7. List type and amount of all equipment (e.g., boom and skimmers) deployed and number of support personnel employed:
   _____
   _____
   _____
   _____

8. Describe goals of the equipment deployment and list any Area Contingency Plan strategies tested (Attach a sketch of equipment deployments and booming strategies):
   _____
   _____
   _____
   _____

9. For deployment of facility-owned equipment, was the amount of equipment deployed at least the amount necessary to respond to your facility's small/average most probable spill?
   _____
   _____

   Was the equipment deployed in its intended operating environment?
   _____
   _____

AGREEMENT FOR PROFESSIONAL EMERGENCY RESPONSE SERVICES

NUMBER 51351

THIS AGREEMENT FOR PROFESSIONAL EMERGENCY RESPONSE SERVICES (the "Agreement") is entered as of April 3, 2012 and effective as of 04/03/2012 (the "Effective Date"), by and between KINDER MORGAN ENERGY PARTNERS, L.P., a limited partnership, with its principal place of business in Houston, Texas (the "COMPANY"), acting for itself and on behalf of any of its affiliates and subsidiaries which execute Work Directives hereunder (defined below), and PARC ENVIRONMENTAL, a corporation, with its principal place of business in FRESNO, CA (the "CONSULTANT").

WITNESSETH:

WHEREAS, CONSULTANT represents that it has the requisite knowledge, familiarity, experience, equipment, tools and fully trained and experienced personnel to perform emergency response services for the containment and cleanup of petroleum products and other hazardous and non-hazardous materials on an on-call, 24 hours 7 days a week basis as further described herein; and

WHEREAS, COMPANY desires CONSULTANT to perform said work.

NOW, THEREFORE, for and in consideration of the covenants and agreement hereinafter contained, the parties do hereby agree as follows:

1.0 CONTRACT DOCUMENTS AND DEFINITIONS

1.1 The "Contract Documents," in order from highest precedence to lowest precedence, shall consist of:

1.1.1 This Agreement 51351

1.1.2 Exhibit A - Form of Work Directive

1.1.3 Exhibit B - Schedule of Values

1.1.4 Exhibit C - Drug & Alcohol/Operator Qualification Program Requirements

1.1.5 Exhibit D - Form of Certificate of Final Completion

1.1.6 Exhibit E1 - Form of Conditional Waiver and Release

1.1.7 Exhibit E2 - Form of Unconditional Waiver and Release

1.1.8 Exhibit F - Form of Certificate of Insurance

1.2 In the event of a conflict between this Agreement and any Exhibit hereto, this Agreement shall control. In the event of a conflict between or among the Exhibits to this Agreement, the Exhibit with the highest order of precedence shall control (that is, for example, Exhibit **B** is higher in order of precedence than Exhibit **C**). For the avoidance of doubt, the term "Agreement" when used hereinafter in this Agreement shall mean this Agreement along with the Exhibits referenced in Section **1.1** and attached hereto (including any actual Work Directive(s), Certificate(s) of Final Completion, Lien Waivers or any other document executed by the parties in connection with this Agreement).

1.3 As used in this Agreement, the terms "hereunder", "herein", "herewith" and "hereof" are references to this Agreement and the Exhibits, taken as a whole. All references to a given agreement, instrument or other document shall be a reference to that agreement, instrument or other document as modified, amended, supplemented and restated through the date as of which such reference is made, and reference to a law, regulation or ordinance includes any amendment

or modification thereof, unless otherwise stated in the context. A reference to a person includes its successors and permitted assigns. The singular shall include the plural and the masculine shall include the feminine, and vice versa.

1.4 Definitions

1.4.1 **"Agreement"** shall have the meaning set forth on the first page of this Agreement and as further described in Section 1.2 of this Agreement.

1.4.2 **"COMPANY"** shall have the meaning set forth on the first page of this Agreement.

1.4.3 **"COMPANY Indemnitees"** shall have the meaning set forth in Section 7.1 of this Agreement.

1.4.4 **"Confidential Information"** shall have the meaning set forth in Section 14.0 of this Agreement.

1.4.5 **"CONSULTANT"** shall have the meaning set forth on the first page of this Agreement.

1.4.6 **"CONSULTANT Indemnitees"** shall have the meaning set forth in Section 7.2 of this Agreement

1.4.7 **"Contract Administrator"** shall have the meaning set forth in Section 2.2 of this Agreement.

1.4.8 **"Contract Documents"** shall have the meaning set forth in Section 1.1 of this Agreement.

1.4.9 **"Designated Representative"** shall have the meaning set forth in Section 2.2 of this Agreement.

1.4.10 **"Effective Date"** shall have the meaning set forth on the first page of this Agreement.

1.4.11 **"EHS Laws"** shall have the meaning set forth in Section 9.6 of this Agreement.

1.4.12 **"Extra Work"** shall have the meaning set forth in Section 3.4 of this Agreement.

1.4.13 **"Force Majeure"** shall have the meaning set forth in subsection 13.1.1 in this Agreement.

1.4.14 **"General Partner"** shall have the meaning set forth in Section 19.0 of this Agreement.

1.4.15 **"Hazardous Materials"** and **"Hazardous Substance"** shall have the meaning set forth in Section 9.6 of this Agreement.

1.4.16 **"Jobsite"**, **"Work Site"**, **"Project Site"**, **"Construction Site"**, "Property", **"Premises"**, **"Facility"**, **"Site"**, or any other wording having a similar meaning, whether capitalized or not herein, shall be interchangeable and shall mean any real property or offshore premises, including rights-of-ways, whether owned by COMPANY or not, on which CONSULTANT will be working under the Contract Documents.

1.4.17 **"Losses"** shall have the meaning set forth in Section 7.1 of this Agreement.

1.4.18 **"Non-Company Onsite Situation"** shall have the meaning set forth in subsection 10.1.2 of this Agreement.

1.4.19 **"Safety Manual"** shall have the meaning set forth in Section 9.2 of this Agreement.

1.4.20 "Waste" shall mean any form of material identified or determined by the COMPANY as having no beneficial value and is either a by-product of the COMPANY'S operations or is

generated during investigation and remediation activities (e.g. soils, debris) and may include any Hazardous Materials and/or Hazardous Substances as the context requires.

1.4.21 **"Work"** shall have the meaning set forth in Section **3.1** of this Agreement.

1.4.22 **"Work Directive"** shall have the meaning set forth in Section **3.1** of this Agreement.

2.0 TERM AND NOTICES

2.1 This Agreement becomes effective upon the Effective Date and shall terminate on the earlier of (i) **04/03/2017** (the "Expiration Date"), or (ii) cancellation or termination of the Agreement pursuant to Section **12.0** provided, however, that if COMPANY desires CONSULTANT to complete a Work Directive that is unfinished at the time of termination or expiration, then this Agreement shall continue with respect to that Work Directive until the Work Directive is satisfactorily completed.

2.2 For the term of this Agreement, matters of a technical nature should be directed to the COMPANY'S Designated Representative as identified on the applicable Work Directive and matters of a commercial nature should be directed to the COMPANY'S Contract Administrator identified below.

2.3 All notices to be given with respect to this Agreement, unless provided for to the contrary herein or in a Work Directive, shall be given to COMPANY and to CONSULTANT respectively at the address herein below shown, and shall be in writing, and sent via nationally recognized courier, facsimile (with the confirmation by the machine), or if mailed, postage prepaid via certified mail return receipt requested. All notices shall be effective upon actual receipt by the party to whom given if receipt occurs outside of normal business hours, then receipt shall be deemed to have occurred on the next business day.

COMPANY:	**CONSULTANT:**

2.4 The individual and/or addresses for notices may be changed upon written notice to the other party which is sent in the manner stated herein.

3.0 GENERAL DESCRIPTION OF AGREEMENT AND SERVICES

3.1 CONSULTANT shall furnish and pay for everything including all services, items, labor, supervision, tools, technical capability, permits, licenses, transportation, materials and supplies (except those materials and supplies which COMPANY hereinafter expressly agrees to furnish) necessary for **CONSULTANT to perform and accomplish emergency response services on an on-call, 24 hours 7 days a week basis at the locations or within the geographic area designated by COMPANY on the applicable Work Directive by having a team of professional personnel capable of (i) containment, characterization, handling,**

transportation, treatment, processing, recovery, repackaging, removal, storage and disposal of Waste and Hazardous Materials; (ii) site evaluation, decontamination and restoration; (iii) technical services, including sampling, laboratory services, analysis, and other related services; (iv) training and mock spill deployments; (v) performing such other activities as further described in any applicable Work Directive; and (vi) coordination of all such activities and services with COMPANY'S Designated Representative or his or her designee. For each assignment the Work shall be further described in a Work Directive, which shall be executed in a form substantially in accordance with Exhibit A ("Work Directive"), and in every case, shall also include all services, materials and goods reasonably inferable therefrom. CONSULTANT shall not provide and shall not be compensated for any services, goods, materials or equipment except pursuant to a properly executed Work Directive. Each Work Directive shall set forth CONSULTANT'S compensation for the Work described therein. The Work shall be performed pursuant to the provisions of the Contract Documents. Notwithstanding the foregoing, in the case of any emergency COMPANY may require CONSULTANT to perform the Work prior to the execution of a Work Directive which CONSULTANT hereby agrees to do pursuant to the terms of this Agreement. As soon as reasonably practicable thereafter the parties will finalize and execute the Work Directive for the performance of Work with respect to such emergency situation. Termination or suspension of any Work under any Work Directive, in whole or in part, shall not diminish CONSULTANT'S liability or obligation to continue prosecution of Work under any other Work Directive.

3.2 This Agreement does not obligate COMPANY to order materials or services from the CONSULTANT, nor does it obligate the CONSULTANT to accept orders for same, but it shall control and govern all Work requested by COMPANY and accepted by CONSULTANT, and shall define the rights and obligations of the COMPANY and CONSULTANT during the term hereof, notwithstanding anything to the contrary contained in instructions orally or in writing from the Designated Representative. CONSULTANT shall not accept any Work from COMPANY other than pursuant to this Agreement.

3.3 All items which CONSULTANT is required to furnish, prepare or develop in the performance and completion of the Work (whether delivered to COMPANY or not), including, but not limited to, reports, plans, drawings and specifications, calculations, maps, sketches, notes, data and samples, are the sole and exclusive property of COMPANY without limitation (except CONSULTANT may retain a copy thereof, subject to CONSULTANT'S right to use the same solely to perform the Work under this Agreement. Such items (including all copies thereof other than the copy that may be retained by CONSULTANT pursuant to the foregoing sentence) shall, together with any materials furnished by COMPANY hereunder, be delivered to COMPANY upon request and in any event upon completion or termination of this Agreement. All such items shall be considered to be Confidential Information.

3.4 COMPANY may require CONSULTANT to perform other services or furnish materials or equipment, or the use thereof, in connection with the Work which are not included in a given Work Directive (hereinafter referred to as "Extra Work"). Extra Work may be occasioned by major changes in specifications requiring materials or equipment of a materially different nature, kind and cost from that contemplated at the time of execution of a given Work Directive, or the performance of other or additional services incidental to the completion of the Work, but not in contemplation of the parties at the time of execution of a given Work Directive. CONSULTANT shall not perform any Extra Work without first having secured written authorization from COMPANY (by Work Directive or written change order) which shall be signed by COMPANY'S Designated Representative. Such authorization shall describe the Extra Work to be done and specify the price to be paid therefore, or the basis on which such price shall be calculated. Should CONSULTANT perform any Extra Work without advance written authorization from COMPANY'S Designated Representative such Extra Work shall be at CONSULTANT'S expense and risk.

3.5 If in the course of performance of Work, there is a change in law applicable to the Work; CONSULTANT shall bear any increased cost in performing the Work. If there is a change in law applicable to COMPANY'S business operations which directly impacts the Work, any increased costs in performing the Work shall be for COMPANY'S account provided CONSULTANT requests and clearly documents any such increased costs within thirty (30) days from the date the change in law first impacted the Work.

3.6 To the extent that Work requires any sampling, boring, excavation, ditching or other disruption of the soil or subsurface at the COMPANY'S site, CONSULTANT shall confer with COMPANY (and others, in CONSULTANT'S discretion and at its expense) prior to such activity and be responsible for making the appropriate one-call or other required notifications to third parties and for identifying, locating and marking, as necessary, any subterranean archaeological artifacts, structures or utilities ("Underground Facilities"). Thereafter, CONSULTANT shall take all reasonable precautions to avoid damage or injury to Underground Facilities which were or reasonably should have been discovered by CONSULTANT in the course of its Work. CONSULTANT will be liable for all costs and claims resulting from damage to the Underground Facilities arising out of the Work, if they were or reasonably should have been identified by CONSULTANT.

4.0 INSPECTION

4.1 **Field Inspection.** Throughout the performance of the Work, COMPANY shall have the right to designate one or more inspectors, engineers or other appropriate professionals to inspect and test the Waste, Work site and the progress of the Work. CONSULTANT shall cooperate with such inspectors, engineers or other appropriate professionals in order that the Waste, Work Site and Work may be fully inspected and tested and that COMPANY may at all times be fully advised of the progress of the Work and the manner in which it is being performed.

4.2 **Inspection or Testing Not Acceptance.** CONSULTANT expressly understands and agrees that any inspection or testing by COMPANY pursuant to this Agreement shall be for COMPANY'S sole benefit and shall not be deemed an acceptance by COMPANY of all or any portion of the Work so inspected or tested. CONSULTANT further understands and agrees that no inspection or testing by COMPANY pursuant to this Agreement or approval or failure to object to any portion of the Work shall relieve or release CONSULTANT from any duties, obligations, or liabilities provided in this Agreement.

4.3 **Non-Conforming Work.** CONSULTANT shall notify COMPANY in writing when the Work has been completed. If, in the sole good faith discretion of COMPANY, the Work conforms to all of the requirements of the Contract Documents, COMPANY shall accept the Work within ten (10) working days after receipt of such written notice. If, in the sole good faith discretion of COMPANY, the Work or any portion of the Work does not conform to all of the requirements of the Contract Documents, COMPANY shall give CONSULTANT notice of any non-conforming Work. Within five (5) working days after receiving such notice from COMPANY, CONSULTANT shall at its expense correct all non-conforming Work or provide a mutually accepted written plan of work for correction of the non-conforming Work. Corrected Work shall be resubmitted for acceptance by COMPANY and the above approval process will be repeated until the Work is acceptable or otherwise rejected by COMPANY.

5.0 INDEPENDENT CONTRACTOR

5.1 The parties expressly understand and agree that CONSULTANT is acting as an independent CONSULTANT unrelated to COMPANY or any of its subsidiary or affiliated companies, entities and persons.

5.2 COMPANY shall have no direction and control over CONSULTANT or CONSULTANT'S employees, agents, subcontractors, volunteers or the manner and method utilized by CONSULTANT and is interested only in results obtained by CONSULTANT. CONSULTANT shall

determine and have sole discretion over the manner and methods utilized to achieve the results desired by COMPANY and shall be solely responsible for the direction, control, and supervision of its acts and those of its agents, employees, subcontractors, and volunteers incident to the performance of this Agreement.

5.3 It is understood that the Designated Representative may make suggestions to CONSULTANT solely for the purpose of obtaining the desired results, but CONSULTANT shall be free to control the details necessary to accomplish such results.

5.4 CONSULTANT has sole responsibility for those matters governing the employment terms and conditions for its employees working under this Agreement, including but not limited to selection, hiring, discipline, grievance resolution, pay and benefits, withholdings, and supervision and control of its employees. COMPANY may require CONSULTANT to reassign employees (including those of its subcontractors) to non-COMPANY projects if COMPANY determines that any such employee is working in an unsafe manner, in violation of any labor laws including equal employment opportunity laws or immigration laws, or is not performing the Work according to the terms of this Agreement. In the event an employee of CONSULTANT or one of its subcontractors files a claim of employment against COMPANY, CONSULTANT agrees to indemnify and hold COMPANY Indemnitees harmless from and against liability and expense arising therefrom and further agrees to (i) promptly notify COMPANY of any employment related claim to which COMPANY may be a party and (ii) cooperate fully with COMPANY by providing COMPANY with all information, and access to employees and records so that COMPANY can investigate and defend such claim.

5.5 CONSULTANT shall be solely responsible, at its own expense, and CONSULTANT represents that it has the necessary accounting resources and an employer identification number, for withholding or paying all applicable state and federal income taxes, making all applicable filings and reports with respect to FICA and FUTA taxes, and making all applicable filings and reports in connection with or relating to the services of CONSULTANT or any individual employed or provided to work under this Agreement by CONSULTANT. CONSULTANT agrees to comply with any applicable laws and regulations governing the retention of employment-related records. CONSULTANT will indemnify and hold harmless COMPANY Indemnitees for and against liability and expense arising from CONSULTANT'S failure to make such filings and reports or retain such records.

5.6 CONSULTANT agrees to observe and comply with all applicable provisions and amendments of federal; state and local laws, rules and regulations, including strict compliance with federal immigration laws, employment verification laws enacted in the state(s) in which the Work will be performed, and the Fair Labor Standards Act of 1938.

6.0 PAYMENT, TAXES, COMPLIANCE WITH LAWS, AND LIENS

6.1 CONSULTANT shall prepare an invoice for the amount accrued to CONSULTANT for Work satisfactorily completed during the period covered by such invoice. The invoice period will be as stated in the Work Directive, or where no Work Directive is issued, no less than once each month following commencement of the Work. All invoices, with supporting data, electronic invoice information, lien releases and waivers, and sworn statements that all bills and materials have been paid, shall be sent with the invoice. If requested by COMPANY or as otherwise required under any Work Directive, lien waivers will be furnished by CONSULTANT with each invoice substantially in accordance with the form(s) set forth in Exhibit F. Invoices, electronic invoice information, and supporting documents will be sent to the Designated Representative unless otherwise instructed by COMPANY. Upon approval of such invoice, and subject to the further provisions hereof, COMPANY shall pay CONSULTANT the amount approved, less any amounts for which payment was made in connection with previous invoices within thirty (30) days from COMPANY'S receipt of the invoice and supporting data. COMPANY may, in its sole discretion, withhold ten percent (10%) of the amount of such payments.

6.2 In the event COMPANY disputes the amount or content of any invoice, COMPANY shall not be responsible for payment of such invoice or portion of such invoice that is in dispute, until such time as the dispute is resolved.

6.3 All invoices must show Agreement number, Work Directive number, Change Order number (as applicable); invoice date; invoice number; site or project name and Kinder Morgan entity name; CONSULTANT'S entity name and remittance address or electronic funds transfer routing number (must match information submitted to COMPANY'S Vendor Maintenance department); name of COMPANY'S Designated Representative; billing period; CONSULTANT contact name and phone number; amount due CONSULTANT; project status report and summary (if applicable) in order to be paid. Any rate schedule or pricing terms provided by CONSULTANT and accepted by COMPANY shall remain in effect until new rates or pricing terms are mutually agreed upon by COMPANY and CONSULTANT and amended into the Agreement. A copy of any time sheets required under any Work Directive for each classification of work or worker showing actual hours worked, description of work performed, progress, valid receipts for all reimbursable expenses, if any, shall accompany each invoice submitted.

6.4 Final payment to CONSULTANT shall be made by COMPANY only after CONSULTANT has fully performed and completed the Work to the reasonable satisfaction of COMPANY and presentation of CONSULTANT'S final adjusted invoice (initialed and dated by COMPANY'S Designated Representative), accompanied by an executed CONSULTANT'S Certificate of Final Completion, substantially in the form of Exhibit E together with a Conditional Lien Waiver substantially in the form of Exhibit F-1. Within two weeks after CONSULTANT'S receipt of final payment, CONSULTANT shall return to COMPANY an executed and notarized Unconditional Waiver and Release substantially in the form of Exhibit F-2. Acceptance by CONSULTANT of such final payment shall constitute a waiver by it of all claims against COMPANY related to or arising out of this Agreement with respect to the applicable Work Directive. Such final acceptance and payment by either party hereto shall not, however, release CONSULTANT and its surety from any warranty work or other unperformed obligations hereunder.

6.5 It is understood and the parties agree that the sums to be paid under any Work Directive shall be the entire consideration to be received by CONSULTANT from COMPANY for the Work and that said sums shall include any and all applicable taxes and contributions as otherwise set forth herein.

6.6 Prior to starting the Work, CONSULTANT shall obtain the necessary permits and licenses to allow CONSULTANT to remit sales, use, gross receipts and like taxes to the applicable taxing authority. CONSULTANT agrees to Indemnify COMPANY Indemnitees for all taxes, penalties and interest resulting from CONSULTANT'S failure to properly remit itemized taxes to the applicable taxing authority.

6.7 **Portions of Work Invoiced on a Time and Material Basis and/or Variations.** Upon written notice to CONSULTANT, COMPANY may elect to directly remit sales, use, gross receipts or like taxes to the taxing authority to whom such taxes are due and directly payable. If COMPANY exercises such election, COMPANY shall provide CONSULTANT with written evidence, as required by applicable taxing authority, prior to CONSULTANT'S procurement or payment of taxable purchases of goods and services. CONSULTANT agrees that the price to be paid for Work performed on a Time and Materials basis under this Agreement includes any such sales, use, gross receipts or like taxes on materials, supplies, equipment or services furnished by CONSULTANT and on services performed by CONSULTANT. CONSULTANT shall itemize price(s), including associated sales, use, gross receipts or like taxes for each component of Work performed on a Time and Material basis for which title and possession will be transferred to COMPANY. If the appropriate taxes are not separately listed, COMPANY shall have the right to calculate such tax based upon the charges, and withhold the calculated amount from its payment.

6.8 **Portions of Work Invoiced on a Lump Sum or Unit Price Basis.** CONSULTANT agrees that the price to be paid for Work performed on a lump sum basis, or unit price basis (such as a price

per foot installed, which includes labor plus materials), under this Agreement includes any such sales, use, gross receipts or like taxes on materials, supplies, equipment or services furnished by CONSULTANT and on services performed by CONSULTANT. CONSULTANT shall separately list all sales, use, gross receipts or like taxes included in the lump sum or unit prices and provide such written verification reasonably acceptable to COMPANY that such taxes have been paid. If the appropriate taxes are not separately listed, COMPANY shall have the right to calculate such tax based upon the charges, and withhold the calculated amount from its payment.

6.9 **Other Taxes.** CONSULTANT assumes full responsibility for and agrees to pay for, and agrees that the price to be paid by COMPANY as set herein shall be fully inclusive of, all labor, including overtime as legally required, all overhead, and all contributions and taxes payable under federal and state social security acts, old age pension, worker's compensation laws, unemployment compensation laws and income tax laws and any other applicable laws as to all of its employees and agents engaged in the performance of the Work hereunder; and CONSULTANT hereby agrees to indemnify and save COMPANY Indemnitees harmless against the consequences of any failure by CONSULTANT or any of its subcontractors to pay or withhold taxes, charges or compensation due on behalf of its employees or agents involved in the Work.

6.10 To the fullest extent permitted by applicable law, CONSULTANT covenants and agrees to protect and keep the Work or any site where the Work is performed, any and all interests and estates therein, and all improvements or materials now or hereafter placed thereon pursuant to this Agreement, free from any and all claims, liens, charges or encumbrances in the nature of mechanics, labor, or material liens or otherwise, arising out of or in connection with performance of the Work by CONSULTANT or any of its subcontractors (including the furnishing of any materials hereunder), and to promptly have any such lien released by bond or otherwise. If CONSULTANT disputes in good faith any lien or claim or encumbrance of any laborer, materialman or subcontractor, in lieu of the immediate payment thereof, CONSULTANT shall post security to protect COMPANY from liability for the payment thereof on terms acceptable to COMPANY and from any expense of defending against that liability, until the dispute is finally resolved. COMPANY may, at its sole discretion, post or place upon the site where any Work is being performed notices of non-responsibility or do any other act permitted by law to exempt COMPANY, the Site, any and all interests and estates therein, and any improvements or materials thereon from any liability to third parties for the performance of the Work. The failure of COMPANY to perform any of the actions described in the previous sentence shall not release or discharge CONSULTANT of any of its obligations hereunder.

6.11 If COMPANY fails to pay undisputed amounts when due, CONSULTANT may file any timely preliminary notice of lien or affidavit as required by applicable law in order to preserve his rights to payment. CONSULTANT shall not file a lien against the Site, COMPANY or COMPANY'S assets unless COMPANY fails to pay CONSULTANT undisputed amounts when due for the Work performed and such failure continues for more than thirty (30) days after COMPANY's receipt of CONSULTANT'S notice of the failure. To the fullest extent permitted under applicable law, CONSULTANT additionally agrees to require or cause all of its subcontractors and vendors performing or furnishing any portion of the Work to consent, prior to the performance thereof, to this provision. If COMPANY fails to timely pay an undisputed amount and CONSULTANT files a notice or affidavit of lien in respect thereof, CONSULTANT shall immediately remove the lien and withdraw all filings upon receipt of payment of such undisputed amount. CONSULTANT shall indemnify and hold harmless COMPANY for any costs or damages (including attorneys' fees) incurred by COMPANY as a result of CONSULTANT'S breach of Sections **6.11** or **6.12**.

6.12 For any work performed or furnished in Louisiana, in all cases where CONSULTANT'S employees (including CONSULTANT'S direct, borrowed, special or statutory employees) are covered by the Louisiana Worker's Compensation Act, La. R.S. 23:1021 et seq., COMPANY and CONSULTANT agree that all Work and operations performed by CONSULTANT and its employees pursuant to this Agreement are an integral part of and are essential to the ability of COMPANY to generate COMPANY'S goods, products and services. Furthermore, COMPANY

and CONSULTANT agree that COMPANY is a statutory employer of CONSULTANT'S employees for purposes of La. R.S. 23:1061(A)(3). Notwithstanding COMPANY'S status as a statutory employer or special employer (as defined in La. R.S. 23:1031 (C)) of CONSULTANT'S employees, CONSULTANT shall remain primarily responsible for the payment of Louisiana Worker's Compensation benefits to its employees, and shall not be entitled to seek contribution from COMPANY for any such payments.

6.13 CONSULTANT shall comply with all applicable U.S. federal, state, local laws, ordinances, codes, local and national standards and regulations, including the EHS Laws, all as the same may be amended from time to time.

6.13.1 CONSULTANT certifies that unless specifically exempted, all work furnished under this Agreement has been furnished in compliance with the following laws, regulations and orders, as amended, Title VI and Title VII of the Civil Rights Act of 1967, the Equal Pay Act of 1963, and Rehabilitation Act of 1974, the Immigration Reform Control Act of 1986, the Americans With Disabilities Act of 1990, Executive Orders of the President of the United States, the Office of Federal Contract Compliance Programs and Executive Orders 11246 and 11758, the Equal Opportunity Regulations at 41 CFR Subsection 60-1.4, Age Discrimination in Employment Act of 1967 (including the Older Workers Benefit Protection Act of 1990), Vietnam Era Veterans Readjustment Assistance Act, the Civil Rights Act of 1871 and 1991, the National Labor Relations Act, the Worker Adjustment and Retraining Notification Act, the Affirmative Action Regulations at 41 CFR Subsections 250.5 and 741.5, and any other applicable anti-discrimination laws or other applicable laws pertaining to an employment relationship. CONSULTANT shall assure that each of its permitted subcontractors complies with said requirements as well. CONSULTANT agrees to protect, indemnify and save harmless COMPANY Indemnitees from all claims, suits, liabilities and costs, including attorney's fees and costs of court, arising out of CONSULTANT'S or its permitted subcontractors' violation of or non-compliance with such laws, regulations, orders and guidelines. Any breach in any material respect by CONSULTANT of any provisions contained in this paragraph (including, without limitation, any citation of CONSULTANT for failure to comply with any valid law, ordinance, regulation or rule) which adversely affects the proper and timely completion or the performance of the Work by CONSULTANT or affects COMPANY'S operations, shall afford COMPANY the right, in addition to all other remedies, to invoke the termination provisions hereof.

6.13.2 If this Agreement is entered into by the parties in support of a federal government contract, the following alternate provision shall apply. Nothing in this provision is intended to create any obligations that do not exist under relevant federal statutes, regulations, and/or orders.

6.13.2.1 As to all transactions performed hereunder, in whole or in part within the United States, as defined by 48 C.F.R. Section 2.101, including, as applicable, the United States of America's outlying areas, CONSULTANT agrees that it shall comply with all applicable federal, state and local laws, regulations and orders, including, but not limited to the following provisions: 48 C.F.R. Section 2.203-13, "Contractor Code of Business Ethics and Conduct"; 48 C.F.R. Section 2.203-15, "Whistleblower Protections Under the American Recovery and Reinvestment Act of 2009"; 48 C.F.R. 2.219-8, "Utilization of Small Business Concerns"; 48 C.F.R. 2.219-9, "Small Business Subcontracting Plan"; 48 C.F.R. 2.222.26, "Equal Opportunity" and 41 C.F.R. Section 60-1.4; 48 C.F.R. Section 2.222-35, "Equal Opportunity for Special Disabled Veterans, Veterans of the Vietnam Era, and Other Eligible Veterans"; and 41 C.F.R. Sections 60-250-5 and 60.300-5; 48 C.F.R. Section 2.222-36, "Notification of Employee Rights Concerning Payment of Union Dues or Fees"; 48 C.F.R. Section 52.222-50, "Combating Trafficking in Persons"; 48 C.F.R. Section 52.247-64, "Preference

for Privately Owned U.S.-Flag Commercial Vessels"; 48 C.F.R. Section 252.247-7023, "Transportation of Supplies by Sea"; and 48 C.F.R. Section 252-247-7024, "Notification of Transportation of Supplies by Sea." These provisions are incorporated herein by reference and have the same force and effect as if they were given in full text in the form and substance that they were incorporated into COMPANY'S contract with the Federal Government.

6.14 CONSULTANT certifies that at the time of execution of this Agreement CONSULTANT is not included on any debarment list maintained by any federal, state or local governmental authority nor prevented from performing Work for COMPANY by virtue of any governmental order, proceeding or otherwise. If at any time during the term of this Agreement CONSULTANT cannot so certify to COMPANY, CONSULTANT shall promptly notify COMPANY as to CONSULTANT'S status.

7.0 INDEMNIFICATION

7.1 CONSULTANT agrees to release, protect, indemnify and hold harmless COMPANY, its parent, subsidiaries, and affiliates, and its and their respective directors, officers, agents and employees (collectively, "COMPANY Indemnitees"), from all damages (including punitive damages), losses, costs, liabilities, penalties, expenses, demands or claims, including but not limited to those arising from personal injury, violation of any laws including EHS Laws, release of any Hazardous Materials or any other type of claim (whether arising in tort, contract, or otherwise), and including any and all costs and fees (including attorneys' and experts fees, and discovery costs) arising out of litigation or settlement, (collectively, "Losses"), including Losses described in the remainder of this Section **7.0**, to the extent the Losses are caused by, arise from or relate to, directly or indirectly, the acts or omissions of CONSULTANT and/or its affiliates, or each of their respective agents, employees (including leased employees) or subcontractors. If such Losses were also caused in part by the acts or omissions of any COMPANY Indemnitees or any third party (that is not one of the CONSULTANT Indemnitees), then CONSULTANT shall only be liable to the extent and for such portion that such Losses were caused by, arise from or relate to, directly or indirectly, (i) breach of this Agreement, or (ii) the acts or omissions of CONSULTANT and/or its affiliates or each of their respective agents, employees or subcontractors. CONSULTANT further agrees that it shall pay any and all costs and expenses (including attorney's fees) incurred by COMPANY in recovering the amount of agreed settlement and/or rendered judgment due to COMPANY from CONSULTANT'S insurer.

7.2 COMPANY agrees to release, protect, indemnify and hold harmless CONSULTANT, its affiliates, and its and their respective directors, officers, agents and employees (collectively, "CONSULTANT Indemnitees"), from every kind or character of Losses, to the extent the Losses are caused by, arise from or relate to, directly or indirectly, (i) breach of this Agreement, or (ii) the acts or omissions of COMPANY, its agents or employees. If such Losses were also caused in part by the acts or omissions of a CONSULTANT Indemnitees or any third party (that is not one of the COMPANY Indemnitees), then COMPANY shall only be liable to the extent and for such portion that such Losses were caused by, arise from or relate to, directly or indirectly, the acts or omissions of COMPANY, its agents or employees.

7.3 CONSULTANT shall require each of its subcontractors engaged for performance of the Work to provide express indemnities, enforceable by and for the benefit of the COMPANY Indemnitees, to the same extent required of CONSULTANT under Section **7.1** above.

7.4 The Parties agree that, to the extent permitted by applicable law, this Section **7.0** shall constitute an effective waiver of any cap(s) established by statute or case law which may limit the Indemnified party's recovery, but for this Agreement; provided, however, such a waiver is not intended to benefit any third parties and is not a waiver of any rights or defenses either party hereto may have against a third party.

7.5 CONSULTANT shall release, protect, indemnify and hold harmless the COMPANY Indemnitees from and against any claim, damage, liability, loss or expense (including costs for defense, settlement, conciliation, and attorney's fees) for which COMPANY may become responsible or pay out, to the extent resulting from any act or omission by CONSULTANT or any of its subcontractors in the performance of the Work, under the Resource Conservation and Recovery Act (RCRA) and the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), as the same may be amended from time to time, or any similar state statutes, regulations or requirements related to the transportation, treatment, storage or disposal of the Waste covered under this Agreement or out of CONSULTANT'S failure to comply with any warranty contained in this Agreement.

7.6 Notwithstanding any provision of this Section 7.0, COMPANY shall indemnify and hold harmless the CONSULTANT, its affiliates, directors, officer, employees, agents and subcontractors from and against any and all costs, liabilities, claims, demands and causes of action under the Oil Pollution Act of 1990, 33 U.S.C. 2701-2761, as the same may be amended from time to time ("OPA") or corresponding applicable state law for Removal Costs (as defined in OPA) and damages which result from actions taken or omitted to be taken in the course of rendering care, assistance or advice in connection with a Discharge (as defined in OPA) or threatened Discharge from a Vessel (as defined in OPA) consistent with the National Contingency Plan or as otherwise directed by the COMPANY, the U.S. Coast Guard or other governmental authorities, which the CONSULTANT, its affiliates, directors, officers, employees, agents and subcontractors, individually or collectively, may suffer, incur, or pay out, EXCEPT TO THE EXTENT THAT:

7.6.1 CONSULTANT, and any of its affiliates, officers, directors, employees or subcontractors is entitled to immunity from liability under laws granting responders immunity;

7.6.2 such liabilities, claims, demands and causes of action arise out of the gross negligence or willful misconduct of CONSULTANT or any of its affiliates, officers, directors, employees or subcontractors;

7.6.3 COMPANY would have been entitled to a complete defense to liability under federal law and any relevant state law had such claim, demand or cause of action been made against COMPANY or the Vessel (as defined in OPA) directly;

7.6.4 such payment or indemnification would result in a payment and/or liability of COMPANY in excess of that to which COMPANY would have been entitled to limit its liability under federal law and any relevant state law had such claim, demand or cause of action been made against COMPANY or the Vessel (as defined in OPA) directly; or

7.6.5 such liabilities, claims, demands and causes of action arise in respect of death or personal injury.

8.0 INSURANCE

8.1 CONSULTANT agrees to carry and maintain the following insurance, from carriers with an A.M. Best rating of at least A-/VIII:

8.1.1 Statutory Coverage Workers' Compensation Insurance (including Occupational Disease Coverage) in accordance with the laws of the states where the Work is to be performed and if CONSULTANT performs Work on or adjacent to navigable waterways CONSULTANT shall furnish a certificate of insurance showing compliance with the provisions of the Federal Longshoremen's and Harbor Workers' Compensation Law and the Jones Act.

8.1.2 Employer's Liability Insurance with limits of not less than **$1,000,000** per occurrence and **$1,000,000** per disease/each employee. In the event Work is being performed more than

three miles offshore, Maritime Employer's Liability (or Bumbershoot off Vessel P&I policy) coverage of not less than **$1,000,000** per occurrence.

8.1.3 Commercial General Liability Insurance insuring the indemnity agreements set forth in this Agreement with a combined single limit of not less than **$1,000,000** per occurrence and **$2,000,000** in the aggregate. All policies shall remove any exclusion for explosion, collapse and underground operations (XCU) and include coverage for blanket contractual liability assumed hereunder.

8.1.4 Comprehensive Automobile Liability Insurance covering liability arising out of any auto (owned, hired and non-owned); with a combined single limit of not less than **$1,000,000**. If necessary, the policy shall be endorsed to provide contractual liability coverage and, where applicable, pollution. In the event the Work includes transporting Hazardous Waste, with limits of not less than **$1,000,000** and which will include an endorsement to auto liability insurance for upsets or overturns (MCS-90 endorsement).

8.1.5 Professional Liability (Engineer's Errors and Omissions) Insurance, in the event CONSULTANT is performing design, engineering or other professional services, with limits of at least **$1**,000,000 per occurrence and $2,000,000 in the aggregate.

8.1.5 Comprehensive Aircraft Liability Insurance with combined bodily injury, including passengers, and property damage liability single limits of not less than **$5,000,000** each occurrence. This coverage is necessary only when CONSULTANT uses owned or non-owned aircraft in connection with Work performed under this Agreement.

8.1.6 Hull and Machinery Insurance if the Work includes the use of a marine vessel, with full market replacement value of the vessel and including coverage for the removal of the wreck; Protection and Indemnity Insurance including marine pollution coverage with a minimum limit of $5,000,000 per occurrence; Marine Towers Liability Insurance if the Work includes towing of any vessel; Marine Cargo Insurance if the Work includes transporting goods or materials on waterways, with limits sufficient to cover the replacement cost thereof (including the cost of insurance and freight).

8.1.7 Pollution Liability Insurance, where there is a known potential for release of Hazardous Materials and/or treatment or remediation of Hazardous Material(s), coverage of not less than **$5,000,000** per occurrence and in the aggregate.

8.1.8 Umbrella Insurance with a minimum limit of not less than **$10,000,000** per occurrence. Such umbrella policy shall follow the form of the Employer's Liability Insurance, Commercial General Liability Insurance and Comprehensive Automobile Liability Insurance set out above, be in excess of those underlying policies without gaps in limits and provide coverage as broad as those underlying policies.

8.2 As additional security for COMPANY and the separate obligation of CONSULTANT, whether or not required by the other provisions of this Agreement, all insurance policies carried by CONSULTANT hereunder (except Worker's Compensation and Professional Liability) shall name Kinder Morgan Energy Partners, L.P. and each of its respective subsidiary or affiliated companies and entities, their respective successors and assigns, and all of their respective directors, officers, agents and employees, and the respective owners of affiliated entities (for their vicarious liability) (all of the foregoing persons and entities, for the purposes of Section **8.3** below only, being identified as "Kinder Morgan") as additional insureds with respect to liability arising out of the Work performed by CONSULTANT or subcontractor, as applicable.

8.3 Also, as additional security for COMPANY and the separate obligation of CONSULTANT, whether or not required by other provisions of this Agreement, all insurance policies of CONSULTANT (except Professional Liability) shall include a waiver of subrogation in favor of Kinder Morgan (unless prohibited by law).

8.4 Before commencing any performance under this Agreement, CONSULTANT shall furnish COMPANY with evidence of insurance coverage as required by the provisions of this Agreement in the form of an ACORD certificate with boxes checked as approved by COMPANY and copies of such endorsements. Failure of CONSULTANT to furnish such evidence of insurance coverage shall not be considered a waiver by COMPANY of such coverage.

8.5 The insurance coverages required of CONSULTANT shall apply as primary insurance with respect to any other insurance or self-insurance programs afforded to or maintained by or for the benefit of COMPANY, and shall not require the exhaustion of any other coverage.

8.6 Should any of the above described CONSULTANT policies be cancelled before the expiration date thereof, CONSULTANT shall cause its carrier to deliver notice to COMPANY within the timeframe provided by the policy for notice of cancellation to be provided to the insured. CONSULTANT shall notify COMPANY immediately if the carrier declines or falls to so notify COMPANY and also notify COMPANY of any such cancellation.

8.7 CONSULTANT shall promptly notify COMPANY when any insurance policy required above is not reasonably available and shall state the reasons therefore.

8.8 All deductibles, self insured retentions and self insurance carried by the CONSULTANT under its insurance program are the sole responsibility of the CONSULTANT and will not be borne in any way by the COMPANY. The CONSULTANT will indemnify the COMPANY Indemnitees in full for any amounts related to such deductibles, retentions and self insurance and for any deductibles or amounts owed under any COMPANY issued policies due to the fault of CONSULTANT.

8.9 In the event of the CONSULTANT'S failure to carry out any of the provisions of this Section 8.0, the COMPANY shall, in addition to any right to recover damages or to obtain other relief, have the right to terminate this Agreement or any Work Directive issued pursuant hereto.

8.10 All subcontractor policies shall be endorsed with the waiver of subrogation and additional insured wording set forth in Section 8.4 above. Any deficiency in the coverage, policy limits, or endorsements of said subcontractors will be the sole responsibility of CONSULTANT.

9.0 SAFETY AND ENVIRONMENTAL REQUIREMENTS

9.1 CONSULTANT shall comply with all applicable federal, state and local laws, ordinances, codes, local and national standards and regulations, including the EHS Laws. CONSULTANT agrees to provide all necessary training, safety equipment and safety instruction, including a written safety plan, necessary for the safety of its employees, the COMPANY'S invitees, employees, representatives and subcontractors, if any, and all other individuals who may be at the Work location pursuant to the requirements, invitation or permission of CONSULTANT or COMPANY.

9.2 CONSULTANT shall be proactive, prudent and take all necessary precautions toward all safety issues and shall actively promote working conditions and work practices which will ensure all workers a safe and healthful work environment. This Agreement shall be governed by the provisions, as the same may be amended from time to time, of the U.S. Occupational Health and Safety Act (OSHA) of 1970 and other EHS Laws, and by regulations imposed by any federal, state or local authority having jurisdiction therefore. CONSULTANT shall access COMPANY'S Contractor Safety Manual and supplemental forms at: http://www.kindermorgan.com/work/contractor_co/safety_req.cfm prior to execution of any Work Directive and the commencement of any work. If CONSULTANT cannot access the Safety Manual, CONSULTANT shall contact the COMPANY Designated Representative prior to execution of any Work Directive and the commencement of any Work. CONSULTANT further agrees to access the Safety Manual no less frequently than every six (6) months during the term of this Agreement to check for updates to the Manual throughout the term hereof. CONSULTANT shall cause copies of the Safety Manual to be available for its employees and subcontractors on the Job Site throughout the course of any Work being performed, and require said employees

and subcontractors to comply with said Safety Manual at all times when they are performing work on COMPANY premises. CONSULTANT can request copies of the Kinder Morgan Contractor Safety Pre-Job Orientation Program materials by emailing the KM Contractor Safety Group at: contractor_safety@kindermorgan.com.

9.3 CONSULTANT will take all necessary precautions to protect personnel and property from injuries or damage due to falls, fumes, fire, explosion or other hazards presented by the Work. It shall be CONSULTANT'S responsibility to instruct its employees, subcontractors and agents to contact, COMPANY'S Designated Representative, prior to commencing any Work, regarding safety policies and procedures and potential hazards or Hazardous Materials in the Work areas, whether or not such hazards are addressed by federal, state or local law or regulations.

9.4 COMPANY may, at its option, suspend the Work for a full safety inspection and correction at any time if the Designated Representative (i) discovers a safety violation, (ii) sees the possibility of a dangerous condition in any Work area, or (iii) notices a pattern by CONSULTANT or any subcontractor of disregard for maintaining a safe jobsite. If CONSULTANT has one major or two or more minor safety violations, then such violations shall be grounds for immediate termination of this Agreement and/or Work Directive and/or COMPANY may eject CONSULTANT, its personnel and any of its subcontractor(s) from COMPANY'S premises or jobsite.

9.5 COMPANY will make available to CONSULTANT all information in its possession regarding the Waste, including its chemical analysis, known surface conditions, topographical surveys or other relevant information, that would assist CONSULTANT in properly evaluating the nature and character of the Waste and the Work to be performed; provided, however, that COMPANY does not warrant the accuracy or completeness of the information provided.

9.6 COMPANY shall be responsible for any environmental condition existing at the Work site prior to the time CONSULTANT commences performance under this Agreement. However, CONSULTANT shall remedy at its sole expense any creation or release of a Hazardous Material at or from the Work site to the extent that such creation or release is the result of CONSULTANT'S performance of Work, whether or not such Hazardous Material existed on the site prior to the performance of the Work. CONSULTANT shall indemnify and hold COMPANY Indemnitees harmless from and against all liability, loss, cost, damage and expense (including attorney's fees) arising from or in connection with (i) such release or creation of Hazardous Materials, or (ii) CONSULTANT'S violation of EHS Laws or any applicable permit, in the course of CONSULTANT'S performance of the Work. "Hazardous Material(s)" means and includes: (a) all elements or compounds that are contained in the list of hazardous substances adopted by the United States Environmental Protection Agency and the list of toxic pollutants designated by Congress or the Environmental Protection Agency or under any EHS Laws, and (b) any "hazardous waste," "hazardous substance", "toxic substance," "regulated substance," "pollutant" "contaminant", "oil" or "petroleum", each as defined under any EHS Laws ("EHS Laws") mean any and all U.S. federal, state, and local laws, regulations, permits, approvals and requirements pertaining to health, safety, or the environment.

9.7 In performing the Work CONSULTANT agrees to maintain all COMPANY premises in a clean, safe condition in compliance with applicable regulations and to COMPANY'S reasonable satisfaction. If CONSULTANT fails to so maintain any COMPANY premises, COMPANY may secure such maintenance from another source at CONSULTANT'S expense without affecting CONSULTANT'S obligations or responsibility to perform hereunder.

9.8 CONSULTANT shall remove all, Waste (including all Hazardous Materials), unused material belonging to CONSULTANT, rubbish, releases, spills, oil sludge, trash, debris or excavations and structures (not necessary to be left as part of the completed Work) from COMPANY premises or other areas where work has been performed, or where such material has accumulated, unless COMPANY elects to retain such matter. CONSULTANT warrants and guarantees that the sludge, spills, releases, trash, debris or other Waste will be disposed of in accordance with all federal, state and other governmental laws, rules and regulations, environmental or otherwise.

9.9 CONSULTANT warrants that it:

9.9.1 shall report usage of all toxic chemicals in the performance of the Work.

9.9.2 will obtain Material Safety Data Sheets ("MSDS") for all Hazardous Materials or substances utilized hereunder and will make same available at all times to COMPANY, CONSULTANT and subcontractor employees at any Work location hereunder.

9.9.3 shall be responsible for and deliver to COMPANY shipping papers, manifests and labels with each shipment of Waste in accordance with all applicable requirements of the United States Department of Transportation, (DOT) and the United States Environmental Protection Agency (EPA) under the Toxic Substances Control Act (TSCA), the Resource Conservation and Recovery Act (RCRA), or any replacement or successor agency thereto, and all other federal, state and local statutes, regulations and ordinances, at COMPANY'S request.

9.9.4 is knowledgeable about current, existing, known Hazardous Materials, Wastes, or substances at any jobsite where the Work is performed and shall be solely responsible to solidify, remove, remediate, encapsulate, treat, neutralize, transport and complete the required record keeping or documentation to take these same Hazardous Materials, wastes or substances away from those jobsites, to treatment and/or disposal sites designated and/or approved by COMPANY and approved by the federal, state or local authorities having jurisdiction over the treatment and/or disposition and control of these products and to the complete satisfaction of these authorities.

9.9.5 has the knowledge, trained personnel, skills, equipment, experience and any other qualification needed to comply fully with this Section **9.0** as defined by the authorities having jurisdiction therefore, or will hire individual(s) or subcontractors which have same, at no additional cost to COMPANY.

9.9.6 will immediately notify COMPANY in the event that it encounters Hazardous Material(s) during the course of its Work which were not known or disclosed at the time of commencement of the applicable Work Directive.

9.9.7 It will obtain and maintain all necessary, valid permits and licenses for the Work including those needed for the handling, transporting and disposing of Hazardous Materials as required under this Section **9.0**.

9.9.8 further represents to COMPANY that it has the skill and professional competence, expertise, experience with United States Coast Guard classification and all other necessary training, certification, licenses and approvals to undertake the obligations imposed by this Agreement.

9.10 If CONSULTANT'S Work includes activity for which a one-call telephone call must be made prior to commencement of such activity and CONSULTANT fails to make the required call(s), which failure becomes known to COMPANY prior to payment of CONSULTANT'S final invoice, then COMPANY may take a credit against such final invoice according to the following schedule: one (1) failure to call equals five hundred dollars ($500); two (2) failures to call equals one thousand dollars ($1,000); three failures to call equals ($5,000); more than three failures to call equals ten thousand dollars ($10,000).

9.11 Chemical of Interest

9.11.1 CONSULTANT shall be liable to COMPANY without limitation for any and all costs and/or damages arising out of any breach by CONSULTANT of Department of Homeland Security ("DHS") Chemical Facility Anti-Terrorism Standards ("CFATS") requirements, codified at 6 C.F.R. Part 27, as the same apply to the Premises. By way of example,

these costs and/or damages may result from the possession, use, storage, handling and/or management by CONSULTANT of a chemical of interest ("COI") identified in Appendix A to CFATS, 6 C.F.R. Part 27, Appendix A, on COMPANY Premises and/or from the failure by CONSULTANT to comply with reporting, record-keeping, or any other requirements contained in CFATS, including but not limited to the submission of a CFATS Top-Screen.

9.11.2 CONSULTANT must notify COMPANY thirty (30) days in advance of any plans by CONSULTANT to bring any COI onto the Premises, and must obtain the written approval of COMPANY's Director - Security or COMPANY representative designated by the COMPANY's Director - Security or COMPANY Officer for the Premises prior to bringing any COI onto the Premises. If providing such notice and obtaining such approval is not possible within this time frame due to an emergency situation, CONSULTANT shall notify COMPANY and gain approval from the COMPANY Director - Security or designated COMPANY representative as soon as reasonably possible.

10.0 CALIFORNIA RELEASE NOTIFICATION REQUIREMENTS

In the event any of the Work is to be performed by CONSULTANT or its permitted subcontractors in the State of California then the following provisions in this Section **10.0** shall apply with respect to such Work:

10.1 CONSULTANT shall ensure that its employees, agents, and subcontractors' employees engaged in CONSULTANT'S activities in the performance of the Work:

10.1.1 Are notified, and when required, as determined by COMPANY, trained and instructed by COMPANY, either directly or through a train-the-trainer program instituted by COMPANY, concerning the order of actions to be taken upon discovery of a release or threatened release condition of a Hazardous Material or pollutant substance; and

10.1.2 Understand that no Work or visit shall be undertaken to any COMPANY right-of-way or facility where there is no COMPANY representative onsite and readily accessible (a "Non-Company Onsite Situation"), unless the training referred to in subsection **10.1.1** above has occurred for CONSULTANT'S employees, agents and subcontractors' employees who will be performing at such a site.

10.1.3 Designation of Non-Company Onsite Situation or Company Onsite Situation shall be made per individual Work Directive.

11.0 DRUG AND ALCOHOL, FIREARMS POLICY, OPERATOR QUALIFICATION POLICY AND TESTING

Per COMPANY'S determination, the Work includes DOT Jurisdictional Work as follows:

☑ YES ☐ NO If YES, Section **11.1** and Section **11.5** apply.

If NO, above Section 11.2 or Section 11.5 below applies, as determined by COMPANY and checked below.

☐ Section **11.2** Company Drugs/Alcohol/Weapons Policy in Non-DOT situations. (For example, office type work)

☐ Section **11.5** Company Drugs/Alcohol/Weapons Policy in Non-DOT situations requiring Pre-Employment, Accident and Random Testing. (For example, field type work)

In the event neither the "Yes" or "No" box is checked, then Sections 11.2 and 11.5 shall be deemed to apply, and CONSULTANT shall not undertake any DOT Jurisdictional work unless and until

CONSULTANT satisfies Section 11.1.

11.1 **Drug/Alcohol/Operator Qualification Program and Testing in DOT Situations.** CONSULTANT represents and warrants that it has established, maintains, and enforces both a Drug and Alcohol Program and an Operator Qualification Program per requirements as outlined in Exhibit _C_.

11.2 **Company Policy Regarding Drugs/Alcohol/Weapons in Non-DOT Situations.** CONSULTANT agrees to advise its employees/provided personnel and the employees/provided personnel of its subcontractors and agents that it is the policy of COMPANY that:

11.2.1 The use, possession, manufacture, and/or distribution of illegal drugs or controlled substances, unauthorized drugs, drug-related paraphernalia or weapons (to the extent permissible by applicable state law) is strictly prohibited on COMPANY Premises. The use or possession of alcoholic beverages, except where authorized by COMPANY'S management, is also prohibited. CONSULTANT'S employees and provided personnel shall not carry or transport any firearm or weapon, whether or not concealed, on the Premises in any COMPANY-owned vehicle or in any other vehicle (except as allowed by applicable State law) while engaged on COMPANY business or in the performance of Work. In the event applicable State law expressly allows weapons to be brought on any Premises, then all such allowed weapons must be unloaded and locked out of sight at all times;

11.2.2 Entry onto or presence on COMPANY'S premises by any person, including CONSULTANT, CONSULTANT'S employees, subcontractors, subcontractors' employees, contract personnel, temporary employees and visitors, constitutes consent to COMPANY to conduct searches, whether announced or unannounced, on COMPANY'S premises of the person and his or her personal effects for such prohibited items, and consent to drug testing at any time while on COMPANY'S premises;

11.2.3 Any person suspected or found in violation of the policy, abusing prescription or over-the-counter medications, or who refuses to permit a search or drug or alcohol test may be removed and barred from COMPANY'S premises, at the sole discretion of COMPANY; and

11.2.4 CONSULTANT personnel, who test positive for illegal drugs or unauthorized alcohol as a result of a test conducted in connection with CONSULTANT's performance of this Agreement, or upon request of COMPANY, will be removed from any further performance or services under this Agreement.

11.3 CONSULTANT is now and at all times during performance of this Agreement shall continue to be a member of ISNetworld or any similar organization which is successor thereto for COMPANY'S purposes, as notified by COMPANY to CONSULTANT;

11.4 CONSULTANT has and during the performance of this Agreement shall continue to report full, complete and accurate information to ISNetworld concerning CONSULTANT'S employees;

11.5 **COMPANY Policy Regarding Drugs/Alcohol/Weapons in Non-DOT Jurisdiction situations requiring Pre-Employment, Accident and Random Testing.** In addition to the notification and other requirements contained in Section 11.2 above, CONSULTANT shall:

11.5.1 At CONSULTANT'S cost, test his employees/provided personnel utilized in performance of the Work for drug and alcohol (D/A) impairment under the following conditions:

11.5.1.1 Pre-Employment Testing: CONSULTANT shall conduct pre-employment D/A testing of all employees/provided personnel who will be required to work on property owned, operated or leased by COMPANY or any Jobsite. A negative

test result is required for each of CONSULTANT'S employees or provided personnel prior to commencing Work.

11.5.1.2 Post-Accident Testing: An employee/provided personnel whom COMPANY or CONSULTANT reasonably believes may have contributed to an accident on the Jobsite or while engaged in the performance of Work may be required to undergo D/A impairment testing as determined by the COMPANY. Such a test will be conducted at CONTRACTOR'S cost as soon as practicable after the accident, but for drugs not later than thirty-two (32) hours after the accident and for alcohol not later than eight (8) hours after the accident. CONSULTANT will make reasonable attempts to obtain a sample from an employee/provided personnel following an Accident (as defined below), but any injury should be treated first.

11.5.1.2.1 **Accident** is defined as an unplanned, undesired event, resulting in injury and/or damaging to property and/or process interruption.

11.5.1.2.2 Obligations of Employee/Provided Personnel Subject to Post-Accident Testing: CONSULTANT (or subcontractor, as the case may be) shall require the employee/provided personnel who is subject to post-accident testing to remain readily available for such testing and caution him/her not take any action which could interfere with the testing or the results of testing.

11.5.1.3 Notify CONSULTANT'S and subcontractor's employees/provided personnel that random testing will occur under the following conditions:

11.5.1.3.1 All CONSULTANT (and subcontractor, as the case may be) employees/provided personnel working on property owned, operated or leased by COMPANY (including right-of-way) or any Jobsite shall be subject to unannounced and random drug and alcohol testing by CONSULTANT at CONSULTANT'S expense. The primary purposes of unannounced random testing are to deter illegal D/A use which may affect work performance or safety, and to ensure a D/A free workforce. Random D/A testing shall be conducted each year during the term of this Agreement, at a minimum twenty-five percent (25%) of the employee/provided personnel engaged in the Work. CONSULTANT shall exercise reasonable efforts to make random testing selections spread reasonably over a twelve (12) month period.

11.5.1.3.2 Random tests will only be administered just before, during, or shortly after a CONSULTANT'S (or subcontractor's) employee's/provided personnel's Work time;

11.5.1.3.3 CONSULTANT (and subcontractor) employees/provided personnel engaged in the Work must remain in the random selection pool at all times, regardless of whether or not they have been previously selected for testing.

11.5.1.3.4 CONSULTANT (and subcontractor) employees/provided personnel shall be selected for testing by using a computer-based random number generator;

11.5.1.3.5 No advance warning will be given to employees/provided personnel regarding the dates and times of random testing.

11.5.1.4 Testing Upon Reasonable Suspicion: If in the course of CONSULTANT'S performance of the Work on COMPANY premises, COMPANY has reasonable suspicion based upon objective observation (or report by a non-COMPANY objective observer) that CONSULTANT (or subcontractor) personnel has violated the policy, COMPANY may require such person(s) to undergo testing. If a person who is CONSULTANT'S (or subcontractor's) personnel is reasonably suspected to be in violation of the policy and does test positively, the expense of the test shall be borne by CONSULTANT.

11.5.1.5 Any person reasonably suspected or found in violation of the policy (by positive test result or otherwise) or who refuses to permit a search or drug or alcohol test may be removed and barred from COMPANY'S premises (owned, operated or leased) or Jobsite, at the sole discretion of COMPANY. CONSULTANT shall advise its employees/provided personnel and subcontractors' employees/provided personnel concerning this provision.

11.5.1.6 CONSULTANT and subcontractor personnel (whether employees, leased employees, temporary employees, or contract workers) who test positive for illegal drugs or unauthorized alcohol, will be removed from any further performance of services under this Agreement; provided that if such personnel has self-reported to his employer as requiring drug or alcohol treatment and successfully completes that treatment, (s)he may become eligible for readmittance to COMPANY'S premises after (s)he submits proof to CONSULTANT of attendance and successful completion of a substance abuse program recognized by CONSULTANT as adequate, and CONSULTANT certifies to COMPANY that CONSULTANT has received the same along with a negative return-to-work test result. An individual whose test specimen is "cancelled without medical explanation" shall be required to undergo a re-test under direct supervision.

11.6 **Operator Qualifications**

COMPANY has determined that the Work includes the performance of "Covered Task(s)" (as defined in Kinder Morgan's Operator Qualification Plan) as follows:

☑ Yes Section **11.6** applies

☐ No Section **11.6** does not apply.

In the event neither box is checked then Section **11.6** shall be deemed to apply.

11.6.1 With respect to Work to which operator qualifications requirements apply, CONSULTANT warrants and covenants to COMPANY as follows, and shall cause its subcontractors performing Work hereunder to which operator qualifications requirements apply to warrant and covenant to CONSULTANT as follows, with respect to their respective workers (whether they be permanent or temporary employees, or contracted/leased workers):

11.6.1.1 All of the workers utilized on COMPANY premises in the performance of Work under this Agreement to which operator qualifications requirements as set forth in Exhibit D hereto (the "Operator Qualifications Requirements") apply (whether such workers be permanent or temporary employees, or contracted/leased workers) shall be in compliance with said Operator Qualifications Requirements at all times when performing such Work; and

11.6.1.2 All welders utilized in the performance of Work under this Agreement are qualified under COMPANY-established welding procedures which shall be notified by COMPANY to CONSULTANT; and

11.6.1.3 For five (5) years following completion or termination of the Work and for so long thereafter as there may remain any unresolved questions or disputes regarding any aspect of operator qualifications as pertains to the Work, CONSULTANT shall provide and retain in ISNetworld (i) copies of its employees' Operator Qualification records, and (ii) copies of its applicable subcontractors' employees' records regarding compliance by such subcontractors' employees with said Operator Qualifications Requirements during the performance of the Work.

11.6.2 During the performance of the Work and for five (5) years following completion or termination of the Work in accordance with this Agreement and for so long thereafter as there may remain any unresolved questions or disputes regarding any aspect of operator qualifications, COMPANY or COMPANY's designee shall have the right to audit CONSULTANT'S personnel records (and its subcontractors' records, as retained per paragraph **11.6.1.2** above) concerning compliance with said Operator Qualifications Requirements in connection with the Work.

11.6.3 The provisions of this Section **11.0** are in addition to and not intended to limit COMPANY's right to audit as provided in Section **12.0** below.

12.0 ASSIGNMENT, TERMINATION AND RIGHT TO AUDIT

12.1 This Agreement shall extend to and be binding upon the heirs, executors, administrators, successors and assigns of the parties hereto, provided that CONSULTANT, due to CONSULTANT'S qualifications and experience, shall not assign CONSULTANT'S rights or obligations or pledge as security any sum that may accrue to CONSULTANT hereunder without the prior written consent of COMPANY. Any such assignment or pledge without COMPANY'S prior written consent shall, at COMPANY'S election, be considered null and void or result in the immediate termination of this Agreement and all or part of the Work being performed hereunder. Notwithstanding such termination, CONSULTANT shall be liable for all additional costs incurred by COMPANY resulting from such termination and in completing the Work.

12.2 CONSULTANT shall not sublet or subcontract any Work to be performed except as authorized in writing by COMPANY. CONSULTANT further agrees to require that its authorized subcontractors accept and comply with all terms of this Agreement.

12.3 Termination

12.3.1 For Convenience: COMPANY may terminate for its convenience this Agreement or any Work Directive in whole or in part for any reason at any time upon ten (10) days written notice to CONSULTANT.

12.3.2 For Default: COMPANY may terminate this Agreement or any Work Directive in whole or in part for default by CONSULTANT in its contractual obligations hereunder by giving ten (10) days prior written notice to CONSULTANT; provided, however, that termination pursuant to Section **9.4** shall not require such ten-day notice. Without limiting the generality of the foregoing sentence, CONSULTANT shall be deemed to be in default hereunder if CONSULTANT:

12.3.2.1 persistently or repeatedly refuses or fails to supply enough properly skilled workers or proper materials;

12.3.2.2 consistently fails to achieve any milestones set out in any given Work Directive;

12.3.2.3 fails to make prompt payment to subcontractors or materialmen for materials or labor;

12.3.2.4 violates, or is indicted for any violation of, any law, ordinance, rule regulation or order of any public authority having jurisdiction;

12.3.2.5 fails to obtain and maintain insurance as required hereunder or fails to observe the insurance provisions hereof;

12.3.2.6 is in breach or default in any material respect of any other duty, obligation, representation or term set forth in the Contract Documents;

12.3.2.7 fails to remedy a default or potential default (which would occur through lapse of time) under the terms governing any security provided by CONSULTANT pursuant to Section 20.0 hereof or

12.3.2.8 violates any EHS law; or

12.3.2.9 suffers any of the following to occur:

12.3.2.9.1 institutes or has instituted against it a proceeding seeking a judgment of insolvency or bankruptcy or any other relief under any bankruptcy or insolvency law or other similar law affecting creditors' rights, or a petition is presented for its winding-up or liquidation,

12.3.2.9.1.1 and this Agreement is not assumed or rejected within sixty 60 thirty days after an order for relief is entered, or

12.3.2.9.1.2 such proceeding or petition results in a judgment of insolvency or bankruptcy or the making of an order for CONSULTANT's winding up or liquidation which judgment is not dismissed, discharged, stayed or restrained within thirty or sixty (60) days after commencement of the action, and this Agreement is not assumed or rejected within such thirty or sixty (60) day period commencement of any such proceeding, or;

12.3.2.9.2 such proceeding or petition results in a judgment of insolvency or bankruptcy or the entry of an order for relief or the making of an order for CONSULTANT'S winding up or liquidation which judgment is not dismissed, discharged, stayed or restrained within sixty (60) days of its entry,

12.3.2.9.3 has a secured party take possession of all or substantially all of its assets or has a distress, execution, attachment, sequestration or other legal process levied or enforced against all or substantially all of its assets and such secured party maintains possession, and any such process is not dismissed, discharged, stayed or restrained; or

12.3.2.9.4 following the occurrence of any of the following, fails to provide assurances of future performance to COMPANY which are satisfactory to COMPANY in COMPANY'S reasonable discretion within fifteen (15) days of COMPANY'S demand therefore:

12.3.2.9.4.1 makes a general assignment, arrangement or composition with or for the benefit of its creditors;

12.3.2.9.4.2 becomes insolvent or is generally unable to pay its debts or fails or admits in writing its inability generally to pay its debts as they become due;

12.3.2.9.4.3 seeks or becomes subject to the appointment of an administrator, provisional liquidator, conservator, receiver, trustee, custodian or other similar official for all or substantially all of its assets;

12.3.2.9.4.4 otherwise seeks protection from creditors.

12.4 Upon termination for convenience under subsection **12.3.1**, COMPANY will pay CONSULTANT'S costs properly allocable and directly relating to the termination, together with reasonable profit for the portions of the Work performed prior to termination, but in no case shall COMPANY be liable for payment to CONSULTANT for unrealized costs or anticipated profits hereunder. COMPANY shall be entitled to deduct any costs or expenses owed to COMPANY by CONSULTANT against any sums due to CONSULTANT as a result of COMPANY terminating this Agreement. CONSULTANT shall provide COMPANY with an itemized invoice for said termination costs allowed hereunder along with supporting documentation within thirty (30) days from the date of termination; otherwise, said termination costs shall be deemed waived by CONSULTANT.

12.5 Upon termination for default under subsection **12.3.2**, COMPANY may take over the Work and prosecute the same to completion and may utilize any other remedies available at law or equity. In addition to any such remedies, CONSULTANT shall be liable to COMPANY for all additional costs and expenses incurred by COMPANY to complete the Work, including any damages for delay in completing the Work, and for any damages or injury of any type or kind caused by CONSULTANT'S failure to fulfill its obligations to complete the Work or fulfill its obligations hereunder.

12.6 Upon receipt of COMPANY'S notice to terminate, CONSULTANT shall, unless the notice directs otherwise, immediately cease Work and if so directed make every reasonable effort to secure cancellation of all existing orders or contracts upon terms and conditions satisfactory to COMPANY and transfer title to the completed Work to COMPANY and deliver to COMPANY all data, designs, drawings, specifications, reports, estimates, summaries, surveys and other materials and information supplied by COMPANY or obtained by CONSULTANT in performing hereunder. In addition, In addition, CONSULTANT will take any action that may be necessary, or required by the COMPANY, for the protection, treatment and preservation or disposal, as directed by COMPANY, of the property related to this Agreement that is in the possession of the CONSULTANT and which COMPANY has or may acquire an interest. The parties agree that "reasonable effort", as a minimum, shall be that CONSULTANT has explicitly contacted each and every supplier for which outstanding orders and/or contracts exist In connection with the Agreement, and has attempted to cancel every such order and/or contract upon terms and conditions reasonably satisfactory to COMPANY.

12.7 Throughout the term of this Agreement and for a period of five (5) years following the completion or termination of this Agreement and for so long thereafter as there may remain any unresolved questions or disputes regarding any item: (i) COMPANY shall, at all reasonable times and upon prior notice to CONSULTANT, have access to all CONSULTANT'S, subcontractors', and vendors' personnel, books, records, correspondence, instructions, plans, equipment maintenance records, drawings, receipts, vouchers, financial accounts and memoranda of every description pertaining to the Work for the purpose of auditing and verifying costs of the Work, CONSULTANT'S compliance with applicable laws, CONSULTANT'S safety performance under this Agreement or for any other reasonable purpose; (ii) COMPANY shall have the right to reproduce any of the aforesaid documents; (iii) in the event that any audit reveals an error or discrepancy of any nature

whatsoever, such error or discrepancy will be corrected promptly, and any moneys owing and due either COMPANY or CONSULTANT will be paid promptly by the other party; and (iv) CONSULTANT shall not charge for any costs incurred by assisting COMPANY with audits performed pursuant to this Agreement.

12.8 Neither CONSULTANT nor COMPANY shall be liable to the other for indirect, special, exemplary, consequential or punitive damages, EXCEPT: (i) arising out of breach of the confidentiality provisions under this Agreement, (ii) resulting from gross negligence or willful misconduct, or (iii) as otherwise provided herein.

13.0 DELAYS; REMEDIES AND DISPUTE RESOLUTION

13.1 Force Majeure

13.1.1 "Force Majeure," as used herein, shall mean acts of God, acts of public enemies, fire, war or civil disturbance, insurrection, blockades, strikes, riots, epidemics, landslides, lightning, hurricanes, tornadoes, earthquakes, floods and/or washouts, explosions, commandeering of raw materials or products or plants or facilities by a government, labor disputes involving a general stoppage of work on the job, rules, regulations, orders or acts of governmental authority, loss or shortage of transportation facilities due solely to an event described in this subsection **13.1.1**, inability with reasonable diligence to obtain materials due solely to the effect of an event described in this subsection **13.1.1**, and in each case not involving the fault or negligence of COMPANY or CONSULTANT.

13.1.2 It is agreed that in the event either party is rendered unable wholly or in part by Force Majeure to carry out its obligations hereunder, then such party shall give notice of the full particulars of such Force Majeure event in writing to the other party as soon as practicable after the occurrence of the cause relied on. The obligation of the party giving such notice, so far and only insofar as affected by such Force Majeure, shall be suspended during the continuance of any inability so caused, but for no longer period, and such cause shall be remedied with all reasonable dispatch. This obligation to remedy shall not require the settlement of labor matters when such course is inadvisable in the judgment of the party claiming same as a Force Majeure. Neither party shall be entitled to any additional compensation for delays resulting from a Force Majeure event.

13.1.3 Time is of the essence for performance hereunder. A delay shall be deemed excusable if the delay is a COMPANY-directed schedule delay. Delays due to subcontractors, suppliers or transporters of CONSULTANT-furnished material, shall not be deemed excusable unless such delay is due to Force Majeure. The party claiming a Force Majeure event shall have the burden of proof with respect to demonstrating that such delay in fact constitutes a Force Majeure event.

13.2 Remedies and Dispute Resolution

13.2.1 This Agreement and any Work Directives associated herewith shall be deemed to have been made and accepted in Harris County, Texas, and the laws of Texas (without giving effect to Texas' choice of law rules and to the extent permitted by applicable law) shall govern any interpretations or constructions of this Agreement. Any dispute between COMPANY and CONSULTANT arising from or related to this Agreement shall be resolved first through discussions among upper management of the parties, and if the dispute cannot be resolved within forty-five (45) days from the date the matter was first brought by the disputing party to the attention of the other party, then either party may elect to resolve the matter through litigation which shall be brought in any court sitting in Harris County, Texas, having jurisdiction thereof. COMPANY and CONSULTANT each submits to the exclusive jurisdiction of said courts and waives the right to change venue. The costs and expenses of the litigation (including attorney's fees) of the prevailing party will be borne by the other party.

13.2.2 If in COMPANY'S sole reasonable discretion the Work cannot be suspended pending the resolution of a dispute, COMPANY may (I) require that CONSULTANT continue prosecuting the Work to completion pursuant to the terms and conditions of this Agreement (including payment of amounts that are invoiced by CONSULTANT and undisputed by COMPANY), or (II) take over the Work and itself prosecute the same to completion. If the pending dispute is resolved in COMPANY'S favor, CONSULTANT shall be liable to COMPANY for any costs and expenses incurred in completion of the Work which are in excess of the amount(s) COMPANY would have paid pursuant to this Agreement.

14.0 CONFIDENTIALITY

14.1 It is understood that CONSULTANT may have access, as determined by COMPANY in its sole discretion, to confidential materials and information ("Confidential Information") of COMPANY, its parent, subsidiaries, or affiliates in order to provide the Work hereunder. Such Confidential Information includes but is not limited to information relating to the progress of the Work and its expected completion date. Although COMPANY shall endeavor to supply CONSULTANT with reliable and accurate information, COMPANY does not make any representation or warranty, express or implied, as to the accuracy or completeness of the Confidential Information furnished for the purposes of the Work. COMPANY shall have no liability to CONSULTANT, nor its directors, officers, employees or advisors to CONSULTANT, or any of its representatives, arising out of the use of Confidential Information by CONSULTANT or its representatives. The above provisions of this Section **14.0** shall apply to CONSULTANT'S parent corporation and all of its subsidiaries and affiliates, if any. It is further understood that CONSULTANT will utilize the Confidential Information only for the purpose of providing the Work contemplated hereunder and for no other purposes whatsoever, and will not utilize the Confidential Information in any manner which could be adverse to COMPANY'S interests. In no event shall CONSULTANT divulge any such Confidential Information to any third party without the express prior written consent of COMPANY'S Designated Representative. In the event any Confidential Information is requested or required of CONSULTANT in the course of legal proceedings, interrogatories, subpoenas, or similar process conducted by a third party, CONSULTANT shall promptly notify COMPANY of such request or requirement in order that COMPANY may seek injunctive relief or protective order, or waive CONSULTANT'S compliance with the provisions hereof. In addition to all remedies at law that COMPANY may be entitled for CONSULTANT'S breach of this section, COMPANY shall also be entitled to equitable remedies including injunctive relief. CONSULTANT shall ensure that its subcontractors comply with the provisions of this Section **14.0**.

15.0 TITLE

15.1 If CONSULTANT is required to transport the Waste from the Work site then title to the Waste passes to CONSULTANT at the time the CONSULTANT'S vehicle is loaded with the Waste. If instead COMPANY transports the Waste from the Work site to CONSULTANT'S facility or site then title to the Waste passes to the CONSULTANT at the time the Waste is delivered to CONSULTANT'S facility or site.

16.0 WAIVER

16.1 No waiver or failure to act by COMPANY with respect to any of its rights under this Agreement shall be construed as a waiver or relinquishment of that right in any other instance or of COMPANY'S right to assert or to rely on the terms of this Agreement. Any express waiver of a provision of this Agreement shall not be binding and effective unless made in writing and properly executed by the waiving party.

17.0 SEVERABILITY AND SURVIVAL

17.1 Each provision of this Agreement is severable. If any provision of this Agreement is determined to be illegal, invalid or unenforceable in any jurisdiction, the illegality, invalidity or unenforceability

of that provision shall not affect (i) the legality, validity or enforceability of the remaining provisions of this Agreement, or (ii) the legality, validity or enforceability of that provision in any other jurisdiction; and provided further, the subject provision shall be applied to the fullest extent permitted by applicable law, and COMPANY and CONSULTANT shall revise the provision so as to confirm their mutual intention upon entering this Agreement and yet be legal, valid and enforceable in the applicable jurisdiction. The provisions of Sections **1.0**, **3.0**, **5.0**, **6.0**, **7.0**, **9.0**, **12.0**, **13.0**, **14.0**, **15.0**, **16.0**, **17.0**, **19.0**, and **21.0** shall survive the termination of this Agreement.

18.0 SERVICES FOR AFFILIATES

18.1 The Work to be performed by CONSULTANT under this Agreement shall be performed, in certain cases, for one or more entities under common control with COMPANY or controlled by the COMPANY or for which the COMPANY serves as an operator through one or more of COMPANY'S affiliates. In the event any such entity requires CONSULTANT to perform Work under this Agreement, a Work Directive for such Work shall be issued by the entity requiring the Work, substantially in the form shown in Exhibit A. Upon execution of said Work Directive, CONSULTANT shall perform such Work for the executing entity in accordance with the Work Directive and the terms and conditions of this Agreement. By execution of the Work Directive, such entity shall be entitled to all rights and privileges, and liable for all commitments and responsibilities held by COMPANY under this Agreement, as same applies to said Work Directive. Upon execution of said Work Directive, CONSULTANT'S agreement to insure and indemnify COMPANY pursuant to this Agreement shall extend to both COMPANY and such entity for purposes of said Work Directive. Unless expressly provided in the Work Directive, such entity which executes the Work Directive shall be solely responsible for the liabilities and obligations set forth in this Agreement under which that Work Directive is being issued as the same apply to the Work to be performed pursuant to that Work Directive. All such liabilities and obligations, as they apply to that Work Directive, shall be non-recourse to the direct and indirect parents (or a general partner or company member, as the case may be) and to the affiliates of the entity executing the particular Work Directive.

19.0 LIABILITY OF GENERAL PARTNER

19.1 In the case where Kinder Morgan G.P., Inc., a Delaware corporation, or any other Kinder Morgan entity is the general partner of COMPANY, (the "General Partner"), the CONSULTANT agrees that the General Partner shall not be liable, directly or indirectly, for any of obligations or liabilities of COMPANY under this Agreement. All such obligations and liabilities shall be non-recourse to the General Partner and shall not constitute debts or obligations of the General Partner. No judgment, attachment, execution or other writ or process shall be sought, issued, or levied in connection with this Agreement against the General Partner or any of its assets or properties to satisfy any such liabilities or obligations or any judgments rendered in connection therewith and all such liabilities and obligations shall be satisfied solely from the assets of COMPANY, or the entity executing the Work Directive, as the case may be.

20.0 SECURITY

20.1 In the event COMPANY elects to require CONSULTANT to obtain a Letter of Credit, Performance and/or Labor and Material Bond(s), Parent Guaranty or other instrument or vehicle to provide financial security for the performance and payment obligations of CONSULTANT under this Agreement or for any particular job or project assigned to CONSULTANT pursuant to any Work Directive, COMPANY shall notify CONSULTANT of COMPANY'S election upon execution of this Agreement or in the Work Directive for the particular job or project, and CONSULTANT shall furnish to COMPANY, at COMPANY'S expense in case of a Bond, within ten (10) days of such notice and prior to commencing the Work or promptly thereafter in the case of an emergency, all documentation associated with such CONSULTANT-provided security, which shall be on terms and in a form satisfactory to COMPANY.

21.0 PUBLIC RELATIONS

21.1 CONSULTANT shall exert all reasonable efforts to maintain goodwill for the benefit of COMPANY with the landowners, occupiers and with the general public in the course of CONSULTANT performing the Work. Nothing contained herein shall permit or be deemed to permit use by CONSULTANT of COMPANY'S name, its logo or trademarks, nor names of it employees, directly or indirectly, orally or in the form of advertising or in a press release without the prior receipt of COMPANY'S written approval. CONSULTANT shall not utilize the fact that this Agreement exists to gain business or revenue elsewhere. Further CONSULTANT agrees to keep and maintain in confidence the commercial terms and conditions of this Agreement.

22.0 FACSIMILE SIGNATURES/COUNTERPARTS

22.1 This Agreement may be executed in multiple original counterparts, each of which shall be deemed an original, and together they shall constitute one and the same agreement. Signature of this Agreement may be effected by facsimile (with confirmation by transmitting machine) and/or transmitted by portable document format ("pdf") file which shall be treated as an original signature, and any such signature, facsimile, pdf file or copy of this signed Agreement shall be construed and treated as the original and shall be binding as if it were the original.

23.0 CAPTIONS

23.1 The captions contained in the Contract Documents are for convenience of reference only and shall not be construed to explain, modify, amplify or otherwise aid in the interpretation or construction of the provisions contained therein.

24.0 ENTIRE AGREEMENT

24.1 This Agreement together with the Contract Documents and Work Directive(s) constitutes the entire agreement between COMPANY and CONSULTANT and supersedes any prior written or oral agreements, or contemporaneous communications with respect to this subject matter. No subsequent amendment to this Agreement between the parties shall be binding on either party unless reduced to writing and signed by an authorized representative of each party. Preparation of the Contract Documents has been a joint effort of the parties and the resulting documents shall not be construed more severely against one of the parties than against the other.

IN WITNESS WHEREOF, the parties hereto have executed this Agreement to be effective as of the day and year first above written.

Fax:
Email:

Date:
Work Directive No.:
Agreement No.:
Requisition No:

This Work Directive is entered pursuant to the terms of the Agreement ("Agreement") dated contract effective date, by and between _____("COMPANY") and _____("CONSULTANT"). By its execution hereof, CONSULTANT agrees to perform for the Kinder Morgan ("KM") entity named below and executing this Work Directive pursuant to the terms, conditions and provisions of the Agreement, the following described Work which will additionally describe "Covered Tasks" as provided for under DOT Operator Qualification Requirements, and shall furnish all services, labor, supervision, technical capability, tools, equipment, vehicles, vessels, barges, transportation, materials, (except as set forth below), and other facilities and items necessary or convenient to complete the following work as further described and specified in the Specifications and/or Drawing(s) attached hereto or the Agreement and by this reference made a part of this Work Directive ("the Work"). If CONSULTANT'S proposal, quotation, or any other CONSULTANT document supplied to the KM entity named below is included as part of this Work Directive or another exhibit to the Agreement, then any terms or conditions provided by CONSULTANT which differ from or conflict with COMPANY'S terms and conditions are hereby rejected and shall be of no force or effect. The KM entity named below in this Work Directive shall be solely responsible for the liabilities and obligations set forth in the Agreement under which this Work Directive is being issued, as the same apply to the Work to be performed pursuant hereto. All such liabilities and obligations, as they apply to this Work Directive, shall be non-recourse to the COMPANY (if the COMPANY is not the KM Entity executing this Work Directive) and other related entities as further provided for and agreed in the Agreement. Payments made to CONSULTANT under this Work Directive shall include all taxes and similar charges except as otherwise agreed to herein or under the terms of the Agreement. Any capitalized term used in this Work Directive and not otherwise defined herein shall have the meaning as ascribed in the Agreement.

1. Project Name and Location:

2. Description of Work: Full and complete description of the services (and goods) to be provided by CONSULTANT including, but not limited to specifications, conditions and referenced bids/proposals.

3. The KM entity shall/shall not furnish the following materials to the work site(s):

4. CONSULTANT shall commence the Work by _____, and shall complete the Work on or before _____.

5. CONSULTANT offers to complete the Work in accordance with the Agreement for the following consideration, which shall constitute full and complete payment therefore:
   a. the total Lump Sum Amount, Fixed Price of $_____ **OR**
   a. the total Time & Materials Amount, not to exceed $_____ with rates specified in the Schedule of Values (Exhibit C to the Agreement) **OR**
   a. in accordance with the Schedule of Values (Exhibit C to the Agreement) **OR**
   a. For this Work Directive only, the schedule of values/rate sheet dated _____, 20XX, attached hereto as Exhibit _____, shall supersede the Schedule of Values in the Agreement. All other terms and conditions of Agreement and its prior amendments will remain unchanged and in force.

6. Retainage Fee:

7. CONSULTANT shall submit invoices to: Attn.:
   Phone:
   Fax:
   Invoices must clearly indicate the Agreement Number, Work Directive Number, and Work Order/ Account Coding, as indicated above.
   For Construction Projects, a Certificate of Final Completion must be completed, signed by an authorized

representative, notarized, and attached to CONSULTANT'S final invoice.

8. CONSULTANT hereby certifies that it has downloaded, reviewed and understood the Kinder Morgan Contractor Safety Manual and shall, prior to the commencement of any Work hereunder, make the same available to its employees and subcontractors who will be performing work on premises owned and/or operated by the KM entity named below. If the English language is a communication barrier, CONSULTANT at its expense shall timely convert/translate the Kinder Morgan Contractor Safety Manual accurately into the appropriate language for its employees and subcontractors. Questions concerning the Manual should be directed to the Kinder Morgan Contractor Safety Group at: contractor_safety@kindermorgan.com prior to commencement of any Work.

9. Facsimile Signatures/Counterparts. This Work Directive may be executed in multiple original counterparts, each of which shall be deemed an original, and together they shall constitute one and the same agreement. Signature of this Work Directive may be effected by facsimile (with confirmation by transmitting machine) and/or transmitted by portable document format ("pdf") file which shall be treated as an original signature, and any such signature, facsimile, pdf file or copy of this signed Work Directive shall be construed and treated as the original and shall be binding as if it were the original.

For Work performed within the State of California, CONSULTANT shall certify within three working days of execution hereof that the requirements set forth in Exhibit B to this Work Directive have been satisfied. Failure by CONSULTANT to do so shall constitute a breach under Section [for cause with no notice] of the Agreement.

In the Agreement, if there is a reference to "Kinder Morgan Kansas, Inc.," it shall now be deemed a reference to Kinder Morgan, Inc., a Delaware Corporation. This is not a change of entity, but merely a change of name only.

By signing below, COMPANY and CONSULTANT affirm that the individual signing below has the requisite authority to authorize the commitment described herein, and that this Work Directive No. #_____ is by reference hereby made part of Agreement No.

This Work Directive is hereby agreed to and accepted:

Please return executed Work Directive to:

The following Exhibits shall be provided by COMPANY:

_____ **Exhibit WD_A** - Scope of Work
_____ **Exhibit WD_B** – Revised Release Reporting Criteria (**California only**)
_____ **Exhibit WD_C** – Work Directive Specific Schedule of Values/Rates
_____ **Exhibit WD_D** – Operator Qualification Form (as provided by the Designated Representative either electronically or hardcopy submission) .

CONSULTANT shall include the following documents with its invoices in accordance with Section 6 of the Agreement which are being required based on the Scope of Work. These documents are located in the Agreement Exhibits.

_____ Certificate of Final Completion
_____ Conditional Waiver and Release
_____ Unconditional Waiver and Release

EXHIBIT B - SCHEDULE OF VALUES

1.0 OVERVIEW.

1.1 The amounts set forth in the Agreement cover payment in full for all materials, work, tools, equipment, insurance, bonds, profit, overhead and all other costs and expenses of every kind, character and nature for which the CONSULTANT is entitled to payment. Unless specifically set forth in the Agreement, no additional payment of any kind will be contemplated. Unless otherwise agreed in writing by COMPANY and CONSULTANT, the rates set forth in this Exhibit constitute all of CONSULTANT'S rates applicable to the Work (except those which may be added with COMPANY'S approval). Modification of any pricing terms for Labor, Equipment and/or Material rates shall be in effect only upon the concurrence of both COMPANY and CONSULTANT, and any such modification shall be evidenced by amendment to this Exhibit. If a Work Directive or Change Order includes rates which are different from those in this Exhibit, said Work Directive/Change Order rates shall apply only to that Work Directive/Change Order, and only after COMPANY and CONSULTANT have approved said rates in writing prior to Work Directive/Change Order issuance.

1.2 COMPANY (throughout this Schedule "KM Entity" or "COMPANY", as the case may be) agrees to pay CONSULTANT for Work performed pursuant to this Agreement on a LUMP SUM, UNIT PRICE or TIME and MATERIAL basis in accordance with the labor, material and equipment rates in this Exhibit or as defined in each Work Directive release, or as mutually agreed in writing where a Work Directive is not issued under Section 3.1 of the Agreement and per the Schedule of Allowable Costs.

2.0 INVOICE PROCEDURE

2.1 Standard Invoice Procedure

2.1.1 CONSULTANT shall submit a detailed invoice for Work performed including all supporting documentation for the invoice period set forth in each Work Directive. CONSULTANT shall submit a Microsoft Excel spreadsheet containing Electronic Invoice Information (EII) as per format set forth in this Exhibit-Appendix A. Where no invoice period is stated, invoices shall be sent to COMPANY at the end of each month. Such invoices and EII will be addressed and sent by email, fax, or mail per the instructions on the Work Directive.

2.1.2 Any invoices that do not relate to this Agreement will not be accepted or processed by COMPANY.

2.1.3 Charges invoiced but not specifically provided for in the Agreement, Work Directive or Change Order requires prior WRITTEN approval BY COMPANY. ALL charges invoiced WITHOUT prior approval in writing from the COMPANY will not be accepted by COMPANY. ALL charges not in compliance with the stated terms and conditions of the Contract Documents, including this Exhibit, will be disputed and deducted from the invoice prior to payment processing.

2.2 Required Invoice Detail

2.2.1 Each invoice shall state the following information on its face:

2.2.1.1 Agreement Number, Work Directive Number and Change Order Number (as applicable).

2.2.1.2 Invoice date.

2.2.1.3 Reference number (invoice number) which is unique to the transaction.

2.2.1.4 Site or project name (if applicable) and COMPANY or KM Entity name on Work Directive.

2.2.1.5 Name of COMPANY'S Designated Representative.

2.2.1.6 Billing Invoice period (time period of charges).

2.2.1.7 CONSULTANT'S entity name and remittance address or electronic funds transfer routing information (as applicable). This information must match information as submitted to COMPANY'S Vendor Maintenance department.

2.2.1.8 Name and telephone number of CONSULTANT'S contact to handle invoice related questions.

2.2.1.9 Amount due CONSULTANT.

2.2.1.10 Project Status Report (if applicable).

2.2.1.11 Summary of amount invoiced to date, current invoiced amount, retention (as applicable), the amount remaining to be invoiced and the percentage of budgeted cost for the applicable milestone already expended (including current invoice) (if applicable).

2.3 Supporting Documentation

2.3.1 Each invoice shall be itemized and submitted to COMPANY together with receipts, time records, lien waivers, evidence of payment to subcontractors, vouchers showing payments for itemized material and labor, and any other evidence of CONSULTANT'S right to payment under this Agreement as COMPANY may, in its sole good faith discretion, from time to time require.

2.3.2 CONSULTANT shall submit the time records and reimbursable expenses to the Designated Representative (or his or her delegate) on a daily basis for verification/acknowledgement of expenses and time spent on a project when required by the Designated Representative. All supporting documentation must be signed by the Designated Representative (or his or her delegate) prior to invoicing. **This verification/acknowledgement does not constitute COMPANY'S agreement to pay these expenses.**

2.4 Final Invoice

2.4.1 CONSULTANT shall submit its final invoice to COMPANY for the Work no later than sixty (60) days after the project completion date and include the following documents:

2.4.1.1 Unconditional Release of Lien notices executed by CONSULTANT and by each person or entity that furnished any labor, services or materials in connection with the Work for labor, materials or any other claim or potential claim for which COMPANY withheld compensation pursuant to the Agreement have been paid or satisfied in a manner acceptable to COMPANY;

2.4.1.2 A Certificate of Final Completion; and

2.4.1.3 Any other documents required by this Agreement.

3.0 PAYMENT PROCEDURE

3.1 Processing of Approved Invoices. Provided that such invoice meets all of the requirements as explained, COMPANY shall pay all undisputed charges set forth in each invoice, less any retention amount applicable, within 30 days after such invoice is received by COMPANY.

3.2 Processing of Disputed Invoices. If COMPANY, in good faith, disputes and does not approve an item billed, COMPANY shall notify CONSULTANT of the item or portion of an item disputed and withhold payment thereof until settlement of the dispute. Such right of COMPANY to withhold such payments shall be in addition to, and not in any way in lieu of, any other right of COMPANY hereunder, including the right to raise disputes for the first time after audit. Payment shall be contingent upon COMPANY'S review of the Invoice and determination that the Work described in the invoice complies with all of the terms of this Agreement. Interest penalties for disputed invoices will not be paid by COMPANY.

3.3 Delayed submittal of Invoices and Non-payment. Any Work for which CONSULTANT does not submit an invoice to COMPANY within sixty (60) days after the month in which such Work is completed shall be deemed to have been performed by CONSULTANT without compensation; provided however, that if prior to the end of such sixty (60) day period, CONSULTANT requests in writing from COMPANY'S Designated Representative an extension of time for submitting such invoice (stating the reasons therefore and the amount of additional time requested). If COMPANY elects to authorize such extension in writing, CONSULTANT shall have until the end of the extension to submit such invoice, and provided further, that nothing in this Agreement shall affect CONSULTANT'S right to submit invoices within a longer period of time if so afforded by applicable statute.

4.0 LABOR RATES

(Attached in this Exhibit as Table 1 **OR** See Work Directive)

4.1 The Labor Rate Schedule shall list the following: (1) Description/Category/Classification, (2) Rate, and (3) Unit of Measure.

4.2 Labor Rates may also apply to any Extra Work and to lump sum Work Directives, when requested by COMPANY, upon execution of a written Change Order which shall modify that Work Directive.

4.3 It is further stipulated and agreed that the rates in this Exhibit are firm and not subject to escalation for one (1) calendar year after the Effective Date of the Agreement. Modification of any pricing terms thereafter shall be in effect only upon the concurrence of both COMPANY and CONSULTANT, and any such modification shall be evidenced by amendment replacing this Exhibit. All Work related to a particular Work Directive will be invoiced at the rates in effect on this Exhibit at the time the Work is requested by COMPANY unless rates are attached to the Work Directive.

5.0 MATERIAL RATES

(Attached in this Exhibit as Table 2 **OR** See Work Directive)

6.0 EQUIPMENT RATES

(Attached in this Exhibit as Table 3 **OR** See Work Directive)

6.1 The Equipment Rate Schedule shall list the following: (1) Description/Category/Classification, (2) Rate, and (3) Unit of Measure.

6.2 Equipment Rates will also apply to any Extra Work and to lump sum Work Directives, when requested by COMPANY, upon execution of a written Change Order which shall modify that Work Directive.

SCHEDULE OF ALLOWABLE COSTS

Cost/Charge	Description
Labor Rates	- Only labor titles listed in the Labor Rates in this Exhibit are reimbursable. If CONSULTANT desires to add labor titles to a particular Work Directive (or Contract), then such titles may be added to that Work Directive with the written approval of COMPANY by an executed Change Order (or Amendment). - Labor Rates shall be inclusive of, but not be limited to, statutory and non-statutory burdens such as taxes, vacation, legislated statutory deductions and contributions (Medicare, FUTA, FICA, Workers Compensation, and State Unemployment), payroll benefits, bonus programs, welfare benefits, and office overhead costs directly and indirectly related to the execution of the Work at CONTRACTOR'S actual cost. Office overhead costs shall include all the costs of operating and otherwise maintaining the CONTRACTOR'S home/head office organization such as office costs, utilities, accounting, payroll, insurance, procurement, human resources, telephone, fax, computer, copying, mail and courier services, and CONTRACTOR'S fee or profit. - Labor Rates shall be inclusive of all tools having an individual cost of $1500 or less, including, but not limited to: disposable parts, software, expendables, consumables, personal protective clothing and safety items required for the performance of the Work. - Labor Rates do not include costs for travel, subsistence, reproduction, subcontracts, freight, etc. (discussed in detail below)
Overtime & Double Time	- "Overtime" is defined as work exceeding 40 hours per calendar week (Monday through Sunday) when working on a weekly basis under a specific Work Directive (or exceeding 8 hours per day when required by state law). Overtime shall be paid by CONSULTANT to its employees consistent with applicable state wage and hour laws. - CONSULTANT'S employee(s) hours worked on project(s) other than the project specifically referred to under any given Work Directive will not be credited hours for the purpose of overtime. - CONSULTANT shall minimize the amount of Overtime and provide a work plan detailing the number of overtime hours expected when required by COMPANY'S Designated Representative. COMPANY will not pay for Overtime for additional hours resulting from CONSULTANT staffing issues. - COMPANY will pay Overtime for emergency call-outs during nights and weekends. - COMPANY will pay Overtime at the "Overtime" rates shown in the Schedule of Values (Table 1) or Work Directive, or at a factor of 1.3 times the straight time or flat rate, if applicable, multiplied by the number of hours worked. Overtime shall be charged to COMPANY only for time spent in performance of the Work in excess of 40 hours/week. - Overtime will be charged as straight time by exempt personnel. Overtime by non-exempt personnel (classifications identified with an asterisk "*" in Table 1) will be charged at 1.3 times the above hourly rates. Classifications and straight time, overtime and double time rates not set forth in this Exhibit shall be approved in advance by COMPANY'S Designated Representative and Contract Administrator listed in the Agreement. - "Double Time" is defined as work on Sundays (if Sunday is not part of the 40 hour work week for performance of the Work) or on COMPANY'S observed holidays. - Double Time shall be paid at the rates shown in the Schedule of Values, or at a factor of 1.7 times the Straight-Time or flat rate, if applicable, multiplied by the number of hours worked. - Double-Time will be charged as straight time by exempt personnel. Double Time by non-exempt personnel classifications identified with an asterisk "*" will be paid a factor of 1.7 times the Straight-Time rate listed herein multiplied by the number of hours worked.
Shift Rates	- Shift Rates. CONSULTANT agrees not to charge Company shift differential for swing (evening) or graveyard (night) shifts.
Labor: Stand-by Time	- Stand-By Time. CONSULTANT'S employee(s) put on stand-by time, through no fault of CONSULTANT, shall be paid for actual hours on stand-by. Stand-by time hours will be credited for the purpose of overtime. Stand-by time hours may not exceed 8 hours per day, 40 hours per week. Standby time shall be coded separately from actual time worked.
Subcontractors	- Reimbursement for Subcontractors. The actual net cost to the CONSULTANT of all subcontracted labor (covering work performed for the CONSULTANT with the COMPANY'S Designated Representative's prior written approval) is plus 7% - Any subcontract that includes work for duties that are, or are similar to work that could be, performed by CONSULTANT cannot be billed at a rate higher than CONTACTOR'S Labor Rates. Any exception must be approved in writing by the COMPANY'S Designated Representative. - COMPANY will not pay markups on work subcontracted to partially owned or wholly owned

Cost/Charge	Description
	companies / subsidiaries of CONSULTANT.
Holidays & Vacations	- COMPANY will not pay for COMPANY and/or CONSULTANT holidays without prior written approval of COMPANY. Vacations are not allowable charges and should not be billed.
Personal Owned Vehicle	- COMPANY will pay miles per IRS allowance per vehicle only. If CONSULTANT is charging for a personal owned vehicle, personal mileage is not allowed. - COMPANY will pay Mileage Reimbursement for Mobilization and Demobilization only no more than the current IRS allowable per mile, per vehicle. COMPANY will compensate only per vehicle and not per man within the vehicle. - CONSULTANT shall provide an accurate log indicating vehicle VIN #, start and finish locations, total miles traveled and purpose of trip along with a Google (or other electronic system) map printout showing start and end locations. Only business related mileage may be reimbursed. - Mileage includes fuel, maintenance, and insurance. Fuel and insurance charges should not be submitted for reimbursement.
Contractor-Owned Vehicles	- COMPANY will pay CONSULTANT owned vehicles at a set day, week or monthly rate determined in this Exhibit or per the Work Directive. In the absence of a day, week, or monthly rate, COMPANY will pay miles per IRS allowance per vehicle only. - CONSULTANT shall provide an accurate log indicating vehicle VIN #, start and finish locations, total miles traveled and purpose of trip along with a Google (or other electronic system) map printout showing start and end locations. Only business related mileage may be reimbursed. - Mileage includes fuel, maintenance, and insurance. Fuel, maintenance, and insurance charges should not be submitted for reimbursement.
Rental Vehicles	- Rental cars should be insured by the CONSULTANT'S automobile insurance. - Rental vehicles should be returned with the same amount of fuel in the tank as when they were checked out, therefore, the Fuel Option should be rejected. COMPANY will pay for required fuel purchased at a gas station only. Charges for the Fuel Option and Rental Car Insurance are not reimbursable. - Mileage Reimbursement does not apply to rental vehicles. Rental vehicle agreements should include unlimited mileage. COMPANY will not reimburse for rental vehicles where the agreements did not stipulate unlimited mileage and the rental agency charged on a per mile basis.
Travel Time	- All travel time requires authorization prior to its incurrence by an individual and, if approved, all travel time requires a separate disclosure on the invoice from worked hours. - COMPANY will pay travel time at the standard hourly rate. Travel time is not included in Overtime calculations. - Travel time shall not include travel time to/from the individual's home and the worksite unless specifically agreed by COMPANY and CONSULTANT and noted on the applicable Work Directive. - COMPANY will pay first and last day of travel at 75% of the GSA-Domestic Per Diem M&IE Rates. (www.gsa.gov/perdiem)
Travel Expenses	- COMPANY will pay CONSULTANT, without markup, for the direct, reasonable cost to CONSULTANT for employee travel expenses away from the project site or employee's base office when this travel occurs as a direct result of the performance of the Work. Travel expenses include air (excluding first class or business airfare, upgrades, and change fees), ground transportation, parking and medium size car rental. - All travel expenses must have prior COMPANY approval and shall be supported by valid receipts.
Per Diem	- COMPANY will pay per diem rates in accordance with published GSA-Domestic Per Diem Rates at time of travel. - Costs not included in MIE (meals and incidental expenses) must be business related, proper and reasonable, pre-approved by Project Manager, and substantiated by receipts. (www.gsa.gov/perdiem)
Safety Equipment	- Safety items are included in Labor Rates. CONSULTANT is responsible at its expense for keeping all of its personnel adequately attired in personal protective clothing and equipment such as hard hats, steel toed work footwear, gloves (where applicable), safety glasses and all fire protective clothing where required snake leggings, and H2S monitors to protect CONSULTANT from injury on the job site. CONSULTANT shall evaluate the situation daily and determine what equipment is necessary for the performance of the Scope of Work. See COMPANY'S Contractor Safety Manual, as updated.
	- Equipment required to perform the Work and not available from CONSULTANT or

Cost/Charge	Description
Equipment Rates/ Standby & Fuel Charges	Subcontractors shall be rented, subject to COMPANY'S approval. The rented equipment will be reimbursed at actual cost (less all discounts and credits) to CONSULTANT as substantiated by paid invoices. - Equipment rates (Table 3) shall include servicing, fuel, lubricants and maintenance. - COMPANY will pay for rates only for the period that equipment is working (with operator) at the work site as authorized by COMPANY's Designated Representative, excepting down-time for repairs and/or servicing which shall not be charged. - Equipment not listed in the Equipment Rates list must be pre-approved by Designated Representative and substantiated before reimbursement is made. - CONSULTANT shall not charge Equipment Standby time unless COMPANY's Designated Representative specifically requests in writing or email that CONSULTANT keep equipment on site on a standby basis. - Compensation shall apply only to on-site equipment utilized by CONSULTANT when performing the Work. The rate payable for any equipment shall be determined according to the length of time during which such equipment is used in connection with the Work, having regard to the most economical rate available for such equipment for the period of time it is required for the Work. The rate payable may be a combination of hourly, weekly or monthly rates. - A Calendar Day shall be any consecutive twenty-four (24) hour period at the COMPANY'S discretion. A Calendar Week shall be any consecutive seven (7) day period at the COMPANY'S discretion. A Calendar Month shall be any consecutive period extending for the number of days in the month that the Lease/Rental begins.
Fuel Surcharges	- COMPANY will not pay for Fuel Surcharges.
Materials	- COMPANY will pay CONSULTANT for materials purchased at wholesale or jobber's actual cost. Materials purchased must be pre-authorized by Designated Representative.
Mobile Phones	- Mobile phones are not reimbursable.
Reproduction Rates	- Reproduction rates for in-house reprographic services are included in the labor rates unless specifically pre-approved in writing by COMPANY's Designated Representative.
Computer Equipment	- Computer equipment and laptops are included in the labor rates.
Software & License Fees	- Software and license fees for standard software provided by CONSULTANT such as Windows OS, MS Office, Internet Explorer, Adobe Acrobat Reader, anti-virus, FAX and WinZip are included in the labor rates.
Charges Not Stated in Contract	- Non-consumable supplies are deemed to be included in CONSULTANT'S overhead and are considered non-reimbursable (e.g., radios, cameras, hole-punches, compasses, and other similar items). - Company will not pay for charges not specifically stated in the contract such as executive and clerical salaries; office rent; mortgage payments; warehouse rent; depreciation; property taxes; insurance; utilities and telephone expenses; professional and trade licenses and fees; employee recruitment; relocation; training and education; photocopying; data processing; office supplies; postage; books and periodicals; miscellaneous general and administrative expenses; advertising expenses; interest on borrowing and other financial costs; entertainment expenses; contributions and donations; bad debts; losses on other contracts; equipment storage and upkeep (if not specifically required and COMPANY-approved for individual jobs); and bid and proposal costs unless specifically pre-approved in writing by COMPANY's Designated Representative. Any of these charges, once approved, must be substantiated for reimbursement.

Table 1 Labor Rates - CONSULTANT Effective From 4/3/2012 To 1/1/2015			
Description/Category/Classification	Straight Time (Rate Per Hour) (US $0.00)	Overtime (Rate Per Hour) (US $0.00)	Double Time (Rate Per Hour) (US $0.00)
Haz Mat Supervisor	$78.75	$104.97	$131.22
Haz Mat Foreman	$63.00	$89.98	$104.97
Haz Mat Technician	$52.50	$69.98	$87.48
Equipment Operator/Driver	$68.25	$91.46	$121.64
Subsistence	$100.00 -per day

TPH-Oil (Solid)	$262.50	Each- 24 Hour Turnaround
Chlor-D-Tect Kit	$25.99	Each
Disposal Rates to be Determined		

EXHIBIT C – DRUG & ALCOHOL/OPERATOR QUALIFICATION PROGRAM REQUIREMENTS

CONSULTANT shall comply with requirements for both DOT Drug and Alcohol and Operator Qualification Requirements Programs, as follows:

1 DOT DRUG AND ALCOHOL PROGRAM

CONSULTANT represents and warrants that it has established, maintains, and enforces a drug and alcohol policy.

1.1 Compliance with DOT Anti-Drug and Alcohol Misuse Regulations.

COMPANY, under 49 CFR Parts 199 and 40, is required by law to ensure compliance with the pipeline safety regulations for drug and alcohol testing applicable to its CONSULTANTS', subcontractors and their agents, performing operations, maintenance, or emergency response functions on a pipeline or LNG facility subject to Parts 191, 192, 193 and 195 of Title 49 of the Code of Federal Regulations or any other provision or Part thereof (or any successor thereof) covering the type of work CONSULTANT may perform pursuant to this Agreement as follows:

1.1.1 CONSULTANT agrees that CONSULTANT, its subcontractors, and their agents will abide by a DOT anti-drug plan and alcohol Misuse Program which applies to all employees of CONSULTANT, its subcontractors, and agents if performing an operations, maintenance or emergency response function on COMPANY'S facilities.

1.1.2 CONSULTANT agrees that CONSULTANT, its subcontractors and their agents shall provide to their respective employees an Anti-drug Plan and Alcohol Misuse Program, the drug and alcohol testing, education, and training required by Title 49 Parts 199 and 40 of the Code of Federal Regulations. Prior to and during the performance of any work hereunder, CONSULTANT shall have in place and shall implement a drug testing program meeting the requirements imposed by the regulations of the Code of Federal Regulations.

1.1.3 CONSULTANT agrees that CONSULTANT, its subcontractors, and their agents, are in compliance with the drug and alcohol testing regulations at 49 CFR Parts 199 and 40 and the Motor Carrier Regulations at 49 CFR Parts 391 and 394, if applicable.

1.1.4 CONSULTANT agrees that CONSULTANT, its subcontractors, and their agents shall allow COMPANY, the administrator and/or representative of a state agency (as defined in 49 CFR Part 199) access to property and records for the purpose of monitoring compliance with the requirements of the Research and Special Programs Administration for drug and alcohol testing at 49 CFR Part 199. This access shall occur periodically, and without prior notice to allow COMPANY, the administrator and/or representative of a state agency to audit CONSULTANT, its subcontractors, and their agents' Anti-drug Plan and Alcohol Misuse Program, the required drug and alcohol testing and results thereof.

1.1.5 COMPANY requires that CONSULTANT'S written Drug Testing Program be approved in writing by COMPANY'S Policy and Compliance Department or its third party designee prior to start of work hereunder. Thereafter, COMPANY reserves the unqualified right to audit the said program at any time, or to ask its third party designee to do likewise, during the performance of work hereunder. In the event that COMPANY, at its sole discretion believes that the said program no longer meets the applicable law and/or regulatory statutes recited in this Policy and its subsections, then COMPANY may suspend work until such time as CONSULTANT restores the said program to full compliance. Any costs incurred by COMPANY because of such suspension, shall be borne by CONSULTANT.

1.1.6 COMPANY, to the extent required by applicable laws or regulations, will monitor the CONSULTANT'S compliance with these regulations and from time to time require

certificates regarding compliance with such testing requirements to be provided by CONSULTANT from CONSULTANT'S testing agency. CONSULTANT will allow access to its property and records by COMPANY or by any authorized state agency (or its representative) having jurisdiction over COMPANY or its facilities, for the purpose of monitoring COMPANY'S compliance with governmental laws, rules or regulations.

2 OPERATOR QUALIFICATION PROGRAM

CONSULTANT represents and warrants that it has established, maintains and enforces an Operator Qualification (OQ) program.

2.1 Compliance with DOT OQ Regulations

COMPANY under 49 CFR Parts 192 and 195 is required by law to ensure compliance with the pipeline safety regulations for OQ applicable to its CONSULTANTS, its subcontractors and their agents who perform specific OQ covered tasks during operations and maintenance work on hazardous liquids (including CO2) or natural gas pipelines or facilities subject to Parts 192 or 195 of Title 49 of the Code of Federal Regulations as follows:

2.1.1 CONSULTANT agrees that CONSULTANT, its subcontractors and their agents shall review and comply with COMPANY'S OQ Program. CONSULTANT agrees that CONSULTANT, its subcontractors and their agents will also review the list of OQ-covered tasks and identify any and all OQ-covered tasks that they would perform for COMPANY (OQ Program and list of covered tasks attached).

2.1.2 CONSULTANT agrees that CONSULTANT, its subcontractors and their agents will be qualified under a COMPANY approved evaluation program which applies to all employees of CONSULTANT, its subcontractors and their agents who perform specific OQ-covered tasks during operations and maintenance work.

2.1.3 CONSULTANT agrees that proper and approved documentation will be kept by CONSULTANT or their agents to verify the OQ evaluations and that CONSULTANT will provide for COMPANY'S access to this documentation as necessary for verification. CONSULTANT will keep documentation in ISNetworld unless instructed by COMPANY.

2.1.4 CONSULTANT agrees that CONSULTANT, its subcontractors and their agents shall allow COMPANY'S representative and/or the representative of a local, State or Federal agency access to property and records for the purpose of monitoring compliance with the requirements of the OQ regulation. This access shall occur periodically and without prior notice.

2.1.5 CONSULTANT personnel who do not have proper and documented OQ qualifications will not be allowed to perform specific OQ-covered tasks during operations and maintenance work on hazardous liquids (including CO2) or natural gas pipelines or facilities subject to Parts 192 or 195 of Title 49 of the Code of Federal Regulations, unless those non-OQ qualified personnel are supervised by an OQ-qualified individual, as described in COMPANY'S OQ Program.

2.1.6 CONSULTANT agrees to provide OQ-related information on its personnel when requested by COMPANY. Typically, this will be requested by COMPANY Project Management or Operations Designated Representatives during the bidding process or if the work is not bid, when the work is assigned to CONSULTANT.

2.1.7 CONSULTANT agrees to review the work it is being asked to perform and identify any OQ-covered tasks being performed which were not identified as OQ-covered tasks by COMPANY'S Project Management personnel, and notify COMPANY'S Project Management

personnel of the discrepancy prior to commencement of the work.

Detailed information on COMPANY'S DOT and Operator Qualification program requirements are located on the Internet at:

DOT Drug and Alcohol Compliance:
http://www.kindermorgan.com/work/contractor_co/dot_drug_alcohol_req.cfm

Operator Qualification Program:
http://www.kindermorgan.com/work/contractor_co/dot_operator_qual.cfm

IMPORTANT NOTICE

To Contractors Of Kinder Morgan And/Or Its Affiliates ("KM")

Department of Transportation Regulations
For
Anti-Drug and Alcohol Misuse Plans

The Department of Transportation ("DOT") continues to report drug/alcohol testing compliance problems with contractors who perform DOT-covered work for pipeline operators. In response to these compliance problems, DOT promises to step-up their enforcement of the regulations contained in 49 CFR Parts 199 and 40. DOT places the responsibility upon the pipeline operators such as KM, to see that contractors and contractor employees performing DOT-covered work are in compliance with the drug testing regulations. Given what we know about DOT drug/alcohol testing plans and contractor monitoring, it is possible many existing contractor's drug plans do not meets the standards required by these regulations. In addition, new alcohol regulations became effective January 1, 1995, for the Pipeline and Hazardous Materials Safety Administration and the Federal Motor Carrier Safety Administration. Consequently, reasonable measures must be undertaken to safeguard against civil penalties from DOT.

Effective January 1996, COMPANY contracted with National Compliance Management Service, Inc., (NCMS) to act as its agent for monitoring contractor DOT anti-drug and alcohol misuse prevention plans and to obtain contractor drug/alcohol testing data. NCMS is authorized by KM to request anti-drug and alcohol misuse plans and statistical data and other documentation from contractors who plan to perform an operating, maintenance or emergency response function on KM covered facilities.

Contractor can access COMPANY'S website for further information and contacts for the NCMS at:

http://www.kindermorgan.com/work/contractor_co/dot_drug_alcohol_req.cfm

Contractor can call NCMS directly or access the required documentation through the National Compliance Management Services website. This information is available under forms: http://www.nationalcompliance.com/forms.htm, selecting the PHMSA Contractor Packet at the bottom of the page. Detailed instructions and information are provided to facilitate completion of the package. The completed package should be then submitted via email to: dot@nationalcompliance.com

If email is not available, contact NCMS as follows:

National Compliance Management Service
(Kinder Morgan Audit)
7 Compound Drive
Hutchinson, KS 67502
Phone: (620) 669-0954 Fax: (620) 669-8430

Only contractors with approved drug/alcohol testing programs will be allowed to perform DOT-covered tasks for KM. If you should have any question pertaining to this matter or require additional information, for general information please contact: Director, Compliance HR. For those Contractors registered in ISNetworld, information is downloaded from NCMS to ISNetworld contractor dashboard.

EXHIBIT D - CERTIFICATE OF FINAL COMPLETION

The State of:
County of:
Date:

To: **[Insert Name and Address of KM Entity executing the applicable Work Directive]**

Re: Work Directive date , 20 (the "Work Directive") by and between WD Entity Name ("KM") and ("CONSULTANT") under that certain [Type of Agreement] dated (the "Agreement")

CONSULTANT, by and through the undersigned officer, duly authorized to represent CONSULTANT and execute and deliver this certificate (the "Certificate") to KM, provides this Certificate to KM under the Agreement and the Work Directive. Capitalized terms used herein not otherwise defined shall have the meaning given such terms in the Agreement (except as may be expressly modified by the terms of the Work Directive). CONSULTANT hereby certifies to KM as of the date hereof that the following are true and correct:

1. The Work under the Work Directive has been completed in accordance with the terms of the Contract Documents;

2. CONSULTANT has met all its obligations under the terms of the Contract Documents, other than warranty obligations and any other obligations that expressly survive the termination thereunder;

3. All amounts that were due and payable by KM in connection with the Work have been paid;

4. All federal and state unemployment and old age benefit taxes have been paid, or will be paid when due; all valid state sales and use taxes properly levied on materials, equipment, supplies and services furnished by CONSULTANT have been paid; all federal and state income taxes required by law to be withheld from employees or others have been withheld and remitted to the proper taxing authority, or will be remitted when due;

5. All premiums for insurance requirements under the Contract Documents have been paid;

6. All claims for damages of any nature arising from the fulfillment of the Contract Documents and for which CONSULTANT is responsible pursuant thereto have been paid, and payment has been made by CONSULTANT in full for all claims for damages for which CONSULTANT is required under the Contract Documents to indemnify KM, its general partner (if any) and its affiliated companies; and

7. Any other items payable by CONSULTANT under the Contract Documents have been paid in full.

8. A Conditional Lien Waiver is attached to this Certificate of Final Completion, and within two weeks of COMPANY'S execution of this Certificate which shall be accompanied by COMPANY'S final payment to CONTRACTOR in respect of the Work covered hereby CONTRACTOR shall return to COMPANY an executed and notarized Unconditional Waiver and Release in the form prescribed by the Agreement.

CONSULTANT agrees to (i) indemnify and hold harmless KM, its parent, general partner (if any), affiliated and subsidiary companies and entities from any claims, damages, fines or penalties, or expenses arising from CONSULTANT'S failure to perform or fulfill any of the acts or obligations referred to above; and (ii) to comply with those terms and conditions contained in the Contract Documents which survive expiration of the applicable Work Directive and/or the Agreement.

CONSULTANT'S EXECUTION OF THIS CERTIFICATE SHALL CONSTITUTE A WAIVER BY IT OF ALL CLAIMS AGAINST KM RELATED TO OR ARISING OUT OF THE APPLICABLE WORK DIRECTIVE (EXCEPT FOR FINAL PAYMENT BY KM, IF IT HAS NOT ALREADY BEEN MADE); PROVIDED, HOWEVER, THAT CONSULTANT (NOR ITS SURETY, IF ANY) SHALL NOT BE RELEASED FROM ANY WARRANTY WORK

OR OTHER UNPERFORMED OBLIGATIONS UNDER THE CONTRACT DOCUMENTS.

This Certificate of Final Completion shall be governed by, construed and enforced in accordance with the laws of the State of Texas (without giving effect to the principles thereof relating to conflicts of laws), except with regard to the creation, recordation and discharge of a lien, which shall be governed by the laws of the state in which the Work was performed.

IN WITNESS WHEREOF, CONSULTANT has duly executed and acknowledges this Certificate of Final Completion on the XX day of XXXXXX, 20XX.

EXHIBIT E-1 – FORM OF CONDITIONAL WAIVER AND RELEASE

[LETTERHEAD OF CONTRACTOR]
Date
To: [Name and Address of Company

Contract No. _____
Work Directive No. _____ Date: _____
Description of Project _____
Site: _____

WHEREAS:

[To be inserted] ("KM") and [To be inserted] ("CONSULTANT") have entered into that certain Work Directive dated as of [To be inserted] under that certain [to be inserted] Agreement dated as of (the "Agreement"), pursuant to which CONSULTANT is to provide [To be inserted] services in connection with a located in [(as more fully defined in the Contract, the "Project"). To be inserted] (the "Project") located at [To be inserted] (the "Site").

As a condition precedent of the obligation of KM to make each payment under the Work Directive that CONSULTANT supplies KM with a waiver and release of liens and security interests and waiver of any claims to the extent of such payment and CONSULTANT provides this Conditional Waiver and Release in order to satisfy the aforesaid condition precedent in relation to its invoice no. [to be inserted] dated [to be inserted] (the "Invoice").

NOW THEREFORE:

1. Capitalized terms used and not defined herein shall have the meaning assigned to them in the Agreement (except as may be expressly modified by the terms of the Work Directive).

2. Upon receipt by CONTRACTOR (the signer of this document) of a check or wire payment from COMPANY in the sum of [$ XXX.00], which sum represents the full amount currently due to CONTRACTOR under the Invoice, payable to [payee(s) of the check or wire], and when the check has been properly endorsed and has been paid by the bank on which it is drawn, this document becomes effective to release any mechanic's lien right, any right arising from a payment bond that complies with a state or federal statute, any common law payment bond right, any claim for payment, and any rights under any similar ordinance, rule, or statute related to claim or payment rights for persons in signer's position, that the signer has on the property of located at to the following extent [description of job]

   This release covers a progress payment for all labor, services, equipment or materials furnished to the Jobsite or to (COMPANY) through , 20 , as indicated in the attached statement(s) or progress payment request(s),only except for any unpaid retention, pending modifications and changes or items furnished after that date. Before any recipient of this document relies on it, that person should verify evidence of payment to the undersigned.

3. CONSULTANT (the undersigned) certifies that:

   3.1 All amounts that were due and payable in connection with the Work have been paid by KM as of the date of payment and as of the last advance applicable to CONSULTANT [save in relation to the amounts of (i) [$To be inserted] under Invoice Nos. [To be inserted], which CONSULTANT acknowledges that KM is withholding in accordance with the Agreement and/or Work Directive and (b) [To be inserted], which CONSULTANT acknowledges are subject to dispute with KM.

3.2 CONSULTANT has not directly or indirectly created, incurred, assumed or suffered to be created by it or any subcontractor, employee, laborer, mechanic, materialman or other supplier of goods or services any lien relating to the Work, the Project, the Site or any part thereof or interest therein, except to the extent lien security has been provided by CONSULTANT and accepted by KM in connection therewith; and

3.3 CONSULTANT has promptly paid and discharged any liens which, notwithstanding paragraph 3.2 hereof it has directly or indirectly created or suffered to be created by it or any subcontractor, employee, laborer, mechanic, materialman or other supplier of goods or services relating to the Work, the Project, the Site or any part thereof or interest therein, except to the extent lien security has been provided by CONSULTANT and accepted by KM in connection therewith; and

3.4 Title to all Work is free and clear of any and all liens, claims, charges, security interests, encumbrances and rights of other persons arising as a result of any actions or failure to act of CONSULTANT, its subcontractors, or their employees or representatives except to the extent lien security has been provided by CONSULTANT and accepted by KM in connection therewith.

The undersigned warrants that he either has already paid or will use the monies received from this progress payment to promptly pay in full all of his laborers, subcontractors, materialmen and suppliers for all work, materials, equipment or services provided for or to the above referenced project up to the date of this waiver, in regard to the attached statement(s) or progress payment request(s).

THIS CONDITIONAL WAIVER AND RELEASE SHALL BE GOVERNED BY, CONSTRUED AND ENFORCED IN ACCORDANCE WITH, THE LAWS OF THE STATE OF TEXAS (WITHOUT GIVING EFFECT TO THE PRINCIPLES THEREOF RELATING TO CONFLICTS OF LAWS), EXCEPT WITH REGARD TO THE CREATION, RECORDATION AND DISCHARGE OF A LIEN, WHICH SHALL BE GOVERNED BY LAWS OF THE STATE WHERE THE WORK HAS BEEN PERFORMED.

IN WITNESS WHEREOF, CONSULTANT has duly executed and acknowledges this Conditional Waiver and Release on the day and year first written above.

EXHIBIT E-2 – FORM OF UNCONDITIONAL WAIVER AND RELEASE

THE STATE OF _____ §
§
COUNTY OF _____ §

NOTICE

This document waives rights unconditionally and states that CONSULTANT has been paid for giving up those rights. It is prohibited for a person to require CONSULTANT to sign this document if CONSULTANT has not been paid the payment amount set forth below. If CONSULTANT has not been paid, use a conditional release form.

UNCONDITIONAL WAIVER AND RELEASE ON PROGRESS [FINAL] PAYMENT

Contract No.: _____

Work Directive No: _____ Dated: _____

Description of Project: _____

Site: _____

1.0 The signer of this document has been paid and has received a progress payment in the sum of $[*to be inserted]* for all labor, services, equipment, and materials furnished to date to the property or to [Name of KM Entity] ("KM") on the property of KM located at [location] to the following extent: [brief job description]. The undersigned therefore irrevocably waives and releases any mechanic's lien, right, security interest, any right arising from a payment bond that complies with a state or federal statute, any common law payment bond right, any claim for payment (whether for breach of contract, pursuant to law, or otherwise), and any rights under any similar ordinance, rule, or statute related to claim or payment rights for persons in the undersigned's position that the undersigned has on the above-referenced project to the following extent: up to and including [date of the Release].

2.0 This release covers a progress [or final, as the case may be] payment for all labor, services, equipment, and materials furnished to the property or to KM by the undersigned, as indicated in the attached "Invoice" which includes all relevant statement(s) or progress payment request(s) [Insert the following for all progress payments except final Invoice: except for unpaid retention, pending modifications or changes, Extra Work furnished and not billed, and $ which was billed to [KM entity] and which the undersigned acknowledges is the subject of dispute between the parties; for final invoice: as well as all retainage and other amounts due CONSULTANT in respect of the job covered by the Contract (or Work Directive, as the case may be)].

3.0 The undersigned warrants that the undersigned has already paid or will use the funds received from this progress payment to promptly pay in full all of the undersigned's laborers, subcontractors, materialmen, and suppliers for all work, materials, equipment, or services provided to date in performance of the above-referenced Work Directive, as reflected in the Invoice.

4.0 The undersigned certifies that:

4.1 CONSULTANT has not directly or indirectly created, incurred, assumed or suffered to be created by it or any subcontractor, employee, laborer, mechanic, materialman or other supplier of goods or services any lien relating to the Work, the Project, the Site or any part thereof or interest therein, except to the extent lien security has been provided by CONSULTANT and accepted by KM in connection therewith;

4.2 CONSULTANT has promptly paid and discharged any liens which, notwithstanding paragraph 3.2 hereof it has directly or indirectly created or suffered to be created by it or any subcontractor, employee, laborer, mechanic, materialman or other supplier of goods or services relating to the Work, the Project, the Site or any part thereof or interest therein, except to the extent lien security has been provided by CONSULTANT and accepted by KM in connection therewith; and

4.3 Title to all Work is free and clear of any and all liens, claims, charges, security interests, encumbrances and rights of other persons arising as a result of any actions or failure to act of CONSULTANT, its subcontractors, or their employees or representatives except to the extent lien security has been provided by CONSULTANT and accepted by KM in connection therewith.

5.0 THIS UNCONDITIONAL WAIVER AND RELEASE SHALL BE GOVERNED BY, CONSTRUED AND ENFORCED IN ACCORDANCE WITH, THE LAWS OF THE STATE OF TEXAS (WITHOUT GIVING EFFECT TO THE PRINCIPLES THEREOF RELATING TO CONFLICTS OF LAWS), EXCEPT WITH REGARD TO THE CREATION, RECORDATION AND DISCHARGE OF A LIEN, WHICH SHALL BE GOVERNED BY LAWS OF THE STATE WHERE THE PROJECT IS LOCATED.

6.0 Capitalized terms used and not defined herein shall have the meaning assigned to them in the Agreement (except as may be expressly modified by the terms of the Work Directive).

IN WITNESS WHEREOF, CONSULTANT has duly executed and acknowledges this Unconditional Waiver and Release on the day of , 20_____.

EXHIBIT F - FORM OF CERTIFICATE OF INSURANCE

CONSULTANT is required to submit the text required for a certificate of insurance (as contained in Section 8.0 of the Agreement) directly to its insurance carrier so that evidence of proper insurance coverage may be submitted. Upon receipt from its carrier of the fully executed certificate, CONSULTANT shall forward same to ISNetworld for ISN's review and approval, unless submission shall be to COMPANY, as explained below. If CONSULTANT has been exempted from ISNetworld, CONSULTANT shall submit said certificate of insurance along with its Agreement requirements for review by the Contract Administrator designated in Section 2.3 of the Agreement. Upon acceptance by COMPANY or its designated representative(s), the executed certificate of insurance shall be incorporated into this Exhibit.

4.0 SPILL IMPACT CONSIDERATIONS

4.1 CRITICAL AREAS TO PROTECT

The critical areas to protect are classified as high, moderate, and low sensitivity to oil. The Federal, state, and local authorities will further clarify these categories at the time of the response. The categories are defined as follows:

HIGH SENSITIVITY

- Areas which are high in productivity, abundant in many species, extremely sensitive, difficult to rehabilitate, or inhabited by threatened/endangered species.
- Areas which consist of vegetated low banks, freshwater/saltwater marshes, swamps, scrub-shrub wetlands and impact to threatened/endangered species.

MODERATE SENSITIVITY

- Areas of moderate productivity, somewhat resistant to the effects of oiling.
- Areas which consist of mixed sand, gravel beaches, bars, gently sloping banks, and no impact to threatened/endangered species.

LOW SENSITIVITY

- Areas of low productivity, man-made structures, and/or high energy.
- Areas which consist of gravel, sand, or clay material, barren/rocky shores or banks, man-made structures, concrete/compacted earthen drainage ditches and no impact to threatened/endangered species.

4.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES

Environmental/socio-economic sensitivities are of extreme importance when planning a response effort. The health and safety of the public and the environment, as well as the protection of the various socio-economic sensitivities, must be promptly addressed in order to mitigate the extent of damage and minimize the cost of the clean-up effort.

To determine adequate response resources, the Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three (3) tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. The tier requirements for high volume areas are for response in six (6) hours (Tier 1), 30 hours (Tier 2), and 54 hours (Tier 3). High volume areas are listed in 49 CFR 194. The tier requirements for all other areas are for response in 12 hours (Tier 1), 36 hours (Tier 2), and 60 hours (Tier 3).

4.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES (Cont'd)

All environmental/socio-economic sensitivities are worthy of protection, but must be prioritized during a response effort. When making decisions on which areas to designate as collection areas and which to protect, the following sources may be consulted:

- U.S. Fish and Wildlife Service and related state agencies
- Applicable Area Contingency Plans (see CD affixed to inside front cover of Volume 1 and the CD Navigation Summary in Figure 4.2)
- Other industry and private experts

The environmental and socio-economic sensitivities in the area have been broken down into specific categories and identified in this section.

4.3 WILDLIFE PROTECTION AND REHABILITATION

The Company will work with Federal, State, and local agency personnel to provide labor and transportation to retrieve, clean, and rehabilitate birds and wildlife affected by an oil spill, as necessary. Oversight of the Company's wildlife preservation activities and coordination with Federal, State, and local agencies during an oil spill is the responsibility of the Incident Commander.

Special consideration should be given to the protection and rehabilitation of endangered species and other wildlife and their habitat in the event of an oil spill and subsequent response. Jurisdictional authorities should be notified and worked with closely on all response/clean-up actions related to wildlife protection and rehabilitation. Laws with significant penalties are in place to ensure appropriate protection of these species.

4.3.1 Endangered/Threatened Species

The U.S. Fish and Wildlife Service (USFWS) and related state agencies classify the status of various wildlife species in the potentially effected states. A summary of critical birds, reptiles, mammals, and plant species status as related to the Facility's operating areas (area of highest oil spill potential) is presented in Figure 4.1.

4.3.2 Wildlife Rescue

The Company will work with Federal, State, and local agency personnel to provide labor and transportation to retrieve, clean, and rehabilitate wildlife affected by an oil spill, as the situation demands.

4.3 WILDLIFE PROTECTION AND REHABILITATION (Cont'd)

4.3.2 Wildlife Rescue (Cont'd)

The following are items which should be considered for wildlife rescue and rehabilitation during a spill response:

- Bird relocation can be accomplished using a variety of deterrents, encouraging birds to avoid areas of spilled oil. Bird relocation can be accomplished by utilizing deterrent methods including:
  - Use of visual stimuli, such as inflatable bodies, owls, stationary figures, or helium balloons, etc.
  - Use of auditory stimuli, such as propane cannons, recorded sounds, or shell crackers.
  - Use of herding with aircraft, boats, vehicles, or people (as appropriate).
  - Use of capture and relocation.

4.3.3 Search and Rescue - Points to Consider

- **The Company's involvement should be limited to offering assistance as needed or requested by the agencies.**
- Prior to initiating any organized search and rescue plan, **authorization must be obtained from the appropriate federal/state agency.**
- **Initial search and rescue efforts, if needed, should be left up to the appropriate agencies.** They have the personnel, equipment, and training to immediately begin capturing contaminated wildlife.
- With or without authorization it must be anticipated that volunteer citizens will aid distressed/contaminated wildlife on their own. It is important to communicate that it may be illegal to handle wildlife without express authority from appropriate agencies. Provisions should be made to support an appropriate rehabilitator, however, **no support should be given to any unauthorized volunteer rescue efforts.**
- The regulatory agencies and response personnel should be provided the name and location of a qualified rehabilitator in the event contaminated wildlife is captured.
- Resources and contacts that can assist with wildlife rescue and rehabilitation are provided in Section 2.0. This list includes:
  - Outside rehabilitation organizations
  - Local regulatory agencies
  - Other resources

4.4 STAGING AREAS

When establishing personnel and equipment staging areas for a response to a Facility discharge, the following criteria should be evaluated:

- Access to waterborne equipment launching facilities and/or land equipment.
- Access to open space for staging/deployment of heavy equipment and personnel.
- Access to public services utilities (electricity, potable water, public phone, restroom and washroom facilities, etc.)
- Access to the environmental and socio-economically sensitive areas which are projected for impact.

4.5 TRAJECTORY ANALYSIS

Oil spilled on water will react primarily to the effects of wind and current. The oil will tend to spread to a thin layer under the influence of gravity (primary) and chemical (secondary) forces. The following describes the behavior of oil on water:

- Oil will move in the direction and at the rate of the current under negligible wind conditions.
- Oil will move in the direction and at approximately 3.4 % of the velocity of the wind under negligible current conditions.
- The combined effects of wind and current on the oil should be carefully analyzed. A method of vector analysis can be performed to determine the net direction of movement (wind forces can work in addition to, against, or in many other combinations with the current).
- The primary method of surveillance for the Facility will be visual. Visual surveillance is not effective however in rain, fog, darkness, or heavy cloud cover. It is difficult to observe a slick on the water from a boat, dock or land due to the angle of observation. Aerial surveillance is the preferred method of visual surveillance because of the elevated view and the ability to cover a large area in a short period.

FIGURE 4.1

ENDANGERED SPECIES LISTING

The following is a list of endangered and threatened species with known or possible occurrence in the State of California by county (listed alphabetically by the scientific name).

