Facility by tanker trucks. All tanker trucks are owned by others, as are some of the loading racks located on Company property.

  The aboveground storage tanks are contained in a bermed secondary containment area that, at a minimum, provides secondary containment for 110 percent of the largest tank. The tanks are filled or drawn down through a system of aboveground and underground pipes that connect this Facility into the Company distribution network.

(b) (7)(F), (b) (3) [redacted]

- The Facility normally operates 24 hours a day 7 days a week.
- The Facility's Worst Case Discharge amount is (b) (7)(F), (b) (3) [redacted]

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL

Products Handled:

- Gasoline
- Diesel
- Turbine
- Transmix
- Ethanol
- Additives

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

PHYSICAL DESCRIPTION - LOADING RACK

Description of Operation:

- The Facility is equipped with 12 loading bays which handle various refined petroleum products and two (2) ethanol offloading spots.
- A maximum of 14 tank trucks may load simultaneously.
- The loading/unloading operations are conducted 24 hours a day 7 days a week.
- The Facility handles an average of 550 trucks per day.

Loading Rate: 600 gpm (*per truck*)

Truck Capacity: 9,000 gallons (*maximum*)

Discharge Prevention:

- The curbed concrete slab drains directly to an oil water separator.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS

- The majority of the Facility was constructed in the 1964 - 65. Expansions since then have included the addition of storage tanks: 1967 - 1; 1968 - 5; 1970 - 1, 1972 - 3; 1978 - 2; 1986 - 1; and 1989 - 1.

MAPS AND DIAGRAMS

The following Maps and Diagrams follow:

- Figure 8.2 – Area Map
- Figure 8.3 – General Layout Diagram
- Figure 8.4 – Fire Protection Diagram

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

The tank farms are protected with surrounding sealed earthen berms designed to withstand pressure from freestanding product and which is sufficiently impervious to spilled oil. The floors of the tanks have impervious linings. The berm is constructed to withstand a moderate earthquake without breaching the integrity of the secondary containment. Capacities for each of the storage tank areas are listed in the Potential Spill Sources and Container Identification table in this Section.

Tanks

- Secondary Containment volumes for all bulk storage tanks are detailed on the Potential Spill Sources and Container Identification table located in this Section.
- In each tank farm at the Facility, the tanks are located within a secondary containment berm. Product in these tanks includes various grades of gasoline, jet, and diesel fuel. The tanks are uniquely designated by a number preceded by "BT" (Brisbane Terminal).
- Age of tanks as an indicator. The majority of the tanks were constructed in the 1960's with additional tanks added to the Facility, most recently in 1986. As these tanks pass their 30th year of service, the general condition of the tanks is good due to the type of construction and ongoing level of maintenance.
- Tank construction. The tanks were built to API-650 standards. They are all state of the art welded tanks constructed of steel, and have reinforcement around the fittings.
- Tank foundation structure. The tanks were built on 3" pads, with a 3/4" class II aggregate base compacted to 95%. Perforated plastic pipe, placed in the soil under flat bottom tanks are used to detect leaks by allowing fluid to seep to the outer perimeter of the tank.

Loading Rack Containment System

- All loading racks have sufficient containment at the rack and are directly piped to an on-line oil-water separator.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Diked Storage Area Drainage Systems

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment area.
- Stormwater which does accumulate within the diked area, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures.
- Drainage from diked storage areas is restrained by manually controlled valves.
- Dike drain valves are secured in the closed position when not draining containment areas.
- Flapper-type drain valves are not used to drain diked areas.
- Stormwater from diked areas is emptied by gravity.
- Oil is removed from the containment area by piping the contents to a proper holding vessel to be recovered or properly disposed.
- Individually diked areas all drain to a common collection points located in the corner of the tank area through normally closed and locked gate valves.

Undiked Area Drainage

Drainage from undiked areas is controlled as follows:

- Piping located outside the diked areas is contained within the confines of the property by following a natural depression northeast and east of the truck racks where any spill is contained by a new 12" drain valve.
- Surface drainage from undiked areas flows northeast and east into the natural depression.
- There is currently a 12" corrugated drain pipe on the west side of TR# 1W that is open on the south end and no one has any knowledge of its endpoint destination. An implementation schedule has been established to identify the endpoint and take the necessary actions to ensure that it does not compromise the Facility's overall containment capability.
- The Facility has experienced a very significant degree of subsidence east of the rock line. Active programs to alleviate the subsidence are ongoing.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Undiked Area Drainage (Cont'd)

- The majority of the piping is contained within the diked areas except for the section noted on the Potential Spill Sources and Container Identification table in Appendix A. These areas would be contained by a depressed area in an open field, natural topography, a curbed area.

- All undiked piping is located in areas away from vehicular traffic.

- The risk of leaks originating from piping is low since it is observed frequently enough to detect excessive corrosion, defective pipe supports, or other anomalies which could compromise the integrity of the pipe.

- In the event that a spill did originate from undiked piping, the Facility would immediately activate its Contingency Plan to mitigate the spill before leaving the property.

Stormwater Drainage Procedures

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is as follows:

- When the containment area requires draining due to accumulation of stormwater, the containment area is examined by the Area Manager or designee to observe for any indications of oil contamination (e.g. oil sheen) to ensure any discharge from the Facility will be in compliance with applicable water quality standards and will not cause a harmful discharge as defined in 40 CFR, Part 110. Drainage is completed by manually operating the drain valves or pumped from the containment area.

- Stormwater is drained from the secondary containment areas.

- Water is visually inspected for product and discharged only if no product sheen is visible.

- Facility drainage flows directly into an open watercourse.

- When draining the containment area, water is discharged to a drainage ditch just north of the property, which flows east to the San Francisco Bay one half mile to the east.

- The Facility has a wastewater treatment system and treats water prior to discharge off site. This applies to water originating from tank water drains, loading and additive containment areas only.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Brisbane Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The loading racks operate 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan, which details additional discharge detection measures

Automated Detection Systems

(b) (3), (b) (7)(F)

Detection by Personnel

- Facility personnel conduct daily visual inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating rounds.
- The loading rack is equipped with warning and instruction signs.

Security

(b) (7)(F), (b) (3)

8.2.2 FACILITY SELF-INSPECTIONS

Inspections, Tests and Records

Container Testing and Inspections

- All aboveground containers are integrity tested on a regular schedule and when material repairs are made.
- The Engineering Department oversees the tank integrity in accordance with the SPCC Plan and L O&M Procedure 2101.
- Comparative records are maintained by the Engineering Department at the Orange office.
- The container inspection programs conducted and maintained by Facility personnel are as follows:
  - The containers are visually inspected by operating personnel for signs of deterioration, leaks, or the accumulation of liquids inside the containment areas.
  - Each storage container is inspected per the SPCC Plan and L O&M Procedure 2101, as required by age, condition, and service.
  - Based on these conditions, the aboveground storage containers are professionally inspected and non-destructive thickness testing is performed.
- The required inspections are divided into three categories:
  - Routine, in-service inspections
  - In-service, external inspections
  - Out-of-service, internal inspections
- If a field-constructed aboveground container undergoes a repair, alteration, reconstruction, or change in service that might affect the risk of a discharge or failure due to brittle fracture, the container will be evaluated.
- Drums or totes brought on-site are built or tested to the standard(s) established by the drum manufacturer or the drum recycler, as applicable.
- While on-site, drums and totes will be visually inspected at least monthly and ground contact will be minimized.
- Liquid level sensing devices are regularly tested once a month.
- High level alarms are tested on a monthly basis.
- The bulk storage containers are equipped with ground-level gauges and are hand-gauged at regular intervals.

8.2.2 FACILITY SELF-INSPECTIONS

Inspections, Tests and Records (Cont'd)

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valves locks and/or seals
  - Other appurtenances

- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement.

- Annually a Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

Documentation

- Records of the inspections and tests (including those maintained under usual and customary business practices), signed by the appropriate supervisor or inspector are retained on file at the Facility and/or other Corporate location for a minimum period of three (3) years.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

- The Facility is south of the city of San Francisco, approximately 1/4 mile west of the San Francisco Bay, the closest navigable water body.
- The Facility is connected by pipelines to other Company facilities in northern and central California.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Water Intakes

(b) (7)(F), (b) (3)

[redacted]

Schools

(b) (3), (b) (7)(F)

[redacted]

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Medical Facilities

No medical facilities were identified within the planning distance.

Residential Areas

Residential areas are located to the north, west and south of the Facility. These areas begin within one mile of the Facility.

Additional detail on the residential areas within the area of the Facility are included on the maps in Section 6.

Businesses

Review of GIS Data determined that the following Businesses are within the planning distance.

Businesses	Distance from Facility
Basin Industrial Park	3.00 miles North
Machinery & Equipment Co., Inc.	0.19 miles
Japan Tv News	0.23 miles
KSTS-Telemundo News	0.23 miles
KTSF Channel 26 Cable Channel 8 Chinese News	0.23 miles

The area surrounding the Facility is for the most part commercialized.

Additional detail on the general layout of businesses within the area of the Facility is included on the maps in Section 6.

Fish and Wildlife, Wetlands, and other Sensitive Environments

The area surrounding the Facility is host to a variety of species. The coastal area is home for a variety of migratory species during parts of the year. The common coastal inhabitants include shorebirds, wading birds, fish, reptiles, invertebrates, and various plants. Refer to Figure 4.1 of this Volume for threatened/endangered species.

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Review of the USF&W Wetlands Mapper and Terraserver data indicates the following wetlands are within the planning distance of the Facility:

Wetlands	Location
San Francisco Bay, Estuarine & Marine Deepwater, EM Wetland, Riverine.	(b) (7)(F), (b) (3)

During a response situation the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact the agencies will be able to:

- Identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge.
- Identify potential environmental effects on fish and wildlife, wetlands, and other sensitive environments resulting from removal actions or countermeasures.

Lakes and Streams

The following lakes and streams were identified.

Lakes and Streams	Distance from Facility
San Francisco Bay	.25 miles West *(approximate)*

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Figure 4.1 of this Volume.

Recreational Areas

Review of GIS Data determined that the following recreational areas are within the planning

Recreational Areas	Location
Candlestick State Rec Area	0.50 miles North
Oyster Point Park & Marina	2.11 miles South
Point San Bruno Park	2.50 miles South

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Transportation Routes (air, land, and water)

There are various public roadways and waterways which may be potentially effected by a discharge originating from the Facility.

Review of GIS Data determined that the following transportation routes are within the planning distance of the Facility:

Transportation Route	Distance from Facility
James Lick (101)	Adjacent to Facility
Bay Shore Highway	Adjacent to Facility
San Francisco International Airport	5.00 miles South
Piers 65 to 98	3.00 to 5.00 miles North

Utilities

No utilities were identified within the planning distance.

Other Areas of Economic Importance

San Francisco Bay is bordered by various areas of economic importance other than those previously mentioned.

Review of GIS Data determined that no terrestrially sensitive or unique environments such as wildlife refuges, management areas, or ecological reserves are within the planning distance of the Facility.

Other Areas of Economic Importance	Distance from the Facility
Sierra Point Marina	1.85 miles South
Oyster Cover Marina	1.85 miles South

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history of the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage container at the Facility.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL (Cont'd)

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Containment and recovery of any spilled material which might escape a diked area would be accomplished through the implementation of spill response activities by: (1) Facility personnel, or if necessary, (2) one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow southwest through the Facility.

Vulnerability to a Natural Disaster

The Company has historical data that defines the probability of seismic activity in the San Francisco / Northern California area; the construction of the Facility has taken the possibility of some seismic activity into consideration, the location of Tank Farms away from slide prone areas, and constructing the Facility, including all subgrade soil preparation, along with slope and tank construction in accordance with appropriate building codes and industry guidelines.

Other Factors

The actions taken to lessen hazards at the Facility petroleum tank farm reduces the probability to a low potential. Hazard reduction protective measures have been designed into tanks and into the construction of the Facility. Tanks were designed to industry standards which reduces the potential for hazards. Based on the care and construction of the tanks, the potential of any one tank rupturing and emptying product into the secondary containment is low. The potential of several tanks simultaneously rupturing is very low.

The Facility conforms to good engineering practices in the tank integrity inspection program. The inspection program reduces the likelihood of leaks. The Facility has not experienced a failure associated with a tank structure.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

Kinder Morgan maintains an online database of reportable spills available at all locations via the company's intranet. The database contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY (Cont'd)

- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

Since the Facility was acquired by Kinder Morgan Energy Partners, the Facility has experienced no reportable spills as defined by 40 CFR 110.

FIGURE 8.7

DRAINAGE DIAGRAM

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

Venting

- Venting operations do not occur at the Facility.

Piping Repair or Replacement

- These operations occur only after the piping is evacuated and made gas-free, and the piping system is isolated from tankage. The piping system is isolated by closing the block valve at the tank and installing a slip blind at the valve flange to further isolate the tank from the piping. In this manner, a serious discharge involving the tank contents is avoided. The volume of material evacuated from the pipe into the tank before commencing operations would be on the average about 375 gallons (250 feet of 6" pipe).

Valve Maintenance

- Block valves at tanks have minor packing maintenance work done while the tanks are still in service. For more involved maintenance or valve replacement, the tank is taken out of service. Valves within piping systems have minor packing maintenance work done while the piping is still in service. For more involved maintenance or valve replacement, the piping is isolated from the tank as described above, or intermediate valves are closed. A serious discharge involving the tank contents is thereby avoided. The volume of material involved in these types of operations would be similar to that for pipelines, about 375 gallons.

Transfer from Tank to Tank or Tank to Piping

- Transfers of product from tank to tank occur through steel piping systems and rubber hoses. These steel piping systems are flexible, and supported by flexible piping supports, and are thus less vulnerable to rupture during earthquakes.

Transfer from Tank/Pipe to Vessel (Vessel Loading)

- Detailed vessel transfer procedures are provided in the Facility; USCG Dock Operations Manual - An excerpt copy of vessel loading procedure No. 5.9 is provided for reference in this Plan Section 8.9.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed in the Potential Spill Sources and Container Identification table in this Section.

Tanks

- Secondary Containment volumes for all bulk storage tanks are detailed in the Potential Spill Sources and Container Identification table in this Section.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Loading Rack Containment System

- All loading racks have sufficient containment at the rack and drain directly to a central location on the eastern side of the Facility to Tank S5001.

Drainage From the Diked Areas

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment areas.

- Stormwater which does accumulate within the diked areas, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures.

- Drainage from diked storage areas is restrained by manually controlled valves.

- Dike drain valves are secured and locked in the closed position when not draining containment areas.

- Flapper-type drain valves are not used to drain diked areas.

- Stormwater from diked areas is emptied by valves and pumps that are manually activated.

- Under normal operating conditions, precipitation accumulating in the secondary containment areas in the Facility is directed by drainage trenches or ground slope to floor drains or catch basins at the low point in each containment area. When sufficient water accumulates in any catch basin, the contents are visually tested for indications of contamination. If the water appears free of contamination it is conveyed by underground piping to a collection sump, then pumped to the 50,000 gallon stormwater receiving Tank No. S5001. Water collection in Tank S5001 is formally tested to confirm that the City of Richmond Sanitary District Sewer Permit requirements have been met. Once the water is confirmed to meet Richmond Sanitary District's requirements, it is pumped through a meter to the sanitary sewer.

- The Facility pumps stormwater from Tank S5001 to the Richmond Sanitary District using a 350 GPM pump located at Tank S5001. Stormwater pumped to Tank S5001 is tested monthly, as rainfall dictates, by an independent laboratory.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Diked Areas (Cont'd)

- This system will reduce the occasions when the Facility discharges stormwater to the Santa Fe channel under their Stormwater Pollution Prevention Plan. Under this plan, the Facility will discharge stormwater to the Santa Fe Channel only in an extreme storm condition.

- If the water in Tank S5001 is found not to meet the requirements set forth by the Richmond Sanitary District Sewer Permit, the material can be removed by truck to an approved disposal site.

- Secondary Containment Area No. 1 is provided with catch basins leading to underground drain lines at the north and south ends of the area. The discharge block valve from the catch basins to the drain piping is kept closed and locked to prevent precipitation or spills from flowing uncontrolled into the Facility stormwater drainage system. Precipitation accumulating in the catch basin is visually checked to determine if oil is present. If it is, the water is treated and disposed of in an appropriate manner, if oil is not present, the block valves are opened and rainwater is permitted to drain to the Facility stormwater drainage system. After the accumulated water in the containment area has been drained, the valves are closed and locked.

- In Secondary Containment Area No. 2, precipitation collects at four catch basins located, two each, on the north and south ends of the area. These catch basins discharge through underground lines into the Facility stormwater drainage system. Each catch basin discharge is equipped with a block valve that is kept closed. Procedures for transferring rainwater to the Facility stormwater drainage system are identical to those employed for Secondary Containment Area No. 1.

- Secondary Containment Area Nos. 3, 4 and 5, located along the north perimeter of the Facility, are equipped with concrete slabs and drainage trenches. These drainage trenches empty into catch basins located in the northeast corner of Area No. 3, the southwest corner of Area No. 4, and the south side of Area No. 5. Each catch basin is fitted with discharge block valves, normally kept closed and locked, piped to stormwater collection piping. Water collected in the catch basins is visually inspected to be free of oil before the valves are opened, allowing the water to flow to the stormwater drainage system. After water has been drained from any of these three areas, the respective block valve is closed and locked. If visual inspection of the collected water in the catch basins reveals indications of oil contamination, the contents of the catch basin can be pumped to the slop tanks located in the respective areas. From the slop tanks, the contaminated water can be trucked to an approved disposal site.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Diked Areas (Cont'd)

- Secondary Containment Area No. 6 is equipped with concrete slabs and drainage trenches that direct runoff to a catch basin located on the north perimeter of the containment area. This catch basin is equipped and operated in a fashion identical to Areas 3, 4 and 5 when the collected precipitation is determined to be oil free. When the water is found by visual inspection to be contaminated, a pump transfers the water to the slop tank in Area 5 for storage and disposal.

- The southern part of the Facility, designated Secondary Containment Area No. 7, is fitted with six catch basins distributed, three each, along the northern and southern edges of the enclosure. These catch basins collect surface runoff and pipe it to underground drain lines. Closed block valves in the transfer lines prevent oily water from passing from the containment area to the stormwater drainage system. Only after precipitation within Secondary Containment Area No. 7 has been visually confirmed to be free of oil are the block valves opened to permit transfer to the stormwater drainage system. After the water has been drained, the valves are closed.

- In the northwest corner of the Facility, south of Tank S5001, is Secondary Containment Area No. 8. The drainage in Containment Area No. 8 surface drains to a closed drain valve through the concrete containment wall. The water is visually inspected and, if oil free, the valve is opened allowing the water to drain to the stormwater drainage system.

Drainage From the Undiked Areas

- Drainage from the truck loading/unloading area slab drains directly to a central location on the eastern side of the Facility to Tank S5001.

- Piping located outside the diked areas is contained by the in-plant drainage system, stormwater collection system. Surface drainage from undiked areas on the property below in to catch basins and conveyed by underground piping to a collection sump, then pumped to the 50,000 gallon stormwater receiving Tank S5001. Water collected in Tank S5001 is formally tested to confirm that the City of Richmond Sanitary District Sewer Permit requirements have been met. Once the water is confirmed to meet Richmond Sanitary District's requirements it is pumped through a meter to the sanitary sewer. The entire Facility is curbed and drains toward the east to the low area near Tank S5001.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Undiked Areas (Cont'd)

- The majority of the piping is contained within the diked areas except for the section noted on the Potential Spill Sources and Container Identification table in this Section. These areas would be contained by a curbed area.
- All undiked piping is located in areas away from vehicular traffic.
- The risk of leaks originating from piping is low since it is observed frequently enough to detect excessive corrosion, defective pipe supports, or other anomalies which could compromise the integrity of the pipe.
- In the event that a spill did originate from undiked piping, the Facility would immediately activate its Contingency Plan to mitigate the spill before leaving the property.

General Drainage

- All water to be drained, including rain water, is collected in containment basins.
- Discharge valves, for the water, are kept chained and locked in the closed position unless water is being discharged.
- Water is inspected before discharging, and then discharged only under direct supervision of Facility operators.
- A record of inspection and drainage is maintained at the Facility.

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Richmond Terminal	Seasonal	(b) (7)(F), (b) (3)	

Normal daily throughput via tank trucks and rail cars is about 507,000 gallons. This total can increase or decrease by approximately 100,000 gallons due to daily truck and rail car traffic fluctuations. These fluctuations do not affect the potential release volumes, because the same type of transfer operations is occurring, only in greater or lesser numbers. Marine transfers greatly affect the Facility's daily throughput.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Discharge Detection

The Facility has a discharge detection program which consists of a manual (personnel) detection system. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan, which details additional discharge detection measures.

Detection by Personnel

- Facility personnel conduct daily visual inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating rounds. Refer to Figures 8.5 and 8.6 for sample Tank Inspection and Secondary Containment Inspection Checklists.

- A card is required to actuate loading facilities for each product offered at rack. Valves at rack and pumps are actuated via authorized cards. The Facility is under continuous operation and always attended by responsible operators.

- The loading rack is equipped with warning and instruction signs.

Security

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION (Cont'd)

(b) (7)(F), (b) (3)

[redacted]

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Methods to Reduce Spills During Transfer and Storage Operations

Standard Procedure for Transfers

Pre-Transfer Checklists

The Declaration of Inspection Checklist and Standard Operating Procedures (SOP) describe transfer procedures, verification of storage levels and volumes, inspection of valves, hoses, piping, pumps, and other key transfer components; to be carried out by operations personnel.

Standard Hook-up, Start-up, Shutdown Procedures

The necessary procedures for hook-up, start-up, and shutdown of marine transfers are described in the facility's SOP.

Level of Reduced Loading Rates at the Beginning and End of a Transfer

The facility's SOP require that the initial transfer into any empty storage tank be conducted at a reduced flow rate until the inlet nozzle is submerged, in order to prevent static charge build-up. Flow rate at the end of a transfer is generally not reduced. This is because the tanks have a large enough volume and the flow rate is low enough that stopping the transfer within 1/8" of the specified level can be achieved without flow rate reduction.

Communications Procedures

Two-way radios are provided to assure clear communications. The facility's SOP specify that all communication are in English.

Protection Measures Within the Facility Subject to Flooding

The Facility retains all stormwater on-site. All stormwater is stored and tested prior to release to the Richmond Industrial Sewer Plant. The possibility of a flood occurring at the same time as a pipeline rupture, and the spilled material being carried to marine waters is very remote.

POTENTIAL SPILL SOURCES AND CONTAINER IDENTIFICATION

SI Number	Substance Stored	Quantity Stored (Gallons)	Maximum Capacity (Gallons)	Surface Area	Year Built	Failure / Cause *(Record cause and date of any SI failure which has resulted in the loss of SI contents)*
		There are no Surface Impoundments				

8.2.2 FACILITY SELF-INSPECTIONS

- Facility personnel conduct monthly inspection of tank gauges and cathodic protection readings. Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating rounds in accordance with the SPCC Plan.

- Annual Secondary Containment Inspections are part of the SPCC Plan.

- Tank Inspections are part of the SPCC Plan.

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valves locks and/or seals
  - Other appurtenances

- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement.

- Annually a Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

8.2.2 FACILITY SELF-INSPECTIONS (Cont'd)

Marine Piping

- All marine pipelines and hoses are pressure tested per USCG regulations from the first valve inside the dike walls to the manifold valve on the dock. Pipelines and tanks are carefully visually examined at least once during transfer operations. All tanks and pipelines are also visually examined quarterly for leaks, external corrosion, improper support, etc. Marine pipelines are pressure tested to 1 ½ times the maximum allowable working pressure (225 psi) annually. Following the pipeline pressurization, all welds, flanges, etc. are inspected for leakage, and the pressure gauge is monitored for pressure loss.

- All marine dock hoses are pressure tested annually in accordance with USCG requirements.

- All marine dock hoses under CSLC jurisdiction are tested every three (3) years per CSLC regulations.

8.2.3 VULNERABILITY ANALYSIS

The Facility is located in an industrial area. The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge. The following sensitivities were identified by utilizing the EPA Planning Distance calculation and researching the location of these downstream sensitivities.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Water Intakes

(b) (7)(F), (b) (3)

[redacted]

(b) (3), (b) (7)(F)

[redacted]

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Residential Areas

Point Richmond is the closest residential area to the Facility. It is located about 1 mile northwest of the Facility. At this distance, none of the materials stored, in the Worst Case Discharge Scenario, would affect this area.

Businesses

The Facility is located in an area of heavy maritime-related industries. It is bounded to the north by National Gypsum, to the south by the Conoco/Phillips Terminal, to the east by the Santa Fe Channel, and to the west by Canal Boulevard. An office complex is located about 3 blocks from the Facility on the west side of Canal Boulevard.

In the event of a combustible material spill, the adjacent National Gypsum, B.P. (Arco) L.A. Chemical and Conoco/Phillips facilities would be immediately notified and cautioned to shut down any ignition sources until the spill was cleaned up and the danger of the fire or explosion ended.

The effects on businesses due to a spill in the Santa Fe and/or Harbor Channels will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

The Facility is located in an area of heavy maritime-related industries. It is bounded by:

Businesses	Distance from Facility
National Gypsum – North	Less than one mile
Conoco/Phillips Terminal – South	Less than one mile
Santa Fe Channel – East	Less than one mile
Canal Boulevard – West	Less than one mile
An office complex	Less than one mile
Moeser Lane Shopping Center	3.3 miles east
El Cerrito Plaza Shopping Center	3.5 miles east

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Fish and Wildlife, Wetlands, and other Sensitive Environments

The Company is using the Regional ACP as well as the NOAA Environmental Sensitivity Study for the San Francisco Bay Region, prepared by Research Planning Institute, Inc., Columbia, South Carolina, 1986, as a reference in determining the locations of wetlands, environmentally sensitive areas, fish and wildlife, and endangered flora and fauna. Refer to Figure 4.1 of this volume for threatened/endangered species.

The Company believes that the arrangements for contracts with oil spill removal organizations made under the USCG OPA 90 Spill Contingency Plan will enable it to contain the largest spill within the narrow Santa Fe and Harbor Channels, thus minimizing the spread of oily types of materials. The Company's strategy after containing the spill within the narrow channels is to corral the spill and keep it away from the channel banks, further minimizing the environmental impact to the area. Referencing the NOAA Study, no biological resources or endangered species exist in the Santa Fe and Harbor Channel areas. There are no wetlands shown in the region of these channels. Shoreline types 5 and 8 are found in this region. These shorelines may provide habitat for barnacles, mussels, limpets, and encrusting organisms. These organisms could be impacted by oil which reached these shorelines.

A review of tank capacities and secondary containment volumes listed in this Plan shows that adequate secondary containment exists for all areas of the Facility. Therefore, no spilled material should reach the Santa Fe Harbor Channels under any of the plan's spill scenarios. In addition, the Facility employs the following strategies in preventing spills from reaching the water:

- Chemical storage tanks close to the water are provided with reserve secondary containment volume, as can be seen for secondary containment areas 1 and 2.

- Chemical storage tanks are generally located as far from the water as possible to take advantage of area grading within the entire Facility as reserve secondary containment.

- The Facility's grading directs flow away from the Santa Fe and Harbor Channels. An asphalt concrete berm exists at the eastern Facility perimeter as a further barrier to spills reaching these waterways.

Review of the USF&W Wetlands Mapper and Terraserver data indicates the following wetlands are within the planning distance of the Facility:

Wetlands	Latitude/Longitude
Brooks Island, Estuarine Marine	(b) (7)(F), (b) (3)
Pt. Isabel, Estuarine Marine	

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Lakes and Streams

Review of GIS Data determined that the following lakes and streams are within the planning distance of the Facility:

Lakes and Streams	Location
San Francisco Bay	0.0 miles south

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Figure 4.1 of this Volume.

Recreational Areas

Review of GIS Data determined that the following recreational areas are within the planning

Recreational Areas	Location
Friendship Park	1.4 miles W *(approximate)*
Albany Hill Park	3.6 miles SW *(approximate)*
Washington Park	4.1 miles NW *(approximate)*
Berkley Aquatic Pond	6.0 miles SW *(approximate)*

Additional details on the Recreation Areas within the planning distance may be found on the Area Map, Figure 8.2.

Transportation Routes (air, land, and water)

Review of GIS Data determined that the following transportation routes are within the planning distance of the Facility:

Transportation Routes	Location
Canal Blvd.	0.05 miles W *(approximate)*
W. Cutting Blvd.	0.47 miles N *(approximate)*
I-580	0.52 miles NE *(approximate)*
Richmond Inner Harbor, Santa Fe and Harbor Channels	0.0 miles E *(approximate)*

There is no air traffic or air traffic services in the vicinity of the Facility that could be impacted by a spill.

Canal Boulevard is the only surface road in the vicinity of the Facility. It is about three (3) feet higher in elevation than the general elevation of the Facility and is thus not vulnerable to closure in the event of a Worst Case Discharge.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

The Santa Fe and Harbor Channels have tanker, barge, bulk carrier, and vehicle transport ship traffic which serves the various terminals and facilities along these channels. A spill in the Harbor or Santa Fe Channels, and the subsequent containment an/or the water cleanup operations would adversely impact vessel traffic on these navigation channels.

Utilities

No utilities were identified within the planning distance.

Other Areas of Economic Importance

Review of GIS Data determined that no terrestrially sensitive or unique environments such as wildlife refuges, management areas, or ecological reserves are within the planning distance of the Facility.

The Santa Fe and Harbor Channels areas do not contain terrestrially sensitive or unique environments such as wildlife refuges, management areas, or ecological reserves. Aquatic environments that are vulnerable to a spill are discussed in the "Wetlands" part of this Section.

Other Areas of Economic Importance	Distance from the Facility
Brooks Island Regional Park	Less than one mile
Santa Fe Channel marinas and a boat ramp	Less than one mile
Richmond Inner Harbor basin Marina	Less than one mile
Richmond Reserve Shipyard	1.0 south
Channel Marina	1.2 miles north
Bayview Branch Richmond Pub Library	2.3 miles north
Richmond Pier	2.6 miles southwest
Municipal Pier	2.6 miles southwest
Brickyard Cove Marina	2.9 miles west
Nobel Station (historical)	3.7 miles east
Highland Station (historical)	3.7 miles east
Golden State Model Railroad Museum	4.0 miles northwest
Golden Gate Fields	3.8 miles southeast
Corbin Station (historical)	4.0 miles southeast
Point Richmond Historical Society Museum	4.0 miles northwest
Jacobs Landing	4.5 miles southeast
Delaware Street Station (historical)	4.6 miles southeast
Long Wharf	5.0 miles northwest
Berkley Marina	5.0 miles southeast

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Plan for details concerning spill history of the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Plan for the year of construction of each of the bulk storage containers at the Facility.

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Containment and recovery of any spilled material which might escape a diked area would be accomplished through the implementation of spill response activities by: (1) Facility personnel, or if necessary, (2) one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow southwest through the Facility.

Vulnerability to a Natural Disaster

All storage tanks and ancillary piping are fabricated in compliance with rigorous nationally recognized design specifications. The specifications include wind-load allowances and recognition of any applicable seismic considerations. These factors minimize the risk of vulnerability to natural disasters.

In addition to the above referenced factors, it should also be noted that Facility inspection and response drills, as well as Standard Operating Procedures (SOPs) for loading operations and the like, contribute to minimization of spill potential at the Facility.

Other Factors

The area in which the Facility is located is prone to earthquakes.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

Kinder Morgan maintains an online database of reportable spills available at all locations via the company's intranet. The database contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

Since the Facility was acquired by Kinder Morgan Energy Partners, the Facility has experienced no reportable spills as defined by 40 CFR 110.

Date of Discharge	Location of Discharge	Cause of Discharge	Product Discharged	Amount Discharged	NRC Incident Report #
10/17/89	Richmond Terminal	Earthquake	Unknown	(b) (7)(F), (b) (3)	Not Available
11/29/98	Water Richmond Canal	Backpressure on pipe on ship causing overflow	Paraffin		465638
11/09/99	Water Harbor channel	Line overpressured on ship	Coconut Oil		505252

NOTE: The table above is provided for the purposes of historical documentation and reporting. In 1989, under the former owner, the facility experienced an earthquake that resulted in a spill of approximately 500 gallons that left the property. In addition, two incidents involving vessels alongside occurred in 1998 and 1999. Each involved discharges involving minimal amounts of product during additional vessel operations that did not pertain to the actual Kinder Morgan transfer.

FIGURE 8.7

DRAINAGE DIAGRAM

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed in the Potential Spill Sources and Container Identification table in this Section.

The tank farms are protected with surrounding sealed earthen berms designed to withstand pressure from freestanding product and which is sufficiently impervious to spilled oil. The floors of the tanks have impervious linings. The berm is constructed to withstand a moderate earthquake without breaching the integrity of the secondary containment.

Tanks

- Secondary Containment volumes for all bulk storage tanks are listed in the Potential Spill Sources and Container Identification table in this Section.

Loading Rack Containment System

The loading/unloading rack area is designed and operated as follows:

- Loading/Unloading area drainage flows into a catchment basin or treatment facility designed to handle discharges.
- The containment system is designed to hold the maximum capacity of any single compartment of a single tank truck loaded or unloaded at the Facility.
- A quick drainage system is not used for tank truck loading/unloading.
- Drainage from the loading rack loading and unloading facilities is contained in a depressed area (with curbs). Drainage is through area drains to a sump. The product is then pumped to the oil/water separator and to the product interface tank. Periodically, the interface tank is pumped down and trucked off for processing. The water phase is drained to an oily water sewer. Water is pumped to two (2) 800 lbs. carbon columns before release to the municipal sewer system.
- Drainage from the additive unloading area gravity flows to the oily water separator.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Drainage From the Diked Areas

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment area.

- Stormwater which accumulates within the diked area, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures.

- Drainage from diked storage areas is restrained by manually controlled valves.

- Dike drain valves are secured in the closed position when not draining containment areas.

- Flapper-type drain valves are not used to drain diked areas.

- Stormwater from diked areas is emptied by gravity.

- Oil is removed from the containment area by pumping the contents to a proper holding vessel to be recovered or properly disposed. When the containment area requires draining due to accumulation of stormwater, the containment area is examined by the Area Manager or designee for any indications of oil contamination (e.g., oil sheen) to ensure any discharge from the Facility will be in compliance with applicable water quality standards and will not cause a harmful discharge as defined in 40 CFR, Part 110. Drainage is completed by manually opening the drain valves, or pumped from the containment area. Forms for recording the drainage of the secondary containment area are included as the Rainwater Inspection and Drainage Report. Adequate records of such events must be kept whenever the secondary containment area is drained.

Drainage From the Undiked Areas

Drainage from undiked areas is controlled as follows:

- Piping located outside the diked areas is contained by the confines of Loading Racks #4W, 7W, and 6W in addition to the in-plant drainage and stormwater collection systems.

- Piping located outside the diked areas is contained by the in-plant drainage system, stormwater collection system, and loading rack containment area.

- The majority of the piping is contained within the diked areas except for the sections noted on the Potential Spill Sources and Container Identification table in this Section. These areas would contained by a depressed area in an open field, natural topography or a curbed area.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

***Secondary Containment Volumes* (Cont'd)**

Drainage From the Undiked Areas (Cont'd)

- All undiked piping is located in areas away from vehicular traffic.
- The risk of leaks originating from piping is low since it is observed frequently enough to detect excessive corrosion, defective pipe supports, or other anomalies which could compromise the integrity of the pipe.
- In the event that a spill did originate from undiked piping, the Facility would immediately activate its Contingency Plan to mitigate the spill before leaving the property.

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is as follows:

- Stormwater is drained from the secondary containment areas.
- When the containment area requires draining due to accumulation of stormwater, the containment area is examined by the Area Manager or designee for any indications of oil contamination (e.g., oil sheen) to ensure any discharge from the Facility will be in compliance with applicable water quality standards and will not cause a harmful discharge as defined in 40 CFR, Part 110. Drainage is completed by manually opening the drain valves, or pumped from the containment area. Forms for recording the drainage of the secondary containment area are included as the Rainwater Inspection and Drainage Report. Adequate records of such events must be kept whenever the secondary containment area is drained.
- Water is visually inspected for product and discharged only if no product sheen is visible.
- Facility drainage flows directly into an open watercourse.
- When draining the containment area, water is discharged to a drainage ditch which drains 1 mile to the Guadalupe River.
- The Facility has a wastewater treatment system and treats water prior to discharge off site. Wastewater that emanates from tank water draws, loading and additive containment areas are processed through this system of carbon filter beds prior to discharge.
- All other uncontaminated rainwater is inspected to ensure compliance with applicable water quality standards and will not cause a harmful discharge as defined in 40 CFR 110.
- Adequate records are kept of such drainage events.
- Records of drainage events are maintained at the Facility.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
San Jose Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading rack has sufficient capability to handle any potential increase in transfer capacity. The loading rack operates 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the following Spill Prevention, Control, and Countermeasure (SPCC) Plan, which details additional discharge measures.

Automated Detection Systems

(b) (3), (b) (7)(F)

Detection by Personnel

- Facility personnel conduct monthly inspection of tank gauges and cathodic protection readings. Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds.

Security

(b) (7)(F), (b) (3)

8.2.2 FACILITY SELF-INSPECTIONS

Detection by Personnel

- Facility personnel conduct monthly inspection of tank gauges and cathodic protection readings. Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds.
- Annual Secondary Containment Inspections are part of the SPCC Plan.
- Tank Inspections are part of the SPCC Plan.

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:
  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valves locks and/or seals
  - Other appurtenances
- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.
- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.
- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement
- Annually a Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

- The Facility is located in central San Jose, approximately 4 miles east of the Guadalupe River, the closest navigable water body. Coyote Creek is located approximately 50 yards to the east of the Facility.

- The Facility is connected by pipelines to other Company facilities in northern and central California.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Water Intakes

(b) (7)(F), (b) (3)

[redacted]

(b) (3), (b) (7)(F)

Medical Facilities

No medical facilities were identified within the planning distance.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Residential Areas

Residential areas are located in all directions from the Facility. These areas begin within one mile of the Facility and continue outward in all directions.

Additional details on the residential areas within the area of the Facility are included on the maps in Section 6.

Businesses

The area surrounding the Facility is for the most part commercialized. Along Coyote Creek there are various businesses and commercial establishments which may be potentially impacted by a discharge.

Review of GIS Data determined that the following businesses are within the planning distance of the Facility:

Businesses	Distance from Facility
Professional Plastics	0.01 miles *(approximate)*
North American Van Line Agency	0.06 miles *(approximate)*
Western States Oil Company	0.06 miles *(approximate)*
Stone Systems	0.09 miles *(approximate)*
Iron Systems, Inc.	0.10 miles *(approximate)*

Additional detail on the general layout of businesses within the area of the Facility is included on the maps in Section 6.

Fish and Wildlife, Wetlands, and other Sensitive Environments

The area surrounding the Facility is host to a variety of species. The Company is using the Regional ACP as well as the NOAA Environmental Sensitivity Study for the San Francisco Bay Region, prepared by Research Planning Institute, Inc., Columbia, South Carolina, 1986, as a reference in determining the locations of wetlands, environmentally sensitive areas, fish and wildlife, and endangered flora and fauna. Refer to Figure 4.1 of this Volume for threatened/endangered species.

Review of the USF&W Wetlands Mapper and Terraserver data indicates the following wetlands are within the planning distance of the Facility:

Wetlands	Latitude/Longitude
Coyote Creek, Freshwater Forested and Shrub Wetland	(b) (7)(F), (b) (3)

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

During a response situation the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact the agencies will be able to:

- Identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge.
- Identify potential environmental effects on fish and wildlife, wetlands, and other sensitive environments resulting from removal actions or countermeasures.

Lakes and Streams

Review of GIS Data determined that the following lakes and streams are within the planning distance of the Facility:

Lakes and Streams	Location
Coyote Creek	0.20 miles W *(approximate)*
Guadalupe River	4 miles W *(approximate)*

Additional details on the lakes, streams, and rivers within the planning distance are identified on the maps in Section 6.

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Figure 4.1 of this Volume.

Recreational Areas

Review of GIS Data determined that the following recreational areas are within the planning

Recreational Areas	Location
San Veron Park	0.10 miles N *(approximate)*

Additional details on the recreation areas within the planning distance may be found on the Area Map, Figure 8.2.

Transportation Routes (air, land, and water)

No transportation routes were identified within the planning distance.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Utilities

No utilities were identified within the planning distance.

Other Areas of Economic Importance

The San Francisco Bay, Coyote Creek and connecting waterways are bordered by various areas of economic importance other than those previously mentioned.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history of the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Containment and recovery of any spilled material which might escape a diked area would be accomplished through the implementation of spill response activities by: (1) Facility personnel, or if necessary, (2) one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow west and northwest through the Facility.

Earthquake

The Facility is located in a semi-active earthquake zone with occasional seismic activity. The Company has historical data that defines the probability of seismic activity in the San Francisco / Northern California area. The construction of the Facility has taken the possibility of some seismic activity into consideration; the location of Tank Farms away from slide prone areas and constructing the Facility, including all subgrade soil preparation, along with slope and tank construction in accordance with appropriate building codes and industry guidelines.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL (Cont'd)

Other Factors

The actions taken to lessen hazards at Facility petroleum tank farm reduce the probability to a low potential. Hazard reduction protective measures have been designed into tanks and into the construction of the Facility. Tanks were designed to industry standards which reduces the potential for hazards. Based on the care and construction of the tanks, the potential of any one tank rupturing and emptying product into the secondary containment is low. The potential of several tanks simultaneously rupturing is very low.

The Facility conforms to good engineering practices in the tank integrity inspection program. The inspection program reduces the likelihood of leaks. The Facility has not experienced a failure associated with a tank structure.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

The Facility maintains a separate Oil Spill History file in the Facility office. The Facility's file contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

Since the Facility was acquired by Kinder Morgan Energy Partners, the Facility has experienced no reportable spills as defined by 40 CFR 110.

FIGURE 8.7
FACILITY DRAINAGE DIAGRAM

(b) (7)(F), (b) (3)

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. - Brisbane Terminal is classified as an EPA jurisdictional "Non-Transportation Related Onshore Facility" which operates in a Higher Volume Port Area.

The EPA discharge volume calculations are described as follows:

EPA Discharge Volume Calculation
● **Worst Case Discharge** *100% of the largest single tank* **WCD** = (b) (7)(F),
● **Medium Discharge** *Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD* **MD** = 857 bbls
● **Small Discharge** *Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD* **SD** = 50 bbls

8.3 DISCHARGE SCENARIOS (Cont'd)

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack or from leaking piping.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the loading rack can be diverted to the in line oil/water separator.

The closest waterway is the San Francisco Bay, which is east of the Facility. The storage tanks and truck loading racks, have adequate secondary containment so it is unlikely that a spill would reach the bay or travel very far if it did. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, as appropriate, include:

- 1,000' of containment boom and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a *Small Discharge* or greater which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a Small Discharge with the manpower and local contract resources as detailed in Section 2 and 3 of Volume 2.

- A 50 bbls discharge typically will not escape the containment of the Facility.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Offsite Impact

- The closest waterway is the San Francisco Bay, which is east of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the bay. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be implemented at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.
- Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before a spill containment could begin. The spilled material would more than likely be routed to the separator system. If a spill of this size escaped the property it could possibly enter the San Francisco Bay. Adverse weather conditions would increase the chances of a discharge entering the river; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages can be referenced in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a medium discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

The closest waterway is the San Francisco Bay so the potential for a spill of this size reaching navigable water does exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 Bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the *Medium Discharge* volume that are capable of arriving on scene within 6 hours.
- Sufficient quantity of containment boom must arrive within 6 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 6 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 6 hours; Tier 2 = 30 hours; Tier 3 = 54 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 6 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage facilities.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the river.
- Recovery of large spills from diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed (b) (7)(F), (b) (3)

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached).