ANIMALS	
Common Name	**Scientific Name**
Fresno County	
Plover, Mountain	Charadrius Montanus
Beetle, Valley Elderberry Longhorn	Desmocerus Californicus Dimorphus
Kangaroo Ray, Giant	Dipodomys Ingens
Kangaroo Rat, Fresno	Dipodomys Nitratoides Exilis
Lizard, Blunt-Nosed Leopard	Gambelia (Crotaphytus) Silus
Eagle, Bald	Haliaeetus Leucocephalus
Snake, Giant Garter	Thamnophis Gigas
Fox, San Joaquin Kit	Vulpes Macrotis Mutica
Kern County	
Plover, Mountain	Charadrius Montanus
Kangaroo Rat, Giant	Dipodomys Ingens
Kangaroo Rat, Tipton	Dipodomys Nitratoides
Flycatcher, Southwestern Willow	Empiodonax Traillii Extimus
Moth, Kern Primrose Sphinx	Euproserpinus Euterpe
Lizard, Blunt-Nosed Leopard	Gambelia (Crotaphytus) Silus
Condor, California	Gymnogyps Californianus
Eagle, Bald	Haliaeetus Leucocephalus
Shrew, Buena Vista Lake	Sorex Ornatus Relictus
Fox, San Joaquin Kit	Vulpes Macrotis Mutica
Kings County	
Plover, Mountain	Charadrius Montanus
Kangaroo Rat, Giant	Dipodomys Ingens
Kangaroo Rat, Tipton	Dipodomys Nitratoides
Kangaroo Rat, Fresno	Dipodomys Nitratoides Exilis
Lizard, Blunt-Nosed Leopard	Gambelia (Crotaphytus) Silus
Fox, San Joaquin Kit	Vulpes Macrotis Mutica
Madera County	
Beetle, Valley Elderberry Longhorn	Desmocerus Californicus Dimorphus
Kangaroo Rat, Fresno	Dipodomys Nitratoides Exilis
Lizard, Blunt-Nosed Leopard	Gambelia (Crotaphytus) Silus
Eagle, Bald	Haliaeetus Leucocephalus
Fox, San Joaquin Kit	Vulpes Macrotis Mutica
Merced County	
Shrimp, Conservancy Fairy	Branchinecta Conservatio
Shrimp, Vernal Pool Fairy	Branchinecta Lynchi
Plover, Mountain	Charadrius Montanus
Beetle, Valley Elderberry Longhorn	Desmocerus Californicus Dimorphus
Kangaroo Rat, Giant	Dipodomys Ingens
Kangaroo Rat, Fresno	Dipodomys Nitratoides Exilis
Lizard, Blunt-Nosed Leopard	Gambelia (Crotaphytus) Silus
Eagle, Bald	Haliaeetus Leucocephalus

FIGURE 4.2

ACP/GRP CD
NAVIGATION INSTRUCTIONS
(Excerpt from CD affixed to inside front cover of Volume 1)

KINDER MORGAN

The information contained herein is provided to identify specific spill response and protection strategies for the applicable Kinder Morgan Pacific Operations Regions. Navigating through the bookmark links provided on the CD will take you to the Environmentally Sensitive Sites and the Economically Significant Sites provided in the applicable Area Contingency Plans and Geographic Response Plans.

INSTRUCTIONS FOR USE

1. From the screen on the left, click on region of interest. The different regions are identified by the red font.
2. Once the appropriate region is accessed, click on the "+" to the left of the region name to display the various areas within each region. These are identified with blue font.
3. Once the appropriate area is accessed, the links to the Environmentally Sensitive Sites and the Economically Significant Sites will be available for selection.
   - ➢ It is important to note that once each Environmentally Sensitive Site and Economically Significant Site is accessed, the user will have to scroll to the desired location.
   - ➢ Use the zoom icon to zoom into each page for easier reading.

NOTES:

1. In those areas where the statement "No ACP Information Available" is made, it indicates that there is no ACP or GRP information which is specific to the particular region or area of interest.
2. EPA REGION IX: For areas without specific ACP/GRP information, the Region IX Contingency Plan (RCP) is used as the response guidance; however, this RCP is currently in revision.
3. EPA REGION X: Region X is covered by the Northwest Area Contingency Plan; however, inland facilities are not addressed.
4. Thus, the following areas are covered by specific area contingency or geographic response plans on this CD:
   - Northern Region—Northwest: Linnton-Willbridge, Washington Area
   - Northern Region—Bay: Brisbane, Concord, Richmond, San Jose
   - Southern Region—Central: Mission Valley-Orange
   - Southern Region—West: Carson, Watson
5. And, the following areas do not have specific area contingency or geographic response plans on this CD:
   - Northern Region—Northwest: Oregon Pipelines (inland)
   - Northern Region—Central: Fresno
   - Northern Region—CalNev: Sacramento, Rocklin, Reno
   - Southern Region—East: Imperial, Phoenix, Tucson
   - Southern Region—Central: Colton, Barstow, Las Vegas

Developed by:
Response Management Associates, Inc.

5.0 DISPOSAL PLAN

5.1 OVERVIEW

A major oil spill response would generate significant quantities of waste materials ranging from oily debris and sorbent materials to sanitation water and used batteries. All these wastes need to be classified and separated (i.e., oily, liquid, etc.), transported from the site, and treated and/or disposed of at approved disposal sites. Each of these activities demands that certain health and safety precautions be taken, which are strictly controlled by federal and state laws and regulations. This section provides an overview of the applicable state regulations governing waste disposal, and a discussion of various waste classification, handling, transfer, storage, and disposal techniques. It is the responsibility of the Environmental Manager or their designee to manage the following:

- Coordinate waste disposal activities;
- Identify appropriate interim storage methods and locations;
- Coordinate permitting activities needed to ensure proper disposal; and
- Document compliance with appropriate local, State, and Federal handling of hazardous materials and/or wastes.

Material will be containerized or stored in a manner complying with applicable environmental regulations pertaining to the known or suspected materials characteristics. Upon characterization, waste, recyclable materials, or contaminated materials will be treated on-site, recycled, or transported and disposed of at an appropriate KMEP approved facility after appropriate regulatory approval.

5.2 WASTE CLASSIFICATION

Oily - Liquid Wastes

Oily liquid wastes (i.e., oily water and emulsions) that would be handled, stored, and disposed of during response operations are very similar to those handled during routine storage and transfer operations. The largest volume of oily liquid wastes would be produced by recovery operations (e.g., through the use of vacuum devices or skimmers). In addition, oily water and emulsions would be generated by vehicle operations (e.g., spent motor oils, lubricants, etc.), and equipment cleaning operations.

Non-Oily - Liquid Wastes

Response operations would also produce considerable quantities of non-oily liquid wastes. Water and other non-oily liquid wastes would be generated by the storage area and stormwater collection systems, vessel and equipment cleaning (i.e., water contaminated with cleaning agents), and office and field operations (i.e., sewage, construction activities).

Solid Wastes

A solid waste is defined as any discarded material provided that it is not specifically excluded under the regulations. These exclusions cover materials such as domestic sewage and mixtures of sewage discharged through a sewer system or industrial wastewater point source discharges.

A discarded material is any material which is abandoned (disposed of, burned or incinerated) or accumulated, stored or treated prior to being abandoned. A discarded material is also any material recycled or any material considered inherently wastelike. Recycled material is considered solid waste when used in a manner constituting disposal, placed on land or burned for energy recovery.

5.2 WASTE CLASSIFICATION (Cont'd)

Solid Wastes (Cont'd)

A solid waste may be considered a hazardous waste. A solid waste, as defined above, may be a hazardous waste if it is not excluded from regulation and is either a listed hazardous waste or exhibits the characteristics of a hazardous waste. A solid waste exhibits the characteristics of a hazardous waste if it exceeds the thresholds established in determining the following:

1) ignitability
2) corrosivity
3) reactivity
4) toxicity

A solid waste may also become a hazardous waste if it is mixed with a listed hazardous waste or, in the case of any other waste (including mixtures), when the waste exhibits any of the characteristics identified above.

Oily - Solid/Semi-Solid Wastes

Oily solid/semi-solid wastes that would be generated by containment and recovery operations include damaged or worn-out booms, disposable/soiled equipment, used sorbent materials, saturated soils, contaminated beach sediments, driftwood, and other debris.

Non-Oily - Solid/Semi-Solid Wastes

Non-oily solid/semi-solid wastes would be generated by emergency construction operations (e.g., scrap, wood, pipe, and wiring) and office and field operations (i.e., refuse). Vessel, vehicle, and aircraft operations also produce solid wastes.

5.3 WASTE HANDLING

A primary concern in the handling of recovered oil and oily debris is contaminating unaffected areas or recontaminating already cleaned areas. Oily wastes generated during the response operations would need to be separated by type and transferred to temporary storage areas and/or transported to incineration or disposal sites. Proper handling of oil and oily wastes is imperative to ensure personnel health and safety.

Safety Considerations

Care would be taken to avoid or minimize direct contact with oily wastes. All personnel handling or coming into contact with oily wastes would wear protective clothing. A barrier cream can be applied prior to putting on gloves to further reduce the possibility of oily waste absorption. Safety goggles would be worn by personnel involved in waste handling activities where splashing might occur. Any portion of the skin exposed to oily waste would be washed with soap and water as soon as possible. Decontamination zones would be set up during response operations to ensure personnel are treated for oil exposure.

5.3 WASTE HANDLING (Cont'd)

Waste Transfer

During response operations, it may be necessary to transfer recovered oil and oily debris from one point to another several times before the oil and oily debris are ultimately recycled, incinerated or disposed of at an appropriate disposal site. Depending on the location of response operations, any or all of the following transfer operations may occur:

- From portable or vessel-mounted skimmers into flexible bladder tanks, storage tanks of the skimming vessel itself, or a barge.
- Directly into the storage tank of a vacuum device.
- From a skimming vessel or flexible bladder to a barge.
- From a vacuum device storage tank to a barge.
- From a barge to a tank truck.
- From a tank truck to a processing system (e.g., oil/water separator).
- From a processing system to a recovery system and/or incinerator.
- Directly into impermeable bags that, in turn, are placed in impermeable containers.
- From containers to trucks.

There are four general classes of transfer systems that may be employed to affect oily waste transfer operations:

- **Pumps:** Rotary pumps, such as centrifugal pumps, may be used when transferring large volumes of oil, but they may not be appropriate for pumping mixtures of oil and water. The extreme shearing action of centrifugal pumps tends to emulsify oil and water, thereby increasing the viscosity of the mixture and causing low, inefficient transfer rates. The resultant emulsion would also be more difficult to separate into oil and water fractions. Lobe or "positive displacement" pumps work well on heavy, viscous oils, and do not emulsify the oil/water mixture. Double-acting piston and double acting diaphragm pumps are reciprocating pumps that may also be used to pump oily wastes.

- **Vacuum Systems**: A vacuum truck may be used to transfer viscous oils but they usually pick up a very high water/oil ratio.

- **Belt/Screw Conveyors:** Conveyors may be used to transfer oily wastes containing a large amount of debris. These systems can transfer weathered debris laden oil either horizontally or vertically for short distances (i.e., 10 feet) but are bulky and difficult to set up and operate.

- **Wheeled Vehicles:** Wheeled vehicles may be used to transfer liquid wastes or oily debris to storage or disposal sites. These vehicles have a limited transfer volume (i.e., 100 barrels) and require good site access.

Figure 5.1 provides a comparative evaluation of 16 types of transfer systems that could be available for transfer operations.

5.4 WASTE STORAGE

Interim storage of recovered oil, oily and non-oily waste would be considered to be an available means of holding the wastes until a final management method is selected. In addition, the segregation of wastes according to type would facilitate the appropriate method of disposal. The storage method used would depend upon:

- The type and volume of material to be stored.
- The duration of storage.
- Access.

During an oil spill incident, the volume of oil that can be recovered and dealt with effectively depends upon the available storage capacity. Typical short-term storage options are summarized in Figure 5.2. The majority of these options can be used either onshore or offshore.

If storage containers such as bags or drums are used, the container must be clearly marked and/or color-coded to indicate the type of material/waste contained and/or the ultimate disposal option. Bladder or pillow tanks would be acceptable, if the available space can support the weight of both the container and the product.

Fuel barges may be the best option for temporary storage of oil recovered in open waters. Depending on size, these vessels may be able to hold up to 6,000 barrels of oil and water. The barge deck can be used as a platform for operating oil spill clean-up equipment and storing containment boom.

Empty barges have four to six feet draft which would increase when these barges are filled with oil or loaded with cargo. Consequently, they may not be able to enter shallow, nearshore waters.

It may be difficult to offload recovered oil stored inside barges. Due to natural forces which affect spilled oil, recovered oil may be very viscous or emulsified, rather than free-flowing. It may be necessary to use steam to heat viscous oil before pumping it from the barge.

Steel or rubber tanks can be used to store oil recovered near the shoreline. To facilitate offloading, demulsifiers may be used to break emulsions prior to placing the recovered substance into the barges or storage tanks.

Use of any site for storage is dependent on the approval of the local authorities. The following elements affect the choice of a potential storage site:

- Geology.
- Ground water.
- Soil.
- Flooding.
- Surface water.
- Slope.
- Covered material.
- Capacity.
- Climatic factors.
- Land use.
- Toxic air emissions.
- Security.
- Access.
- Public contact.

5.4 WASTE STORAGE (Cont'd)

Temporary storage sites should use the best achievable technology to protect the environment and human health. They should be set up to prevent leakage, contact, and subsequent absorption of oil by the soil. The sites should be bermed (1 to 1.5 meters high) and double lined with plastic or visqueen sheets 6-10 mils or greater in thickness, without joints, prior to receiving loose and bagged debris. The edges of the sheet should be weighted with stones or earth to prevent damage by wind, and the sheet should be placed on a sand layer or an underfelt thick enough to prevent piercing. A reinforced access area for vehicles at the edge of the site should be provided. In addition, the oily debris should be covered by secured visqueen or tarps and an adequate stormwater runoff collection system for the size and location of the site would be utilized. Additionally, the sites should be at least three (3) meters above mean sea level.

Oily debris can be hauled to approved temporary storage sites in visqueen lined trucks or other vehicles. Burnable, non-burnable, treatable and re-usable materials can be placed in well defined separate areas at temporary storage sites.

When the last of the oily debris leaves a temporary storage site, the ground protection would be removed and disposed of with the rest of the oily debris. Any surrounding soil which has become contaminated with oil would also be removed for disposal or treatment. If the soils were removed for treatment, they may be replaced if testing proves acceptable levels have been achieved. Treatment and remediation is encouraged when feasible. The temporary storage should be returned to its original condition.

5.5 WASTE DISPOSAL

Techniques for Disposal of Recovered Oil

Recovery, reuse, and recycling are the best choices for remediation of a spill, thereby reducing the amount of oily debris to be bermed onsite or disposed of at a solid waste landfill. Treatment is the next best alternative, but incineration and burning for energy recovery have more options within the state. There are some limitations and considerations in incinerating for disposal. Environmental quality of incineration varies with the type and age of the facility. Therefore, when incineration becomes an option during an event, local air quality authorities would be contacted for advice about efficiency and emissions of facilities within their authority. Approval of the local air authorities is a requirement for any incineration option. Landfilling is the last option. Final disposal at a solid or dangerous waste landfill is the least environmentally sound method of dealing with a waste problem such as oily debris.

During an oil spill incident, KMEP would consult with the Federal and state On Scene Coordinator (OSC) to identify the acceptable disposal methods and sites appropriately authorized to receive such wastes. KMEP maintains a list of approved disposal sites that satisfy local, state, and Federal regulations and KMEP requirements. This identification of suitable waste treatment and disposal sites would be prepared by the Environmental Manager or their designee in the form of an Incident Disposal Plan which must be authorized by the U.S. Coast Guard and/or the EPA. An Incident Disposal Plan would include predesignated interim storage sites, segregation strategies, methods of treatment and disposal for various types of debris, and the locations/contacts of all treatment and disposal site selections. Onsite treatment/disposal will be preferred.

5.5 WASTE DISPOSAL (Cont'd)

Techniques for Disposal of Recovered Oil (Cont'd)

In order to obtain the best overall Incident Disposal Plan, a combination of methods should be used. There is no template or combination of methods that can be used in every spill situation. Each incident should be reviewed carefully to ensure an appropriate combination of disposal methods are employed.

The different types of wastes generated during response operations would require different disposal methods. To facilitate the disposal of wastes, they should be separated by type for temporary storage, transport and disposal. Figure 5.3 lists some of the options that would be available to segregate oily wastes. The table also depicts methods that may be employed to separate free and/or emulsified water from the oily liquid waste.

The following is a brief discussion of some disposal techniques available for recovered oil and oily debris.

Recycling

This technique entails removing water from the oil and blending the oil with uncontaminated oil. Recovered oil can be shipped to refineries provided that it is exempt from hazardous waste regulations. There it can be treated to remove water and debris, and then blended and sold as a commercial product.

The Environmental Manager or their designee is responsible for ensuring that all waste materials be disposed of at an internally approved disposal site.

Incineration

This technique entails the complete destruction of the recovered oil by high temperature thermal oxidation reactions. There are licensed incineration facilities as well as portable incinerators that may be brought to a spill site. Incineration may require the approval of the local Air Pollution Control Authority. Factors to consider when selecting an appropriate site for onsite incineration would include:

- Proximity to recovery locations.
- Access to recovery locations.
- Adequate fire control.
- Approval of the local air pollution control authorities.

In Situ Burning/Open Burning

Burning techniques entail igniting oil or oiled debris and allowing it to burn under ambient conditions. These disposal techniques are subject to restrictions and permit requirements established by federal, state and local laws. They would not be used to burn PCBs, waste oil containing more than 1,000 parts per million of halogenated solvents, or other substances regulated by the EPA. Permission for *in situ* burning may be difficult to obtain when the burn takes place near populated areas.

5.5 WASTE DISPOSAL (Cont'd)

In Situ Burning/Open Burning

As a general rule, *in situ* burning would be appropriate only when atmospheric conditions will allow the smoke to rise several hundred feet and rapidly dissipate. Smoke from burning oil will normally rise until its temperature drops to equal the ambient temperature. Afterwards, it will travel in a horizontal direction under the influence of prevailing winds.

Landfill Disposal

This technique entails burying the recovered oil in an approved landfill in accordance with regulatory procedures. Landfill disposal of free liquids is prohibited by federal law in the United States.

With local health department approval, non-burnable debris which consists of oiled plastics, gravel and oiled seaweed, kelp, and other organic material may be transported to a licensed, lined, approved municipal or private landfill and disposed of in accordance with the landfill guidelines and regulations. Landfill designation would be planned only for those wastes that have been found to be unacceptable by each of the other disposal options (e.g., waste reduction, recycling, energy recovery). Wastes would be disposed of only at Company-approved disposal facilities. The Environmental Manager or their designee is responsible for ensuring that all waste materials are disposed of at a Company internally approved disposal site. Disposal at a non-approved facility would require approval by the Environmental Manager or their designee prior to sending any waste to such a facility.

KEY TO RATINGS: 5 = Best; 1 = Worst

KEY TO COMMENTS:

A. Normally require remote power sources, thus are safe around flammable fluids.
B. Should have a relief valve in the outlet line to prevent bursting hoses.
C. Air powered units tend to freeze up in sub-freezing temperatures.
D. Units with work ball valves are difficult to prime.
E. Some remotely powered types are designed to fit in a tanker's butterworth hatch.
F. Can also pump air at low pressure.
G. Transfer is batch-wise rather than continuous.
H. Waste must be in separate container for efficient transfer.
I. Transportable with its own prime mover.
J. High shear action tends to emulsify oil and water mixtures.

Oil mixed with wood, seaweed and sorbents	Screening Collection of liquid oil leaching from debris during temporary storage Flushing of oil from debris with water	Incineration Direct disposal Degradation through land farming or composting for oil mixed with seaweed or natural sorbents
Tar balls	Separation from sand by sieving	Incineration Direct disposal

6.0 AREA PIPELINE SECTIONS

6.1 SCOPE

The scope of this section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Fresno Area Lines:	
• Merced River-South BV – Atwater 12”	50
• Atwater – Fresno 12”	60
• Fresno – Fresno Military 8” – 10”	119A
• Fresno Military – Lemoore 6”	119
• Bakersfield – Fresno 8”	15
• Refinery – Bakersfield 8”	91
Pipeline Facilities (non-storage):	
• Bakersfield Pump Station (booster)	
• Fresno Military Pump Station (booster)	
• Lemoore NAS – meter facility only	

- Figures 6.1a through 6.1f on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled “Worst Case Discharge Data” of the applicable Line Segment. The specific information summary for these pipeline sections is provided as follows:

  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps

- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent sections in this Volume 2.

- Northern and Southern pipeline schematic diagrams are provided in Volume 1, Figures 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

MERCED RIVER-SOUTH BV - ATWATER 12" (50)

Pipe and Operational Data

- Section Length: 10.33 Miles 54,542 Feet
- Line Diameter: 12.75 in., O.D. 12.312 in., I.D. (note 1)
- Line Capacity: 778 bbls/mile (note 2)
- Capacity of entire line section: (b) (7)(F),
- Maximum flow rate: 4,500 bph or 108,000 bpd

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description

- County(s)/State(s) Traversed: Merced, CA
- Location Description: (b) (3), (b) (7)(F) southeast parallel to railroad right of way to Atwater Terminal near Atwater.

7.0 BREAKOUT STATIONS/TERMINALS

7.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the breakout stations/terminals that have storage (breakout tanks) connected to the pipeline sections described in the previous section of this Volume 2. The data is summarized as follows:

BREAKOUT STATION/TERMINAL	LARGEST TANK (BBLS)	WCD (BBLS)
Fresno Military (Tank FR-25)	(b) (7)(F), (b) (3)	
Fresno Terminal (Tank FR-08)		

- The largest Worst Case Discharge (WCD) for the breakout station/terminal within this Area of Operation has been determined to be as follows:

(b) (7)(F), (b) (3)

  - The tanks in the breakout station/terminal within this area have adequate secondary containment.

- The specific information summary for this breakout station/terminal is provided as follows:

  - Breakout Station/Terminal Tank Information Summary (one per station/ terminal)
  - Facility Diagram

- Pipeline sections or terminaling operations associated with this Area of Operation are detailed in other sections of this Volume 2.

FIGURE 7.1a

BREAKOUT STATION/TERMINAL TANK INFORMATION

(Note: EPA – Jurisdictional Tanks Not Listed)

FRESNO MILITARY				
TANK #	**TYPICAL PRODUCT**	**MAX. CAPACITY (BBLS) ***	**DIAMETER**	**HEIGHT**
FR-24	JP-5	(b) (7)(F), (b) (3)

* The maximum capacity is calculated using the indicated diameter and height of the tank. The actual maximum storage capacity to overflow would typically be less than this calculated number.

Note: Fresno Terminal is a multi-jurisdictional Facility (DOT and EPA). The complete Facility information for Fresno Terminal required by EPA is located in Section 8 of this Volume.

FIGURE 7.2b

FACILITY DIAGRAM

8.1.1 CERTIFICATION OF SUBSTANTIAL HARM

CERTIFICATION OF THE APPLICABILITY OF THE SUBSTANTIAL HARM CRITERIA

FACILITY NAME: SFPP, L.P. Fresno Terminal
FACILITY ADDRESS: 4149 South Maple Avenue
Fresno, CA 93725

(Detailed Facility information, including data required for the Response Plan Cover Sheet, is provided in Figure 1.3)

1. Does the facility transfer oil over water to or from vessels ***and*** does the facility have a total oil storage capacity greater than or equal to 42,000 gallons?	Yes		No	✓
2. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area?	Yes		No	✓
3. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix or a comparable formula[1]) such that a discharge from the facility could cause injury to fish and wildlife and sensitive environments? For further description of fish and wildlife and sensitive environments, see Appendices I, II, and III to DOC/NOAA's "Guidance for Facility and Vessel Response Plans: Fish and Wildlife and Sensitive Environments" (59 FR 14713, March 29, 1994) and the applicable Area Contingency Plan.	Yes	✓	No	
4. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix or a comparable formula[1]) such that a discharge from the facility would shut down a public drinking water intake[2]?	Yes		No	✓
5. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the last 5 years?	Yes		No	✓

[1] If a comparable formula is used, documentation of the reliability and analytical soundness of the comparable formula must be attached to this form.

[2] For the purposes of 40 CFR part 112, public drinking water intakes are analogous to public water systems as described at 40 CFR 143.2(c).

CERTIFICATION

I hereby certify the following:

- Under penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe that the submitted information is true, accurate, and complete.
- The information and procedures contained herein are considered to be accurate as of this date and are consistent with the National Contingency Plan (NCP) and applicable Area Contingency Plans (ACP) as detailed in Section 1.5.

Michael McWhorter — Signature

NOTE: The information and procedures in this Plan must be treated as guidelines only. The user should determine to what extent it is practical and advisable to follow them. This decision may involve considerations not discussed in this Plan. Response Management Associates, Inc. (RMA) provided consulting and plan development services in the preparation of this plan utilizing data provided by the owner/operator and/or the Facility. RMA assumes no liability for injury, loss, or damage of any kind resulting directly or indirectly from the use of the regulatory interpretation, response planning, or information contained in this plan.

8.1.2 INTRODUCTION

This Facility is a bulk distribution Facility for refined petroleum products. Product arrives via pipeline and is transported out of the Facility by tanker trucks. Ethanol is received via tank truck. The following Figure 8.1 provides Facility specific information and Figure 8.2 provides an Area Map for the Facility.

This Section 8 is provided in order to document the following Facility-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- Facility Information (Figure 8.1)
- Area Map (Figure 8.2)
- Hazard Identification including Tank Tables (Section 8.2)
- Inspections (Section 8.2.2)
- Vulnerability Analysis (Section 8.2.3)
- Discharge Scenarios (Section 8.3)
- Evacuation (Section 8.4)

FIGURE 8.1

FACILITY INFORMATION

GENERAL INFORMATION	
Facility Name:	Kinder Morgan Energy Partners, L.P.
Physical Address:	Fresno Terminal 4149 South Maple Avenue Fresno, CA 93725 (559) 237-4612 (559) 264-5531 *(Fax)*
SIC Code:	4226
Primary NAICS Code:	493190
EPA FRP Number:	FRP09A0088
Dun & Bradstreet Number:	618 450-886
Date of Initial Storage:	October, 1964
Owner/Operator:	See Volume 1, Section 1.1
Qualified Individual (Emergency Coordinator):	See Volume 1, Section 1.1
Telephone/FAX:	Additional telephone references, including 24 hour numbers, for the Facility, Owner, and QI/AQI are provided in Section 2 of Volume I.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

FACILITY LOCATION	
County:	Fresno County, CA
Latitude:	(b) (7)(F), (b) (3) [redacted]
Longitude:	
Area Map:	Provided in Figure 8.2
Facility Diagram:	Provided in Figure 8.3
Wellhead Protection Area:	None
Facility Distance to Navigable Water:	Greater than one mile
Landside Directions:	From Highway 99 North, go west on E. Central Avenue for .25 miles. Turn left onto S. Maple Avenue. Travel .19 miles to the Facility.
Waterside Directions:	There is no water access to this Facility.

PHYSICAL DESCRIPTION - GENERAL

Description of Operation:

- This Facility is a bulk distribution facility for refined petroleum products.

(b) (7)(F), (b) (3) [redacted]

- The Facility normally operates 24 hours a day 7 days a week.
- The Facility's Worst Case Discharge amount is (b) (7)(F), (b) (3) [redacted]

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL (Cont'd)

Products Handled:

- Gasoline
- Diesel
- Jet Fuel
- Transmix

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility Office.

PHYSICAL DESCRIPTION - LOADING RACK

Description of Operation:

- The Facility is equipped with 12 loading spots which handle various refined petroleum products and one unloading spot for ethanol offloading.
- A maximum of 12 tank trucks may load simultaneously.
- The loading/unloading operations are conducted 24 hours a day 7 days a week.
- The Facility handles an average of 450 trucks per day.

Loading Rate: 600 gpm (*per truck*)

Truck Capacity: 9,000 gallons (*maximum*)

Discharge Prevention:

- The curbed concrete slab drains directly to an oil water separator.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS

- The majority of the Facility was constructed in 1964. Sixteen tanks with a maximum capacity of 16,212,420 gallons date from this initial period. The Facility expanded storage capacity by purchasing one tank (FR-17, 1,512,000 gallons) in 1970 which increased capacity to 17,724,420 gallons. Two tanks (FR-18 and 19, 2,310,000 gallons) increased capacity to 20,034,420 gallons in 1984. In 1987, two tanks (FR-20 and 21, 5,880,000 gallons) were added which increased total capacity to 25,914,420 gallons. An additional four (4) tanks (FR-22 through 25) were added to the Facility, bringing the total number of tanks to 25. FR-26 and Loading Rack 8 added in 2008.

Figures presented on the following pages include:

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed in the Potential Spill Sources and Container Identification table in this Section.

Tanks

- Secondary Containment volumes for all bulk storage tanks are detailed in the Potential Spill Sources and Container Identification table in this Section.

Loading Rack Containment System

The loading/unloading rack area is designed and operated as follows:

- The Facility loading racks are equipped with curbing and drains that lead to the oil/water separators.
- Surface drainage at the loading racks lead to catch basins where all liquids are pumped to the main oil/water separator. Surface drainage at the adjacent facility (formerly Chevron) drains to a collection pit (formerly used as a separator). From there it is transferred to the main oil/water separator.
- Surface drainage from the additive unloading headers is contained within its own secondary containment. Drainage from this area is tied to the oil-water separator.
- All transfers are in constant attendance by qualified personnel who are properly trained prior to conducting transfers.
- In the event that a spill did originate from the transfer area piping, the Facility would immediately shut down the source, activate its Contingency Plan, and commence clean up operations with local and contract resources as necessary to insure prompt removal of the discharged product.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Diked Areas

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/structures or inhibit operations conducted within the containment area.

- Stormwater which does accumulate within the diked area, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures.

- Drainage from the west tank farm is restrained by a manually controlled valve.

- Dike drain valves, when present, are secured in the closed position when not draining containment areas.

- Flapper-type drain valves are not used to drain diked areas.

- The west tank farm has a drain that leads to the retention pond. It is equipped with a valve that is maintained closed and locked when not in use.

- The main tank farm (north and south areas) does not have a drain. Accumulated liquids that do not percolate or evaporate are collected in a catch basin and inspected for any evidence of oil or oil sheen. After determination of no evidence of oil or oil sheen, a manually activated portable pump is used to pump stormwater to an adjacent culvert that leads to the retention pond. If there is any evidence of oil or oil sheen, the stormwater would be pumped to the oil/water separator.

Drainage From the Undiked Areas

Drainage from undiked areas is controlled as follows:

- Surface drainage from undiked areas near the ethanol unloading rack would be contained by a ponding area immediately east of the unloading rack. This piping is only in service when the rack is staffed for ethanol unloading operations.

- All other undiked piping within the Facility is situated such that releases would be directed into diked areas of the main tank farm or to culverts that lead to one of two retention ponds.

- The risk of leaks originating from piping is low since it is observed frequently enough to detect excessive corrosion, defective pipe supports, or other anomalies which could compromise the integrity of the pipe.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Undiked Areas (Cont'd)

- In the event that a spill did originate from undiked piping, the Facility would immediately activate its Contingency Plan to mitigate the spill before leaving the property.

- The Facility loading racks are equipped with curbing and drains that lead to the oil/water separators.

- Surface drainage at the loading racks lead to catch basins where all liquids are pumped to the main oil/water separator. Surface drainage at the adjacent facility (formerly Chevron) drains to a collection pit (formerly used as a separator). From there it is transferred to the main oil/water separator.

- Surface drainage from the additive unloading headers would either flow toward one of the loading rack drains or toward the secondary containment area of the main tank farm.

- The Facility maintains response equipment on site to utilize in the event that a spill did escape the Facility.

- Catchment basins, if applicable, are not located in areas subject to periodic flooding.

General Drainage

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is as follows:

- The west tank farm has a drain that leads to the retention pond. It is equipped with a valve that is maintained closed and locked when not in use.

- The main tank farm (north and south areas) does not have a drain. Accumulated liquids that do not percolate or evaporate are collected in a catch basin and inspected for any evidence of oil or oil sheen. After determination of no evidence of oil or oil sheen, a portable pump is used to pump stormwater to an adjacent culvert that leads to the retention pond. If there is any evidence of oil or oil sheen, the stormwater would be pumped to the oil/water separator.

- Stormwater occasionally accumulates on Maple Avenue, interfering with truck access to the Facility. In the event that this occurs, stormwater can be pumped from the street into culverts that flow to the main retention basin.

- Facility drainage does not flow directly into an open watercourse.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

General Drainage (Cont'd)

- The Facility does not have a wastewater treatment plant nor does it chemically treat water prior to discharge off site.
- Uncontaminated rainwater is inspected to ensure compliance with applicable water quality standards and will not cause a harmful discharge as defined in 40 CFR 110.
- Adequate records are kept of such drainage events.
- Records of drainage events are maintained at the Facility office.

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Fresno Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus, changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading rack has sufficient capability to handle any potential increase in transfer capacity. The loading rack operates 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan, which details additional discharge detection measures.

(b) (3), (b) (7)(F)

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Detection by Personnel

- Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds.
- The loading rack is equipped with warning and instruction signs.

Security

(b) (7)(F), (b) (3)

[redacted]

8.2.2 FACILITY SELF-INSPECTIONS

Container Testing and Inspections

- All aboveground containers are integrity tested on a regular schedule and when material repairs are made.
- The Engineering Department oversees the tank integrity in accordance with the SPCC Plan and L O&M Procedure 2101.
- Comparative records are maintained by the Engineering Department at the Orange office.
- The container inspection programs conducted and maintained by Facility personnel are as follows:
  - The containers are visually inspected by operating personnel for signs of deterioration, leaks, or the accumulation of liquids inside the containment areas.
  - Each storage container is inspected per the SPCC Plan and L O&M Procedure 2101 as required by age, condition, and service.
  - Based on these conditions, the aboveground storage containers are professionally inspected and non-destructive thickness testing is performed.
- The required inspections are divided into three categories:
  - Routine, in-service inspections
  - In-service, external inspections
  - Out-of-service, internal inspections
- If a field-constructed aboveground container undergoes a repair, alteration, reconstruction, or change in service that might affect the risk of a discharge or failure due to brittle fracture, the container will be evaluated.
- Drums or totes brought on-site are built or tested to the standard(s) established by the drum manufacturer or the drum recycler, as applicable.
- While on-site, drums and totes will be visually inspected at least monthly and ground contact will be minimized.
- Liquid level sensing devices are regularly tested on a monthly basis.
- High level alarms are tested on a monthly basis.
- The bulk storage containers are equipped with ground-level gauges and are hand-gauged at regular intervals.

8.2.2 FACILITY SELF-INSPECTIONS (Cont'd)

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valves locks and/or seals
  - Other appurtenances

- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement.

- Annually a Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

Documentation

- Records of the inspections and tests (including those maintained under usual and customary business practices), signed by the appropriate supervisor or inspector are retained on file at the Facility and/or other Corporate location for a minimum period of three (3) years.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

- The Facility is located in an agricultural and residential area.
- The Facility is located in south Fresno and is less than one (1) mile south of the Central Canal, which is the closest water body.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Water Intakes

[redacted]

(b) (3), (b) (7)(F)

[redacted]

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Medical Facilities

Review of GIS Data determined that the following medical facilities are within the planning distance of the Facility:

Medical Facility	Distance from Facility
Valley Industrial Family Medical	6.5 miles (*approximate*)
Fresno Community Medical Center	6.8 miles (*approximate*)

Additional details on the medical facilities within the area of the Facility are included on the maps in Section 6.

Residential Areas

Residential areas are located south and east of the Facility.

Additional details on the residential areas within the area of the Facility are included on the maps in Section 6.

Businesses

The area surrounding the Facility is for the most part commercial and agricultural. Along the San Joaquin River there are various businesses and commercial establishments which may be potentially impacted by a discharge. Review of GIS Data determined that the following businesses are within the planning distance of the Facility:

Businesses	Distance from Facility
Valley Pacific Petroleum	0.00 miles *(approximate)*
Beneto, Inc.	0.06 miles *(approximate)*
Williams Tank Lines, Inc.	0.06 miles *(approximate)*
Cox Petroleum	0.06 miles *(approximate)*
Robert V. Jensen, Inc.	0.11 miles *(approximate)*
Rvj's Truck Stop	0.11 miles *(approximate)*

Additional detail on the general layout of businesses within the area of the Facility is included on the maps in Section 6.

Fish and Wildlife, Wetlands, and other Sensitive Environments

The area surrounding the Facility is host to a variety of species. Refer to Figure 4.1 of this Volume for details.

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Fish and Wildlife, Wetlands, and other Sensitive Environments (Cont'd)

No wetlands were identified within the planning distance.

Wetland habitats, however, are common throughout portions of the area. The size and diversity of the wetland environments vary with season and year. Wetlands play a disproportionally large role in maintaining the stability of the global environment. Wetlands retain and gradually release large quantities of water and their dense vegetation traps sediments and consumes pollutants.

During a response situation the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact the agencies will be able to:

- Identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge.
- Identify potential environmental effects on fish and wildlife, wetlands, and other sensitive environments resulting from removal actions or countermeasures.

Lakes and Streams

Review of GIS Data determined that the following lakes and streams are within the planning distance of the Facility:

Lakes and Streams	Location
Central Canal	Less than 1 mile N

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Figure 4.1 of this Volume.

Recreational Areas

No recreational areas were identified within the planning distance.

8.2.3 VULNERABILITY ANALYSIS (Cont'd

Transportation Routes (air, land, and water)

There are various public roadways and waterways which may be potentially effected by a discharge originating from the Facility. Review of GIS Data determined that the following transportation routes are within the planning distance of the Facility:

Transportation Route	Distance from Facility
Highway 99	.5 miles NE *(approximate)*
Santa Fe Railroad	Adjacent

Utilities

No utilities were identified within the planning distance.

Other Areas of Economic Importance

Review of GIS Data determined that no terrestrially sensitive or unique environments such as wildlife refuges, management areas, or ecological reserves are within the planning distance of the Facility.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Potential Spill Sources and Container Identification table in this Section for details concerning spill history for the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Containment and recovery of any spilled material which might escape a diked area would be accomplished through the implementation of spill response activities by: (1) Facility personnel, or if necessary, (2) one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow southwest through the Facility.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL (Cont'd)

Vulnerability to a Natural Disaster

- The Facility is located in south Fresno and is less than one (1) mile south of the Central Canal, which is the closest water body.

- The Facility is connected by pipelines to facilities in northern and central California.

Potential hazards are identified below:

Earthquake	The Facility is located in a semi-active earthquake zone with occasional seismic activity.
Fire	Fire from an external source. Internal fire sources out of control are also a threat.
Terrorism	Bombing or malicious destruction could be directed at tanks, piping systems, or control systems by a third-party source.
Vehicular Accident	This would include any of the tank trucks that are visiting the Facility for loading or off-loading.
Material Failure	Tank plating, fittings, and piping, are all subject to failure from material corrosion, impact, or fatigue breakage.
Equipment Failure	Pumps, gauges, detectors, or controllers (mechanical or electrical) are all subject to failure.
Human Error	The wrong decision and or action by personnel may potentially cause a spill.

- The Company has taken considerable action to lessen the probability of the hazard occurring.

Investigation and Monitoring of Natural Hazards

- The Company has historical data that defines the low probability of seismic activity in the area.

- The construction of the Facility has taken the possibility of some seismic activity into consideration; the location of Tank Farms away from slide prone areas and constructing the Facility, including all subgrade soil preparation, along with slope and tank construction in accordance with appropriate building codes and industry guidelines.

Fire Protection Safety

- The Facility has installed fire suppressant foam capability and adequate portable fire extinguishers to combat a moderate fire.

- The Facility is located close to city and county fire departments that would respond to fires.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL (Cont'd)

Fire Protection Safety (Cont'd)

- The brush free zone surrounding the Facility will prevent brush fires from reaching the fuel storage tanks.
- The fuel piping and transfer systems have metal supports, fire walls, and additional protection including welded pipe joints within the fire walls.
- The Facility has a fire system consisting of two (2) fire pumps. Backup for this system is provided by city water lines.

Material Maintenance of Tanks, Piping Systems, and Valves

- The tanks are visually inspected daily on the outside and are inspected internally when the tanks are taken out of service.

Other Factors

The actions taken to lessen hazards at the Facility petroleum tank farm reduces the probability to a low potential. Hazard reduction protective measures have been designed into tanks and into the construction of the Facility. Tanks were designed to industry standards which reduces the potential for hazards. Based on the care and construction of the tanks, the potential of any one tank rupturing and emptying product into the secondary containment is low.

The Facility conforms to good engineering practices in the tank integrity inspection program. The inspection program reduces the likelihood of leaks. The Facility has not experienced a failure associated with a tank structure.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

The Facility maintains a separate Oil Spill History file in the Facility office. The Facility's file contains the below listed information to the extent that such information is reasonably identifiable.

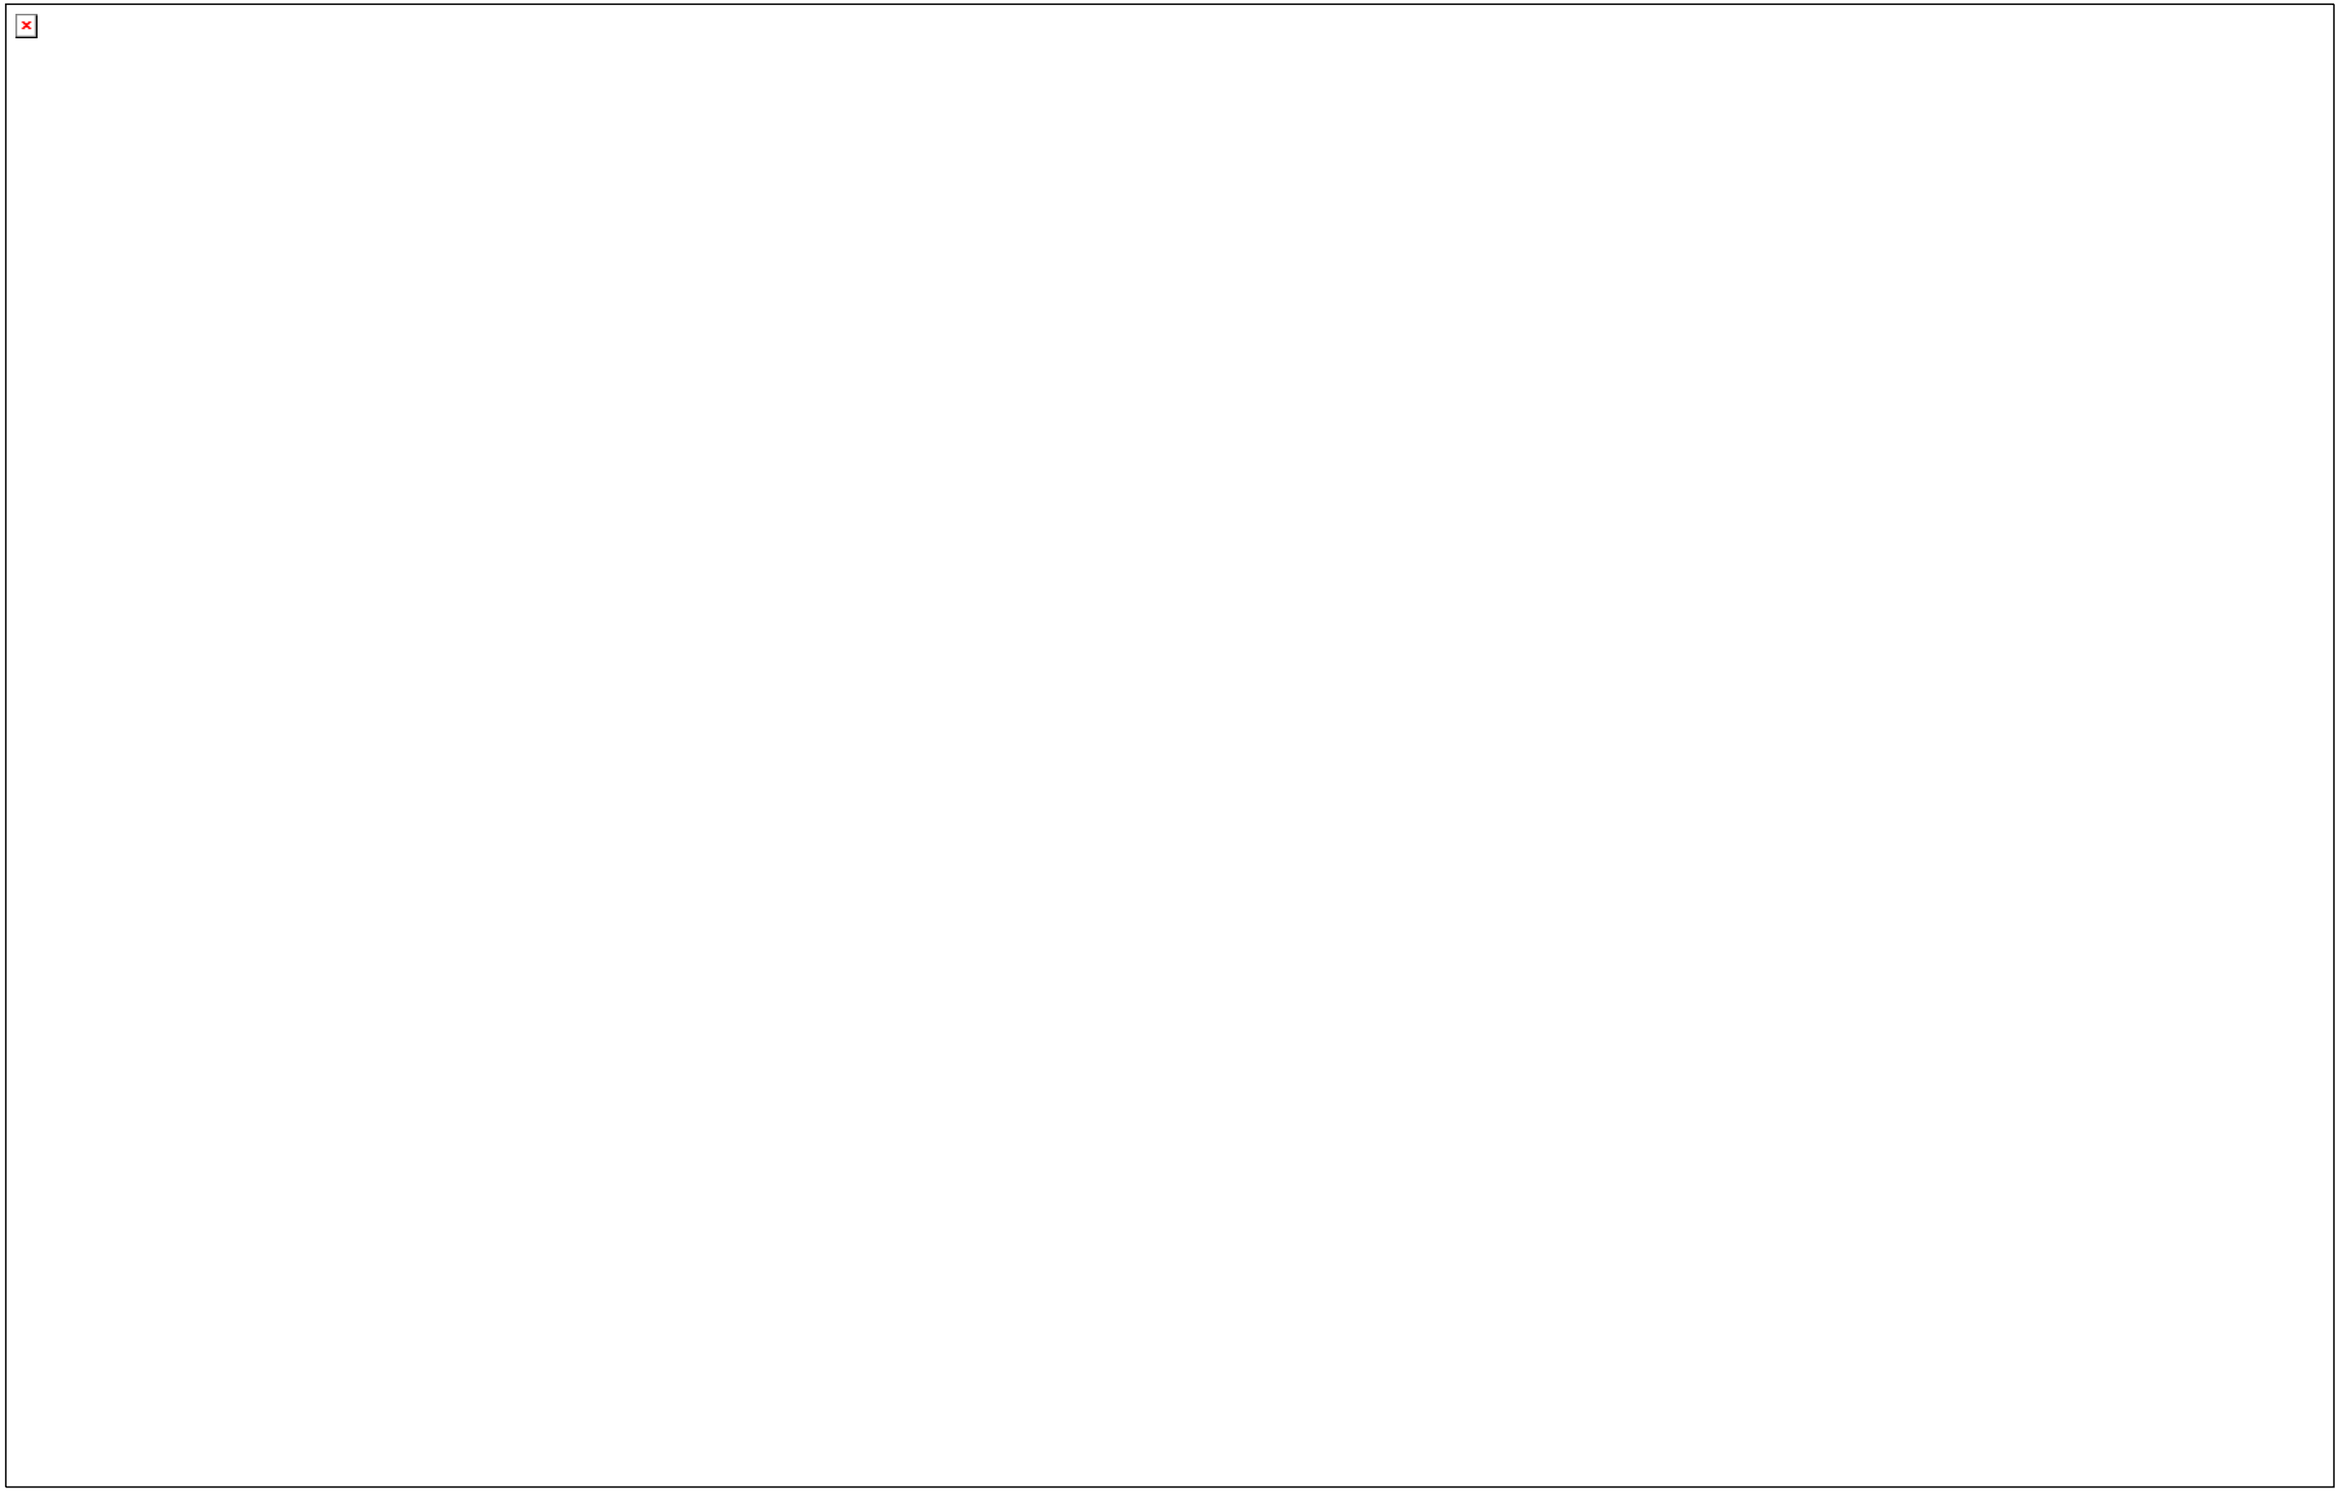
- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY (Cont'd)

- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

Since the Facility was acquired by Kinder Morgan Energy Partners, the Facility has experienced no reportable spills as defined by 40 CFR 110.

(b) (7)(F), (b) (3)



8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. - Fresno Terminal is classified as an "EPA Jurisdictional Non-Transportation Onshore Facility" which operates in a Non-Higher Volume Port Area.

The EPA discharge volume calculations are described as follows:

EPA Discharge Volume Calculation
● **Worst Case Discharge** *100% of the largest single tank* **WCD** = (b) (7)(F),
● **Medium Discharge** *Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD* **MD** = 857 bbls
● **Small Discharge** *Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD* **SD** = 50 bbls

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A Small Discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack, or leaking piping and would be Gasoline.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the loading rack would be diverted to the in line oil water separator.

The closest waterway is the Central Canal, which is north of the Facility. The storage tanks and truck loading racks have adequate secondary containment so it is unlikely that a spill would reach the canal or travel very far if it did. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Summary of EPA Regulatory Response Requirements for a Small Discharge

*The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, **AS APPROPRIATE**, include:*

- *1,000' of containment boom **and a means of deploying it** within one (1) hour of the discovery of a spill. [Guidance: The appropriate level of response resources to address a small discharge from this Facility should arrive on-scene; including the equipment and appropriately trained manpower necessary to deploy the response resources; within one (1) hour of discovery of the discharge.]*
- *Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a Small Discharge or greater which is available at the Facility within two (2) hours of the detection of an oil discharge. [Guidance: Oil recovery devices with a minimum of 50 bbls/day recovery capacity (or greater) should be on scene and ready to commence recovery of discharged oil within two (2) hours of discovery of the discharge. The response resources that arrived to the site in the first hour (noted in the first bullet above) should be deployed and actively containing discharged oil within this two (2) hour period.]*
- *Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate. [Guidance: Storage capacity for twice the effective daily recovery rate (2 times 50 bbls/day) is 100 bbls/day which should be available at the commencement of the recovery operations, therefore within two (2) hours of discovery of the discharge.]*

Facility Response Resources/Capability

The Facility will respond to a *Small Discharge* with the manpower and local contract resources as detailed in Section 2 and 3 of Volume 2.

- A 50 bbls discharge typically will not escape the containment of the Facility.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack while loading Gasoline. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack or Control Room. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Offsite Impact

- The closest waterway is the Central Canal, which is north of the Facility. The surface topography of the area around the Facility is relatively flat with a slight increase in elevation toward the canal. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be implemented at the Facility, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)
Offsite Impact (Cont'd)   ● A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.   ● Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.
Notes: ● Equipment and manpower resources are detailed in Section 3 of Volume 2.   ● Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.   ● Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A Medium Discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Spills of this size would likely be Gasoline. Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property. The spilled material would likely collect in the containment area sump system and be routed to the separator system. If a spill of this size escaped the property, there is a remote possibility it could flow upgradient and enter the Central Canal. Adverse weather conditions would increase the chance of a discharge entering the canal; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages can be referenced in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a medium discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

The closest waterway is the Central Canal. The potential for a spill this size reaching the canal is minimal. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the *Medium Discharge* volume that are capable of arriving on scene within 12 hours.
- Sufficient quantity of containment boom must arrive within 12 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 12 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 12 hours; Tier 2 = 36 hours; Tier 3 = 60 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 12 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage facilities.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the river.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed (b) (7)(F), (b) (3)

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached). Spills of this size would likely be Gasoline.

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages can be located in Potential Spill Sources and Container Identification table in Section 8.2.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow north upgradient and possibly enter the Central Canal which is located north of the property.

For a spill that is confined to the land along the pathway, Facility personnel would have at least two (2) options by which to contain the spill:

- Dams
- Trenches

Ditch Containment

A spill may be contained in stormwater ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located south of the Central Canal. The priority during larger spills is to prevent oil from reaching the waterway. OSROs are under contract with the Facility. The Company, however, will use a combination of Facility personnel, contractor personnel, and Facility-owned and contractor-owned equipment to initiate initial boom deployment and anchoring at the waterway, if necessary, within one hour. Several recreating areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by state and Federal trustees would likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Response Requirement (Cont'd)

- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage facilities.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, and equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Company Personnel (IC) assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 4149 South Maple Avenue
Fresno, CA 93725
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility and Santa Fe Railroad, if applicable.
h. Staging Area for Emergency Command Post will be at the entrance to the Facility or where the Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the Control Building. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel (IC) will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the main office or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility north gate.

4. Community Evacuation

The local Law Enforcement provides methods of warning the public of the need to evacuate. The current procedure for informing the public when there is a need to do so is by door-to-door notification, use of electronic media by direct contact to radio and television stations, or the employment of the Emergency Broadcast System (EBS). The local authorities will initiate and coordinate all efforts concerning the evacuation of the community.

5. Directions to Fresno Community Medical Center

From the Facility, turn left going north on S. Maple Avenue. Turn right onto E. Central Avenue. Turn left onto Highway 99 going north for 3.2 miles. Take the Highway 41 north exit and merge onto Highway 41 traveling north for 1.4 miles. Take the Tulare Street exit and turn left on Tulare. Turn right onto U Street. Turn left onto E. Divisadero Street. Turn right onto N. Howard Street. Turn left onto E. Illinois Avenue. Turn left onto N. Thesta Street into Hospital.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gate located southeast of the Control Building. If the situation permits, the Facility may also be accessed through the northern access road.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

8. Prevailing Winds

The prevailing winds in the Facility area generally come from the northwest at an average speed of 0-5 mph year round.

9. Water Currents

Currents in the Central Canal, San Joaquin River and Kings River are minimal most of the year.

The Company has confirmed with the Fresno Police Department that a Community Evacuation Plan currently exists for this area. However, the Sheriff's Department does have standard guidelines that are followed in the event of an evacuation.

FIGURE 8.9

TACTICAL PLAN

The following Tactical Plan has been provided to assist initial response to a spill incident from this Facility. The plan includes the following:

- Driving directions
- General pictures of the site and tactical response strategy
- General response equipment and personnel recommendations

Note: This Tactical Plan is provided as a general guidance tool for response to an incident emanating from this Facility. The selection of response strategy equipment, manpower and deployment site may vary based on actual field conditions (e.g. terrain, weather conditions, product type/volume) and incident details.

FACILITY INFORMATION

GENERAL INFORMATION	
Facility Name:	Kinder Morgan Energy Partners, L.P.
Physical Address:	Linnton Terminal 11400 NW St. Helens Road Portland, OR 97231-1036 (503) 220-1260 *(24 Hrs)* (503) 220-1270 *(Fax)*
NAICS Code:	493190
EPA FRP Number:	FRP-95
Dun & Bradstreet Number:	618 450-866
Date of Initial Storage:	Prior to 1941
Owner/Operator:	Kinder Morgan Energy Partners, L.P. 500 Dallas Street, Suite 1000 Houston, TX 77002 or 1100 Town & Country Road Orange, CA 92868
Qualifed Individual: ***(Emergency Coordinator)*** ***(On-Site Firefighting Coordinator)*** (Work Address)	Jeff Hibner - Area Manager (b) (3), (b) (7)(F) (503) 220-1263 *(Work)* (b) (6) *(Mobile)*
Alternate Qualified Individual: ***(Alt. Emergency Coordinator)*** (Work Address)	Andrew Holbrook - Operations Manager Northwest (b) (3), (b) (7)(F) (503) 220-1257 *(Work)* (b) (6) *(Mobile)*
Telephone/FAX:	Additional telephone references, including 24 hour numbers, for the Facility, Owner, and QI/AQI are provided in Section 2 of Volume I.

* Company policy is to treat an employee's home address as confidential. This information is kept on file at the Regional Office (909) 877-2373, and Houston Corporate Office, Human Resources Dept. (713) 369-8876.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

FACILITY LOCATION	
County:	Multnomah County, OR
Latitude:	(b) (7)(F), (b) (3)
Longitude:	
River Mile:	Willamette River Mile 4.5
Area Map:	Provided in Figure 8.2
Facility Diagram:	Provided in Figure 8.3
Wellhead Protection Area:	None
Oil Spill Response Planning Zone:	Columbia River - Portland sub-zone
Facility Distance to Navigable Water:	Less than 0.25 miles
Landside Directions:	Starting at the airport, go northwest on NE Airport Way. NE Airport Way becomes Long Term Parking. Turn left onto parking exit, then left again onto NE Airport Way. Merge onto I-205/Veterans Memorial Hwy. At Exit 21B merge onto US-30 toward Portland. Merge onto I-405 S via exit number 302B. Merge onto US-30 W via exit number 3, then merge onto NW Yeon Ave. NW Yeon Ave. becomes NW St. Helens Rd. The Facility is located at 11400 NW St. Helens Rd.
Waterside Directions:	From the Columbia River travel southwest, south and southeast on the Willamette River approximately three (3) miles. Facility is on the left descending bank approximately two (2) miles downstream of the St. Johns Bridge.

FIGURE 2.1c

COMPANY EMPLOYEE OTHER THAN OPERATOR - NON-CALIFORNIA NOTIFICATION PROCESS

This flowchart shows the appropriate notifications a company employee **other than an operator** is required to make ***immediately*** in the event of an actual or suspected release. This process is to ensure all levels of management are notified of the situation, as appropriate.

Internal notification references are provided in Figure 2.3a, b, c.

Company employee **other than an operator** is notified by telephone or becomes aware of a release or threatened release.

↓

Call Orange Pipeline Control Center.
NOTE: Control Center initiates ERL or ERL+ notifications

↓

Obtain information and complete Initial Reporting Details form
(See Figure 2.2)

↓

Notify 911 - Fire Department/Police as necessary.
NOTE: If emergency warrants, notify 911 first.

↓

Notify Area Manager. If Area Manager is not available, proceed until first notification is made to:

- Operations Manager
- Director of Operations
- V.P. of Operations

*ERL = Emergency Response Line. Initiated per External Notification References (see Fig. 2.4).
*ERL+ = Emergency Response Line Plus – Notification for any major event associated with the Company, such as: major disruption or operations shutdown, death of employee(s) or contract employee(s), or any fatality or injury to member of public.

REQUIRED NOTIFICATIONS (FOR ALL FACILITIES)		
NATIONAL RESPONSE CENTER		
National Response Center c/o United States Coast Guard (CG-3RPF-2) 2100 2nd Street Southwest Room 2111-B Washington, D.C. 20593-0001	(800) 424-8802* (202) 267-2675* (202) 267-1322 (Fax)	**REPORTING REQUIREMENTS** TYPE: For all spills that impact or threaten to impact navigable water or for any failure in a pipeline system that: 1. Caused a death or a personal injury requiring hospitalization 2. Resulted in either a fire or explosion not intentionally set by the carrier. 3. Caused estimated damage to the property of the carrier or others, or both, of a total of $50,000 or more. 4. Resulted in the pollution of any stream, river, lake, reservoir, or other similar body of water that violated applicable water or adjoining shoreline, causing a discoloration or emulsion beneath the surface of the water or upon adjoining shorelines. 5. In the judgment of the carrier, was significant even though it did not meet the criteria of any other subparagraph of this paragraph **(cleared through the V.P. of Operations).** NOTE: A call to the NRC must also be made for spills or releases of hazardous substances that meet or exceed their RQ. VERBAL: Immediate notification required. WRITTEN: Not required

DEPARTMENT OF TRANSPORTATION		
US Dept. of Transportation Information Resources Manager Office of Pipeline Safety Pipeline & Hazardous Material Safety Administration 1200 New Jersey Avenue SE-E-22-321 Washington, DC 20590 Fax Filing: (202) 366-4566	(800) 424-8802* (202) 267-2675*	**REPORTING REQUIREMENTS** TYPE: In addition to the reporting of accidents to the NRC, a written accident report must be submitted for releases resulting in any of the following: 1. Explosion or fire not intentionally set by the operator. 2. Release of 5 gallons or more of hazardous liquid or carbon dioxide, except that no report is required for a release of less than 5 barrels resulting from a pipeline maintenance activity if the release is: a. Not one described under the NRC's reporting conditions. b. Confined to Company property or pipeline right-of-way; and c. Cleaned up promptly. 3. Death of any person. 4. Personal injury necessitating hospitalization. 5. Estimated property damage, including cost of cleanup and recovery, value of lost product, and damage to the property of the operator or others, or both, exceeding $50,000. VERBAL: Call to the NRC meets the required verbal notification under DOT reporting requirement. WRITTEN: As soon as practicable, an accident meeting any of the above criteria must be reported on DOT Form PHMSA F 7000-1. The report must be sent to DOT no later than 30 days after the release. Changes or additions to the original report (DOT Form PHMSA F 7000-1) must file a supplemental report within 30 days.

INITIAL REPORTING DETAILS

Incident Name:_____ **Data Base Record #**_____

Date Event Occurred:_____ Time Event Occurred: _____ Time Reported to ORCC: _____

Reported by: _____ Area of Responsibility: _____

Contact #'s: _____

Address where incident occurred: _____

_____ County: _____

Location of Event relative to railways, highways, roads, residents, etc. _____

Incident occurred at:

- ❑ Terminal Name: _____
- ❑ Breakout Facility (*) Name: _____
- ❑ Pump Station/Booster Name: _____
- ❑ Pipeline LS _____ PLMP _____ Line Size _____
- ❑ Other _____

Did the event cause any of the following?

- Fire or Explosion ❑ Yes ❑ No
- Death or injury ❑ Yes ❑ No # of employees _____ # of non-employees _____
- Product into the Water ❑ Yes ❑ No
- Damage Greater than $50,000 ❑ Yes ❑ No

If yes to any of the above, describe weather conditions: _____

Did the Incident occur during:

- ❑ Maintenance
- ❑ Operational Activity
- ❑ Failure of Equipment/Non-pipe component (valve, seals, gasket, piping, etc.)
- ❑ Terminal Loading ❑ Dome out (release to atmosphere) ❑ Dome out (contained in truck)

Additional Description

Size of Wet Area Type of Product

Description of Event:

Local Agencies Notified/Time: (Fire, Police, 911, etc.)

Reporting Requirements (To be determined by ORCC)

- ❑ Non-Reportable ❑ OES (Calif.)
- ❑ Railroad ❑ Other _____
- ❑ NRC ❑ State Agency _____
- ❑ Initiate Leak Wheel Call-out

(*) Breakout Facility Definition: Facility that uses tanks and equipment for input into a pipeline i.e., Concord, Watson, Rocklin (portions of Colton & Tucson

Prepared by: _____ Date: _____

NOTE: Completing this form does not satisfy the need to enter this information in the Leak Database.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS

The initial reporting detail form is used by the Control Center to document the necessary information for reporting to governmental agencies and the initial entry into the leak database. The initial responder and the Area Manger should use the form as a guideline to insure that the necessary information is available to the Control Center. However, reporting should not be delayed due to incomplete information. Some of this information will be collected as the emergency response continues or after repairs are completed. Area Managers, Maintenance Managers and the Manager of Control Centers are responsible for completing or coordinating the answers to this form. This form should be retained in the official leak file.

Instructions for completion of this form are as follows:

Incident Name — Document the name of the leak. It is typical for a given leak to be named. This name is used in subsequent discussion and documentation.

Database Number — This is the number automatically assigned in the leak database.

General Information Section

The Initial Responder is responsible for the answers to this section.

Date event occurred — This is the date of the month the incident is reported to the Control Center. This should be the date that there is evidence of a suspected leak. It may be different from the date the leak is confirmed or sufficient information is collected to indicate governmental reportability. However, if there are differences in the dates, the reason for differences should be documented.

Time event occurred — This is the time that evidence of a suspected leak is discovered. Time should be reported using the 2400 clock. The local time zone should be designated. It may be different from the time the leak is confirmed or determination that the incident is determined to be reportable to a government agency. However if the time is different, the reason for differences should be documented.

Time Reported to OCC — This is the time the event was reported to the Orange Control Center.

Reported by — This is the person who is reporting the suspected leak to the Orange Control Center.

Area of Responsibility — This is the name of the Area office where the suspected leak occurred.

Contact number — This is the telephone number that the control center (or others) will use to get further information, if needed.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS	
Address where incident occurred	This is the actual address or closest cross street address where the event occurred. It will be used to locate the incident site on maps and to communicate to others where event occurred.
County	This is County where incident occurred.
Location of event relative to Railways, highways, roads, residents, etc.	Give detail relative to other significant assets. This may be used to determine other emergency response action.

Facility Type Section

The Initial Responder is responsible for the answers to this section. Check the appropriate facility type.

Terminal	Refers to Truck Loading facilities, truck racks and associated storage. Document the name of the facility.
Breakout Facility	Refers to storage, piping, and equipment associated with pipeline transportation. There are two types of Breakout Tanks. Storage – where product comes from pipeline and then is reinjected back into pipeline for further transportation. Breakout also includes tanks associated with pipeline overpressure protection. Document the name of the facility.
Pump Station/Booster	This refers to pump stations associated with pipeline transportation. Document the name of the facility.
Pipeline	This refers to line pipe in the pipeline right-of-way. Document the Line Section number (LS), pipeline mile post (PLMP), and line size.
Other	This refers to valve sites, measurements stations and other facilities, such as gravitometer sites, in the pipeline right of way that is not at a breakout facility, pump station or line pipe. Document the name of the facility.

Consequence Section

The Initial Responder is responsible for the answers to this section. Check the consequence of the event. This is used to determine whether the event is reportable to DOT.

Fire or Explosion	If possible, denote whether fire or explosion was a result of the event or caused the event.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS	
Death or Injury	If possible, differentiate the number of employees and non-employees affected.
Product into the water	Denote if product resulted in pollution of any stream, river, lake, reservoir, or other similar body of water that violated applicable water quality standards, caused a discoloration of the surface of the water or adjoining shoreline, or deposited a sludge or emulsion beneath the surface of the water or upon adjoining shorelines.
Damage greater than $50,000	This includes cost of cleanup and recovery, value of lost product, and damage to the property of the operator or others, or both. In many cases this may not be known in the early stages of the incident, however leaks involving breakout tanks should be considered as having met this requirement.
Describe weather conditions	Document temperature, rain, and wind conditions (direction and estimated speed) if the incident involved a fire, explosion, death, injury requiring hospitalization, water, or damage greater than $50,000.
Activity Section	
The Initial Responder is responsible for the answers to this section. Document the activity of the system at the time the evidence of the incident was discovered.	
Maintenance	Check if maintenance activities are involved.
Operation Activity	This applies to normal operations, such as start up and shut down of pump(s) or pipeline, filling or emptying tanks.
Failure of Equipment	Check if failure of equipment was involved. Examples of "failure of equipment" includes malfunction of control or leak equipment, failure of components, seal failures etc.
Terminal Loading	This pertains to the actual loading transports.
Dome out	Dome outs should be documented. Only Dome outs released to the atmosphere should be reported to the Control Center and documented on this form.
Additional Descriptions Section	
The Initial Responder is responsible for the answers to this section.	
Size of Wet Area	This is useful to assist in the estimation of released product and determine appropriate emergency response.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS	
Type of Product	This pertains to the product that was released from the pipeline. Document the product that is in the pipeline at point of incident at the time of the incident.
Description of Event	Give narrative description of incident. This will help others understand the facts and circumstances surrounding the incidents.
Local Agencies Notified / Time	Document local agencies and emergency response organizations contacted and the time of notification.

External Reporting Section

The Control Center is responsible for determining the external notifications to be made. However, if the Incident Commander requests the Control Center to assist in making other notifications, they may do so. The Manager of Control Centers is responsible for determination of the "reportability" of an incident. If there are questions, or the Manager of Control Centers needs assistance in determining whether or not a given incident is reportable, the Director Pipeline Safety will be consulted.

Non- Reportable	Check if the incident was determined to be non-reportable to State or Federal Agencies.
Initiate Leak Wheel	Check if the pipeline wheel is notified. The pipeline wheel is a predetermined list of pipeline operators that operate in the area of Kinder Morgan's pipeline. Document the date, time, and person (s) receiving notification.
OES	Check if the California's Office of Emergency Services (OES) was notified. Document the date, time, and person receiving notification and the OES number.
Other	Check if other external notifications were made that are not included elsewhere in this section. Document the date, time, and person receiving notification.
State Agency	Check, if other state agencies are notified. Document the date, time, and person receiving notification and State ID number.
NRC	Check if the National Response Center (NRC) is notified. Document the date, time, and person receiving notification and NRC number.

Leak Control & Remediation

The Incident Commander is responsible for determining the answers to this section. However times may be coordinated with others.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS	
Time Leak Stopped:	Document the time the leak was stopped. Use the 2400 hour clock.
Time Product was contained:	Document the time the leak was contained. Use the 2400 hour clock.
How was product contained:	Document the method that the product was contained.

Type of Repair Section

The Area Manager or Maintenance Manager is responsible for completing this section. Check the type of repair used.

Replaced	Replace means that the affected segment was cut out or the affected component removed and replaced.
Sleeve – Type A, Type B, Clock Spring	Sleeve means that the affected pipe was left in place and a pressure containing sleeve, non-pressure containing sleeve or a composite wrap was used as the repair method.
Torqued	Torque means to tighten the fitting or nut used as repair method to stop the leak. This typically refers to repairs on components.
Other: Describe	Check if a repair method other than the ones previously listed were used. Describe type of repair.

Method of Clean-up Section

The Area Manager or Maintenance Manager is responsible for completing this section. Check who was responsible for the clean up and the method used.

HQ Remediation	Check if the EHS Remediation Department was responsible for cleanup.
Local Environmental Contractor	Check if a local environmental contractor was responsible for cleanup.
Local Field Personnel	Check if local field personnel were responsible for cleanup.
Describe Cleanup:	Document the method of Cleanup.

Terminal Dome-out Section

The Area Manager is responsible for completing this section. If Equipment Failure was involved designate ownership of equipment or if it was Driver Error, check apparent cause of driver error.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS	
KMEP Equipment:	
Scully System Failure	Check if cause of event was due to failure of the Scully System. List the root cause of the failure.
Brodie Hung Open	Check if cause of event was due to failure of the Brodie Valve. List the root cause of the failure.
TMS Failure to Shutdown or Problem	Check if cause of event was due to failure of the TMS System. List the root cause of the failure.
Other	Check if cause of event was due to cause not otherwise listed. List the root cause of the failure.
Carrier Equipment:	
Sensors set too high	Check if cause of event was due to the failure of the Carriers sensors. List the root cause of the failure.
Other	Check if the cause of event was due to failure of the Carrier's equipment and not otherwise listed. List the root cause of the failure.
Driver Error:	
Retain on Truck	Check if cause of event was due to the driver was not aware of residual volumes on truck. List the root cause of the failure.
Two Compartments Opened	Check if cause of event was due to two compartments of the truck being opened. List the root cause of the failure.
Incorrect Preset	Check if cause of event was due to the incorrect volume being set by the Operator. List the root cause of the failure.
Other	Check if the cause of event was due to driver's error and not otherwise listed in this section. List the root cause of the failure.

FIGURE 3.8

FLAMMABLE LIQUIDS (Polar/Water-Miscible)

The following information is intended to provide the initial responder(s) with data that may be useful in making quick decisions and executing prompt response actions. The information is intended for guideline purposes only.

PRODUCTS **Ethanol and Ethanol Solutions**

HAZARD IDENTIFICATION / RECOGNITION

GUIDE NO. 127

DANGERS

- HIGHLY FLAMMABLE: Will be easily ignited by heat, sparks or flames.
- Vapors may form explosive mixtures with air.
- Vapors may travel to source of ignition and flash back.
- Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks).
- Vapor explosion hazard indoors, outdoors or in sewers.
- Those substances designated with a "P" may polymerize explosively when heated or involved in a fire.
- Runoff to sewer may create fire or explosion hazard.
- Containers may explode when heated.
- Many liquids are lighter than water.

HEALTH

- Move victim to fresh air. Call 911 or emergency medical service.
- Apply artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult.
- Remove and isolate contaminated clothing and shoes.
- In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes.
- Wash skin with soap and water.
- Keep victim warm and quiet.
- Ensure that medical personnel are aware of the material(s) involved, and take precautions.

PUBLIC SAFETY

- Isolate spill or leak area immediately for at least 25 to 50 meters (80 to 160 feet) in all directions.
- Keep unauthorized personnel away.
- Stay upwind.
- Keep out of low areas.
- Ventilate closed spaces before entering.

EVACUATION

Large Spill

- Consider initial downwind evacuation for at least 300 meters (1,000 feet).

Fire

- If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 meters (1/2 mile) in all directions; also, consider initial evacuation for 800 meters (1/2 mile) in all directions.

Information provided by the Emergency Response Guidebook 2008.

FIGURE 3.8 (Cont'd)

FLAMMABLE LIQUIDS (Non-Polar/Water-Immiscible)

The following information is intended to provide the initial responder(s) with data that may be useful in making quick decisions and executing prompt response actions. The information is intended for guideline purposes only.

PRODUCTS **Diesel Fuel** **Gasoline** **Fuel Oils (#1- #6)** **Jet Fuel**

HAZARD IDENTIFICATION / RECOGNITION

GUIDE NO. 128

DANGERS

- HIGHLY FLAMMABLE: Will be easily ignited by heat, sparks or flames.
- Vapors may form explosive mixtures with air.
- Vapors may travel to source of ignition and flash back.
- Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks).
- Vapor explosion hazard indoors, outdoors or in sewers.
- Those substances designated with a "P" may polymerize explosively when heated or involved in a fire.
- Runoff to sewer may create fire or explosion hazard.
- Containers may explode when heated.
- Many liquids are lighter than water.
- Substance may be transported hot.

HEALTH

- Move victim to fresh air. Call 911 or emergency medical service.
- Apply artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult.
- Remove and isolate contaminated clothing and shoes.
- In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes.
- Wash skin with soap and water.
- Keep victim warm and quiet.

- Keep unauthorized personnel away.
- Stay upwind.
- Keep out of low areas.
- Ventilate closed spaces before entering.

EVACUATION

Large Spill

- Consider initial downwind evacuation for at least 300 meters (1,000 feet).

Fire

- If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 meters (1/2 mile) in all directions; also, consider initial evacuation for 800 meters (1/2 mile) in all directions.

Information provided by the Emergency Response Guidebook 2008.

FIGURE 3.1a

INCIDENT SPECIFIC RESPONSE ACTIONS
PRODUCT RELEASE

Incident Type	Mitigation Actions
Flange, Valve, or Hose Leak	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Shut off flow to line ❑ Move to safe area ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify Qualified Individual or Alternate ❑ Secure area and eliminate ignition sources ❑ Tighten connection, if possible ❑ Initiate spill containment (if outside containment area) ❑ Block and purge affected equipment ❑ Initiate recovery/clean-up action as required.

Incident Type	Mitigation Actions
Tank Truck or Rack Valve Leak	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Stop transfer operation ❑ Move to safe area ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify Qualified Individual or Alternate ❑ Secure area and eliminate ignition sources ❑ Tighten connection, if possible ❑ Offload the leaking compartment ❑ Flush area into containment drains or other containment ❑ Initiate other cleanup action as required

Incident Type	Mitigation Actions
Pipeline Leak or Rupture	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Shut down system to control release ❑ Move to safe area ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify Qualified Individual or Alternate ❑ Secure area and eliminate ignition sources ❑ If possible, place containment under the leak ❑ Initiate spill containment (if outside containment area) ❑ Initiate other recovery/cleanup action as required

FIGURE 3.1a

INCIDENT SPECIFIC RESPONSE ACTIONS
PRODUCT RELEASE (Cont'd)

Incident Type	Mitigation Actions
Tank Leak or Rupture	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Stop flow into the tank ❑ Ensure dike drains are closed ❑ Move to safe area ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify Qualified Individual or Alternate ❑ Secure area and eliminate ignition sources ❑ Begin transferring contents to available tankage to reduce level ❑ Organize temporary tank patch and begin repair ❑ Initiate other response actions as required

Incident Type	Mitigation Actions
Tank Overfill	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Shut off transfer or flow to tank ❑ Ensure dike drains are closed ❑ Move to safe area ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify Qualified Individual or Alternate ❑ Secure area and eliminate ignition sources ❑ Begin transferring contents to available tankage to reduce level ❑ Initiate other response actions as required

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Company Personnel IC assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 11400 NW St. Helens Road
Portland, OR 97231
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility, if applicable.
h. Establish a Command Center immediately at the entrance to the Facility or where the Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the Control Building. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel IC will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the secondary command center or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility Main Office, Control Building, or the north or south staging area.

8.4 FACILITY EVACUATION (Cont'd)

4. Community Evacuation

The Company has confirmed with the Linnton Fire Department that no Community Evacuation Plan currently exists for this area. However, the Fire Department does have Standard Guidelines that are followed in the event of an evacuation.

5. Directions to Oregon Health & Science University Hospital

From the Facility go southwest on NW St. Helens Rd/Columbia River Hwy/US-30. Stay straight to go onto NW Yeon Ave. Take US-30 W. Merge onto I-405 S toward Beaverton. Take exit number 1C toward 6th Ave./US-26 E/Ross 1s. Br. The ramp becomes SW Broadway. Make a slight right onto SW 6th Ave., which becomes SW Terwilliger Blvd. Stay straight to go onto SW Sam Jackson Park Rd. OHSU is located at 3181 SW Sam Jackson Park Road.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gates located east of St. Helens Road.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

8. Prevailing Winds

The prevailing summer winds in the Facility area generally come from the northwest with speeds ranging from 10-15 knots. Winter winds are primarily from the east and southeast with speeds ranging from 10-15 knots.

9. Water Currents

Currents in the Willamette River average 0.5 knots.

FACILITY INFORMATION

GENERAL INFORMATION	
Facility Name:	Kinder Morgan Energy Partners, L.P.
Physical Address:	Willbridge Terminal 5880 NW St. Helens Rd. Portland, OR 97210 (503) 224-0319 / (503) 209-5046 *(24 Hrs)* (503) 220-1270 *(Fax)*
NAICS Code:	493190
EPA FRP Number:	FRP-37
Dun & Bradstreet Number:	618 450-886
Date of Initial Storage:	1915
Owner/Operator:	Kinder Morgan Energy Partners, L.P. 500 Dallas Street, Suite 1000 Houston, TX 77002 or 1100 Town & Country Road Orange, CA 92868
Qualified Individual: ***(Emergency Coordinator)*** ***(On-Site Firefighting Coordinator)*** (Work Address)	Jeff Hibner - Area Manager (b) (3), (b) (7)(F) (503) 220-1263 *(Work)* (b) (6) *(Mobile)*
Alternate Qualified Individual: ***(Alt. Emergency Coordinator)*** (Work Address)	Andrew Holbrook - Operations Manager Northwest (b) (3), (b) (7)(F) (503) 220-1257 *(Work)* (b) (6) *(Mobile)*
Telephone/FAX:	Additional telephone references, including 24 hour numbers, for the Facility, Owner, and QI/AQI are provided in Section 2 of Volume I.

* Company policy is to treat an employee's home address as confidential. This information is kept on file at the Regional Office (909) 877-2373, and Houston Corporate Office, Human Resources Dept. (713) 369-8876.

FACILITY INFORMATION (Cont'd)

FACILITY LOCATION	
County:	Multnomah County, OR
Latitude:	(b) (7)(F), (b) (3)
Longitude:	
River Mile:	Willamette River Mile 7
Area Map:	Provided in Figure 8.2
Facility Diagram:	Provided in Figure 8.3
Wellhead Protection Area:	None
Oil Spill Response Planning Zone:	Columbia River - Portland sub-zone
Facility Distance to Navigable Water:	Less than 0.25 miles
Landside Directions:	Starting at the airport, go northwest on NE Airport Way. NE Airport Way becomes Long Term Parking. Turn left onto Parking Exit, then left again onto NE Airport Way. Merge onto I-205/Veterans Memorial Hwy. At Exit 21B merge onto US-30 toward Portland. Merge onto I-405 S via exit number 302B. Merge onto US-30 W via exit number 3, then merge onto NW Yeon Ave. NW Yeon Ave. becomes NW St. Helens Rd. The Facility is located at 5880 NW St. Helens Rd.
Waterside Directions:	From the Columbia River travel southwest, south and southeast on the Willamette River approximately seven (7) miles. Facility is on the left descending bank approximately two (2) miles upstream of the St. Johns Bridge.

FIGURE 2.1c

COMPANY EMPLOYEE OTHER THAN OPERATOR - NON-CALIFORNIA NOTIFICATION PROCESS

This flowchart shows the appropriate notifications a company employee **other than an operator** is required to make ***immediately*** in the event of an actual or suspected release. This process is to ensure all levels of management are notified of the situation, as appropriate.

Internal notification references are provided in Figure 2.3a, b, c.

Company employee **other than an operator** is notified by telephone or becomes aware of a release or threatened release.

↓

Call Orange Pipeline Control Center.
NOTE: Control Center initiates ERL or ERL+ notifications

↓

Obtain information and complete Initial Reporting Details form
(See Figure 2.2)

↓

Notify 911 - Fire Department/Police as necessary.
NOTE: If emergency warrants, notify 911 first.

↓

Notify Area Manager. If Area Manager is not available, proceed until first notification is made to:

- Operations Manager
- Director of Operations
- V.P. of Operations

*ERL = Emergency Response Line. Initiated per External Notification References (see Fig. 2.4).
*ERL+ = Emergency Response Line Plus – Notification for any major event associated with the Company, such as: major disruption or operations shutdown, death of employee(s) or contract employee(s), or any fatality or injury to member of public.

INITIAL REPORTING DETAILS

Incident Name:_____ **Data Base Record #**_____

Date Event Occurred:_____ Time Event Occurred: _____ Time Reported to ORCC: _____

Reported by: _____ Area of Responsibility: _____

Contact #'s: _____

Address where incident occurred: _____

_____ County: _____

Location of Event relative to railways, highways, roads, residents, etc. _____

Incident occurred at:

- ❑ Terminal Name: _____
- ❑ Breakout Facility (*) Name: _____
- ❑ Pump Station/Booster Name: _____
- ❑ Pipeline LS _____ PLMP _____ Line Size _____
- ❑ Other _____

Did the event cause any of the following?

- Fire or Explosion ❑ Yes ❑ No
- Death or injury ❑ Yes ❑ No # of employees _____ # of non-employees _____
- Product into the Water ❑ Yes ❑ No
- Damage Greater than $50,000 ❑ Yes ❑ No

If yes to any of the above, describe weather conditions: _____

Did the Incident occur during:

- ❑ Maintenance
- ❑ Operational Activity
- ❑ Failure of Equipment/Non-pipe component (valve, seals, gasket, piping, etc.)
- ❑ Terminal Loading ❑ Dome out (release to atmosphere) ❑ Dome out (contained in truck)

Additional Description

Size of Wet Area Type of Product

Description of Event:

Local Agencies Notified/Time: (Fire, Police, 911, etc.)

Reporting Requirements (To be determined by ORCC)

- ❑ Non-Reportable ❑ OES (Calif.)
- ❑ Railroad ❑ Other _____
- ❑ NRC ❑ State Agency _____
- ❑ Initiate Leak Wheel Call-out

(*) Breakout Facility Definition: Facility that uses tanks and equipment for input into a pipeline i.e., Concord, Watson, Rocklin (portions of Colton & Tucson

Prepared by: _____ Date: _____

ORCC Fax 714/541-3682 Northern Region Fax 707/424-6089 Southern Region Fax 909/877-9036

Rev: 10/1/02

FIGURE 2.2 (Cont'd)

INITIAL REPORTING DETAILS

Incident Name:_____ **Data Base Record #**_____

Time Leak Stopped: _____ Time Product was Contained: _____

How was product contained: _____

_____

_____

_____

Type of Repairs Required: _____

- ❑ Replaced – Pipe or Component
- ❑ Sleeved – Type A, Type B, Clock Spring
- ❑ Torqued
- ❑ Other: Describe _____

Method of Clean-up:

- ❑ HQ Remediation
- ❑ Local Environment Contractor
- ❑ Local field Personnel

Describe Cleanup: _____

_____

_____

Terminal Dome-Out

KMEP Equipment:

- ❑ Scully System Failure
- ❑ Brodie Hung Open
- ❑ TMS Failure to Shutdown or Problem
- ❑ Other: Describe _____

Carriers Equipment

- ❑ Sensor set to high
- ❑ Other: Describe _____

Driver Error:

- ❑ Retain on truck
- ❑ Two Compartments Opened
- ❑ Hooked up to wrong compartment
- ❑ Incorrect Preset
- ❑ Other: Describe _____

ORCC Fax 714/541-3682 Northern Region Fax 707/424-6089 Southern Region Fax 909/877-9036

Rev: 10/1/02

NOTE: Completing this form does not satisfy the need to enter this information in the Leak Database.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS

The initial reporting detail form is used by the Control Center to document the necessary information for reporting to governmental agencies and the initial entry into the leak database. The initial responder and the Area Manger should use the form as a guideline to insure that the necessary information is available to the Control Center. However, reporting should not be delayed due to incomplete information. Some of this information will be collected as the emergency response continues or after repairs are completed. Area Managers, Maintenance Managers and the Manager of Control Centers are responsible for completing or coordinating the answers to this form. This form should be retained in the official leak file.

Instructions for completion of this form are as follows:

Incident Name — Document the name of the leak. It is typical for a given leak to be named. This name is used in subsequent discussion and documentation.

Database Number — This is the number automatically assigned in the leak database.

General Information Section

The Initial Responder is responsible for the answers to this section.

Date event occurred — This is the date of the month the incident is reported to the Control Center. This should be the date that there is evidence of a suspected leak. It may be different from the date the leak is confirmed or sufficient information is collected to indicate governmental reportability. However, if there are differences in the dates, the reason for differences should be documented.

Time event occurred — This is the time that evidence of a suspected leak is discovered. Time should be reported using the 2400 clock. The local time zone should be designated. It may be different from the time the leak is confirmed or determination that the incident is determined to be reportable to a government agency. However if the time is different, the reason for differences should be documented.

Time Reported to OCC — This is the time the event was reported to the Orange Control Center.

Reported by — This is the person who is reporting the suspected leak to the Orange Control Center.

Area of Responsibility — This is the name of the Area office where the suspected leak occurred.

Contact number — This is the telephone number that the control center (or others) will use to get further information, if needed.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS	
Address where incident occurred	This is the actual address or closest cross street address where the event occurred. It will be used to locate the incident site on maps and to communicate to others where event occurred.
County	This is County where incident occurred.
Location of event relative to Railways, highways, roads, residents, etc.	Give detail relative to other significant assets. This may be used to determine other emergency response action.

Facility Type Section

The Initial Responder is responsible for the answers to this section. Check the appropriate facility type.

Terminal	Refers to Truck Loading facilities, truck racks and associated storage. Document the name of the facility.
Breakout Facility	Refers to storage, piping, and equipment associated with pipeline transportation. There are two types of Breakout Tanks. Storage – where product comes from pipeline and then is reinjected back into pipeline for further transportation. Breakout also includes tanks associated with pipeline overpressure protection. Document the name of the facility.
Pump Station/Booster	This refers to pump stations associated with pipeline transportation. Document the name of the facility.
Pipeline	This refers to line pipe in the pipeline right-of-way. Document the Line Section number (LS), pipeline mile post (PLMP), and line size.
Other	This refers to valve sites, measurements stations and other facilities, such as gravitometer sites, in the pipeline right of way that is not at a breakout facility, pump station or line pipe. Document the name of the facility.

Consequence Section

The Initial Responder is responsible for the answers to this section. Check the consequence of the event. This is used to determine whether the event is reportable to DOT.

Fire or Explosion	If possible, denote whether fire or explosion was a result of the event or caused the event.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS	
Death or Injury	If possible, differentiate the number of employees and non-employees affected.
Product into the water	Denote if product resulted in pollution of any stream, river, lake, reservoir, or other similar body of water that violated applicable water quality standards, caused a discoloration of the surface of the water or adjoining shoreline, or deposited a sludge or emulsion beneath the surface of the water or upon adjoining shorelines.
Damage greater than $50,000	This includes cost of cleanup and recovery, value of lost product, and damage to the property of the operator or others, or both. In many cases this may not be known in the early stages of the incident, however leaks involving breakout tanks should be considered as having met this requirement.
Describe weather conditions	Document temperature, rain, and wind conditions (direction and estimated speed) if the incident involved a fire, explosion, death, injury requiring hospitalization, water, or damage greater than $50,000.
Activity Section	
The Initial Responder is responsible for the answers to this section. Document the activity of the system at the time the evidence of the incident was discovered.	
Maintenance	Check if maintenance activities are involved.
Operation Activity	This applies to normal operations, such as start up and shut down of pump(s) or pipeline, filling or emptying tanks.
Failure of Equipment	Check if failure of equipment was involved. Examples of "failure of equipment" includes malfunction of control or leak equipment, failure of components, seal failures etc.
Terminal Loading	This pertains to the actual loading transports.
Dome out	Dome outs should be documented. Only Dome outs released to the atmosphere should be reported to the Control Center and documented on this form.
Additional Descriptions Section	
The Initial Responder is responsible for the answers to this section.	
Size of Wet Area	This is useful to assist in the estimation of released product and determine appropriate emergency response.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS	
Type of Product	This pertains to the product that was released from the pipeline. Document the product that is in the pipeline at point of incident at the time of the incident.
Description of Event	Give narrative description of incident. This will help others understand the facts and circumstances surrounding the incidents.
Local Agencies Notified / Time	Document local agencies and emergency response organizations contacted and the time of notification.

External Reporting Section

The Control Center is responsible for determining the external notifications to be made. However, if the Incident Commander requests the Control Center to assist in making other notifications, they may do so. The Manager of Control Centers is responsible for determination of the "reportability" of an incident. If there are questions, or the Manager of Control Centers needs assistance in determining whether or not a given incident is reportable, the Director Pipeline Safety will be consulted.

Non- Reportable	Check if the incident was determined to be non-reportable to State or Federal Agencies.
Initiate Leak Wheel	Check if the pipeline wheel is notified. The pipeline wheel is a predetermined list of pipeline operators that operate in the area of Kinder Morgan's pipeline. Document the date, time, and person (s) receiving notification.
OES	Check if the California's Office of Emergency Services (OES) was notified. Document the date, time, and person receiving notification and the OES number.
Other	Check if other external notifications were made that are not included elsewhere in this section. Document the date, time, and person receiving notification.
State Agency	Check, if other state agencies are notified. Document the date, time, and person receiving notification and State ID number.
NRC	Check if the National Response Center (NRC) is notified. Document the date, time, and person receiving notification and NRC number.

Leak Control & Remediation

The Incident Commander is responsible for determining the answers to this section. However times may be coordinated with others.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS	
Time Leak Stopped:	Document the time the leak was stopped. Use the 2400 hour clock.
Time Product was contained:	Document the time the leak was contained. Use the 2400 hour clock.
How was product contained:	Document the method that the product was contained.

Type of Repair Section

The Area Manager or Maintenance Manager is responsible for completing this section. Check the type of repair used.

Replaced	Replace means that the affected segment was cut out or the affected component removed and replaced.
Sleeve – Type A, Type B, Clock Spring	Sleeve means that the affected pipe was left in place and a pressure containing sleeve, non-pressure containing sleeve or a composite wrap was used as the repair method.
Torqued	Torque means to tighten the fitting or nut used as repair method to stop the leak. This typically refers to repairs on components.
Other: Describe	Check if a repair method other than the ones previously listed were used. Describe type of repair.

Method of Clean-up Section

The Area Manager or Maintenance Manager is responsible for completing this section. Check who was responsible for the clean up and the method used.

HQ Remediation	Check if the EHS Remediation Department was responsible for cleanup.
Local Environmental Contractor	Check if a local environmental contractor was responsible for cleanup.
Local Field Personnel	Check if local field personnel were responsible for cleanup.
Describe Cleanup:	Document the method of Cleanup.

Terminal Dome-out Section

The Area Manager is responsible for completing this section. If Equipment Failure was involved designate ownership of equipment or if it was Driver Error, check apparent cause of driver error.

FIGURE 2.2 (Cont'd)

"INITIAL REPORTING DETAILS" FORM INSTRUCTIONS	
KMEP Equipment:	
Scully System Failure	Check if cause of event was due to failure of the Scully System. List the root cause of the failure.
Brodie Hung Open	Check if cause of event was due to failure of the Brodie Valve. List the root cause of the failure.
TMS Failure to Shutdown or Problem	Check if cause of event was due to failure of the TMS System. List the root cause of the failure.
Other	Check if cause of event was due to cause not otherwise listed. List the root cause of the failure.
Carrier Equipment:	
Sensors set too high	Check if cause of event was due to the failure of the Carriers sensors. List the root cause of the failure.
Other	Check if the cause of event was due to failure of the Carrier's equipment and not otherwise listed. List the root cause of the failure.
Driver Error:	
Retain on Truck	Check if cause of event was due to the driver was not aware of residual volumes on truck. List the root cause of the failure.
Two Compartments Opened	Check if cause of event was due to two compartments of the truck being opened. List the root cause of the failure.
Incorrect Preset	Check if cause of event was due to the incorrect volume being set by the Operator. List the root cause of the failure.
Other	Check if the cause of event was due to driver's error and not otherwise listed in this section. List the root cause of the failure.

FIGURE 3.8

FLAMMABLE LIQUIDS (Polar/Water-Miscible)

The following information is intended to provide the initial responder(s) with data that may be useful in making quick decisions and executing prompt response actions. The information is intended for guideline purposes only.

PRODUCTS **Ethanol and Ethanol Solutions**

HAZARD IDENTIFICATION / RECOGNITION

GUIDE NO. 127

DANGERS

- HIGHLY FLAMMABLE: Will be easily ignited by heat, sparks or flames.
- Vapors may form explosive mixtures with air.
- Vapors may travel to source of ignition and flash back.
- Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks).
- Vapor explosion hazard indoors, outdoors or in sewers.
- Those substances designated with a "P" may polymerize explosively when heated or involved in a fire.
- Runoff to sewer may create fire or explosion hazard.
- Containers may explode when heated.
- Many liquids are lighter than water.

HEALTH

- Move victim to fresh air. Call 911 or emergency medical service.
- Apply artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult.
- Remove and isolate contaminated clothing and shoes.
- In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes.
- Wash skin with soap and water.
- Keep victim warm and quiet.
- Ensure that medical personnel are aware of the material(s) involved, and take precautions.

PUBLIC SAFETY

- Isolate spill or leak area immediately for at least 25 to 50 meters (80 to 160 feet) in all directions.
- Keep unauthorized personnel away.
- Stay upwind.
- Keep out of low areas.
- Ventilate closed spaces before entering.

EVACUATION

Large Spill

- Consider initial downwind evacuation for at least 300 meters (1,000 feet).

Fire

- If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 meters (1/2 mile) in all directions; also, consider initial evacuation for 800 meters (1/2 mile) in all directions.

Information provided by the Emergency Response Guidebook 2008.

FIGURE 3.8 (Cont'd)

FLAMMABLE LIQUIDS (Non-Polar/Water-Immiscible)

The following information is intended to provide the initial responder(s) with data that may be useful in making quick decisions and executing prompt response actions. The information is intended for guideline purposes only.

PRODUCTS **Diesel Fuel** **Gasoline** **Fuel Oils (#1- #6)** **Jet Fuel**

HAZARD IDENTIFICATION / RECOGNITION

GUIDE NO. 128

DANGERS

- HIGHLY FLAMMABLE: Will be easily ignited by heat, sparks or flames.
- Vapors may form explosive mixtures with air.
- Vapors may travel to source of ignition and flash back.
- Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks).
- Vapor explosion hazard indoors, outdoors or in sewers.
- Those substances designated with a "P" may polymerize explosively when heated or involved in a fire.
- Runoff to sewer may create fire or explosion hazard.
- Containers may explode when heated.
- Many liquids are lighter than water.
- Substance may be transported hot.

HEALTH

- Move victim to fresh air. Call 911 or emergency medical service.
- Apply artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult.
- Remove and isolate contaminated clothing and shoes.
- In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes.
- Wash skin with soap and water.
- Keep victim warm and quiet.
- Ensure that medical personnel are aware of the material(s) involved, and take precautions.

PUBLIC SAFETY

- Isolate spill or leak area immediately for at least 25 to 50 meters (80 to 160 feet) in all directions.
- Keep unauthorized personnel away.
- Stay upwind.
- Keep out of low areas.
- Ventilate closed spaces before entering.

EVACUATION

Large Spill

- Consider initial downwind evacuation for at least 300 meters (1,000 feet).

Fire

- If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 meters (1/2 mile) in all directions; also, consider initial evacuation for 800 meters (1/2 mile) in all directions.

Information provided by the Emergency Response Guidebook 2008.

FIGURE 3.1a

INCIDENT SPECIFIC RESPONSE ACTIONS
PRODUCT RELEASE

Incident Type	Mitigation Actions
Flange, Valve, or Hose Leak	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Shut off flow to line ❑ Move to safe area ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify Qualified Individual or Alternate ❑ Secure area and eliminate ignition sources ❑ Tighten connection, if possible ❑ Initiate spill containment (if outside containment area) ❑ Block and purge affected equipment ❑ Initiate recovery/clean-up action as required.

Incident Type	Mitigation Actions
Tank Truck or Rack Valve Leak	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Stop transfer operation ❑ Move to safe area ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify Qualified Individual or Alternate ❑ Secure area and eliminate ignition sources ❑ Tighten connection, if possible ❑ Offload the leaking compartment ❑ Flush area into containment drains or other containment ❑ Initiate other cleanup action as required

Incident Type	Mitigation Actions
Pipeline Leak or Rupture	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Shut down system to control release ❑ Move to safe area ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify Qualified Individual or Alternate ❑ Secure area and eliminate ignition sources ❑ If possible, place containment under the leak ❑ Initiate spill containment (if outside containment area) ❑ Initiate other recovery/cleanup action as required

FIGURE 3.1a

INCIDENT SPECIFIC RESPONSE ACTIONS
PRODUCT RELEASE (Cont'd)

Incident Type	Mitigation Actions
Tank Leak or Rupture	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Stop flow into the tank ❑ Ensure dike drains are closed ❑ Move to safe area ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify Qualified Individual or Alternate ❑ Secure area and eliminate ignition sources ❑ Begin transferring contents to available tankage to reduce level ❑ Organize temporary tank patch and begin repair ❑ Initiate other response actions as required

Incident Type	Mitigation Actions
Tank Overfill	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Shut off transfer or flow to tank ❑ Ensure dike drains are closed ❑ Move to safe area ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify Qualified Individual or Alternate ❑ Secure area and eliminate ignition sources ❑ Begin transferring contents to available tankage to reduce level ❑ Initiate other response actions as required

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Company Personnel IC assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 5880 NW St. Helens Rd.
Portland, OR 97210
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility and Burlington Northern if applicable.
h. Establish a Command Center immediately at the entrance to the Facility or where the Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the Control Building. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel IC will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the secondary command center or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility main office (Building #6) or the warehouse (Building #2).

4. Community Evacuation

The Company has confirmed with the Portland Fire Department that no Community Evacuation Plan currently exists for this area. However, the Fire Department does have Standard Guidelines that are followed in the event of an evacuation.

5. Directions to Oregon Health & Science University Hospital (OHSU)

From the Facility go southwest on NW St. Helens Rd/Columbia River Hwy/US-30. Stay straight to go onto NW Yeon Ave. Take US-30 E. Merge onto I-405 S toward Beaverton. Take exit number 1C toward 6th Ave./US-26 E/Ross Is. Br. The ramp becomes SW Broadway. Make a slight right onto SW 6th Ave., which becomes SW Terwilliger Blvd. Stay straight to go onto SW Sam Jackson Park Rd. OHSU is located at 3181 SW Sam Jackson Park Road.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gates located northeast of NW Culebra Avenue.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram in Section 8.2.

8. Prevailing Winds

The prevailing summer winds in the Facility area generally come from the northwest with speeds ranging from 10-15 knots. Winter winds are primarily from the east and southeast with speeds ranging from 10-15 knots.

9. Water Currents

Currents in the Willamette River average 0.5 knots.

AGENCY CORRESPONDENCE

STATE OF WASHINGTON
DEPARTMENT OF ECOLOGY
PO Box 47600 • Olympia, WA 98504-7600 • 360-407-6000
711 for Washington Relay Service • Persons with a speech disability can call 877-833-6341

May 13, 2014

David Rowland
Kinder Morgan Harbor Island
2720 13th Ave. SW
Seattle, WA 98134

Dear Mr. Rowland:

We have received and reviewed the update sent to our office May 6, 2014. The following changes are noted relating to this update:

- Updated Internal Notifications- Crisis Support Team, replace Chuck Mathis with Rod Dillon (Figure 2.2)
- Updated External Notifications- Response Contractors to reflect MSRC contact information (Figure 2.3)
- Updated Wildlife Facilities, Equipment, and Personnel to reflect MSRC information pg. 6-6.
- Updated Shoreline Response Resources to reflect MSRC information on pg. 6-10.
- Updated App. B to include MSRC information in scenarios and Washington State Planning Standards table on pg. B-5
- Updated contact information for Contracted Response Resources on pg. A-6. New service agreement and equipment lists for MSRC.
- New letter of intent from Global Diving & Salvage for spill response services, including equipment list.

These changes to your plan have been added to our copies of your oil spill contingency plan residing at the Department of Ecology.

Enclosed is a copy of the planning standard spreadsheet Ecology has calculated for your contingency plan, which reflects the change in your response contractor. Please add this spreadsheet to your contingency plan by printing the "Summary" tab. Include the following link in your plan to access the full, detailed spreadsheets. Your spreadsheets will remain available at this location.

ftp://ecy.wa.gov/spills/Planning%20Spreadsheets/KinderMorganLiquidsTerminalHarborIsland/

If you have any questions regarding your oil spill contingency plan please contact me at (360) 407-7281. As always, we appreciate your partnership in protecting Washington State's marine environment.

Sincerely,

Danielle Butsick

June 28, 2010

Jeffery Hibner
Kinder Morgan Liquid Terminals, LLC
Area Manager
2720 13th Avenue SW
Seattle, WA 98134

Dear Mr. Hibner:

Congratulations, on behalf of the state of Washington I am granting final approval to the Kinder Morgan Harbor Island oil spill contingency plan. The plan meets Washington's statutory and regulatory requirements and must be maintained in an accurate condition. Please add a copy of the enclosed certificate to the front of each plan as proof of compliance. This approval expires on June 28, 2015.

Your work to improve this plan is a significant milestone in the history of Washington's preparedness program. The new regulatory standards have improved plans and resulted in:

- Response equipment pre-staged in more than 45 locations around the state, effective in fast flowing rivers, shallow waters, estuaries, and open waters.
- Commitment to a variety of drills that will test all aspects of your plan over time.
- Participation in our program to verify maintenance of all spill response equipment including boats, trucks, boom, vacuum devices and skimmers.
- New standards for non-dedicated workboats, shoreline cleanup crews, and aerial surveillance.

Thank you for your cooperation and patience throughout the process. If you have questions, please contact your plan manager, Sabrina Payne at (360) 407-6394 or spay461@ecy.wa.gov.

Sincerely,

Linda Pilkey-Jarvis
Preparedness Section Manager
Spill Prevention, Preparedness, and Response

Attn: Chuck Mathis
500 Dallas Street
Houston, TX 77002

Dear Mr. Chuck Mathis:

Your Facility Response Plan submitted to this office on March 5, 2012, to meet the requirements of the Oil Pollution Act of 1990, and 33 CFR 154, Subpart F is approved.

I commend your efforts in maintaining a Facility Response Plan that reflects your company's commitment to this program. Your response plan will help ensure effective oil spill response and mitigation. Please be sure that all parties with responsibilities under the plan are familiar with the plan's procedures and requirements.

You are reminded that Kinder Morgan is prohibited from handling, storing, transporting, transferring, or lightering oil unless it is operating in full compliance with this plan. Compliance includes ensuring the required response resources are in place and available through contract or other approved means.

Your plan's approval will remain valid until 5 years from the date of submittal. You must review your plan annually and resubmit the plan to the Coast Guard for re-approval six months before the end of the approval period as required by 33 CFR 154.1065. If there are questions please contact the Sector Puget Sound, Facilities and Containers Branch at 206-217-6165 or email d13-pf-spsfac@uscg.mil.

Please keep a copy of this letter with your plan.

Sincerely,

J.D. Dwyer
U.S. Coast Guard
Chief Inspections Division
By Direction of the Captain of the Port

RESPONSE EQUIPMENT/RESOURCES

The following sections outline the various response equipment/resources available from the Facility, other Company facilities, Oil Spill Removal Organizations, and other outside resources.

A.1 FACILITY RESPONSE EQUIPMENT

This Facility maintains response equipment readily available for spill response as detailed on the "Response Equipment Inventory" list provided in Figure A.1. The equipment is stored at locations in the Facility as detailed on the equipment lists.

The preventative maintenance schedule requires a monthly inventory and visual inspection of spill response equipment. Maintenance and repair is performed as needed, following manufacturers recommended procedures. Spill response equipment maintenance records are kept for at least five (5) years and will be made available if requested by the EPA, USCG or WDOE. The equipment will be exercised semi-annually as required by PREP Guidelines. A sample form for documenting these Equipment Deployment Exercises is provided in Appendix G.

The Qualified Individual has the authority to activate these and other Company resources or that of private contractors and other experts and consultants as the situation demands.

A.2 OTHER COMPANY RESOURCES

Additional Company spill response equipment and manpower resources may be available to supplement the response operation.

A.3 CONTRACT RESOURCES

In the event of a discharge which is beyond the initial response capabilities of the Local Response Team, contract manpower and equipment resources can be obtained through Oil Spill Removal Organization(s) (OSRO) / Primary Response Contractor (PRC). These OSROs / PRCs can provide manpower and containment/clean-up equipment for the response operation. The Company will ensure that each OSRO / PRC has a comprehensive maintenance program and applicable training / drills programs in place at contract renewal.

Response resources, including spill tracking and aerial surveillance, will be secured from a Company approved contractor. Facility Management will typically handle notification/implementation of these resources. Section 2 of this Plan provides a quick reference to the OSROs / PRCs and additional clean-up and response contract organizations. Specific reference to their response capability (UCSG OSRO classification) is provided in Figure A.3.

These OSROs / PRCs have adequate equipment and personnel resources available to respond to the applicable regulatory planning volumes in the required time frames.

OSROs / PRCs have the expertise to conduct and lead on water and shoreline containment and recovery efforts. Company personnel will oversee and coordinate with the OSRO / PRC to ensure their actions conform with overall incident objectives and established incident action plans.

A.4 COOPERATIVE/MUTUAL AID RESOURCES

Cooperative/mutual aid resources are not currently available to the Facility.

A.5 EXPERTS AND CONSULTANTS

The Company maintains a relationship with various environmental and technical consultants that can provide support in the event of an emergency incident. These consultants can provide expertise and support in the areas of emergency response management, environmental services, site assessment, permitting, waste treatment, recycling, dewatering, hazardous waste disposal, and remediation.

A.6 VOLUNTEERS

Volunteers will not be utilized by the Company for the response operations. All volunteers will be referred to the State or Federal On-Scene Coordinator.

A.7 COMMUNICATIONS

Effective and efficient communications systems are essential for emergency response at every level. The communications system will be utilized to gather information and current status reports as well as to provide coordination and direction to widely separated work groups involved in search, containment/ diversion, repair, traffic control, public control or evacuation, and restoration.

Communication of the overall spill response operation between the Company and the responsible government agencies in the Federal Regional Response Team (RRT) will occur between the Incident Commander and the Federal On-Scene Coordinator.

A.7.1 Central Communications System

Prearranged communication channels are of the utmost importance in dealing with emergencies. The notification procedures and telephone contacts documented in Section 2 will be reviewed in accordance with the earlier documented updating procedures. The predetermined communications channels include the following:

- A list of required Federal and state emergency telephone numbers for the Orange Control Center and emergency response personnel (Figure 2.1).
- A list of emergency telephone numbers for various external resources such as the fire and police department, medical, and regulatory agencies (Figure 2.1).
- A list of emergency telephone numbers for contract response resources (Figure 2.1).

A.7 COMMUNICATIONS (Cont'd)

A.7.2 Communications Equipment

Field communications during a spill response to a small or medium discharge will be handled via the existing Company communications network. This network will utilize existing radios, telephones, pagers, fax machines, and computers and will be maintained by Company personnel. In the event of a Worst Case Discharge, field communications will be enhanced with other Company and contract resources as the situation demands.

Each Company responder has, at a minimum, a cellular telephone. All Company response personnel also have access to other telephones, radios and satellite communications equipment that may be needed for effective response operations. Additionally, communications equipment is maintained in the Company spill response trailers. The Logistics Officer would create a communications plan based on the equipment immediately available and would identify the need for any additional equipment that may be needed throughout the response effort.

3.8.3 Communication Types

Radios - Handheld and vehicle mounted radio sets are the most effective means of communication for the field response operation. The units are battery operated, multi-channeled and have a typical range that will cover the area of the response operation. Each location maintains a minimum of 4 radio sets, functionally maintained per manufacturer's specifications and kept in designated Company response trailers. In addition, the Company also utilizes radio sets provided by contract resources. Additional radio sets and battery packs/charges will be necessary in the event of a prolonged response operation.

Telephone (Conventional) - Conventional land line telephones are the most effective means of communication for regulatory and advisory notifications during a spill response operation. Additional telephone lines can be installed in the event of a prolonged response operation.

Telephone (Cellular) - Cellular telephones allow for added mobility and response effectiveness. Cellular phones are commonly maintained by certain Company personnel. Additional cellular phones can be secured in the event of a prolonged response operation.

Pagers - Pagers are used for rapid notification to field personnel when radio and telephone resources are limited. Most response team members carry a pager.

FAX Machines - FAX machines allow for a rapid transfer of information/ documentation such as status reports/updates, written notifications, and purchase orders.

Computers - Computers are commonly used in networks which allow access to various other locations and Company personnel. Computers also speed the consolidation of information and preparation of written reports.

FIGURE A.1

RESPONSE EQUIPMENT INVENTORY

Item	Quantity	Location	Year Acquired
SPILL RESPONSE EQUIPMENT			
Spill Containment Boom 24" Petrobarrier	400'	Dock Response Trailer	Approximately 1990 & 2008

Misc.	4 ea. 3M Sorbent Pads (100 ct. - HP 156) 2 ea SPC1900 Sorbent Sweep _____ 2 ea. SXT638 Sorbent Roll _____ 2 ea. SPC 150 sorbent roll _____ 4 ea. Ergon Sorbent Boom E810 8" x 10" _____	A Yard Emergency Response Supplies South End of Storage Building	Replaced as needed.
100' Sorbent Sweep Boom	3 each	Dock Storage	Replaced as needed.
Sorbent Pads	5 Bales	Dock Storage Container	Replaced as needed.

All contractor response equipment to be available during a spill event can be found on the Western Response Resource List (WRRL) website: www.wrrl.us/index.html

Note: All Facility emergency response equipment is maintained in an operable status at all times. Equipment is inspected quarterly. All equipment maintenance records are maintained at the Facility for five (5) years. A sample inspection form is located in Appendix G.

The Company primarily relies on its Primary Response Contractor during spill scenarios.

FIGURE A.2

CONTRACTED RESPONSE RESOURCES

AMPD INFORMATION

- **AMPD response provider**

OSRO / Clean-up Contractor	Contract Expiration Date
Harbor Island Terminal (Equipment deployment personnel are located at equipment site.)	Proprietary Equipment

- **Equipment Address (*1-hour response time):**

Boom: Harbor Island Terminal
2720 13th Ave. SW
Seattle, WA 98134

- **Equipment Address (*2-hour response time):**

Skimmer (Vacuum Trucks): Harbor Island Terminal
2720 13th Ave. SW
Seattle, WA 98134

Temporary Storage: Harbor Island Terminal
2720 13th Ave. SW
Seattle, WA 98134

- **Aerial Oil Tracking Capabilities:**
Aircraft, pilots and trained observers capable of arriving on scene within 6 hours will be sourced from Marine Spill Response Corporation.

**Planning Assumptions*: *On-water speed, 5 knots; land speed, 35 miles per hour; notification/mobilization – 30 minutes.*

[1] Rivers/canals include bodies of water, including the Intracoastal Waterway and other bodies artificially created for navigation, confined within an inland area and having a project depth of 12 feet (3.66 meters).

[2] EDRC stands for "effective daily recovery capacity," or the calculated recovery capacity of oil recovery devices determined by using a formula that takes into account limiting factors such as daylight, weather, sea state, and emulsified oil in the recovered material.

[3] TSC stands for "temporary storage capacity," meaning sufficient storage capacity equal to twice the EDRC of an OSRO. Temporary storage may include inflatable bladders, rubber barges, certified barge capacity, or other temporary storage that can be utilized on scene at a spill response and which is designed and intended for the storage of flammable or combustible liquids. It does not include vessels or barges of opportunity for which no pre-arrangements have been made. Fixed shore-based storage capacity, ensured available by contract or other means, will be acceptable.

* In addition, 1,000 feet of containment boom plus 300 feet per skimming system.

Diving & Salvage Incorporated

April 23rd 2014

KINDERMORGAN LIQUIDS TERMINAL
2720 13th Ave SW
Seattle, WA 98134

Attn: David Rowland

Re: Environmental Response Under OPA-90

Work Scope and Performance:

Thank you for your inquiry into Global Diving & Salvage, Inc.'s response capabilities. You have our permission to list Global among the response resources in your facility/vessel contingency plans. It does not guarantee a performance standard or obligate Global to respond. Any response would be subject to the availability of our personnel and equipment. This authorization extends only to pollution services. Global's personnel, equipment and materials will be billed out in accordance with our most current tariff rates.

Period of Performance:

This listing is valid from January 1st 2014 through January 1, 2015.

For your records, Global Diving & Salvage, Inc. is currently registered as a Washington State Department of Ecology Primary Response Contractor. Please contact Global directly should you require a copy of this certification. A current Certificate of Insurance is also available upon request.

Respectfully Submitted,

Connie Alvarez
Office Manager
Pacific Northwest Region
Global Diving & Salvage, Inc.

APPENDIX B

WORST CASE DISCHARGE ANALYSIS AND SCENARIOS

Page

B.1 Discharge Scenarios B-2

B.2 EPA Planning Distance Calculation B-7

B.3 Response Capability Scenarios B-7

Small Discharge B-9

Medium Discharge B-14

Worst Case Discharge B-16

Oil Spill Trajectory B-23

B.1 DISCHARGE SCENARIOS

The Facility is classified as a "Complex Facility" which operates in a High Volume Port Area.

"Complex" means a facility possessing a combination of transportation-related and non-transportation-related components that is subject to the jurisdiction of more than one Federal agency under section 311(j) of the Clean Water Act (CWA).

Complexes must perform discharge calculations for each jurisdictional agency and plan for the largest Worst Case Discharge Volume pursuant to the respective regulations. The EPA, WDOE and USCG discharge volume calculations are described as follows:

EPA Discharge Volume Calculation
• **Worst Case Discharge** *100% of the largest single tank* **WCD** = (b) (7)(F), (b) (2)
• **Medium Discharge** *Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD* **MD** = 857 bbls
• **Small Discharge** *Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD* **SD** = 50 bbls

WDOE Worst Case Spill Volume Calculation
(b) (7)(F), (b) (3)

B.1 DISCHARGE SCENARIOS (Cont'd)

USCG Discharge Volume Calculations
- Worst Case Discharge (WCD)
(b) (7)(F), (b) (3)

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

Plan Holder: Kinder Morgan Harbor Island

Planning Standard Summary Analysis: WAC 173-182-355 Transfer sites for covered vessels and facilities with vessel terminal.

The summary analysis spreadsheet is based on a conceptual model of equipment that would be available based on the guidelines set forth in WAC 173-182 for; planning standards, determining effectiveness of recovery systems, documenting compliance with planning standards, and plan evaluation criteria. Actual times and performance in spills will depend on the conditions of the day. An electronic version of the equipment detail spreadsheet which lists all equipment can be made available by Ecololgy upon request.The planning standard summary analysis indicates total access to boom, storage and recovery resources required to meet the planning standard. Equipment access is based on information listed on the WRRL and information provided through the plan holder contingency plan and Primary Response Contractor applications as of **4/4/2014**. This information is subject to change as additional equipment is acquired and/or relocated. Substantive changes will result in an update of the spreadsheets.

B.2 EPA PLANNING DISTANCE CALCULATION

In lieu of planning distances, the Company has provided a 72-hour Spill Trajectory as required by the State of Washington Department of Ecology. The trajectory depictions are located at the end of this section.

B.3 RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Appendix A. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls
A Small Discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons). ***Description*** This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to, • Pump seal leak • Truck loading rack hose rupture • Valve leak • Container rupture • Storage spill The most likely location for a discharge of this size would be at the loading rack, or leaking piping and would be Gasoline. This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge. ***Prevention*** Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures. ***Additional Comments*** While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the Facility could be diverted to the product tanks. The closest waterway is the Duwamish Waterway East, which is east of the Facility. The storage tanks and truck loading racks have adequate secondary containment so it is unlikely that a spill would reach the river. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, as appropriate, include:

- 1,000' of containment boom (or two times the length of the largest vessel that regularly conducts oil transfers to or from the facility, whichever is greater) and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a *Small Discharge* or greater which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a *Small Discharge* with the manpower and local contract resources as detailed in Appendix A.

- A 50 bbls discharge typically will not escape the containment of the Facility.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack while loading Gasoline. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Offsite Impact

- The closest waterway is the Duwamish Waterway East, which is east of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the river. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be deployed at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage tanks, as the situation demands.
- Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Notes:

- Equipment and manpower resources are detailed in Appendix A.
- Telephone references are provided in Section 2.
- Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

This section outlines a fictitious incident involving a small spill scenario which illustrates how the KMEP Harbor Island Terminal could be expected to respond to a small oil spill. It must be noted that, due to the number of spill containment devices and features in place, and the fact that most areas within the Facility are monitored on a 24-hour basis, this scenario is extremely unlikely to occur and should be viewed only as a hypothetical situation.

While the Barge *Roseanne* unloads diesel to the KMEP tank farm, a hose ruptures. At the time of the rupture, two Terminal Operators are on duty at the Facility. Heavy rain and wind interfere with detection of the spill and communication between Facility personnel and the tankerman. Approximately 500 gallons of diesel is spilled onto the dock and into the water before the tankerman can hit the emergency shut-off for the transfer pump.
Time: 4:00 am.
Tide: Low.
Current: Negligible.
Wind: From S at 15 knots.
Weather: Rain, 50°

Time	Action
	Day 1
4:00 am	The Terminal Operator follows the established emergency procedures posted on the wall of the control house on the dock, i.e. 1. Stop the product flow. 2. Warn personnel in area. 3. Shut off ignition sources. 4. Contact the Area Manager. 5. Initiate containment on the deck and in the water.
4:15 am	The Area Manager is notified and assumes the role of KMEP Incident Commander (IC) and activates the notification procedures outlined in Section 2.2. The IC's report includes weather conditions and an estimate of spill size and direction of movement and other pertinent information and is recorded on an Initial Reporting Details form (Figure 2.2). Initial spill volume is reported as 100 gallons. The IC activates Marine Spill Response Corporation (MSRC). ETA of MSRC personnel and equipment is 2

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Time	Action
	Day 1 (Cont'd)
4:30 am	Facility personnel use the Facility's response boat to deploy 1500' of containment boom and available sorbent boom around the barge.
4:45 am	MSRC Cleanup Manager arrives at the Harbor Island Terminal. A command post is established inside the terminal office using the portable VHF radios, telephones and cellular telephones. As a precautionary measure, the IC notifies the Seattle Aquarium located at Pier 59, Elliott Bay Marina located below Magnolia Bluff--just west of the Pier 90/91 complex, and the Washington State Ferries at Colman Dock about the spill.
5:00 am	The tankerman advises that, based on pre- and post-spill tank soundings, the estimated spill size is 500 gallons. The IC requests additional equipment and personnel from MSRC. A skimmer, on trailer; 100 gpm/1,200 gallon capacity), with crew of two, and a 3,000 gallon vacuum truck are dispatched from MSRC. ETA on-scene (with skimmer in water, operational) is about 2-2.5 hours from time of notification.
5:30 am	USCG personnel arrive on scene from the Marine Safety Office to investigate the spill and monitor cleanup operations. The IC and Coast Guard personnel form a Unified Command and form up an ICS Organization with personnel from the Terminal, Kinder Morgan, and supported by USCG personnel. The MSRC Representative operates under the Operations Section.
5:45 am	MSRC work vessel with 1000' of containment boom arrive on scene. The Unified Command directs the immediate deployment of this boom from the NE tip of Terminal 18 to the NW tip of Pier 36 to contain the majority of the product within the East Waterway.
6:00 am	The local fire department, notified of spill by the Washington State Emergency Management Division (WEMD), conducts own air/vapor analysis in the spill area for volatility levels, with special emphasis under the dock. They find no abnormal readings, but will, as a precaution, stand by to monitor cleanup operations.
6:15 am	Four (4) additional MSRC HAZWOPER trained personnel arrive at the Terminal to assist with clean up operations.
6:40 am	The Coast Guard establishes a safety zone in the vicinity of the spill and broadcasts a Local Notice to Mariners concerning the closure of the East Waterway of the Duwamish River.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Time	Action
	Day 1 (Cont'd)
7:00 am	Representatives from WDOE arrive on scene from Northwest Regional Office in Bellevue to manage the Environmental Unit under Planning Section as well as investigate and monitor situation. The IC conducts an initial briefing to all response personnel including Federal On-Scene Coordinator (FOSC) State On-Scene Coordinator (SOSC), and representatives from all participating organizations at the Terminal. Local police, fire and HAZMAT teams are contacted for assistance in restricting access to shorelines determined likely to be impacted.
7:15 am	MSRC' 3,000 gallon vac-truck arrives at the Terminal with a crew of two (2) HAZWOPER trained personnel, and begins recovery operations alongside the dock -- inside the containment boom. MSRC' 28' Marco 1C skimmer arrives off the end of Terminal 18 with a crew of two (2) HAZWOPER trained personnel. The skimmer first makes several passes at small ribbons of sheen floating just north of Terminal 18.
	Day 2 and Beyond
	Containment, recovery and cleanup operations continue as before. Response operations will continue until cleanup is judged satisfactory by USCG and WDOE representatives.
NOTE:	There are MSRC skimmers capable of arriving on scene within 3.5 hours after notification. They would arrive by water from Anacortes, Bellingham and Port Angeles. The combined maximum recovery capacity of these vessels (Cormorant, Crane, Heron and Western Gull) is 76,980 gph (x 20% efficiency factor = 15,396). Nine (9) additional contractor or MSRC skimmers could arrive fpr planning purposes, overland and by water from Port Angeles, Port Ludlow, Seattle and Tacoma, within 6 hours. The combined maximum recovery capacity of these nine (9) vessels is 136,200 (x 20% efficiency factor - 27,240 gph). Within 12 hours, MSRC could have another 36,700' of boom as defined in regulations.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A Medium Discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Spills of this size would likely be Gasoline. Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before a spill containment could begin. The spilled material would more than likely collect in the containment area sump system and be routed to the separator system. If a spill of this size escaped the property it could possibly enter the Duwamish Waterway East. Adverse weather conditions would increase the chances of a discharge entering the river; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages are listed in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a Medium Discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 3.

The closest waterway is the Duwamish Waterway East so the potential for a spill of this size reaching navigable water does exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity (EDRC) equal to 50% of the Medium Discharge volume that is capable of arriving on scene within 12 hours.
- Sufficient quantity of containment boom must arrive within 12 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Appendix A and will arrive within 12 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 12 hours; Tier 2 = 36 hours; Tier 3 = 60 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) is capable of being on scene within 12 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage tanks.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the river.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Appendix A.
- Telephone references are provided in Section 2.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed (b) (7)(F), (b) (3)

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached). Spills of this size would likely be Gasoline.

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages are listed in the Potential Spill Sources and Container Identification table in Appendix C.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow east toward the Duwamish Waterway East.

For a spill that is confined to the land along the pathway, Facility personnel would contain the spill using dams or trenches.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Ditch Containment

A spill may be contained in stormwater ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located west of the Duwamish Waterway East. The priority during larger spills is to prevent oil from reaching the waterway. OSROs are under contract with the Facility. The Company, however, will use Facility personnel and Facility owned equipment to initiate initial boom deployment and anchoring at the waterway within a reasonable time. Several recreation areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by state and Federal trustees would likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity (EDRC) equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.
- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate "immediate response actions" located in Section 3 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage tanks.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

Notes:

- Equipment and manpower resources are detailed in Appendix A.
- Telephone references are provided in Section 2.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

This section outlines a fictitious incident involving a worst case discharge scenario which illustrates how the KMEP Harbor Island Terminal could be expected to respond to a major oil spill. It must be noted that, due to the number of spill containment devices and features in place, and the fact that most areas within the Facility are monitored on a 24-hour basis, this scenario is extremely unlikely to occur and should be viewed only as a hypothetical situation.

A 12" transfer line ruptures within the tank yard area as the containment wall suffers a structural failure. The worst case quantity of marine fuel oil (bunker C) is spilled in the tank farm area and moves through breaks in the containment wall across the street to Terminal 18 and into the water.
Time: 1:00 pm.
Tide: Flooding, 2 hours till peak.
Current: Negligible.
Wind: From N at 10 knots.
Weather: Rain, 50°.
Southwesterly winds continue into early evening and then shift toward the south.

Time	Action
	Day 1
1:15 pm	The Area Manager is onsite to act as the KMEP Incident Commander (IC). The Area Manager makes an initial assessment of explosion or safety hazards and spill conditions and then initiates notification of emergency contacts as outlined in Section 2.2. The IC's report includes weather conditions and an estimate of spill size and direction of movement and other pertinent information and is recorded on an Initial Reporting Details form (Figure 2.2).
1:25 pm	Marine Spill Response Corporation (MSRC) dispatch initiates the internal call down procedure. The MSRC Cleanup Manager is contacted and in turn notifies spill response personnel to begin mobilization from both the Puget sound area spill response centers and other local response contractors and coops (e.g. Global Environmental, Clean Sound) for assistance through their agreements.
2:15 pm	MSRC response van and FRV (32' fast response vessel, containing 1000' of containment boom) arrives on scene.
2:25 pm	The local fire department, notified of spill by the Washington State Emergency Management Division (WEMD), conducts own air/vapor analysis in the spill area for volatility levels, with special emphasis under the dock. They find no abnormal readings, but will, as a precaution, stand by to monitor cleanup operations.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Time	Action
	Day 1 (Cont'd)
2:30 pm	MSRC Cleanup Manager arrives at the Harbor Island Terminal. A command post is established inside the terminal office using the portable VHF radios, telephones and cellular telephones. As a precautionary measure, the IC notifies the Seattle Aquarium located at Pier 59 about the spill, Elliott Bay Marina located below Magnolia Bluff--just west of the Pier 90/91 complex, and the Washington State Ferries at Colman Dock.
2:35 pm	Four (4) additional MSRC HAZWOPER trained personnel arrive at the Terminal to assist with clean up operations. USCG personnel arrive on scene from the Marine Safety Office to investigate the spill and monitor cleanup operations. The IC and Coast Guard personnel form a Unified Command and form up an ICS Organization with personnel from the Terminal, Kinder Morgan, and supported by USCG personnel. The MSRC Representative operates under the Operations Section. The Unified Command directs the immediate deployment of approximately 1000' containment boom from the NE tip of Terminal 18 to the NW tip of Pier 36 to contain the majority of the product within the East Waterway. The southerly wind will push the oil to the north of the boom. When additional boom arrives, 1000' will be placed at the northern end of the East Waterway.
2:40 pm	The Coast Guard establishes a safety zone in the vicinity of the spill and broadcasts a Local Notice to Mariners concerning the closure of the East Waterway of the Duwamish River.
3:00 pm	Representatives from WDOE arrive on scene from Northwest Regional Office in Bellevue to investigate and monitor situation. The IC conducts an initial briefing to all response personnel including Federal On-Scene Coordinator (FOSC) State On-Scene Coordinator (SOSC), and representatives from all participating organizations at the Terminal. The U.S. Coast Guard, acting as the FOSC, issues a notice to vessels not involved in response to stay out of the spill area.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Time	Action
	Day 1 (Cont'd)
3:00 pm (Cont'd)	Local police, fire and HAZMAT teams are contacted for assistance in restricting access to shorelines determined likely to be impacted. The Port of Seattle is contacted for permission to use Terminals 18, 25, 102 and 106 and Piers 48, 56, 69, 70, 90 and 91 for the attachment of containment boom and recovery operations. The Scientific Support Coordinator from NOAA has been notified and will arrive within the hour from Sand Point with a team to assist in oil spill trajectories. The Unified Command is concerned given the southwest wind, if the spilled oil will remain in Elliott Bay. It is determined that initial spill response strategy should focus on minimizing oil movement into Elliott Bay during slack tide and preventing oil from reaching the wetland at Foster's Island.
3:15 pm	MSRC' 3,000 gallon vac-truck arrives at the Terminal with a crew of two (2) HAZWOPER trained personnel, and begins recovery operations alongside the dock -- inside the containment boom. MSRC' 28' Marco 1C skimmer arrives off the end of Terminal 18 with a crew of two (2) HAZWOPER trained personnel. The skimmer first makes several passes at small ribbons of sheen floating just north of Terminal 18.
5:00 pm	Oil recovery from contained areas in the East Waterway using vacuum trucks is initiated. Monitoring slick size and movement by helicopter is initiated. The East Waterway remains closed to commercial vessel movement. Primary and secondary staging areas are established at the terminal and across the waterway at Terminal 18. Sites for staging areas are chosen based on proximity to the spill site, slick position and availability of facilities for boat launching and equipment setup. Additional containment boom and a skimmer arrive from MSRC Puget sound area with eight (8) HAZWOPER trained response team members. Given the strong southwest wind, the Unified Command has given priority to the GRP exclusion booming strategies north of the Terminal.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Time	Action
	Day 1 (Cont'd)
5:00 pm (Cont'd)	MSRC continues mobilization of crews and equipment. Crews begin a cascading boom deployment north of the Terminal to contain and recover oil moving toward Elliott Bay with the falling tide and changing wind direction. Pier 48 is used as a collection point by deploying 1200' of boom along the south side anchored to the southwest of the end of the Pier. A Desmi weir skimmer is deployed from a crane truck between Pier 46 and Pier 48. A Baker Tank is placed in the parking lot at Pier 48 and used for temporary storage of the recovered product. Crews continue skimming and vacuum recovery of oil from the water surface. MSRC has subcontractor agreements with Baker Tank (2 m gallons) and Pacific Northern Oil (210,000 gallons) for temporary storage of recovered product. In addition, Foss Maritime Company has numerous tank vessels and tugs located in Puget Sound which may be available for temporary storage for recovered product. It is evident that there is ample storage capacity readily available in the Puget Sound region.
	Day 2 and Beyond
	Containment, recovery and cleanup operations continue as before. Response operations will continue until cleanup is judged satisfactory by USCG and WDOE representatives.
NOTE:	There are four (4) MSRC skimmers capable of arriving on scene within 3.5 hours after notification. They would arrive by water from Anacortes, Bellingham and Port Angeles. The combined maximum recovery capacity of these vessels (Cormorant, Crane, Heron and Western Gull) is 76,980 gph (x 20% efficiency factor = 15,396). Nine (9) additional contractor or Clean Sound skimmers could arrive, overland and by water from Port Angeles, Port Ludlow, Seattle and Tacoma, within 6 hours. The combined maximum recovery capacity of these nine (9) vessels is 136,200 (x 20% efficiency factor - 27,240 gph). Within 12 hours, MSRC could have another 36,700' of boom and three more FRV's (7 total) on-scene. KINDER MORGAN is not a member of Clean Sound, however in view of such an event in Elliott Bay, the FOSC and SOSC could ask for their participation.