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages can be located in the Potential Spill Sources and Container Identification table in Section 8.2.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow east and enter the San Francisco Bay which is located east of the property.

For a spill that is confined to the land along the pathway, Facility personnel would have at least two (2) options by which to contain the spill:

- Dams
- Trenches

Ditch Containment

A spill may be contained in storm water ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located west of the San Francisco Bay. The priority during larger spills is to prevent oil from reaching the waterway. OSROs are under contract with the Facility. The Company, however, will use Facility personnel and Facility owned equipment to initiate response actions within one hour. Several recreating areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by state and Federal trustees would likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Response Requirement (Cont'd)

- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage facilities.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. – Richmond Facility is classified as a "Complex Facility" which operates in a High Volume Port Area.

"Complex" means a facility possessing a combination of transportation-related and non-transportation-related components that is subject to the jurisdiction of more than one Federal agency under section 311(j) of the Clean Water Act (CWA).

Complexes must perform discharge calculations for each jurisdictional agency and plan for the largest Worst Case Discharge Volume pursuant to the respective regulations. The agency discharge volume calculations are described as follows:

EPA Discharge Volume Calculation

- **Worst Case Discharge**
  100% of the largest single tank

  WCD = (b) (7)(F),

- **Medium Discharge**
  Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD

  MD = 857 bbls

- **Small Discharge**
  Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD

  SD = 50 bbls

USCG Discharge Volume Calculation

(b) (7)(F), (b) (3)

8.3 DISCHARGE SCENARIOS (Cont'd)

OSPR Discharge Volume Calculation
● **Reasonable Worse Case Spill (RWCS)** *The portion of the total linefill capacity which could be lost during a spill, taking into account the availability and location of the emergency shut-off controls; plus the amount of additional spillage that could reasonably be expected to enter California marine waters during emergency shut-off, transfer or pumping operations if a hose or pipeline ruptures or becomes disconnected, or if some other incident occurs which could cause or increase the size of an oil spill.* *Total Linefill Capacity + Additional Spillage (during Shut Down) = RWCS.*

Discharge Volume Calculations from Marine Operations
USCG Worst Case Discharge (WCD) **OSPR Reasonable Worst Case Spill (RWCS)**
(b) (7)(F), (b) (3)
Maximum Most Probable Discharge Calculations (MMPD)
(b) (7)(F), (b) (3)

Note: The quantity associated with "the loss of the entire capacity of all in-line, break-out and portable storage tank(s)…" is excluded from the RWCS volume calculation since these tanks are under SPCC jurisdiction (i.e., tanks are subject to Chapter 6.67 or Chapter 6.7 of Div. 20, CA health and Safety Code and thus, exempt from this calculation.)

8.3 DISCHARGE SCENARIOS (Cont'd)

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small/Average Most Probable, Medium/Maximum Most Probable, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Vessel loading/unloading operations
- Failure of manifold, mechanical loading arm, other transfer equipment, or hoses
- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1 and Section 2 of Volume 2.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small/Average Most Probable Discharge = 50 bbls

A small/average most probable discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Hose rupture
- Valve leak
- Container rupture
- Storage spill.

The most likely location for a discharge of this size would be at the loading rack.

The most likely spill that could occur with product transfers to and from tank trucks and rail cars is overfilling the truck or rail car compartment. The typical pumping rate for these operations is 350 GPM/hr. It would take about ½ minute to detect and shut down the pumping; thus about 175 gallons would be spilled in this event.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product. All truck loading is done by truck drivers or Company operators who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the Facility could be diverted to the product tanks that are not at maximum capacity.

The closest waterway is the Richmond Inner Harbor Channel which is east of the Facility. The storage tanks, truck and rail loading racks, have adequate secondary containment so it is unlikely that a spill would reach the water. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

Conoco/Phillips would provide the immediate response to a spill at their dock.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small/Average Most Probable Discharge = 50 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small/Average Most Probable Discharge. The response resources shall include:

- 1,000' of containment boom (or two times the length of the largest vessel that regularly conducts oil transfers to or from the facility, whichever is greater) and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a *Small/Average Most Probable Discharge* or greater which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a *Small/Average Most Probable Discharge* with the manpower and local contract resources as detailed in Section 2 and 3 of Volume 2.

- A 50 bbls discharge typically will not escape the containment of the Facility.
- Spills at tank truck loading areas LR 1, 2, 3, 5, 6, 8 through 11 will be directed to low point catchbasins. Spills, at tank truck loading areas LR 7, 12, and 13 will be directed to local grading catchbasins which connect to the stormwater collection systems. Spills at the eastern end of the railcar loading areas will be directed to catchbasins, which connect to the stormwater collection system. Spills at the western end of the railcar loading areas, where there are galvanized steel pans will be directed to secondary containment area 5.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack.

Offsite Impact

- The closest waterway is the Richmond Inner Harbor Channel, which is east of the Facility. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be implemented at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.
- Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small/Average Most Probable Discharge = 50 bbls (Cont'd)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, ICP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium/Maximum Most Probable Discharge = 857 bbls

A medium/maximum most probable discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Because of containment and the drainage system located throughout the Facility, it is very unlikely that the discharge would leave Facility property or reach a navigable waterway before spill containment could begin. The spilled material would more than likely collect in the containment area and Facility drainage systems. If a spill of this size escaped the property it could possibly enter the Richmond Inner Harbor Channel. Adverse weather conditions would increase the chances of a discharge entering the bay; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for unloading/loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages can be referenced in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a medium/maximum most probable discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility (as necessary) and initiate "immediate response actions".

The closest waterway is the Richmond Inner Harbor Channel so the potential for a spill of this size reaching navigable water does exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium/Maximum Most Probable Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium/Maximum Most Probable Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the *Medium/Maximum Most Probable Discharge* volume that are capable of arriving on scene within 6 hours.
- Sufficient quantity of containment boom must arrive within 6 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium/Maximum Most Probable Discharge* with a similar response to the Small/Average Most Probable Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 6 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 6 hours; Tier 2 = 30 hours; Tier 3 = 54 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium/Maximum Most Probable Discharge volume) secured from the OSRO(s) will be on scene within 6 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage facilities.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the Richmond Inner Harbor Channel.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, ICP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed (b) (7)(F), (b) (3)).

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spill
- Pipeline manifold rupture.

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached).

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). This Facility opened in 1973 and about 60% of the Facility has been built in expansions since 1987. In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tanks ages can be located in the Potential Spill Sources and Container Identification table in Section 8.2.

Worst Case Discharge and Adverse Weather

Calculation of the planning distance for a WCD is provided at the end of this Section.

Severe rain events and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow east and enter the Richmond Inner Harbor Channel which is located east of the property.

For a spill that is confined to the land along the pathway, Facility personnel would have at least two (2) options by which to contain the spill:

- Dams
- Trenches

Ditch Containment

A spill may be contained in storm water ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located east of the San Francisco Bay, which flows to the Pacific Ocean. The priority during larger spills is to prevent oil from reaching the waterway. Oil spill response organizations (OSROs) are under contract with the Facility. The Company, however, will use Facility personnel and Facility owned equipment to initiate response actions within one hour. There are several locations along the Richmond Inner Harbor Channel that could be used as strategic booming points. Recreation areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by state and Federal trustees would likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Response Requirement (Cont'd)

- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small/Average Most Probable or Medium/Maximum Most Probable Discharge. Facility Management will initiate "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage facilities.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, ICP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

Boom Deployment Strategies (Dock Spill Scenario)

- Deploy the two 1,000-foot lengths of boom located on the dock to contain the spilled product.
- Direction of current and wind will determine which sea curtain will be deployed and anchored first; deploy the second boom to encircle the balance of the spill.

  In the event of a large spill, containment within the Harbor Channel is of prime importance. One or more booms need to be extended across the channel to prevent further spreading of the product. Clean Bay must be contacted to provide additional boom if needed to extend across the channel.
- Due to the relatively small size of the channel, the collection point for the recovered oil would be within the boomed area of the channel. Contracted personnel will perform the cleanup operations.
- OSROs will be contacted for spills, which exceed the capabilities of onsite equipment and/or staff. OSROs will respond and report to the Incident Commander for instructions.

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. – San Jose Terminal is an EPA jurisdictional "Non-Transportation Related Onshore Facility" which operates in a Non-Higher Volume Port Area.

The EPA discharge volume calculations are described as follows:

EPA Discharge Volume Calculation

- **Worst Case Discharge**
  100% of the largest single tank

  WCD = [redacted]

- **Medium Discharge**
  Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD

  MD = 857 bbls

- **Small Discharge**
  Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD

  SD = 50 bbls

8.3 DISCHARGE SCENARIOS (Cont'd)

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack, or leaking piping.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the Facility could be diverted to the product tanks that are not at maximum capacity.

The closest waterway is Coyote Creek, which is east of the Facility. The storage tanks and truck loading racks have adequate secondary containment so it is unlikely that a spill would reach the creek or travel very far if it did. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, as appropriate, include:

- 1,000' of containment boom and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a *Small Discharge* or greater which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a *Small Discharge* with the manpower and local contract resources as detailed in Section 2 and 3 of Volume 2.

- A 50 bbls discharge typically will not escape the containment of the Facility.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Offsite Impact

- The closest waterway is Coyote Creek, which is east of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the creek. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be implemented at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)
Offsite Impact (Cont'd)
● Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.
Notes:
● Equipment and manpower resources are detailed in Section 3 of Volume 2.
● Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
● Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before a spill containment could begin. The spilled material would more than likely collect in the containment area sump system and be routed to the separator system. If a spill of this size escaped the property it could possibly enter Coyote Creek. Adverse weather conditions would increase the chances of a discharge entering the creek; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages can be referenced in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a medium discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

The closest waterway is Coyote Creek so the potential for a spill of this size reaching navigable water does exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the *Medium Discharge* volume that are capable of arriving on scene within 6 hours.
- Sufficient quantity of containment boom must arrive within 6 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 6 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 6 hours; Tier 2 = 30 hours; Tier 3 = 54 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 6 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage facilities.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the creek.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed [redacted]

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached).

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages can be located in the Potential Spill Source and container Identification table in Section 8.2.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow south and enter Coyote Creek which is located south of the property.

For a spill that is confined to the land along the pathway, Facility personnel would have at least two (2) options by which to contain the spill:

- Dams
- Trenches

Ditch Containment

A spill may be contained in stormwater ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located west of Coyote Creek. The priority during larger spills is to prevent oil from reaching the waterway. OSROs are under contract with the Facility. The Company, however, will use Facility personnel and Facility owned equipment to initiate response actions within one hour. Several recreating areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by state and Federal trustees would likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Response Requirement (Cont'd)

- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage facilities.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which utilizes the Incident Command and Unified Command Systems.

1. <u>(First Responder until Company Personnel (IC) assumes control)</u>

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location:950 Tunnel Avenue
Brisbane, CA 94005
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility and Southern Pacific Railroad, if applicable.
h. Staging area for Emergency Command Post will be at the entrance to the Facility or where Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. <u>Assembly Area</u>

a. **Primary Assembly Area** - All employees will report to the Control Building. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel (IC) will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the secondary emergency response command center #1 or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. <u>Location of Shelter at the Facility</u>

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility office buildings.

8.4 FACILITY EVACUATION (Cont'd)

4. Community Evacuation

The Company has confirmed with the Brisbane Fire Department that no Community Evacuation Plan currently exists for this area. However, the Fire Department does have standard guidelines that are followed in the event of an evacuation.

5. Directions to Kaiser Permanente Emergency Medical Center

Start out going south on Tunnel Ave. toward Lagoon Way. Turn left onto Sierra Point Parkway after approximately half a mile, then merge onto US-101 South toward San Francisco. After 2.7 miles take the Grand Ave./Downtown exit, then turn left onto Airport Blvd. The hospital is located at 1200 El Camino Real.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the two main gates located off of Tunnel Avenue.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

8. Prevailing Winds

The prevailing winds in the Facility area generally come from the northwest at an average speed of 5 to ten (5-10) mph.

FIGURE 8.8

EVACUATION DIAGRAM

(b) (7)(F), (b) (3)

FIGURE 8.9

TACTICAL PLAN

The following Tactical Plan has been provided to assist initial response to a spill incident from this Facility. The plan includes the following:

- Driving directions
- General pictures of the site and tactical response strategy
- General response equipment and personnel recommendations

Note: This Tactical Plan is provided as a general guidance tool for response to an incident emanating from this Facility. The selection of response strategy equipment, manpower and deployment site may vary based on actual field conditions (e.g. terrain, weather conditions, product type/volume) and incident details.

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). Local law enforcement will coordinate community evacuation activities, if necessary, and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which utilizes the Incident Command and Unified Command System.

An evacuation will be initiated under the following circumstances:

- In case of fire. When there is a fire, activation of the fire alarm alerts personnel to evacuate.
- Whenever the Incident Commander or other person acting in good judgment considers evacuation as a means of protecting personnel. This could occur following an earthquake, spill, bomb threat, or other emergency situation.

An evacuation will be signaled by the fire alarm, announcements over the public address system, walkie-talkie, radio, or other means. During evacuation:

- Be aware of potential hazards along the evacuation route, such as downed power lines, ruptured gas lines, vapor clouds, and other barriers.
- Monitor wind direction by looking at flags, or other means.
- Move upwind of the emergency to prevent potential exposure to releases of vapors, gases, or particulates. If it is not possible to move upwind, move at a 90-degree angle from the emergency.

1. First Responder until Emergency Director assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 1140 Canal Boulevard
Richmond, CA 94804
c. Activate the Facility's employee emergency alarm system (siren). (Notifications and announcements to be made to personnel via 2-way radio.)
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility.
h. Establish a Command Center immediately.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

8.4 FACILITY EVACUATION (Cont'd)

2. Non-essential Personnel

a. Proceed to assembly area, evacuate area of assigned workplace in orderly fashion.
b. Account for all personnel, including contractors.
c. Notify Command Center of all missing personnel and last known location.

3. Assist Physically Handicapped

Locate physically handicapped and assist out of Facility.

4. **First Aid Members**

Organize to handle emergencies/injuries. Under no circumstances shall any Company personnel re-enter an evacuated area unless authorized.

5. Assembly Area

a. **Primary Assembly Area** - All employees will report to the designated muster area. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel (IC) will conduct a head count of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves between the incident and the primary assembly area should proceed to the main office or other safe area upwind of the incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

6. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility Main Office, Control Building, or the north or south staging area.

7. Community Evacuation

Local Law Enforcement provides the means to warn the public of the need to evacuate. The current procedure for informing the public when there is a need to do so is by door-to-door notification, use of electronic media by direct contact to radio and television stations, or the employment of the Emergency Broadcast System (EBS). The local authorities will initiate and coordinate all efforts concerning the evacuation of the community.

8. Directions to Alta Bates Hospital

Turn right onto Canal Boulevard towards I-580/Oakland. Take the onramp South. Continue South on I-80 (I-580). Turn off onto Ramp towards CA-13/Ashby Avenue. Merge onto SR-13 (Ashby Ave.) East. Arrive 3001 Colby Street, Berkeley, CA 94705

9. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gate. If the situation permits, the Facility may also be accessed through the adjacent Conoco/Phillips Terminal.

8.4 FACILITY EVACUATION (Cont'd)

10. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled hazardous materials, and inhalation of vapors associated with spilled hazardous materials. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

11. Prevailing Winds

The prevailing winds in the Facility area generally come from the northwest, west northwest at an average speed of eight (8) mph year round.

12. Water Currents

The waterways are tidally influenced.

FIGURE 8.8

EVACUATION DIAGRAM

(b) (7)(F), (b) (3)

FIGURE 8.9

TACTICAL PLAN

The following Tactical Plan has been provided to assist initial response to a spill incident from this Facility. The plan includes the following:

- Driving directions
- General pictures of the site and tactical response strategy
- General response equipment and personnel recommendations

Note: This Tactical Plan is provided as a general guidance tool for response to an incident emanating from this Facility. The selection of response strategy equipment, manpower and deployment site may vary based on actual field conditions (e.g. terrain, weather conditions, product type/volume) and incident details.

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Company personnel (IC) assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 2150 Kruse Drive
San Jose, CA 95131
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility and Southern Pacific Railroads, if applicable.
h. Establish a Command Center immediately at the entrance to the Facility or where Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the Control Building. (Refer to the Evacuation Diagram in the SPCC Plan in this Section for evacuation routes.) Company Personnel (IC) will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the secondary emergency response Command Center or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Control Building, or the north staging area.

8.4 FACILITY EVACUATION (Cont'd)

4. Community Evacuation

The Company has confirmed with the San Jose Fire Department that no Community Evacuation Plan currently exists for this area. However, the Fire Department does have standard guidelines that are followed in the event of an evacuation.

5. Directions to O'Connor Hospital (2105 Forest Avenue, San Jose, CA (408) 947-2500)

From the Facility, go northwest for 0.35 miles on Kruse Drive towards Montegue Expressway. Turn right on Montague Expressway and travel 0.39 miles. Take the I-880 S ramp towards San Jose. Merge onto I-880 S and travel for 4.91 miles. Take the Bascom Avenue exit. Keep left at the fork in the ramp. Merge onto N. Bascom Avenue and travel 0.58 miles. Turn right onto Naglee Avenue for 0.11 miles. Turn slight right onto Forest Avenue and travel 0.19 miles to O'Connor Hospital.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gate located off Kruse Avenue.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

8. Prevailing Winds

The prevailing winds in the Facility area generally come from the northwest, west northwest at an average speed of eight (8) mph year round.

9. Water Currents

Currents in Coyote Creek are minimal due to the number of dams located along the length of the river.

TACTICAL PLAN

The following Tactical Plan has been provided to assist initial response to a spill incident from this Facility. The plan includes the following:

- Driving directions
- General pictures of the site and tactical response strategy
- General response equipment and personnel recommendations

Note: This Tactical Plan is provided as a general guidance tool for response to an incident emanating from this Facility. The selection of response strategy equipment, manpower and deployment site may vary based on actual field conditions (e.g. terrain, weather conditions, product type/volume) and incident details.

8.5 RISK AND HAZARD ANALYSIS

A Risk and Hazard Analysis for the KMEP (former GATX) Richmond Terminal has been prepared to comply with the requirements of 40 CFR 112.20 (f)(4), Hazard Evaluations, and California Code of Regulations Title 14, Division 1, Subdivision 4, Office of Oil Spill Prevention and Response Planning §817.02(c) Risk and Hazard Analysis.

The analysis was conducted by G. Wiley Associates in March 1994. A copy of the Summary of Results from the analysis and a description of the approach are included in this section.

The objectives of the analysis contained herein are to (1) identify potential sources of oil spills from the facility into navigable waters; and (2) establish a matrix to estimate oil spill risk for each potential source. This risk analysis is prepared as a working document based on the readily available information regarding the Richmond Terminal and its operations; the analysis is performed and documented in such a way that it can be updated as new information is required or becomes available.

Attachment 1: Detailed Hazard Evaluation and Recommendations.

I. Facility History of Significant Spills

1. Cause of the Spill

GATX Terminals Corporation has had one reportable spill event, occurring on October 17, 1989 at 5:04 p.m. At that time, an earthquake measuring 7.1 on the Richter Scale caused sufficient movement of the storage tanks to result in leaks from two tanks. Tank No. 10-4 was damaged when a pump support bracket welded to the tank shell was broken off, resulting in a hole in the shell approximately □" in diameter. Unrefined coconut oil in the tank leaked for a brief period at approximately 3 gallons per minute until the opening was sealed off by facility personnel. A 2" nozzle on Tank No. 10-6 was broken off also, allowing approximately 1400 barrels of unrefined coconut oil to spill before the leak was sealed. Both tanks were located in Secondary Containment Area No. 1, with a containment volume of 923,000 gallons, which contained the majority of the spill.

(b) (7)(F), (b) (3) [redacted]

2. Impact of the Spill

(b) (7)(F), (b) (3) [redacted]

3. Corrective Action Taken in Response to the Spill

Corrective actions at the time of the spill included plugging and repairing the leaks in Tanks 10-4 and 10-6. When the damage to the underground line and the leak to the channel became evident, IT Corporation was called to assist in the containment and cleanup of the (b) (7)(F), (b) (3) spill. It quickly erected booms offshore, containing the coconut oil, which had solidified on the surface of the water. The material was collected using a vacuum truck and placed in a holding tank for disposal. All appropriate agencies, including the Coast Guard, were notified in accordance with facility permits and local regulations.

The pump that broke away from Tank No. 10-4 has been relocated, eliminating the bracket on the tank. The 2" nozzle on Tank No. 10-6 was connected as a water draw, and is unnecessary to the current operation of the tank. The line, therefore, has been deleted and the nozzle removed in order to prevent any possibility of future failure.

Cleanup of material contained in Secondary Containment Area No. 1 was accomplished by pumping the liquid back into tankage. Material that had solidified was collected manually by laborers into drums. The collected material was reprocessed, filtered, and returned to product storage.

The 30" outfall was not in service, and was pumped full of concrete to completely plug it; thus, it no longer represents a potential leakage path.

II. Expertise of the Working Group Responsible for the Analysis

Eric Arnold, Terminal Manager: Mr. Arnold has been the facility's Terminal Manager since January 1993. Prior to this he served as the facility's Terminal Engineer for 5 years. Prior to that position, Mr. Arnold worked for 6 years in several Terminal Management positions at a Bulk Liquid Storage Facility with Marine Transfer Operations in Richmond, California.

Chuck Wagner, Operations Manager: Mr. Wagner has been the facility's Operations Manager since January 1990. Prior to that he served as the facility's Operations Supervisor for 2 years. Prior to this assignment, Mr. Wagner worked for 13 years in Terminal Operations at several other facilities in the San Francisco Bay Area.

Greg Wiley, Consulting Engineer: Mr. Wiley is a licensed Civil Engineer in California, Colorado, and Texas, and has worked in Design and Construction for 20 years. Mr Wiley prepared the OPA 90 Oil Spill Contingency Plans for the GATX Richmond Terminal. He also performed the Risk and Hazard Analysis for the State Oil Spill Contingency Plan for the Time Oil Richmond Terminal.

III. Risk and Hazard Analysis Summary of Results

1. Statement of Method of Analysis, and that the Analysis is Facility Specific

Because the operating systems for the terminal are not complex, the checklist method for hazard evaluation was selected. The AICHE Publication "Guidelines for Hazard Evaluation Procedures", 2nd edition, was used as the principal reference in preparing the analysis. Typically, a risk and hazard analysis will focus on a particular life cycle phase of a facility. This focus would generally be on the design, start up, operational, or shut down phase of a facility's life cycle. Since the terminal is in the operational phase of its life cycle, checklist questions for evaluating hazards were selected from the operations section of appendix B of the principal reference. The scope of the hazard evaluation was limited to events which would produce a marine spill of similar magnitude to the plan's reasonable worst case spill; thus events such as simultaneous failure of tanks and dike walls were not considered as credible scenarios. Most of the products transferred in Marine Operations are vegetable oils and vegetable oil products, which are not subject to OSPR Regulation. The scope of this analysis is limited to the Petroleum Type Oil Products transferred in Marine Operations. This risk and hazard analysis was prepared specifically for the GATX Terminals Corporation, Richmond, California Terminal. The analysis was performed in March 1994.

2. Inventory of Hazards Identified

Because this risk and hazard analysis is to identify hazards associated with the operation of the facility, it focuses on the following general hazard groups:

A. Operator error
B. Equipment failure
C. External events, such as earthquakes, vandalism, social upheaval
D. Use of the facility by various types of vessels.

Scenarios and hazard events which could create a marine spill are considered in the checklist hazard evaluation review.

It should be noted that many of the questions in the hazard evaluations concern secondary factors that influence a general hazard group; e.g. lack of understanding of written procedures or improper training, as explored in questions 4 through 8, could lead to many of the operator errors listed in question 1. This summary of results has analyzed the primary hazard groups in detail. The full hazard evaluation analyzes the secondary influences also.

General Hazard D above, concerns use of the facility by various types of vessels. In the case of the GATX Terminal, this would be barges and tankers. The detailed hazard evaluation showed no scenario for this general hazard which would produce a spill of the general magnitude described in Section 1. above. Therefore this general hazard is not included in this summary of results.

3. Analysis of Potential Oil Discharges

The GATX Terminal stores products in storage tanks located at their facility. GATX shares the dock at the adjacent Unocal Terminal, transferring products from marine vessels at the Unocal dock to storage tanks at the GATX Terminal (and vice versa.), through an above grade pipeline system. This analysis is concerned with marine transfers of petroleum type oil products. These operations are examined for potential oil spills that could reach marine waters. Potential oil spills are evaluated for cause, size, duration, frequency of occurrence, and location of the spill, for each hazard group.

Operator Errors

Checklist item No. 1a. examines operator errors that could cause an explosion or spill. These are summarized as follows:

1a. (1) Because of the low vapor pressure and relatively high flash point of the materials handled, explosion is not considered to be a credible scenario for marine spills.

1a. (2) Item A. describes a condition in which the person-in-charge on the dock has become incapacitated for a number of reasons. The credible worst case scenario is shown in Appendix #8 of the terminal's Oil Spill Contingency Plan, in which 800 barrels are spilled into the Santa Fe Channel. This spill scenario requires 10 minutes to detect and shutdown. An event of this type has not occurred in the 20 plus years of terminal marine transfers. Based on this experience, a credible frequency could be set at once in 25 years, believing that the terminal will not suffer from this event in the next five years.

1a. (2) Items B. and C. describe a condition in which the pipeline or hose becomes overpressurized due to an incorrectly closed valve in the tank farm or a hose hooked to the incorrect manifold valve. Referencing appendix #8 of the terminal's Oil Spill Contingency Plan, this spill scenario could discharge 800 barrels to the Santa Fe Channel in the 10 minutes it would require to detect and shutdown the operation. An event of this type has not occured in the 20 plus year operating history of the terminal. Hence, the frequency of this event could be set at once in 25 years, employing similar reasoning to that used in the P.I.C. incapacitated scenario.

1a. (2) Item D. describes a vessel collision with the dock, when the facility is operating or at standby status. If the collision occurred when the dock is at standby, and all the dock lines were ruptured, no oil would be spilled because the lines are not packed in standby status; thus the worst case is for the collision to occur when the facility is transferring product. This scenario creates the worst case spill event described in appendix #8 of the terminals Oil Spill Contingency Plan, in which 800 barrels of oil are spilled in the 10 minutes it takes to shutdown the operation

after the collision has occured. This would be a rare event, and it has not occured in the 20 plus years of terminal operating experience. Thus, similar reasoning to that for the P.I.C. incapacitated could be used to set the credible frequency for this event at once in 25 years.

1a. (2) Item E. describes a condition in which the marine vessel is overfilled. Referencing appendix #8 of the terminal's Oil Spill Contingency Plan, this condition could spill 800 barrels to the Santa Fe Channel in the 1□ minutes it would take to detect the overfill and shutdown the operation. An event of this type has not occurred in the 20 plus years of operating experience at the facility. Thus, employing similar reasoning to that used for an incapacitated P.I.C. scenario, a credible frequency for this scenario could be set at once in 25 years.

Equipment Failures

Checklist items 9, 12, and 18 examine equipment failures that could cause a spill. These are summarized as follows:

9a. This item examines the materials of the pipeline system, and upset conditions which could cause failure (rupture) of these materials. The worst case scenario for a piping system rupture would be rupture of the system at the dock and residual pipeline drain-out through the rupture point. The consequences of this scenario are analogous to over pressure rupture of the pipeline due to operator error, and described in the section above in items 1a.(2)B. and C. This scenario could result in 800 barrels of oil being spilled into the Santa Fe Channel in the 1 1/2 minutes required to detect and shutdown the discharge. An event of this type has not occurred in the 20 plus years of terminal operating experience. Applying similar reasoning as for the incapacitated P.I.C. Scenario above, this event could be estimated to occur at a frequency of once in 25 years.

12. This item describes a failure of utility systems. Failure of utility systems would not lead to a spill event.

18. This checklist item describes failures of the critical equipment in the transfer operations. This spill scenario is described in appendix #8 of the Terminal's Oil Spill Contingency Plan. The worst case for this scenario would spill 800 barrels of oil into the Santa Fe Channel. It would require 1 1/2 minutes to detect and shutdown this event. A failure of this type has not occurred in the 20 plus years of terminal operating experience. Thus, applying the reasoning used for the incapacitated P.I.C. Scenario, the frequency of this event could be estimated to be once in 25 years.

External Events

External events would include natural disasters such as a earthquake, explosion due to an electrical storm, vandalism, and social upheaval. Checklist items

1a.(1), 18c. and 19 examine these events.

1a.(1) The petroleum type products transferred at the facility have low vapor pressures and relatively high flash points, making explosion from an electrical storm unlikely. To ensure that an explosion never occurs, terminal S.O.P is to suspend operations during an electrical storm.

18c. In a major earthquake, all of the dock pipelines could be simultaneously ruptured. The worst case scenario for this event would be for the pipelines to be in operation, since at standby the lines are not packed. Referencing Appendix #8 of the Oil Spill Contingency Plan, this event could spill 800 barrels of oil to the Santa Fe Channel in the 1 1/2 minutes required to shutdown the operation following the earthquake. The last major earthquake in terminal personnel's memory was the 1989 Loma Prieta earthquake, which caused no damage to the marine pipeline transfer system. Considering that large earthquakes (richter 7 or greater) occur at a frequency of about once every 30 years in this area, a conservative credible frequency of once in 25 years could be assigned for this event. This frequency is conservative considering that the richter magnitude 7.1 Loma Prieta earthquake did not damage the marine pipeline transfer system.

19. This item describes the events of vandalism and social upheaval. Vandalism would have to occur when the terminal was unmanned. Since the pipelines are unpacked in the standby status, a vandal would be unable to discharge oil to marine waters. Social upheaval is difficult to predict the consequences and frequency of. Considering that this event would be resisted by civil authorities, and that transfer operations would be suspended, it is reasonable to believe that oil would not be discharged to marine waters.

4. **Control Measures Used to Mitigate or Eliminate the Hazards Identified**

The detailed hazard evaluation lists control measures used by the terminal in mitigating or eliminating hazards. These control measures are listed in the "Terminal Procedure" section. Where a corrective action or recommendation is required to strengthen or modify existing terminal practice or procedure, it is indicated in the "Corrective Action/Recommendation" section, and fully described in the list of "Recommended Terminal Actions" at the end of the hazard evaluation. A brief overview summary of control measures used, and recommended actions follows. Details of the control measures and recommended terminal actions are fully described in the hazard evaluation, and are not repeated for the sake of brevity. A spreadsheet summary is included which shows time frames for implementing recommendations which cannot be implemented immediately.

Operator Errors

Checklist item 1d. lists control measures used by the terminal to mitigate or prevent hazards, and recommendations for improving the control measure effects.

KM Risk and Hazard Analysis 7 March 1994

5. **Prediction of Potential Oil Spills After Mitigating Recommendations are Implemented**

This terminal has operated for over twenty years with a single reportable spill incident. The spill was due to the strong 1989 Loma Prieta Earthquake, which broke tank nozzles and a pump support, and ruptured an abandoned, previously unknown underground stormwater drain. The small volume of coconut oil spilled to the Santa Fe Channel was quickly contained and cleaned up. The risk and hazard analysis produced only a few recommendations, these being the incorporation of an existing operating practice into terminal S.O.P., incorporation of response procedures to be used in the event of a power failure, and additional fencing to improve security against vandalism. Thus, the facility's spill history and risk and hazard analysis indicate that it has been operated competently and safely in the past as well as the present.

If the terminal continues its operational training, and operational procedures and practices, as well as its inspection and maintenance procedures; it is reasonable to believe that the facility can continue to operate indefinitely without a spill incident.

The hazard of a major earthquake remains as the most significant oil spill threat to the terminal. This is because of the virtual certainty that this event will occur in the future, and because past history at this terminal and others indicates that some structures and pipelines will fail in major earthquakes. Hence, the terminal needs to prepare for the type of spill that will occur if all the dock lines are simultaneously ruptured by an earthquake during a transfer operations. This being the worst case scenario under consideration.

8.6 OFFSITE CONSEQUENCE ANALYSIS

8.6.1 Scope

This Offsite Consequence Analysis (OCA) is intended to supplement the Hazard Analysis to identify the impact area from the Reasonable Worst Case Discharge (RWCD) for the Facility. The Hazard analysis, which is documented separately, focused on the identification of possible hazards that may result in an oil spill from the Facility. Whereas, the goal of the OCA is to identify from a given spill scenario the credible impact area and the potentially impacted sensitive environmental sites over a 72 hour period.

The Offsite Consequence Analysis involved a progressive study of the spill site involving evaluation of the sensitivity of spill trajectories to pessimistic seasonal weather and environmental conditions, 72 hour spill trajectory for the identified pessimistic conditions, identification of the area at risk from a spill and the potential impacted sensitive sites including the weathering effects for the studied materials. This analysis was performed and documented by BlueWater Consultants, Novato, California using the "OILMAP" spill modeling software by ASA.

The results of the trajectory analyses are shown on color maps delineating time contours for the extent and impact of oil discharged from the terminal location. The trajectory plots display the differences with seasonal conditions and types of products. The modeling analyses supports the oil spill contingency planning complying with Federal OPA 90 legislation and State of California (OSPR) regulations.

The impact areas were correlated to the sites identified by the ACP (12/97 ed.) The description of the risk for each site and the planned protection and recovery strategies would follow the recommendations contained in the ACP. The ACP information includes a description of the area, shoreline characteristics, identification of sensitive marine resources, and strategy for deployment of resources

8.6.2 Approach and Spill Model Background

Analysis Approach

The offsite consequence analysis involved a progressive study for each site involving the following tasks:

a. Sensitivity analysis of spill trajectories to seasonal weather and environmental conditions
b. 72 hour spill trajectory for the identified pessimistic conditions
c. Identification of the area at risk from a spill and the potential impacted sensitive sites including the weathering effects for the studied materials.

8.6 OFFSITE CONSEQUENCE ANALYSIS (Cont'd)

8.6.2 Approach and Spill Model Background (Cont'd)

Analysis Approach (Cont'd)

The areas at risk from a release at site were evaluated using a trajectory and fates modeling analysis for potential RWCD spill volumes, which may result from oil transfer operations. A sensitivity analysis was performed on these results to evaluate possible seasonal environmental , and weather impacts. This was performed using stochastic evaluation technique for trajectories over each seasonal period. The identified "pessimistic conditions" were used to develop trajectory plots depicting the projected areas of impact over a 72-hour period. These trajectories are based on specific type of products and have incorporated weathering and fates considerations.

The areas at risk of impact from the analysis have been compared to the sites identified in the Area Contingency Plan (12/97 edition). The ACP is developed through a joint effort by California State representatives, USCG representatives, local city and county representatives, environmental groups, and industry representatives. The sites considered through the ACP process include:

- water intakes
- fish and wildlife
- endangered flora and fauna
- wetlands or other environmentally sensitive areas
- other areas of economic importance including
- sensitive terrestrial environments, aquatic environments, and unique habitats
- lakes and streams
- recreational areas

Oil Spill Model

The analyses were completed using oil spill modeling software OILMAP for Windows V2.4 from Applied Science Associates (ASA). Several oil spill modes within OILMAP were applied to the analysis. These modes were configured to address specific types of spill impact including assessment of different response scenarios on the spill fate, spill trajectory and weathering prediction, and statistical probabilities of shoreline impact of the spilled oil.

The oil spill trajectory analysis for support of the Offsite Consequence Analysis involved primarily the Trajectory, Fates, and Stochastic modes summarized below:

Trajectory and Fates Mode

The trajectory and fates mode of operation predicts both the movement and weathering of surface oil. The fate processes simulated are spreading, evaporation, entrainment, emulsification and shoreline stranding.

8.6 OFFSITE CONSEQUENCE ANALYSIS (Cont'd)

8.6.2 Approach and Spill Model Background (Cont'd)

Oil Spill Model (Cont'd)

Either instantaneous or continuous spills with a constant oil release rate can be simulated. Each spiller is transported and weathered independently. The oil composition, selected by the user from a library of oil types, is characterized by its boiling point curve. This characterization allows the model to accurately predict the weathering of a variety of crude and refined oil products.

Stochastic Mode

In the stochastic mode, a user-specified number of spill simulations are executed varying only the environmental conditions at the time of the spill. The stochastic model includes all the weathering processes in the trajectory and fate model.

The spill release occurs at random times over a period (by month to over an entire year). Historical wind records from regional meteorological stations can be used, or the model can generate wind time series from zero- or first-order statistical wind distributions. The multiple trajectories predicted by the stochastic model are summarized as probability contours showing the probability of land and water areas being impacted by oil spilled at the specified release site. The probability contours form an envelope showing the direction(s) oil will move from the site and where it will impact land. Simulation results enable the user to assess potential extent of the area at risk for that seasonal period.

8.6.3 Application of OilMap Model to Spill Scenarios

Oil Spill Scenario

The Reasonable Worst Case Discharge (RWCD) scenario identified by the Oil Spill Contingency Plan was used to evaluate the potential impact on the shoreline. The parameters of the spill are summarized below:

Table 8-1 - Oil Spill Modeling Scenario Information

Product:	Group III Oil (Coconut Oil) (Note: Modeled as Fuel Oil with adjustment for lower Specific Gravity and other material factors)
Quantity	460 bbls.
Source Location:	Pipeline between Terminal and Dock
Seasonal Considerations:	Winter and Summer Seasons

In each scenario, the spill was considered instantaneous discharge at the identified location. The model calculation time step was 10 minutes, with a dispersion factor of .75 m2/sec. The simulations were run until all the oil was fully dissipated from either evaporation, dissolution, or grounded on-shore over a period of 72 hours (3 days).

8.6 OFFSITE CONSEQUENCE ANALYSIS (Cont'd)

8.6.3 Application of OilMap Model to Spill Scenarios (Cont'd)

Oil Spill Scenario (Cont'd)

A trajectory and fates modeling runs were completed with differing seasonal wind data and at varying times of release in the tidal cycle. The trajectories considered both summer and winter conditions to determine effects of seasonal wind trends on the potential impacted areas.

Environmental Data

Hydrodynamic

Tidal current and river induced flows, providing input to OILMAP for San Francisco Bay, were derived from a two dimensional, depth averaged, finite element hydrodynamic model of San Francisco Bay (King, 1990; Shrestha et al., 1993). The model solves the vertically averaged equations of motion to predict the currents and water surface elevations. Friction losses are approximated using either a Chez or Manning formulation.

The bay was represented by a finite element mesh consisting of two-dimensional (e.g., rectangular, triangular) and one-dimensional elements. The grid covers the entire bay from the entrance at Golden Gate Bridge and both the south and northern branches of the bay. The model was forced by tidal elevation at the open boundary at the Golden Gate Bridge and river and other freshwater flows in the interior.

Wind

Wind data used in the model simulation was based on a regional statistical wind summary. Wind speed and direction time series for the Summer (July - August) and Winter (December - February) were created from summary data taken from the International Station Meteorological Climate Summary (NCDC, 1992) for the nearest recording site.

This wind data was compiled into monthly speed and direction probability tables. The tables are monthly statistical summaries of the probability of wind coming from a particular direction and within a range of speeds. The monthly data records generated are essentially a synthetic time series based on wind probabilities for the selected month.

8.6.4 Results

The Sensitivity Analysis and Trajectory results are summarized on the following maps:

4 Hour through 72 Hour Trajectory Maps
Spill Time Contour Map - Summer Conditions
Spill Time Contour Map - Winter Conditions

8.6 OFFSITE CONSEQUENCE ANALYSIS (Cont'd)

8.6.4 Results (Cont'd)

Spill Trajectory Results

The Spill Time Contour maps identifying a spill trajectory for the RWCD volume under specific seasonal conditions identified by sensitivity analysis. Shoreline impacts are identified by red markings , or by the overrun of the time contour across the shoreline. Key geographic and sensitive environmental site references are identified by either name or colored shoreline. A legend of the color key is also provided on each map.

The model has incorporated weathering effects on the oil and partial loss by evaporation, and mixing with the water column. As a conservative factor, the shoreline characteristics have been negated to allow maximum refloating and circulation of the oil particles.

The modeling time period was a maximum of 72 hours. The time required for the oil to reach the shoreline is determined by the tide stage and the speed, direction of the wind, and the amount of material loss to evaporation.

Sensitivity Analysis Results

Seasonal variations impact have been evaluated through the stochastic model. Historical winds for the period were categorized into summer and winter seasons. Wind velocity and direction vectors representative for the seasons were evaluated creating a range of probable spill trajectories.

Generally, the regional weather generally has two primary seasonal conditions, summer conditions and winter conditions. In the summer, winds are dominated by the prevailing west wind and the thermal induction from the valley. In the early morning and evening, winds can be light and variable. In the winter or fall, the winds are generally light and variable, with occasional stronger winds representative of passing winter storm systems. Generally, a strong wind cross the tidal flow tends to act as a driving function forcing the spill out of the main tidal flow. This can result in grounding on the shoreline earlier and may result in less travel and shoreline area impact.

The RWCD spill was tested for both summer and winter wind influences on the spill trajectory. The relative impact is illustrated in the Spill Time Contour maps. They present a summary of several iterations of spill trajectories from various states of tidal currents and seasonal environmental factors for each season. These results are depicted on color maps delineating time contours in 1/4 day (6 hour) increments up to 72 hours. A legend to the color scale is provided on each map.

The greatest shoreline impact with the RWCD was determined to be during the winter conditions, and as a result, the 72 hour trajectory is based on the winter seasonal conditions.

8.7 RISK REDUCTION INCENTIVE PROGRAMS

The Facility participates in an annual safety awareness program which is administered at the Corporate level. The Facility has evaluated workplace hazards and how to prevent or mitigate them under workplace illness and injury prevention guidelines. The Facility conducts monthly safety meetings to discuss conditions, which could cause accidents or spills, and how to mitigate or prevent them from occurring. The Facility (through the Operations Review Committee) also conducts quarterly meetings for continuously improving the quality and effectiveness of operating practices and procedures.

8.8 DRUG AND ALCOHOL POLICIES

Kinder Morgan, Inc. and Kinder Morgan Energy Partners, L.P.

Human Resources Policy Manual

Drugs and Alcohol in the Workplace

(Effective 01/01/2000)

(Revised 01/01/2003)

Purpose

The purpose of this Policy is to maintain a safe and productive work environment for all employees, applicants, and the public by ensuring that employees on Company property, while conducting Company business, operating Company property, or during their employment with the Company may not possess or use illegal or unauthorized drugs. The Policy is also intended to promote worker and public safety, to comply with the Drug-Free Workplace Act of 1988, and to provide procedures for workplace-related searches of persons and property and the lawful drug and alcohol testing of employees. Kinder Morgan maintains a "Zero Tolerance" policy.

Scope

This Policy applies to all Company employees, applicants, contract workers, and employees of third-party contractors, including employees and contract workers who perform functions covered by regulations promulgated by the Department of Transportation (DOT). In the event of a contradiction between this Policy and the Company's Anti-Drug Plan and Alcohol Misuse Prevention Plan, the Company's Anti- Drug Plan and Alcohol Misuse Prevention Plan shall govern.

This Policy is broader in scope than the Company's Anti-Drug Plan and Alcohol Misuse Prevention Plan. For additional information refer to the Anti-Drug Plan and Alcohol Misuse Prevention Plan.

This Policy shall be administered in accordance with all applicable federal, state, and local laws and regulations.

Responsibilities and Prohibitions

Employees

All applicants and employees are reminded that the following actions are included as violations of this Policy: (1) use, possession, sale, distribution of illegal or unauthorized drugs on Company property, while operating any Company vehicle or equipment, or while conducting Company business; (2) use, possession, sale, distribution of alcohol on Company property. while operating any Company vehicle or equipment, or while conducting Company business, with the exception that use and possession of alcohol during Company sponsored business or social functions, where the use of alcohol remains moderate, will not be considered a violation of this Policy; (3) use of any drug, including prescribed drugs, which is unsafe to use while operating Company vehicles or equipment; (4) possession, sale or distribution of paraphernalia and equipment related to illegal or unauthorized drug use; and (5) refusal to test in any testable situation.