C.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Marine Transfer Operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed in the Potential Spill Sources and Container Identification table in this Section.

- The Terminal Facility is located in Seattle, WA, approximately 400 yards west of the Duwamish Waterway East which is the closest navigable waterway.
- The Marine Transfer Facility is located on the waterfront at the northeast corner of Harbor Island at Terminal 18, Berth 1.

Tanks

- Secondary Containment volumes for all bulk storage containers are detailed in the Potential Spill Sources and Container Identification table in this Section.

Loading/Unloading Rack Containment System

Main Loading/Unloading Rack

The loading/unloading rack areas are designed and operated as follows:

- Drainage from the truck rack loading and unloading facilities is contained in a depressed area with engineered emergency containment.

The following systems are in place to eliminate spills at the loading rack:

- The truck loading/unloading rack areas are constructed on a contoured concrete slab designed to inhibit the flow of product out of the loading rack area in the case of a spill. If a spill did occur, liquids would enter the containment system consisting of one (1) 10,000 gallon underground collection sump at each of the two (2) truck loading/unloading areas. This capacity is more than enough to handle a complete failure of a tank truck storage compartment.

C.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Main Loading/Unloading Rack (Cont'd)

- Each truck rack has warning signs and an Interlock System to prevent overfill and vehicular departure before complete disconnect of flexible or fixed product transfer lines. Dry brake connection systems are in place on all truck loading arms. The terminal also requires truck drivers to place a traffic cone at the front of their truck while loading.

- Truck loading/unloading rack valving and piping systems are inspected daily by Facility operators.

- All tanker trucks loading/unloading at the racks are owned and operated by companies independent from the Company. Truck valves are to be inspected by the vehicle operators prior to and at the completion of loading before departing from the loading area.

Drainage From the Diked Areas

Drainage of stormwater or other liquids accumulated within the Facility's diked storage areas are controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment area.

- Stormwater which accumulates within the diked area, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures detailed in the Storm Water Pollution Prevention Plan (SWPPP).

- Flapper-type drain valves are not used to drain diked areas.

- Stormwater from diked areas is emptied by gravity.

General Drainage

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is detailed in the SWPPP as follows:

- Stormwater is not drained from the secondary containment areas.

C.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

General Drainage (Cont'd)

- Water is visually inspected for product and discharged only if no product sheen is visible.
- Facility drainage does not flow directly into an open watercourse.
- No stormwater drainage system is in place for the aboveground storage tank secondary containment areas for the B-Yard and C-Yard. These two areas do not require displacement of normal stormwater. Water naturally percolates into the ground within the tank farm walls. If an unusually large amount of rainwater were to collect, water would be removed by vacuum trucks and disposed of by a permitted contract service contractor.
- The A-Yard, which is fully paved with concrete or asphalt, contains operational areas and non-operational areas. The operational areas include the truck loading/unloading racks, and the laboratory in the main building. The rack areas are covered with permanent canopies which keeps most of the rainfall from impacting them. Any water which does collect is piped to a 10,000 gallon underground collection tank for each rack area. This contact water is regularly removed and treated by a permitted contractor.
- Surface runoff from non-operational areas in A-Yard (parking lots, driveways, building roof drains) goes to one of five stormwater catch basins located around the perimeter of the yard. Each catch basin is equipped with a manual flap valve located beneath the surface grate to impede flow into the storm sewer. Additionally, in the event of an emergency or release in this non-operational area, the surface of the catch basins would be blocked using a HDPE cover mat, which are stored in the Spill Response Locker. The Spill Response Locker is located in the southeastern portion of the A-Yard. Any product released to non-operational areas will be removed and the area will be cleaned prior to allowing stormwater to be diverted into the basins. The catch basins drain to one main basin with a 12-inch stormwater isolation valve on the outflow side which is closed in case of a spill. This basin then flows into the city storm sewer system under 13th Avenue.
- Stormwater can also collect in a partially-buried tank in the D-Yard. Should an unusually large stormwater event occur, any significant accumulation of stormwater in the D-Yard would be visually inspected and pumped to the city storm drain per the SWPPP.
- The Facility does not have a wastewater treatment plant nor does it treat water prior to discharge off site. The stormwater enters the city rainwater system.
- Since the Facility does not have a wastewater treatment plant nor chemically treat its water prior to discharge off site:
  - Uncontaminated rainwater is inspected to ensure compliance with applicable water quality standards and will not cause a harmful discharge as defined in 40 CFR 110.
  - Adequate records are kept of such drainage events and records of drainage events are maintained at the Facility.

C.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Harbor Island Terminal	(b) (7)(F), (b) (3)		

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading rack has sufficient capability to handle any potential increase in transfer capacity. The loading racks operate 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan and State of Washington Oil Spill Prevention Plan, which detail additional discharge detection measures

Detection by Personnel

- Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds. Refer to Figures 8.5 and 8.6 for sample Tank Inspection and Secondary Containment Inspection Checklists.
- Monthly inspection of tank gauges and cathodic protection readings.
- Annual Secondary Containment Inspection as part of the SPCC Plan.
- Tank Inspections as part of the SPCC Plan.
- The loading rack is equipped with warning and instruction signs.
- The entire plant is adequately illuminated to provide security and safe operations at night.

C.2 FACILITY SELF-INSPECTIONS

Container Testing and Inspections

- All aboveground containers are integrity tested on a regular schedule and when material repairs are made.
- The Engineering Department oversees the tank integrity "10-Year Program".
- Comparative records are maintained by the Engineering Department at the Orange office.
- The container inspection programs conducted and maintained by Facility personnel are as follows:
  - The containers are visually inspected by operating personnel for signs of deterioration, leaks, or the accumulation of liquids inside the containment areas.
  - Each storage container is inspected per Company policy, as required by age, condition, and service.
  - Based on these conditions, the aboveground storage containers are professionally inspected and non-destructive thickness testing is performed.
- The required inspections are divided into three categories:
  - Routine, in-service inspections
  - In-service, external inspections
  - Out-of-service, internal inspections
- If a field-constructed aboveground container undergoes a repair, alteration, reconstruction, or change in service that might affect the risk of a discharge or failure due to brittle fracture, the container will be evaluated (see Sample Log in Appendix B).
- Drums or totes brought on-site are built or tested to the standard(s) established by the drum manufacturer or the drum recycler, as applicable.
- While on-site, drums and totes will be visually inspected at least monthly and ground contact will be minimized.
- Liquid level sensing devices are regularly tested. The systems are tested monthly to ensure operability.

C.2 FACILITY SELF-INSPECTIONS (Cont'd)

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are visually inspected daily during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valves locks and/or seals
  - Other appurtenances

- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement.

- Annually a Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

Documentation

- Records of inspections and tests (including those maintained under usual and customary business practices), signed by the appropriate supervisor or inspector are retained on file at the Facility and/or other Corporate location for a minimum period of three (3) years.

FIGURES C.5 AND C.6

Note: The following Kinder Morgan forms comprise the typical tank and secondary containment Inspection Checklists for this Facility. These forms may change over time to accommodate the specific operations of the Facility.

C.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

The tank farm is protected with concrete block walls and earthen berms designed to withstand pressure from freestanding product. The floors of the tanks have impervious linings. The berm is constructed to withstand a moderate earthquake without breaching the integrity of the secondary containment.

- The Facility is located in Seattle, WA approximately 400 yards west of the Duwamish Waterway East.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Water Intakes

(b) (7)(F), (b) (3)

(b) (3), (b) (7)(F)

C.3 VULNERABILITY ANALYSIS (Cont'd)

Medical Facilities

No medical facilities were identified within the planning distance of the Facility.

Residential Areas

In general the area surrounding the Facility is commercial and industrial. In the event of an incident impact on residential areas would be minimal.

Businesses

The area surrounding the Facility is for the most part commercialized. There are various businesses and commercial establishments which may be potentially impacted by a discharge. Review of GIS Data determined that the following businesses are within the planning distance of the Facility:

Businesses	Distance from Facility
Kinder Morgan Energy Partners	0.00 miles *(approximate)*
Foreign Trade Zone No. 5	0.01 miles *(approximate)*
Shell Oil Products US	0.08 miles *(approximate)*
BP/Arco Fuels Distribution Terminal	0.08 miles *(approximate)*

Additional detail on the general layout of businesses within the area of the Facility is included on the maps in Section 6.

Fish and Wildlife, Wetlands, and other Sensitive Environments

The area surrounding the Facility is host to a variety of species. The Northwest Area Contingency Plan for this area details these categories. Refer to Figure 4.1 of this Volume for details.

Review of the USF&W Wetlands Mapper and Terraserver_ data indicates the following wetlands are within the planning distance of the Facility:

Wetlands	Latitude/Longitude
Harbor Island, Estuarine and Marine Wetlands	(b) (7)(F), (b) (3)
Puget Sound (shoreline), Estuarine & Marine Wetlands	
Puget Sound (shoreline), Estuarine & Marine Wetlands	

C.3 VULNERABILITY ANALYSIS (Cont'd)

Fish and Wildlife, Wetlands, and other Sensitive Environments (Cont'd)

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

During a response situation the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact the agencies will be able to:

- Identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge.
- Identify potential environmental effects on fish and wildlife, wetlands, and other sensitive environments resulting from removal actions or countermeasures.

Lakes and Streams

Review of GIS Data determined that the following lakes and streams are within the planning distance of the Facility:

Lakes and Streams	Location
Elliott Bay	0.5 miles N *(approximate)*
Duwamish River	1.0 SE miles *(approximate)*
Puget Sound	3.0 W miles *(approximate)*

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Figure 4.1 of this Volume.

Recreational Areas

Review of GIS Data__ determined that the following recreational areas are within the planning

Recreational Areas	Location
Hamilton Viewpoint Park	1.2 miles NW *(approximate)*
Klondike Gold Rush NHP	1.5 miles NE *(approximate)*
Alki Beach Park	2.0 miles W *(approximate)*
Bar S Playground	3.5 miles W *(approximate)*
Kinnear Park	4.0 miles NE *(approximate)*
Mee Kwa Mooks Park	4.5 miles SW *(approximate)*
Open Water Park	5.0 miles NE *(approximate)*

C.3 VULNERABILITY ANALYSIS (Cont'd)

Recreational Areas (Cont'd)

Recreational Areas	Location
Seacrest Park	1.0 miles NW *(approximate)*
Waterfront Park	2.0 miles NE *(approximate)*
Seattle Aquarium	2.2 miles NE *(approximate)*
Victor Steinbrueck Park	2.5 miles NE *(approximate)*
Regrade Park	2.6 miles NE *(approximate)*
Space Needle	3.0 miles NE *(approximate)*
Seattle Center	3.3 miles NE *(approximate)*
Richey Viewpoint	4.0 miles W *(approximate)*

Transportation Routes (air, land, and water)

Review of GIS Data__ determined that the following transportation routes are within the planning distance of the Facility:

Transportation Routes	Location
13th Avenue SW	Less than 1 mile *(approximate)*
SW Lander Street	Less than 1 mile *(approximate)*
16th Avenue SW	Less than 1 mile *(approximate)*
Klickitat Avenue SW	Less than 1 mile *(approximate)*
SW Hanford Street	Less than 1 mile *(approximate)*
11th Avenue SW	Less than 1 mile *(approximate)*
SW Florida Street	Less than 1 mile *(approximate)*
West Duwamish Waterway	Less than 1 mile *(approximate)*
East Duwamish Waterway	Less than 1 mile *(approximate)*
Elliott Bay	Less than 1 mile *(approximate)*
Berths 1 to 5	Less than 1 mile N, W, SW and NW *(approximate)*
Piers 3 to 91	Less than 5 miles N, W, SW and NW *(approximate)*

Utilities

No utilities were identified within the planning distance.

C.3 VULNERABILITY ANALYSIS (Cont'd)

Other Areas of Economic Importance

Review of GIS Data/OAEI determined that no terrestrially sensitive or unique environments such as wildlife refuges, management areas, or ecological reserves are within the planning distance of the Facility.

Other Areas of Economic Importance	Distance from the Facility
Hiawatha Community Center	1.0 miles SW (approximate)
Duwamish Light	1.3 miles NE (approximate)
Rainier Club	1.4 miles NE (approximate)
Federal Office Building	1.5 miles NE (approximate)
Smith Tower	1.7 miles NE (approximate)
Seattle Tower	1.7 miles NE (approximate)
Olympic Hotel	2.0 miles NE (approximate)
Alki Point Lighthouse	3.5 miles West (approximate)
Schmitz Memorial Overlook	4.7 miles West (approximate)

C.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history of the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Any spilled material which might escape a diked area would be mitigated through the implementation of spill response activities by: Facility personnel, or if necessary, one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow southwest through the Facility.

C.4 ANALYSIS OF THE POTENTIAL FOR A SPILL (Cont'd)

Vulnerability to a Natural Disaster

The Facility is located in a semi-active earthquake zone with occasional seismic activity.

The Company has historical data that defines the probability of seismic activity in the Seattle, Washington area. The construction of the Facility has taken the possibility of some seismic activity into consideration; the location of tank farms away from slide prone areas, and constructing the Facility, including all subgrade soil preparation, along with slope and tank construction in accordance with appropriate building codes and industry guidelines.

Other Factors

The actions taken to lessen hazards at the Facility tank farm reduces the probability to a low potential. Hazard reduction protective measures have been designed into tanks and into the construction of the Facility. Tanks were designed to industry standards which reduces the potential for hazards. Based on the care and construction of the tanks, the potential of any one tank rupturing and emptying product into the secondary containment is low. The potential of several tanks simultaneously rupturing is very low.

The Facility conforms to good engineering practices in the tank integrity inspection program. The inspection program reduces the likelihood of leaks. The Facility has not experienced a failure associated with a tank structure.

C.5 REPORTABLE OIL DISCHARGE HISTORY

Kinder Morgan maintains an online database of reportable spills available at all locations via the company's intranet. The database contains the below listed information to the extent that such information is reasonably identifiable. A list of known spills reportable under 40 CFR 110 during previous facility ownership is included below.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

REPORTABLE OIL DISCHARGE HISTORY (40 CFR 112.20 (h)(4))

Date of Discharge (Owner)	Location of Discharge	Cause of Discharge	Product Discharged	Amount Discharged	NRC Incident Report #
01/12/1996 (GATX)	Harbor Island Terminal – Spilled to Puget Sound.	Flowline dripping material.	Diesel	(b) (7)(F), (b) (3)	319842
05/28/1999 (Owner)	Harbor Island Terminal – Spilled to East Duwamish Waterway.	Leaking pipe connection between piping leading into the sump.	Bunker Fuel		485531

(b) (7)(F), (b) (3)

D.1 RESPONSE TEAM TRAINING

The Company requires that all response personnel, including Qualified Individual and Alternates, contractors and casual labor, have the appropriate training necessary to serve on a response team during an emergency. Team members will receive training in the following:

Integrated Contingency Plan Review

All Facility Response Team Members should review their Integrated Contingency Plan whenever their job position or responsibilities change under the Plan. A copy of this Plan will be available at all times to Team Members.

HAZWOPER (29 CFR 1910.120)

Federal and state regulations require that response team members maintain up-to-date HAZWOPER training necessary to function in their assigned positions. At a minimum, Team members will receive "First Responder Awareness Level" training. All personnel responding to an incident must satisfy the applicable HAZWOPER training requirements of 29 CFR 1910.120.

OSHA HAZWOPER TRAINING REQUIREMENTS		
Responder Classification	**Required Training Hours**	**Refresher**
29CFR 1910.120(q) Emergency Response		
First Responder - Awareness Level	2-4 hrs demonstration of competency	same
First Responder - Operations Level	8 hrs	8 hrs
Hazardous Materials Technician	24 hrs plus competency	8 hrs
Hazardous Materials Specialist	24 hrs plus competency in specialized areas	8 hrs
Incident Commander	24 hrs plus competency	8 hrs
29CFR 1910.120(e) Clean Up Sites		
General Site Workers	40 hrs / 3 days on the job training	8 hrs
Occasional Workers (Limited Tasks)	24 hrs / 1 day on the job training	8 hrs
General Site Workers (Low Hazard)	24 hrs / 1 day on the job training	8 hrs
Supervisors	8 hrs supervisor training	8 hrs
29CFR 1910.120(p)(7)(8) RCRA TSD Sites		
New Employees	24 hrs	8 hrs
Current Employees*	24 hrs	8 hrs

* Previous work experience and/or training certified as equivalent by employer.

Incident Command System

Response team members will receive ICS training and may also receive supplemental training in other related general topics.

D.1 RESPONSE TEAM TRAINING (Cont'd)

Training Records

Training records for local team members will be maintained at the Facility according to Federal, state, and local government requirements (three (3) years for the U.S. Coast Guard and five (5) years for the U.S. Environmental Protection Agency).

D.2 RESPONSE TEAM EXERCISES

The Company spill drill program is consistent with the National Preparedness for Response Exercise Program (NPREP) which is summarized below. The program is to be conducted by the Facility in cooperation with WDOE. The drill program includes internal and external drills conducted at the specific frequencies over a three (3) year cycle. Procedures for maintaining drill documentation and ensuring the availability of drill records for WDOE review are in place.

TRIENNIAL CYCLE		
Total Number	**Frequency**	**Exercise Type/Description**
12	Quarterly	QI Notification Exercise
6	Semi-Annual (Twice per Year)	Equipment Deployment Exercise *(Facility-owned equipment)*
3	Annual	Response Team Tabletop Exercise
3	Annual	Equipment Deployment Exercise *(facilities with OSRO-owned equipment)*
3	Annual	Unannounced Exercise *(not a separate exercise)* Actual response can be considered as an unannounced exercise.
NOTE: All response plan components must be exercised at least once in the Cycle.		

Quarterly QI Notification Exercise

- **Scope:** Exercise communication between facility personnel and the QI(s) and/or designated alternate(s). At least once each year, one of the notification exercises should be conducted during non-business hours.

- **Objective:** Contact must be made with a QI or designated alternate, as identified in the Plan.

- **General:** All personnel receiving notification shall respond to the notification and verify their receipt of the notification. Personnel who do not respond should be contacted to determine whether or not they received the notification.

D.2 RESPONSE TEAM EXERCISES (Cont'd)

Semi-Annual Equipment Deployment Exercise (for facilities with equipment)

- **Scope:** Deploy and operate facility response equipment identified in the response plan. The equipment to be deployed must include the following, at a minimum:

  - 1,000 feet of representative type of boom;
  - one of each type of skimming system; or
  - the equipment necessary to respond to the facility's Small/Average Most Probable Discharge, whichever is less.

- **Objective:** Demonstrate personnel's ability to deploy and operate response equipment. Ensure that the response equipment is in proper working order.

- **General:** The Facility may take credit for actual equipment deployment to a spill, or for training sessions, as long as the activities are properly documented.

Annual Equipment Deployment Exercise (OSRO/PRC-owned equipment)

- **Review:** The Facility should verify that the OSRO/PRC has completed the equipment deployment exercise requirements and has maintained the necessary documentation. The OSRO/PRC may deploy equipment at any location, so long as it occurs within an operating environment similar to the Facility's.

- **Scope:** OSRO/PRC must deploy and operate response equipment identified in the response plan. The equipment to be deployed must include the following, at a minimum:

  - 1,000 feet of representative type of boom.
  - One of each type of skimming system.

- **Objective:** OSRO/PRC must demonstrate the ability of the personnel (OSRO/PRC) to deploy and operate response equipment (OSRO/PRC). Ensure that the response equipment (OSRO/PRC) is in proper working order.

Annual Response Team Tabletop Exercise

- **Scope:** Exercise the response team's organization, communication, and decision-making in managing a spill response. Each team identified within the plan must conduct an annual Response Team Tabletop Exercise.

- **Objective:** Exercise the response team in a review of the following:

  - Knowledge of the Plan.
  - Proper notifications.
  - Communications system.
  - Ability to access an OSRO/PRC.
  - Coordination of internal spill response personnel.

D.2 RESPONSE TEAM EXERCISES (Cont'd)

- **Objective (Cont'd)**

  - Review of the transition from a local team to a regional team.
  - Ability to effectively coordinate response activity with the National Response System (NRS) Infrastructure.
  - Ability to access information in the NWACP.

- **General:** A minimum of one Response Team Tabletop Exercise in a triennial cycle will involve a Worst-Case Discharge scenario.

Government-Initiated Unannounced Exercise

- **Scope:** The Facility is required to participate in only one unannounced exercise every 36 months from the date of the last government-initiated unannounced exercise.

  - Exercises are limited to approximately four hours in duration.
  - Exercises would involve response to a Small/Average Most Probable Discharge scenario.
  - Exercise would involve equipment deployment to respond to a spill scenario.

- **Objective:** Conduct proper notifications to respond to unannounced scenario of a Small/Average Most Provable Discharge.

  - Demonstrate that the response is timely, conducted with an adequate amount of equipment for the scenario, and properly conducted.

- **General:** This exercise is only applicable to those facilities which are randomly chosen.

Area Exercises

- **Objective:** The purpose of the area exercise is to exercise the entire response community in a particular area. An area is defined as "that geographic area for which a separate and distinct Area Contingency Plan has been prepared, as described in OPA 90." The response community includes the federal, state, and local government and industry. The area exercises are designed to exercise the government and industry interface for spill response.

- **General:** The goal is to ensure that all areas of the country are exercised triennially. All of the area exercises will be developed by an exercise design team. The exercise design team is comprised of representatives from the federal, state, and local government and industry. A lead plan holder would lead each area exercise. The lead plan holder is the organization (government or industry) that holds the primary plan that is exercised in the area exercise. The lead plan holder would have the final word on designing the scope and scenario of the exercise.

D.2 RESPONSE TEAM EXERCISES (Cont'd)

Exercise Documentation

- All exercises should be documented and maintained at the facility; documentation should specify:

  - The type of exercise;
  - Date and time of the exercise;
  - A description of the exercise;
  - The objectives met in the exercise;
  - The components of the response plan exercised; and
  - Lessons learned.

- Exercise documentation should be kept on file for the required length of time depending on the regulating agency (three (3) years for the U.S. Coast Guard and five (5) years for the U.S. Environmental Protection Agency).

D.3 PURPOSE OF REVIEW AND EVALUATION

This section provides procedures and information useful to responders for post incident/exercise review and evaluation. Post incident/exercise reviews should be conducted in a timely manner following an incident/exercise. In the event that a Unified Command was established, WDOE and other participating agency representatives should be debriefed, and their observations and recommendations should be incorporated. The Plan should be evaluated to determine its usefulness during the incident/exercise and appropriate revisions should be made. All incident/exercise documentation should be included in the Plan evaluation process.

Outline of Review

Given below are items a team composed of outside people knowledgeable in spill response and key members of the response teams should examine. These questions are intended as guidelines only; many other questions are likely to be appropriate at each stage of a critique.

- ***Detection***

  - Was the spill detected promptly?
  - How was it detected?
  - By whom?
  - Could it have been detected earlier? How?
  - Are any instruments or procedures available to consider which might aid in spill detection?

- ***Notification***

  - Were proper procedures followed in notifying government agencies? Were notifications prompt?
  - Was management notified promptly?
  - Was management response appropriate?
  - Was the Facility/company notified promptly? If so, why, how, and who? If not, why not?

D.3 PURPOSE OF REVIEW AND EVALUATION (Cont'd)

- ***Assessment/Evaluation***
  - Was the magnitude of the problem assessed correctly at the start?
  - What means were used for this assessment?
  - Are any guides or aids needed to assist spill evaluation?
  - What sources of information were available on winds and on water currents?
  - Is our information adequate?
  - Was this information useful (and used) for spill trajectory forecasts? Were such forecasts realistic?
  - Do we have adequate information on product properties?
  - Do we need additional information on changes of product properties with time, i.e., as a result of weathering and other processes?
- ***Mobilization***
  - What steps were taken to mobilize spill countermeasures?
  - What resources were used?
  - Was mobilization prompt?
  - Could it have been speeded up or should it have been?
  - What about mobilization of manpower resources?
  - Was the local spill cooperative used appropriately?
  - How could this be improved?
  - Was it appropriate to mobilize the Facility/company resources and was this promptly initiated?
  - What other corporate resources are available and have they been identified and used adequately?
- ***Response - Strategy***
  - Is there an adequate spill response plan for the location?
  - Is it flexible enough to cope with unexpected spill events?
  - Does the plan include clear understanding of local environmental sensitivities?
  - What was the initial strategy for response to this spill?
  - Is this strategy defined in the spill plan?
  - How did the strategy evolve and change during this spill and how were these changes implemented?
  - What caused such changes?
  - Are there improvements needed? More training?

D.3 PURPOSE OF REVIEW AND EVALUATION (Cont'd)

- ***Response - Resources Used***

  - What resources were mobilized?
  - How were they mobilized?
  - How did resource utilization change with time? Why?
  - Were resources used effectively?
    - Contractors
    - Government agencies
    - Company resources
    - Cooperatives
    - Volunteers
    - Consultants
    - Other (e.g., bird rescue centers)
  - What changes would have been useful?
  - Do we have adequate knowledge of resource availability?
  - Do we have adequate knowledge of waste disposal capabilities?

- ***Response - Effectiveness***

  - Was containment effective and prompt?
  - How could it have been improved?
  - Should the location or the local cooperative have additional resources for containment?
  - Was recovery effective and prompt?
  - How could it have been improved?
  - Should the location or the local cooperative have additional resources for recovery of spilled product?
  - Was contaminated equipment disposed of promptly and safely?
  - Was there adequate in-house product separation, recovery, and disposal?
  - How could it have been improved?
  - Was there adequate outside disposal resources available?

D.3 PURPOSE OF REVIEW AND EVALUATION (Cont'd)

- ***Command Structure***
  - Who was initially in charge of spill response?
  - What sort of organization was initially set up?
  - How did this change with time? Why?
  - What changes would have been useful?
  - Was there adequate surveillance?
  - Should there be any changes?
  - Were communications adequate?
  - What improvements are needed? Hardware, procedures, etc.
  - Was support from financial services adequate? Prompt?
  - Should there be any changes?
  - Is more planning needed?
  - Should financial procedures be developed to handle such incidents?
- ***Measurement***
  - Was there adequate measurement or estimation of the volume of product spilled?
  - Was there adequate measurement or estimation of the volume of product recovered?
  - Was there adequate measurement or estimation of the volume of product disposed of?
  - Should better measurement procedures be developed for either phase of operations?
  - If so, what would be appropriate and acceptable?
- ***Government Relations***
  - What are the roles and effects of the various government agencies which were involved?
  - Was there a single focal point among the government agencies for contact?
  - Should there have been better focus of communications to the agencies?
  - Were government agencies adequately informed at all stages?
  - Were too many agencies involved?
  - Are any changes needed in procedures to manage government relations?

D.3 PURPOSE OF REVIEW AND EVALUATION (Cont'd)

- ***Government Relations (Cont'd)***
  - Examples of affected agencies (there may be others):
    - U.S. Coast Guard
    - Environmental Protection Agency
    - National Oceanic Atmospheric Administration
    - Dept of Fish and Wildlife
    - Washington Department of Ecology
    - State Parks
    - Harbors and Marinas
    - Other State Agencies
    - Cities
    - Counties
  - Was there adequate agreement with the government agencies on disposal methods?
  - Was there adequate agreement with the government agencies on criteria for cleanup?
  - How was this agreement developed?
  - Were we too agreeable with the agencies in accepting their requests for specific action items (e.g., degree of cleanup)?
  - Should there be advance planning of criteria for cleanup, aimed at specific local environmentally sensitive areas? (Such criteria should probably also be designed for different types of product.)

- ***Public Relations***
  - How were relations with the media handled?
  - What problems were encountered?
  - Are improvements needed?
  - How could public outcry have been reduced? Was it serious?
  - Would it be useful to undertake a public information effort to "educate" reporters about product and effects to it if spilled?
  - These areas should be investigated shortly after the incident to assure that actions taken are fresh in peoples' minds.

APPENDIX E

EVACUATION PLAN

Page

E.1 Facility Evacuation E-2

Evacuation Diagram E-4

E.1 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which uses the Incident Command and Unified Command Systems.

1. First Responder until Company Personnel IC assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 2720 13th Avenue SW
Seattle, WA 98134
c. Activate the Facility's employee emergency alarm system (siren).
d. Contact Olympic Pipeline to shut down inbound pipeline and cease all truck and marine loading/offloading. Do not start engines or move trucks. If emergency is at the marine dock, do not allow the vessel to move. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility and Burlington Northern if applicable.
h. Establish a Command Center immediately at the entrance to the Facility or where the Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the western exterior of the office building. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel IC will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the secondary command center or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility office building, or the north or south staging area.

4. Community Evacuation

The Company has confirmed with the Seattle Fire Department that no Community Evacuation Plan currently exists for this area. However, the Fire Department does have Standard Guidelines that are followed in the event of an evacuation.

5. Directions to Harborview Medical Center

From the main terminal exit gate at the corner of SW Lander St. and 13th Avenue SW, proceed west on Lander to 16th Avenue SW, turn left on 16th Avenue SW. Travel approximately one quarter mile on 16th Avenue SW which becomes Klickitat Way SW, stay in to right lane and merge onto eastbound SW Spokane Street. Stay to the left to go up onto W Seattle Bridge towards I-5. Merge onto I-5 N via the ramp on the left, heading toward Vancouver, B.C. Travel approximately one mile on I-5 before taking the Dearborn Street/James Street exit, number 164A, toward Madison Street. Take the James Street exit and turn right onto James Street then right again onto 9th Avenue. The hospital is located at 325 9th Avenue.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gates located east of 13th Avenue SW. If the emergency is at the marine dock, access is via the Port of Seattle/SSA Terminal 18 – Gate 4 manned security checkpoint.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the aboveground storage tanks (ASTs) in the two main tank farms at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Appendix C.

8. Prevailing Winds

From October through May, winds are generally from the southwest at 10 to 20 mph. From June through September, winds are generally from the north at 0 to 9 mph.

9. Water Currents

Elliot Bay and the Duwamish River in the vicinity of the Facility are tidally influenced waters with net surface currents that flow generally toward the sea (north). Average currents in the area do not exceed much more than one knot. The mean tidal range for the Central Puget Sound area is 9.4 to 10.48 feet. The diurnal tidal range is 13.1 to 15.0 feet.

9620

Washington State Disposal Guidance

9621 Washington State Disposal Guidance For Disposal of Waste from Spills of Oil and Other Potentially Hazardous Substances

Oil spill recovery and cleanup operations potentially can generate large quantities of recovered oil and oily wastes. Overlooked waste management issues or delayed actions can result in the cessation of recovery operations, delays in redeploying equipment, and potential violation of state and federal law.

The Oil and Hazardous Substance Spills Act of 1990 (HB2494), and the Spill Prevention Act of 1991 (ESHB 1027), commissions the Washington State Department of Ecology (Ecology) to develop effective oil spill response regulations and to support and complement the federal oil pollution act of 1990, especially those provisions relating to the national contingency plan. This document serves as part of the Washington Statewide Master Plan, which has been incorporated into the Northwest Area Contingency Plan.

9621.1 Purpose

This guidance provides a "Guideline" and a "Sample Disposal Plan" for developing incident specific disposal plans at oil spills, more specifically, the treatment and disposal of wastes generated from the cleanup of oil spills. This document's "Guideline" describes how waste must be handled, designated, segregated, tracked, stored, transported, treated, and finally disposed. The "Sample Disposal Plan", provided at the end of this section serves as a model format for incident specific disposal plans. The "Sample Disposal Plan" is designed to directly correspond with the "Guideline".

9621.2 Applicability

This document should be used when formulating a waste disposal plan during oil spills and oil spill drills. This document covers all oil and oily debris recovered and generated during oil spill cleanup operations. Oily debris includes but is not limited to: sorbents pads/booms, protective clothing/gear, soil, sand, rocks, logs, kelp, litter, plastics, mousse, oil/water mixture and animal carcasses.

It is the expectation of Ecology that incident specific disposal plans will be in accordance with the "Guideline" and will follow the "Sample Disposal Plan" format. As per the NWACP Section 4260, incident specific disposal plans should be developed by the Environmental Unit.

Historically, since most oily debris generated from oil spills has not designated as dangerous waste in Washington State, this document is focused primarily on solid waste disposal options. This does not preclude the use of this document in the event of hazardous material spills. If material is designated as extremely hazardous waste or dangerous waste the requirements for handling and treatment or disposal are more stringent, and it is essential to work with Ecology and local governments to ensure that the wastes are being managed appropriately.

9621.3 Regulatory Authority

Under the provisions of Chapter 90.56.340 RCW (Oil and Hazardous Substance Spill Prevention and Response Act) the **spiller** is responsible for immediately collecting and removing spilled oil and any contaminated debris and/or soil. It is important to recognize that, if the responsible party is unable or unwilling to fulfill this requirement, Ecology is authorized under the provisions of Chapter 90.56.350 RCW "to take such actions as are necessary to collect, investigate, perform surveillance over, remove, contain, treat, or disperse oil or hazardous substances discharged into waters of the state."

9622 Washington State Disposal Plan Guideline

9622.1 Section I Approved Waste Handlers

It is expected that the responsible party will be working closely with local approved waste handlers who are familiar with Washington State's rules and regulations as well as transport and disposal options in the state. The Washington State Department of Ecology Hazardous Waste Services Directory provides an online partial list of companies and the services that they provide (http://www.ecy.wa.gov/biblio/98412.html). This list is periodically updated. Updated lists can be obtained from any regional office. Only licensed transporters and approved (or permitted) treatment and disposal facilities are to be used for waste handling and disposition unless otherwise directed by Ecology.

9622.2 Section II Designation

The process of classifying wastes, as solid or dangerous waste is known as "designation". Laboratory tests or knowledge of the material must be used to determine if the material designates as dangerous waste. Consult with your spill contractor, chemical testing laboratory, and the Department of Ecology for advice on designating wastes as dangerous or solid. Designation procedures and waste management requirements are contained in Dangerous Waste Regulations (Chapter 173-303 WAC). The Dangerous Waste Regulations also apply to other wastes and are more stringent than Federal Hazardous Waste Regulations (40 CFR, Parts 261 to 279).

Petroleum products such as bunker, diesel, and kerosene generally do not designate as dangerous waste. Recovered oily liquids and other materials contaminated by oil that do not designate as dangerous waste may be recycled, burned, or blended for fuel, without following the requirements of hazardous waste. Recovered oily liquids may be managed as "off specification fuels" under the exemption in the dangerous waste rules, as long as it is used as fuel. Recovered oily liquids and other materials contaminated by oil that cannot be recycled, burned, or blended for fuel are considered solid waste and subject to designation. Testing is generally required to determine whether such mixtures designate as dangerous waste.

Oily waste may be designated as dangerous waste (dangerous waste or extremely hazardous waste) depending on characteristics such as: ignitability, corrosivity, reactivity, toxicity, and persistence.

Wastes may designate as "dangerous waste" because they are:

- listed (appear on lists for discarded chemical products or from specified industrial processes);
- ignitable (flash point <140 degrees F);
- corrosive (pH £ 2.0 or ³ 12.5) ;
- reactive (explosive, self-igniting, reactive with water);
- toxic (specific standards and test methods apply, i.e. Toxicity Characteristic Leaching Procedure (TCLP) and DW bioassay; and
- persistent (specific standards and test methods apply).

If a waste is classified as a dangerous waste the responsible party must ensure safe management procedures:

- the waste is placed in proper tanks or stored in closed compatible drums,
- has appropriate labels and markings,
- is transported by authorized haulers,
- is shipped using a Hazardous Waste Manifest,
- is delivered to an authorized recycler or permitted treatment, storage or disposal facility

If recovered oily liquids and other materials contaminated by oil do not designate as dangerous waste then they are classified as solid waste and subject to RCW 70.95.

9622.3 Section III Interim Storage, Segregation, and Tracking

A. Interim Storage Sites

Interim storage sites shall be specifically designated in the incident specific disposal plan. The location of interim storage sites is dependent on the approval of the On-Scene-Coordinator (OSC) and local health department. Interim storage sites shall be established with the goal of preventing additional contamination from being reintroduced to the environment or posing a public health threat. Interim storage sites, and roll-off boxes within these sites, should be lined with plastic tarps or visqueen, and bermed to prevent runoff or leakage of oily material. In addition oily debris should be covered with secured tarps or visqueen to prevent rainwater infiltration. Continued use of interim storage sites beyond 90 days is subject to approval by Ecology. Interim storage sites should be returned to the maximum extent feasible to the sites original condition. Interim storage sites are subject to periodic inspections.

B. Segregation

The segregation of wastes facilitates the determination of volume spilled and recovered. The purpose of segregation is to assist determining the volume spilled and recovered. It also helps simplify disposal procedures that may be required by incinerator or landfill operators. Material recovered must be segregated in the following manner unless otherwise directed by the State or Federal OSC:

- Oil collected from sources other than state waters/shorelines (e.g. on vessels or pier);
- Oil and oil/water mixtures recovered from state waters/shorelines;
- Oiled organic debris: wood, aquatic vegetation.. Oily debris should be placed in **clear plastic bags** for ease of identifying contents and segregation. To the extent possible efforts should be made to homogenize recovered organic debris, e.g., heavily oiled eel grass should be kept separate from dissimilar debris;
- Oiled sorbent material: oil snares, pads, and booms; and
- PPE and other typically non-sorbent materials.

C. Washington State Oil Recovery Credit for Natural Resource Damages

If the responsible party will seek credit for oil recovery under Washington State's Natural Resource Damage Assessment process, additional segregation is required

for product collected during the first 24 hours after the oil release. Detailed guidance on the credit and segregation/measurement methods can be obtained from the Washington Department of Ecology document "Compensation Schedule Credit for Oil Recovery, RDA Committee Resolution 96-1".

D. Tracking

Continually reporting and updating the Situation Unit with waste management data is a crucial aspect of response. Waste management data is used to assess the progress of the response and to determine potential response needs. Typically waste management data is summarized by the ICS Form 209, which includes total volumes recovered, stored, and disposed of. The Environmental Unit in conjunction with the Situation Unit must assure that this information is accurately reported. Clear lines of communication must be quickly established with Operations to assure that an adequate tracking system is in place. Waste disposal plans should describe the waste tracking system. The use of waste disposition tracking forms is highly recommended, e.g., (See Sample Disposal Plan, Section IIID and Appendix 1).

E. Decanting

Decanting is addressed in a separate section of the Northwest Area Contingency Plan (Section 4650). The decanting approval form should be attached to the Incident Specific Disposal Plan. The Environmental Unit should endeavor to assure that the intent of the decanting approval is followed.

9622.4 Section IV Decontamination

Decontamination areas for personnel and equipment, including oiled booms, need to be addressed in the disposal plan. In addition, areas may need to be set up for the decontamination of oiled vessels. Each area designated as a decontamination site should be addressed in the incident specific disposal plan. The location and set up of each decontamination area should be described in the incident specific disposal plan.

9622.5 Section V Animal Carcasses

The disposal of animal carcasses may need to be addressed in the disposal plan. The collection of animal carcasses is the responsibility of the Washington Department of Fish and Wildlife in conjunction with the U.S. Fish and Wildlife Service. Prior to the cleanup of any beach, an agent of the joint trustees should coordinate the removal of oiled carcasses. No oiled carcasses shall be disposed of until authorized by the appropriate natural resource trustee. With the approval of local Air and Health authorities, the Department of Ecology recommends incineration of oiled carcasses at a permitted facility.

9622.6 Section VI Waste Disposition and Final Disposal

It is important that the responsible party work closely with approved waste handler(s) in formulating an Incident Disposal Plan (sample plan in appendix). Local approved waste handlers should be knowledgeable in the appropriate rules and

regulations concerning proper waste management, transport, treatment, and disposal facilities. For clarification and assistance the regional office of Ecology and/or local government authorities should be consulted.

- **Hazardous Waste.** The following priorities for the collection, handling, and management of hazardous wastes are necessary, and should be followed in descending order as applicable (Chapter 70.105.150 RCW):
  Waste reduction;
  Waste recycling;
  Physical, chemical, and biological treatment;
  Incineration;
  Solidification/stabilization treatment. and
  Landfill.

- **Solid Waste.** The following priorities for the collection, handling, and management of solid wastes are necessary and should be followed in descending order as applicable (Chapter 70.95.010 RCW):
  Waste reduction:
  Recycling, with source separation of recyclable materials as the preferred method.
  Energy recovery, incineration, or land filling of separated wastes.
  Energy recovery, incineration, or land filling of mixed wastes.

- **Waste Reduction.** Waste reduction is attainable through prevention and minimization of waste generated during cleanup operations. Waste reduction is the responsibility of the responsible party, cleanup contractors and workers.

- **Recycling.** Recovered liquid oil that is exempt from the dangerous waste regulations should be recycled at a licensed refinery or recycling facility. Pads saturated with oil can be wrung out for recovery of liquid oil for recycling.

  Certain solid wastes recovered and generated during cleanup operations can be treated and used again as useful materials. An example is the use of oiled sand, rock and gravel in asphalt production. The waste may be handled at a treatment facility if it does not designate as a hazardous waste or extremely hazardous waste under Chapter 173-303-070.

  Additional options put forth by Hazardous Waste regulation 70.105, include:

  Bioremediation
  Thermal Desorption
  Asphalt Incorporation

- **Energy recovery, incineration, or land filling of separated wastes or mixed wastes.** Energy recovery facilities use the oily debris such as sorbent pads, booms, and oily rags, as a supplemental energy source in a rotary kiln.

Incineration refers to burning at an approved facility and open outdoor burning. These both require the approval of Ecology and the local air pollution control authority. Controlled burning can be conducted at an approved energy recovery facility or hog fuel burner.

- **Thermal desorption.** With this method heat does not destroy contaminants but separates them from the media. Sufficient heat is applied to vaporize water, organic compounds, and some volatile metals. Vapors can then be destroyed in an afterburner or collected as liquid for further treatment

- **Outdoor burning.** Open outdoor burning may be a viable option for disposal, if the waste is considered "dangerous material". Prohibited materials may only be burned in an outdoor fire when ordered by a fire protection authority and authorized by Ecology or the local air pollution control authority. However such approval may only be given when the material constitutes "dangerous material" (i.e. materials presenting a danger to life, property or public welfare) and no approved practical alternative method of disposal is available.

- **Land filling.** Upon attaining local health department approval, oily waste may be disposed of in accordance with landfill guidelines and regulations. Landfill disposition should be planned only for those wastes that other disposal options have been found to be unacceptable. Final approval and acceptance of waste material is at the discretion of the landfill operator.

9622.7 Final Report

In addition to daily updates of the disposal plan, at the conclusion of response activities and when all parties have signed off on the closure of the response, a final report shall be provided by the responsible party to Ecology within a timely manner. The final report should state in detail the amount of oily waste generated, disposed of and/or treated. The report should be broken down by how the oily waste material was segregated, e.g., oiled sorbents, free liquids recovered, contaminated soil and other material collected. Disposal receipts should be attached to the final report.

Sample Incident Disposal Plan

SAMPLE INCIDENT DISPOSAL PLAN
Model Disposal Plan for Oil Spills in Washington State

_____
(Incident Name)

Responsible Party: _____
Spilled Material: _____
Spill Volume (estimate): _____
Spill Location: _____
Spill Date/Time: _____
Report Update Time: _____

Disposal Plan Authorization

This plan is written at the request of the USCG and/or EPA and the Washington State Department of Ecology. The responsible party will recover the maximum feasible amount of oil spilled during the above named incident. In addition an unknown quantity of oily waste debris (including plastics, sands, etc.) will be recovered. When disposing of this material, the responsible party will abide by all applicable state, local and federal laws and regulations. Disposed material will be tracked to provide an accurate means of estimating total oil recovered. Each section of this incident specific disposal plan addresses and corresponds with the waste disposal "Guideline" found in Section 9620 of the NWACP.

This plan may be amended as necessary to ensure compliance with all applicable laws and regulations. Amendment may occur only upon mutual agreement of the responsible party, the Federal OSC (USCG/EPA), and/or the State OSC (WDOE).

Submitted By: _____ Date: _____

Approved by WDOE: _____ Date: _____

Reviewed by USCG/EPA: _____ Date: _____

Approved by Responsible Party: _____ Date: _____

Approved by other Local Government
Representative(s) (Optional): _____ Date: _____

SECTION I WASTE HANDLERS

The following licensed transporters and approved treatment and disposal facilities are to be used for waste handling and disposition unless otherwise directed by Ecology. All waste handlers have read and are working in accordance with this plan.

Name of Company	Disposal Functions	Company Representative Signature

SECTION II DESIGNATION

The spilled material was deemed (non-) dangerous waste based on the following:

SECTION III INTERIM STORAGE, SEGREGATION, and TRACKING

A. INTERIM STORAGE OF SOLID MATERIAL

Interim storage sites will be located at: _____

_____

_____

Provide a description each site, lined roll-off boxes, etc. Describe how each site was constructed, bermed, covered, etc. to minimize infiltration of rainwater and prevent leaching.
Describe measures that will be taken to return sites to their original condition

Ecology's authorization

B. SEGREGATION

Describe measures taken to ensure material recovered was properly segregated. Material recovered must be segregated in the following manner unless otherwise directed by the State or Federal OSC:

- *Oil collected from sources other than state waters/shorelines (e.g. on vessels or pier)*
- *Oil and oil/water mixtures recovered from state waters/shorelines*
- *Oiled organic debris: wood, aquatic vegetation... Oily debris should be placed in **clear plastic bags** for ease of identifying contents and segregation. To the extent possible efforts should be made to homogenize recovered organic debris e.g., heavily oiled eel grass should be kept separate from dissimilar debris*
- *Oiled sorbent material: oil snares, pads, and booms*

- *PPE and other typically non-sorbent materials*

C. WASHINGTON STATE OIL RECOVERY CREDIT FOR NATURAL RESOURCE DAMAGES

Detail measures taken to ensure segregation as per oil spill recovery credit. See Washington Department of Ecology document "Compensation Schedule Credit for Oil Recovery, RDA Committee Resolution 96-1".

D. TRACKING

Describe the waste tracking system used during this response. Include copies of waste tracking forms, (See Appendix 1 for example).

E. DECANTING

Decanting authorization form (if approved) should be attached.

SECTION IV DECONTAMINATION

Describe the areas designated for decontamination including location, set up, and pollution prevention measures.

SECTION V ANIMAL CARCASSES

If applicable describe the number of animal carcasses disposed of and methods used for their disposal.

SECTION VI WASTE DISPOSITION and FINAL DISPOSAL

ICS Form 209 Final Waste Status Summary

Type	Recovered	Stored	Disposed of
Oil (bbl)			
Oily Liquids (bbl)			
Oily Solids (tons)			
Solids (tons)			

Include copies of waste tracking forms for final disposal if used, (See Appendix A for example). Also, include copies of receipts from disposal facilities.

A. RECOVERABLE OIL

Oil recovered will be transported by _____ to _____.

Company names and Contacts

_____

_____

_____

B. BURNABLE MATERIAL

Burnable material includes oily wood, debris, PPE, sorbents, oil snares and other suitable organic material collected during cleanup operations. The debris will be transported from the interim storage site by _____ to _____.

Transporter(s)	Facility
_____	_____
_____	_____
_____	_____

C. OTHER MATERIAL:

This material may consist of sand and tar balls and other assorted material that has been collected from the cleanup effort and has been stored at interim storage sites. All of this material will be transported to a licensed facility

Transporter(s)	Facility
_____	_____
_____	_____
_____	_____

9623 Oregon State Disposal Guidance

The general policy of the Department of Environmental Quality is that, whenever possible, recovered oil and oily debris be recycled and reused, thereby reducing the amount of oily debris to be burned on-site or disposed of at a solid waste landfill. Spilled oils and oil contaminated materials resulting from control, treatment, and clean up shall be handled and disposed of in a manner approved by the Department. General guidelines for the handling, storage, and recycling/reuse or disposal of wastes are discussed below.

9623.1 Classification and Segregation

The state of Oregon will utilize its access to federal samples taken by the Coast Guard. As necessary, the state will also utilize sampling capabilities of the DEQ laboratory. All oily waste and debris is classified as a specified waste in the state of Oregon.

The segregation of oily waste and debris is a key part of the disposal process. Oil recovered from an aquatic area will typically contain large amounts of water and debris. Excess water needs to be removed; it increases the amount of material to be transported and can cause problems for disposal facilities. It is most productive to segregate the waste on site to facilitate transportation and disposal. An oil/water separator or a vacuum truck should be available on site to complete this process. Oiled debris needs to be separated out as well. Oil and oily debris should be segregated into the following categories:

- Reuse/Recycle;
- Incinerate;

- Burn on site; and
- Landfill.

9623.2 Reuse/Recycle

Whenever possible, recovered oil and oily debris should be recycled and reused, thereby reducing the amount of oily debris to be burned on site or disposed of at a solid waste landfill.

9623.3 Incineration

Facilities are available which are capable of burning combustible, oiled debris, subject to any emission limits or restriction of the Air Containment Discharge Permit and Solid Waste Disposal Permit, if applicable.

A 60-day letter permit can be obtained immediately from the Air Quality Division of the Department of Environmental Quality in Portland by the facility to change fuel. In order to obtain this permit, a written request must be submitted including a statement of anticipated emissions based on the petroleum product contaminating the debris to be burned. Consecutive permits may be issued, but an evaluation will be conducted by DEQ prior to combustion.

For a list of facilities capable of incinerating oily debris, consult the appropriate Geographic Response Plan.

9623.4 On-Site Burning

Although no specific sites have been identified, the DEQ may authorize a 60-day letter permit for controlled open burning of combustible, oiled debris on the Oregon Coast and portions of the Columbia River in accordance with Oregon Administrative Rules, Division 23. The 60-day letter permit may be obtained from the Air Quality Division of the DEQ in Portland. A written request is required to obtain the permit, and must include the anticipated emissions based on the petroleum product contaminating the debris to be burned. Controlled open burning is defined as follows from most to least preferable:

- Forced air pit incineration;
- Tall stack burning with auxiliary air supply;
- Pile burning with auxiliary air supply; and
- Pile burning.

The DEQ would generally intend to require forced air pit incineration for burning proposed in or near any population center or sensitive area. Combustion efficiency enhancement through utilization of an air curtain or fan devices is generally recommended. There are several areas in Oregon currently regulated by local authorities. They are listed in Division 23 rules for open burning.

9623.5 Landfills

There are several landfills which may receive oiled debris, subject to the rules for disposal of spill cleanup materials, any restriction of the Solid Waste Permits, any

franchise restrictions, and the concurrence of the owner/operator. See Oregon Administrative Rules Chapter 340, Division 61 on solid waste management.

9623.6 Interim Storage

Interim storage site selection will be made on a case-by-case basis. Oregon Administrative Rules Chapter 340, Division 61 on solid waste management addresses the definition of and guidelines for a "disposal site" which includes temporary storage sites.

A letter of authorization for six months can be obtained from the DEQ by written application. The application must contain specific criteria regarding the site; these criteria can be found in Oregon Administrative Rules Chapter 340, Division 61, page 5.

Recovered oil should be stored in sealable containers such as 55-gallon drums, portable pillow tanks, empty fuel storage tanks, tank trucks, barges, or any other available container that can be sealed to prevent spillage. If necessary, a pit can be dug to hold the waste and lined with plastic or polymeric sheeting to prevent leaching.

Oily debris should be placed in leak-proof containers, such as plastic bags or debris boxes, provided they are lined with plastic. Debris should be stored on impermeable sheeting to prevent penetration into the soil should a breach of the container occur.

Temporary storage sites should be located with good access to the cleanup operations and nearby streets and highways. Good sites are flat areas such as parking lots or undeveloped lots, with a minimum of slope to reduce potential contamination from leaching oil. Sites should be at least three meters above mean sea level. A 1- to 1-1/2 meter high earth berm should be constructed around the perimeter of the site and the site lined with an impermeable liner to the top of the berm.

After oiled debris is in storage, a monitoring program should be set up to ensure that oil is not escaping outside the berm. Free oil accumulation within the bermed area should be monitored as well. For specific guidance on hazardous waste determination see 'How to Determine if Your Waste is Hazardous' at http://www.deq.state.or.us/lq/pubs/factsheets/hw/HazardousWasteDetermination.pdf

9623.7 Transportation

Transportation of oiled debris to its disposal destination is the contractor's responsibility. Certified haulers should be used. Trucks should be lined with plastic or otherwise made leak-proof in order to prevent leakage during transport.

WDOE DRILL EVALUATION CHECKLIST

Ecology Spill Drill Evaluation Checklist

Put Plan Holder Name Here
Spill Management Team
Choose, one if not both, Deployment Drill and Tabletop Drill, Worst Case Tabletop

Exercise Overview

Location:
Type of drill:
Date:
Time started:
Time completed:
Estimated size of spill to water:

Scenario:

Note: The purpose of the drill is to test the Ecology approved contingency plan. Over the three year drill cycle, plan holders design drills that demonstrate the ability to meet the planning standards within the scope of the plan, including recovery systems and system compatibility.

Evaluation:

☐ 1. Notifications

Note: The notifications checkbox is checked only after components below are obtained.

☐ **1.1 Internal spill response team was notified following plan procedures.**
☐ Observed **OR** ☐ Verified documentation.

☐ **1.2 Entire spill response organization, including Primary Response Contractor, was notified in a timely manner, following plan procedures.**
☐ Observed **OR** ☐ Verified documentation.

☐ **1.3 Notifications to government agencies were made in a timely manner following plan procedures** (goal is within 1 hour).
☐ Observed **OR** ☐ Verified documentation **and** ☐ Verified with DEM.

☐ 2. Staff Mobilization

Note: The staff mobilization checkbox is checked only after components below are obtained.

☐ **2.1 The number of local/internal response team personnel identified in the contingency plan were mobilized and on-site appropriate to the scope of the drill.**

☐ **2.2 Regional/National ("away") response team members as identified in the contingency plan were mobilized in state within last five years for facilities and within the last three years for vessels.**
☐ Percent of away team transitioned into ICS as appropriate to scope of drill.
OR
☐ Cumulative item: the positions filled in this drill are listed below (this item only checked after all away positions per plan are filled throughout the triennial cycle)
OR
☐ Not applicable.

☐ 3. Initial Response Actions

Note: Initial Response Actions checkbox is checked only after components below are obtained.

☐ **3.1 Field Document including the initial response checklist in the contingency plan was used.**

☐ **3.2 Initial Site Safety addressed following plan procedures.**
☐ Briefing observed. ☐ Documentation developed (hazard worksheet).
☐ Air monitoring documented.

☐ **3.3 Performed initial assessment of spill status.**
- ☐ Spill volume calculated (for example, using mass balance).
- ☐ Environmental conditions assessed (weather, tides).
- ☐ Analyzed where product was going (using trajectory, river speed).
- ☐ Deployed or discussed use of limited visibility tracking devices as identified in the plan.
- ☐ Product type identified, or provided in scenario and MSDS acquired.

☐ **3.4 Population Protection: Demonstrated the ability to quickly identify health hazards associated with the discharged product and the population at risk.**
- ☐ Acquired knowledge of risks.
- ☐ Notified the public of possible health hazards.

OR
- ☐ Not applicable.

☐ **3.5 Water Intake Protection: Demonstrated the ability to quickly identify water intakes and followed the proper protection procedures from the contingency plan or developed a plan for use.**
- ☐ Identified intakes in vicinity of spill/trajectory and started notifications.

OR
- ☐ Not applicable.

☐ **3.6 Documented early actions on ICS 201 form.**
- Initial Incident Map is appropriately labeled (for example, scale, time, author, north arrow, date).
- Objectives developed.
- Current Actions documented including input from key team members.
- Initial Organization.
- Initial Resources ordered documented on ICS 201 form.

☐ **3.7 Demonstrated smooth transition of the key personnel from initial response team to the spill management team through completion of an Initial Incident Briefing (ICS 201).**
- ICS 201 or equivalent hand out available for Unified Command.
- Briefing followed ICS 201 format.
- Objectives identified during briefing.
- Observed transition from IIC to RPIC and Unified Command, key members present and identified/introduced.

☐ 4. Response Management

Note: Response Management checkbox is checked only after all of the Response Management components (A – J) have been obtained (cumulative).

☐ **4.A Overall Staffing and Coordination: Demonstrated the ability to field the team as described in the plan and ensure coordination between sections.**

Note: The overall staffing and coordination box (A) is checked only after all of the components below are obtained.

☐ **4.A1 Expanded response management team task assignments were consistent with the contingency plan and the Northwest Area Contingency Plan.**
- ☐ Away team was present. **OR** ☐ Not applicable.
- ☐ Away team members fill roles as indicated in Contingency Plan.

The following were designated/established (typically this credit is achieved during a worst case drill).

☐ Responsible Party Incident Commander	☐ Safety Officer	☐ Information Officer
☐ Liaison Officer	☐ Operations Section	☐ Planning Section
☐ Resource Unit	☐ Situation Unit	☐ Environmental Unit
☐ Documentation Unit	☐ Logistics Section	☐ Finance Section

☐ **4.A2 Coordination took place between the following ICS sections.**

Note: when credit is not given, examples will be provided in the checklist.

☐ Planning and Operations
☐ Planning and Logistics
☐ Operations and Logistics
☐ Operations and Safety
☐ Unified Command and Command and General Staff

☐ **4.B <u>Unified Command and Command Staff</u>:**

Note: The Unified Command and Command Staff checkbox (B) is checked only after all of the Unified Command components are obtained.

☐ **4.B1 Members of the Unified Command were identified and an Initial Incident Briefing was conducted (for example, using an ICS 201 format).**

☐ Responsible Party Incident Commander designated. ☐ Federal On Scene Coordinator present (or invited).
☐ State On Scene Coordinator present (or invited).
☐ Local On Scene Coordinator present/consulted (or invited).
☐ Tribal On Scene Coordinator present/consulted (or invited) or ☐ Not applicable.

☐ **4.B2 Unified Command discussed the following issues.**

☐ Staffing needs were discussed/clarified including the need for night operations or second shift staffing.
☐ Qualifications of staff were discussed for key positions—Command and General Staff.
☐ Meeting Schedule was discussed and approved, and included press conferences and other special purpose meetings.
☐ Role of deputies and others working within unified command discussed, if applicable.

☐ **4.B3 Operational Period discussed and established.**

☐ **4.B4 Unified Command developed and prioritized overall incident objectives and assessed if current and planned actions were consistent with those objectives.**

☐ Updated ICS 201 Objectives or completed ICS 202 for the current operational period.
☐ Completed ICS 202 for the next operational period (if applicable).

☐ **4.B5 Unified Command prepared for and participated in Press Conference.**

☐ Unified command attended pre-press conference meeting with Information Officer.

☐ **4.B6 Dedicated historian/scribe assigned for Unified Command.**

☐ **4.B7 Unified Command approved or authorized news releases and updates to the news media through the Information Officer.**

☐ Unified Command verified accuracy of press releases.
☐ Unified Command signatures were on press releases.

☐ **4.C <u>Information Officer/Joint Information Center (JIC)</u>:**
Note: The Information Officer/JIC checkbox (C) is checked only after all of Information Officer/JIC components are obtained.

☐ **4.C1 Information Officer designated.**
- ☐ Information Officer was a government representative **<u>OR</u>**
- ☐ Government representative invited but not present **<u>OR</u>**
- ☐ Other individual designated by Unified Command.

☐ **4.C2 The JIC was established.**
- JIC manager used Northwest Area Contingency plan JIC manual.

☐ **4.C3 News releases.**
- ☐ News releases were published as requested by Unified Command.
- ☐ New releases were accurate.
- ☐ JIC prepared at least one news release.

☐ **4.C4 Preparation for press conference.**
- Speakers identified.
- Questions from the media predicted and draft answers provided to speakers.
- Outline for the press conference discussed.
- Displays/Maps developed for press conference match command post maps and information.

☐ **4.C5 Ensured appropriate representatives and technical specialists were present and utilized at all news briefings.**
- Unified Command.
- Scientific Support Coordinator.
- Environmental Unit Leader.
- Wildlife expert.

☐ **4.C6 Information Officer attended meetings as appropriate.**

☐ **4.D <u>Liaison</u> :**
Note: The Liaison checkbox (D) is checked only after all of the Liaison components are obtained.

☐ **4.D1 Liaison Officer designated.**
- ☐ Liaison Officer was a government representative **<u>OR</u>**
- ☐ Government representative invited but not present **<u>OR</u>**
- ☐ Other individual designated by Unified Command.

☐ **4.D2 Liaison Officer, through coordination with the PIO, established contact and tracked input from stakeholders as appropriate.**

☐ **4.D3 Liaison Officer planned for or conducted Local Official Briefing.**

☐ **4.D4 Liaison Officer provided information regarding the spill cleanup effort to citizens.**
☐ Public outreach focused press release **OR** ☐ Public meeting / open house held.

☐ **4.D5 Liaison Officer attended meetings as appropriate.**

☐ **4.E Safety:**
Note: The Safety Officer checkbox (E) is checked only after all of the Safety components are obtained.

☐ **4.E1 Safety Officer designated.**

☐ **4.E2 Ensured safety plan was developed in a timely manner in accordance with the contingency plan (covers all operations of the response including command post and night operations).**

☐ **4.E3 Safety plan approved by the Unified Command and communicated to appropriate field staff.**
☐ Unified Command signature on Safety Plan
☐ Developed in writing, or described during a meeting the plan to ensure proper communication to field staff beyond timeframe of drill

☐ **4.E4 Safety Officer attended meetings as appropriate.**

General Staff

☐ **4.F Operations Section:**
Note: The Operations Section checkbox (F) is checked only after all of the Operations components are obtained.

☐ **4.F1 Operations Section was established following the contingency plan.**
☐ Operations Section staffed appropriately for scope of drill
☐ Operations Section Chief trained in ICS, Northwest Area Contingency Plan and GRP's

☐ **4.F2 Tactical assignments were made appropriate to the overall incident objectives developed by the Unified Command.**
☐ Operations Section Chief worked with the Planning Section Chief prior to the tactics meeting to develop draft ICS Form 215s for the next operational period.
- Contain/recover spilled material.
- Maximize protection of sensitive areas.
- Maximize removal of oil from impacted areas.
- Maximize primary and secondary storage for recovered product.
- Source control.
- Salvage.
- Wildlife recovery and rehabilitation.

☐ Tactics on the ICS 215s covered all operational incident objectives.

☐ **4.F3 Operations Section staff developed a plan to provide aircraft support.**

☐ Plan included aircraft for all aspects of the response.
☐ Ordered support resources including aircraft maintenance, fueling, and staging.
☐ Completed an ICS Form 220.
☐ Documentation was submitted or a general message was circulated that detailed the above information.

☐ **4.F4 Operations Section staff coordinated with the Planning Section on the following, if appropriate for plan holder and scope of the drill.**

- Develop division boundaries.
- GRPs and GRP revisions.
- Shoreline Cleanup Assessment Teams and shoreline cleanup teams.
- Disposal plans and logistics.
- Alternate technology.

☐ **4.F5 Operations Section staff coordinated with Planning and Logistics to develop resource orders, tracking, and documentation.**

☐ Equipment status change forms submitted.
☐ Check-in forms submitted.
☐ Identified needs for shoreline cleanup workers (if applicable).
☐ Identified needs for non-dedicated workboats (if applicable).

☐ **4.F6 Operations Section staff coordinated with the Planning Section to ensure situation status displays were accurate.**

☐ **4.F7 Operations Section staff coordinated with the Planning Section to ensure disposal plan is developed and accurate.**

☐ Provided input to Environmental Unit Leader.
☐ Coordinated on interim disposal locations.

☐ **4.F8 Operations Section Chief attended meetings as appropriate.**

☐ **4.F9 Coordinated with local, state and federal operations representatives as appropriate to the scope of the drill.**

- Local fire department/police department participated in Operations.
- Federal (FBI, NOAA, EPA, US F&W) representative participated in Operations.
- State (F&W, PARKS and ARCHEOLOGY, DNR) representative participated in Operations.

☐ **4.G <u>Planning Section</u>:**

Note: The Planning Section checkbox (G) is checked only after all of the Planning components are obtained.

☐ **4.G1 Planning Section was established following the contingency plan.**

☐ Planning Section staffed appropriately for scope of drill
☐ Planning Section Chief trained in ICS, Northwest Area Contingency Plan, and GRP's

☐ **4.G2 Planning Section staff utilized the appropriate tools.**

- Contingency plan.
- Northwest Area Contingency Plan.
- Geographic Response Plans, most current version.
- ESI Maps.

☐ **4.G3 Planning Section Chief established an appropriate meeting schedule.**

☐ Draft meeting schedule provided to Unified Command.
☐ Meeting schedule allowed time for staff to prepare and develop deliverables.
☐ Meeting schedule included all meetings appropriate to the scope of drill.

☐ **4.G4 Planning Section Chief facilitated and ensured appropriate attendance and participation at all scheduled meetings.**

☐ **4.G5 Prepared meeting room displays as needed or hand outs available including:**

☐ Agenda for the meeting.
☐ The following displays are developed, if applicable:

- Weather, tides, and currents for current and next operational period.
- Trajectory, situation, and planning maps for current and next operational period.
- Current overflight map.
- ICS 202 form.

☐ **4.G6 Prepared and maintained situation displays (this is typically achieved at a worst case drill)**

☐ Out of date or obsolete information is removed in a timely manner
☐ Set-up is well organized and the information is updated on a schedule

Situation displays included the following, as appropriate:

- Weather, tides
- Resources at risk
- Trajectory, situation and planning maps
- Response objectives
- Master resource list
- Organization chart
- Incident status summary (ICS Form 209)
- Overflight map
- Meeting schedule

☐ **4.G7 Developed, maintained, and posted a master list of all resources involved the incident including check-in, status, current location, assignment**.

☐ **4.G8 Documented the spill response effort.**

☐ Documentation flow and process established and communicated to Sections.
☐ Reviewed all documentation for signature, correct operational period, and incident name.

☐ **4.H <u>Environmental Unit:</u>**

Note: According to the Northwest Area Contingency Plan, the plan holder is not expected to lead the Planning Section's Environmental Unit. However, the plan holder is expected to assist with the core Environmental Unit tasks.

☐ **4.H1 Unit Leader designated.**

☐ Environmental Unit Leader was a government natural resource trustee agency representative **<u>OR</u>**
☐ Government representative invited but not present **<u>OR</u>**
☐ Other individual designated by Unified Command.

☐ **4.H2 Plan holder assisted state/federal agency staff with the following core Environmental Unit activities, as appropriate to the drill design.**

- Identify sensitive areas and recommended response priorities.
- Determined the extent, fate, and effects of contamination.
- Acquired, distributed, and provided analysis of weather forecasts.
- Monitored the environmental consequences of cleanup actions.
- Developed shoreline cleanup and assessment plans.
- Identified the need for, and prepare, any special advisories or orders.
- Identified the need for, and obtain, permits, consultations, and other authorizations.
- Identified and develop plans for protection of affected historical/cultural resources.
- Evaluated the opportunities to use various Response Technologies.
- Developed disposal plans with operations.
- Developed plan for collecting, transporting, and analyzing samples.

☐ **4.I <u>Logistics Section</u>:**

Note: The Logistics Section checkbox (I) is checked only after all of the Logistics components are obtained.

☐ **4.I1 Logistics Section was established following the contingency plan.**

☐ Logistics Section staffed appropriately for scope of drill.
☐ Logistics Section Chief trained in ICS, Northwest Area Contingency Plan and GRP's.

☐ **4.I2 Resource ordering process established.**

☐ Informed the Command and General staff on the process.
☐ Established signature authority.

☐ **4.I3 Developed, maintained, and posted an incident Radio Communications Plan (ICS Form 205) and communications list (ICS Form 205a).**

☐ **4.I4 Developed a Medical Plan that encompasses all areas of the response.**

☐ **4.I5 Developed or described a plan, and ordered all resources necessary, to ensure sufficient feeding, potable water, sanitary arrangements, and berthing was available to meet incident needs.**

☐ **4.I6 Provided personnel for all elements of the response, as applicable.**
- ☐ Command post staffing, day and night shift.
- ☐ Field staffing, day and night shift.

☐ **4.I7 Established a command post that accommodated the needs of the response organization.**
- ☐ Command post/facility was appropriate for the scope of the drill **OR**
- ☐ Plan was in place to move command post to more appropriate location as drill/spill ramps up.

☐ **4.I8 Identified and planned for staging areas and other areas as needed.**
- All staging areas were listed on the ICS Form 215.
- Ensured situation unit and operations identified the same staging areas.

☐ **4.I9 Developed a plan to provide ground support/traffic plan including; vehicle maintenance, fueling, and parking.**

☐ **4.I10 Developed a plan to provide support for all response vessels including; vessel maintenance, fueling, and berthing.**

☐ **4.I11 Logistics Section Chief attended meetings as appropriate.**

☐ **4.J <u>Finance Section</u>:**

Note: The overall Finance Section checkbox (J) is checked only after all of the Finance components are obtained.

☐ **4.J1 Finance section established following contingency plan.**

☐ **4.J2 Finance is able to provide a cost estimate (burn rate) if requested.**

☐ **4.J3 Compensation and claims numbers established, and information distributed.**

☐ 5. Response Operations

Note: The check items for Response Operations are for deployment drills only. The checkbox for Response Operations is checked only after all of the components of Response Operations are obtained. Where applicable, include WRRL ID, staging area, home base and owner.

☐ **5.A Initial Response Operations:**

☐ **5.A1 Initial Site Safety equipment deployed and Safety Officer established.**
- ☐ Briefing observed
- ☐ Documentation developed (hazard worksheet)
- ☐ Air monitoring documented
- ☐ Site safety assessed before deployment (list resources used, including home base or staging area)
- ☐ Assessed environmental conditions and determined that equipment is appropriate before deployment
- ☐ Deployed or discussed use of limited visibility tracking devices

☐ **5.A2 The local/internal response team members identified in the contingency plan were mobilized and on-site appropriate to the scope of the drill.**

☐ **5.A3 The number of personnel appropriate for the environmental conditions and the scope of the drill were mobilized (include the number and affiliation of the personnel).**

☐ **5.A4 Walk through of emergency shutdown procedures for each type of transfer identified in the contingency plan, by the appropriate trained personnel (at least once a triennial drill cycle).**
- ☐ Pipeline to/from facility
- ☐ Pipeline to/from vessel
- ☐ Vessel to vessel
- ☐ Truck racks
- ☐ Facility to/from vessel

☐ **5.A5 Field-tested plan holders initial response communication equipment and systems.**
- ☐ Observed utilization/coordination of all comms equipment (list equipment, system, and channels used).

☐ **5.A6 Plan holder and response contractor field-tested the compatibility of communications equipment and systems.**
- ☐ Observed utilization/coordination of all comms equipment (include equipment, system, and channels used).

☐ **5.B. Containment and Recovery:**

☐ **5.B1 Deployment drills are conducted in all operating environments within the scope of the contingency plan during the triennial cycle.**

Note: This is cumulative each deployment will be tracked and operating environment will be identified in the evaluation.
- ☐ Boom
- ☐ Recovery
- ☐ On-water Storage

☐ **5.B2 Plan holder began initial deployment of plan holder owned response equipment on-site (include operating environment/conditions on the drill day and check maintenance records for company owned response equipment at least once a year). May be through demonstration.**
- ☐ Deployed pre-boom configuration.
- ☐ Deployed other boom configuration.

☐ **5.B3 Deployed initial mechanical recovery resources identified in the contingency plan.**

☐ **5.B4 Set-up and demonstrated, or discussed, ability to transfer product from skimmer or temporary storage to on-shore storage facilities.**

☐ **5.B5 Demonstrated or described containment of a land spill from entering water by channeling, diverting, or berming.**
- ☐ Demonstrated or described one of the above techniques.
- ☐ Deployed resources (list resource used including home base or staging area).

☐ **5.B6 Demonstrated or described damage control procedures as identified in the contingency plan (such as plugging or patching a leak in a pipeline or storage tank).**
- ☐ Walked through the above procedures.
- ☐ Identified resources for damage control.

☐ **5.C <u>Protection:</u>**

☐ **5.C1 Plan Holder deployed GRP or protection strategy identified in the contingency plan (include operating environment/conditions on the drill day).**
- ☐ GRP deployed by plan holder as written **<u>OR</u>** ☐ GRP deployed by PRC as written **<u>OR</u>**
- ☐ Plan Holder or PRC deployed a modified version of the GRP strategy based on environmental conditions.

Summary:

It is not necessary to wait for all information before calling the NRC.
National Response Center - 800-424-8802.

Field Notification Form
Name and phone number of KM caller:
Name and phone number of designated KM employee for follow-up calls (Area Manager or Designee):
Company Name and Mailing Address: *Mailing address for reports: Kinder Morgan Energy Partners L.P. 1100 Town & Country Rd. Orange, CA 92868*
Date and Time of Incident:
Product Type:
Location of Release or Threatened Release (see facility address list as needed): ☐ Harbor Island Terminal 2730 13th Avenue SW Seattle, WA 98134-1040 ☐ Main Terminal Latitude/Longitude: (b) (7)(F), (b) (3) [redacted] ☐ Marine Terminal Latitude/Longitud [redacted]
County: King State: Washington Nearest City (Name and Distance): Seattle
Weather Conditions:
Description of what happened:
Amount Released estimate size of release area (i.e. 5ft by 5ft by 3in) or quantity (barrels or gallons): **Approximately = by by or barrels/gallons**
Water Affected or Threatened, if any:
Measures taken or plans to abate, contain and cleanup the spill:
Death, Injuries or Evacuations, if any:
Other Agencies Notified, if any:
Information provided in follow-up calls:

§154.1045	**BRIEF DESCRIPTION**	**SECTION**
(d)(3)(iii)	In all other locations, ... within 12 hours ...	App A, App B
(d)(4)	... COTP may impose additional operational restrictions ...	App A, App B
(e)	... identify the response resources ... worst case discharge ...	App A, App B
(e)(2)(i)	The volume of the Facility's worst case discharge;	App A, App B
(e)(2)(ii)	Group(s) of oil...handled, stored or transported by the Facility; and	Fig 1.3, App B, App C
(e)(2)(iii)	The geographic area(s) in which the Facility operates.	App A, App B
(e)(3)	... sufficient boom, oil recovery devices, and storage capacity to recover the worst case discharge planning volumes.	App A, App B
(e)(4)	... quantity of response resources ... to respond ... to the worst case discharge to the maximum extent practicable.	App A, App B
(e)(5)	... The following percentages of the response equipment ... must be capable of operating in waters of 6 feet or less depth.	App A, App B
(e)(5)(i)	Offshore - 10 percent.	App A, App B
(e)(5)(ii)	Nearshore/inland/Great Lakes/rivers and canals - 20 percent.	App A, App B
(e)(6)	... COTP may impose additional operational restrictions ...	App A, App B
(f)	Response equipment ... must be capable of arriving on scene within the times specified in this paragraph ...	App A, App B
(g)	... response equipment identified for Tier 1 plan credit must be capable of being mobilized and en route to the scene of a discharge within 2 hours of notification ...	App A, App B
(g)(1)	Either directly or through the qualified individual; and	App A, App B
(g)(2)	Within 30 minutes of a discovery ...	App A, App B
(h)	Response resources identified for Tier 2 and Tier 3 plan credit must be capable of arriving on scene within the time specified ...	App A, App B
(i), (i)(1), (i)(2)(i) – (iv), (i)(3)	The owner or operator of a facility that handles, stores, or transports groups II through IV petroleum oils within the inland, nearshore, or offshore areas where pre-authorization for dispersant use exists must identify in their response plan, and ensure the availability of, through contract or other approved means, response resources capable of conducting dispersant operations within those areas.	N/A
(j)	The owner or operator of a facility handling Groups I through IV petroleum oil as a primary cargo must identify in the response plan, and ensure the availability through contract or other approved means, of response resources necessary to provide aerial oil tracking to support oil spill assessment and cleanup activities. Facilities operating exclusively on inland rivers are not required to comply with this paragraph. Aerial oil tracking resources must:	§ 2, App A
(j)(1)	Be capable of arriving at the site of a discharge in advance of the arrival of response resources identified in the plan for tiers 1, 2, and 3 Worst-Case Discharge response times, and for a distance up to 50 nautical miles from shore (excluding inland rivers);	§ 2, App A
(j)(2)	Be capable of supporting oil spill removal operations continuously for three 10-hour operational periods during the initial 72 hours of the discharge;	§ 2, App A

U.S. COAST GUARD 33 CFR 154 ***FINAL RULE – July 1, 2010 (Cont'd)***		
§154.1035	**BRIEF DESCRIPTION**	**SECTION**
(j)(3)	Include appropriately located aircraft and personnel capable of meeting the response time requirement for oil tracking from paragraph (j)(1) of this section; and	§ 2, App A
(j)(4)	Include sufficient numbers of aircraft, pilots, and trained observation personnel to support oil spill removal operations, commencing upon initial assessment, and capable of coordinating on-scene cleanup operations, including dispersant and mechanical recovery operations. Observation personnel must be trained in: (i) The protocols of oil-spill reporting and assessment, including estimation of slick size, thickness, and quantity; and (ii) The use of assessment techniques in ASTM F1779–08 (incorporated by reference, *see* § 154.106), and familiar with the use of other guides …	§ 2, App A
(k)	… identify response resources with firefighting capability…	App A, App B
(l)	... identify equipment and required personnel ... to protect fish and wildlife and sensitive environments.	App A, App B
(l)(1)	... the identified response resources must include the quantities of boom sufficient to protect	App A, App B
(l)(2)	... resources and response methods ... must be consistent with the ... ACP in effect 6 months prior to initial plan submission or the annual plan review ...	§ 1.5; Fig 3.7, § 6.0
(m)	The response plan for a Facility that handles, stores, or transports Groups I through IV petroleum oils must identify an oil spill removal organization(s) with response resources that are available...	App A, App B
(m)(1)	Except as required in paragraph (l)(2) ... shoreline clean-up response resources required must be determined as described in Appendix C of this part.	App A, App B
(m)(2)	... resources and response methods ... must be consistent with the ... ACP in effect 6 months prior to initial plan submission or the annual plan review ...	§ 1.5; App A, App B
(n)	Appendix C ... quantity of response resources ... for the maximum most probable discharge volume, and for each worst case discharge response tier.	§ 1.5; App A, App B
(n)(1)	Included in Appendix C of this part is a cap that recognizes the practical and technical limits of response capabilities ...	§ 1.5; App A, App B
(n)(2)	... Appendix C of this part lists the caps that will apply in ... February 18, 1998. ...Facility whose estimated recovery capacity exceeds ... caps ... shall identify sources of additional equipment equal to twice the cap ... or the amount necessary to reach the calculated planning volume, whichever is lower.	§ 1.5; App A, App B
(o)(1)...(2)	The Coast Guard will initiate a review of cap increases and other requirements contained within this subpart ...	---

OSHA EMERGENCY ACTION PLANS *(29 CFR 1910.38(a)) and Process Safety (29 CFR 1910.119)*		
29 CFR	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
1910.38(a)	***Emergency action plan:***	
(1)	Scope and applicability	§1.0
(2)	Elements:	-----
(i)	Emergency escape procedures and emergency escape route assignments.	App E
(ii)	Procedures to be followed by employees who remain to operate critical terminal operations before they evacuate.	§ 3.0
(iii)	Procedures to account for all employees after emergency evacuation has been completed.	App E
(iv)	Rescue and medical duties for those employees who are to perform them.	§ 3.0, 5.0
(v)	The preferred means of reporting fires and other emergencies.	§ 2.0, 3.0
(vi)	Names or regular job titles of persons or departments who can be contacted for further information or explanation of duties under the plan.	§ 2.0
(3)	Alarm system	App E
(4)	Evacuation	App E
(5)	Training	App D
1910.165	***Employee alarm systems:***	-----
(b)	General requirements	App E
(b)(1)	Purpose of alarm system	App E
(b)(4)	Preferred means of reporting emergencies	§ 2.0, 3.0
(d)	Maintenance and testing	App E

OSHA HAZWOPER *(29 CFR 1910.120)*

(viii)	Emergency medical treatment and response procedures	§ 3.0
(ix)	Emergency alerting and response procedures	§ 2.0, 3.0
(x)	Critique of response and follow-up	§ 1.4
(xi)	PPE and emergency equipment	§ 3.0, 5.0
(xii)	Emergency response plan coordination and integration	§ 4.0, 5.0
(3)	Procedures for handling emergency response:	-----
(i)	The senior emergency response official responding to an emergency shall become the individual in charge of a site-specific Incident Command System (ICS).	§ 4.0
(ii)	The individual in charge of the ICS shall identify, to the extent possible, all hazardous substances or conditions, present and shall address as appropriate site analysis, use of engineering controls, maximum exposure limits, hazardous substance handling procedures, and use of any new technologies.	§ 3.0, 4.0
(iii)	Implementation of appropriate emergency operations and use of PPE.	§ 3.0, 5.0
(iv)	Employees engaged in emergency response and exposed to hazardous substances presenting an inhalation hazard or potential inhalation hazard shall wear positive pressure self-contained breathing apparatus while engaged in emergency response.	§ 3.0, 5.0
(v)	The individual in charge of the ICS shall limit the number of emergency response personnel at the emergency site, in those areas of potential or actual exposure to incident or site hazards, to those who are actively performing emergency operations.	§ 3.0, 4.0, 5.0
(vi)	Backup personnel shall stand by with equipment ready to provide assistance or rescue.	§ 3.0, 4.0, 5.0
(vii)	The individual in charge of the ICS shall designate a safety official, who is knowledgeable in the operations being implemented at the emergency response site.	§ 3.0, 4.0

OSHA HAZWOPER *(29 CFR 1910.120) (Cont'd)*		
29 CFR	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(viii)	When activities are judged by the safety official to be an IDLH condition and/or to involve an imminent danger condition, the safety official shall have authority to alter, suspend, or terminate those activities.	§ 3.0, 5.0
(ix)	After emergency operations have terminated, the individual in charge of the ICS shall implement appropriate decontamination procedures.	3.0, 5.0
(x)	When deemed necessary for meeting the tasks at hand, approved self-contained compressed air breathing apparatus may be used with approved cylinders from other approved self-contained compressed air breathing apparatus provided that such cylinders are of the same capacity and pressure rating.	§ 3.0, 5.0
(4)	Skilled support personnel	§ 4.0
(5)	Specialist employees	§ 4.0
(6)	Training	App D
(7)	Trainers	App D
(8)	Refresher training	App D
(9)	Medical surveillance and consultation	§ 3.0, 5.0
(10)	Chemical protective clothing	§ 3.0, 5.0
(11)	Post-emergency response operations	§ 3.0, 5.0

FACILITY INFORMATION

GENERAL INFORMATION	
Facility Name:	Kinder Morgan Energy Partners, L.P.
Physical Address:	Harbor Island Terminal 2720 13th Avenue SW Seattle, WA 98134 (206) 682-4706 (206) 623-9023 *(24 hrs)* (206) 622-8003 *(Fax)*
NAICS Code:	493190
EPA FRP Number:	FRP-6A
Dun & Bradstreet Number:	618 450-886
Date of Initial Storage:	Prior to 1937
Owner/Operator:	Kinder Morgan Liquid Terminals, LLC 1001 Louisiana Street, Suite 1000 Houston, TX 77002 or 1100 Town & Country Road Orange, CA 92868
Qualified Individual: ***(Emergency Coordinator)*** ***(On-Site Firefighting Coordinator)***	David Rowland – Area Manager (Home Address *) (206) 682-4706 *(Work)* (b) (6) *(Cell)*
Alternate Qualified Individual: ***(Alt. Emergency Coordinator)***	Andrew Holbrook – Operations Manager (Home Address *) (503) 220-1257 *(Work)* (b) (6) *(Cell)*
Alternate Qualified Individual: ***(Alt. Emergency Coordinator)***	Del Carey – Lead Operator (Home Address *) (206) 682-4706 *(Work)* (b) (6) *(Cell)*
Telephone/FAX:	Additional telephone references, including 24 hour numbers, for the Facility, Owner, and QI/AQI are provided in Section 2 of Volume 1.

* Company policy is to treat an employee's home address as confidential. This information is kept on file at the Regional Office (909) 877-2373, and Houston Corporate Office, Human Resources Dept. (713) 369-8876.

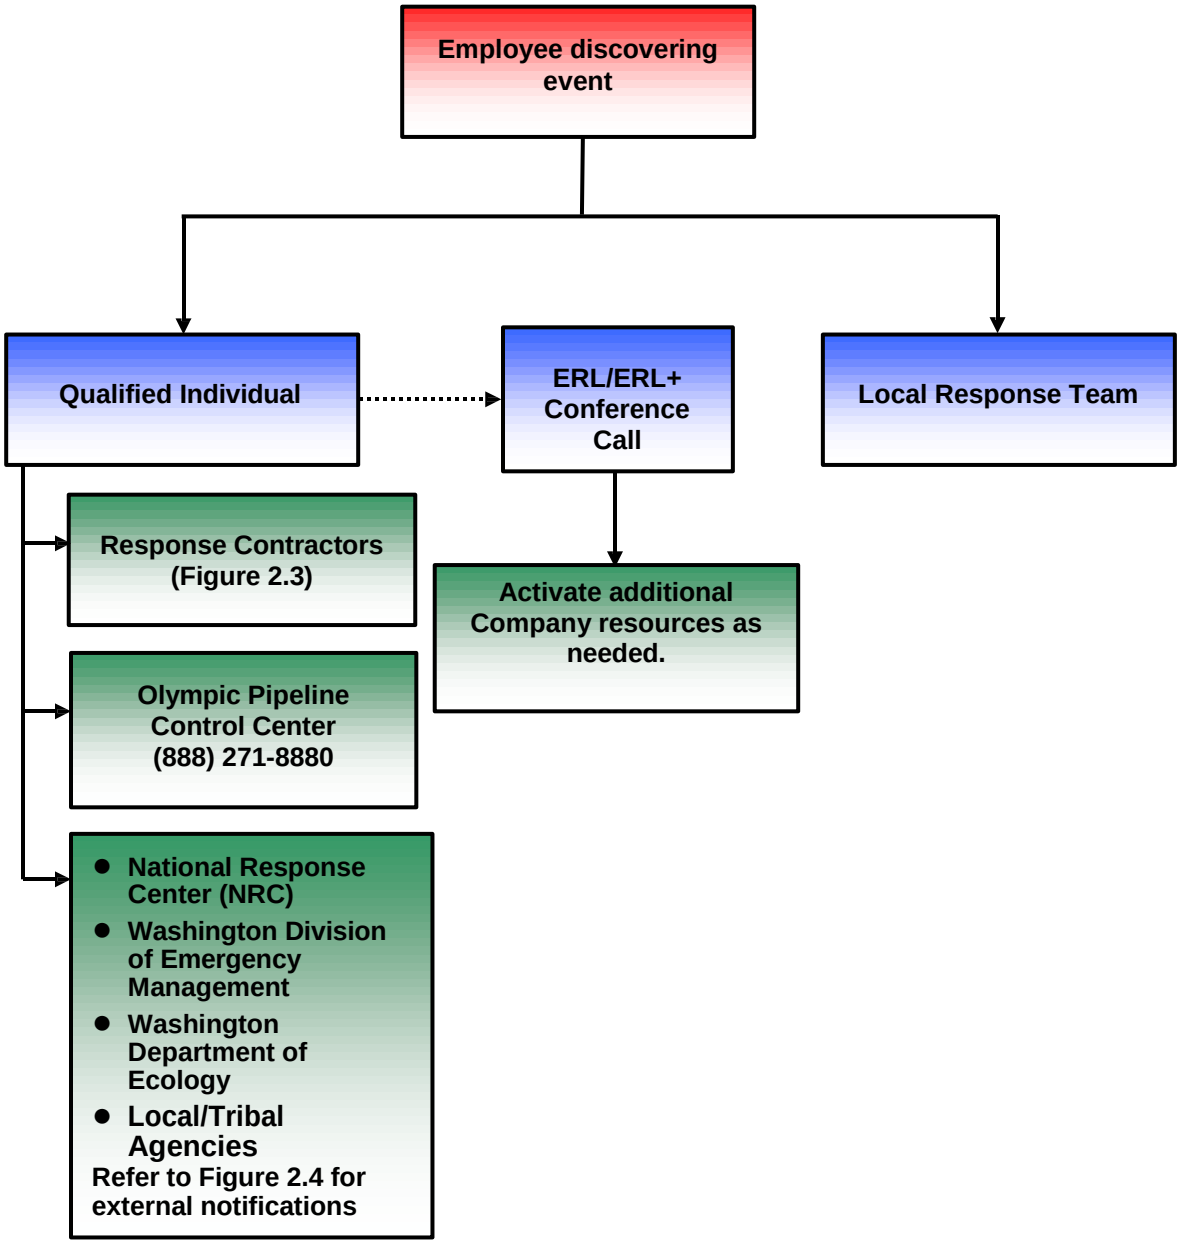
FIGURE 1.3

FACILITY INFORMATION (Cont'd)

FACILITY LOCATION	
County:	King County
Latitude:	(b) (7)(F), (b) (3)
Longitude:	
Area Map:	Provided in Figure 1.1
Facility Diagram:	Provided in Figure 1.2
Wellhead Protection Area:	None
Facility Distance to Navigable Water:	Less than 400 yards
Landside Directions:	Leave Seattle-Tacoma Airport going southwest on Alaskan Way toward Vine Street. Turn left onto Wall Street then right onto Elliott Avenue. Merge onto WA-99 S/Alaskan Way and travel approximately 2.5 miles. Take the W Seattle BR exit toward Harbor Island. Stay straight to go onto S Spokane Street. Turn left onto Klickitat Way SW, which becomes Klickitat Avenue SW. Turn right onto 13th Avenue SW. The Facility is approximately half a mile from the intersection of Klickitat Avenue SW and 13th Avenue SW.
Waterside Directions:	From Elliott Bay travel south on the Duwamish Waterway East for approximately one half mile. The Facility is on the left descending bank at the Port of Seattle Berth 18.

FIGURE 2.1

EMERGENCY RESPONSE NOTIFICATIONS PROCESS



- The sequence of notification depends on the type and severity of the situation, and is to be used for spills to navigable waters, state waters, and spills to ground or permeable secondary containment that threaten state waters..
- Judgment must be used.
- Public and employee safety must always be the first consideration.
- Notification of Olympic is dependent upon whether their operation is involved.

Death, Injuries or Evacuations, if any:	
Other Agencies Notified, if any:	
Information provided in follow-up calls:	

3.1 RECOGNIZING AN EMERGENCY

Definition of an Emergency

An emergency is defined as any uncontrolled release, occurrence, or incident which requires the response of persons outside of the immediate area, including KMEP employees or response agencies. These may include leaks, spills, fires or explosions; or natural disasters or terror threats which could result in any of these situations.

Product Release

The Facility handles refined petroleum products, ethanol, biodiesel, and petroleum additives.

Refined petroleum fuels comprise a majority of the products handled by the Facility. A refined petroleum product release is recognized by any visual signs of liquid hydrocarbons the ground or water. Other signs may include:

- Staining of soil
- Dead or discolored vegetation near pipeline or right-of-way areas
- Product sheen on water
- Distinct odors of petroleum or hydrocarbons
- (b) (7)(F), (b) (3)

3.1.1 Fire/Explosion

Any unplanned fire is considered an emergency and requires some level of response action. If the fire is small enough and personnel are trained they may attempt to extinguish the fire prior to notifications. See KMEP Safety Manual, for more detail. Larger fires should be reported immediately and this ICP should be implemented.

3.1.2 Natural Disasters

Natural disasters may include the following:

- Earthquakes
- Floods
- Severe storms
- Tornados

Natural disasters may not necessarily constitute an emergency response. However, if the natural disaster results in a release or fire, as described above, implementation of this plan may be required.

3.1 RECOGNIZING AN EMERGENCY (Cont'd)

3.1.3 Bomb or Terrorist Threats

(b) (7)(F), (b) (3)

[redacted]

3.2 INITIAL PROTECTIVE MEASURES

Recognizing an emergency allows an initial responder to effectively determine protective measures. Protective measures are necessary to ensure the safety of personnel, environment and property. These measures may include:

- Evacuation of persons exposed to immediate hazards. Move personnel in an up-wind or cross-wind direction.

NEVER ALLOW PERSONS TO ENTER
THE VAPOR AREA DURING AN EMERGENCY

- Restrict access of the immediate area
- Eliminate and controlling ignition sources
- Shut down system to control release

Once these initial, protective measures are taken, the first employee on site should perform a site Risk Assessment.

FIGURE 3.1a

INCIDENT SPECIFIC RESPONSE ACTIONS
PRODUCT RELEASE

Incident Type	Mitigation Actions
Flange, Valve, or Hose Leak	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* D Shut off flow to line D Move to safe area D Notify Qualified Individual D Notify ***Control Center*** D Notify local emergency agencies, as required D Notify local management D Secure area and eliminate ignition sources D Tighten connection, if possible D Initiate spill containment (if outside containment area) D Block and purge affected equipment D Initiate recovery/clean-up action as required.

Incident Type	Mitigation Actions
Tank Truck or Rack Valve Leak	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* D Stop transfer operation D Move to safe area D Notify Qualified Individual D Notify ***Control Center*** D Notify local emergency agencies, as required D Notify local management D Secure area and eliminate ignition sources D Tighten connection, if possible D Offload the leaking compartment D Flush area into containment drains or other containment D Initiate other cleanup action as required

Incident Type	Mitigation Actions
Pipeline Leak or Rupture	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* D Shut down system to control release D Move to safe area D Notify Qualified Individual D Notify ***Control Center*** D Notify local emergency agencies, as required D Notify local management D Secure area and eliminate ignition sources D If possible, place containment under the leak D Initiate spill containment (if outside containment area) D Initiate other recovery/cleanup action as required

FIGURE 3.1a

INCIDENT SPECIFIC RESPONSE ACTIONS
PRODUCT RELEASE (Cont'd)

Incident Type	Mitigation Actions
Tank Leak or Rupture	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* D Stop flow into the tank D Ensure dike drains are closed D Move to safe area D Notify Qualified Individual D Notify ***Control Center*** D Notify local emergency agencies, as required D Notify local management D Secure area and eliminate ignition sources D Begin transferring contents to available tankage to reduce level D Organize temporary tank patch and begin repair D Initiate other response actions as required

Incident Type	Mitigation Actions
Tank Overfill	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* D Shut off transfer or flow to tank D Ensure dike drains are closed D Move to safe area D Notify Qualified Individual D Notify ***Control Center*** D Notify local emergency agencies, as required D Notify local management D Secure area and eliminate ignition sources D Begin transferring contents to available tankage to reduce level D Initiate other response actions as required

FIGURE 3.1b

INCIDENT SPECIFIC RESPONSE ACTIONS
FIRE/EXPLOSION

Incident Type	Initial Response Actions
Fire/Explosion	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* D Alert personnel D Move to safe area D Notify Qualified Individual D Notify ***Control Center*** D Notify local emergency agencies, as required D Notify local management D Activate alarm as required D Notify local fire department D Evacuate non-essential individuals D Identify cause/source/materials involved D Contain fire/spill material released D Consider potential for escalation D Protect exposures

FIGURE 3.1c

INCIDENT SPECIFIC RESPONSE ACTIONS
NATURAL DISASTERS

Incident Type	Response Action
Earthquake	Earthquakes may damage pipeline and terminal equipment. Damage may result in an emergency situation. The following are response actions that should be taken only when it is deemed safe to do so: During Earthquake D If indoors, stay inside and take refuge D Stay away from windows, glass, bookcases, heavy objects etc. D If outdoors, move to open area D If driving a vehicle, pull over and remain in car D Avoid parking near power lines or other overhead hazards After Earthquake D Identify immediate hazards D Evacuation building if impending collapse D Check for product releases D Check for injuries D Notify local authorities as appropriate D Be prepared for after-shocks D Use portable radios for news reports

FIGURE 3.1c

INCIDENT SPECIFIC RESPONSE ACTIONS
NATURAL DISASTERS (Cont'd)

Incident Type	Mitigation Actions
Severe Storm	Severe storms can hit west coast locations. Historically, severe storms have been documented on numerous occasions. They can involve high winds and tides, severe rainstorms and lightning and flooding. D Listen to local and national news of impending storm D Verify adequate emergency supplies D Shut down non-essential operations D Review evacuation plan D Provide alerting information to employees, contractors and others D Conduct planning meetings with appropriate personnel D Assess available emergency equipment: D Back-up generators D Portable water pumps D Earth moving equipment D Water, food provisions D Relocate important records D Safe guard hazardous materials D Prior to evacuation, turn off gas, water and electrical D Prepare to account for employees D Prepare for expected media coverage D Contact fire departments as necessary D Prepare vehicles for possible evacuation D Open tank roof drains D Verify that tank dikes are closed

FIGURE 3.1d

INCIDENT SPECIFIC RESPONSE ACTIONS
BOMB/TERROR THREATS

(b) (7)(E), (b) (3)

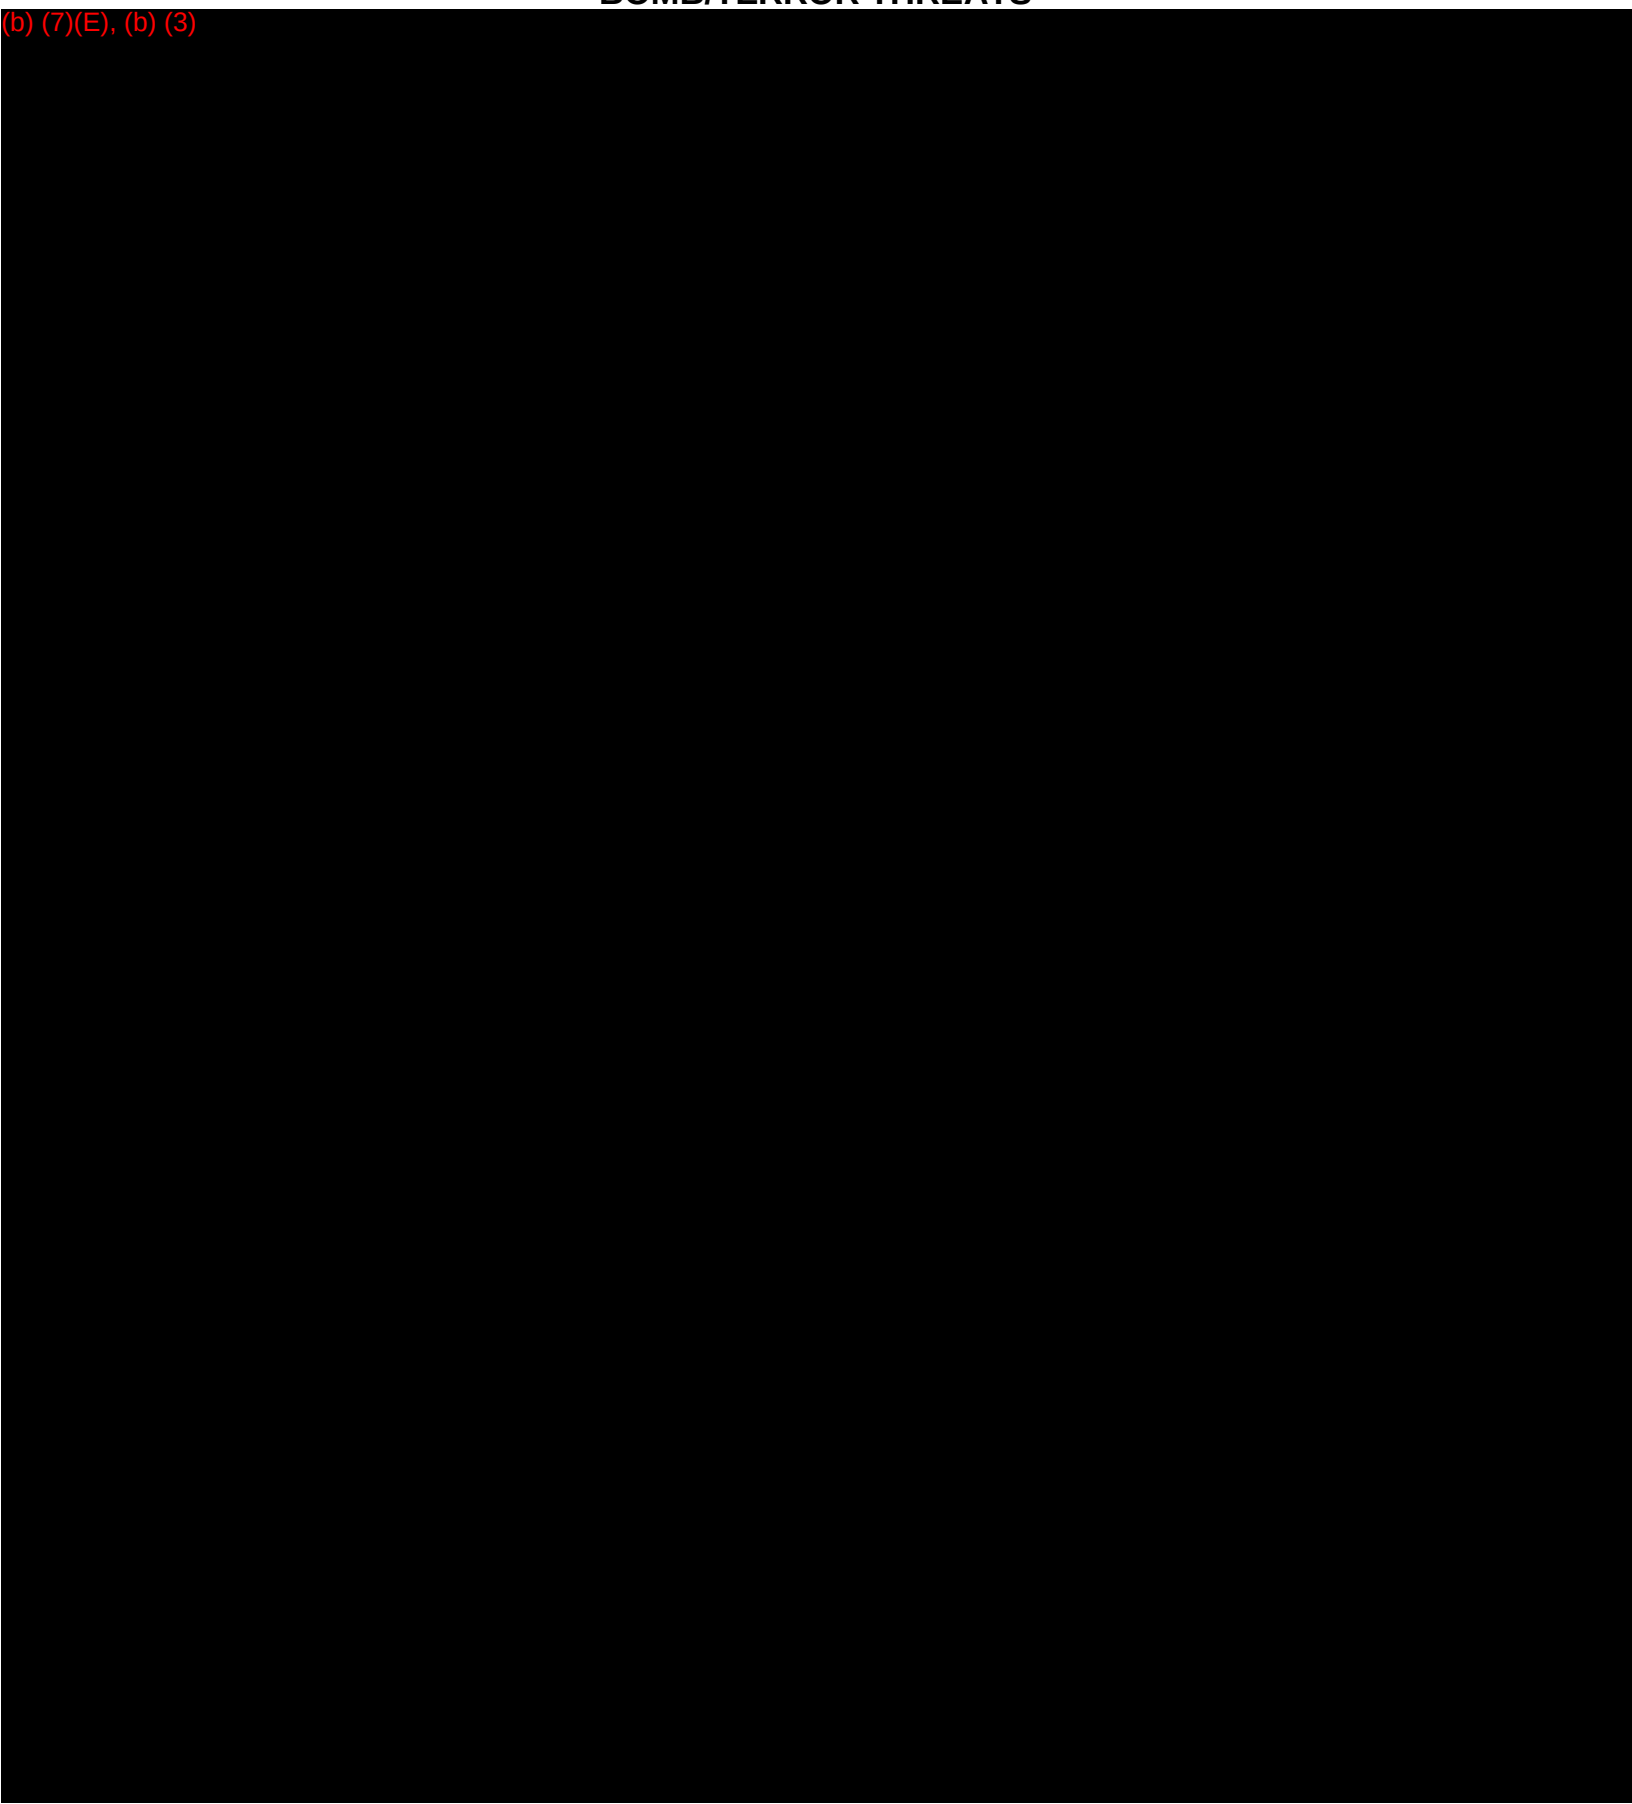

FIGURE 3.2

INITIAL RESPONSE ACTIONS

First Employee On Site

First employee on site is the KMEP Incident Commander until relieved by a more senior Company employee. The Incident Commander has the authority to make decisions and to take steps necessary to control the emergency. The following list will aid this person in establishing safe initial response actions in preparation of a larger response effort.

D Evacuate yourself and all persons exposed to immediate hazards. Move personnel in an up-wind or cross-wind direction.

NEVER ALLOW PERSONS TO ENTER
THE VAPOR AREA DURING AN EMERGENCY

D Perform initial notifications (Section 2.1)

- O Qualified Individual
- O Pipeline Control Center
- O 911
- O Manager
- O Verify external notifications (via Pipeline Control Center)

D Shut down system to control release, as appropriate

D Restrict access to the immediate area of the emergency

D Eliminate and control ignition sources

D Initiate Incident Command System (ICS)

D Establish Central Command Post

D Use Site Health and Safety Plan to conduct site assessment (Figure 3.5)

D Meet with arriving response authorities (fire department, police, etc.).

- O Introduce yourself as the KMEP Incident Commander.
- O Communicate critical incident information
  - Type of incident (fire, spill, release)
  - Product involved
  - Equipment involved
  - Location of personnel in immediate area
  - Known hazards
  - Wind direction

D Advise the federal, state and local authorities (Unified Command) of a safe place to locate the Command Post.

D Initial Reporting Details Form (Figure 2.5)

FIGURE 3.2

INITIAL RESPONSE ACTIONS (Cont'd)

First Employee On Site (Cont'd)

Designate additional IC positions as the situation dictates and/or the availability of additional personnel: _____

Note number of injuries if any: _____

Ambulance/emergency medical service needed: _____

Consider need for road closures: _____

Consider hazards to trains: _____

D Call Control Center to contact RR dispatcher - Time called: _____

D Consider extent of release (estimate area impacted, i.e. 50'x100'): _____

D Consider if product is in water, sewers, canals etc.: _____

D Consider if structures are in danger: _____

D Product still flowing: _____

D All appropriate valves closed? Valves closed: _____

D Agencies on site (note who, when): _____

D News media on-site: _____

FIGURE 3.6

FLAMMABLE LIQUIDS (Polar/Water-Miscible)

The following information is intended to provide the initial responder(s) with data that may be useful in making quick decisions and executing prompt response actions. The information is intended for guideline purposes only.

PRODUCTS **Ethanol**

HAZARD IDENTIFICATION / RECOGNITION

GUIDE NO. 127

DANGERS

- HIGHLY FLAMMABLE: Will be easily ignited by heat, sparks or flames.
- Vapors may form explosive mixtures with air.
- Vapors may travel to source of ignition and flash back.
- Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks).
- Vapor explosion hazard indoors, outdoors or in sewers.
- Those substances designated with a "P" may polymerize explosively when heated or involved in a fire.
- Runoff to sewer may create fire or explosion hazard.
- Containers may explode when heated.
- Many liquids are lighter than water.

HEALTH

- Move victim to fresh air. Call 911 or emergency medical service.
- Apply artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult.
- Remove and isolate contaminated clothing and shoes.
- In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes.
- Wash skin with soap and water.
- Keep victim warm and quiet.
- Ensure that medical personnel are aware of the material(s) involved, and take precautions.

PUBLIC SAFETY

- Isolate spill or leak area immediately for at least 25 to 50 meters (80 to 160 feet) in all directions.
- Keep unauthorized personnel away.
- Stay upwind.
- Keep out of low areas.
- Ventilate closed spaces before entering.

EVACUATION

Large Spill

- Consider initial downwind evacuation for at least 300 meters (1,000 feet).

Fire

- If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 meters (1/2 mile) in all directions; also, consider initial evacuation for 800 meters (1/2 mile) in all directions.

Information provided by the Emergency Response Guidebook 2008.

FIGURE 3.6 (Cont'd)

All contractor response equipment to be available during a spill event can be found on the Western Response Resource List (WRRL) website: www.wrrl.us/index.html

Note: All Facility emergency response equipment is maintained in an operable status at all times. Equipment is inspected quarterly. All equipment maintenance records are maintained at the Facility for five (5) years. A sample inspection form is located in Appendix G.

The Company primarily relies on its Primary Response Contractor during spill scenarios.

FIGURE A.2

CONTRACTED RESPONSE RESOURCES

AMPD INFORMATION

- **AMPD response provider**

OSRO / Clean-up Contractor
Harbor Island Terminal

(Equipment deployment personnel are located at equipment site.)

Contract Expiration Date
Proprietary Equipment

- **Equipment Address (*1-hour response time):**

Boom: Harbor Island Terminal
2720 13th Ave. SW
Seattle, WA 98134

- **Equipment Address (*2-hour response time):**

Skimmer (Vacuum Trucks): Harbor Island Terminal
2825 NW Market St
Seattle, WA 98107

Temporary Storage: Harbor Island Terminal
2720 13th Ave. SW
Seattle, WA 98134

****Planning Assumptions**: *On-water speed, 5 knots; land speed, 35 miles per hour; notification/mobilization – 2 hours.*

			MM	W1	W2	W3	
Marine Spill Response Corporation	6MPA374	River/Canal	X	X	X	X	Yes
		Inland	X	X	X	X	

E.1 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which uses the Incident Command and Unified Command Systems.

1. First Responder until Company Personnel IC assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 2720 13th Avenue SW
Seattle, WA 98134
c. Activate the Facility's employee emergency alarm system (siren).
d. Contact Olympic Pipeline to shut down inbound pipeline and cease all truck and marine loading/offloading. Do not start engines or move trucks. If emergency is at the marine dock, do not allow the vessel to move. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility and Burlington Northern if applicable.
h. Establish a Command Center immediately at the entrance to the Facility or where the Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the western exterior of the office building. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel IC will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the secondary command center or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility office building, or the north or south staging area.

4. Community Evacuation

The Company has confirmed with the Seattle Fire Department that no Community Evacuation Plan currently exists for this area. However, the Fire Department does have Standard Guidelines that are followed in the event of an evacuation.

5. Directions to Harborview Medical Center

From the main terminal exit gate at the corner of SW Lander St. and 13th Avenue SW, proceed west on Lander to 16th Avenue SW, turn left on 16th Avenue SW. Travel approximately one quarter mile on 16th Avenue SW which becomes Klickitat Way SW, stay in to right lane and merge onto eastbound SW Spokane Street. Stay to the left to go up onto W Seattle Bridge towards I-5. Merge onto I-5 N via the ramp on the left, heading toward Vancouver, B.C. Travel approximately one mile on I-5 before taking the Dearborn Street/James Street exit, number 164A, toward Madison Street. Take the James Street exit and turn right onto James Street then right again onto 9th Avenue. The hospital is located at 325 9th Avenue.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gates located east of 13th Avenue SW. If the emergency is at the marine dock, access is via the Port of Seattle/SSA Terminal 18 – Gate 4 manned security checkpoint.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the aboveground storage tanks (ASTs) in the two main tank farms at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Appendix C.

8. Prevailing Winds

From October through May, winds are generally from the southwest at 10 to 20 mph. From June through September, winds are generally from the north at 0 to 9 mph.

9. Water Currents

Elliot Bay and the Duwamish River in the vicinity of the Facility are tidally influenced waters with net surface currents that flow generally toward the sea (north). Average currents in the area do not exceed much more than one knot. The mean tidal range for the Central Puget Sound area is 9.4 to 10.48 feet. The diurnal tidal range is 13.1 to 15.0 feet.

DEPARTMENT OF ECOLOGY
State of Washington

WAC 173-182-220. Binding Agreement
Each plan shall contain a written statement binding the plan holder to its use. The binding agreement shall be signed by the owner or operator, or a designee with authority to bind the owners and operators of the facility or vessel covered by the plan. The agreement is submitted with the plan.

Submitting Party Information

Company Name:	Kinder Morgan Liquids Terminals LLC - Harbor Island Terminal		
Contact Name:	David Rowland		
Address:	2720 13th Ave SW Seattle, WA 98134-1040		
Phone Number:	(206) 682-4706	**Fax Number:**	(206) 622-8003
Email:	david_rowland@kindermorgan.com	**Website:**	www.kindermorgan.com

Binding Agreement

I certify that I reviewed and am familiar with the information submitted in this Plan. I verify acceptance of the plan and commit to (a) a safe and immediate response to spills and to substantial threats of spills that occur in, or could impact Washington waters or Washington's natural, cultural and economic resources; (b) having an incident commander in the state within six hours after notification of a spill; (c) the implementation and use of the plan during a spill and substantial threat of a spill, and to the training of personnel to implement the plan; (d) the authority and capability to make the necessary and appropriate expenditures in order to implement plan provisions; (e) working in unified command within the incident command system to ensure that all personnel and equipment resources necessary to the response will be called out to clean up the spill safely and to the maximum extent practicable.

CERTIFICATION OF THE APPLICABILITY OF THE SUBSTANTIAL HARM CRITERIA

Facility Name and Address: KMEP, L.P. Harbor Island Terminal
2720 13th Avenue SW
Seattle, WA 98134

(Detailed Facility information, including data required for the Response Plan Cover Sheet, is provided in Figure 1.3)

1. Does the facility transfer oil over water to or from vessels ***and*** does the facility have a total oil storage capacity greater than or equal to 42,000 gallons?	**Yes: X**	**No:**
2. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area?	**Yes:**	**No: X**
3. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix (40 CFR 112 Appendix C) or a comparable formula[1]) such that a discharge from the facility could cause injury (as defined in 40 CFR 112.2) to fish an wildlife and sensitive environments?	**Yes: X**	**No:**
4. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix (40 CFR 112 Appendix C) or a comparable formula[1]) such that a discharge from the facility would shut down a public drinking water intake[2]?	**Yes:**	**No: X**
5. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the past five (5) years?	**Yes:**	**No: X**

[1] If a comparable formula is used, documentation of the reliability and analytical soundness of the comparable formula must be attached to this form.

[2] For the purposes of 40 CFR part 112, public drinking water intakes are analogous to public water systems as described at 40 CFR 143.2(c).

CERTIFICATION

I hereby certify the following:

- Under penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe the submitted information is true, accurate and complete.
- The information and procedures contained herein are considered to be accurate as of this date.
- This Integrated Contingency Plan fulfills the requirements of 33 CFR Subpart F and the information and procedures are consistent with the National Contingency Plan (NCP) and applicable Area Contingency Plans (ACP) as detailed in Section 1.5.

Signature: _____ Date: 4/25/2012

David W. Rowland, Area Manager

NOTE: It is the responsibility of the holder of this Plan to insure that all changes and updates are made. The Plan Holder must:

- Remove and discard obsolete pages.
- Replace obsolete pages with the updated pages.
- Record each change on this form.

GLOSSARY OF TERMS/ACRONYMS

Page

Glossary of Terms.....Glossary/Acronyms-2

Acronyms Glossary/Acronyms-10

This glossary contains definitions of terms that will be used frequently during the course of response operations.

Activate: The process of mobilizing personnel and/or equipment within the response organization to engage in response operations.

Activator: An individual in the response organization whose responsibilities include notifying other individuals or groups within the organization to mobilize personnel and/or equipment.

Adverse Weather: The weather conditions that will be considered when identifying response systems and equipment in a response plan for the applicable operating environment. Factors to consider include significant wave height, ice, temperature, weather - related visibility, and currents within the Captain of the Port (COTP) zone in which the systems or equipment are intended to function.

Agency Representative: Individual assigned to an incident from an agency who has been delegated full authority to make decisions on all matters affecting that agency's participation in response operations.

Area Committee: As defined by Sections 311(a)(18) and (j)(4) of CWA, as amended by OPA, means the entity appointed by the President consisting of members from Federal, State, and local agencies with responsibilities that include preparing an Area Contingency Plan for the area designated by the President. The Area Committee may include ex-officio (i.e., non-voting) members (e.g., industry and local interest groups).

Area Contingency Plan: As defined by Sections 311(a)(19) and (j)(4) of CWA, as amended by OPA, means the plan prepared by an Area Committee, that in conjunction with the NCP, shall address the removal of a discharge including a worst-case discharge and the mitigation or prevention of a substantial threat of such a discharge from a vessel, offshore facility, or onshore facility operating in or near an area designated by the President.

Average Most Probable Discharge: A discharge of the lesser of 50 barrels or 1% of the volume of the worst case discharge.

Barrel (bbl): Measure of space occupied by 42 U.S. gallons at 60 degrees Fahrenheit.

Bioremediation Agents: Means microbiological cultures, enzyme additives, or nutrient additives that are deliberately introduced into an oil discharge and that will significantly increase the rate of biodegradation to mitigate the effects of the discharge.

Boom: A piece of equipment or a strategy used to either contain free floating oil to a confined area or protect an uncontaminated area from intrusion by oil.

Booming Strategies: Strategic techniques which identify the location and quantity of boom required to protect certain areas. These techniques are generated by identifying a potential spill source and assuming certain conditions which would affect spill movement on water.

Bulk: Material that is stored or transported in a loose, unpackaged liquid, powder, or granular form capable of being conveyed by a pipe, bucket, chute, or belt system.

Chemical Agents: Means those elements, compounds, or mixtures that coagulate, disperse, dissolve, emulsify, foam, neutralize, precipitate, reduce, solubilize, oxidize, concentrate, congeal, entrap, fix, make the pollutant mass more rigid or viscous, or otherwise facilitate the mitigation of deleterious effects or the removal of the oil pollutant from the water. Chemical agents include biological additives, dispersants, sinking agents, miscellaneous oil spill control agents, and burning agents, but do not include solvents.

Clean-up Contractor: Persons contracted to undertake a response action to clean up a spill.

Cleanup: For the purposes of this document, cleanup refers to the removal and/or treatment of oil, hazardous substances, and/or the waste or contaminated materials generated by the incident. Cleanup includes restoration of the site and its natural resources.

Coastal Waters: For the purpose of classifying the size of discharges, means the waters of the coastal zone except for the Great Lakes and specified ports and harbors on inland rivers.

Coastal Zone: As defined for the purpose of the NCP, means all United States waters subject to the tide, United States waters of the Great Lakes, specified ports and harbors on inland rivers, waters of the contiguous zone, other waters of the high seas subject to the NCP, and the land surface or land substrata, ground waters, and ambient air proximal to those waters. The term coastal zone delineates an area of federal responsibility for response action. Precise boundaries are determined by EPA/USCG agreements and identified in federal regional contingency plans.

Coast Guard District Response Group (DRG): As provided for by CWA sections 311(a)(20) and (j)(3), means the entity established by the Secretary of the department in which the USCG is operating within each USCG district and shall consist of: the combined USCG personnel and equipment, including firefighting equipment, of each port within the district; additional prepositioned response equipment; and a district response advisory team.

Command: The act of controlling manpower and equipment resources by virtue of explicit or delegated authority.

Command Post: A site located at a safe distance form the spill site where response decisions are made, equipment and manpower deployed, and communications handled. The Incident Commander and the On-Scene Coordinators may direct the on-scene response from this location.

Communications Equipment: Equipment that will be utilized during response operations to maintain communication between the Company employees, contractors, Federal/State/Local agencies. (Radio/ telephone equipment and links)

Containment Boom: A flotation/freeboard device, made with a skirt/curtain, longitudinal strength member, and ballast unit/weight designed to entrap and contain the product for recovery.

Contingency Plan: A document used by (1) federal, state, and local agencies to guide their planning and response procedures regarding spills of oil, hazardous substances, or other emergencies; (2) a document used by industry as a response plan to spills of oil, hazardous substances, or other emergencies occurring upon their vessels or at their facilities.

Contract or Other Approved Means: For OPA 90, a written contract with a response contractor; certification by the facility owner or operator that personnel and equipment are owned, operated, or under the direct control of the facility, and available within the stipulated times; active membership in a local or regional oil spill removal organization; and/or the facility's own equipment.

Critical Areas to Monitor: Areas which if impacted by spilled oil may result in threats to public safety or health.

Cultural Resources: Current, historic, prehistoric and archaeological resources which include deposits, structures, ruins, sites, buildings, graves, artifacts, fossils, or other objects of antiquity which provide information pertaining to the historical or prehistorical culture of people in the state as well as to the natural history of the state.

Damage Assessment: The process of determining and measuring damages and injury to the human environment and natural resources, including cultural resources. Damages include differences between the conditions and use of natural resources and the human environment that would have occurred without the incident, and the conditions and use that ensued following the incident. Damage assessment includes planning for restoration and determining the costs of restoration.

Decontamination: The removal of hazardous substances from personnel and their equipment necessary to prevent adverse health effects.

Discharge: Any spilling, leaking, pumping, pouring, emitting, emptying, or dumping.

Dispersants: Means those chemical agents that emulsify, disperse, or solubilize oil into the water column or promote the surface spreading of oil slicks to facilitate dispersal of the oil into the water column.

Diversion Boom: A floatation/freeboard device, made with a skirt/curtain, longitudinal strength member, and ballast unit/weight designed to deflect or divert the product towards a pick up point, or away from certain areas.

Drinking Water Supply: As defined by Section 101(7) of CERCLA, means any raw or finished water source that is or may be used by a public water system (as defined in the Safe Drinking Water Act) or as drinking water by one or more individuals.

Economically Sensitive Areas: Those areas of explicit economic importance to the public that due to their proximity to potential spill sources may require special protection and include, but are not limited to: potable and industrial water intakes; locks and dams; and public and private marinas.

Emergency Service: Those activities provided by state and local government to prepare for and carry out any activity to prevent, minimize, respond to, or recover from an emergency.

Environmentally Sensitive Areas: Streams and water bodies, aquifer recharge zones, springs, wetlands, agricultural areas, bird rookeries, endangered or threatened species (flora and fauna) habitat, wildlife preserves or conservation areas, parks, beaches, dunes, or any other area protected or managed for its natural resource value.

Facility: Either an onshore facility or an offshore facility and includes, but is not limited to structures, equipment, and appurtenances thereto, used or capable of being used to transfer oil to or from a vessel or a public vessel. A facility includes federal, state, municipal, and private facilities.

Facility Operator: The person who owns, operates, or is responsible for the operation of the facility.

Federal Fund: The spill liability trust fund established under OPA.

Federal Regional Response Team: The federal response organization (consisting of representatives from selected federal and state agencies) which acts as a regional body responsible for planning and preparedness before an oil spill occurs and providing advice to the FOSC in the event of a major or substantial spill.

Federal Response Plan (FRP): Means the agreement signed by 25 federal departments and agencies in April 1987 and developed under the authorities of the Earthquake Hazards Reduction Act of 1977 and the Disaster Relief Act of 1974, as amended by the Stafford Disaster Relief Act of 1988.

First Responders, First Response Agency: A public health or safety agency (e.g., fire service or police department) charged with responding to a spill during the emergency phase and alleviating immediate danger to human life, health, safety, or property.

Handle: To transfer, transport, pump, treat, process, store, dispose of, drill for, or produce.

Harmful Quantity Of Oil: The presence of oil from an unauthorized discharge in a quantity sufficient either to create a visible film or sheen upon or discoloration of the surface of the water or a shoreline, tidal flat, beach, or marsh, or to cause a sludge or emulsion to be deposited beneath the surface of the water or on a shoreline, tidal flat, beach, or marsh.

Hazardous Material: Any nonradioactive solid, liquid, or gaseous substance which, when uncontrolled, may be harmful to humans, animals, or the environment. Including but not limited to substances otherwise defined as hazardous wastes, dangerous wastes, extremely hazardous wastes, oil, or pollutants.

Hazardous Substance: Any substance designed as such by the Administrator of the EPA pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act; regulated pursuant to Section 311 of the Federal Water Pollution Control Act, or discharged by the SERC.

Hazardous Waste: Any solid waste identified or listed as a hazardous waste by the Administrator of the EPA pursuant to the federal Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act (RCRA), 42 U.S.C., Section 6901, et seq as amended. The EPA Administrator has identified the characteristics of hazardous wastes and listed certain wastes as hazardous in Title 40 of the Code of Federal Regulations, Part 261, Subparts C and D respectively.

HAZMAT: Hazardous materials or hazardous substances, exposure to which may result in adverse effects on health or safety of employees.

HAZWOPER: Hazardous Waste Operations and Emergency Response Regulations published by OSHA to cover worker safety and health aspects of response operations.

Heat Stress: Dangerous physical condition caused by over exposure to extremely high temperatures.

Hypothermia: Dangerous physical condition caused by over exposure to freezing temperatures.

Incident: Any event that results in a spill or release of oil or hazardous materials. Action by emergency service personnel may be required to prevent or minimize loss of life or damage to property and/or natural resources.

Incident Briefing Meeting: Held to develop a comprehensive, accurate, and up-to-date understanding of the incident, nature of status of control operations, and nature and status of response operations; ensure the adequacy of control and response operations; begin to organize control and response operations; and prepare for interactions with outside world.

Incident Command Post (ICP): That location at which all primary command functions are executed.

Incident Command System (ICS): The combination of facilities, equipment, personnel, procedures, and communications operating within a common organizational structure, with responsibility for the management of assigned resources at an incident.

Incident Commander (IC): The one individual in charge at any given time of an incident. The Incident Commander will be responsible for establishing a unified command with all on-scene coordinators.

Indian Tribe: As defined in OPA section 1001, means any Indian tribe, band, nation, or other organized group or community, but not including any Alaska Native regional or village corporation, which is recognized as eligible for the special programs and services provided by the United States to Indians because of their status as Indians and has governmental authority over lands belonging to or controlled by the Tribe.

Initial Cleanup: Remedial action at a site to eliminate acute hazards associated with a spill. An initial clean-up action is implemented at a site when a spill of material is an actual or potentially imminent threat to public health or the environment, or difficulty of cleanup increases significantly without timely remedial action. All sites must be evaluated to determine whether initial cleanup is total cleanup, however, this will not be possible in all cases due to site conditions (i.e., a site where overland transport or flooding may occur).

Initial Notification: The process of notifying necessary the Company personnel and Federal/ State/Local agencies that a spill has occurred, including all pertinent available information surrounding the incident.

Initial Response Actions: The immediate actions that are to be taken by the spill observer after detection of a spill.

Inland Area means the area shoreward of the boundary lines defined in 46 CFR part 7, except that in the Gulf of Mexico, it means the area shoreward of the lines of demarcation (COLREG lines) as defined in §80.740 through 80.850 of this chapter. The inland area does not include the Great Lakes.

Inland Waters: State waters not considered coastal waters; lakes, rivers, ponds, streams, underground water, et. al.

Inland Zone: Means the environment inland of the coastal zone excluding the Great Lakes, and specified ports and harbors on inland rivers. The term inland zone delineates an area of federal responsibility for response action. Precise boundaries are determined by EPA/USCG agreements and identified in federal regional contingency plans.

Interim Storage Site: A site used to temporarily store recovered oil or oily waste until the recovered oil or oily waste is disposed of at a permanent disposal site. Interim storage sites include trucks, barges, and other vehicles, used to store waste until the transport begins.

Lead Agency: The government agency that assumes the lead for directing response activities.

Lead Federal Agency: The agency which coordinates the federal response to incident on navigable waters. The lead federal agencies are:

- **U.S. Coast Guard:** Oil and chemically hazardous materials incidents on navigable waters.
- **Environmental Protection Agency:** Oil and chemically hazardous materials incidents on inland waters.

Lead State Agency: The agency which coordinates state support to federal and/or local governments or assumes the lead in the absence of federal response.

Loading: Transfer from Facility to vehicle.

Local Emergency Planning Committee (LEPC): A group of local representatives appointed by the State Emergency Response Commission (SERC) to prepare a comprehensive emergency plan for the local emergency planning district, as required by the Emergency Planning and Community Right-to-know Act (EPCRA).

Local Response Team: Designated Facility individuals who will fulfill the roles determined in the oil spill response plan in the event of an oil or hazardous substance spill. They will supervise and control all response and clean-up operations.

Lower Explosive Limit: Air measurement utilized to determine the lowest concentration of vapors that support combustion. This measurement must be made prior to entry into a spill area.

Marinas: Small harbors with docks, services, etc. for pleasure craft.

Medium Discharge: Means a discharge greater than 2,100 gallons (50 Bbls) and less than or equal to 36,000 gallons (85+ Bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD.

National Contingency Plan: The plan prepared under the Federal Water Pollution Control Act (33 United State Code §1321 et seq) and the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (42 United State Code § 9601 et seq), as revised from time to time.

National Pollution Funds Center (NPFC): Means the entity established by the Secretary of Transportation whose function is the administration of the Oil Spill Liability Trust Fund (OSLTF). Among the NPFC's duties are: providing appropriate access to the OSLTF for federal agencies and states for removal actions and for federal trustees to initiate the assessment of natural resource damages; providing appropriate access to the OSLTF for claims; and coordinating cost recovery efforts.

National Response System (NRS): Is the mechanism for coordinating response actions by all levels of government in support of the OSC. The NRS is composed of the NRT, RRTs, OSC, Area Committees, and Special Teams and related support entities.

National Strike Force (NSF): Is a special team established by the USCG, including the three USCG Strike Teams, the Public Information Assist Team (PIAT), and the National Strike Force Coordination Center. The NSF is available to assist OSCs in their preparedness and response duties.

National Strike Force Coordination Center (NSFCC): Authorized as the National Response Unit by CWA section 311(a)(23) and (j)(2), means the entity established by the Secretary of the department in which the USCG is operating at Elizabeth City, North Carolina, with responsibilities that include administration of the USCG Strike Teams, maintenance of response equipment inventories and logistic networks, and conducting a national exercise program.

Natural Resource: Land, fish, wildlife, biota, air, water, ground water, drinking water supplies, and other such resources belonging to, managed by, held in trust by, appertaining to or otherwise controlled by the state, federal government, private parties, or a municipality.

Navigable Waters: As defined by 40 CFR 110.1 means the waters of the United States, including the territorial seas. The term includes:

All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters that are subject to the ebb and flow of the tide;

Interstate waters, including interstate wetlands;

All other waters such as interstate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, and wetlands, the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters;

That are or could be used by interstate or foreign travelers for recreational or other purposes;

From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; and

That are used or could be used for industrial purposes by industries in interstate commerce. All impoundments of waters otherwise defined as navigable waters under this section;

Tributaries of waters identified in paragraphs (a) through (d) of this definition, including adjacent wetlands; and

Wetlands adjacent to waters identified in paragraphs (a) through (e) of this definition: Provided, that waste treatment systems (other than cooling ponds meeting the criteria of this paragraph) are not waters of the United States.

Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency,

for the purposes of the Clean Water Act jurisdiction remains with EPA.