As a condition of employment, any employee whose work directly relates to the performance of a federal contract and who is or has been convicted of a criminal drug offense occurring in the workplace during employment must notify his/her supervisor and Human Resources representative in writing within five days of such conviction. Similarly, as a condition of employment, any employee that is required to possess a valid driver's license as a pre-requisite of their position, must notify his/her supervisor and Human Resources representative in writing within five days of either a drug and/or alcohol related criminal offense. Failure to provide notification will result in disciplinary action being taken, up to and including termination.

All employees while operating any Company vehicle or equipment, or while conducting Company business (either during or after regular business hours), cannot refuse to submit to drug and/or alcohol testing administered or ordered by the Company or a lawful authority. Refusal to submit to the testing will result in disciplinary action being taken, up to and including termination.

All employees taking a prescription or over-the-counter medication that could adversely affect performance of job-related functions or pose a direct threat to the health and safety of the employee or others in the workplace are responsible for notifying their supervisor. It is not the intent of the Company to interfere with the use of drugs legitimately prescribed by a physician. The Company's designated physician will be the sole person that the Company uses in making determinations concerning employees' fitness to perform the job.

All employees should notify a supervisor or Human Resources Representative of any behavior of co-workers or contract workers that may indicate a violation of this Policy.

Definitions

"Alcohol" means ethyl alcohol, an intoxicating element in fermented or distilled liquor or in any other compound, or other low molecular weight alcohol, including but not limited to, methyl and isopropyl alcohol, and including without limitation, beer, wine, and distilled liquors.

"Company property" is used in the broadest sense and includes, but is not limited to, all property, equipment, land, onshore and offshore platforms, buildings, structures, installations, facilities, locations, boats, aircraft, and vehicles which are owned, leased, used or operated by or on behalf of the Company for any purpose, or which are located on Company property, and any personal effects or items located thereon or therein. This includes, among other items, desks, lockers, and workstations, as well as privately owned vehicles and other personal belongings located on or in Company property,

"Possess" or "possession" means having any amount of illegal or unauthorized drugs or alcohol on one's person or belongings at any time during employment; on Company property; while conducting Company business; operating Company property; in one's personal belongings or vehicle while on Company property; in a vehicle or any mode of transportation owned or leased, or rented for Company use; or at any location used by the Company to conduct business.

"Drugs" means prescription drugs, inhalants, and other illegal, controlled, or unauthorized substances that may cause addiction and/or affect coordination of memory, or a drug that federal and state law makes illegal to distribute, use or possess.

"Use" with regard to drugs is defined as having any trace amount of drugs in the applicant's or employee's system, or physical consumption of drugs, "Use" with regard to alcohol is defined as the physical consumption of alcohol. "Use" with regard to drugs and alcohol is also defined as being under the influence of drugs or alcohol at any time during working hours.

"Zero Tolerance" means that if an employee tests positive for drugs or alcohol, as defined by this Policy, the resulting disciplinary action will be termination of employment for cause.

Testing for Types of Drugs/Alcohol and their Cutoff Levels

Drug/Alcohol tests will be conducted in a confidential manner according to procedures adopted by the Company and in compliance with applicable law. Below are the examples of illegal and unauthorized drugs for which Kinder Morgan tests and the , levels at which an employee will be considered as "testing positive for drugs": Employees who test at a alcohol concentration level of .04 or greater will be considered as "testing positive" for alcohol.

1. Marijuana 15 ng/ml

2. Cocaine 150 ng/ml

3. Amphetamines and Methamphetamines 500 ng/ml

4. Opiates (codeine, heroin, morphine) 2000 ng/ml

5. Phencyclidine (PCP or Angel Dust) 25 ng/ml

Types of Drug and Alcohol Testing

Kinder Morgan conducts the following types of drug and alcohol testing:

Drug Testing	Alcohol Testing
1. Pre-employment	1. Reasonable cause
2. Reasonable cause	2. Random (as permitted by federal and state law)
3. Random (as permitted by federal and state law)	3. Return to duty
4. Return to duty	4. Post-Accident
5. Post-Accident	

Searches and Tests

The Company reserves the right to have authorized personnel conduct searches of our employees, contract workers, and employees of third-party contractors without prior notice to determine if this Policy is being violated. Accordingly, all areas of Company property may be searched, including employee work locations, stations, areas, offices, desks, files, lockers, etc.; employees and their personal belongings, vehicles, etc. may also be searched if on or within Company property. Employee searches will be conducted in compliance with applicable law.

The Company reserves the right, at all times, to have authorized personnel conduct urinalyses, blood tests, or other types of tests of our applicants, employees, contract workers, and employees of third-party contractors for the purposes of determining if any such persons are in violation of this Policy. A urinalysis, blood test, or other type of test may be used in the following situations: (a) pre-employment testing, (b) testing based on reasonable cause or suspicion, (c) random or periodic testing, (d) testing following an accident or incident involving injury or property damage, and (e) testing that is consistent with the enforcement of this Policy.

The Company reserves the right to inspect and search Company property at any time without the presence or consent of any employee. An employee who, as a result of a search, has been found in violation of this Policy or other Company Policy will be subject to corrective action as described in the Corrective Action Policy.

Violations of Policy

Any violation of the Drugs and Alcohol in the Workplace Policy will result in disciplinary action being taken, up to and including termination.

Employee Assistance Program

The Employee Assistance Program (EAP) is available to all Company employees. Employees are encouraged to obtain professional help when needed by using the EAP . Employees may contact their supervisor or Human Resources for information about the EAP. The EAP is strictly confidential and available for use by telephoning:

- Magellan Behavioral Health 1-800-424-5654

Use of the EAP does not exempt or excuse a violation of this Policy.

Voluntary Rehabilitation

Any employee who voluntarily seeks counseling or rehabilitation in advance of failing any of the tests or who would otherwise be in violation of this policy must provide certification, in accordance with any applicable governmental requirements, of the credentials of the attending physician, psychologist, or psychiatrist, who is trained in substance abuse disorders.

When the employee successfully completes or is participating in a supervised substance-abuse or alcohol-related rehabilitation program and is no longer engaging in the use of illegal drugs or unauthorized alcohol, the Company requires certification from the substance abuse professional that the employee is fit to return to duty and perform the essential functions of his or her job.

An employee described in the paragraph above will be tested on a random basis by the Medical Review Officer and/or Substance Abuse Professional to ensure such employee is no longer engaging in the illegal use of drugs or unauthorized alcohol.

Interpretation and Exceptions

Questions regarding this Policy should be referred to the Vice President, Human Resources. Requests for exceptions should be submitted to Human Resources for review by Human Resources and the Legal Department to ensure regulatory requirements and appropriate test protocols and standards are met. The President and Chief Operating Officer must approve all exceptions.

This Policy does not constitute or imply a contract between the Company and its employees. This Policy creates no Company obligation nor any individual obligation, right, privilege, term, or condition of employment not otherwise established by law. The Company has voluntarily adopted this Policy for its sole and exclusive and may amend or withdraw it at any time without prior notice.

8.9 VESSEL LOADING PROCEDURES

[The following document is an excerpt of the Facility; Vessel Loading Procedure No. 5.9 and is included here for regulatory reference only].

Subject: Vessel Loading (Outbound)
Procedure No. 5.9

General Comments

The following operating procedures will be used by Kinder Morgan personnel when loading liquid products to a vessel from a shore tank(s). The following comments are important to achieve a full understanding of the procedures as they include references to procedures which are required for special handling of products such as heated or corrosive products.

1. The terms Kinder Morgan Supervisor and TPIC (Terminal Person-in-Charge) are used interchangeably, and all TPIC's must have received the required USCG training before they can act in this capacity.

2. The Conoco Philips fire-watch and PIC are responsible for the dock and manifold area. The vessel's first mate/tankerman or his/her designee (VPIC) is responsible for the vessel. The Conoco Philips fire-watch will monitor the dock and manifold at the direction of a Kinder Morgan operations supervisor. The Conoco Philips fire-watch has the authority to shut down the operation at any time.

3. Richmond Terminal is not equipped with a marine vapor recovery or incineration system.

4. It is a Kinder Morgan policy for vessels to be scheduled for loading on a "First-Come, First-Served" basis, although we reserve the right to depart from this policy at our discretion.

5. Surveyors may be required to test and approve vessel and shore pipelines and manifolds for some products as determined by customer needs. These special instructions must be included on the Vessel Loading/Unloading Schedule (V .L.U.S.) and must be performed before any transfer operation begins.

6. Products which must be heated (i.e. animal fats, vegetable oil, #6 oil, heat sensitive chemicals, etc.) for pumping require extra caution to be sure the product is heated to the proper temperature prior to pump off and also to be certain the product is not overheated.

a. Prior to pumping, pipelines must be checked to be sure they are not plugged and that heat is applied during the operation if required.

b. After pumping, product lines may have to be pigged or blown to ensure the lines are cleared of product. This prevents product from solidifying in the line, and avoids line problems in the future.

c. Caution must be exercised when gauging heated products that are pumped into tanks which are not completely liquid (i.e. animal fats).

d. Hoses must be cleaned, blown or drained after pumping to prevent blockage.

7. Corrosive products require special personal protective equipment which must be worn during transfer operations, and extra attention must be given to eye and skin protection. Care must be exercised when gauging and sampling corrosive products, and safety showers must be checked to be sure they are in good operating condition.

   a. Special attention is required to be sure the pipelines used during the transfer operation are compatible with the product. Corrosive products can cause violent chemical reactions if they are mixed with other reactive products.

   b. Corrosive products may also require the use of special equipment (i.e. scrubbers, etc.) which must be checked to be sure they are operating properly.

8. These procedures do <u>not</u> assume the availability of product meters; but if meter systems are avail\able, the procedures should be modified accordingly. However, this will not relieve the terminal of the responsibility of complying with the balance of the handling requirements.

9. All Kinder Morgan employees involved in marine transfers are responsible for following these procedures.

Subject: Vessel Loading (Outbound)
Procedure No. 5.9

PRE-LOADING PROCEDURES

1. Kinder Morgan receives notice from a customer , in writing (e.g. facsimile, telex), to load product(s) from tankage to a vessel. This notice should contain at least the following information:

   a. Vessel name, dimensions, and loaded draft (if required).
   b. Name(s) and volume(s) of product(s).
   c. Customer order numbers (if applicable).
   d. Estimated time of arrival.
   e. Shore tank(s) to unload (unless designated by Kinder Morgan).
   f. Special instructions, i.e. independent surveyor, lab testing, blending.

   Depending on the customer's requirements, either Kinder Morgan or the customer will arrange for an independent lab surveyor to survey the vessel and shore tank(s). The customer will normally notify the surveyor of the vessel's ETA, and Kinder Morgan will keep the surveyor updated. as the ETA changes.

   NOTE: Information regarding the above may be obtained from the agent and confirmed with the customer.

2. Kinder Morgan will notify the Conoco Philips Bulk Foreman of the E. T .A. and discuss berth availability. If there is a berth conflict between a Kinder Morgan vessel and a Conoco Philips vessel the first come, first serve rule will apply. Conoco Philips will be informed of the following:

   a. Vessel's name.
   b. Name(s) and volume(s) of the product.
   c. Estimated hours alongside.

3. A Kinder Morgan supervisor will obtain the final ETA from the vessel's agent and confirms the following:

   a. Vessel's name.
   b. ETA.
   c. Product name(s).
   d. Customer.
   e. Transfer direction (inbound/outbound).
   f. Berth congestion (if applicable).
   g. Vessel's loaded draft.

4. Once the vessel's ETA has been finalized it may be necessary to notify regulatory agencies, such as the U. S. Coast Guard, Customs, State Lands Commission, local Port Authority and the Fire Department.

h. 5. Based on the order, Kinder Morgan will check the book and physica1 inventories to verify that there is both enough product(s) available to meet the loading request and that the tank inventory is within acceptable limits, consistent wit11 established

i. inventory control practices. If a problem exists, the inventory will be rechecked and if the problem persists, the Customer Service and the Operations Manager will be notified.

j. NOTE: The tank inventory should be checked as close to the vessel's arriva1 time as possible.

k. NOTE: If the product is to be unloaded from a tank with more than one customer, Kinder Morgan must be sure the transfer does not exceed the amount of product the customer currently has in the tank.

l. 6. A V.L.U.S. and Operating Order or its equivalent must be generated by the supervisor and copies distributed to the Kinder Morgan supervisor(s) responsible for the plant/yard and dock areas. One copy of the V .L. U .S .and Operating Order is

m. maintained in the office for control purposes. The following information will be recorded on the V.L.U.S. & operating order:

n. Customer name.

o. Customer order number (if applicable). c. Date.

p. Kinder Morgan order number . e. Shore tank(s) number(s). f. Product(s) name.

q. g. Tons of product to be triU1sferred. h. Vessel name.

a) Vessel tank(s) number(s).

r. j. Name/initials of Kinder Morgan employee who issued V .L.U.S. & Operating Order.

s. k. Estimates of shore tan1(stop gauge.

t. .I. Special instructions: sampling and testing.

u. m. Name and phone of inspection company and vessel agent.

v. The V .L. U .S. must be signed and approved before being issued. It will also be checked to confirm correctness.

w. 7. If the shore tank(s) listed on the V.L.U.S. are not equipped with dedicated dock lines, a note will be placed under the special instructions section of the V .L.U.8. explaining which common dock line to use. The selection of dock lines must be made and verified by appropriate Kinder Morgan operating personnel.

x. **Required Safety Equipment: At the least a hard hat, life jacket, and rubber work gloves must be worn by all personnel on the dock during line handling. Extra safety equipment may be required for corrosive or heated products. Dock personnel will don additional PPE as required by the product MSDS. Life jackets must be worn if working within three feet of the dock's edge.**

y. After receiving one copy of the V.L.U.S. & Operating Order, the Kinder Morgan supervisor will select the proper hoses to expedite the vessel handling operations. All hoses must be clean and compatible or dedicated to the product being transferred. Special attention is required for the proper selection of hoses to handle chemical products to prevent leaks and contamination.

z.Before the vessel arrives, the Kinder Morgan supervisor will inspect the following at the dock area:

aa. Availability of nitrogen (if needed) .

bb. Availability of compressed air (if needed).

cc. Inspect safety eye/shower washes and be assured they are unobstructed and working properly.

dd. Inspect fire protection equipment and insure it is properly located and working

ee. properly.

ff. Check that the potable water meter is in proper working order (if needed).

gg. Check that pollution containment equipment is in working order and on standby.

hh. Boom boat is on standby with:

ii. Charged batteries.

jj. Full fuel tank.

kk. Safety equipment on board.

ll. Pipeline grounding system working properly.

mm. Personnel safety equipment is ready and available:

i) Life preservers.

ii) Hard hats, rubber gloves, eye goggles. face shields, special protective clothing.

iii) First aid kit.

iv) Respirators (if applicable).

nn. Check that radio and telephones are working.

oo. Dock area exhibits good housekeeping a11d adequate walking and working surfaces.

i) Dock lights in working order .

pp. m. Inspect containment boom, if necessary .

qq. n. Check that the dock drip/spill containment system drains are closed and

rr. manifold containment covers removed. Dock drip/spill containments must be free of standing water.

a) Condition of dock crane.

ss. 9. The Kinder Morgan supervisor must have the following paperwork and documentation available in the dock house before the vessel arrives:

tt. Kinder Morgan Marine Operations Manual (MOM).

uu. Signed Letter of Adequacy from USCG Capt. of the Port. c. Blank Declaration of Inspection.

vv. MSDS for each product being handled (not required for veg oils). e. Vessel Log (on file in operations office).

ww. f. Bill of Lading or customer authorization documents (on file in the operations office).

xx. V.L.U.S. & Operating Order. h. Radio receipt sheet.

yy. Dock safety checklist.

zz. 10. Just prior to the vessel's arrival, a Kinder Morgan operator and independent surveyor

aaa. will <u>independently</u> gauge and sample the appropriate shore tank(s). The gauge(s) will be recorded on a gauge sheet. If required, dock lines will also be sampled and tested. The Kinder Morgan operator will also visually check the following:

bbb. Tank manways are secured - no leaking. b. Tank is grounded.

ccc. Valve setups and pressure relief lines are set correctly (if applicable). d. Dike drains are closed and not breached.

ddd. Operational status of the auto tank gauge (if provided).

eee. Verification that maintenance activity is not being conducted on the tank or in the dike area.

fff. 11. Upon the vessel's arrival:

ggg. The Kinder Morgan supervisor will be out on the dock to be sure the vessel is properly spotted and secured, with the vessel's manifold aligned with the dock manifolds.

hhh. NOTE: The Kinder Morgan supervisor may assist the vessel's crew with the tie-up of the vessel, provided he/she has donned a life jacket.

iii. Insulating flanges are used, the vessel will not require a grounding wire.

jjj. The gangway is lowered and secured.

kkk. A Kinder Morgan supervisor boards the vessel and issues a walkie-talkie to the first mate/tankerman/tankerman or his/her designee. The person receiving the radio must sign a radio receipt sheet and is responsible for its safe return. This sheet will record the following:

i) Name of recipient (printed).

ii) 2. Number of radio.

iii) 3. Date/time.

lll. 4. Signature of recipient and Kinder Morgan supervisor.

mmm. TUG BOATS MUST IMMEDIATELY LEAVE THE Kinder Morgan DOCK AREA (UPWIND IF POSSIBLE) AFTER THE VESSEL IS DOCKED, UNLESS PERMISSION HAS BEEN GRANTED BY THE OPERATIONS MANAGER OR HIS/HER DESIGNEE TO REMAIN AT THE DOCK.

nnn. 12. The Kinder Morgan supervisor adds the following information to the vessel log upon the vessel's arrival:

ooo. Most current ETA date/time.

ppp. Time when vessel arrived off the dock. c. Draft upon arrival - forward, and aft.

qqq. Direction of vessel (port or starboard side to the dock). e. Vessel's name.

rrr. Name of the tug used for the vessel's arrival. g. Outbound movement.

sss. h. Location of vessel's manifold. I. Hose size used.

ttt. .i. Number of moves (number of dock lines needed). k. Tide and weather .

uuu. NOTE: If regulations require vessels to be boomed, the pollution containment

vvv. booms must be deployed before any pumping operations can commence. Conoco Philips will provide these services and the Kinder Morgan

1.2 OPERATING ASSETS COVERED BY THIS PLAN

The following tables provide a general information summary for the pipeline sections, pipeline facilities, breakout stations and terminals in each of the Areas in this Region. Specific detail can be located in the following sections for the applicable area.

- Section 6 – Area Pipeline Sections (for DOT jurisdiction)
- Section 7 – Area Breakout Stations (for DOT jurisdiction)
- Section 8 – Area Terminals (for EPA jurisdiction)

SACRAMENTO AREA		
PIPELINE SECTIONS	**LINE NO.**	**COUNTY / STATE**
SACRAMENTO AREA LINES		
Hay Road - Sacramento 20”	130	Yolo, CA
Sacramento - Shell 10”	34	Yolo, CA
Sacramento - Shell 10”	35	Yolo, CA
Sacramento - Arco 10”	29	Yolo, CA
Sacramento - Arco 10”	31	Yolo, CA
Sacramento - River Junction 10”	28	Yolo, Sacramento, CA
Sacramento - Antelope Road 12”	20	Yolo, Sacramento, Placer, CA
BRADSHAW AREA LINES		
Brentwood Junction - Bradshaw 10”	9	San Joaquin, Sacramento, CA
Bradshaw – Mather 4”	57	Sacramento, CA

1.2 OPERATING ASSETS COVERED BY THIS PLAN (Cont'd)

SACRAMENTO AREA (Cont'd)	
PIPELINE FACILITIES (Non-Storage)	
Brentwood Junction - Piping Manifold Only	
Stockton Junction - Piping Manifold Only	
Sacramento River Junction - Piping Manifold Only	
Sacramento Shell Terminal - Manifold Only	
Atwater Terminal - Piping Manifold Only	
Mather Airport - Meter Station Only	
Rough & Ready Junction - Piping Manifold Only	
Sacramento Airport Junction Take-off - Piping Manifold Only	
West Capital - Meter Station Only	
BREAKOUT STATIONS	**COUNTY / STATE**
Sacramento Station	Yolo, CA
Stockton Terminal	San Joaquin, CA
TERMINALS	**COUNTY / STATE**
Bradshaw Terminal	Sacramento, CA

1.2 OPERATING ASSETS COVERED BY THIS PLAN (Cont'd)

RENO AREA		
PIPELINE SECTIONS	**LINE NO.**	**COUNTY / STATE**
RENO AREA LINES		
Donner Summit - State Line 8"/10"	12	Nevada, Sierra, CA
Donner Summit - Reno Terminal 10"/6"	12,13	Washoe, Lyon, NV
Reno - Fallon 6"	55	Washoe, Churchill, NV
PIPELINE FACILITIES (Non-Storage)		
Fallon Terminal – Meter Station Only		
BREAKOUT STATIONS		**COUNTY / STATE**
None		---
TERMINALS		**COUNTY / STATE**
Reno Terminal		Washoe, NV

1.2 OPERATING ASSETS COVERED BY THIS PLAN (Cont'd)

CHICO ROCKLIN AREA		
PIPELINE SECTIONS	**LINE NO.**	**COUNTY / STATE**
CHICO ROCKLIN AREA LINES		
Antelope Road - Rocklin 12"	20	Sacramento, Placer, CA
Rocklin - Chico 8"	64	Placer, Yuba, Butte, Sutter, CA
Erle - Beale 6"	65	Yuba, CA
Rocklin – UPRR 4"	48	Placer, CA
Rocklin – Colfax 10"/6"/10"	11	Placer, CA
Colfax – Donner Summit 8"	12	Placer, Nevada, CA
PIPELINE FACILITIES (Non-Storage)		
UPRR Terminal - Meter Station Only		
Feather Pump Station - Booster		
Colfax Pump Station - Booster		
Cisco Grove Pump Station - Booster		
Erle Junction - Piping Manifold Only		
BREAKOUT STATIONS		**COUNTY / STATE**
Rocklin Station		Sacramento, CA
Beale Terminal		Yuba, CA
TERMINALS		**COUNTY / STATE**
Chico Terminal		Butte, CA

1.3 SUBSTANTIAL HARM

It is Kinder Morgan Energy Partners, L.P.'s (KMEP) goal to respond as quickly as possible to all uncontrolled releases of petroleum product, regardless of the source point location along the system. Based upon this goal, and the overbreadth of the definitions provided in each of the applicable regulations, KMEP is compelled to consider all of the Facility's breakout stations, and active line sections listed above in this Section, as capable of a release potentially causing "significant and substantial harm". A summary of the Worst Case Discharge scenarios for these facilities is provided as follows:

NORTHERN REGION – CALIFORNIA/NEVADA WORST CASE DISCHARGE DOT JURISDICTION	
Discharge Scenario	**Planning Volume**
(b) (7)(F), (b) (3)	

* DOT Worst Case Discharge volumes are based on 50% of the tank maximum storage capacity and for pipelines based on an annual Integrity Management Program study, as follows:

Release volume prior to line shutdown and valve closures (Initial Loss):

- Full flow release due to rupture. This is computed at the maximum pumping rate the line segment.
- Detection time, analysis and pump shutdown in adverse weather conditions. This is based on a maximum of fifteen (15) minutes in the event of a full flow rupture, which would cause an instant alarm (unless otherwise noted in the line segment information).
- Line segment valve closures. All line segments are equipped with remote activating isolation valves. Adverse weather would have no impact on line segment isolation, as isolation valves are not dependent on manual closure.

Line drainage following pump shutdown (Stabilization Loss) is computed the maximum potential line drainage between adjacent isolation or check valves, and incorporated pipeline elevation profiles to estimate how much of that total volume would escape at any release point along the line. The historic discharges have not approached either the breakout tank WCD volume or the pipeline WCD in the area.

1.3 SUBSTANTIAL HARM (Cont'd)

NORTHERN REGION – CALIFORNIA/NEVADA WORST CASE DISCHARGE EPA JURISDICTION	
Discharge Scenario	**Planning Volume**
Small Discharge	
• Bradshaw Terminal	50 bbls
• Chico Terminal	50 bbls
• Reno Terminal	50 bbls
Medium Discharge	
• Bradshaw Terminal	857 bbls
• Chico Terminal	857 bbls
• Reno Terminal	857 bbls
Worst Case Discharge*	
(b) (7)(F), (b) (3)	

* EPA Worst Case Discharge is based on the maximum storage capacity of the largest tank at each Facility.

NORTHERN REGION BAY WORST CASE DISCHARGE CALIFORNIA OSPR JURISDICTION
The Reasonable Worst Case Spill (RWCS) for the California OSPR jurisdictional pipeline segments are detailed in Section 9.3.

These Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three-tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. Sections 6, 7, 8 and 9 of this Plan demonstrate a series of calculations and planning volume determinations based on guidance provided by all applicable regulations. The inclusion of these calculations is for demonstration of the response planning volumes and response capability necessary for on-water and on-shore recovery requirements as the result of the discharge scenarios detailed in the table above.

1.4 FORMAT AND SCOPE OF PLAN

This Volume 2 of the Integrated Contingency Plan (ICP) is intended to guide emergency response activities throughout KMEPs Pacific Operation Northern Region – California/Nevada. This Region is divided into three (3) Areas (see Figure 1.1) each of which has its own tab in this document. These areas are as follows:

- Sacramento Area
- Reno Area
- Chico Rocklin Area

Each of the Volume 2 plans in this ICP has identical Sections 1 through 5. Section 6 of each Area details the Pipeline Sections in the respective area, Section 7 of each Area details the Breakout Stations/Terminals (DOT-jurisdictional) in the respective area, and Sections 8 of each Area details the Terminals (multi-jurisdictional) in the respective Area. The Areas covered by this particular plan are identified on the front cover of this plan and on the footer of each page and on the maps provided in Figure 1.1.

Volume 1 of the Integrated Contingency Plan provides guidance which is consistent across the Pacific Operations. The two (2) documents are intended to work together as one seamless Integrated Contingency Plan for the various facilities/operations and agency jurisdictions in Pacific Operations.

2.0 NOTIFICATIONS

2.1 INTERNAL NOTIFICATIONS

Specific reference to all internal notifications is detailed in **Volume 1** Section 2.1 which provides the following:

- KM Employee or Agent Notification Process - California Only (Figure 2.1a)
- Operator Notification Process - Non-California (Figure 2.1b)
- Company Employee Other Than Operator Notification Process - Non-California (Figure 2.1c)
- Controller - Orange, CA Notification Process - California Only (Figure 2.1d-1)
- Controller - Orange, CA Notification Process - Non-California (Figure 2.1d-2)
- Controller - Houston, TX Notification Process (Figure 2.1e)
- Managers Internal Notification Process (Figure 2.1f)
- Initial Reporting Details Form (Figure 2.2)
- Northern Region Internal Notifications References (Figure 2.3a)
- Southern Region Internal Notifications References (Figure 2.3b)
- Crisis Support Team Internal Notifications References (Figure 2.3c)

2.2 EXTERNAL NOTIFICATIONS

Specific reference to all **"Regulatory Required"** external notifications is detailed in Volume 1, Figure 2.1 and Figure 2.4. **With the exception of notification to 911 and/or local fire/police agencies which are handled by local area operations, the Environmental, Health and Safety (EHS) and/or Compliance, Codes and Standards is responsible for making all regulatory required external notifications in all states other than in California. In California and locations monitoring or controlling, pipeline sections in California, refer to Volume 1, Section 2.2 and Figure 2.4.**

The locally required notifications and additional external notification references which are detailed in the following Volume 2, Figure 2.1 provide for assistance/advisory notifications. Specific notifications for contacting OSRO's is found in Volume 2, Figure, 2.1, "_____ Terminal Response Contractors".

3.0 RESPONSE RESOURCES

The following sections outline the various response equipment/resources available from the Facility, other Company facilities, and other outside resources.

3.1 AREA RESPONSE EQUIPMENT

This Area of the KMEP operations maintains response equipment readily available for spill response as detailed on the "Facility Response Equipment" lists provided in Figure 3.1 and the "Pipeline Repair Equipment" lists provided in Figure 3.2. The equipment is stored at locations in the Area as detailed on the equipment lists.

The preventative maintenance schedule requires a monthly inventory and visual inspection of spill response equipment. Maintenance and repair is performed as needed, following manufacturers recommended procedures. The equipment will be exercised as semi-annually (Terminal equipment) or annually (pipeline equipment) as required (PREP Guidelines). A sample form for documenting these Equipment Deployment Exercises is provided in Figure 3.4.

KMEP has contracts in place with Oil Spill Removal Organizations and other clean-up and response contractors that are capable of responding to all discharges within the Area and supplementing Area KMEP resources.

The Qualified Individual has the authority to activate these and other KMEP resources or that of private contractors and other experts and consultants as the situation demands.

3.2 OTHER COMPANY RESOURCES

Neighboring KMEP Areas have response resources similar to those provided in this Area (Figures 3.1 and 3.2). These resources as well as additional Company spill response equipment and manpower resources may be available to supplement the response operation.

3.3 CONTRACT RESOURCES

In the event of a discharge which is beyond the initial response capabilities of the Local Response Team, contract manpower and equipment resources can be obtained through Oil Spill Removal Organization(s) (OSRO). These OSROs can provide manpower and containment/clean-up equipment for the response operation. *The Company will ensure that each OSRO has a comprehensive maintenance program and applicable training / drills programs in place at contract renewal.*

Response resources will be secured from a Company approved contractor. Facility Management will typically handle notification/implementation of these resources. Section 2 of this Volume provides a quick reference to the OSROs and additional clean-up and response contract organizations. A detailed list of the "Pacific Region Open End and On-Call Contractors" is provided in Figure 2.2. Specific reference to their response capability (UCSG OSRO classification) is provided in Figure 3.3.

These OSRO's have adequate equipment and personnel resources available within the Area to respond to the applicable regulatory planning volumes in the required time frames.

3.3 CONTRACT RESOURCES (Cont'd)

OSROs have the expertise to conduct and lead on water and shoreline containment and recovery efforts. KMEP personnel will oversee and coordinate with the OSRO to ensure their actions conform with overall incident objectives and established incident action plans.

OSROs also have extensive experience in using the Area Contingency Plans (ACPs) as a resource when responding to an incident that has affected a navigable waterway. The KMEP Incident Commander, Planning Officer and Operations Chief will employ the OSRO's experience to integrate applicable local ACPs into the overall incident action plans.

3.4 AREA CONTINGENCY PLANS (ACP)

Area Committees comprised of federal, state and local agencies develop ACP. Response efforts performed within a certain "area" should reference the ACPs for that specific area. ACPs include clean-up strategies and information on environmentally sensitive areas within a particular region. Some of the ACPs include maps, shoreline characteristics and booming strategies for specific areas while other ACPs offer priority lists of environmentally sensitive areas.

ACPs generally contain the following information:

- Physical features
- Seasonal concerns
- Resources of primary concern
- Containment, and cleanup strategies, including recommended techniques
- Equipment considerations
- Incident Command System Roles and Responsibilities (NIMS)

To identify specific spill response and protection strategies for the applicable region/area, ACP and Geographic Response Plan information can be found at: http://kmonline.kindermorgan.com/operations/products/pacific_icp/pacific_icp.html Responders can navigate through the site to locate the region/area of interest and the appropriate response resources needed for the operation.

For all controlled copies of the Integrated Contingency Plan distributed to non-KMEP plan holders, a CD-ROM containing the same information as referenced above will be included in a CD-sleeve in Volume 1 (inside front cover) or in a separate folder in electronic copies and is referenced in Figure 4.2.

To determine adequate response resources, the Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three (3) tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. The tier requirements for high volume areas are for response in six (6) hours (Tier 1), 30 hours (Tier 2), and 54 hours (Tier 3). High volume areas are listed in 49 CFR 194. The tier requirements for all other areas are for response in 12 hours (Tier 1), 36 hours (Tier 2), and 60 hours (Tier 3).

3.5 COOPERATIVE/MUTUAL AID RESOURCES

Cooperative/mutual aid resources will be utilized when available and/or necessary.

3.6 EXPERTS AND CONSULTANTS

KMEP maintains a relationship with various environmental and technical consultants that can provide support in the event of an emergency incident. These consultants can provide expertise and support in the areas of emergency response management, environmental services, site assessment, permitting, waste treatment, recycling, dewatering, hazardous waste disposal, and remediation.

3.7 VOLUNTEERS

Volunteers will not be utilized by KMEP for the response operations. All volunteers will be referred to the state or Federal On-Scene Coordinator.

3.8 COMMUNICATIONS

Effective and efficient communications systems are essential for emergency response at every level. The communications system will be utilized to gather information and current status reports as well as to provide coordination and direction to widely separated work groups involved in search, containment / diversion, repair, traffic control, public control or evacuation, and restoration.

Communication of the overall spill response operation between KMEP and the responsible government agencies in the Federal Regional Response Team (RRT) will occur between the Incident Commander and the Federal On-Scene Coordinator.

3.8.1 Central Communications System

Prearranged communication channels are of the utmost importance in dealing with KMEP emergencies. The notification procedures and telephone contacts documented in Section 2 of Volume 1 and Volume 2 will be reviewed in accordance with the earlier documented updating procedures. The predetermined communications channels include the following:

- A list of required Federal and state emergency telephone numbers for the Orange Control Center and emergency response personnel (Volume 1; Section 2).
- A list of emergency telephone numbers for various external resources such as the fire and police department, medical, and regulatory agencies (Volume 2; Figure 2.1).
- A list of emergency telephone numbers for contract response resources (Volume 2; Figure 2.1).

3.8 COMMUNICATIONS (Cont'd)

3.8.2 Communications Equipment

Field communications during a spill response to a small or medium discharge will be handled via the existing KMEP communications network. This network will utilize existing radios, telephones, beepers, fax machines, and computers and will be maintained by KMEP personnel. In the event of a Worst Case Discharge, field communications will be enhanced with other KMEP and contract resources as the situation demands.

Each KMEP responder has, at a minimum, a cellular telephone. All KMEP response personnel also have access to other telephones, radios and satellite communications equipment that may be needed for effective response operations. Additionally, communications equipment is maintained in the KMEP spill response trailers. The Logistics Officer would create a communications plan based on the equipment immediately available and would identify the need for any additional equipment that may be needed throughout the response effort.

3.8.3 Communication Types

Radios - Handheld and vehicle mounted radio sets are the most effective means of communication for the field response operation. The units are battery operated, multi-channeled and have a typical range that will cover the area of the response operation. Each location maintains a minimum of 4 radio sets, functionally maintained per manufacturer's specifications and kept in designated KMEP response trailers. In addition, KMEP also utilizes radio sets provided by contract resources. Additional radio sets and battery packs/charges will be necessary in the event of a prolonged response operation.

Telephone (Conventional) - Conventional land line telephones are the most effective means of communication for regulatory and advisory notifications during a spill response operation. Additional telephone lines can be installed in the event of a prolonged response operation.

Telephone (Cellular) - Cellular telephones allow for added mobility and response effectiveness. Cellular phones are commonly maintained by certain KMEP personnel. Additional cellular phones can be secured in the event of a prolonged response operation.

Pagers - Pagers are used for rapid notification to field personnel when radio and telephone resources are limited.

FAX Machines - FAX machines allow for a rapid transfer of information/ documentation such as status reports/updates, written notifications, and purchase orders.

Computers - Computers are commonly used in networks which allow access to various other locations and KMEP personnel. Computers also speed the consolidation of information and preparation of written reports.

AMPD INFORMATION - KMEP Chico Terminal

- **AMPD response provider**

OSRO / Clean-up Contractor
National Response Corporation Environmental Services, Inc. (NRCES)
1111 Marauder Street
Chico, CA 95973

Contract Expiration Date 12/31/2014
Contract Number: 11559

Under Section 3.3 to Appendix E of 40 CFR 112 – *Determination and Evaluation of Required Response Resources for Facility Response Plans*, it states, "The response resources shall, as appropriate, include: 3.3.1 One thousand feet of containment boom…" (59FR34112)

"EPA recognizes that certain other elements may not be applicable in all cases. To provide flexibility for facilities with unique circumstances, certain elements are prefaced by use of the words 'shall, as appropriate' or modified by the use of the words 'or equivalent.'"(59FR34074)

Accordingly, 1,000 ft of containment boom would not be practicable for a response to a discharge from this facility. Based upon the facility's topography, the initial response effort (1 Hour) will be accomplished by using a damming and diversion response strategy, utilizing a system of drainage valves located East of the facility. One valve is used to dam the discharge while the other is used to divert the discharge back to the facility's retention pond.

Valves used for the damming and diversion of an off site discharge shall be maintained, operable and clear of debris.
The manmade trench leading to the retention pond shall be maintained so that debris would not obstruct or restrict flow back to the retention pond.

Recovery capability per the two (2) hour requirement will be provided within two hours by NRCES.

****Planning Assumptions**: *On-water speed, 5 knots; land speed, 35 miles per hour; notification/mobilization – 30 minutes.*

OSRO CONTRACTS

National Response Corporation Environmental Services

WORK DIRECTIVE

To : NRC ENVIRONMENTAL SERVICES INC

9520 10TH AVE
SUITE 150
SEATTLE, WA 98108
Attention: STEPHANIE BARTON

Phone: 206-730-3990
Fax: 206-607-3001
Email: SBARTON@NRCC.COM

Date: May 1, 2014

Work Directive No.: 402461-81-CONT

Agreement No.: **05ER45064ORG**

Requisition No/ Accounting Information: 289302

This Work Directive is entered pursuant to the terms of the Emergency Response Agreement ("Agreement") dated 06/01/2005 , by and between KINDER MORGAN OPERATING L.P. "D" ("COMPANY") and NRC ENVIRONMENTAL SERVICES INC ("CONSULTANT"). By its execution hereof, CONSULTANT agrees to perform for the Kinder Morgan ("KM") entity named below and executing this Work Directive pursuant to the terms, conditions and provisions of the Agreement, the following described Work which will additionally describe "Covered Tasks" as provided for under DOT Operator Qualification Requirements, and shall furnish all services, labor, supervision, technical capability, tools, equipment, vehicles, vessels, barges, transportation, materials, (except as set forth below), and other facilities and items necessary or convenient to complete the following work as further described and specified in the Specifications and/or Drawing(s) attached hereto or the Agreement and by this reference made a part of this Work Directive ("the Work"). If CONSULTANT'S proposal, quotation, or any other CONSULTANT document supplied to the KM entity named below is included as part of this Work Directive or another exhibit to the Agreement, then any terms or conditions provided by CONSULTANT which differ from or conflict with COMPANY'S terms and conditions are hereby rejected and shall be of no force or effect. The KM entity named below in this Work Directive shall be solely responsible for the liabilities and obligations set forth in the Agreement under which this Work Directive is being issued and this Work Directive arising out of or related to the Work to be performed pursuant hereto. All such liabilities and obligations, as they apply to this Work Directive, shall be non-recourse to the COMPANY (if the COMPANY is not the KM Entity executing this Work Directive) and all other related entities as further provided for and agreed in the Agreement. Payments made to CONSULTANT under this Work Directive shall include all taxes and similar charges except as otherwise agreed to herein or under the terms of the Agreement. Any capitalized term used in this Work Directive and not otherwise defined herein shall have the meaning as ascribed in the Agreement.

1.0 **Project Name and Work Location Details:** OSRO COVERAGE – CHICO TERMINAL 2570 HEGAN LANE, CHICO, CA 95928

2.0 **Scope of Work:** The following is a full and complete description of the Work (and goods) to be provided by CONSULTANT including, but not limited to specifications, conditions and referenced bids/proposals.

2.1 SEE ATTACHED SCOPE OF WORK.

2.2 For Questions, contact VILLALOVOS, FRANK at 530-342-6140

3.0 The COMPANY will not furnish any materials to the Work Site(s), unless previously approved by the Designated Representative.

4.0 CONSULTANT shall commence the Work by the 05/02/2014 and shall complete the Work on or before 12/31/2014.

5.0 CONSULTANT offers to complete the Work in accordance with the Agreement for the total Lump Sum Amount of **$14,037.95**, Fourteen Thousand Thirty Seven Dollars and Ninety Five Cents, which shall constitute full and complete payment.

6.0 The parties hereby agree to AMEND Agreement 05ER45064ORG as follows (or if the Agreement has been thus amended previously, to repeat the following sections):

i) Under the Compliance with Laws section, a **new subsection** is hereby added to the Agreement which reads as follows:

CONSULTANT certifies that at the time of execution of this Agreement CONSULTANT is not included on any debarment list maintained by any federal, state or local governmental authority nor prevented from performing Work for COMPANY by virtue of any governmental order, proceeding or otherwise. If at any time during the term of this Agreement CONSULTANT cannot so certify to COMPANY, CONSULTANT shall promptly notify COMPANY as to CONSULTANT'S status.

ii) The following language is hereby added to the Termination section under the termination for default paragraphs:

-- violates any EHS law; or

iii) All other provisions of the Agreement shall continue in full force and effect.

7.0 **Retainage:** Waive 10% retainage.

8.0 CONSULTANT shall submit invoices in duplicate to:

SFPP, L.P.

2570 Hegan Ln

Chico, CA 95928

Attn: VILLALOVOS, FRANK
Phone: 530-342-6140
Fax: 714-560-6633

8.1 Invoices must clearly indicate the Agreement Number, Work Directive Number, and Work Order/ Account Coding, as indicated above.

8.2 For Construction Projects, a Certificate of Final Completion must be completed, signed by an authorized representative, notarized, and attached to CONSULTANT'S final invoice.

9.0 CONSULTANT hereby certifies that it has downloaded, reviewed and understood the Kinder Morgan Contractor Safety Manual and shall, prior to the commencement of any Work hereunder, make the same available to its employees and subcontractors who will be performing work on premises owned and/or operated by the KM entity named below. If the English language is a communication barrier, CONSULTANT at its expense shall timely convert/translate the Kinder Morgan Contractor Safety Manual accurately into the appropriate language for its employees and subcontractors. Questions concerning the Manual should be directed to the Kinder Morgan Contractor Safety Indemnitees at: contractor_safety@kindermorgan.com prior to commencement of any Work.

10.0 Facsimile Signatures/Counterparts. This Work Directive may be executed in multiple original counterparts, each of which shall be deemed an original, and together they shall constitute one and the same agreement. Signature of this Work Directive may be effected by facsimile (with confirmation by transmitting machine) and/or transmitted by portable document format ("pdf") file which shall be treated as an original signature, and any such signature, facsimile, pdf file or copy of this signed Work Directive shall be construed and treated as the original and shall be binding as if it were the original.

11.0 For Work performed within the State of California, CONSULTANT shall certify within three working days of execution hereof that the requirements set forth in Exhibit B to this Work Directive have been satisfied. Failure by CONSULTANT to do so shall constitute a breach under Section 10 [for cause with no notice] of the Agreement.

In the **Agreement**, if there is a reference to "Kinder Morgan Kansas, Inc.," it shall now be deemed a reference to Kinder Morgan, Inc., a Delaware corporation. This change resulted from an internal corporate reorganization. Kinder Morgan, Inc. owns the same assets formerly owned by Kinder Morgan Kansas, Inc.

By signing below, COMPANY and CONSULTANT affirm that the individual signing below has the requisite authority to authorize the commitment described herein, and that this Work Directive No. 402461-81-CONT is by reference hereby made part of Agreement No. 05ER45064ORG .

This Work Directive is hereby agreed to and accepted:

SFPP, L.P.