Nearshore Area: For OPA 90, the area extending seaward 12 miles from the boundary lines defined in 46 CFR Part 7, except in the Gulf of Mexico. In the Gulf of Mexico, it means the area extending seaward 12 miles from the line of demarcation defined in §80.740 - 80.850 of title 33 of the CFR.

Non-persistent or Group I Oil: A petroleum-based oil that, at the time of shipment, consists of hydrocarbon fractions:

1. At lease 50% of which by volume, distill at a temperature of 340 degrees C (645 degrees F);
2. At least 95% of which volume, distill at a temperature of 370 degrees C (700 degrees F).

Ocean: The open ocean, offshore area, and nearshore area as defined in this subpart.

Offshore area: The area up to 38 nautical miles seaward of the outer boundary of the nearshore area.

Oil or Oils: Naturally occurring liquid hydrocarbons at atmospheric temperature and pressure coming from the earth, including condensate and natural gasoline, and any fractionation thereof, including, but not limited to, crude oil, petroleum gasoline, fuel oil, diesel oil, oil sludge, oil refuse, and oil mixed with wastes other than dredged spoil. Oil does not include any substance listed in Table 302.4 of 40 CFR Part 302 adopted August 14, 1989, under Section 101(14) of the federal comprehensive environmental response, compensation, and liability act of 1980, as amended by P. L. 99-499.

Oil Spill Liability Trust Fund: Means the fund established under section 9509 of the Internal Revenue Code of 1986 (26 U.S.C. 9509).

Oily Waste: Product contaminated waste resulting from a spill or spill response operations.

On-Scene Coordinator (OSC): Means the federal official predesignated by the EPA or the USCG to coordinate and direct response under subpart D.

On-site: Means the areal extent of contamination and all suitable areas in very close proximity to the contamination necessary for implementation of a response action.

Open Ocean: means the area from 38 nautical miles seaward of the outer boundary of the nearshore area, to the seaward boundary of the exclusive economic zone.

Owner or Operator: Any person, individual, partnership, corporation, association, governmental unit, or public or private organization of any character.

Persistent Oil: A petroleum-based oil that does not meet the distillation criteria for a non-persistent oil. For the purposes of this Appendix, persistent oils are further classified based on specific gravity as follows:

1. Group II specific gravity less than .85
2. Group III specific gravity between .85 and less than .95
3. Group IV specific gravity .95 and including 1.0
4. Group V specific gravity greater than 1.0

Plan Holder: The plan holder is the industry transportation related facility for which a response plan is required by federal regulation to be submitted by a vessel or facility's owner or operator.

Post Emergency Response: The portion of a response performed after the immediate threat of a release has been stabilized or eliminated and cleanup of the sites has begun.

Post Emergency: The phase of response operations conducted after the immediate threat of the release has been stabilized, and cleanup operations have begun.

Primary Response Contractors or Contractors: An individual, company, or cooperative that has contracted directly with the plan holder to provide equipment and/or personnel for the containment or cleanup of spilled oil.

Qualified Individual (QI): That person or entity who has authority to activate a spill cleanup contractors, act as liaison with the "On-Scene Coordinator" and obligate funds required to effectuate response activities.

Recreation Areas: Publicly accessible locations where social/sporting events take place.

Regional Response Team (RRT): The Federal response organization (consisting of representatives from selected Federal and State agencies) which acts as a regional body responsible for overall planning and preparedness for oil and hazardous materials releases and for providing advice to the OSC in the event of a major or substantial spill.

Remove or Removal: As defined by section 311(a)(8) of the CWA, refers to containment and removal of oil or hazardous substances from the water and shorelines or the taking of such other actions as may be necessary to minimize or mitigate damage to the public health or welfare (including, but not limited to, fish, shellfish, wildlife, public and private property, and shorelines and beaches) or to the environment. For the purpose of the NCP, the term also includes monitoring of action to remove discharge.

Response Activities: The containment and removal of oil from the water and shorelines, the temporary storage and disposal of recovered oil, or the taking of other actions as necessary to minimize or mitigate damage to public health or welfare, or the environment.

Response Contractors: Persons/companies contracted to undertake a response action to contain and/or clean up a spill.

Response Guidelines: Guidelines for initial response that are based on the type of product involved in the spill, these guidelines are utilized to determine clean-up methods and equipment.

Response Plan: A practical manual used by industry for responding to a spill. Its features include: (1) identifying the notifications sequence, responsibilities, response techniques, etc. in a easy to use format; (2) using decision trees, flowcharts, and checklists to ensure the proper response for spills with varying characteristics; and (3) segregating information needed during the response from data required by regulatory agencies to prevent confusion during a spill incident.

Response Resources: All personnel and major items of equipment available, or potentially available, for assignment to incident tasks on which status is maintained.

Responsible Party: Any person, owner/operator, or facility that has control over an oil or hazardous substance immediately before entry of the oil or hazardous substance into the atmosphere or in or upon the water, surface, or subsurface land of the state.

Response Priorities: Mechanism used to maximize the effective use of manpower and equipment resources based upon their availability during an operational period.

Response Resources: All personnel and major items of equipment available, or potentially available, for assignment to incident tasks on which status is maintained.

Restoration: The actions involved in returning a site to its former condition.

Rivers and Canals: A body of water confined within the inland area that has a project depth of 12 feet or less, including the Intracoastal Waterway and other waterways artificially created for navigation.

Securing the Source: Steps that must be taken to stop discharge of oil at the source of the spill.

Sinking Agents: Means those additives applied to oil discharges to sink floating pollutants below the water surface.

Site Characterization: An evaluation of a cleanup site to determine the appropriate safety and health procedures needed to protect employees from identified hazards.

Site Conditions: Details of the area surrounding the facility, including shoreline descriptions, typical weather conditions, socioeconomic breakdowns, etc.

Site Safety and Health Plan: A site specific plan developed at the time of an incident that addresses:

- Safety and health hazard analysis for each operation.
- Personal protective equipment to be used.
- Training requirements for site workers.
- Medical surveillance requirements.
- Air monitoring requirements.
- Site control measures.
- Decontamination procedures.
- Emergency response procedures.
- Confined space entry procedures.

Site Security and Control: Steps that must be taken to provide safeguards needed to protect personnel and property, as well as the general public, to ensure an efficient clean-up operation.

Skimmers: Mechanical devices used to skim the surface of the water and recover floating oil. Skimmers fall into four basic categories (suction heads, floating weirs, oleophilic surface units, and hydrodynamic devices) which vary in efficiency depending on the type of oil and size of spill.

Snare Boom: Oil will adhere to the material of which this boom is made of and thus collect it.

Sorbents: Materials ranging from natural products to synthetic polymeric foams placed in confined areas to soak up small quantities of oil. Sorbents are very effective in protecting walkways, boat decks, working areas, and previously uncontaminated or cleaned areas.

Spill: An unauthorized discharge of oil or hazardous substance into the waters of the state.

Spill Observer: The first Facility individual who discovers a spill. This individual must function as the first responder and person-in-charge until relieved by an authorized supervisor.

Spill of National Significance (SONS): Means a spill which due to its severity, size, location, actual or potential impact on the public health and welfare or the environment, or the necessary response effort, is so complex that it requires extraordinary coordination of federal, state, local, and responsible party resources to contain and cleanup the discharge.

Spill Management Team: The personnel identified to staff the organizational structure identified in a response plan to manage response plan implementation.

Spill Response: All actions taken in responding to spills of oil and hazardous materials, e.g.: receiving and making notifications; information gathering and technical advisory phone calls; preparation for and travel to and from spill sites; direction of clean-up activities; damage assessments; report writing, enforcement investigations and actions; cost recovery; and program development.

Spill Response Personnel: Federal, state, local agency, and industry personnel responsible for participating in or otherwise involved in spill response. All spill response personnel will be pre-approved on a list maintained in each region.

Staging Areas: Designated areas near the spill site accessible for gathering and deploying equipment and/or personnel.

State Emergency Response Commission (SERC): A group of officials appointed by the Governor to implement the provisions of Title III of the Federal Superfund Amendments and Re-authorization Act of 1986 (SARA). The SERC approves the State Oil and Hazardous Substance Discharge Prevention and Contingency Plan and Local Emergency Response Plans.

Surface Collecting Agents: Means those chemical agents that form a surface film to control the layer thickness of oil.

Surface Washing Agent: Is any product that removes oil from solid surfaces, such as beaches and rocks, through a detergency mechanism and does not involve dispersing or solubilizing the oil into the water column.

Tanker: A self-propelled tank vessel constructed or adapted primarily to carry or hazardous material in bulk in the cargo spaces.

Tidal Current Tables: Tables which contain the predicted times and heights of the high and low waters for each day of the year for designated areas.

Trajectory Analysis: Estimates made concerning spill size, location, and movement through aerial surveillance or computer models.

Transfer: Any movement of oil to, from, or within a vessel by means of pumping, gravitation, or displacement.

Trustee: Means an official of a federal natural resources management agency designated in subpart G of the NCP or a designated state official or Indian tribe or, in the case of discharges covered by the OPA, a foreign government official, who may pursue claims for damages under section 1006 of the OPA.

Underwriter: An insurer, a surety company, a guarantor, or any other person, other than an owner or operator of a vessel or facility, that undertakes to pay all or part of the liability of an owner or operator.

Unified Command: The method by which local, state, and federal agencies and the responsible party will work with the Incident Commander to:

- Determine their roles and responsibilities for a given incident.
- Determine their overall objectives for management of an incident.
- Select a strategy to achieve agreed-upon objectives.
- Deploy resources to achieve agreed-upon objectives.

Unified or Coordinated Command Meeting: Held to obtain agreement on strategic objectives and response priorities; review tactical strategies; engage in joint planning, integrate response operations; maximize use of resources; and minimize resolve conflicts.

Volunteers: An individual who donates their services or time without receiving monetary compensation.

Waste: Oil or contaminated soil, debris, and other substances removed from coastal waters and adjacent waters, shorelines, estuaries, tidal flats, beaches, or marshes in response to an unauthorized discharge. Waste means any solid, liquid, or other material intended to be disposed of or discarded and generated as a result of an unauthorized discharge of oil. Waste does not include substances intended to be recycled if they are in fact recycled within 90 days of their generation or if they are brought to a recycling facility within that time.

Waters of the U.S. - See Navigable Waters

Wetlands: Those areas that are inundated or saturated by surface or groundwater at a frequency or duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include playa lakes, swamps, marshes, bogs, and similar areas such as sloughs, prairie potholes, wet meadows, prairie river overflows, mudflats, and natural ponds (40 CFR 112.2(y)).

Wildlife Rescue: Efforts made in conjunction with Federal and State agencies to retrieve, clean, and rehabilitate birds and wildlife affected by an oil spill.

Worst Case Discharge: The largest foreseeable discharge under adverse weather conditions. For facilities located above the high water line of coastal waters, a worst case discharge includes those weather conditions most likely to cause oil discharged from the facility to enter coastal waters.

1.0 INTRODUCTION AND PLAN CONTENT

1.1 PLAN PURPOSE/OBJECTIVES

The purpose of this Integrated Contingency Plan (“Plan") is to assist the Kinder Morgan Liquids Terminals LLC (“Company”) Harbor Island Terminal ("Facility") personnel prepare for and respond quickly and safely to a discharge originating from the Facility. The Plan provides techniques and guidelines for achieving an efficient, coordinated and effective response to a discharge incident, which may occur at the Facility.

The Company, in compliance with WAC 173-182-145, will implement this Plan throughout the response to a spill or drill.

The Incident Commander will seek approval from WDOE before conducting any spill response activities contrary to those outlined in this Plan unless these actions are necessary to protect human health and safety must be performed immediately in response to unforeseen conditions to avoid additional environmental damage, or when directed by the FOSC and/or SOSC.

The specific objectives of the Plan are to:

- Establish a Local Response Team, assign individuals to fill the positions on the team and define the roles and responsibilities of team members.
- Define notification, activation, and mobilization procedures to be followed when a discharge occurs.
- Define organizational lines of responsibility to be adhered to during a response operation.
- Ensure compliance with certain federal, state, and local regulatory requirements. A summary of the applicable regulations addressed by this plan is provided in Section 1.5.
- Ensure consistency with the National Contingency Plan and Area Contingency Plan(s) for the area of operation.

1.2 FORMAT AND SCOPE OF PLAN

This Plan has been developed under the general guidance published in the Federal Register by the EPA entitled “The National Response Team’s Integrated Contingency Plan” (61 FR 28642). The NRT guidance was developed in conjunction with the Environmental Protection Agency, Department of Transportation (U.S. Coast Guard, Research and Special Programs Administration), Department of the Interior (Minerals Management Service), and the Department of Labor (Occupational Safety and Health Administration). This guidance also provides for state and local contingency planning requirements to be incorporated into the Plan.

This Plan contains prioritized procedures for Facility personnel to mitigate or prevent any discharge resulting from the operations of the Facility. A description of the operations conducted at the Facility is provided in Figure 1.3 with additional information provided in the

1.2 FORMAT AND SCOPE OF PLAN (Cont'd)

"Hazard Evaluation" located in Appendix C. Facility spill mitigation procedures and response guidelines are provided in Section 3.0 for discharges that could result from a variety of sources including, but not limited to:

- Tank overfill/failure
- Piping rupture/leak
- Explosion and/or fire
- Equipment failure (e.g. system failure etc.)

1.3 PLAN DISTRIBUTION PROCEDURES

Distribution will be handled in the following manner:

- Distribution of the Plan is controlled by the number on the binder cover. A distribution list is provided in the Foreword to facilitate control.

- Company personnel who may be called upon to provide assistance during discharge response activities will have access to a copy of the plan for their use and training.

- It is the responsibility of any person holding a copy of the Plan to ensure that the copy is transferred to their replacement in the event of reassignment or change in responsibility.

- Various regulatory agencies will also be distributed a copy of the Plan. The list of agencies is provided in the Distribution List.

1.4 PLAN REVIEW AND UPDATE PROCEDURES

Annual Review/Update

- At least once each year review and make appropriate revisions as required by operational or organizational changes.

- At least once each year review and make appropriate revisions as required by changes in the names and telephone numbers detailed in Section 2.0.

- Plan review opportunities may occur during response team tabletop exercises or actual emergency responses.

- Following each spill or drill the Plan shall be reviewed for accuracy and effectiveness. The Incident Commander will debrief the Spill Management Team, participating agencies and PRCs. When significant plan updates are identified they will be forwarded to the Manager – Emergency Response Programs for inclusion in the next Plan update.

1.4 PLAN REVIEW AND UPDATE PROCEDURES (Cont'd)

Agency Review/Revision Requirements

AGENCY TIMING REQUIREMENTS	EPA	USCG	DOE
Timing for Plan reviews.	Periodically but not to exceed five (5) years.	Within one (1) month of the anniversary of COTP approval letter. If NO CHANGES are required, the Facility should submit a letter to the USCG stating "NO CHANGES REQUIRED."	At least once annually.
Timing for submission of significant Plan revisions as detailed in the following table.	60 days	30 days	24 hours
When submitting revisions to the applicable agencies always include the Facility identification number (see Figure 1.3) with the revisions.			

WDOE must be notified in writing as soon as possible and within 24 hours of any significant change that could affect implementation of the Plan, including a significant decrease in available spill response equipment or personnel. The Plan Holder must also provide a schedule for the prompt return of the Plan to full operational status. Plan revisions must be distributed within 30 days.

The Facility shall revise and resubmit revised portions of the Plan for each change that may materially affect the response to a Worst Case Discharge, including:

CONDITIONS REQUIRING CHANGES	EPA	USCG	DOE
Relocation or replacement of portions of the Facility (including the pipeline) which in any way substantially affect the information included in this Plan, such as a change to the Worst Case Discharge volume.	✓	✓	✓
Emergency response procedures.		✓	✓
A change in the listings of economically important or environmentally sensitive areas identified in the applicable ACP in effect six (6) months prior to the plan review.		✓	✓
Change in the Facility's configuration that materially alters the information included in the Plan.	✓	✓	✓
Change in the type of oil handled, stored, or transferred that materially alters the required response resources.	✓	✓	✓
A change in the name of the Oil Spill Removal Organization (OSRO).		✓	✓
Material change in capabilities of the Oil Spill Removal Organization(s) (OSROs) that provide equipment and personnel.	✓	✓	✓
Material change in the Facility's spill prevention and response procedures.	✓		✓
Any other changes that materially affect the implementation of the Plan.	✓	✓	✓

NOTE: Any agency may require revisions to this Plan at any time if deficiencies are found under their applicable regulations or during an actual response.

1.4 PLAN REVIEW AND UPDATE PROCEDURES (Cont'd)

Incorporation of Plan Revisions

The **Plan Holder**, immediately upon receipt of any revisions, shall:

- Review and insert the revised pages into the Plan.
- Discard the obsolete pages.

1.5 REGULATORY COMPLIANCE

The development, maintenance, and utilization of this Plan implements company policy and addresses the following regulatory requirements and guidelines:

- U.S. EPA - Non-Transportation Related On-Shore Facility Response Planning Rule (40 CFR 112.20).
- U.S. Coast Guard - Marine Transportation Related Facility Response Planning Rule (33 CFR 154).
- Washington Department of Ecology - Oil Spill Contingency Plan (WAC 173-182).
- OSHA's Emergency Action Plan Regulation (29 CFR 1910.38(a)).
- OSHA's HAZWOPER Regulation (29 CFR 1910.120).

This Plan is consistent with the most recent version of the applicable Area Contingency Plans (ACPs). The applicable ACP for the Facility is:

- Northwest Area Contingency Plan (NWACP).

This Plan is consistent with the most recent version of the National Contingency Plan (NCP). The NCP for the Facility is:

- U.S. Environmental Protection Agency; National Oil and Hazardous Substances Pollution Contingency Plan; Final Rule.

Specific Regulatory Cross References are provided at the end of this document.

FACILITY INFORMATION

GENERAL INFORMATION	
Facility Name:	Kinder Morgan Energy Partners, L.P.
Physical Address:	Harbor Island Terminal 2720 13th Avenue SW Seattle, WA 98134 (206) 682-4706 (206) 623-9023 *(24 hrs)* (206) 622-8003 *(Fax)*
NAICS Code:	493190
EPA FRP Number:	FRP-6A
Dun & Bradstreet Number:	618 450-886
Date of Initial Storage:	Prior to 1937
Owner/Operator:	Kinder Morgan Liquid Terminals, LLC 1001 Louisiana Street, Suite 1000 Houston, TX 77002 or 1100 Town & Country Road Orange, CA 92868
Qualified Individual: ***(Emergency Coordinator)*** ***(On-Site Firefighting Coordinator)***	David Rowland – Area Manager (Home Address *) (206) 682-4706 *(Work)* (b) (6) *(Cell)*
Alternate Qualified Individual: ***(Alt. Emergency Coordinator)***	Andrew Holbrook – Operations Manager (Home Address *) (503) 220-1257 *(Work)* (b) (6) *(Cell)*
Alternate Qualified Individual: ***(Alt. Emergency Coordinator)***	Del Carey – Lead Operator (Home Address *) (206) 682-4706 *(Work)* (b) (6) *(Cell)*
Telephone/FAX:	Additional telephone references, including 24 hour numbers, for the Facility, Owner, and QI/AQI are provided in Section 2.

* Company policy is to treat an employee's home address as confidential. This information is kept on file at the Regional Office (909) 877-2373, and Houston Corporate Office, Human Resources Dept. (713) 369-8876.

FIGURE 1.3

FACILITY INFORMATION (Cont'd)

FACILITY LOCATION	
County:	King County
Latitude:	(b) (7)(F), (b) (3) [redacted]
Longitude:	
Area Map:	Provided in Figure 1.1
Facility Diagram:	Provided in Figure 1.2
Wellhead Protection Area:	None
Facility Distance to Navigable Water:	Less than 400 yards
Landside Directions:	Leave Seattle-Tacoma Airport going southwest on Alaskan Way toward Vine Street. Turn left onto Wall Street then right onto Elliott Avenue. Merge onto WA-99 S/Alaskan Way and travel approximately 2.5 miles. Take the W Seattle BR exit toward Harbor Island. Stay straight to go onto S Spokane Street. Turn left onto Klickitat Way SW, which becomes Klickitat Avenue SW. Turn right onto 13th Avenue SW. The Facility is approximately half a mile from the intersection of Klickitat Avenue SW and 13th Avenue SW.
Waterside Directions:	From Elliott Bay travel south on the Duwamish Waterway East for approximately one half mile. The Facility is on the left descending bank at the Port of Seattle Berth 18.

PHYSICAL DESCRIPTION - GENERAL

Description of Operation:

- This Facility is a bulk distribution facility for refined petroleum products. The Facility receives product by tanker truck, barge and ship, and the Olympic Pipeline. Product is transported out of the Facility by tanker truck, barge and ship.
- The aboveground storage tanks are contained in a bermed secondary containment area that, at a minimum, provides secondary containment for 110 percent of the largest tank. The tanks are filled or drawn down through a system of aboveground pipes that connect this Facility into the Company distribution network.

FIGURE 1.3

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL (Cont'd)

Description of Operation (Cont'd):

(b) (7)(F), (b) (3) [redacted]

- The Facility normally operates 24 hours a day 7 days a week.
- The Facility's Worst Case Discharge amount is (b) (7)(F), (b) (3) [redacted]

Products Handled:

Trade Name	Density (lbs/gal)	Specific Gravity	API Gravity	Oil Group No.	Sulfur Content
Biodiesel	7.43	0.86-0.90	28.4 (average)	3	
Diesel (ULS)	6.94	0.81-0.88	25-36	1	<15.0 ppm
Ethanol	6.58	0.79	46.5 (average)	1	
Gasoline (RUL/PUL)	6.07	0.72-0.76	50-75	1	
Heavy Fuel Oil	8.25	0.98 (approx)	6-12	3, 4, 5	4.5% max
Intermediate Fuel Oil (180/380/500)	8.25	0.98 (approx)	10-11	4	1.8-2.0%
Jet-A	7.08 g/ml	0.81	25	1	
Marine Diesel Oil	7.34	0.80-0.90	11.2 (min)	3	5.0%
Transmix	6.58	0.79	46.5	1	Varies

Note: The Facility maintains a stand alone full encompassing MSDS reference binder. The Company maintains an MSDS database at http://kmonline.kindermorgan.com/ehs/Pages/msds.aspx

PHYSICAL DESCRIPTION - LOADING RACK

Description of Operation:

- The Facility is equipped with four (4) loading spots which handle various refined petroleum products.
- A maximum of four (4) tank trucks may load simultaneously.
- The loading/unloading operations are conducted 24 hours a day 7 days a week.
- The Facility handles an average of 1,200 trucks per week.

Loading Rate: 600 gpm

Truck Capacity: 11,500 gallons (maximum)

FIGURE 1.3

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - LOADING RACK (Cont'd)

Discharge Prevention:

- The curbed concrete slab drains directly to an underground tank.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

PHYSICAL DESCRIPTION - MARINE OPERATIONS

Description of Operation:

- The Facility operates seven (7) pipelines at the dock. Six (6) 12" diameter, and one (1) 10" diameter pipelines.

Simultaneous Transfers: Typically the Facility will transfer to or from one (1) barge or tanker at a time. In rare situations the Facility may transfer to or from two (2) barges at the same time.

Length: Tank Ships: Maximum 810 ft. length, 45 ft. maximum draft

Barges: 450 ft.

Average Shipment Size: 5,000 – 80,000 bbls

Discharging Rates: Approximately 1,860 – 5,750 bph

Amount of Transfer: 25,000 bbls *(typical)*

Frequency of Transfer: 30 transfers per month *(typical)*

Duration of Transfer: 2 - 18 Hours *(typical)*

Discharge Prevention:

- Each transfer at the dock is closely monitored by two (2) operators, one (1) at the dock area and one (1) at the Facility end of the line. Radio communication is maintained between the operators to assure a safe product transfer.
- The loading/unloading lines are equipped with drip pans under the pump header connections.
- The dock area is well lighted and operations conducted in this area are in strict accordance with USCG procedures. These procedures are written in the Facility's Dock Operations Manual.

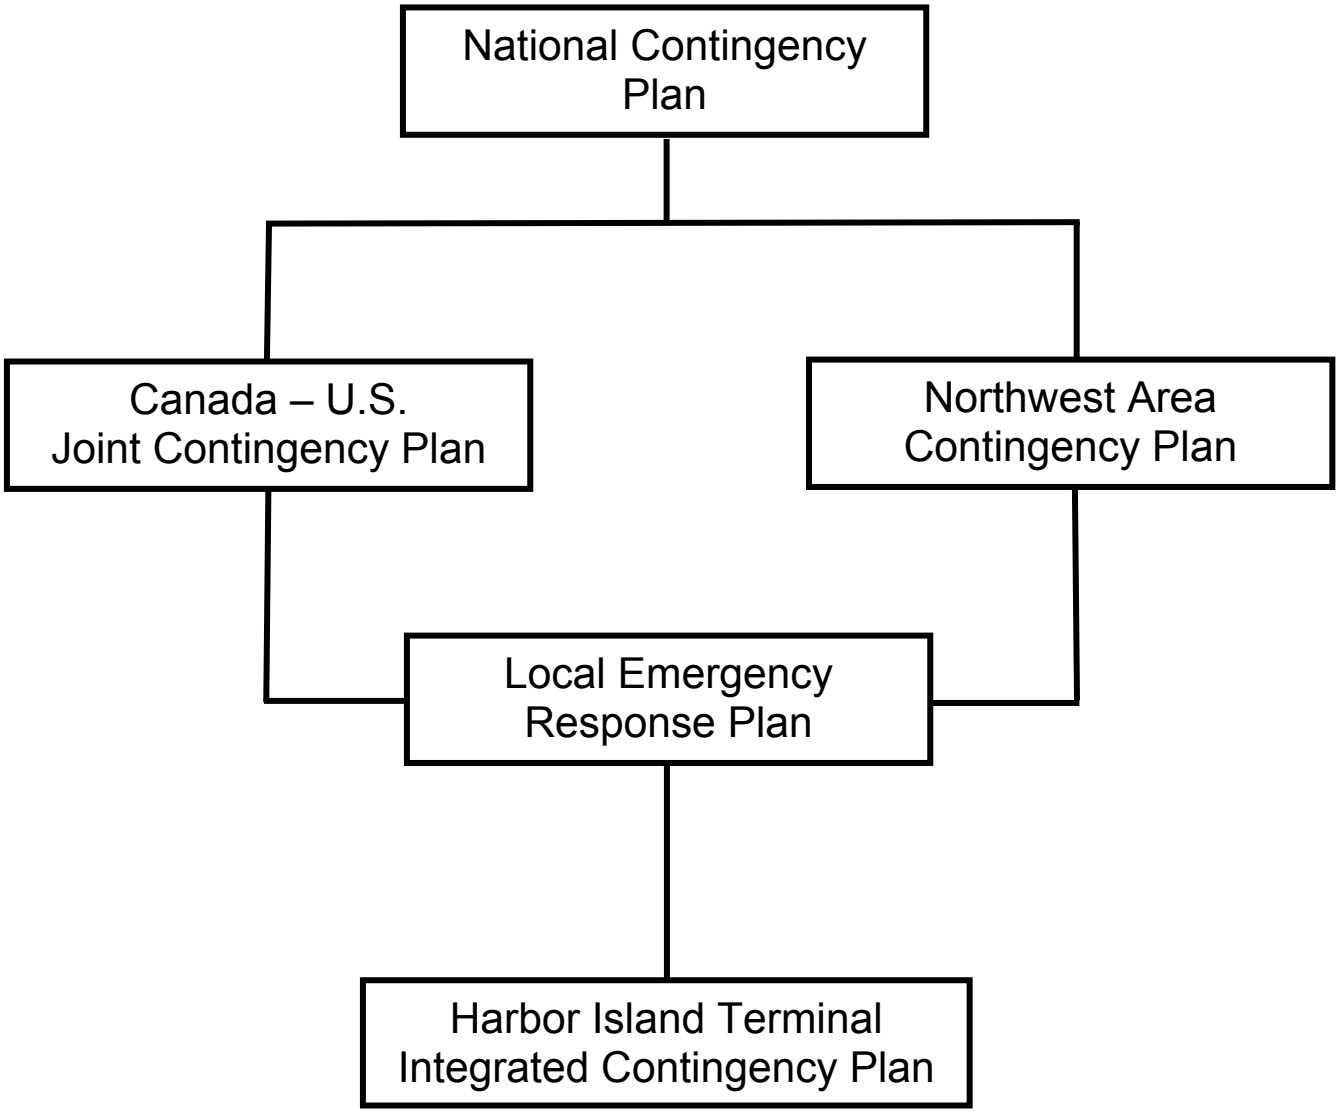
FIGURE 1.3

FACILITY INFORMATION (Cont'd)

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS
● 2002 Facility was acquired from GATX. ● 2005 Marine Transfer Facility and associated piping relocated to Terminal 18, Berth 1.

FIGURE 1.4

INTERFACE WITH OTHER PLANS



2.0 NOTIFICATIONS

2.1 INTERNAL NOTIFICATIONS

Specific internal notification sequence for both drills and spills to navigable waters, state waters or grounds, including permeable secondary containment, which threaten navigable waters, state waters or grounds including permeable secondary containment is detailed in Figure 2.1 which provides the following:

Person Discovering Event

- Immediately notify Qualified Individual (and 911, if necessary)

Qualified Individual

- Immediately notify (PRC) OSRO
- Activate ERL
- If the volume of the spill has not yet been determined use the appropriate Initial Release Volume Estimation formula from Attachment 5 of Liquids O&M Procedure 159 available at http://team/opseng/lom/L_OM%20Manual/L_Procedure_159.doc. In determining whether spills to ground, including permeable secondary containment, may threaten navigable or state waters – consider current and predicted weather conditions which may affect the rate of flow across the surface or rate of absorption into the ground.

Internal Notification References are detailed in Figure 2.2.

2.2 EXTERNAL NOTIFICATIONS

All external notifications for both spills and drills to navigable waters, state waters or grounds, including permeable secondary containment, which threaten navigable waters, state waters or grounds including permeable secondary containment are the responsibility of the Qualified Individual or his/her designated alternate.

Spills to ground greater than 42 gallons (1 barrel) shall be reported immediately using the contact information in Section 2. If the spilled quantity is unknown or the release is ongoing a report shall be made. The form in Figure 2.6 should be used to document the decision process for spills to ground notification and includes factors such as whether the spill is ongoing, whether it is in an area with environmental conditions that make ground water impact more likely.

A spill is considered to have not impacted ground if it occurs on a paved surface such as asphalt or concrete. A spill to dirt or gravel is considered to have impacted ground and is reportable. See Appendix C for surface water drainage, collection and discharge.

All spills are considered reportable spills except:

- Spills which are known to be less than forty-two gallons that do not impact surface or groundwater.
- CERCLA releases.
- On-facility air releases to the atmosphere only.
- Releases from underground storage tanks regulated under chapter 173-360 WAC.

2.0 NOTIFICATIONS

- Preexisting sources of releases identified as RCRA solid waste management units.
- Spills contained within areas controlled by NPDES
- Permitted systems that are not likely to threaten groundwater and do not exceed applicable federal reportable quantities.

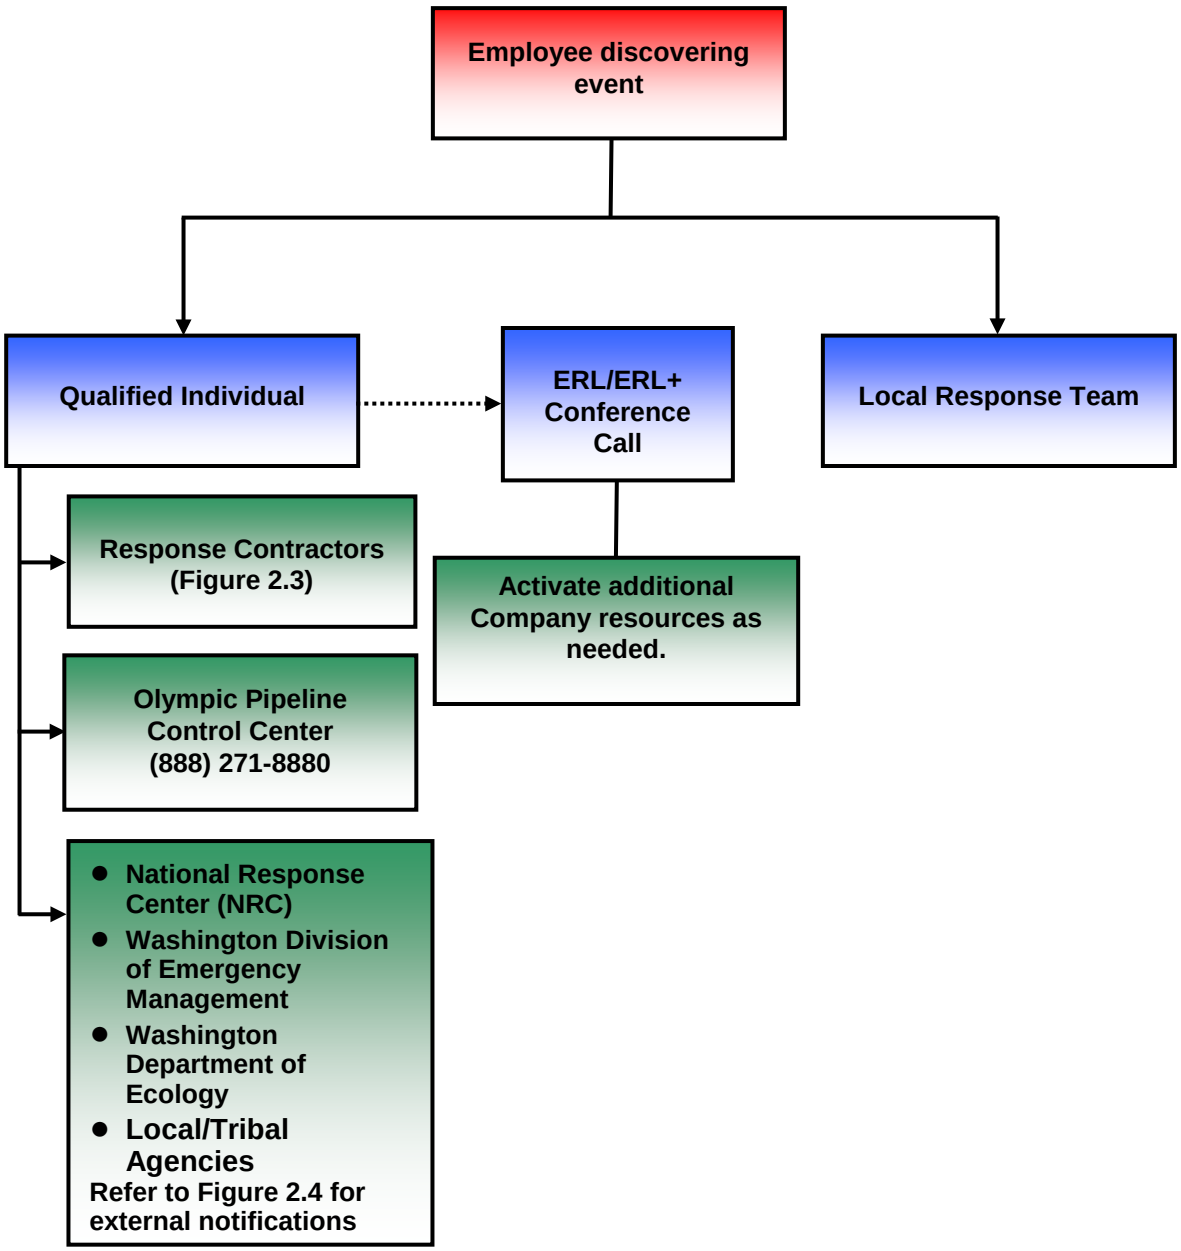
Spills to ground will be assessed as soon as practicable in accordance with Section 6.5, Figure 6.3 and Attachment 5 of Liquids O&M Procedure 159.

Qualified Individual

- Notify PRC (OSRO)
- Notify all required regulatory/governmental agencies and other external organizations (refer to Figure 2.4). The “Initial Reporting Details” form and instructions for its use are provided in Figure 2.5.

FIGURE 2.1

EMERGENCY RESPONSE NOTIFICATIONS PROCESS



- The sequence of notification depends on the type and severity of the situation, and is to be used for spills to navigable waters, state waters, and spills to ground or permeable secondary containment that threaten state waters.
- Judgment must be used.
- Public and employee safety must always be the first consideration.
- Notification of Olympic is dependent upon whether their operation is involved.

2.3 NOTIFICATIONS

Guidelines for Considerations When Initiating Notifications

The following are guidelines to be considered when initiating notifications:

- Do not report information that has not been verified or confirmed, usually by field personnel.
- Do not speculate as to the cause on an incident or make any statements about liability.
- Do not delay notifications because of incomplete information.
- When making notifications, document:
  - Agency notified, including telephone number
  - Date and time of notification
  - Person notified
  - Content of message
  - Incident number, if applicable

Periodic Follow-up Notification during Emergency Response

Periodic follow-up notification must be made within the Company as well as to Federal, State, Local and Tribal agencies. Responsibility for periodic follow-up notifications remains with each individual as initially assigned within the notification process flowchart provided in Figure 2.1, unless that responsibility has been transferred based on the magnitude of the response.

FIGURE 2.5

It is not necessary to wait for all information before calling the NRC.
National Response Center - 800-424-8802.

Field Notification Form	
Name and phone number of KM caller:	
Name and phone number of designated KM employee for follow-up calls (Area Manager or Designee):	
Company Name and Mailing Address: Kinder Morgan Energy Partners L.P., 1100 Town & Country Rd., Orange, CA 92868	
Date and Time of Incident:	**Were materials discharged?**
Product Type:	
Location of Release or Threatened Release ☐ Harbor Island Terminal 2730 13th Avenue SW Seattle, WA 98134-1040	☐ Main Terminal Latitude/Longitude: (b) (7)(F), (b) (3) ☐
County: King **State:** Washington **Nearest City (Name and Distance):** Seattle

Information provided in follow-up calls:	

FIGURE 2.6

WDOE Potential Notification Trigger Checklist

Yes	No	Potential Notification Trigger	Notes
		The source of the spill is unknown	
		The volume of the spill is uncertain	
		The volume of the spill is known to be less than 42 gallons and does not threaten surface or ground water	
		The spill is contained	
		The spill is located in an area where there is a pathway to waters of the state, and environmental conditions, such as rain events, male an impact to state surface or ground waters likely	
		The spill has the potential to impact groundwater	
		As a result of the spill, actions have been taken to isolate the area from vehicle traffic, equipment, or human contact	
		A spill that indicated a systemic spill problem (for example is it the second time a spill resulted from a certain practice, or came from a piece or type of equipment/tank/pipe).	

SECTION 3.0 RESPONSE ACTIONS

This section addresses initial response actions at an incident site. These initial response actions will transition response efforts from initial "Notifications" as required in Section 2 to the Incident Command System that is addressed in Section 4. This section is divided into the following sub-sections:

Section

- Recognizing an Emergency 3.1
- Initial Protective Measures 3.3
- Assessing the Site 3.3
- General Response Actions 3.4
  - Incident Specific Response Actions (Figures 3.1a - d)
  - Initial Response Actions First Employee On Site (Figure 3.2)
- Mobilization of Resources 3.13
  - Mobilization of Resources (Figures 3.3a - d)
- Response Levels 3.18
  - Response Level Chart (Figure 3.4)
- Response Strategies 3.21
- Site Specific Health & Safety Plan 3.23
  - Site Specific Health and Safety Plan (Figure 3.5)
- Material Safety Data Sheets 3.36
  - Product Specific Response Considerations (Figure 3.6)
  - Tactical Plan (Figure 3.7)

3.1 RECOGNIZING AN EMERGENCY

Definition of an Emergency

An emergency is defined as any uncontrolled release, occurrence, or incident which requires the response of persons outside of the immediate area, including KMEP employees or response agencies. These may include leaks, spills, fires or explosions; or natural disasters or terror threats which could result in any of these situations.

Product Release

The Facility handles refined petroleum products, ethanol, biodiesel, and petroleum additives.

3.1 RECOGNIZING AN EMERGENCY (Cont'd)

Refined petroleum fuels comprise a majority of the products handled by the Facility. A refined petroleum product release is recognized by any visual signs of liquid hydrocarbons on the ground or water. Other signs may include:

- Staining of soil
- Dead or discolored vegetation near pipeline or right-of-way areas
- Product sheen on water
- Distinct odors of petroleum or hydrocarbons
- (b) (7)(F), (b) (3)
- Hydrocarbon detection in Monitoring Wells

3.1.1 Fire/Explosion

Any unplanned fire is considered an emergency and requires some level of response action. If the fire is small enough and personnel are trained they may attempt to extinguish the fire prior to notifications. See KMEP Safety Manual, for more detail. Larger fires should be reported immediately and this ICP should be implemented.

3.1.2 Natural Disasters

Natural disasters may include the following:

- Earthquakes
- Floods
- Severe storms
- Tornados

Natural disasters may not necessarily constitute an emergency response. However, if the natural disaster results in a release or fire, as described above, implementation of this plan may be required.

3.1.3 Bomb or Terrorist Threats

(b) (7)(F), (b) (3)

3.2 INITIAL PROTECTIVE MEASURES

Recognizing an emergency allows an initial responder to effectively determine protective measures. Protective measures are necessary to ensure the safety of personnel, environment and property. These measures may include:

- Evacuation of persons exposed to immediate hazards. Move personnel in an up-wind or cross-wind direction.

NEVER ALLOW PERSONS TO ENTER THE VAPOR AREA DURING AN EMERGENCY

- Restrict access of the immediate area
- Eliminate and controlling ignition sources
- Shut down system to control release

Once these initial, protective measures are taken, the first employee on site should perform a site Risk Assessment.

3.3 ASSESSING THE SITE

Assessing the site involves the determination of risk (safety) associated with the incident. This is necessary in order to begin the preparation of a larger response effort. The key component in conducting an organized site assessment is the use of the "Site Specific Health and Safety Plan" (Section 3.8). This plan will help guide the "first person" through the process effectively performing a site assessment.

Initial risk assessment elements should determine the following:

- Wind direction
- Preliminary hazard zones
- Product involved
- Proximity to sensitive receptors (residences, businesses, schools, water ways, etc.)
- Chemical, physical and health hazards

Current forecasts and other weather information is available through the NWS Interactive Weather Information Network at: http://iwin.nws.noaa.gov/iwin/main.html .

All of the weather data gathered for the U.S. can be found through NOAA's National Climatic Data Center in Asheville, NC ((828) 271-4800).

Note: These initial site assessment elements will be described in more detail in the Section 3.8 - Site Specific Health & Safety Plan.

3.4 GENERAL RESPONSE ACTIONS

For the purposes of this plan, this General Response Actions section includes the actions taken by the First Employee On-site. The First Employee On-site must be able to recognize an emergency, implement protective measures, assess the site and perform internal notifications. The Pipeline Controller is responsible for initial response actions associated with pipeline shutdown procedures and external notifications.

3.4.1 Incident Specific Response Actions

The following information provides guidelines when responding to varying types of incidents. These include:

- ***Product Release (Figure 3.1a)***
- ***Fire / Explosion (Figure 3.1b)***
- ***Natural Disasters (Figure 3.1c)***
- ***Bomb/Terror Threats (Figure 3.1d)***

The first employee functions as the IC until relieved of that responsibility.

NOTE: The following tables (Figure 3.1) provide general guidelines only for responding to various incidents. More detailed procedures may be available in other Company documents such as abnormal operating procedures.

FIGURE 3.1a

INCIDENT SPECIFIC RESPONSE ACTIONS
PRODUCT RELEASE

Incident Type	Mitigation Actions
Flange, Valve, or Hose Leak	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Shut off flow to line ❑ Move to safe area ❑ Notify Qualified Individual ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify local management ❑ Secure area and eliminate ignition sources ❑ Tighten connection, if possible ❑ Initiate spill containment (if outside containment area) ❑ Block and purge affected equipment ❑ Initiate recovery/clean-up action as required.

Incident Type	Mitigation Actions
Tank Truck or Rack Valve Leak	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Stop transfer operations ❑ Move to safe area ❑ Notify Qualified Individual ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify local management ❑ Secure area and eliminate ignition sources ❑ Tighten connection, if possible ❑ Offload the leaking compartment ❑ Flush area into containment drains or other containment ❑ Initiate other cleanup action as required

Incident Type	Mitigation Actions
Pipeline Leak or Rupture	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Shut down system to control release ❑ Move to safe area ❑ Notify Qualified Individual ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify local management ❑ Secure area and eliminate ignition sources ❑ If possible, place containment under the leak ❑ Initiate spill containment (if outside containment area) ❑ Initiate other recovery/cleanup action as required

FIGURE 3.1a

INCIDENT SPECIFIC RESPONSE ACTIONS
PRODUCT RELEASE (Cont'd)

Incident Type	Mitigation Actions
Tank Leak or Rupture	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Stop flow into the tank ❑ Ensure dike drains are closed ❑ Move to safe area ❑ Notify Qualified Individual ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify local management ❑ Secure area and eliminate ignition sources ❑ Begin transferring contents to available tankage to reduce level ❑ Organize temporary tank patch and begin repair ❑ Initiate other response actions as required

Incident Type	Mitigation Actions
Tank Overfill	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Shut off transfer or flow to tank ❑ Ensure dike drains are closed ❑ Move to safe area ❑ Notify Qualified Individual ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify local management ❑ Secure area and eliminate ignition sources ❑ Begin transferring contents to available tankage to reduce level ❑ Initiate other response actions as required

FIGURE 3.1b

INCIDENT SPECIFIC RESPONSE ACTIONS
FIRE/EXPLOSION

Incident Type	Initial Response Actions
Fire/Explosion	*If safe, the following mitigating actions will be taken by any trained and qualified person(s):* ❑ Alert personnel ❑ Move to safe area ❑ Notify Qualified Individual ❑ Notify ***Control Center*** ❑ Notify local emergency agencies, as required ❑ Notify local management ❑ Activate alarm as required ❑ Notify local fire department ❑ Evacuate non-essential individuals ❑ Identify cause/source/materials involved ❑ Contain fire/spill material released ❑ Consider potential for escalation ❑ Protect exposed tanks and equipment

FIGURE 3.1c

INCIDENT SPECIFIC RESPONSE ACTIONS
NATURAL DISASTERS

Incident Type	Response Action
Earthquake	Earthquakes may damage pipeline and terminal equipment. Damage may result in an emergency situation. The following are response actions that should be taken only when it is deemed safe to do so: During Earthquake ❑ If indoors, stay inside and take refuge ❑ Stay away from windows, glass, bookcases, heavy objects etc. ❑ If outdoors, move to open area ❑ If driving a vehicle, pull over and remain in car ❑ Avoid parking near power lines or other overhead hazards After Earthquake ❑ Identify immediate hazards ❑ Evacuation building if impending collapse ❑ Check for product releases ❑ Check for injuries ❑ Notify local authorities as appropriate ❑ Be prepared for after-shocks ❑ Use portable radios for news reports

FIGURE 3.1c

INCIDENT SPECIFIC RESPONSE ACTIONS
NATURAL DISASTERS (Cont'd)

Incident Type	Mitigation Actions
Severe Storm	Severe storms can hit west coast locations. Historically, severe storms have been documented on numerous occasions. They can involve high winds and tides, severe rainstorms and lightning and flooding. ❑ Listen to local and national news of impending storm ❑ Verify adequate emergency supplies ❑ Shut down non-essential operations ❑ Review evacuation plan ❑ Provide alerting information to employees, contractors and others ❑ Conduct planning meetings with appropriate personnel ❑ Assess available emergency equipment: ❑ Back-up generators ❑ Portable water pumps ❑ Earth moving equipment ❑ Water, food provisions ❑ Relocate important records ❑ Safe guard hazardous materials ❑ Prior to evacuation, turn off gas, water and electrical ❑ Prepare to account for employees ❑ Prepare for expected media coverage ❑ Contact fire departments as necessary ❑ Prepare vehicles for possible evacuation ❑ Open tank roof drains ❑ Verify that tank dikes are closed

FIGURE 3.1d

INCIDENT SPECIFIC RESPONSE ACTIONS
BOMB/TERROR THREATS

(b) (7)(F), (b) (3)

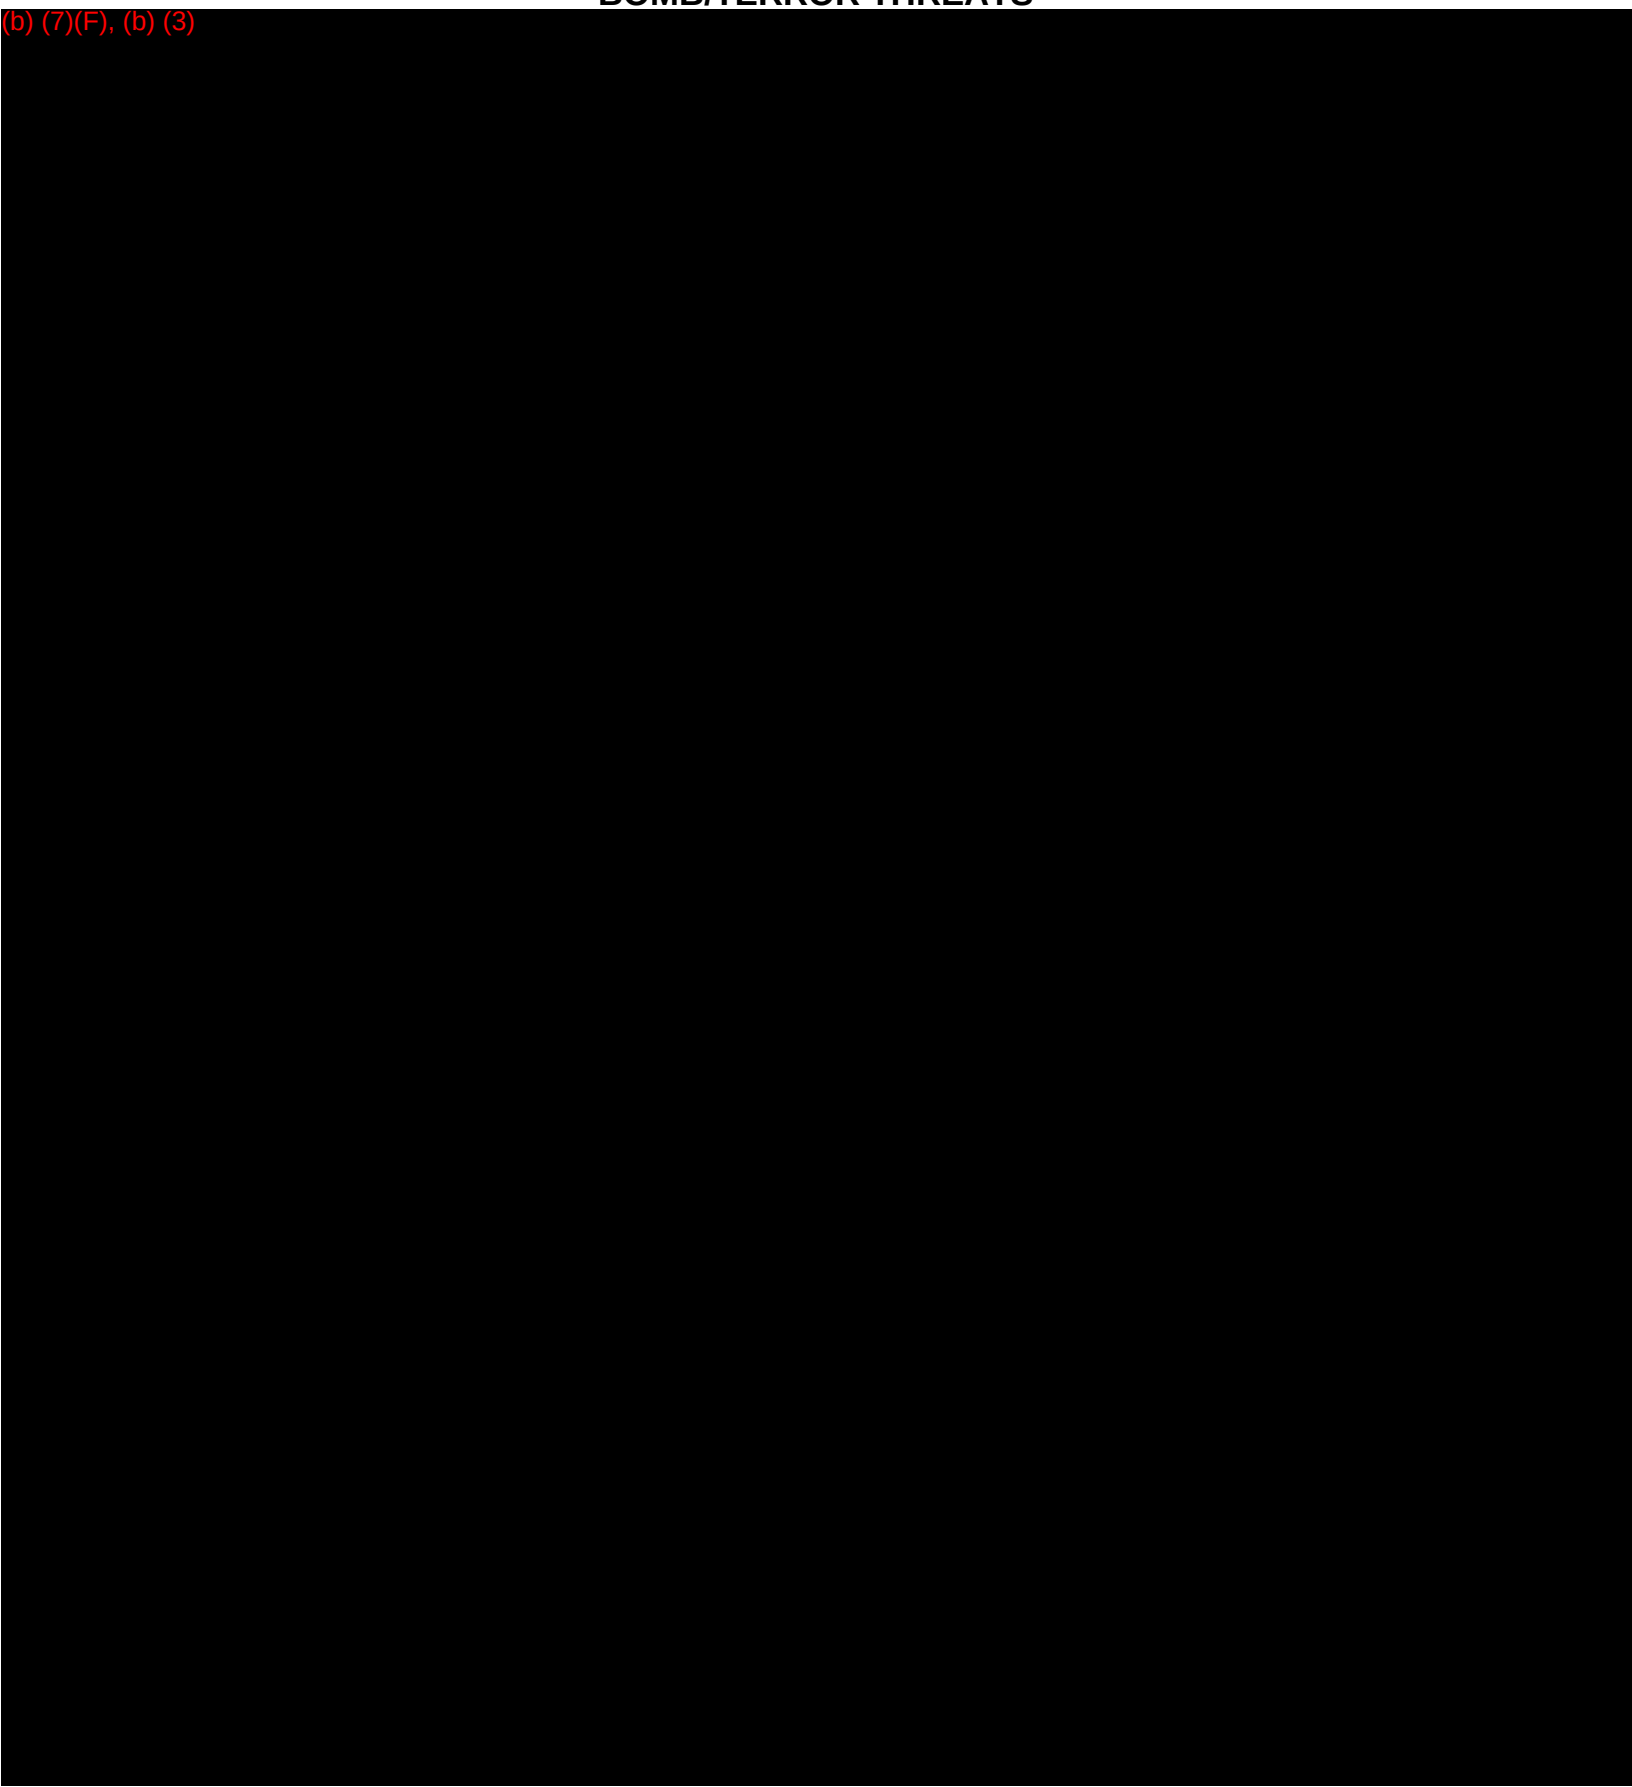

FIGURE 3.2

INITIAL RESPONSE ACTIONS

First Employee On Site

First employee on site is the KMEP Incident Commander until relieved by a more senior Company employee. The Incident Commander has the authority to make decisions and to take steps necessary to control the emergency. The following list will aid this person in establishing safe initial response actions in preparation of a larger response effort.

- ❑ Evacuate yourself and all persons exposed to immediate hazards. Move personnel in an up-wind or cross-wind direction.

NEVER ALLOW PERSONS TO ENTER THE VAPOR AREA DURING AN EMERGENCY

- ❑ Perform initial notifications (Section 2.1)
  - ❍ Qualified Individual
  - ❍ Pipeline Control Center
  - ❍ 911
  - ❍ Manager
  - ❍ Verify external notifications (via Pipeline Control Center)
- ❑ Shut down system to control release, as appropriate
- ❑ Restrict access to the immediate area of the emergency
- ❑ Eliminate and control ignition sources
- ❑ For spills to water, deploy sorbent pads as close to the leading edge as safe to facilitate tracking
- ❑ Initiate Incident Command System (ICS)
- ❑ Establish Central Command Post
- ❑ Use Site Health and Safety Plan to conduct site assessment (Figure 3.5)
- ❑ Meet with arriving response authorities (fire department, police, etc.).
  - ❍ Introduce yourself as the KMEP Incident Commander.
  - ❍ Communicate critical incident information
    - Type of incident (fire, spill, release)
    - Product involved
    - Equipment involved
    - Location of personnel in immediate area
    - Known hazards
    - Wind direction
- ❑ Advise the federal, state, local, and tribal authorities (Unified Command) of a safe place to locate the Command Post.
- ❑ Initial Reporting Details Form (Figure 2.5)

FIGURE 3.2

INITIAL RESPONSE ACTIONS (Cont'd)

First Employee On Site (Cont'd)

- ❑ Designate additional IC positions as the situation dictates and/or the availability of additional personnel: _____
- ❑ Note number of injuries if any: _____
- ❑ Ambulance/emergency medical service needed: _____
- ❑ Consider need for road closures: _____
- ❑ Consider hazards to trains: _____
- ❑ Call Control Center to contact RR dispatcher - Time called: _____
- ❑ Consider extent of release (estimate area impacted, i.e. 50'x100'): _____
- ❑ Consider if product is on ground or in water, sewers, canals etc.: _____
- ❑ Consider if structures are in danger: _____
- ❑ Product still flowing: _____
- ❑ All appropriate valves closed? Valves closed: _____
- ❑ Agencies on site (note who, when): _____
- ❑ News media on-site: _____

3.5 MOBILIZATION OF RESOURCES

This section describes how response resources are mobilized to the emergency scene. Resources may include:

- Company ICS (includes local/regional personnel and Crisis Support Team as needed)
- Appropriate agencies (fire departments, law enforcement, etc.)
- Contractors to support emergency response efforts
- Response equipment (containment of product and equipment repair)

To assess the need for adequate response resources, the Worst Case Discharge volumes are used in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the WDOE Response Planning Standards timeframes. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable Response Planning Standards detailed in Appendix A.

Once initial notifications are made, mobilization of resources is usually coordinated by management (Area Managers, Operations Managers, Pipeline Maintenance Manager, etc.).

These General Mobilization Actions should serve as general guidelines only. Additional actions may be required as the situation dictates. General Mobilization Actions for the various managers are detailed in the following checklists:

- ***Area Manager (Figure 3.3a)***
- ***Operations Manager (Figure 3.3b)***
- ***Director of Operations (Figure 3.3c)***
- ***V. P. of Operations (Figure 3.3d)***

FIGURE 3.3a

MOBILIZATION OF RESOURCES

Area Manager

The Area Manager will usually, but not always, be the first person called by the First Employee on-site. After receipt of the initial call, the Area Manager will evaluate the information and initiate appropriate mobilization of resources. In addition, the Area Manager will verify the level of the response and the appropriate response resources.

- ❑ Evaluate incident information
- ❑ Verify the level of the response (Level 1, 2 or 3; see Section 3.6)
- ❑ Notify of the following:
  - ❍ Local/regional response personnel
  - ❍ Operations Manager
  - ❍ Oil Spill Removal Organization/Primary Response Contractor
- ❑ Verify that the following personnel have been notified
  - ❍ Pipeline Control Center (usually called by First Employee On-site)
  - ❍ Director of Operations (usually called by Operations Manager)
- ❑ Verify that external notifications have been made (usually completed by Pipeline Controller)
- ❑ Consider notifying the following response support groups, as appropriate
  - ❍ Crisis Support Team (See Figure 2.2)

FIGURE 3.3b

MOBILIZATION OF RESOURCES

Operations Manager
The Operations Manager will usually be contacted by the Area Manager. After communicating with the Area Manager, the Operations Manager will evaluate the information and assist with appropriate mobilization of resources. In addition, the Operations Manager will assist with determining the level of the response and the appropriate response resources.
❑ Evaluate incident information
❑ Work with the Area Manager to determine the level of the response (Level 1, 2 or 3; see Section 3.6)
❑ Consider notification to Corporate Communications
❑ Notification of the following: ❍ Director of Operations ❍ Pipeline Maintenance Manager, as needed
❑ Verify that the following personnel have been notified ❍ Pipeline Control Center (usually called by First Employee On-site) ❍ Local/regional response personnel (usually called by Area Manager) ❍ V. P. of Operations
❑ Verify with Area Manager that external notifications have been made (usually completed by Pipeline Controller)
❑ Coordinate with Area Manager to ensure the following response support groups have been notified, as appropriate: ❍ Crisis Support Team (See Figure 2.2)

FIGURE 3.3c

MOBILIZATION OF RESOURCES

Director of Operations
The Director of Operations will usually be contacted by the Operations Manager. After communicating with the Operations Manager, the Director of Operations will evaluate the information and assist with appropriate mobilization of resources. In addition, the Director of Operations will assist with determining the level of the response and the appropriate response resources. ❑ Evaluate incident information ❑ Evaluates whether the appropriate level of response (Level 1, 2 or 3; see Section 3.6) has been declared ❑ Notification of the following: ❍ V. P. of Operations ❍ Consider notification to Corporate Communications ❑ Verify that the following personnel have been notified ❍ Pipeline Control Center (usually called by First Employee On-site) ❑ Verify with Operations Manager that external notifications have been made (usually completed by Pipeline Controller) ❑ Coordinate with Operations Manager that the following response support groups have been notified as appropriate: ❍ Crisis Support Team (See Figure 2.2)

FIGURE 3.3d

MOBILIZATION OF RESOURCES

V. P. of Operations
The V. P. of Operations will usually be contacted by the Director of Operations. After communicating with the Director of Operations, the VP of Operations will evaluate the information and notify personnel at the corporate level, as appropriate.

- ❑ Evaluate incident information
- ❑ Evaluate whether the appropriate level of response (Level 1, 2 or 3; see Section 3.6) has been declared
- ❑ Notification of the following:
  - ❍ Corporate level management, as appropriate
  - ❍ Consider notification to Corporate Communications
- ❑ Verify with Director of Operations that external notifications have been made (usually completed by Pipeline Controller)
- ❑ Coordinate with Director of Operations to determine if Crisis Support Team should be initiated
- ❑ If Crisis Support Team is deemed necessary:
  - ❍ Mobilize appropriate members of the Crisis Support Team
  - ❍ Establish corporate Emergency Operations Centers “EOC” as necessary
  - ❍ Coordinate with local city, county, state EOC, as appropriate

3.6 RESPONSE LEVELS

The following Response Levels and corresponding chart (see Figure 3.4 Response Level Chart) have been adopted from the Crisis Support Plan to assist local responders in determining if the Crisis Support Team should be activated. Every incident will be classified in one of three categories based on the specific nature and seriousness of the event.

3.6.1 Level 1 Response

A Level 1 response is an event that:

- Requires immediate response by the local field team but does not result in any injuries
- Involves little or no property damage
- Has little or no environmental impact
- Attracts no media attention
- Requires only routine or no reporting to regulatory agencies
- Is easily handled by the regional team and control center

A Level 1 response however, could develop into a Level 2 or Level 3 response if not immediately controlled (see Figure 3.4: Response Level Chart).

3.6.2 Level 2 Response

A Level 2 response is a more significant event that may:

- Involve injuries to an employee, contractor or the general public
- Result in significant property damage
- Involve a fire, explosion or significant environmental impact
- Involve local media attention
- Likely be reportable to some federal, state or local agencies

For the most part, Level 2 responses are within the capability of Operations, but may require certain Crisis Support Team resources to help mitigate the problem or conduct subsequent investigations. A Level 2 response can quickly escalate to a Level 3 response if not mitigated (see Figure 3.4: Response Level Chart).

3.6 RESPONSE LEVELS (Cont'd)

3.6.3 Level 3 Response

A Level 3 response is a major event that may include:

- Fatalities or serious injuries to employees or the public
- Extensive property damage or environmental impact
- Regional or national media attention
- Involvement of federal regulatory agencies.

Response to a Level 3 response requires significant additional resources/support beyond what may be locally available. A Level 3 will in most cases result in activation of the KMEP Crisis Support Center and mobilization of the Crisis Support Team (see Figure 3.4: Response Level Chart).

FIGURE 3.4

RESPONSE LEVEL CHART

CLASSIFICATION	Level 1	Level 2	Level 3
BODILY INJURY			
No bodily injury	●		
KMEP Employee or contractor employee injured; no hospitalization		●	
KMEP Employee or contractor employee injured; hospital admittance required		●	
General public; hospital admittance required		●	
General public, three or more injured			●
Fatality (any)			●
PROPERTY DAMAGE			
Insignificant	●		
Significant damage to property		●	
Extensive			●
ENVIRONMENTAL INCIDENTS			
Insignificant on site and no off-site impact	●		
Minor, but significant on-site or any off-site impact		●	
Extensive on-site and/or off-site impact			●
NEWS MEDIA COVERAGE			
No immediate attention	●		
Local attention only		●	
Regional or national attention			●
REGULATORY REPORTING			
No notification or routine or local level only (local emergency planning committee)	●		
State or Federal level		●	
OTHER (as example, strikes, riots, demonstrations, bomb threats, etc.)			
Incidents handled and corrected by local management only	●		
Complaints or actions by individuals or groups which could damage the Company's reputation but not threaten employees, property, or operations		●	
Actions taken by individuals or groups which threaten Company, employees, property, or operations			●
ECONOMIC IMPACT			
Insignificant	●		
Significant		●	
Extensive			●
REPORT ALL INSURANCE CLAIMS IN ACCORDANCE WITH ESTABLISHED PROCEDURES. CRISIS NOTIFICATION DOES NOT REPLACE INSURANCE CLAIMS REPORTING REQUIREMENTS AND REGULATORY REPORTING REQUIREMENTS.			

FOOTNOTE: Property damage and economic impact levels will be defined by Business Unit Management.

3.7 RESPONSE STRATEGIES

General Response Strategies

The general procedure for Company response is summarized as follows:

3.7.1 Response Action Plan:

Section 4.0 of this Plan includes specific duties for all personnel involved in a spill incident and uses the Incident Command System for Company personnel as well as the Unified Command System for the entire response structure including governmental and other agency representatives.

3.7.2 Notifications:

In the event of a spill, employees are trained to shut down operations and then make notifications as shown in Section 2.0 of this Plan. The initial report would be from the Operator to the Qualified Individual/Alternate (Area Manager, Operations Manager) and the local emergency responders (police and fire) and the Orange Control Center.

3.7.3 Actions:

The first person at the leak site will take the immediate actions detailed in this section.

To assess the need for adequate response resources, the Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the WDOE Response Planning Standards. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable WDOE Response Planning Standards.

SAFETY of all people, including the public as well as the responders, is the single most important item to keep before all people during all activities of the response and clean-up of a spill.

The Incident Commander (IC) is the Qualified Individual (QI) in the Kinder Morgan plan for emergency response. Typically the IC position would progress from the first person on site to the Area Manager to the Director of Operations. All responders in the company have the authority to commit necessary resources to deal with the emergency situation.

As more company personnel arrive at the site, the Incident Command System would go into action. The IC would appoint various trained persons to fill roles such as Safety, Operations, Logistics, Information Officer, Liaison, and Planning, Section 4.0 contains more information on both the Incident and Unified Command Systems (ICS and UCS).

3.7 RESPONSE STRATEGIES (Cont'd)

General Response Strategies (Cont'd)

3.7.4 Procedures to Stop the Discharge:

The IC would have a reconnaissance of the area done with appropriate safety precautions taken including personal protective equipment (PPE), if required, and would formulate a plan of action with the OSCs of agencies on site. Stopping the flow of product by closing valves, starting downstream pumps if appropriate, etc. and containing the product by constructing dikes, berms, pits, etc. would take place.

3.7.5 Managing the Leak Site:

The IC acting with agency OSCs would secure the area using local police and fire departments to keep all but required people out of the area and to take fire prevention actions as necessary. After recon, Kinder Morgan IC meeting with Operations, Planning, and Federal, State, Local and Tribal OSCs would agree on a plan of action to build dikes, deploy booms, vacuum trucks, and other equipment to contain and pick up the product.

All notifications would have been made by this time and agencies would continue to arrive at the site. Examples: U. S. Coast Guard, U.S. EPA, WDOE, State Fire Marshal, Dept. of Fish and Game, local water resources agency, etc. Periodic internal and external follow-up status reports will be made during the emergency response. The process will be repeated periodically.

Response contractors and Company maintenance personnel working under the direction of the Operations Section Chief would be working to contain the spill and clean it up. Staging and De-contamination areas would be set up. The Planning Section would be working to develop incident strategies, plan required resources for the next 12 hour period, as well as longer (several days or weeks) periods.

Safety would be monitoring all actions to assure that nothing was being done that might endanger the health or safety of any persons in the area. Other support areas acting under the Incident Command System would be set up including the Information Officer, Logistics section, and the Liaison section.

In addition, the Company Crisis Support Team may be activated to provide assistance, such as engineering information, drawings, calculations, drafting news releases, assisting in financial/accounting paperwork, insurance contacts, logistics assistance etc.

3.7 RESPONSE STRATEGIES (Cont'd)

General Response Strategies (Cont'd)

3.7.6 Extended Response Activities:

In all scenarios the extended response activities would be similar. After the initial situation has been stabilized and there is no threat of fire or significant health and safety problems, the Incident Command System would be fully in place and operational. The planning function would propose appropriate human and equipment resources to staff the continuing clean up and remediation efforts as appropriate. This would all be discussed and approved by the Unified Command System representatives. In the case of Company personnel, personnel would be brought in from other operating regions and/or HQ and would be supplemented by contract and/or consulting personnel.

Contractor personnel would be arranged for by the contractor under the direction of the Company IC acting in concert with the Unified Command.

3.8 SITE SPECIFIC HEALTH AND SAFETY PLAN

Health and Safety

It is the Company's policy that the health and safety of all personnel will be given the absolute highest priority. To insure this, all response decisions/actions should be based on the following three priorities:

- Safety of Company personnel
- Safety of surrounding community
- Safety/protection of environment

The Kinder Morgan Site Specific Health and Safety Plan (H&S Plan) was created to address these priorities. The H&S Plan is intended to guide company personnel through an assessment of the risk(s) associated with the emergency. Development of the H&S Plan, particularly the first six boxes, should take precedence during the initial stages of an emergency.

Examples of safety issues addressed in the H&S Plan include:

- Chemical Involved
- Specific and general hazards
- PPE
- Evacuation
- Hospital locations
- Air monitoring

3.8 SITE SPECIFIC HEALTH & SAFETY PLAN (Cont'd)

Health and Safety (Cont'd)

- Hazard zones
- MSDS

Site Specific Health & Safety Plan

The H&S Plan is an integral part of the Company emergency response effort. The H&S Plan is required, prior to and during all emergency response operations. Completion of the H&S Plan should occur within the first hour of a response. The first six boxes, at a minimum, should be completed as soon as possible. The information in these boxes will guide Company responders through an initial site assessment.

The H&S Plan serves several purposes:

- Assist in performing an initial risk assessment
- Gather critical incident information into an easy-to-read document (e.g. incident details, product involved, hazards, etc.)
- Establishes hazard zones
- Designates which responders are allowed to go where (e.g. Company vs. FD)
- Prompts responders to initiate the Incident Command System
- Once completed, the H&S Plan will be utilized to:
- Brief Company response personnel
- Coordinate initial response efforts with Fire Department and law enforcement
- Provide regulatory agency representatives and/or visitors with a concise and consistent overview of the incident
- Ensure that anyone that arrives onsite will receive a site-specific health & safety briefing before entering the emergency site
- Demonstrate Company ability to respond to an emergency in a safe and organized manner

The Health and Safety Plan is a dynamic and ever-changing plan that requires continuous updating.

It is important to communicate significant changes to the H&S plan to the appropriate responders.

This is best accomplished by scheduling regular safety meetings.

Table 3. Secondary Hazards

Hazards	Recommended Precaution(s)
❑ Fire (potential)	• Remain safe distance away • Eliminate ignition sources • Keep upwind of vapor/smoke • Provide vapor suppression (if safe) • Do not impede Fire Dept. efforts
❑ Heavy Equipment	• Qualified operators only • Hardhats and safety boots needed around heavy equip. • Minimum 10ft. clearance from power lines • Make "one call" if excavating • Proper machine guarding in place
❑ Excavations	• Trenches/excavations equal to or greater than 5ft. deep must meet OSHA requirements • No one allowed to enter excavation > 5ft. unless shored, sloped or protected • Excavations < 5ft. and judged by competent person as cave-in hazard must also follow OSHA requirements
❑ Noise	• Portable generators & heavy equip. can generate potentially high noise levels • Hearing protection available to workers • Hearing protection must be worn in area with noise levels above 85dBA.
❑ Confined Spaces	• Site Safety Officer will determine whether confined space will be entered • All confined space entries must meet OSHA requirements (permits, atmospheric monitoring, attendants, etc.)
❑ Heat Stress	• Potential hazard when temp >80°F • Workers should take more breaks and drink plenty of appropriate liquids • More PPE = higher risk • Be aware of heat cramps (stomach cramps), heat exhaustion (excessive sweating, flushed/clammy skin) – treat with rest and liquids. Heat stroke (dry, hot, pale skin; no sweating) can be deadly – get medical help immediately, reduce core body temp by applying cold water to body & fanning.
❑ Cold Stress	• Skin takes on gray-glossy look • Appendages become non-responsive • Blisters or sores may appear • Do not rub • Submerse affected areas in warm water or wrap in warm cloth.
❑ Rain / Lightning	• Stop excavation activities during excessive rainfall • Avoid shock hazards by stopping work during thunderstorm or lightening • Prevent & control erosion & transport of soils out of incident area.
❑ General	• Slip, trip & fall hazards • Keep work area clear of debris • Smoking not permitted in work areas • Use hand tools safely
❑ Other:	

FIGURE 3.5 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS

KMEP employees who have received HAZWOPER training are familiar with how to complete and implement the H&S Plan. The following instructions are provided for those persons who have not received the same level of training.

The first 6 boxes of the H&S Plan are priority for filling out during the initial stages of an emergency.

BOX #1: Incident Information

This section is intended to provide general information about the incident.

Location can be a KMEP facility name, pipeline section, address with cross streets, etc.

Note the **date** (including year) and **approximate time** the incident occurred.

The "**Incident Name**" can be left blank until an appropriate name has been determined. Generally the name refers to the piece of equipment involved, location along the pipeline or some other way which will allow for easy recognition in the future. Fire Department responders may refer to the incident as the "Kinder Morgan Incident". However, avoid using this as the incident name because it is too generic and will not provide KMEP with adequate detail for future reference.

A description of **weather conditions** should be provided. Use simple and straightforward language (e.g. light rain, strong winds, sunny, etc.)

Check the appropriate "Incident Type" based on what has occurred. Some emergencies may involve one or more incident types. Check all that apply.

BOX #2: Chemical Hazards Involved

Most emergencies will involve the release of product. This section is intended to communicate what product involved in the particular incident. Most of the products KMEP handles or transports are listed. Place a check next to the products involved. Check "Other" if additional, unlisted chemicals are involved. In general, refined products pose a very low health risk. The first concern should be physical hazards (flash/fire/explosions).

FIGURE 3.5 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

There is a note referring to Table 1: Chemical & Physical Properties provided on the backside of the H&S Plan. This table lists the chemical and physical properties for several of KMEP products. Properties for some chemicals, such as fuel additive or DRA, are not provided because the products vary significantly in composition. In these cases, refer to the products Material Safety Data Sheet (MSDS).

Material Safety Data Sheet

A Material Safety Data Sheet (MSDS) is required for each chemical involved in the incident. Ensure that a copy of the MSDS is readily available. Later in the response effort, the MSDS can be attached to the H&S Plan. Check "Yes" once a MSDS has been made available.

Note: Table 1: Chemical & Physical Properties is intended as a reference but does not replace the need for a Material Safety Data Sheet (MSDS).

BOX #3: Physical / Health Hazards

The section is intended to inform responders or visitors of the **primary** physical or health hazards posed by the emergency situation. In general, refined products pose a very low health risk. The first concern should be physical hazards (flash/fire/explosions). Secondary hazards will be address in another part of the H&S Plan.

Physical Hazards	
Fire -	Check if the incident actually entails a fully involved fire.
Vapor -	Check if incident involves or has the likely potential to involve a vapor release and potential fire flashback.

Health Hazards	
Respiratory -	Check if incident involves a vapor release or if chemical involved poses specific inhalation hazard.
Skin -	Check if incident involves a splash hazard or if chemical involved poses specific skin hazard.

BOX #4: Personal Protective Equipment

The section is intended to designate what personal protective equipment (PPE) or what levels of PPE will be required within the various defined areas ("hazard zones") of the emergency site. It is important that the hazards zones are communicated to all responders so they understand the PPE requirements.

FIGURE 3.5 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

There is a note referring to Table 2: PPE Classes provided on the backside of the H&S Plan. This table describes the various levels of PPE. It should be used as a guideline when choosing PPE for personnel based on where they will be responding. KMEP's policy is that company employees may only respond in Level C or Level D. Mutual aid responders or emergency response contractors are permitted to don Level B or higher, according to their own SOP's.

All contractors shall wear the level of PPE required by the H&S Plan. It is the responsibility of the contractor to supply their personnel with the required PPE and ensure they are knowledgeable and skilled in its use. KMEP has the right to request proof of training, if deemed necessary.

The Table 2: PPE Classes is based on Appendix "B" of the HAZWOPER Standard. Therefore, it should be used as a guideline. All the pieces of PPE listed under a particular level may not be required (e.g. inner chemical resistant gloves, chemical resistant safety boots, etc.). However, the proper choice of respiratory protection is essential and should be used as a deciding factor when choosing between the different levels of PPE.

The following discussion will describe the different levels of PPE in greater detail:

Level A

KMEP personnel do not respond in Level A.

Level A is intended to provide the highest level of skin, eye and respiratory protection. It requires the use of a totally encapsulating chemical suit and SCBA. The product KMEP transports do not warrant the use of Level A. Should an incident involve such chemicals (e.g. train derailment), KMEP personnel are to remove themselves from the immediate area and assist in a defensive mode only.

Level B

KMEP personnel do not respond in Level B.

Level B is intended to provide the highest level of respiratory protection but a lower level of skin and eye protection than Level A. Respiratory protection can include an SCBA or airline. Skin protection will normally include fire resistant (Nomex) or Tyvex (splash resistant) coveralls. Nomex should be worn if the potential for ignition is greater than the potential for splashes. Tyvex, or equivalent, should be worn if the potential for splashes is greater than the potential for ignition. It is not recommended to wear both Nomex and Tyvex coveralls together.

FIGURE 3.5 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

Level B may also include the following PPE, as needed:

- Inner gloves and outer, chemical resistant (nitrile) gloves
- Safety boots (possibly chemical resistant)
- Hard hat
- Face shield / safety glasses
- Hearing Protection

Level C

Level C is the highest level of PPE KMEP personnel are permitted to wear.

Level C is a significant reduction in respiratory protection. Full- or half-face respirators should be selected when the type and concentration of the chemical(s) involved are known. Air monitoring is required to determine the amount of airborne chemical responders may be exposed to.

Once air monitoring is conducted, the appropriate respirator must be chosen. If the chemical hazard is in a gas/vapor form, the proper respirator cartridge must be identified. If the chemical poses a particulate/dust hazard, then a high efficiency particulate air (HEPA) filter is recommended. Cartridges and filters are universally color-coded:

Chemical Hazard	Universal Color Code
Organic vapors (petroleum products)	Black
Acid gases	Yellow
Particulate / dust (HEPA rated)	Bright Pink

If fitted properly, most full- and half-face respirators will provide protection up to 10 times (10x) the permissible exposure limit (PEL).

No person shall be required to wear a respirator or other PPE without proper training in its use and limitations. In the case of respiratory equipment, personnel must have:

Completed an annual, qualitative fit test (e.g. with irritant smoke)

Been trained on how to properly put on a respirator (e.g. field fit check)

Complete a medical evaluation form

Access to a new or properly cleaned and inspected respirator.

FIGURE 3.5 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

Level C skin protection may include fire resistant (Nomex) or Tyvex (splash resistant) coveralls. Do not enter Flash Area

Level C may also include the following PPE, as needed:

- Inner gloves and outer, chemical resistant (nitrile) gloves
- Safety boots (possibly chemical resistant)
- Hard hat
- Face shield / safety glasses
- Hearing Protection

BOX #5: Hot Zone Authorized Entrants

The intent of this section is to determine who is permitted to enter the Hot Zone. All other responders are not allowed to enter the Hot Zone without express permission from the Incident Commander. Place a check next to the responders permitted to enter the Hot Zone.

BOX #6: Site Map

The Site Map plays a key role in communicating essential incident information set forth in the H&S Plan. The open space in the center of the H&S Plan is intended for a hand-drawn version of the incident area. In the event the emergency occurs at a facility, a pre-printed facility plot plan can be used.

At a minimum, a Site Map should include:

Wind direction – Draw an arrow indicating wind direction. Include the actual bearing of the wind (N, S, E or W) and speed, if available

Hazard Zones

Hazard zones include the hot, warm and cold zones. These zones are utilized during an emergency to:

Outline the location of the greatest hazards, as well as, areas considered safe.

Communicate areas where certain personnel are (and are not) permitted to respond.

FIGURE 3.5 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

- Communicate areas where visitors are (and are not) permitted to access.
- Provide a means to control the "flow" of response personnel into and out of the hot zone.
- Contain the released product within the smallest area possible.

In the initial stages of an emergency, the hazard zones may only be established through the use of landmarks (e.g. trees, fences, roads, etc.). However, this process is important because it creates a visual "foot print" of the hazardous areas, which can be communicated to responding agencies or personnel.

Hot Zone

Only personnel with proper HAZWOPER training are allowed to enter the hot zone. The Hot zone is an established area that encircles the released product or primary hazard of emergency. The size of the hot zone will depend on product involved, wind direction, terrain, etc. During early stages of an emergency, the hot zone will be an estimate. When doing so, estimate a much larger are to include a margin of safety. You can always move closer, but it is difficult to pull responders back. Upon arrival at the scene, Fire Departments will often consider an entire facility as the hot zone. This is to ensure all personnel are evacuated and site reconnaissance can begin.

Warm Zone

Only personnel who have been HAZWOPER trained are allowed to enter the warm zone. The warm zone is the area between the hot and cold zones. Like the hot zone, the size on the area depends on product involved, wind direction, terrain, etc. The warm zone should completely surround the hot zone. It acts as a buffer and transition area from the cold zone into the hot zone and visa versa. Whenever possible, the warm zone should be delineated with tape or barrier.

Cold Zone

The cold zone is a non-hazardous area where emergency management and support services are stationed. It is located beyond the warm zone and does necessarily need to be delineated with tape or signs. The cold zone generally contains the Staging area and the Command Post. If the emergency warrants, the cold zone will also support a liaison area and a media area.

- **Staging** - The Staging Area is located within the cold zone and will serve as the first control point into the emergency. Although the Staging Area may not be established in the initial phase of the response, it is important for it to be included on the Site Map once it is established. Indicate the location of the Staging Area on the Site Map.

FIGURE 3.5 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

- **Command Post** - The Command Post is also located within the cold zone. It will serve as the main communication and action planning post for the duration of the emergency. Although the Command Post may not be established in the initial phase of the response, it is important for it to be included on the Site Map once it is established. More details regarding the Command Post and its role in the Incident Command System are provided. Indicate the location of the Command Post on the Site Map.

- **Decon** - A decontamination corridor ("decon area") is established at the edge of the hot zones and extends into the warm zone. Whenever possible, the decon area should be located upwind of the incident. Decontamination will be discussed further.

- **Cross Streets** - Identification of cross streets will provide a point of reference, particularly if the incident occurs along the pipeline.

- **Sensitive Receptors** - Sensitive receptors include creeks, storm channels, schools or any vulnerable conditions that could be impacted by the incident. Include the location of any sensitive receptors on the Site Map.

BOX #7: Secondary Hazards

This section is intended to communicate possible hazards that are secondary to the hazards directly posed by the incident. There is a note referring to Table 3: Secondary Hazards provided on the backside of the H&S Plan. This table lists possible secondary hazards that may deserve additional attention by the KMEP Safety Officer and provides some recommended precautions. Put a check next to all the secondary hazards that apply. Take the necessary precautions as they apply to each hazard. Use the "Other" box to describe additional secondary hazards, as necessary.

BOX #8: Evacuation Plan

This section is intended to clearly communicate where responders and/or visitors are to assemble in the event of an unexpected emergency or evacuation occurred during the response. The evacuation signal may be an existing facility alarm, three blasts of an air horn or any other easily identifiable and audible signal.

If the incident occurred at a facility and the existing evacuation areas are safe and appropriate (based on the established hazard zones), indicate these primary and secondary evacuation areas on the H&S Plan.

If the incident occurred outside a facility or along the pipeline, designate primary and secondary evacuation areas on the H&S Plan. These areas may be a simple as the Staging area or the corner of an intersection.

FIGURE 3.5 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

BOX #9: Nearest Hospital

Provide the address, phone number and driving directions for the hospital nearest to the incident area. It is advisable to contact the hospital and ask if they have an emergency room.

BOX #10: PROP 65 Notices

This section applies to incident occurring in California only. PROP 65 notices are required to warn people of potential toxicological effects of released products. At a minimum, PROP 65 notices are to be posted at the entrance to the incident (e.g. facility entrance or Staging area). PROP 65 notices do not need to be posted if they are already posted at facility entrances. Efforts also should be made to post them along the incident perimeter.

Check to appropriate box according to the incident location and posting needs.

BOX #11: KMEP ICS Organization

Fill-in and update the KMEP organization chart as responders arrive at the scene and assume ICS positions. See Section 4.0 for more details on ICS.

BOX #12: Enforcement / Regulatory Agencies (On-Site)

This section is intended to communicate what enforcement / regulatory agencies are on the scene. Include type of agency, representative's name and time of arrival. The KMEP Safety Officer may wish to coordinate with the KMEP Liaison Officer to complete and update this section.

BOX #13: Contractors (On Site)

This section is intended to keep track of the various contractors on site. The KMEP Safety Officer may wish to coordinate with the KMEP Operations and/or Logistics Officer(s) to complete and update this section. Check the type of contractor and fill-in the company name.

BOX #14: Hot Zone Entry Objectives

This section is intended to answer the following questions:

Why are "Hot Zone Authorized Entrants" (Box # 5) entering the Hot Zone?

FIGURE 3.5 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

- What are they planning to do?
- Are the benefits of accomplishing objectives worth the risk of entering the Hot Zone?

Write the answer to the questions in the space provided. Use simple, straightforward language.

BOX #15: Decon Procedures

This section is to be used to develop decontamination procedures. Procedures need to be appropriate for the hazard involved.

During a response to a release, personnel and equipment may come into contact with the product. The purpose of decontamination is to minimize the spread of product. In order to accomplish this, it is important to practice effective decontamination that is appropriate to the hazards of the product. Decontamination includes the removal or neutralization of product from personnel and response equipment. The following are consideration for establishing an in-the-field decon system:

- Decon systems should be located up-wind of the Hot Zone. The decon system should extend from the edge of the Hot Zone into the Warm Zone.
- The decon system should be considered the entrance and exit (control point for personnel) into the Hot Zone.
- A secondary decon system should be considered for response equipment such as backhoes, vacuum trucks etc. Likewise, the "equipment" decon system should be used as the control point for response equipment.
- Design decon systems appropriate for the hazards involved. Refined petroleum products present a low health hazard. The approved Company decon system for refined petroleum products consists of the following components:

FIGURE 3.5 (Cont'd)

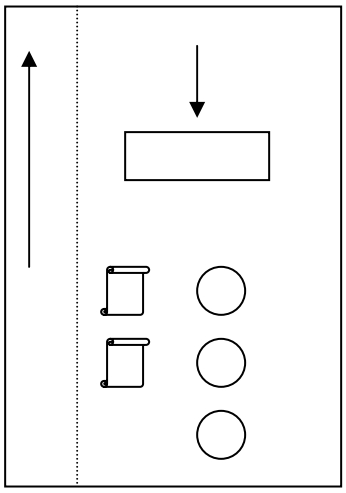
SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

- o Plastic tarp floor to contain product
- o Tub of kitty litter absorbent
- o Boot brush
- o Folding chairs
- o Large plastic trash bags
- o Entrant log and supervision

A sample decon system includes:

= Container with 4" of absorbent material (i.e. kitty litter) and a boot brush.

= Several folding chairs lined up with trash bags in front.



BOX #16: Atmospheric Monitoring

Air monitoring should be conducted to ensure that appropriate hazard zone areas have been designed. KMEP, fire department or contractor personnel may perform air monitoring to establish levels where appropriate. These times include:

- Ensure warm/cold zones free of vapor
- Need for respiratory protection
- Determine safe levels for confined space entry and hot work

Air monitoring to establish the hot zone perimeter should be delegated to the lead agencies (Fire Dept., HazMat teams, etc).

BOX # 17: Authorization Signatures

Once completed, have the KMEP Incident Commander and Safety Officer sign the H&S Plan.

3.9 MATERIAL SAFETY DATA SHEETS

Product Specific Response Considerations for the major products are provided in Figure 3.6. The Facility maintains a more detailed and all-inclusive list of MSDS.

FIGURE 3.6

FLAMMABLE LIQUIDS (Polar/Water-Miscible)

The following information is intended to provide the initial responder(s) with data that may be useful in making quick decisions and executing prompt response actions. The information is intended for guideline purposes only.

PRODUCTS **Ethanol**

HAZARD IDENTIFICATION / RECOGNITION

GUIDE NO. 127

DANGERS

- HIGHLY FLAMMABLE: Will be easily ignited by heat, sparks or flames.
- Vapors may form explosive mixtures with air.
- Vapors may travel to source of ignition and flash back.
- Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks).
- Vapor explosion hazard indoors, outdoors or in sewers.
- Those substances designated with a "P" may polymerize explosively when heated or involved in a fire.
- Runoff to sewer may create fire or explosion hazard.
- Containers may explode when heated.
- Many liquids are lighter than water.

HEALTH

- Move victim to fresh air. Call 911 or emergency medical service.
- Apply artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult.
- Remove and isolate contaminated clothing and shoes.
- In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes.
- Wash skin with soap and water.
- Keep victim warm and quiet.
- Ensure that medical personnel are aware of the material(s) involved, and take precautions.

PUBLIC SAFETY

- Isolate spill or leak area immediately for at least 25 to 50 meters (80 to 160 feet) in all directions.
- Keep unauthorized personnel away.
- Stay upwind.
- Keep out of low areas.
- Ventilate closed spaces before entering.

EVACUATION

Large Spill

- Consider initial downwind evacuation for at least 300 meters (1,000 feet).

Fire

- If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 meters (1/2 mile) in all directions; also, consider initial evacuation for 800 meters (1/2 mile) in all directions.

Information provided by the Emergency Response Guidebook 2008.

FIGURE 3.6 (Cont'd)

FLAMMABLE LIQUIDS (Non-Polar/Water-Immiscible)

The following information is intended to provide the initial responder(s) with data that may be useful in making quick decisions and executing prompt response actions. The information is intended for guideline purposes only.

EVACUATION

Large Spill

- Consider initial downwind evacuation for at least 300 meters (1,000 feet).

Fire

- If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 meters (1/2 mile) in all directions; also, consider initial evacuation for 800 meters (1/2 mile) in all directions.

Information provided by the Emergency Response Guidebook 2008.

FIGURE 3.7

TACTICAL PLAN

The following Tactical Plan has been provided to assist initial response to a spill incident from this Facility. The plan includes the following:

- Driving directions
- General pictures of the site and tactical response strategy
- General response equipment and personnel recommendations

Note: This Tactical Plan is provided as a general guidance tool for response to an incident emanating from this Facility. The selection of response strategy equipment, manpower and deployment site may vary based on actual field conditions (e.g. terrain, weather conditions, product type/volume) and incident details.

(b) (7)(F), (b) (3)

4.0 RESPONSE TEAMS

4.1 INTRODUCTION

This section describes organizational features and duties of the Local Response Team and the broader Company Incident Management Team.

The key to an effective emergency response is a rapid, coordinated, tiered response by the affected facility and the Incident Management Team, consistent with the magnitude of the incident.

First response to an incident at the Facility will be provided by the Local Response Team (LRT). The Incident Management Team will respond, to the degree necessary, to incidents exceeding local capability. If a response exceeds the Local Response Team's capabilities, the Local Incident Commander will activate the Incident Management Team.

These response teams will use the NIMS Incident Command System (ICS) to manage the emergency response activities. Because ICS is a management tool that is readily adaptable to incidents of varying magnitude, it will typically be used for all emergency incidents. Staffing levels will be adjusted to meet specific response team needs based on incident size, severity, and type of emergency.

An explanation of ICS and the roles and responsibilities for primary members of the response teams are provided in Section 4.9. The USCG Incident Management Handbook (IMH) can be referenced for an in-depth description of all ICS positions, ICS development, response objectives and strategies, command responsibilities, ICS specific glossary/acronyms, resource typing, the IAP process, and meetings (http://www.uscg.mil/hq/nsfweb/docs/FinalIMH18AUG2006.pdf).

Another important aspect of the ICS system is that individuals working on specific response tasks complete standard ICS forms. Accurate and complete documentation of a response activity using these standard forms is vital to the communication of information during any transition phase of responsibilities as well as post-incident assessments and follow-up. Standard ICS forms are included in Section 5.

4.2 QUALIFIED INDIVIDUAL

It is the responsibility of the Qualified Individual (QI) or his/her designee to coordinate with the Federal On-Scene Coordinator (FOSC), State On-Scene Coordinator (SOSC), Local On-Scene Coordinator (LOSC), Tribal On-Scene Coordinator (TOSC), and/or other On-Scene Coordinators throughout the response.

Vital duties of the Qualified Individual (QI) include:

- Activate internal alarms and hazard communication systems to notify all Facility personnel.
- Notify all response personnel, as needed.
- Identify the character, exact source, amount, and extent of the release, as well as the other items needed for notification.

4.2 QUALIFIED INDIVIDUAL (Cont'd)

- Notify and provide necessary information to the appropriate Federal, State, Local, and Tribal authorities with designated response roles, including the National Response Center (NRC), State Emergency Response Commission (SERC), and local response agencies.

- Assess the interaction of the spilled substance with water and/or other substances stored at the Facility and notify response personnel at the scene of that assessment.

- Assess the possible hazards to human health and the environment due to the release. This assessment must consider both the direct and indirect effects of the release (i.e., the effects of any toxic, irritating, or asphyxiating gases that may be generated or the effects of any hazardous surface water runoffs from water or chemical agents used to control fire and heat-induced explosion).

- Assess and implement prompt removal actions to contain and remove the substance released.

- Coordinate rescue and response actions as previously arranged with all response personnel.

- Activate and engage in contracting with oil spill removal organizations.

- Use authority to immediately access company funding to initiate cleanup activities.

- Direct cleanup activities until properly relieved of this responsibility.

- Arrangements will be made to ensure that the Qualified Individual (QI) or the Alternate Qualified Individual (AQI) is available on a 24-hour basis and is able to arrive at the Facility in a reasonable time.

- The AQI shall replace the QI in the event of his/her absence and have the same responsibilities and authority.

4.3 LOCAL RESPONSE TEAM

The first Company person on scene will function as the Incident Commander (IC) and person-in-charge until relieved by an authorized supervisor who will then assume the position of Incident Commander. Transfer of command will take place as more senior management respond to the incident. For response operations within the control of the Local Response Team, the role of IC will typically be assumed and retained by Terminal Management.

The number of positions/personnel required to staff the Local Response Team will depend on the size and complexity of the incident. The duties of each position may be performed by the IC directly or delegated as the situation demands. The IC is always responsible for directing the response activities and will assume the duties of all the primary positions until the duties can be delegated to other qualified personnel.

4.3 LOCAL RESPONSE TEAM (Cont'd)

A complete functional ICS organization is shown in Figure 4.1. The LRT should try to fill the necessary positions and request additional support from the Incident Management Team to fill/back up the positions necessitated by the incident may dictate. Detailed job descriptions of the primary response team positions are provided in Section 4.9.

4.4 INCIDENT MANAGEMENT TEAM

For spill response operations outside the capabilities of the Local Response Team (LRT), the QI/AQI or IC will determine the need for mobilization of the Incident Management Team (IMT). The members of the LRT will typically become members of the IMT.

The Incident Management Team (IMT), once fully staffed, is designed to cover all aspects of a comprehensive and prolonged incident response. The number of positions/ personnel required to staff the IMT will depend on the size and complexity of the incident. During a prolonged response, additional personnel may be cascaded in, and more than one level within the Team may be involved to sustain 24-hour operations.

The IMT is basically organized according to the NIMS Incident Command System principles (Figure 4.2). Led by the Incident Commander, the team is composed of the following principal components:

- Command
- Planning
- Finance/Administration
- Operations
- Logistics

The Incident Management Team is staffed by specially trained personnel from various facility/corporate locations, and by various contract resources as the situation requires (IMT organization chart is provided in Figure 4.2; telephone reference is provided in Figure 2.2.). Command and Unit Leader responsibilities are described in Section 4.9.

4.5 KM CRISIS SUPPORT TEAM (CST)

Kinder Morgan (KM) has established a Crisis Support Plan (CSP) to assist local field groups in responding to crises in their areas. In addition to typical emergencies such as releases, fires, and explosions, the plan may be used to address the response to less obvious crises such as negative media, national security threats and natural disasters that affect the overall well being of KM.

During most emergencies and crises, the local facility response plan provides the appropriate immediate response. If the situation warrants, the Crisis Support Plan would be implemented to supplement local response activities by using personnel (called the Crisis Support Team (CST)) in the Houston, Texas; Orange, California; Lakewood, Colorado; and/or Alpharetta, Georgia offices – all of which can operate 24 hours per day when activated.

The focus of the KM Crisis Support Team (CST) is to augment the company's various existing emergency response plans and capabilities with additional resources, equipment, and crisis response planning, at the KM management level. The CSP provides the mechanism for activating the KM CST and affiliated Crisis Support Center.

4.6 INCIDENT COMMAND SYSTEM

The Incident Command System is intended to be used as an emergency management tool to aid in mitigating all types of emergency incidents. This system is readily adaptable to very small emergency incidents as well as more significant or complex emergencies. The Incident Command System utilizes the following criteria as key operational factors:

- Assigns overall authority to one individual
- Provides structured authority, roles and responsibilities during emergencies
- The system is simple and familiar, and is used routinely at all incidents
- Communications are structured
- The system for response and assignment of resources is structured
- The system provides for expansion, escalation, and transfer/transition of roles and responsibilities
- The system allows for "Unified Command" where agency involvement at the command level is required

Effective establishment and utilization of the Incident Command System during response to all types of emergencies can:

- Provide for increased safety
- Shorten emergency mitigation time by providing more effective and organized mitigation
- Cause increased confidence and support from local, state, and federal public sector emergency response personnel
- Provide a solid cornerstone for emergency planning efforts

Section 4.9 provides a comprehensive list of every response team member's duty assignment.

4.7 UNIFIED COMMAND

As a component of an ICS, the Unified Command (UC) is a structure that brings together the Incident Commanders of all major organizations involved in the incident to coordinate an effective response while still meeting their own responsibilities (A UC organization chart is provided in Figure 4.3). The UC links the organizations responding to the incident and provides a forum for the Responsible Party and responding agencies to make consensus decisions. Under the UC, the various jurisdictions and/or agencies and responders may blend together throughout the organization to create an integrated response team. The ICS process requires the UC to set clear objectives to guide the on-scene response resources.

4.7 UNIFIED COMMAND (Cont'd)

Multiple jurisdictions may be involved in a response effort utilizing Unified Command. These jurisdictions could be represented by any combination of:

- Geographic boundaries
- Government levels
- Functional responsibilities
- Statutory responsibilities

The participants of Unified Command for a specific incident will be determined taking into account the specifics of the incident and existing response plans and/or decisions reached during the initial meeting of the UC. The UC may change as an incident progresses, in order to account for changes in the situation.

The UC is responsible for overall management of an incident. The UC directs incident activities and approves and releases resources. The UC structure is a vehicle for coordination, cooperation and communication which is essential to an effective response.

UC representatives must be able to:

- Agree on common incident objectives and priorities
- Have the capability to sustain a 24-hour-7-day-per-week commitment to the incident
- Have the authority to commit agency or company resources to the incident
- Have the authority to spend agency or company funds
- Agree on an incident response organization
- Agree on the appropriate Command and General Staff assignments
- Commit to speak with "one voice" through the Information Officer or Joint Information Center
- Agree on logistical support procedures
- Agree on cost-sharing procedures

4.8 DISCHARGE/INCIDENT CLASSIFICATION

The severity of a discharge/incident will have a bearing on the level of management involvement necessary and the extent of resource mobilization. The following definitions provide guidance in the early classification of discharges:

TIER I EVENT
Incident Command will normally be assumed by Terminal Management. Regional and Head Office support will be utilized on an as needed basis.
Exposure
The potential public and environmental exposure is moderate. The type and quantity of material released, while considering the overall nature of the incident (e.g. fire, proximity to private dwellings, etc.), will have moderate impact on the public and/or the environment.
Degree of Control
The incident can be controlled in a short period of time through implementation of the local resources available to the Facility (including contract resources).
Governmental Involvement
Government involvement will be moderate and generally restricted to State and local levels.
Media Involvement
Media interest will be moderate and generally restricted to State and Local levels.

4.8 DISCHARGE/INCIDENT CLASSIFICATION (Cont'd)

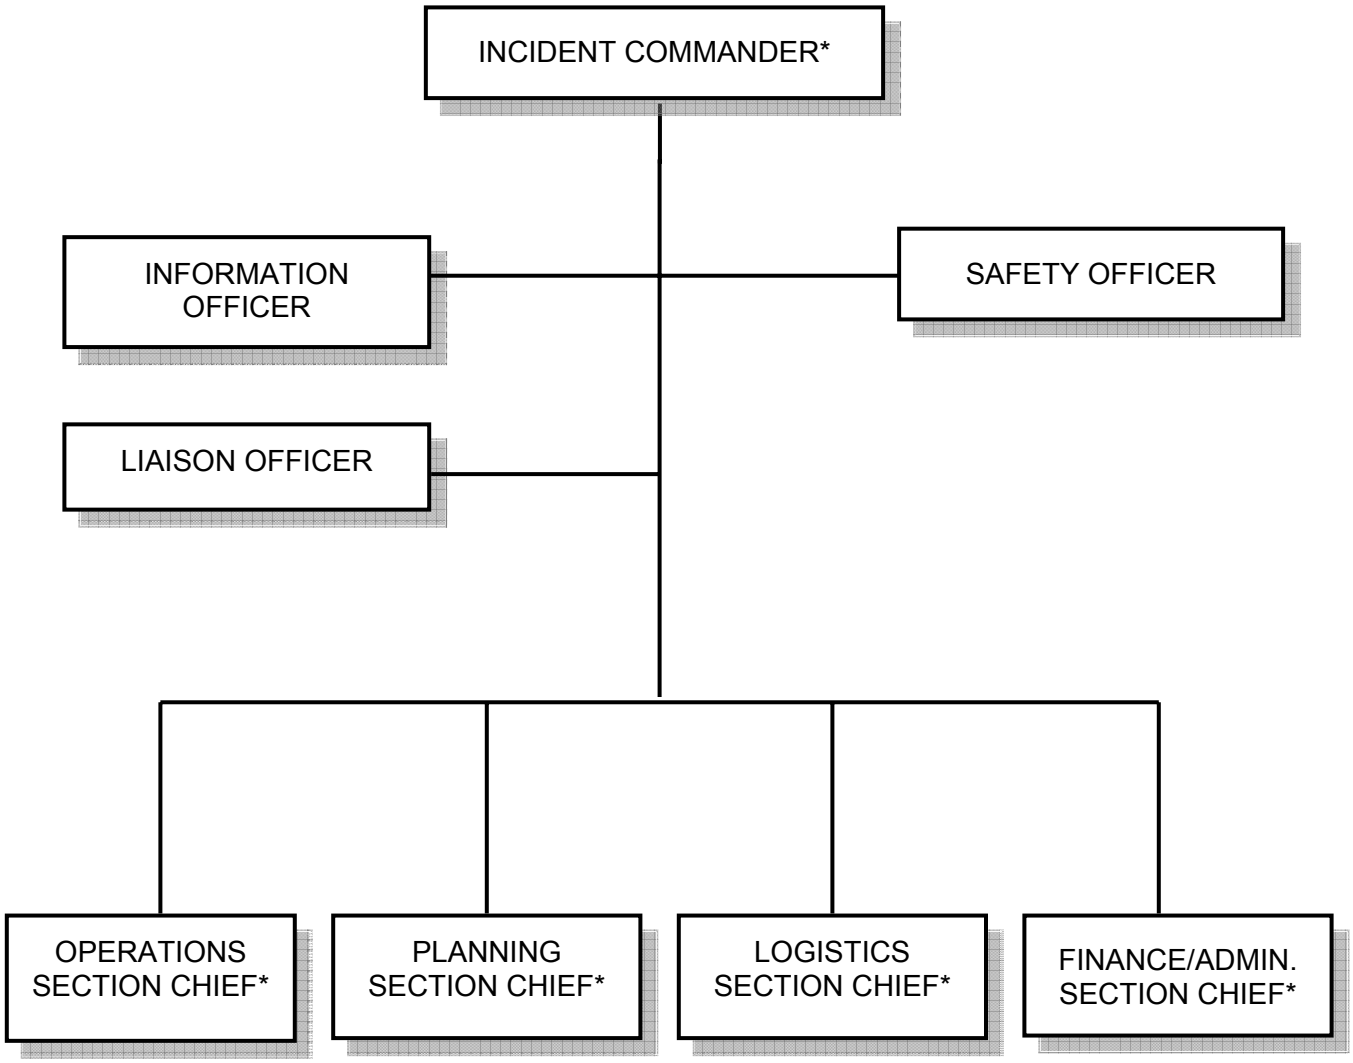
TIER II EVENT
Local Company resources may have to be supplemented with Head Office and external resources to manage the spill incident.
Exposure
The potential public and environmental exposure is moderately high. The type and quantity of material released, while considering the overall nature of the incident (e.g. fire, proximity to private dwellings, etc.), will have moderately high impact on the public and/or the environment.
Degree of Control
The incident can be brought under control in a moderate period of time through implementation of local resources available to the Facility (including contract resources) with possible implementation of regional resources.
Governmental Involvement
Government involvement will be moderately high and generally restricted to Regional levels.
Media Involvement
Media interest will be moderately high and generally restricted to Regional levels.

TIER III EVENT
Maximum Company and external resources must be implemented to respond to the spill incident. Activation of the Crisis Management Team would be anticipated during a Tier III incident.
Exposure
The potential public and environmental exposure is significant. The type and quantity of material released, while considering the overall nature of the incident (e.g. fire, proximity to private dwellings, etc.), will have significant impact on the public and/or the environment.
Degree of Control
Maximum Company and third party resources must be implemented in order to gain control of the incident.
Governmental Involvement
Government involvement will be high.
Media Involvement
Media interest will be high.

FIGURE 4.1

LOCAL RESPONSE TEAM

(For Initial Response and Tier I & II Incidents)



* NOTE: Local Response Team (LRT) personnel can assume any of these positions as necessary.

FIGURE 4.2

INCIDENT MANAGEMENT TEAM

(For incidents beyond the response capability of the Local Response Team)

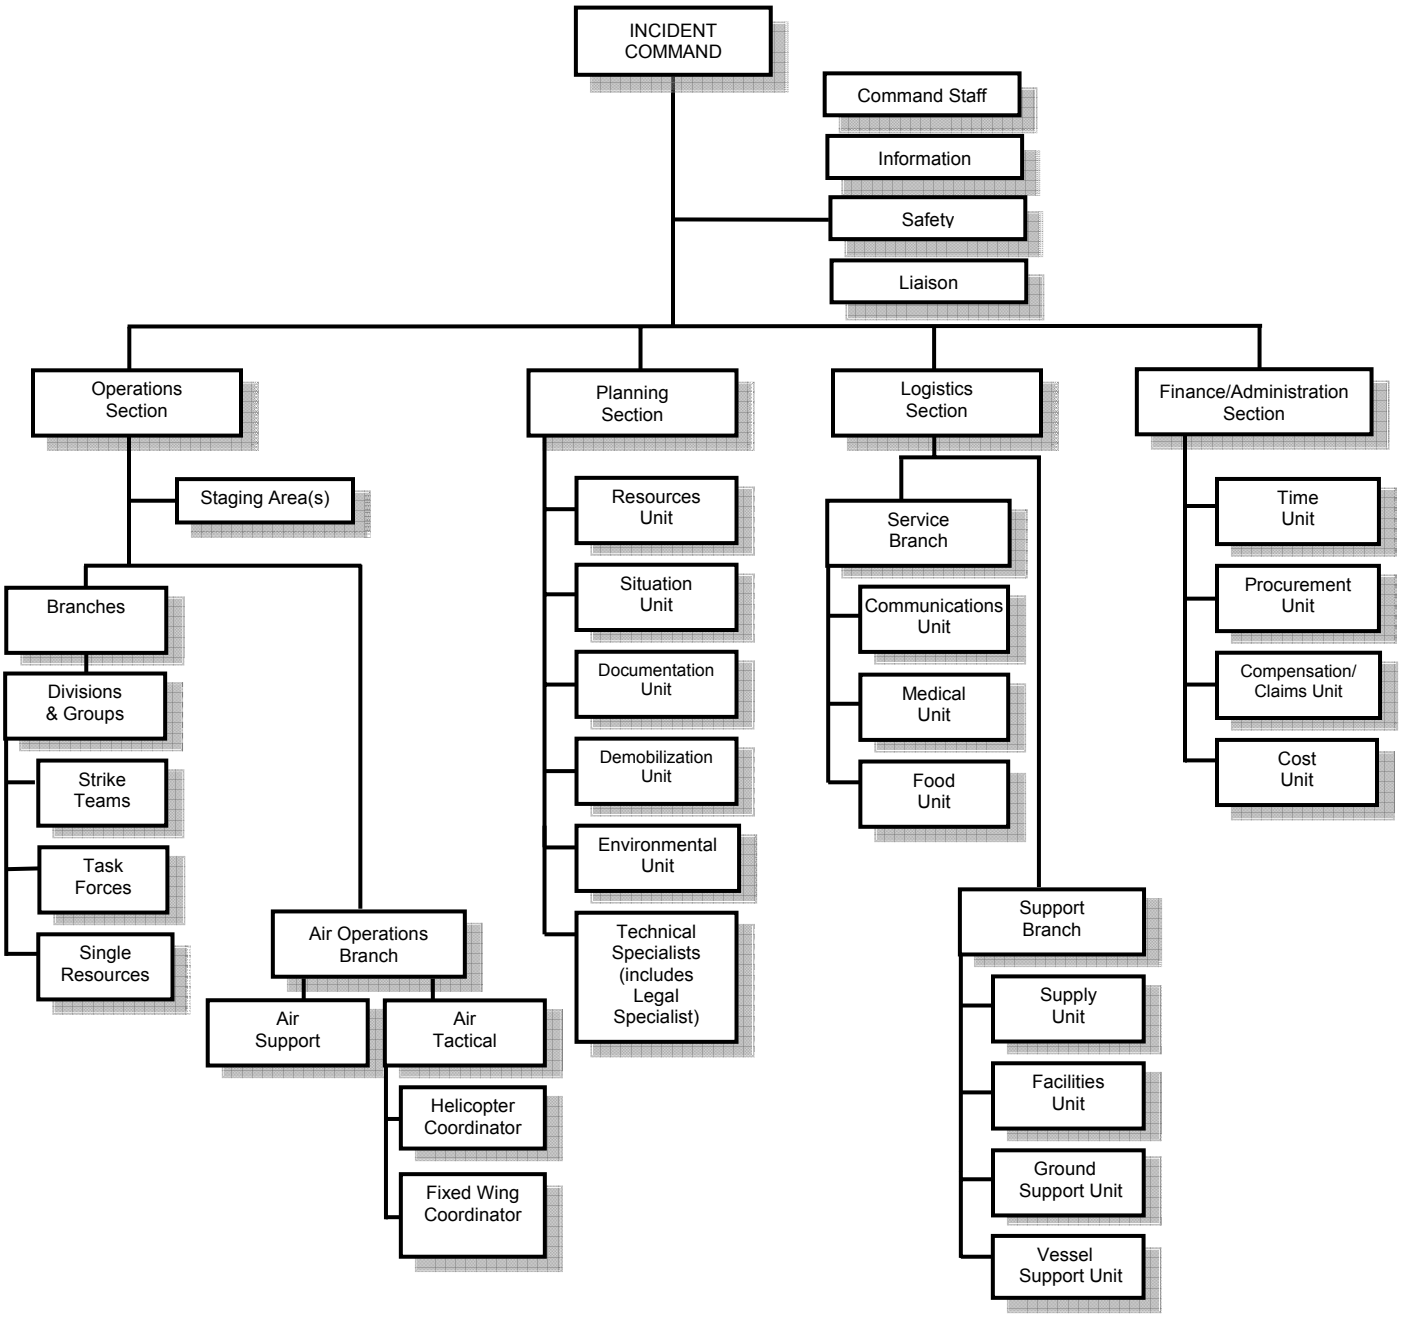


FIGURE 4.3

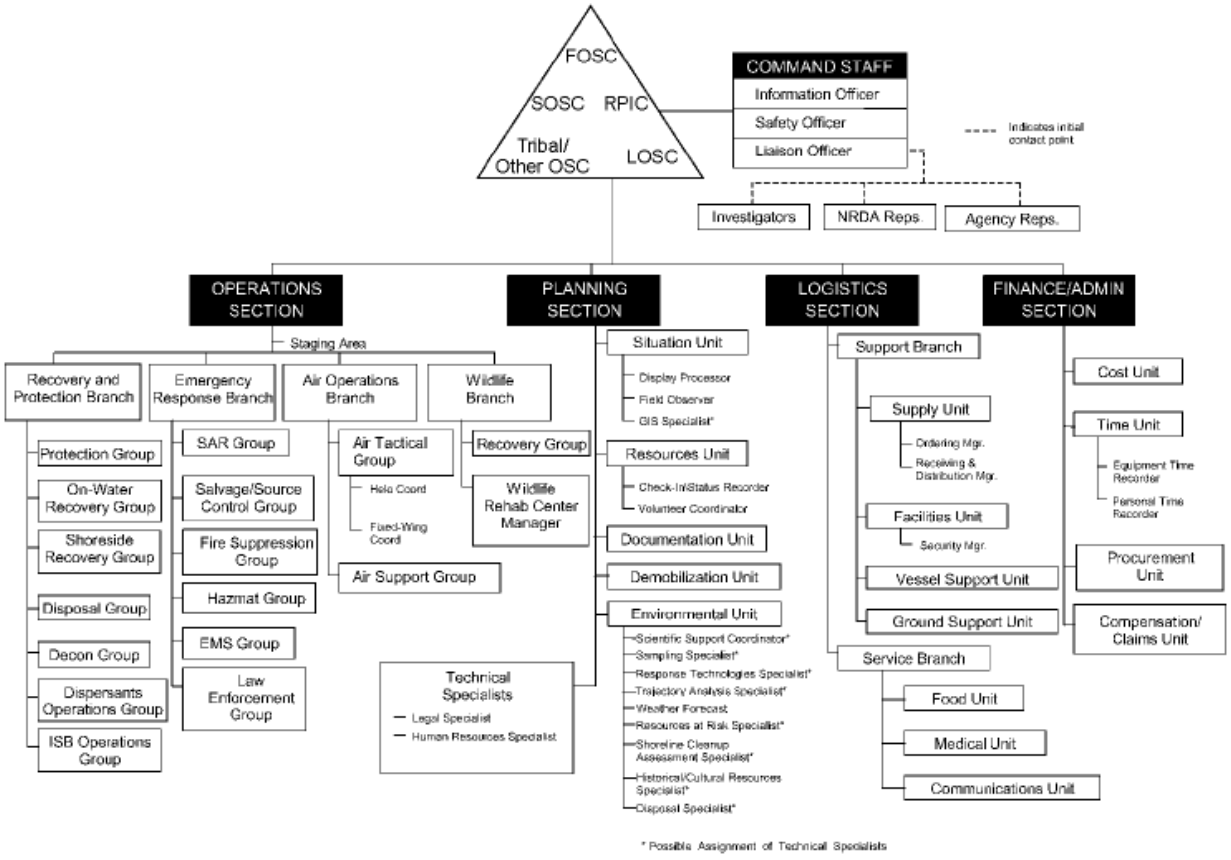
UNIFIED COMMAND



4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Use IAP and Unit/Activity Log (ICS Form 214) to brief relief personnel.
- Respond to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

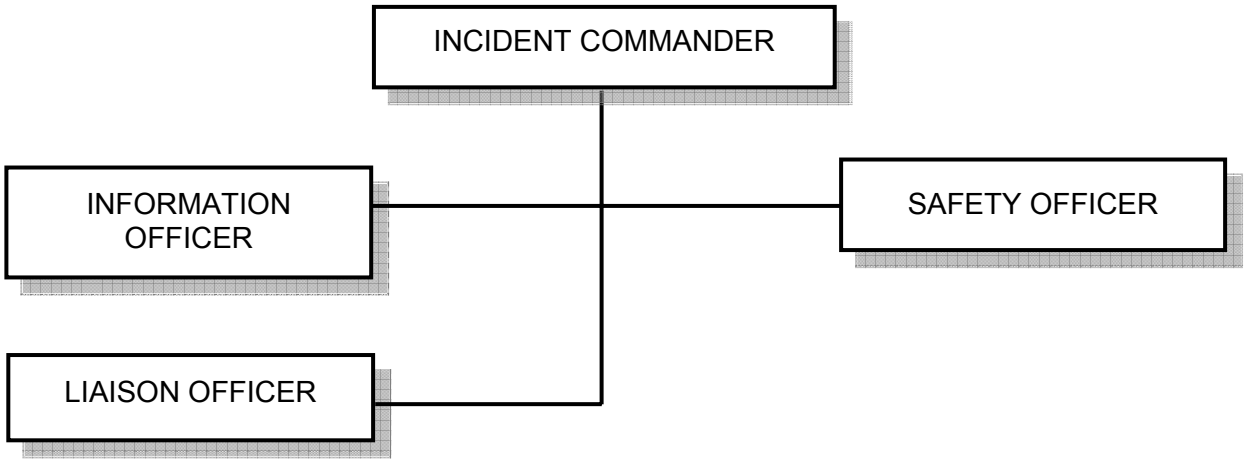
COMMAND

Incident Commander.....4-12

Safety Officer 4-15

Liaison Officer 4-17

Information Officer 4-18



INCIDENT COMMANDER

The Incident Commander (IC) has responsibility for overall management of the incident. The KM IC has the authority to approve the use of a contractor even if no "open-end" contract exists, as well as the authority to commit monies to initiate response and clean-up activities. The first employee on-site will assume the responsibilities of IC until properly relieved. Generally, the most senior employee on-site will assume the IC position. The IC also has overall responsibility for the health and safety of responders.

KM Initial IC Responsibilities (During the first few hours):

- Make internal Company notifications
- Conduct initial site assessment
- Initiate Incident Command System (assign ICS roles & complete org. chart)
- Ensure Site Specific Health & Safety plan is being developed within the first hour
- Maintain site control (establish hazard zones and appropriate corridors)
- Request Unified Command with lead agencies as appropriate
- Establish immediate priorities (i.e. control the discharge, initiate containment, ensure safety, etc.)

Overall IC Responsibilities:

- Assess the situation and/or obtain a briefing from the prior IC.
- Determine Incident Objectives and strategy.
  Objectives and strategies should be documented on ICS form 201or 202 and used to communicate Unified Command's expectations for the next operational period
- Establish the immediate priorities.
- Establish an Incident Command Post.
- Brief Command Staff and Section Chiefs.
- Review meetings and briefings.
- Establish an appropriate organization.
  The organization should be documented on ICS forms 201, 203 or 207, depending on the level of response.
- Ensure planning meetings are scheduled as required.
- Approve and authorize the implementation of an IAP.
- Ensure that adequate safety measures are in place.
- Coordinate activity for all Command and General Staff.
- Coordinate with key people and officials.
- Approve requests for additional resources or for the release of resources. *This is usually accomplished through the approval of the Incident Action Plan.*
- Keep corporate offices and agency administrator(s) informed of incident status.
- Approve the use of trainees, volunteers, and auxiliary personnel.
- Authorize release of information to the news media.
- Ensure incident Status Summary (ICS Form 209) is completed and forwarded to appropriate higher authority.
- Order the demobilization of the incident when appropriate.

INCIDENT COMMANDER (Cont'd)

OIL SPILL

The IC for oil discharges will, whenever possible and practical, be organized under the Unified Command (UC) Structure that includes, but is not limited to:

- The pre-designated Federal On-Scene Incident Commander (FOSC)
- The pre-designated State On-Scene Incident Commander (SOSC)
- The representative of the Responsible Party (RP) IC

The UC is responsible for the overall management of the incident. The UC directs incident activities including the development and implementation of strategic decisions and approves the ordering and releasing of resources. The UC may assign a Deputy IC to assist in carrying out IC responsibilities. IC tasks specific to oil spill events are:

- Be cognizant of the primary objectives for oil spill response activities.
  - Ensure the safety of citizens and response personnel.
  - Control the source of the spill.
  - Manage a coordinated response effort.
  - Maximize protection of environmentally sensitive areas.
  - Contain and recover spilled material.
  - Recover and rehabilitate injured wildlife.
  - Remove oil from impacted areas.
  - Minimize economic impacts.
  - Keep stakeholders informed of response activities.
  - Keep the public informed of response activities.
  - Ensure that the source of a discharge is designated and that procedures by which claims may be presented are advertised.
  - All removal and damage claims must be handled appropriately.

HAZARDOUS SUBSTANCE RELEASE

Incident Commander and Safety Officer - The IC and SO for a hazardous substance incident will use the following guidance when preparing the Site Safety Plan:

- Assign site safety responsibility.
- Establish perimeter and restrict access.
- Characterize site hazards:
  - Identity pollutant
  - Obtain Material Safety Data Sheets
  - Conduct air monitoring
  - Identify physical and biological hazards i.e., slips, trips, falls, confined spaces, noise, weather conditions, poisonous insects, reptiles, plants and biological waste
- Establish control zones:
  - Exclusion zone
  - Contamination reduction zone
  - Support zone

INCIDENT COMMANDER (Cont'd)

HAZARDOUS SUBSTANCE RELEASE (Cont'd)

- Assess training requirements:
  - Check HAZWOPER cards
  - Insure safety briefings
- Select personal protective equipment (PPE) Level A, B, C, or D.
- Establish decontamination stations.
- Establish Emergency Medical Plan Locate hospital, EMT(S) and first-aid stations; and List emergency numbers: fire, police, and ambulance.

TERRORISM INCIDENT

(b) (7)(F), (b) (3)

[redacted]

SAFETY OFFICER

The Safety Officer's (SO) function is to develop and recommend measures for assuring personnel safety, and to assess and/or anticipate hazardous and unsafe situations. Only one SO will be assigned for each incident; however, there may be assistants.

Overall SO Responsibilities:

- Participate in planning meetings.
- Identify hazardous situations associated with the incident.
- Review the IAP for safety implications.
- Exercise emergency authority to stop and prevent unsafe acts.
- Investigate accidents that have occurred within the incident area.
  Ensure information is relayed to the Situation Unit Leader in order to update incident status information (ICS form 209) on the display board.
- Review and approve the medical plan (ICS form 206).
- Develop the Site Safety Plan and publish Site Safety Plan summary (ICS Form 208) as required.
  This plan may be more detailed than the KM Site Specific Health and Safety Plan.

Additional KM Required SO Responsibilities:

- Ensure all initial response personnel are located in a safe location
- Complete the KM Site Specific Health and Safety Plan (**within the first hour**)
- Conduct initial briefing of the KM Site Specific Health and Safety Plan
- Establish regularly scheduled safety meetings
  - Ensure that an "attendance roster" is maintained during these meetings
  - Work with Staging Officer to conduct H&S Plan briefings with arriving response personnel
- Assess need for atmospheric monitoring – coordinate as needed
  - Ensure air monitoring results are accurately documented; use map of area to record results if necessary
- Coordinate with appropriate agencies to assess need for triage; suggest possible locations
- Establish smoking areas; communicate clearly
- Establish Emergency Medical Plan Locate hospital, EMT(S) and first-aid stations; and List emergency numbers: fire, police, and ambulance.
- Control access to an offsite incident site by working within the Unified Command Structure to effect the necessary control measures for air, (FAA), marine(USCG) and ground (local law enforcement) traffic.
- In the event of a need to control traffic before the arrival of local, state, or federal authorities, the following methods of traffic control may be considered:
  - Vehicular and/or pedestrian access to an offsite incident should be controlled to the extent possible prior to the arrival of local law enforcement or other agency personnel trained to handle traffic control.
  - Until agencies respond to the scene and take control of access and traffic, vehicles can be used to block traffic flow on streets leading to the spill site, if it is safe to do so. Do not operate vehicles at the scene of a gasoline or other light hydrocarbon spill where a flammable vapor cloud may be present.
  - For an on water spill, control of marine traffic may be attempted prior to the arrival of the US Coast Guard response vessel by alerting vessel operators of the spill hazard by radio where possible.
  - Control of air traffic may be necessary due to operations aircraft. The local Federal Aviation Administration (FAA) office can be contacted by the Incident Commander, or coordinated with local authorities, to establish safe operations.

SAFETY OFFICER (Cont'd)

HAZARDOUS SUBSTANCE RELEASE

Incident Commander and Safety Officer - The IC and SO for a hazardous substance incident will use the following guidance when preparing the Site Safety Plan:

- Assign site safety responsibility.
- Establish perimeter and restrict access.
- Characterize site hazards:
  - Identity pollutant
  - Obtain Material Safety Data Sheets
  - Conduct air monitoring
  - Identify physical and biological hazards i.e., slips, trips, falls, confined spaces, noise, weather conditions, poisonous insects, reptiles, plants and biological waste
- Establish control zones:
  - Exclusion zone
  - Contamination reduction zone
  - Support zone
- Assess training requirements:
  - Check HAZWOPER cards
  - Insure safety briefings
- Select personal protective equipment (PPE) Level A, B, C, or D.
- Establish decontamination stations.
- Establish Emergency Medical Plan Locate hospital, EMT(S) and first-aid stations; and List emergency numbers: fire, police, and ambulance.

LIAISON OFFICER

The Liaison Officer (LO) serves as a "go-between" linking the IC to various agencies. These are agencies that do not have a direct tactical assignment within the Unified Command however, have an interest in the response activities or wish to offer assistance.

The Liaison Officer intercepts, greets and briefs agency representatives as they arrive on scene. It is the responsibility of the Liaison Officer to notify the IC before escorting anyone to the Command Post. A separate Liaison Area may need to be established to accommodate agency representatives not directly involved in the Unified Command.

Overall LO Responsibilities:

- Be a contact point for Agency Representatives.
  Agency Representatives are agency personnel who do not have direct tactical assignment but are present to assist in response efforts and have authority to make decision on matters affecting that agency's participation.

- Maintain a list of assisting and cooperating agencies and Agency Representatives.
  Obtain business cards or any other means of collecting contact information.

- Monitor check-in sheets daily to ensure that all Agency Representatives are identified.

- Assist in establishing and coordinating interagency contacts.
  Determine if there are any agencies that could assist in the response effort. Locate the contact information and make contact with the agencies.

- Keep agencies supporting the incident aware of incident status.

- Monitor incident operations to identify current or potential inter-organizational problems.
  Report any problems/conflicts to the IC.

- Participate in planning meetings, providing current resource status, including limitations and capability of assisting agency resources.

- Coordinate response resource needs for Natural Resource Damage Assessment and Restoration (NRDAR) activities with the OPS during oil and HAZMAT responses.
  This generally involves working with agencies to evaluate the impact the incident had on the environment and wildlife.

- Coordinate response resource needs for incident investigation activities with the OPS.

- Ensure that all required agency forms, reports and documents are completed prior to demobilization.

- Coordinate activities of visiting dignitaries.

- Have a debriefing session with the IC prior to departure.

INFORMATION OFFICER

The Information Officer (IO) is responsible for developing and releasing information about the incident to the news media, incident personnel, and other appropriate agencies and organizations.

Only one IO will be assigned for each incident. The IO may have assistants as necessary. The assistants may represent assisting agencies, companies, or jurisdictions. The IO and assistants will establish a Joint Information Center to assist with developing information releases.

Overall IO Responsibilities:

- Determine from the IC if there are any limits on information release.
- Develop material for use in media briefings.
- Obtain IC approval of media releases.
- Inform media and conduct media briefings.
- Arrange for tours and other interviews or briefings that may be required.
- Obtain media information that may be useful to incident planning.
- Maintain current information summaries and/or displays on the incident and provide information on the status of the incident to assigned personnel.

Additional KM Required IO Responsibilities:

- Receive briefing of incident
- Anticipate need for and establish a Media Area
- Coordinate with the KMEP Corporate Communications Office for development and release of appropriate media information
- Maintain a log of agency IOs, news media, news releases, etc.

TERRORISM INCIDENT

(b) (7)(F), (b) (3)

[redacted]

INFORMATION OFFICER (Cont'd)

(b) (7)(F), (b) (3)

[redacted]

OPERATIONS

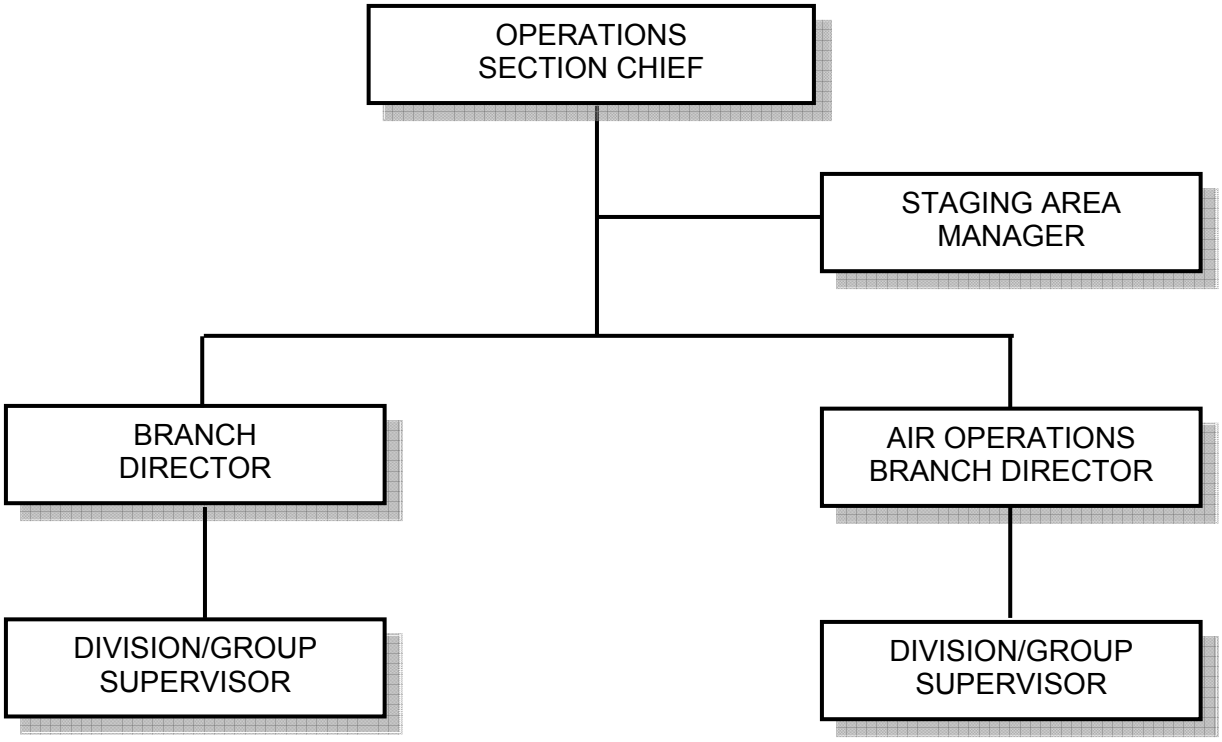
Operations Section Chief 4-21

Air Operations Branch Director 4-21

Staging Area Manager 4-25

Branch Director 4-25

Division/Group Supervisor 4-29



OPERATIONS SECTION CHIEF

The Operations Section Chief (OPS) is responsible for the management of all operations directly applicable to the primary mission (i.e. clean-up, recovery etc.). The OPS activates and supervises tactical response elements in accordance with the Incident Action Plan (IAP) and directs its execution. The OPS also requests or releases resources, makes expedient changes to the IAP, as necessary; and reports these actions to the IC.