The following Exhibits shall be provided by COMPANY:

X	Exhibit WD_A	- Scope of Work
X	Exhibit WD_B	- Revised Release Reporting Criteria (California only)
___	Exhibit WD_C	- Work Directive Specific Schedule of Values/Rates
___	Exhibit WD_D	- Operator Qualification Form (as provided by the Designated Representative via electronic or hardcopy submission)

EXHIBIT WD_A – SCOPE OF WORK

Scope of Work or Services:

a. Environmental emergency response
b. Hauling of treated contact water

OSRO coverage would include the equipment and personnel necessary to perform the described response strategies. In order to facilitate the deployment of the required resources at an initial response strategy site, NRCES proposes to pre-position equipment and supplies, including boom, sorbent boom and sand bags at the Chico Terminal.

To provide initial response, NRCES would dispatch personnel from its Chico office to retrieve the pre-positioned equipment at the Terminal and commence initial deployment of boom and/or sand bags as needed. NRCES Chico can also provide trained equipment operators to perform earth moving strategies with heavy equipment as described as additional response strategies. NRCES will also maintain 24-hour access to owned and vendor heavy equipment in the local area.

These resources need to meet the EPA mandated response time of "within one hour response personnel from NRC will be on site and within two hours equipment will be on site.

In addition to meeting the Chico Terminal's initial response requirements, NRC can also meet its state and federal response planning requirements, including MMPD and WCD Tiers 1, 2, and 3. In addition to the equipment and personnel available from the NRCES Chico office, NRCES can also rapidly cascade response resources from its other offices located throughout Northern California and the balance of the West Coast as needed for the Terminal's WCD of 60,000 barrels and above.

NRC proposed to provide the above OSRO coverage under a Work Directive similar to those currently issues under the existing contract between NRC and KM. As discussed, NRC provided a proposal in 2009 to provide OSRO coverage to the Chico Terminal. NRC proposes to provide the currently proposed OSRO coverage, including the pre-positioned equipment, at the ~~same annual~~ retainer fee of ~~$20,848.44~~ $14,031.95 for 5/1/14 - 12/31/14. In addition to the OSRO coverage, the retainer would also include participation of two NRCES response personnel in Chico Terminal's annual tabletop drill.

5-1-14 MKM 5-7-14

EXHIBIT WD_B – REVISED RELEASE REPORTING CRITERIA

1.0 CONSULTANT shall ensure that its employees, agents, and subcontractors' employees engaged in CONSULTANT'S activities in the performance of the Work:

1.1 are notified, and when required, as determined by COMPANY, trained and instructed by COMPANY, either directly or through a train-the-trainer program instituted by COMPANY, concerning the order of actions to be taken upon discovery of a release or threatened release condition of a Hazardous Material or pollutant substance; and

1.2 understand that no Work or visit shall be undertaken to any COMPANY right-of-way or facility where there is no COMPANY representative onsite and readily accessible (a "Non-Company Onsite Situation"), unless the training referred to in (i) above has occurred for CONSULTANT'S employees, agents and subcontractors' employees who will be performing at such a site.

1.3 Will be working in a COMPANY Onsite Situation and MUST ensure that its employees, agents and subcontractors' employees have been notified accordingly, and if deemed necessary by COMPANY, CONSULTANT will assure that prior to performing any Work CONSULTANT'S employees, agents and subcontractors' employees will be trained relative to COMPANY'S revised release reporting criteria.

1.4 For purposes of this Exhibit "Hazardous Material(s)" shall mean and include (a) all elements or compounds that are contained in the list of hazardous substances adopted by the United States Environmental Protection Agency and the list of toxic pollutants designated by Congress or the Environmental Protection Agency or under any EHS Laws; and (b) any "hazardous waste," "hazardous substance" (including, but not limited to, petroleum and petroleum-related materials), "toxic substance," regulated substance," "pollutant" or "contaminant", each as defined under any EHS Law. "EHS Laws" shall mean any and all federal, state, and local laws, regulations and requirements pertaining to health, safety, or the environment.

CONSULTANT shall certify its compliance with this training requirement upon COMPANY request.

Acknowledged, agreed and accepted this day of , 20___

AGREEMENT FOR PROFESSIONAL EMERGENCY RESPONSE SERVICES

Agreement Number: 05-ER-45-064-ORG

THIS AGREEMENT is made as of the **22nd day of November , 2005**, by and between **Kinder Morgan Operating L.P. "D"** a Delaware Limited Partnership, and, to the extent of any Work Directive executed by any of its affiliates or subsidiaries, those affiliates and subsidiaries, respectively, acting as agent for Kinder Morgan and its affiliates and subsidiaries who are requiring such work as set forth in this Agreement and/or in **Exhibit A-1** (Work Directive) and who will be releasing payments for such work, with its principal place of business in **Houston, Texas**, hereinafter referred to as "**COMPANY**", and **National Response Corporation**, a Delaware corporation having its principal office at 3500 Sunrise Highway, Great River, New York 11739 hereinafter referred to as "**CONSULTANT**".

WITNESSETH:

WHEREAS, COMPANY desires the services of CONSULTANT and a network of subcontractors and/or Local Contractors (as defined in **Section 2.2** below), including NRC Environmental Services Inc., to provide OSRO Coverage Services and be available to provide Emergency Response Services for the containment and cleanup of oil, discharge of hazardous material and non-hazardous materials, and

WHEREAS, CONSULTANT represents that it is qualified and desires to provide OSRO Coverage Services and to perform such Emergency Response Service (as defined in **Section 2.4** below) for COMPANY.

NOW, THEREFORE, in consideration of the promises and mutual covenants contained herein, the parties do hereby agree as follows:

1.0 TERM

1.1 This Agreement becomes effective upon the date first above written and shall continue until December 31, 2008; (unless earlier terminated pursuant to Section 14.1 or 14.2 below); provided however this Agreement may be extended by agreement of the parties upon COMPANY's written notice given at least ninety (90) days prior to expiration of the then current term; and further provided that if a Work Directive issued under this Agreement is continuing beyond the expiration date, the term of this Agreement shall be extended automatically for ninety (90) days or until that Work Directive has been completed, whichever occurs first. All rates and fees under this agreement shall be subject to adjustment on an annual basis.

2.0 CONTRACT DOCUMENTS, SCOPE OF WORK AND ADMINISTRATION

2.1 This Agreement shall consist of the Contract Documents itemized below. In the event of a conflict between or among the provisions of the Contract Documents, the more or most specific provision shall control:

2.1.1 Agreement Number **05-ER-45-064-ORG**

2.1.2 **Exhibit A** Work Directive(s) as may be issued from time to time (including Scope of Work)

2.1.3 **Exhibit B** Schedule of Values

2.1.4 **Exhibit C** Certificate of Insurance

2.1.5 **Exhibit D** (1) United States Environmental Protection Agency Title III, List of Lists, Consolidated List of Chemicals Subject to the Emergency Planning and Community Right To Know Act (EPCRA) and Section 112(r) of the Clean Air Act, published April 1995, as amended

2.1.6 **Exhibit E** Project Scope Change Order

2.1.7 **Exhibit F** INTENTIONALLY OMITTED

2.1.8 **Exhibit G** Kinder Morgan Contractor Safety Rules & Regulations

2.1.9 **Exhibit H** Parent Guaranty

Note that any references to "CONTRACTOR" in an Exhibit, apply to CONSULTANT.

2.2 Definitions:

2.2.1 ""**Best Endeavors**" means, with respect to either party, the performance in good faith to the extent of its total capabilities;

2.2.2 "**Classification**" means classification or other governmental approval required or available under Federal Law and State Law for an Oil Spill Removal Organization to be designated as such in the Response Plan;

2.2.3 "**Contract Documents**" means all relevant documents described in **Section 2.1** of this Agreement.

2.2.4 ""**Day**" or "**Week**" means, respectively, a calendar day or seven (7) calendar days.

2.2.5 "**Designated Representative**" means the person identified as COMPANY'S Designated Representative in **Section 2.8** of this Agreement.

2.2.6 "**Discharge**" means any emission (other than natural seepage), including, but not limited to, spilling, leaking, pumping, pouring, emitting, emptying or dumping of Oil;

2.2.7 "**Drills**" means any drills, exercises, practices or other preparatory or simulated activities in connection with which the COMPANY has requested the CONSULTANT to mobilize or deploy Response Resources or to provide other services;

2.2.8 **"Emergency Response Services"** shall have the meaning given in **Section 2.4** below.

2.2.9 **"Environmental Law"** means any and all federal, state, and local laws, regulations and requirements pertaining to health, safety, or the environment, including the United States Oil Pollution Act (33 U.S.C. 2701, et seq.) ("OPA") and the Federal Water Pollution Control Act (33 U.S.C. 1321, et seq.) ("FWPCA") and any other laws regarding a Discharge and Emergency Response Services and regulations promulgated pursuant thereto;

2.2.10 "**Force Majeure**" has the meaning given in **Section 18.1** below.

2.2.11 "**Hazardous Material**" means (a) all elements or compounds that are contained in the list of hazardous substances adopted by the United States Environmental Protection Agency and the list of toxic pollutants designated by Congress or the Environmental Protection Agency or under any Environmental Laws; (b) any "hazardous waste," "hazardous substance" (including , but not limited to, petroleum and petroleum-related materials), "toxic substance," regulated substance," pollutant" or "contaminant", each as defined under any Environmental Laws and (c) oil of any kind or in any form when it is classified as a hazardous substance under any applicable State or Federal Law, including any and all substances defined or identified as oil under OPA.

2.2.12 "**Hereunder**," "**herein**" and words of similar import shall refer to this Agreement as a whole, rather than to a single provision.

2.2.13 "**Local Contractors**" means independent oil spill removal companies located near the Areas of Services, including NRC Environmental Services Inc., with whom the CONSULTANT has contracted to maintain and provide Response Resources in fulfillment of the CONSULTANT's obligations hereunder;

2.2.14 "**Oil**" means oil of any kind or in any form, including any and all substances defined or identified as oil under OPA, but shall not include substances defined or identified as Hazardous Substances;

2.2.15 "**Oil Spill Removal Organization**" means an entity established in a given geographic area to provide the personnel, equipment, supplies and other capability necessary to conduct Emergency Response Services;

2.2.16 "**Qualified Individual**" means an English-speaking shore-based representative of the COMPANY located in the United States, available on a 24-hour basis, familiar with implementation of the Response Plan and trained in his or her responsibilities under the plan, with full written authority to implement Emergency Response Services and to engage the CONSULTANT for services hereunder;

2.2.17 "**Removal Costs**" means the charges of the CONSULTANT for deploying Response Resources to a Discharge or threatened Discharge, including the charges for mobilization and demobilization of personnel, equipment and supplies; and containment, removal and storage of discharged Oil;

2.2.18 "**Responder Immunity Law**" means Federal Law or applicable State Law which provides immunity from liability to those who respond to Discharges for the purpose of attempting to contain and remove Oil from the water, beaches or shoreline;

2.2.19 "**Response Plan**" means any contingency plan or response plan regarding Discharges covering the Facility prepared by or on behalf of the COMPANY pursuant to Federal Law or State Law;

2.2.20 "**Response Resources**" means the trained personnel, equipment, supplies and other capability named in a Response Plan or mobilized to perform Emergency Response Services pursuant to Federal Law and State Law, other than personnel, equipment, supplies and other capability required to be stored at the Facility;

2.2.21 "**Site**" or "**Area of Service**" "**Facility**" or shall mean any, facility, pipeline, or other real property identified in an executed Work Directive on which CONSULTANT will be performing Work pursuant to the terms of the Contract Documents, whether or not owned by COMPANY.

2.2.22 "**Waste**" shall mean any form of material identified or determined by the COMPANY as having no beneficial value and is either a by-product of the COMPANY's operations or is generated during investigation and remediation activities (e.g. soils, debris) and includes personal or real property contaminated as a result of a Discharge.

2.2.23 "**Work**" or "**Services**", shall mean, collectively, any and all obligations, duties and responsibilities necessary to the successful completion of the project assigned to or undertaken by CONSULTANT under the Contract Documents, including the furnishing of all labor, services, materials, equipment and other incidentals necessary to perform Emergency Response Services.

2.3 CONSULTANT agrees to render **OSRO Coverage Services**, as more specifically defined in each applicable Work Directive executed by the COMPANY affiliate or subsidiary to whom the service will be provided and by CONSULTANT, in exchange for the Fee contained in the applicable Work Directive.

2.3.1 In performing OSRO Coverage Services, CONSULTANT shall:

2.3.1.1 obtain and maintain Classification as an Oil Spill Removal Organization as provided under Federal Law and State Law;

2.3.1.1.1 In the event Classification is not available, CONSULTANT warrants that it and its Local Contractors shall have sufficient Response Resources to enable the Client to meet the mandated levels of response capacity under Federal Law and State Law.

2.3.1.2 Subject to the California release notification requirements set forth in **Article 10.0** hereunder, provide sufficient Response Resources to enable the COMPANY to meet the requirements of Federal Law and State Law for precontracting for availability of Response Resources, except as provided in **Section 2.14**;

2.3.1.3 provide the training of the CONSULTANT's and Local Contractors' response personnel, in compliance with Federal Law and State Law requirements for Oil Spill Removal Organization Classification, and maintenance of records of such training;

2.3.1.4 ensure compliance by the CONSULTANT and Local Contractors with all applicable Federal Occupational Safety and Health Administration (OSHA) standards and similar State Laws and standards; and

2.3.1.5 provide all information regarding the CONSULTANT's and the Local Contractors' Response Resources which must be included in the Response Plan(s) of the Facility(ies) or to be filed with the U.S. Coast Guard or EPA or appropriate State authorities to obtain Classification, including any equipment that is out of service that would diminish CONSULTANT's Classification as an Oil Spill Removal Organization.

2.4 CONSULTANT agrees to render **Emergency Response Services,** as more specifically defined in each applicable Work Directive executed by the COMPANY affiliate or subsidiary to whom the service will be provided and by CONSULTANT, in exchange for the payment of Removal Costs as provided for in **Section 3.1**.

2.4.1 CONSULTANT agrees to provide or cause to be provided an on-call team of personnel and equipment (Response Resources) to perform Emergency Response Services in the location(s) designated on the applicable Work Directive and as directed by the Designated Representative (or his or her designee). Emergency Response Services may include: 1) containment, characterization, handling, transportation, treatment, processing, recovery, repackaging, removal, storage and transportation for disposal of oil (in accordance with **Section 19.8** hereunder), hazardous material and non-hazardous material; 2) site evaluation, decontamination and restoration; 3) technical services, including sampling, laboratory services, analysis, and other related services; 4) training and mock spill deployments; and 5) coordination with COMPANY'S Designated Representative or his or her designee. Specific description of the Emergency Response Services shall be set forth in the applicable Work Directive. When CONSULTANT needs specific clarification pertaining to the Work, it shall request the same from the Designated Representative.

2.4.2 It is understood and agreed that provision of Response Resources by CONSULTANT under this Agreement is incidental to the performance of the Services hereunder and are subject to CONSULTANT's continuing supervision, direction and control. All Response Resources utilized by CONSULTANT in performance of the Work as directed by the applicable Work Directive, shall be paid for by COMPANY in accordance with the terms, conditions and rates in Exhibit B.

CONSULTANT shall provide, supervise, direct, control and pay for all personnel provided hereunder, including, but not limited to, permanent or temporary personnel of CONSULTANT, and "Subcontractors" of CONSULTANT, including but not limited to, employees of third parties who are assigned to perform services for CONSULTANT on a contract basis, or employees of Local Contractors. CONSULTANT shall not be responsible for, and shall not be required to supervise, direct or control any personnel provided by COMPANY or temporary personnel hired by COMPANY to perform emergency response services unless agreed to in writing between the parties and specified in the applicable Work Directive. Similarly, all equipment utilized by CONSULTANT in the performance of the Work, whether owned, rented or under subcontract, including but not limited to all vessels, boom, and skimmers, shall be installed, operated, monitored, maintained, demobilized and decontaminated by CONSULTANT personnel, employees, agents, subcontractors or Local Contractors. Such equipment, and the labor hours associated with installing, operating, monitoring, maintaining, demobilizing and decontaminating the equipment, shall be paid for by COMPANY in accordance with Exhibit B.

2.5 COMPANY is responsible under this Agreement to:

2.5.1 designate an On-site Representative and provide CONSULTANT with the name, address, twenty four (24) hours-a-day telephone number and telefacsimile number of the Qualified Individual/On-site Representative, and shall amend or update this information as necessary;

2.5.2 deliver, or caused to be delivered, to the CONSULTANT such information concerning the Facility as the CONSULTANT may reasonably request for the performance of the Work;

2.5.3 pay for services and Removal Costs of the CONSULTANT in accordance with **Section 3.0**;

2.5.4 be responsible for deciding which Response Resources shall be requested from the CONSULTANT to conduct Emergency Response Services;

2.5.5 be responsible for coordinating and directing overall Emergency Response Services;

2.5.6 be responsible for disposal of all Oil,Hazardous Materals and Waste collected by the CONSULTANT;

2.5.7 give notice to the CONSULTANT of any significant increase in the volume of Oil movements or any significant changes in operation of the Facility;

2.5.8 obtain and provide CONSULTANT with the COMPANY'S Environmental Protection Agency identification number or other such authorization required by law for any Discharge or threatened Discharge classified as a Hazardous Material, or similar designation, prior to the CONSULTANT providing services hereunder.

2.5.9 Provide a Parent Guaranty to CONSULTANT in accordance with **Section 6.5**.

2.6 Notwithstanding this Agreement, COMPANY shall not be required to utilize CONSULTANT to deploy Response Resources for Emergency Response Services and may arrange for the supply and deployment of Response Resources for Emergency Response Services in the Area of Service by any other person.

2.7 Emergency Response Services Procedure.

2.7.1 COMPANY may initiate a request for the deployment of resources to perform Emergency Response Services by a direct telephone call to the CONSULTANT's Local Representative at (562) 432-1304 or 1-(800) 334-4755, and such telephone

Re: Amendment to Term & Rates

Dear Stephanie Barton:

Pursuant to the terms and conditions of Agreement No. **11559** effective **June 1, 2005**, by and between **KINDER MORGAN OPERATING L.P. "D"** and **NRC ENVIRONMENTAL SERVICES COMPANY**, which Agreement is made a part hereof by reference, the same as if set forth herein in full, you are hereby requested to amend the Agreement to include the following:

Section 1.0 **TERM**

Replace "shall continue until February 18, 2012"

With "shall continue until February 18, 2013"

EXHIBIT B **SCHEDULE OF VALUES**

Section 5.0 Replace previous Price List with new Price List Effective February 18, 2012

All other terms and conditions of Agreement No. **11559,** as amended by prior contract amendments (if any), which are not changed by this amendment will continue in full force and effect.

This amendment now forms an integral part of this Agreement. Confirm your acceptance by signing on the line provided and return to COMPANY'S Contract Administrator as listed below:

KINDER MORGAN OPERATING L.P. "D"
Attention: **Michael Martinez**
1100 Town And Country Road
7th Floor
Orange, CA 92868

This Amendment is effective as of February 19, 2012.

PRICE LIST

Effective February 18, 2012

Price List Terms: Customer's request for NRC Environmental Services Inc. (NRCES) to perform services constitutes an agreement to pay for those services under the Personnel, Equipment and Material Terms of this Price List, regardless of any estimates provided by NRCES. Charges will be based on the most current published Price List. Surcharges to current published rates may apply in non-local areas. Surcharges may also apply to cover unanticipated cost increases for items, including but not limited to fuel and insurance, resulting from circumstances beyond the control of NRCES. Rates are based upon net 10 payment terms unless otherwise agreed by prior written contract with NRCES. Balances outstanding more than ten (10) days after the invoice date shall be deemed delinquent and shall earn interest at the rate of 1.5 % per month. Customers without a pre-existing NRCES contract are subject to a minimum charge of $3,500.00 to be paid at time of call out for emergency response services and any charges for services estimated to exceed the minimum are also payable in advance. All prices are in U.S. dollars.

PS	Project Scientist / Field Chemist	75.00
PR	Purchaser / Subcontracts Administrator	65.00
AS	Administrative Support / Accountant	50.00
FS	Field Supervisor	70.00
MC	Mechanic / Welder	70.00
EO	Equipment Operator	60.00
DR	Driver (Commercial)	55.00
SF	Site Foreman	55.00
RT	Confined Space / Rescue Technician	50.00
LO	Licensed Vessel Operator	75.00
VO	Vessel Operator	55.00
DH	Deckhand	45.00
TE	Technician – HAZWOPER	45.00
ST	Support Technician (Warehouseman, Personnel, Resource Coordinator)	45.00

Personnel Terms:

1. Minimum call out is 4 hours per person, except for projects over 50 miles from office location require 8-hour daily minimum.
2. Rates for FS, MC, EO, DR, RT, SF, LO, VO, DH, TE, SA, AS and ST are subject to the following: a) Weekdays: 0700 to 1500 hours charged at Straight Time (ST = Hourly Rate); 1500 to 1900 hours charged at Overtime (OT = 1½ times the Hourly Rate); 1900 to 0700 hours charged at Double Time (DT = 2 times the Hourly Rate). Changes to start times for Weekday ST, OT and DT may be requested by Client and may be approved by NRCES on a case-by-case basis for longer projects. b) Saturday: First 8 hours charged at OT; hours over first 8 hours charged at DT.. c) Sundays and Holidays: All time charged at DT. d) The following are included holidays: New Years Day, Presidents Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, Day after Thanksgiving and Christmas Day. Other holidays may apply when employing certain union personnel, including but not limited to: Martin Luther King, Jr. Day, Cesar Chavez's Birthday, Veterans Day, day before Christmas and day after Christmas. e) The above Rates are applied regardless of the number of hours worked for any Client on any particular day. Rates for hours subsequent to a break of less than 8 hours are charged at the appropriate OT or PT rate continuous to hours prior to break.
3. All project specific personnel, including accounting, administrative, personnel support, logistics and management, whether on site, at NRCES offices, or at support locations, are chargeable. All personnel are charged according to the above rates, regardless of full-time, part-time or third party labor source status, unless provided as part of a specified subcontracted service. Surcharges apply for remote sites and prevailing-wage projects.
4. Time charges begin with equipment and personnel mobilization activities and terminate at the conclusion of the services, including transportation of equipment and personnel back to operations centers and any necessary demobilization activities. Personnel time is charged in half-hour increments for all personnel. All hourly rates will be charged Portal-to-Portal from the location of personnel when dispatched, including but not limited to NRCES office, personnel home, hotel or other jobsite as applicable. Personnel on standby for Customer will be charged at 8 hours per 24-hour period.
5. Transportation and any incidental costs for all emergency response personnel, both on site, at support locations and traveling to and from the site or support locations, are charged at cost plus 20%. Per Diem charges for food in metropolitan areas are $50.00 per person per day. Typical per diem rates for lodging, based on double occupancy, are $100.00 per person per day. Rates for premium areas and remote sites determined at time of service.

EQUIPMENT

CATEGORY	ITEM #	DESCRIPTION	UNIT	RATE
BOOM	1001/1002	Anchor Gear / Boom Mooring Light	Day/Each	30.00/13.00
	1003	Contractor Boom, up to 21"	Ft/Day	1.75
	1004	Petro Barrier, up to 24"	Ft/Day	2.50
	1005	Ocean Boom, up to 42"	Ft/Day	6.75
RECOVERY / SKIMMERS	2001	Air Conveyor, VS-50	Day	3,000.00
	2002	Belt Skimmer, Marco Class XI-C	Day	4,000.00
	2003	Belt Skimmer Vessel, JBF DIP 3001	Hour	350.00
	2004	Belt Skimmer Vessel, Marco I C	Hour	375.00
	2005	Brush Skimmer, Lamor	Day	3,600.00
	2006	Brush Skimmer, Aquaguard RBS-40	Day	2,500.00
	2007	Brush Skimmer, Aquaguard RBS-25 or 10 Twin	Day	2,000.00
	2008	Brush/Drum/Disc Skimmer, Aquaguard RBS-05	Day	850.00
	2009	Disc Skimmer, MI-30, Komara 12K	Day	1,800.00
	2010	Disc Skimmer, Vikoma Sea Skimmer	Day	2,000.00
	2011	Drum Skimmer, Roto 70	Day	3,500.00
	2012	Drum Skimmer, Action Petroleum Model 60	Day	1,400.00
	2013	Drum Skimmer, Action Petroleum Model 36	Day	1,200.00
	2014	Drum Skimmer, Action Petroleum Model 24	Day	800.00
	2015	Rope Mop Skimmer, II-9	Day	800.00
	2016	Rope Mop Skimmer, I-4, II-4, II-6	Day	600.00
	2017	Rope Mop Skimmer, extra rope, 100'	Day	110.00
	2018	Vacuum/Transfer Unit (VTU)	Day	1,800.00
	2019	Weir Skimmer, Desmi 250	Day	3,500.00
	2020	Weir Skimmer, Foilex, vacuum	Day	1,500.00
	2021	Weir Skimmer, Foilex, hydraulic	Day	2,500.00
	2022	Weir, Cascade LP 3000 or Vikoma Fastflowec	Day	1,600.00
	2023	Weir Skimmer, Skimpak or Oleo, 2" or 3"	Day	300.00
TEMPORARY STORAGE	3001	Bladder Tank, 24 barrel	Day	250.00
	3002	Bladder Tank, 25 - 100 barrel	Day	500.00
	3003	Bladder Tank, 101 - 240 barrel	Day	1,000.00
	3004/3005	Container, Intermodal or Connex Storage, 20' / 40'	Day	22.00/44.00
	3006/3007	Roll-off Bins, up to 20 cu. yd. / 30-40 cu. yd.	Day	22.00/44.00
	3008	Storage Tank, 500 to 2,499 gal	Day	20.00
	3009	Storage Tank, 2,500 to 4,499 gal	Day	25.00
	3010	Storage Tank, 4,500 to 6,000 gal	Day	35.00
	3011	Tank Barge, up to 210 bbls (NRCES only)	Day	1,500.00
	3014	Tank Barge, Pebble Beach	Day	9750.00
	3012	Tote Tank, DOT approved, 275 to 300 gal	Day	80.00
	3013	Vacuum Box, up to 25 cu. yd.	Day	80.00
VESSELS / SUPPORT	4001	Deck Barge, up to 110'	Day	500.00
	4002	Response Vessel, 65'	Hour	375.00
	4003	Response Vessel, 35' - 55'	Hour	225.00
	4004	Response Vessel, 30' - 34'	Hour	160.00
	4005	Response Vessel, 25' - 29'	Hour	125.00
	4006	Response Vessel, 16'- 24'	Hour	100.00
	4007	Skiffs w/outboard, 15' or less	Hour	50.00
	4008	Skiffs w/o outboard	Hour	25.00
EXCAVATION	5001	Backhoe, 710 or equivalent	Day	375.00
	5002	Backhoe, 580 or equivalent	Day	325.00
	5003/5004	Backhoe Attachment, Breaker / Compactor	Each/Day	220.00/125.00
	5006	Dump Bed, Morooka 5-10 cu. yd.	Day	350.00

CATEGORY	ITEM #	DESCRIPTION	UNIT	RATE
	5021	Dump Truck, 5 cu. Yd, w/ Plow & Sander	Hour	175.00
	5007	Excavator, Mini	Day	325.00
	5008	Excavator, up to 37,000 lb	Day	850.00
	5009	Excavator, 38,000 to 53,000 lb	Day	1,050.00
	5010	Excavator, over 53,000 lb	Day	1,500.00
	5017	Excavator, over 100,000 lb	Hour	250.00
	5011/5012	Excavator Attachment, Thumb or Wheel / Hammer	Each/Day	350.00/550.00
	5013	Loader, Bobcat, Skidsteer or equivalent	Day	350.00
	5014	Loader Attachment, Breaker, Compactor, Grapple	Each/Day	175.00
	5015	Loader, up to 4 yds.	Day	650.00
TRAILERS	6001	Trailer, Confined Space Entry/Rescue	Day	2,000.00
	6002	Trailer, Decon, up to 24'	Day	350.00
	6003	Trailer, Dump, 7,000 lb	Day	250.00
	6004	Trailer, Dump, Side/End, 18 yd.	Hour	35.00
	6005	Trailer, Emergency Response, up to 24'	Day	350.00
	6006	Trailer, Emergency Response, 40'- 48'	Day	500.00
	6007/6008	Trailer, Equipment, Utility, 1-2 ton / 3-10 ton	Day	100.00/250.00
	6009	Trailer, Flatbed, up to 48'	Day	250.00
	6010	Trailer, Incident Command Center, 24'	Day	650.00
	6011	Trailer, Incident Command Center, 48'	Day	1,500.00
	6012	Trailer, Low Boy	Day	300.00
	6013	Trailer, MTR (boom, boat, skimmer add'l if deployed)	Day	350.00
	6014	Trailer, Office	Day	200.00
	6015	Trailer, Rocket (Roll Off) Launcher	Hour	40.00
	6016	Trailer, Side Dump, 3 axle	Day	600.00
	6017	Trailer, Tilt Top, 26 ton	Day	250.00
	6018	Trailer, Van, up to 48'	Day	350.00
	6019	Trailer, Water Buffalo (up to 500 gallons, with pump)	Day	200.00
	6020	Trailer, Wildlife Response and Rehab (supplies add'l)	Day	2,500.00
	6021	Trailer, Wildlife Search & Collection	Day	1,000.00
	6022	Trailer, Wildlife Support	Day	350.00
TRUCKS	7001	Tractor, Diesel	Hour	45.00
	7002	Truck, Camera	Hour	125.00
	7003	Truck, Crane, 1 ton - 6 ton	Hour	65.00
	7004	Truck, Crane, 7 ton - 10 ton	Hour	75.00
	7005	Truck, Crane, 10 ton - 18 ton	Hour	95.00
	7006	Truck, Crane, 40 ton	Hour	140.00
	7007	Truck, Dump, up to 10 yard	Hour	60.00
	7008/7009	Truck, Dump, over 10 yard / with pup	Hour	65.00/70.00
	7016	Truck, Flatbed or Van, 2-Axle, up to 24'	Hour	45.00
	7010	Truck, Gear, less than 1 ton	Day	125.00
	7012	Truck, Gear, 1 ton	Day	150.00
	7014	Truck, Gear, 2 ton - 5 ton	Day	225.00
	7017	Truck, Hazmat Response, up to 24'	Hour	75.00
	7018	Truck, Marine Response	Hour	50.00
	7019/7020	Truck, Roll Off, bobtail / with trailer	Hour	70.00/80.00
	7021	Truck, Water, up to 3000 gallons	Hour	110.00
VACUUM	8001	Guzzler/Air Mover (filters add'l)	Hour	150.00
TRUCKS /	8002	Vactor/Jetter - Combo Unit (attachments add'l)	Hour	185.00
TRAILERS	8003/8004	Vacuum Trailer, 120 -130 bbl, black iron/ stainless	Hour	30.00/45.00
	8005/8006	Vacuum Truck, less than 35 bbl / 35 - 70 bbl	Hour	50.00/60.00
	8007	Vacuum Trailer, less than 50 bbl	Hour	25.00
VEHICLES	9001/9002	All Terrain Vehicle / cargo carrying	Day	240.00/375.00
	9003	Auto, Personnel or Support	Day	100.00

CATEGORY	ITEM #	DESCRIPTION	UNIT	RATE
	9004	Van, MTR (boom, boat, skimmer add'l if deployed)	Day	400.00
	9005	Van, Maintenance, Personnel or Support	Day	150.00
	9006	Wildlife Transport-Care Vehicle	Day	600.00
BLOWERS / COMPRESSORS	1101	Air Compressor, up to 100 CFM	Day	150.00
	1102	Air Compressor, 100 to 185 CFM	Day	225.00
	1103	Air Compressor, 210 to 375 CFM	Day	325.00
	1104	Blower, Coppus, Electric/Pneumatic	Day	100.00
	1105/1106	Blower, Negative Air Exhaust, 6" / 12" (consumables add'l)	Day	75.00/110.00
	1107	Blower, Venturi, Horn	Day	30.00
	1109	Corken Compressor (291T / Corrosive Compatible)	Day	750.00
	1110	Corken Compressor (490T / Corrosive Compatible)	Day	1000.00
	1108	Exhaust Duct, 25' x 6", 10" or 12"	Day	25.00
PRESSURE WASHERS	1202	Hydroblaster, 6,000 psi	Hour	50.00
	1203	Hydroblaster, 10,000 psi	Hour	70.00
	1204	Hydroblaster, 20,000 psi	Hour	180.00
	1209	Jetter Trailer	Hour	95.00
	1206	Pipeline Lancing Nozzle, w/ Hose & Foot Pedal	Day	75.00
	1207/1210	Pressure Washer, up to 3,000 psi, single / dual w/ tank	Day	250.00/600.00
	1208	Pressure Washer, 3,000 to 5,000 psi	Day	350.00
	1205	Remote Tank Cleaning (Gamajet) Head	Day	275.00
	1201	Specialty Nozzles, Roto Jet or Butterworth or equivalent	Day	45.00
PUMPS	1311	Air Conveyor, Vac-U-Max	Day	150.00
	1301/1302	Pump, up to 1", Petroleum / Chemical	Day	60.00/95.00
	1313	Pump, 1" or 2", Jet (Gas Eductor)	Day	$250.00
	1303/1304	Pump, 2", Petroleum / Chemical	Day	85.00/195.00
	1305	Pump, 2", Chemical Peristaltic	Day	350.00
	1306/1307	Pump, 3", Petroleum / Chemical	Day	100.00/295.00
	1312	Pump, 3", Hydraulic (Archimedes/MT30) w/power pack	Day	1,500.00
	1308/1309	Pump, 4", Petroleum / Petro-Submersible	Day	175.00/325.00
	1310	Pump, 5"- 6", Petroleum	Day	400.00
	1314	Pump, Blackmer Stainless Steel Sliding Vane	Day	650.00
	1315	Pump, Corken, Coro Vane or Equivalent	Day	650.00
	1316	Pump, Double Diaphragm, stainless steel, 1" / 2"	Day	200.00/300.00
HOSES / PIPES FITTINGS	1405	Guzzler/Air Mover Vacuum Breaker	Day	30.00
	1406	Guzzler/Air Mover/Jetter Fittings (elbows, tees, etc.)	Day/Each	8.00
	1423	Hose, Chlorine Transfer, certified	Ft/Day	45.00
	1415/1416	Hose, Discharge (lay flat) 2" / 3"	50 ft/Day	10.00/12.00
	1417/1418	Hose, Discharge (lay flat) 4" / 6"	50 ft Day	15.00/25.00
	1401/1402	Hose, Fire, 1.5" / 2.5"	50 Ft/Day	15.00/17.50
	1403/1404	Hose, Guzzler/Air Mover, Flex or Pipe, 4" / 6"	Ft/Day	3.50/4.00
	1420	Hose, Hydraulic, 1"	Ft/Day	25.00
	1421/1422	Hose, LPG/NH_3, 1" Vapor / 2" Liquid Transfer	Ft/Day	10.00/20.00
	1407	Hose, Pneumatic	50 Ft/Day	10.00
	1425	Hose, Stainless Steel	Ft/Day	35.00
	1408/1409	Hose, Suction & Discharge, 2", Petro / Chemical	25 Ft/Day	15.00/30.00
	1410/1411	Hose, Suction & Discharge, 3", Petro / Chemical	25 Ft/Day	25.00/40.00
	1412/1413	Hose, Suction & Discharge, 4", Petro / Chemical	25 Ft/Day	35.00/60.00
	1414	Hose, Suction & Discharge, 6", Petro	25 Ft/Day	45.00
	1424	Hose, Teflon, 1" Rubber Jacketed or 2" Stainless Braid	Ft/Day	35.00
	1419	Hose, Wash, up to 1"	50 ft/Day	10.00
	1426	Stinger, 2", CPVC/SS/Carbon	Day	100.00
	1427	Transfer Fittings (gauges, nipples, risers, etc,)	Transfer	250.00
SUPPORT	1501	Air Knife	Day	150.00
	1554	Airless Sprayer	Day	85.00

CATEGORY	ITEM #	DESCRIPTION	UNIT	RATE
SUPPORT (cont.)	1555/1502	Bag Filter System, Single / Dual Pod (bag filters add'l)	Day	60.00/75.00
	1567/1568	Banding Equipment, 2-inch	Hour/Day	30.00/240.00
	1503	Carbon Filtration System, 55 gal drum	Each	350.00
	1504	Chipping Gun, Pneumatic	Day	40.00
	1505	Compactor, Hand Operated	Day	150.00
	1506	Decon Cleaning Pool, Portable 10' x 15'	Day	125.00
	1507	Decon Cleaning Pool, Portable 10' x 30'	Day	200.00
	1508	Decon Cleaning Pool, Portable 20' x 100'	Day	550.00
	1509	Decon Cleaning Pool, Portable 25' x 50'	Day	275.00
	1510/1553	Decon Station, Personnel 2 / 3 Stage (supplies add'l)	Day	50.00/75.00
	1511	Electrical Accessories (cords, GFI, adaptors)	Day	14.00
	1559/1560	Flare, Ground Set 2" / 3"	Day	200.00/300.00
	1561	Flare, Stack, 2"	Day	100.00
	1562	Flow Meter, 2", Stainless Steel	Day	150.00
	1512/1513	Forklift, 5K to 10K lb / Attachment	Day	275.00/100.00
	1514	Generator, less than 4 kW	Day	50.00
	1515	Generator, 4 kW to less than 7.5 kW	Day	115.00
	1516	Generator, 7.5 kW to 12.5 kW	Day	165.00
	1517	Handheld Pipeline Locator System	Day	150.00
	1518	Jackhammer	Day	150.00
	1519	Ladder, Extension & Folding	Day	40.00
	1557/1558	Laser Level Kit, 1/16" x 100' / ¼" x 100'	Day	55.00/15.00
	1520	Light Tower, Trailer Mounted	Day	175.00
	1521	Light, Explosion-Proof	Day	44.00
	1522/1523	Light, Stand, Regular, 500W / 1000W	Day	16.00/60.00
	1524	Office Space (for command post at NRCES as available)	Day	1,500.00
	1525	Pipe Plug 4" to 18" (includes 20' air line hose)	Day	95.00
	1526	Pipe Plug 18" to 24" (includes 20' air line hose)	Day	155.00
	1527	Pipe Plug 24" to 36" (includes 20' air line hose)	Day	175.00
	1528	Pipe Plug 36" to 48" (includes 20' air line hose)	Day	215.00
	1529	Pipe Plug 48" to 60" (includes 20' air line hose)	Day	350.00
	1563	Portable Breathing Air Compressor	Day	375.00
	1530	Power Pack, Hydraulic, 1 hp (<0.75 kW)	Day	50.00
	1531	Power Pack, Hydraulic, 16 hp (0.75 kW < 12 kW)	Day	138.00
	1532	Power Pack, Hydraulic, 40 hp (12 kW < 30 kW)	Day	275.00
	1533	Power Pack, Hydraulic, 60 hp (30 kW < 45 kW)	Day	500.00
	1564	Power Pack, Hydraulic, 75 hp (45 kW - 56 kW)	Day	750.00
	1534	Road Closure Signs, reflective	Day/Each	50.00
	1535	Road Closure, Barricades, Cones, Delineators	Day/Each	5.00
	1536	Sand & Floor Dry Spreader Attachment	Day	95.00
	1537/1538	Saw, Chain / Cutoff	Day	60.00/125.00
	1539	Soil Sampler, Hollow Stem	Day	50.00
	1556	Surf Rake, Model 600 HD	Day	750.00
	1540	Tools, Hand (brooms, shovels, etc.)	Each/Day	5.00
	1541	Tools, Mechanical Set	Each/Day	50.00
	1542	Tools, Non-Sparking	Each/day	15.00
	1543	Tools, Power, small (drills, sawzall etc.)	Each/Day	35.00
	1565	Trident Magnetic Patch	Day	1,000.00
	1544	Truck Ramps	Day	150.00
	1545/1546	Vacuum, HEPA / Shop (filters add'l)	Day	250.00/50.00
	1547	Vactor/Jetter Attachment (hydro-exca, Drum-It Head, nozzles)	Day/Each	95.00
	1566	Vapor Extraction System, portable	Day	350.00
	1548	Welding Unit / Torch Set, Portable	Day	85.00
	1549	Wildlife Rehabilitation Pool	Day	200.00
	1550	Wildlife Shelter, 19' x 35'	Day	2,000.00
	1551	Wildlife Shelter, 20' x 20'	Day	750.00

Equipment Terms:

1. NRCES does not rent equipment in a bare condition. All equipment shall be operated and controlled by NRCES Personnel only. All equipment sent to site by NRCES shall be in a basic operating condition. Additional components charged to customer include, but are not limited to, multiple hose lengths, blast shields, specialty tips or fittings, specialty connections, noise abatement, catalytic converters, etc. Equipment prices do not include fuel, operator or mobilization unless otherwise stated. Fuel consumed in non-mileage related operation of equipment, including vehicle and non-vehicle equipment and vessels, will be charged at cost plus 20%. Vacuum truck washouts will be charged at cost plus 20%. Regulatory permits and environmental fees (HP Fees, BTU Fees, etc) shall be assessed at cost plus 20% based upon the equipment and duration of such unit.
2. Time charges are calculated portal to portal, including any demurrage beginning with equipment mobilization activities from the NRCES office or operations center unless otherwise specified, including all time at the site. Time charges terminate at the conclusion of the operation, which includes transportation of equipment back to NRCES office or operations center and completion of any necessary demobilization activities, including disposal, cleaning, repair, replacement and/or delivery to NRCES of restored equipment.
3. Day rates are based on 8 hours of operation. Equipment will be charged in half-day increments for additional hours over 8, up to a total of 3 days charge during a 24-hour period. Minimum charge for daily rate equipment is daily charge per day. Minimum call out for hourly equipment is four hours per day for local projects and eight hours per day for projects over 50 miles from mobilization site. Customers will be charged for unused requested equipment until released and returned to service per Note 2.
4. Equipment not specified on the Price List will be charged at cost (including rental, insurance, freight, fuel, etc.) plus 20%.
5. In addition to payment of rental charges, Customer agrees to pay NRCES, in accordance with rates contained in this Price List, for any cleaning or repairs necessary to return all equipment to the same condition as at the commencement of services (with the exception of normal wear and tear). Customer is also responsible for the payment of all transportation and disposal charges for any waste generated during cleaning. Only NRCES or its subcontractors shall perform any cleaning and decontamination operations on all equipment owned, rented or subcontracted by NRCES. If NRCES determines that equipment cannot be returned to the condition it was in at the commencement of the services, Customer shall pay for all costs at cost plus 20%, including freight and other expenses incurred by NRCES to replace this equipment. All boom, whether new or used, that is damaged beyond repair shall be replaced by NRCES with new boom at Customer's expense at cost plus 20%, including freight and other expenses.

MATERIALS AND SUPPLIES

CATEGORY	ITEM #	DESCRIPTION	UNIT	RATE
BAGS/SHEETING	M100	Bulk Bag, 1 yard	Each	22.00
	M101	Plastic Bag, 36" x 60", 6 mil, 50/roll or box	Roll/Box	95.00
	M102	Plastic Bag, 36" x 60" (drum liner)	Each	3.00
	M103	Roll Off Box Liner	Each	35.00
	M104	Sheeting, 20' to 32' x 100', 10 mil	Roll	155.00
	M105	Sheeting, 20' to 32' x 100', 6 mil	Roll	115.00

	D903	Disposal of Non-Haz Liquid Waste at NRCES	Gallon	0.35

Materials and Supplies Terms:

1. All materials and supplies utilized, whether listed in daily reports or not, are chargeable. Any materials or supplies not listed on Price List, including Wildlife Trailer supplies and expendables and third-party invoices for services, charged at cost plus 20%.
2. Quotes for waste disposal are based on meeting approved profiles. NRCES will assist Customer in identifying disposal facility options and provide price quotes. However, this does not constitute a referral and it is the sole responsibility of the Customer to designate the disposal facility. NRCES will not take title to any wastes: dangerous, hazardous or non-hazardous.
3. The number of change-outs of Personal Protective Equipment (PPE) are based on conditions occurring in the work area. PPE shall be changed at a frequency that conforms to safety practices to prevent exposure to employees during the work activity. PPE categories:
   - Level D: Coveralls/Uniform, Steel Toe Boots, Safety Glasses, Work Gloves, Hard Hat and Safety Vest as applicable;
   - Level C: Level D plus, Disposable Tyvek, Full Face or Half Face Respirator (excluding cartridges) ;
   - Level B: Level C plus supplied air and egress air bottle or SBCA (Supplied air equipment includes mask, 100' air supply hose, supplied air, bottle manifold and egress bottle or SBCA);
   - Level A: Quoted per Price List for specific project requests and requirements
4. Petroleum based products prices subject to change at any time based on increased manufacturing costs.
5. NRCES reserves the right to substitute products or equal quality and construction without affecting the performance. NRCES applies the Brand Name of a product as a reference only, and reserves the right to substitute the product for similar and or equivalent products as it deems necessary.
6. NRCES use of facility-directed or customer-directed decontamination products, including but not limited to degreasing agents, cleaners, strippers, conditioners, cutter stock, etc , shall be done at the facility's or customer's risk.
7. A surcharges of $0.15 per mile will be added to Mileage rates for every $0.50 over $4.00 cost per gallon of diesel. A surcharge of $0.25 per gallon will be added to Equipment Fuel rates for every $0.20 over $3.75 cost per gallon of gasoline and $4.00 cost per gallon of diesel. Fuel cost data will be based on fuel prices in the local NRCES office area at time of service per U.S. Energy Information Administration statistics available at www.eia.gov.

ATTN: Mr. Mr. Stevenson

RE: EMERGENCY RESPONE INFORMATION

Dear Mr. Stevenson,

Clean Harbors Environmental Services (CHES) effective response area (1-2 hours) would be approximately 50 miles from Benicia, CA. This would encompass Stockton to the East, Rancho Cordova to the Northeast and Contra Costa, Alameda and Solano counties. Additional coverage would be for Stanislaus, San Joaquin, Sacramento, Marin, Sonoma, Napa and Lake Counties.

CHES' Sparks, NV effective response area (1-2 hours) would be approximately 50 miles from Sparks, NV. This would mean that CHES could respond for the Kinder Morgan Reno Terminal in 2 hours or less in the event of a release. This also covers Sierra, Modoc, Nevada, Placer, Lassen, Plumas, Modoc and Butte counties in California. This would also cover Washoe, Churchill, Douglas and Storey counties in Nevada. We also maintain a network of Field Service offices across the Nation to assist with more remote locations, and can travel as far as required to service our customer's interests. CHES has the ability to mobilize as much equipment and personal needed from other areas in the event of a catastrophic release.

CHES provides support to MSRC for spills involving navigable waters and is a current subcontractor for them. In areas where MSRC does not operate, CHES will provide Emergency Response and boom support as well as shoreline clean-up. For land-based events, CHES will provide a required resources including; soil removal, transportation, disposal services, site restoration, etc.

CHES is currently a United States Coast Guard classified OSRO and has a rating in each of the USCG COTP regions i is area. Please check the attached USCG rating for your area. Additionally we have a current BOA contract with the Coast Guard and several offices in CA have an OSRO rating with the CA Fish and Game and the Department of Oil Spill Prevention and Response. In addition, please see the attached list of personnel and equipment currently at each of our local offices. This will include amount, size of boom and deployment equipment at each location.

CHES has Certificate of Owners Financial Responsibility (COFR) certificates from the USCG and the CA Department of Fish and Game for marine over-the-water transfer of petroleum products.

If you have any questions or need further information, please feel free to contact me at (408) 210-3393.

Sincerely,

Lee Barfield

Marine Spill Response Corporation (MSRC)

03-CK-20291-ORa

AMENDMENT ONE
TO
MARINE SPILL RESPONSE CORPORATION
SERVICE AGREEMENT
FOR CB TRANSITIONAL MEMBERS

The MSRC SERVICE AGREEMENT FOR CB TRANSITIONAL MEMBERS by and between Kinder Morgan (the "COMPANY") and MARINE SPILL RESPONSE CORPORATION ("MSRC"), a standard form of agreement dated as of December 31, 2003 (the "Agreement"), is hereby amended as follows:

1. Section 2.01(a) is hereby amended in its entirety as follows:

2.01(a). Oil Spill Event outside Northern California Operational Area or Not Involving a Covered Facility or Covered Vessel. MSRC will not provide any Resources for a Spill Event occurring outside the Northern California Operational Area (which for the purposes of this Section 2.01(a) includes the area of California inland from the Northern California Operational Area) or not involving a Covered Facility or Covered Vessel. However, if MSRC becomes involved in a response outside the Northern California Operational Area (due to spill migration or any other reason), or involving a non-Covered Facility or non-Covered Vessel, that response will be governed by the terms and conditions of this Agreement.

2. The parties agree this Amendment shall be effective December 31, 2003.

3. Any MSRC response in inland areas of the Northern California Operational Area shall be subject to and in accordance with an Inland (Non-Responder Immunity) Addendum to the Agreement to be executed and maintained by the COMPANY.

IN WITNESS WHEREOF, the parties hereto each have caused this Amendment to be duly executed and effective as set forth above.

ADDENDUM
SERVICE AGREEMENT
(NON-RESPONDER IMMUNITY OIL SPILL RESPONSE)

THIS ADDENDUM TO SERVICE AGREEMENT (this "Addendum"), entered into as of December 31, 2003 modifies and supplements the Service Agreement (the "Service Agreement") by and between Marine Spill Response Corporation ("MSRC") and Kinder Morgan Energy Partners ("Kinder Morgan"), as set forth below. Notwithstanding anything to the contrary set forth in the Service Agreement, this Addendum shall control in the event of a conflict between any provision of this Addendum and any other provision of the Service Agreement.

In consideration of the promises and the mutual covenants of this Addendum, MSRC and Kinder Morgan agree as follows:

1. Kinder Morgan has requested Resources for a Spill Events in a state (California) which has not adopted Responder Immunity.

2. Kinder Morgan and MSRC acknowledge and agree that the lack of Responder Immunity potentially exposes MSRC to additional liabilities. In other states with Responder Immunity, MSRC would not have this exposure, but rather this potential liability would be transferred to the responsible party by the Responder Immunity statute. The intent of this Addendum is to place MSRC and Kinder Morgan in the same respective positions they would be had [state] adopted Responder Immunity.

3. Section 9.03(b) of the Service Agreement is hereby amended in its entirety as follows for this Such Spill Events (with changes underlined):

10/19/04

9.03(b) COVER INDEMNIFICATION. SUBJECT TO THE PROVISIONS OF SECTIONS 9.03(d) AND (e) BELOW, IT IS AGREED THAT THE COVERED ENTITY (Kinder Morgan) WILL DEFEND, INDEMNIFY AND HOLD HARMLESS THE INDEMNITEES AND EACH OF THEM, AGAINST AND FROM ANY AND ALL LOSSES, LIABILITIES, DAMAGES, COSTS AND EXPENSES OF ANY SUCH INDEMNITEES RELATED TO ANY CLAIM ARISING OUT OF, OR IN ANY MANNER CONNECTED WITH, MSRC'S PERFORMANCE OF OR ALLEGED FAILURE TO PERFORM ITS OBLIGATIONS UNDER THIS AGREEMENT AS A RESULT OF A SPILL EVENT WHERE THE INDEMNITEE DEMONSTRATES THAT THE COMPANY, OR ANY APPLICABLE COVERED ENTITY, COULD HAVE BEEN LIABLE IF SUED DIRECTLY OR DID OR DOES HAVE A LIABILITY FOR OR WITH RESPECT TO SUCH CLAIM UNDER OPA OR ANY OTHER APPLICABLE FOREIGN, FEDERAL, STATE OR LOCAL LAW (WHETHER STATUTORY OR COMMON) (OR WOULD HAVE HAD SUCH LIABILITY IF [STATE] HAD ADOPTED RESPONDER IMMUNITY) AND IRRESPECTIVE AS TO WHETHER SUCH LIABILITY WOULD BE CONSIDERED DIRECT, INDIRECT, CONCURRENT, JOINT, PRIMARY, SECONDARY, VICARIOUS OR DERIVATIVE

OF THE LIABILITY OF ANY INDEMNITEE WITH RESPECT TO SUCH CLAIM. IF THE COVERED ENTITY PROVIDING AN INITIAL CALL-OUT NOTICE IS NOT THE "RESPONSIBLE PARTY" FOR THE APPLICABLE DISCHARGE AS DEFINED IN OPA, THE LIABILITY OF THE COVERED ENTITY FOR THE PURPOSES OF THIS SECTION 9.03(b) SHALL INCLUDE THE LIABILITY OF SUCH "RESPONSIBLE PARTY".

4. Section 9.03(d) of the Service Agreement is hereby amended in its entirety as follows for this Such Spill Event (with changes underlined):

9.03(d) Excluded Obligations. The obligations of the Covered Entity under Sections 9.03(b) and (c) shall not include and shall not apply to:

(i) the extent (but only to the extent) that applicable law would render such indemnity or hold harmless agreement void or unenforceable;

(ii) the extent that any Claim is caused by any Indemnitee's gross negligence or willful, reckless, or criminal misconduct;

(iii) the portion of any Claim for which an insurer of MSRC recognizes or otherwise has an obligation to pay under the applicable policy or cover;

(iv) any portion of a Claim arising from or related to services or equipment provided by MSRC to a Spill Event other than pursuant to this Agreement including services or equipment provided by MSRC to a Spill Event after the Covered Entity has, pursuant to this Agreement, terminated the services of MSRC under this Agreement at such Spill Event;

(v) any Claim for personal injury or wrongful death of Persons who are employees of MSRC or MSRC Integral Subcontractors;

(vi) any portion of a Claim with respect to a Spill Event where the payment of such portion of the Claim would cause the aggregate of (i) the amount of any payments actually made by or on behalf of the COMPANY or the Covered Entity to or on behalf of any Indemnitees under this Agreement or any MSRC Subcontractors pursuant to Section 9.03(i) with respect to such Spill Event and (ii) the amount of any payments made by or on behalf of the COMPANY or the Covered Entity for removal costs or damages under OPA with respect to such Spill Event, to exceed the Cap with respect to such Spill Event, whether or not under OPA or any other applicable law or regulation or in any proceeding the Cap can be maintained by the COMPANY or the Covered Entity; provided that the restrictions of this Section 9.03(d)(vi) shall not apply to any Claim for which (A) the COMPANY or the Covered Entity has previously assumed the defense of such Claim under Section 9.03(e), or (B) the Indemnitee would have been entitled to immunity if [state] had in effect Responder Immunity; or

(vii) any portion of a Claim with respect to which an Indemnitee has successfully maintained an immunity from liability under any applicable provision of OPA or other foreign, Federal or state law; provided, however, that the exclusion under this Section 9.03(d)(vii) shall not apply to costs (including attorneys' fees) incurred by the Indemnitee in asserting said immunity.

IN WITNESS WHEREOF, the undersigned have executed this Addendum as of the date first above written.

4.0 SPILL IMPACT CONSIDERATIONS

4.1 CRITICAL AREAS TO PROTECT

The critical areas to protect are classified as high, moderate, and low sensitivity to oil. The Federal, state, and local authorities will further clarify these categories at the time of the response. The categories are defined as follows:

HIGH SENSITIVITY
● Areas which are high in productivity, abundant in many species, extremely sensitive, difficult to rehabilitate, or inhabited by threatened/endangered species. ● Areas which consist of vegetated low banks, freshwater/saltwater marshes, swamps, scrub-shrub wetlands and impact to threatened/endangered species.

MODERATE SENSITIVITY
● Areas of moderate productivity, somewhat resistant to the effects of oiling. ● Areas which consist of mixed sand, gravel beaches, bars, gently sloping banks, and no impact to threatened/endangered species.

LOW SENSITIVITY
● Areas of low productivity, man-made structures, and/or high energy. ● Areas which consist of gravel, sand, or clay material, barren/rocky shores or banks, man-made structures, concrete/compacted earthen drainage ditches and no impact to threatened/endangered species.

4.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES

Environmental/socio-economic sensitivities are of extreme importance when planning a response effort. The health and safety of the public and the environment, as well as the protection of the various socio-economic sensitivities, must be promptly addressed in order to mitigate the extent of damage and minimize the cost of the clean-up effort.

To determine adequate response resources, the Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three (3) tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. The tier requirements for high volume areas are for response in six (6) hours (Tier 1), 30 hours (Tier 2), and 54 hours (Tier 3). High volume areas are listed in 49 CFR 194. The tier requirements for all other areas are for response in 12 hours (Tier 1), 36 hours (Tier 2), and 60 hours (Tier 3).

4.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES (Cont'd)

All environmental/socio-economic sensitivities are worthy of protection, but must be prioritized during a response effort. When making decisions on which areas to designate as collection areas and which to protect, the following sources may be consulted:

- U.S. Fish and Wildlife Service and related state agencies
- Applicable Area Contingency Plans (see CD affixed to inside front cover of Volume 1 and the CD Navigation Summary in Figure 4.2)
- Other industry and private experts

The environmental and socio-economic sensitivities in the area have been broken down into specific categories and identified in this section.

4.3 WILDLIFE PROTECTION AND REHABILITATION

The Company will work with Federal, State, and local agency personnel to provide labor and transportation to retrieve, clean, and rehabilitate birds and wildlife affected by an oil spill, as necessary. Oversight of the Company's wildlife preservation activities and coordination with Federal, State, and local agencies during an oil spill is the responsibility of the Incident Commander.

Special consideration should be given to the protection and rehabilitation of endangered species and other wildlife and their habitat in the event of an oil spill and subsequent response. Jurisdictional authorities should be notified and worked with closely on all response/clean-up actions related to wildlife protection and rehabilitation. Laws with significant penalties are in place to ensure appropriate protection of these species.

4.3.1 Endangered/Threatened Species

The U.S. Fish and Wildlife Service (USFWS) and related state agencies classify the status of various wildlife species in the potentially effected states. A summary of critical birds, reptiles, mammals, and plant species status as related to the Facility's operating areas (area of highest oil spill potential) is presented in Figure 4.1.

4.3.2 Wildlife Rescue

The Company will work with Federal, State, and local agency personnel to provide labor and transportation to retrieve, clean, and rehabilitate wildlife affected by an oil spill, as the situation demands.

4.3 WILDLIFE PROTECTION AND REHABILITATION (Cont'd)

4.3.2 Wildlife Rescue (Cont'd)

The following are items which should be considered for wildlife rescue and rehabilitation during a spill response:

- Bird relocation can be accomplished using a variety of deterrents, encouraging birds to avoid areas of spilled oil. Bird relocation can be accomplished by utilizing deterrent methods including:
  - Use of visual stimuli, such as inflatable bodies, owls, stationary figures, or helium balloons, etc.
  - Use of auditory stimuli, such as propane cannons, recorded sounds, or shell crackers.
  - Use of herding with aircraft, boats, vehicles, or people (as appropriate).
  - Use of capture and relocation.

4.3.3 Search and Rescue - Points to Consider

- **The Company's involvement should be limited to offering assistance as needed or requested by the agencies.**
- Prior to initiating any organized search and rescue plan, **authorization must be obtained from the appropriate federal/state agency.**
- **Initial search and rescue efforts, if needed, should be left up to the appropriate agencies.** They have the personnel, equipment, and training to immediately begin capturing contaminated wildlife.
- With or without authorization it must be anticipated that volunteer citizens will aid distressed/contaminated wildlife on their own. It is important to communicate that it may be illegal to handle wildlife without express authority from appropriate agencies. Provisions should be made to support an appropriate rehabilitator, however, **no support should be given to any unauthorized volunteer rescue efforts.**
- The regulatory agencies and response personnel should be provided the name and location of a qualified rehabilitator in the event contaminated wildlife is captured.
- Resources and contacts that can assist with wildlife rescue and rehabilitation are provided in Section 2.0. This list includes:
  - Outside rehabilitation organizations
  - Local regulatory agencies
  - Other resources

4.4 STAGING AREAS

When establishing personnel and equipment staging areas for a response to a Facility discharge, the following criteria should be evaluated:

- Access to waterborne equipment launching facilities and/or land equipment.
- Access to open space for staging/deployment of heavy equipment and personnel.
- Access to public services utilities (electricity, potable water, public phone, restroom and washroom facilities, etc.)
- Access to the environmental and socio-economically sensitive areas which are projected for impact.

4.5 TRAJECTORY ANALYSIS

Oil spilled on water will react primarily to the effects of wind and current. The oil will tend to spread to a thin layer under the influence of gravity (primary) and chemical (secondary) forces. The following describes the behavior of oil on water:

- Oil will move in the direction and at the rate of the current under negligible wind conditions.
- Oil will move in the direction and at approximately 3.4 % of the velocity of the wind under negligible current conditions.
- The combined effects of wind and current on the oil should be carefully analyzed. A method of vector analysis can be performed to determine the net direction of movement (wind forces can work in addition to, against, or in many other combinations with the current).
- The primary method of surveillance for the Facility will be visual. Visual surveillance is not effective however in rain, fog, darkness, or heavy cloud cover. It is difficult to observe a slick on the water from a boat, dock or land due to the angle of observation. Aerial surveillance is the preferred method of visual surveillance because of the elevated view and the ability to cover a large area in a short period.

ACP/GRP CD
NAVIGATION INSTRUCTIONS
(Excerpt from CD affixed to inside front cover of Volume 1)

KINDER MORGAN

The information contained herein is provided to identify specific spill response and protection strategies for the applicable Kinder Morgan Pacific Operations Regions. Navigating through the bookmark links provided on the CD will take you to the Environmentally Sensitive Sites and the Economically Significant Sites provided in the applicable Area Contingency Plans and Geographic Response Plans.

INSTRUCTIONS FOR USE

1. From the screen on the left, click on region of interest. The different regions are identified by the red font.
2. Once the appropriate region is accessed, click on the "+" to the left of the region name to display the various areas within each region. These are identified with blue font.
3. Once the appropriate area is accessed, the links to the Environmentally Sensitive Sites and the Economically Significant Sites will be available for selection.
   - ➢ It is important to note that once each Environmentally Sensitive Site and Economically Significant Site is accessed, the user will have to scroll to the desired location.
   - ➢ Use the zoom icon to zoom into each page for easier reading.

NOTES:

1. In those areas where the statement "No ACP Information Available" is made, it indicates that there is no ACP or GRP information which is specific to the particular region or area of interest.
2. EPA REGION IX: For areas without specific ACP/GRP information, the Region IX Contingency Plan (RCP) is used as the response guidance; however, this RCP is currently in revision.
3. EPA REGION X: Region X is covered by the Northwest Area Contingency Plan; however, inland facilities are not addressed.
4. Thus, the following areas are covered by specific area contingency or geographic response plans on this CD:
   - Northern Region—Northwest: Linnton-Willbridge, Washington Area
   - Northern Region—Bay: Brisbane, Concord, Richmond, San Jose
   - Southern Region—West: Carson, Mission Valley, Watson
5. And, the following areas do not have specific area contingency or geographic response plans on this CD:
   - Northern Region—Northwest: Oregon Pipelines (inland)
   - Northern Region—Central: Fresno
   - Northern Region—CalNev: Sacramento, Rocklin, Reno
   - Southern Region—East: Imperial, Phoenix, Tucson
   - Southern Region—Central: Colton, Barstow, Las Vegas

5.0 DISPOSAL PLAN

5.1 OVERVIEW

A major oil spill response would generate significant quantities of waste materials ranging from oily debris and sorbent materials to sanitation water and used batteries. All these wastes need to be classified and separated (i.e., oily, liquid, etc.), transported from the site, and treated and/or disposed of at approved disposal sites. Each of these activities demands that certain health and safety precautions be taken, which are strictly controlled by federal and state laws and regulations. This section provides an overview of the applicable state regulations governing waste disposal, and a discussion of various waste classification, handling, transfer, storage, and disposal techniques. It is the responsibility of the Environmental Manager or their designee to manage the following:

- Coordinate waste disposal activities;
- Identify appropriate interim storage methods and locations;
- Coordinate permitting activities needed to ensure proper disposal; and
- Document compliance with appropriate local, State, and Federal handling of hazardous materials and/or wastes.

Material will be containerized or stored in a manner complying with applicable environmental regulations pertaining to the known or suspected materials characteristics. Upon characterization, waste, recyclable materials, or contaminated materials will be treated on-site, recycled, or transported and disposed of at an appropriate KMEP approved facility after appropriate regulatory approval.

5.2 WASTE CLASSIFICATION

Oily - Liquid Wastes

Oily liquid wastes (i.e., oily water and emulsions) that would be handled, stored, and disposed of during response operations are very similar to those handled during routine storage and transfer operations. The largest volume of oily liquid wastes would be produced by recovery operations (e.g., through the use of vacuum devices or skimmers). In addition, oily water and emulsions would be generated by vehicle operations (e.g., spent motor oils, lubricants, etc.), and equipment cleaning operations.

Non-Oily - Liquid Wastes

Response operations would also produce considerable quantities of non-oily liquid wastes. Water and other non-oily liquid wastes would be generated by the storage area and stormwater collection systems, vessel and equipment cleaning (i.e., water contaminated with cleaning agents), and office and field operations (i.e., sewage, construction activities).

Solid Wastes

A solid waste is defined as any discarded material provided that it is not specifically excluded under the regulations. These exclusions cover materials such as domestic sewage and mixtures of sewage discharged through a sewer system or industrial wastewater point source discharges.

A discarded material is any material which is abandoned (disposed of, burned or incinerated) or accumulated, stored or treated prior to being abandoned. A discarded material is also any material recycled or any material considered inherently wastelike. Recycled material is considered solid waste when used in a manner constituting disposal, placed on land or burned for energy recovery.

5.2 WASTE CLASSIFICATION (Cont'd)

Solid Wastes (Cont'd)

A solid waste may be considered a hazardous waste. A solid waste, as defined above, may be a hazardous waste if it is not excluded from regulation and is either a listed hazardous waste or exhibits the characteristics of a hazardous waste. A solid waste exhibits the characteristics of a hazardous waste if it exceeds the thresholds established in determining the following:

1) ignitability
2) corrosivity
3) reactivity
4) toxicity

A solid waste may also become a hazardous waste if it is mixed with a listed hazardous waste or, in the case of any other waste (including mixtures), when the waste exhibits any of the characteristics identified above.

Oily - Solid/Semi-Solid Wastes

Oily solid/semi-solid wastes that would be generated by containment and recovery operations include damaged or worn-out booms, disposable/soiled equipment, used sorbent materials, saturated soils, contaminated beach sediments, driftwood, and other debris.

Non-Oily - Solid/Semi-Solid Wastes

Non-oily solid/semi-solid wastes would be generated by emergency construction operations (e.g., scrap, wood, pipe, and wiring) and office and field operations (i.e., refuse). Vessel, vehicle, and aircraft operations also produce solid wastes.

5.3 WASTE HANDLING

A primary concern in the handling of recovered oil and oily debris is contaminating unaffected areas or recontaminating already cleaned areas. Oily wastes generated during the response operations would need to be separated by type and transferred to temporary storage areas and/or transported to incineration or disposal sites. Proper handling of oil and oily wastes is imperative to ensure personnel health and safety.

Safety Considerations

Care would be taken to avoid or minimize direct contact with oily wastes. All personnel handling or coming into contact with oily wastes would wear protective clothing. A barrier cream can be applied prior to putting on gloves to further reduce the possibility of oily waste absorption. Safety goggles would be worn by personnel involved in waste handling activities where splashing might occur. Any portion of the skin exposed to oily waste would be washed with soap and water as soon as possible. Decontamination zones would be set up during response operations to ensure personnel are treated for oil exposure.

5.3 WASTE HANDLING (Cont'd)

Waste Transfer

During response operations, it may be necessary to transfer recovered oil and oily debris from one point to another several times before the oil and oily debris are ultimately recycled, incinerated or disposed of at an appropriate disposal site. Depending on the location of response operations, any or all of the following transfer operations may occur:

- From portable or vessel-mounted skimmers into flexible bladder tanks, storage tanks of the skimming vessel itself, or a barge.
- Directly into the storage tank of a vacuum device.
- From a skimming vessel or flexible bladder to a barge.
- From a vacuum device storage tank to a barge.
- From a barge to a tank truck.
- From a tank truck to a processing system (e.g., oil/water separator).
- From a processing system to a recovery system and/or incinerator.
- Directly into impermeable bags that, in turn, are placed in impermeable containers.
- From containers to trucks.

There are four general classes of transfer systems that may be employed to affect oily waste transfer operations:

- **Pumps:** Rotary pumps, such as centrifugal pumps, may be used when transferring large volumes of oil, but they may not be appropriate for pumping mixtures of oil and water. The extreme shearing action of centrifugal pumps tends to emulsify oil and water, thereby increasing the viscosity of the mixture and causing low, inefficient transfer rates. The resultant emulsion would also be more difficult to separate into oil and water fractions. Lobe or "positive displacement" pumps work well on heavy, viscous oils, and do not emulsify the oil/water mixture. Double-acting piston and double acting diaphragm pumps are reciprocating pumps that may also be used to pump oily wastes.

- **Vacuum Systems**: A vacuum truck may be used to transfer viscous oils but they usually pick up a very high water/oil ratio.

- **Belt/Screw Conveyors:** Conveyors may be used to transfer oily wastes containing a large amount of debris. These systems can transfer weathered debris laden oil either horizontally or vertically for short distances (i.e., 10 feet) but are bulky and difficult to set up and operate.

- **Wheeled Vehicles:** Wheeled vehicles may be used to transfer liquid wastes or oily debris to storage or disposal sites. These vehicles have a limited transfer volume (i.e., 100 barrels) and require good site access.

Figure 5.1 provides a comparative evaluation of 16 types of transfer systems that could be available for transfer operations.

5.4 WASTE STORAGE

Interim storage of recovered oil, oily and non-oily waste would be considered to be an available means of holding the wastes until a final management method is selected. In addition, the segregation of wastes according to type would facilitate the appropriate method of disposal. The storage method used would depend upon:

- The type and volume of material to be stored.
- The duration of storage.
- Access.

During an oil spill incident, the volume of oil that can be recovered and dealt with effectively depends upon the available storage capacity. Typical short-term storage options are summarized in Figure 5.2. The majority of these options can be used either onshore or offshore.

If storage containers such as bags or drums are used, the container must be clearly marked and/or color-coded to indicate the type of material/waste contained and/or the ultimate disposal option. Bladder or pillow tanks would be acceptable, if the available space can support the weight of both the container and the product.

Fuel barges may be the best option for temporary storage of oil recovered in open waters. Depending on size, these vessels may be able to hold up to 6,000 barrels of oil and water. The barge deck can be used as a platform for operating oil spill clean-up equipment and storing containment boom.

Empty barges have four to six feet draft which would increase when these barges are filled with oil or loaded with cargo. Consequently, they may not be able to enter shallow, nearshore waters.

It may be difficult to offload recovered oil stored inside barges. Due to natural forces which affect spilled oil, recovered oil may be very viscous or emulsified, rather than free-flowing. It may be necessary to use steam to heat viscous oil before pumping it from the barge.

Steel or rubber tanks can be used to store oil recovered near the shoreline. To facilitate offloading, demulsifiers may be used to break emulsions prior to placing the recovered substance into the barges or storage tanks.

Use of any site for storage is dependent on the approval of the local authorities. The following elements affect the choice of a potential storage site:

- Geology.
- Ground water.
- Soil.
- Flooding.
- Surface water.
- Slope.
- Covered material.
- Capacity.
- Climatic factors.
- Land use.
- Toxic air emissions.
- Security.
- Access.
- Public contact.

5.4 WASTE STORAGE (Cont'd)

Temporary storage sites should use the best available technology to protect the environment and human health. They should be set up to prevent leakage, contact, and subsequent absorption of oil by the soil. The sites should be bermed (1 to 1.5 meters high) and double lined with plastic or visqueen sheets 6-10 mils or greater in thickness, without joints, prior to receiving loose and bagged debris. The edges of the sheet should be weighted with stones or earth to prevent damage by wind, and the sheet should be placed on a sand layer or an underfelt thick enough to prevent piercing. A reinforced access area for vehicles at the edge of the site should be provided. In addition, the oily debris should be covered by secured visqueen or tarps and an adequate stormwater runoff collection system for the size and location of the site would be utilized. Additionally, the sites should be at least three (3) meters above mean sea level.

Oily debris can be hauled to approved temporary storage sites in visqueen lined trucks or other vehicles. Burnable, non-burnable, treatable and re-usable materials can be placed in well defined separate areas at temporary storage sites.

When the last of the oily debris leaves a temporary storage site, the ground protection would be removed and disposed of with the rest of the oily debris. Any surrounding soil which has become contaminated with oil would also be removed for disposal or treatment. If the soils were removed for treatment, they may be replaced if testing proves acceptable levels have been achieved. Treatment and remediation is encouraged when feasible. The temporary storage should be returned to its original condition.

5.5 WASTE DISPOSAL

Techniques for Disposal of Recovered Oil

Recovery, reuse, and recycling are the best choices for remediation of a spill, thereby reducing the amount of oily debris to be bermed onsite or disposed of at a solid waste landfill. Treatment is the next best alternative, but incineration and burning for energy recovery have more options within the state. There are some limitations and considerations in incinerating for disposal. Environmental quality of incineration varies with the type and age of the Facility. Therefore, when incineration becomes an option during an event, local air quality authorities would be contacted for advice about efficiency and emissions of facilities within their authority. Approval of the local air authorities is a requirement for any incineration option. Landfilling is the last option. Final disposal at a solid or dangerous waste landfill is the least environmentally sound method of dealing with a waste problem such as oily debris.

During an oil spill incident, KMEP would consult with the Federal and state On Scene Coordinator to identify the acceptable disposal methods and sites appropriately authorized to receive such wastes. KMEP maintains a list of approved disposal sites that satisfy local, state, and Federal regulations and KMEP requirements. This identification of suitable waste treatment and disposal sites would be prepared by the Environmental Manager or their designee in the form of an Incident Disposal Plan which must be authorized by the U.S. Coast Guard and/or the EPA. An Incident Disposal Plan would include predesignated interim storage sites, segregation strategies, methods of treatment and disposal for various types of debris, and the locations/contacts of all treatment and disposal site selections. Onsite treatment/disposal will be preferred.

5.5 WASTE DISPOSAL (Cont'd)

Techniques for Disposal of Recovered Oil (Cont'd)

In order to obtain the best overall Incident Disposal Plan, a combination of methods should be used. There is no template or combination of methods that can be used in every spill situation. Each incident should be reviewed carefully to ensure an appropriate combination of disposal methods are employed.

The different types of wastes generated during response operations would require different disposal methods. To facilitate the disposal of wastes, they should be separated by type for temporary storage, transport and disposal. Figure 5.3 lists some of the options that would be available to segregate oily wastes. The table also depicts methods that may be employed to separate free and/or emulsified water from the oily liquid waste.

The following is a brief discussion of some disposal techniques available for recovered oil and oily debris.

Recycling

This technique entails removing water from the oil and blending the oil with uncontaminated oil. Recovered oil can be shipped to refineries provided that it is exempt from hazardous waste regulations. There it can be treated to remove water and debris, and then blended and sold as a commercial product.

The Environmental Manager or their designee is responsible for ensuring that all waste materials be disposed of at an internally approved disposal site.

Incineration

This technique entails the complete destruction of the recovered oil by high temperature thermal oxidation reactions. There are licensed incineration facilities as well as portable incinerators that may be brought to a spill site. Incineration may require the approval of the local Air Pollution Control Authority. Factors to consider when selecting an appropriate site for onsite incineration would include:

- Proximity to recovery locations.
- Access to recovery locations.
- Adequate fire control.
- Approval of the local air pollution control authorities.

In Situ Burning/Open Burning

Burning techniques entail igniting oil or oiled debris and allowing it to burn under ambient conditions. These disposal techniques are subject to restrictions and permit requirements established by federal, state and local laws. They would not be used to burn PCBs, waste oil containing more than 1,000 parts per million of halogenated solvents, or other substances regulated by the EPA. Permission for *in situ* burning may be difficult to obtain when the burn takes place near populated areas.

5.5 WASTE DISPOSAL (Cont'd)

In Situ Burning/Open Burning

As a general rule, *in situ* burning would be appropriate only when atmospheric conditions will allow the smoke to rise several hundred feet and rapidly dissipate. Smoke from burning oil will normally rise until its temperature drops to equal the ambient temperature. Afterwards, it will travel in a horizontal direction under the influence of prevailing winds.

Landfill Disposal

This technique entails burying the recovered oil in an approved landfill in accordance with regulatory procedures. Landfill disposal of free liquids is prohibited by federal law in the United States.

With local health department approval, non-burnable debris which consists of oiled plastics, gravel and oiled seaweed, kelp, and other organic material may be transported to a licensed, lined, approved municipal or private landfill and disposed of in accordance with the landfill guidelines and regulations. Landfill designation would be planned only for those wastes that have been found to be unacceptable by each of the other disposal options (e.g., waste reduction, recycling, energy recovery). Wastes would be disposed of only at Company-approved disposal facilities. The Environmental Manager or their designee is responsible for ensuring that all waste materials are disposed of at a Company internally approved disposal site. Disposal at a non-approved facility would require approval by the Environmental Manager or their designee prior to sending any waste to such a facility.

KEY TO RATINGS: 5 = Best; 1 = Worst

KEY TO COMMENTS:

A. Normally require remote power sources, thus are safe around flammable fluids.
B. Should have a relief valve in the outlet line to prevent bursting hoses.
C. Air powered units tend to freeze up in sub-freezing temperatures.
D. Units with work ball valves are difficult to prime.
E. Some remotely powered types are designed to fit in a tanker's butterworth hatch.
F. Can also pump air at low pressure.
G. Transfer is batch-wise rather than continuous.
H. Waste must be in separate container for efficient transfer.
I. Transportable with its own prime mover.
J. High shear action tends to emulsify oil and water mixtures.

9.1.3 INTRODUCTION

KMEP, in compliance with CCR Title 14, Division 1, Sections 815-819, has elected to substitute its approved DOT Oil Spill Response Plan for a blanket California OSPR Contingency Plan supplemented by this section. A complete Cross Reference of OSPR regulations to this substitute plan is included in Volume 1.

This OSPR section for the Northern Region – California Nevada Areas provides additional spill planning and response information appropriate for use along identified OSPR line segments of the KMEP pipeline system in these Areas.

The line segments referenced in Figure 9.1 have been identified as subject to OSPR jurisdiction based on the likelihood of a worst case pipeline rupture potentially resulting in impact to California marine waters. Figure 9.1 lists valve or control point locations, distances to marine waters, and reasonable worst case spill (RCWS) volumes.

This Section 9 is provided in order to document the following OSPR pipeline segment-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- OSPR Pipeline Segment Information (Figure 9.1)
- HCA Index Map (Figure 9.2)
- Discharge Scenarios (Section 9.3)
- Reportable Oil Discharge History (Section 9.4)
- Risk Analysis Summary (Section 9.5)
- Offsite Consequence Analysis (Section 9.6)
- Risk Reduction Incentive Programs (Section 9.7)
- Drug and Alcohol Policies (Section 9.8)

9.2 OSPR LINE SEGMENTS

The pipeline segments identified in Figure 9.1 for this area have been identified as subject to OSPR contingency plan requirements. The segments were selected based on the likelihood of a worst case pipeline release potentially resulting in impacts to California marine waters. Some minor ephemeral drainages crossed at substantial distances from coastal waters are not included due to the sufficient time to respond and avoid marine water impacts.

Design Details:	The design details of these line segments are provided on large-scale, alignment sheets which are revised and updated as needed. Detailed procedures for operating the pipeline system are contained within KMEP's Operations Manuals.
Products Handled:	Gasoline, Diesel and Jet Fuel

FIGURE 9.1

OSPR JURISDICTIONAL PIPELINE SEGMENTS (Cont'd)

GENERAL INFORMATION (Cont'd)	
Seasonal Weather Conditions:	
Air Temperature:	Ranges from 30° to 95°F
Water Temperature:	Ranges from 40° to 76°F
Winds:	Generally southwest at 15 to 25 mph in afternoons from April to September; calm in other months except during storms.
Rain:	Generally 16 to 20 inches per year during October to May.
River Stage/Tidal Range:	Sacramento River – generally from 0 to 3 feet with extremes being – 0.9 feet and +3.6 feet. San Joaquin River – generally from 0 to 4 feet with extremes being – 0.7 feet and + 4.9 feet.
Site Descriptions:	
Sacramento Area:	The Sacramento area is located within the Sacramento Valley, at the northern end of the broad, flat California Central Valley. The region consists of mostly flat, fertile terrain, as well as the Sacramento – San Joaquin River Delta, which is tidally influenced by the San Francisco Bay. This region is dependant on its levee system to control the waters of the delta.
Stockton Area:	The Stockton area is located on the San Joaquin River south of Sacramento. The region is located within the broad, flat California Central Valley and consists of flat, fertile terrain, as well as the vast Sacramento – San Joaquin River Delta, which is tidally influenced by the San Francisco Bay. The region is heavily dependant of its levee system to control the waters of the delta.

Note[3]: Reasonable worst case spill volume based on annual Liquid Volume Release Modeling which takes into account maximum pumping rate, discovery/shutdown times and drainage volumes based on elevation changes between isolation points (EFRDs and/or endpoint block valves).

FIGURE 9.1 OSPR JURISDICTIONAL PIPELINE SEGMENTS (Cont'd)

PREVENTION MEASURES

KMEP Operations and Maintenance Manuals

KMEP facilities are built and maintained in accordance with all applicable codes and regulations as well as relevant API (American Petroleum Institute) standards. Pipelines are coated and cathodically protected. Any abnormalities found by periodic maintenance inspections and/or internal inspections are promptly repaired. The Company's operating practices meet or exceed industry standards.

KMEP Operations and Maintenance Manuals have been developed in accordance with DOT 49 CFR 195 and various of the operations, inspection, and maintenance procedures have been summarized below for reference. The design and installation details of KMEP's pipelines are provided on large-scale alignment sheets which are revised and updated as needed.

Integrity testing of pipelines and leak detection equipment.

Pipelines are hydrostatically pressure tested, in accordance with DOT Part 195 when installed. In addition, KMEP performs integrity testing of OSPR pipelines by utilizing internal inspection tools or pressure test every five years. The internal inspection log produces data which is read and interpreted by third party experts and KMEP designs its verification and repair program utilizing these results.

Line monitoring and leak detection is described in the Operations Manual.

Damage criteria for equipment repair or replacement.

Damage criteria for pipelines (which would require action to be taken, such as reducing the maximum operating pressure, pipeline repair or replacement) is included in the Maintenance Manual (and generally follows ASME B31G).

Protection measures for areas subject to flooding.

Certain sections of the pipeline cross streams, rivers and bays. Other areas may be subject to periodic flooding during periods of high rainfall.

During initial pipeline construction, streambed profiles and pipe profiles are designed and installed to withstand or be protected from the effects of flooding. In addition, major waterway crossings are inspected periodically. For example, pipeline crossings are inspected every 5 years. If necessary, rip-rap or other protective covering is installed.

Describe any leak detection, spill prevention safety and alarm systems, devices, equipment or procedures.

9.3 DISCHARGE SCENARIOS

Reasonable worst case spill (RWCS) volumes were calculated for each OSPR Line Segment to determine the segments which had the largest potential spill volumes and impacts to marine waters. OSPR Line Segments are defined by the valve or control points on either side of drainage crossings. In parallel approaches along marine waters, the segment of the line with the longest distance between valves was used to calculate spill volumes, although in long approaches many valves may be present.

Drain down after a pipeline rupture generally contributes most of the spill volume from a significant pipeline rupture, since computer and operator monitoring normally shuts off all pumping within a reasonably brief time following a release. Precise predictions of drain down volumes is a function of the size of the pipe, topography, elevation of the break, and other variables. Motor operated remote valves and check valves effectively prevent drain down where present. Conservative assumptions were used to calculate reasonable worst case spill volumes.

Note: The quantity associated with "the loss of the entire capacity of all in-line, break-out and portable storage tank(s)…" is excluded from the RWCS volume calculation since these tanks are under SPCC jurisdiction (i.e., tanks are subject to Chapter 6.67 or Chapter 6.7 of Div. 20, CA health and Safety Code and thus, exempt from this calculation.)

The Reasonable Worst Case Spill (RWCS) volumes are consistent with the OSPR criteria as described below.

CALIFORNIA OSPR Discharge Volume Calculation

- **Reasonable Worst Case Spill (RWCS)**
  The largest volume (bbls) at the following:
  - *The pipeline's maximum release time in hours (i.e., the time between pipeline rupture and discovery, plus the maximum shut-down response time in hours based on historic discharge data or in the absence of such historic data, the operator's best estimate), multiplied by the maximum flow rate expressed in barrels per hour (based on the maximum daily capacity of the pipeline), plus the largest line drainage volume after a shutdown of the line section(s) in the response zone expressed in barrels. (As used in this subsection: line section means a continuous run of pipe that is contained between adjacent pressure pump stations, between a pressure pump station and a Facility or break-out tank, between a pressure pump station and block valve, or between adjacent block valves; response zone means a geographic area either along a length of pipeline or including multiple pipelines, containing one or more adjacent line sections, for which the operator must plan for the deployment of, and provide spill response capabilities. The size of the zone is determined by the operator after considering available capabilities, resources, and geographic characteristics); or*
  - *The largest foreseeable discharge for the line section(s) within a response zone, expressed in barrels, based on the maximum historic discharge, if one exists, adjusted for any subsequent corrective or preventive action taken.*

OSPR PERSISTENCE FACTORS

Oil Group	Group 1	Group 2	Group 3	Group 4
On-Water Volumes	(b) (7)(F), (b) (3)			

9.3 DISCHARGE SCENARIOS (Cont'd)

OSPR EMULSIFICATION FACTORS				
Oil Group	Group 1	Group 2	Group 3	Group 4
Emulsification	(b) (7)(F), (b) (3)			

OSPR DAILY RECOVERY RATES (Cap) HIGH VOLUME PORTS				
Delivery Time (Hrs)	6	24	36	60
Bbls/Day Capability	(b) (7)(F), (b) (3)			

OSPR DAILY RECOVERY RATES (Cap) FACILITY/TRANSFER AREAS AND SANTA BARBARA CHANNEL AREA			
Delivery Time (Hrs)	12	36	60
Bbls/Day Capability	(b) (7)(F), (b) (3)		

Realistic worst case spill volume based on 3 minute pumping plus 60% of volume between isolation points (EFRDs and/or endpoint block valves). The RWCS for each OSPR Line Segment is referenced in Figure 9.1 and the largest RWCS for this Region is as follows:

- Largest RWCS in Region = (b) (7)(F),

The planning volumes based on the largest RWCS for the OSPR pipeline segments in this Region are provided below, based on a nearshore/inland environment and an emulsification factor of 1.8 for Group 2 Oil discharges of gasoline, diesel and jet fuel.

OSPR – RESPONSE PLANNING VOLUME CALCULATIONS

(b) (7)(F), (b) (3)

9.4 REPORTABLE OIL DISCHARGE HISTORY

A summary of significant spills that occurred prior to KMEP ownership is provided in Section 9.5. A summary of significant OSPR Line Segment spills that have been recorded in this Region is provided in the following table. (Note: A significant spill is a spill of one barrel or greater reported within control points of each OSPR line segment.)

Line Section	Pipeline Milepost	Date	Volume	Product	Cause
45		12/7/02	(b) (7)(F), (b) (3)	Mix/Transmix	Equipment and operators

9.5 RISK ANALYSIS SUMMARY

A summary of the Risk Analysis and the Offsite Consequence Analysis developed during October through December 2007 to address updated Company policies and procedures, and account for additional line segments and facilities not considered in previous efforts, is presented on pages 9-14 through 9-37.

A full version of this document is available on request.

9.6 OFFSITE CONSEQUENCE ANALYSIS

Refer to pages 9-14 through 9-37.