Overall OPS Responsibilities

- Develop operations portion of IAP.
  This generally includes the designation of branches, divisions and groups, as well as input on required resources.
- Brief and assign Operations Section personnel in accordance with the IAP.
- Supervise Operations Section.
- Determine need and request additional resources.
- Review suggested list of resources to be released and initiate recommendation for release of resources.
- Assemble and disassemble strike teams assigned to the Operations Section.
- Report information about special activities, events, and occurrences to the IC.
- Respond to resource requests in support of NRDAR activities.

Additional KM Required OPS Responsibilities

- Directs KM personnel and emergency response contractors performing operations activities
- Review and ensure communication of the Site Specific H&S Plan to KM personnel and emergency response contractors performing operations activities
- Supervise the decontamination system
  - Ensure decontamination system is set-up and functional prior to Hot Zone entry
  - Request input from the Safety Officer, as necessary

AIR OPERATIONS BRANCH DIRECTOR

The Air Operations Branch Director (AIROPS), who is ground-based, is primarily responsible for preparing the air operations portion of the IAP. The plan will reflect agency restrictions that have an impact on the operational capability or utilization of resources (e.g., night flying, hours per pilot). After the plan is approved, the AIROPS is responsible for implementing its strategic aspects, which are those that relate to the overall incident strategy as opposed to those that pertain to tactical operations (specific target selection). Additionally, the AIROPS is responsible for providing logistical support to helicopters operating on the incident. The Air Tactical Group Supervisor, working in conjunction with ground and air resources, normally performs specific tactical activities, such as target selection and suggested modifications to specific tactical actions in the IAP.

Overall AIROPS Responsibilities:

- Organize preliminary air operations.
- Request declaration (or cancellation) of restricted air space
- Participate in preparation of the IAP through the OPS. Insure that the air operations portion of the IAP takes into consideration the Air Traffic Control requirements of assigned aircraft.
- Perform operational planning for air operations.

AIR OPERATIONS BRANCH DIRECTOR (Cont'd)

Overall AIROPS Responsibilities (Cont'd):

- Prepare and provide Air Operations Summary Worksheet (ICS Form 220) to the Air Support Group and Fixed-Wing Bases.
- Determine coordination procedures for use by air organization with ground Branches, Divisions, or Groups.
- Coordinate with appropriate Operations Section personnel.
- Supervise all air operations activities associated with the incident.
- Evaluate helibase locations.
- Establish procedures for emergency reassignment of aircraft.
- Schedule approved flights of non-incident aircraft in the restricted air space area.
- Coordinate with the Operations Coordination Center (OCC) through normal channels on incident air operations activities.
- Inform the Air Tactical Group Supervisor of the air traffic situation external to the incident.
- Consider requests for non-tactical use of incident aircraft.
- Resolve conflicts concerning non-incident aircraft.
- Coordinate with FAA.
- Update air operations plans.
- Report to the OPS on air operations activities.
- Report special incidents/accidents.
- Arrange for an accident investigation team when warranted.

Air Tactical Group Supervisor - The Air Tactical Group Supervisor is primarily responsible for the coordination of aircraft operations when fixed and/or rotary-wing aircraft are operating on an incident. These coordination activities are performed by the Air Tactical Group Supervisor while airborne. The Air Tactical Group Supervisor reports to the AIROPS.

Overall Air Tactical Group Supervisor Responsibilities:

- Determine what aircraft (air tankers and helicopters) are operating within the area of assignment.
- Manage air tactical activities based upon the IAP.
- Establish and maintain communications and Air Traffic Control, with pilots, Air Operations, Helicopter Coordinator, Air Tanker/Fixed Wing Coordinator, Air Support Group (usually Helibase Manager), and fixed-wing Support Bases.
- Coordinate approved flights of non-incident aircraft or non-tactical flights in restricted air space area.
- Obtain information about air traffic external to the incident.
- Receive reports of non-incident aircraft violating restricted air space area (OPS, Branch Director, or Division/Group Supervisor).
- Make tactical recommendations to approved ground contact.
- Inform AIROPS of tactical recommendations affecting the air operations portion of the IAP.
- Report on air operations activities to the AIROPS. Advise air operations immediately if aircraft mission assignments are causing conflicts in the Air Traffic Control System.
- Report on incidents/accidents.

AIR OPERATIONS BRANCH DIRECTOR (Cont'd)

Air Support Group Supervisor - The Air Support Group Supervisor is primarily responsible for supporting and managing helibase and helispot operations and maintaining liaison with fixed-wing air bases. This includes providing: 1) fuel and other supplies; 2) maintenance and repair of helicopters; 3) retardant mixing and loading; 4) keeping records of helicopter activity, and 5) providing enforcement of safety regulations. These major functions are performed at helibases and helispots. Helicopters during landing and take-off and while on the ground are under the control of the Air Support Groups Helibase or Helispot Managers. The Air Support Group Supervisor reports to the AIROPS.

Overall Air Support Group Supervisor Responsibilities:

- Obtain a copy of the IAP from the AIROPS including Air Operations Summary Worksheet (ICS Form 220).
- Participate in AIROPS planning activities.
- Inform AIROPS of group activities.
- Identify resources/supplies dispatched for the Air Support Group.
- Request special air support items from appropriate sources through Logistics Section.
- Identify helibase and helispot locations (from IAP) or from AIROPS.
- Determine need for assignment of personnel and equipment at each helibase and helispot.
- Coordinate special requests for air logistics.
- Maintain coordination with airbases supporting the incident.
- Coordinate activities with AIROPS.
- Obtain assigned ground-to-air frequency for helibase operations from the Communications Unit Leader (CUL) or Incident Radio Communications Plan (ICS Form 205).
- Inform AIROPS of capability to provide night flying service.
- Ensure compliance with each agency's operations checklist for day and night operations.
- Ensure dust abatement procedures are implemented at helibases and helispots.
- Provide crash-rescue service for helibases and helispots.
- Ensure that Air Traffic Control procedures are established between helibases and helispots and the Air Tactical Group Supervisor, the Helicopter Coordinator or the Air Tanker/Fixed-Wing Coordinator.

OIL SPILL

Air Tactical Group Supervisor - The coordination and scheduling of aircraft operations intended to locate, observe, track, survey, support dispersant applications, or to be used for other deliverable response application techniques, or report on the incident situation when fixed and/or rotary-wing aircraft are airborne at an incident. These coordination activities are normally performed by the Air Tactical Group Supervisor while airborne.

Overall Air Tactical Group Supervisor Responsibilities:

- Obtain a briefing from the Air Operations Branch Director or the OPS.
- Coordinate dispersant, in-situ burning, and bioremediation application through the Air Operations Branch Director.

AIR OPERATIONS BRANCH DIRECTOR (Cont'd)

OIL SPILL (Cont'd)

- Coordinate air surveillance mission scheduling and observer assignments with the SUL.
- Identify remote sensing technology that may enhance surveillance capabilities.
- Coordinate air surveillance observations and provide reports by the most direct methods available.
- Report on air surveillance and operations activities to the Air Operations Branch Director.
- Coordinate application-monitoring requirements with the Helicopter and Fixed-Wing Coordinators and the Situation Unit.
- Report on air application activities to the Air Operation Branch Director.

STAGING AREA MANAGER

The Staging Area Manager works for the Operations Section Chief and is responsible for managing all activities within a Staging Area or areas. Since there may be more than one Staging Area for an incident, all personnel and equipment should check-in at one of these Staging Areas (sometimes referred to as a "base camp").

Overall Staging Area Manager Responsibilities:

- Proceed to Staging Area.
- Establish Staging Area layout.
- Consider assigning Assistant Staging Managers at each area.
- Determine any support needs for equipment, feeding, sanitation and security.
- Establish check-in function as appropriate.
- Post areas for identification and traffic control.
- Request maintenance service for equipment at Staging Area as appropriate.
- Respond to request for resource assignments.
  (Utilize ICS Forms 211, 211p, 211e)
- Obtain and issue receipts for radio equipment and other supplies distributed and received at Staging Area.
- Track resources distributed from the Staging Area(s) and resources received at the Staging Area(s).
- Determine required resource levels from the OPS.
- Advise the OPS when reserve levels reach minimums.
- Maintain and provide status to Resource Unit of all resources in Staging Area.
- Demobilize Staging Area in accordance with the Incident Demobilization Plan.

Additional KM Required Staging Area Manager Responsibilities:

- Determine whether multiple Staging Areas will be required
- Consider assigning Assistant Staging Managers at each area
- Ensure Staging Area(s) are maintained in orderly condition.
- Work with KM Safety Officer to conduct H&S Plan briefings with arriving response personnel.

BRANCH DIRECTOR

The Branch Directors when activated, are under the direction of the OPS, and are responsible for the implementation of the portion of the IAP appropriate to the Branches.

Overall Branch Director Responsibilities:

- Develop with subordinates alternatives for Branch control operations.
- Attend planning meetings at the request of the OPS.
- Review Division/Group Assignment Lists (ICS Form 204) for Divisions/Groups within the Branch. Modify lists based on effectiveness of current operations.
- Assign specific work tasks to Division/Group Supervisors.
- Supervise Branch operations.
- Resolve logistic problems reported by subordinates.

BRANCH DIRECTOR (Cont'd)

Overall Branch Director Responsibilities (Cont'd):

- Report to OPS when: the IAP is to be modified; additional resources are needed; surplus resources are available; or hazardous situations or significant events occur.
- Approve accident and medial reports originating within the Branch.

OIL SPILL

Recovery and Protection Branch Director - The Recovery and Protection Branch Director is responsible for overseeing and implementing the protection, containment and cleanup activities established in the IAP.

Emergency Response Branch Director - The Emergency Response Branch Director is primarily responsible for overseeing and implementing emergency measures to protect life, mitigate further damage to the environment, and stabilize the situation.

Wildlife Branch Director - The Wildlife Branch Director is responsible for minimizing wildlife injuries during spill responses; coordinating early aerial and ground reconnaissance of the wildlife at the spill site and reporting results to the SUL; advising on wildlife protection strategies, including diversionary booming placements, in-situ burning, and chemical countermeasures; removing of oiled carcasses, employing wildlife hazing measures as authorized in the IAP; and recovering and rehabilitating impacted wildlife. A central Wildlife Processing Center should be identified and maintained for, evidence tagging, transportation, veterinary services, treatment and rehabilitation storage, and other support needs. The activities of private wildlife care groups, including those employed by the RP, will be overseen and coordinated by the Wildlife Branch Director.

Overall Wildlife Branch Director Responsibilities:

- Review Branch Director Responsibilities.
- Develop the Wildlife Branch portion of the IAP.
- Supervise Wildlife Branch operations.
- Determine resource needs.
- Review the suggested list of resources to be released and initiate recommendation for release of resources.
- Assemble and disassemble teams/task forces assigned to the Wildlife Branch.
- Report information about special activities, events, and occurrences to the OPS.
- Assist the Volunteer Coordinator in determining training needs of wildlife recovery volunteers.

TERRORISM INCIDENT

(b) (7)(F), (b) (3)

[redacted]

BRANCH DIRECTOR (Cont'd)

Event Site Branch Director (Cont'd)

- Coordinate with Medical Unit for medical treatment and transport capability, including requesting county transit buses.
- Coordinate with Safety Officer for a site safety and control plan.
- Determine containment and control procedures to be used.
- Coordinate with other agencies (investigative/evident gathering)

Community Impact Branch Director – Tasks specific to terrorist incidents are:

- Review Branch Director Responsibilities
- Coordinate for perimeter security and traffic control.
- Determine hazards presented to the community through detection/monitoring.
- Determine best protective actions to use:
  - Rescue
  - Shelter-in-place (SIP)
  - Evacuation
  - Red Cross
  - Establish shelters and notify American Red Cross
- Establish emergency decontamination capability for off site personnel and public.
- Establish a medical treatment and transport capability for off-site personnel and the public.
- Coordinate with Safety Officer for site safety and control plan.
- Coordinate with Information Officer to develop emergency broadcast messages to alert and update the community.
- Determine re-entry procedures to be used
- Coordination with other agencies and notify the County Health Officer

MULTI-CASUALTY

Multi-Casualty Branch Director - The Multi-Casualty Branch Director is responsible for the implementation of the IAP within the Branch. This includes the direction and execution of branch planning for the assignment of resources within the Branch.

Overall Multi-Casualty Branch Director Responsibilities:

- Review Group/Division Assignments for effectiveness of current operations and modify as needed.
- Provide input to OPS for the IAP.
- Supervise Branch Activities.

Family Assistance Branch – The Family assistance Branch provides services to the victims' family members; coordinates activities, lodging, food, spiritual and emotional needs, and transportation to special events (press conferences, memorial services to the scene of the incident when authorized, etc.), and any special needs that arise during the incident that may assist the victims' family members.

NOTE: The National Transportation Safety Board (NTSB) provides this assistance for aircraft disasters.

BRANCH DIRECTOR (Cont'd)

Overall Family Assistance Branch Responsibilities:

- Coordinate with local and state authorities, to include the medical examiner, local law enforcement, emergency management, hospitals, and other emergency support personnel.
- Conduct daily coordination meetings with the local and Federal government representatives to review daily activities, resolve problem areas, and synchronize future family support operations and activities.
- Coordinate and provide briefings to families at the site and those who decide not to be at the site.

Overall Family Assistance Branch Responsibilities:

- Ensure adequate number of Family Assistance Team members present at all times to allow for rest, exercise and proper rotation.
- Establish and maintain working relationship with the CERT and CISM teams to cross-reference needs of the victims' families.
- Attend all staff briefings and planning meetings as required.
- Request necessary equipment and supplies through LSC.
- Ensure adequate lodging and/or sleeping arrangements.
- Ensure that security needs for the victims' family members are addressed.
- Ensure that all communications are centrally coordinated.
- Ensure that all transportation scheduling is centrally coordinated.
- The following agencies provide similar assistance during emergencies and may be of assistance:
  - American Red Cross (ARC)
  - Department of Health and Human Services (DHHS)
  - Federal Emergency Management Agency (FEMA)
  - NTSB
- Maintain Unit/Activity Log (ICS Form 214).

DIVISION/GROUP SUPERVISOR

The Division/Group Supervisor reports to the OPS (or Branch Director when activated). The Supervisor is responsible for the implementation of the assigned portion of the IAP, assignment of resources within the Division/Group, and reporting on the progress of control operations and status of resources within the Division/Group.

Overall Division/Group Supervisor Responsibilities:

- Implement IAP for Division/Group.
- Provide the IAP to Strike Team Leaders, when available.
- Identify increments assigned to the Division/Group.
- Review Division/Group assignments and incident activities with subordinates and assign tasks.
- Ensure that the IC and/or Resources Unit is advised of all changes in the status of resources assigned to the Division/Group.
- Coordinate activities with adjacent Division/Group.
- Determine need for assistance on assigned tasks.
- Submit situation and resources status information to the Branch Director or the OPS.
- Report hazardous situations, special occurrences, or significant events (e.g., accidents, sickness, discovery of unanticipated sensitive resources) to the immediate supervisor.
- Ensure that assigned personnel and equipment get to and from assignments in a timely and orderly manner.
- Resolve logistics problems within the Division/Group.
- Participate in the development of Branch plans for the next operational period.

OIL SPILL

Protection Group Supervisor - Group Supervisor is responsible for the deployment of containment, diversion, and adsorbent/absorbent materials in designated locations. Depending on the size of the incident, the Protection Group may be further divided into Teams, Task Forces and Single Resources.

Overall Protection Group Supervisor Responsibilities:

- Implement Protection Strategies in the IAP
- Direct, coordinate, and assess the effectiveness of protective actions.
- Modify protective actions, as needed.

On-water Recovery Group Supervisor - The On Water Recovery Group Supervisor is responsible for managing on water recovery operations in compliance with the IAP. The Group may be further divided into Teams, Task Forces and Single Resources.

Overall On-water Recovery Group Supervisor Responsibilities:

- Implement Recovery Strategies in the IAP.
- Direct, coordinate, and assess the effectiveness of on water recovery actions.
- Modify recovery actions as needed.

DIVISION/GROUP SUPERVISOR (Cont'd)

OIL SPILL (Cont'd)

Dispersant Operations Group Supervisor - The Dispersants Operations Group Supervisor is responsible for coordinating all aspects of a dispersant operation. For aerial applications, the Group works closely with the Air Tactical Group Supervisor.

Overall Dispersant Operations Group Supervisor Responsibilities:

- Determine resource needs.
- Assist the Planning Section in the development of dispersant operations and monitoring plans.
- Implement approved dispersant operations and monitoring plans.
- Manage dedicated dispersant resources and coordinate required monitoring.
- Coordinate required monitoring.

In-situ Burn Operations Group Supervisor - The In-Situ Burn Operations Group Supervisor is responsible for coordinating all aspects of an in-situ burn operation. For aerial ignition, the Group works closely with the Air Tactical Group Supervisor.

Overall In-situ Burn Operations Group Supervisors Responsibilities:

- Determine resource needs.
- Assist the Planning Section in the development of in-situ burn operations and monitoring plans.
- Implement approved in-situ burn operations and monitoring plans.

- Manage dedicated in-situ burning resources.
- Coordinate required monitoring.

Shoreside Recovery Group Supervisor - The Shoreside Recovery Group Supervisor is responsible for managing shoreside cleanup operations in compliance with the IAP. The Group may be further divided into Strike Teams, Task Forces, and Single Resources.

Overall Shoreside Recovery Group Supervisor Responsibilities:

- Implement Recovery Strategies in the IAP.
- Direct, coordinate, and assess effectiveness of shoreside recovery actions.
- Modify protective actions, as needed.

DIVISION/GROUP SUPERVISOR (Cont'd)

OIL SPILL (Cont'd)

Disposal Group Supervisor - The Disposal Group Supervisor is responsible for coordinating the on-site activities of personnel engaged in collecting, storing, transporting, and disposing of waste materials. Depending on the size and location of the spill, the Disposal Group may be further divided into Teams, Task Forces, and Single Resources.

Overall Disposal Group Supervisor Responsibilities:

- Implement the Disposal Portion of the IAP.
- Ensure compliance with all hazardous waste laws and regulations.
- Maintain accurate records of recovered material.

Decontamination Group Supervisor – The Decontamination Group Supervisor is responsible for decontamination of personnel and response equipment in compliance with approved statutes.

Overall Decontamination Group Supervisor Responsibilities:

- Implement Decontamination Plan.
- Determine resource needs.
- Direct and coordinate decontamination activities.
- Brief Site SO on conditions.

Salvage/Source Control Group Supervisor - Under the direction of the Emergency Response Branch Director, the Salvage/Source Control Group Supervisor is responsible for coordinating and directing all salvage/source control activities related to the incident.

Overall Salvage/Source Control Group Supervisor Responsibilities:

- Coordinate the development of Salvage/Source Control Plan.
- Determine Salvage/Source Control resource needs.
- Direct and coordinate implementation of the Salvage/Source Control Plan.
- Manage dedicated salvage/Source Control resources.

Wildlife Recovery Group Supervisor – The Wildlife Recovery Group Supervisor is responsible for coordinating the search for collection and field tagging of dead and live impacted wildlife and transporting them to the processing center(s). This group should coordinate with the Planning Situation Unit in conducting aerial and group surveys of wildlife population in the vicinity of the spill. They should also deploy acoustic and visual wildlife hazing equipment, as needed.

Overall Wildlife Recovery Group Supervisor Responsibilities:

- Determine resource needs.
- Establish and implement protocols for collection and logging of impacted wildlife.
- Coordinate transportation of wildlife to processing stations(s).

DIVISION/GROUP SUPERVISOR (Cont'd)

HAZARDOUS SUBSTANCE RELEASE

Decontamination Group Supervisor – The Decontamination Group Supervisor is responsible for the operations of the decontamination element and for providing decontamination, as required by the ICP.

Overall Decontamination Group Supervisor Responsibilities:

- Establish the Contamination Reduction Corridor(s).
- Identify contaminated people and equipment.
- Supervise the operations of the decontamination element in the process of decontaminating people and equipment.
- Maintain control of movement of people and equipment within the Contamination Reduction Zone.
- Maintain communications and coordinate operations with the Entry Leader.
- Maintain communications and coordinate operations with the Site Access Control Leader and the Safe Refuge Area Manager (if activated).
- Coordinate the transfer of contaminated patients requiring medical attention (after decontamination) to the Medical Group.
- Coordinate handling, storage, and transfer of contaminants within the Contamination Reduction Zone.

DIVISION/GROUP SUPERVISOR (Cont'd)

HAZARDOUS SUBSTANCE RELEASE (Cont'd)

Sampling Group Supervisor - The Sampling Group is assigned to the Operations Section because of the immediate communication and coordination they must have with the other field groups. The Field Sampling Group will normally include an Air Monitoring Team, Water Sampling Team, and a Soil Sampling Team. They will normally be responsible for perimeter monitoring and sampling, and will either coordinate sampling within the hot zone and warm zones with the Entry Group, or if properly trained and outfitted with PPE, they may take samples within the hot/warm zones themselves.

Overall Sampling Group Supervisor Responsibilities:

- Conducting all sampling required for immediate operation activity and communicating sampling data, such as results of routine air monitoring to on-site operational and safety personnel.
- Conducting air, water, and soil sampling as directed by the regulatory agencies and other interested parties through the Sampling Protocol Team.
- Ensuring that all samples are obtained following appropriate sample protocol and other special instructions they may obtain.
- Ensuring that all samples taken are properly documented and following the chain of custody procedures.
- Ensuring that the samples are properly transferred to the Sample Documentation and Tracking Teams for proper documentation, analysis, and final dissemination.

Technical Specialist Group Supervisor - There are a number of specialist positions that will be required for hazardous substance response operations. Because of their field locations and requirement for close coordination with the Operations Section Field Personnel, they are assigned to the Technical Group. The Technical Specialist Group Supervisor is responsible for coordinating the activities of these various specialists and ensuring that their services and information are made available to the appropriate field and command post activities.

Overall Technical Specialist Group Supervisor Responsibilities:

- Will oversee the activities of the following identified specialists.
  - Hazardous Substance/Materials Reference
  - Toxicologist
  - Industrial Hygienist
  - Chemical Engineer
  - Product Specialist
  - Marine Chemist

DIVISION/GROUP SUPERVISOR (Cont'd)

TERRORISM INCIDENT

(b) (7)(F), (b) (3)

[redacted]

DIVISION/GROUP SUPERVISOR (Cont'd)

TERRORISM INCIDENT (Cont'd)

(b) (7)(F), (b) (3)

MULTI-CASUALTY

Medical Group/Division Supervisor – The Medical Group/Division Supervisor supervises the Triage Team Leader, Treatment Team Leader and Medical Supply Coordinator. The Medical Group/Division Supervisor establishes command and controls the activities within a Medical Group/Division, in order to assure the best possible emergency medical care to patients during a multi-casualty incident.

Overall Medical Group/Division Supervisor Responsibilities:

- Participate in Multi-Casualty Branch/Operations Section Planning Activities.
- Establish Medical Group/Division with assigned personnel. Request additional personnel and resources sufficient to handle the magnitude of the incident.
- Designate Treatment Team Leaders and treatment area locations as appropriate.
- Isolate Morgue and Minor Treatment Area from Immediate and Delayed Treatment Areas.
- Request law enforcement/coroner involvement as needed.
- Determine amount and types of additional medical resources and supplies needed to handle the magnitude of the incident (medical caches, backboards, litters, cots).
- Establish communications and coordination with the Patient Transportation Group Supervisor.
- Ensure activation of hospital alert system, local EMS/health agencies.
- Direct and/or supervise on-scene personnel from agencies such as Coroner's Office, Red Cross, law enforcement, ambulance companies, county health agencies, and hospital volunteers.
- Ensure proper security, traffic control, and access for the Medical Group/Division area.
- Direct medically trained personnel to the appropriate team leader.

DIVISION/GROUP SUPERVISOR (Cont'd)

MULTI-CASUALTY (Cont'd)

Patient Transportation Group Supervisor - The Patient Transportation Group Supervisor supervises the Medical Communications Coordinator and the Air and Ground Ambulance Coordinators. The Patient Transportation Group Supervisor is responsible for the coordination of patient transportation and maintenance of records relating to patient identification, injuries, mode of off-incident transportation and destination.

Overall Patient Transportation Group Supervisor Responsibilities:

- Establish communications with hospital(s).
- Designate ambulance staging area(s).
- Direct the transportation of patients as determined by Treatment Team Leaders.
- Assure that patient information and destination is recorded.
- Establish communications with Ambulance Coordinator(s).
- Request additional ambulances, as required.
- Notify Ambulance Coordinator(s) of ambulance requests.
- Coordinate requests for air ambulance transportation through the Air Operations Director.
- Establish Air Ambulance Helispot with the Multi- Casualty Branch Director and Air Operation Director.

PLANNING

Planning Section Chief....4-38

Resources Unit Leader....4-38

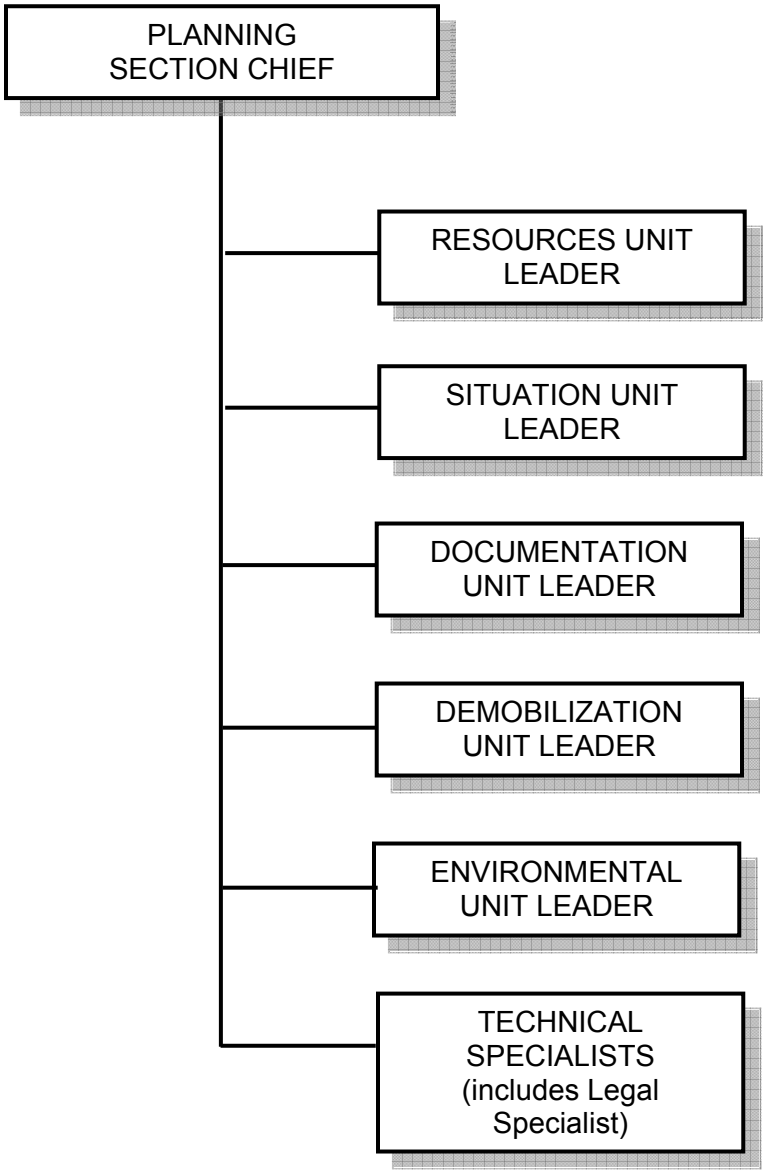
Situation Unit Leader....4-39

Documentation Unit Leader....4-40

Demobilization Unit Leader....4-41

Environmental Unit Leader....4-42

Technical Specialists....4-42



PLANNING SECTION CHIEF

The Planning Section Chief (PSC) is responsible for the collection, evaluation, dissemination and use of information; particularly with regard to the development of the incident and the status resources. This information is needed to: 1) understand the current situation, 2) predict the probable course of incident events; and 3) prepare alternative strategies for the incident.

Overall PSC Responsibilities:

- Collect and process situation information about the incident.
- Supervise preparation of the IAP.
- Provide input to the IC and the OPS in preparing the IAP.
- Chair planning meetings and participate in other meetings as required.
- Reassign out-of-service personnel already on-site to ICS organizational positions as appropriate.
- Establish information requirements and reporting schedules for Planning Section Units (e.g., Resources, Situation Units).
- Determine the need for any specialized resources in support of the incident.
- If requested, assemble and disassemble Strike Teams and Task Forces not assigned to Operations.
- Establish special information collection activities as necessary (e.g., weather, environmental, toxics, etc.).
- Assemble information on alternative strategies.
- Provide periodic predictions on incident potential.
- Report any significant changes in incident status.
- Compile and display incident status information.
- Oversee preparation and implementation of the Incident Demobilization Plan.
- Incorporate plans (e.g., Traffic, Medical, Communications, Site Safety) into the IAP.

RESOURCES UNIT LEADER

The Resource Unit Leader (RUL) works within the Planning Section and is responsible for maintaining the status of all assigned resources (primary and support) at an incident. This is achieved by overseeing the check in/out of all resources, maintaining a status-keeping system indicating current location and status of all resources, and maintenance of a master list of all resources (e.g. key supervisory personnel, primary and support resources, etc.).

Overall RUL Responsibilities:

- Establish the check-in function at incident locations.
  The Staging Area Manager may already be tracking this on ICS Form 211-p and 211-e. However, the RUL should verify that tracking is being conducted and is accurate. Additionally, the RUL should determine how to gather this resource information from Staging Areas.
- Prepare Organization Assignment List (ICS Form 203) and Organization Chart (ICS Form 207).
- Prepare appropriate parts of Division Assignment Lists (ICS Form 204).
- Prepare and maintain the ICP display (to include organization chart and resource allocation and deployment).

RESOURCES UNIT LEADER (Cont'd)

Overall RUL Responsibilities (Cont'd):

- Maintain and post the current status and location of all resources.
  The RUL is responsible for developing a system to best track the resource status. Ensure information is relayed to the Situation Unit Leader in order to update incident status information on the display board (ICS Form 209)
- Maintain master roster of all resources checked in at the incident.
- Assign an additional person to fill the "Check-in/status Recorder" position to assist with the accounting of all resources assigned to the incident.
  If a Check-in/status Recorder is not assigned, the RUL is responsible for all functions.

SITUATION UNIT LEADER

The Situation Unit Leader (SUL) works within the Planning Section and is responsible for collecting, processing and organizing all incident information. The SUL may prepare future projections of incident growth and maps.

Overall SUL Responsibilities:

- Begin collection and analysis of incident data as soon as possible.
- Prepare, post, or disseminate resource and situation status information as required, including special requests.
  Establish location for situation status boards and displays. This is where maps, charts, and other incident information will be posted for responders to view.
- Prepare periodic predictions or as requested by the PSC.
- Prepare the Incident Status Summary Form (ICS Form 209).
  Acquire the information from various Command and General ICS Staff.
- Provide photographic services and maps if required.

The SUL may have a Display Processor and Field Observer reporting to him/her. However, if not assigned, the SUL will be responsible for their functions

Display Processor - The Display Processor is responsible for the display of incident status information obtained from Field Observers, resource status reports, aerial and other photographs, and infrared data.

Overall Display Processor Responsibilities:

- Determine:
  - Location of work assignment
  - Numbers, types and locations of displays required
  - Priorities
  - Map requirements for the IAP
  - Time limits for completion
  - Field Observer assignments and communications means
- Obtain necessary equipment and supplies.
- Obtain a copy of the IAP for each operational period.
- Assist SUL in analyzing and evaluating field reports.
- Develop required displays in accordance with time limits for completion.

SITUATION UNIT LEADER (Cont'd)

Field Observer - The Display Processor is responsible for the display of incident status information obtained from Field Observers, resource status reports, aerial and other photographs, and infrared data.

Overall Field Observer Responsibilities:

- Determine:
  - Location of assignment
  - Type of information required
  - Priorities
  - Time limits for completion
  - Method of communication.
  - Method of transportation.
- Obtain a copy of the IAP for the Operational Period.
- Obtain necessary equipment and supplies.
- Perform Field Observer responsibilities to include but not limited to the following:
  - Perimeters of incident
  - Locations of hot spots
  - Unburned islands
  - Rates of spread
  - Weather conditions
  - Hazards including escape routes and safe areas
  - Progress of operations resources
- Be prepared to identify all facility locations (e.g., Helispots, Division and Branch boundaries).
- Report information to the SUL by established procedure.
- Report immediately any condition observed that may cause danger and a safety hazard to personnel.
- Gather intelligence that will lead to accurate predictions.

DOCUMENTATION UNIT LEADER

The Documentation Unit Leader (DUL) works within the Planning Section and is responsible for the maintenance of accurate, up-to-date incident files. The DUL should ensure that each section is maintaining and providing appropriate documents. The DUL will provide duplication and copying services for all other sections. The DUL will store incident files for legal, analytical and historical purposes.

Overall DUL Responsibilities

- Set up work area; begin organization of incident files.
- Establish duplication service; respond to requests.
- File all official forms and reports.
- Review records for accuracy and completeness; inform appropriate units of errors or omissions.
  Ensure ICS forms and documentation are dated and signed, as necessary.
- Provide incident documentation as requested.
- Store files for post-incident use.

DEMOBILIZATION UNIT LEADER

The Demobilization Unit Leader works with the Planning Section and is responsible for developing the Incident Demobilization Plan. This position will be activated in order to ensure that resources are effectively demobilized when they are no longer required.

Overall Demobilization Unit Leader Responsibilities:

- Participate in planning meetings as required.
- Review incident resource records to determine the likely size and extent of demobilization effort.
- Based on the above analysis, add additional personnel, workspace, and supplies as needed.
- Coordinate demobilization with Agency Representatives.
- Monitor the on-going Operations Section resource needs.
- Identify surplus resources and probable release time.
- Develop incident check-out function for all units.
- Evaluate logistics and transportation capabilities to support demobilization.
  Ensure that there is sufficient transportation to effectively demobilize resources.
- Establish communications with off-incident facilities, as necessary.
  Off-incident facilities can include locations where resources will be returned to and off-site locations that are assisting the response (i.e. laboratories, oiled wildlife care facilities, etc.). These facilities will eventually be demobilized as well.
- Develop an Incident Demobilization Plan detailing specific responsibilities and release priorities and procedures.
- Prepare appropriate directories (e.g., maps, instructions, etc.) for inclusion in the demobilization plan.
- Distribute demobilization plan (on and off-site).
- Provide status reports to appropriate requestors.
- Ensure that all Sections/Units understand their specific demobilization responsibilities.
- Supervise execution of the Incident Demobilization Plan.
- Brief the PSC on demobilization progress.

ENVIRONMENTAL UNIT LEADER

The Environmental Unit Leader (EUL) works with the Planning Section and is responsible for environmental matters associated with the response, including strategic assessment, modeling, surveillance, and environmental monitoring and permitting . The EUL prepares environmental data for the situation unit.

Overall Environmental Unit Leader Responsibilities:

- Obtain a briefing and special instructions from the PSC.
- Participate in Planning Section meetings.
- Identify sensitive areas and recommend response priorities.
  Utilize ICS Form 232.
- Following consultation with natural resource trustees, provide input on wildlife protection strategies (e.g., removing oiled carcasses, pre-emptive capture, hazing, and/or capture and treatment).
- Determine the extent, fate and effects of contamination.
- Acquire, distribute and provide analysis of weather forecasts.
- Monitor the environmental consequences of cleanup actions.
- Develop shoreline cleanup and assessment plans. Identify the need for, and prepare any special advisories or orders.
- Identify the need for, and obtain, permits, consultations, and other authorizations including Endangered Species Act (ESA) provisions.
- Following consultation with the FOSC's Historical/Cultural Resources Technical Specialist identify and develop plans for protection of affected historical/cultural resources.
- Evaluate the opportunities to use various response technologies.
- Develop disposal plans.
- Develop a plan for collecting, transporting, and analyzing samples.

TECHNICAL SPECIALISTS

Certain incidents or events may require the use of Technical Specialists who have specialized knowledge and expertise. Technical Specialists may function within the Planning Section, or be assigned wherever their services are required.

An example of a Technical Specialist is:

LEGAL SPECIALIST:

The Legal Specialist will act in an advisory capacity within the Planning Section.

Overall Legal Specialist Responsibilities:

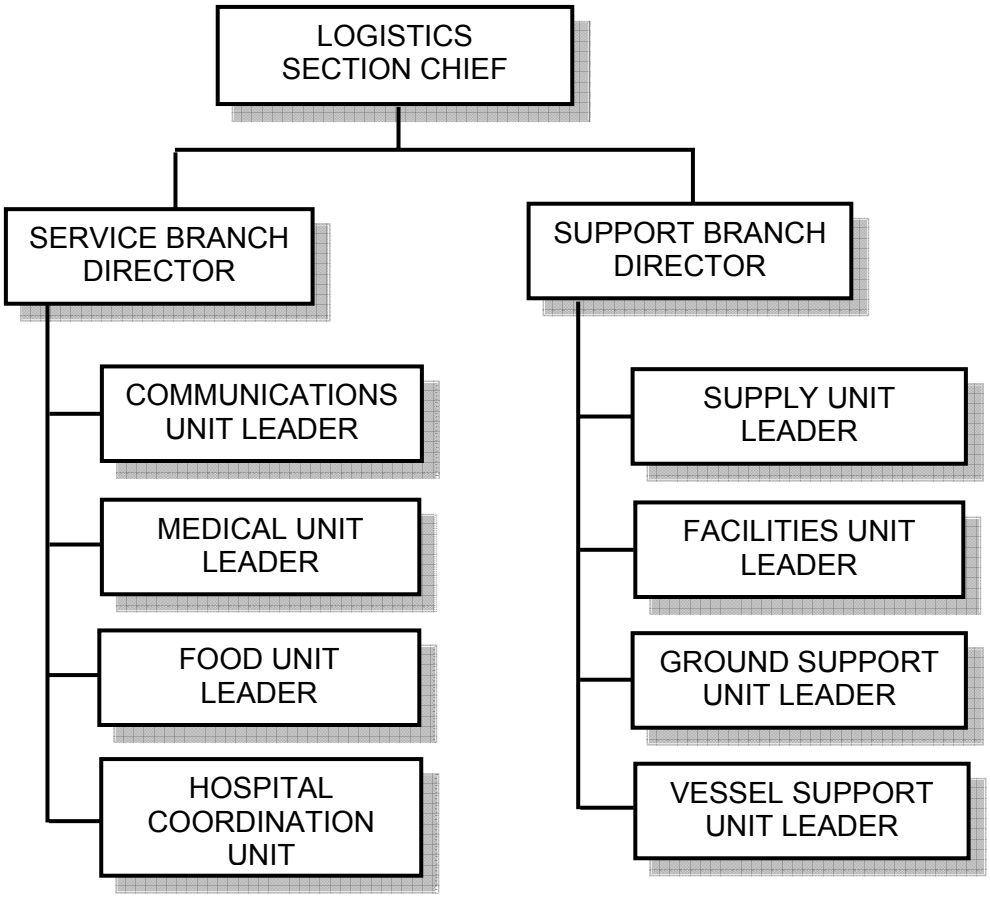
- Participate in planning meetings, if requested.
- Advise on legal issues relating to in-situ burning, use of dispersants, and other alternative response technologies.
- Advise on legal issues relating to differences between Natural Resource Damage Assessment Restoration (NRDAR) and response activities.
- Advise on legal issues relating to investigations.
- Advise on legal issues relating to finance and claims.
- Advise on legal issues relating to response.
- Utilize ICS Form 214.

LOGISTICS

Logistics Section Chief....4-44

Service Branch Director....4-44
- Communications Unit Leader....4-45
- Medical Unit Leader....4-45
- Food Unit Leader....4-46
- Hospital Coordination Unit....4-46

Support Branch Director....4-47
- Supply Unit Leader....4-47
- Facilities Unit Leader....4-47
- Ground Support Unit Leader....4-48
- Vessel Support Unit Leader....4-49



LOGISTICS SECTION CHIEF

The Logistics Section Chief (LSC) is responsible for providing facilities, services, and material in support of the incident. The LSC participates in the development and implementation of the Incident Action Plan (IAP). The LSC activates and supervises the Branches and Units within the Logistics Section.

Resources are divided into Support and Services. Support resources are used in support of the IAP (i.e. boom, vacuum trucks, skimmers etc.). Service resources include food/water, communication and medical resources.

Overall LSC Responsibilities:

- Plan the organization of the Logistics Section.
- Assign work locations and preliminary work tasks to Section personnel.
- Notify the Resources Unit of the Logistics Section units activated including names and locations of assigned personnel.
- Assemble and brief Branch Directors and Unit Leaders.
- Participate in preparation of the IAP.
- Identify service and support requirements for planned and expected operations.
- Provide input to and review the Communications Plan (ICS Form 205), Medical Plan (ICS Form 206) and Traffic Plan.
- Coordinate and process requests for additional resources.
- Review the IAP and estimate Section needs for the next operational period.
- Advise on current service and support capabilities.
- Prepare service and support elements of the IAP.
- Estimate future service and support requirements.
- Receive Incident Demobilization Plan from Planning Section.
- Recommend release of Unit resources in conformity with Incident Demobilization Plan.
- Ensure the general welfare and safety of Logistics Section personnel.

SERVICE BRANCH DIRECTOR

The Service Branch Director, when activated, is under the supervision of the LSC, and is responsible for the management of all service activities at the incident. The Branch Director supervises the operations of the Communications, Medical and Food Units.

Overall Service Branch Director Responsibilities:

- Determine the level of service required to support operations.
- Confirm dispatch of Branch personnel.
- Participate in planning meetings of Logistics Section personnel.
- Review the IAP.
- Organize and prepare assignments for Service Branch personnel.
- Coordinate activities of Branch Units.
- Inform the LSC of Branch activities.
- Resolve Service Branch problems.

SERVICE BRANCH DIRECTOR (Cont'd)

Communications Unit Leader – The Communications Unit Leader is responsible for developing plans for the effective use of incident communications equipment and facilities; installing and testing of communications equipment; supervision of the Incident Communications Center; distribution of communications equipment to incident personnel; and the maintenance and repair of communications equipment.

Overall Communications Unit Leader Responsibilities:

- Prepare and implement the Incident Radio Communications Plan (ICS Form 205).
- Ensure the Incident Communications Center and the Message Center is established.
- Establish appropriate communications distribution/maintenance locations within the Base/Camp(s).
- Ensure communications systems are installed and tested.
- Ensure an equipment accountability system is established.
- Ensure personal portable radio equipment from cache is distributed per Incident Radio Communications Plan.
- Provide technical information as required on:
  - Adequacy of communications systems currently in operation.
  - Geographic limitation on communications systems.
  - Equipment capabilities/limitations.
  - Amount and types of equipment available.
  - Anticipated problems in the use of communications equipment.
- Supervise Communications Unit activities.
- Maintain records on all communications equipment as appropriate.
- Ensure equipment is tested and repaired.
- Recover equipment from Units being demobilized.

Medical Unit Leader - The Medical Unit Leader, under the direction of the Service Branch Director or Logistics Section Chief, is primarily responsible for the development of the Medical Plan, obtaining medical aid and transportation for injured and ill incident personnel, and preparation of reports and records.

Overall Medical Unit Leader Responsibilities:

- Participate in Logistics Section/Service Branch planning activities.
- Prepare the Medical Plan (ICS Form 206).
- Prepare procedures for major medical emergency.
- Declare major emergency as appropriate.
- Respond to requests for medical aid, medical transportation, and medical supplies.
- Prepare and submit necessary documentation.

SERVICE BRANCH DIRECTOR (Cont'd)

Food Unit Leader - The Food Unit Leader is responsible for supplying the food needs for the entire incident, including all remote locations (e.g., Camps, Staging Areas), as well as providing food for personnel unable to leave tactical field assignments.

Overall Food Unit Leader Responsibilities:

- Determine food and water requirements.
- Determine the method of feeding to best fit each facility or situation.
- Obtain necessary equipment and supplies and establish cooking facilities.
- Ensure that well-balanced menus are provided.
- Order sufficient food and potable water from the Supply Unit.
- Maintain an inventory of food and water.
- Maintain food service areas, ensuring that all appropriate health and safety measures are being followed.
- Supervise caterers, cooks, and other Food Unit personnel as appropriate.

TERRORISM INCIDENT

(b) (7)(F), (b) (3)

[redacted]

SUPPORT BRANCH DIRECTOR

The Support Branch Director, when activated, is under the direction of the LSC, and is responsible for the development and implementation of logistics plans in support of the Incident Action Plan. The Support Branch Director supervises the operations of the Supply, Facilities and Ground Support Units.

Overall Support Branch Director Responsibilities:

- Obtain work materials.
- Identify Support Branch personnel dispatched to the incident.
- Determine initial support operations in coordination with the LSC and Service Branch Director.
- Prepare initial organization and assignments for support operations.
- Assemble and brief Support Branch personnel.
- Determine if assigned Branch resources are sufficient.
- Maintain surveillance of assigned units work progress and inform the LSC of their activities.
- Resolve problems associated with requests from the Operations Section.

Supply Unit Leader - The Supply Unit Leader is primarily responsible for ordering personnel, equipment and supplies; receiving and storing all supplies for the incident; maintaining an inventory of supplies; and servicing non-expendable supplies and equipment.

Overall Supply Unit Leader Responsibilities:

- Participate in Logistics Section/Support Branch planning activities.
- Determine the type and amount of supplies en route.
- Review the IAP for information on operations of the Supply Unit.
- Develop and implement safety and security requirements.
- Order, receive, distribute, and store supplies and equipment.
- Receive and respond to requests for personnel, supplies, and equipment.
- Maintain an inventory of supplies and equipment.
- Service reusable equipment.
- Submit reports to the Support Branch Director.

Facilities Unit Leader - The Facilities Unit Leader is primarily responsible for the layout and activation of incident facilities, (e.g., Base, Camp(s), and ICP). The Facilities Unit Leader provides sleeping and sanitation facilities for incident personnel and manages Base and Camp(s) operations. Each facility (Base, Camp) is assigned a manager who reports to the Facilities Unit Leader and is responsible for managing the operation of the facility. The basic functions or activities of the Base and Camp Managers are to provide security service and general maintenance. The Facility Unit Leader reports to the Support Branch Director.

SUPPORT BRANCH DIRECTOR (Cont'd)

Overall Facilities Unit Leader Responsibilities:

- Obtain a briefing from the Support Branch Director or the LSC.
- Receive and review a copy of the IAP.
- Participate in Logistics Section/Support Branch planning activities.
- Determine requirements for each facility, including the ICP.
- Prepare layouts of incident facilities.
- Notify Unit Leaders of facility layout.
- Activate incident facilities.
- Provide Base and Camp Managers and personnel to operate facilities.
- Provide sleeping facilities.
- Provide security services.
- Provide facility maintenance services (e.g., sanitation, lighting, clean up).
- Demobilize Base and Camp facilities.
- Maintain facility records

Ground Support Unit Leader - The Ground Support Unit Leader is primarily responsible for: 1) support out-of-service resources; 2) transportation of personnel, supplies, food, and equipment 3) fueling, service, maintenance, and repair of vehicles and other ground support equipment; and 4) implementing the Traffic Plan for the incident.

Overall Ground Support Unit Leader Responsibilities:

- Participate in Support Branch/Logistics Section planning activities.
- Develop and implement the Traffic Plan.
- Support out-of-service resources.
- Notify the Resources Unit of all status changes on support and transportation vehicles.
- Arrange for and activate fueling, maintenance, and repair of ground resources.
- Maintain Support Vehicle Inventory and transportation vehicles (ICS Form 218).
- Provide transportation services, IAW requests from the LSC or Support Branch Director.
- Collect information on rented equipment.
- Requisition maintenance and repair supplies (e.g., fuel, spare parts).
- Maintain incident roads.
- Submit reports to Support Branch Director as directed.

SUPPORT BRANCH DIRECTOR (Cont'd)

Vessel Support Unit Leader - The Vessel Support Unit Leader is responsible for implementing the Vessel Routing Plan for the incident and coordinating transportation on the water and between shore resources. Since most vessels will be supported by their own infrastructure, the Vessel Support Unit may be requested to arrange fueling, dockage, maintenance, and repair of vessels on a case-by-case basis.

Overall Vessel Support Unit Leader Responsibilities:

- Obtain a briefing from the Support Branch Director or the LSC.
- Participate in Support Branch/Logistics Section planning activities.
- Coordinate development of the Vessel Routing Plan.
- Coordinate vessel transportation assignments with the Protection and Recovery Branch or other sources of vessel transportation.
- Coordinate water-to-land transportation with the Ground Support Unit, as necessary.
- Maintain a prioritized list of transportation requirements that need to be scheduled with the transportation source.
- Support out-of-service vessel resources, as requested.
- Arrange for fueling, dockage, maintenance and repair of vessel resources, as requested.
- Maintain inventory of support and transportation vessels.

FINANCE/ADMINISTRATION

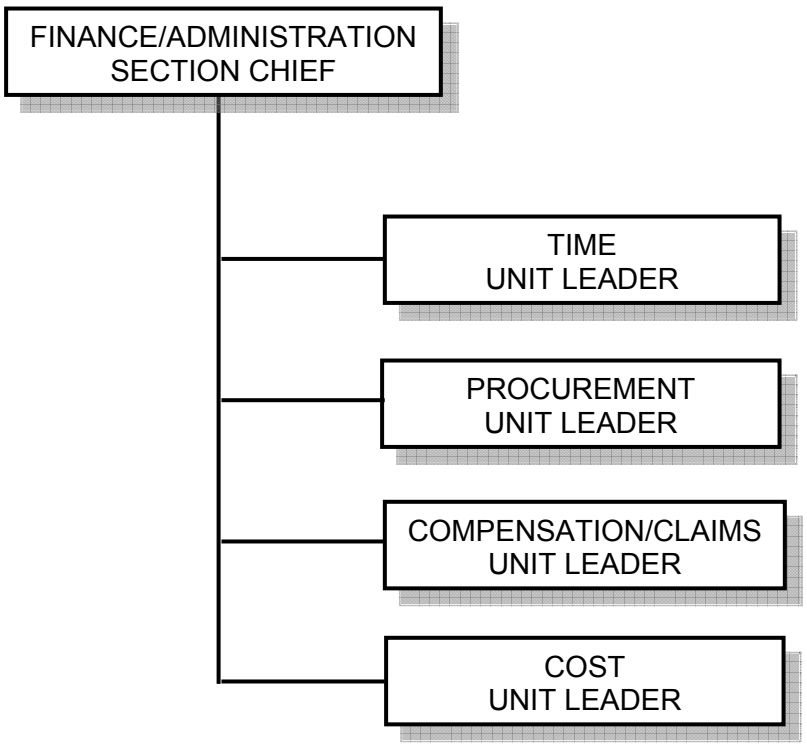
Finance/Administration Section Chief 4-51

Time Unit Leader 4-52

Procurement Unit Leader 4-52

Compensation/Claims Unit Leader 4-53

Cost Unit Leader 4-53



FINANCE/ADMINISTRATION SECTION CHIEF

The Finance/Administration Section Chief (FASC) is responsible for all financial, administrative, and cost analysis aspects of the incident and for supervising members of the Finance/Administration Section. Depending on the incident, the FASC position may or may not be assigned. Agencies within the Unified Command may require and staff the FASC position. In either case, it is always beneficial to establish a system to oversee financial aspects of an incident.

Overall FASC Responsibilities:

- Attend planning meetings as required.
- Manage all financial aspects of an incident.
- Provide financial and cost analysis information as requested.
- Gather pertinent information from briefings with responsible agencies.
- Develop an operating plan for the Finance/Administration Section; fill supply and support needs.
- Determine the need to set up and operate an incident commissary.
- Meet with Assisting and Cooperating Agency Representatives, as needed.
- Maintain daily contact with agency(s) administrative headquarters on Finance/Administration matters.
- Ensure that all personnel time records are accurately completed and transmitted, according to policy.
- Provide financial input to demobilization planning.
- Ensure that all obligation documents initiated at the incident are properly prepared and completed.
- Brief administrative personnel on all incident-related financial issues needing attention or follow-up prior to leaving incident.

Additional KM Required FASC Responsibilities:

- Ensure compensation/claims are being managed for the incident.
  If necessary or required by the agencies, establish a claims telephone number.
- Arrange on-site legal counsel.
- Work with insurance adjusters.
- Track and assess charges related to the related effort.
- Coordinating activities with other Section Chiefs
- Providing cost authorization.
- Supervising daily activities of the Finance Section.
- Analyzing contract bids, management and payroll.

The FASC may have a Time Unit Leader, Procurement Unit Leader, Compensation/Claim Unit Leader, and Cost Unit Leader reporting to him/her. However if not assigned, the FASC will be responsible for their functions.

TIME UNIT LEADER

The Time Unit Leader is responsible for equipment and personnel time recording and for managing the commissary operations.

Overall Time Unit Leader Responsibilities:

- Determine incident requirements for time recording function.
- Determine resource needs.
- Contact appropriate agency personnel/representatives.
- Ensure that daily personnel time recording documents are prepared and in compliance with policy.
- Establish time unit objectives.
- Maintain separate logs for overtime hours.
- Establish commissary operation on larger or long-term incidents as needed.
- Submit cost estimate data forms to the Cost Unit, as required.
- Maintain records security.
- Ensure that all records are current and complete prior to demobilization.
- Release time reports from assisting agency personnel to the respective Agency Representatives prior to demobilization.
- Brief the Finance/Administration Section Chief on current problems and recommendations, outstanding issues, and follow-up requirements.

PROCUREMENT UNIT LEADER

The Procurement Unit Leader is responsible for administering all financial matters pertaining to vendor contracts, leases, and fiscal agreements.

Overall Procurement Unit Leader Responsibilities:

- Review incident needs and any special procedures with Unit Leaders, as needed.
- Coordinate with local jurisdiction on plans and supply sources.
- Obtain the Incident Procurement Plan.
- Prepare and authorize contracts and land-use agreements.
- Draft memoranda of understanding as necessary.
- Establish contracts and agreements with supply vendors.
- Provide for coordination between the Ordering Manager, agency dispatch, and all other procurement organizations supporting the incident.
- Ensure that a system is in place that meets agency property management requirements. Ensure proper accounting for all new property.
- Interpret contracts and agreements; resolve disputes within delegated authority.
- Coordinate with the Compensation/Claims Unit for processing claims.
- Coordinate use of impress funds, as required.
- Complete final processing of contracts and send documents for payment.
- Coordinate cost data in contracts with the Cost Unit Leader.
- Brief the Finance/Administration Section Chief on current problems and recommendations, outstanding issues, and follow-up requirements.

COMPENSATION/CLAIMS UNIT LEADER

The Compensation/Claims Unit Leader is responsible for the overall management and direction of all administrative matters pertaining to compensation for injury and claims related activities (other than injury) for an incident.

Overall Compensation/Claims Unit Leader Responsibilities:

- Obtain a briefing from the Finance/Administration Section Chief.
- Establish contact with the incident SO and LO (or Agency Representatives if no LO is assigned).
- Determine the need for Compensation for Injury and Claims Specialists and order personnel as needed.
- Establish a Compensation for Injury work area within or as close as possible to the Medical Unit.
- Review Incident Medical Plan (ICS Form 206).
- Ensure that Compensation/Claims Specialists have adequate workspace and supplies.
- Review and coordinate procedures for handling claims with the Procurement Unit.
- Brief the Compensation/Claims Specialists on incident activity.
- Periodically review logs and forms produced by the Compensation/Claims Specialists to ensure that they are complete, entries are timely and accurate and that they are in compliance with agency requirements and policies.
- Ensure that all Compensation for Injury and Claims logs and forms are complete and routed appropriately for post-incident processing prior to demobilization.
- Keep the Finance/Administration Section Chief briefed on Unit status and activity.
- Demobilize unit in accordance with the Incident Demobilization Plan.

COST UNIT LEADER

The Cost Unit Leader is responsible for collecting all cost data, performing cost effectiveness analyses and providing cost estimates and cost saving recommendations for the incident.

Overall Cost Unit Leader Responsibilities:

- Obtain a briefing from the Finance/Administration Section Chief.
- Coordinate cost reporting procedures.
- Collect and record all cost data.
- Develop incident cost summaries.
- Prepare resources-use cost estimates for the Planning Section.
- Make cost-saving recommendations to the Finance/Administration Section Chief.
- Ensure all cost documents are accurately prepared.
- Maintain cumulative incident cost records.
- Complete all records prior to demobilization.
- Provide reports to the Finance/Administration Section Chief.

5.0 NIMS INCIDENT COMMAND SYSTEM

5.1 INTRODUCTION

Section 4.0 described the typical NIMS response structure that KMEP would follow. This Section describes the planning cycle and Incident Action Plan forms necessary for properly documenting an incident response within that structure.

Section 5.2 and 5.3 provide the basic guidance and framework to preparing, facilitating executing, assessing and documenting the response activities associated with the incident. Section 5.2 explains the Operational Period Planning Cycle toward assembling an Incident Action Plan (IAP). Section 5.3 assembles the necessary standard ICS forms for completion during the incident so that the incident lifespan is captured and communicated in written form.

5.2 PLANNING CYCLE, MEETINGS, BRIEFINGS, AND THE PLANNING CHART

The Operational Period Planning Cycle delineates those events most related to assembling an Incident Action Plan (IAP). The explanation of the planning cycle, meetings, briefing and the planning chart provides the guidance for effective facilitation of the meeting process to establish goals and objectives, develop strategies and responses, prioritize assignments and responsibilities, assign available resources, execute plans and assess outcomes.

5.3 NIMS ICS FORMS

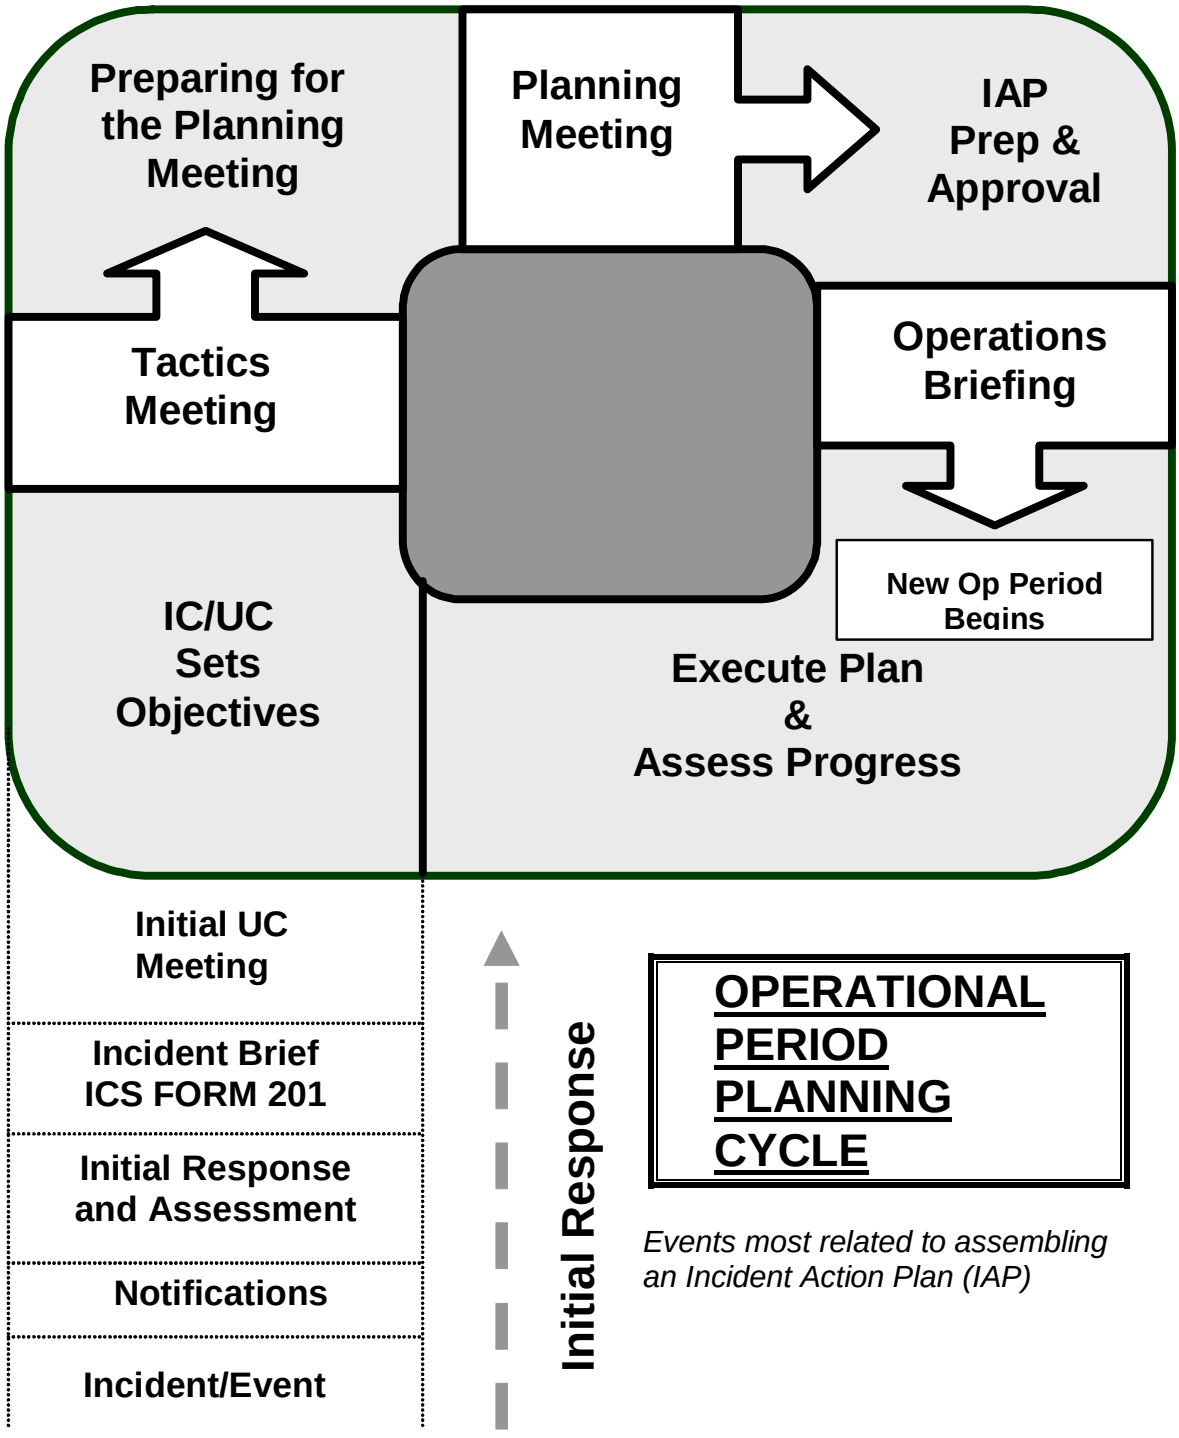
When responding to an incident, the accurate and complete documentation of a response activity is vital for the communication of information during the incident itself, during any transition phase of responsibilities and at the post incident assessments and follow-ups. This section provides the most common NIMS ICS Standard Forms to be used by KMEP to comply with NIMS ICS documentation guidelines during an on-water release. Regulator response agencies will expect KMEP to recognize and apply NIMS ICS forms.

5.4 INCIDENT COMMAND POST

In the event that the Facility office is not safe or too small for use as the Incident Command Post during an incident alternate Incident Command Post locations should be considered. Potential locations should be evaluated based on accessibility, availability of sufficient working space (breakout rooms, briefing rooms, etc.) and availability of support services (electrical service, communications systems, HVAC, restrooms, berthing, meals, etc.).

.

PLANNING CYCLE, MEETINGS, BRIEFINGS, AND THE PLANNING CHART



INITIAL RESPONSE AND ASSESSMENT

The period of **Initial Response and Assessment** occurs in all incidents. Short-term responses, which are small in scope and/or duration (e.g., a few resources working one operational period) can often be coordinated using only ICS Form 201 (Incident Briefing Form).

INCIDENT BRIEFING (ICS Form 201) - During the transfer-of-command process, an ICS Form 201-formatted briefing provides the incoming Incident Commander (IC)/Unified Commander (UC) with basic information regarding the incident situation and the resources allotted to the incident. Most importantly it functions as the Incident Action Plan (IAP) for the initial response and remains in force and continues to develop until the response ends or the Planning Section generates the incident's first IAP. It is also suitable for briefing individuals newly assigned to the Command and General Staff as well as needed assessment briefings for the staff.

ICS Form 201 facilitates documentation of response objectives, situational awareness, resource employment and deployment, and significant actions taken. This form is essential for future planning and the effective management of initial response activities.

When:	New IC/UC; staff briefing as required
Facilitator:	Current IC/UC
Attendees:	Prospective IC/UC; Command and General Staff, as required

General Tasks

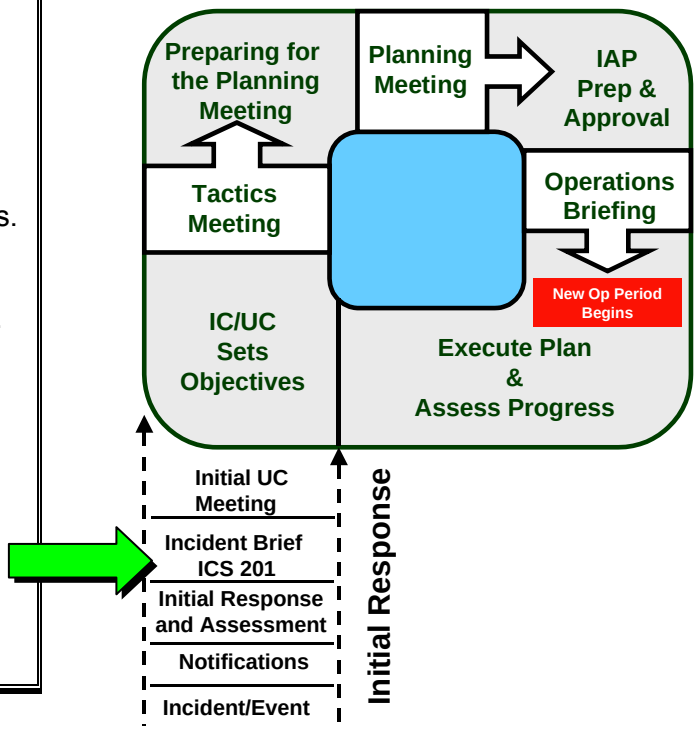
Incident Commander (IC)
- ❑ Obtain incident brief using ICS-201.
- ❑ Assess operational requirements.
- ❑ Determine organizational and response requirements and objectives.

Operations (OPS)
- ❑ Obtain briefing from IC.
- ❑ Consider available Contingency Plan.
- ❑ Develop strategies and tactics.
- ❑ Assemble resources.
- ❑ Conduct response using ICS-201.

Planning
- ❑ If/when activated orders staff.

Logistics
- ❑ If/when activated orders staff.

Finance/Admin
- ❑ If/when activated orders staff.



Agenda:

Using ICS Form 201 as an outline, include:

1. Situation (note territory, exposures, safety concerns, etc.; use map/charts).
2. Current priorities.
3. Strategy(s) and tactics.
4. Current organization.
5. Resource assignments.
6. Resources en-route and/or ordered.
7. Facilities established.

INITIAL UNIFIED COMMAND MEETING - Provides UC officials with an opportunity to discuss and concur on important issues prior to joint incident action planning. The meeting should be brief and important points documented. Prior to the meeting, parties should have an opportunity to review and prepare to address the agenda items. Planning meeting participants will use the results of this meeting to guide the operational efforts prior to the first tactics meeting.

When: The UC is formed prior to the first meeting
Facilitator: UC member
Attendees: Only ICs that will comprise the UC

General Tasks

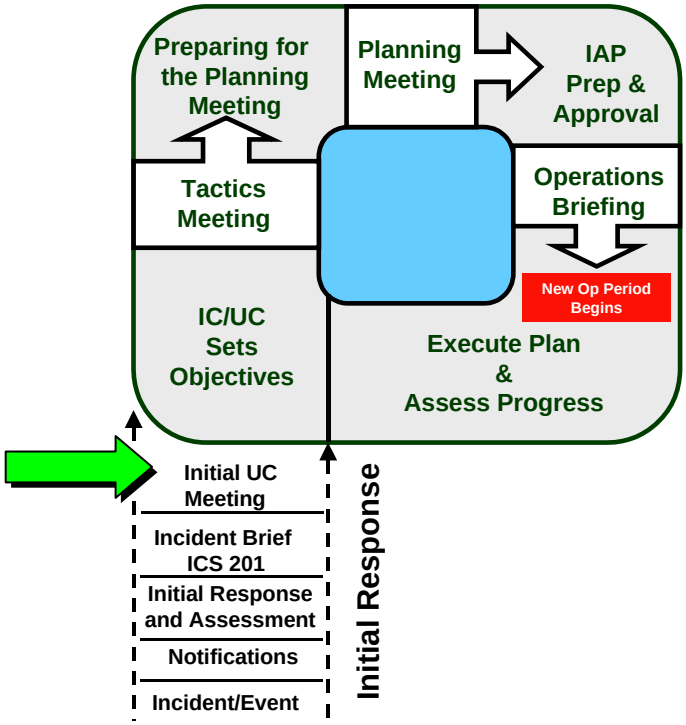
Incident Commander (IC)
- ❑ Determine need for UC.
- ❑ Negotiate/facilitate UC participation.
- ❑ Clarify UC roles & responsibilities.
- ❑ Negotiate and agree on response organization, facilities, and support.
- ❑ Determine Op Period length/start time.

Operations (OPS)
- ❑ Brief UC members on current operations.

Planning
- ❑ If activated, contact UC members as directed by IC.

Logistics
- ❑ May not be activated at this time.

Finance/Admin
- ❑ May not be activated at this time.



Agenda:

1. Identify UC, based on Chapter 6 criteria.
2. Identify jurisdictional priorities and objectives.
3. Present jurisdictional limitations, concerns and restrictions.
4. Develop a collective set of incident objectives.
5. Establish and agree on acceptable priorities.
6. Agree on basic organization structure.
7. Designate the best-qualified and acceptable Operations Section Chief (OPS).
8. Agree on General Staff personnel designations and planning, logistical, and financial agreements and procedures.
9. Agree on resource ordering procedures to follow.
10. Agree on cost-sharing procedures.
11. Agree on informational matters.
12. Designate a Unified Command Information Officer.

UNIFIED COMMAND OBJECTIVES MEETING - The IC/UC will identify/review and prioritize objectives for the next operational period on the ICS Form 202. Objectives from the previous operational period are reviewed and any new objectives are identified.

When: Prior to tactics meeting.
Facilitator: UC Member
Attendees: UC Members; Command and General Staff as appropriate

General Tasks

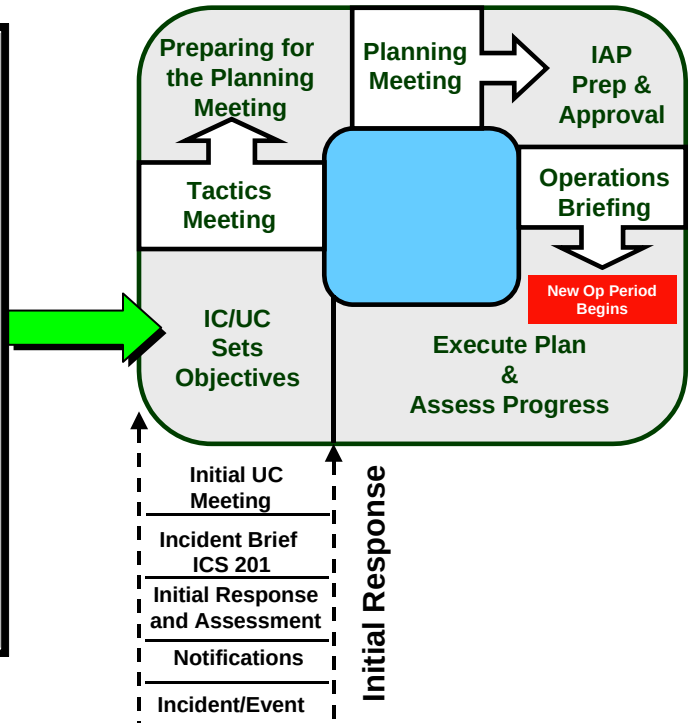
Incident Commander (IC/UC)
- Develop SMART incident objectives.
- Consider "Best Response".
- Delegate and provide guidance to Command and General Staff.

Operations (OPS)
- May be present if invited.

Planning
- May be present if invited.
- Propose draft SMART objectives to IC/UC.

Logistics
- May be present if invited.

Finance/Admin
- May be present if invited.



Agenda:

1. Review/identify objectives for the next operational period (Clearly stated and attainable with the resources available, yet flexible enough to allow members to choose tactics).
2. Review any open agenda items from initial/previous meetings.

TACTICS MEETING - This 30-minute meeting creates the blueprint for tactical deployment during the next operational period. In preparation for the Tactics Meeting, the Planning Section Chief (PSC), and OPS review the first stage of response operations or the current IAP situation status information as provided by the Situation Unit to assess work progress against IAP objectives. The OPS/PSC will jointly develop primary and alternate strategies to meet objectives for consideration at the next Planning Meeting.

When: Prior to Planning Meeting.
Facilitator: PSC
Attendees: PSC, OPS, Logistics Section Chief (LSC), and Resources Unit Leader (RUL)

General Tasks

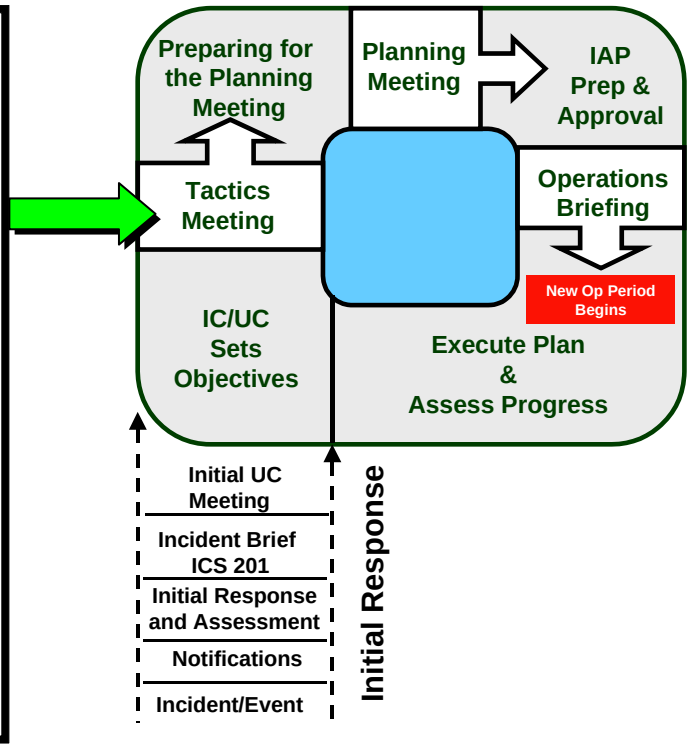
Incident Commander (IC/UC)
- Provide guidance/clarification.

Operations:
- Be prepared!
- Brief current operations.
- Develop strategies, tactics, and resource needs using ICS-215.

Planning
- Facilitate meeting.
- Determine support requirements for ICS-215.
- Consider alternative strategies.

Logistics
- Participate/contribute logistics information as necessary.
- Verify support requirements.

Finance/Admin
- Not normally present.



Agenda:

1. Review the objectives for the next operational period and develop strategies (primary and alternatives).
2. Prepare a draft of ICS Form 215 (used in planning meeting) to identify resources that should be ordered through Logistics.

PREPARE FOR THE PLANNING MEETING - During this phase of the Planning Cycle, the Section Chiefs and their associated staff members begin the work of preparing for the upcoming Planning Meeting. Each Section Chief is responsible for ensuring that his/her Planning meeting responsibilities are met. The PSC should facilitate this to the greatest extent possible to ensure that the material, information, resources, etc., to be used or discussed in the Planning Meeting is organized and prepared. There are to be no surprises in the Planning Meeting.

When: After the Tactics Meetings
Facilitator: PSC

General Tasks

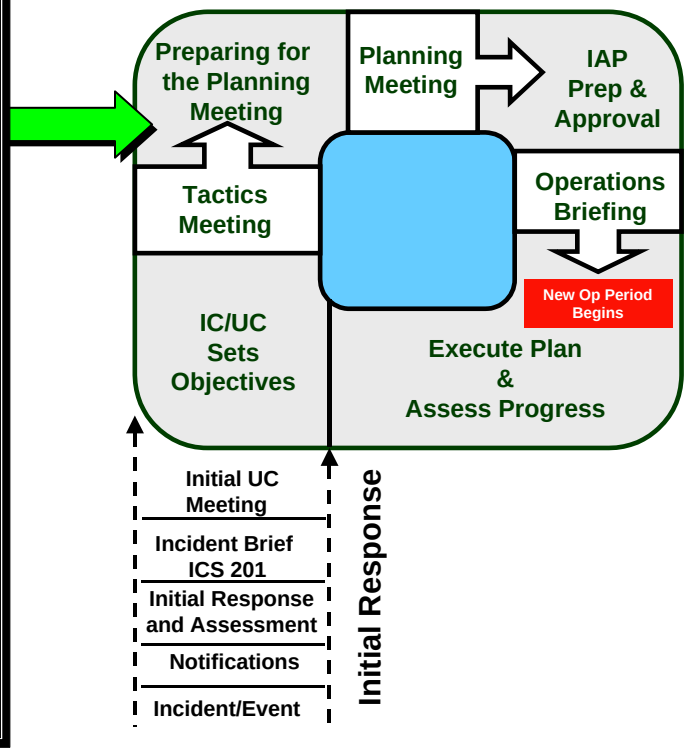
Incident Commander (IC/UC)
- Provide guidance/clarification.
- Monitor on-going operations.

Operations (OPS)
- Continue Operations.
- Prepare for Planning Meeting

Planning
- Facilitate General Staff and attendees' preparations for Planning Meeting.
- Publish/distribute meeting schedule and ensure attendees know roles.
- Allow no surprises.

Logistics
- Prepare for Planning Meeting.
- Verify support requirements.

Finance/Admin
- Prepare for Planning Meeting.
- Verify financial and administrative requirements.



PLANNING MEETING - This meeting defines incident objectives, strategies, and tactics and identifies resource needs for the next operational period. Depending on incident complexity, this meeting should last no longer than 45 minutes. This meeting fine tunes objectives and priorities, identifies and solves problems, and defines work assignments and responsibilities on a completed ICS Form 215 (Operations Planning Worksheet). Displays in the meeting room should include Objectives ICS Form 202 for the next period, large sketch maps or charts clearly dated and timed, a poster-sized ICS Form 215, a current resource inventory prepared by the Resource Unit, and current situation status displays prepared by the Situation Unit.

After the meeting, ICS Form 215 is used by the LSC to prepare the off incident tactical and logistical resource orders, and used by the PSC to develop IAP assignment lists.

When: After the UC and Tactics Meetings
Facilitator: PSC
Attendees: Determined by IC/UC, generally IC/UC, Command Staff, General Staff, Air Operations Branch Director (Air Ops), the RUL, Safety Officer (SO), and Technical Specialists, as required.

General Tasks

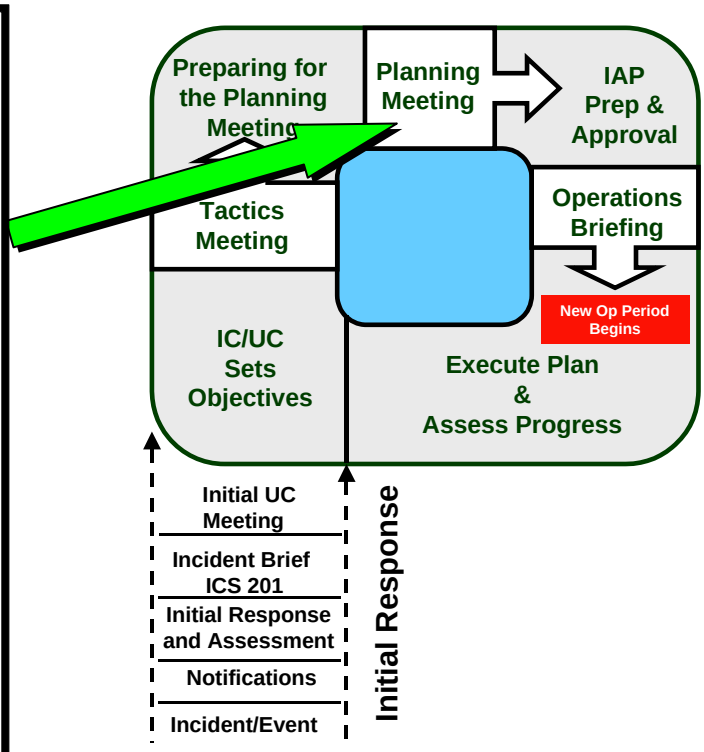
Incident Commander (IC/UC)
- ❑ Provide appropriate leadership.
- ❑ Brief incident objectives.

Operations (OPS)
- ❑ Brief operational strategies, and tactics using ICS-215, maps, charts, etc.
- ❑ Brief Branch/Division/Group functions and boundaries

Planning
- ❑ Facilitate Planning Meeting agenda.
- ❑ Brief present situation.
- ❑ Address/resolve response coordination issues as needed, gain consensus.

Logistics
- ❑ Brief logistical support and resource ordering status.

Finance/Admin
- ❑ Brief administrative and financial status/projections, etc.



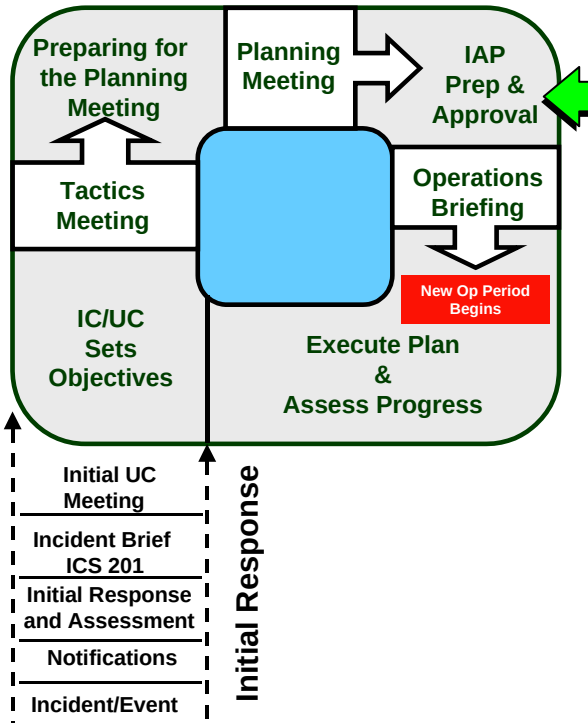
PLANNING MEETING (Cont'd)

	Agenda:	Primary Responsibility
1.	State incident objectives and Policy issues.	IC/UC
2.	Briefing of situation, critical and sensitive areas, weather/sea forecast, and resource status/availability.	SUL
3.	State primary and alternative strategies to meet objectives.	OPS
4.	Designate Branch, Division, and Group boundaries and functions as appropriate, use maps and ICS form 215.	OPS
5.	Specify tactics for each Division, note limitations.	OPS
6	Specify resources needed by Divisions/Groups.	OPS
7.	Specify operations facilities and reporting locations and plot on map.	OPS/LSC
8.	Develop resources, support, and overhead order (orders).	LSC
9.	Consider support: communications, traffic, safety, medical, etc.	LSC
10.	Contributing organization/agency considerations regarding work plan.	LO
11	Safety considerations regarding work plan.	SO
12	Media considerations regarding work plan.	IO
13.	Report on expenditures and claims.	F/ASC
14.	Finalize and approve work plan for the next operational period.	IC/UC

INCIDENT ACTION PLAN (IAP) PREPARATION - Attendees immediately prepare their assignments for the IAP to meet the PSC deadline for assembling the IAP components. The deadline will be early enough to permit timely IC/UC approval and duplication of sufficient copies for the Operations Briefing and for overhead.

When: Immediately following the Planning Meeting, the PSC assigns the deadline

Facilitator: PSC



General Tasks

Incident Commander (IC/UC)
- ❑ Review, approve and sign IAP

Operations (OPS)
- ❑ Provide required information for inclusion into IAP.
- ❑ Communicate incident status changes.

Planning
- ❑ Facilitate General Staff's IAP input.
- ❑ Ensure assignments and expectations are clear.
- ❑ Provide completed IAP to IC/UC for review/approval.
- ❑ Distribute completed IAP.

Logistics
- ❑ Provide logistics information for IAP.
- ❑ Verify resources ordered.

Finance/Admin
- ❑ Verify financial and administrative requirements for IAP.

Common Components	Primary Responsibility
1. Incident Objectives (ICS form 202).	Resources Unit
2. Organization List/Chart (ICS FORMS 203/207).	Resources Unit
3. Assignment List (ICS form 204).	Resources Unit
4. Communication Plan (ICS form 205).	Communications Unit
5. Medical Plan (ICS form 206).	Medical Unit
6. Incident Map.	Situation Unit
7. Safety Plan.	Safety Officer
8. Decontamination Plan.	Technical Unit
9. Waste Management or Disposal Plan.	Technical Unit

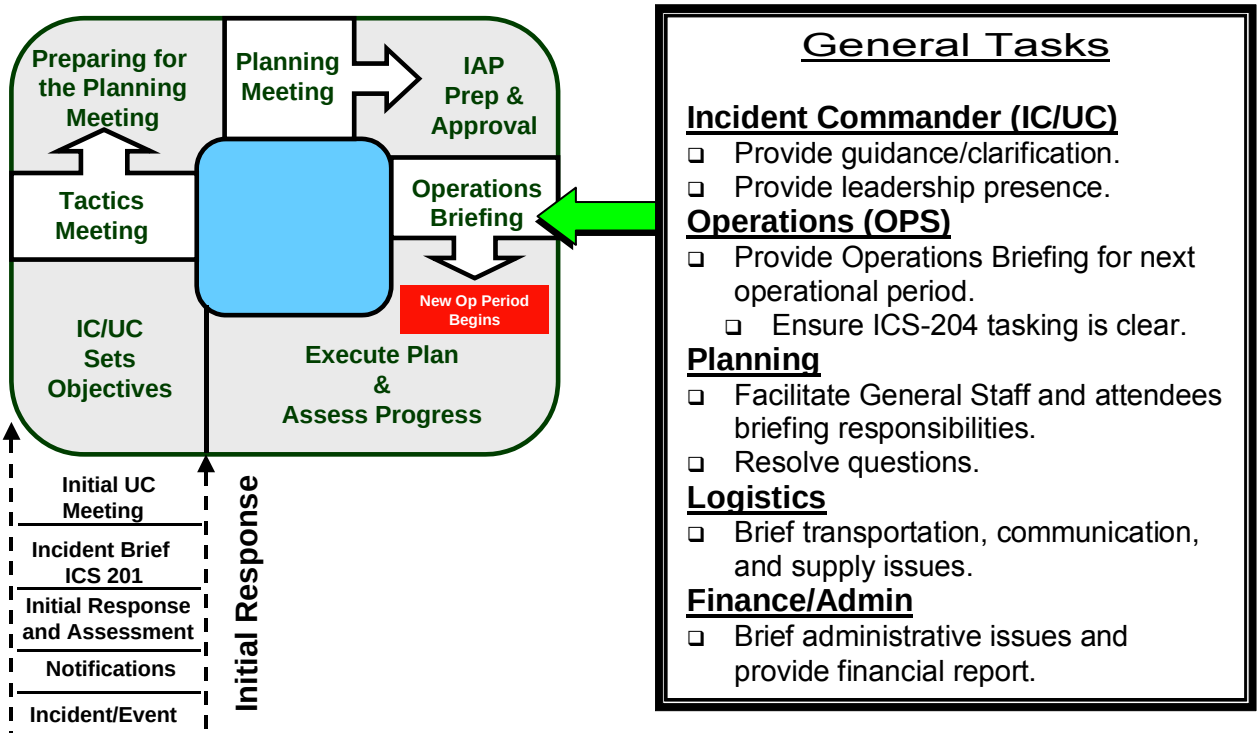
INCIDENT ACTION PLAN (IAP) PREPARATION (Cont'd)

Optional Components (use as pertinent):

1. Air Operations Summary (ICS form 220).	Air Operations Branch Director
2. Traffic Plan.	Ground Support Unit
3. Demobilization Plan.	Demobilization Unit

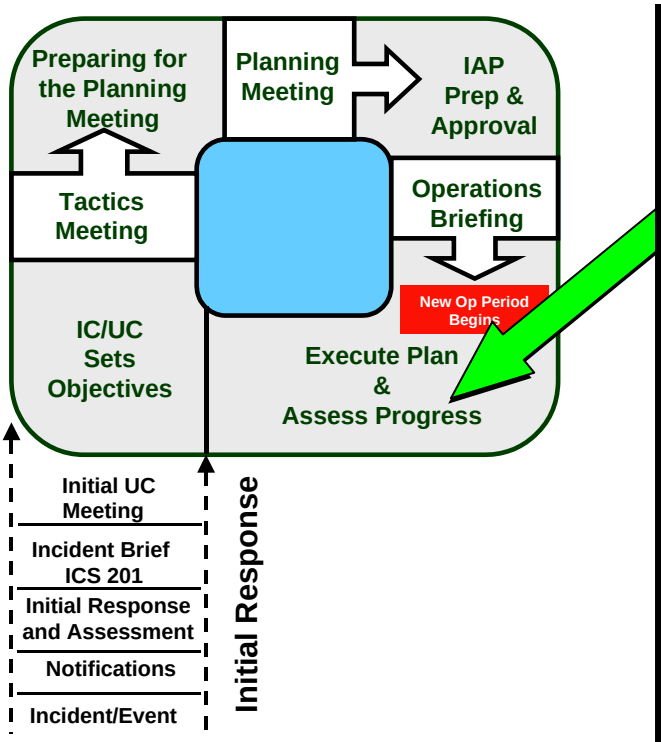
OPERATIONS BRIEFING - This 30-minute, or less, meeting presents the IAP to the oncoming shift of the response organization. After this meeting, off-going supervisors should be interviewed by their relief and by OPS in order to further confirm or adjust the course of the oncoming shift's IAP. Shifts in tactics may be made by the Division/Group supervisor in whose purview they are. Similarly, a supervisor may reallocate resources within that division to adapt to changing conditions.

When: About an hour prior to each shift change
Facilitator: PSC
Attendees: IC/UC, Command Staff, General Staff, Branch Directors, Division/Group Supervisors, Task Force/Strike Team Leaders (if possible), Unit Leaders, others as appropriate.



Agenda:	**Primary Responsible**
1. Review IC/UC objectives and changes to IAP.	PSC
2. Discuss current response actions and last shift's accomplishments.	OPS
3. Review weather and sea conditions forecast.	SUL
4. Division/Group and Air Operations assignment.	OPS
5. Trajectory analysis.	SUL
6. Transport, communications, and supply updates.	LSC
7. Safety message.	SO
8. Incident Action Plan (IAP) approval and motivational remarks.	IC/UC

ASSESS PROGRESS - Following the operation brief, all Section Chiefs will review the incident response progress and make recommendations to the IC/UC in preparation for the next UC Objective Meeting for the next operational period. This feedback/information is gathered from various sources, including Field Observers, responder debriefs, stakeholders, etc.



General Tasks

Incident Commander (IC/UC)
- Monitor on-going operations.
- Measure progress against stated objectives.
- Consider "Best Response."

Operations (OPS)
- Monitor on-going operations and make tactical changes as necessary.
- Measure/ensure progress against stated objectives.

Planning
- Facilitate General Staff's effectiveness and efficiency as appropriate.
- Provide response objectives recommendations to IC/UC.

Logistics
- Verify resources, resolve logistical problems.

Finance/Admin
- Facilitate smooth administrative and financial reporting.

SPECIAL PURPOSE MEETINGS

The **Special Purpose** meetings are most applicable to larger incidents requiring an **Operational Period Planning Cycle**, but may be useful during **Initial Response and Assessment**.

COMMAND STAFF MEETING - Coordinate Command Staff functions, responsibilities, and objectives. It is held before the Tactical Meeting. Command Staff (IC/UC, SO, LO, IO) attend.

COMMAND & GENERAL STAFF MEETING - An opportunity for the Command & General staffs to gather under informal conditions (breakfast/dinner) to discuss developing issues.

BUSINESS MANAGEMENT MEETING - This under-30-minute meeting develops and updates the operating plan for finance and logistical support. The agenda could include: documentation issues, cost sharing, cost analysis, finance requirements, resource procurement, and financial summary data. Attendees include: F/ASC, Cost Unit Leader (CUL), LSC, SUL, DUL.

AGENCY REPRESENTATIVE MEETING - This meeting is held to update Agency Representatives and ensure that they can support the IAP. It is conducted by the LO, and attended by Agency Representatives. It is most appropriately held after the Planning Meeting in order to announce plans for the next operational period. It allows for changes should the plan not meet the expectations of the Agency Representatives.

NEWS BRIEFING - This meeting briefs media and the public on the most current and accurate facts. It is set up by the IO, moderated by a UC spokesperson, and features selected spokespersons. This brief must be held away from the ICP. Spokespersons should be prepared by the IO to address anticipated issues. The briefing should be well-planned, organized, and scheduled to meet the media's needs.

NIMS ICS Forms

Another important aspect when implementing NIMS ICS during releases is the use of NIMS ICS forms. Regulatory response agencies will expect KMEP to recognize and apply NIMS ICS and forms during on water emergencies. Some of these response agencies may include:

- US Coast Guard
- Environmental Protection Agency
- Department of Ecology (Washington)
- Department of Fish and Game/Oil Spill Prevention and Response (California)
- Department of Environmental Quality (Oregon)
- Texas General Land Office (Texas)
- Texas Railroad Commission (Texas)

The following table provides a list of NIMS ICS forms to be used during an on-water release. Copies of these forms are also included.

NIMS ICS Forms		
ICS Form #	**Form Title**	**Prepared By**
ICS-201-OS	Incident Briefing	Incident Commander (IC)
ICS-202-OS	Response Objectives	Planning Section Chief (Planning)
ICS-203-OS	Organization Assignment List	Resources Unit Leader (Planning)
ICS-204-OS	Assignment List	Resources Unit Leader (Planning)
ICS-204a-OS	Assignment List Attachment	Resources Unit Leader (Planning)
ICS-205-OS	Incident Radio Communications Plan	Communications Unit Leader (Logistics)
ICS-205A-OS	Communications List	Communications Unit Leader (Logistics)
ICS-206-OS	Medical Plan	Medical Unit Leader (Logistics)
ICS-207-OS	Incident Organization Chart	Resources Unit (Planning)
ICS-209-OS	Incident Status Summary	Situation Unit Leader (Planning)
ICS-210-OS	Status Change Card	Communications Center (Logistics)
ICS-211	Check-In List	Resources Unit (Planning)
ICS-211e-OS	Check-In List (Equipment)	Resources Unit (Planning)
ICS211-p-OS	Check-In List (Personnel)	Resources Unit (Planning)
ICS-213-OS	General Message	Any message originator
ICS-214-OS	Unit Log	All sections and units
ICS-214a-OS	Individual Log	All sections and units
ICS-215-OS	Operational Planning Worksheet	Operations Section Chief (Operations)
ICS-216	Radio Requirements Worksheet	Communications Unit (Logistics)
ICS-217	Radio Frequency Assignment Worksheet	Communications Unit (Logistics)
ICS-218	Support Vehicle Inventory	Ground Support Unit (Logistics)
ICS-220-OS	Air Operations Summary	Operations Section Chief or Air Branch Director (Operations)
ICS-221 -OS	Demobilization Check-Out	Demobilization Unit (Planning)
ICS-230-OS	Daily Meeting Schedule	All sections and units
ICS-231-OS	Meeting Summary	All sections and units
ICS-232	Resources at Risk Summary	Situation Unit Leader (Planning)
ICS-232a-OS	ACP Site Index	Situation Unit Leader (Planning)

6.0 SPILL IMPACT CONSIDERATIONS

6.1 CRITICAL AREAS TO PROTECT

The critical areas to protect are classified as high, moderate, and low sensitivity to oil for non-coastal/inland environments. The Federal, State, Local, and Tribal authorities will further clarify these categories at the time of the response. The categories are defined as follows:

HIGH SENSITIVITY
● Areas which are high in productivity, abundant in many species, extremely sensitive, difficult to rehabilitate, or inhabited by threatened/endangered species.
● Areas which consist of forested areas, brush/grassy areas, wooded lake areas, freshwater marshes, wildlife sanctuaries/refuges, and vegetated river/stream banks.

MODERATE SENSITIVITY
● Areas of moderate productivity, somewhat resistant to the effects of oiling.
● Areas which consist of degraded marsh habitat, clay/silt banks with vegetated margins, and gravel/cobble beaches.

LOW SENSITIVITY
● Areas of low productivity, man-made structures, and/or high energy.
● Areas which consist of gravel, sand, or clay material, barren/ rocky riverbanks and lake edges, man-made structures, and concrete/ compacted earthen drainage ditches.

These areas are identified in the Central Puget Sound Geographic Response Plan (GRP) available at http://www.ecy.wa.gov/programs/spills/preparedness/GRP/CentralPugetSound/central_puget_sound.htm.

6.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES

Environmental/Socio-economic sensitivities are of extreme importance when planning a response effort. The health and safety of the public and the environment, as well as the protection of the various socio-economic sensitivities, must be promptly addressed in order to mitigate the extent of damage and minimize the cost of the clean-up effort.

The Company will respond to a release with all necessary resources and personnel using the guidance contained in GRP and in coordination with the Washington Department of Ecology. The Company is committed to maintain its response throughout the incident until a satisfactory level of clean up is attained.

6.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES (Cont'd)

All environmental/socio-economic sensitivities are worthy of protection, but must be prioritized during a response effort. When making decisions on which areas to designate as collection areas and which to protect, the following sources may be consulted:

- U.S. Fish and Wildlife Service and related state agencies
- Applicable Area Contingency Plans
- Other industry and private experts

The environmental and socio-economic sensitivities in the vicinity of the Facility can be divided into a number of categories. The following environmental/socio-economic sensitivity summary describes these categories which may be impacted by a discharge and should be addressed in the response:

Environmental:

- Environmentally sensitive areas are prevalent throughout any marine and/or terrestrial environment and may be affected by any potential discharge incident.

- Environmentally sensitive areas subjected to stress and sudden change may be severely damaged. All means of exclusion/diversion should be utilized during a response effort to minimize the impact on these areas.

Historical Areas:

- Properties listed in the National Register of Historic Places and Natural Landmarks are included in this category.

- These areas may need to be boomed off or otherwise protected to minimize impact.

Major Recreational Areas:

- There are recreational areas within the planning distance from the Facility. Those in the immediate vicinity include:

Recreational Areas	Distance from Facility
Seacrest Marina Park	3.2 miles

- A discharge affecting these areas may pose a public safety/health risk during a response effort.

- Shoreline access for personnel and equipment deployment (boats, boom, etc.) is typically available in these areas.

6.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES (Cont'd)

Marinas:

- There are marinas within the planning distance from the Facility. Those in the immediate vicinity include:

Marinas	Distance from Facility
Jim Clark Marina	1 mile
West Lake Marina	4 miles

- These areas have a high degree of public exposure (personal and property) and should be boomed for protection.

- Boats and other water deployed equipment can often be deployed and/or obtained in these areas.

Residential Areas:

- These are areas with high public impact and may warrant evacuation in extreme cases (See Figure 6.2).

- Cleanup must be performed with extreme caution due to extensive public exposure.

Commercial Farming/Ranching Areas:

- Commercial Farming/Ranching Areas have the potential of human and livestock impact, as well as socio-economic impact in the potential loss of crops or loss of property use.

Water Intake Points:

(b) (7)(F), (b) (3)

[redacted]

Wildlife Management Areas and Refuges:

- These areas have a high degree of exposure to threatened/endangered species and many other types of wildlife.

- Protection booming and clean-up efforts are high priority in these areas.

6.3OILED WILDLIFE CARE

In the event of a spill, wildlife may come into contact with oil - especially on the surface of water or along shorelines. The numbers and types of animals affected will depend on factors such as: the size and distribution of the spill; the weather, wind and current conditions; the habitats affected by the oil; and the time of year that the spill occurs. Birds have historically been the most likely wildlife to be affected during on-water spills in Washington, but both aquatic and marine mammals may also come into contact with the oil. In addition to direct oiling, birds and mammals may become indirectly impacted if they feed on oiled animals.

All spill response personnel should refer to the Northwest Wildlife Response Plan and Policy, as found in Chapters 3000 and 9970 of the Northwest Area Contingency Plan (NWACP), regarding wildlife response operations, which are incorporated into this plan by reference.

6.3.1 Notifications

Report any observation of oiled wildlife to the Washington Emergency Management Division at (800) 258-5990 if an ICS has not been established. The Washington Emergency Management Division will forward any reports of oiled wildlife to the Washington State Department of Fish and Wildlife (WDFW).

Once an ICS has been established, all observations of oiled wildlife will be reported to the Wildlife Branch Director (or their designee) within the Operations Section.

Contact the United States Fish and Wildlife Service (USFWS) Response Coordinator to initiate the process of obtaining spill-specific authorizations related to oiled wildlife (see Migratory Bird Treaty Act below) prior to initiating any oiled wildlife activities other than reconnaissance.

Contact private oiled wildlife care contractors according to the number and type of species affected. These contractors have varying abilities to provide service and personnel during response activities and will be engaged as needed by the Wildlife Branch. Refer to Figures 2.3 and 2.4 for contact information..

6.3.2 Permits

All wildlife collection and rehabilitation activities carried out during a spill response will be done in accordance with established NWACP procedures and all applicable federal and state laws. This section identifies the state and federal permits that are required and generally describes their purpose.

- **Migratory Bird Treaty Act (Federal).** The Migratory Bird Permit Act makes it illegal for anyone to “take” or possess any migratory bird except under the terms of a valid Migratory Bird Permit. The USFWS is responsible for issuing Federal Migratory Bird Rehabilitation permits to qualified applicants for the recovery, temporary possession, transportation, and rehabilitation of migratory birds.

  In addition to the Federal Migratory Bird Rehabilitation permit, a rehabilitator must also secure a separate *spill-specific* authorization from the USFWS at the time of the spill for the recovery of both live and dead oiled birds. In Washington State, this authorization must be requested from the USFWS Response Coordinator in Lacey.

6.3 OILED WILDLIFE CARE (Cont'd)

6.3.2 Permits (Cont'd)

- **Endangered Species Act (Federal).** Listed species that become oiled are subject to Endangered Species Act requirements. For migratory birds, the Migratory Bird Rehabilitation Permit and the spill-specific authorization (see above) authorizes the recovery, temporary possession, transport, and rehabilitation of *threatened and endangered* species of migratory birds that have become oiled with no additional ESA permits required. For marine mammals, all response actions will be coordinated by the Wildlife Branch Director and appropriate federal agencies.

- **Marine Mammal Protection Act (Federal).** Federal, state and local government officials, or designees of the relevant Secretaries of the Departments of the Interior and Commerce, may "take" marine mammals during the course of official response duties under certain conditions. Contractors may also receive authorization to take marine mammals under special circumstances (see NWACP 9970). All marine mammal response actions will be coordinated by the Wildlife Branch Director and appropriate federal agencies.

- **Washington State Rehabilitation Permit (Washington State).** Washington State law makes it illegal for any person to possess wildlife for the purpose of rehabilitation unless they have a valid wildlife rehabilitation permit or they are working under the supervision of a person who has a valid wildlife rehabilitation permit. This rule (WAC 232-12-175) also requires that any facilities used for oiled bird rehabilitation must meet certain infrastructure requirements.

As of this writing, the organizations listed below possess all permits needed to conduct oiled bird rehabilitation operations in Washington State. Note that the USFWS Spill specific authorizations will also be required:

- Focus Wildlife.
- The International Bird Rescue Research Center (IBRRC).
- The Progressive Animal Welfare Society (PAWS).

6.3.3 Wildlife Branch

The Wildlife Branch functions within the Operations Section of the ICS and is more fully described in the NWACP. The Wildlife Branch Director is responsible for overseeing all activities related to oiled wildlife recovery and rehabilitation during a response.

It is the policy of the Northwest Area Committee (NWAC) that representatives of the USFWS will assume the positions of Director and Deputy Director of the Wildlife Branch. It is also the policy of the NWAC that WDFW representatives will assume these positions if USFWS representatives are not available.

6.3.3 Wildlife Branch (Cont'd)

Unless otherwise indicated, USFWS will delegate the Wildlife Branch Director and Deputy Branch Director positions to WDFW for spills that occur within Washington State. Appointment of other parties (including representatives of Responsible Parties) to one or both of these positions may be made by a USFWS representative or their designee at any time during an incident and for such periods of time as may be deemed appropriate.

The Wildlife Branch typically uses wildlife contractors to provide care for affected wildlife. All persons who serve as part of rehabilitation or field crews must be trained in accordance with the site safety plan established for the incident and should be familiar with generally accepted published guidelines for collecting, cleaning, and rehabilitating oiled birds.

6.3.4 Oiled Wildlife Care Procedures

Federal (USFWS) policy requires that rehabilitation activities involving oiled-birds comply with the care standards as described in "*Best Practices for Migratory Bird Care during Oil Spill Response"* (US Fish and Wildlife Service. 2002). This document is incorporated by reference as a part of the NWACP. Additional animal care and husbandry information may also be obtained in the Oiled Wildlife Care Network manual "*Protocols for the Care of Oil-Affected Birds"* (UC Davis. 2000).

6.3.5 Oiled Wildlife Facilities, Equipment and Personnel

The equipment and personnel needed for oiled wildlife operations will be deployed through the ICS as needed during a spill response. The NWACP establishes four response levels for oiled bird operations: Level 4 (up to 15 birds), Level 3 (up to 100 birds), Level 2 (up to 500 birds), and Level 1 (more than 500 birds). *Note: The number of birds refers only to birds in captivity.*

Facilities. An oiled-wildlife rehabilitation unit capable of providing the equipment and infrastructure necessary to support a Level 3 response has been developed by Focus Wildlife. When needed, this equipment will be deployed within 24 hours of spill awareness to a location approved by the Wildlife Branch Director. This equipment is included within the online Western Regional Response List (WRRL) and is available via contract with Marine Spill Response Corporation (MSRC). (http://www.wrrl.us/fmi/iwp/res/iwp_auth.html)

Wastewater generated by the wildlife cleaning and rehabilitation operations contains contaminants that may include surfactants, oil, and biological waste and must be appropriately treated prior to discharge. All wastewater produced by oiled wildlife operations will be stored using temporary storage tanks delivered to the site. Based upon the results of sampling and analysis, the wastewater will be treated and disposed of on-site or transported to an off-site facility. This determination will be made by the Disposal Group Supervisor and approved by the Washington Department of Ecology.

6.3.5 Oiled Wildlife Facilities, Equipment and Personnel (Cont'd)

Equipment. The wildlife cleaning facility described above is equipped with sufficient supplies and equipment to support the initial few days of an oiled wildlife response. Replacement supplies and equipment will be obtained as needed using the established channels within the ICS.

Additional wildlife equipment may be also available at the time of a spill incident from the Washington Department of Fish and Wildlife Oil Spill Team or by calling out the oiled wildlife rehabilitation unit (MRU) developed by MSRC and CRC.

Personnel. The personnel requirements described in the NWACP will be met through the use of the oiled wildlife care contractors listed in Figure 2.4. Personnel support space will be provided using existing buildings or mobile structures brought to the site for this purpose.

6.4 STAGING AREAS

The GRP identifies staging areas for each selected response site. When establishing additional personnel and equipment staging areas, the following criteria should be evaluated:

- Access to waterborne equipment launching facilities and/or land equipment.
- Access to open space for staging/deployment of heavy equipment and personnel.
- Access to public services utilities (electricity, potable water, public phone, restroom and washroom facilities, etc.)
- Access to the environmental and socio-economically sensitive areas which are projected for impact.

6.5 SPILL VOLUME ESTIMATES

Type

In most situations, spills occur during transfer operations and will be easily identifiable by the personnel involved based on their knowledge of the material(s) being transferred. Spills from storage tanks, loading racks, and pipelines can also be quickly identified since the contents of each are generally marked on the tanks and pipelines or are well known by Facility personnel.

In the event that a spill of unknown origin does occur, the type of product will be identified initially by color and/or smell. It is easy to differentiate the smell of gasoline from diesel fuel, although it is generally impossible to differentiate between types of gasoline by smell alone. In this case, a sample of the materials is taken and a gravity test conducted to identify the type of product.

Size/Quantity

Early in a spill response, total spill volume determines, in part, the equipment, logistics, manpower, and disposal requirements. Actual spill volumes are often unavailable or inaccurate so that field estimates are usually required. A few quick methods, as discussed below, can be used to provide working approximations of spill size.

If a spill occurs during a transfer operation, the total spill volumes can be estimated by multiplying the pumping rate by the elapsed time between leak commencement and transfer shutdown plus the contents (drain down) of the line between the two closest valves or isolation points. A simplified equation for estimating transfer spill volumes involving total line ruptures is:

Volume Loss (bbl) = Pump Rate (bbl/min) x Elapsed Time (min) + Line Contents (bbl)

Spills resulting from flange or hose leaks will likely occur at a significantly lower rate. For tank overfills, the total volume would be limited to the elapsed time multiplied by the pumping rate. Potential spill volumes for various transfer operations are discussed in Appendix C.

A working estimate of a spill volume on water can be made by a visual assessment of the surface area and thickness of the slick. Slick dimensions can also be estimated from the air using electronic surveillance and occasionally from the water surface using radar. Figure 6.3 can be used to estimate spill volume based on the appearance of the slick. Slick thicknesses greater than 0.25 mm (0.001 inch) cannot generally be differentiated by appearance.

6.5 SPILL VOLUME ESTIMATES (Cont'd)

Classification

To ensure consistency in spill reporting and response criteria, the State of Washington has developed a spill classification system which, for inland waters, is summarized below:

- **Minor Spill** – A spill or discharge of oil of less than 4.5 bbl (100 gallons). Depending on their degree of impact, minor spills may be upgraded to moderate or major spills if they 1) occur in or endanger critical water areas; 2) generate critical public concern; 3) become the focus of an enforcement action; or 4) pose a threat to public health or welfare.

- **Moderate Spill** – A spill or discharge of oil of 4.5 bbl (100 gallons) to 240 bbl (10,000 gallons) or a discharge of any material in any quantity that poses a threat to human health or welfare.

- **Major Spill** – A spill or discharge of oil of more than 240 bbl (10,000 gallons) or a discharge of any material in any quantity that poses a substantial threat to human health or welfare.

- **Catastrophic Spill** – A spill or discharge of oil of more than 24,000 bbl (1,000,000 gallons).

6.6 TRAJECTORY ANALYSIS

Oil spilled on water will react primarily to the effects of wind and current. The oil will tend to spread to a thin layer under the influence of gravity and chemical forces. Trajectory analysis for worst case spills are provided in Appendix B. During a response updated trajectories will be requested from O'Brien's Response Management as needed.

6.7 RESPONSE STRATEGIES

A comprehensive response strategy is important to insure an effective response effort. Although no single strategy is applicable to all spill situations, the response to a spill at the Facility would generally entail consideration of the following:

- Location Response Strategy - involves the use of on-site equipment and resources to contain and clean up minor spills, or to initiate response operations for larger spills. For a small spill such as a sheen of oil in the water, sorbent boom placed in the water with the Jon boat would be considered. A larger spill would require placement of containment boom. In the event of a major spill beyond the capabilities of on-site equipment, the focus of local response operations would be geared toward controlling the source of the spill.

- Nearshore Response Strategy - involves containment and recovery techniques and resources that can be used to prevent oil from reaching sensitive shorelines, such as by means of diversion or exclusion booming.

6.7 RESPONSE STRATEGIES (Cont'd)

- Shoreline Response Strategy - involves the use of techniques to most effectively remove oil from affected shorelines, taking into consideration factors such as the degree of oiling, shoreline type, and accessibility to the area, and environmental sensitivity.

- Open Water Response Strategy - involves the effective use of available on-water recovery equipment to contain and recover the oil.

- Non-Mechanical Response Strategies - involves the consideration of alternative techniques such as in-situ burning, dispersants and bioremediation. Each of these non-mechanical remediation efforts requires extensive assessment and agency involvement and will normally only be considered if they can be proven to be substantially more effective than mechanical recovery efforts. However, due to the population/industrial density and environmental sensitivity of the area, the Company does not intend to use these strategies.

The GRP and the Shoreline Countermeasures Assessment Manual (Ch. 9640) of the Northwest Area Contingency Plan provide extensive detail on the application of the above strategies. The Company will respond to a release with all necessary resources and personnel using the guidance contained in the GRP and the Shoreline Countermeasures Assessment Manual (Ch. 9640) of the Northwest Area Contingency Plan and in coordination with the Washington Department of Ecology. In the event of product release, The Company is committed to maintain its response throughout the incident until a satisfactory level of clean up is attained.

MSRC is capable of providing local and pre-trained response personnel with shoreline cleanup capability. Additional information can be found in MSRC's PRC application.

FIGURE 6.1

ENDANGERED/THREATENED SPECIES LISTING

The following is a complete listing of the endangered/threatened species in the State of Washington.

ANIMALS	
Common Name	**Scientific Name**
Albatross, short-tailed	*Phoebastria albatrus*
Bear, grizzly (Lower 48 state)	Ursus arctos horribilis
Butterfly, Oregon silverspot	*Speyeria zerene hippolyta*
Caribou, woodland (IO,WA,BC)	*Rangifer tarandus caribou*
Deer, Columbian white-tailed	*Odocoilcus virginianus leucuras*
Eagle, bald (lower 48 states)	*Haliaeetus leucocephalus*
Lynx, Canada (lower 48 states)	*Lynx Canadensis*
Murrelet, marbled (CA, OR, WA)	*Brachyramphus marmoratus marmoratus*
Owl, northern spotted	*Strix occidentalis caurina*
Pelican, brown (except U.S. Atlantic Coast, FL, AL)	*Pelecanus occidentalis*
Plover, western snowy (Pacific coastal pop.)	*Charadrius alexandrinus nivosus*
Rabbit, pygmy Columbia Basin DPS	*Brachy lagus iduhoensis*
Salmon, chinook (spring upper Columbia R.)	*Oncorhynchus (=Salmo) tshawytscha*
Salmon, chinook (Puget Sound)	*Oncorhynchus (=Salmo) tshawytscha*
Salmon, chinook (fall Snake R.)	*Oncorhynchus (=Salmo) tshawytscha*
Salmon, chinook (lower Columbia R.)	*Oncorhynchus (=Salmo) tshawytscha*
Salmon, chinook (spring/summer Snake R.)	*Oncorhynchus (=Salmo) tshawytscha*
Salmon, chum (Columbia R.)	*Oncorhynchus (=Salmo) keta*
Salmon, chum (summer-run Hood Canal)	*Oncorhynchus (=Salmo) keta*
Salmon, sockeye U.S.A. (Snake River, ID stock wherever found.)	*Oncorhynchus (=Salmo) nerka*
Salmon, sockeye U.S.A. (Ozette Lake, WA)	*Oncorhynchus (=Salmo) nerka*
Sea turtle, green (except where endangered)	*Chelonia mydas*
Sea turtle, leatherback	*Dermochelys coriacea*
Sea turtle, loggerhead	*Caretta caretta*
Sea-Lion, Steller (eastern pop.)	*Eumetopias jubatus*
Steelhead (upper Columbia River Basin)	*Oncorhynchus mykiss*
Steelhead (Snake River Basin)	*Oncorhynchus mykiss*
Steelhead (upper Willamette River)	*Oncorhynchus mykiss*
Steelhead (lower Columbia River)	*Oncorhynchus mykiss*
Trout, bull (U.S.A., coterminous, lower 48 states)	*Salvelinus confluentus*
Trout, Lahontan cutthroat	*Oncorhynchus clarki henshawi*
Whale, humpback	*Megaptera novaeangliae*
Wolf, Gray Western District Topolation Segment	*Canis lupus*

FIGURE 6.1

ENDANGERED/THREATENED SPECIES LISTING (Cont'd)

PLANTS	
Common Name	**Scientific Name**
Sandwort, Marsh	*Arenaria paludicola*
Paintbrush, golden	*Castilleja levisecta*
Stickseed, showy	*Huckelia venusta*
Dessert-parsley, Bradshaw's	*Lomatium bradshawii*
Howellia, water	*Howellia aquatilis*
Lupine, Kincaid's	*Lupinus sulphureus kincaidii*
Checker-mallow, Nelson's	*Sidalcea nelsoniana*
Checker-Mallow, Wenatchee Mountains	*Sidalcea oregana var. calva*
Catchfly, spalding's	*Silene spaldragii*
Ladies'-tresses, Ute	*Spiranthes diluvialis*

FIGURE 6.2

HUMAN POPULATIONS AND DRINKING WATER INTAKES

The following table identifies the cities and towns paralleling the shorelines of the nearshore waters of Puget Sound within the downstream planning distance calculation of the Facility, along with their corresponding populations.

CITY/TOWN	POPULATION
Downtown Seattle	900
South Queen Anne	9,000
Southeast Magnolia	5,600
North Beach	4,400
Edmonds	27,526
Kingston	‹ 250
Suquamish	‹ 500
Agate Point	‹ 250
Port Madison	‹ 500
Rollingbay	‹ 250
Manitou Beach	‹ 250
Ferncliff	‹ 100
Yeomalt	‹ 100
Winslow	‹ 500
Eagledale	‹ 250
Creosote	‹ 250
Port Blakely	‹ 250
South Beach	‹ 250
Manchester	‹ 250
Southworth	‹ 250
Alki	5,000
Fauntleroy	4,800
Ingelsea	‹ 1,000

7.0 OIL SPILL CLAIMS PROCEDURES

7.1 OIL SPILL CLAIMS EVENT TIERS

Oil spill claims events can be generally classified by the number of claims anticipated rather than the quantity of product released. These tiers are defined as follows:

Tier 1
● Up to 50 oil spill claims are anticipated
Tier 2
● Between 50 and 500 oil spill claims are anticipated
Tier 3
● More than 500 oil spill claims are anticipated

7.2 OIL SPILL CLAIMS MANAGEMENT

Management of oil spill claims will be provided by the Crisis Support Team Risk Management representatives in cooperation with the Incident Commander (Refer to Figure 2.2 for contact information). Outside contractors will support claims processing during all events.

7.3 INSURANCE

KMEP is insured in excess of the oil spill liability requirements for onshore facilities outlined in the Oil Pollution Act of 1990.

7.4 OIL SPILL CLAIMS HANDLING PROCESS

After an oil spill occurs, KMEP will advertise for claims following the information provided in Section 7.5. Oil spill claims information and forms will be made available through local claims centers, if established, or via the internet at http://response.kindermorgan.com. Sample claims forms and internal claim check and tracking forms are presented in Figures 7.1 through 7.3. Examples of documentation needed for various types of claims can be found in Section 7.10. Section 7.9 explains the KMEP claims adjudication process and provides related timeframes. Depending on the anticipated number of claims related to the spill, KMEP will establish local claim centers. Oil spill claims will be accepted by KMEP up to 3-years from the date that KMEP began advertising for claims or 3-years from the date that the injury or damage being claimed was reasonably discovered – whichever date is earlier. Natural Resources Damage Assessment (NRDA) claims are handled separately from other claims, and may be accepted by KMEP in a manner and timeframe agreed to by the company and the lead federal and/or state trustee agency.

7.5 OIL SPILL CLAIMS ADVERTISEMENTS

KMEP will advertise for claims after being advised to do so by our legal department, or within 15-days after being designated as the Responsible Party for an oil spill by the Federal On-Scene Coordinator (FOSC) or the USCG National Pollution Funds Center (NPFC). The geographic extent of the oil spill will dictate the publications in which claim advertisements will be placed. At minimum, KMEP will advertise for oil spill claims in the Seattle Times. The length of time advertisements will run in local publications will be based on recommendations provided by our legal department or the length of time specified by FOSC or the NPFC. A sample claims advertisement is presented in Figure 7.4.

7.6 OIL SPILL CLAIMS CONTACT INFORMATION

In the event of an oil spill contact information for oil spill claims, location of local claim centers and mailing address for claims submission will be available via the toll free Public Information Line (877) 936-2253 and on the internet at http://response.kindermorgan.com as well as in advertisements placed in local publications.

7.7 LOCAL CLAIMS CENTERS

Local claims centers will be established based on community need and/or the number anticipated claims. Local claims centers will remain in operation for as long as warranted by workload and community need.

7.8 OIL SPILL CLAIMS FORMS

The claims form used by KMEP is presented in Figure 7.1. A sample Claims Tracking Form is presented in Figure 7.2. Other forms may be used if they provide an equivalent level of information as that found in Figure 7.1. Information entered in the claim form must be typed or legibly hand-written in blue or blue-black ink. The claim form must include the “sum-certain” monetary amount being claimed and be signed by the claimant in black or blue-black ink. The Claims Tracking Sheet presented in Figure 7.2 is used in the claims adjudication process to track the status of claims received and Claim Check Sheet presented in Figure 7.3 is used to record the type of documentation provided with each claim.

7.9 OIL SPILL CLAIMS ADJUDICATION AND TIMEFRAME

KMEP will process claims in the order they are received. Each claim will be assigned a unique identification number which will be used to track the claim internally. The identification number can also be used by claimants who wish to provide additional information to support their claim, or inquire about the status of a claim. KMEP will review each claim received to ensure, as much as possible, that all needed information to make a claim decision has been provided by the claimant. If additional information is needed, we will request that the claimant forward that information to us so it can be added to the claim and considered during adjudication. If the information requested is not received within 90 days, KMEP will adjudicate the claim with the available information. This may result in a reduction of possible claim compensation or an outright

denial of the claim.

7.9 OIL SPILL CLAIMS ADJUDICATION AND TIMEFRAME (Cont'd)

Once KMEP sends the claimant a claim determination, the claimant must either accept or reject the offer within 60 days. The claimant must sign a release before the claim will processed for payment. If the claimant takes no action within 60 days after receiving the claim determination, the offer to pay the claim will be voided and the claim will be closed. If the claimant rejects the offer, they can provide additional information and ask KMEP to reconsider the claim determination; typically, this would start an entirely new review process with another claim determination made as a result of the reconsideration. Claims submitted to KMEP will be paid in the order that accepted offers (with signed releases) are received. Claims are usually paid with 30-days from the date KMEP receives the claimant's signed release.

7.10 OIL SPILL CLAIMS DOCUMENTATION

The amount and type of documentation needed to make a claim determination depends on many factors, including the claim type and the monetary amount claimed.

The following types of claims may be submitted to KMEP. Example types of documentation are also included below within the listing of each claim type. The examples provided are for reference only; they may or may not represent everything needed to adjudicate a claim.

Removal Costs: Costs to prevent, minimize, mitigate, or clean up the oil spill.
Examples of Proof and Documentation that may be needed:

- Proof that actions were coordinated with the FOSC.
- Witness statements
- Detailed description of actions
- Dates on which work was performed
- Analysis of spill substance
- Map of area
- Pictures of area, damage, and spill
- Receipts, invoices, or similar records with description of work
- How rates were determined and any comparison of rates
- Daily records of personnel costs including details on labor rates, hours, travel, and transportation
- Daily records of equipment costs including description and use
- Signed disposal manifests and proof of payment for disposal

- Payroll verification of hourly rate at the time of spill
- Verification of equipment rates for equipment used

7.10 OIL SPILL CLAIMS DOCUMENTATION (Cont'd)

Property Damage: Injury or damage to or economic loss resulting from destruction of real property (land or buildings) or other personal property including a boat.

Examples of Proof and Documentation that may be needed:

- Proof of ownership or leasehold interest in the property; lease or rental agreement of any substitute property used
- Proof or evidence that property was injured, destroyed, or not usable because of the oil spill
- Report of any expenses or money lost while the property was unavailable because of spill damage
- Proof of value of property both before and after the spill or injury
- Documented cost of repair or replacement of the property
- Proof of value of property before and after the spill
- Documentation that shows whether or not substitute property was available, and related costs of substitute property if used.
- Documentation that shows how claimant lost money from the damage to the property
- Witness statements
- Copy of title, deed, lease, or license to property in claimant's name
- Pictures or videotape of property and/or damage
- Maps or legal documents showing the location of the property within the spill area
- Professional property appraisals for the value of the property prior to and after the spill, actual selling price of the property, and evidence connecting the depressed selling price to the oil spill rather than to other economic or real property factors
- Copies of bills paid for repair of damage or two estimates showing activities and costs to repair the damage

7.10 OIL SPILL CLAIMS DOCUMENTATION (Cont'd)

Loss of Profits or Earning Capacity: Damages equal to the loss of profits or impairment of earning capacity due to the injury, destruction, or loss of property or natural resources

Examples of Proof and Documentation that may be needed:

- Proof that property or natural resources that were damaged, destroyed or lost, resulted in claimant's loss
- Proof the claimant's income was reduced due to the damage or loss of the property or natural resources and how much it was reduced
- Documentation showing the amount of profits and earnings in similar time periods
- Documentation showing any alternative employment or business during the period claimed and any income received during that period
- Documentation showing and savings to overhead costs or other normal expenses - those not paid as a result of the spill (commuting costs, utility fees, employee salaries)
- Photos of damaged property (before and after the spill)
- Witness Statements on how the spill led to loss of business income or earning capacity; explain any earnings anomalies
- Statement on how the spill caused a loss in income
- Affidavit from claimant's employer about the impact the spill had on an employees work or income, and if the employer intends to file a claim for lost profits or earning capacity.
- Copies of pay stubs, receipts, timesheets from before, during, and after the spill
- Personnel records from claimant's employer before, during, and after the spill, showing employment
- Claimant's description of efforts to reduce loss, including job search
- Copies of any job-hunting expenses (e.g., travel costs)
- Signed copies of income tax returns and schedules for at least two years prior to spill
- Details of employment expenses not paid during period being claimed (e.g., commuting costs)
- Copies of pay stubs, receipts, timesheets from alternative employment during time of spill (including unemployment compensation)
- Description and documentation of business losses due to spill
- Copies of letters of business cancellations caused by the spill damage
- Maps or descriptions of the area showing the business location and the spill impact area
- Financial statements for at least two years prior to spill and from the year of the spill

- Signed copies of business income tax returns and schedules for at least three years prior to spill

7.10 OIL SPILL CLAIMS DOCUMENTATION (Cont'd)

Loss of Profits or Earning Capacity (Continued):

- Details on efforts to mitigate business losses or why no efforts were taken
- For hotels, daily and monthly occupancy information for two years prior to spill and the year of the spill
- Description of marine charter business losses caused by the spill
- Evidence that charter vessel(s) was in the area impacted by the spill and were unable to carry on their business due to the spill
- Maps or descriptions of the area showing charter business location within spill area
- Signed copies of income tax returns (for charter boat business) and schedules for at least three years prior to spill
- Details on expenses not paid out during period being claimed (e.g., wages)
- Booking records for three years prior to spill and year of spill
- List of charter rates, including any services the business specializes in (e.g., sport fishing)
- Copies of any logs relating to boating activities for the year prior to and the year of the spill
- Registration documents for the vessel

Loss of Subsistence Use of Natural Resources: Loss of subsistence use claim if natural resources claimants depend on for subsistence use purposes that have been injured, destroyed, or lost by an oil spill event.

Examples of Proof and Documentation that may be needed:

- Proof that injury, destruction, or loss of natural resources would have been used by the claimant to obtain food, shelter, clothing, medicine, or other minimum necessities of life.
- Documentation identifying each specific natural resource for which compensation for loss of subsistence use is being claimed
- Description of the actual subsistence use you make of each specific natural resource you identify;
- Description of how and to what extent claimant's subsistence use of the natural resource was affected by the injury to, destruction of, or loss of, each specific natural resource;
- Description of claimant's efforts to mitigate subsistence use loss
- Description of alternative source(s) or means of subsistence available to claimant during the period

7.10 OIL SPILL CLAIMS DOCUMENTATION (Cont'd)

Loss of Government Revenue: Net loss by Federal, State, or Local Governments of taxes, royalties, rents, fees, or net profit shares due to the injury, destruction, or loss of real property, personal property, or natural resources.

Examples of Proof and Documentation that may be needed:

- Information showing that the loss of revenue was caused by the injury to, destruction of, or loss of real or personal property or natural resources caused by the discharge
- Information showing the amount, identity, and description of the revenue loss for which compensation is claimed, including the applicable authority for collecting the revenue, method of assessment, applicable rate, and dates of collection or periods of loss
- Documentation showing expenditures saved because revenue was not collected
- The total assessment or revenue collected and related expenditures for comparable revenue periods, typically covering two years
- Description of what revenues were impacted and how the spill caused a loss of revenues
- Copies of statutes, regulations, ordinances, etc., outlining applicable authority to raise such revenues, property affected, method of assessment, rate of assessment, and method and dates of collection of assessment
- Government financial reports showing total assessment or revenue collected for comparable periods, typically covering two years
- Details of any expenses not paid out by government

Increased Public Service Costs: Net costs by State & Local Governments for providing increased or additional public services during or after removal activities, including protection from fire, safety, or health hazards, caused by a discharge of oil or directly attributable to response to the oil spill Event.

Examples of Proof and Documentation that may be needed:

- Documentation showing justification for the public services provided, including documentation of what specific services were provided and the relationship to the spill.
- Documentation showing when services were provided during and after the oil spill removal.
- Documentation showing services were in addition to services normally provided
- Documentation showing the net cost for the services and the methods used to compute those costs

7.10 OIL SPILL CLAIMS DOCUMENTATION (Cont'd)

Increased Public Service Costs (continued)

- Reports showing the increased public services were required and if the services were due to fire, health, or safety hazards
- Detailed description of what increased services were necessary and why, including a distinction between removal activities, safety acts, and law enforcement acts, and if the increase was actually incurred or if normal resources were diverted for use
- Daily reports on the activities of the government personnel and equipment involved Government Labor and Equipment Rates:
- Payroll verification of the government hourly rate at the time
- Verification of the standard government equipment rates for any equipment claimed
- Signed and dated records of the spill including hourly rates for labor and equipment
- Explanation as to whether rates are fully loaded or not and formulas used
- Certification that rates used reflected actual costs incurred and did not include punitive damages or fees

REPORTED BY	REPORTED TO

AGENCY CUSTOMER ID: _____

APPLICABLE IN ALABAMA

Any person who knowingly presents a false or fraudulent claim for payment of a loss or benefit or who knowingly presents false information in an application for insurance is guilty of a crime and may be subject to restitution fines or confinement in prison, or any combination thereof.

APPLICABLE IN ALASKA

A person who knowingly and with intent to injure, defraud, or deceive an insurance company files a claim containing false, incomplete, or misleading information may be prosecuted under state law.

APPLICABLE IN ARIZONA

For your protection, Arizona law requires the following statement to appear on this form. Any person who knowingly presents a false or fraudulent claim for payment of a loss is subject to criminal and civil penalties.

APPLICABLE IN ARKANSAS, DELAWARE, KENTUCKY, LOUISIANA, MAINE, MICHIGAN, NEW JERSEY, NEW MEXICO, NEW YORK, NORTH DAKOTA, PENNSYLVANIA, RHODE ISLAND, SOUTH DAKOTA, TENNESSEE, TEXAS, VIRGINIA, AND WEST VIRGINIA

Any person who knowingly and with intent to defraud any insurance company or another person, files a statement of claim containing any materially false information, or conceals for the purpose of misleading, information concerning any fact, material thereto, commits a fraudulent insurance act, which is a crime, subject to criminal prosecution and [NY: substantial] civil penalties. In LA, ME, TN, and VA, insurance benefits may also be denied.

APPLICABLE IN CALIFORNIA

For your protection, California law requires the following to appear on this form: Any person who knowingly presents a false or fraudulent claim for payment of a loss is guilty of a crime and may be subject to fines and confinement in state prison.