OSPR PIPELINE SEGMENTS – RISK ANALYSIS SUMMARY

Risk Analysis Summary

A Risk Analysis was conducted on segments of the Kinder Morgan Pacific Region Pipeline and some fixed facilities within California that are jurisdictional to OSPR regulations. The method used for the Risk Analysis consisted of both a "checklist" and "what if" scenarios. The Risk Analysis team consisted of various Subject Matter Experts (SMEs) as well as others knowledgeable as to the risk analysis process. During numerous SME sessions, the SMEs were asked to provide technical information within their field of knowledge or experience directly relating to specific risk issues. The information gathered from the various SMEs was presented to the Risk Analysis Team during team meetings conducted over an approximate two (2) month period, and compiled to gauge the level of risk facing the OSPR jurisdictional pipeline segments and facilities.

2.0 RISK ANALYSIS TEAM CONSENSUS REPORT

2.1 DIRECT IMPACT ISSUES:

The team has concluded policies, practices and procedures that are currently in place are adequate with respect to those issues having a direct affect on safe pipeline operations.

2.2 INDIRECT IMPACT ISSUES

The team has identified some opportunities for improvement with respect to the following issues in the categories that indirectly impact safe operations:

- Reinforce the procedures that are followed for updating alignment sheets to assure that revision submittals have been completed (Issues AM-1 and AM-2).

- Proceed with the program for "Continuing Risk Analysis to Identify Preventative and Mitigative Measures" (Procedure L-O&M 275) for the OSPR-jurisdictional pipelines in the Pacific Region (Issue AM-9).

- Proceed with the program to complete the Emergency Flow Restriction Device studies for the OSPR-jurisdictional pipelines in the Pacific Region, when those pipeline segments are next integrity inspected (Issue O-6).

- When reviewing some of the forms placed in use in recent months there was some uncertainty as to what data might be needed and what data might not be required under some circumstances. Updated instructions for preparation of these forms have been drafted. All locations should proceed to implement these instructions (Issue M-7).

The above summary of conclusions and the detailed conclusions of the several integrity issues addressed in Section 3.0 of this report represent a consensus of the following Subject Matter Experts participating in the analysis:

Edward (Buzz) Fant
Phil Vasquez
Larry Hosler
Ed Hahn
Bob Cote
Mike Outlaw
Mike Ortiz

3.0 SUBJECT MATTER EXPERT EVALUATIONS

The Risk Analysis Team, upon reviewing the comments by team SMEs developed in both group sessions and one-on-one with the Risk Analysis Coordinator, has reached consensus on the following conclusions and recommendations.

3.1 PIPELINE RISK ISSUES

ADMINISTRATIVE AND MANAGEMENT ISSUES	
The following two issues are related and were reviewed as a single issue by the SMEs.	
AM-1	Maps and drawings accuracy: Do pipeline maps and drawings reflect accurate pipeline and related information? Are pipeline locations based on GPS data? Have the drawings been digitized for reliable database reference?
AM-2	Maps and drawings current: Are procedures in place to insure that maps and drawing have up-to-date information? Are field drawings 'red-lined" pending engineering revisions?

Primary SMEs: Phil Vasquez, Larry Hosler, Bob Cote
Others offering comments: Steve Marositz, Curtis Parker, Pete Murphy, Grant McClellan

Comments: The current process for maintaining maps and records is reasonably good. Some areas maintain their master set of alignment sheets current by "red-lining" changes until revisions have been completed, while other locations do not. There is currently a substantial delay in getting revisions back, and no current procedure for confirming that revisions submitted by field personnel have been completed.

New procedures implemented in recent months have been reinforced to better assure accuracy and should improve revision turnaround time. The process for managing the preparation of all alignment sheets, which includes having all revision data entered electronically and having all current alignment sheets available to all users on line, is currently a "work-in progress".

Recommendation: There should be a procedure established to follow up on pending revisions to confirm they have been accurately made, and are received back on a timely basis. When the electronic version of the alignment sheet maintenance process has been completed the procedures that guide the process should be reviewed to confirm applicability; and they should include a procedure for the personnel submitting revisions to confirm that the electronic updating has been completed.

The following two issues are related and were reviewed as a single issue by the SMEs.	
AM-3	Qualified personnel for operations: Are all personnel involved in pipeline operations qualified? How is qualification determined?
AM-4	Qualified personnel for maintenance: Are all personnel involved in pipeline maintenance efforts qualified? How is qualification determined?

Primary SMEs: Buzz Fant, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: The OQ program as set forth in API 1162 is the guidance for this issue. It is monitored on a continuing basis to assure compliance. The SMEs that addressed this issue confirmed that regional personnel having oversight of the OQ program are knowledgeable in the OQ program requirements and follow them when covered tasks are being performed.

Recommendations: None

AM-5	Qualified personnel for line locates: Are all personnel involved in one call responses and line locates familiar with locate requirement, marking, pipe locator usage, documentation and follow-up?

Primary SMEs: Phil Vasquez, Larry Hosler, Buzz Fant
Others offering comments: Steve Marositz, Curtis Parker

Comments: The SMEs that addressed this issue have confirmed that all personnel associated with line locates are qualified under the OQ program and are thoroughly trained in line locate and marking requirements; and are adequately trained in the use of line locate equipment.

Recommendations: None

AM-6	Qualified contractor personnel: Are all contractor personnel involved in pipeline maintenance efforts qualified? How is qualification determined?

Primary SMEs: Phil Vasquez, Larry Hosler, Bob Cote
Others offering comments: Steve Marositz, Curtis Parker

Comments: We have a firm requirement in our contracts with contractors requiring them to fully comply with OQ guidelines. All contract personnel that may perform covered tasks must be pre-identified by name and must be in the ISNetworld database. The SMEs that addressed this issue confirmed that regional personnel having oversight of contractors performing covered tasks are knowledgeable in the OQ program requirements as they apply to contract personnel, and they follow them when contract work us being performed.

Recommendations: None

AM-7	Contractor supervision: Are all contractor personnel adequately supervised when performing maintenance work on or adjacent to pipeline facilities? Who determines level of supervision required? How is contractor performance verified?

Primary SMEs: Phil Vasquez, Larry Hosler, Bob Cote
Others offering comments: Steve Marositz, Curtis Parker

Comments: We have a firm requirement in our contracts that require full time supervision of all maintenance personnel by qualified contractor supervisors. The SMEs that addressed this issue confirmed that regional personnel having oversight of contract work are knowledgeable in this requirement. The KM contract inspector assigned to oversee the contract work determines the level of contrast supervision that the work may require. The KM contract inspectors enforce this requirement.

Recommendations: None

AM-8	Relief personnel: What is the source of relief personnel for routine operating and maintenance positions? Is there adequate depth of trained/qualified relief personnel?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: We have adequate qualified personnel to fill in as may be required for routine operations tasks and for maintenance work. Personnel are cross-trained in multiple disciplines so they can back stop any short time gaps that may develop. The SMEs that addressed this issue confirmed that all relief personnel that may be required to perform covered tasks have the requisite qualifications.

Recommendations: None

AM-9	Integrity Management Program (IMP): Has the operator established an Integrity Management Program for the pipeline systems that are subject to the PHMSA IMP program? Is it being followed at all locations where required? Are all elements of the program being adequately documented?

Primary SMEs: Mike Outlaw
Others offering comments: Buzz Fant

Comments: The IMP has been in place as required by the pipeline regulations. The SME that addressed this issue confirmed that baseline integrity assessments have been performed throughout the Pacific Region based on a priority schedule that was identified at the inception of the program. The baseline and follow-up inspections are administered by a risk management person in the Pacific Region.

The SME confirms that they have a program in place to conduct annual reviews of the risks associated with each segment. The follow up throughout the Pacific Region to address any corrective or mitigative efforts that may be required as a result of the annual reviews will be initiated in 2008.

Recommendations: Proceed with the program to follow up on any corrective or mitigative efforts required based on the annual reviews of Pacific Region pipeline segments.

AM-10	Management of Change: Has the operator adopted the "Management of Change" concept or something similar? If so, how has it been conveyed to all personnel? If no, what process is used to convey operating and procedural change information to personnel?

Primary SMEs: Buzz Fant, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: An extensive MOC procedure is in place and it is used to address all variety of changes. The SMEs that addressed this issue confirmed that regional personnel having responsibility for MOC initiation and processing are knowledgeable in the MOC requirements, and they follow them whenever any applicable change is being considered.

Recommendations: None

The following two issues are related and were reviewed as a single issue by the SMEs.

AM-11	Operations and Maintenance (O/M) Manual: Is the manual complete, used by all, relevant to current operations.
AM-12	Procedure amendments: Is there a process for amending operating and maintenance procedures when needed and conveying these changes to all personnel?

Primary SME: Buzz Fant

Comments: The L-O&M Manual is an extensive compilation of procedures that are relevant to all phases of operations and maintenance. It is accessible on-line for all personnel that have a need to refer to it. It is maintained current by a rigorous amendment process. Changes are made available to all personnel. The SMEs that addressed this issue confirmed that regional personnel are familiar with the on-line set of procedures and have ready access to them whenever necessary.

Recommendations: None

AM-13	Reference materials: Do all locations have copies of applicable regulations, standards, recommended practices that are applicable to those areas of operation? Are personnel sufficiently familiar with those documents?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Curtis Parker, Buzz Fant

Comments: All such references are available on-line. The SMEs that addressed this issue confirmed that regional personnel having a need to access such documents know where to obtain them.

Recommendations: None

OPERATIONS ISSUES

The following two issues are related and were reviewed as a single issue by the SMEs.

O-1	Segment MOP: Has the MOP for each segment of line been determined? Is it recorded and clearly identified for operators and controllers? Is it consistent with the pressure relief and pressure control settings?
O-2	Overpressure relief: Are the overpressure relief systems set at the appropriate level above MOP? Are they adequately sized? Are they tested and tagged as required?

Primary SMEs: Bob Cote

Comments: The MOP for each line segment has been established. It is known by those that have to apply the MOP in operations. (b) (7)(F), (b) (3) [redacted].

The SMEs that addressed this issue confirmed that the controllers and others responsible for pipeline operations understand the MOP and the MAOP of each line segment. The SMEs also confirmed that the relief pressure settings are properly set to assure that the MAOP is never exceeded in any portion of the line segment.

Recommendations: None

O-3	Personnel work hours: Are operator and controller work shifts designed to assure minimization of fatigue?

Primary SMEs: Phil Vasquez, Larry Hosler, Ed Hahn
Others offering comments: Gary Yates, Steve Marositz, Curtis Parker

Comments: The work shifts of all personnel (field personnel, station operators and controllers) are managed in a manner that the fatigue factor is controlled. The SME responsible for controller personnel emphasized that fatigue awareness and fatigue management is emphasized. Actions or incidents that may suggest fatigue could have been a contributing factor are investigated. Job performance is monitored to assure that if it appears to be an impending concern for any individual or group follow-up investigation would be conducted.

Recommendations: None

O-4	Fail-safe operations: Are line segments designed to fail safe in case of communications failure between the segment and the controllers?

Primary SME: Ed Hahn
Others offering comments: Gary Yates

Comments: (b) (7)(F), (b) (3) [redacted]

Recommendations: None

O-5	Backup operations: Are personnel available to staff remote facilities in case of prolonged communications failures or other situations where remote monitoring may be inadequate? Are these personnel sufficiently trained to operate such facilities?

Primary SMEs: Ed Hahn, Phil Vasquez, Larry Hosler

Comments: The SMEs that addressed this issue confirmed that the standard practice is to shut down remotely operated facilities when prolonged communications failures persist, rather than arrange for remote staffing.

Recommendations: None

O-6	Has the EFRD evaluation been conducted on this segment? Were EFRD recommendations implemented? If not, was the rationale for not following the recommendations documented?

Primary SMEs: Mike Outlaw, Mike Ortiz

Comments: The program for EFRD evaluations in conjunction with the Integrity Management Program is currently in progress. It has not yet been initiated for the Pacific Region Pipelines. The SMEs that addressed this issue have confirmed that the EFRD studies are being programmed in conjunction with integrity inspections..

Recommendation: Perform the EFRD analyses for the Pacific Region segments when those segments are next integrity inspected.

MAINTENANCE ISSUES

The following five issues are related and were reviewed as a single issue by the SMEs.

M-1	Rights-of-Way visibility: Does the segment have adequate right-of-way visibility to assure effective aerial patrol surveillance?
M-2	Aerial Markers: Are they adequate, properly spaced, in good condition, visible from air?
M-6	Line marker maintenance: Are all markers maintained in good condition, with current operator information?
P-5	Line marker adequacy: Are line markers located at all appropriate locations (as required by regulations plus other locations where they may be needed to insure location awareness)?
P-6	Line marker alternatives: In areas where typical post type markers cannot be situated or kept, what alternatives are used?

Primary SMEs: Phil Vasquez, Larry Hosler

Comments: All rights-of-way that are covered by aerial patrol are adequately cleared for surveillance. We have a routine program for monitoring the condition of line and aerial markers and replace them as necessary. Where appropriate we have surface markers that can be used in place of post markers.

Recommendations: None

The following three issues are related and were reviewed as a single issue by the SMEs.	
M-3	Cathodic Protection: Does the line have cathodic protection? If not, what is the rationale?
M-4	Cathodic protection annual surveys: Have annual surveys been done on each line segment? If not, what is the survey frequency? Is the frequency deemed adequate?
M-5	Cathodic protection close interval surveys: Have CIS been done on each segment? What was the rationale for doing or not doing? Are alternatives to CIS being used and if so, what is rationale?
Primary SMEs: Phil Vasquez, Larry Hosler Others offering Comments: CP technicians Comments: Annual surveys are done regularly and the resulting data is reviewed by NACE certified CP technicians. The SMEs that addressed this issue confirmed that the decision to conduct a CIS would depend on the results of the annual survey; and where warranted a CIS would be performed. Recommendations: None	
M-7	Maintenance records: Are all records (routine and abnormal) that may be required to confirm and support routine maintenance retained and available as may be required by management and regulatory agencies?
Primary SMEs: Phil Vasquez, Larry Hosler Others offering comments: Steve Marositz, Buzz Fant Comments: All records required to confirm compliance and to assure continued compliance with the routine maintenance programs are being developed. The SMEs that addressed this issue advised that in recent months several forms that address routine inspection and maintenance information have been updated to include more comprehensive information. Revised procedures for completing the forms have been drafted. Recommendation: Finalize the draft procedures.	

M-8	Safety-related condition reports: Are these records being prepared and retained as may be required to meet agency requirements and to support corrective actions?

Primary SMEs: Buzz Fant, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: We have a program in place to address conditions that might warrant a safety-related condition report and procedures are in place to support corrective actions.

Recommendations: None

M-9	Pipe integrity discoveries: Are procedures adequate to identify and record instances of potential lack of pipe integrity, to meet agency requirements and to support corrective actions and future review?

Primary SMEs: Mike Outlaw, Mike Ortiz, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: The region SMEs advised that the Risk Management group addressed such issues. The Risk Management Group SMEs confirmed this, and advised that integrity discoveries stemming from the integrity inspections are handled on a timely basis as required by the regulations, and that any discoveries that might require a temporary reduction in segment MAOP or other temporary mitigative measures would be immediately addressed by the project managers that oversee the integrity inspection program.

Recommendations: None

PREVENTION ISSUES

The following two issues are related and were reviewed as a single issue by the SMEs.

P-1	Internal corrosion detection: Does the segment have test coupons for checking internal corrosion rates? Is there a routine monitoring program to confirm effectiveness?
P-2	Internal corrosion inhibition: Are inhibitors being used to prevent internal corrosion? Is there a routine monitoring program to confirm effectiveness?

Issues P-1 and P-2 (continued)	
Primary SMEs: Phil Vasquez, Larry Hosler Others offering comments: Steve Marositz, Buzz Fant, Curtis Parker Comments: There have been no apparent indications of internal corrosion concerns on the OSPR-jurisdictional systems. If such conditions were to appear as a result of internal inspections, action would be taken to identify and mitigate the problem. Recommendations: None	
P-3	Adjacent utilities awareness: Is operator pro-active in knowing exact location of all adjacent underground utilities in pipeline vicinity?
Primary SMEs: Phil Vasquez, Larry Hosler Others offering comments: Steve Marositz, Buzz Fant, Curtis Parker Comments: To the extent possible these are noted on our alignment sheets. The SMEs that addressed this issue confirmed that our line riders are instructed to be alert to any indication of adjacent utilities, and to arrange to have them included on our alignment sheets when they are discovered. Recommendations: None	
The following two issues are related and were reviewed as a single issue by the SMEs.	
P-4	Foreign excavation monitoring: Is operator representative always present when foreign excavations are made over or near pipelines? How is this requirement conveyed to operator personnel? To excavator personnel?
P-7	Excavation in close proximity to pipeline: Does operator demand hand excavation when opening ditch within close proximity to pipeline? How is this controlled?
Primary SMEs: Phil Vasquez, Larry Hosler Others offering comments: Steve Marositz, Buzz Fant, Curtis Parker Comments: Our personnel are to be on site whenever any subsurface work is being done on or around our lines. We have definite requirements that at any time an excavation is to be within 24 inches of the pipe it must be done by hand only. Recommendations: None	

P-8	Line locating instruments: Are all pipe locators calibrated as required by manufacture? Have all operators been trained in proper use of the instrument and been made aware of performance limitations?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Buzz Fant, Curtis Parker

Comments: Our personnel are trained in the use of this equipment. The SMEs that addressed this issue advised that the accuracy of the unit is verified at least daily by testing against a known section of buried pipe.

Recommendations: None

P-9	Post-Incident Review: Are such reviews conducted in manner that will identify and trigger corrective measures?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Buzz Fant

Comments: We have a formal procedure for conducting post-incident reviews, including where appropriate a root cause analysis; and follow through with corrective measures as necessary. The SMEs that addressed this issue advised that there is a rigorous procedure involving several staff personnel to discuss all aspect of the incident.

Recommendations: None

MONITORING AND CONTROL ISSUES

The following three issues are related and were reviewed as a single issue by the SMEs.

MC-1	Aerial patrol familiarity: Are the pilots sufficiently familiar with the exact line locations to insure proper surveillance?
MC-2	Local staff familiarity: Does local staff fly with aerial patrol periodically to insure pilots are adequately familiar with the line locations and to keep local staff familiar with line location and surface conditions?
MC-6	Are pilots directed to observe conditions beyond the pipeline right-of-way that suggest potential pending impact to the right-of-way? How is this information reported?

Issues MC-1; MC-2, MC-6 (Cont'd)	
Primary SMEs: Phil Vasquez, Larry Hosler Others offering comments: Steve Marositz, Buzz Fant Comments: Our patrol pilots are familiar with precise line locations; and we confirm this by having local personnel periodically fly with them. Pilots are directed to look beyond the right-of-way and report any signs of potential concern along with their other reporting priorities. Recommendations: None	
The following three issues are related and were reviewed as a single issue by the SMEs.	
MC-3	Aerial patrol priorities: Have pilots been advised on notification priorities? Some may require immediate notice to local staff, while others may permit routine reporting. Do the pilots understand and follow any expedited reporting requirements?
MC-4	Aerial patrol routine notices: Are procedures set up to insure that routine reporting of patrol surveillance information goes to the right personnel? Is a log maintained of this? How is it used to follow up on potential problems?
MC-5	Aerial patrol reporting items: Do the pilots report only abnormal conditions, or do they also advise of the need for routine maintenance work (sign painting, marker repairs etc.)?
Primary SMEs: Phil Vasquez, Larry Hosler Others offering comments: Steve Marositz, Buzz Fant Comments: Our reporting priorities are clearly given to the patrol pilots. They have the ability to immediately contact our field personnel as necessary. The SMEs that addressed this issue confirmed that their line coverage records are thorough as to details that they report and this includes any situation where maintenance or potential encroachment should been evaluated. Recommendations: None	

The following four issues are related and were reviewed as a single issue by the SMEs.	
MC-7	Volume balance: Does this segment have adequate volume measurements for effective real time balance data?
MC-8	Volume deviations: Are volume balance deviation limits set to reflect the minimum possible deviations within reliable tolerances?
MC-9	Slack lines: Is the system designed and operated to eliminate slack line conditions for adequate volume balance? It is maintained packed to insure good balance during start-up?
MC-10	(b) (7)(F), (b) (3) [redacted]

Primary SMEs: Ed Hahn, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Gary Yates

Comments: All line segments have volume balance measurements and volume deviation alarm set points. The SMEs that reviewed these issues confirmed that:

- Deviation tolerances are set sufficiently close to maximize the controller's ability promptly react to potential adverse conditions.
- Lines are maintained packed when shut down, thus slack line conditions are not experienced.
- (b) (7)(F), (b) (3) [redacted]

Recommendations: None

PUBLIC AWARENESS ISSUES

The following three issues are related and were reviewed as a single issue by the SMEs.	
PA-1	Public awareness programs, conducted: Does operator have, or contract for an active awareness program?
PA-2	Public awareness programs, active participation: Does operator have local personnel actively participate in public awareness efforts? To what degree?
PA-3	Public awareness, excavator contacts: Is operator pro-active in making system known to excavators (area contractors, other utilities, private back-hoe operators)?

PA-1, PA-2, PA-3 (Cont'd)

Primary SMEs: Buzz Fant, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: Our public awareness is consistent with API 1162 guidelines. The region SMEs confirmed that area personnel participate in the programs involving local agencies, excavators and the public in close proximity to our pipelines, and they document this participation.

Recommendations: None

The following three issues are related and were reviewed as a single issue by the SMEs.

PA-4	One call systems, who are they forwarded to (local personnel or a central location)?
PA-5	One call systems, follow-up: How are calls followed up on by local personnel?
PA-6	Damage prevention program formalized: Is there a written program? Is it clearly conveyed to all applicable personnel? Is it followed by all personnel? Does it have clear support and mandate from upper management?

Primary SMEs: Buzz Fant, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: All locations participate in one-call programs at the local level. Information typically comes in by computer linkage with the one-call system, and can be followed by fax or phone as necessary. Local personnel follow up on all one call notices and evaluate the potential for impact to our systems. We have an active written damage prevention program with full support of upper management.

Recommendations: None

3.2 FIXED FACILITY RISK ASSESSMENT

Facility: **Richmond Terminal** Date: 12/19/2007

Subject Matter Expert: Mike Sudheimer

Recorder: Vern Grimshaw

Facility Operations:

The terminal handles vegetable oils and some petroleum products. Operations include marine vessel receipts and deliveries; and loading to tank trucks and rail cars. There are no pipeline movements of petroleum products into or out of the facility.

Potential Product Releases:

The two possible sources of a release of petroleum products from the facility would be:

- During marine transfer operations, and
- From facility storage facilities and related piping.

In the event of a product release during vessel transfer operations, or if any release from facility tanks or piping were to escape containment, an Integrated Contingency Plan (ICP) is in place to address the situation. The ICP addresses the potential off-site consequences of a release and the response capabilities of KM and contractor resources.

Marine Transfer Operations:

Vessel transfers typically occur at a maximum flow rate of approximately 1,900 barrels per hour. All transfers are constantly monitored by dock and vessel personnel. In the event of a major transfer line or hose failure the maximum probable worst case discharge has been calculated to be (b) (7)(F), (b) .

All vessel transfer operations are performed in accordance with USCG and applicable state regulations. KM personnel responsible for transfer operations are familiar with the Dock Operations Manual and applicable regulations; and are trained in the response requirements of the ICP.

Facility Storage Facilities:

Spill prevention from any of the facility's tanks and related piping is addressed in the facility SPCC plan.

(b) (7)(F), (b) (3)

Facility Storage Facilities (Cont'd):

All petroleum piping within the facility (except dock piping that is utilized during vessel transfer operations) is contained within curbing that would direct piping releases to a controlled area on site.

Surface drainage from areas that have the potential to contain petroleum is controlled on site and checked for potential petroleum contaminants before being released.

There is no buried piping within the facility. The tank bottoms are protected from corrosion by means of a cathodic protection system. There has been no indication of internal corrosion of any of the petroleum piping.

Release History:

There have been no petroleum releases from this facility in the past ten years.

Risk Assessment Conclusions:

Based on the information provided above, it can be concluded that all appropriate preventative and mitigative efforts for spill prevention are in place for this facility.

Facility: **Los Angeles Harbor Terminal** Date: 12/19/2007

Subject Matter Expert: Tom Hosler

Recorder: Vern Grimshaw

Facility Operations:

The terminal handles refined petroleum products and crude oil. Operations include marine vessel receipts and deliveries, loading to tank trucks, and pipeline movements of petroleum products out of the facility.

Potential Product Releases:

The two possible sources of a release of petroleum products from the facility would be:

- During marine transfer operations, and
- From facility storage facilities and related piping.

In the event of a product release during vessel transfer operations, or if any release from facility tanks or piping were to escape containment, an Integrated Contingency Plan (ICP) is in place to address the situation. The ICP addresses the potential off-site consequences of a release and the response capabilities of KM and contractor resources.

Marine Transfer Operations:

Vessel transfers typically occur at maximum flow rates of approximately 10,000 barrels per hour (offloading) and 7,000 barrels per hour (loading). All transfers are constantly monitored by dock and vessel personnel. In the event of a major transfer line or hose failure the maximum probable worst case discharge has been calculated to be (b) (7)(F), (b) .

All vessel transfer operations are performed in accordance with USCG and applicable state regulations. KM personnel responsible for transfer operations are familiar with the Dock Operations Manual and applicable regulations; and are trained in the response requirements of the ICP.

Facility Storage Facilities:

Spill prevention from any of the facility's tanks and related piping is addressed in the facility SPCC plan.

(b) (7)(F), (b) (3)

[redacted]

Facility Storage Facilities (Cont'd):

All above ground petroleum piping within the facility (except dock piping that is utilized during vessel transfer operations) is contained within curbing that would direct piping releases to a controlled area on site.

Surface drainage from areas that have the potential to contain petroleum is controlled on site and checked for potential petroleum contaminants before being released.

The buried piping within the facility and the tank bottoms are protected from corrosion by means of a cathodic protection system. There has been no indication of internal corrosion of any of the petroleum piping.

Release History:

There have been six petroleum releases from this facility in the past ten years:

- A one barrel release was the result of a tank spill-over during an earthquake. This was contained within the tank block.
- A release of less than one gallon that reached the water was the result of a leak in a dock pan drain line.
- Four others, reported as too small to measure (a few drops or less), resulted in minor stains on the ground surface or minor sheens on the water.

All releases were cleaned up in a timely manner.

Risk Assessment Conclusions:

Based on the information provided above, it can be concluded that all appropriate preventative and mitigative efforts for spill prevention are in place for this facility.

Appendix D

(Includes only events with a release amount of at least 42 gallons)

Line Section ID	Event Date	Event Description	Product	Cause	Amount Released (gallons)
95	8/23/1999	Outside Force Damage: Third Party: Cost: A foreign pipeline company was excavating their pipeline, which parallels and is in close proximity to Kinder Morgan's pipeline - L.S. 95. The trench was being backfilled.	Jet/turbine fuel	Excavation	(b) (7)(F), (b) (3)
25	5/17/2000	Failure in original seam defect combined with external corrosion.	Diesel Fuel	Material and Welds	
25	12/12/2000	Approximately 22:58 Concord personnel contacted the ORCC regarding the discovery of product in a slough next to the Carquinez Straight approximately 3.09 miles west of the Concord Station	Gasoline	Other	
	7/27/2001	Approximately 1300, Contra Costa personnel contacted ORCC regarding the release of Diesel. A 10'x10' stain on gravel had a diesel odor. Stain originated at HOV-3.	Diesel Fuel	Other	
45	12/7/2002	Approximately 1104 on 12/7/02 Stockton personnel contacted ORCC regarding a dripping Bypass Valve on the Rough & Ready Manifold.	Mix/Transmix	Equipment and Operations	
25	4/27/2004	At 1832 on 4/27/04 an abnormal operating condition was observed on LS 25 and the line was shut down and field personnel started conducting field surveys. Approximately at 1406 on 04/28/04 the field contacted ORCC confirming that a pipeline release had occurred.	Diesel Fuel	Corrosion	
47	11/7/2004	Approximately 1650 on 11/07/04 Concord personnel contacted ORCC regarding a release that occurred from third party mechanical damage. OES was advised at 1742, case number 04-5795 was given. NRC was contacted at 1750, case number 740716 was assigned.	Jet/turbine fuel	Excavation	
16	11/9/2004	Approximately 1326 on 11/09/04 Concord personnel contacted ORCC regarding a possible line hit on LS 16 between PLMP 7 and 11. Pressure Loss was observed and reports of possible explosion and fire in area of hit. NRC was advised at 1352, case number 740-9	Gasoline	Excavation	

Line Section ID	Event Date	Event Description	Product	Cause	Amount Released (gallons)
42	2/7/2005	On the evening of 02/07/05 PNR personnel contacted ORCC regarding a mysterious sheen and odor in the San Francisco Bay downstream of Oakland Tank that the USCG was investigating and had pre-determined that it was coming from LS 42.	Jet/turbine fuel	Other Outside Force	(b) (7)(F), (b) (3) [redacted]
	8/2/2005	Approximately 1557 on 08/02/05 Concord personnel contacted ORCC regarding a stain observed near Travis Line. OES, NRC, CUPA, and US BOR were notified.	Jet/turbine fuel		
Richmond Terminal	10/24/2007	Wax Kettle overflowed onto the ground resulting in reportable spill	Wax	Incorrect Operation	
123	6/17/2002	Approximately 1410 on 06/17/02 Mission Valley personnel contacted ORCC regarding a release that occurred from a weeping hole found on MOV 101. Advised OES (case # 02-3331).	Mix/Transmix	Equipment and Operations	
1	7/11/2003	Approximately 1958 on 07/11/03 Watson personnel contacted ORCC regarding a turbine release from third party damage on LS 1. OES and NRC were advised.	Jet/turbine fuel	Other Outside Force	
120	5/2/2005	Approximately 0650 on 05/02/05 Watson personnel contacted ORCC regarding the LA River West Block Valve leaking in valve box within Nursery. OES was advised at 0658, case number 05-2619 was assigned. NRC was advised at 0825, case number 757427 was given.	Diesel Fuel	Material and Welds	
108	12/8/2005	Approximately 0921 on 12/08/05 Carson personnel contacted ORCC regarding a release that occurred the seal failed on pump 63. OES, NRC, CUPA, and the US BOR were also notified.	Diesel Fuel		

9.7 RISK REDUCTION INCENTIVE PROGRAMS

The Facility participates in an annual safety awareness program which is administered at the Corporate level. The Facility has evaluated workplace hazards and how to prevent or mitigate them under workplace illness and injury prevention guidelines. The Facility conducts monthly safety meetings to discuss conditions, which could cause accidents or spills, and how to mitigate or prevent them from occurring. The Facility (through the Operations Review Committee) also conducts quarterly meetings for continuously improving the quality and effectiveness of operating practices and procedures.

9.8 DRUG AND ALCOHOL POLICIES

Kinder Morgan, Inc. and Kinder Morgan Energy Partners, L.P. Human Resources Policy Manual

Drugs and Alcohol in the Workplace

(Effective 01/01/2000)
(Revised 01/01/2003)

Purpose

The purpose of this Policy is to maintain a safe and productive work environment for all employees, applicants, and the public by ensuring that employees on Company property, while conducting Company business, operating Company property, or during their employment with the Company may not possess or use illegal or unauthorized drugs. The Policy is also intended to promote worker and public safety, to comply with the Drug-Free Workplace Act of 1988, and to provide procedures for workplace-related searches of persons and property and the lawful drug and alcohol testing of employees. Kinder Morgan maintains a "Zero Tolerance" policy.

Scope

This Policy applies to all Company employees, applicants, contract workers, and employees of third-party contractors, including employees and contract workers who perform functions covered by regulations promulgated by the Department of Transportation (DOT). In the event of a contradiction between this Policy and the Company's Anti-Drug Plan and Alcohol Misuse Prevention Plan, the Company's Anti- Drug Plan and Alcohol Misuse Prevention Plan shall govern.

This Policy is broader in scope than the Company's Anti-Drug Plan and Alcohol Misuse Prevention Plan. For additional information refer to the Anti-Drug Plan and Alcohol Misuse Prevention Plan. This Policy shall be administered in accordance with all applicable federal, state, and local laws and regulations.

Responsibilities and Prohibitions

Employees

All applicants and employees are reminded that the following actions are included as violations of this Policy: (1) use, possession, sale, distribution of illegal or unauthorized drugs on Company property, while operating any Company vehicle or equipment, or while conducting Company business; (2) use, possession, sale, or distribution of alcohol on Company property. while operating any Company vehicle or equipment, or while conducting Company business, with the exception that use and possession of alcohol during Company sponsored business or social functions, where the use of alcohol remains moderate, will not be considered a violation of this Policy; (3) use of any drug, including prescribed drugs, which is unsafe to use while operating Company vehicles or equipment; (4) possession, sale or distribution of paraphernalia and equipment related to illegal or unauthorized drug use; and (5) refusal to test in any testable situation.

As a condition of employment, any employee whose work directly relates to the performance of a federal contract and who is or has been convicted of a criminal drug offense occurring in the workplace during employment must notify his/her supervisor and Human Resources representative in writing within five days of such conviction. Similarly, as a condition of employment, any employee that is required to possess a valid driver's license as a pre-requisite of their position, must notify his/her supervisor and Human Resources representative in writing within five days of either a drug and/or alcohol related criminal offense. Failure to provide notification will result in disciplinary action being taken, up to and including termination.

All employees while operating any Company vehicle or equipment, or while conducting Company business (either during or after regular business hours), cannot refuse to submit to drug and/or alcohol testing administered or ordered by the Company or a lawful authority. Refusal to submit to the testing will result in disciplinary action being taken, up to and including termination.

All employees taking a prescription or over-the-counter medication that could adversely affect performance of job-related functions or pose a direct threat to the health and safety of the employee or others in the workplace are responsible for notifying their supervisor. It is not the intent of the Company to interfere with the use of drugs legitimately prescribed by a physician. The Company's designated physician will be the sole person that the Company uses in making determinations concerning employees' fitness to perform the job.

All employees should notify a supervisor or Human Resources Representative of any behavior of co-workers or contract workers that may indicate a violation of this Policy.

Definitions

"Alcohol" means ethyl alcohol, an intoxicating element in fermented or distilled liquor or in any other compound, or other low molecular weight alcohol, including but not limited to, methyl and isopropyl alcohol, and including without limitation, beer, wine, and distilled liquors.

"Company property" is used in the broadest sense and includes, but is not limited to, all property, equipment, land, onshore and offshore platforms, buildings, structures, installations, facilities, locations, boats, aircraft, and vehicles which are owned, leased, used or operated by or on behalf of the Company for any purpose, or which are located on Company property, and any personal effects or items located thereon or therein. This includes, among other items, desks, lockers, and workstations, as well as privately owned vehicles and other personal belongings located on or in Company property,

"Possess" or "possession" means having any amount of illegal or unauthorized drugs or alcohol on one's person or belongings at any time during employment; on Company property; while conducting Company business; operating Company property; in one's personal belongings or vehicle while on Company property; in a vehicle or any mode of transportation owned or leased, or rented for Company use; or at any location used by the Company to conduct business.

"Drugs" means prescription drugs, inhalants, and other illegal, controlled, or unauthorized substances that may cause addiction and/or affect coordination of memory, or a drug that federal and state law makes illegal to distribute, use or possess.

"Use" with regard to drugs is defined as having any trace amount of drugs in the applicant's or employee's system, or physical consumption of drugs, "Use" with regard to alcohol is defined as the physical consumption of alcohol. "Use" with regard to drugs and alcohol is also defined as being under the influence of drugs or alcohol at any time during working hours.

"Zero Tolerance" means that if an employee tests positive for drugs or alcohol, as defined by this Policy, the resulting disciplinary action will be termination of employment for cause.

Testing for Types of Drugs/Alcohol and their Cutoff Levels

Drug/Alcohol tests will be conducted in a confidential manner according to procedures adopted by the Company and in compliance with applicable law. Below are the examples of illegal and unauthorized drugs for which Kinder Morgan tests and the levels at which an employee will be considered as "testing positive for drugs": Employees who test at a alcohol concentration level of .04 or greater will be considered as "testing positive" for alcohol.

1. Marijuana	15 ng/ml
2. Cocaine	150 ng/ml
3. Amphetamines and Methamphetamines	500 ng/ml
4. Opiates (codeine, heroin, morphine)	2000 ng/ml
5. Phencyclidine (PCP or Angel Dust)	25 ng/ml

Types of Drug and Alcohol Testing

Kinder Morgan conducts the following types of drug and alcohol testing:

Drug Testing	Alcohol Testing
1. Pre-employment	1. Reasonable cause
2. Reasonable cause	2. Random (as permitted by federal and state law)
3. Random (as permitted by federal and state law)	3. Return to duty
4. Return to duty	4. Post-Accident
5. Post-Accident	

Searches and Tests

The Company reserves the right to have authorized personnel conduct searches of our employees, contract workers, and employees of third-party contractors without prior notice to determine if this Policy is being violated. Accordingly, all areas of Company property may be searched, including employee work locations, stations, areas, offices, desks, files, lockers, etc.; employees and their personal belongings, vehicles, etc. may also be searched if on or within Company property. Employee searches will be conducted in compliance with applicable law.

The Company reserves the right, at all times, to have authorized personnel conduct urinalyses, blood tests, or other types of tests of our applicants, employees, contract workers, and employees of third-party contractors for the purposes of determining if any such persons are in violation of this Policy. A urinalysis, blood test, or other type of test may be used in the following situations: (a) pre-employment testing, (b) testing based on reasonable cause or suspicion, (c) random or periodic testing, (d) testing following an accident or incident involving injury or property damage, and (e) testing that is consistent with the enforcement of this Policy.

The Company reserves the right to inspect and search Company property at any time without the presence or consent of any employee. An employee who, as a result of a search, has been found in violation of this Policy or other Company Policy will be subject to corrective action as described in the Corrective Action Policy.

Violations of Policy

Any violation of the Drugs and Alcohol in the Workplace Policy will result in disciplinary action being taken, up to and including termination.

Employee Assistance Program

The Employee Assistance Program (EAP) is available to all Company employees. Employees are encouraged to obtain professional help when needed by using the EAP . Employees may contact their supervisor or Human Resources for information about the EAP. The EAP is strictly confidential and available for use by telephoning:

- Magellan Behavioral Health 1-800-424-5654

Use of the EAP does not exempt or excuse a violation of this Policy.

Voluntary Rehabilitation

Any employee who voluntarily seeks counseling or rehabilitation in advance of failing any of the tests or who would otherwise be in violation of this policy must provide certification, in accordance with any applicable governmental requirements, of the credentials of the attending physician, psychologist, or psychiatrist, who is trained in substance abuse disorders.

When the employee successfully completes or is participating in a supervised substance-abuse or alcohol-related rehabilitation program and is no longer engaging in the use of illegal drugs or unauthorized alcohol, the Company requires certification from the substance abuse professional that the employee is fit to return to duty and perform the essential functions of his or her job.

An employee described in the paragraph above will be tested on a random basis by the Medical Review Officer and/or Substance Abuse Professional to ensure such employee is no longer engaging in the illegal use of drugs or unauthorized alcohol.

Interpretation and Exceptions

Questions regarding this Policy should be referred to the Vice President, Human Resources. Requests for exceptions should be submitted to Human Resources for review by Human Resources and the Legal Department to ensure regulatory requirements and appropriate test protocols and standards are met. The President and Chief Operating Officer must approve all exceptions.

This Policy does not constitute or imply a contract between the Company and its employees. This Policy creates no Company obligation nor any individual obligation, right, privilege, term, or condition of employment not otherwise established by law. The Company has voluntarily adopted this Policy for its sole and exclusive and may amend or withdraw it at any time without prior notice.

6.0 AREA PIPELINE SECTIONS

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Reno Area Lines:	
• (b) (3), (b) (7)(F) Line 8"/10"	12
• State Line – Reno 10"/6"	13
• Reno – Fallon 6"	55
Pipeline Facilities (Non-Storage)	
• Fallon Terminal – meter station only	

- Figures 6.1a through 6.1c on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled "Worst Case Discharge Data" of the applicable Line Segment.

- The specific information summary for these pipeline sections is provided as follows:

  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps

- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.

- Northern and Southern pipeline schematic diagrams are provided in Volume 1, Figures 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

(b) (3), (b) (7)(F) – STATE LINE 8"/10" (12)

Pipe and Operational Data

• Section Length:	12.70 Miles	67,044 Feet
• Line Diameter:	8.625 in., O.D.	8.125 in., I.D.
• Section Length:	15.08 Miles	79,602 Feet
• Product types:	EPA & CARB ULSD, Conventional Gas, Turbine, JP-8, Ethanol	
• Line Diameter:	10.75 in., O.D.	10.02 in., I.D.
• Line Capacity:	515 bbls/mile in 10 in. size 339 bbls/mile in. 8 in. size	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	2,400 bph or 57,600 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description

- County(s)/State(s) Traversed: Nevada County, Sierra County, CA
- Location Description: (b) (3), (b) (7)(F) Truckee, generally parallel to the Union Pacific Railroad east of Truckee. The pipeline then heads northeast under Highway 80, under Prosser Lake and through Dog Valley to the Nevada State line in Verdi.

Worst Case Discharge Data

(b) (7)(F), (b) (3)

FIGURE 6.1b

PIPELINE SECTION INFORMATION SUMMARY

STATE LINE – RENO 10"/6"/10" (13)		
Pipe and Operational Data		
• Section Length:	7.88 Miles	41,590 Feet
• Line Diameter:	10.75 in., O.D.	10.02 in., I.D. (note 1)
• Section Length:	7.24 Miles	38,232 Feet
• Line Diameter:	6.625 in., O.D.	6.065 in., I.D. (note 1)
• Line Capacity:	515 bbls/mile in 10 in. size (note 2) 189 bbls/mile in. 6 in. size (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	2,400 bph or 57,600 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Washoe, NV	
• Location Description:	From the California State Line, generally parallel to the Southern Pacific Railroad east to Reno Terminal.	

FIGURE 6.1c

PIPELINE SECTION INFORMATION SUMMARY

RENO – FALLON 6" (55)		
Pipe and Operational Data		
• Section Length:	63.33 Miles	334,382 Feet
• Line Diameter:	6.625 in., O.D.	6.125 in., I.D. (note 1)
• Line Capacity:	192 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F), (b)	
• Maximum flow rate:	425 bbls/hr or 10,200 bbls/day	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Washoe, Churchill, Lyon, Storey, NV	
• Location Description:	From Reno Terminal east, generally parallel to the Southern Pacific Railroad to Ferneey, then southeast to Fallon.	

FIGURE 6.2

HCA INDEX

Refer to Figure 6.1a through Figure 6.1c for specific information on line segments.

The following Index Map shows all the corresponding Line Segments for Figure 6.1.

Detailed HCA Maps are contained in the CD inside the front cover of Volume 2 (or in a separate folder on electronic copy CD).

The specific HCA maps for this area are:

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Rocklin Area Lines:	
• Rocklin – Colfax 10"/6"/10"	11
• Colfax – (b) (3), (b) (7)(F)	12
• Antelope Road – Rocklin 12"	20
• Rocklin – UPRR 4"	48
• Rocklin – Chico 8"	64
• Erle – Beale 6"	65
(b) (3), (b) (7)(F)	

- Figures 6.1a through 6.1f on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled "Worst Case Discharge Data" of the applicable Line Segment.

- The specific information summary for these pipeline sections is provided as follows:

  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps

- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.

- Northern and Southern pipeline schematic diagrams are provided in Volume 1, Figures 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

ROCKLIN - COLFAX 10"/6"/10" (11)		
Pipe and Operational Data		
• Section Length:	11.67 Miles	61,592 Feet
• Line Diameter:	6.625 in., O.D.	6.065 in., I.D. (note 1)
• Section Length:	21.99 Miles	116,151 Feet
• Line Diameter:	10.75 in., O.D.	10.192 in., I.D. (note 1)
• Line Capacity:	189 bbls/mile in 6 in. size (note 2) 533 bbls/mile in 10 in. size (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	2,100 bph or 50,400 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Placer, CA	
• Location Description:	From Rocklin, generally northeast paralleling the Southern Pacific Railroad to Colfax Station.	