APPLICABLE IN COLORADO

It is unlawful to knowingly provide false, incomplete, or misleading facts or information to an insurance company for the purpose of defrauding or attempting to defraud the company. Penalties may include imprisonment, fines, denial of insurance, and civil damages. Any insurance company or agent of an insurance company who knowingly provides false, incomplete, or misleading facts or information to a policy holder or claimant for the purpose of defrauding or attempting to defraud the policy holder or claimant with regard to a settlement or award payable from insurance proceeds shall be reported to the Colorado Division of Insurance within the Department of Regulatory Agencies.

APPLICABLE IN THE DISTRICT OF COLUMBIA

Warning: It is a crime to provide false or misleading information to an insurer for the purpose of defrauding the insurer or any other person. Penalties include imprisonment and/or fines. In addition, an insurer may deny insurance benefits, if false information materially related to a claim was provided by the applicant.

APPLICABLE IN FLORIDA

Pursuant to S. 817.234, Florida Statutes, any person who, with the intent to injure, defraud, or deceive any insurer or insured, prepares, presents, or causes to be presented a proof of loss or estimate of cost or repair of damaged property in support of a claim under an insurance policy knowing that the proof of loss or estimate of claim or repairs contains any false, incomplete, or misleading information concerning any fact or thing material to the claim commits a felony of the third degree, punishable as provided in S. 775.082, S. 775.083, or S. 775.084, Florida Statutes.

APPLICABLE IN HAWAII

For your protection, Hawaii law requires you to be informed that presenting a fraudulent claim for payment of a loss or benefit is a crime punishable by fines or imprisonment, or both.

APPLICABLE IN IDAHO

Any person who knowingly and with the intent to injure, defraud, or deceive any insurance company files a statement of claim containing any false, incomplete or misleading information is guilty of a felony.

APPLICABLE IN INDIANA

A person who knowingly and with intent to defraud an insurer files a statement of claim containing any false, incomplete, or misleading information commits a felony.

AGENCY CUSTOMER ID: _____

APPLICABLE IN KANSAS

Any person who, knowingly and with intent to defraud, presents, causes to be presented or prepares with knowledge or belief that it will be presented to or by an insurer, purported insurer, broker or any agent thereof, any written statement as part of, or in support of, an application for the issuance of, or the rating of an insurance policy for personal or commercial insurance, or a claim for payment or other benefit pursuant to an insurance policy for commercial or personal insurance which such person knows to contain materially false information concerning any fact material thereto; or conceals, for the purpose of misleading, information concerning any fact material thereto commits a fraudulent insurance act.

APPLICABLE IN MARYLAND

Any person who knowingly or willfully presents a false or fraudulent claim for payment of a loss or benefit or who knowingly or willfully presents false information in an application for insurance is guilty of a crime and may be subject to fines and confinement in prison.

APPLICABLE IN MINNESOTA

A person who files a claim with intent to defraud or helps commit a fraud against an insurer is guilty of a crime.

APPLICABLE IN NEVADA

Pursuant to NRS 686A.291, any person who knowingly and willfully files a statement of claim that contains any false, incomplete or misleading information concerning a material fact is guilty of a felony.

APPLICABLE IN NEW HAMPSHIRE

Any person who, with purpose to injure, defraud or deceive any insurance company, files a statement of claim containing any false, incomplete or misleading information is subject to prosecution and punishment for insurance fraud, as provided in RSA 638:20.

APPLICABLE IN OHIO

Any person who, with intent to defraud or knowing that he/she is facilitating a fraud against an insurer, submits an application or files a claim containing a false or deceptive statement is guilty of insurance fraud.

APPLICABLE IN OKLAHOMA

WARNING: Any person who knowingly and with intent to injure, defraud or deceive any insurer, makes any claim for the proceeds of an insurance policy containing any false, incomplete or misleading information is guilty of a felony.

APPLICABLE IN WASHINGTON

It is a crime to knowingly provide false, incomplete, or misleading information to an insurance company for the purpose of defrauding the company. Penalties include imprisonment, fines and denial of insurance benefits.

Documents Provided		
1	Claim Form - Signed (Accord, GL Notice of Occurrence or Equivalent)	
2	Affidavit from employer on the impact on work or income due to the spill and if the company will be filing a claim for lost profits	
3	Analysis of spill substance	
4	Any expenses or money lost while the property was unavailable because of spill damage	
5	Beach closures or fishing advisories	
6	Booking records for three years prior to spill and year of spill	
7	Certification that rates used reflected actual costs incurred and did not include punitive damages or fees	
8	Copies of any job-hunting expenses (e.g., travel costs)	
9	Copies of any logs relating to boating activities for the year prior to and the year of the spill	
10	Copies of bills paid for repair of damage or two estimates showing activities and costs to repair the damage	
11	Copies of letters of business cancellations caused by the spill damage	
12	Copies of pay stubs and other documentation showing income Claimant received before, during, and after the spill and oil spill response	
13	Copies of pay stubs, etc., from alternative employment during time of spill	

Documents Provided		
14	Copies of pay stubs, receipts, etc., from before, during, and after the spill	
15	Copies of statutes, regulations, ordinances, etc., outlining applicable authority to raise such revenues, property affected, method of assessment, rate of assessment, and method and dates of collection of assessment	
16	Copy of title, deed, lease, or license to property in Claimant's name	
17	Daily records of equipment costs including description and use	
18	Daily records of personnel costs including details on labor rates, hours, travel, and transportation	
19	Daily reports on the activities of the government personnel and equipment involved	
20	Dates on which work was performed	
21	Describe any compensation available to Claimant for the subsistence loss Claimant suffered	
22	Describe each alternative source or means of subsistence available to Claimant during the period of time for which Claimant claim a loss of subsistence	
23	Describe each effort Claimant made to mitigate Claimant's subsistence use loss	
24	Describe how and to what extent Claimant's subsistence use of the natural resource was affected by the injury to, destruction of, or loss of, each specific natural resource	
25	Describe the actual subsistence use Claimant make of each specific natural resource Claimant identify	
26	Description and documentation of business losses due to spill	
27	Description of business losses caused by the spill	
28	Description of efforts to reduce Claimant's loss, including job search	
29	Description of what revenues were impacted and how the spill caused a loss of revenues	
30	Detailed description of actions	

Documents Provided		
31	Detailed description of what increased services were necessary and why, including a distinction between removal activities, safety acts, and law enforcement acts, and if the increase was actually incurred or if normal resources were diverted for use	
32	Details and explanation of net loss of revenue	
33	Details of any expenses not paid out by government during the period being claimed	
34	Details of employment expenses not paid during period being claimed (e.g., commuting costs)	
35	Details on efforts to mitigate losses or why no efforts were taken	
36	Details on expenses not paid out during period being claimed (e.g., wages)	
37	Evidence connecting the depressed selling price of a property to the oil spill rather than to other economic or real property factors	
38	Evidence that vessel(s) were in the area impacted by the spill and were unable to carry on their business due to the spill	
39	Explanation as to whether rates are fully loaded or not and formulas used; states should provide rates under OMB Circular A-87	
40	Financial statements for at least two years prior to spill and from the year of the spill	
41	For hotels, daily and monthly occupancy information for two years prior to spill and the year of the spill	
42	FOSC report	
43	FOSC, natural resource trustee and newspaper reports describing the oil spill and response, and the resulting injury, destruction or loss of natural resources	
44	Government financial reports showing total assessment or revenue collected for comparable periods, typically covering two years	
45	Government Labor and Equipment Rates	
46	How rates were determined and any comparison of rates	

Documents Provided		
47	Identify each specific natural resource for which compensation for loss of subsistence use is being claimed	
48	Information in EPA or USCG notifications, and claims advertising	
49	Information on EPA or USCG notification	
50	Lease or rental agreement of any substitute property used	
51	List of charter rates, including any services the business specializes in (e.g., sport fishing)	
52	Map of area	
53	Maps or descriptions of the area showing business location within spill area	
54	Maps or descriptions of the area showing the business location and the spill impact area	
55	Maps or legal documents showing the location of the property within the spill area	
56	Maps	
57	Newspaper reports describing the spill	
58	Payroll verification of hourly rate at the time of spill	
59	Payroll verification of the government hourly rate at the time	
60	Personnel records from Claimant's employer before, during, and after the spill, showing employment	
61	Photographs and videos	
62	Photos of damaged property (before and after the spill)	
63	Pictures of area, damage, and spill	
64	Pictures or videotape of property and/or damage	
65	Professional property appraisals for the value of the property prior to and after the spill	

Documents Provided		
66	Published accounts, witness statements and other written records documenting Claimant's use of natural resources for subsistence purposes before, during, and after the spill and oil spill response	
67	Receipts, invoices, or similar records with description of work	
68	Records showing compensation Claimant received for Claimant's loss	
69	Records showing the expenses Claimant avoided during the time Claimant were not able to carry out Claimant's subsistence use of the affected natural resource	
70	Registration documents for the vessel(s), copies of business license, vessel license, fishing license, captain's license	
71	Reports showing the increased public services were required and if the services were due to fire, health, or safety hazards	
72	Signed and dated records of the spill including hourly rates for labor and equipment	
73	Signed copies of income tax returns and schedules for at least three years prior to spill	
74	Signed copies of income tax returns and schedules for at least two years prior to spill	
75	Signed disposal manifests and proof of payment for disposal	
76	Statement from Claimant or witnesses on how the spill caused the loss of income; explain any earnings anomalies	
77	Statement from Claimant or witnesses on how the spill led to loss of income or earning capacity; explain any earnings anomalies	
78	Statement on how the spill caused a loss in income	
79	Store and barter receipts showing the replacement costs Claimant claim;	
80	Verification of standard equipment rates for equipment used	
81	Verification of the standard government equipment rates for any equipment claimed	

Documents Provided		
82	Witness statements and documents showing the alternative sources of subsistence available to Claimant, and Claimant's efforts to reduce the damages resulting from Claimant's loss of subsistence use, including receipts from job-hunting expenses (e.g., travel costs)	
83	Witness statement(s)

CompanyX

Oil Spill - January 24, 2010
4300 Gallons Heavy Oil
Budd Inlet (Olympia, WA)
South Puget Sound

The U.S. Coast Guard National Pollution Funds Center has designated CompanyX as the Responsible Party for an oil spill that occurred around 7:00AM (PST) on January 24, 2010, impacting the waters of Budd Inlet and South Puget Sound. An estimated 4,300 gallons of heavy fuel oil was released from our facility on Boston Harbor Road (in Olympia) into Budd Inlet and South Puget Sound.

CompanyX is receiving claims related to this incident. Information about claims and the claims process is available on-line at the CompanyX website (see link below). You can also call, email, or mail us if you need additional assistance or information.

Website: **www.companyx.com\claims.htm**

Email: **claims@companyx.com**

Phone: **(360) 407-0007** (Mon-Sat, 8am to 5pm PST)

Mail: CompanyX – Oil Spill Claims

EMERGENCY RESPONSE ACTION PLAN (ERAP)

The users of this Plan carry and maintain the complete Volume 1 and Volume 2 documents and the Plan has been designed for quick reference. Accordingly, the Emergency Response Action Plan (ERAP) for this Integrated Contingency Plan is addressed by cross-reference as follows:

● Qualified Individual	Volume 1 Figure 2.3; Volume 2 § 8.1.2
● Emergency Notification Phone List	Volume 1§ 2.1, 2.2; Volume 2 § 2.1, 2.2
● Spill Response Notification Form	Volume 1 Figure 2.2
● Response Equipment List and Location	Volume 2 § 3.1 and Figure 3.2
● Response Equipment Testing and Deployment	Volume 2 § 3.1, 3.2, 3.3, Figure 3.4
● Facility Response Team	Volume 1 § 2.0; Volume 2 § 2.0
● Evacuation Plan	Volume 2 § 8.4
● Immediate Actions	Volume 1 § 3.4
● Facility Diagram	Volume 2 § 8.1.2, Figure 8.3

REVISION RECORD			
CHANGE DATE	**REMOVE**	**INSERT**	**DESCRIPTION OF CHANGE(S)**
	PAGE NUMBER(S)		
October 2002	ALL	ALL	New plan distribution by RMA replacing all former CalNev Pipeline, GATX Terminals, and SFPP, L.P. OPA 90 Response Plans
April 2004	Major revisions to all sections	Major revisions to all sections	General Plan Updates; Revisions to Address DOT-RSPA Review
January 2005	Pgs. iii, TOC-i, TOC-ii, TOC-v, 1-5, 1-9, 2-1, 2-2, 2-7 thru 2-13, 3-1, 3-3, 3-5 thru 3-34, Eugene - 8.2-14, 8.2-21,Linnton-Willbridge - 7-4, Linnton - 8.2-12, 8.2-18, 8.2-19, 8.3-21, 8.3-22, Willbridge - 8.2-3, 8.2-22, 8.2-23, 8.2-30, Harbor Island - 8.1-6, 8.1-8, 8.2-15, 8.2-21 thru 8.2-23, 8.3-2, 8.3-7, 8.3-9 thru 8.3-24	Pgs. iii, TOC-i, TOC-ii, TOC-v, 1-5, 1-9, 2-1, 2-2, 2-7 thru 2-13, 3-1, 3-3, 3-5 thru 3-34, Eugene - 8.2-14, 8.2-21,Linnton-Willbridge - 7-4, Linnton - 8.2-12, 8.2-18, 8.2-19, 8.3-21, 8.3-22, Willbridge - 8.2-3, 8.2-22, 8.2-23, 8.2-30, Harbor Island - 8.1-6, 8.1-8, Add Figure 8.3a, 8.2-15, 8.2-21 thru 8.2-23, 8.3-2, 8.3-7, 8.3-9 thru 8.3-24	Facility information update and miscellaneous revisions
June 2005	Pgs. iii, iv; Linnton - 8.3-9; Willbridge - 8.3-9; Harbor Island - 8.3-8	Pgs. iii, iv; Linnton - 8.3-9; Willbridge - 8.3-9; Harbor Island - 8.3-8	Facility information update and miscellaneous revisions; Revisions to address Notifications and OSPR review.
October 2005	Pgs. iii, v, 2-6 thru 2-10, Linnton – 8.1-2, Willbridge – 8.1-3	Pgs. iii, v, 2-6 thru 2-10, Linnton – 8.1-2, Willbridge – 8.1-3	General Plan Update
December 2005	Pgs. Foreword, Table of Contents, Sec. 2.0, 3-2, 3-4, 3-22, 3-34, 4-8, Oregon Pipeline Area - Sec. 6.0, Eugene - Sec. 8.2, Linnton - 8.1-3, Sec. 8.2, Willbridge - 8.1-3, Sec. 8.2, Harbor Island - Sec. 8.2 (See revision packet for specific pages.)	Pgs. Foreword, Table of Contents, Sec. 2.0, 3-2, 3-4, 3-22, 3-34, 4-8, Oregon Pipeline Area - Sec. 6.0, Eugene - Sec. 8.2, 8.4-4 (Fig. 8.9 & inserts), Linnton - 8.1-3, Sec. 8.2, 8.4-4 (Fig. 8.9 & inserts), Willbridge - 8.1-3, Sec. 8.2, 8.4-4 (Fig. 8.9 & inserts), Harbor Island - Sec. 8.2, 8.4-4 (Fig. 8.9 & inserts) (See revision packet for specific pages.)	General Plan Update; Revisions to Distribution List (Copies #39-41).

1.2 OPERATING ASSETS COVERED BY THIS PLAN

The following tables provide a general information summary for the pipeline sections, pipeline facilities, breakout stations and terminals in each of the Areas in this Region. Specific detail can be located in the following sections for the applicable area.

- Section 6 – Area Pipeline Sections (for US DOT and Oregon DEQ jurisdiction)
- Section 7 – Area Breakout Stations (for US DOT and Oregon DEQ jurisdiction)
- Section 8 – Area Terminals (for EPA, USCG and Oregon DEQ jurisdiction)

1.3 SUBSTANTIAL HARM

It is Kinder Morgan Energy Partners, L.P. (KMEP)'s goal to respond as quickly as possible to all uncontrolled releases of petroleum product, regardless of the source point location along the system. Based upon this goal, and the overbreadth of the definitions provided in each of the applicable regulations, KMEP is compelled to consider all of the Facility's breakout stations, and active line sections listed above in this Section as capable of a release potentially causing "significant and substantial harm". A summary of the worst case discharge scenarios for these facilities is provided as follows:

NORTHERN REGION NORTHWEST WORST CASE DISCHARGE DOT JURISDICTION	
Discharge Scenario	**Planning Volume**
(b) (7)(F), (b) (3)	

* DOT worst case discharge volumes are based on 50% of the tank's maximum storage capacity and for pipelines based on an annual Integrity Management Program study, as follows:

Release volume prior to line shutdown and valve closures (Initial Loss):

- Full flow release due to rupture. This is computed at the maximum pumping rate the line segment.
- Detection time, analysis and pump shutdown in adverse weather conditions. This is based on a maximum of fifteen (15) minutes in the event of a full flow rupture, which would cause an instant alarm (unless otherwise noted in the line segment information).
- Line segment valve closures. All line segments are equipped with remote activating isolation valves. Adverse weather would have no impact on line segment isolation, as isolation valves are not dependent on manual closure.

Line drainage following pump shutdown (Stabilization Loss) is computed the maximum potential line drainage between adjacent isolation or check valves, and incorporated pipeline elevation profiles to estimate how much of that total volume would escape at any release point along the line. The historic discharges have not approached either the breakout tank WCD volume or the pipeline WCD in the area.

1.3 SUBSTANTIAL HARM (Cont'd)

NORTHERN REGION NORTHWEST WORST CASE DISCHARGE EPA JURISDICTION	
Discharge Scenario	**Planning Volume**
Small Discharge	
• Eugene Terminal	50 Bbls
• Linnton Terminal	50 Bbls
• Willbridge Terminal	50 Bbls
Medium Discharge	
• Eugene Terminal	857 Bbls
• Linnton Terminal	857 Bbls
• Willbridge Terminal	857 Bbls
Worst Case Discharge	
(b) (7)(F), (b) (3)	

Note: EPA worst case discharge is based on the maximum storage capacity of the largest tank at each terminal.

NORTHERN REGION-NORTHWEST DISCHARGE SCENARIOS USCG JURISDICTION	
Discharge Scenario	**Planning Volume**
(b) (7)(F), (b) (3)	

1.3 SUBSTANTIAL HARM (Cont'd)

NORTHERN REGION-NORTHWEST DISCHARGE SCENARIOS ODEQ JURISDICTION	
Discharge Scenario	**Planning Volume**
(b) (7)(F), (b) (3)	

These Worst Case Discharge/Spill volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three-tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. Sections 6, 7, 8 and 9 of this Plan demonstrate a series of calculations and planning volume determinations based on guidance provided by all applicable regulations. The inclusion of these calculations is for demonstration of the response planning volumes and response capability necessary for on-water and on-shore recovery requirements as the result of the discharge scenarios detailed in the table above.

1.4 FORMAT AND SCOPE OF PLAN

This Volume 2 of the Integrated Contingency Plan (ICP) is intended to guide emergency response activities throughout KMEP's Pacific Operation Northern Region Northwest. This Region is divided into two (2) Areas (see Figure 1.2) each of which has its own tab in this document. These areas are as follows:

- Oregon Pipelines Area
- Linnton-Willbridge Area

Each of the Volume 2 plans in this ICP has Sections 1 through 5 that contain information and procedures common to all facilities in the Region. Section 6 of each Area details the Pipeline Sections in the respective Area, Section 7 of each Area details the Breakout Stations and/or Terminals (DOT-jurisdictional) in the respective Area, Section 8 of each Area details the Terminals (multi-jurisdictional) in the respective Area, and, in California and Oregon, Section 9 addresses state specific requirements for jurisdictional line segments. The Areas covered by this particular Plan are identified on the front cover of this Plan, on the footer of each page and on the map provided in Figure 1.2.

Volume 1 of the Integrated Contingency Plan provides guidance which is consistent across the Pacific Operations. The two (2) documents are intended to work together as one seamless Integrated Contingency Plan for the various facilities/operations and agency jurisdictions in Pacific Operations.

1.5 INTERFACE WITH OTHER PLANS

This Plan is consistent with the most recent versions of the National Contingency Plan (NCP) and applicable Area Contingency Plans (ACPs). The applicable ACPs for the Facilities included in this Plan are:

- National Contingency Plan
- Canada – US Joint Contingency Plan
- Northwest Area Contingency Plan
- Local Emergency Response Plan

The interface between this Plan and the plans listed above is illustrated in Figure 1.1.

2.0 NOTIFICATIONS

2.1 INTERNAL NOTIFICATIONS

Specific reference to all internal notifications is detailed in Volume 1 Section 2.1 which provides the following:

- Operator Notification Process (Figure 2.1a)
- Company Employees Other Than Operator Notification Process (Figure 2.1b)
- Controller - Orange, CA Notification Process (Figure 2.1c)
- Controller - Houston, TX Notification Process (Figure 2.1d)
- Managers Notification Process (Figure 2.1e)
- Initial Reporting Details Form (Figure 2.2)
- Northern Region Internal Notifications References (Figure 2.3a)
- Southern Region Internal Notifications References (Figure 2.3b)
- Crisis Support Team Internal Notifications References (Figure 2.3c)

2.2 EXTERNAL NOTIFICATIONS

Specific reference to all **"Regulatory Required"** external notifications is detailed in Volume 1 Figure 2.1 and Figure 2.4. **With the exception of notification to 911 and/or local fire/police agencies which are handled by local area operations, the Environmental, Health and Safety (EHS) and/or Compliance, Codes and Standards is responsible for making all regulatory required external notifications.**

The locally required notifications and additional external notification references which are detailed in the following Volume 2 Figure 2.1 provide for assistance/advisory notifications.

3.0 RESPONSE RESOURCES

The following Section outlines the various response equipment/resources available from the Facility, other Company facilities, and other outside resources.

3.1 AREA RESPONSE EQUIPMENT

This Area of the KMEP operations maintains response equipment readily available for spill response as detailed on the "Facility Response Equipment" lists provided in Figure 3.1 and the "Pipeline Repair Equipment" lists provided in Figure 3.2. The equipment is stored at locations in the Area as detailed on the equipment lists

The preventative maintenance schedule requires a monthly inventory and visual inspection of spill response equipment. Maintenance and repair is performed as needed, following manufacturers recommended procedures. The equipment will be exercised as semi-annually (Facility equipment) or annually (pipeline equipment) as required (PREP Guidelines). A sample form for documenting these Equipment Deployment Exercises is provided in Figure 3.4. Equipment Deployment Exercises must be scheduled on the NWAC Drill Calendar 10 days prior to conducting an Equipment Deployment Exercise. A sample scheduling form is provided in Figure 3.5.

KMEP has contracts in place with Oil Spill Removal Organizations and other clean-up and response contractors that are capable of responding to all discharges within the Area and supplementing Area KMEP resources.

The Qualified Individual has the authority to activate these and other KMEP resources or that of private contractors and other experts and consultants as the situation demands.

3.2 OTHER COMPANY RESOURCES

Neighboring KMEP Areas have response resources similar to those provided in this Area (Figures 3.1 and 3.2). These resources as well as additional Company spill response equipment and manpower resources may be available to supplement the response operation.

3.3 CONTRACT RESOURCES

In the event of a discharge which is beyond the initial response capabilities of the Local Response Team, contract manpower and equipment resources can be obtained through Oil Spill Removal Organization(s) (OSRO). These OSROs can provide manpower and containment/clean-up equipment for the response operation. The Company will ensure that each OSRO has a comprehensive maintenance program and applicable training / drills programs in place at contract renewal.

Response resources will be secured from a Company approved contractor. Facility Management will typically handle notification/implementation of these resources. Section 2 of this Volume provides a quick reference to the OSROs and additional clean-up and response contract organizations.* Specific reference to their response capability (UCSG OSRO classification) is provided in Figure 3.3.

These OSRO's have adequate equipment and personnel resources available within the Area to respond to the applicable regulatory planning volumes in the required time frames.

3.3 CONTRACT RESOURCES (Cont'd)

OSROs have the expertise to conduct and lead on water and shoreline containment and recovery efforts. KMEP personnel will oversee and coordinate with the OSRO to ensure their actions conform to overall incident objectives and established incident action plans.

OSROs also have extensive experience in using the Area Contingency Plans (ACPs) as a resource when responding to an incident that has affected a navigable waterway. The KMEP Incident Commander, Planning Officer and Operations Chief will employ the OSRO's experience to integrate applicable local ACPs into the overall incident action plans.

3.4 AREA CONTINGENCY PLANS (ACP)

Area Committees comprised of Federal, state and local agencies develop ACPs. Response efforts performed within a certain "area" should reference the ACPs for that specific area. ACPs include clean-up strategies and information on environmentally sensitive areas within a particular region. Some of the ACPs include maps, shoreline characteristics and booming strategies for specific areas while other ACPs offer priority lists of environmentally sensitive areas.

ACPs generally contain the following information:

- Physical features
- Seasonal concerns
- Resources of primary concern
- Containment, and cleanup strategies, including recommended techniques
- Equipment considerations
- Incident Command System Roles and Responsibilities (NIMS)

To identify specific spill response and protection strategies for the applicable region/area, ACP and Geographic Response Plan information can be found at: http://kmonline.kindermorgan.com/operations/products/pacific_icp/pacific_icp.html Responders can navigate through the site to locate the region/area of interest and the appropriate response resources needed for the operation.

For all controlled copies of the Integrated Contingency Plan distributed to non-KMEP plan holders, a CD-ROM containing the same information as referenced above will be included in a CD-sleeve in Volume 1 (inside front cover) or in a separate folder in electronic copies and is referenced in Figure 4.2.

To determine adequate response resources, the Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three (3) tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. The tier requirements for high volume areas are for response in six (6) hours (Tier 1), 30 hours (Tier 2), and 54 hours (Tier 3). High volume areas are listed in 49 CFR 194. The tier requirements for all other areas are for response in 12 hours (Tier 1), 36 hours (Tier 2), and 60 hours (Tier 3).

3.5 COOPERATIVE/MUTUAL AID RESOURCES

KMEP is a member of the Clean Rivers Cooperative for the pipelines in the Linnton-Willbridge Area.

3.6 EXPERTS AND CONSULTANTS

KMEP maintains a relationship with various environmental and technical consultants that can provide support in the event of an emergency incident. These consultants can provide expertise and support in the areas of emergency response management, environmental services, site assessment, permitting, waste treatment, recycling, dewatering, hazardous waste disposal, and remediation.

3.7 VOLUNTEERS

Volunteers will not be utilized by KMEP for the response operations. All volunteers will be referred to the Federal or State On-Scene Coordinator.

3.8 COMMUNICATIONS

Effective and efficient communications systems are essential for emergency response at every level. The communications system will be utilized to gather information and current status reports as well as to provide coordination and direction to widely separated work groups involved in search, containment/ diversion, repair, traffic control, public control or evacuation, and restoration.

Communication of the overall spill response operation between KMEP and the responsible government agencies in the Federal Regional Response Team (RRT) will occur between the Incident Commander and the Federal On-Scene Coordinator.

3.8.1 Central Communications System

Prearranged communication channels are of the utmost importance in dealing with KMEP emergencies. The notification procedures and telephone contacts documented in Section 2 of Volume 1 and Volume 2 will be reviewed in accordance with the earlier documented updating procedures. The predetermined communications channels include the following:

- A list of required Federal and state emergency telephone numbers for the Orange Control Center and emergency response personnel (Section 2 of Volume 1).
- A list of emergency telephone numbers for various external resources such as the fire and police department, medical, and regulatory agencies (Figure 2.1).
- A list of emergency telephone numbers for contract response resources (Figure 2.1).

3.8 COMMUNICATIONS (Cont'd)

3.8.2 Communications Equipment

Field communications during a spill response to a small or medium discharge will be handled via the existing KMEP communications network. This network will utilize existing radios, telephones, pagers, fax machines, and computers and will be maintained by KMEP personnel. In the event of a Worst Case Discharge, field communications will be enhanced with other KMEP and contract resources as the situation demands.

Each KMEP responder has, at a minimum, a cellular telephone. All KMEP response personnel also have access to other telephones, radios and satellite communications equipment that may be needed for effective response operations. Additionally, communications equipment is maintained in the KMEP spill response trailers. The Logistics Officer would create a communications plan based on the equipment immediately available and would identify the need for any additional equipment that may be needed throughout the response effort.

3.8.3 Communication Types

Radios - Handheld and vehicle mounted radio sets are the most effective means of communication for the field response operation. The units are battery operated, multi-channeled and have a typical range that will cover the area of the response operation. Each location maintains a minimum of 4 radio sets, functionally maintained per manufacturer's specifications and used during normal daily operations. In addition, KMEP will rely on radio sets provided by contract resources. Additional radio sets and battery packs/chargers will be necessary in the event of a prolonged response operation and will be procured as needed through direct purchase or contract resources.

Telephone (Conventional) - Conventional land line telephones are the most effective means of communication for regulatory and advisory notifications during a spill response operation. Additional telephone lines can be installed in the event of a prolonged response operation.

Telephone (Cellular) - Cellular telephones allow for added mobility and response effectiveness. Cellular phones are commonly maintained by certain KMEP personnel. Additional cellular phones can be secured in the event of a prolonged response operation.

Telephone (Satellite) – Satellite telephones allow for added mobility and response effectiveness. KMEP maintains several satellite telephones in the regional offices in Fairfield and Orange, California. These telephones maybe deployed as needed.

Pagers - Pagers are used for rapid notification to field personnel when radio and telephone resources are limited. Selected management and response team members carry pagers.

FAX Machines - FAX machines allow for a rapid transfer of information/ documentation such as status reports/updates, written notifications, and purchase orders.

Computers - Computers are commonly used in networks which allow access to various other locations and KMEP personnel. Computers also speed the consolidation of information and preparation of written reports.

NATIONAL RESPONSE CORPORATION ENVIRONMENTAL SERVICES (NRCES)

WORK DIRECTIVES

LINNTON AND WILLBRIDGE TERMINALS

Agreement Number: 11559

WORK DIRECTIVE

To:	NRC ENVIRONMENTAL SERVICES COMPANY Attention: Stephanie Barton 815 West Ewing St Seattle, WA 98119 **Phone:** 206-730-3993 **Fax:** 206-652-0840 **Email:** sbarton@nrces.com	Date:	May 2, 2011
		Work Directive No.:	402461-55-CONT
		Agreement No.:	11559
		Account Coding:	10-049446906364-623200 - 9400 --

Work Directive Origin: ORANGE, CA

This Work Directive is entered pursuant to the terms of the **EMERGENCY RESPONSE** Agreement ("Agreement") dated June 1, 2005, by and between KINDER MORGAN OPERATING L.P. "D" ("COMPANY") and NATIONAL RESPONSE CORPORATION ("CONSULTANT"). By its execution hereof, CONSULTANT agrees to perform for the KM entity named below and executing this Work Directive pursuant to the terms, conditions and provisions of the Agreement, the following described Work, which will additionally describe "Covered Tasks" as provided for under DOT Operator Qualification Requirements, and shall furnish all services, labor, supervision, technical capability, tools, equipment, transportation, materials, (except as set forth below), and other facilities and items necessary or convenient to complete the following work as further described and specified in the Specifications and/or Drawing(s) attached hereto or the Agreement and by this reference made a part of this Work Directive ("the Work"). If CONSULTANT's proposal, quotation, or any other CONSULTANT document supplied to the KM entity named below is included as part of this Work Directive or another exhibit to the Agreement, then any terms or conditions provided by CONSULTANT which differ from or conflict with Company's terms and conditions are hereby rejected and shall be of no force or effect. The KM entity named below in this Work Directive shall be solely responsible for the liabilities and obligations set forth in the Agreement under which this Work Directive is being issued, as the same apply to the Work to be performed pursuant hereto. All such liabilities and obligations, as they apply to this Work Directive, shall be non-recourse to the Company (if the COMPANY is not the KM Entity executing this Work Directive) and other related entities as further provided for and agreed in the Agreement. Payments made to CONSULTANT under this Work Directive shall include all taxes and similar charges except as otherwise agreed to herein or under the terms of the Agreement. Any capitalized term used in this Work Directive and not otherwise defined herein shall have the meaning as ascribed in the Agreement.

1. Project Name:	2011 OSRO Emergency Response	Location:	Linnton Terminal, 11400 NW St. Helens Rd, Portland, OR 97231

Description of Work:

National Response Corporation shall provide Kinder Morgan Liquids Terminal, LLC (Linnton Terminal) with all trained personnel, labor, tools, and equipment necessary to provide Oil Spill Removal Organization (OSRO) services to meet the State of Oregon and Federal OPA '90 requirements for contracted oil spill response services as follows:

- Kinder Morgan Liquids Terminals, LLC Linnton Terminal Pipelines located at 11400 NW St. Helens Rd, Portland, OR 97231

CONSULTANT Services to include:

- 2800 feet of boom and a means to deploy it within two (2) hours of notification.
- Sufficient Response Resources to enable the COMPANY to meet the requirements of the State of Oregon and OPA '90 for pre-contracted Response Resources beginning with two (2) hour requirement at the commencement of the Agreement including:
- Recovery and Storage capabilities rated by the State of Oregon and USCG as capable of meeting the planning volumes of the covered pipeline or facility, including 2 (two) hour response requirements for the facilities;
- Compliance with all State of Oregon and USCG Oil Spill Removal Organization (OSRO) requirements including required equipment deployments and personnel training. Documentation compliance with these requirements must be submitted annually to Kinder Morgan at:

  Attention: Chuck Mathis @ charles_mathis@kindermorgan.com.

- Compliance by the CONSULTANT and CONSULTANT'S subCONSULTANTs' with all applicable Federal Occupational Safety and Health Adminstration (OSHA) standards and similar State Laws and standards.
-

For Questions, contact Jeff Hibner at 503-220-1263

2. The COMPANY shall furnish the following materials to the work site(s):	None, unless previously approved by the KM Entity's authorized representative.
3. The Work shall be performed at the following location:	Location where work will be performed, if different from Project Location indicated above.

4. CONSULTANT shall commence the Work by January 1, 2011, and shall complete the Work on or before December 31, 2011.

5. CONSULTANT offers to complete the Work in accordance with the Agreement for the following consideration, which shall constitute full and complete payment therefore:

(a) ☐ the total Lump Sum Amount	Fixed Price Of
(b) ☒ the total Time & Materials Amount	Not To Exceed **$21,062.00** with rates specified in the Schedule of Values (Exhibit _____ to the Agreement)

(c) ☐ in accordance with the Schedule of Values (Exhibit _____ to the Agreement) or

(d) ☐ For this Work Directive only, the schedule of values/rate sheet dated _____, 20XX, attached hereto as Exhibit ___, shall supersede the Schedule of Values in the Agreement. All other terms and conditions of Agreement and its prior amendments will remain unchanged and in force.

SELECT WAIVER ACCORDING TO PROJECT'S TOTAL DOLLAR VALUE

☒ Waive 10% Retainage Fee; or ☐ Do not Waive 10% Retainage Fee

6. CONSULTANT shall submit invoices in duplicate to:	KINDER MORGAN LIQUIDS TERMINALS LLC Jeff Hibner 5880 Nw St. Helens Rd Portland, OR 97210 Attn.: Jeff Hibner Phone: 503-220-1263 Fax: 503-220-1270 **Invoices must clearly indicate the Agreement Number, Work Directive Number, and Work Order/ Account Coding, as indicated above.** For Construction Projects, a Certificate of Final Acceptance must be completed, signed by an authorized representative, notarized, and attached to CONSULTANT'S final invoice.

7. CONSULTANT hereby certifies that it has downloaded, reviewed and understood the Kinder Morgan CONSULTANT Safety Manual and shall, prior to the commencement of any Work hereunder, make the same available to its employees and subCONSULTANTs who will be performing work on premises owned and/or operated by the Kinder Morgan entity named below. If the English language is a communication barrier, CONSULTANT at its expense shall timely convert/translate the Kinder Morgan CONSULTANT Safety Manual accurately into the appropriate language for its employees and subCONSULTANTs. Questions concerning the Manual should be directed to the Kinder Morgan CONSULTANT Safety Group at: contractor_safety@kindermorgan.com prior to commencement of any Work.

8. Facsimile Signatures/Counterparts

This Work Directive may be executed in multiple original counterparts, each of which shall be deemed an original, and together they shall constitute one and the same agreement. Signature of this Work Directive may be effected by facsimile (with confirmation by transmitting machine) and/or transmitted by portable document format ("pdf") file which shall be treated as an original signature, and any such signature, facsimile, pdf file or copy of this signed Work Directive shall be construed and treated as the original and shall be binding as if it were the original.

In the Agreement, if there is a reference to "Kinder Morgan, Inc.," it shall now be deemed a reference to Kinder Morgan Kansas, Inc. This is not a change of entity, but merely a change of name only.

By signing below, KM Entity and CONSULTANT affirm that the individual signing below has the requisite authority to authorize the commitment described herein, and that this Work Directive No. 402461-55-CONT is by reference hereby made part of Agreement No. 11559.

For Work performed within the state of California, the attached Exhibit B must be acknowledged and signed.

This Work Directive is hereby agreed to and accepted this May 2, 2011.

This Work Directive is entered pursuant to the terms of the **EMERGENCY RESPONSE** Agreement ("Agreement") dated June 1, 2005, by and between KINDER MORGAN OPERATING L.P. "D" ("COMPANY") and NATIONAL RESPONSE CORPORATION ("CONSULTANT"). By its execution hereof, CONSULTANT agrees to perform for the KM entity named below and executing this Work Directive pursuant to the terms, conditions and provisions of the Agreement, the following described Work, which will additionally describe "Covered Tasks" as provided for under DOT Operator Qualification Requirements, and shall furnish all services, labor, supervision, technical capability, tools, equipment, transportation, materials, (except as set forth below), and other facilities and items necessary or convenient to complete the following work as further described and specified in the Specifications and/or Drawing(s) attached hereto or the Agreement and by this reference made a part of this Work Directive ("the Work"). If CONSULTANT's proposal, quotation, or any other CONSULTANT document supplied to the KM entity named below is included as part of this Work Directive or another exhibit to the Agreement, then any terms or conditions provided by CONSULTANT which differ from or conflict with Company's terms and conditions are hereby rejected and shall be of no force or effect. The KM entity named below in this Work Directive shall be solely responsible for the liabilities and obligations set forth in the Agreement under which this Work Directive is being issued, as the same apply to the Work to be performed pursuant hereto. All such liabilities and obligations, as they apply to this Work Directive, shall be non-recourse to the Company (if the COMPANY is not the KM Entity executing this Work Directive) and other related entities as further provided for and agreed in the Agreement. Payments made to CONSULTANT under this Work Directive shall include all taxes and similar charges except as otherwise agreed to herein or under the terms of the Agreement. Any capitalized term used in this Work Directive and not otherwise defined herein shall have the meaning as ascribed in the Agreement.

1. Project Name:	2011 OSRO Emergency Response	Location:	Willbridge Terminal 5880 NW St. Helens Rd., Portland, OR 97210

SELECT WAIVER ACCORDING TO PROJECT'S TOTAL DOLLAR VALUE

☒ Waive 10% Retainage Fee; or ☐ Do not Waive 10% Retainage Fee

6. CONSULTANT shall submit invoices in duplicate to:	KINDER MORGAN LIQUIDS TERMINALS LLC Jeff Hibner 5880 Nw St. Helens Rd Portland, OR 97210 Attn.: Jeff Hibner Phone: 503-220-1263 Fax: 503-220-1270 **Invoices must clearly indicate the Agreement Number, Work Directive Number, and Work Order/ Account Coding, as indicated above.** For Construction Projects, a Certificate of Final Acceptance must be completed, signed by an authorized representative, notarized, and attached to CONSULTANT'S final invoice.

7. CONSULTANT hereby certifies that it has downloaded, reviewed and understood the Kinder Morgan CONSULTANT Safety Manual and shall, prior to the commencement of any Work hereunder, make the same available to its employees and subCONSULTANTs who will be performing work on premises owned and/or operated by the Kinder Morgan entity named below. If the English language is a communication barrier, CONSULTANT at its expense shall timely convert/translate the Kinder Morgan CONSULTANT Safety Manual accurately into the appropriate language for its employees and subCONSULTANTs. Questions concerning the Manual should be directed to the Kinder Morgan CONSULTANT Safety Group at: contractor_safety@kindermorgan.com prior to commencement of any Work.

8. Facsimile Signatures/Counterparts

This Work Directive may be executed in multiple original counterparts, each of which shall be deemed an original, and together they shall constitute one and the same agreement. Signature of this Work Directive may be effected by facsimile (with confirmation by transmitting machine) and/or transmitted by portable document format ("pdf") file which shall be treated as an original signature, and any such signature, facsimile, pdf file or copy of this signed Work Directive shall be construed and treated as the original and shall be binding as if it were the original.

In the Agreement, if there is a reference to "Kinder Morgan, Inc.," it shall now be deemed a reference to Kinder Morgan Kansas, Inc. This is not a change of entity, but merely a change of name only.

By signing below, KM Entity and CONSULTANT affirm that the individual signing below has the requisite authority to authorize the commitment described herein, and that this Work Directive No. 402461-54-CONT is by reference hereby made part of Agreement No. 11559.

For Work performed within the state of California, the attached Exhibit B must be acknowledged and signed.

This Work Directive is hereby agreed to and accepted this May 2, 2011.

Re: Amendment Number 1 to Master Service Agreement 11556

Dear Margie Wilson:

Pursuant to the terms and conditions of Agreement No. **11556** effective **September 27, 2005**, by and between **KINDER MORGAN OPERATING L.P. "D"** and **NORTHWEST HAZMAT, INC.**, which Agreement is made a part hereof by reference, the same as if set forth herein in full, you are hereby requested to amend the Agreement to include the following:

Section 1.0 TERM AND NOTICES

Replace Section 1.1 in its entirety by deleting the following:

1.1 This Agreement becomes effective upon the date first above written and shall terminate on **September 26, 2010** (the "**ANNIVERSARY DATE**"). Upon the ANNIVERSARY DATE, COMPANY, at its option, may extend the Agreement for an additional 12-month period. Upon exercise of any extension of this Agreement, the parties agree to renegotiate CONSULTANT'S rate structure tot heir mutual satisfaction.

With

1.1 This Agreement becomes effective upon the date first above written and shall terminate on **September 26, 2011** (the "**ANNIVERSARY DATE**"). Upon the ANNIVERSARY DATE, COMPANY, at its option, may extend the Agreement for an additional 12-month period. Upon exercise of any extension of this Agreement, the parties agree to renegotiate CONSULTANT'S rate structure tot heir mutual satisfaction.

AND

Replace Exhibit B, Schedule of Values with the attached Exhibit B.

All other terms and conditions of Agreement No. **11556,** as amended by prior contract amendments (if any), which are not changed by this amendment will continue in full force and effect.

This amendment now forms an integral part of this Agreement. Confirm your acceptance by signing on the line provided and return to COMPANY'S Contract Administrator as listed below:

EXHIBIT B – SCHEDULE OF VALUES

1.0 OVERVIEW

1.1 The amounts set forth in the Agreement cover payment in full for all materials, work, tools, equipment, insurance, bonds, profit, overhead and all other costs and expense of every kind, character and nature for which the CONTRACTOR is entitled to payment. Unless specifically set forth in the Agreement, no additional payment of any kind will be contemplated.

1.1.1 COMPANY agrees to pay CONSULTANT, for Work performed pursuant to this Agreement either on a COST REIMBURSABLE BASIS or FIRM FIXED PRICE, LUMP SUM BASIS (The "**Contract Price**") as specified in each Work Directive. The cumulative total of all Work Directives under this Agreement SHALL NOT EXCEED **Error! Reference source not found.**, in accordance with the Schedule of Values, **Exhibit B**.

2.0 PROCESSING OF TIMESHEETS & REIMBURSABLE RECEIPTS PRIOR TO INVOICE SUBMITTAL

2.1 CONTRACTOR shall submit the timesheets and reimbursable expenses to the AUTHORIZED PROJECT REPRESENTATIVE on a daily basis for verification/acknowledgement of expenses and time spent on the project. All supporting documentation must be signed by the project Inspector prior to invoicing. Signature by these personnel does not constitute agreement to pay theses expenses.

3.0 INVOICING

3.1 Standard Invoice Procedure

3.1.1 At the end of each calendar month, CONTRACTOR shall submit to COMPANY an original detailed invoice for Work performed during that month, together with one copy of such invoice and one set of supporting documentation. Such invoice shall be sent to the following address:

3.1.2 Reference each individual contract for the appropriate addressee and company name for the invoice to be submitted.

Company Name:	Error! Reference source not found.
Attn:	Error! Reference source not found.
Address:	**Error! Reference source not found.**
	Error! Reference source not found., Error! Reference source not found. Error! Reference source not found.
REFERENCE:	
Contract No.:	Error! Reference source not found.
Work Directive No.:	(Per the Work Directive (Exhibit A-2) Issued for Services)
Amendment / Change Order No.:	(Per the Amendment /Change Order Issued for Services)

3.2 Non-acceptance of Invoices

3.2.1 Invoices that do not relate to this Contract **will not be processed** and such invoices will not be accepted by COMPANY. All charges not in compliance

with the stated terms and conditions of this Contract will be deducted from the invoice prior to payment processing.

3.3 Required Invoice Detail

3.3.1 Each of CONTRACTOR's invoices shall contain the following information on its face:

3.3.1.1 An invoice date.

3.3.1.2 A reference number (invoice number) which is unique to the transaction

3.3.1.3 Site or project name (if applicable) and COMPANY.

3.3.1.4 Reference of COMPANY'S Project Representative.

3.3.1.5 Contract Number, Change Order Number and Directive Number (as applicable).

3.3.1.6 Billing period (time period of charges).

3.3.1.7 CONTRACTOR's remittance address or electronic funds transfer routing information, (as applicable).

3.3.1.8 CONTRACTOR'S name and telephone number of contact to handle invoice related questions.

3.3.1.9 Amount due CONTRACTOR.

3.3.1.10 Project Status Report

3.3.1.11 Summary of amount invoiced to date, this invoiced amount, retention (as applicable), and the amount remaining to be invoiced.

3.4 Supporting Documentation

3.4.1 Each of CONTRACTOR's invoices shall be itemized and submitted to COMPANY together with receipts, time records, lien waivers, evidence of payment to subcontractors, vouchers showing payments for itemized material and labor, and any other evidence of CONTRACTOR's right to payment under this Contract as COMPANY may, in its sole good faith discretion, from time to time require.

3.5 Final Invoice

3.5.1 When CONTRACTOR submits its final invoice to COMPANY for the Work, in addition to the requirements outlined above, CONTRACTOR shall additionally include the following which shall be submitted no later than thirty (30) days after the project completion date:

3.5.2 Mechanics lien and stop notice releases executed by CONTRACTOR and by each person or entity that furnished any labor, services or materials in connection with the Work;

3.5.3 Reasonable proof satisfactory to COMPANY that any claims for labor, materials or any other claim or potential claim for which COMPANY withheld

compensation pursuant to the Contract have been paid or satisfied in a manner acceptable to COMPANY; and

3.5.4 All final drawings and other documents required by this Contract.

4.0 PAYMENT PROCEDURE

4.1 Processing of Approved Invoices

4.1.1 Provided that such invoice meets all of the requirements as explained, COMPANY shall use its best efforts to pay all undisputed charges set forth in each invoice, less any retention amount applicable, within thirty (30) days after such invoice is received by COMPANY.

4.2 Processing of Disputed Invoices

4.2.1 If COMPANY, in good faith, disputes and does not approve an item billed, COMPANY shall notify CONTRACTOR of the item or portion of an item disputed and withhold payment thereof until settlement of the dispute. Such right of COMPANY to withhold such payments shall be in addition, and not in any way in lieu of, any other right of COMPANY hereunder, including the right to raise disputes for the first time after audit. Payment shall be contingent upon COMPANY's review of the invoice and determination that the Work described in the invoice complies with all of the terms of this Contract. Interest penalties for disputed invoices will not be paid by COMPANY.

4.3 Delayed submittal of Invoices and Non-payment

4.3.1 Any Work for which CONTRACTOR does not submit an invoice to COMPANY within thirty (30) days after the month in which such Work is completed shall be deemed to have been performed by CONTRACTOR without compensation; provided however, that if prior to the end of such thirty (30) day period, CONTRACTOR requests in writing from COMPANY's Project Representative a further extension of time for submitting such invoice (stating the reasons therefore and the amount of additional time requested), and COMPANY elects to authorize such extension in writing, CONTRACTOR shall have until the end of the extension to submit such invoice.

5.0 TIME AND MATERIALS RATES

5.1 Labor:

Table 1
Labor Rates
Effective September 27, 2010 through September 26, 2011

Description/Category/Classification	Straight Time (Rate Per Hour) (US $0.00)	Overtime (Rate Per Hour) (US $0.00)	Double Time (Rate Per Hour) (US $0.00)
Incident Manager/Site Supervisor	$50.00	$82.50	
Emergency Response Manager	$50.00	$82.50	
Safety/Public Information Officer	$40.00	$45.00	
HazMat Technician	$38.00	$57.00	
Hazardous Materials Manager	$50.00	$82.50	
High Hazard Specialist	$100.00	$150.00	

Table 1
Labor Rates
Effective September 27, 2010 through September 26, 2011

Description/Category/Classification	Straight Time (Rate Per Hour) (US $0.00)	Overtime (Rate Per Hour) (US $0.00)	Double Time (Rate Per Hour) (US $0.00)
Confined Space Supervisor	$35.00	$45.00	
Confined Space E/A	$38.00	$57.00	
Secretary/Administrative	$20.00		

5.1.1 Rates shown on the rate sheet in the Schedule of Values include all benefits, withholding, workers compensation, and small tools and consumables.

5.1.2 All labor rates shown in Table 1 of the Schedule of Values shall be all-inclusive of small tools having a cost less than $750, disposable parts, consumables and personal protective gear that is normally utilized in the performance of daily work.

5.1.3 Rates are subject to change from time to time at Contractor's discretion. The rate schedule, once adopted will remain in effect until new rates are mutually agreed upon by Company and Contractor and amended into the Agreement

5.1.4 Classifications and straight time, overtime and double time rates not defined in Table 1 above shall be approved in advance by the Technical Designated Representative and the Administrator of the Agreement.

5.1.5 Day rates as approved in advance by COMPANY will apply to mobilization and demobilization personnel to the worksite.

5.1.6 Travel pay - See section "5.3" below.

5.2 Definition of Overtime:

5.2.1 CONTRACTOR defines Overtime as work exceeding eight (8) hours per days and/or forty (40) hours per calendar week. CONTRACTOR's employee(s) hours worked on project(s) other than project here under will not be credited hours for the purpose of overtime. Overtime will be paid at the "Over Time" rates shown (in Table 1) of the Schedule of Values, **or at a factor of 1.3 times the straight time or flat rate, if applicable**, multiplied by the number of hours worked.

5.2.2 CONTRACTOR defines Double Time as work on Sundays or on CONTRACTOR's observed holidays. Double-Time shall be paid at the rates shown in Table 1 of the Schedule of Values, **or at a factor of 1.7 times the Straight-Time or flat rate, if applicable,** multiplied by the number of hours worked.

5.2.3 CONTRACTOR agrees not to pay shift differential for swing (evening) or graveyard (night) shifts.

5.2.4 CONTRACTOR's employee(s) put on stand-by time be paid for actual hours on stand-by. Stand-by time hours will be credited for the purpose of overtime.

5.3 Definition of Travel and Expenses:

5.3.1 Travel Time is charged as work time. Travel time for hourly rate personnel will be actual travel time but not to exceed eight hours per day. Agreement rates do not include costs for travel, subsistence, reproduction, communications, computer, modeling, subcontracts, freight, etc.

5.3.2 COMPANY shall reimburse CONTRACTOR, without markup, for the direct, reasonable cost to CONTRACTOR for employee travel expenses away from the (Site/Employee's base office) when this travel occurs as a direct result of the performance of the Work. Travel expenses include air (excluding first class airfare), ground transportation, lodging, meals, and telephone expenses. All travel expenses must have prior COMPANY approval and shall be supported by valid receipts.

5.3.3 Mileage Reimbursement will be paid for Mobilization and Demobilization Only and shall be no more than $0.40½ cents/mile/vehicle. (COMPANY will compensate only per vehicle and not per man within the vehicle.)

5.3.4 Per Diem (subsistence) when in outlying areas (outside of a 50 mile radius from office/site) will be $40.00 per person per day; or $50.00 per person per day in high cost areas agreed to in advance by the parties.

AGREEMENT FOR PROFESSIONAL EMERGENCY RESPONSE SERVICES

(Environmental On-Call Emergency Response Services)

Agreement Number: 05-ER-45-011-ORG

THIS AGREEMENT is made as of the **27th day of September, 2005**, by and between **Kinder Morgan Operating L.P. "D"** a Delaware Limited Partnership, acting as agent for Kinder Morgan and its affiliates and subsidiaries who are requiring such work as set forth in this Agreement and/or in **Exhibit A-2** (Work Directive) and who will be releasing payments for such work, with its principal place of business in **Houston, Texas**, hereinafter referred to as "**COMPANY**", and **NorthWest HazMat, Inc.**, a corporation with its principal place of business in **Springfield, Oregon** hereinafter referred to as "**CONSULTANT**".

WITNESSETH:

WHEREAS, COMPANY desires the services of CONSULTANT to be on-call to provide Emergency Response Services for the containment and cleanup of oil, discharge of hazardous material and non-hazardous materials, and

WHEREAS, CONSULTANT represents that it is qualified and desires to perform such Emergency Response Service (as defined in **Section 2.2** below) for COMPANY.

NOW, THEREFORE, in consideration of the promises and mutual covenants contained herein, the parties do hereby agree as follows:

1.0 TERM

1.1 This Agreement becomes effective upon the date first above written and shall terminate on **September 26, 2010** (the "**ANNIVERSARY DATE**"). Upon the ANNIVERSARY DATE, COMPANY, at its option, may extend the Agreement for an additional 12-month period. Upon exercise of any extension of this Agreement, the parties agree to renegotiate CONSULTANT'S rate structure to their mutual satisfaction.

2.0 CONTRACT DOCUMENTS, SCOPE OF WORK AND ADMINISTRATION

2.1 This Agreement shall consist of the Contract Documents itemized below. In the event of a conflict between or among the provisions of the Contract Documents, the more or most specific provision shall control:

2.1.1 Agreement Number **05-ER-45-011-ORG**

2.1.2 **Exhibit A-1** Scope of Work

2.1.3 **Exhibit A-2** Work Directive (including Scope of Work pursuant to **Section 2.5**)

2.1.4 **Exhibit B** Schedule of Values

2.1.5 **Exhibit C** Certificate of Insurance

2.1.6 **Exhibit D** (1) United States Environmental Protection Agency Title III, List of Lists, Consolidated List of Chemicals Subject to the Emergency Planning and Community Right To Know Act (EPCRA) and Section 112(r) of the Clean Air Act, published April 1995, as amended

2.1.7 **Exhibit E** Project Scope Change Order

2.1.8 **Exhibit F** Drug & Alcohol/Operator Qualification Program Requirements

2.1.9 **Exhibit G** Kinder Morgan Contractor Safety Rules & Regulations

Note that any references to "CONTRACTOR" in an Exhibit, apply to CONSULTANT.

2.2 CONSULTANT agrees to render **Emergency Response Services** as more specifically defined in **Exhibit A-1**, attached hereto, and the applicable Work Directive released.

2.3 CONSULTANT agrees to provide an on-call team of personnel and equipment to perform Emergency Response Services in the location(s) designated on the applicable Work Directive and as directed by the Designated Representative (or his or her designee). Emergency Response Services shall include: 1) containment, characterization, handling, transportation, treatment, processing, recovery, repackaging, removal, storage and disposal of oil, hazardous material and non-hazardous material; 2) site evaluation, decontamination and restoration; 3) technical services, including sampling, laboratory services, analysis, and other related services; 4) training and mock spill deployments; and 5) coordination with COMPANY'S Designated Representative or his or her designee. Specific description of the Emergency Response Services may be set forth in the applicable Work Directive. COMPANY may obtain Emergency Response equipment with or without Emergency Response personnel at the sole option of COMPANY. When CONSULTANT needs specific clarification pertaining to the Work, it shall request the same from the Designated Representative.

2.4 The Designated Representative shall coordinate and sequence the Work with CONSULTANT. It is understood and agreed between the parties hereto that the means or methods of performance of the Work, as well as the workers and crews provided by CONSULTANT, shall be under the exclusive charge and control of CONSULTANT, COMPANY being interested only in the results obtained. Matters of a technical nature should be directed to the COMPANY'S Designated Representative, **Steve Marositz, 713-369-9454** (phone), **713-495-2713** (facsimile), **Steve_Marositz@kindermorgan.com** (electronic mail) or his or her designee(s). Matters of a commercial nature should be directed to the COMPANY'S Contract Administrator, **Kerri L. Singleton, 714-560-4919** (phone), **714-560-6643** (facsimile), **kerri_singleton@kindermorgan.com** (electronic mail).

2.5 This Agreement is an on-call contract. As such, COMPANY may, from time to time and in its sole discretion, issue Work Directives, substantially in the form attached hereto as **Exhibit A-2**, describing Work that COMPANY wishes CONSULTANT to perform, the location of the Work (the **"Site,"** as more fully defined in **Section 2.9** below), and the compensation to be paid for performing such Work. The Scope of Work shall include, without limitation, any modifications or specifications related to the Work, Milestone Schedules, deadlines, responsibilities for communications or meetings, and compensation to be paid. In case of emergency, COMPANY, may require CONSULTANT to provide Emergency Response Services prior to the execution of a Work Directive, under the terms and conditions of this Agreement.

2.6 Except as otherwise provided in this Agreement or in another applicable Contract Document, CONSULTANT shall furnish all of the supervision, materials, equipment, tools, supplies and services required for the complete performance of all Work, including but not limited to the Work described in each Work Directive that has been signed and returned by CONSULTANT.

2.7 Time of Completion; Extensions

2.7.1 CONSULTANT shall commence the Work immediately upon request of the COMPANY'S Designated Representative or his or her designee, but in no event no later than the date specified in the applicable Work Directive executed by the parties and shall complete the Work in its entirety no later than the date specified therein. CONSULTANT acknowledges that COMPANY may require completion of certain portions or phases of the Work ahead of others, and CONSULTANT shall diligently and expeditiously perform the Work in the sequence required by COMPANY. CONSULTANT shall also meet any and all applicable deadlines established by governmental agency orders, permits, or agreements, or by judicial decrees.

2.7.2 CONSULTANT understands and agrees that TIME IS OF THE ESSENCE in its performance of the Work and each of its obligations under this Agreement. CONSULTANT is available to perform Emergency Response Services for COMPANY on an on-call basis, 24-hours per day, seven (7) days per week.

2.7.3 If CONSULTANT is delayed in the performance of the Work by an act of the COMPANY, by COMPANY issuance of any Project Scope Change Order, or by a Force Majeure event, and if the CONSULTANT immediately provides COMPANY with a written request for an extension of time COMPANY shall extend the time of completion by such reasonable time as possible.

2.7.4 Should the whole or any part of the Work be delayed or suspended by late delivery of materials furnished by the COMPANY, by inability of the COMPANY to obtain necessary rights of access to the Site, or by failure of other contractors of the COMPANY to complete work

which is a prerequisite to the performance of the Work by CONSULTANT, then upon written request of CONSULTANT, COMPANY shall extend the time of completion by such reasonable time as possible under the circumstances.

2.7.5 CONSULTANT shall notify COMPANY in writing when the Work has been completed. If, in the sole good faith discretion of COMPANY, the Work conforms to all of the requirements of this Agreement, COMPANY shall accept the Work within ten (10) working days after receipt of such written notice. If, in the sole good faith discretion of COMPANY, the Work or any portion of the Work does not conform to all of the requirements of this Agreement, COMPANY shall give CONSULTANT notice of any non-conforming Work. Within five (5) working days after receiving such notice from COMPANY, CONSULTANT shall correct all non-conforming Work or provide a mutually accepted written plan of work for correction of the non-conforming Work. Corrected Work shall be resubmitted by CONSULTANT for acceptance by COMPANY and the above approval process will be repeated until the Work is acceptable.

2.8 Damage or Injury to Subterranean Structures or Utilities

2.8.1 To the extent that Work pursuant to this Agreement requires any sampling, boring, excavation, ditching or other disruption of the soil or subsurface at the Site, CONSULTANT shall confer with COMPANY (and others, in CONSULTANT'S discretion and at its expense) prior to such activity and be responsible for identifying, locating and marking, as necessary, any subterranean archaeological artifacts, structures or utilities (**"Underground Facilities"**). Thereafter, CONSULTANT shall take all reasonable precautions to avoid damage or injury to Underground Facilities which were or reasonably should have been discovered by CONSULTANT in the course of its Work. CONSULTANT will be liable for all costs and claims resulting from damage to the Underground Facilities arising out of the Work, if they were or reasonably should have been identified by CONSULTANT.

2.9 Definitions:

2.9.1 **"Contract Documents"** means all relevant documents described in **Section 2.1** of this Agreement.

2.9.2 **"Data"** has the meaning given in **Section 11.2** below.

2.9.3 **"Day"** or **"Week"** means, respectively, a calendar day or seven (7) calendar days.

2.9.4 **"Description of Waste"** means the document which defines the chemical content and physical characteristics of the Waste.

2.9.5 **"Designated Representative"** means the person identified as COMPANY'S Designated Representative in **Section 2.4** of this Agreement.

2.9.6 **"Emergency Response Services"** shall have the meaning given in **Section 2.2** above.

2.9.7 **"Environmental Law"** means any and all federal, state, and local laws, regulations and requirements pertaining to health, safety, or the environment.

2.9.8 **"Force Majeure"** has the meaning given in **Section 17.1** below.

2.9.9 **"Hazardous Material"** means (a) all elements or compounds that are contained in the list of hazardous substances adopted by the United States Environmental Protection Agency and the list of toxic pollutants designated by Congress or the Environmental Protection Agency or under any Environmental Laws; and (b) any "hazardous waste," "hazardous substance" (including , but not limited to, petroleum and petroleum-related materials), "toxic substance," regulated substance," pollutant" or "contaminant", each as defined under any Environmental Laws.

2.9.10 **"Hereunder,"** **"herein"** and words of similar import shall refer to this Agreement as a whole, rather than to a single provision.

2.9.11 "**Milestone Schedule**" shall mean any schedule or modification thereof developed by COMPANY and CONSULTANT that identifies key dates and deadlines to be met by CONSULTANT in the applicable Contract Document.

2.9.12 "**Site**" shall mean any real property on which CONSULTANT will be performing Work pursuant to the terms of the Contract Documents, whether or not owned by COMPANY.

2.9.13 "**Waste**" shall mean any form of material identified or determined by the COMPANY as having no beneficial value and is either a by-product of the COMPANY's operations or is generated during investigation and remediation activities (e.g. soils, debris).

2.9.14 "**Work**", shall mean, collectively, any and all obligations, duties and responsibilities necessary to the successful completion of the project assigned to or undertaken by CONSULTANT under the Contract Documents, including the furnishing of all labor, services, materials, equipment and other incidentals necessary to perform Emergency Response Services.

2.10 Both COMPANY and CONSULTANT acknowledge that the most current Kinder Morgan Contractor Safety Rules & Regulations is attached to this Agreement as **Exhibit G.** Furthermore, COMPANY and CONSULTANT acknowledge that COMPANY updates the regulations periodically. As part of its obligation under this Agreement, CONSULTANT will request from COMPANY updated regulations every six (6) months from the effective date of this Agreement throughout the term of this Agreement.

3.0 CONSIDERATION AND CHANGES TO THE WORK

3.1 COMPANY agrees to pay CONSULTANT, for Work performed pursuant to this Agreement in accordance with CONSULTANT'S rates in the Schedule of Values, **Exhibit B.** CONSULTANT shall notify COMPANY when the total it is owed is **As Limited in Section 5 of each applicable Work Directive released**.

3.2 COMPANY shall have the right to (i) make changes in any Work performed or to be performed, (ii) require additional Work, or (iii) require the deletion, stoppage or cancellation of Work previously ordered. The provisions of this Agreement shall apply to all changed and added Work to the same extent as they would have applied to the Work originally described in the applicable release.

3.3 COMPANY or CONSULTANT may generate a written Project Scope Change Order, substantially in the form attached hereto as **Exhibit E**, describing any changes, additions or deletions to the Work. COMPANY will determine whether Project Scope Change Order is to be authorized or rejected. COMPANY shall not be required to furnish notice of such changes, additions or deletions to CONSULTANT's sureties. CONSULTANT shall perform the Work in accordance with COMPANY's written Project Scope Change Order. This provision does not relieve CONSULTANT of its obligation to use its best professional judgment in performing its Work in a manner consistent with the level of care and skill exercised by other experts in the same field. The parties shall negotiate an equitable adjustment to the amount of compensation to be paid CONSULTANT in connection with the Work Directive to which the Project Scope Change Order applies.

4.0 INSPECTION

4.1 Materials Inspections

4.1.1 COMPANY may from time to time, at its sole good faith option, inspect and test certain materials or equipment. Therefore in contracting for the purchase of any material or equipment that CONSULTANT will use in the performance of the Work, CONSULTANT shall obtain for COMPANY from the vendor of such material or equipment the right to inspect all such material and the manufacture and fabrication thereof. Whether or not COMPANY conducts such inspection, COMPANY shall also have the right to reject all materials or equipment that, in the sole good faith discretion of COMPANY, fail to conform to either adequate manufacturing specifications, the specifications under which such materials or equipment were purchased or the specifications required for the performance of the Work.

4.2 Field Inspection

4.2.1 Throughout the performance of the Work, COMPANY shall have the right to designate one or more inspectors or engineers to inspect and test the Site and the progress of the Work.

CONSULTANT shall cooperate with such inspectors and engineers in order that the Work may be fully inspected and that COMPANY may at all times be fully advised of the progress of the Work and the manner in which it is being performed.

4.3 Inspection Not Acceptance

4.3.1 CONSULTANT expressly understands and agrees that any inspection by COMPANY pursuant to this Agreement shall be for COMPANY'S sole benefit and shall not be deemed an acceptance by COMPANY of all or any portion of the materials or Work so inspected. CONSULTANT further understands and agrees that no inspection by COMPANY pursuant to this Agreement or approval or failure to object to any portion of the Work shall relieve or release CONSULTANT from any duties, obligations, or liabilities provided in this Agreement.

5.0 INSURANCE

5.1 CONSULTANT agrees to carry and maintain the following insurance, from carriers with an A.M. Best rating of at least A-/VIII:

5.1.1 Statutory Coverage Workers' Compensation Insurance (including Occupational Disease Coverage) in accordance with the laws of the states where the Work is to be performed;

5.1.1.1 If CONSULTANT performs Work on or adjacent to navigable waterways CONSULTANT shall furnish a certificate of insurance showing compliance with the provisions of the Federal Longshoremen's and Harbor Workers' Compensation Law.

5.1.2 Employer's Liability Insurance with limits of not less than **$1,000,000** per occurrence and **$1,000,000** per disease/each employee.

5.1.3 Commercial General Liability Insurance insuring the indemnity agreement set forth in this contract with a combined single limit of not less than **$2,000,000** per occurrence and in the aggregate. All policies shall include coverage for blanket contractual liability assumed hereunder.

5.1.4 Comprehensive Automobile Liability Insurance covering liability arising out of any auto (owned, hired and non-owned); with a combined single limit of not less than **$1,000,000**. If necessary, the policy shall be endorsed to provide contractual liability coverage.

5.1.5 Umbrella Insurance may be used to satisfy the limit requirements for Employer's Liability Insurance, Commercial General Liability Insurance, and Comprehensive Automobile Liability Insurance set out in **paragraphs 5.1.2**, **5.1.3** and **5.1.4**, above. Such umbrella policy shall follow the form of those primary coverages, be in excess of those underlying policies without gaps in limits and provide coverage as broad as the underlying coverage.

5.1.6 Comprehensive Aircraft Liability Insurance with combined bodily injury, including passengers, and property damage liability single limits of not less than **$5,000,000** each occurrence. This coverage is necessary only when CONSULTANT uses owned or non-owned aircraft in connection with Work performed under this Agreement.

5.1.7 CONSULTANT's Pollution Liability Insurance covering losses caused by pollution conditions that arise from the operations of CONSULTANT. Insurance mentioned above shall apply to bodily injury, including death; loss or damage to property, including loss of use of damaged property or of property that has not been physically injured; cleanup and monitoring costs; and defense, including costs and expenses incurred in the investigation, defense, or settlement of claims. This coverage shall be maintained in force for the full period of this Agreement with available limits of not less than **$2,000,000** per occurrence.

5.1.8 Pollution Legal Liability Insurance. If the work contemplated under this Agreement includes the disposal of any hazardous materials from the Job Site(s), CONSULTANT must furnish to COMPANY evidence of pollution legal liability insurance maintained by the disposal site operator, covering losses arising from the insured facility accepting waste under this Agreement. Such coverage must be maintained in minimum amounts of **$5,000,000** per occurrence for bodily injury, including death, or loss or damage to property combined.

5.2 All insurance policies carried by CONSULTANT hereunder shall name the COMPANY (**Kinder Morgan Energy Partners, L.P.** and the contracting company), its affiliated and subsidiary companies, and its and their respective directors, officers, agents and employees as additional insureds with respect to liability arising out of work performed by CONSULTANT or subcontractor, as applicable.

5.3 All insurance policies of CONSULTANT shall include waiver of subrogation against **Kinder Morgan Energy Partners, L.P.** and its subsidiary or affiliated companies, successors, and assigns.

5.4 Before commencing any performance under this Agreement, CONSULTANT shall furnish COMPANY with Certificates of Insurance evidencing insurance coverage and provisions provided for in this Agreement. Failure of CONSULTANT to furnish such evidence of insurance coverage shall not be considered a waiver by COMPANY of such coverage. All insurance certificates shall include the following statement:

5.4.1 **"Kinder Morgan Energy Partners, L.P.** and its affiliated or subsidiary companies are named as additional insured on all above policies (except Worker's Compensation) and waiver of subrogation in favor of **Kinder Morgan Energy Partners, L.P.** and its affiliated or subsidiary companies, its and their respective directors, officers, agents and employees applies as required by written contract."

5.5 The insurance provided in accordance herewith shall apply as primary insurance with respect to any other insurance or self-insurance programs afforded to or maintained by COMPANY, and shall not require the exhaustion of any other coverage. Insurance coverage required under this Agreement shall not be deemed to limit the amount(s) of CONSULTANT'S liability under this Agreement, nor shall such requirements be considered by CONSULTANT as the limit of the amounts or types of insurance CONSULTANT should carry to protect itself adequately from the risks of its occupation; rather, CONSULTANT shall make its own independent determination in this regard.

5.6 All insurance policies shall provide that the insurance carrier will notify the COMPANY no less than thirty (30) days prior to the termination or cancellation of any policy.

5.7 CONSULTANT shall promptly notify COMPANY when any insurance policy required above is not reasonably available and shall state the reasons therefor.

5.8 All deductibles, self insured retentions and self insurance carried by the CONSULTANT under its insurance program are the sole responsibility of the CONSULTANT and will not be borne in any way by the COMPANY. The CONSULTANT will indemnify the COMPANY, in full, for any amounts related to the above.

5.9 In the event of the CONSULTANT's failure to carry out any of the provisions of this **Section 5.0**, the COMPANY shall, in addition to any right to recover damages or to obtain other relief, have the right to cancel this Agreement or any Work Order.

5.10 CONSULTANT shall require all of its subcontractors to provide the foregoing coverage, as well as any other coverage that CONSULTANT may consider necessary. All subcontractor policies shall be endorsed with the waiver of subrogation and additional insured wording above. Any deficiency in the coverage, policy limits, or endorsements of said subcontractors will be the sole responsibility of CONSULTANT.

6.0 PAYMENT, AND LIENS

6.1 COMPANY will accept one invoice monthly, payable with Commercial Terms Net 30 Days after receipt of invoice. Invoices will be sent to:

Kinder Morgan Operating L.P. "D"
Attn: **As specified in Section 6 of each Work Directive released**

6.2 Invoices shall be submitted in such detail so as to delineate Work performed per job assignment described in the applicable Work Directive. For each job assignment, CONSULTANT shall include a description of services, number of hours expended per individual employee job classification, itemization of expenses, location(s) at which expended, receipts for expenses or other evidence in

support of CONSULTANT's statement as may be requested by COMPANY, extended subtotals, applicable taxes and grand total.

6.3 CONSULTANT covenants and agrees to protect and keep the Site, any and all interests and estates therein, and all improvements or materials now or hereafter placed thereon pursuant to this Agreement, free from any and all claims, liens, charges or encumbrances in the nature of mechanics, labor, or material liens or otherwise, arising out of or in connection with performance of the Work by CONSULTANT or any of its subtier contractors (including the furnishing of any materials hereunder), and to promptly have any such lien released by bond or otherwise. If CONSULTANT disputes in good faith any lien or claim or encumbrance of any laborer, materialman or subcontractor, in lieu of the immediate payment thereof, CONSULTANT shall post adequate security to protect COMPANY from liability for the payment thereof and from any expense of defending against that liability, until the dispute is finally resolved. COMPANY may, at its sole discretion, post or place upon the Site notices of non-responsibility or do any other act permitted by law to exempt COMPANY, the Site, any and all interests and estates therein, and any improvements or materials thereon from any liability to third parties for the performance of the Work. The failure of COMPANY to perform any of the actions described in the previous sentence shall not release or discharge CONSULTANT of any of its obligations hereunder.

6.4 CONSULTANT hereby covenants and agrees to waive and does hereby waive any rights to liens to which CONSULTANT might be entitled for Work performed and materials or other property and labor furnished under this Agreement. CONSULTANT additionally covenants and agrees to require or cause all of its subcontractors and vendors performing or furnishing any portion of the Work to consent, prior to the performance thereof, to the waiver of any such rights to liens which might accrue to such subcontractor or vendor.

7.0 INDEPENDENT CONTRACTOR

7.1 CONSULTANT agrees to undertake the Work as an independent contractor, at its sole risk, and agrees to employ and direct any persons or subcontractors performing any Work hereunder, and such persons and subcontractors shall be and remain the sole employees or agents of CONSULTANT, subject to the sole direction and control of CONSULTANT, and shall not be subject to the direction or control of COMPANY nor shall they be employees of COMPANY. CONSULTANT shall comply with all applicable federal and state enactments regarding Employer's Liability, Workers' Compensation, Social Security, and Unemployment Compensation Insurance, as well as be responsible for all valid sales or other taxes levied on the Work performed by CONSULTANT, its employees and agents. CONSULTANT further agrees to indemnify and hold COMPANY harmless from any cost, expense, tax, interest or penalty which COMPANY may be required by law to pay on account of CONSULTANT's failure to comply with the aforementioned laws.

8.0 INDEMNIFICATION

8.1 CONSULTANT agrees to release, defend, and to protect, indemnify and hold harmless COMPANY, its parent, affiliates, and subsidiaries, and its and their respective directors, officers, agents and employees (collectively "COMPANY Indemnitees"), from every kind or character of damages, losses, liabilities, expenses, demands or claims, including but not limited to those arising from personal injury, and including any and all costs and fees arising out of litigation or settlement personal injury claim(s) or any other type of claim (collectively "Losses"), including Losses described in the remainder of this **Article 8.0**, to the extent the Losses are related to the performance of the Work and caused by, arise from or relate to, directly or indirectly, the acts or omissions of CONSULTANT, its agents, employees, or subcontractors. The foregoing obligation of CONSULTANT shall not be diminished in any regard if such Losses may have been caused in part by the negligence, either active or passive, or the strict liability of any COMPANY Indemnitee(s) or any third party. CONSULTANT further agrees that it shall, at its own expense, defend any suit or action brought against COMPANY Indemnitees where the CONSULTANT'S alleged acts or omissions are asserted by either the petitioner or COMPANY, and CONSULTANT shall pay, in proportion to its obligation pursuant to this **Section 8.1**, all damages, costs and expenses (including attorneys' fees) in connection therewith or any matter resulting therefrom. CONSULTANT shall not agree to settle any such suit or action without COMPANY'S prior written consent. **CONSULTANT'S obligations under this section shall survive termination of this Agreement.**

8.2 COMPANY agrees to release, defend, and to protect, indemnify and hold harmless CONSULTANT, its affiliates, their directors, officers, agents and employees (collectively, "CONSULTANT Indemnitees"),

from every kind or character of damages, losses, liabilities, expenses, demands or claims, including but not limited to those arising from personal injury, and including any and all costs and fees arising out of litigation or settlement personal injury claim(s) or any other type of claim (collectively "Losses"), to the extent the Losses are caused by, arise from or relate to, directly or indirectly, the acts or omissions of COMPANY, its agents, Company's other contractors, or employees. The foregoing obligation of COMPANY shall not be diminished in any regard if such Losses may have been caused in part by the negligence, either active or passive, or the strict liability of any CONSULTANT Indemnitee(s) or any third party. COMPANY further agrees that it shall at its own expense, defend any suit or action brought against CONSULTANT Indemnitees where the COMPANY'S alleged act or omissions are asserted by either the petitioner or CONSULTANT, and COMPANY shall pay, in proportion to its obligation pursuant to this **Section 8.2**, all damages, costs and expenses (including attorneys' fees) in connection therewith or any matter resulting therefrom. COMPANY shall not agree to settle any such suit or action without CONSULTANT'S prior written consent. **COMPANY'S obligations under this section shall survive termination of this Agreement.**

8.3 Subject to the provisions of **Section 8.1** above, COMPANY agrees to release, defend, and to protect, indemnify and hold harmless CONSULTANT Indemnitees from and against all losses related to CONSULTANT's performance of Emergency Response Services where the CONSULTANT Indemnitees demonstrate that COMPANY would have been liable if COMPANY was sued directly. COMPANY'S obligations under this section survive termination of this Agreement.

8.4 Subcontractor Indemnification

8.4.1 CONSULTANT shall require each of its subcontractors engaged for performance of the Work to provide express indemnities, enforceable by and for the benefit of the COMPANY Indemnitees, to the same extent required of CONSULTANT under **Section 8.1** above.

8.5 The Parties agree that, to the extent permitted by applicable law, this **Article 8.0** shall constitute an effective waiver of any cap(s) established by statute or case law which may limit the indemnified Party's recovery, but for this Agreement.

9.0 COMPLIANCE WITH LAWS

9.1 CONSULTANT will perform the Work in a good and workmanlike manner in accordance with the approved practices and standards of the industry, and shall, in the performance of the Work contemplated hereunder, comply with all valid, applicable federal, state and local laws, ordinances, codes, local and national standards and regulations including without limitation all environmental laws. When it appears during the course of CONSULTANT'S performance of the Work that any of the Work does not conform to the provisions of this Agreement, CONSULTANT, at its sole expense, shall immediately make the necessary corrections so that its Work shall so conform.

10.0 CALIFORNIA RELEASE NOTIFICATION REQUIREMENTS

10.1 CONSULTANT shall ensure that its employees, agents, and subcontractors' employees engaged in CONSULTANT's activities in the performance of the Work are:

10.1.1 notified, and when determined by Company, trained and instructed by COMPANY, either directly or through a train-the-trainer program by COMPANY, concerning the order of actions to be taken upon discovery of a release or threatened release condition of a Hazardous Material or pollutant substance; and

10.1.2 Understand that no Work or visit shall be undertaken to any COMPANY right-of-way or facility where there is no COMPANY representative onsite and readily accessible (a "Non-COMPANY Onsite Situation"), unless the training referred to in (i) above has occurred for CONSULTANT's employees, agents and subcontractors' employees who will be performing at such a site.

10.2 For purposes of this Section, "Hazardous Material" shall mean and include (a) all elements or compounds that are contained in the list of hazardous substances adopted by the United States Environmental Protection Agency and the list of toxic pollutants designated by Congress or the Environmental Protection Agency or under any Environmental Laws; and (b) any "hazardous waste", "hazardous substance" (including, but not limited to, petroleum and petroleum-related materials), "toxic substance", "regulated substance", "pollutant" or "contaminant", each as defined under any

Environmental Law. "Environmental Laws" shall mean any and all federal, state, and local laws, regulations and requirements pertaining to health, safety, or the environment.

COMPANY has determined that CONSULTANT:

☐ will be working in a Non-COMPANY Onsite Situation and MUST complete the training

☒ Will be working in a COMPANY Onsite Situation and MUST ensure that its employees, agents and subcontractors' employees have been notified accordingly, and if deemed necessary by COMPANY, CONTRACTOR will assure that prior to performing any Work CONTRACTOR's employees, agents and subcontractors' employees will be trained relative to COMPANY's revised release reporting criteria.

11.0 CONFIDENTIALITY

11.1 Subject to the provisions of **Section 20.3** below, unless required by court order or valid legal process, CONSULTANT agrees not to publish or disclose to any third party any information conclusion, recommendation, opinion or data or other matter used or arising in the performance of Work under this Agreement without prior written authorization of COMPANY and also agrees to require a similar agreement from any employee, agent, or subcontractor participating in the rendering of Work under this Agreement. In the event that a court order or valid legal process requires disclosure by CONSULTANT or any employee, agent, or subcontractor, of any information or other matter used or arising in the performance or Work under this Agreement, CONSULTANT shall notify COMPANY prior to disclosing such information in order to provide COMPANY with the opportunity to challenge the court order or legal process. **CONSULTANT's obligations under this section survive the termination of this Agreement.**

11.2 All data, including but not limited to, drawings, designs, specifications, notebooks, computer programs, computer output, models, tracings, photographs, negatives, video and/or audio recordings, reports, findings, recommendations, and memoranda of every description relating to the Work under this Agreement, in whole or in part, shall be the property of COMPANY.

11.3 CONSULTANT may retain duplicate copies of the materials identified above for its records subject to the stipulation that such records shall be marked and treated as confidential and shall not be released to any third party or used for any other purpose without the prior written consent of COMPANY.

11.4 CONSULTANT shall not in any manner advertise, publish or release for publication or disclosure any statement mentioning this Agreement, or CONSULTANT's performance of, or contracting to perform the Work, without the prior written consent of COMPANY.

12.0 SUSPENSION

12.1 COMPANY may, at its sole option, by written notice to CONSULTANT, suspend at any time the performance of all or any portion of the Work being or to be performed under this Agreement. Upon receipt of any such notices, CONSULTANT shall immediately discontinue Work, including, without limitation, the placing of orders, contracts, and rental agreements to the extent they relate to Work suspended, on the date and to the extent specified in the notice; and unless otherwise specifically stated in the notice, CONSULTANT shall continue to protect and maintain the Work completed, including those portions on which Work has been suspended.

12.2 In the event of such suspension, CONSULTANT will be reimbursed for the following costs, reasonably incurred, without duplication of any items, to the extent that such costs result from such suspension of Work:

12.2.1 Except in cases of Force Majeure, a standby charge to be paid to CONSULTANT to compensate for keeping, to the extent required in the notice, its organization and equipment committed to the Site (s) in a standby status, and for the cost of maintaining and protecting that portion of the Work upon which activities have been suspended;

12.2.2 All reasonable costs as mutually agreed associated with demobilization and relocation of CONSULTANT's plant, forces, and equipment, and costs which CONSULTANT is or will be legally obligated to pay related to the performance of the Work.

12.3 COMPANY may, at its option, suspend the Work for a full safety inspection and correction at any time the Designated Representative: 1) discovers a clear safety violation; 2) sees the possibility of a dangerous condition in any Work area; or 3) notices a pattern by CONSULTANT of disregard for maintaining a safe jobsite.

12.4 If COMPANY observes a serious safety violation on a Site which is capable of causing imminent serious injury or death, or if CONSULTANT has two or more safety violations documented by COMPANY, then such violations shall be grounds for immediate termination of this Agreement. However, nothing herein shall relieve CONSULTANT of its sole responsibility and liability for safety at the Site. COMPANY may terminate any subcontractor who (a) has two or more safety violations documented by COMPANY or CONSULTANT, or (b) has an observed pattern of disregard for maintaining a safe Site.

13.0 TERMINATION AND RIGHT TO AUDIT

13.1 All or any part of the work performed under the Work Directive of this Agreement may be canceled by COMPANY for its own convenience or for any reason or reasons whatsoever upon seven (7) days written notice to CONSULTANT (except as provided in **Section 12.4** above). After the receipt of such notice, and except as otherwise directed by COMPANY, CONSULTANT shall, in good faith and to the best of its ability, do all things in light of such notice and of such request for implementation thereof as COMPANY may make, to assure the efficient, proper close out of canceled Work. Upon receipt of such notice, CONSULTANT shall reasonably cooperate with COMPANY in all matters including, potentially, transferring Work to another consultant.

13.2 Upon termination of any or all Work, CONSULTANT shall deliver to COMPANY all specifications, drawings, surveys, reports, plans, maps, calculations, bills of materials and any other data or documents pertaining to the Work which are in CONSULTANT's possession. CONSULTANT shall cooperate with COMPANY in transferring to COMPANY all rights to equipment, materials, supplies and services to be incorporated in, or as are necessary for, the Work. If appropriate documentation of such transfer of rights is requested by COMPANY, CONSULTANT's execution of such documentation shall be a condition of any final payment by COMPANY.

13.3 In the event COMPANY cancels any part of the Work to be performed hereunder or elects to terminate this Agreement, CONSULTANT shall be paid for Work performed through the date of cancellation or termination and including demobilization and restocking charges for which CONSULTANT has not been previously paid by COMPANY. In no case shall COMPANY be liable for payment to CONSULTANT for unrealized costs or anticipated profits hereunder. In the event termination by COMPANY is due to failure of CONSULTANT to fulfill its contractual obligations (including but not limited to failure to prosecute the Work in a safe manner), COMPANY may pursue any and all remedies available to it at law or in equity, and in addition to any such remedies, CONSULTANT shall be liable to COMPANY for all additional costs incurred by COMPANY to complete the Work in excess of costs which would have been incurred by COMPANY under this Agreement, including any damages for delay in completing the Work, and any damages or injury of any type or kind caused by CONSULTANT'S failure to fulfill its contractual obligation to complete the Work hereunder.

13.4 CONSULTANT shall be deemed to have materially breached this Agreement if CONSULTANT is insolvent, seeks protection from creditors, makes a general assignment for the benefit of creditors, persistently or repeatedly refuses or fails to supply enough properly skilled workers or proper materials, fails to make prompt payment to subcontractors or materialmen for materials or labor, violates any law, ordinance, rule regulation or order of any public authority having jurisdiction, if a receiver is appointed for its business, or it otherwise violates a material provision of the Contract Documents. In the event CONSULTANT files a petition for bankruptcy protection, this Agreement shall be deemed to have terminated the day before such petition was filed.

13.5 CONSULTANT may terminate this Agreement or a particular Work Directive for COMPANY's breach of a material obligation hereunder by notifying COMPANY in writing of such default. COMPANY shall have ten (10) days from receipt of notice in which to cure its performance or begun expeditious efforts to cure as can be reasonably expected under the circumstances. In the event COMPANY does not cure its performance, or commence cure as the case may be, within such ten (10) day period, CONSULTANT may terminate the applicable Work Directive.

13.6 Notwithstanding the above provisions, if CONSULTANT has taken control or possession of the Waste, CONSULTANT may not suspend performance of this Agreement with respect to such Waste.

13.7 Throughout the term of this Agreement and for a period of three years following the completion or termination of this Agreement and for so long thereafter as there may remain any unresolved questions or disputes regarding any item, COMPANY shall, at all reasonable times and upon prior notice to CONSULTANT, have access to all CONSULTANT's, subcontractors', and vendors' personnel, books, records, correspondence, instructions, plans, equipment maintenance records, drawings, receipts, vouchers, financial accounts and memoranda of every description pertaining to the Work for the purpose of auditing and verifying costs of the Work, CONSULTANT's safety performance under this Agreement or for any other reasonable purpose. COMPANY shall have the right to reproduce any of the aforesaid documents. In the event that any audit reveals an error or discrepancy of any nature whatsoever, such error or discrepancy will be corrected promptly, and any moneys owing and due either COMPANY or CONSULTANT will be paid promptly by the other party. CONSULTANT shall not charge for any costs incurred by assisting COMPANY with audits performed pursuant to this Article. CONSULTANT's obligations under this Article shall survive the termination of this Agreement.

14.0 ASSIGNMENT

14.1 CONSULTANT shall not assign this Agreement or subcontract the Work or any part thereof without first having obtained COMPANY's written approval.

14.2 All obligations imposed upon CONSULTANT pursuant to this Agreement shall be similarly imposed upon any authorized subcontractor. The fees and costs of authorized subcontractors shall be included in CONSULTANT's fees and costs as provided in the Schedule of Values or the appropriate Work Directive.

15.0 NOTICES

15.1 Any notice required hereunder to be given to either party shall be deemed duly given when ritten and delivered personally or when sent by mail or facsimile, to such party at the following addresses:

COMPANY:	CONSULTANT:
Kinder Morgan Operating L.P. "D" **1100 Town & Country Road** **Orange, California 92868** Attention: **Kerri L. Singleton** Phone: **714-560-4919** FAX: **714-560-6643** E-Mail Address: **kerri_singleton@kindermorgan.com**	**NorthWest HazMat, Inc.** **36 West Q Street** **Springfield, Oregon 97477** Attention: **Margie Wilson** Phone: **800-597-1323** FAX: **541-988-9833** E-Mail Address: **MWilson@NWHazmat.com**

15.2 The address for notices may be changed upon written notice to the other party. Notices shall be effective upon receipt.

16.0 CONFLICT OF INTEREST

16.1 During the term of this Agreement, CONSULTANT will, with respect to any Work, act as consultant for and on behalf of the COMPANY only. CONSULTANT represents that it is not now engaged, and will not during the term of this Agreement engage in employment, perform services, provide material or labor, communicate with governmental agencies, or other third parties which would constitute a conflict of interest with CONSULTANT'S obligations hereunder.

17.0 FORCE MAJEURE

17.1 Force Majeure, as used herein, shall mean acts of God, acts of public enemies, fire, war or civil disturbance, insurrection, blockades, strikes, riots, epidemics, landslides, lightning, earthquakes, floods, washouts, explosions, inability with reasonable diligence to obtain materials because of a Force Majeure event affecting a material supplier's performance, loss or shortage of transportation facilities, commandeering of raw materials or products or plants or facilities by a government, labor disputes involving a general stoppage of work on the job, rules or regulations or orders or acts of governmental authority, the unforeseeable inability to obtain necessary site access, authorization, permits, licenses, certifications and approvals and not involving the fault or negligence of COMPANY or CONSULTANT.

18.0 LIABILITIES, WARRANTIES AND TITLE

18.1 **IN NO EVENT, WHETHER AS A RESULT OF NEGLIGENCE OR OTHERWISE, SHALL CONSULTANT OR COMPANY BE LIABLE TO THE OTHER FOR ANY INDIRECT, INCIDENTAL, CONSEQUENTIAL, PUNITIVE, EXEMPLARY OR SPECIAL DAMAGES OF ANY KIND..**

18.2 CONSULTANT warrants and represents to COMPANY that:

18.2.1 CONSULTANT understands the known hazards and risks to human beings, property, and the environment associated with Emergency Response Services.

18.2.2 CONSULTANT is engaged in the business of Emergency Response Services, and has the highest level of professional expertise in these areas. CONSULTANT represents to COMPANY that it has the skill and professional competence, expertise, experience with United States Coast Guard classification and all other necessary certification, licenses and approvals to undertake the obligations imposed by this Agreement. The service performed by CONSULTANT will be conducted using its best professional judgment in a manner consistent with the level of care and skill ordinarily exercised by comparable members of the profession currently practicing under similar conditions in the community.

18.2.3 CONSULTANT will perform Emergency Response Services and all other obligations under this Agreement in a safe and workmanlike manner and in full compliance with all applicable laws, statutes, ordinances, orders, rules, regulations and guidelines of the federal, state and local governments who have jurisdiction to regulate the activities performed under this Agreement.

18.2.4 CONSULTANT shall provide COMPANY with reasonable advance written notice if any license, permit, certificate or any other approval is necessary to perform the Work hereunder, or if any license, permit, certificate, or any other approval necessary to perform the Work is to expire and cannot be renewed during the term of the corresponding Work Directive or is the subject of any judicial or administrative action seeking to impose a penalty or fine or to revoke or suspend such license, permit, certificate or approval. Such notice shall also be provided if CONSULTANT decides not to obtain any necessary license, permit, certificate or approval which becomes required after execution of the corresponding Work Directive. Upon COMPANY's receipt of such notice or upon COMPANY's learning that CONSULTANT is performing the Work without a required license, permit, certificate or any other necessary approval, COMPANY shall be entitled to terminate the Work Directive upon written notice thereof to CONSULTANT as set forth in **Section 13.0** herein.

18.2.5 If the Work entails use of one or more treatment, storage or disposal facilities, CONSULTANT shall utilize only such treatment, storage and disposal facilities as described in the applicable Work Directive that have been issued (or as directed by the Designated Representative or his or her designee).

18.2.6 CONSULTANT shall provide each person whom CONSULTANT should reasonably foresee being exposed to Waste, oil, hazardous materials, or non-hazardous material (including, but not limited to, CONSULTANT's employees and subcontractors) with clear and reasonable warning of the hazards associated with the material or Waste, and shall take all actions necessary to protect such persons, property and the environment from such hazards. CONSULTANT shall comply with all applicable laws, statutes, ordinances, orders, rules, regulations and guidance of the federal, state or local government with respect to worker safety during CONSULTANT's activities at the Site.

18.3 COMPANY warrants and represents to CONSULTANT that COMPANY will make available to CONSULTANT all information in its possession or that comes into its possession during the term of this Agreement regarding the Waste, the known surface and subsurface conditions in the vicinity of the Work and the Site, applicable topographical surveys, chemical analysis or other relevant information that would assist CONSULTANT in properly evaluating the nature and character of the Waste and the Work to be performed.

18.4 Shipping Manifests

18.4.1 Unless otherwise mutually agreed, CONSULTANT shall be responsible for and deliver to COMPANY shipping papers, manifests and labels with each shipment of Waste in accordance

with all applicable requirements of the United States Department of Transportation, (DOT) and the United States Environmental Protection Agency (EPA) under the Toxic Substances Control Act (TSCA), the Resource Conservation and Recovery Act (RCRA), or any replacement or successor agency thereto, and all other federal, state and local statutes, regulations and ordinances.

19.0 WAIVER

19.1 Any waiver by either party of any provision or conditions of this Agreement shall not be construed or deemed to be a waiver of any other provision or condition of this Agreement, nor a waiver or subsequent breach of the same provision or condition, unless such waiver be so expressed in writing and signed by the party to be bound.

20.0 SPECIAL PROVISIONS

20.1 CONSULTANT shall furnish and be responsible for the adequacy, accuracy and sufficiency of any designs, drawings, surveys or specifications which have been or which shall be produced in relation to the Work to be performed under the Agreement.

20.2 It is not the purpose or intention of this Agreement to create and the same shall not be construed as creating a joint venture, oil and gas partnership, commercial partnership or other partnership relation between the parties hereto.

20.3 CONSULTANT shall immediately notify COMPANY of all directions CONSULTANT receives from and all communication with any governmental body or agency with regard to the Emergency Response Services. CONSULTANT shall, to the extent practicable, under the circumstances, coordinate any response to a governmental body or agency's direction, request or other communication with COMPANY's Designated Representative or his or her designee.

20.4 COMPANY may obtain Emergency Response Services to substitute for or supplement those available under this Agreement at COMPANY's sole discretion, cost and expense.

21.0 DISPUTES

21.1 This Agreement and any Authorizations for Expenditure shall be deemed to have been made and accepted in Harris County, Texas, and the laws of Texas (without giving effect to Texas' choice of law rules) shall govern any interpretations or constructions of this Agreement. Except as provided in **Section 2.7.5** hereof, any dispute between COMPANY and CONSULTANT arising from this Agreement shall be resolved first through discussions among upper management of the parties, and if the dispute cannot be resolved within sixty (60) days from the date the matter was first brought by the disputing party to the attention of the other party, then either party may elect to resolve the matter through litigation which shall be brought in any court sitting in Harris County, Texas having jurisdiction thereof. COMPANY and CONSULTANT each submits to the exclusive jurisdiction of said courts and waive the right to change venue.

21.2 If in COMPANY's sole reasonable discretion the Work cannot be suspended pending the resolution of a dispute, COMPANY may (a) request that CONSULTANT continue prosecuting the Work to completion pursuant to the terms and conditions of this Agreement, or (b) take over the Work and itself prosecute the same to completion. If the pending dispute is resolved in COMPANY's favor, CONSULTANT shall be liable to COMPANY for any costs incurred in completion of the Work which are in excess of the amount(s) COMPANY would have paid pursuant to this Agreement.

21.3 It is understood that with respect to any goods and materials provided in the course of performing this Agreement the Uniform Commercial Code shall prevail as the basis for contractual obligations between COMPANY and CONSULTANT in the event that such obligations are not otherwise defined in this Agreement.

22.0 SEPARABILITY

22.1 If any section, subsection, sentence or clause of this Agreement shall be adjudged illegal, invalid or unenforceable, such illegality, invalidity or unenforceability shall not affect the legality, validity or enforceability of the Agreement as a whole or of any remaining sections, subsections, sentences or clauses.

23.0 SURVIVAL OF OBLIGATIONS

23.1 Without limiting the effect of any provisions in this Agreement, the warranties and indemnification provisions of this Agreement shall survive the termination or expiration of this Agreement.

24.0 SUCCESSORS AND ASSIGNS

24.1 The covenants and agreements contained in this Agreement shall apply to, inure to the benefit of and be binding upon the parties hereto and upon their respective heirs, executors, administrators, assigns and successors in interest.

25.0 LIABILITY OF GENERAL PARTNER

25.1 Kinder Morgan G.P., Inc., a Delaware corporation (the "**General Partner**"), is the general partner of COMPANY. CONSULTANT agrees that the General Partner shall not be liable, directly or indirectly, for any of COMPANY's obligations or liabilities under this Agreement. All such obligations and liabilities shall be non-recourse to the General Partner and shall not constitute debts or obligations of the General Partner. No judgment, attachment, execution or other writ or process shall be sought, issued, or levied in connection with this Agreement against the General Partner or any of its assets or properties to satisfy any such liabilities or obligations or any judgments rendered in connection therewith and all such liabilities and obligations shall be satisfied solely from the assets of COMPANY.

26.0 SERVICES FOR AFFILIATES

26.1 The services to be performed by CONSULTANT under this Agreement shall be performed, in certain cases, for one or more of COMPANY's Affiliates except Kinder Morgan, Inc. In the event an Affiliate requires CONSULTANT's services hereunder, a Work Directive for such service shall be issued in the Affiliate's name and executed by the Affiliate and CONSULTANT. Such Work Directive shall be in the form shown on **Exhibit A-2**, attached hereto and made a part hereof for all purposes. Upon execution of said Work Directive, CONSULTANT shall perform such Work for Affiliate in accordance with the Work Directive and the terms and conditions of this Agreement. By execution of the Work Directive, the Affiliate shall be entitled to all rights and privileges, and liable for all commitments and responsibilities held by COMPANY under this Agreement, as same applies to said Work Directive. Upon execution of said Work Directive, CONSULTANT's agreement to indemnify COMPANY pursuant to this Agreement, shall extend to both COMPANY and Affiliate for purposes of said Work Directive. Unless expressly provided in the Work Directive, the Kinder Morgan entity which executes the Work Directive shall be solely responsible for the liabilities and obligations set forth in this Agreement under which that Work Directive is being issued as the same apply to the Work to be performed pursuant to that Work Directive. All such liabilities and obligations, as they apply to that Work Directive, shall be non-recourse to the direct and indirect parents (or a general partner, as the case may be) and to the affiliates of the Kinder Morgan entity executing that Work Directive.

27.0 ENTIRE AGREEMENT

27.1 This Agreement, together with the exhibits attached hereto, constitutes the entire agreement between COMPANY and CONSULTANT and supersedes any prior written or oral agreements, or contemporaneous communications with respect to this subject matter. No subsequent amendment to this Agreement between the parties shall be binding on either party unless reduced to writing and signed by an authorized representative of each of the parties. To the extent any Work Directive issued pursuant to this Agreement conflicts with this Agreement, the Work Directive shall prevail.

28.0 DRUG/ALCOHOL/FIREARMS/OPERATOR QUALIFICATION POLICY AND TESTING

DOT Jurisdictional Work

☐ YES **Section 28.1** and **Section 28.2** apply.

☒ NO **Section 28.2** applies.

28.1 Drug/Alcohol/Operator Qualification Program and Testing

28.1.1 CONSULTANT represents and warrants that it has established, maintains, and enforces both a Drug and Alcohol Program and an Operator Qualification Program per requirements as outlined in **Exhibit F.**

28.2 COMPANY Policy Regarding Drugs/Alcohol/Weapons

28.2.1 CONSULTANT agrees to advise its employees and the employees of its subcontractors and agents that it is the policy of COMPANY that:

28.2.1.1 The use, possession and/or distribution of illegal or unauthorized drugs, drug-related paraphernalia or weapons on COMPANY's premises, right-of-way, or job site is prohibited and the use or possession of alcoholic beverages, except where authorized by COMPANY's management, is also prohibited;

28.2.1.2 Entry onto or presence on COMPANY's premises by any person, including CONSULTANT, CONSULTANT's employees, subcontractors, subcontractors' employees, contract personnel, temporary employees and visitors, constitutes consent to COMPANY to conduct searches, whether announced or unannounced, on COMPANY's premises of the person and his or her personal effects for such prohibited items, and consent to drug testing at any time while on COMPANY's premises; and

28.2.1.3 Any person suspected or found in violation of the policy or who refuses to permit a search or drug or alcohol test may be removed and barred from COMPANY's premises, at the sole discretion of COMPANY; and

28.2.1.4 CONSULTANT personnel who test positive for illegal drugs or unauthorized alcohol as a result of a test conducted on COMPANY premises, or upon request of COMPANY, will be removed from any further performance or services under this Agreement.

IN WITNESS WHEREOF, the parties hereto have executed this Agreement as of the day and year first above written.

EXHIBIT A-1 – SCOPE OF WORK

CONSULTANT shall provide all tools, labor and equipment necessary to complete the Work as described herein.

24/7 Emergency Response capabilities under Section 3.3 to Appendix E of 40CFR 112 for EPA Jurisdictional Facility's and Section 3 to Appendix C of 33CFR 154 for USCG Regulated Facilities. This includes but is not limited to:

(i) One thousand feet (1,000 ft) of containment boom (or, for complexes with marine transfer components, one thousand feet (1,000 ft) of containment boom or two times the length of the largest vessel that regularly conducts oil transfers to or from the facility, whichever is greater), and a means of deploying it within one (1) hour of the discovery of a discharge;

(ii) Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a small discharge (Average Most Probable Discharge) or greater which is available at the facility within 2 hours of the detection of an oil discharge; and

(iii) Oil storage capacity for recovered oily material.

CONSULTANT will provide response equipment and manpower resources in accordance with the National Preparedness for Response Exercise Program (PREP) Guidelines. Specific reference for USCG regulated facilities is located on pages 3-18 and 3-19 of the August 2002 PREP Guideline. Specific reference for EPA regulated facilities is located on pages 4-9 and 4-10 of the August 2002 PREP Guideline. These requirements include, but are not limited to, an annual equipment deployment exercise in the operating environment of the Area of the Facility, a comprehensive OSRO personnel training program, and a maintenance program to ensure that the equipment is periodically inspected and maintained in good operating condition. The satisfactory completion of these PREP requirements must be documented and submitted annually to Kinder Morgan to the attention of Steve Marositz, 2319 S. Riverside Ave., Bloomington, California 92316.

Please return executed work directive and Exhibit A to:
Kinder Morgan Energy Partners, L.P., 1100 Town & Country Road, Orange, California 92868
ATTENTION: CONTRACTS ADMINISTRATION

Exhibit A — Work Directive No. Directive Number

Attachment No. 01 — Revised Release Reporting Criteria

Contractor shall ensure that its employees, agents, and subcontractors' employees engaged in Contractor's activities in the performance of the Work are:

(i) notified, and when determined by Company, trained and instructed by Company, either directly or through a train-the-trainer program by Company, concerning the order of actions to be taken upon discovery of a release or threatened release condition of a Hazardous Material or pollutant substance; and

(ii) understand that no Work or visit shall be undertaken to any Company right-of-way or facility where there is no Company representative onsite and readily accessible (a "Non-Company Onsite Situation"), unless the training referred to in (i) above has occurred for Contractor's employees, agents and subcontractors' employees who will be performing at such a site.

For purposes of this Exhibit A "Hazardous Material" shall mean and include (a) all elements or compounds that are contained in the list of hazardous substances adopted by the United States Environmental Protection Agency and the list of toxic pollutants designated by Congress or the Environmental Protection Agency or under any Environmental Laws; and (b) any "hazardous waste," "hazardous substance" (including, but not limited to, petroleum and petroleum-related materials), "toxic substance," regulated substance," "pollutant" or "contaminant", each as defined under any Environmental Law. "Environmental Laws" shall mean any and all federal, state, and local laws, regulations and requirements pertaining to health, safety, or the environment.

Company has determined that Contractor:

☐ will be working in a Non-COMPANY Onsite Situation and MUST complete the training

☒ Will be working in a COMPANY Onsite Situation and MUST ensure that its employees, agents and subcontractors' employees have been notified accordingly, and if deemed necessary by COMPANY, CONTRACTOR will assure that prior to performing any Work CONTRACTOR's employees, agents and subcontractors' employees will be trained relative to COMPANY's revised release reporting criteria.

Contractor shall certify its compliance with this training requirement upon Company request.

EXHIBIT B – SCHEDULE OF VALUES

1.0 OVERVIEW

1.1 The amounts set forth in the Agreement cover payment in full for all materials, work, tools, equipment, insurance, bonds, profit, overhead and all other costs and expense of every kind, character and nature for which the CONTRACTOR is entitled to payment. Unless specifically set forth in the Agreement, no additional payment of any kind will be contemplated.

1.1.1 COMPANY agrees to pay CONSULTANT, for Work performed pursuant to this Agreement either on a COST REIMBURSABLE BASIS or FIRM FIXED PRICE, LUMP SUM BASIS (The "**Contract Price**") as specified in each Work Directive. The cumulative total of all Work Directives under this Agreement SHALL NOT EXCEED **As Limited in Section 5 of each applicable Work Directive released**, in accordance with the Schedule of Values, **Exhibit B**.

2.0 PROCESSING OF TIMESHEETS & REIMBURSABLE RECEIPTS PRIOR TO INVOICE SUBMITTAL

2.1 CONTRACTOR shall submit the timesheets and reimbursable expenses to the AUTHORIZED PROJECT REPRESENTATIVE on a daily basis for verification/acknowledgement of expenses and time spent on the project. All supporting documentation must be signed by the project Inspector prior to invoicing. Signature by these personnel does not constitute agreement to pay theses expenses.

3.0 INVOICING

3.1 Standard Invoice Procedure

3.1.1 At the end of each calendar month, CONTRACTOR shall submit to COMPANY an original detailed invoice for Work performed during that month, together with one copy of such invoice and one set of supporting documentation. Such invoice shall be sent to the following address:

3.1.2 Reference each individual contract for the appropriate addressee and company name for the invoice to be submitted.

Company Name:	**Kinder Morgan Operating L.P. "D"**
Attn:	**As specified in Section 6 of each Work Directive released**
Address:	
	,
REFERENCE:	
Contract No.:	**05-ER-45-011-ORG**
Work Directive No.:	(Per the Work Directive (Exhibit A-2) Issued for Services)
Amendment / Change Order No.:	(Per the Amendment /Change Order Issued for Services)

3.2 Non-acceptance of Invoices

3.2.1 Invoices that do not relate to this Contract **will not be processed** and such invoices will not be accepted by COMPANY. All charges not in compliance with the stated terms and conditions of this Contract will be deducted from the invoice prior to payment processing.

3.3 Required Invoice Detail

3.3.1 Each of CONTRACTOR's invoices shall contain the following information on its face:

3.3.1.1 An invoice date.

3.3.1.2 A reference number (invoice number) which is unique to the transaction

3.3.1.3 Site or project name (if applicable) and COMPANY.

3.3.1.4 Reference of COMPANY'S Project Representative.

3.3.1.5 Contract Number, Change Order Number and Directive Number (as applicable).

3.3.1.6 Billing period (time period of charges).

3.3.1.7 CONTRACTOR's remittance address or electronic funds transfer routing information, (as applicable).

3.3.1.8 CONTRACTOR'S name and telephone number of contact to handle invoice related questions.

3.3.1.9 Amount due CONTRACTOR.

3.3.1.10 Project Status Report

3.3.1.11 Summary of amount invoiced to date, this invoiced amount, retention (as applicable), and the amount remaining to be invoiced.

3.4 Supporting Documentation

3.4.1 Each of CONTRACTOR's invoices shall be itemized and submitted to COMPANY together with receipts, time records, lien waivers, evidence of payment to subcontractors, vouchers showing payments for itemized material and labor, and any other evidence of CONTRACTOR's right to payment under this Contract as COMPANY may, in its sole good faith discretion, from time to time require.

3.5 Final Invoice

3.5.1 When CONTRACTOR submits its final invoice to COMPANY for the Work, in addition to the requirements outlined above, CONTRACTOR shall additionally include the following which shall be submitted no later than thirty (30) days after the project completion date:

3.5.2 Mechanics lien and stop notice releases executed by CONTRACTOR and by each person or entity that furnished any labor, services or materials in connection with the Work;

3.5.3 Reasonable proof satisfactory to COMPANY that any claims for labor, materials or any other claim or potential claim for which COMPANY withheld compensation pursuant to the Contract have been paid or satisfied in a manner acceptable to COMPANY; and

3.5.4 All final drawings and other documents required by this Contract.

4.0 PAYMENT PROCEDURE

4.1 Processing of Approved Invoices

4.1.1 Provided that such invoice meets all of the requirements as explained, COMPANY shall use its best efforts to pay all undisputed charges set forth in each invoice, less any

retention amount applicable, within thirty (30) days after such invoice is received by COMPANY.

4.2 Processing of Disputed Invoices

4.2.1 If COMPANY, in good faith, disputes and does not approve an item billed, COMPANY shall notify CONTRACTOR of the item or portion of an item disputed and withhold payment thereof until settlement of the dispute. Such right of COMPANY to withhold such payments shall be in addition, and not in any way in lieu of, any other right of COMPANY hereunder, including the right to raise disputes for the first time after audit. Payment shall be contingent upon COMPANY's review of the invoice and determination that the Work described in the invoice complies with all of the terms of this Contract. Interest penalties for disputed invoices will not be paid by COMPANY.

4.3 Delayed submittal of Invoices and Non-payment

4.3.1 Any Work for which CONTRACTOR does not submit an invoice to COMPANY within thirty (30) days after the month in which such Work is completed shall be deemed to have been performed by CONTRACTOR without compensation; provided however, that if prior to the end of such thirty (30) day period, CONTRACTOR requests in writing from COMPANY's Project Representative a further extension of time for submitting such invoice (stating the reasons therefore and the amount of additional time requested), and COMPANY elects to authorize such extension in writing, CONTRACTOR shall have until the end of the extension to submit such invoice.

5.0 TIME AND MATERIALS RATES

5.1 Labor:

Table 1
Labor Rates

Description/Category/Classification	Straight Time (Rate Per Hour) (US $0.00)	Overtime (Rate Per Hour) (US $0.00)	Double Time (Rate Per Hour) (US $0.00)
Incident Manager/Site Supervisor	$50.00	$82.50	
Emergency Response Manager	$50.00	$82.50	
Safety/Public Information Officer	$40.00	$45.00	
HazMat Technician	$38.00	$57.00	
Hazardous Materials Manager	$50.00	$82.50	
High Hazard Specialist	$100.00	$150.00	
Confined Space Supervisor	$35.00	$45.00	
Confined Space E/A	$38.00	$57.00	
Secretary/Administrative	$20.00		

5.1.1 Rates shown on the rate sheet in the Schedule of Values include all benefits, withholding, workers compensation, and small tools and consumables.

5.1.2 All labor rates shown in Table 1 of the Schedule of Values shall be all-inclusive of small tools having a cost less than $750, disposable parts, consumables and personal protective gear that is normally utilized in the performance of daily work.

5.1.3 Rates are subject to change from time to time at Contractor's discretion. The rate schedule, once adopted will remain in effect until new rates are mutually agreed upon by Company and Contractor and amended into the Agreement

5.1.4 Classifications and straight time, overtime and double time rates not defined in Table 1 above shall be approved in advance by the Technical Designated Representative and the Administrator of the Agreement.

5.1.5 Day rates as approved in advance by COMPANY will apply to mobilization and demobilization personnel to the worksite.

5.1.6 Travel pay - See section "5.3" below.

5.2 Definition of Overtime:

5.2.1 CONTRACTOR defines Overtime as work exceeding eight (8) hours per days and/or forty (40) hours per calendar week. CONTRACTOR's employee(s) hours worked on project(s) other than project here under will not be credited hours for the purpose of overtime. Overtime will be paid at the "Over Time" rates shown (in Table 1) of the Schedule of Values, **or at a factor of 1.3 times the straight time or flat rate, if applicable**, multiplied by the number of hours worked.

5.2.2 CONTRACTOR defines Double Time as work on Sundays or on CONTRACTOR's observed holidays. Double-Time shall be paid at the rates shown in Table 1 of the Schedule of Values, **or at a factor of 1.7 times the Straight-Time or flat rate, if applicable,** multiplied by the number of hours worked.

5.2.3 CONTRACTOR agrees not to pay shift differential for swing (evening) or graveyard (night) shifts.

5.2.4 CONTRACTOR's employee(s) put on stand-by time be paid for actual hours on stand-by. Stand-by time hours will be credited for the purpose of overtime.

5.3 Definition of Travel and Expenses:

5.3.1 Travel Time is charged as work time. Travel time for hourly rate personnel will be actual travel time but not to exceed eight hours per day. Agreement rates do not include costs for travel, subsistence, reproduction, communications, computer, modeling, subcontracts, freight, etc.

5.3.2 COMPANY shall reimburse CONTRACTOR, without markup, for the direct, reasonable cost to CONTRACTOR for employee travel expenses away from the (Site/Employee's base office) when this travel occurs as a direct result of the performance of the Work. Travel expenses include air (excluding first class airfare), ground transportation, lodging, meals, and telephone expenses. All travel expenses must have prior COMPANY approval and shall be supported by valid receipts.

5.3.3 Mileage Reimbursement will be paid for Mobilization and Demobilization Only and shall be no more than $0.40½ cents/mile/vehicle. (COMPANY will compensate only per vehicle and not per man within the vehicle.)

5.3.4 Per Diem (subsistence) when in outlying areas (outside of a 50 mile radius from office/site) will be $40.00 per person per day; or $50.00 per person per day in high cost areas agreed to in advance by the parties.

6.0 EQUIPMENT

6.1 Equipment, rented, at cost plus ten percent (10%)

Table 2
Equipment Rates

Description/Category/Classification	Rate (U.S. $0.00)	Unit of Measure (Per Hour, Day, Week, Etc.)
VEHICLES		
Emergency Response Vehicle	$150.00/day

EXHIBIT F – DRUG & ALCOHOL/OPERATOR QUALIFICATION PROGRAM REQUIREMENTS

CONTRACTOR shall comply with requirements for both DOT Drug and Alcohol and Operator Qualification Requirements Programs, as follows:

1.0 DOT DRUG AND ALCOHOL PROGRAM

1.1 CONTRACTOR represents and warrants that it has established, maintains, and enforces a drug and alcohol policy.

1.1.1 Compliance with DOT Anti-Drug and Alcohol Misuse Regulations.

1.1.1.1 COMPANY, under 49 CFR Parts 199 and 40, is required by law to ensure compliance with the pipeline safety regulations for drug and alcohol testing applicable to its CONTRACTORS', subcontractors and their agents, performing operations, maintenance, or emergency response functions on a pipeline or LNG facility subject to Parts 191, 192, 193 and 195 of Title 49 of the Code of Federal Regulations or any other provision or Part thereof (or any successor thereof) covering the type of work CONTRACTOR may perform pursuant to this Agreement as follows:

1.1.1.1.1 CONTRACTOR agrees that CONTRACTOR, its subcontractors, and their agents will abide by a DOT anti-drug plan and alcohol Misuse Program which applies to all employees of CONTRACTOR, its subcontractors, and agents if performing an operations, maintenance or emergency response function on COMPANY's facilities.

1.1.1.1.2 CONTRACTOR agrees that CONTRACTOR, its subcontractors and their agents shall provide to their respective employees an Anti-drug Plan and Alcohol Misuse Program, the drug and alcohol testing, education, and training required by Title 49 Parts 199 and 40 of the Code of Federal Regulations. Prior to and during the performance of any work hereunder, CONTRACTOR shall have in place and shall implement a drug testing program meeting the requirements imposed by the regulations of the Code of Federal Regulations.

1.1.1.1.3 CONTRACTOR agrees that CONTRACTOR, its subcontractors, and their agents, are in compliance with the drug and alcohol testing regulations at 49 CFR Parts 199 and 40 and the Motor Carrier Regulations at 49 CFR Parts 391 and 394, if applicable.

1.1.1.1.4 CONTRACTOR agrees that CONTRACTOR, its subcontractors, and their agents shall allow COMPANY, the administrator and/or representative of a state agency (as defined in 49 CFR Part 199) access to property and records for the purpose of monitoring compliance with the requirements of the Research and Special Programs Administration for drug and alcohol testing at 49 CFR Part 199. This access shall occur periodically, and without prior notice to allow COMPANY, the administrator and/or representative of a state agency to audit CONTRACTOR, its subcontractors, and their agents' Anti-drug Plan and Alcohol Misuse Program, the required drug and alcohol testing and results thereof.

1.1.1.1.5 COMPANY requires that CONTRACTOR'S written Drug Testing Program be approved in writing by COMPANY'S Policy and Compliance Department or its third party designee prior to start of work hereunder. Thereafter, COMPANY reserves the unqualified right to audit the said program at any time, or to ask its third party designee to do likewise, during the performance of work hereunder. In the event that COMPANY, at its sole discretion believes that the said program no longer meets the applicable law and/or regulatory statutes recited in this Policy and its subsections, then COMPANY may suspend work until such time as CONTRACTOR restores the said program to full compliance. Any costs incurred by COMPANY because of such suspension, shall be borne by CONTRACTOR.

1.1.1.1.6 COMPANY, to the extent required by applicable laws or regulations, will monitor the CONTRACTOR's compliance with these regulations and from time to time require certificates regarding compliance with such testing requirements to be provided by CONTRACTOR from CONTRACTOR'S testing agency. CONTRACTOR will allow access to its property and records by COMPANY or by any authorized state agency (or its representative) having jurisdiction over COMPANY or its facilities, for the purpose of monitoring COMPANY'S compliance with governmental laws, rules or regulations.

2.0 OPERATOR QUALIFICATION PROGRAM

2.1 CONTRACTOR represents and warrants that is has established, maintains and enforces an Operator Qualification (OQ) program.

2.1.1 Compliance with DOT OQ Regulations

2.1.1.1 COMPANY under 49 CFR Parts 192 and 195 is required by law to ensure compliance with the pipeline safety regulations for OQ applicable to its CONTRACTORS, its subcontractors and their agents who perform specific covered tasks during operations and maintenance work on hazardous liquids (including CO2) or natural gas pipelines or facilities subject to Parts 192 or 195 of Title 49 of the Code of Federal Regulations as follows:

2.1.1.1.1 CONTRACTOR agrees that CONTRACTOR, its subcontractors and their agents shall review and comply with COMPANY's OQ Program. CONTRACTOR agrees that CONTRACTOR, its subcontractors and their agents will also review the list of covered tasks and identify any and all covered tasks that they would perform for COMPANY (OQ Program and list of covered tasks attached).

2.1.1.1.2 CONTRACTOR agrees that CONTRACTOR, its subcontractors and their agents will be qualified under a COMPANY approved evaluation program which applies to all employees of CONTRACTOR, its subcontractors and their agents who perform specific covered tasks during operations and maintenance work.

2.1.1.1.3 CONTRACTOR agrees that proper and approved documentation will be kept by CONTRACTOR or their agents to verify the OQ evaluations and that CONTRACTOR will provide for COMPANY's access to this documentation as necessary for verification. CONTRACTOR will keep documentation in an electronic format, such as Qualifier™ database, the National Center for

Construction Education and Research database, the Midwest Energy Association database, CONTRACTOR's website or other format pre-approved by COMPANY's OQ Administrator.

2.1.1.1.4 CONTRACTOR agrees that CONTRACTOR, its subcontractors and their agents shall allow COMPANY's representative and/or the representative of a local, State or Federal agency access to property and records for the purpose of monitoring compliance with the requirements of the OQ regulation. This access shall occur periodically and without prior notice.

2.1.1.1.5 CONTRACTOR personnel who do not have proper and documented OQ qualifications will not be allowed to perform specific covered tasks during operations and maintenance work on hazardous liquids (including CO2) or natural gas pipelines or facilities subject to Parts 192 or 195 of Title 49 of the Code of Federal Regulations, unless those non-OQ qualified personnel are supervised by an OQ-qualified individual, as described in COMPANY's OQ Program.

2.1.1.1.6 CONTRACTOR agrees to provide OQ-related information on its personnel when requested by COMPANY. Typically, this will be requested by COMPANY Project Management or Operations Designated Representatives during the bidding process or if the work is not bid, when the work is assigned to CONTRACTOR.

2.1.1.1.7 CONTRACTOR agrees to review the work it is being asked to perform and identify any covered tasks being performed which were not identified as covered tasks by COMPANY's Project Management personnel, and notify COMPANY's Project Management personnel of the discrepancy prior to commencement of the work.

For detailed information on COMPANY's Operator Qualification requirements contact Doug Thacker, Senior Coordinator, Safety Services Phone: 307-261-3330, Fax: 307-262-5717, E-mail: Doug_Thacker@kindermorgan.com .

IMPORTANT NOTICE

To Contractors Of Kinder Morgan And/Or Its Affiliates ("KM")

Department of Transportation Regulations
For
Anti-Drug and Alcohol Misuse Plans

The Department of Transportation ("DOT") continues to report drug/alcohol testing compliance problems with contractors who perform DOT-covered work for pipeline operators. In response to these compliance problems, DOT promises to step-up their enforcement of the regulations contained in 49 CFR Parts 199 and 40. DOT places the responsibility upon the pipeline operators such as KM, to see that contractors and contractor employees performing DOT-covered work are in compliance with the drug testing regulations. Given what we know about DOT drug/alcohol testing plans and contractor monitoring, it is possible many existing contractor's drug plans do not meets the standards required by these regulations. In addition, new alcohol regulations became effective January 1, 1995, for the Research and Special Programs Administration and the Federal Highway Administration. Consequently, reasonable measures must be undertaken to safeguard against civil penalties from DOT.

1. KM Action: Effective January 1996, COMPANY contracted with National Compliance Management Service, Inc., (NCMS) to act as its agent for monitoring contractor DOT anti-drug and alcohol misuse prevention plans and to obtain contractor drug/alcohol testing data. NCMS is authorized by KM to request anti-drug and alcohol misuse plans and statistical data and other documentation from contractors who plan to perform an operating, maintenance or emergency response function on KM covered facilities.

   DOT's Transportation Safety Institute has model anti-drug and alcohol misuse plans available for guidance when writing your plans. You can contact them at (405) 954-4643.

2. Contractor Action: Please forward the following items immediately to National Compliance Management Service, Inc.:

   A. A copy of your current DOT anti-drug and alcohol misuse prevention program;

   B. A completed Contractor Audit Request Form (enclosed with this notice) to:

   National Compliance Management Service
   (Kinder Morgan Audit)
   7 Compound Drive
   Hutchinson, KS 67502
   Phone: (620) 669-0954 Fax: (620) 669-8430

3. National Compliance Management Service, Inc. (NCMS) Action: NCMS, KM's authorized agent for reviewing contractors DOT anti-drug/alcohol misuse plans and drug/alcohol testing data shall:

4. Review your anti-drug/alcohol misuse plan utilizing the federal inspection forms. These forms contain the same criteria utilized by the Federal and State agencies.

   A. Based on this review, if your anti-drug/alcohol misuse plan should require revision, NCMS will so advise your company and provide you with the necessary information to bring your plan into compliance. All contractors must revise their anti-drug/alcohol misuse plan to comply with regulations as determined by NCMS.

   B. Request the necessary drug/alcohol testing data on your company employee, numbers and kinds of tests performed and their result. The statistical information shall be requested on a quarterly basis.

IMPORTANT NOTICE

To Contractors Of Kinder Morgan And/Or Its Affiliates ("KM")

Department of Transportation Regulations
For
Anti-Drug and Alcohol Misuse Plans

C. The first review and notice of anti-drug plan/alcohol misuse plan revisions by NCMS is without fee. KM has paid for this service. However, additional reviews will result in a fee of $75.00 for the first and $150.00 for the second additional review. These fees shall be paid to NCMS by the contractor. These will be no third review unless KM approves it.

Information on a Pipeline Testing Consortium:

Pipeline Testing Consortium, Inc. (PTC) is one of several consortia in the USA that is available to provide administration of the DOT anti-drug/alcohol misuse regulations. Contractors who become members of PTC are in compliance with DOT regulations. Although we do not endorse one consortium, if you are interested in its service, please contact it by phone or mail at:

Pipeline Testing Consortium, Inc.
9 Compound Drive
Hutchinson, KS 67502
Phone 1-800-294-8758 Fax: (316) 669-0906

Only contractors with approved drug/alcohol testing programs will be allowed to perform DOT-covered tasks for KM. If you should have any question pertaining to this matter or require additional information, please contact for KMI systems, Scott Evans at 307-261-3310, and for KMEP systems, Barry Kerns at 714-560-4400.

KINDER MORGAN CONTRACTOR COMPLIANCE PROCEDURES	
Item 1	KINDER MORGAN will request copies of the alcohol and drug testing plans of its contractors. The contractor will provide the information to National Compliance Service, Inc. (NCMS).
Item 2	NCMS will evaluate contractor plans utilizing and evaluation form that follows the DOT/RSPA Headquarters Audit Inspection form.
Item 3	NCMS will return the evaluation form to the contractor advising the status of the evaluation.
Item 4	If the plan is acceptable, it will be so noted and returned to the contractor.
Item 5	If the plan is unacceptable, it will be so noted and returned to the contractor with the evaluation form including remarks representing what needs to be accomplished in order to be accepted.
Item 6	If the contractor returns the plan for a second review, the plan must be accompanied by a check or money order from the contractor in the amount of $75.00, payable to National Compliance Management Service, Inc. The plan must be returned by the contractor for the second review within 30 days of the contractor receiving the plan from the first review.
Item 7	The third review will require a payment of $150.00 by check or money order from the contractor. The plan must be returned by the contractor for the third review within 30 days of the contractor receiving the plan from the second review.
Item 8	Plans will not be reviewed more than three times, without the intervention of a KINDER MORGAN management official.

If yes, please list the name and address:	

Please Provide The Following Information*

One (1) copy of your DOT drug and alcohol program (latest revision)

Complete & Return statistical data reports (drug & alcohol - attached)

Drug/Alcohol data for 1995	1st		2nd		3rd		4th
Drug/Alcohol data for 1996	1st		2nd		3rd		4th
Drug/Alcohol data for 1997	1st		2nd		3rd		4th
Drug/Alcohol data for _____	1st		2nd		3rd		4th

One blank copy of the laboratory chain-of-custody form

List of covered employees

Verification of supervisory drug/alcohol training

* Note: It Is Absolutely Necessary That All Of The Above Information Be Submitted, To Ensure That Your Company Is Eligible To Perform Dot Regulated Services For Kinder Morgan.

Return this form and the requested documents to:	National Compliance Management Service, Inc. **(KINDER MORGAN Audit)** 7 Compound Drive Hutchinson, KS 67502 Phone: (620) 669-0954 Fax: (620) 669-8430 **For questions, contact: Richard L. Rippert at (620) 669-4410**

Notice to Contractors
1997

This form has been designed by our pipeline clients for use by the contractor for submission of drug/alcohol statistical data on a quarterly basis and can be used for the entire reporting year.

Complete the section marked **First Quarter** and retain the original in your file. Mail a copy of the completed form (mail both pages) to NCMS for inclusion in your contractor file. At the end of the second quarter, complete the section marked **Second Quarter** and again retain the original for your file. Mail the completed form to NCMS. Complete the same process for the **Third Quarter** and the **Fourth Quarter**. There is no need to complete the totals section until the fourth quarter of the reporting year. This process will allow for the use of the same form all year long and will provide a running tally of your statistical data. Be sure to mail the complete form each quarter. If you do not conduct any alcohol tests during the quarter, you may put zeros or draw a diagonal line thru the section.

The submission of the quarterly statistical data report is the key to demonstrating your company's compliance with the federal regulations and provides notification to our pipeline clients of your status. The quarterly statistical data reports must be received no later than 30 days after the end of the reporting quarter.

Notice to Contractors
Drug/Alcohol Statistical Data Report Submission

Contractors have been required by pipeline operators to submit drug testing statistical data on a quarterly basis as a means to demonstrate their compliance with the pipeline safety regulations. Beginning on January 1, 1995, contractors were required to maintain and report alcohol statistical data on their programs. In the past a number of statistical reporting formats have been utilized by various operators, contractors, and consortium. After reviewing all the information supplied we have determined that some of these reports are not sufficient as they don't meet the minimum requirements of the pipeline safety drug and alcohol regulations as set forth in 49 CFR Part 199.23 and 199.25 for drug testing data; 49 CFR Part 199.227 and 199.229 for alcohol testing data; and 49 CFR Part 40.31 blind sampling as required by our pipeline clients.

The pipeline safety drug and alcohol regulations clearly specify what types of records must be maintained by each contractor. The regulations also specify what type of information must be maintained and available for reporting to the pipeline operator in order for them to determine the contractor's compliance with the regulations. Under 49 CFR 199.21 the regulations clearly stipulate the pipeline operator shall remain responsible for ensuring that the requirements of Parts 199 and 40 are complied with and that contractors shall allow access to property and records for the purpose of monitoring compliance with the regulations.

The review of contractor statistical data is an ongoing process and is the key used to determine that contractors performing covered functions for our clients are conducting the required types and numbers of drug and alcohol tests. It is essential contractors realize they must submit valid and accurate statistical drug/alcohol data. The submission of incomplete, partial reports, incorrect data/totals, or the submission of laboratory reports which do not address all the federally-mandated requirements creates a major problem for our clients.

In recent federal and state audits it appears the focus of their inspections is now to look more closely at contractor's files and to concentrate on the statistical data being forwarded to the pipeline operator. If the information is incomplete, incorrect or missing, this could lead to the issuance of a probable violation against the pipeline operator.

At the request of our pipeline clients, NCMS has developed a drug and alcohol statistical data reporting format which addresses the minimum federal record keeping and reporting requirements for drug and alcohol testing. The use of this form will ensure more accurate information and provide a mechanism for reviewing the data to determine compliance with pre-employment testing, random test numbers and other components of the regulations. This form has been accepted by our clients as the minimum measuring standard for compliance with the reporting requirements. Therefore, contractors shall submit their drug and alcohol statistical data on the designated NCMS form.

Agreement Number: 05-ER-45-011-ORG

EXHIBIT G – KINDER MORGAN CONTRACTOR SAFETY RULES & REGULATIONS

Issued: 8-16-1995
Revised: 01--2005

KINDER MORGAN

CONTRACTOR SAFETY MANUAL

This document is intended to provide all contractors, including inspectors, sub-contractors and contract employees with the essential safety, health and environmental standards required to successfully complete tasks while working on and/or adjacent to Kinder Morgan job sites.

All contractor employees and inspectors are required to read and sign the applicable **Contractor Employee Safety Training Document** (ATTACHMENT 01) upon completion of the pre-job briefing and site orientation prior to the start of any work activity at Kinder Morgan facilities and/or projects.

Thank you for your continued commitment to and implementation of our cooperative Contractor Safety Program. Your continued safety

IS OUR PRIMARY GOAL!

INTRODUCTION

Contractors are required to comply with all applicable Federal, State and local safety, health, and environmental regulations including all site specific Kinder Morgan policies applicable to work scope. All Contractors must have and adhere to their own Health and Safety Plan. The guidelines presented in this document are not an exhaustive list of all applicable requirements and regulations for the Contractor to conduct work for Kinder Morgan. Instead, these guidelines highlight certain Kinder Morgan standards that may be applicable for the Contractor's scope of work for Kinder Morgan.

It is essential that these rules and safety responsibilities are understood before starting work on Kinder Morgan property and/or project. Violating safety standards could jeopardize the welfare of the Contractor and/or Kinder Morgan employees and could result in expulsion from Kinder Morgan property and/or project and deny the Contractor the opportunity to be considered for future Kinder Morgan work projects.

If these standards are not clearly understood, or if safety problems arise which are not covered by these standards, contact the company EHS representative before proceeding. This company representative will be designated at the pre-job meeting along with contact information.

All Contractors shall provide direct supervision of their employees. Contractors or subcontractors shall not be supervised by Kinder Morgan management or personnel.

All Contractors are required to have, and make available for Kinder Morgan's review, written compliance programs which address specific work related activities such as confined space entry and safe excavation plans. Providing written Health and Safety programs to Kinder Morgan does not constitute an express or implied approval of such programs by Kinder Morgan management.

Additional information specific to Contractor Safety may be accessed through the web site www.kindermorgan.com under "Work with KM". This web site allows access to the various forms available to achieve documentation requirements such as the Contractor Injury/Accident Report, etc.