FIGURE 6.1b

PIPELINE SECTION INFORMATION SUMMARY

COLFAX – (b) (3), (b) (7)(F)

Pipe and Operational Data

Section Length:	44.14 Miles 233,038 Feet
Line Diameter:	8.625 in., O.D. 8,125 in., I.D. (note 1)
Line Capacity:	339 bbls/mile in 8 in. size (note 2)
Capacity of entire line section:	(b) (7)(F),
Maximum flow rate:	2,400 bph or 57,600 bpd

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description

County(s)/State(s) Traversed:	Placer, Nevada, CA
Location Description:	From Colfax Station northeast generally parallel to the Southern Pacific Railroad to (b) (3), (b) (7)(F) e near Donner Lake-West of Truckee.

FIGURE 6.1c

PIPELINE SECTION INFORMATION SUMMARY

ANTELOPE ROAD - ROCKLIN 12" (20)		
Pipe and Operational Data		
• Section Length:	11.64 Miles	61,466 Feet
• Line Diameter:	12.75 in., O.D.	12.25 in., I.D. (note 1)
• Line Capacity:	770 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	6,000 bph or 144,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Sacramento, Placer, CA	
• Location Description:	From Antelope Road and Roseville Road generally northeast parallel to the Southern Pacific Railroad to Rocklin Terminal.	

FIGURE 6.1d

PIPELINE SECTION INFORMATION SUMMARY

ROCKLIN - UPRR 4" (48)		
Pipe and Operational Data		
• Section Length:	3.76 Miles	19,846 Feet
• Line Diameter:	4.50 in., O.D.	4.124 in., I.D. (note 1)
• Line Capacity:	87 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7) (F) (b)	
• Maximum flow rate:	271 bph or 6,500 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Placer, CA	
• Location Description:	From Rocklin Station southwest to the UP Rail Yard.	

FIGURE 6.1e

PIPELINE SECTION INFORMATION SUMMARY

ROCKLIN - CHICO 8" (64)

Pipe and Operational Data

• Section Length:	77.30 Miles	408,133 Feet
• Line Diameter:	8.625 in., O.D.	8.125 in., I.D. (note 1)
• Line Capacity:	339 bbls/mile (note 2)	
• Product types:	CARB ULSD, Gas, Ethanol	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	2,000 bph or 48,000 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description

• County(s)/State(s) Traversed:	Placer, Yuba, Butte & Sutter, CA
• Location Description:	From Rocklin North to Lincoln, then generally Northwest to Marysville, then parallel to State Highway 99 to Chico Terminal

Worst Case Discharge Data

(b) (7)(F), (b) (3)

[redacted]

FIGURE 6.1f

PIPELINE SECTION INFORMATION SUMMARY

ERLE - BEALE 6" (65)		
Pipe and Operational Data		
• Section Length:	5.74 Miles	30,311 Feet
• Line Diameter:	6.625 in., O.D.	6.187 in., I.D. (note 1)
• Line Capacity:	197 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	1,350 bph or 32,400 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Yuba, CA	
• Location Description:	From a connection with Line 64 at Erle Road near Marysville east to Beale AFB.	

FIGURE 6.2

HCA INDEX

Refer to Figure 6.1a through Figure 6.f for specific information on line segments.

The following Index Map shows all the corresponding Line Segments for Figure 6.1.

Detailed HCA Maps are contained in the CD inside the front cover of Volume 2 (or in a separate folder on electronic copy CD).

The specific HCA maps for this area are:

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Sacramento Area Lines:	
• Brentwood Junction - Bradshaw 10”	9
• Sacramento - Rocklin 12”	20
• Sacramento – Sacramento River Junction 10”	28
• Sacramento - Arco 10”	29
• Sacramento - Arco 10”	31
• Sacramento - Shell 10”	34
• Sacramento - Shell 10”	35
• Hay Road - Sacramento 20”	130
Bradshaw Area Lines:	
• Bradshaw - Mather 4”	57
Pipeline Facilities (Non-Storage)	
• Brentwood Junction - piping manifold only	
• Sacramento River Junction - piping manifold only	
• Sacramento Shell Terminal - manifold	
• Mather Airport - meter station only	

- Figures 6.1a thru 6.1m on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled “Worst Case Discharge Data” of the applicable Line Segment.

- The specific information summary for these pipeline sections is provided as follows:

  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps

- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.

- Northern and Southern pipeline schematic diagrams are provided in Volume 1, Figures 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

BRENTWOOD JUNCTION – BRADSHAW 10" (9)

Pipe and Operational Data

- Section Length: 65.13 Miles 343,865 Feet
- Line Diameter: 10.75 in., O.D. 10.25 in., I.D. (note 1)
- Line Capacity: 539 bbls/mile (note 2)
- Product types: CARB ULSD, Gas, JP-5, Ethanol
- Capacity of entire line section: (b) (7)(F),
- Maximum flow rate: 4,250 bph or 102,000 bpd

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description

- County(s)/State(s) Traversed: San Joaquin and Sacramento, CA
- Location Description: From Brentwood Junction east across the Old, Middle and San Joaquin Rivers to northwest edge of Stockton, then north generally adjacent to Highway 99, across the Mokelumne River, to the Bradshaw Terminal.

Worst Case Discharge Data

(b) (7)(F), (b) (3)

FIGURE 6.1b

PIPELINE SECTION INFORMATION SUMMARY

SACRAMENTO – ANTELOPE ROAD 12" (20)		
Pipe and Operational Data		
• Section Length:	11.92 Miles	62,927 Feet
• Line Diameter:	12.75 in., O.D.	12.25 in., I.D. (note 1)
• Line Capacity:	770 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	6,000 bph or 144,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Yolo, Sacramento, CA	
• Location Description:	From Sacramento Station north through old Sacramento, east across the Sacramento River through north Sacramento, across the American River, then generally northeast along Roseville Road to Antelope Road.	

FIGURE 6.1c

PIPELINE SECTION INFORMATION SUMMARY

SACRAMENTO – SACRAMENTO RIVER JUNCTION 10" (28)	
Pipe and Operational Data	
● Section Length:	0.52 Miles 2,766 Feet
● Line Diameter:	10.75 in., O.D. 10.312 in., I.D. (note 1)
● Line Capacity:	545 bbls/mile (note 2)
● Capacity of entire line section:	[redacted] (b) (7) (F) (b)
● Maximum flow rate:	7,000 bph or 168,000 bpd
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.	
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.	
Location Description	
● County(s)/State(s) Traversed:	Yolo, Sacramento, CA
● Location Description:	From Sacramento Station east across the Sacramento River to a pipeline connection with Tosco.

FIGURE 6.1d

PIPELINE SECTION INFORMATION SUMMARY

SACRAMENTO – ARCO 10" (29)		
Pipe and Operational Data		
• Section Length:	0.13 Miles	670 Feet
• Line Diameter:	10.75 in., O.D.	10.312 in., I.D. (note 1)
• Line Capacity:	545 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7) (F) (b)	
• Maximum flow rate:	7,000 bph or 168,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Yolo, CA	
• Location Description:	From Sacramento Station south to the adjacent Arco Terminal	

FIGURE 6.1e

PIPELINE SECTION INFORMATION SUMMARY

SACRAMENTO – ARCO 10" (31)	
Pipe and Operational Data	
● Section Length:	0.15 Miles 792 Feet
● Line Diameter:	10.75 in., O.D. 10.02 in., I.D. (note 1)
● Line Capacity:	515 bbls/mile (note 2)
● Capacity of entire line section:	(b) (7) (F) (b)
● Maximum flow rate:	7,000 bph or 168,000 bpd
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.	
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.	
Location Description	
● County(s)/State(s) Traversed:	Yolo, CA
● Location Description:	From Sacramento Station south to the adjacent Arco Terminal.

SACRAMENTO – SHELL 10" (34)		
Pipe and Operational Data		
• Section Length:	0.18 Miles	935 Feet
• Line Diameter:	10.75 in., O.D.	10.25 in., I.D. (note 1)
• Line Capacity:	539 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7) (F) (b)	
• Maximum flow rate:	7,000 bph or 168,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Yolo, CA	
• Location Description:	From Sacramento Station north along the west edge of the Sacramento River to the Shell Terminal.	

FIGURE 6.1g

PIPELINE SECTION INFORMATION SUMMARY

SACRAMENTO – SHELL 10" (35)

Pipe and Operational Data

• Section Length:	0.18 Miles	951 Feet
• Line Diameter:	10.75 in., O.D.	10.25 in., I.D. (note 1)
• Line Capacity:	539 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7) (F) (b)	
• Maximum flow rate:	7,000 bph or 168,000 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description

• County(s)/State(s) Traversed:	Yolo, CA
• Location Description:	From Sacramento Station north along the west edge of the Sacramento River to the Shell Terminal.

FIGURE 6.1h

PIPELINE SECTION INFORMATION SUMMARY

HAY ROAD – SACRAMENTO 20" (130)	
Pipe and Operational Data	
• Section Length:	35.05 Miles 185,063 Feet
• Line Diameter:	20.00 in., O.D. 19.250 in., I.D. (note 1)
• Line Capacity:	2,113 bbls/mile (note 2)
• Capacity of entire line section:	(b) (7)(F),
• Maximum flow rate:	8,333 bph or 200,000 bpd
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.	
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.	
Location Description	
• County(s)/State(s) Traversed:	Solano, Yolo, CA
• Location Description:	From Hay Road near Vacaville generally northeast adjacent to I-80 to West Sacramento.

FIGURE 6.1m

PIPELINE SECTION INFORMATION SUMMARY

BRADSHAW – MATHER 4" (57)		
Pipe and Operational Data		
• Section Length:	2.64 Miles	13,949 Feet
• Line Diameter:	4.50 in., O.D.	4.026 in., I.D. (note 1)
• Line Capacity:	83 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7) (F) (b)	
• Maximum flow rate:	420 bph or 10,080 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Sacramento, CA	
• Location Description:	From Bradshaw Terminal south to Old Placerville Road then east to Mather Airport facilities.	

FIGURE 6.2

HCA INDEX

Refer to Figure 6.1a through Figure 6.1m for specific information on line segments.

The following Index Map shows all the corresponding Line Segments for Figure 6.1.

Detailed HCA Maps are contained in the CD inside the front cover of Volume 2 (or in a separate folder on electronic copy CD).

The specific HCA maps for this area are:

7.0 BREAKOUT STATIONS/TERMINALS

7.1 SCOPE

The scope of this section is to provide an information summary with specific data for the breakout stations/terminals that have storage (breakout tanks) connected to the pipeline sections described in the previous section of this Volume 2. The data is summarized as follows:

BREAKOUT STATION/TERMINAL	LARGEST TANK (BBLS)	WCD (BBLS)
Reno Terminal (Tank R-21)	(b) (7)(F), (b) (3)	

- The largest Worst Case Discharge (WCD) for the breakout stations/terminals within this Area of Operation has been determined to be as follows:

(b) (7)(F), (b) (3) [redacted]

  - The tanks in the breakout station/terminal within this area have adequate secondary containment.

- The specific information summary for these breakout stations/terminals is provided as follows:

  - Breakout Station/Terminal Tank Information Summary (one per station/terminal)
  - Facility Diagram

- Pipeline sections or terminaling operations associated with this Area of Operation are detailed in other sections of this Volume 2.

FIGURE 7.1

RENO AREA
BREAKOUT TERMINAL TANK INFORMATION SUMMARY
(Note: EPA-Jurisdictional Tanks not Listed)

RENO TERMINAL				
TANK #	**TYPICAL PRODUCT**	**MAX. CAPACITY (BBLS) ***	**DIAMETER**	**HEIGHT**
R-10	Transmix	(b) (7)(F), (b) (3)		
R-12	Transmix			
R-21	JP-8			
R-36	JP-8			
R-37	JP-8			
LOCATION DESCRIPTION				
• County/State	Washoe, NV			
• Location	Reno Terminal			
WORST CASE DISCHARGE				
(b) (7)(F), (b) (3)				

* The maximum capacity is calculated using the indicated diameter and height of the tank. The actual maximum storage capacity to overflow would typically be less than this calculated number.

Note: Reno Terminal is a multi jurisdictional Facility (DOT and EPA). The complete Facility information for Reno Terminal required by EPA is located in Section 8 of this Volume.

(b) (7)(F), (b) (3)

7.0 BREAKOUT STATIONS

7.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the breakout stations that have storage (breakout tanks) connected to the pipeline sections described in the previous Section of this Volume. The data is summarized as follows:

BREAKOUT STATION	LARGEST TANK (BBLS)	WCD (BBLS)
Beale Breakout Station	(b) (7)(F), (b) (3)	
Rocklin Breakout Station		
Chico Terminal		

- The largest Worst Case Discharge (WCD) for the breakout stations within this Area of Operation has been determined to be as follows:

(b) (7)(F), (b) (3)

  - The tanks in the breakout station within this area have adequate secondary containment.

- The specific information summary for these breakout stations is provided as follows:

  - Breakout Station Tank Information Summary (one per station)
  - Facility Diagram

- Pipeline sections or terminaling operations associated with this Area of Operation are detailed in other Sections of this Volume.

7.0 BREAKOUT STATIONS/TERMINALS

7.1 SCOPE

The scope of this section is to provide an information summary with specific data for the breakout stations/terminals that have storage (breakout tanks) connected to the pipeline sections described in the previous section of this Volume 2. The data is summarized as follows:

BREAKOUT STATION/TERMINAL	LARGEST TANK (BBLS)	WCD (BBLS)
Bradshaw Terminal	(b) (7)(F), (b) (3)	
Sacramento Station		
Stockton Terminal		

- The largest Worst Case Discharge (WCD) for the breakout stations/terminals within this Area of Operation has been determined to be as follows:

(b) (7)(F), (b) (3)

  - The tanks in the breakout stations/terminals within this area have adequate secondary containment.

- The specific information summary for these breakout stations/terminals is provided as follows:

  - Breakout Station/Terminal Tank Information Summary (one per station/ terminal)
  - Facility Diagram

- Pipeline sections or terminaling operations associated with this Area of Operation are detailed in other sections of this Volume 2.

8.1.1 CERTIFICATION OF SUBSTANTIAL HARM

CERTIFICATION OF THE APPLICABILITY OF THE SUBSTANTIAL HARM CRITERIA

FACILITY NAME: SFPP, L.P. Bradshaw Terminal
FACILITY ADDRESS: 2901 Bradshaw Road
Sacramento, CA 95827

(Detailed Facility information, including data required for the Response Plan Cover Sheet, is provided in Figure 1.3)

1. Does the facility transfer oil over water to or from vessels ***and*** does the facility have a total oil storage capacity greater than or equal to 42,000 gallons?	Yes		No	✓
2. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area?	Yes		No	✓
3. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix or a comparable formula[1]) such that a discharge from the facility could cause injury to fish and wildlife and sensitive environments? For further description of fish and wildlife and sensitive environments, see Appendices I, II, and III to DOC/NOAA's "Guidance for Facility and Vessel Response Plans: Fish and Wildlife and Sensitive Environments" (59 FR 14713, March 29, 1994) and the applicable Area Contingency Plan.	Yes	✓	No	
4. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix or a comparable formula[1]) such that a discharge from the facility would shut down a public drinking water intake[2]?	Yes	✓	No	
5. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the last 5 years?	Yes		No	✓

[1] If a comparable formula is used, documentation of the reliability and analytical soundness of the comparable formula must be attached to this form.

[2] For the purposes of 40 CFR part 112, public drinking water intakes are analogous to public water systems as described at 40 CFR 143.2(c).

CERTIFICATION

I hereby certify the following:

- Under penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe that the submitted information is true, accurate, and complete.
- The information and procedures contained herein are considered to be accurate as of this date and are consistent with the National Contingency Plan (NCP) and applicable Area Contingency Plans (ACP) as detailed in Section 1.5.

Waterside Directions:	There is no water access to this Facility.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL

Description of Operation:

- This Facility is a bulk distribution facility for refined petroleum products.

(b) (7)(F), (b) (3) [redacted]

- The Facility normally operates 24 hours a day 7 days a week.
- The Facility's Worst Case Discharge amount is (b) (7)(F), (b) (3) [redacted]

Products Handled:

- Gasoline
- Ethanol
- Diesel
- Transmix
- Jet Fuel
- Commercial Turbine

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

PHYSICAL DESCRIPTION - LOADING RACK

Description of Operation:

- The Facility is equipped with three (3) loading racks which handle various refined petroleum products and one (1) off loading rack which handles ethanol and off-spec product.
- A maximum of six (6) tank trucks may load simultaneously.
- The loading/unloading operations are conducted 24 hours a day 7 days a week.
- The Facility handles an average of 150 trucks per day.

Loading Rate: 400 gpm (*per truck*)

Truck Capacity: 9,000 gallons (*maximum*)

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - LOADING RACK (Cont'd)

Discharge Prevention:

- The curbed concrete slab drains directly to an oil water separator.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS

- The majority of the Facility was constructed in 1955-56. Three tanks with a maximum capacity of 5,838,000 gallons date from this initial period. The Facility expanded storage capacity by constructing three to four tanks about every three years. These tanks are situated in six separate areas at the Facility.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL

Description of Operation:

- The Facility is a bulk storage/distribution facility for refined petroleum products. The stored product arrives through the main Company pipeline to aboveground storage tanks, transfers to fueling racks through pipelines, and moves out of the Facility by tanker trucks. All tanker trucks are owned by others.

- The aboveground storage tanks are contained in a bermed secondary containment area that, at a minimum, provides secondary containment for 110 percent of the largest tank. The tanks are filled or drawn down through a system of aboveground and underground pipes that connect this Facility into the Company distribution network.

(b) (7)(F), (b) (3)

- The Facility normally operates 24 hours a day 7 days a week.

- The Facility's Worst Case Discharge amount is (b) (7)(F), (b) (3)

Products Handled:

- Ethanol
- Diesel
- Gasoline
- Transmix
- Additives

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - LOADING RACK

Description of Operation:

- The Facility is equipped with four (4) loading racks with seven (7) spots which handle various refined petroleum products.
- Additive unloading areas are located in each loading rack.
- A maximum of seven (7) tank trucks may load simultaneously.
- The loading/unloading operations are conducted 24 hours a day 7 days a week.
- The Facility handles an average of 200 trucks per day.

Loading Rate: 500 gpm (*per truck*)

Truck Capacity: 9,200 gallons (*maximum*)

Discharge Prevention:

- The curbed concrete slab drains directly to an oil water separator.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS

- The majority of the Facility was constructed in the 1960's. The largest tank CH-8 has a maximum capacity of 1,260,000 gallons. In the 1970's tanks CH-30 thru 33 were added. Tank CH-32 was then the larger tank at 1,470,000 gallons. Two additional tanks were added in the 1980's - tanks CH-36 and CH-37 with maximum capacities of 2,520,000 and 1,680,000 gallons respectively.

8.1.2 INTRODUCTION

Description of Facility

This Facility is a bulk distribution facility for refined petroleum products. The Facility receives product via pipeline and additives via rail car and tank truck. Product is transported out of the Facility by tanker trucks, which are owned and operated by third parties, and via pipeline. The following Figure 8.1 provides Facility specific information, Figure 8.2 provides an Area Map for the Facility and Figure 8.3 provides a Facility Diagram.

- Facility Information (Figure 8.1)
- Area Map (Figure 8.2)
- Hazard Identification including Tank Tables (Section 8.2)
- Inspections (Section 8.2.2)
- Vulnerability Analysis (Section 8.2.3)
- Discharge Scenarios (Section 8.3)
- Evacuation (Section 8.4)

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL

Description of Operation:

- This Facility is a bulk storage and distribution facility for refined petroleum products. The stored product arrives through the main Company pipeline to aboveground storage tanks, transfers to fueling racks through pipelines, and moves out of the Facility by tanker trucks. All tanker trucks are owned by others, as are some of the loading racks located on Company property.

- The aboveground storage tanks are contained in a bermed secondary containment area that, at a minimum, provides secondary containment for 110 percent of the largest tank. The tanks are filled or drawn down through a system of aboveground and underground pipes that connect this Facility into the Company distribution network.

(b) (7)(F), (b) (3) [redacted]

- The Facility normally operates 24 hours a day 7 days a week.

- The Facility's Worst Case Discharge amount is (b) (7)(F), (b) (3) [redacted]

Products Handled:

- Gasoline
- Diesel
- Jet Fuel
- Transmix
- Ethanol
- Turbine Fuel

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION – LOADING RACK

Description of Operation:

- The Facility is equipped with six (6) loading bays which handle various refined petroleum products.
- A maximum of six (6) tank trucks may load simultaneously.
- The loading/unloading operations are conducted 24 hours a day 7 days a week.
- The Facility handles an average of 60 trucks per day.

Loading Rate: 380 gpm (*per truck*)

Truck Capacity: 12,000 gallons (*maximum*)

Discharge Prevention:

- The curbed concrete slab drains directly to an oil water separator.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

PHYSICAL DESCRIPTION - RAIL CAR UNLOADING AREA

Description of Operation:

- The Facility is equipped with three (3) rail car unloading spots for ethanol.
- The Facility is capable of handling six (6) tank cars per day depending on demand (seasonal).

Unloading Rate: 350 gpm *(typical)*

Railcar Capacity: 29,000 gallons

Discharge Prevention:

- Drip collection pans are positioned at each unloading spot.
- Unloading events are only performed by qualified Company personnel.

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS

- The majority of the Facility was constructed in 1957-59. Tanks R-1 thru R-31 were in place in 1959 with a maximum capacity of 1,260,000 gallons for at least four tanks. The Facility expanded storage capacity by constructing two more tanks in 1960 and 1963. Tanks R-33 thru R-36 were added during the 1970's with R-36 having the largest capacity of 1,209,264 gallons. Tank R-37 with a maximum capacity of 1,216,866 gallons, was built in 1980.
- Rail Car Unloading facility purchased in 2010.

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed on the Potential Spill Sources and Container Identification table in this Section.

Tanks

- Secondary Containment volumes for all bulk storage tanks are detailed on the Potential Spill Sources and Container Identification table located in this Section.

Loading Rack Containment System

Main Loading/Unloading Rack

The loading/unloading rack area is designed and operated as follows:

- Loading/Unloading area drainage flows into a catchment basin or treatment facility, designed to handle discharges.
- The containment system is designed to hold the maximum capacity of any single compartment of a single tank truck loaded or unloaded at the Facility.
- A quick drainage system is not used for tank truck loading/unloading.
- Drainage from the loading rack loading and unloading facilities is contained in a depressed area (with curbs). Drainage is through area drains to an oil/water separator. The product is pumped using a skimming device from the oil/water separator to a transmix tank. Water is pumped through sock and carbon filter units before release to the Sacramento County sewer system.
- All transfers are in constant attendance by qualified personnel who are properly trained prior to conducting transfers.
- In the event that a spill did originate from the transfer area piping, the Facility would immediately shut down the source, activate its Contingency Plan, and commence clean up operations with local and contract resources as necessary to insure prompt removal of the discharged product.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Diked Areas

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment area.
- Stormwater which does accumulate within the diked area, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures.
- Drainage from diked storage areas is restrained by manually controlled valves.
- Dike drain valves are secured in the closed position when not draining containment areas.
- Flapper-type drain valves are not used to drain diked areas.
- Accumulated liquid is visually inspected for evidence of sheen. With Area Manager or designee approval, clean water is discharged to the local storm drain system. If evidence of contamination is present liquids are routed to the oil/water separator. The oil phase is transferred to a transmix tank and the water phase is passed through sock and charcoal filter units and sampled before being discharged to the Sacramento County sewer system in accordance with the county issued permit.

Drainage From the Undiked Areas

Drainage from undiked areas is controlled as follows:

- Surface drainage from undiked areas flows toward the drainage ditch near the center of the property then to the local storm sewer system along Bradshaw Road.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

- If the Facility does not have a wastewater treatment plant nor does it chemically treat water prior to discharge off site:
  - Uncontaminated rainwater is inspected to ensure compliance with applicable water quality standards and will not cause a harmful discharge as defined in 40 CFR 110.
  - Adequate records are kept of such drainage events.
  - Records of drainage events are maintained at the Control Room.

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Bradshaw Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading rack has sufficient capability to handle any potential increase in transfer capacity. The loading rack operates 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan which details additional detection methods.

Detection by Personnel

- Facility personnel conduct monthly inspection of tank gauges and cathodic protection readings Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds. Refer to Figures 8.5 and 8.6 for sample Tank Inspection and Secondary Containment Inspection Checklists.

8.2.2 FACILITY SELF-INSPECTIONS

Detection by Personnel

- Facility personnel conduct monthly inspection of tank gauges and cathodic protection readings Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds. Refer to Figures 8.5 and 8.6 for sample Tank Inspection and Secondary Containment Inspection Checklists.
- Annual Secondary Containment Inspections are part of the SPCC Plan.
- Tank Inspections are part of the SPCC Plan.

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:
  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valve locks and/or seals
  - Other appurtenances
- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.
- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.
- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement.
- Annually a Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

Documentation

- Records of the inspections and tests (including those maintained under usual and customary business practices), signed by the appropriate supervisor or inspector are retained on file at the Facility and/or other Corporate location for a minimum period of three (3) years.

FIGURES 8.5 AND 8.6

Note: The following Kinder Morgan forms comprise the typical tank and secondary containment Inspection Checklists for this Facility. These forms may change over time to accommodate the specific operations of the Facility.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

- The immediate area around the Facility (approximately within one (1) mile) is heavily populated, however, beyond that distance to the north and west, the area becomes more heavily populated.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Water Intakes

(b) (7)(F), (b) (3)

[redacted]

(b) (3), (b) (7)(F)

[redacted]

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

(b) (3), (b) (7)(F)

Additional detail on the medical facilities within the area of the Facility are included on the maps in Section 6.

Residential Areas

Residential areas are located in all directions from the Facility. These areas begin within one mile of the Facility and continue outward in all directions.

Businesses

The area surrounding the Facility is for the most part commercialized. Along Folsom Road there are numerous residences which may be potentially impacted by a discharge. Review of GIS Data determined that the following businesses are within the planning distance of the Facility:

Businesses	Distance from Facility
Santa Fe Pacific Pipelines, LP	0.00 miles *(approximate)*
Sun Barber Shop	0.00 miles *(approximate)*
Smile Food Market	0.00 miles *(approximate)*
Creations Landscaping	0.01 miles *(approximate)*
Safety Investigative Services	0.01 miles *(approximate)*
Riverwood Shopping Center	0.15 miles SW *(approximate)*
Pavilions Shopping Center	2.76 miles SW *(approximate)*

Additional detail on the general layout of businesses within the area of the Facility is included on the maps in Section 6.

Fish and Wildlife, Wetlands, and other Sensitive Environments

The area surrounding the Facility is host to a variety of species. The Company is using the Regional ACP as well as the NOAA Environmental Sensitivity Study for the San Francisco Bay Region, prepared by Research Planning Institute, Inc., Columbia, South Carolina, 1986, as a reference in determining the locations of wetlands, environmentally sensitive areas, fish and wildlife, and endangered flora and fauna. Refer to Figure 4.1 of this Volume for threatened/endangered species.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Fish and Wildlife, Wetlands, and other Sensitive Environments (Cont'd)

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

Review of the USF&W Wetlands Mapper and Terraserver data indicates the following wetlands are within the planning distance of the Facility:

Wetlands	Latitude/Longitude
American River, Freshwater Emergent Wetlands	(b) (7)(F), (b) (3)
Sacramento River, Freshwater Emergent Wetlands	

Wetland habitats, however, are common throughout portions of the area. The size and diversity of the wetland environments vary with season and year. Wetlands play a disproportionally large role in maintaining the stability of the global environment. Wetlands retain and gradually release large quantities of water and their dense vegetation traps sediments and consumes pollutants.

During a response situation the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact the agencies will be able to:

- Identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge.
- Identify potential environmental effects on fish and wildlife, wetlands, and other sensitive environments resulting from removal actions or countermeasures.

Lakes and Streams

Review of GIS Data determined that the following lakes and streams are within the planning distance of the Facility:

Lakes and Streams	Location
American River	NW
Sacramento River	NW

Additional details on the lakes, streams, and rivers within the planning distance are found on the maps in Section 6.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Figure 4.1 of this Volume.

Recreational Areas

There are several recreational areas within the planning distance from the Facility. Review of GIS Data determined that the following recreational areas are within the planning

Recreational Area	Distance from Facility
Rosemont Community Park	.75 mile SSE *(approximate)*
Lincoln Village Park	1.70 miles SW *(approximate)*
Old Sacramento State Park	14.85 miles SW *(approximate)*

Additional details on the recreational areas within the planning distance are found on the maps in Section 6.

Transportation Routes (air, land, and water)

There are various public roadways and waterways which may be potentially affected by a discharge originating from the Facility. Review of GIS Data determined that the following transportation routes are within the planning.

Transportation Route	Distance from Facility
Bradshaw Road	West of Facility
Folsom Road	Adjacent
Sacramento Light Rail	Adjacent
Union Pacific Railroad	Adjacent
U.S. Highway 50	200 feet
Central Pacific Passenger Station	14.65 miles SW *(approximate)*

Utilities

Review of GIS Data determined that the following utilities are within the planning

Utilities	Distance from Facility
E.A. Fairbain Treatment Plant	5.0 miles SW *(approximate)*
Sacramento Filtration Plant	12.32 miles NW *(approximate)*

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Other Areas of Economic Importance

Review of GIS Data determined that no terrestrially sensitive or unique environments such as wildlife refuges, management areas, or ecological reserves are within the planning distance of the Facility.

Other Areas of Economic Importance	Distance from the Facility
Sacramento Museum	11.22 miles NW *(approximate)*
Sacramento History Museum	14.67 miles SW *(approximate)*
Peoples Market	14.76 miles SW *(approximate)*
Old Eagle Theater	14.77 miles SW *(approximate)*
Ogden Building	14.78 miles SW *(approximate)*
California State Railroad Museum	14.80 miles SW *(approximate)*
Schroth Bathhouse	14.81 miles SW *(approximate)*
Sam Brannan building	14.84 miles SW *(approximate)*
Schoolhouse Museum	14.99 miles SW *(approximate)*
California Citizens Museum	15.05 miles SW *(approximate)*
Crocker Art Museum	15.46 miles SW *(approximate)*
Towne Ford Museum	16.43 miles SW *(approximate)*
Sacramento Marina	16.93 miles SW *(approximate)*
Dippenbrock Landing	22.08 miles SE *(approximate)*

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history of the Facility.

Tank Age

The tanks were constructed in 1955, 1958, 1959, 1961, 1963, 1965, 1968, 1969, 1971, 1973, and 1978. The general condition of the tanks is good due to the type of construction and ongoing level of maintenance. Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL (Cont'd)

Horizontal Range of a Spill

The tank farm is protected with concrete block walls and asphalt covered dikes designed to withstand pressure from freestanding product. The berm is constructed to withstand a moderate earthquake without breaching the integrity of the secondary containment.

Should a spill escape containment, it would flow southwest through the Facility.

Vulnerability to a Natural Disaster

The Tank Farm location is relatively flat area and is therefore unlikely to incur damage due to shifting and sliding. The seismic stability of the area is good. The probability of a landslide or earthquake is low.

In addition to the above referenced factors, it should also be noted that Facility inspection and response drills, as well as Standard Operating Procedures (SOPs) for loading operations and the like, contribute to minimization of spill potential at the Facility.

Other Factors

The area in which the Facility is located is prone to minor earthquakes; however, the actions taken to lessen hazards at the Facility petroleum tank farm reduces the probability to a low potential. Hazard reduction protective measures have been designed into tanks and into the construction of the facility. Tanks were designed to industry standards which reduces the potential for hazards. Based on the care and construction of the tanks, the potential of any one tank rupturing and emptying product into the secondary containment is low. The potential of several tanks simultaneously rupturing is very low.

The Facility conforms to good engineering practices in the tank integrity inspection program. The inspection program reduces the likelihood of leaks. The Facility has not experienced a failure associated with a tank structure.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

The Facility maintains a separate Oil Spill History file in the Kinder Morgan corporate office located at 1100 Town & Country Road, Orange, CA 92868. The Facility's file contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY (Cont'd)

- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

Date of Discharge	Location of Discharge	Cause of Discharge	Product Discharged	Amount Discharged	NRC Incident Report #
12/29/02	American River, Sacramento, CA	Oily water sump overfill	Oily water	(b) (7)(F), (b) (3)	632934

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed on the Potential Spill Sources and Container Identification table in this Section.

The tank farm is protected with concrete block walls and asphalt covered dikes designed to withstand pressure from freestanding product. The floors of the tanks have impervious linings. The berm is constructed to withstand a moderate earthquake without breaching the integrity of the secondary containment.

Tanks

- Secondary Containment volumes for all bulk storage tanks are detailed in the Potential Spill Sources and Container Identification table in this Section.

Loading Rack Containment System

Main Loading/Unloading Racks

The loading/unloading rack areas are designed and operated as follows:

- Loading/unloading rack drainage flows into a catchment basin and OWS system, designed to handle discharges.
- The containment system is designed to hold the maximum capacity of any single compartment of a single tank truck loaded or unloaded at the Facility.
- Drainage from each loading/unloading rack is contained in a depressed area with curbs. Drainage is through area drains to a 10,000 gallon oil/water separator. The product is pumped using a skimming device from the oil/water separator to a transmix tank. The water phase is drained to two (2) 11,000 gallon fiberglass holding tanks. The water is pumped through a sock filter and three (3) carbon filters to two (2) Visual Inspection Tanks (VITs) and sampled for contamination (alcohol, suspended solids, hydrocarbons, etc.) before being transferred by truck to the East Bay M.U.D.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Diked Areas

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment area.
- Stormwater which does accumulate within the diked area, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures.
- Drainage from diked storage areas is restrained by manually controlled valves.
- Dike drain valves are secured in the closed position when not draining diked storage areas.
- Flapper-type drain valves are not used to drain diked storage areas.
- Stormwater from diked storage areas is emptied by gravity.
- Drainage from the diked storage areas, as described above, is controlled by manual valves kept closed except when draining. Water, which is drained from these areas following visual inspection for signs of contamination, is directed through the drainage ditch system to the stormwater pond where the water either evaporates or dissipates into the soil.
- Contaminated stormwater is routed to the OWS where the oil phase is sent to a transmix tank and the water phase is sent first to a visual inspection tank then through sock and carbon filter units before being transferred to the waste water tank. Contents of the waste water tank are transferred via tank truck to the East Bay M.U.D.

Drainage From the Undiked Areas

Drainage from undiked areas is controlled as follows:

- All Facility aboveground piping is contained within diked storage areas or the containment systems provided for the loading racks.
- Surface drainage from undiked areas flows to a perimeter drainage ditch that directs collected stormwater to a holding pond at the northwest corner of the property.
- In the event that a spill originates from undiked areas, the Facility would immediately activate its Contingency Plan to mitigate the spill before leaving the property.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Undiked Areas (Cont'd)

The procedure for supervising the drainage of stormwater from diked storage areas into a storm drain or an open watercourse is as follows:

- Water is visually inspected for product and discharged only if no product sheen is visible and the Area Manager has granted approval to open drain valves.
- Facility drainage does not flow directly into an open watercourse.
- When draining the diked storage areas, water is discharged to the perimeter drainage ditch which directs water to the holding pond in the northwest corner of the Facility.
- The Facility does have a wastewater treatment plant to filter contaminated water prior to transport to the East Bay M.U.D.
- Records of drainage events are kept at the Facility office.

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Chico Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading rack has sufficient capability to handle any potential increase in transfer capacity. The loading racks operate 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan which details additional detection measures.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Detection by Personnel

- Facility personnel conduct weekly inspection of tank gauges and cathodic protection readings Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds. Refer to Figures 8.5 and 8.6 for sample Tank Inspection and Secondary Containment Inspection Checklists.

Automated Detection Systems

(b) (3), (b) (7)(F)

(b) (7)(F), (b) (3)

8.2.2 FACILITY SELF-INSPECTIONS

Detection by Personnel

- Facility personnel conduct weekly inspection of tank gauges and cathodic protection readings Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds. Refer to Figures 8.5 and 8.6 for sample Tank Inspection and Secondary Containment Inspection Checklists.

- Annual Secondary Containment Inspections are part of the SPCC Plan.

- Tank Inspections are part of the SPCC Plan.

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valves locks and/or seals
  - Other appurtenances

- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement

- A Corrosion Specialist visits the Facility annually to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

FIGURES 8.5 AND 8.6

Note: The following Kinder Morgan forms comprise the typical tank and secondary containment Inspection Checklists for this Facility. These forms may change over time to accommodate the specific operations of the Facility.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

- The Facility is located southwest of Chico and is approximately 200 yards east southeast of Edgar Slough and Little Chico Creek, the closest navigable water body.
- The Facility is connected by pipelines to other Company facilities in northern and central California.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Water Intakes

(b) (7)(F), (b) (3)

[redacted]

(b) (3), (b) (7)(F)

Medical Facilities

Miscellaneous medical facilities (primarily hospitals) are located within the Chico City Limits. The majority of the facilities lie to the northwest of the Facility. Review of GIS Data determined that the following medical facilities are within the planning distance of the Facility:

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Medical Facilities (Cont'd)

(b) (3), (b) (7)(F)

Additional detail on the medical facilities within the area of the Facility is included on the maps in Section 6.

Residential Areas

The immediate area around the Facility (within approximately one mile) is sparsely populated, however, beyond that distance to the northwest, the area becomes more heavily populated.

Additional detail on the residential areas within the area of the Facility is included on the maps in Section 6.

Businesses

The area surrounding the Facility is for the most part commercialized. Along Hegan Lane and Park Avenue there are various businesses and commercial establishments which may be potentially impacted by a discharge. Review of GIS Data determined that the following businesses are within the planning distance of the Facility:

Businesses	Distance from Facility
Atc-Vancom, Inc.	0.05 miles *(approximate)*
Chico Area Transit	0.05 miles *(approximate)*
Adexpedia, Inc.	0.11 miles *(approximate)*
Travidia, Inc.	0.11 miles *(approximate)*
Work Training Center	0.11 miles *(approximate)*

Additional detail on the general layout of businesses within the area of the Facility is included on the maps in Section 6.

Fish and Wildlife, Wetlands, and other Sensitive Environments

The area surrounding the Facility is host to a variety of species. The coastal area is home for a variety of migratory species during parts of the year. The common coastal inhabitants include shorebirds, wading birds, fish, reptiles, invertebrates, and various plants. The coastal shorelines have been divided into ten categories according to potential sensitivity to oil. The U.S. Coast Guard - Area Contingency Plan for this area details these categories.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Fish and Wildlife, Wetlands, and other Sensitive Environments (Cont'd)

The Company is using the Regional ACP as well as the NOAA Environmental Sensitivity Study for the San Francisco Bay Region, prepared by Research Planning Institute, Inc., Columbia, South Carolina, 1986, as a reference in determining the locations of wetlands, environmentally sensitive areas, fish and wildlife, and endangered flora and fauna. Refer to Figure 4.1 of this Volume for threatened/endangered species.

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

Review of the USF&W Wetlands Mapper and Terraserver data indicates the following wetlands are within the planning distance of the Facility:

Wetlands	Latitude/Longitude
Comanche Creek, Freshwater Emergent Wetlands	(b) (7)(F), (b) (3)

Wetland habitats, however, are common throughout portions of the area. The size and diversity of the wetland environments vary with season and year. Wetlands play a disproportionally large role in maintaining the stability of the global environment. Wetlands retain and gradually release large quantities of water and their dense vegetation traps sediments and consumes pollutants.

During a response situation the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact the agencies will be able to:

- Identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge.
- Identify potential environmental effects on fish and wildlife, wetlands, and other sensitive environments resulting from removal actions or countermeasures.

Lakes and Streams

Review of GIS Data determined that the following lakes and streams are within the planning distance of the Facility:

Lakes and Streams	Location
Little Chico Creek, Edgar Slough	0.1 miles N-NW *(approximate)*
Comanche Creek	0.5 miles NW *(approximate)*

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Figure 4.1 of this Volume.

Recreational Areas

Review of GIS Data determined that the following recreational areas are within the planning distance:

Recreational Area	Distance from Facility
Silver Dollar Fairgrounds	0.5 miles *(approximate)*
Butte Creek Country Club	1.4 miles NW *(approximate)*

Additional details on the recreational areas within the planning distance are found on the maps in Section 6.

Transportation Routes (air, land, and water)

There are various public roadways and waterways which may be potentially affected by a discharge originating from the Facility. Review of GIS Data determined that the following transportation routes are within the planning distance of the Facility:

Transportation Route	Distance from Facility
State Highway 99	0.7 miles NE *(approximate)*

Utilities

PG&E is located directly behind the Facility and may be potentially impacted by a discharge originating from the Facility.

Other Areas of Economic Importance

Review of GIS Data determined that the following other areas of economic importance are within the planning distance of the Facility.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Other Areas of Economic Importance (Cont'd)

Other Areas of Economic Importance	Distance from the Facility
Chapman Neighborhood Center	1.5 miles N *(approximate)*
Chico Cemetary	3.5 miles SW *(approximate)*
Chico Museum	3.7 miles SW *(approximate)*
Chico City Hall	3.7 miles SW *(approximate)*
Bidwell Mansion State Monument	3.8 miles SW *(approximate)*
Bidwell Mansion	3.8 miles SW *(approximate)*
Meriam Library	3.9 miles SW *(approximate)*

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history of the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Containment and recovery of any spilled material which might escape a diked area would be accomplished through the implementation of spill response activities by: (1) Facility personnel, or if necessary, (2) one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow toward the drainage ditch inside the perimeter fence then to the retention pond at the northwest corner of the property.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL (Cont'd)

Vulnerability to a Natural Disaster

The Facility is located in a semi-active earthquake zone with occasional seismic activity.

The Company has historical data that defines the probability of seismic activity in the San Francisco / Northern California area. The construction of the Facility has taken the possibility of some seismic activity into consideration; the location of tank farms away from slide prone areas, and constructing the Facility, including all subgrade soil preparation, along with slope and tank construction in accordance with appropriate building codes and industry guidelines.

Other Factors

The actions taken to lessen hazards at the Facility tank farm reduces the probability to a low potential. Hazard reduction protective measures have been designed into tanks and into the construction of the Facility. Tanks were designed to industry standards which reduces the potential for hazards. Based on the care and construction of the tanks, the potential of any one tank rupturing and emptying product into the secondary containment is low. The potential of several tanks simultaneously rupturing is very low.

The Facility conforms to good engineering practices in the tank integrity inspection program. The inspection program reduces the likelihood of leaks. The Facility has not experienced a failure associated with a tank structure.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

The Facility maintains a separate Oil Spill History file in the Facility office. The Facility's file contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY (Cont'd)

- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

Since the Facility was acquired by Kinder Morgan Energy Partners, the Facility has not experienced a reportable spill as defined in 40 CFR 110.

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Rail car unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed in the Potential Spill Sources and Container Identification table in this Section.

- The Facility is located in Sparks, NV, approximately one (1) mile north of the Truckee River which is the closest navigable waterway.
- The Facility is connected by pipelines to other Company facilities in northern California and western Nevada.

Tanks

- Secondary Containment volumes for all bulk storage tanks are detailed in the Potential Spill Sources and Container Identification table in this Section.