1.0 DEFINITIONS

1.1 **ACCIDENT/INCIDENT INVESTIGATION**: An accident/incident investigation is an analysis of the factual information gathered by a thorough and conscientious examination of all factors involved. It is an objective evaluation of all facts, opinions, statements, and related information to determine the cause, as well as definite action steps to be taken to prevent reoccurrence.

1.2 **CARRIER ACCESS AGREEMENT**: A facility access agreement specifically developed for truck drivers and their employers (where applicable).

1.3 **CONFINED SPACE**: An area which has, by design, limited openings for entry and exit, unfavorable natural ventilation that could contain or produce dangerous levels of air contaminants, and which is not intended for continuous human occupancy.

1.3.1 Various recognized confined space areas on Kinder Morgan property fall under the OSHA definition of "Permit Required Confined Space". Kinder Morgan may choose to treat all confined space areas as "Permit Required Confined Spaces", depending on the type of work to be performed within the space.

1.4 **CONTRACTOR**: Any person contracted to perform short or long-term work for Kinder Morgan. With respect to this policy, references to "contractor" shall also include subcontractors and third party contractors, inspectors (e.g. customer contract personnel, and other contract personnel that may have an effect on facility safety).

1.5 **FIRE WATCH**: An individual who has been designated for monitoring the hot work site where open flames are present, where work on in-service equipment is being performed, or where sparks have the potential for landing on adjacent, in-service equipment. This individual is capable of evaluating unsafe conditions and who is capable of initiating emergency action in the event of a fire. Fire watch can have "no other assigned duties while conducting this task".

1.6 **HOT WORK**: Any work that involves the use of open flames or other sources of ignition.

1.7 **INSPECTORS/KINDER MORGAN REPRESENTATIVE**: Any person contracted or assigned to perform short or long-term work place inspections for Kinder Morgan. References to "inspector" in these guidelines shall also include company and third party contract inspectors.

1.8 **KINDER MORGAN PROPERTY**: Any Kinder Morgan Property and/or job site which may include terminals, facilities, stations, roads, parking lots, pipeline right-of-ways, common areas, compressor/pump station, offices, etc.

1.9 **WORK PERMIT**: A daily written authorization that describes the scope of the work to be completed, describes where and when the work is to be completed, special precautions, personal protective equipment required, and emergency information. To be valid, the permit must be signed by the designated permit issuer and it shall indicate the date and time of expiration.

2.0 GENERAL REQUIREMENTS

2.1 All contractors are required to participate in Kinder Morgan's Contractor Safety Evaluation Program. Each contractor will be required to complete a Standardized Contractor Questionnaire-Verified (SCQ-V) provided by ISN Software Corporation. The information shall be completed on ISN's online compliance database, ISNetworld. Based on safety performance and training, each contractor will be evaluated and placed on a "contractor" list if appropriate.

ISN Software Corporation

(214) 303-1303

www.isnetworld.com

2.2 Kinder Morgan will evaluate safety performance of contractors as the job progresses. At a minimum, this shall include periodic job site reviews.

2.3 Kinder Morgan has the right to review each contractor's safety data and supporting documentation submitted on the Standardized Contractor Questionnaire – Verified (SCQ-V).

2.4 Kinder Morgan reserves the right to request copies of all applicable procedures, plans and documentation specific to training, inspections, permitting and accident/injury reporting.

2.5 After the project is awarded, the contractor's employees must participate in the contractor employee orientation program consisting of the following elements:

2.5.1 Safety Orientation

2.5.1.1 Prior to beginning any work the Kinder Morgan Company job representative(s) and the General Contractor's representative(s) along with any applicable operations personnel and EHS staff shall conduct a pre-job meeting covering this contractor safety manual and any site specific procedures.

2.5.1.2 The contractor shall ensure all contractor employees and sub-contractors receive a safety orientation. This can be accomplished by viewing the "Contractor Safety Video" and reviewing all applicable requirements outlined in the contractor safety manual based on the scope of work, along with a review of any site specific procedures, emergency action plans and special circumstances associated with the project and/or site.

2.5.1.3 All Contractor employee orientations shall be documented with the content of the orientation on the Contractor Pre-Job Orientation Report CSM-003 (or equivalent form). Each Contractor employee shall sign the Contractor Employee Safety Summary Document (or equivalent form) to verify full

understanding of the covered topics. A copy of the completed form shall be provided to the Kinder Morgan job representative. Where applicable contractor employees shall be issued the current "contractor safety orientation" sticker for their hard hats.

2.5.1.4 The site specific orientation may include a review of procedures, restricted areas, security, hazards that contract personnel may encounter, warning signs, evacuation routes, other emergency procedures, rendezvous areas, emergency systems such as eye washes, safety showers, and contractor access ways and parking requirements.

2.5.1.5 All Contractor employees/visitors must sign in/out each time they enter/leave Kinder Morgan property.

2.6 Visitors shall not be granted entry without prior permission from Kinder Morgan site personnel.

2.7 All communication equipment used by Contractor's employees (radios, phones, computers, beepers) must be determined to be intrinsically safe where appropriate. No cell phones or pagers will be allowed in an area where a Hazardous Atmosphere may exist, unless a Hot Work Permit has been completed - no exceptions.

2.8 Pets are not allowed on Kinder Morgan property.

3.0 GENERAL INSURANCE REQUIREMENTS

3.1 All contractors shall have insurance that complies with Kinder Morgan Contract Administration Department and Procurement requirements. All changes in coverage of Contractor's insurance policies must be approved by the Kinder Morgan Corporate Contract Administrator.

4.0 ACCIDENT / INJURY REPORTING (29 CFR 1904)

4.1 The Contractors shall immediately report all accidents, spills, injuries, and near misses to the Kinder Morgan representative and the company EHS representative.

4.2 Contractors and inspectors are required to investigate and document all contractor incidents within 48hrs, use form CSM-OO1 or equivalent for proper documentation. This includes major property damage incidents, injuries, fires, and significant near misses. These reports shall be forwarded to the company EHS representative for review. Kinder Morgan may conduct investigations of any or all contractor incidents occurring on-site.

4.3 Contractors shall maintain a separate OSHA 300 log for their respective employees. Contractors may also be required to supply on a bi-weekly basis a safety and environmental performance report outlining any accidents, spills, injuries, and near misses that have occurred on the project.

4.4 The following are minimum first aid requirements for construction contract companies working at Kinder Morgan facilities:

4.4.1 First Aid Trained Personnel: Contractor shall have personnel trained and immediately available to provide first aid treatment at the job site. All trained personnel must possess a current (First Aid) certificate.

4.4.2 First Aid Kit: Each Contractor must supply each job site with a first aid kit appropriate for potential exposures and number of employees at the job site.

4.4.3 Emergency Procedures: Each Contractor must post a copy of the company's emergency medical procedures at the job site or have a copy immediately available, at all times, to each employee The procedure must include:

4.4.3.1 The name of the hospital or emergency care center where employees are to be transported for treatment of non life-threatening injuries.

4.4.3.2 Travel route to the hospital or emergency care center and emergency telephone numbers.

4.4.3.3 The statement "IN CASE OF SERIOUS INJURY CALL 911" (or a specified emergency number).

5.0 ASBESTOS (29 CFR 1926.1101 and1910.1001)

5.1 The likelihood of encountering asbestos-containing material while conducting maintenance on equipment in our facilities exists. It is the responsibility of the contractor to test for its existence prior to conducting work. All Contractors who perform any type of work where there is exposure to asbestos as well as maintenance or repair operations where there is exposure to asbestos shall comply with 29 CFR 1926.1101 & 1910.1001 as it relates to their particular scope of work. All Contractors are required to have a written Compliance Program that meets the minimum content requirements specified in 29 CFR 1926.1101 and 1910.1001. Training records and certificates shall be documented and maintained by the Contractor.

6.0 CONFINED SPACE ENTRY (29 CFR 1910.146)

6.1 All Contractors who perform any type of Confined Space Work, as it relates to their particular scope of work, shall comply with OSHA Standard 29 CFR 1910.146. All Contractors are required to have a written Confined Space Entry Program regardless of industry SIC designation (29 CFR 1910.146 (h)(9)(iii)). Contractor's written program must meet the minimum requirements of 29 CFR 1910.146(c)(4) and any applicable state and local Confined Space Entry regulations and requirements. Training records and certificates shall be documented and maintained by the Contractor.

7.0 CONTROL OF ALCOHOL, ILLEGAL DRUGS AND FIREARMS

7.1 The possession of firearms or other perceived dangerous weapons while on ANY Kinder Morgan property is strictly prohibited.

7.2 The use, sale, purchase, transfer, or possession of alcohol or any illegal drugs while on Kinder Morgan property is strictly prohibited.

7.3 Based on business unit or DOT requirements the Contractor and its subcontractors shall establish and maintain acceptable Anti-drug and Alcohol Misuse Programs. Acceptable means the Contractor has demonstrated to Kinder Morgan's satisfaction that the programs are conducted in accordance with the requirements of 49 CFR Parts 40 and 199. Such programs shall be reviewed and approved by National Compliance Management Systems (NCMS) before the Contractor or subcontractor is allowed to perform work that Kinder Morgan deems "Safety Sensitive". Positions that Kinder Morgan classifies as Safety Sensitive under 49 CFR Parts 40 and 199 must be included in an approved Anti-drug Plan and an Alcohol Misuse Plan.

7.4 If applicable National Compliance Management Systems (NCMS) shall evaluate the Contractor's drug/alcohol programs. Based on the above-mentioned drug testing requirements, if the contractor is required to have a drug/alcohol program. The plan shall be submitted to NCMS for evaluation and approval by Kinder Morgan.

National Compliance Management Systems

1-800-294-8758

www.nationalcompliance.com

8.0 ELECTRICAL SAFETY (29 CFR 1910 Subpart S and 1926 Subpart K)

8.1 Contractor shall be responsible for implementing all electrical safety requirements in accordance with 29 CFR 1910 Subpart S and 1926 Subpart K.

8.2 Prior to conducting operations near overhead power lines contractor shall contact the local utility company for specific requirements, and at a minimum, meet the following applicable guidelines:

- National Electric Safety Code - NESC
- National Association of Corrosion Engineers - NACE - Standard RP-01-77
- Occupational Safety and Health Administration - OSHA
- Federal, State, and Local requirements
- US D.O.T. Pipeline Safety Regulations - Parts 192 and 195 as applicable

8.3 Contractor shall identify all overhead power lines with signage where appropriate. When it is determined that electrical lines may be affected, the Contractor must take steps to elevate, cover, or otherwise protect such cables from incidental contact. The Contractor must advise his employees of the location of any power lines, the hazards involved, and the protective measures to be taken.

8.4 In work areas where the exact locations of the underground electrical power lines are unknown, the Contractor must locate and clearly identify all such lines prior to beginning excavation. Power cable systems within the work area must be de-energized during excavation whenever there is doubt about cable location.

8.5 The Contractor must protect his/her employees from electric shock while using power tools, appliances, and related equipment. Contractor must install ground fault interrupters on all power outlets that will be used during construction and maintenance.

9.0 EMERGENCY/EVACUATION PROCEDURES (29 CFR 1910.38, 1926.35)

9.1 The contractor and all of their personnel shall familiarize themselves with the KM site specific emergency action plan, including where assembly areas/evacuation areas are, that they are to be accounted for, and that they are to follow the direction of KM personnel in the event of fire or hazardous materials release or when otherwise directed by Kinder Morgan personnel:

9.1.1.1 Shut-off all equipment if doing so does not present a risk of bodily injury.

9.1.1.2 Evacuate the area. In the event of a fire or other emergency incident, contract employees are to immediately evacuate the area by the safest available route. Normally, evacuation routes shall be as specified by Kinder Morgan personnel.

9.1.1.3 Confirm all Contractor's employees are accounted for.

9.1.1.4 All Contractor employees shall remain at the rendezvous location until directed otherwise by Kinder Morgan.

9.2 If any Contractor employee suspects that an emergency condition exists, they shall immediately contact Kinder Morgan personnel or local authorities (e.g. call 911 or the particular emergency number in your area).

10.0 EXCAVATIONS/TRENCHING/SHORING (29 CFR 1926.650-.652, Subpart P)

10.1 All excavation (trenching/shoring) projects shall comply with the latest requirements as outlined in 29 CFR 1926 Subpart P. The contractor shall develop and have available for review a Site Specific Safe Excavation Plan based on the project scope. This plan will outline the contractors plan for excavation requirements, such as trenching, sloping and or shielding for the particular project.

10.2 The contractor's competent person shall conduct daily excavation inspections prior to anyone entering an excavation and this documentation shall be present at each excavation and retained in job files. Use form CSM-002 or equivalent to document these inspections.

10.3 See the facility or business unit's site specific procedures for any additional requirements.

11.0 FALL PROTECTION (29 CFR 1910.66 & 1926.500-.503)

11.1 Fall protection devices shall be used whenever fall hazards exist. Contractors are required to have a written Fall Protection Compliance Program that meets the minimum content requirements specified in 29 CFR 1910.66 App C & 1926.500-.503. Training records and certificates shall be documented and maintained by the Contractor.

11.2 The contractor shall provide a competent person to oversee fall protection and compliance.

11.3 Contractors shall provide a "rescue plan" wherever personal fall arrest equipment is employed.

12.0 FIRE PREVENTION AND PROTECTION (29 CFR 1910 Subpart L and 1926 Subpart F)

12.1 Contractors shall be required to provide fire prevention protection in accordance with the latest requirements outlined in 29 CFR 1910 Subpart L and 1926 Subpart F or any environmental regulatory requirements. Fire extinguishers shall be used only for the control of incipient stage fires.

12.2 Smoking is allowed only in designated areas. At some locations, there may be no designated areas. "Strike Anywhere" matches or uncovered and trigger-type lighters are not allowed within Kinder Morgan property.

13.0 HAZARD ASSESSMENTS - Task Analysis System

13.1 The contractor shall utilize a Task Analysis System daily, (e.g. Job Safety Analysis (JSA) to identify any Critical Tasks), based on the daily job scope and develop controls for any potential hazards. These controls shall be documented and utilized on a daily basis. The contractor shall communicate any controls required to the KM onsite representatives for review. In addition, the Contractor shall conduct pre-placement qualification checks for critical job tasks to ensure employees match up with the task requirements.

14.0 HAZARDOUS ENERGY CONTROL (LOCKOUT/TAGOUT) (29 CFR 1910.147 & 1926.417, & 1926.702)

14.1 Hazardous energy control procedures shall follow applicable guidelines as outlined in 29 CFR 1910.147. The Contractor's key individual responsible for Lockout/Tagout shall be identified to Kinder Morgan company personnel and/or KM Representative. All Lockout/Tagout must be coordinated with KM company personnel prior to the Contractor working in an area of hazardous or stored energy.

15.0 HOT WORK PERMITS (29 CFR 1910.252)

15.1 Hot Work Permit is required PRIOR to the start of any hot work and/or work that creates a source of ignition. Hot Work permits MUST be coordinated with Kinder Morgan management or designee prior to commencing any Hot Work. Contractors performing hot work shall be responsible for the safe execution of assigned tasks. If an unsafe condition (or potentially unsafe

condition) arises, work shall be stopped and the condition reported to Kinder Morgan management.

15.2 Work involving open flames or other sources of ignition on the exterior of tanks, pipelines, and other structures that contain flammable, combustible liquids, or any other hazardous atmosphere presents a wide variety of potential hazards. Adequate knowledge of the work to be performed is essential. Proper safeguards shall be established to guard against unsuspected changes in the situation that may alter the working conditions.

15.2.1 Hot work intended for "in-service" equipment shall follow procedures set forth for all hot work activities. Special precautions shall be identified in the hot work permit.

15.2.2 Persons welding and cutting shall be qualified in accordance with applicable codes and shall be thoroughly familiar with potential hazards of the operation and precautions necessary to ensure safety.

16.0 HYDROGEN SULFIDE (H2S)

16.1 All personnel working in an H2S environment shall have certificates to verify they have been properly trained and are proficient in the use of emergency air packs. All personnel working in an H2S environment shall be required to be clean-shaven in a manner consistent with accepted practices governing SCBA use with H2S gas.

17.0 IDENTIFICATION OF HAZARDOUS MATERIALS (29 CFR 1910.1200 & 1926.59)

17.1 Kinder Morgan shall inform the Contractor of known hazardous material(s) that may be present, how and where to locate material safety data sheets (MSDS) and any PPE requirements. Contractors are required to maintain copies of MSDS for any and all contractor-supplied materials requiring special handling on the job site. Each Contractor or sub-contactor is required to provide Kinder Morgan a copy of MSDS for all chemicals brought on site. Each Contractor or sub-contactor shall implement a Hazard Communication Program and document employee training.

17.2 All Contractor personnel who are likely to encounter or be exposed to hazardous materials as identified by DOT, shall be trained in hazardous material/waste handling per OSHA 1910.1200.

18.0 LEAD IN CONSTRUCTION (29 CFR 1926.62 and 1910.1025)

18.1 The likelihood of encountering lead while conducting maintenance on equipment in our facilities exists. It is the responsibility of the contractor to test for its existence prior to conducting work. All Contractors who perform any type of work where there is exposure to lead (excluding tetraethyl lead) as well as maintenance or repair operations where there is exposure to lead shall comply with 29 CFR 1926.62 and 1910.1025. Lead Exposure in Construction as it relates to their particular scope of work. All Contractors are required to have a written Compliance Program that meets the minimum content requirements specified in 29 CFR 1926.62 and 1910.1025. Training records and certificates shall be documented and maintained by the Contractor.

19.0 OPERATOR QUALIFICATION (OQ)

19.1 Contractors who perform Kinder Morgan defined covered tasks must be qualified to perform such tasks or be directly observed performing such covered tasks by a qualified individual. Workers or observers shall provide documentation of qualifications. (The contractor will supply this documentation from the ISNetworld database)

19.2 Contractor programs to train and qualify their employees to perform covered tasks must be reviewed and approved by Kinder Morgan's Operator Qualification Administrator prior to performing contracted covered tasks.

19.3 Contractors must supply a daily roster of qualified covered task workers to a Kinder Morgan representative unless the roster of covered task workers does not change from day to day during the project.

20.0 PERMIT TO BEGIN WORK

20.1 The Contractor is responsible for obtaining all appropriate agency required permits and or other notifications PRIOR to the start of work, unless otherwise obtained by Kinder Morgan. This includes "One Call" or excavation notices within required timelines.

20.2 Where applicable Kinder Morgan may require the Contractor to obtain general or safe work permits, on a daily basis, from facility management or a Kinder Morgan representative PRIOR to the start of work. The permits shall identify work to be completed, additional permits that may be required, potential hazards, and safety measures to be followed. Additional permits that may be required are discussed in the following two sections.

21.0 PERSONAL PROTECTIVE EQUIPMENT (29 CFR 1910 Subpart I)

21.1 Hazard Assessment - Proper Personal Protective Equipment (PPE) shall be determined by one of two methods:

21.1.1 The Contractor shall conduct a daily Job Safety Analysis (JSA), of the current work assignment area and confirm the existence of safe working conditions for its employees. The Contractor shall provide and insure proper use of personal protective equipment to its employees PRIOR to beginning work as required. The daily JSA, shall determine the minimum applicable PPE requirements and then those requirements shall be documented. The Contractor shall provide and insure proper use of personal protective equipment to its employees PRIOR to beginning work as required.

21.2 All personal protective equipment shall comply with the applicable standards specified for that equipment.

21.3 Kinder Morgan shall not supply any Personal Protective Equipment.

21.4 PPE Equipment includes but is not limited to:

21.4.1 Eye and Face Protection (29 CFR 1910.133 & 1926.102). Eye protection equipment shall comply with the latest revision of ANSI Z87.1.

21.4.2 Head Protection (29 CFR 1910.135 & 1926.100) – (HARDHATS). Head protection shall comply with the latest revision of ANSI Z89.1

21.4.3 Foot Protection (29 CFR 1910.136 & 1926.96). Foot protection shall comply with the latest revision of ANSI Z41. Open-toe footwear is prohibited

21.4.4 Hearing Protection (29 CFR 1910.95 & 1926.52). Hearing protection shall be worn in areas that have been identified or where there is a potential for exposure to high sound levels (in excess of 85 dB).

21.4.5 Hand Protection (29 CFR 1910.138). Gloves must be worn where appropriate for the performance of the work.

22.0 PROCESS SAFETY MANAGEMENT (PSM) (29 CFR 1910.119 & 1926.450-454)

22.1 Contractors who perform work in a facility that is under the jurisdiction of OSHA 29 CFR 1910.119, Process Safety Management, shall comply with all applicable requirements of 1910.119 in addition to the general requirements that may be specified by the scope of work.

23.0 RESPIRATORY PROTECTION (29 CFR 1910.134 & 1926.103)

23.1 Where applicable, all Contractors must follow an approved written program relating to respirator use during work activities. The Contractor's written respiratory protection program, training records and certificates, medical clearance to use respiratory protective equipment, and fit test records shall be documented and maintained by the Contractor.

24.0 RADIATION PRODUCING EQUIPMENT

24.1 Radiation Producing Equipment: Only properly trained, qualified personnel shall be allowed to use radiation producing equipment or materials at Kinder Morgan facilities. The Contractor shall maintain records of all training and qualifications.

24.2 When radiographic equipment is used, the Contractor shall ensure that the area is clear and that all personnel are at a safe distance from the radiation source. Radiation warning devices and signs containing the internationally recognized symbol for radiation must be placed around the perimeter of any area which may be affected by radiation. The contractor shall be in compliance with all State and Federal safety regulations dealing with radioactive materials. Only properly trained and qualified persons shall be allowed entrance to these restricted areas.

25.0 SCAFFOLDS AND LADDERS (29 CFR Part 1926 subpart L and 1910 Subpart D)

25.1 Scaffolds and ladders shall be installed and used in accordance with the latest requirements outlined under OSHA 29 CFR Part 1926 subpart L and 1910 Subpart D.

25.2 The contractor shall provide a competent person to oversee scaffold erection and use.

26.0 SECURITY REQUIREMENTS (FACILITY & CONTRACTOR)

(b) (7)(F), (b) (3)

[redacted]

(b) (7)(F), (b) (3)

[redacted]

28.0 SPILL PREVENTION, CONTROL & COUNTERMEASURES PLAN (SPCC)

28.1 All contractors who meet the requirements for needing an SPCC plan such to address any applicable "oil" spills that may develop during the course of a construction project.

28.2 Spills resulting from routine Contractor activity shall be reported to Kinder Morgan immediately and clean-up in accordance with state and federal regulations. Including, but not limited to reporting release to appropriate agencies. Report all environmental incidents to a Kinder Morgan representative and the company EHS representative. Contractors and inspectors are required to investigate and document all contractor incidents within 48hrs, use form CSM-OO1 or equivalent for proper documentation. These types of spills include, but are not limited to:

28.2.1 Small quantities of hydraulic fluid, motor oil, and fuel spilled during equipment refueling operations.

28.2.2 For spills of large quantities of petroleum product, chemicals, or other hazardous materials release, see Identification of Hazardous Materials, Section 17.

29.0 TRAINING REQUIREMENTS

29.1 The Contractor is obligated to perform the requisite safety training of its personnel relative to the scope of the subject work activities. Training and documentation for the proper use and care of applicable safety equipment shall be provided by the Contractor.

29.2 Training shall be documented by the Contractor for each employee involved in the subject work activities. The documentation shall include each training topics discussed, content, attendees, dates, and the name(s) of instructors or persons presiding and date training was completed.

29.3 The Contractor shall conduct safety meetings to instruct their personnel in the recognition and avoidance of hazards in the work place.

29.4 Safety meetings shall be conducted at a frequency appropriate, in light of the safety characteristics of the assignment, but no less than once per week. Safety meetings shall focus on the quality and not the quantity of daily and weekly safety meetings to ensure all contract employees understand the subjects discussed during this meeting. Kinder Morgan Inspectors should sit in during these meetings to evaluate their value and improve communications.

30.0 VEHICLE/MOBILE EQUIPMENT POLICY (29 CFR 1926.600, 1926.601 & 1926.20)

30.1 Permission is required for vehicular entry into all Kinder Morgan facilities. Special permission above and beyond the previous requirement is needed for vehicles to enter restricted areas such as dike areas.

30.2 All persons shall be transported to the job site in a safe manner. Each passenger shall have adequate seating. Standing up in a moving vehicle is strictly prohibited. Riding in the back of a pick-up or similar truck that has not been equipped with adequate seating and riding as passenger on a forklift is also prohibited.

30.3 All posted speed limits and traffic regulating signs shall be observed. Persons shall only drive on designated roads or rights of way.

30.4 Reckless driving and horseplay are prohibited.

30.5 Only properly trained, qualified personnel shall be permitted to operate equipment or machinery. The Contractor shall keep records of training and qualifications on file. Contractors are prohibited from operating Kinder Morgan owned equipment or machinery, except under specific written authorization by Kinder Morgan management.

30.6 When operating vehicles and equipment, whether on or off-road, proper PPE and safety equipment shall be used (such as helmets for off-road vehicles). The Contractor shall be responsible for providing such PPE and safety equipment.

30.7 All cranes shall meet applicable Federal, State and local requirements.

30.8 Mobile hydraulic and boom cranes shall meet Federal, State and local requirements.

30.9 Forklifts and Forklift operators must follow all applicable OSHA 29 CFR 1917.43 and 1910.178 requirements for the safe operations of the forklift.

31.0 WATER/DOCK OPERATIONS (29 CFR 1917 & 1918)

31.1 Contractors who perform work on marine docks or who are at risk of falling into water must be protected from the fall or shall use USCG-approved, personal floatation devices.

32.0 WORK CLOTHING

32.1 Normal Work Attire: Sleeved shirts and long pants are required at all times. Sleeveless shirts, tank top-type shirts, or shirtless attire are not allowed. Where hazards exist due to moving parts on machinery or equipment, clothing shall be maintained to avoid entanglement.

32.2 Special Work Clothing: Appropriate work clothing shall be worn where exposure to fire, extreme heat or cold, corrosive chemicals, body impacts, cuts from handled materials or other specialized hazards are possible. See the facility or business unit's site specific procedures for any additional requirements.

33.0 WORKSITE SAFETY (29 CFR 1910.22)Error! Bookmark not defined.

33.1 It is the responsibility of each Contractor to inspect each work area at the beginning of each shift and periodically thereafter to ensure safe working conditions exist. Contractor must inform each of its affected employees of any concealed dangers or changes in work conditions and must comply with all applicable regulations.

33.2 The Contractor shall provide illumination bright enough for work to proceed without risking personal injury or affecting the quality of work. Where hazardous atmospheres may be present, the Contractor shall use intrinsically safe equipment (lighting, communications, and computers) where appropriate.

33.3 All tools shall be used, maintained and inspected in accordance with the latest requirements as outlined in OSHA 29 CFR 1926 Subpart I.

33.4 The Contractor shall clean their work areas following the end of each work shift. Debris shall be placed in appropriate containers and properly disposed. All tools and equipment remaining at the job site shall be properly stored.

33.5 The Contractor shall provide, on a daily basis, an adequate supply of fresh drinking water for its employees. Portable rest room facilities may be required to be provided and maintained by the Contractor.

33.6 Right-Of-Way/Road-Side Work

33.6.1 The Contractor must follow an approved written plan relating to vehicular traffic control during road side work activities. This plan will be in compliance with 29 C.F.R. 1926.201(a) and 29 C.F.R. § 1926.202. This plan will be available on site for review by a KM Representative.

33.6.2 Employees working in a public road right-of-way or otherwise exposed to vehicular traffic, shall be provided and instructed to wear warning vests marked with or made of reflective or highly visible material.

33.6.3 Barricades, cones, flashers and warning signs shall be placed at strategic locations when working on or near roads and other areas where vehicular traffic may be a hazard. Signs and flashers must meet the requirements of applicable local and state traffic authorities.

ATTACHMENT NO. 01 – CONTRACTOR EMPLOYEE SAFETY TRAINING DOCUMENT

I have received instruction from my company regarding the Kinder Morgan Contractor Safety Program requirements. I shall conduct myself in a safe manner at all times while on Kinder Morgan property and shall comply with the Kinder Morgan Contractor Safety Manual/Site-specific rules. I understand and agree to comply with all requirements of this program.

Equipment Deployment Exercise

1. Date(s) performed: _____

2. Terminal/Response Zone: _____

3. Exercise or actual response? _____
   If an exercise, announced or unannounced? _____

4. Deployment location(s):
   _____
   _____
   _____
   _____
   _____
   _____

5. Time started: _____
   Time completed: _____

6. Equipment deployed was:
   - ❑ Facility - owned
   - ❑ Oil spill removal organization - owned if so, which OSRO? _____
   - ❑ Both

7. List type and amount of all equipment (e.g., boom and skimmers) deployed and number of support personnel employed:
   _____
   _____
   _____
   _____

8. Describe goals of the equipment deployment and list any Area Contingency Plan strategies tested (Attach a sketch of equipment deployments and booming strategies):
   _____
   _____
   _____
   _____

9. For deployment of facility-owned equipment, was the amount of equipment deployed at least the amount necessary to respond to your facility's small/average most probable spill?
   _____
   _____

   Was the equipment deployed in its intended operating environment?
   _____
   _____

4.0 SPILL IMPACT CONSIDERATIONS

4.1 CRITICAL AREAS TO PROTECT

The critical areas to protect are classified as high, moderate, and low sensitivity to oil. The Federal, state, and local authorities will further clarify these categories at the time of the response. The categories are defined as follows:

HIGH SENSITIVITY
● Areas which are high in productivity, abundant in many species, extremely sensitive, difficult to rehabilitate, or inhabited by threatened/endangered species. ● Areas which consist of vegetated low banks, freshwater/saltwater marshes, swamps, scrub-shrub wetlands and impact to threatened/endangered species.

MODERATE SENSITIVITY
● Areas of moderate productivity, somewhat resistant to the effects of oiling. ● Areas which consist of mixed sand, gravel beaches, bars, gently sloping banks, and no impact to threatened/endangered species.

LOW SENSITIVITY
● Areas of low productivity, man-made structures, and/or high energy. ● Areas which consist of gravel, sand, or clay material, barren/rocky shores or banks, man-made structures, concrete/compacted earthen drainage ditches and no impact to threatened/endangered species.

4.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES

Environmental/socio-economic sensitivities are of extreme importance when planning a response effort. The health and safety of the public and the environment, as well as the protection of the various socio-economic sensitivities, must be promptly addressed in order to mitigate the extent of damage and minimize the cost of the clean-up effort.

To determine adequate response resources, the Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three (3) tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response Tier. The Tier requirements for high volume areas are for response in six (6) hours (Tier 1), 30 hours (Tier 2), and 54 hours (Tier 3). High volume areas are listed in 49 CFR 194. The Tier requirements for all other areas are for response in 12 hours (Tier 1), 36 hours (Tier 2), and 60 hours (Tier 3).

4.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES (Cont'd)

All environmental/socio-economic sensitivities are worthy of protection, but must be prioritized during a response effort. When making decisions on which areas to designate as collection areas and which to protect, the following sources may be consulted:

- U.S. Fish and Wildlife Service and related state agencies
- Applicable Area Contingency Plans (see CD affixed to inside front cover of Volume 1 and the CD Navigation Summary in Figure 4.2)
- Other industry and private experts

The environmental and socio-economic sensitivities in the area have been broken down into specific categories and identified in this section.

4.3 WILDLIFE PROTECTION AND REHABILITATION

The Company will work with Federal, State, and local agency personnel to provide labor and transportation to retrieve, clean, and rehabilitate birds and wildlife affected by an oil spill, as necessary. Oversight of the Company's wildlife preservation activities and coordination with Federal, State, and local agencies during an oil spill is the responsibility of the Incident Commander.

Special consideration should be given to the protection and rehabilitation of endangered species and other wildlife and their habitat in the event of an oil spill and subsequent response. Jurisdictional authorities should be notified and worked with closely on all response/clean-up actions related to wildlife protection and rehabilitation. Laws with significant penalties are in place to ensure appropriate protection of these species.

4.3.1 Endangered/Threatened Species

The U.S. Fish and Wildlife Service (USFWS) and related state agencies classify the status of various wildlife species in the potentially effected states. A summary of critical birds, reptiles, mammals, and plant species status as related to the Facility's operating areas (area of highest oil spill potential) is presented in Figure 4.1.

4.3.2 Wildlife Rescue

The Company will work with Federal, State, and local agency personnel to provide labor and transportation to retrieve, clean, and rehabilitate wildlife affected by an oil spill, as the situation demands.

4.3 WILDLIFE PROTECTION AND REHABILITATION (Cont'd)

4.3.2 Wildlife Rescue (Cont'd)

The following are items which should be considered for wildlife rescue and rehabilitation during a spill response:

- Bird relocation can be accomplished using a variety of deterrents, encouraging birds to avoid areas of spilled oil. Bird relocation can be accomplished by utilizing deterrent methods including:
  - Use of visual stimuli, such as inflatable bodies, owls, stationary figures, or helium balloons, etc.
  - Use of auditory stimuli, such as propane cannons, recorded sounds, or shell crackers.
  - Use of herding with aircraft, boats, vehicles, or people (as appropriate).
  - Use of capture and relocation.

4.3.3 Search and Rescue - Points to Consider

- **The Company's involvement should be limited to offering assistance as needed or requested by the agencies.**
- Prior to initiating any organized search and rescue plan, **authorization must be obtained from the appropriate federal/state agency.**
- **Initial search and rescue efforts, if needed, should be left up to the appropriate agencies.** They have the personnel, equipment, and training to immediately begin capturing contaminated wildlife.
- With or without authorization it must be anticipated that volunteer citizens will aid distressed/contaminated wildlife on their own. It is important to communicate that it may be illegal to handle wildlife without express authority from appropriate agencies. Provisions should be made to support an appropriate rehabilitator, however, **no support should be given to any unauthorized volunteer rescue efforts.**
- The regulatory agencies and response personnel should be provided the name and location of a qualified rehabilitator in the event contaminated wildlife is captured.
- Resources and contacts that can assist with wildlife rescue and rehabilitation are provided in Section 2.0. This list includes:
  - Outside rehabilitation organizations
  - Local regulatory agencies
  - Other resources

4.4 STAGING AREAS

When establishing personnel and equipment staging areas for a response to a Facility discharge, the following criteria should be evaluated:

- Access to waterborne equipment launching facilities and/or land equipment.
- Access to open space for staging/deployment of heavy equipment and personnel.
- Access to public services utilities (electricity, potable water, public phone, restroom and washroom facilities, etc.)
- Access to the environmental and socio-economically sensitive areas which are projected for impact.

4.5 TRAJECTORY ANALYSIS

Oil spilled on water will react primarily to the effects of wind and current. The oil will tend to spread to a thin layer under the influence of gravity (primary) and chemical (secondary) forces. The following describes the behavior of oil on water:

- Oil will move in the direction and at the rate of the current under negligible wind conditions.
- Oil will move in the direction and at approximately 3.4 % of the velocity of the wind under negligible current conditions.
- The combined effects of wind and current on the oil should be carefully analyzed. A method of vector analysis can be performed to determine the net direction of movement (wind forces can work in addition to, against, or in many other combinations with the current).
- The primary method of surveillance for the Facility will be visual. Visual surveillance is not effective however in rain, fog, darkness, or heavy cloud cover. It is difficult to observe a slick on the water from a boat, dock or land due to the angle of observation. Aerial surveillance is the preferred method of visual surveillance because of the elevated view and the ability to cover a large area in a short period.

FIGURE 4.1

ENDANGERED SPECIES LISTING

The following is a list of endangered and threatened species with known or possible occurrence in the State of Oregon by county (listed alphabetically by the common name).

ANIMALS	
Common Name	**Scientific Name**
Benton County	
Aleutian Canada Goose	Branta canadensis leucopareia
Arctic Peregrine Falcon	Falco peregrinus tundrius
Canada Lynx	Lynx canadensis
Fender's Blue Butterfly	Icaricia Icarioides Fenderi
Marbled Murrelet	Brachyramphus marmoratus
Northern Spotted Owl	Strix Occidentalis Caurina
Oregon Chub	Oregonichthys Crameri
Streaked Horned Lark	Eremophila alpestris strigata
Taylor's Checkerspot Butterfly	Euphydryas editha taylori
Clackamas County	
Aleutian Canada Goose	Branta canadensis leucopareia
Arctic Peregrine Falcon	Falco peregrinus tundrius
Canada Lynx	Lynx canadensis
Streaked Horned Lark	Eremophila alpestris strigata
Lane County	
Aleutian Canada Goose	Branta canadensis leucopareia
Arctic Peregrine Falcon	Falco peregrinus tundrius
Fender's Blue Butterfly	Icaricia Icarioides Fenderi
Green Sea Turtle	Chelonia mydas
Leatherback Sea Turtle	Dermochelys coriacea
Loggerhead Sea Turtle	Caretta caretta
Marbled Murrelet	Brachyramphus Marmoratus
Oregon Chub	Oregonichthys Crameri
Oregon Silverspot Butterfly	Speyeria Zerene Hippolyta
Oregon Spotted Frog	Rana pretiosa
Northern Spotted Owl	Strix occidentalis caurina
Short-tailed Albatross	Phoebastria albatrus
Streaked Horned Lark	Eremophila alpestris strigata
Western Snowy Plover	Charadrius Alexandrinus Nivosus
Linn County	
Aleutian Canada Goose	Branta canadensis leucopareia
Arctic Peregrine Falcon	Falco peregrinus tundrius
Bull Trout	Salvelinus confluentus
Canada Lynx	Lynx canadensis
Fender's Blue Butterfly	Icaricia Icarioides Fenderi
Northern Spotted Owl	Strix Occidentalis Caurina
Oregon Chub	Oregonichthys Crameri
Streaked Horned Lark	Eremophila alpestris strigata
Marion County	
Aleutian Canada Goose	Branta canadensis leucopareia
Arctic Peregrine Falcon	Falco peregrinus tundrius
Northern Spotted Owl	Strix Occidentalis Caurina
Oregon Chub	Oregonichthys Crameri
Streaked Horned Lark	Eremophila alpestris strigata

ACP/GRP CD
NAVIGATION INSTRUCTIONS
(Excerpt from CD affixed to inside front cover of Volume 1)

KINDER MORGAN

The information contained herein is provided to identify specific spill response and protection strategies for the applicable Kinder Morgan Pacific Operations Regions. Navigating through the bookmark links provided on the CD will take you to the Environmentally Sensitive Sites and the Economically Significant Sites provided in the applicable Area Contingency Plans and Geographic Response Plans.

INSTRUCTIONS FOR USE

1. From the screen on the left, click on region of interest. The different regions are identified by the red font.
2. Once the appropriate region is accessed, click on the "+" to the left of the region name to display the various areas within each region. These are identified with blue font.
3. Once the appropriate area is accessed, the links to the Environmentally Sensitive Sites and the Economically Significant Sites will be available for selection.
   - ➢ It is important to note that once each Environmentally Sensitive Site and Economically Significant Site is accessed, the user will have to scroll to the desired location.
   - ➢ Use the zoom icon to zoom into each page for easier reading.

NOTES:

1. In those areas where the statement "No ACP Information Available" is made, it indicates that there is no ACP or GRP information which is specific to the particular region or area of interest.
2. EPA REGION IX: For areas without specific ACP/GRP information, the Region IX Contingency Plan (RCP) is used as the response guidance; however, this RCP is currently in revision.
3. EPA REGION X: Region X is covered by the Northwest Area Contingency Plan; however, inland facilities are not addressed.
4. Thus, the following areas are covered by specific area contingency or geographic response plans on this CD:
   - Northern Region—Northwest: Linnton-Willbridge, Washington Area
   - Northern Region—Bay: Brisbane, Concord, Richmond, San Jose
   - Southern Region—West: Carson, Mission Valley, Watson
5. And, the following areas do not have specific area contingency or geographic response plans on this CD:
   - Northern Region—Northwest: Oregon Pipelines (inland)
   - Northern Region—Central: Fresno
   - Northern Region—CalNev: Sacramento, Rocklin, Reno
   - Southern Region—East: Imperial, Phoenix, Tucson
   - Southern Region—Central: Colton, Barstow, Las Vegas

5.0 DISPOSAL PLAN

5.1 OVERVIEW

A major oil spill response would generate significant quantities of waste materials ranging from oily debris and sorbent materials to sanitation water and used batteries. All these wastes need to be classified and separated (i.e., oily, liquid, etc.), transported from the site, and treated and/or disposed of at approved disposal sites. Each of these activities demands that certain health and safety precautions be taken, which are strictly controlled by federal and state laws and regulations. This section provides an overview of the applicable state regulations governing waste disposal, and a discussion of various waste classification, handling, transfer, storage, and disposal techniques. It is the responsibility of the Environmental Manager or their designee to manage the following:

- Coordinate waste disposal activities;
- Identify appropriate interim storage methods and locations;
- Coordinate permitting activities needed to ensure proper disposal; and
- Document compliance with appropriate local, State, and Federal handling of hazardous materials and/or wastes.

Material will be containerized or stored in a manner complying with applicable environmental regulations pertaining to the known or suspected materials characteristics. Upon characterization, waste, recyclable materials, or contaminated materials will be treated on-site, recycled, or transported and disposed of at an appropriate KMEP approved facility after appropriate regulatory approval.

5.2 WASTE CLASSIFICATION

Oily - Liquid Wastes

Oily liquid wastes (i.e., oily water and emulsions) that would be handled, stored, and disposed of during response operations are very similar to those handled during routine storage and transfer operations. The largest volume of oily liquid wastes would be produced by recovery operations (e.g., through the use of vacuum devices or skimmers). In addition, oily water and emulsions would be generated by vehicle operations (e.g., spent motor oils, lubricants, etc.), and equipment cleaning operations.

Non-Oily - Liquid Wastes

Response operations would also produce considerable quantities of non-oily liquid wastes. Water and other non-oily liquid wastes would be generated by the storage area and stormwater collection systems, vessel and equipment cleaning (i.e., water contaminated with cleaning agents), and office and field operations (i.e., sewage, construction activities).

Solid Wastes

A solid waste is defined as any discarded material provided that it is not specifically excluded under the regulations. These exclusions cover materials such as domestic sewage and mixtures of sewage discharged through a sewer system or industrial wastewater point source discharges.

A discarded material is any material which is abandoned (disposed of, burned or incinerated) or accumulated, stored or treated prior to being abandoned. A discarded material is also any material recycled or any material considered inherently wastelike. Recycled material is considered solid waste when used in a manner constituting disposal, placed on land or burned for energy recovery.

5.2 WASTE CLASSIFICATION (Cont'd)

Solid Wastes (Cont'd)

A solid waste may be considered a hazardous waste. A solid waste, as defined above, may be a hazardous waste if it is not excluded from regulation and is either a listed hazardous waste or exhibits the characteristics of a hazardous waste. A solid waste exhibits the characteristics of a hazardous waste if it exceeds the thresholds established in determining the following:

1) ignitability
2) corrosivity
3) reactivity
4) toxicity

A solid waste may also become a hazardous waste if it is mixed with a listed hazardous waste or, in the case of any other waste (including mixtures), when the waste exhibits any of the characteristics identified above.

Oily - Solid/Semi-Solid Wastes

Oily solid/semi-solid wastes that would be generated by containment and recovery operations include damaged or worn-out booms, disposable/soiled equipment, used sorbent materials, saturated soils, contaminated beach sediments, driftwood, and other debris.

Non-Oily - Solid/Semi-Solid Wastes

Non-oily solid/semi-solid wastes would be generated by emergency construction operations (e.g., scrap, wood, pipe, and wiring) and office and field operations (i.e., refuse). Vessel, vehicle, and aircraft operations also produce solid wastes.

5.3 WASTE HANDLING

A primary concern in the handling of recovered oil and oily debris is contaminating unaffected areas or recontaminating already cleaned areas. Oily wastes generated during the response operations would need to be separated by type and transferred to temporary storage areas and/or transported to incineration or disposal sites. Proper handling of oil and oily wastes is imperative to ensure personnel health and safety.

Safety Considerations

Care would be taken to avoid or minimize direct contact with oily wastes. All personnel handling or coming into contact with oily wastes would wear protective clothing. A barrier cream can be applied prior to putting on gloves to further reduce the possibility of oily waste absorption. Safety goggles would be worn by personnel involved in waste handling activities where splashing might occur. Any portion of the skin exposed to oily waste would be washed with soap and water as soon as possible. Decontamination zones would be set up during response operations to ensure personnel are treated for oil exposure.

5.3 WASTE HANDLING (Cont'd)

Waste Transfer

During response operations, it may be necessary to transfer recovered oil and oily debris from one point to another several times before the oil and oily debris are ultimately recycled, incinerated or disposed of at an appropriate disposal site. Depending on the location of response operations, any or all of the following transfer operations may occur:

- From portable or vessel-mounted skimmers into flexible bladder tanks, storage tanks of the skimming vessel itself, or a barge.
- Directly into the storage tank of a vacuum device.
- From a skimming vessel or flexible bladder to a barge.
- From a vacuum device storage tank to a barge.
- From a barge to a tank truck.
- From a tank truck to a processing system (e.g., oil/water separator).
- From a processing system to a recovery system and/or incinerator.
- Directly into impermeable bags that, in turn, are placed in impermeable containers.
- From containers to trucks.

There are four general classes of transfer systems that may be employed to affect oily waste transfer operations:

- **Pumps:** Rotary pumps, such as centrifugal pumps, may be used when transferring large volumes of oil, but they may not be appropriate for pumping mixtures of oil and water. The extreme shearing action of centrifugal pumps tends to emulsify oil and water, thereby increasing the viscosity of the mixture and causing low, inefficient transfer rates. The resultant emulsion would also be more difficult to separate into oil and water fractions. Lobe or "positive displacement" pumps work well on heavy, viscous oils, and do not emulsify the oil/water mixture. Double-acting piston and double acting diaphragm pumps are reciprocating pumps that may also be used to pump oily wastes.

- **Vacuum Systems**: A vacuum truck may be used to transfer viscous oils but they usually pick up a very high water/oil ratio.

- **Belt/Screw Conveyors:** Conveyors may be used to transfer oily wastes containing a large amount of debris. These systems can transfer weathered debris laden oil either horizontally or vertically for short distances (i.e., 10 feet) but are bulky and difficult to set up and operate.

- **Wheeled Vehicles:** Wheeled vehicles may be used to transfer liquid wastes or oily debris to storage or disposal sites. These vehicles have a limited transfer volume (i.e., 100 barrels) and require good site access.

Figure 5.1 provides a comparative evaluation of 16 types of transfer systems that could be available for transfer operations.

5.4 WASTE STORAGE

Interim storage of recovered oil, oily and non-oily waste would be considered to be an available means of holding the wastes until a final management method is selected. In addition, the segregation of wastes according to type would facilitate the appropriate method of disposal. The storage method used would depend upon:

- The type and volume of material to be stored.
- The duration of storage.
- Access.

During an oil spill incident, the volume of oil that can be recovered and dealt with effectively depends upon the available storage capacity. Typical short-term storage options are summarized in Figure 5.2. The majority of these options can be used either onshore or offshore.

If storage containers such as bags or drums are used, the container must be clearly marked and/or color-coded to indicate the type of material/waste contained and/or the ultimate disposal option. Bladder or pillow tanks would be acceptable, if the available space can support the weight of both the container and the product.

Fuel barges may be the best option for temporary storage of oil recovered in open waters. Depending on size, these vessels may be able to hold up to 6,000 barrels of oil and water. The barge deck can be used as a platform for operating oil spill clean-up equipment and storing containment boom.

Empty barges have four to six feet draft which would increase when these barges are filled with oil or loaded with cargo. Consequently, they may not be able to enter shallow, nearshore waters.

It may be difficult to offload recovered oil stored inside barges. Due to natural forces which affect spilled oil, recovered oil may be very viscous or emulsified, rather than free-flowing. It may be necessary to use steam to heat viscous oil before pumping it from the barge.

Steel or rubber tanks can be used to store oil recovered near the shoreline. To facilitate offloading, demulsifiers may be used to break emulsions prior to placing the recovered substance into the barges or storage tanks.

Use of any site for storage is dependent on the approval of the local authorities. The following elements affect the choice of a potential storage site:

- Geology.
- Ground water.
- Soil.
- Flooding.
- Surface water.
- Slope.
- Covered material.
- Capacity.
- Climatic factors.
- Land use.
- Toxic air emissions.
- Security.
- Access.
- Public contact.

5.4 WASTE STORAGE (Cont'd)

Temporary storage sites should use the best achievable technology to protect the environment and human health. They should be set up to prevent leakage, contact, and subsequent absorption of oil by the soil. The sites should be bermed (1 to 1.5 meters high) and double lined with plastic or visqueen sheets 6-10 mils or greater in thickness, without joints, prior to receiving loose and bagged debris. The edges of the sheet should be weighted with stones or earth to prevent damage by wind, and the sheet should be placed on a sand layer or an underfelt thick enough to prevent piercing. A reinforced access area for vehicles at the edge of the site should be provided. In addition, the oily debris should be covered by secured visqueen or tarps and an adequate stormwater runoff collection system for the size and location of the site would be utilized. Additionally, the sites should be at least three (3) meters above mean sea level.

Oily debris can be hauled to approved temporary storage sites in visqueen lined trucks or other vehicles. Burnable, non-burnable, treatable and re-usable materials can be placed in well defined separate areas at temporary storage sites.

When the last of the oily debris leaves a temporary storage site, the ground protection would be removed and disposed of with the rest of the oily debris. Any surrounding soil which has become contaminated with oil would also be removed for disposal or treatment. If the soils were removed for treatment, they may be replaced if testing proves acceptable levels have been achieved. Treatment and remediation is encouraged when feasible. The temporary storage should be returned to its original condition.

5.5 WASTE DISPOSAL

Techniques for Disposal of Recovered Oil

Recovery, reuse, and recycling are the best choices for remediation of a spill, thereby reducing the amount of oily debris to be bermed onsite or disposed of at a solid waste landfill. Treatment is the next best alternative, but incineration and burning for energy recovery have more options within the state. There are some limitations and considerations in incinerating for disposal. Environmental quality of incineration varies with the type and age of the Facility. Therefore, when incineration becomes an option during an event, local air quality authorities would be contacted for advice about efficiency and emissions of facilities within their authority. Approval of the local air authorities is a requirement for any incineration option. Landfilling is the last option. Final disposal at a solid or dangerous waste landfill is the least environmentally sound method of dealing with a waste problem such as oily debris.

During an oil spill incident, KMEP would consult with the Federal and state On Scene Coordinator (OSC) to identify the acceptable disposal methods and sites appropriately authorized to receive such wastes. KMEP maintains a list of approved disposal sites that satisfy local, state, and Federal regulations and KMEP requirements. This identification of suitable waste treatment and disposal sites would be prepared by the Environmental Manager or their designee in the form of an Incident Disposal Plan which must be authorized by the U.S. Coast Guard and/or the EPA. An Incident Disposal Plan would include predesignated interim storage sites, segregation strategies, methods of treatment and disposal for various types of debris, and the locations/contacts of all treatment and disposal site selections. Onsite treatment/disposal will be preferred.

5.5 WASTE DISPOSAL (Cont'd)

Techniques for Disposal of Recovered Oil (Cont'd)

In order to obtain the best overall Incident Disposal Plan, a combination of methods should be used. There is no template or combination of methods that can be used in every spill situation. Each incident should be reviewed carefully to ensure an appropriate combination of disposal methods are employed.

The different types of wastes generated during response operations would require different disposal methods. To facilitate the disposal of wastes, they should be separated by type for temporary storage, transport and disposal. Figure 5.3 lists some of the options that would be available to segregate oily wastes. The table also depicts methods that may be employed to separate free and/or emulsified water from the oily liquid waste.

The following is a brief discussion of some disposal techniques available for recovered oil and oily debris.

Recycling

This technique entails removing water from the oil and blending the oil with uncontaminated oil. Recovered oil can be shipped to refineries provided that it is exempt from hazardous waste regulations. There it can be treated to remove water and debris, and then blended and sold as a commercial product.

The Environmental Manager or their designee is responsible for ensuring that all waste materials be disposed of at an internally approved disposal site.

Incineration

This technique entails the complete destruction of the recovered oil by high temperature thermal oxidation reactions. There are licensed incineration facilities as well as portable incinerators that may be brought to a spill site. Incineration may require the approval of the local Air Pollution Control Authority. Factors to consider when selecting an appropriate site for onsite incineration would include:

- Proximity to recovery locations.
- Access to recovery locations.
- Adequate fire control.
- Approval of the local air pollution control authorities.

In Situ Burning/Open Burning

Burning techniques entail igniting oil or oiled debris and allowing it to burn under ambient conditions. These disposal techniques are subject to restrictions and permit requirements established by federal, state and local laws. They would not be used to burn PCBs, waste oil containing more than 1,000 parts per million of halogenated solvents, or other substances regulated by the EPA. Permission for *in situ* burning may be difficult to obtain when the burn takes place near populated areas.

5.5 WASTE DISPOSAL (Cont'd)

In Situ Burning/Open Burning

As a general rule, *in situ* burning would be appropriate only when atmospheric conditions will allow the smoke to rise several hundred feet and rapidly dissipate. Smoke from burning oil will normally rise until its temperature drops to equal the ambient temperature. Afterwards, it will travel in a horizontal direction under the influence of prevailing winds.

Landfill Disposal

This technique entails burying the recovered oil in an approved landfill in accordance with regulatory procedures. Landfill disposal of free liquids is prohibited by federal law in the United States.

With local health department approval, non-burnable debris which consists of oiled plastics, gravel and oiled seaweed, kelp, and other organic material may be transported to a licensed, lined, approved municipal or private landfill and disposed of in accordance with the landfill guidelines and regulations. Landfill designation would be planned only for those wastes that have been found to be unacceptable by each of the other disposal options (e.g., waste reduction, recycling, energy recovery). Wastes would be disposed of only at Company-approved disposal facilities. The Environmental Manager or their designee is responsible for ensuring that all waste materials are disposed of at a Company internally approved disposal site. Disposal at a non-approved facility would require approval by the Environmental Manager or their designee prior to sending any waste to such a facility.

KEY TO RATINGS: 5 = Best; 1 = Worst

KEY TO COMMENTS:

A. Normally require remote power sources, thus are safe around flammable fluids.
B. Should have a relief valve in the outlet line to prevent bursting hoses.
C. Air powered units tend to freeze up in sub-freezing temperatures.
D. Units with work ball valves are difficult to prime.
E. Some remotely powered types are designed to fit in a tanker's butterworth hatch.
F. Can also pump air at low pressure.
G. Transfer is batch-wise rather than continuous.
H. Waste must be in separate container for efficient transfer.
I. Transportable with its own prime mover.
J. High shear action tends to emulsify oil and water mixtures.

FIGURE 5.2

TEMPORARY STORAGE METHODS

CONTAINER	ONSHORE	OFFSHORE	SOLIDS	LIQUIDS	NOTES
Barrels	x	x	x	x	May require handling devices. Covered and clearly marked.
Tank Trucks	x	x		x	Consider road access. Barge-mounted offshore.

6.0 AREA PIPELINE SECTIONS

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Linnton-Willbridge Area Lines	
• Portland – Albany 8”	14
• Shell – Portland 8”	77
• ConocoPhillips – Portland 8”	78/78B
• Chevron – Portland 8”	79
• Willbridge – Portland 8”	81
• BP/Arco – Portland 8”	82
• Linnton – Portland 8”	82/83/84
• Nustar – Portland 8”	83/84
• Portland Airport Pipeline 8”	1880
Pipeline Facilities (non-storage)	
• Portland Station	
• Fargo Pump Station (Booster)	
• Salem Pump Station (Booster)	

- Figures 6.1a through 6.1i on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled “Operational and Worst Case Discharge Data” of the applicable Line Segment.

- The specific information summary for these pipeline sections is provided as follows:

  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps

- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.

- Northern and southern pipeline schematic diagrams are provided in Volume 1, Figure 1.2 and 1.3.

6.0 AREA PIPELINE SECTIONS

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

PORTLAND – ALBANY 8" (14)		
Pipe and Operational Data		
• Section Length:	70.4 Miles	371,712 Feet
• Line Diameter:	8.625 in., O.D.	8.249 in., I.D. (note 1)
• Line Capacity:	349 Bbls/mile (note 2)	
• Product types:	Petroleum (Refined Products & Marine Fuel Oils)	
• Capacity of entire line section:	(b) (7)(F), (b) (3)	
• Maximum flow rate:	2,500 Bbls/hr or 60,000 Bbls/day	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
• County(s)/State(s) Traversed:	Multnomah, Clackamas, Marion, OR
• Location Description:	From Portland Station on St. Helens Road in West Portland, generally south through the Portland west hills, crossing the Willamette River near Wilsonville, continuing south to the (b) (3), (b) (7)(F)

Operational and Worst Case Discharge Data

PIPELINE SECTION INFORMATION SUMMARY

CHEVRON - PORTLAND 8" (79)	
Pipe and Operational Data	
• Section Length:	1.23 Miles 6,494 Feet
• Line Diameter:	8.625 in., O.D. 8.249 in., I.D. (note 1)
• Line Capacity:	349 bbls/mile (note 2)
• Capacity of entire line section:	(b) (7) (F) (b)
• Maximum flow rate:	2,600 bph or 62,400 bpd
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.	
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.	
Location Description	
• County(s)/State(s) Traversed:	Multnomah, OR
• Location Description:	From the Chevron Terminal west along NW Front Avenue turning south on NW 61st Avenue then west along NW St. Helens Road to Portland Station.

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Oregon Area Lines	
• Albany-Eugene 8”	14
Pipeline Facilities (non-storage)	
• Morgan Pump Station (booster)	

- Figure 6.1 on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled “Operational and Worst Case Discharge Data” of the applicable Line Segment.

- The specific information summary for these pipeline sections is provided as follows:

  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps

- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.

- Northern and Southern pipeline schematic diagrams are provided in Volume 1, Figures 1.2 and 1.3.

FIGURE 6.1

PIPELINE SECTION INFORMATION SUMMARY

ALBANY – EUGENE 8" (14)

Pipe and Operational Data

- Section Length: 44.44 Miles 234,643.2 Feet
- Line Diameter: 8.625 in., O.D. 8.249 in., I.D. (note 1)
- Line Capacity: 349 Bbls/mile (note 2)
- Product types: EPA ULSD, Conventional Gas, Ethanol
- Capacity of entire line section: (b) (7)(F), (b) (3)
- Maximum flow rate: 2,500 Bbls/hr or 60,000 Bbls/day

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

7.0 BREAKOUT STATIONS/TERMINALS

7.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the breakout stations and/or terminals that have storage (breakout tanks) connected to the pipeline sections described in the previous Section of this Volume. The data is summarized as follows:

TERMINAL BREAKOUT TANKS	LARGEST TANK (BBLS)	WCD (BBLS)
Linnton Terminal (Tank 72021)	(b) (7)(F), (b) (3)	
Willbridge Terminal (Tank 12002)		
Portland Station (PD-1)		

- The largest Worst Case Discharge (WCD) for the breakout stations/terminals within this Area of Operation has been determined to be as follows:

(b) (7)(F), (b) (3)

- The specific information summary for these breakout stations/terminals is provided in this Section as follows:
  - Breakout Station/Terminal Tank Information Summary (one per station)
  - Facility Diagram
- Pipeline sections or terminaling operations associated with this Area of Operation are detailed in Sections 6 and 8 of this Volume.

7.1 SCOPE

The scope of this section is to provide an information summary with specific data for the breakout stations that have storage (breakout tanks) connected to the pipeline sections described in the previous section of this Volume 2. The data is summarized as follows:

BREAKOUT STATION	LARGEST TANK (BBLS)	WCD (BBLS)
There are no breakout tanks within the Oregon Pipelines Area of the Northern Region - Northwest		

8.1.1 CERTIFICATION OF SUBSTANTIAL HARM

CERTIFICATION OF THE APPLICABILITY OF THE SUBSTANTIAL HARM CRITERIA

Facility Name and Address: SFPP, L.P. Eugene Terminal
1765 Prairie Road
Eugene, OR 97210

(Detailed Facility information, including data required for the Response Plan Cover Sheet, is provided in Figure 8.1)

1. Does the facility transfer oil over water to or from vessels ***and*** does the facility have a total oil storage capacity greater than or equal to 42,000 gallons?	**Yes:**	**No: X**
2. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area?	**Yes:**	**No: X**
3. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix (40 CFR 112 Appendix C) or a comparable formula[1]) such that a discharge from the facility could cause injury (as defined in 40 CFR 112.2) to fish an wildlife and sensitive environments?	**Yes: X**	**No:**
4. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix (40 CFR 112 Appendix C) or a comparable formula[1]) such that a discharge from the facility would shut down a public drinking water intake[2]?	**Yes:**	**No: X**
5. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the past five (5) years?	**Yes:**	**No: X**

[1] If a comparable formula is used, documentation of the reliability and analytical soundness of the comparable formula must be attached to this form.

[2] For the purposes of 40 CFR part 112, public drinking water intakes are analogous to public water systems as described at 40 CFR 143.2(c).

CERTIFICATION

I hereby certify the following:

- Under penalty of law that I have personally examined and am familiar wit the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe the submitted information is true, accurate and complete.
- The information and procedures contained herein are considered to be accurate as of this date and are consistent with the National Contingency Plan (NCP) and applicable Area Contingency Plans (ACP) as detailed in Volume 1, Section 1.5.

Signature:  Date: 6-19-12

Kelly W. Johnson, Area Manager

8.1.2 INTRODUCTION

This Facility is a bulk distribution facility for refined petroleum products. Product is received via pipeline and transported out of the Facility by tanker trucks.

This Section 8 is provided in order to document the following Facility-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- Facility Information (Figure 8.1)
- Area Map (Figure 8.2)
- Hazard Identification including Tank Tables (Section 8.2)
- Inspections (Section 8.2.2)
- Vulnerability Analysis (Section 8.2.3)
- Discharge Scenarios (Section 8.3)
- Evacuation (Section 8.4)

FACILITY INFORMATION (Cont'd)

FACILITY LOCATION	
County:	Lane County, OR
Latitude:	(b) (7)(F), (b) (3) [redacted]
Longitude:	
Area Map:	Provided in Figure 8.2
Facility Diagram:	Provided in Figure 8.3
Wellhead Protection Area:	None
Facility Distance to Navigable Water:	More than one mile
Landside Directions:	From I-5 take OR-126 W. Take the Delta Highway exit towards Beltline Highway. Merge onto Delta Highway N. Take the Beltline Highway west exit towards Eugene Airport. Merge onto Beltline Highway W. Take the Prairie Road exit. Turn left onto Prairie Road.
Waterside Directions:	There is no water access to this Facility.

PHYSICAL DESCRIPTION - GENERAL

Description of Operation:

- This Facility is a bulk distribution facility for refined petroleum products.

(b) (7)(F), (b) (3) [redacted]

- The Facility normally operates 24 hours a day 7 days a week.
- The Facility's Worst Case Discharge amount is (b) (7)(F), (b) (3) [redacted]

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL (Cont'd)

Products Handled:

- Additives
- Ethanol
- Diesel
- Gasoline
- Transmix

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

PHYSICAL DESCRIPTION - LOADING RACK

Description of Operation:

- The Facility is equipped with four (4) loading racks which handle various refined petroleum products.
- A maximum of eight (8) tank trucks may load simultaneously.
- The loading/unloading operations are conducted 24 hours a day 7 days a week.
- The Facility handles an average of 150 trucks per day.

Loading Rate: 600 gpm (*per truck*)

Truck Capacity: 11,600 gallons (*maximum*)

Discharge Prevention:

- The curbed concrete slab drains directly to an oil water separator.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS

- Twenty six tanks with a total capacity of 14.2 million gallons were built in 1962. The Facility expanded in 1963 and 1964 with three additional tanks that increased maximum capacity by 3.4 million gallons. Two more tanks, constructed in 1971, added an additional 1.4 million gallon capacity. In 1973, four more tanks with a maximum capacity of 1 million gallons were built.

MAPS AND DIAGRAMS

The following Maps and Diagrams follow:

4. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix (40 CFR 112 Appendix C) or a comparable formula[1]) such that a discharge from the facility would shut down a public drinking water intake[2]?	**Yes: X**	**No:**
5. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the past five (5) years?	**Yes:**	**No: X**

[1] If a comparable formula is used, documentation of the reliability and analytical soundness of the comparable formula must be attached to this form.

[2] For the purposes of 40 CFR part 112, public drinking water intakes are analogous to public water systems as described at 40 CFR 143.2(c).

CERTIFICATION

I hereby certify the following:

- Under penalty of law that I have personally examined and am familiar wit the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe the submitted information is true, accurate and complete.
- The information and procedures contained herein are considered to be accurate as of this date and are consistent with the National Contingency Plan (NCP) and applicable Area Contingency Plans (ACP) as detailed in Volume 1, Section 1.5.

8.1.2 INTRODUCTION

Description of Facility

This Facility is a marine terminal and bulk distribution facility for refined petroleum products in conjunction with a common carrier pipeline. The Facility receives product via pipeline and tank vessels (barge and ships). Product is transported out of the Facility via pipeline and barge.

This Section 8 is provided in order to document the following Facility-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- Facility Information (Figure 8.1)
- Area Map (Figure 8.2)
- Hazard Identification including Tank Tables (Section 8.2)
- Inspections (Section 8.2.2)
- Vulnerability Analysis (Section 8.2.3)
- Discharge Scenarios (Section 8.3)
- Evacuation (Section 8.4)

FIGURE 8.1

FACILITY INFORMATION

GENERAL INFORMATION	
Facility Name:	Kinder Morgan Energy Partners, L.P.
Physical Address:	Linnton Terminal 11400 NW St. Helens Road Portland, OR 97231-1036 (503) 220-1260 *(24 Hrs)* (503) 220-1270 *(Fax)*
NAICS Code:	493190
EPA FRP Number:	FRP-95
Dun & Bradstreet Number:	618 450-866
Date of Initial Storage:	Prior to 1941
Owner/Operator:	Kinder Morgan Energy Partners, L.P. 500 Dallas Street, Suite 1000 Houston, TX 77002 or 1100 Town & Country Road Orange, CA 92868

FACILITY INFORMATION (Cont'd)

FACILITY LOCATION	
County:	Multnomah County, OR
Latitude:	(b) (7)(F), (b) (3)
Longitude:	
River Mile:	Willamette River Mile 4.5
Area Map:	Provided in Figure 8.2
Facility Diagram:	Provided in Figure 8.3
Wellhead Protection Area:	None
Oil Spill Response Planning Zone:	Columbia River - Portland sub-zone
Facility Distance to Navigable Water:	Less than 0.25 miles
Landside Directions:	Starting at the airport, go northwest on NE Airport Way. NE Airport Way becomes Long Term Parking. Turn left onto parking exit, then left again onto NE Airport Way. Merge onto I-205/Veterans Memorial Hwy. At Exit 21B merge onto US-30 toward Portland. Merge onto I-405 S via exit number 302B. Merge onto US-30 W via exit number 3, then merge onto NW Yeon Ave. NW Yeon Ave. becomes NW St. Helens Rd. The Facility is located at 11400 NW St. Helens Rd.
Waterside Directions:	From the Columbia River travel southwest, south and southeast on the Willamette River approximately three (3) miles. Facility is on the left descending bank approximately two (2) miles downstream of the St. Johns Bridge.

PHYSICAL DESCRIPTION - GENERAL

Description of Operation:

- The Facility is a marine terminal and bulk distribution facility for refined petroleum products in conjunction with a common carrier pipeline. The Facility receives product via pipeline and tank vessels (barge and ships). Product is transported out of the Facility via pipeline and barge.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL (Cont'd)

Description of Operation (Cont'd):

- The aboveground storage tanks are contained in a bermed secondary containment area that, at a minimum, provides secondary containment for 110 percent of the largest tank. The tanks are filled or drawn down through a system of aboveground and underground pipes that connect this Facility into the Company distribution network.

(b) (7)(F), (b) (3) [redacted]

- The Facility normally operates 24 hours a day 7 days a week.
- The Facility's Worst Case Discharge amounts are (b) (7)(F), (b) (3) [redacted]

Products Handled:

- Gasoline
- Diesel

Note: The Facility maintains a stand alone full encompassing MSDS reference binder.

PHYSICAL DESCRIPTION - MARINE OPERATIONS

Description of Operation:

- The Facility operates five (5) pipelines at the dock facility. Three (3) of these are 10" diameter and one (1) is a 12" diameter. One (1) 10" diameter pipeline is out of service.

Type:	Tank Ships:	7,000 - 105,000 DWT
	Barges:	11,000 DWT
Tow Quantity:	One (1)	
Length:	Tank Ships:	Maximum 700 ft. length, 27 ft. maximum draft
	Barges:	350 ft.
Average Shipment Size:	20,000 bbls	

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - MARINE OPERATIONS (Cont'd)

Discharging Rates: Approximately 6,500 bph

Frequency of Transfer: Five (5) transfers per month *(typical)*

Duration of Transfer: 5 to 8 hrs *(typical)*

Discharge Prevention:

- Each Linnton Terminal marine transfer is closely monitored by two (2) on-site operators, one (1) at the Linnton dock and one (1) within the Linnton Terminal. Additional operations personnel are available at the Willbridge Terminal to initiate the notification process in the event of a spill. Radio communication is maintained between the operators to assure a safe and accurate product transfer.
- The loading/unloading lines are equipped with drip pans under the pump header connections.
- The dock area is well lighted and operations conducted in this area are in strict accordance with USCG procedures. These procedures are written in the Facility's Dock Operations Manual.
- In the event of a spill during a marine transfer operation additional personnel identified in Volume 1 Figure 2.3a from the Facility and the neighboring facilities would be mobilized for the initial response as well as personnel from the contracted OSRO identified in Volume 2 Figure 2.2 and Figure 3.3.

  As necessary, Northern Region personnel identified in Volume 1 Figure 2.3a, Corporate personnel identified in Volume 1 Figures 2.3b and 2.3c, as well as personnel from the Spill Management Team support contractor identified in Volume 2 Figure 2.2 will be activated and/or mobilized.

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS

- No substantial expansions have occurred at this Facility.

MAPS AND DIAGRAMS

The following Maps and Diagrams follow:

Waterside Directions:	From the Columbia River travel southwest, south and southeast on the Willamette River approximately seven (7) miles. Facility is on the left descending bank approximately two (2) miles upstream of the St. Johns Bridge.

PHYSICAL DESCRIPTION - GENERAL

Description of Operation:

- This Facility is a marine terminal and bulk distribution facility for refined petroleum products in conjunction with a common carrier pipeline. The Facility receives product via pipeline, tank vessels (barge and ships) and rail cars. Additives are received via tank truck. Product is transported out of the Facility by tank truck, barge and via pipeline.
- The aboveground storage tanks are contained in a bermed secondary containment area that, at a minimum, provides secondary containment for 110 percent of the largest tank. The tanks are filled or drawn down through a system of aboveground and underground pipes that connect this Facility into the Company distribution network.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL (Cont'd)

Description of Operation (Cont'd):

(b) (7)(F), (b) (3) [redacted]

- The Facility normally operates 24 hours a day 7 days a week.
- The Facility's Worst Case Discharge amounts are (b) (7)(F), (b) (3) [redacted]

Products Handled:

- Additives
- Aviation Gasoline
- Diesel
- Ethanol
- Gasoline
- Jet Fuel
- Distillate Transmix

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

PHYSICAL DESCRIPTION - LOADING RACK

Description of Operation:

- The Facility is equipped with one (1) loading rack with three (3) loading spots which handle various refined petroleum products.
- A maximum of three (3) tank trucks may load simultaneously.
- The loading/unloading operations are conducted 24 hours a day 7 days a week.
- The Facility handles an average of 100 trucks per day.

Loading Rate: 600 gpm (*per loading arm*)

Truck Capacity: 11,000 gallons (*maximum*)

Discharge Prevention:

- The concrete slab strip drain drains directly to an oil water separator.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - MARINE OPERATIONS

Description of Operation:

- The Facility operates six (6) pipelines at the dock facility on the Willamette River and one (1) - 12" vapor recovery line. One (1) pipeline carries Diesel, two (2) pipelines carry Jet A and three (3) pipelines carry Gasoline. All six (6) lines are 10" diameter and approximately 600 feet in length, and pump at an average rate of 4,200 bph.

Tow Quantity: One (1)

Length: Vessels: 695 ft. length; 27'-0" Bow, 31'-6" Stern

Average Shipment Size: 35,000 - 45,000 bbls

Discharging Rates: Approximately 6,500 bph

Frequency of Transfer: 14 transfers per month *(typical)*

Duration of Transfer: 12 to 20 Hours *(typical)*

Discharge Prevention:

- Each Willbridge Terminal marine transfer is closely monitored by two (2) on-site operators, one (1) at the Willbridge dock and one (1) within the Willbridge Terminal. Additional operations personnel are available at the Willbridge Terminal to initiate the notification process in the event of a spill. Radio communication is maintained between the operators to assure a safe and accurate product transfer.
- The loading/unloading lines are equipped with drip pans under the pump header connections.
- The dock area is well lighted and operations conducted in this area are in strict accordance with USCG procedures. These procedures are written in the Facility's Dock Operations Manual.
- In the event of a spill during a marine transfer operation additional personnel identified in Volume 1 Figure 2.3a from the Facility and the neighboring facilities would be mobilized for the initial response as well as personnel from the contracted OSRO identified in Volume 2 Figure 2.2 and Figure 3.3.

  As necessary, Northern Region personnel identified in Volume 1 Figure 2.3a, Corporate personnel identified in Volume 1 Figures 2.3b and 2.3c, as well as personnel from the Spill Management Team support contractor identified in Volume 2 Figure 2.2 will be activated and/or mobilized.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - RAIL CAR RACK

Description of Operation:

- The Facility is equipped with two (2) rail car offloading racks. There is an upstream and downstream side. The Ethanol offloading has three (3) spots and the AvGas offloading has four (4) spots.
- The Facility handles an average of five (5) tank cars per week (seasonal).

Unloading Rate: 350 gpm *(typical)*

Railcar Capacity: 29,000 gallons

Discharge Prevention:

- The curbed concrete slabs drain directly to a sump and oil/water separator system.
- Unloading events are only performed by qualified Company personnel.

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS

- The Facility has undergone numerous expansions since its initial construction in 1915. Expansion periods include:
  - 1923-24: 23 storage tanks
  - 1927-30: 16 storage tanks
  - 1937-38: 9 storage tanks
  - 1946: 2 storage tanks
  - 1948-56: 31 storage tanks
  - 1959-61: 6 storage tanks
  - 1964-65: 5 storage tanks
  - 1969-70: 8 storage tanks
  - 1972: 1 storage tank
  - 2012: 3 storage tanks

MAPS AND DIAGRAMS

The following Maps and Diagrams follow:

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed on the Potential Spill Sources and Container Identification table in this Section.

Tanks

- Secondary Containment volumes for all bulk storage tanks are detailed on the Potential Spill Sources and Container Identification table located in this Section.

Loading Rack Containment System

The loading/unloading rack area is designed and operated as follows:

- Loading/Unloading area drainage flows into a catchment basin and oil/water separator system, designed to handle discharges.
- The containment system is designed to hold the maximum capacity of any single compartment of a single tank truck loaded or unloaded at the Facility.
- A quick drainage system is not used for tank truck loading/unloading.
- Drainage from the truck rack loading and unloading facilities is contained in a depressed area (with curbs). Drainage is through central drains to a 8,900 gallon sump. The product is pumped using a skimming device from the oil/water separator to the product interface tank.

Drainage From the Diked Areas

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment area.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Diked Areas (Cont'd)

- Drainage from diked storage areas is restrained by manually controlled valves.
- Dike drain valves are secured in the closed position when not draining containment areas.
- Flapper-type drain valves are not used to drain diked areas.
- Stormwater from diked areas is emptied by gravity via manually activated valves.
- Accumulated stormwater is inspected for sheen. If sheen is not present, the Area Manager authorizes the Operator to open drain valves as necessary. Clean water is discharged to the local storm sewer system.
- All stormwater from tank roofs and loading rack sumps is transferred via one of the oil/water separators to the collection pond. Accumulated water is tested for contamination. Contaminated water is passed through sock and carbon filter units and tested again prior to discharge to the local storm sewer system under an NPDES permit.

Drainage From the Undiked Areas

Drainage from undiked areas is controlled as follows:

- All Truck Racks are equipped with sumps that automatically transfer accumulated liquids to an oil/water separator. Sumps are equipped with high liquid alarms that will alert the Operator should liquid levels rise and the automatic pumps not activate. The water phase from the oil/water separator is transferred to the collection pond where it is sampled for contamination prior to discharge. Contaminated water is passed through sock and carbon filter units and sampled again prior to discharge to the local storm sewer system under an NPDES permit. The oil phase is transferred to a transmix tank.

General Drainage

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is as follows:

- Water is visually inspected for product and discharged only if no product sheen is visible.
- Contaminated water is transferred to the collection pond, sampled and, if necessary, passed through sock and carbon filter units prior to discharge.
- Facility drainage does not flow directly into an open watercourse.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

General Drainage (Cont'd)

- When draining the containment area, water is discharged to the local storm sewer system under NPDES permit.
- The Facility does not have a wastewater treatment plant nor does it treat water prior to discharge off site.

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Eugene Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading rack has sufficient capability to handle any potential increase in transfer capacity. The loading rack operates 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan.

(b) (3), (b) (7)(F)

Detection by Personnel

- Facility Security personnel monthly inspection of tank gauges and cathodic protection readings. Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds. Refer to Figures 8.5 and 8.6 for sample Tank Inspection and Secondary Containment Inspection Checklists.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Detection by Personnel (Cont'd)

- Annual Secondary Containment Inspections are part of the SPCC Plan.
- Tank Inspections are part of the SPCC Plan.

Security

8.2.2 FACILITY SELF-INSPECTIONS

Container Testing and Inspections

- All aboveground containers are integrity tested on a regular schedule and when material repairs are made.
- The Engineering Department oversees the tank integrity "10-Year Program".
- Comparative records are maintained by the Engineering Department at the Orange office.
- The container inspection programs conducted and maintained by Facility personnel are as follows:
  - The containers are visually inspected by operating personnel for signs of deterioration, leaks, or the accumulation of liquids inside the containment areas.
  - Each storage container is inspected per Company policy, as required by age, condition, and service. (Refer to the "10-Year Program" and the storage tanks section (Section 11) of the Kinder Morgan Specification Manual).
  - Based on these conditions, the aboveground storage containers are professionally inspected and non-destructive thickness testing is performed.
- The required inspections are divided into three categories:
  - Routine, in-service inspections
  - In-service, external inspections
  - Out-of-service, internal inspections
- If a field-constructed aboveground container undergoes a repair, alteration, reconstruction, or change in service that might affect the risk of a discharge or failure due to brittle fracture, the container will be evaluated (see Sample Log in Appendix B).
- Drums or totes brought on-site are built or tested to the standard(s) established by the drum manufacturer or the drum recycler, as applicable.
- While on-site, drums and totes will be visually inspected at least monthly and ground contact will be minimized.
- Liquid level sensing devices are regularly tested.
- High level alarms are tested on a monthly basis.
- The bulk storage containers are equipped with ground-level gauges and are hand-gauged at regular intervals.

8.2.2 FACILITY SELF-INSPECTIONS (Cont'd)

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valve locks and/or seals
  - Other appurtenances

- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement.

- Annually a Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

Documentation

- Records of the inspections and tests (including those maintained under usual and customary business practices), signed by the appropriate supervisor or inspector are retained on file at the Facility and/or other Corporate location for a minimum period of three (3) years.

- Sample inspection and test records are provided in Figures 8.5 and 8.6.

FIGURES 8.5 AND 8.6

Note: The following Kinder Morgan forms comprise the typical tank and secondary containment Inspection Checklists for this Facility. These forms may change over time to accommodate the specific operations of the Facility.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Water Intakes

(b) (7)(F), (b) (3)

[redacted]

(b) (3), (b) (7)(F)

[redacted]

Medical Facilities

Miscellaneous medical facilities (primarily hospitals) are located within the Eugene City Limits. The majority of the facilities lie to the southwest of the Facility. Review of GIS Data determined that the following medical facilities are within the planning distance of the Facility:

8.2.3 VULNERABILITY ANALYSIS

[redacted]

Residential Areas

Residential areas are located in all directions from the Facility. These areas begin within one mile of the Facility and continue outward.

Businesses

The area surrounding the Facility is for the most part light industrial with some open areas. There are various businesses and commercial establishments which may be potentially impacted by a discharge. Review of GIS Data determined that the following businesses are within the planning distance of the Facility:

Businesses	Distance from Facility
Maxxum Marine	0.02 miles *(approximate)*
USA Nutrasources	0.03 miles *(approximate)*
Western Parcel Express	0.03 miles *(approximate)*
Equilon Enterprises	0.04 miles *(approximate)*
Jet Deliver Service	0.09 miles *(approximate)*
Mid-Valley Athletic Supply	0.09 miles *(approximate)*
Mr. Logo	0.09 miles *(approximate)*
Organically Grown Company	0.09 miles *(approximate)*
Pacific Display Corporation	0.09 miles *(approximate)*
Point & Click Software	0.09 miles *(approximate)*

Additional detail on the general layout of businesses within the area of the Facility is included on the maps in Section 6.

8.2.3 VULNERABILITY ANALYSIS

Fish and Wildlife, Wetlands, and other Sensitive Environments

The area surrounding the Facility is host to a variety of species. The Company is using the Regional ACP as well as the NOAA Environmental Sensitivity Study for the San Francisco Bay Region, prepared by Research Planning Institute, Inc., Columbia, South Carolina, 1986, as a reference in determining the locations of wetlands, environmentally sensitive areas, fish and wildlife, and endangered flora and fauna. Refer to Figure 4.1 of this Volume for threatened/endangered species.

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

Wetland habitats, however, are common throughout portions of the area. The size and diversity of the wetland environments vary with season and year. Wetlands play a disproportionally large role in maintaining the stability of the global environment. Wetlands retain and gradually release large quantities of water and their dense vegetation traps sediments and consumes pollutants.

Review of the USF&W Wetlands Mapper and Terraserver data indicates the following wetlands are within the planning distance of the Facility

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

Wetlands	Latitude/Longitude
Freshwater Emergent Wetland	(b) (7)(F), (b) (3)
Spring Creek, Freshwater Emergent Wetland	
Spring Creek, Riverine	

Wetland habitats are common throughout portions of the area. The size and diversity of the wetland environments vary with season and year. Wetlands play a disproportionally large role in maintaining the stability of the global environment. Wetlands retain and gradually release large quantities of water and their dense vegetation traps sediments and consumes pollutants.

During a response situation the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact the agencies will be able to:

- Identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge.
- Identify potential environmental effects on fish and wildlife, wetlands, and other sensitive environments resulting from removal actions or countermeasures.

8.2.3 VULNERABILITY ANALYSIS

Lakes and Streams

Review of GIS Data determined that the following lakes and streams are within the planning distance of the Facility:

Lakes and Streams	Location
Spring Creek	1.0 miles NE *(approximate)*
Flat Creek	5.0 miles NE *(approximate)*
Ingram Slough	10.0 miles NE *(approximate)*

Additional details on the lakes, streams and rivers within the planning distance are found on the maps in Section 6.

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Section 4.

Recreational Areas

Review of GIS Data determined that the following recreation areas are within the planning distance of the Facility:

Recreational Areas	Location
Eugene Blue Star Safety Rest Area	4.0 miles NW *(approximate)*
Cartney County Park	17.0 miles N *(approximate)*

Additional detail on the recreational areas within the planning distance are found on the maps in Section 6.

Transportation Routes (air, land, and water)

There are various public roadways and waterways which may be potentially affected by a discharge originating from the Facility. Review of GIS Data determined that the following transportation routes are within the planning distance of the Facility

Transportation Route	Distance from Facility
Highway 99	0.1 mile W *(approximate)*
Interstate 5	1.5 miles E *(approximate)*
Mahlon Sweet Field Airport	4.0 miles NW *(approximate)*

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Utilities

No utilities were identified within the planning distance.

Other Areas of Economic Importance

Review of GIS Data determined that no terrestrially sensitive or unique environments such as wildlife refuges, management areas, or ecological reserves are within the planning distance of the Facility.

Other Areas of Economic Importance	Distance from the Facility
Ross (historical)	1.0 miles NW *(approximate)*
Fox Valley Lumber Company (historical)	2.0 miles NW *(approximate)*
Milorn (historical)	6.0 miles NW *(approximate)*
Shadow Hills Country Club	6.2 miles NW *(approximate)*
Team Track (historical)	8.0 miles N *(approximate)*
Junction City Remilling (historical)	9.0 miles N *(approximate)*
Western Farmers Spur (historical)	10.0 miles N *(approximate)*
Washburne Wayside	16.5 miles N *(approximate)*

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history of the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

Horizontal Range of a Spill

The Tank Farms are protected with an 8' wide dirt impervious barrier. This is built to withstand pressure from freestanding product. The berms are sprayed with asphalt in proximity of the tank. The berm is constructed to withstand a moderate earthquake without breaching the integrity of the secondary containment.

Should a spill escape containment, it would flow west and then north along the access road.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL (Cont'd)

Vulnerability to a Natural Disaster

The North and South Tank Farms location are flat and are therefore unlikely to incur damage due to shifting and sliding. The seismic stability of the area is good. The probability of a landslide or earthquake is low.

Other Factors

The actions taken to lessen hazards at the Facility petroleum tank farm reduces the probability to a low potential. Hazard reduction protective measures have been designed into tanks and into the construction of the Facility. Tanks were designed to industry standards which reduces the potential for hazards. Based on the care and construction of the tanks, the potential of any one tank rupturing and emptying product into the secondary containment is low. The potential of several tanks simultaneously rupturing is very low.

The Facility conforms to good engineering practices in the tank integrity inspection program. The inspection program reduces the likelihood of leaks.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

The Facility maintains a separate Oil Spill History file in the Facility office. The Facility's file contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY (Cont'd)

- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

Since the Facility was acquired by Kinder Morgan Energy Partners, the Facility has experienced no reportable spills as defined by 40 CFR 110.

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Vessel loading/unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed in the Potential Spill Sources and Container Identification table in this Section.

- The Facility is located in Portland, OR, adjacent to the Willamette River which is the closest navigable waterway.
- The Facility is connected by pipelines to other Company facilities and the Olympic Pipeline in Renton, WA.

Tanks

- Secondary Containment volumes for all bulk storage tanks are detailed in the Potential Spill Sources and Container Identification table in this Section.

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Linnton Terminal	(b) (7)(F), (b) (3)		

The rate of flow from the pipeline system to tankage is essentially fixed and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan, which details additional discharge detection measures.

Detection by Personnel

- Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds.
- Monthly inspection of tank gauges and cathodic protection readings.
- Annual Secondary Containment Inspection as part of the SPCC Plan.
- Tank Inspections as part of the SPCC Plan.
- The loading rack is equipped with warning and instruction signs.
- The entire plant is adequately illuminated to provide security and safe operations at night.

(b) (3), (b) (7)(F)

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Security (Cont'd)

(b) (7)(F), (b) (3)

COMPLETELY AND PARTIALLY BURIED TANKS									
			There are no Underground Storage Tanks at this Facility.						

8.2.2 FACILITY SELF-INSPECTIONS

Container Testing and Inspections

- All aboveground containers are integrity tested on a regular schedule and when material repairs are made.
- The Engineering Department oversees the tank integrity in accordance with the SPCC Plan and L O&M Procedure 2101.
- Comparative records are maintained by the Engineering Department at the Orange office.
- The container inspection programs conducted and maintained by Facility personnel are as follows:
  - The containers are visually inspected by operating personnel for signs of deterioration, leaks, or the accumulation of liquids inside the containment areas.
  - Each storage container is inspected per the SPCC Plan and L O&M Procedure 2101, as required by age, condition, and service.
  - Based on these conditions, the aboveground storage containers are professionally inspected and non-destructive thickness testing is performed.
- The required inspections are divided into three categories:
  - Routine, in-service inspections
  - In-service, external inspections
  - Out-of-service, internal inspections
- If a field-constructed aboveground container undergoes a repair, alteration, reconstruction, or change in service that might affect the risk of a discharge or failure due to brittle fracture, the container will be evaluated.
- Drums or totes brought on-site are built or tested to the standard(s) established by the drum manufacturer or the drum recycler, as applicable.
- While on-site, drums and totes will be visually inspected at least monthly and ground contact will be minimized.
- Liquid level sensing devices are regularly tested.

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

8.2.2 FACILITY SELF-INSPECTIONS

- Flange joints
- Valve glands and bodies
- Pipe supports
- Metal surfaces
- Expansion joints
- Catch pans
- Valves locks and/or seals
- Other appurtenances

- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation or replacement.

- Annually a Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

Documentation

- Records of the inspections and tests (including those maintained under usual and customary business practices), signed by the appropriate supervisor or inspector are retained on file at the Facility and/or other Corporate location for a minimum period of three (3) years.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

The tank farm is protected with poured concrete walls designed to withstand pressure from freestanding product. The berm is constructed to withstand a moderate earthquake without breaching the integrity of the secondary containment.

- The Facility is located in Portland, OR adjacent to the Willamette River.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

The EPA Planning Distance Calculation is presented in Section 8.3 of this Volume.

Water Intakes

(b) (7)(F), (b) (3)

(b) (3), (b) (7)(F)

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Residential Areas

Residential areas are located in all directions from the Facility. These areas begin within one mile of the Facility and continue outward in all directions.

CITY/STATE	POPULATION
WILLAMETTE RIVER	
Portland, Oregon	582,130
University Park, Oregon	5,250
Linnton, Oregon	465
St. John's, Oregon	11,346
MULTNOMAH CHANNEL	
Burlington, Oregon	Unincorporated
McNulty, Oregon	Unincorporated
Ridgefield, Washington	4,314
Columbia City, Oregon	1,955
St. Helens, Oregon	10,019
COLUMBIA RIVER	
Woodland, Washington	4,843
Deer Island, Oregon	Unincorporated
Kalama, Washington	1,783
Goble, Oregon	2,739
Prescott, Oregon	72
Rainier, Oregon	1,687
Longview, Washington	36,562
Clatskanie, Oregon	1,710
Eagle Cliff, Washington	Unincorporated
West Port, Oregon	Unincorporated
Cathlamet, Washington	565
Skamokawa, Washington	449
Brownsmead, Oregon	Unincorporated
Knappa, Oregon	Unincorporated
Altoona/Brookfield/Dahlia/Rosburg, Washington	395
Svensen, Oregon	Unincorporated
Tongue Point, Oregon	Unincorporated
Astoria, Oregon	10,045
Ilwaco, Washington	945

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Businesses

The area surrounding the Facility is for the most part commercialized. There are various businesses and commercial establishments which may be potentially impacted by a discharge. Review of GIS Data determined that the following businesses are within the planning distance:

Businesses	Distance from Facility
Port of Portland	2.77 to 5.95 miles NE to SE *(approximate)*
Fred's Marina	1.27 miles NW *(approximate)*
Tidewater Barge Lines	3.78 miles N *(approximate)*
Boise	13.28 miles N *(approximate)*
Saint Helens Marina	14.45 miles N *(approximate)*
Harvest States	23.0 miles N *(approximate)*

Fish and Wildlife, Wetlands, and other Sensitive Environments

Fish and wildlife, wetlands and other sensitive environments within the planning distance of the Facility are listed in the Lower Columbia River Geographic Response Plan contained on the CD inside the front cover of Volume 1 of this ICP or in a separate ACP/GRP folder in the electronic copies. Refer to Figure 4.1 of this Volume for threatened/endangered species.

Lakes and Streams

Lakes and streams within the planning distance of the Facility are listed in the Lower Columbia River Geographic Response Plan contained on the CD inside the front cover of Volume 1 of this ICP or in a separate ACP/GRP folder in the electronic copies.

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Figure 4.1 of this Volume.

Recreational Areas

Recreational areas within the planning distance of the Facility are listed in the Lower Columbia River Geographic Response Plan contained on the CD inside the front cover of Volume 1 of this ICP or in a separate ACP/GRP folder in the electronic copies.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Transportation Routes (air, land, and water)

Review of GIS Data determined that the following transportation routes are within the planning distance:

Transportation Routes	Location
St. Helens Road	0.09 miles SW *(approximate)*
Portland & Western Railroad	0.0 miles W (approximate)
Willamette River	0.0 miles NE (approximate)
Sauvie Island Bridge	2.12 miles NW (approximate)
Port of Portland	2.77 to 5.95 miles NE to SE *(approximate)*
Columbia River	3.43 miles NNE (approximate)

Utilities

No utilities were identified within the planning distance.

Other Areas of Economic Importance

Other areas of economic importance within the planning distance of the Facility are listed in the Lower Columbia River Geographic Response Plan contained on the CD inside the front cover of Volume 1 of this ICP or in a separate ACP/GRP folder in the electronic copies.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history of the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL (Cont'd)

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Any spilled material which might escape a diked area would be mitigated through the implementation of spill response activities by: Facility personnel, or if necessary, one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow northeast through the Facility.

Vulnerability to a Natural Disaster

The Facility is located in a semi-active earthquake zone with occasional seismic activity.

The Company has historical data that defines the probability of seismic activity in the area. The construction of the Facility has taken the possibility of some seismic activity into consideration; the location of tank farms away from slide prone areas and, constructing the Facility, including all subgrade soil preparation, along with slope and tank construction in accordance with appropriate building codes and industry guidelines.

Other Factors

The actions taken to lessen hazards at the Facility tank farm reduces the probability to a low potential. Hazard reduction protective measures have been designed into tanks and into the construction of the Facility. Tanks were designed to industry standards which reduces the potential for hazards. Based on the care and construction of the tanks, the potential of any one tank rupturing and emptying product into the secondary containment is low. The potential of several tanks simultaneously rupturing is very low.

The Facility conforms to good engineering practices in the tank integrity inspection program. The inspection program reduces the likelihood of leaks. The Facility has not experienced a failure associated with a tank structure.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

Kinder Morgan maintains an online database of reportable spills available at all locations via the company's intranet. The database contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

History of Oil Discharges Greater in Excess of 25 Barrels (OAR 340-141-0160 (3)(h))					
Date of Discharge	**Location of Discharge**	**Cause of Discharge**	**Product Discharged**	**Amount Discharged**	**NRC Incident Report #**
Searches of the Kinder Morgan incident database and the NRC incident report database revealed no discharges of oil in excess of 25 barrels (1,050 gallons) to land or waters of the state from the Linnton Terminal in the five years preceding submittal of this ICP.					

FIGURE 8.7

DRAINAGE DIAGRAM

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Marine transfer operations
- Rail car unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed in the Potential Spill Sources and Container Identification table in this Section.

- The Facility is located in Portland, OR, adjacent to the Willamette River which is the closest navigable waterway.
- The Facility is connected by pipelines to other Company facilities and Olympic Pipeline in Renton, WA.

Tanks

- Secondary Containment volumes for all bulk storage tanks are detailed in the Potential Spill Sources and Container Identification in this Section.

Loading Rack Containment System

Main Loading/Unloading Rack

The loading/unloading rack area is designed and operated as follows:

- Loading/Unloading area drainage flows into a catchment basin designed to handle discharges.
- The containment system is designed to hold the maximum capacity of any single compartment of a single tank truck loaded or unloaded at the Facility.

  A quick drainage system is not used for tank truck loading/unloading.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Main Loading/Unloading Rack (Cont'd)

- All transfers are in constant attendance by qualified personnel who are properly trained prior to conducting transfers.

- In the event that a spill did originate from the transfer area piping, the Facility would immediately shut down the source, activate its Contingency Plan, and commence clean up operations with local and contract resources as necessary to ensure prompt removal of the discharged product.

- Drainage from the loading rack enters a gutter and flows to a sump. From the sump it goes through a sump pump to an upright oil/water separator. The water is then transferred to WB-166, through a sock and carbon filtration system, and the resulting clean water is pumped to WB-167. This water is batch tested and confirmed to be free of product. The City of Portland must be notified 48 hours in advance of release into the NPDES system.

Drainage From the Diked Areas

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment area.

- Stormwater which does accumulate within the diked area, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures.

- Drainage from diked storage areas is restrained by manually controlled valves.

- Flapper-type drain valves are not used to drain diked areas.

- Drainage from the North Yard is diverted to the Asphalt Oil Water Separator. The water is then pumped from the separator through the North Yard Water Monitor located at NPDES 003. If the amount of oil and grease in the water equals less than 10ppm, the water is allowed to flow into Saltzman Creek (Willamette River). If the water contains more than 10ppm of oil and grease, the water is diverted to tank WB-140 until the level drops below 10ppm.

- Drainage from the South Yard is diverted to the South Yard Oil Water Separator. The water is then pumped through the South Yard Water Monitor located at NPDES 003. If the amount of oil and grease in the water equals less than 10ppm, then the water is allowed to flow into Saltzman Creek (Willamette River). If the water contains more than 10ppm of oil and grease, the water is diverted into tank WB-140 until it drops below 10ppm.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Undiked Areas

Drainage from undiked areas is controlled as follows:

- Surface drainage from undiked areas along N.W. Culebra Avenue flows to Facility storm drains and is collected in WB-166. It is then pumped through a sock and carbon filter unit to WB-167. There it is tested for compliance with the POTW permit prior to being discharged into Saltzman Creek, which flows into the Williamette River.

- Drainage from undiked overhead piping between the north and south yards is captured by this system.

- All undiked piping is located in areas away from vehicular traffic.

- The risk of leaks originating from piping is low since it is observed frequently enough to detect excessive corrosion, defective pipe supports, or other anomalies which could compromise the integrity of the pipe.

- In the event that a spill did originate from undiked piping, the Facility would immediately activate its Contingency Plan to mitigate the spill before leaving the property.

General Drainage

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is as follows:

- Stormwater accumulating in secondary containment areas is processed through an oily water separator and carbon filters then tested by the Lead Operator prior to being discharged under an NPDES permit.

- Water is visually inspected for product and discharged only if no product sheen is visible.

- When draining the containment area, water is discharged under an NPDES permit to Saltzman Creek which flows into the Willamette River, and the POTW to the City of Portland POTW system.

- The Facility does not have a wastewater treatment plant nor does it chemically treat water prior to discharge off site.

- Uncontaminated rainwater is inspected to ensure compliance with applicable water quality standards and will not cause a harmful discharge as defined in 40 CFR 110.

- Records of drainage events are maintained at the Facility office.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Willbridge Terminal	(b) (7)(F), (b) (3)		

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading rack has sufficient capability to handle any potential increase in transfer capacity. The loading racks operate 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan, which details additional discharge detection measures.

Detection by Personnel

- Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds.
- Monthly inspection of tank gauges and cathodic protection readings.
- Annual Secondary Containment Inspection as part of the SPCC Plan.
- Tank Inspections as part of the SPCC Plan.
- The loading rack is equipped with warning and instruction signs.
- The entire plant is adequately illuminated to provide security and safe operations at night.

8.2.2 FACILITY SELF-INSPECTIONS

Container Testing and Inspections

- All aboveground containers are integrity tested on a regular schedule and when material repairs are made.
- The Engineering Department oversees the tank integrity in accordance with the SPCC Plan and L O&M Procedure 2101.
- Comparative records are maintained by the Engineering Department at the Orange office.
- The container inspection programs conducted and maintained by Facility personnel are as follows:
  - The containers are visually inspected by operating personnel for signs of deterioration, leaks, or the accumulation of liquids inside the containment areas.
  - Each storage container is inspected per the SPCC Plan and L O&M Procedure 2101, as required by age, condition, and service.
  - Based on these conditions, the aboveground storage containers are professionally inspected and non-destructive thickness testing is performed.
- The required inspections are divided into three categories:
  - Routine, in-service inspections
  - In-service, external inspections
  - Out-of-service, internal inspections
- If a field-constructed aboveground container undergoes a repair, alteration, reconstruction, or change in service that might affect the risk of a discharge or failure due to brittle fracture, the container will be evaluated.
- Drums or totes brought on-site are built or tested to the standard(s) established by the drum manufacturer or the drum recycler, as applicable.
- While on-site, drums and totes will be visually inspected at least monthly and ground contact will be minimized.
- Liquid level sensing devices are regularly tested.
- High and redundant high level alarms are tested on a monthly basis by manually activating the alarm sensor on the tank.
- The bulk storage containers are equipped with ground-level gauges and are hand-gauged at regular intervals.

8.2.2 FACILITY SELF-INSPECTIONS (Cont'd)

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valve locks and/or seals
  - Other appurtenances

- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement.

- Annually a Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

Documentation

- Records of the inspections and tests (including those maintained under usual and customary business practices), signed by the appropriate supervisor or inspector are retained on file at the Facility and/or other Corporate location for a minimum period of three (3) years.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

The tank farm is protected with concrete block walls and earthen berms designed to withstand pressure from freestanding product. The floors of the tanks have impervious linings. The berm is constructed to withstand a moderate earthquake without breaching the integrity of the secondary containment.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

The EPA Planning Distance Calculation is presented in Section 8.3 of this Volume.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Businesses

The area surrounding the Facility is heavily industrialized. There are various businesses and commercial establishments which may be potentially impacted by a discharge. Review of GIS Data determined that the following businesses are within the planning distance:

Businesses	Distance from Facility
Anderson Roofing Co., Inc.	0.15 miles SW *(approximate)*
Reinhard Petroleum	0.15 miles SW *(approximate)*
Rogers Repair Service	0.11 miles WSW *(approximate)*
Beaver State Scaffolding & Equipment Co.	0.13 miles WSW *(approximate)*
Chevron	0.14 miles SE *(approximate)*
ConocoPhillips	0.28 miles SE *(approximate)*
Certainteed Roofing	0.17 miles NE *(approximate)*
Gilmore Steel	0.13 miles NW *(approximate)*
Delco	0.2 miles WNW *(approximate)*
A Bear Box Company	0.33 miles NW *(approximate)*
Port of Portland	0.50 to 4.98 miles NNW to NW *(approximate)*
Nustar	2.07 miles NW *(approximate)*

Boise	19.51 miles N *(approximate)*
Saint Helens Marina	20.68 miles N *(approximate)*
Harvest States	29.25 miles N *(approximate)*

Fish and Wildlife, Wetlands, and other Sensitive Environments

Fish and wildlife, wetlands and other sensitive environments within the planning distance of the Facility are listed in the Lower Columbia River Geographic Response Plan contained on the CD inside the front cover of Volume 1 of this ICP or in a separate ACP/GRP folder in the electronic copies. Refer to Figure 4.1 of this Volume for threatened/endangered species.

Lakes and Streams

Lakes and streams within the planning distance of the Facility are listed in the Lower Columbia River Geographic Response Plan contained on the CD inside the front cover of Volume 1 of this ICP or in a separate ACP/GRP folder in the electronic copies.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Figure 4.1 of this Volume.

Recreational Areas

Recreational areas within the planning distance of the Facility are listed in the Lower Columbia River Geographic Response Plan contained on the CD inside the front cover of Volume 1 of this ICP or in a separate ACP/GRP folder in the electronic copies.

Transportation Routes (air, land, and water)

Review of GIS Data determined that the following transportation routes are within the planning distance:

Transportation Routes	Location
Portland & Western Railroad	0.0 miles W (approximate)
NW Front Street	0.0 miles NE (approximate)
Willamette River	0.0 miles NE (approximate)
St. Helens Road	0.09 miles SW *(approximate)*
Port of Portland	0.50 to 4.98 miles NNW to NW *(approximate)*
St. John's RR Bridge	0.77 miles NNW (approximate)
St. John's Bridge	1.65 miles NW (approximate)
Columbia River	5.95 miles NNW (approximate)

Utilities

No utilities were identified within the planning distance.

Other Areas of Economic Importance

Other areas of economic importance within the planning distance of the Facility are listed in the Lower Columbia River Geographic Response Plan contained on the CD inside the front cover of Volume 1 of this ICP or in a separate ACP/GRP folder in the electronic copies.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history of the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Any spilled material which might escape a diked area would be mitigated through the implementation of spill response activities by: Facility personnel, or if necessary, one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow southwest through the Facility.

Vulnerability to a Natural Disaster

The Facility is located in a semi-active earthquake zone with occasional seismic activity.

The Company has historical data that defines the probability of seismic activity in the Oregon area. The construction of the Facility has taken the possibility of some seismic activity into consideration; the location of tank farms away from slide prone areas and, constructing the Facility, including all subgrade soil preparation, along with slope and tank construction in accordance with appropriate building codes and industry guidelines.

Other Factors

The actions taken to lessen hazards at the Facility tank farm reduces the probability to a low potential. Hazard reduction protective measures have been designed into tanks and into the construction of the Facility. Tanks were designed to industry standards which reduces the potential for hazards. Based on the care and construction of the tanks, the potential of any one tank rupturing and emptying product into the secondary containment is low. The potential of several tanks simultaneously rupturing is very low.

The Facility conforms to good engineering practices in the tank integrity inspection program. The inspection program reduces the likelihood of leaks. The Facility has not experienced a failure associated with a tank structure.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

Kinder Morgan maintains an online database of reportable spills available at all locations via the company's intranet. The database contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

History of Oil Discharges Greater in Excess of 25 Barrels (OAR 340-141-0160 (3)(h))

Date of Discharge	Location of Discharge	Cause of Discharge	Product Discharged	Amount Discharged	NRC Incident Report #

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. - Eugene Terminal is classified as a "Complex Facility" which operates in a Non-Higher Volume Port Area.

"Complex" means a facility possessing a combination of transportation-related and non-transportation-related components that is subject to the jurisdiction of more than one Federal agency under section 311(j) of the Clean Water Act (CWA).

Complexes must perform discharge calculations for each jurisdictional agency and plan for the largest Worst Case Discharge Volume pursuant to the respective regulations. Volume 2, Section 6 contains the Worst Case Discharge Volumes required by DOT-RSPA. The EPA discharge volume calculations are described as follows:

EPA Discharge Volume Calculation

- **Worst Case Discharge**
  100% of the largest single tank

  WCD = (b) (7)(F),

- **Medium Discharge**
  Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD

  MD = 857 bbls

- **Small Discharge**
  Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD

  SD = 50 bbls

ODEQ Discharge Volume Calculation

- **Worst Case Spill (WCS)**
  In the case of an onshore or offshore facility, the largest foreseeable spill in adverse weather conditions.

- **Average Most Probable Spill, Release or Discharge**
  The probable volume of oil that may spill as defined in a plan considering the history of spills from similar facilities or vessels of the same class operating on the west coast of the United States. It may be defined as the lesser of one percent of the worst case spill, or 50 barrels, when used as a planning volume.

8.3 DISCHARGE SCENARIOS (Cont'd)

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack, or leaking piping and would be Gasoline.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the loading rack could be diverted to the in line oil/water separator.

The closest waterway is Crow Creek, which is east of the Facility. The storage tanks and truck loading racks, have adequate secondary containment so it is unlikely that a spill would reach the creek or travel very far if it did. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, as appropriate, include:

- 1,000' of containment boom and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a *Small Discharge* or greater which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a Small Discharge with the manpower and local contract resources as detailed in Section 2 and 3 of Volume 2.

- A 50 bbls discharge typically will not escape the containment of the Facility.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack while loading Gasoline. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Offsite Impact

- The closest waterway is Crow Creek, which is east of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the creek. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be implemented at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)
Offsite Impact (Cont'd) ● Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.
Notes: ● Equipment and manpower resources are detailed in Section 3 of Volume 2. ● Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1. ● Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Spills of this size would likely be Gasoline. Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before a spill containment could begin. The spilled material would more than likely collect in the containment area sump system and be routed to the separator system. If a spill of this size escaped the property it could possibly enter the Willamette River. Adverse weather conditions would increase the chances of a discharge entering the river; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages can be referenced in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a medium discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

The closest waterway is Crow Creek so the potential for a spill of this size reaching water does exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the *Medium Discharge* volume that are capable of arriving on scene within 12 hours.
- Sufficient quantity of containment boom must arrive within 12 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a Medium Discharge with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 12 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 12 hours; Tier 2 = 36 hours; Tier 3 = 60 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 12 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage facilities.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the river.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed (b) (7)(F), (b) (3)

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached). Spills of this size would likely be Gasoline or Diesel.

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages can be located in the Potential Spill Sources and Container Identification table in Section 8.2.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow east and enter Crow Creek which is located east of the property.

For a spill that is confined to the land along the pathway, Facility personnel would have at least two (2) options by which to contain the spill:

- Dams
- Trenches

Ditch Containment

A spill may be contained in storm water ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located west of Crow Creek, which flows into the north. The priority during larger spills is to prevent oil from reaching the waterway. OSROs are under contract with the Facility. The Company, however, will use Facility personnel and Facility owned equipment to initiate initial boom deployment and anchoring at the waterway within one hour. Several commercial and residential areas as well as other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by state and Federal trustees would likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Response Requirement (Cont'd)

- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage facilities.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. - Linnton Terminal is classified as a "Marine Transportation Related Onshore Facility" which operates in a Non-Higher Volume Port Area.

"Complex" means a facility processing a combination of transportation-related and non-transportation-related components that is subject to the jurisdiction of more than one Federal agency under section 311(j) of the Clean Water Act (CWA).

Complexes must perform discharge calculations for each jurisdictional agency and plan for the largest Worst Case Discharge Volume pursuant to the respective regulations. Volume 2 Section 6 contains the Worst Case Discharge Volumes required by DOT-RSPA. The EPA discharge volume calculations are described as follows:

EPA Discharge Volume Calculation

- **Worst Case Discharge**
  100% of the largest single tank

  WCD = (b) (7)(F),

- **Medium Discharge**
  Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD

  MD = 857 bbls

- **Small Discharge**
  Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD

  SD = 50 bbls

USCG Discharge Volume Calculation

(b) (7)(F), (b) (3)

8.3 DISCHARGE SCENARIOS (Cont'd)

Worst Case Discharge Volume Calculations from Marine Operations (WCD)

(b) (7)(F), (b) (3)

[redacted]

ODEQ Discharge Volume Calculation

- **Worst Case Spill (WCS)**
  In the case of an onshore or offshore facility, the largest foreseeable spill in adverse weather conditions.

- **Average Most Probable Spill, Release or Discharge**
  The probable volume of oil that may spill as defined in a plan considering the history of spills from similar facilities or vessels of the same class operating on the west coast of the United States. It may be defined as the lesser of one percent of the worst case spill, or 50 barrels, when used as a planning volume.

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

EPA PLANNING DISTANCE CALCULATION

Planning Distance Calculation **D = V x T x C**

V = Chezy-Manning Equation
= 2.17 feet/sec

T = Substantial harm planning time interval
= 24 hours arrival plus 3 hours deployment = 27 hours

C = Constant conversion factor = 0.68 sec•mile/hr•ft, Therefore;

D = *Distance downstream from a facility within which fish and wildlife and sensitive environments could be injured or a public drinking water intake would be shut down in the event of an oil discharge.*
= 2.17 feet/sec x 27 hours x 0.68 sec•mile/hr•ft =
= 39.9 miles

ODEQ PLANNING DISTANCE CALCULATION

Planning Distance Calculation **D = V x T**
V = 4 nautical miles per hour (knots)
T = 24 hours
D = 96 nautical miles (192,000 yards)
This distance encompasses the Willamette River from the Terminal to the confluence with the Columbia River and the Columbia River into the Pacific Ocean to Longitude 124^{0} 16’ 24” W approximately 10.4 miles west of the Cape Disappointment Light. The environmental variables for the area defined by this distance are addressed in the Northwest Area Contingency Plan and Lower Columbia River Geographic Response Plan.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be leaking piping and would be Gasoline.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the Facility could be diverted to the product tanks.

The closest body of navigable water is the Willamette River, which is northeast of the Facility. The storage tanks and truck loading racks have adequate secondary containment so it is unlikely that a spill would reach the river. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall include:

- 1,000' of containment boom (or two times the length of the largest vessel that regularly conducts oil transfers to or from the facility, whichever is greater) and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a *Small Discharge* or greater which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a *Small Discharge* with the manpower and local contract resources as detailed in Section 2 and 3 of Volume 2.

- A 50 bbls discharge typically will not escape the containment of the Facility.
- If a 50 bbls discharge escaped the Facility it would likely occur at the dock while loading Gasoline. In the event of a spill, the dock operations would immediately be shut down by manually activating one of the ESDs that are located at the dock. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the dock manifold area.

Offsite Impact

- The closest waterway is the Willamette River, which is northeast of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the River. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be deployed at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage tanks, as the situation demands.
- Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Spills of this size would likely be Gasoline. Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before a spill containment could begin. The spilled material would more than likely collect in the containment area sump system and be routed to the separator system. If a spill of this size escaped the property it could possibly enter the Willamette River. Adverse weather conditions would increase the chances of a discharge entering the river; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages are listed in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a Medium Discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

The closest waterway is the Willamette River so the potential for a spill of this size reaching navigable water does exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the Medium Discharge volume that are capable of arriving on scene within 12 hours.
- Sufficient quantity of containment boom must arrive within 12 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 12 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 12 hours; Tier 2 = 36 hours; Tier 3 = 60 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 12 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage tanks.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the river.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO

This section outlines a fictitious worst case spill scenario which illustrates how KMEP could be expected to respond to a major gasoline spill. Due to the number of spill containment devices and features in place, and most areas within the Facility being monitored on a 24-hour basis, this scenario is extremely unlikely.

The weather is cool and very foggy with limited visibility. Winds are from the south-southeast at approximately 7 knots. River currents range between 0.5 and 1.5 knots, depending on location. A volume of diesel equal to the Facility's largest storage tank, (b) (7) (F) (b) Bbls, has spilled into the Willamette River from an unknown source.

At the 6-hour mark the center of the spill is still in the vicinity of the KMEP Linnton Terminal, after which it begins to migrate north along the river. At 9 hours the slick center is off Sauvie Island and continues north, passing the northern tip of the island after 12 hours. After 24 hours the slick center is in the Columbia River directly in front of the Port of Longview where the river turns in a northwesterly direction. Winds then begin to play a factor, pushing the diesel toward the northern shoreline of the Columbia River between Longview and Astoria. Diesel remains in the water and reaches Astoria in 54 hours. At this point, the current slows dramatically as tidal effects become more pronounced.

Time	Actions	
Sun Rise 0630	**Day 1**	**Sun Set 1721**
0701	The dock is out-of-service for maintenance and is not continually manned although a ship is moored but is not engaged in transfer operations. The Terminal Operator is making his regular check of the dock area and notices a strong hydrocarbon odor. After further investigation, he notices that diesel is covering the entire surface of the water around the dock. The Terminal Operator immediately notifies the Orange Control Center. The Operator then: ● Notifies local police and fire (via 911) ● Notifies the Area Manager (QI) The Area Manager (QI): ● Initiates Emergency Response Line (ERL) notification ● Assumes the role of Incident Commander (IC) ● Notifies local response personnel ● Mobilizes to the Willbridge Terminal Office Building (Command Post (CP))	
0712	The IC arrives at the CP and receives an update on the spill status. A systems check has been completed and no leaks are indicated. Although the spill origin is unknown, the IC conservatively assumes that KMEP is responsible and continues to implement a response. The IC then performs an initial assessment of the health and safety hazards and reviews the MSDS for diesel and determines the appropriate PPE. At the direction of the IC, local responders deploy 1400' of KMEP boom backed by sorbent boom at the Linnton Terminal Tactical Site #1	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO		
Time	**Actions**	
Sun Rise 0630	**Day 1**	**Sun Set 1721**
0720	The Area Manager/IC participates in the ERL teleconference with the Operations Manger, Director of Operations (Fairfield, CA), V.P. of Operations (Orange, CA) and representatives from Products Movement, EHS, CCS, Engineering, Pipeline Integrity, Remediation, and Public Relations (Fairfield, CA; Orange, CA; Houston, TX). During the call the IC also requests KMEP management to dispatch the appropriate personnel to the CP. The CCS representative notifies: ● National Response Center (NRC) ● Oregon Emergency Response System (OERS) ● Washington Department of Ecology (WDOE) since Columbia River impact is likely Following these initial notifications the CCS representative contacts the Portland Fire Department, US Coast Guard Sector Columbia River, EPA Region 10, and Oregon Department of Environmental Quality.	
0725	Additional local response personnel arrive at the CP and the IC: ● Communicates spill, MSDS, and potential PPE information to response team members. ● Assigns continuing hazard monitoring responsibility to qualified team members. ● Activates National Response Corporation Environmental Services (NRCES) and O'Brien's Response Management response contractors. ● Directs response team members to begin staging equipment at CP. ● Requests security services from a local security company to secure the Facility and limit access to response personnel only. ● Reviews the Site Safety Plan. ● Dispatches personnel to shoreline access/viewing points to assess spill movements.	
0745	The IC directs National Response Corporation Environmental Services (NRCES) to provide a Marco skimmer at the Linnton Terminal Tactical Site #1; 2800' of boom at the Linnton Terminal Tactical Site #2/GRP MC-1: and 800' of boom at GRP LCR 100.8. Officials of the International Bird Rescue Research Center are alerted and the Coast Guard is requested to restrict marine traffic in the Columbia and Willamette Rivers.	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO		
Time	**Actions**	
Sun Rise 0630	**Day 1**	**Sun Set 1721**
0755	The Command Post (CP) has been established at the Willbridge Terminal Office and key personnel have arrived to staff the various positions. The Operations Manager assumes the role of Liaison Officer and the IC assigns Terminal personnel the roles of Safety Officer, Operations Section Chief, Planning Section Chief and Logistics Section Chief. Terminal personnel issue orange ICS Vests and 'Black Books' (ICS roles and responsibilities) The IC contacts O'Brien's Response Management to request Spill Management Team Support Personnel. O'Brien's RM dispatches personnel from Seattle, Brea, and Houston with estimated arrival times between 4 and 8 hours. O'Brien's RM Northwest Manager contacts NOAA to request a trajectory based on available information. The IC directs the Logistics Section begin establishing a communications system. The Facility radio system is used initially for all response activities and will switch over to the NRC communications systems for offshore operations once they arrive on-site. Local radio suppliers are contacted to provide additional VHF radios for offshore and remote shoreline operations. Level D PPE is required although contractors are advised to carry respirators. The response team established hot zones at the dock area and the IC directs the Safety Officer to continually reassess the optimal hot zone location at the dock and establish other hot zones at remote response locations. The spill is considerably larger than originally assumed, although dense fog has prevented a thorough evaluation. The IC then: ● Directs the response team to begin deploying KMEP's response equipment. ● Directs the Logistics Section to arrange for a helicopter for aerial surveillance at first opportunity. ● Initiates the preparation of an Incident Action Plan.	
0800	Surveillance personnel downriver estimate that the center of the spill is located half way between the Facility dock and Sauvie Island, although visibility is still very poor. This would indicate that the spill was undetected for approximately 3 hours before the Operator initiated the notification procedure. **Boom Required: 2,500 Feet** (4 x length of largest vessel) **Total Boom Available: 2,500 Feet** **Total Boom Deployed: 1,400 Feet** **Required Recovery: None** **Required Temporary Storage: None** **Recovered Oil: 0** **Evaporated Oil: 0** **Remaining Oil: 67,674 barrels**	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO		
Time	**Actions**	
Sun Rise 0630	**Day 1**	**Sun Set 1721**
0820	Shoreline protection operations are underway. The fog is still too dense to adequately assess the extent of the spill or permit aerial reconnaissance. NRCES personnel begin to arrive on-site and are assigned roles in the Operations, Planning and Logistics Sections.	
0900	Additional NRCES personnel are dispatched to Hewlett Point to deploy deflection boom in an attempt to protect the Shillapoo Wildlife Recreational Area. One of the NRCES response boats at Tactical Site #3/GRP WR-0.9 (Kelly Point) is redirected to deploy 500 feet of exclusion boom in front of the Port of Vancouver water intake/GRP LCR-100.8. The other boat at Kelly Point informs the IC that the slick appears to be approaching Kelly Point. Staff at the Port of Vancouver Facility are instructed by the IC to shut down the intake. NRCES personnel and equipment are dispatched by the IC to establish a staging area at Bachelor Point. **Boom Required: 5,000 Feet** **Total Boom Available: 27,800 Feet** **Total Boom Deployed: 1,400 Feet** **Required Recovery: None** **Available Recovery: 17,379 bpd** **Recovery Deployed: 7,176 bpd** **Required Temporary Storage: None** **Available Temporary Storage: 47,421 Barrels** **Temporary Storage Deployed: 1260 Barrels** **Recovered Oil: 0** **Evaporated Oil: 300 Barrels** **Remaining Oil: 67,374 Barrels (in water)**	
1145	The slick is still moving north and the center point is offshore of Blurock Landing. NRCES boom and other equipment begins to arrive from Rainier, Wuana, St. Helens, and Kalama. NRCES crews are dispatched to the eastern shore of Sauvie Island to prepare for exclusion booming operations along the shoreline on an as needed basis. ODEQ, Coast Guard, EPA, Multnomah County, WDOE, and other agency personnel have arrived on-site and are briefed on the status of the spill and response operations by the IC. The ODEQ and Coast Guard OSCs confer with the IC on the intended response strategies and assume positions at the CP. Consistent with the Unified Command System, the OSCs and other state and federal agency ICS members begin to work with their KMEP counterparts in an advisory role. The local police department personnel arrive and are requested by the IC to assist in controlling access to the Facility and response operations at St. Helens Road.	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO		
Time	**Actions**	
Sun Rise 0630	**Day 1**	**Sun Set 1721**
1150	The IC directs the Logistics Section to make immediate arrangements for housing, food, protective clothing, decontamination facilities, and cleanup supplies. The Logistics Section is also directed to establish equipment staging areas in the Linnton Terminal parking lot, and warehouse. The Logistics Section establishes procedures for purchasing equipment and supplies and tracking deliveries and inventories. Buses and additional helicopters are contracted to provide transportation support for equipment, supplies, and personnel. The IC also directs the Planning Section to begin establishing interim waste storage sites in remote areas of the Facility parking lot and other clear areas for interim storage of oily debris and other waste materials.	
1200	The fog abates sufficiently for flight operations and an overflight is conducted to assess the extent of the spill. The spill is considerably larger than anticipated and estimated to range from 60,000 to 70,000 bbls in size. The center of the spill is now offshore of Sauvie Island but the leading edge is approaching the Willow Bar Islands. Several crews staged at Bachelor Point are directed to begin booming operations for the sensitive areas in their vicinity. One boat crew deploys exclusion boom around the Campbell Lake intake to protect the Ridgefield National Wildlife Refuge. A second boat crew is deployed to anchor exclusion boom around water intakes around Bachelor Island on an as needed basis. The last crew remains in their boat on standby, ready to boom the eastern side of Sauvie Island on an as-need basis to protect the game management area.	
1300	Supplies and equipment continue to arrive as operations continue. **Boom Required: 5,000 Feet (2-Hour Planning Standard)** **Total Boom Available: 27,800 Feet** **Total Boom Deployed: 11,100 Feet** **Required Recovery: 6.767 bpd (10% of WCS)** **Available Recovery: 17,379 bpd** **Recovery Deployed: 8,500 bpd** **Required Temporary Storage: 20,301 Barrels** **Temporary Storage Available: 47,421 Barrels** **Recovered Oil: 1,196 Barrels** **Evaporated Oil: 900 Barrels** **Dispersed Oil: 0** **Remaining Oil: 54,778 Barrels**	
1330	Aerial surveillance reports the slick has continued north with the river and has reached the tip of Sauvie Island. The IC directs shoreline booming operations in this area to continue. A number of media representatives have arrived and are given a briefing and tour by the Public Affairs Representative prior to a news conference with the Incident Commander and regulatory agency representatives.	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO		
Time	**Actions**	
Sun Rise 0630	**Day 1**	**Sun Set 1721**
1400	NRCES crews, equipment, and response vessels are deployed to set up staging areas, one at Waterview and the other at Kalama to prepare for deflection and exclusion booming operations in those areas.	
1430	The slick center is continuing to move north and is centered off Bachelor Point.	
1530	Three NRCES boat crews have arrived at the Waterview staging area and initiate boom deployment activities. One response vessel is deployed to install exclusion boom at the mouth of Island Slough. The other two vessel crews are dispatched to the southern end of Martin Island to anchor exclusion boom wherever accessible for protection of the Canada goose nesting area.	
1630	Five response crews with vessels have arrived at the staging area at Kalama to begin booming operations in that area. Exclusion boom is deployed at the mouth of Merill Creek, Carolls Channel, and the Kalama Chemical water intake. Kalama Chemical is notified of the impending slick and alerted to prepare to shut down their intakes.	
1700	Portable lighting obtained from contractors and rental yards is set up at the shoreline booming locations to enable operations to continue through the night. NRCES personnel and equipment have arrived in Longview and begun protection operations deploying exclusion boom around water intakes at Longview Fibre, Weyerhaeuser, and City of Longview intakes. These facilities are also notified of the impending hazard. Another crew anchors deflection boom along the southeast side of Lord Island.	
1730	Operations in most areas are scaled back approximately 50 percent because of darkness. A press conference is held involving the Incident Commander, Public Affairs Staff, and agency representatives to summarize the status of the spill and response operations.	
1900	The Logistics, Operations, and Planning personnel along with O'Brien's RM, NRCES, and agency representatives, begin to develop an Incident Action Plan for the following day's activities. Winds are monitored continually and spill trajectories are updated every 2 hours. **Boom Required: 35,000 feet** **Total Boom Available: 35,600 Feet** **Total Boom Deployed: 18,500 Feet** **Required Recovery: 10,151 bpd** **Available Recovery: 17,379 bpd** **Recovery Deployed: 8,980 bpd** **Temporary Storage Required: 30,453 Barrels** **Temporary Storage Available: 54,291 Barrels** **Recovered Oil: 3,321 Barrels** **Evaporated Oil: 3,300 Barrels** **Dispersed Oil: 300 Barrels** **Remaining Oil: 60,753 Barrels**	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO		
Time	**Actions**	
Sun Rise 0631	**Day 2**	**Sun Set 1720**
0530	The PSC facilitates a UC meeting with the IC, LOSC, SOSC, and FOSC to review the previous day's objectives and situation status.	
0600	The PSC facilitates the Command & General Staff Meeting with the UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader.	
0630	The helicopter overflight launches from PDX with observers from the Coast Guard, ODEQ and O'Brien's RM on board.	
0700	**Boom Required: Amount needed to protect sensitive areas** **Total Boom Available: 35,600 Feet** **Total Boom Deployed: 18,500 Feet** **Required Recovery: 13,535 bpd** **Available Recovery: 31,129 bpd** **Recovery Deployed: 8,980 bpd** **Temporary Storage Required: 40,604 Barrels** **Temporary Storage Available: 64,291 Barrels** **Recovered Oil: 7,811 Barrels** **Evaporated Oil: 7,650 Barrels** **Dispersed Oil: 2,190 Barrels** **Remaining Oil: 50,023 Barrels**	
0800	Extra boom and spill response vessels are deployed to staging areas in Westport, Cathlamet, and Skamokawa.	
1100	The Joint Information Center (JIC) issues a press release describing what has occurred and what actions are being taken to protect sensitive areas while waiting for the spill to completely evaporate. The spill has not reached the southern tip of Puget Island. Crews staged in Westport deploy boom at the mouth of the Westport Slough and water intakes around the Wauna area.	
1230	Fog lifts sufficiently to launch flight operations. Aerial reconnaissance reports that the center of the spill is still in the vicinity of Puget Island. The leading edge of the slick, however, has reached Tenasillahe Island. Exclusion boom is deployed at the entrance to the Elochoman Slough. Oiled/injured birds are encountered and arrangements are made with the IBRRC to establish a bird cleaning and rehabilitation center. These activities are coordinated with the Department of Wildlife.	
1300	Crews staged at Skamokawa deploy diversion and exclusion boom at Steamboat Slough and Brooks Slough, respectively.	
1330	Aerial surveillance reports that the slick is centered off the northern tip of Puget Island.	
1530	Aerial surveillance reports the slick is centered off Goose Island.	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO		
Time	**Actions**	
Sun Rise 0631	**Day 2**	**Sun Set 1720**
1600	Two response crews are dispatched from the Skamokawa Marina to deploy deflection boom in the Snag Island area for protection of the Miller Sands. Three other crews deploy exclusion booming around the entrance to the Karlson Marshes, the mouth of Grays River and Crooked Creek, and the mouth of the John Day River. Land crews also deploy exclusion boom at the mouth of the Sisson Creek and Deep River.	
1800	The last aerial flight for the day indicates that the spill has moved slowly west into the Lewis and Clark National Wildlife Refuge. Operations are reduced with the onset of darkness. A press conference is held involving the IC, Public Affairs staff, and agency representatives to summarize the status of the spill and response operations. Operations, Logistics, Planning, O'Brien's RM, and NRCES personnel work into the night to develop an Incident Action Plan for the following day's activities. Spill trajectories are updated every two hours.	
Sun Rise 0632	**Day 3**	**Sun Set 1718**
0530	The PSC facilitates a UC meeting with the IC, LOSC, SOSC, and FOSC to review the previous day's objectives and situation status.	
0600	The PSC facilitates the Command & General Staff Meeting with the UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader.	
0630	The helicopter overflight launches from PDX with observers from the Coast Guard, ODEQ and O'Brien's RM on board.	
0700	**Boom Required: Amount needed to protect sensitive areas** **Total Boom Available: 35,600 Feet** **Total Boom Deployed: 18,500 Feet** **Required Recovery: 16,919 bpd** **Available Recovery: 31,129 bpd** **Recovery Deployed: 8,980** **Temporary Storage Required: 50,756 Barrels** **Temporary Storage Available: 64,219 Barrels** **Recovered Oil: 16,791 Barrels** **Evaporated Oil: 13,200 Barrels** **Dispersed Oil: 9,600 Barrels** **Remaining Oil: 28,083 Barrels**	
0800	The JIC issues a press release describing what has occurred and what actions are being taken to clean up the spill and restore the environment.	
1200	Crews stationed in Astoria are alerted to standby and prepare for deployment of deflection, diversion, and exclusion boom on an as needed basis.	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO		
Time	**Actions**	
Sun Rise 0632	**Day 3**	**Sun Set 1718**
1800	A small portion of the spill has reached Fort Stevens. However, the speed with which the slick is spreading is dramatically reduced as the river enters marine waters. Operations, Logistics, Planning, O'Brien's RM, and NRCES personnel work into the night to develop an Incident Action Plan for the following day's activities. Spill trajectories are updated every two hours.	
Sun Rise 0633	**Day 4**	**Sun Set 1717**
0530	The PSC facilitates a UC meeting with the IC, LOSC, SOSC, and FOSC to review the previous day's objectives and situation status.	
0600	The PSC facilitates the Command & General Staff Meeting with the UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader.	
0630	The helicopter overflight launches from PDX with observers from the Coast Guard, ODEQ and O'Brien's RM on board.	
0700	**Boom Required: Amount needed to protect sensitive areas** **Total Boom Available: 35,600 Feet** **Total Boom Deployed: 18,500 Feet** **Required Recovery: 16,919 bpd** **Available Recovery: 31,129 bpd** **Recovery Deployed: 8,980** **Temporary Storage Required: 50,756 Barrels** **Temporary Storage Available: 64,219 Barrels** **Recovered Oil: 25,771 Barrels** **Evaporated Oil: 18,750 Barrels** **Dispersed Oil: 17,010 Barrels** **Remaining Oil: 6,143 Barrels**	
0800	All operations continue. The JIC issues a press release describing what has occurred and what actions are being taken.	
Sun Rise 0634	**Day 5**	**Sun Set 1715**
0530	The PSC facilitates a UC meeting with the IC, LOSC, SOSC, and FOSC to review the previous day's objectives and situation status.	
0600	The PSC facilitates the Command & General Staff Meeting with the UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader.	
0630	The helicopter overflight launches from PDX with observers from the Coast Guard, ODEQ and O'Brien's RM on board.	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO		
Time	**Actions**	
Sun Rise 0634	**Day 5 and Beyond**	**Sun Set 1715**
0700	**Boom Required: Amount needed to protect sensitive areas** **Total Boom Available: 35,600 Feet** **Total Boom Deployed: 18,500 Feet** **Required Recovery: 16,919 bpd** **Available Recovery: 31,129 bpd** **Recovery Deployed: 8,980** **Temporary Storage Required: 50,756 Barrels** **Temporary Storage Available: 64,219 Barrels** **Recovered Oil: 34,751 Barrels** **Evaporated Oil: 24,300 Barrels** **Dispersed Oil: 24,420 Barrels** **Remaining Oil: 0 Barrels**	
0800	All surveillance and shoreline cleanup operations continue. The JIC issues a press release describing what has occurred and what actions are being taken. Upon completion of operations, demobilization is authorized by the USCG, ODEQ, WDOE, and the resource trustee agencies. KMEP continues to monitor the area affected by the spill. The Documentation Unit completed documentation of the incident.	

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. - Willbridge Terminal is classified as a "Marine Transportation Related Onshore Facility" which operates in a Non-Higher Volume Port Area.

"Complex" means a facility processing a combination of transportation-related and non-transportation-related components that is subject to the jurisdiction of more than one Federal agency under section 311(j) of the Clean Water Act (CWA).

Complexes must perform discharge calculations for each jurisdictional agency and plan for the largest Worst Case Discharge Volume pursuant to the respective regulations. Volume 2 Section 6 contains the Worst Case Discharge Volumes required by DOT-PHMSA. The EPA discharge volume calculations are described as follows:

EPA Discharge Volume Calculation

- **Worst Case Discharge**
  100% of the largest single tank

  WCD = (b) (7)(F), (b) (3)

- **Medium Discharge**
  Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD

  MD = 857 bbls

- **Small Discharge**
  Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD

  SD = 50 bbls

ODEQ Discharge Volume Calculation

- **Worst Case Spill (WCS)**
  In the case of an onshore or offshore facility, the largest foreseeable spill in adverse weather conditions.