Loading Rack Containment System

The loading/unloading rack area is designed and operated as follows:

- Drainage from loading/unloading areas flows into a catchment basin then to OS1, designed to handle discharges.
- The containment systems are designed to hold the maximum capacity of any single compartment of a single tank truck loaded or unloaded at the Facility.
- A quick drainage system is not used for tank truck loading/unloading.
- Drainage from the Company loading rack south of Area 1, the military loading rack south of Area 4 and the Berry-Hinkley loading rack between Areas 2 and 5 is contained in depressed areas beneath the loading stations. Drainage through the area drains goes to a 13,219 gallon oil/water separator (OS1). Drainage from the additive unloading area north of the control building is routed to the oil/water separator (OS2) in the northwest corner of Area 1. The product recovered by OS1 and OS2 is pumped to an available transmix tank (R-10, R-11, or R-12). The water phase is drained to a holding pond. When the pond is filled the water is passed through four (4) sand filters, two (2) 2,000 lbs. carbon filter units, and sampled before being released to the municipal sewer system in accordance with the City of Sparks Environmental Control Section, Environmental Control Permit.

8.2.1 HAZARD IDENTIFICATION

Secondary Containment Volumes (Cont'd)

Drainage From the Diked Areas

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment area.
- Stormwater which does accumulate within the diked area, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures.
- Drainage from diked areas is restrained by manually controlled valves.
- Dike drain valves are secured in the closed position when not draining containment areas.
- Flapper-type drain valves are not used to drain diked areas.
- Stormwater from diked areas is emptied by gravity.
- Areas 2, 4 and 5 on the south side of the Facility drain to OS1.
- Areas 1 and 3 on the north side of the Facility drain to OS2.
- Oil phase from both oil/water separators OS1 and OS2 is transferred to a transmix tank. Water phase is processed through four (4) sand and two (2) carbon filter units and sampled before being discharged to the sewer system in accordance with the City of Sparks Environmental Control Section Environmental Control Permit.

Drainage From the Undiked Areas

Drainage from undiked areas is controlled as follows:

- Aboveground piping outside diked areas is contained by the oil/water separator system OS1 that serves the southern portions of the Facility.
- Surface drainage from undiked areas is routed to OS1 located in Area 2. The oil phase is transferred to a transmix and water is passed through the filter system described in the SPCC Plan.
- The risk of leaks originating from piping is low since it is observed frequently enough to detect excessive corrosion, defective pipe supports, or other anomalies which could compromise the integrity of the pipe.
- In the event that a spill did originate from undiked piping, the Facility would immediately activate its Contingency Plan to mitigate the spill before it leaves the property.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

- Catchment basins, if applicable, are not located in areas subject to periodic flooding.

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is as follows:

- Stormwater is allowed to evaporate from the secondary containment areas.
- Water is visually inspected for product and discharged only if no product sheen is visible.
- When draining the containment area, water is discharged to oily water separators OS1 or OS2 and passed through four (4) sand and two (2) carbon filter units and sampled before being discharged to the City of Sparks sewer system.

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Reno Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading rack has sufficient capability to handle any potential increase in transfer capacity. The loading racks operate 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the following document which is related to Discharge Detection:

- Spill Prevention, Control, and Countermeasure (SPCC) Plan

Detection by Personnel

- Facility personnel conduct monthly inspection of tank gauges and cathodic protection readings. Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds.

8.2.2 FACILITY SELF-INSPECTIONS

Detection by Personnel

- Facility personnel conduct monthly inspection of tank gauges and cathodic protection readings. Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds.
- Annual Secondary Containment Inspections are part of the SPCC Plan.
- Tank Inspections are part of the SPCC Plan.

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:
  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valves locks and/or seals
  - Other appurtenances
- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.
- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.
- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement.
- Annually a Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report which recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

The tank farm is protected with concrete block walls and earthen berms designed to withstand pressure from freestanding product. The floors of the tanks have impervious linings. The berm is constructed to withstand a moderate earthquake without breaching the integrity of the secondary containment.

- The Facility is located in Sparks, NV approximately one (1) mile north of the Truckee River.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Water Intakes

(b) (7)(F), (b) (3)

[redacted]

(b) (3), (b) (7)(F)

[redacted]

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Medical Facilities

No medical facilities were identified within the planning distance.

Residential Areas

Residential areas are located in all directions from the Facility. These areas begin within one mile of the Facility and continue outward in all directions.

Additional details on the residential areas within the area of the Facility are included on the maps in Section 6.

Businesses

The area surrounding the Facility is for the most part commercialized. There are various businesses and commercial establishments which may be potentially impacted by a discharge. Review of GIS Data determined that the following businesses are within the planning distance of the Facility:

Businesses	Distance from Facility
Truckee River Spa Company	0.02 miles *(approximate)*
Two College Guys	0.02 miles *(approximate)*
Holiday Inn	0.02 miles *(approximate)*
Scudders Performance	0.10 miles *(approximate)*
Sparks Jewelers	0.10 miles *(approximate)*

Additional detail on the general layout of businesses within the area of the Facility is included on the maps in Section 6.

Fish and Wildlife, Wetlands, and other Sensitive Environments

The area surrounding the Facility is host to a variety of species. The EPA Region 9 - Area Contingency Plan for this area details these categories. The Company is using the Regional ACP as well as the NOAA Environmental Sensitivity Study for the San Francisco Bay Region, prepared by Research Planning Institute, Inc., Columbia, South Carolina, 1986, as a reference in determining the locations of wetlands, environmentally sensitive areas, fish and wildlife, and endangered flora and fauna. Refer to Figure 4.1 of this Volume for threatened/endangered species.

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

No wetlands were identified within the planning distance.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Lakes and Streams

Review of GIS Data determined that the following lakes and streams are within the planning distance of the Facility:

Lakes and Streams	Location
Truckee River	1.0 miles S *(approximate)*
Peoples Ditch	1.0 miles ESE *(approximate)*
Steamboat Creek	1.5 miles SE *(approximate)*
Truckee Canal	23.2 miles NE *(approximate)*

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Figure 4.1 of this Volume.

Recreational Areas

There are several recreational areas within the planning distance from the Facility. Review of GIS Data determined that the following recreational areas are within the planning distance:

Recreational Area	Distance from Facility
Garayenta Ranch	0.30 miles S *(approximate)*
Kleppe Ranch	0.90 miles SE *(approximate)*
Jones Ranch	1.00 miles SE *(approximate)*
Community Recreation Center	2.00 miles NNE *(approximate)*
Casci Ranch	2.2 miles SE *(approximate)*
Sparks Marina Park	2.5 miles NNE *(approximate)*
Sturtevant Ranch	5.3 miles SE *(approximate)*
Peri Ranch	6.5 miles SE *(approximate)*
102 Ranch	15 miles NE *(approximate)*
Gilpin Rest Stop	25.2 miles NE *(approximate)*
James Ranch	29.7 miles NE *(approximate)*

Additional details on the recreational areas within the planning distance are found on the maps in Section 6.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Transportation Routes (air, land, and water)

The Facility is located just south of I-80, with the Southern Pacific Railroad running approximately one quarter mile south, between the Truckee River and the Facility. Review of GIS Data determined that the following transportation routes are within the planning distance of the Facility:

Transportation Route	Distance from Facility
Union Pacific Railroad	Adjacent *(approximate)*
I-80	Adjacent *(approximate)*
McCarran Blvd.	700 yards E *(approximate)*
Airway Beacon 212	23.6 miles S *(approximate)*

Utilities

Review of GIS Data determined that the following transportation routes are within the planning distance of the Facility:

Transportation Route	Distance from Facility
Sparks Sewage Disposal Plant	1.8 miles SE *(approximate)*
Tracy Powerplant	14.0 miles SE *(approximate)*

Other Areas of Economic Importance

Review of GIS Data determined that the following other areas of economic importance are within the planning distance of the Facility:

Other Areas of Economic Importance	Distance from the Facility
Eastman Mil	0.20 miles SW *(approximate)*
Brothers of the Holy Rosary	0.20 miles S *(approximate)*
Court of Antiquity	3.70 miles SE *(approximate)*
Ditho (historical)	9.8 miles SE *(approximate)*
Browns (historical)	12.5 miles SE *(approximate)*
Wunotoo	14.0 miles SE *(approximate)*
Sarvia (historical)	20.9 miles NE *(approximate)*
Smith Ranch	24.1 miles NE *(approximate)*
Gilpin (historical)	25.4 miles NE *(approximate)*
Olinghouse Junction (historical)	27.0 miles NE *(approximate)*

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history of the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Any spilled material which might escape a diked area would be mitigated through the implementation of spill response activities by: Facility personnel, or if necessary, one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow southwest through the Facility.

Vulnerability to a Natural Disaster

The Facility is located in a semi-active earthquake zone with occasional seismic activity.

The Company has historical data that defines the probability of seismic activity in the Northern California / Nevada area. The construction of the Facility has taken the possibility of some seismic activity into consideration; the location of tank farms away from slide prone areas and constructing the Facility, including all subgrade soil preparation, along with slope and tank construction in accordance with appropriate building codes and industry guidelines.

Other Factors

The actions taken to lessen hazards at the Facility tank farm reduces the probability to a low potential. Hazard reduction protective measures have been designed into tanks and into the construction of the Facility. Tanks were designed to industry standards which reduces the potential for hazards. Based on the care and construction of the tanks, the potential of any one tank rupturing and emptying product into the secondary containment is low. The potential of several tanks simultaneously rupturing is very low.

The Facility conforms to good engineering practices in the tank integrity inspection program. The inspection program reduces the likelihood of leaks. The Facility has not experienced a failure associated with a tank structure.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

Kinder Morgan maintains an online database of reportable spills available at all locations via the company's intranet. The database contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

Since the Facility was acquired by Kinder Morgan Energy Partners, the Facility has experienced no spills as defined by 40 CFR 110.

(b) (7)(F), (b) (3)

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. - Bradshaw Terminal is classified as an EPA jurisdictional "Non-Transportation Related Onshore Facility" which operates in a Non-Higher Volume Port Area.

The EPA discharge volume calculations are described as follows:

EPA Discharge Volume Calculation

- **Worst Case Discharge**
  100% of the largest single tank

  WCD = (b) (7)(F),

- **Medium Discharge**
  Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD

  MD = 857 bbls

- **Small Discharge**
  Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD

  SD = 50 bbls

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack, or leaking piping and would be Gasoline or Diesel.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the loading rack would be diverted to the on line oil/water separator.

The closest waterway is the American River, which is north of the Facility. The storage tanks and truck loading racks, have adequate secondary containment so it is unlikely that a spill would reach the river or travel very far if it did. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, as appropriate, include:

- 1,000' of containment boom and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a *Small Discharge* or greater which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a *Small Discharge* with the manpower and local contract resources as detailed in Section 2 and 3 of Volume 2.

- A 50 bbls discharge typically will not escape the containment of the Facility.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack while loading Gasoline. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Offsite Impact

- The closest waterway is the American River, which is north of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the river. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be implemented at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.
- Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to:

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Spills of this size would likely be Gasoline or Diesel. Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before spill containment could begin. The spilled material would more than likely collect in the containment area sump system and be routed to the separator system. If a spill of this size escaped the property it could possibly enter the American River. Adverse weather conditions would increase the chances of a discharge entering the river; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages can be referenced in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a medium discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

The closest waterway is the American River so the potential for a spill of this size reaching navigable water does exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power

lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the *Medium Discharge* volume that are capable of arriving on scene within 12 hours.
- Sufficient quantity of containment boom must arrive within 12 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 12 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 12 hours; Tier 2 = 36 hours; Tier 3 = 60 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 12 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage facilities.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the River.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed (b) (7)(F), (b) (3)

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached). Spills of this size would likely be Gasoline.

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages can be located in the Potential Spill Sources and Container Identification table in Section 8.2.

Worst Case Discharge and Adverse Weather

Calculation of the planning distance for a WCD is provided at the end of this section.

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow north and enter the American River which is located north of the property.

For a spill that is confined to the land along the pathway, Facility personnel would have at least two (2) options by which to contain the spill:

- Dams
- Trenches

Ditch Containment

A spill may be contained in stormwater ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located south of the American River. The priority during larger spills is to prevent oil from reaching the waterway. OSROs are under contract with the Facility. Several recreating areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by state and Federal trustees would likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Response Requirement (Cont'd)

- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage facilities.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of six (6) feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. - Chico Terminal is classified as an EPA jurisdictional "Non-Transportation Related Facility" which operates in a Non-Higher Volume Port Area.

The agency discharge volume calculations are described as follows:

EPA Discharge Volume Calculation

- **Worst Case Discharge**
  100% of the largest single tank

  WCD = (b) (7)(F), (b) (2)

- **Medium Discharge**
  Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD

  MD = 857 bbls

- **Small Discharge**
  Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD

  SD = 50 bbls

8.3 DISCHARGE SCENARIOS (Cont'd)

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack, or leaking piping and would be Gasoline.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the Facility could be diverted to the transmix tanks that are not at maximum capacity.

The Facility is approximately 200 yards east-southeast of Edgar Slough and Little Chico Creek, the closest major body of water. The storage tanks and truck loading racks, have adequate secondary containment so it is unlikely that a spill would reach either waterway or travel very far if it did. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Summary of EPA Regulatory Response Requirements for a Small Discharge

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, ***AS APPROPRIATE****, include:*

- *1,000' of containment boom* ***and a means of deploying it*** *within one (1) hour of the discovery of a spill. [Guidance: The appropriate level of response resources to address a small discharge from this Facility should arrive on-scene; including the equipment and appropriately trained manpower necessary to deploy the response resources; within one (1) hour of discovery of the discharge.]*
- *Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a Small Discharge or greater which is available at the Facility within two (2) hours of the detection of an oil discharge. [Guidance: Oil recovery devices with a minimum of 50 bbls/day recovery capacity (or greater) should be on scene and ready to commence recovery of discharged oil within two (2) hours of discovery of the discharge. The response resources that arrived to the site in the first hour (noted in the first bullet above) should be deployed and actively containing discharged oil within this two (2) hour period.]*
- *Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate. [Guidance: Storage capacity for twice the effective daily recovery rate (2 times 50 bbls/day) is 100 bbls/day which should be available at the commencement of the recovery operations, therefore within two (2) hours of discovery of the discharge.]*

Facility Response Resources/Capability

The Facility will respond to a *Small Discharge* with the manpower and local contract resources as detailed in Sections 2 and 3 of Volume 2.

Probable Scenario

- A 50 bbls discharge typically will not escape the containment of the Facility.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack while loading Gasoline. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Potential Offsite Impact

- The closest waterways are the Edgar Slough and Little Chico Creek, which are northwest of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the slough and creek. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Potential Offsite Impact (Cont'd)

- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be implemented at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.
- Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.

Appropriate Level of Response (in unlikely event of offsite impact)

- Under Section 3.3 to Appendix E of 40 CFR 112 – *Determination and Evaluation of Required Response Resources for Facility Response Plans*, it states, "The response resources shall, **as appropriate**, include: 3.3.1 One thousand feet of containment boom…" (59FR34112)
- "EPA recognizes that certain other elements may not be applicable in all cases. To provide flexibility for facilities with unique circumstances, certain elements are prefaced by use of the words **'shall, as appropriate'** or modified by the use of the words **'or equivalent'.**"(59FR34074)
- **Accordingly, 1,000ft of containment boom is not appropriate and would not be practicable for a response to a discharge from this facility. Based upon local topography, initial response will be accomplished with diking/damming, underflow dams and a minimal amount of containment and sorbent boom (approximately 50 feet of each). The response will be implemented utilizing local contract resources. These tactical response strategies have been pre-identified and documented. These Tactical PrePlans have been provided herein behind tab "Tactical PrePlans" located at the end of this Volume 2, Section 8.**
- The equipment for these response strategies to be utilized for the small discharge will be provided by Ben's Truck & Equipment, Inc. with which KMEP has a contract (Contract 06-ER-20-011-ORG).
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.
- Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and

actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Spills of this size would likely be Gasoline. Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before a spill containment could begin. The spilled material would more than likely collect in the containment area sump system and be routed to the oil/water separator system. If a spill of this size escaped the property it could possibly enter the Edgar Slough and Little Chico Creek. Adverse weather conditions would increase the chances of a discharge entering the waterways; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, Facility personnel receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages can be referenced in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a medium discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

The closest waterways are the Edgar Slough and Little Chico Creek so the potential for a spill of this size reaching navigable water does exist. Damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the *Medium Discharge* volume that are capable of arriving on scene within 12 hours.
- Sufficient quantity of containment boom must arrive within 12 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 12 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 12 hours; Tier 2 = 36 hours; Tier 3 = 60 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 12 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage facilities.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the waterways.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed (b) (7)(F), (b) (3)

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached). Spills of this size would likely be Diesel.

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages can be located in the Potential Spill Sources and Container Identification table in Section 8.2.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow east-southeast and enter the Edgar Slough and Little Chico Creek which are located east-southeast of the property.

For a spill that is confined to the land along the pathway, Facility personnel would have at least two (2) options by which to contain the spill:

- Dams

- Trenches

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Ditch Containment

A spill may be contained in stormwater ditches. Some practical containment methods are:

- A board skimming device

- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located east southeast of Edgar Slough and Little Chico Creek. The priority during larger spills is to prevent oil from reaching the waterway. OSROs are under contract with the Facility. The Company, however, will use Facility personnel and Facility owned equipment to initiate initial boom deployment and anchoring at the waterway within one hour. Several recreating areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by state and Federal trustees would likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a worst case discharge to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.
- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage facilities.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility members, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. - Reno Terminal is classified as an EPA jurisdictional "Non-Transportation Related Onshore Facility" which operates in a Non-Higher Volume Port Area.

The EPA discharge volume calculations are described as follows:

EPA Discharge Volume Calculation

- **Worst Case Discharge**
  100% of the largest single tank

  WCD = [redacted]

- **Medium Discharge**
  Discharge greater than 50 bbls (2,100 gallons) and less than or equal to 857 bbls (36,000 gallons) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD

  MD = 857 bbls

- **Small Discharge**
  Discharge of less than or equal to 50 bbls (2,100 gallons), not to exceed the WCD

  SD = 50 bbls

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack, or leaking piping and would be Gasoline.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the Facility could be diverted to the product tanks.

The closest waterway is the Truckee River, which is south of the Facility. The storage tanks and truck loading racks, have adequate secondary containment so it is unlikely that a spill would reach the river. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, as appropriate, include:

- 1,000' of containment boom and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a *Small Discharge* or greater which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a *Small Discharge* with the manpower and local contract resources as detailed in Section 2 and 3 of Volume 2.

- A 50 bbls discharge typically will not escape the containment of the Facility.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack while loading Gasoline. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Offsite Impact

- The closest waterway is the Truckee River, which is south of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the river. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be deployed at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage tanks, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)
Offsite Impact (Cont'd) ● Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.
Notes: ● Equipment and manpower resources are detailed in Section 3 of Volume 2. ● Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1. ● Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Spills of this size would likely be Gasoline. Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before a spill containment could begin. The spilled material would more than likely collect in the containment area sump system and be routed to the separator system. If a spill of this size escaped the property it could possibly enter the Truckee River. Adverse weather conditions would increase the chances of a discharge entering the river; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages are listed in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a Medium Discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

The closest waterway is the Truckee River so the potential for a spill of this size reaching navigable water does exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the Medium Discharge volume that are capable of arriving on scene within 12 hours.
- Sufficient quantity of containment boom must arrive within 12 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 12 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 12 hours; Tier 2 = 36 hours; Tier 3 = 60 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 12 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage tanks.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the Truckee River.
- Recovery of large spills from diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed (b) (7)(F), (b) (3)

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached). Spills of this size would likely be Gasoline.

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages are listed in the Potential Spill Sources and Container Identification table in Section 8.2.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow south toward the Truckee River.

For a spill that is confined to the land along the pathway, Facility personnel would contain the spill using dams or trenches.

Ditch Containment

A spill may be contained in storm water ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located north of the Truckee River. The priority during larger spills is to prevent oil from reaching the waterway. OSROs are under contract with the Facility. The Company, however, will use Facility personnel and Facility owned equipment to initiate initial boom deployment and anchoring at the waterway within a reasonable time. Several recreation areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by the state and federal trustees would more than likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.
- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Response Requirement (Cont'd)

- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage tanks.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Company Personnel (IC) assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 2901 Bradshaw Road
Sacramento, CA 95827
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility and Union Pacific Railroad and Sacramento Light Rail if affected.
h. Staging area for Emergency Command Post will be at the Restaurant on Bradshaw Road or where the Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the Control Building. (Refer to the Evacuation Diagram in the SPCC Plan in this Section for evacuation routes.) Company Personnel (IC) will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the main office or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility Main Office, Control Building, or the north or south staging area.

8.4 FACILITY EVACUATION (Cont'd)

4. Community Evacuation

The local Law Enforcement provides methods of warning the public of the need to evacuate. The current procedure for informing the public when there is a need to do so is by door-to-door notification, use of electronic media by direct contact to radio and television stations, or the employment of the Emergency Broadcast System (EBS). The local authorities will initiate and coordinate all efforts concerning the evacuation of the community.

5. Directions to Mercy General Hospital

From the Facility, start out going south on Bradshaw Road towards Oates Drive by turning left. Proceed 0.24 miles and take the US-50 W ramp towards Sacramento. Go 0.51 miles and merge onto US-50 W. Travel 4.54 miles and take the 65th Street exit. After going 0.19 miles, turn right onto 65th Street. Proceed 0.30 miles and turn left onto Elvas Avenue. Travel 0.71 miles and turn slight left onto ramp and go 0.06 miles, then left onto 57th Street. Proceed 0.07 miles and turn right onto J Street. Go 1.08 miles to Mercy General Hospital.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via Gore Road or the main gate. If the situation permits, the Facility may also be accessed through the northern access road.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

8. Prevailing Winds

The prevailing winds in the Facility area generally come from the southwest at an average speed of 5-10 mph year round.

TACTICAL PLAN

The following Tactical Plan has been provided to assist initial response to a spill incident from this Facility. The plan includes the following:

- Driving directions
- General pictures of the site and tactical response strategy
- General response equipment and personnel recommendations

Note: This Tactical Plan is provided as a general guidance tool for response to an incident emanating from this Facility. The selection of response strategy equipment, manpower and deployment site may vary based on actual field conditions (e.g. terrain, weather conditions, product type/volume) and incident details.

(b) (7)(F), (b) (3)

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Emergency Director Company Personnel (IC) assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 2570 Hegan Lane
Chico, CA 95928-9598
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility and Union Pacific Railroad.
h. Establish a Command Center immediately at the entrance to the Facility or where the Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All personnel will report to the Control Building. (Refer to the Evacuation Diagram in the SPCC Plan in this Section for evacuation routes.) Company Personnel (IC) will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Personnel who find themselves isolated from the Primary Assembly Area by the incident should proceed to the secondary emergency response command center or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility Control Building or the secondary staging area.

8.4 FACILITY EVACUATION (Cont'd)

4. Community Evacuation

The Company has confirmed with the Chico Fire Department that no community evacuation plan currently exists for this area. However, the fire department does have standard guidelines that are followed in the event of an evacuation.

5. Directions to Enloe Hospital

Take a left on Midway. Take another left on Park Avenue and continue on Park Avenue to Main Street. At Main Street turn right toward Esplanade Road. Take a right on Esplanade Road. The hospital is located at 1531 Esplanade Road.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gate located Southeast of the Control Building.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

8. Prevailing Winds

The prevailing winds in the Facility area generally come from the northwest at an average speed of 5-10 mph.

9. Water Currents

Currents in the Little Chico Creek are minimal.

(b) (7)(F), (b) (3)

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Company Personnel IC assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location:301 Nugget Avenue
Sparks, NV 89431-5749
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility and Union Pacific Railroad if applicable.
h. Establish a Command Center immediately at the entrance to the Facility or where the Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the Control Building. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel IC will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the secondary command center or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility Main Office, Control Building, or the north or south staging area.

8.4 FACILITY EVACUATION (Cont'd)

4. Community Evacuation

The Company has confirmed with the Sparks Fire Department that no Community Evacuation Plan currently exists for this area. However, the Fire Department does have Standard Guidelines that are followed in the event of an evacuation.

5. Directions to St. Mary's Hospital

From the Facility on Nugget Avenue go west by turning left. Travel 0.37 miles and make a slight right onto Pyramid Way. Stay straight on Pyramid Way/NV-445 for 0.02 miles. Turn left onto I-80 towards Reno and travel 3.05 miles. Take exit number 13 towards Downtown Reno/Virginia Street. Stay straight to go onto E. 8th Street for 0.07 miles. Turn left onto N. Virginia Street/US-395 Bridge and travel 0.18 miles. Turn right onto W. 6th Street. Turn left onto N. Sierra Street. Turn right onto W. 6th Street and travel 0.09 miles to St. Mary's Regional Medical Center.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gates located south of Nugget Avenue and Stanford Way.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

8. Prevailing Winds

The prevailing winds in the Facility area generally come from the northwest, at an average speed of 5-10 mph year round.

1.0 INTRODUCTION AND PLAN CONTENT

1.1 OPERATOR NAME, ADDRESS AND PHONE NUMBER

Kinder Morgan Energy Partners, L.P.
1001 Louisiana Street, Suite 1000
Houston, Texas 77002
(713) 369-9454

Qualified Individual:	Doug Schminke Director Operations 707.438.2104 *(Office)* (b) (6) *(Mobile)* doug_schminke@kindermorgan.com
Alternate Qualified Individual:	Steve Osborn Operations Manager 916.624.2431x13 *(Office)* (b) (6) *(Mobile)* osborns@kindermorgan.com
Area Manager – Fresno	Mike McWhorter 559.493.2975 Office (b) (6) Mobile mcwhorterm@kindermorgan.com

1.2 OPERATING ASSETS COVERED BY THIS PLAN

The following tables provide a general information summary for the pipeline sections, pipeline facilities, breakout stations and terminals in each of the Areas in this Region. Specific detail can be located in the following sections for the applicable area.

- Section 6 – Area Pipeline Sections (for DOT jurisdiction)
- Section 7 – Area Breakout Stations (for DOT jurisdiction)
- Section 8 – Area Terminals (for EPA, USCG and OSPR jurisdiction)

FRESNO AREA		
PIPELINE SECTIONS	**LINE NO.**	**COUNTY / STATE**
FRESNO AREA LINES		
Merced River-South BV – Atwater 12”	50	Merced, CA
Atwater - Fresno 12”	60	Merced, Madera, Fresno, CA
Fresno - Fresno Military 8” – 10”	119A	Fresno, CA
Fresno Military - Lemoore 6”	119	Fresno, Kings, CA
Bakersfield – Fresno 8”	15	Fresno, CA
PIPELINE FACILITIES (Non-Storage)		
Bakersfield Pump Station – Booster		
Fresno Military Pump Station – Booster		
Lemoore NAS - Meter Facility Only		
BREAKOUT STATIONS		**COUNTY / STATE**
Fresno Military		Fresno, CA
TERMINALS		**COUNTY / STATE**
Fresno Terminal		Fresno, CA

1.3 SUBSTANTIAL HARM

It is Kinder Morgan Energy Partners, L.P. (KMEP)'s goal to respond as quickly as possible to all uncontrolled releases of petroleum product, regardless of the source point location along the system. Based upon this goal, and the overbreadth of the definitions provided in each of the applicable regulations, KMEP is compelled to consider all of the Facility's breakout stations, and active line sections listed above in this Section, as capable of a release potentially causing "significant and substantial harm". A summary of the worst case discharge scenarios for these facilities is provided as follows:

NORTHERN REGION CENTRAL WORST CASE DISCHARGE DOT JURISDICTION	
Discharge Scenario	**Planning Volume**
Worst Case Discharge for the Response Zone	
(b) (7)(F), (b) (3)	

* DOT worst case discharge volumes are based on 50% of the tank's maximum storage capacity and for pipelines based on an annual Integrity Management Program study, as follows:

Release volume prior to line shutdown and valve closures (Initial Loss):

- Full flow release due to rupture. This is computed at the maximum pumping rate the line segment.
- Detection time, analysis and pump shutdown in adverse weather conditions. This is based on a maximum of fifteen (15) minutes in the event of a full flow rupture, which would cause an instant alarm (unless otherwise noted in the line segment information).
- Line segment valve closures. All line segments are equipped with remote activating isolation valves. Adverse weather would have no impact on line segment isolation, as isolation valves are not dependent on manual closure.

Line drainage following pump shutdown (Stabilization Loss) is computed the maximum potential line drainage between adjacent isolation or check valves, and incorporated pipeline elevation profiles to estimate how much of that total volume would escape at any release point along the line. The historic discharges have not approached either the breakout tank WCD volume or the pipeline WCD in the area.

.

NORTHERN REGION CENTRAL WORST CASE DISCHARGE EPA JURISDICTION	
Discharge Scenario	**Planning Volume**
Small Discharge	
• Fresno Terminal	50 Bbls
Medium Discharge	
• Fresno Terminal	857 Bbls
Worst Case Discharge	
(b) (7)(F), (b) (3)	

Note: EPA worst case discharge is based on the maximum storage capacity of the largest tank.

1.3 SUBSTANTIAL HARM (Cont'd)

These Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three-tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. Sections 6, 7 and 8 of this Plan demonstrate a series of calculations and planning volume determinations based on guidance provided by all applicable regulations. The inclusion of these calculations is for demonstration of the response planning volumes and response capability necessary for on-water and on-shore recovery requirements as the result of the discharge scenarios detailed in the table above.

1.4 FORMAT AND SCOPE OF PLAN

This Volume 2 of the Integrated Contingency Plan is intended to guide emergency response activities throughout KMEPs Pacific Operation Northern Region - Central. This Region is composed of the Fresno Area (see Figure 1.1).

Section 6 details the Pipeline Sections in the Area, Section 7 details the Breakout Stations and/or Terminals (DOT-jurisdictional) in the Area, and Section 8 details the Terminal (multi-jurisdictional) in the Area. The Area covered by this particular Plan is identified on the front cover of this Plan and on the footer of each page and on the maps provided in Figure 1.1.

Volume 1 of the Integrated Contingency Plan provides guidance which is consistent across the Pacific Operations. The two (2) documents are intended to work together as one seamless Integrated Contingency Plan for the various facilities/operations and agency jurisdictions in Pacific Operations.

2.0 NOTIFICATIONS

2.1 INTERNAL NOTIFICATIONS

Specific reference to all internal notifications is detailed in Volume 1 Section 2.1 which provides the following:

- KM Employee or Agent Notification Process - California Only (Figure 2.1a)
- Operator Notification Process - Non-California (Figure 2.1b)
- Company Employee Other Than Operator Notification Process - Non-California (Figure 2.1c)
- Controller - Orange, CA Notification Process - California Only (Figure 2.1d-1)
- Controller - Orange, CA Notification Process - Non-California (Figure 2.1d-2)
- Controller - Houston, TX Notification Process (Figure 2.1e)
- Managers Internal Notification Process (Figure 2.1f)
- Initial Reporting Details Form (Figure 2.2)
- Northern Region Internal Notifications References (Figure 2.3a)
- Southern Region Internal Notifications References (Figure 2.3b)
- Crisis Support Team Internal Notifications References (Figure 2.3c)

2.2 EXTERNAL NOTIFICATIONS

Specific reference to all **"Regulatory Required"** external notifications is detailed in Volume 1, Figure 2.1 and Figure 2.4. **With the exception of notification to 911 and/or local fire/police agencies which are handled by local area operations, the Environmental, Health and Safety (EHS) and/or Compliance, Codes and Standards is responsible for making all regulatory required external notifications in all states other than in California. In California and locations monitoring or controlling, pipeline sections in California, refer to Volume 1, Section 2.2 and Figure 2.4.**

The locally required notifications and additional external notification references which are detailed in the following Volume 2 Figure 2.1 provide for assistance/advisory notifications. Specific notifications for contacting OSRO's is found in Volume 2, Figure, 2.1, "Regional Contractors / Services".

3.0 RESPONSE RESOURCES

The following sections outline the various response equipment/resources available from the Facility, other Company facilities, and other outside resources.

3.1 AREA RESPONSE EQUIPMENT

This Area of the KMEP operations maintains response equipment readily available for spill response as detailed on the "Facility Response Equipment" lists provided in Figure 3.1 and the "Pipeline Repair Equipment" lists provided in Figure 3.2. The equipment is stored at locations in the Area as detailed on the equipment lists.

The preventative maintenance schedule requires a monthly inventory and visual inspection of spill response equipment. Maintenance and repair is performed as needed, following manufacturers recommended procedures. The equipment will be exercised as semi-annually (Terminal equipment) or annually (pipeline equipment) as required (PREP Guidelines). A sample form for documenting these Equipment Deployment Exercises is provided in Figure 3.4.

KMEP has contracts in place with Oil Spill Removal Organizations and other clean-up and response contractors that are capable of responding to all discharges within the Area and supplementing Area KMEP resources.

The Qualified Individual has the authority to activate these and other KMEP resources or that of private contractors and other experts and consultants as the situation demands.

3.2 OTHER COMPANY RESOURCES

Neighboring KMEP Areas have response resources similar to those provided in this Area (Figures 3.1 and 3.2). These resources as well as additional Company spill response equipment and manpower resources may be available to supplement the response operation.

3.3 CONTRACT RESOURCES

In the event of a discharge which is beyond the initial response capabilities of the Local Response Team, contract manpower and equipment resources can be obtained through Oil Spill Removal Organization(s) (OSRO). These OSROs can provide manpower and containment/clean-up equipment for the response operation. *The Company will ensure that each OSRO has a comprehensive maintenance program and applicable training / drills programs in place at contract renewal.*

Response resources will be secured from a Company approved contractor. Facility Management will typically handle notification/implementation of these resources. Section 2 of this Volume provides a quick reference to the OSROs and additional clean-up and response contract organizations. A detailed list of the "Pacific Region Open End and On-Call Contractors" is provided in Figure 2.2. Specific reference to their response capability (UCSG OSRO classification) is provided in Figure 3.3.

These OSRO's have adequate equipment and personnel resources available within the Area to respond to the applicable regulatory planning volumes in the required time frames.

3.3 CONTRACT RESOURCES (Cont'd)

OSROs have the expertise to conduct and lead on water and shoreline containment and recovery efforts. KMEP personnel will oversee and coordinate with the OSRO to ensure their actions conform with overall incident objectives and established incident action plans.

OSROs also have extensive experience in using the Area Contingency Plans (ACPs) as a resource when responding to an incident that has affected a navigable waterway. The KMEP Incident Commander, Planning Officer and Operations Chief will employ the OSRO's experience to integrate applicable local ACPs into the overall incident action plans.

3.4 AREA CONTINGENCY PLANS (ACP)

Area Committees comprised of Federal, state and local agencies develop ACPs. Response efforts performed within a certain "area" should reference the ACPs for that specific area. ACPs include clean-up strategies and information on environmentally sensitive areas within a particular region. Some of the ACPs include maps, shoreline characteristics and booming strategies for specific areas while other ACPs offer priority lists of environmentally sensitive areas.

ACPs generally contain the following information:

- Physical features
- Seasonal concerns
- Resources of primary concern
- Containment, and cleanup strategies, including recommended techniques
- Equipment considerations
- Incident Command System Roles and Responsibilities (NIMS)

To identify specific spill response and protection strategies for the applicable region/area, ACP and Geographic Response Plan information can be found at: http://kmonline.kindermorgan.com/operations/products/pacific_icp/pacific_icp.html Responders can navigate through the site to locate the region/area of interest and the appropriate response resources needed for the operation.

For all controlled copies of the Integrated Contingency Plan distributed to non-KMEP plan holders, a CD-ROM containing the same information as referenced above will be included in a CD-sleeve in Volume 1 (inside front cover) or in a separate folder in electronic copies and is referenced in Figure 4.2.

To determine adequate response resources, the Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three (3) tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. The tier requirements for high volume areas are for response in six (6) hours (Tier 1), 30 hours (Tier 2), and 54 hours (Tier 3). High volume areas are listed in 49 CFR 194. The tier requirements for all other areas are for response in 12 hours (Tier 1), 36 hours (Tier 2), and 60 hours (Tier 3).

3.5 COOPERATIVE/MUTUAL AID RESOURCES

Cooperative/mutual aid resources will be utilized when available and/or necessary.

3.6 EXPERTS AND CONSULTANTS

KMEP maintains a relationship with various environmental and technical consultants that can provide support in the event of an emergency incident. These consultants can provide expertise and support in the areas of emergency response management, environmental services, site assessment, permitting, waste treatment, recycling, dewatering, hazardous waste disposal, and remediation.

3.7 VOLUNTEERS

Volunteers will not be utilized by KMEP for the response operations. All volunteers will be referred to the state or Federal On-Scene Coordinator.

3.8 COMMUNICATIONS

Effective and efficient communications systems are essential for emergency response at every level. The communications system will be utilized to gather information and current status reports as well as to provide coordination and direction to widely separated work groups involved in search, containment / diversion, repair, traffic control, public control or evacuation, and restoration.

Communication of the overall spill response operation between KMEP and the responsible government agencies in the Federal Regional Response Team (RRT) will occur between the Incident Commander and the Federal On-Scene Coordinator.

3.8.1 Central Communications System

Prearranged communication channels are of the utmost importance in dealing with KMEP emergencies. The notification procedures and telephone contacts documented in Section 2 of Volume 1 and Volume 2 will be reviewed in accordance with the earlier documented updating procedures. The predetermined communications channels include the following:

- A list of required Federal and state emergency telephone numbers for the Orange Control Center and emergency response personnel (Volume 1; Section 2).
- A list of emergency telephone numbers for various external resources such as the fire and police department, medical, and regulatory agencies (Volume 2; Figure 2.1).
- A list of emergency telephone numbers for contract response resources (Volume 2; Figure 2.1).

3.8 COMMUNICATIONS (Cont'd)

3.8.2 Communications Equipment

Field communications during a spill response to a small or medium discharge will be handled via the existing KMEP communications network. This network will utilize existing radios, telephones, beepers, fax machines, and computers and will be maintained by KMEP personnel. In the event of a Worst Case Discharge, field communications will be enhanced with other KMEP and contract resources as the situation demands.

Each KMEP responder has, at a minimum, a cellular telephone. All KMEP response personnel also have access to other telephones, radios and satellite communications equipment that may be needed for effective response operations. Additionally, communications equipment is maintained in the KMEP spill response trailers. The Logistics Officer would create a communications plan based on the equipment immediately available and would identify the need for any additional equipment that may be needed throughout the response effort.

3.8.3 Communication Types

Radios - Handheld and vehicle mounted radio sets are the most effective means of communication for the field response operation. The units are battery operated, multi-channeled and have a typical range that will cover the area of the response operation. Each location maintains a minimum of 4 radio sets, functionally maintained per manufacturer's specifications and kept in designated KMEP response trailers. In addition, KMEP also utilizes radio sets provided by contract resources. Additional radio sets and battery packs/charges will be necessary in the event of a prolonged response operation.

Telephone (Conventional) - Conventional land line telephones are the most effective means of communication for regulatory and advisory notifications during a spill response operation. Additional telephone lines can be installed in the event of a prolonged response operation.

Telephone (Cellular) - Cellular telephones allow for added mobility and response effectiveness. Cellular phones are commonly maintained by certain KMEP personnel. Additional cellular phones can be secured in the event of a prolonged response operation.

Pagers - Pagers are used for rapid notification to field personnel when radio and telephone resources are limited. Most response team members carry a pager.

FAX Machines - FAX machines allow for a rapid transfer of information/ documentation such as status reports/updates, written notifications, and purchase orders.

Computers - Computers are commonly used in networks which allow access to various other locations and KMEP personnel. Computers also speed the consolidation of information and preparation of written reports.

FIGURE 3.1
Facility Response Equipment
(Reserved)

Response to an oil spill incident will be conducted by KMEP contracted Oil Spill Removal Organizations as detailed in Figures 2.1 and 3.3

FIGURE 3.2
Pipeline Repair Equipment

Fresno Terminal		
Qty.	**Item**	**Location**
INCIDENT SUPPORT AND PIPELINE REPAIR EQUIPMENT		
13 ea. 10’	Absorbent boom	Warehouse
7 pkgs.	Absorbent Pads	Warehouse
1-12” 1-8”	Leak sleeves	Yard
2	Line Probes	RV
2	Line Fider	RV/Shop
2	30# Ansul Fire Extinguishers.	Emergency Trailer
2	Fire Blankets/Water Gel	RV/Emergency Trailer
1	MSA-261	RV/Emergency Trailer
1	Gastech	RV/Emergency Trailer

NOTE: This inventory of equipment is intended for PIPELINE REPAIR ONLY. Response to an oil spill incident will be conducted by KMEP contracted Oil Spill Removal Organizations as detailed in Figures 2.1 and 3.3. This equipment will not be “deployed” for equipment deployment exercise purposes.

OIL SPILL REMOVAL ORGANIZATIONS (Cont'd)

USCG OSRO Classifications

The USCG has classified OSROs according to their response capabilities, within each Captain of the Port (COTP) zone, for vessels and for facilities in four types of environments. Response capabilities are rated MM, W1, W2, or W3 as described below.

MINIMUM EQUIPMENT REQUIREMENTS FOR OSRO CLASSIFICATIONS

Classification	Resource Quantity Guidelines [2,3]	Maximum Facility Response Times	Maximum Vessel Response Times
Rivers/Canals [1]			
MM	Protective Boom: 4,000*ft EDRC: 1,200 bbls TSC: 2,400 bbls	High Volume Ports: 6 hours Other Ports: 12 hours	High Volume Ports: 12 hours Other Ports: 24 hours
W 1	Protective Boom: 25,000*ft EDRC: 1,875 bbls TSC: 3,750 bbls	High Volume Ports: 12 hours Other Ports: 24 hours	High Volume Ports: 12 hours Other Ports: 24 hours
W 2	Protective Boom: 25,000*ft EDRC: 3,750 bbls TSC: 7,500 bbls	High Volume Ports: 30 hours Other Ports: 36 hours	High Volume Ports: 36 hours Other Ports: 48 hours
W 3	Protective Boom: 25,000*ft EDRC: 7,500 bbls TSC: 15,000 bbls	High Volume Ports: 54 hours Other Ports: 60 hours	High Volume Ports: 60 hours Other Ports: 72 hours
Inland [1]			
MM	Protective Boom: 6,000* ft EDRC: 1,200 bbls TSC: 2,400 bbls	High Volume Ports: 6 hours Other Ports: 12 hours	High Volume Ports: 12 hours Other Ports: 24 hours
W 1	Protective Boom: 30,000* ft EDRC: 12,500 bbls TSC: 25,000 bbls	High Volume Ports: 12 hours Other Ports: 24 hours	High Volume Ports: 12 hours Other Ports: 24 hours
W 2	Protective Boom: 30,000* ft EDRC: 25,000 bbls TSC: 50,000 bbls	High Volume Ports: 30 hours Other Ports: 36 hours	High Volume Ports: 36 hours Other Ports: 48 hours
W 3	Protective Boom: 30,000* ft EDRC: 50,000 bbls TSC: 100,000 bbls	High Volume Ports: 54 hours Other Ports: 60 hours	High Volume Ports: 60 hours Other Ports: 72 hours
Nearshore			
MM	Protective Boom: 8,000* ft EDRC: 1,200 bbls TSC: 2,400 bbls	High Volume Ports: 6 hours Other Locations: 12 hours	High Volume Ports: 12 hours Other Locations: 24 hours (for open ocean, plus travel time from shore)
W 1	Protective Boom: 30,000* ft EDRC: 12,500 bbls TSC: 25,000 bbls	High Volume Ports: 12 hours Other Locations: 24 hours	High Volume Ports: 12 hours Other Locations: 24 hours
W 2	Protective Boom: 30,000* ft EDRC: 25,000 bbls TSC: 50,000 bbls	High Volume Ports: 30 hours Other Locations: 36 hours	High Volume Ports: 36 hours Other Locations: 48 hours
W 3	Protective Boom: 30,000* ft EDRC: 50,000 bbls TSC: 100,000 bbls	High Volume Ports: 54 hours Other Locations: 60 hours (for open ocean, plus travel time from shore)	High Volume Ports: 60 hours Other Locations: 72 hours (for open ocean, plus travel time from shore)