- **Average Most Probable Spill, Release or Discharge**
  The probable volume of oil that may spill as defined in a plan considering the history of spills from similar facilities or vessels of the same class operating on the west coast of the United States. It may be defined as the lesser of one percent of the worst case spill, or 50 barrels, when used as a planning volume.

8.3 DISCHARGE SCENARIOS (Cont'd)

USCG Discharge Volume Calculation

(b) (7)(F), (b) (3)

Worst Case Discharge Volume Calculations from Marine Operations (WCD)

(b) (7)(F), (b) (3)

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

EPA PLANNING DISTANCE CALCULATION

Planning Distance Calculation **D = V x T x C**

V = Chezy-Manning Equation
= 2.17 feet/sec

T = Substantial harm planning time interval
= 24 hours arrival plus 3 hours deployment = 27 hours

C = Constant conversion factor = 0.68 sec•mile/hr•ft, Therefore;

D = *Distance downstream from a facility within which fish and wildlife and sensitive environments could be injured or a public drinking water intake would be shut down in the event of an oil discharge.*
= 2.17 feet/sec x 27 hours x 0.68 sec•mile/hr•ft =
= 39.9 miles

ODEQ PLANNING DISTANCE CALCULATION

Planning Distance Calculation **D = V x T**
V = 4 nautical miles per hour (knots)
T = 24 hours
D = 96 nautical miles (192,000 yards)
This distance encompasses the Willamette River from the Terminal to the confluence with the Columbia River and the Columbia River into the Pacific Ocean to Longitude 124° 11' 17" W approximately 6.9 miles west of the Cape Disappointment Light. The environmental variables for the area defined by this distance are addressed in the Northwest Area Contingency Plan and Lower Columbia River Geographic Response Plan.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 barrels (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack, or leaking piping and would be Gasoline.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the Facility could be diverted to the product tanks.

The closest waterway is the Willamette River, which is adjacent to the Facility. The storage tanks and truck loading racks, have adequate secondary containment so it is unlikely that a spill would reach the river. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall include:

- 1,000' of containment boom (or two times the length of the largest vessel that regularly conducts oil transfers to or from the facility, whichever is greater) and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a *Small Discharge* or greater which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a *Small Discharge* with the manpower and local contract resources as detailed in Section 2 and 3 of Volume 2.

- A 50 bbls discharge typically will not escape the containment of the Facility.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack while loading Gasoline. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Offsite Impact

- The closest waterway is the Willamette River, which is adjacent to the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the river. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be deployed at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage tanks, as the situation demands.
- Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Spills of this size would likely be Gasoline. Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before a spill containment could begin. The spilled material would more than likely collect in the containment area sump system and be routed to the separator system. If a spill of this size escaped the property it could possibly enter the Willamette River. Adverse weather conditions would increase the chances of a discharge entering the river; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages are listed in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a Medium Discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

The closest waterway is the Willamette River so the potential for a spill of this size reaching navigable water does exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the Medium Discharge volume that are capable of arriving on scene within 12 hours.
- Sufficient quantity of containment boom must arrive within 12 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 12 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 12 hours; Tier 2 = 36 hours; Tier 3 = 60 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 12 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage tanks.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the Willamette River.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO

This section outlines a fictitious incident involving a Worst Case Spill (as defined by ODEQ) scenario which illustrates how KMEP could be expected to respond to a major diesel spill at the Willbridge Terminal.

The weather is cool and very foggy with limited visibility. Winds are blowing from the south-southeast at approximately 7 knots. River currents range between .5 and 1.5 knots, depending on location. After a minor seismic event Tank WB-12002, containing120,000 barrels (5,040,000 gallons) of diesel fuel, collapses releasing its entire contents into the South Tank Yard. The spilled product sloshes over the containment wall and begins to flow across the rail car loading/unloading area, into Saltzman Creek and on to the Willamette River.

At the 6-hour mark the leading edge of the spill is beginning to enter to Columbia River. At 9 hours the leading edge off Willow Bar Islands and continues north, approaching Bachelor Point after 12 hours. After 24 hours the slick is approaching Prescott, OR. Winds then begin to play a factor, pushing the diesel toward the northern shoreline of the Columbia River between Longview and Astoria. Diesel remains in the water and reaches Tenasillahe Island at 48 hours. At this point, the current slows dramatically as tidal effects become more pronounced.

Time	Actions	
Sun Rise 0630	**Day 1**	**Sun Set 1721**
0701	Upon feeling the earthquake, the Terminal Operator immediately notifies the Orange Control Center and stops all pipeline and truck transfer operations. The Operator then: ● Notifies the Area Manager (QI) ● Begins an inspection of the terminal The Area Manager (QI): ● Initiates Emergency Response Line (ERL) notification ● Mobilizes to Terminal Office Building	
0711	The Terminal Operator sees the diesel fuel flowing into Saltzman creek and immediately notifies the Area Manager.	
0715	The Area Manager arrives at the Terminal and receives an update on the spill status. A systems check has been completed and no other damage is indicated. The Area Manager assumes the role of IC then performs an initial assessment of the health and safety hazards and reviews the MSDS for diesel to determine the appropriate PPE.	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO (Cont'd)

Time	Actions	
Sun Rise 0630	Day 1	Sun Set 1721
0730	The Area Manager participates in the ERL teleconference with the Operations Manger, Director of Operations (Fairfield, CA), V.P. of Operations (Orange, CA) and representatives from Products Movement, EHS, CCS, Engineering, Pipeline Integrity, Remediation, and Public Relations (Fairfield, CA; Orange, CA; Houston, TX). During the call the IC also requests KMEP management to dispatch the appropriate personnel to the CP. The CCS representative notifies: ● National Response Center (NRC) ● Oregon Emergency Response System (OERS) ● Washington Department of Ecology (WDOE) since Columbia River impact is likely Following these initial notifications the CCS representative contacts the Portland Fire Department, US Coast Guard Sector Portland, EPA Region 10, and Oregon Department of Environmental Quality. At the direction of the IC, local responders deploy two (2) 1400' lengths of KMEP boom backed by sorbent boom at the Willbridge Terminal Tactical Site #2/GRP WR-7.5 across the mouth of Saltzman Creek. Of the 120,000 barrels released approximately 30,000 barrels escaped secondary containment and is flowing into Saltzman Creek.	
0740	The IC activates National Response Corporation Environmental Services (NRCES) and directs them to provide a Marco skimmer at the Willbridge Terminal Tactical Site #2; deploy 2000' of boom and skimmer at the Willbridge Terminal Tactical Site #3/GRP WR-6.9b; 2000' of boom and skimmer at GRP WR-5.8; 2800' of boom at the Linnton Terminal Tactical Site #2/GRP MC-1: and 800' of boom at GRP LCR 100.8.	
0745	The Command Post (CP) has been established at the Terminal Office and key personnel have arrived to staff the various positions. The Operations Manager assumes the role of Liaison Officer and the IC assigns Terminal personnel the roles of Safety Officer, Operations Section Chief, Planning Section Chief and Logistics Section Chief. Terminal personnel issue orange ICS Vests and 'Black Books' (ICS roles and responsibilities) The IC contacts O'Brien's Response Management to request Spill Management Team Support Personnel. O'Brien's RM dispatches personnel from Seattle, Brea, and Houston with estimated arrival times between 4 and 8 hours. O'Brien's RM Northwest Manager contacts NOAA to request a trajectory based on available information. Linnton and Willbridge Terminal Operators begin transferring product from the undamaged tanks in the South Yard to available tanks at the Linnton Terminal. Thermo Fluids Environmental is contacted to provide vacuum trucks and temporary storage for product recovery in the South Yard.	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO (Cont'd)

Time	Actions	
Sun Rise 0630	Day 1	Sun Set 1721
0801	**Boom Required: 2,800 Feet** (4 x length of largest vessel) **Total Boom Available: 2,800 Feet** **Total Boom Deployed: 2,800 Feet** **Required Recovery: None** **Required Temporary Storage: None** **Recovered Oil: 0** **Evaporated Oil: 0** **Remaining Oil: 30,000 barrels (in water)**	
0815	The IC directs the Logistics Section Chief to establish a communications plan using Terminal radios, company cell phones and land lines.	
0820	Officials of the International Bird Rescue Research Center are alerted and the Coast Guard is requested to advise marine traffic on the Columbia and Willamette Rivers.	
0835	Surveillance personnel downriver estimate that the leading edge of the spill is located just upstream of the St. John's Bridge, although visibility is still very poor. Initial containment operations are underway. The fog is still too dense to adequately assess the extent of the spill or permit aerial reconnaissance. NRCES representatives begin to arrive at the CP and are assigned roles in the Operations, Planning and Logistics Sections. NRCES skimmers arrive at Willbridge Terminal Tactical Sites #2 and #3/ GRPs WR-7.5 and 6.9b.	
0855	NRCES personnel complete deployment of 2000' of boom at Willbridge Terminal Tactical Site #3/GRP WR-6.9b and 2000' of boom at GRP WR-5.8.	
0901	NRCES personnel and equipment are dispatched by the IC to establish a staging area at Bachelor Point. **Boom Required: 5,600 Feet** **Total Boom Available: 27,800 Feet** **Total Boom Deployed: 5,500 Feet** **Required Recovery: None** **Available Recovery: 47,828 bpd** **Recovery Deployed: 7,176 bpd** **Required Temporary Storage: None** **Temporary Storage Deployed: 23,850 Barrels** **Recovered Oil: 0** **Evaporated Oil: 300 Barrels** **Remaining Oil: 29,700 Barrels (in water)**	
0935	NRCES personnel complete deployment of 2,800' of boom at Linnton Terminal Tactical Site #2/GRP MC-1.	
1035	NRCES personnel complete deployment of 800' of boom at GRP LCR-100.8. Additional personnel, boom and skimmers are deployed to the Linnton Terminal Tactical Site #3/GRP WR-0.9	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO (Cont'd)

Time	Actions	
Sun Rise 0630	Day 1	Sun Set 1721
1045	ODEQ, Coast Guard, EPA, Multnomah County, WDOE, and other agency personnel have arrived on-site and are briefed on the status of the spill and response operations by the IC. Consistent with the Unified Command System local, state and federal agency ICS members begin to work with their KMEP counterparts. The Planning Section Chief (PSC) facilitates the Objectives Meeting with the IC, FOSC, SOSC, and LOSC. The local police department personnel arrive and are requested by the IC to assist in controlling access to the Terminal and response operations at NW Front Ave. NRCES personnel and equipment are dispatched to GRPs LCR-94.5 and LCR-91.0 to deploy protective boom (1,400 feet) at the Willow Bar Islands and south end of Bachelor Island Slough.	
1100	The IC directs the Logistics Section to make arrangements for housing, food, protective clothing, decontamination facilities, and cleanup supplies. The Logistics Section is also directed to establish equipment staging areas in the Linnton Terminal parking lot, and warehouse. The Logistics Section works with procurement personnel in Orange, CA to establish procedures for purchasing equipment and supplies and tracking deliveries and inventories. The IC also directs the Planning Section to establish an interim waste storage site near the out of service Asphalt Fill Stand for oily debris and other waste materials.	
1151	O'Brien's RM Northwest Manager arrives and, following briefing, assumes the role of Planning Section Chief. NRCES personnel complete deployment of Linnton Terminal Tactical Site #3/GRP WR-0.9.	
1235	The PSC facilitates the Command & General Staff Meeting with the UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader.	
1301	**Boom Required: 5,600 Feet (2-Hour Planning Standard)** **Total Boom Available: 27,800 Feet** **Total Boom Deployed: 11,100 Feet** **Required Recovery: 12,000 bpd (10% of WCS)** **Available Recovery: 47,828 bpd** **Recovery Deployed: 8,500 bpd** **Recovered Oil: 1,196 Barrels** **Evaporated Oil: 900 Barrels** **Dispersed Oil: 0** **Remaining Oil: 27,904 Barrels (in water)**	
1335	The PSC facilitates the Tactics Meeting with the Operations and Logistics Section Chiefs, Resource Unit Leader, Situation Unit Leader, Safety Officer, Documentation Unit Leader, and Communications Unit Leader. Based on the NOAA trajectory and known river conditions NRCES is directed to deploy boom at LCR GRPs 87.6, 87.3, 82.4, 81.8, 81.2, 81.0, 79.8, 79.5, 76.0, 73.7, 71.6, and 71.5 (7,400 feet).	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO (Cont'd)		
Time	**Actions**	
Sun Rise 0630	**Day 1**	**Sun Set 1721**
1445	KM Northern Region Director of Operations and EHS/Remediation personnel arrive from Fairfield, CA. EHS/Remediation personnel are assigned to the Environmental Unit within the Planning Section.	
1515	The PSC facilitates the Planning Meeting with UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader.	
1715	The Incident Action Plan (IAP) for the Operational Period is completed and approved by the UC and the Operations Briefing held. On-water operations are suspended for the night. On-shore recovery operations continue through the night.	
1745	The KM Manager – Emergency Response Programs arrives from Houston, TX and, following briefing, relieves the Planning Section Chief. The O'Brien's RM Northwest Manager assumes the role of Deputy IC. Additional O'Brien's RM personnel arriving from Brea, CA and Spring, TX are assigned to the Operations and Planning Sections, and Documentation Unit. The Planning, Operations and Logistics Sections work through the evening to develop plans for the next operational period and monitor ongoing recovery operations. The visibility is forecast to clear so the UC schedules a helicopter overflight to determine the extent of the spill at first light.	
1901	**Boom Required: 35,000 feet** **Total Boom Available: 35,600 Feet** **Total Boom Deployed: 18,500 Feet** **Required Recovery: 18,000 bpd** **Available Recovery: 60,193 bpd** **Recovery Deployed: 8,980 bpd** **Temporary Storage Required: 54,000 Barrels** **Temporary Storage Available: 54,441 Barrels** **Recovered Oil: 3,321 Barrels** **Evaporated Oil: 3,300 Barrels** **Dispersed Oil: 300 Barrels** **Remaining Oil: 23,709 Barrels**	
Sun Rise 0631	**Day 2**	**Sun Set 1720**
0530	The PSC facilitates a UC meeting with the IC, LOSC, SOSC, and FOSC to review the previous day's objectives and situation status.	
0600	The PSC facilitates the Command & General Staff Meeting with the UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader.	
0630	The helicopter overflight launches from PDX with observers from the Coast Guard, ODEQ and O'Brien's RM on board.	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO (Cont'd)		
Time	**Actions**	
Sun Rise 0631	**Day 2**	**Sun Set 1720**
0701	**Boom Required: Amount needed to protect sensitive areas** **Total Boom Available: 35,600 Feet** **Total Boom Deployed: 18,500 Feet** **Required Recovery: 24,000 bpd** **Available Recovery: 60,193 bpd** **Recovery Deployed: 8,980 bpd** **Temporary Storage Required: 72,000 Barrels** **Temporary Storage Available: 75,215 Barrels** **Recovered Oil: 7,811 Barrels** **Evaporated Oil: 7,650 Barrels** **Dispersed Oil: 2,190 Barrels** **Remaining Oil: 12, 349 Barrels**	
0800	The JIC issues a press release describing what has occurred and what actions are being taken.	
0830	The overflight observers report that the leading edge of the sheen is approaching the northwestern end of Cottonwood Island. Four NRCES response boats, skimmer, vacuum truck, two Baker tanks, and 3,000 feet of boom are dispatched to the Port of Longview (GRP LCR-66.2) to establish an on-water recovery site. The boats, working in pairs towing 1,000 feet of boom between them, will capture product and transport it to the Port where it will be recovered using a skimmer.	
1715	On-water operations are suspended for the night. On-shore recovery operations continue through the night. The Planning, Operations and Logistics Sections work through the evening to develop plans for the next operational period and monitor ongoing recovery operations. The visibility is forecast to remain clear so the UC schedules a helicopter overflight to determine the extent of the spill at first light.	
Sun Rise 0632	**Day 3**	**Sun Set 1718**
0530	The PSC facilitates a UC meeting with the IC, LOSC, SOSC, and FOSC to review the previous day's objectives and situation status.	
0600	The PSC facilitates the Command & General Staff Meeting with the UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader.	
0630	The helicopter overflight launches from PDX with observers from the Coast Guard, ODEQ and O'Brien's RM on board.	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO (Cont'd)		
Time	**Actions**	
Sun Rise 0632	**Day 3**	**Sun Set 1718**
0701	**Boom Required: Amount needed to protect sensitive areas** **Total Boom Available: 35,600 Feet** **Total Boom Deployed: 18,500 Feet** **Required Recovery: 30,000 bpd** **Available Recovery: 60,139 bpd** **Recovery Deployed: 8,980 bpd** **Temporary Storage Required: 90,000 Barrels** **Temporary Storage Available: 95,615 Barrels** **Recovered Oil: 16,791 Barrels** **Evaporated Oil: 13,200 Barrels** **Dispersed Oil: 9,600 Barrels** **Remaining Oil: 0**	
0830	The overflight observers report some small patches of weathered sheen but no large concentrations of product. On-water recovery operations are demobilized and protective booming removed. All equipment is decontaminated prior to return to storage. Shore lie clean up continues until all evidence of diesel has been removed from impacted areas. Clean up and remediation in the South Tank Yard continue until all trace of diesel has been removed. The Unified Command agrees to meet at a later date to discuss lessons learned from the incident. The Documentation unit completes documentation of the event.	
0900	The JIC issues a press release describing what has occurred and what actions are being taken.	

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Company personnel (IC) assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 1765 Prairie Road
Eugene, OR 97402
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility and Southern Pacific Railroad, if applicable.
h. Staging area for Emergency Command Post will be at the entrance to the Facility or where the Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the Employee Parking Lot west of the office building. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel (IC) will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the frontage road west of the office building, in the parking lot of the old Shell office building or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility Main Office, control building, or the north or south staging area.

8.4 FACILITY EVACUATION (Cont'd)

4. Community Evacuation

The local Law Enforcement provides methods of warning the public of the need to evacuate. The current procedure for informing the public when there is a need to do so is by door-to-door notification, use of electronic media by direct contact to radio and television stations, or the employment of the Emergency Broadcast System (EBS). The local authorities will initiate and coordinate all efforts concerning the evacuation of the community.

5. Directions to Sacred Heart Medical Center

Start going south on Prairie Road to Hwy 99. Turn left on Hwy 99. Head straight on Hwy 99 and exit to Chambers Street. Turn right on Chambers Street and go south to 13th Avenue. Turn left on 13th Avenue and go to Hilyard. The hospital is located at 1255 Hilyard Street.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gate located southwest of the Office Building.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram in Section 8.2.

8. Prevailing Winds

The prevailing winds in the Facility area generally come from the northwest at an average speed of 5-10 mph year round.

9. Water Currents

Currents in the Willamette River are swift.

TACTICAL PLAN

The following Tactical Plan has been provided to assist initial response to a spill incident from this Facility. The plan includes the following:

- Driving directions
- General pictures of the site and tactical response strategy
- General response equipment and personnel recommendations

Note: This Tactical Plan is provided as a general guidance tool for response to an incident emanating from this Facility. The selection of response strategy equipment, manpower and deployment site may vary based on actual field conditions (e.g. terrain, weather conditions, product type/volume) and incident details.

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Company Personnel IC assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 11400 NW St. Helens Road
Portland, OR 97231
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility, if applicable.
h. Establish a Command Center immediately at the entrance to the Facility or where the Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the Control Building. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel IC will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the secondary command center or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility Main Office, Control Building, or the north or south staging area.

8.4 FACILITY EVACUATION (Cont'd)

4. Community Evacuation

The Company has confirmed with the Linnton Fire Department that no Community Evacuation Plan currently exists for this area. However, the Fire Department does have Standard Guidelines that are followed in the event of an evacuation.

5. Directions to Oregon Health & Science University Hospital

From the Facility go southwest on NW St. Helens Rd/Columbia River Hwy/US-30. Stay straight to go onto NW Yeon Ave. Take US-30 W. Merge onto I-405 S toward Beaverton. Take exit number 1C toward 6th Ave./US-26 E/Ross 1s. Br. The ramp becomes SW Broadway. Make a slight right onto SW 6th Ave., which becomes SW Terwilliger Blvd. Stay straight to go onto SW Sam Jackson Park Rd. OHSU is located at 3181 SW Sam Jackson Park Road.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gates located east of St. Helens Road.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

8. Prevailing Winds

The prevailing summer winds in the Facility area generally come from the northwest with speeds ranging from 10-15 knots. Winter winds are primarily from the east and southeast with speeds ranging from 10-15 knots.

9. Water Currents

Currents in the Willamette River average 0.5 knots.

TACTICAL PLAN

The following Tactical Plan has been provided to assist initial response to a spill incident from this Facility. The plan includes the following:

- Driving directions
- General pictures of the site and tactical response strategy
- General response equipment and personnel recommendations

Note: This Tactical Plan is provided as a general guidance tool for response to an incident emanating from this Facility. The selection of response strategy equipment, manpower and deployment site may vary based on actual field conditions (e.g. terrain, weather conditions, product type/volume) and incident details.

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Company Personnel IC assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 5880 NW St. Helens Rd.
Portland, OR 97210
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility and Burlington Northern if applicable.
h. Establish a Command Center immediately at the entrance to the Facility or where the Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the Control Building. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel IC will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the secondary command center or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility main office (Building #6) or the warehouse (Building #2).

4. Community Evacuation

The Company has confirmed with the Portland Fire Department that no Community Evacuation Plan currently exists for this area. However, the Fire Department does have Standard Guidelines that are followed in the event of an evacuation.

5. Directions to Oregon Health & Science University Hospital (OHSU)

From the Facility go southwest on NW St. Helens Rd/Columbia River Hwy/US-30. Stay straight to go onto NW Yeon Ave. Take US-30 E. Merge onto I-405 S toward Beaverton. Take exit number 1C toward 6th Ave./US-26 E/Ross Is. Br. The ramp becomes SW Broadway. Make a slight right onto SW 6th Ave., which becomes SW Terwilliger Blvd. Stay straight to go onto SW Sam Jackson Park Rd. OHSU is located at 3181 SW Sam Jackson Park Road.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gates located northeast of NW Culebra Avenue.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram in Section 8.2.

8. Prevailing Winds

The prevailing summer winds in the Facility area generally come from the northwest with speeds ranging from 10-15 knots. Winter winds are primarily from the east and southeast with speeds ranging from 10-15 knots.

9. Water Currents

Currents in the Willamette River average 0.5 knots.

PROFESSIONAL ENGINEER CERTIFICATION

By means of this Professional Engineer Certification, I hereby attest to the following:

- I am familiar with the requirements of OAR 340-141-0160 and have verified that this Plan has been prepared in accordance with the requirements of this regulation.
- I have verified that this plan has been prepared in accordance with good engineering practice, including consideration of applicable industry standards.
- I have verified that the Plan is adequate for the Facility.

State of Georgia Registration No. PE031706

9.2 INTRODUCTION

KMEP, in compliance with OAR 340-141-0160 (1) (a), has elected to substitute its approved DOT Oil Spill Response Plan, supplemented by this section, for a stand alone prevention plan. A complete Cross Reference of ODEQ regulations to this substitute plan is included in Volume 1.

This ODEQ section for the Northern Region – Northwest Oregon Pipelines Area provides additional spill prevention, planning and response information appropriate for use along identified ODEQ line segments of the KMEP pipeline system in this Area.

The line segments referenced in Figure 9.1 have been identified as subject to ODEQ jurisdiction based on the likelihood of a worst case pipeline rupture potentially resulting in impact to navigable waters of the state.

This Section 9 is provided in order to document the following ODEQ pipeline segment-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- ODEQ Pipeline Segments Information (Figure 9.1)
- LS-14 Environmental Sensitivity Index Maps (Figure 9.2)
- Discharge Scenarios (Section 9.3)
- Reportable Oil Discharge History (Section 9.4)
- Drug and Alcohol Policies (Figure 9.3)

9.3 ODEQ LINE SEGMENTS

The pipeline segments identified in Figure 9.1 for this area have been identified as subject to ODEQ contingency and prevention plan requirements. The segments were selected based on the likelihood of a worst case pipeline release potentially resulting in impacts to navigable waters of the state. Some minor ephemeral drainages crossed at substantial distances from navigable waters are not included due to the sufficient time to respond and avoid navigable water impacts.

ODEQ JURISDICTIONAL PIPELINE SEGMENTS (Cont'd)

GENERAL INFORMATION

Seasonal Weather Conditions:

Air Temperature:	Ranges from 33° to 79.7°F
Winds:	Generally west-southwest at 7 to 9 mph.
Rain:	Generally 17.89 inches per year.

Site Descriptions:

Oregon Pipelines Area: Most pipeline segments in the Portland area run generally parallel to the Willamette River, the BNSF Railroad and St. Helens Road through the commercial and industrial developments in the area. LS 1880 originates at the Willbridge Terminal and crosses the Willamette River between the Kinder Morgan and Chevron docks running generally northeast and east through residential and commercial areas to the Portland Airport. LS-14 originates at Portland Station and runs northwest parallel to and under St. Helens Road for approximately 0.5 miles before turning southwest then south through residential and agricultural areas of the Willamette Valley to the Eugene Terminal.

PIPELINE SECTION	LINE NO.	WCS (BBLS)

FIGURE 9.1 ODEQ JURISDICTIONAL PIPELINE SEGMENTS (Cont'd)

PREVENTION MEASURES

KMEP Operations and Maintenance Manuals

KMEP facilities are built and maintained in accordance with all applicable codes and regulations as well as relevant API (American Petroleum Institute) standards. Pipelines are coated and cathodically protected. Any abnormalities found by periodic maintenance inspections and/or internal inspections are promptly repaired. The Company's operating practices meet or exceed industry standards.

KMEP Operations and Maintenance Manuals have been developed in accordance with DOT 49 CFR 195 and various aspects of the operations, inspection, and maintenance procedures have been summarized below for reference. The design and installation details of KMEP's pipelines are provided on large-scale alignment sheets which are revised and updated as needed.

Integrity testing of pipelines and leak detection equipment

Pipelines are hydrostatically pressure tested, in accordance with DOT Part 195 when installed. In addition, KMEP performs integrity testing of pipelines by using internal inspection tools or pressure test every five years. The internal inspection log produces data which is read and interpreted by third party experts and KMEP designs its verification and repair program utilizing these results.

Line monitoring and leak detection is described in the Operations Manual.

Damage criteria for equipment repair or replacement.

Damage criteria for pipelines (which would require action to be taken, such as reducing the maximum operating pressure, pipeline repair or replacement) is included in the Maintenance Manual (and generally follows ASME B31G).

Protection measures for areas subject to flooding.

Certain sections of the pipeline cross streams, rivers and bays. Other areas may be subject to periodic flooding during periods of high rainfall.

- During initial pipeline construction, streambed profiles and pipe profiles are designed and installed to withstand or be protected from the effects of flooding. In addition, major waterway crossings are inspected periodically. For example, pipeline crossings are inspected every 5 years. If necessary, rip-rap or other protective covering is installed.

Describe any leak detection, spill prevention safety and alarm systems, devices, equipment or procedures.

(b) (7)(F), (b) (3)

9.4 DISCHARGE SCENARIOS/RESPONSE STRATEGY OUTLINES

ODEQ PLANNING DISTANCE CALCULATION

Planning Distance Calculation **D = V x T**

V = 4 nautical miles per hour (knots)
T = 24 hours
D = 96 nautical miles (192,000 yards)

For the LS-14 Willamette River Crossing this distance encompasses the Willamette River from the LS-14 crossing at (b) (7)(F), (b) (3) to the confluence with the Columbia River, and the Columbia River to Longitude 123° 31' 56.97" W between Grassy and Woody Islands approximately 15 miles northeast of Astoria, OR. The environmental variables for the area defined from the crossing to Willamette Falls are addressed in Figure 9.2 and from Willamette Falls to the full extent of the planning distance are addressed in the Northwest Area Contingency Plan Lower Columbia River Geographic Response Plan.

For the LS-14 Tualatin River Crossing this distance encompasses the Tualatin River from the LS-14 crossing at (b) (7)(F), (b) (3) the Willamette River to the confluence with the Columbia River; and the Columbia River to Longitude (b) (7)(F), (b) (3) near Fitzpatrick Island approximately 16 miles northeast of Astoria, OR. The environmental variables for the area defined from the crossing to Willamette Falls are addressed in Figure 9.2 and from Willamette Falls to the full extent of the planning distance are addressed in the Northwest Area Contingency Plan Lower Columbia River Geographic Response Plan.

For the LS-1880/Willamette River Crossing this distance encompasses the Willamette River from the LS-1880 crossing at (b) (7)(F), (b) (3) The environmental variables for the area defined by this distance are addressed in the Northwest Area Contingency Plan Lower Columbia River Geographic Response Plan.

Note: The crossing locations above are not the Worst Case Spill locations for these line segments.

9.3 DISCHARGE SCENARIOS/RESPONSE STRATEGY OUTLINES (Cont'd)

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO

This section outlines a fictitious incident involving a Worst Case Spill (as defined by ODEQ) scenario which illustrates how KMEP could be expected to respond to a diesel spill from LS-14 near Woodburn, Oregon.

The weather is cool with winds are blowing from the south-southeast at approximately 7 knots. Rain is expected later in the day. At approximately 0700 a backhoe operator working near Butteville Road NE and Crosby Road NE strikes LS-14 causing the line to rupture.

Time	Actions	
Sun Rise 0630	**Day 1**	**Sun Set 1721**
0701	The Portland Station Operator notices a pressure fluctuation and flow deviations at the Fargo and Morgan Pump Stations. The Operator shuts down the Fargo Pump Station and closes upstream valves. The Morgan Pump Station is kept in operation to move as much product as possible away from the potential pipeline rupture. The Operator then: ● Notifies the Area Manager (QI) ● Notifies the Orange Control Center (ORCC) The QI: ● Initiates Emergency Response Line (ERL) notification ● Dispatches the Line Rider from Portland Station to investigate	
0715	The QI participates in the ERL teleconference with the Operations Manger, Director of Operations (Fairfield, CA), V.P. of Operations (Orange, CA) and representatives from Products Movement, EHS, CCS, Engineering, Pipeline Integrity, Remediation, and Public Relations (Fairfield, CA; Orange, CA; Houston, TX). The QI contacts Terra Hydro, NW Hazmat and National Response Corporation Environmental Services to place them on stand-by for response to the possible spill.	
0720	ORCC receives a telephone call from a construction foreman reporting that the pipeline has been ruptured in the vicinity of Butteville Road NE and Crosby Road NE. Escaping product has filled the excavation and is flowing into roadside ditches along both roads. ORCC passes this information to the QI who notifies the Line Rider. The QI requests earth moving equipment, vacuum trucks and temporary storage tanks from contractors.	

9.3 DISCHARGE SCENARIOS/RESPONSE STRATEGY OUTLINES (Cont'd)

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO (Cont'd)		
Time	**Actions**	
Sun Rise 0630	**Day 1**	**Sun Set 1721**
0745	The Line Rider arrives at the spill site, relays his observations to the Area Manager and begins an initial Site Safety Plan. Based on information provided by the Line Rider the QI estimates the spill volume to be in excess of 2,400 barrels.	
0750	The QI initiates a follow-up ERL to discuss the Line Rider's observations and subsequent actions. Following the ERL the CCS representative notifies: ● National Response Center (NRC) ● Oregon Emergency Response System (OERS) Following these initial notifications the CCS representative contacts the EPA Region 10, and Oregon Department of Environmental Quality. Local police and fire departments are notified. The Manager-Pipeline Maintenance and EHS/Remediation personnel mobilize from the Fairfield Office with estimated arrival times between 6 and 8 hours. The KM Public Relations office issues a press release describing the incident and activates the KM Response Web Site.	
0800	The QI assumes the role of Incident Commander (IC) and the Operations Manager assumes the role of Liaison. Via teleconference, the IC assigns personnel from Portland Station, Linnton and Willbridge Terminals as Safety, Operations, Planning, and Logistics. Pipeline personnel issue orange ICS Vests and 'Black Books' (ICS roles and responsibilities) and mobilize to the site.	
0801	**Leak Detected and Pipeline Shutdown**	
0900	Portland area personnel and the Operations Manager arrive at the site and direct arriving contractors to construct berms in the roadside ditches to restrict the spread and create recovery sites. Local police are requested to restrict traffic on Butteville Road NE and Crosby Road NE. An equipment staging area is established at the northwest corner of Butteville Road NE and Crosby Road NE.	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO (Cont'd)		
Time	**Actions**	
Sun Rise 0630	**Day 1**	**Sun Set 1721**
0901	**Pipeline Personnel and Equipment Assigned to Locate Leak** **Required Boom: None** **Available Boom: 1,450 Feet** **Required Recovery: None** **Available Recovery: 1,000 bpd** **Required Storage: None** **Available Storage: 2,352 Barrels** **Volume Spilled: 5,719** **Volume Recovered: 0**	
0930	The IC and additional Portland area personnel arrive at the site. The IC directs the Logistics Section Chief to acquire a suitable location for an Incident Command Post.	
0945	The ODEQ On Scene Coordinator and additional ODEQ personnel arrive at the site and are briefed on the situation and actions taken. ODEQ personnel are assigned to the Environmental Unit. The Planning Section Chief (PSC) facilitates the Objectives Meeting with the IC, SOSC, and LOSC.	
1015	The PSC facilitates the Command & General Staff Meeting with the UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader.	
1100	The PSC facilitates the Tactics Meeting with the Operations and Logistics Section Chiefs, Resource Unit Leader, Situation Unit Leader, Safety Officer, Documentation Unit Leader, and Communications Unit Leader.	
1145	The PSC facilitates the Planning Meeting with UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader.	
1215	The EPA Federal On Scene Coordinator (FOSC) arrives on site and is briefed on the situation and actions taken.	
1301	**Complete Assessment and Dispatch Response Personnel and Equipment** **Required Boom: None** **Available Boom: 5,450 Feet** **Required Recovery: None** **Available Recovery: 5,274 bpd** **Required Storage: None** **Available Storage: 2,765 Barrels** **Volume Spilled: 5,719** **Volume Recovered: 166 Barrels** **Oil Remaining: 5,553 Barrels**	
1345	The Incident Action Plan (IAP) for the Operational Period is completed and approved by the UC and the Operations Briefing held.	
1550	Personnel from the Fairfield Office arrive and are briefed on the incident. EHS/Remediation personnel are assigned to the Operations Section and Environmental Unit.	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO (Cont'd)	
Time	**Actions**
Sun Rise 0630	**Day 1** **Sun Set 1721**
1615	The Logistics Section arranges for work space at the Best Western Woodburn facility and sets up an Incident Command Post (ICP). IMT personnel mobilize to the ICP.
1845	The IMT is scaled back for the evening. Recovery activities continue through the night.
1901	**Required Boom: None** **Available Boom: 5,450 Feet** **Required Recovery: 286 bpd** **Available Recovery: 5,274 bpd** **Required Storage: None** **Available Storage: 9,315 Barrels** **Volume Spilled: 5,719** **Volume Recovered: 1,484.5 Barrels** **Oil Remaining: 4,234.5 Barrels**
Sun Rise 0631	**Day 2** **Sun Set 1720**
0530	The Manager-Pipeline Maintenance assumes the role of IC. The Area Manager assumes the role of Planning Section Chief. The PSC facilitates a UC meeting with the IC, LOSC, SOSC, and FOSC to review the previous day's objectives and situation status.
0600	The PSC facilitates the Command & General Staff Meeting with the UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader. The recovery operations from the previous day are continued.
0630	Environmental Unit personnel develop a plan to collect soil samples and place monitoring wells to determine the subsurface spread of the spill.
0701	**Required Boom: None** **Available Boom: 5,450 Feet** **Required Recovery: 572 bpd** **Available Recovery: 5,274 bpd** **Required Storage: None** **Available Storage: 19,315 Barrels** **Volume Spilled: 5,719** **Volume Recovered: 4,121.5 Barrels** **Oil Remaining: 1,597.5 Barrels**
0800	The JIC issues a press release describing what has occurred and what actions are being taken.

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO (Cont'd)		
Time	**Actions**	
Sun Rise 0631	**Day 2**	**Sun Set 1720**
1431	Recovery activities continue until all free standing product has been recovered. Contaminated soil is removed for processing at an approved treatment facility. The damaged pipe section is removed and work begins to install a replacement section. With the concurrence of the Federal, State and Local On Scene Coordinators the IC begins demobilizing response resources. The UC agrees to meet at a later date toe review lessons learned. The Documentation Unit collects all relevant documentation for the Post Incident Report.

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO

This section outlines a fictitious incident involving a Worst Case Spill (as defined by ODEQ) scenario which illustrates how KMEP could be expected to respond to a jet fuel spill from LS 1880 (Portland Airport Line).

The weather is cool and very foggy with limited visibility. Winds are blowing from the northeast at approximately 9 knots. River currents range between .5 and 1.5 knots, depending on location. Columbia Slough currents are minimal and tidally influenced. Tide predictions are:
High – 0030 Low – 0919
High – 1320 Low – 193

Time	Actions	
Sun Rise 0630	Day 1	Sun Set 1721
0605	The Portland Station Operator notices a sudden pressure drop and flow deviation on LS 1880. The Operator initiates pipeline shut down. The Operator then: ● Notifies the Area Manager (Qualified Individual (QI)) ● Notifies the Orange Control Center The Area Manager (QI): ● Initiates Emergency Response Line (ERL) notification ● Dispatches the Line Rider to investigate	
0630	The Line Rider reports the line has ruptured near Columbia Slough and oil is flowing southeast across the parking lot adjacent to Multnomah County Drainage District Pump Station #1 into the slough.	
0640	The Line Rider dials 911 to alert local police and fire of the incident.	

9.3 DISCHARGE SCENARIOS/RESPONSE STRATEGY OUTLINES (Cont'd)

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO (Cont'd)		
Time	**Actions**	
Sun Rise 0630	**Day 1**	**Sun Set 1721**
0635	The Operations Manager and Area Manager participate in the ERL+ teleconference with the V.P. of Operations and Engineering (Houston, TX), V.P. of Operations (Orange, CA), Director of Operations (Fairfield, CA), and representatives from Products Movement, Environmental Health and Safety, Compliance Codes and Standards, Engineering, Pipeline Integrity, Remediation, and Public Relations (Fairfield, CA; Orange, CA; Houston, TX). The CCS representative notifies: ● National Response Center (NRC) ● Oregon Emergency Response System (OERS) Following these initial notifications the CCS representative contacts the Portland Fire Department, US Coast Guard Sector Portland, EPA Region 10, Oregon Department of Environmental Quality, and Washington Department of Ecology (since there is potential to impact the Columbia River). The Manager-Pipeline Maintenance and EHS/Remediation personnel mobilize from the Fairfield Office with estimated arrival times between 5 and 7 hours. The KM Public Relations office issues a press release describing the incident and activates the KM Response Web Site. The Lead Operator at the direction of the Area Manager assumes the role of Incident Commander (IC) and establishes an Incident Command Post (ICP) in the Willbridge Terminal Office. Pipeline personnel issue orange ICS Vests and 'Black Books' (ICS roles and responsibilities) and mobilize to the ICP.	
0645	The QI contacts Clean Rivers Cooperative (CRC) and National Response Corporation Environmental Services (NRCES) directing them to provide a skimmer at the spill site and deploy boom and a rope mop skimmer in Columbia Slough downstream of Pump Station #1. The Line Rider notifies Multnomah County Drainage District arriving at their office of the incident and request that they secure Pump Station #1 to prevent the spread of additional product to Columbia Slough.	
0700	Portland Fire Department personnel arrive at the scene and apply foam to the product in the pool area upstream of Pump Station #1.	
0735	**Leak Detected and Pipeline Shut Down** **Boom Required: None** **Required Recovery: None** **Required Storage: None**	

9.3 DISCHARGE SCENARIOS/RESPONSE STRATEGY OUTLINES (Cont'd)

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO (Cont'd)		
Time	**Actions**	
Sun Rise 0630	**Day 1**	**Sun Set 1721**
0740	NRCES personnel arrive at Columbia Slough and begin deploying containment boom, sorbet boom and skimmer upstream of the HWY 99E/NE Martin Luther King, Jr. Blvd bridge.	
0835	**Boom Required: 1,000 feet** **Boom Available: 32,600 feet** **Boom Deployed: 1,000 feet** **Required Recovery: None** **Available Recovery: 44,926 bpd** **Deployed Recovery: 384 bpd** **Required Storage: None** **Available Storage: 48,068 bbl** **Volume Spilled: 1,427 Barrels** **Volume Recovered: 0**	
0845	The QI arrives at the Incident Command Post and assumes the role of IC. The Lead Operator assumes the role of Planning Section Chief. Personnel from ODEQ, Sector Portland, the Portland Fire Department, and NRCES arrive at the ICP. ODEQ, Coast Guard and NRCES personnel are assigned to the Operations and Planning Sections, and the Environmental Unit. Officials of the International Bird Rescue Research Center are alerted	
0900	The Planning Section Chief (PSC) facilitates the Objectives Meeting with the IC, SOSC, and LOSC. Four (4) additional rope mop skimmers are in place at Pump Station #1.	
0915	The Safety Officer and the Environmental Unit develop a comprehensive air monitoring plan for the site.	
0930	The PSC facilitates the Command & General Staff Meeting with the UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader.	
1015	The PSC facilitates the Tactics Meeting with the Operations and Logistics Section Chiefs, Resource Unit Leader, Situation Unit Leader, Safety Officer, Documentation Unit Leader, and Communications Unit Leader.	
1145	The PSC facilitates the Planning Meeting with UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader.	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO (Cont'd)		
Time	**Actions**	
Sun Rise 0630	**Day 1**	**Sun Set 1721**
1235	**Boom Required: 1,000 feet** **Boom Available: 42,400 feet** **Boom Deployed: 1,000 feet** **Required Recovery: 179 bpd (10% of WCS)** **Available Recovery: 55,700 bpd** **Deployed Recovery: 624 bpd** **Required Storage: None** **Available Storage: 64,525 bbls** **Volume Spilled: 1,427 Barrels** **Volume Recovered: 64 Barrels** **Volume Evaporated: 54 barrels** **Volume Remaining: 1,309 Barrels**	
1305	The Incident Action Plan (IAP) for the Operational Period is completed and approved by the UC and the Operations Briefing held.	
1550	Personnel from the Fairfield Office arrive and are briefed on the incident. EHS/Remediation personnel are assigned to the Operations Section and Environmental Unit.	
1835	**Boom Required: 15,000 feet** **Boom Available: 61,500 feet** **Boom Deployed: 1,000 feet** **Required Recovery: 268 bpd (15% of WCS)** **Available Recovery: 61,871 bpd** **Deployed Recovery: 624 bpd** **Required Storage: None** **Available Storage: 120,449 bbls** **Volume Spilled: 1,427 Barrels** **Volume Recovered: 220 Barrels** **Volume Evaporated: 196 Barrels** **Volume Remaining: 1,011 Barrels**	
1930	The PSC facilitates the Command & General Staff Meeting with the UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader. ICP operations are scaled back for the evening. On site recovery operations continue through the night.	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO (Cont'd)		
Time	**Actions**	
Sun Rise 0631	**Day 2**	**Sun Set 1720**
Weather and current conditions are essentially unchanged. Tide predictions are: High – 0125 Low – 1036 High – 1452 Low – 2025		
0530	The Manager-Pipeline Maintenance assumes the role of IC. The Area Manager assumes the role of Planning Section Chief. The PSC facilitates a UC meeting with the IC, LOSC, SOSC, and FOSC to review the previous day's objectives and situation status.	
0600	The PSC facilitates the Command & General Staff Meeting with the UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader. The recovery operations from the previous day are continued.	
0630	Environmental Unit personnel develop a plan to collect soil samples and place monitoring wells to determine the subsurface spread of the spill.	
0635	**Boom Required: Amount Needed to Protect Sensitive Areas** **Boom Available: 93,800 feet** **Boom Deployed: 1,500 feet** **Required Recovery: 357 bpd (20% of WCS)** **Available Recovery: 73,870 bpd** **Deployed Recovery: 624 bpd** **Required Storage: None** **Available Storage: 120,449 bbls** **Volume Spilled: 1,427 Barrels** **Volume Recovered: 532 Barrels** **Volume Evaporated: 455 Barrels** **Volume Remaining: 440 Barrels**	
0800	The JIC issues a press release describing what has occurred and what actions are being taken.	
0900	Air monitoring and on site recovery operations continue throughout the day.	
1930	The PSC facilitates the Command & General Staff Meeting with the UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader. ICP operations are scaled back for the evening. On site recovery operations continue through the night.	
Sun Rise 0629	**Day 3**	**Sun Set 1719**
Weather and current conditions are essentially unchanged. Tide predictions are: High – 0221 Low – 1137 High – 1610 Low – 2126		
0530	The PSC facilitates a UC meeting with the IC, LOSC, SOSC, and FOSC to review the previous day's objectives and situation status.	

WORST CASE SPILL RESPONSE STRATEGY OUTLINE/ RESPONSE CAPABILITY SCENARIO (Cont'd)		
Time	**Actions**	
Sun Rise 0629	**Day 3**	**Sun Set 1719**
0600	The PSC facilitates the Command & General Staff Meeting with the UC Members, Command and General Staff, Situation Unit Leader, and Documentation Unit Leader. The recovery operations from the previous day are continued.	
0635	**Boom Required: Amount Needed to Protect Sensitive Areas** **Boom Available: 93,800 feet** **Boom Deployed: 1,500 feet** **Required Recovery: 446 bpd (25% of WCS)** **Available Recovery: 73,870 bpd** **Deployed Recovery: 694 bpd** **Required Storage: None** **Available Storage: 120,449 bbls** **Volume Spilled: 1,427 Barrels** **Volume Recovered: 1226 Barrels** **Volume Evaporated: 785 Barrels** **Volume Remaining: 0**	
0800	The JIC issues a press release describing what has occurred and what actions are being taken.	
1431	Recovery activities continue until all free standing product has been recovered. Contaminated soil is removed for processing at an approved treatment facility. The damaged pipe section is removed and work begins to install a replacement section. With the concurrence of the Federal, State and Local On Scene Coordinators the IC begins demobilizing response resources. The UC agrees to meet at a later date toe review lessons learned. The Documentation Unit collects all relevant documentation for the Post Incident Report.	

9.5 REPORTABLE OIL DISCHARGE HISTORY

Kinder Morgan maintains an online database of reportable spills available at all locations via the company's intranet. The database contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

History of Oil Discharges Greater in Excess of 25 Barrels (OAR 340-141-0160 (3)(h))

Date of Discharge	Location of Discharge	Cause of Discharge	Product Discharged	Amount Discharged	NRC Incident Report #
Searches of the Kinder Morgan incident database and the NRC incident report database showed no discharges of oil in excess of 25 barrels (1,050 gallons) to land or waters of the state from the Oregon pipelines system in the five years preceding submittal of this ICP.

Kinder Morgan 500 Dallas Street Houston, TX 77002 (713) 369-9480 Effective Date: April 1, 1997	Alcohol Misuse Prevention Plan U.S. Department of Transportation Pipeline & Hazardous Materials Safety Administration (PHMSA) Federal Motor Carrier Safety Administration (FMCSA) Plan Revision Date: October 1, 2010

I. INTRODUCTION

A. Alcohol Misuse Prevention Policy (AMPP) - (§199.202).

1. The Company has a long-standing commitment to maintain the highest standards for employee safety and health and to help prevent accidents and injuries resulting from the misuse of alcohol by employees who perform covered functions.

2. Company Purpose (§199.200). The purpose of 49 CFR Part 199 is to establish programs designed to help prevent accidents and injuries resulting from the misuse of alcohol by employees who perform covered functions for operators of certain pipeline facilities subject to 49 CFR Parts 192, 193, or 195 of this part.

3. In addition, the company must comply with all DOT regulations and other regulations, which require affirmative actions to eliminate the impact of the misuse of alcohol in the workplace. The purpose of the alcohol misuse prevention plan is to reduce accidents that result from the misuse of alcohol, thereby reducing fatalities, injuries, and property damage.

4. The company will maintain and follow a written alcohol misuse prevention plan that conforms to the requirements of 49 CFR Part 199 and DOT procedures 49 CFR Part 40 concerning alcohol testing programs.

5. The use or possession of alcoholic beverages while on company property, or in any company vehicle, or on company time, including breaks or lunch, paid or unpaid, on any shift, is strictly prohibited. Nothing in Part 199 shall be construed to affect the company's independent authority, or the rights of their employees with respect to the use or possession of alcohol when conducting alcohol testing and rehabilitation.

6. The use or possession of alcoholic beverages while on company property, or in any company vehicle, or on company time, including breaks or lunch, paid or unpaid, on any shift, is strictly prohibited.

7. **In addition, all Company employees are subject to Kinder Morgan's Human Resource Policy Manual "Drug and Alcohol In The Workplace".**

B. Implementation of Alcohol Misuse Prevention Plan (AMPP).

1. The company has implemented the Pipeline Hazardous and Materials Safety Administration (PHMSA), Alcohol and Drug Testing Regulations as set forth in 49 CFR Part 199 and the Department of Transportation, Procedures for Transportation Workplace Alcohol and Drug Testing Programs as set forth in 49 CFR Part 40.

2. Alcohol materials supplied to covered employees may also include information on additional company mandated policies with respect to the use or possession of alcohol, including any consequences for an employee found to have a specified alcohol level, that are based on the company's authority independent of the federal regulations under 49 CFR Part 199 and 40.

3. Applicability (§199.2).

   a. 49 CFR Part 199 applies to pipeline operators only with respect to employees located within the territory of the United States including those employees located within the limits of the "outer Continental Shelf" as that term is defined in the Outer Continental Shelf Lands Act (43 U.S.C. 1331).

   b. 49 CFR Part 199 does not apply to any person for whom compliance with this part would violate the domestic laws or policies of another country.

   c. 49 CFR Part 199 does not apply to covered functions performed on:

© Pipeline Testing Consortium, Inc. 2002

(1) Master meter systems, as defined in 49 CFR Part 199.3.
(2) Pipeline systems that transport only petroleum gas or petroleum gas/air mixtures.

4. **Compliance with DOT Regulations §40.1 -** DOT Part 40 regulations provide that all parties who conduct drug and alcohol tests required by Department of Transportation (DOT) agency regulations how to conduct these tests and what procedures to use. DOT Part 40 concerns the activities of transportation employers, safety-sensitive transportation employees (including self-employed individuals, contractors and volunteers as covered by DOT agency regulations), and service agents.

5. Other Requirements Imposed by Operators (§199.209). Except as expressly provided in 49 CFR Part 199 nothing in this subpart shall be construed to affect the authority of pipeline operators, or the right of employees, with respect to the use or possession of alcohol, including authority and rights with respect to alcohol testing and rehabilitation.

6. **The alcohol misuse prevention plan herein sets forth the requirements of 49 CFR Parts 199 and 40. Those areas of the plan that appears in bold and underlined print reflect this company's independent authority to require additional provisions with regard to the alcohol testing procedures.**

C. Background.

1. The catalyst for the alcohol misuse plan is Title 49 Code of Federal Regulations (CFR) Part 199 which requires pipeline operators subject to 49 CFR Parts 192, 193, and 195, and their contractors to test their employees for misuse of alcohol under the following work-related conditions:

   a. Pre-Employment (Optional)
   b. Post-Accident
   c. Reasonable Suspicion
   d. Return-to-duty
   e. Follow-up

2. Title 49 CFR Part 40 specifies procedures, which must be followed by the company when conducting alcohol misuse testing pursuant to regulations issued by agencies of the Department of Transportation.

3. DOT Procedures (§199.5) - Title 49 CFR Part 40 specifies procedures that must be followed by the company when conducting drug testing pursuant to regulations issued by agencies of the Department of Transportation. The anti-drug and alcohol programs required by 49 CFR Part 199 must be conducted in accordance to the requirements of 49 CFR Part 199 and DOT procedures. Terms and concepts used in 49 CFR Part 199 have the same meaning as in DOT procedures. Violations of DOT procedures with respect to anti-drug and alcohol programs required by 49 CFR Part 199 are violations of this part.

4. Authoritative interpretations (§40.5) – The DOT Office of Drug and Alcohol Policy Compliance (ODAPC) and the DOT Office of General Counsel (OGC) provide written interpretations of the provisions of 49 CFR Part 40. These written DOT interpretations are the only official and authoritative interpretations concerning the provisions of this part. DOT agencies may incorporate ODAPC/OGC interpretations in written guidance they issue concerning drug and alcohol testing matters.

D. Preemption Provisions.

1. Except as provided in paragraph 2 of this section, Part 199 preempts any state or local law, rule, regulation, or order to the extent that:

   a. Compliance with both state or local requirement and this regulation is not possible;

© Pipeline Testing Consortium, Inc. 2002

b. Compliance with state or local requirement is an obstacle to the accomplishment and execution of any requirement as set forth in 49 CFR Part 199.

c. The state or local requirement is a pipeline safety standard applicable to interstate pipeline facilities.

2. This provision shall not be construed to preempt provisions of state criminal law that impose sanctions for reckless conduct leading to actual loss of life, injury, or damage to property, whether the provisions apply specifically to transportation employees or employers or to the general public.

E. Definitions - (§199.3 & 40.3). For purposes of this AMPP the following definitions apply:

1. Accident - means an incident reportable under Part 191 involving gas pipeline facilities or LNG facilities or an accident reportable under Part 195 involving hazardous liquid pipeline facilities.

a. § 191.3 - An accident on a gas pipeline or LNG facility is defined as an "incident," as follows:

(1) An event that involves a release of gas from a pipeline or of liquefied natural gas or gas from an LNG facility and:

(a) A death, or personal injury necessitating inpatient hospitalization; or

(b) Estimated property damage, including cost of gas lost, to the operator or others, or both, of $50,000 or more ($5,000 or more for intrastate operators/contractors in Oklahoma and New Mexico).

.

(2) An event that results in an emergency shutdown of an LNG facility.

(3) An event that is significant, in the judgment of the operator, even though it did not meet the criteria of paragraphs (1) or (2).

b. §195.50 – An accident report is required for each failure in a pipeline system in which there is a release of the hazardous liquid or carbon dioxide transported resulting in any of the following:

(1) Explosion or fire not intentionally set by the operator.
(2) Release of 5 gallons (19 liters) or more of hazardous liquid or carbon dioxide, except that no report is required for a release of less than 5 barrels (0.8 cubic meters) resulting from a pipeline maintenance activity if this release is:

(a) Not otherwise reportable under this section;
(b) Not one described in §195.52(a)(4);
(c) Confined to company property or pipeline right-of-way; and
(d) Cleaned up promptly;

(3) Death of any person.

(4) Personal injury necessitating hospitalization;

(5) Estimated property damage, including cost of clean-up and recovery, value of lost product, and damage to the property of the operator or others, or both, exceeding $50,000.

2. Administrator – means the Administrator of the Pipeline Hazardous and Materials Safety Administration (PHMSA) or any person to whom authority in the matter concerned has been delegated by the Secretary of Transportation.

3. Affiliate. Persons are affiliates of one another if, directly or indirectly, one controls or has the power to control the other or a third party controls or has the power to control both. Indicators of control include, but are not limited to interlocking management or ownership; shared interest among family

© Pipeline Testing Consortium, Inc. 2002

members; shared facilities or equipment or common use of employees. Following the issuance of a Public Interest Exclusion, an organization having the same or similar management, ownership, or principal employees as the service agent concerning whom a public interest exclusion is in effect is regarded as an affiliate. This definition is used in connection with the public interest exclusion procedures of 49 CFR Part 40, Subpart F.

4. Air Blank – In evidential breath testing devices (EBTs) using gas chromatography technology, a reading of the device's internal standard. In all other EBTs, a reading of ambient air containing no alcohol.

5. Alcohol - means the intoxicating agent in beverage alcohol, ethyl alcohol or other low molecular weight alcohol's including methyl or isopropyl alcohol.

6. Alcohol concentration - means the alcohol in a volume of breath expressed in terms of grams of alcohol per 210 liters of breath as indicated by an evidential breath test conducted under the federal regulations.

7. Alcohol Screening Device - A breath or saliva device, other than an EBT, that is approved by the National Highway Traffic Safety Administration (NHTSA) and placed on a conforming products list (CPL) for such devices.

8. Alcohol Testing Site – A place selected by the company where employees present themselves for the purpose of providing breath or saliva for an alcohol test.

9. Alcohol Use - means the consumption of any beverage, mixture, or preparation, including any medication, containing alcohol.

10. Breath Alcohol Technician (BAT) - means an individual who instructs and assists individuals in the alcohol testing process and operates an EBT.

11. Cancelled test – A drug or alcohol test that has a problem identified that cannot be or has not been corrected, or which this part otherwise requires to be cancelled. A cancelled test is neither a positive nor a negative test.

12. Confirmation Test - means a second test following a screening test with a result of 0.02 or greater that provides quantitative data of alcohol concentration.

13. Consortium/Third Party Administrator (C-TPA) – A service agent that provides or coordinates the provision of a variety of drug and alcohol testing services to employees. C/TPAs typically perform administrative tasks concerning the operation of the employers' drug and alcohol testing programs. This term includes, but is not limited to groups of employers who join together to administer, as a single entity, the DOT drug and alcohol program of its members. C/TPAs are not "employers" for the purpose of this part.

14 Continuing education – Training for medical review officers (MROs) and substance abuse professionals (SAPs) who have completed qualification training and are performing MRO or SAP functions, designed to keep MROs and SAPs current on changes and developments in the DOT drug and alcohol testing program.

15. Covered employee, employee, or individual to be tested - means any person who performs a covered function, including persons employed by operators, contractors engaged by operators, and persons employed by such contractors.

16. Covered Function (safety-sensitive function) - means an operations, maintenance, or emergency-response function regulated by Part 192, 193, or 195 of 49 CFR that is performed on a pipeline or on an LNG facility.

17. Designated Employer Representative (DER) – An employee authorized by the employer to take immediate action(s) to remove employees from safety-sensitive duties, or cause employees to be removed from these covered duties, and to make required decisions in the testing and evaluation processes. The DER also receives test results and other communications for the employer,

© Pipeline Testing Consortium, Inc. 2002

consistent with the requirements of 49 CFR Part 40. Service agents cannot act as DERs.

18. DOT Procedures – means the Procedures for Transportation Workplace Drug and Alcohol Testing Program published by the Office of the Secretary of Transportation in 49 CFR Part 40.

19. DOT, The Department, DOT agency – These terms encompass all DOT agencies, including, but not limited to, the United States Coast Guard (USCG), the Federal Aviation Administration (FAA), the Federal Railroad Administration (FRA), the Federal Motor Carrier Safety Administration (FMCSA), the Federal Transit Administration (FTA), the National Highway Traffic Safety Administration (NHTSA), the Pipeline Hazardous Materials and Safety Administration (PHMSA), and the Office of the Secretary (OST). These terms include any designee of a DOT agency.

20. EBT (or evidential breath testing device) - means an EBT approved by the National Highway Traffic Safety Administration (NHTSA) for the evidential testing of breath and placed on NHTSA's "Conforming Products List" (CPL) of evidential breath measurement devices.

21. Employee - Any person who is designated in a DOT agency regulation as subject to drug testing and/or alcohol testing. The term includes individuals currently performing safety-sensitive functions designated in DOT agency regulations and applicants for employment subject to pre-employment testing. For purposes of drug testing under this part, the term employee has the same meaning as the term "donor" as found on CCF and related guidance materials produced by the Department of Health and Human Services.

22. Employer - A person or entity employing one or more employees (including an individual who is self-employed) subject to DOT agency regulations requiring compliance with this part. The term includes an employer's officers, representatives, and management personnel. Service agents are not employers for the purposes of this part.

23. Error Correction Training - Training provided to BATs, collectors, and screening test technicians (STTs) following an error that resulted in the cancellation of a drug or alcohol test. Error correction training must be provided in person or by a means that provides real-time observation and interaction between the instructor and trainee.

24. Office of Drug and Alcohol Policy and Compliance (ODAPC) -The office in the Office of the Secretary, DOT, that is responsible for coordinating drug and alcohol testing program matters within the Department and providing information concerning the implementation of this part.

25. Operator - is defined as an owner or operator of pipeline facilities.

26. Performing a Covered Function – includes actually performing, ready to perform, or immediately available to perform a covered function.

27. Pipeline - means all parts of the physical facilities through which product moves in transportation. This includes pipe, valves, and other appurtenances attached to pipe, compressor units, metering stations, delivery stations, holders, and fabricated assemblies.

28. Pipeline Facilities - include new and existing pipeline, rights-of-way, and any equipment, facility, or building used in the transportation of product.

29. Prohibited Conduct - means anyone who has an alcohol concentration of 0.02 or greater, who has used alcohol within 4 hours of reporting for duty and anyone who has used alcohol on-duty.

30. Qualification Training - The training required in order for a collector, BAT, MRO, SAP, or STT to be qualified to perform their functions in the DOT drug and alcohol testing program. Qualification training may be provided by any appropriate means (e.g., classroom instruction, internet application, CD-ROM, video).

31. Refresher Training - The training required periodically for qualified collectors, BATs, and STTs to review basic requirements and provide instruction concerning changes in technology (e.g., new testing methods that may be authorized) and amendments, interpretations, guidance, and issues concerning this part and DOT agency drug and alcohol testing regulations. Refresher training can

© Pipeline Testing Consortium, Inc. 2002

be provided by any appropriate means (e.g., classroom instruction, internet application, CD-ROM, video).

32. Refusal to Submit, Refuse, or Refuse to take - means behavior consistent with DOT Procedures concerning refusal to take a drug test or refusal to take an alcohol test. See Section VII of this plan for additional information.

33. Screening Test (or initial test) - means an analytic procedure to determine whether an employee may have a prohibited concentration of alcohol in a breath specimen.

34. Screening Test Technician (STT) means an individual who has successfully completed an approved Department of Transportation non-evidential training course and who will conduct alcohol-screening tests in accordance with Part 199 and Part 40.

35. Secretary - The Secretary of Transportation or the Secretary's designee.

36. Service Agent - Any person or entity, other than an employee of the employer, who provides services specified under this part to employers and/or employees in connection with DOT drug and alcohol testing requirements. This includes, but is not limited to, collectors, BATs and STTs, laboratories, MROs, substance abuse professionals, and C/TPAs. To act as service agents, persons and organizations must meet the qualifications set forth in applicable sections of 49 CFR Part 199 and Part 40. Service agents are not employers for purposes of 49 CFR Part 199 and 40.

37. Stand-Down - The practice of temporarily removing an employee from the performance of safety-sensitive functions based only on a report from a laboratory to the MRO of a confirmed positive test for a drug or drug metabolite, an adulterated test, or a substituted test, before the MRO has completed verification of the test result.

38. State Agency - means an agency of any of the several states, the District of Columbia, or Puerto Rico that participates under section 5 of the Natural Gas Pipeline Safety Act of 1968 (49 App. U.S.C. 1674) or section 205 of the Hazardous Liquid Pipeline Safety Act of 1979 (49 App. U.S.C. 2009).

39. Substance Abuse Professional (SAP) - A person who evaluates employees who have violated a DOT drug and alcohol regulation and makes recommendations concerning education, treatment, follow-up testing, and aftercare.

F. Company Responsibilities.

1. Alcohol Program Manager (APM) or Designated Employer Representative (DER). Appendix A contains the name, address, and phone number of the responsible individual(s). The APM or DER shall be responsible for the preparation of an alcohol misuse plan which complies with requirements of the Department of Transportation regulations as set forth in 49 CFR Parts 199 and 49 CFR Part 40. The APM or DER shall be responsible for providing oversight and evaluation on the plan; providing guidance and counseling; reviewing of all discipline applied under this plan for consistency and conformance to human resources policies and procedures; scheduling for types of testing (post-accident, reasonable suspicion, etc.); maintaining a locked file system on all alcohol test results; and overseeing the referral of employees for evaluation and treatment. The company shall ensure that all covered employees are aware of the provisions and coverage of the company's AMPP and that all employees are notified prior to testing that such a test is required by Part 199.

2. Requirement for Notice (§199.211). The company shall ensure that all covered employees are aware of the provisions and coverage of the company's AMPP and that all employees are notified prior to testing. Before performing an alcohol test under this plan, the company shall notify a covered employee that the alcohol test is required by 49 CFR Part 199. The company shall not falsely represent that an alcohol test is being conducted under the provisions of Part 199.

3. Supervisor(s). Any Company individuals responsible for observing the performance and behavior of employees; observation/documentation of events suggestive of reasonable suspicion; and post-accident testing if determined that it is applicable.

© Pipeline Testing Consortium, Inc. 2002

4. Employees. The company shall ensure that each employee is notified and aware of the provisions of the company AMPP and has knowledgeable of the requirements of the company's AMPP and to fully comply with the provisions of the plan.

5. The company shall be responsible for compliance with all applicable requirements and procedures of 49 CFR Part 40.

6. The company is responsible for all actions of its officials, representatives, and agents (including service agents) in carrying out the requirements of the DOT agency regulations.

7. All agreements and arrangements, written or unwritten, between and among employers and service agents concerning the implementation of DOT drug and alcohol testing requirements are deemed, as a matter of law, to require compliance with all applicable provisions of 49 CFR Part 40 and DOT agency drug and alcohol testing regulations. Compliance with these provisions is a material term of all such agreements and arrangements.

G. Background Check Procedures (§40.25) – The company must check on the drug and alcohol testing records of employees it is intending to use to perform safety-sensitive duties.

1. The company must, after obtaining an employee's written consent, request the information about the employee listed in paragraph 2 of this section. This requirement applies only to employees seeking to begin performing safety-sensitive duties for the company for the first time (i.e., a new hire, an employee transfers into a safety-sensitive position). If the employee refuses to provide this written consent, the company must not permit the employee to perform safety-sensitive functions.

2. The company must request the information listed below from DOT-regulated companies who have employed the employee during any period during the two years before the date of the employee's application or transfer:

   a. Alcohol tests with a result of 0.04 or higher alcohol concentration;

   b. Verified positive drug tests;

   c. Refusals to be tested (including verified adulterated or substituted drug test results);

   d. Other violations of DOT agency drug and alcohol testing regulations; and

   e. With respect to any employee who violated a DOT drug and alcohol regulation, documentation of the employee's successful completion of DOT return-to-duty requirements (including follow-up tests) is required. If the previous company does not have information about the return-do-duty process (e.g., a company who did not hire an employee who tested positive on a pre-employment test), the company must seek to obtain this information from the employee.

3. The information obtained from a previous employer includes any drug or alcohol test information obtained from previous employers under this section or other applicable DOT agency regulations.

4 If feasible, the company must obtain and review this information before the employee first performs safety-sensitive functions. If this is not feasible, the company must obtain and review the information as soon as possible. However, the company must not permit the employee to perform safety-sensitive functions after 30 days from the date on which the employee first performed safety-sensitive functions, unless the company has obtained or made and documented a good faith effort to obtain this information.

5. If the company obtains information that the employee has violated a DOT agency drug and alcohol regulation, the company must not use the employee to perform safety-sensitive functions unless the company also obtains information that the employee has subsequently complied with the return-to-duty requirements of Subpart O of 49 CFR Part 40 and DOT agency drug and alcohol regulations.

© Pipeline Testing Consortium, Inc. 2002

6. The company must provide to each of the employers from whom they request information under paragraph 2 of this section written consent for the release of the information cited in paragraph 1 of this section.

7. The release of information under this section must be in any written form (e.g., fax, e-mail, letter) that ensures confidentiality. The previous company must maintain a written record of the information released, including the date, the party to whom it was released, and a summary of the information provided.

8. The company from whom information is requested under paragraph 2 of this section must, after reviewing the employee's specific, written consent, immediately release the requested information to the company making the inquiry.

9. As the company requesting the information required under this section, the company must maintain a written, confidential record of the information the company obtained or of the good faith efforts the company made to obtain the information. The company must retain this information for three years from the date of the employee's first performance of safety-sensitive duties for the company.

10. The company must also ask the employee whether he or she has tested positive, or refused to test, on any pre-employment drug or alcohol test administered by a company to which the employee applied for, but did not obtain, safety-sensitive transportation work covered by DOT agency drug and alcohol testing rules during the past two years. If the employee admits that he or she had a positive test or a refusal to test, the company must not use the employee to perform safety-sensitive functions for the company, until and unless the employee documents successful completion of the return-to-duty process (see paragraphs 2(e) and 5 of this section).

H. DOT Testing versus Non-DOT Testing Provisions (§40.13).

1. DOT tests must be completely separate from non-DOT tests in all respects.

2. DOT tests must take priority and must be conducted and completed before a non-DOT test is begun.

3. Except as provided in paragraph 4 of this section, the company must not perform any tests on DOT urine or breath specimens other than those specifically authorized by 49 CFR Part 40 or DOT agency regulations.

4. No one is permitted to change or disregard the results of DOT tests based on the results of non-DOT tests. The company must not disregard a verified breath test result because the employee presents a negative breath test result collected by the employee's physician or a DNA test result purporting to question the identity of the DOT specimen.

5. The company must not use the CCF or the ATF in the non-DOT drug and alcohol testing program. This prohibition includes the use of the DOT forms with references to DOT programs and agencies crossed out. The company must always use the CCF and ATF for all DOT-mandated drug and alcohol tests. Non-DOT custody and control forms must be used for all non-DOT drug and alcohol tests.

I. Company's Use of Service Agent for DOT Drug & Alcohol Testing Requirements (§40.15).

1. The company may use a service agent to perform the tasks needed to comply with 49 CFR Part 40 and DOT agency drug and alcohol testing regulations, consistent with the requirements of Roles and Responsibilities of Service Agents Section in this plan and other applicable provisions of 49 CFR Part 40.

2. The company is responsible for ensuring that the service agents used meet the qualifications set forth in 49 CFR Part 40 (e.g., Medical Review Officer requirements). The company may require service agents to show documentation that they meet the requirements of 49 CFR Part 40 (e.g., documentation of MRO qualifications as required in this plan).

© Pipeline Testing Consortium, Inc. 2002

3. The company remains responsible for compliance with all applicable requirements of 49 CFR Part 40 and other DOT drug and alcohol testing regulations, even when using a service agent. If the company violates any part of this plan or other DOT drug and alcohol testing regulations because a service agent has not provided services as 49 CFR Part 40 requires, a DOT agency can subject the company to sanctions. The company's good faith use of a service agent is not a defense in an enforcement action initiated by a DOT agency in which the company's alleged noncompliance with 49 CFR Part 40 or a DOT agency drug and alcohol regulation may have resulted from the service agent's conduct.

4. The company must not permit a service agent to act as the company's Designated Employer Representative (DER).

J. Company's Responsibility For Obtaining Information From Its Service Agents (§40.17).

1. The company is responsible for obtaining information required by 49 CFR Part 40 from the company's service agents. This is required whether or not the company chooses to use a consortium/third party administrator (C/TPA) as an intermediary in transmitting information to the company. An example of this requirement would be an applicant for a safety-sensitive job takes a pre-employment drug test, but there is a significant delay in the company's receipt of the test result from an MRO or C/TPA. The company must not assume that "no news is good news" and permit the applicant to perform safety-sensitive duties before receiving the result. The company would be in violation of the DOT regulations.

II. ROLES AND RESPONSIBILITIES OF SERVICE AGENTS – 49 CFR Part 40 – Subpart Q

A. General Provisions for Service Agents (§40.341).

1. Service agent's compliance with DOT drug and alcohol testing requirements (§ 40.341).

   a. The service agent who provides services to transportation employers must meet the requirements of 49 CFR Part 40 and the DOT agency drug and alcohol testing regulations.

   b. The employer will not use, or no later than 90 days after the *Federal Register* notification by ODAPC will stop using, any service agent who has been issued a Public Interest Exclusions, under 49 CFR part 40, Subpart R, by DOT.

B. Tasks and Functions of Service Agents. (§40.343 – 40.345 – 40.347).

1. Tasks that a service agent may perform for the company (§40.343) – The service agent may perform for the company the tasks needed to comply with DOT agency drug and alcohol testing regulations, subject to the requirements and limitations of this part.

2. Circumstances in which a C/TPA may act as an intermediary in the transmission of drug and alcohol testing information to the company (§40.345).

   a. The C/TPA or other service agent, may act as an intermediary in the transmission of drug and alcohol testing information in the circumstances specified in this section only if the company chooses to have the C/TPA do so. Each company makes the decision about whether to receive some or all of this information from the C/TPA, acting as an intermediary, rather than directly from the service agent who originates the information (e.g., an MRO or BAT).

   b. The specific provisions of 49 CFR Part 40 concerning which services C/TPAs may act as an intermediary are listed in Appendix F to 49 CFR Part 40.

   c. In every case, the C/TPA must ensure that, in transmitting information to the company,

© Pipeline Testing Consortium, Inc. 2002

the C/TPA must meet all requirements (e.g., concerning confidentiality and timing) that would apply if the service agent originating the information (e.g., an MRO or collector) sent the information directly to the company. For example, if the C/TPA transmits drug test results from MROs to DERs, the C/TPA must transmit each drug test result to the DER in compliance with the MRO requirements set forth in §40.167.

3. Functions that C/TPAs may perform with respect to administering testing (§40.347) -The C/TPA, except as otherwise specified in this part, may perform the following functions for the company concerning random selection and other selections for testing.

   a. The C/TPA may operate random testing programs for the company and may assist (i.e., through contracting with laboratories or collection sites, conducting collections) the company with other types of testing (e.g., pre-employment, post-accident, reasonable suspicion, return-to-duty, and follow-up).

   b. The C/TPA may combine employees from more than one company or one transportation industry in a random pool if permitted by all the DOT agency drug and alcohol testing regulations involved.

      (1) If the C/TPA combines employees from more than one transportation industry, the C/TPA must ensure that the random testing rate is at least equal to the highest rate required by each DOT agency.

      (2) Employees not covered by DOT agency regulations may not be part of the same random pool with DOT covered employees.

   c. The C/TPA may assist the company in ensuring that follow-up testing is conducted in accordance with the plan established by the SAP. However, neither the C/TPA nor the company is permitted to randomly select employees from a '' follow-up pool'' for follow-up testing.

C. Record-Keeping Requirements for Service Agents (§40.349).

1. Records that a service agent may receive and maintain (§40.349).

   a. Except where otherwise specified in 49 CFR Part 40 a service agent may receive and maintain all records concerning DOT drug and alcohol testing programs, including positive, negative, and refusal to test individual test results. The C/TPA does not need the employee's consent to receive and maintain these records.

   b. The C/TPA may maintain all information needed for operating a drug/alcohol program (e.g., CCFs, ATFs, names of employees in random pools, random selection lists, copies of notices to the company of selected employees) on behalf of the company.

   c. A service agent originating drug or alcohol testing information, such as an MRO or BAT, sends the information directly to the DER, he or she may also provide the information simultaneously to the C/TPA or other service agent who maintains this information for the company.

   d. If the C/TPA is serving as an intermediary in transmitting information that is required to be provided to the company, the C/TPA must ensure that it reaches the company in the same time periods required elsewhere in this part.

   e. The C/TPA must ensure that he/she can make available to the company within two days any information the company is asked to produce by a DOT agency representative.

   f. At the request of the company, the C/TPA must transfer immediately all records pertaining to the company and its employees to the company or to any other service agent the company designates. The C/TPA must carry out this transfer as soon as the company requests it. The C/TPA is not required to obtain employee consent for this

© Pipeline Testing Consortium, Inc. 2002

transfer. The C/TPA must not charge more than a reasonable administrative cost for conducting this transfer. The C/TPA may not charge a fee for the release of these records.

g. If the C/TPA is planning to go out of business or the organization will be bought by or merged with another organization, the C/TPA must immediately notify all companies and offer to transfer all records pertaining to the company and its employees to the company or to any other service agent the company designates. The C/TPA must carry out this transfer as soon as the company requests it. The C/TPA is not required to obtain employee consent for this transfer. The C/TPA must not charge more than a reasonable administrative cost for conducting this transfer. The C/TPA may not charge a fee for the release of these records.

D. Confidentiality Requirements for Service Agents (§40.351 - §40.353).

1. Confidentiality requirements that apply to service agents (§40.351) – Except where otherwise specified in 49 CFR Part 40 the confidentiality requirements apply to the C/TPA and shall include the following:

   a. When the C/TPA receives or maintains confidential information about employees (e. g., individual test results), the C/TPA must follow the same confidentiality regulations as the company with respect to the use and release of this information.

   b. The C/TPA must follow all confidentiality and records retention requirements applicable to the company.

   c. The C/TPA may not provide individual test results or other confidential information to another company without a specific, written consent from the employee. For example, suppose a C/TPA that has employers X and Y as clients. Employee Jones works for X, and the C/TPA maintains Jones' drug and alcohol test for X. Jones wants to change jobs and work for Y. The C/TPA may not inform Y of the result of a test conducted for X without having a specific, written consent from Jones. Likewise, the C/TPA may not provide this information to employer Z, who is not a C/TPA member, without this consent.

   d. The C/TPA must not use blanket consent forms authorizing the release of employee testing information.

   e. The C/TPA must establish adequate confidentiality and security measures to ensure that confidential employee records are not available to unauthorized persons. This includes protecting the physical security of records, access controls, and computer security measures to safeguard confidential data in electronic databases.

2. Principles that govern the interaction between MROs and other service agents (§40.353) – The service agent other than an MRO (e.g., a C/TPA) is subject to the following principles that govern the interaction with MROs:

   a. The service agent may provide MRO services to the company, directly or through contract, if the service agent meets all applicable provisions of 49 CFR Part 40.

   b. If the service agent employs or contracts for an MRO, the MRO must perform duties independently and confidentially. When the service agent has a relationship with an MRO, the service agent must structure the relationship to ensure that this independence and confidentiality are not compromised. Specific means (including both physical and operational measures, as appropriate) to separate MRO functions and other service agent functions are essential.

   c. Only the service agents staff who are actually under the day-to-day supervision and control of an MRO with respect to MRO functions may perform these functions. This does not mean that those staff may not perform other functions at other times. However, the designation of the service agent's staff to perform MRO functions under MRO supervision must be limited and not used as a subterfuge to circumvent confidentiality and other

© Pipeline Testing Consortium, Inc. 2002

requirements of this part and DOT agency regulations. The service agent must ensure that MRO staff operates under controls sufficient to ensure that the independence and confidentiality of the MRO process are not compromised.

d. Like other MROs, an MRO the service agent employs or contracts with must personally conduct verification interviews with employees and must personally make all verification decisions. Consequently, the service agent staff cannot perform these functions.

E. Service Agent Limitations (§40.355).

1. Limitations that apply to the activities of service agents – The service agent is subject to the following limitations concerning the service agent's activities in the DOT drug and alcohol-testing program.

a. The service agent must not require an employee to sign a consent, release, waiver of liability, or indemnification agreement with respect to any part of the drug or alcohol testing process covered by this part (including, but not limited to, collections, laboratory testing, MRO, and SAP services). No one may do so on behalf of a service agent.

b. The service agent must not act as an intermediary in the transmission of drug test results from the laboratory to the MRO. That is, the laboratory may not send results to the service agent with the service agent in turn sending them to the MRO for verification. For example, a practice in which the laboratory transmits results to the service agent's computer system, and the service agent then assign the results to a particular MRO, is not permitted.

c. The service agent must not transmit drug test results directly from the laboratory to the company (by electronic or other means) or to a service agent who forwards them to the company. All confirmed laboratory results must be processed by the MRO before they are released to any other party.

d. The service agent must not act as an intermediary in the transmission of alcohol test results of 0.02 or higher from the STT or BAT to the DER.

e. Except as provided in paragraph 1.f. of this section, the service agent must not act as an intermediary in the transmission of individual SAP reports to the company. That is, the SAP may not send such reports to the service agent and then in turn send them to the company. However, the service agent may maintain individual SAP summary reports and follow-up testing plans after they are sent to the DER, and the SAP may transmit such reports to the service agent simultaneously with sending them to the DER.

f. As an exception to paragraph 1.e. of this section, the service agent may act as an intermediary in the transmission of SAP report from the SAP to an owner-operator or other self-employed individual.

g. Except as provided in paragraph 1.h. of this section, the service agent must not make decisions to test an employee based upon reasonable suspicion, post-accident, return-to-duty, and follow-up determination criteria. These are duties the company cannot delegate to a C/TPA. The service agent may, however, provide advice and information to the company regarding these testing issues and how the company should schedule required testing.

h. As an exception to paragraph 1.g. of this section, the service agent may make decisions to test an employee based upon reasonable suspicion, post-accident, return-to-duty, and follow-up determination criteria with respect to an owner-operator or other self-employed individual.

i. Except as provided in paragraph 1.j. of this section, the service agent must not make a determination that an employee has refused a drug or alcohol test. This is a non-delegable duty of the company. The service agent may, however, provide advice and information to the company regarding refusal-to-test issues.

© Pipeline Testing Consortium, Inc. 2002

j. As an exception to paragraph 1.i. of this section, the service agent may make a determination that an employee has refused a drug or alcohol test, if:

(1) The service agent schedules a required test for an owner-operator or other self-employed individual, and the individual fails to appear for the test without a legitimate reason; or

(2) The MRO determines that an individual has refused to test on the basis of adulteration or substitution.

k. The service agent must not act as a DER. For example, while the service agent may be responsible for transmitting information to the company about test results, the service agent must not act on behalf of the company in actions to remove employees from safety-sensitive duties.

l. In transmitting documents to laboratories, the service agent must ensure that the service agent sends to the laboratory that conducts testing only the laboratory copy of the CCF. The service agent is not to transmit other copies of the CCF or any ATFs to the laboratory.

m. The service agent must not impose conditions or requirements on the company that DOT regulations do not authorize. For example, as a C/TPA serving companies in the pipeline or motor carrier industry the service agent must not require companies to have provisions in their DOT plans that PHMSA or FMCSA regulations do not require.

n. The service agent must not intentionally delay the transmission of drug or alcohol testing-related documents concerning actions the service agent has performed, because of a payment dispute or other reasons.

Example 1 to Paragraph (1.n.): A laboratory that has tested a specimen must not delay transmitting the documentation of the test result to an MRO because of a billing or payment dispute with the MRO or a C/TPA.

Example 2 to Paragraph (1.n.): An MRO or SAP who has interviewed an employee must not delay sending a verified test result or SAP report to the company because of such a dispute with the company or employee.

Example 3 to Paragraph (1.n.): A collector who has performed a urine specimen collection must not delay sending the drug specimen and CCF to the laboratory because of a payment or other dispute with the laboratory or a C/TPA.

Example 4 to Paragraph (1.n.): A BAT who has conducted an alcohol test must not delay sending test result information to the company or C/TPA because of a payment or other dispute with the company or C/TPA.

o. While the service agent must follow the DOT agency regulations, the company remains accountable to DOT for compliance, and the service agent's failure to implement any aspect of the program as required in this part and other applicable DOT agency regulations makes the company subject to enforcement action by DOT.

III. EMPLOYEE/SUPERVISOR ALCOHOL TESTING REQUIREMENTS

A. Individuals Subject to Alcohol Testing (§199.200).

1. Any applicant/employee who would perform on a pipeline, an operating, maintenance, or emergency response function regulated by Part 192, 193, or 195, would be subject to alcohol testing under this program. A covered employee, employee, or individual to be tested - means any person who performs a covered function, including persons employed by operators, contractors engaged by operators, and persons employed by such contractors.

© Pipeline Testing Consortium, Inc. 2002

2. Refer to Appendix B for specific employee titles/job classifications subject to testing under this program.

B. Procedure for Notifying Employees (§199.202).

1. This AMPP shall be included in the appropriate company manual. Upon receipt of the company's AMPP, each manager shall post the plan in a prominent location that is readily accessible to all covered employees.

2. All covered employees will be provided a complete copy of the AMPP.

C. Criteria For Employee Notification (§199.202).

1. General Criteria. The company shall provide written educational materials explaining the alcohol misuse requirements and the company's policies and procedures on how they will comply with those requirements.

   a. The company will distribute to each covered employee prior to the start of alcohol testing and to each person subsequently hired/transferred to perform covered functions.

   b. The company shall provide written notice to representatives of employee organizations on the availability of this written educational information.

2. Required Information (§199.239). The company shall provide written materials to all covered employees that shall include detailed information and discussion of the following elements:

   a. Name of company representative designated to answer questions for covered employees about the alcohol regulations. See Appendix A.

   b. List of categories of covered employees who are subject to the alcohol regulations. See Appendix B for listing of employee/supervisor job classifications/titles.

   c. Information about covered functions, which provides sufficient guidance on which portions of the workday the covered employee is required to be in compliance with the AMPP.

   d. Information concerning covered employee conduct that specifies what is prohibited by the AMPP.

   e. Circumstances under which a covered employee will be tested for alcohol under the AMPP.

   f. Procedures that cover:

      (1) Testing for presence of alcohol
      (2) Protection of employee rights
      (3) Integrity of breath testing process
      (4) Safeguarding validity of test results
      (5) Assignment of test results to proper employee

   g. Information concerning requirement for covered employee to submit to various types of alcohol tests.

   h. Information which detailing what constitutes a refusal and consequences of such refusal.

   i. Information detailing consequences of covered employees who violate the prohibitions as set forth in the AMPP. It must address removal from performing covered functions and guidance on referral for evaluation and/or treatment.

   j. Information detailing consequences of covered employees who test at an alcohol

© Pipeline Testing Consortium, Inc. 2002

concentration of 0.02 or greater but less than 0.04.

k. Information detailing alcohol misuse and how it impacts on:

(1) Individual's health, work and personal life
(2) Detecting signs and symptoms of alcohol problem
(3) Intervening evaluation and resolving problems associated with alcohol misuse (suspicions, confrontation, referral to EAP and referral to management official)

IV. ALCOHOL TESTS REQUIRED (§199.225).

A. Pre-Employment (Optional) (§199.209).

1. The company may, but is not required to, conduct pre-employment alcohol testing under 49 CFR Part 199. If the company conducts pre-employment alcohol testing the company must:

a. Conduct a pre-employment alcohol test before the first performance of covered functions by every covered employee (whether a new employee or someone who has transferred to a position involving the performance of covered functions);

b. Treat all employees the same for the purpose of pre-employment alcohol testing (i.e., company must not test some covered employees and not others);

c. Conduct the pre-employment tests after making a contingent offer of employment or transfer, subject to the employee passing the pre-employment alcohol test;

d. Conduct all pre-employment alcohol tests using the alcohol testing procedures in the DOT procedures in 49 CFR Part 40; and

e. Not allow any covered employee to begin performing covered functions unless the result of the employee's test indicates an alcohol concentration of less than 0.04.

B. Post-Accident Testing (§199.225 (a)).

1. The company shall promptly determine and test each surviving covered employee for alcohol if that employee's performance contributed to the "accident" or cannot be completely discounted as a contributing factor to the accident. The decision not to administer an alcohol test under this section shall be based on the company's determination, using the best available information at the time of the determination that the employee's performance could not have contributed to the accident.

2. Each employee shall be required to submit to an alcohol test within 2 hours of the accident. If a test is not administered within two hours following the accident the company shall prepare and maintain on file a record stating the reasons why the test was not administered. If a test is not administered within 8 hours following the accident the company shall cease all attempts to conduct an alcohol test and shall prepare and maintain on file written documentation indicating why the alcohol test was not conducted.

3. An employee who is subject to post-accident testing who fails to remain readily available for such testing, including notifying the company or company representative of his/her location if he/she leaves the scene of the accident prior to submission to such test, may be deemed by the company to have refused to submit to testing.

4. The employee must remain available for alcohol testing and may not consume any alcohol for 8 hours following the accident or until the alcohol test has been conducted. Notwithstanding the previous statement, employees shall not be delayed in seeking necessary medical attention for injured people. An employee shall not be prohibited from leaving the scene of an accident for a period of time necessary to obtain assistance in responding to the accident or to obtain necessary medical personnel to administer medical care to any injured people.

© Pipeline Testing Consortium, Inc. 2002

5. The following steps will be used to guide supervisor to a satisfactory outcome in a post-accident situation.

   a. Verify the post-accident decision. Does the definition of accident in Section I apply to the current situation. Does the possibility exist that the employee's performance contributed to the accident or cannot be completely discounted as a factor, which contributed to the accident? Anonymous tips must be taken seriously, but should not be the sole reason to initiate a request for a specimen. If witnesses saw a specific event or behavior, ask them to describe what they saw. How far away were they? Before proceeding further, individual may need to obtain approval from the division manager/department head or designee to proceed with post-accident testing.

   b. Isolate and inform the employee. Remove the employee from the work place. Explain that you have reason to believe his/her performance contributed to the accident or cannot be completely discounted as a contributing factor to the accident and therefore, they will be required to submit to an alcohol test.

   c. Transport the employee. The potentially affected employee should not be allowed to proceed alone to or from the collection site. In addition to the safety concerns for the employee, accompanying the employee also assures that there is no opportunity enroute to the collection site for the employee to ingest anything that could affect the outcome of the alcohol test.

   d. Document the events. Record the activity performed that support the determination to conduct a post-accident alcohol test. This documentation of the employee's activity should be prepared and signed by the supervisor and remain on file. See Appendix E for documentation format if test is not administered within prescribed time frames.

   e. Denial should be an expected reaction. If a person knows he/she will test positive, he/she may give many explanations and protestations, wanting to avoid submission to an alcohol test. If he/she is not under the influence of alcohol, vehement denial also would be expected. Listen to the employee and carefully evaluate the employee's explanation. Remember, a request for an alcohol test is not an accusation; it is merely a request for additional objective data. To the employee it may feel like an accusation; so it is important to stress that this is merely a request for additional data.

   f. Following administration of alcohol test. After returning from the collection site, the employee should not be allowed to return to performing any covered functions pending the results of the alcohol test and any discussion of disciplinary action that may occur.

   g. Employee Responsibility. As soon as practicable following an accident as defined in this plan, the employee shall make every attempt to contact his/her supervisor and the APM.

      (1) The employee will be given instructions for obtaining alcohol and substance abuse testing.

      (2) An employee who is subject to post-accident testing must remain available for testing, or the company may consider the employee to have refused to submit to an alcohol test.

      (3) The employee subject to post-accident testing must refrain from consuming alcohol for eight hours following the accident, or until he or she submits to an alcohol test, whichever comes first.

   h. Company Responsibility.

      (1) Upon receiving a report of an accident the company shall test the employee (if not a fatality) for alcohol and controlled substance as soon as practicable.

      (2) The DER will instruct the employee in obtaining the required drug and alcohol

© Pipeline Testing Consortium, Inc. 2002

test.

C. Reasonable Suspicion Testing (§199.225 (b)).

1. Reasonable suspicion testing is designed to provide management with a tool (in conjunction with supervisor training on the signs and symptoms of alcohol misuse) to identify alcohol-affected employees who may pose a danger to themselves and others in their job performance. Employees may be at work in a condition that raises concern regarding their safety or productivity. Supervisors must then make a decision as to whether there is reasonable suspicion to believe an employee is using or has used alcohol.

2. Supervisor Reasonable Suspicion Determinations:

   a. The company's determination that reasonable suspicion exists to require a covered employee to undergo an alcohol test shall be based on specific, contemporaneous, articulable observations concerning the appearance, behavior, speech, or body odors of the employee. The required observations shall be made by a supervisor who has received at least 60 minutes of training in detecting the symptoms of alcohol misuse.

   b. The supervisor's observation must be made just before, during, or just after the employee is performing a covered function.

   c. The supervisors who makes such a determination that reasonable suspicion exists shall not be authorized to conduct the breath alcohol test on that employee.

3. In making a determination of reasonable suspicion, the factors to be considered include, but are not limited to the following:

   a. Adequately documented pattern of unsatisfactory work performance, for which no apparent non-impairment related reason exists, or a change in an employee's prior pattern of work performance, especially where there is some evidence of alcohol related behavior on or off the work site.

   b. Physical signs and symptoms consistent with alcohol abuse.

   c. Evidence of prohibited alcohol use, possession, sale, or delivery while on duty.

   d. Occurrence of a serious or potentially serious accident that may have been caused by human error, or flagrant violations of established safety, security, or other operational procedures.

   e. The company will direct a covered employee to under go reasonable suspicion testing only while the employee is performing, just before performing or just after ceasing to perform a covered function. The test must be conducted within 2 hours of the reasonable suspicion determination and the company shall continue to attempt for up to 8 hours and then shall cease all attempts to conduct the test.

4. The following steps will be used to guide the supervisor to a satisfactory outcome in a reasonable suspicion situation.

   a. Verify the reasonable suspicion decision. Anonymous tips must be taken seriously, but should not be the sole reason to initiate a request for a specimen. Hearsay is not an acceptable basis for reasonable suspicion referral. If witnesses saw a specific event or behavior, ask them to describe what they saw. How far away were they? How long did they observe the person? What, if anything, caused them to believe it was alcohol related? On what basis did they reach their conclusion? Before proceeding further, obtain concurrence or approval from the manager/department head or designee to proceed with reasonable suspicion alcohol testing.

   b. Isolate and inform the employee. Remove the employee from the work location. Explain that there is reasonable suspicion to believe the employee's performance is being

© Pipeline Testing Consortium, Inc. 2002

affected by alcohol. Ask the employee to explain the suspected behavior and to describe the events that took place from his/her perspective. Ask if there is any medication or physical condition that would explain the behavior. A persuasive explanation may or may not deter you from asking for the employee to submit to an alcohol test. If there is still a reasonable belief that alcohol is a factor in the situation/ incident, a request for testing should be made; if no reasonable belief is determined then no request for testing should be made. If the decision to test is made, inform the employee that they are being requested to accompany the appropriate company official or representative to the specimen collection site to conduct an alcohol test. Inform the employee of the consequences of refusal to submit to alcohol testing.

c. Review your findings. During the conversation, observe physical and mental symptoms. Be sure to document any characteristics that either support or contradict initial information. In all cases, a reasonable suspicion decision to test must be made by a supervisor who has received the required supervisor training. This creates greater objectivity, provides additional observation, and generally strengthens the defensibility of the reasonable cause determination.

d. Transport the employee. The potentially affected employee should not be allowed to proceed alone to or from the collection site. In addition to the safety concerns for the employee, accompanying the employee also assures that there is no opportunity enroute to the collection site for the employee to ingest anything that could affect the alcohol test result.

e. Document the events. Record the behavioral signs and symptoms that support the determination to conduct a reasonable suspicion alcohol test. This documentation (See Appendix D for guidance) of the employee's conduct should be prepared and maintained on file to document the request for reasonable suspicion alcohol testing. See Appendix E for documentation format if test is not administered within prescribed time frames.

f. Denial should be an expected reaction. If a person knows he/she will test positive, he/she may give many explanations and protestations, wanting to avoid alcohol testing. If he/she is not under the influence or affected by alcohol, vehement denial also would be expected. Listen to the employee and carefully evaluate the employee's explanation. Remember, a request to submit to an alcohol test is not an accusation; it is merely a request for additional objective data. To the employee it may feel like an accusation; so it is important to stress that this is merely a request for additional data.

g. Following administration of alcohol test. After returning from the collection site, the employee should not be allowed to return to performing any covered functions if the result of the alcohol test is positive. A discussion of disciplinary action may occur at this time, if necessary. The employee should make arrangements to be transported home. The employee should be instructed not to drive any motor vehicle due to the reasonable suspicion belief that he/she may be under the influence of alcohol. If the employee insists on driving, the proper local enforcement authority may be notified that an employee who the company believes may be under the influence of alcohol is leaving the company premises driving a motor vehicle.

5. The company shall conduct an alcohol test within two hours of a determination to test under reasonable suspicion. If a reasonable suspicion test is not administered within two hours following the determination, the company shall prepare and maintain on file a record stating the reasons why the test was not promptly administered. If the required test is not administered within eight hours of the determination, the company shall cease all attempts to administer an alcohol test and shall state in the record the reasons for not administering the test. Upon request such records shall be made available to the agency administrator or any person who has been delegated authority in the matter concerned.

6. The company shall not permit a covered employee to report for duty or remain on duty requiring the performance of covered functions while the employee is under the influence of or impaired by alcohol, as shown by the behavioral, speech, or performance indicators of alcohol misuse, nor shall the employee be permitted to perform or continue to perform covered functions until:

© Pipeline Testing Consortium, Inc. 2002

a. An alcohol test is administered and the employee's alcohol concentration measures less than 0.02; or

b. The start of the employee's next regularly scheduled duty period, but not less than 8 hours following the determination that there is reasonable suspicion to believe that the employee has violated the prohibitions as contained in the AMPP.

7. Except as provided above, the company shall not take any action under 49 CFR Part 199 against a covered employee based solely on the employee's behavior and appearance in the absence of an alcohol test. However, this does not prohibit the company from taking any disciplinary action otherwise consistent with local and/or state laws.

D. Return-to-Duty Testing (§199.225 (c)).

- **NOTE: A covered employee who refuses to take or has a positive alcohol test will be terminated. Therefore, return-to-duty testing is not an option, unless the employee is otherwise covered by a bargaining agreement.**

1. The company shall ensure that before an employee may return-to-duty to perform covered functions after engaging in prohibited conduct, as set forth in Section VI of this plan, that the employee shall undergo a return-to-duty alcohol test with a result indicating an alcohol concentration of less than 0.02. The company shall not permit an employee who refuses to submit to an alcohol test to perform or continue to perform covered functions.

2. If the substance abuse professional makes a determination that some form of evaluation and/or treatment is required then the employee must comply with the recommended provisions in order to be considered eligible for consideration in being allowed to return-to-duty.

3. To ensure the individual is fit for duty, any employee with a violation of the alcohol testing rule who has been removed from safety-sensitive functions as indicated by a positive alcohol test result of 0.04 must comply with a return to duty alcohol test. This test must occur following a removal from safety-sensitive duties and prior to resuming covered functions. The test result must be below 0.02 in order to resume safety-sensitive duties. Refusal to cooperate will be viewed as insubordination and the employee would be subject to disciplinary action up to and including discharge.

E. Follow-up Testing (§199.225 (d)).

- **NOTE: A covered employee who refuses to take or has a positive alcohol test will be terminated. Therefore, follow-up testing is not an option, unless the employee is otherwise covered by a bargaining agreement.**

1. Following the determination that a covered employee is in need of assistance in resolving problems associated with alcohol misuse, the employee will be subject to unannounced follow-up alcohol testing as directed by a substance abuse professional. An employee who returns to duty shall be subject to a reasonable program of follow-up alcohol testing, without prior notice, for up to 60 months after his or her return to duty.

2. The employee shall be subject to at least six, unannounced alcohol follow-up tests during the first 12-months following his/her return to duty. The substance abuse professional may terminate the requirement for follow-up testing at any time after the initial six tests have been completed, if the substance abuse professional makes the determination that such testing is no longer warranted.

3. The company may require a covered employee to submit to drug follow-up testing when the substance abuse professional has reason to suspect drug involvement. The drug testing must comply with the requirements contained in 49 CFR Part 40, Subpart A. The same procedures would apply should it be determined that an employee had tested positive for drugs and the substance abuse professional had reason to suspect alcohol misuse.

© Pipeline Testing Consortium, Inc. 2002

4. Follow-up testing will only be conducted when the covered employee is performing, just before performing, or just after ceasing to perform covered functions.

F. Stand Down Procedures (§40.21) - The employer may stand down an employee before the MRO has completed the verification by following these procedures.

1. The company is prohibited from standing employees down, except consistent with a waiver a DOT agency grants under 49 CFR Part 40.

2. The company may make a request to the concerned DOT agency for a waiver from the prohibition of the above paragraph in this section. Such a waiver, if granted, permits the company to stand an employee down following the MRO's receipt of a laboratory report of a confirmed positive test for a drug or drug metabolite, an adulterated test, or a substituted test pertaining to the employee.

   a. For this purpose, the concerned DOT agency is the one whose drug and alcohol testing rules apply to the majority of the covered employees in your organization. The concerned DOT agency uses its applicable procedures for considering requests for waivers.

   b. Before taking action on a waiver request, the concerned DOT agency coordinates with other DOT agencies that regulate the company's other covered employees.

   c. The concerned DOT agency provides a written response to each company that petitions for a waiver, setting forth the reasons for the agency's decision on the waiver request.

3. The company request for a waiver must include, at a minimum, the following elements:

   a. Information about the company's organization:

      (1) The company's determination that standing employees down is necessary for safety in the company's organization and a statement of the company's basis for it, including any data on safety problems or incidents that could have been prevented if a stand-down procedure had been in place;

      (2) Data showing the number of confirmed laboratory positive, adulterated, and substituted test results for the company's employees over the two calendar years preceding your waiver request, and the number and percentage of those test results that were verified positive, adulterated, or substituted by the MRO;

      (3) Information about the work situation of the employees subject to stand-down, including a description of the size and organization of the unit(s) in which the employees work, the process through which employees will be informed of the stand-down, whether there is an in-house MRO, and whether your organization has a medical disqualification or stand-down policy for employees in situations other than drug and alcohol testing; and

      (4) A statement of which DOT agencies regulate the company's employees.

   b. The company's proposed written company policy concerning stand-down, which must include the following elements:

      (1) The company's assurance that they will distribute copies of the company's written policy to all employees that it covers;

      (2) The company's means of ensuring that no information about the confirmed positive, adulterated, or substituted test result or the reason for the employee's temporary removal from performance of safety-sensitive functions becomes available, directly or indirectly, to anyone in the company's organization (or subsequently to another company) other than the employee, the MRO and the DER;

      (3) The company's means of ensuring that all covered employees in a particular job

© Pipeline Testing Consortium, Inc. 2002

category in the company's organization are treated the same way with respect to stand-down;

(4) The company's means of ensuring that a covered employee will be subject to stand-down only with respect to the actual performance of safety-sensitive duties;

(5) The company's means of ensuring that the company will not take any action adversely affecting the employee's pay and benefits pending the completion of the MRO's verification process. This includes continuing to pay the employee during the period of the stand-down in the same way you would have paid him or her had he or she not been stood down;

(6) The company's means of ensuring that the verification process will commence no later than the time an employee is temporarily removed from the performance of safety-sensitive functions and that the period of stand-down for any employee will not exceed five days, unless the company is informed in writing by the MRO that a longer period is needed to complete the verification process; and

(7) The company's means of ensuring that, in the event that the MRO verifies the test negative or cancels it --

(a) The company returns the employee immediately to the performance of safety-sensitive duties;

(b) The employee suffers no adverse personnel or financial consequences as a result; and

(c) The company maintains no individually identifiable record that the employee had a confirmed laboratory positive, adulterated, or substituted test result (i.e., the company maintains a record of the test only as a negative or cancelled test).

4. The Administrator of the concerned DOT agency, or his or her designee, may grant a waiver request only if he or she determines that, in the context of the company's organization, there is a high probability that the procedures the company proposes will effectively enhance safety and protect the interests of employees in fairness and confidentiality.

a. The Administrator, or his or her designee, may impose any conditions he or she deems appropriate on the grant of a waiver.

b. The Administrator, or his or her designee, may immediately suspend or revoke the waiver if he or she determines that the company has failed to protect effectively the interests of employees in fairness and confidentiality, that the company has failed to comply with the requirements of this section, or that the company has failed to comply with any other conditions the DOT agency has attached to the waiver.

5. The company must not stand employees down in the absence of a waiver, or inconsistent with the terms of the waiver. The company shall be in violation of 49 CFR Part 40 and DOT agency drug testing regulations, and the company is subject to enforcement action by the DOT agency just as the company is for other violations of this 49 CFR Part 40 and DOT agency rules.

G. Provisions Governing Retesting of Covered Employee (§199.237).

1. A covered employee tested and found to have an alcohol concentration of 0.02 or greater but less than 0.04 shall not be permitted to perform or continue to perform covered functions until:

a. The employee's alcohol concentration measures less than 0.02 in another alcohol test administered in compliance with this plan; or

b. The start of the employee's next regularly scheduled duty period, but not less than eight

© Pipeline Testing Consortium, Inc. 2002

hours following administration of the alcohol test.

2. Except as provided above, the company shall not take any action under 49 CFR Part 199 against a covered employee based solely on test results showing an alcohol concentration less than 0.04. However, this does not prohibit the company from taking any disciplinary action otherwise consistent with local and/or state law.

V. SUBSTANCE ABUSE PROFESSIONALS AND THE RETURN-TO-DUTY PROCESS – 49 CFR PART 40 – SUBPART O

A. SAP Evaluation (§40.281).

1. Qualifications to act as a SAP **-** To be permitted to act as a SAP in the DOT alcohol and drug-testing program, the SAP must meet each of the requirements of this section:

   a. SAP Credentials. The SAP must have one of the following credentials:

      (1) A licensed physician (Doctor of Medicine or Osteopathy);
      (2) A licensed or certified social worker;
      (3) A licensed or certified psychologist;
      (4) A licensed or certified employee assistance professional;
      (5) A state-licensed or certified marriage and family therapist; or
      (6) A drug and alcohol counselor certified by the National Association of Alcoholism and Drug Abuse Counselors Certification Commission (NAADAC); or by the International Certification Reciprocity Consortium/Alcohol and Other Drug Abuse (ICRC); or by the National Board for Certified Counselors, Inc. and Affiliates/Master Addictions Counselor (NBCC).

   b. SAP Basic Knowledge. The SAP must be knowledgeable in the following areas:

      (1) The SAP must be knowledgeable about and have clinical experience in the diagnosis and treatment of alcohol and controlled substances-related disorders.

      (2) The SAP must be knowledgeable about the SAP function as it relates to company interests in safety-sensitive duties.

      (3) The SAP must be knowledgeable about this part, the DOT agency regulations applicable to the companies for whom the SAP evaluates employees, and the DOT SAP Guidelines, and the SAP must keep current on any changes to these materials.

   c. SAP Qualification Training. The SAP must receive qualification training meeting the requirements of this paragraph.

      (1) Qualification training must provide instruction on the following subjects:

         (a) Background, rationale, and coverage of the Department's drug and alcohol testing program;
         (b) 49 CFR Part 40 and DOT agency drug and alcohol testing rules;
         (c) Key DOT drug testing requirements, including collections, laboratory testing, MRO review, and problems in drug testing;
         (d) Key DOT alcohol testing requirements, including the testing process, the role of BATs and STTs, and problems in alcohol tests;
         (e) SAP qualifications and prohibitions;
         (f) The role of the SAP in the return-to- duty process, including the initial employee evaluation, referrals for education and/ or treatment, the follow-up evaluation, continuing treatment recommendations, and the follow-up testing plan;
         (g) SAP consultation and communication with companies, MROs, and treatment providers;

© Pipeline Testing Consortium, Inc. 2002

(h) Reporting and record-keeping requirements;
(i) Issues that SAPs confront in carrying out their duties under the program.

(2) Following the SAP completion of qualification training under paragraph 1.c.(1) of this section, the SAP must satisfactorily complete an examination administered by a nationally recognized professional or training organization. The examination must comprehensively cover all the elements of qualification training listed in paragraph 1.c.(1) of this section.

(3) The following is the schedule for qualification training the SAP must meet:

(a) If the individual became a SAP before August 1, 2001, the SAP must meet the qualifications training requirement no later than December 31, 2003.

(b) If the individual becomes a SAP between August 1, 2001, and December 31, 2003, the SAP must meet the qualification training requirements no later than December 31, 2003.

(c) If the individual becomes a SAP on or after January 1, 2004, the SAP must meet the qualification training requirements before the SAP begins to perform SAP functions.

(4) SAP Continuing Education. During each three-year period from the date on which the SAP satisfactorily complete the examination under paragraph 1.c.(2) of this section, the SAP must complete continuing education consisting of at least 12 professional development hours (e.*g.* ,CEUs) relevant to performing SAP functions.

(a) This continuing education must include material concerning new technologies, interpretations, recent guidance, rule changes, and other information about developments in SAP practice, pertaining to the DOT program, since the time the SAP met the qualification training requirements of this section.

(b) The SAP continuing education activities must include documentable assessment tools to assist the SAP in determining whether the SAP has adequately learned the material.

(5) SAP Documentation. The SAP must maintain documentation showing that he/she currently meet all requirements of this section. The SAP must provide this documentation on request to DOT agency representatives and to the company and C/TPAs who are using or contemplating using the SAPs services.

2. Criteria for a certification organization to obtain recognition for its members as SAPs (§40.283).

a. If the SAP represents a certification organization that wants DOT to authorize its certified drug and alcohol counselors to be added to §40.281(a)(6), the SAP may submit a written petition to DOT requesting a review of the SAPs petition for inclusion.

b. The SAP must obtain the National Commission for Certifying Agencies (NCCA) accreditation before DOT will act on the SAPs petition.

c. The SAP must also meet the minimum requirements of 49 CFR Part 40, Appendix E before DOT will act on the SAPs petition.

B. SAP Requirements (§40.285 - §40.289).

1. Requirements for conducting a SAP evaluation.

© Pipeline Testing Consortium, Inc. 2002

a. When an employee violates the DOT drug and alcohol regulations the employee cannot again perform any DOT safety-sensitive duties for the company until and unless the employee has completed the SAP evaluation, referral, and education/ treatment process set forth in this subpart and in applicable DOT agency regulations. The first step in this process is a SAP evaluation.

b. A verified positive DOT drug test result, a DOT alcohol test with a result indicating an alcohol concentration of 0.04 or greater, a refusal to test (including by adulterating or substituting a urine specimen) or any other violation of the prohibition on the use of alcohol or drugs under a DOT agency regulation constitutes a DOT drug and alcohol regulation violation.

2. Information the company is required to provide concerning SAP services to an employee who has a DOT drug and alcohol regulation violation (§40.287).

a. The company must provide to each employee (including an applicant or new employee) who violates a DOT drug and alcohol regulation a listing of SAPs readily available to the employee and acceptable to the company, with names, addresses, and telephone numbers. The company cannot charge the employee any fee for compiling or providing this list.

b. The company may provide this list or through a C/TPA or other service agent.

3. Company requirements regarding SAP evaluation and treatment services to employees (§ 40.289).

a. The company is not required to provide a SAP evaluation or any subsequent recommended education or treatment for an employee who has violated a DOT drug and alcohol regulation.

b. However, if the company offers the employee an opportunity to return to a DOT safety-sensitive duty following a violation, the company must, before the employee again performs that duty, ensure that the employee receives an evaluation by a SAP meeting the requirements of § 40.281 and that the employee successfully complies with the SAP's evaluation recommendations.

c. Payment for SAP evaluations and services is left for the company and employees to decide and may be governed by existing management-labor agreements and health care benefits.

C. SAP Evaluation, Referral, and Treatment (§40.291 - §40.297).

1. The role of the SAP in the evaluation, referral, and treatment process of an employee who has violated DOT agency drug and alcohol testing regulations.

a. The SAP is charged with:

(1) Making a face-to-face clinical assessment and evaluation to determine what assistance is needed by the employee to resolve problems associated with alcohol and/ or drug use;

(2) Referring the employee to an appropriate education and/ or treatment program;

(3) Conducting a face-to-face follow-up evaluation to determine if the employee has actively participated in the education and/or treatment program and has demonstrated successful compliance with the initial assessment and evaluation recommendations;

© Pipeline Testing Consortium, Inc. 2002

(4) Providing the DER with a follow-up drug and/or alcohol testing plan for the employee; and

(5) Providing the employee and company with recommendations for continuing education and/or treatment.

b. The SAP is not an advocate for the company or employee. The SAP function is to protect the public interest in safety by professionally evaluating the employee and recommending appropriate education/ treatment, follow-up tests, and aftercare.

2. The SAP's functions in conducting the initial evaluation of an employee (§ 40.293) – The SAP must for every employee who comes to the SAP following a DOT drug and alcohol regulation violation the SAP must accomplish the following:

a. Provide a comprehensive face-to-face assessment and clinical evaluation.

b. Recommend a course of education and/or treatment with which the employee must demonstrate successful compliance prior to returning to DOT safety-sensitive duty.

(1) The SAP must make such a recommendation for every individual who has violated a DOT drug and alcohol regulation.

(2) The SAP must make a recommendation for education and/ or treatment that will, to the greatest extent possible, protect public safety in the event that the employee returns to the performance of safety-sensitive functions.

c. Appropriate education may include, but is not limited to, self-help groups (e.*g.,* Alcoholics Anonymous) and community lectures, where attendance can be independently verified, and bona fide drug and alcohol education courses.

d. Appropriate treatment may include, but is not limited to, in-patient hospitalization, partial in-patient treatment, outpatient counseling programs, and aftercare.

e. The SAP must provide a written report directly to the DER highlighting the specific recommendations for assistance (see §40.311(c)).

f. For purposes of the evaluation process, the SAP must assume that a verified positive test result has conclusively established that the employee committed a DOT drug and alcohol regulation violation. The SAP must not take into consideration in any way, as a factor in determining what the recommendation will be, any of the following:

(1) A claim by the employee that the test was unjustified or inaccurate;

(2) Statements by the employee that attempt to mitigate the seriousness of a violation of a DOT drug or alcohol regulation (e. *g.,* related to assertions of use of hemp oil, " medical marijuana" use, " contact positives, " poppy seed ingestion, job stress); or

(3) Personal opinions the SAP may have about the justification or rationale for drug and alcohol testing.

g. In the course of gathering information for purposes of the evaluation in the case of a drug-related violation, the SAP may consult with the MRO. The MRO is required to cooperate with the SAP and provide available information the SAP requests. It is not necessary to obtain the consent of the employee to provide this information.

3. Criteria for employees or the company to seek a second SAP evaluation if they disagree with the first SAP's recommendations (§40.295).

© Pipeline Testing Consortium, Inc. 2002

a. The employee with a DOT drug and alcohol regulation violation having been evaluated by a SAP must not seek a second SAPs evaluation in order to obtain another recommendation.

b. The company must not seek a second SAPs evaluation, if the employee has already been evaluated by a qualified SAP. If the employee, contrary to paragraph (a) of this section, has obtained a second SAP evaluation the company may not rely on it for any purpose under this part.

4. Authority to change a SAP's initial evaluation (§40.297).

a. Except as provided in paragraph 4.b. of this section, no one (e. *g.,* the company, employee, a managed-care provider, any service agent) may change in any way the SAPs evaluation or recommendations for assistance. For example, a third party is not permitted to make more or less stringent a SAPs recommendation by changing the SAPs evaluation or seeking another SAPs evaluation.

b. The SAP who made the initial evaluation may modify his or her initial evaluation and recommendations based on new or additional information (e. *g.,* from an education or treatment program).

D. SAP's Role and Limitations (§40.299). - Requirements of SAP's role and the limits on a SAP's discretion in referring employees for education and treatment

1. The SAP upon making a determination of the best recommendation for assistance, the SAP will serve as a referral source to assist the employee's entry into a education and/ or treatment program.

2. To prevent the appearance of a conflict of interest the SAP must not refer an employee requiring assistance to the SAPs private practice or to a person or organization from which the SAP receives payment or to a person or organization in which the SAP has a financial interest. The SAP is precluded from making referrals to entities with which the SAP is financially associated.

3. There are four exceptions to the prohibitions contained in paragraph (b) of this section. The SAP may refer an employee to any of the following providers of assistance, regardless of the company's relationship with them:

a. A public agency (e.*g.,* treatment facility) operated by a state, county, or municipality;

b. The company or a person or organization under contract to the company to provide alcohol or drug treatment and/or education services (e.*g.,* the employer's contracted treatment provider);

c. The sole source of therapeutically appropriate treatment under the employee's health insurance program (e.*g.,* the single substance abuse in-patient treatment program made available by the employee's insurance coverage plan); or

d. The sole source of therapeutically appropriate treatment reasonably available to the employee (e.*g.,* the only treatment facility or education program reasonably located within the general commuting area).

E. SAP Functions in Evaluation, Treatment, and Aftercare or Support Group Services (§40.301 - §40.303).

1. The SAP's functions in the follow-up evaluation of an employee.

a. The SAP, once the prescribed assistance under §40.293 is complete, must re-evaluate the employee to determine if the employee has successfully carried out the SAP's education and/or treatment recommendations.

© Pipeline Testing Consortium, Inc. 2002

(1) This is the SAP's way to gauge for the company the employee's ability to demonstrate successful compliance with the education and/ or treatment plan.

(2) The SAP evaluation may serve as one of the reasons the company decides to return the employee to safety-sensitive duty.

b. The SAP must make the follow-up evaluation determination:

(1) The SAP must confer with or obtain appropriate documentation from the appropriate education and/or treatment program professionals where the employee was referred; and

(2) The SAP must conduct a face-to-face clinical interview with the employee to determine if the employee demonstrates successful compliance with the initial evaluation recommendations.

c. SAP requirements:

(1) If the employee has demonstrated successful compliance, the SAP must provide a written report directly to the DER highlighting the clinical determination that the employee has done complied with the initial evaluation recommendation (see §40.311(d)).

(2) The SAP may determine that an employee has successfully demonstrated compliance even though the employee has not yet completed the full regimen of education and/ or treatment recommended or needs additional assistance. For example, if the employee has successfully completed the 30-day in-patient program prescribed, the SAP may make a "successful compliance" determination even though the SAP concludes that the employee has not yet completed the outpatient counseling you recommended or should continue in an aftercare program.

d. SAP Determinations:

(1) The SAP, as a result of the follow-up evaluation finds, that the employee has not demonstrated successful compliance with recommendations must provide written notice directly to the DER (see §40.311(e)).

(2) The company who receives the SAP's written notice that the employee has not successfully complied with the SAP's recommendations must not return the employee to the performance of safety-sensitive duties.

(3) The SAP may conduct additional follow-up evaluation(s) if the company determines that doing so is consistent with the employee's progress as the SAP has reported it and with the company's policy and/ or labor-management agreements.

(4) The company, following a SAP report that the employee has not demonstrated successful compliance, may take personnel action consistent with company policy and/ or labor-management agreements.

2. Criteria to be followed if the SAP believes the employee needs additional treatment, aftercare, or support group services even after the employee returns to safety-sensitive duties (§ 40.303).

a. The SAP may believe that ongoing services (in addition to follow-up tests) are needed to assist an employee to maintain sobriety or abstinence from drug use after the employee resumes the performance of safety-sensitive duties, the SAP must provide recommendations for these services in the follow-up evaluation report (see §40.311(d)(10)).

© Pipeline Testing Consortium, Inc. 2002

b. The company receiving a recommendation for these services from a SAP may as part of a return-to-duty agreement with the employee, require the employee to participate in the recommended services. The company may monitor and document the employee's participation in the recommended services. The company may also make use of SAP and employee assistance program (EAP) services in assisting and monitoring employees' compliance with SAP recommendations. Nothing in this section permits the company to fail to carry out its obligations with respect to follow-up testing (See §40.309).

c. The employee has an obligation to comply with the SAP's recommendations for these services. If the employee fails or refuses to do so, the employee may be subject to disciplinary action by the company.

F. Completion of the Return-to-Duty Process (§40.305).

1. If the company must decide that the employee is permitted to return to the performance of safety-sensitive functions the employee takes a return-to-duty test. This test cannot occur until after the SAP has determined that the employee has successfully complied with prescribed education and/or treatment. The employee must have a negative drug test result and/ or an alcohol test with an alcohol concentration of less than 0.02 before resuming performance of safety-sensitive duties.

2. The company must not return an employee to safety-sensitive duties until the employee meets the conditions of paragraph 1. above. However, the company is not required to return an employee to safety-sensitive duties because the employee has met these conditions. That is a personnel decision that the company has the discretion to make, subject to collective bargaining agreements or other legal requirements.

3. The SAP or MRO must not make a " fitness for duty" determination as part of this re-evaluation unless required to do so under an applicable DOT agency regulation. It is the company, rather than the SAP or MRO who must decide whether to put the employee back to work in a safety-sensitive position.

G. SAP's Functions in Prescribing the Employee's Follow-up Tests (§40.307).

1. The SAP for each employee who has committed a DOT drug or alcohol regulation violation, and who seeks to resume the performance of safety-sensitive functions, must establish a written follow-up testing plan. The SAP does not establish this plan until after it has been determined that the employee has successfully complied with the recommendations for education and/or treatment.

2. The SAP must present a copy of this plan directly to the DER (see §40.311(d)(9)).

3. The SAP is the sole determiner of the number and frequency of follow-up tests and whether these tests will be for drugs, alcohol, or both, unless otherwise directed by the appropriate DOT agency regulation. For example, if the employee had a positive drug test, but the evaluation or the treatment program professionals determined that the employee had an alcohol problem as well the SAP should require that the employee have follow-up tests for both drugs and alcohol.

4. However, the SAP must, at a minimum, direct that the employee be subject to six unannounced follow-up tests in the first 12 months of safety-sensitive duty following the employee's return to safety-sensitive functions.

   a. The SAP may require a greater number of follow-up tests during the first 12-month period of safety-sensitive duty (e.*g. the SAP* may require one test a month during the 12-month period; the SAP may require two tests per month during the first 6-month period and one test per month during the final 6-month period).

   b. The SAP may also require follow-up tests during the 48 months of safety-sensitive duty following this first 12-month period.

© Pipeline Testing Consortium, Inc. 2002

c. The SAP is not to establish the actual dates for the follow-up tests the SAP prescribes. The decision on specific dates to test is the company's.

d. The company must not impose additional testing requirements (e.*g.,* under company authority) on the employee that go beyond the SAP's follow-up testing plan.

e. The requirements of the SAP's follow-up testing plan " follow the employee" to subsequent employers or through breaks in service.

Example 1 to Paragraph e: The employee returns to duty with Employer A. Two months afterward, after completing the first two of six follow-up tests required by the SAP's plan, the employee quits his job with Employer A and begins to work in a similar position for Employer B. The employee remains obligated to complete the four additional tests during the next 10 months of safety-sensitive duty, and Employer B is responsible for ensuring that the employee does so. Employer B learns of this obligation through the inquiry it makes under § 40.25.

Example 2 to Paragraph e: The employee returns to duty with Employer A. Three months later, after the employee completes the first two of six follow-up tests required by the SAP's plan, Employer A lays the employee off for economic or seasonal employment reasons. Four months later, Employer A recalls the employee. Employer A must ensure that the employee completes the remaining four follow-up tests during the next nine months.

f. The SAP may modify the determinations the SAP has made concerning follow-up tests. For example, even if the SAP recommended follow-up testing beyond the first 12-months the SAP can terminate the testing requirement at any time after the first year of testing. The SAP must not, however, modify the requirement that the employee take at least six follow-up tests within the first 12 months after returning to the performance of safety-sensitive functions.

H. Company's Responsibilities on SAP's Directions for Follow-up Tests (§40.309).

1. The company must carry out the SAP's follow-up testing requirements. The company may not allow the employee to continue to perform safety-sensitive functions unless follow-up testing is conducted as directed by the SAP.

2. The company should schedule follow-up tests on dates of their own choosing, but the company must ensure that the tests are unannounced with no discernable pattern as to their timing, and that the employee is given no advance notice.

3. The company cannot substitute any other tests (e.*g.,* those carried out under the random testing program) conducted on the employee for this follow-up testing requirement.

4. The company cannot count a follow-up test that has been cancelled as a completed test. A cancelled follow-up test must be recollected.

I. Requirements of SAP's Reports (§40.311).

1. The SAP conducting the required evaluations must send the written reports required by this section in writing directly to the DER and not to a third party or entity for forwarding to the DER (except as provided in §40.355(e)). The SAP may, however, forward the document simultaneously to the DER and to a C/TPA.

2. The SAP must ensure that the company receives written reports directly from the SAP performing the evaluation and that no third party or entity changed the SAP's report in any way.

3. The SAP's written report, following an initial evaluation that determines what level of assistance is needed to address the employee's drug and/ or alcohol problems, must be on the SAP's own letterhead (and not the letterhead of another service agent) signed and dated by the SAP, and must contain the following delineated items:

© Pipeline Testing Consortium, Inc. 2002

a. Employee's name and SSN;
b. Employer's name and address;
c. Reason for the assessment (specific violation of DOT regulations and violation date);
d. Date(s) of the assessment;
e. SAP's education and/ or treatment recommendation; and
f. SAP's telephone number.

4. The SAP's written report concerning a follow-up evaluation that determines the employee has demonstrated successful compliance must be on the SAP's own letterhead (and not the letterhead of another service agent), signed by the SAP and dated, and must contain the following items:

a. Employee's name and SSN;
b. Employer's name and address;
c. Reason for the initial assessment (specific violation of DOT regulations and violation date);
d. Date(s) of the initial assessment and synopsis of the treatment plan;
e. Name of practice(s) or service(s) providing the recommended education and/or treatment;
f. Inclusive dates of employee's program participation;
g. Clinical characterization of employee's program participation;
h. SAP's clinical determination as to whether the employee has demonstrated successful compliance;
i. Follow-up testing plan;
j. Employee's continuing care needs with specific treatment, aftercare, and/or support group services recommendations; and
k. SAP's telephone number.

5. The SAP's written report concerning a follow-up evaluation that determines the employee has not demonstrated successful compliance must be on the SAP's own letterhead (and not the letterhead of another service agent), signed by the SAP and dated, and must contain the following items:

a. Employee's name and SSN;
b. Employer's name and address;
c. Reason for the initial assessment (specific DOT violation and date);
d. Date(s) of initial assessment and synopsis of treatment plan;
e. Name of practice(s) or service(s) providing the recommended education and/ or treatment;
f. Inclusive dates of employee's program participation;
g. Clinical characterization of employee's program participation;
h. Date(s) of the first follow-up evaluation;
i. Date(s) of any further follow-up evaluation the SAP has scheduled;
j. SAP's clinical reasons for determining that the employee has not demonstrated successful compliance; and
k. SAP's telephone number.

6. The SAP must also provide these written reports directly to the employee if the employee has no current employer and to the gaining DOT regulated employer in the event the employee obtains another transportation industry safety-sensitive position.

7. The SAP is to maintain copies of the employer's reports to employers for 5 years, and the employer's employee clinical records in accordance with Federal, state, and local laws regarding record maintenance, confidentiality, and release of information. The SAP must make these records available, on request, to DOT agency representatives (e. *g.,* inspectors conducting an audit or safety investigation) and representatives of the NTSB in an accident investigation.

8. The company must maintain the reports from SAP's for 5 years from the date the company receives the reports.

J. Additional Information on SAP Functions and Return-to-duty Process (§40.313).

Other information on the role and functions of SAP's is located in the following sections of 49 CFR Part 40.

© Pipeline Testing Consortium, Inc. 2002

§ 40.3 - Definition.
§ 40.347 - Service agent assistance with SAP-required follow-up testing.
§ 40.355 - Transmission of SAP reports.
§ 40.329(c) - Making SAP reports available to employees on request.
Appendix E to Part 40-SAP Equivalency Requirements for Certification Organizations.

VI. ALCOHOL PROHIBITED CONDUCT (§199.215 – §199.221)

A. General. The company shall provide guidance to all covered employees regarding the various types of alcohol-prohibited conducts.

B. Alcohol Concentration (§199.215 & §40.23).

When the company receives an alcohol test result of 0.04 or higher, the company must immediately remove the employee involved from performing safety-sensitive functions. If the company receives an alcohol test result of 0.02 – 0.039, the company must temporarily remove the employee involved from performing safety-sensitive functions, as provided in applicable DOT agency regulations. Do not wait to receive the written report of the result of the test.

A covered employee shall be prohibited from reporting for duty or remaining on duty requiring the performance of covered functions while having an alcohol concentration of 0.04 or greater. If a company representative has actual knowledge that a covered employee has an alcohol concentration of 0.04 or greater, the employee shall not be permitted to perform or continue to perform covered functions.

C. On-Duty Use (§199.217). The company shall prohibit a covered employee from using alcohol while performing covered functions. If a company representative has actual knowledge that a covered employee is using alcohol while performing covered functions, the employee shall not be permitted to perform or continue to perform covered functions.

D. Pre-Duty Use (§199.219). The company shall prohibit a covered employee from using alcohol within four hours prior to performing covered functions, or, if an employee is called to duty to respond to an emergency, within the time period after the employee has been notified to report for duty, the employee shall not be permitted to perform or continue to perform covered functions.

E. Use Following an Accident (§199.221). Each company shall prohibit a covered employee who has actual knowledge of an accident in which his or her performance of covered functions has not been discounted by the company as a contributing factor to the accident from using alcohol for eight hours following an accident, unless he or she has been given a post-accident test under (§199.225(a)), or the company has determined that the employee's performance could not have contributed to the accident.

F. On-Call Employees.

1. Employees who are not at work, but who could be called at any time to perform covered functions is subject to the pre-duty alcohol prohibition. An employee, who has been notified to report for duty to respond to an emergency, may not use alcohol after being notified to report. If company personnel determine that an employee has used alcohol within the time period after the employee has been notified to report for duty, the company shall not permit the covered employee to perform or continue to perform covered functions.

2. **Employees who are not at work, but who could be called out are expected to be fit for duty upon reporting for work. If an employee is under the influence of alcohol, the employee must notify company personnel when contacted. Failure to advise the company of alcohol consumption may result in disciplinary action. If a covered employee is perceived to be under the influence of alcohol when reporting to work after being called in, the employees supervisor must be notified.**

3. **The supervisor must objectively observe the employee's behavior and if possible,**

© Pipeline Testing Consortium, Inc. 2002

substantiate the behavior with a second supervisor. Supervisors must have received training in alcohol and/or substance abuse detection. The supervisor must follow procedures outlined in the AMPP. If a determination to test for reasonable suspicion is made, the employee is immediately removed from safety-sensitive duties and the alcohol program manager is contacted. An alcohol test site location is identified to conduct the test. The supervisor will accompany the individual to the test site and remain at the location for results of the test. If the results are positive, the individual is removed from safety-sensitive duties and may be subject to disciplinary action up to and including termination.

VII. PROBLEMS ASSOCIATED WITH ALCOHOL TESTING (49 CFR PART 40 – SUBPART N)

A. Refusal Criteria and Consequences (§40.261) - Criteria for refusal to take an alcohol test and the consequences.

1. The employee is considered to have refused to take an alcohol test if he/she

   a. Fail to appear for any test (except a pre-employment test) within a reasonable time, as determined by the company, consistent with applicable DOT agency regulations, after being directed to do so by the company. This includes the failure of an employee (including an owner-operator) to appear for a test when called by C/TPA (see §40.241(b)(1));

   b. Fail to remain at the testing site until the testing process is complete; Provided, that an employee who leaves the testing site before the testing process commences (see Section 40.243(a)) for a pre-employment test is not deemed to have refused to test;

   c. Fail to attempt to provide an adequate amount of saliva or breath for any alcohol test required by this part or DOT Agency regulations; provided, that an employee who does not provide an adequate amount of breath or saliva because he or she has left the testing site before the testing process commences (See Section 40.243(a)) for a pre-employment test is not deemed to have refused to test;

   d. Fail to provide a sufficient breath specimen, and the physician has determined, through a required medical evaluation, that there was no adequate medical explanation for the failure (See §40.265(c));

   e. Fail to undergo a medical examination or evaluation, as directed by the company as part of the insufficient breath procedures outlined at §40.265(c);

   f. Fail to sign the certification at Step 2 of the ATF (see §40.241(g) and §40.251(d));

   g. Fail to cooperate with any part of the testing process.

2. Any employee who refuses to take an alcohol test will incur the same consequences specified under DOT agency regulations for a violation of those DOT agency regulations.

3. As a BAT or an STT, or as the physician evaluating a " shy lung" situation, when an employee refuses to test as provided in paragraph 1. of this section, the collector must terminate the portion of the testing process in which they are involved, document the refusal on the ATF (or in a separate document which should be attached to the form), immediately notify the DER by any means (e. *g.,* telephone or secure fax machine) that ensures the refusal notification is immediately received. The collector must make this notification directly to the DER (not using a C/TPA as an intermediary).

4. An employee who refuses to take a non-DOT test or to sign a non-DOT form, has not refused to take a DOT test. There are no consequences under DOT agency regulations for such a refusal.

© Pipeline Testing Consortium, Inc. 2002

B. Consequences for Inability to Provide Sufficient Saliva for Alcohol Test (§40.263) - Consequences for an employee who is unable to provide a sufficient amount of saliva for an alcohol screening test.

1. The STT must take the following steps if an employee is unable to provide sufficient saliva to complete a test on a saliva screening device (e.*g.,* the employee does not provide sufficient saliva to activate the device). §40.265.

    a. The STT must conduct a new screening test using a new screening device.

    b. If the employee refuses to make the attempt to complete the new test, the STT must discontinue testing, note the fact on the " Remarks" line of the ATF, and immediately notify the DER. This is a refusal to test.

    c. If the employee has not provided a sufficient amount of saliva to complete the new test, the STT must note the fact on the " Remarks" line of the ATF and immediately notify the DER.

2. The DER, when the STT informs the DER that the employee has not provided a sufficient amount of saliva (see paragraph (a)(3) of this section), the DER must immediately arrange to administer an alcohol test to the employee using an EBT or other breath testing device.

C. Criteria for Inability to Provide Sufficient Breath for Alcohol Test (§40.265) - Criteria for an employee who is unable to provide a sufficient amount of breathe for an alcohol test.

1. If an employee does not provide a sufficient amount of breath to permit a valid breath test, the BAT must take the steps listed in this section.

2. The BAT must instruct the employee to attempt again to provide a sufficient amount of breath and about the proper way to do so.

    a. If the employee refuses to make the attempt the BAT must discontinue the test, note the fact on the " Remarks" line of the ATF, and immediately notify the DER. This is a refusal to test.

    b. If the employee again attempts and fails to provide a sufficient amount of breath, the BAT may provide another opportunity to the employee to do so if they believe that there is a strong likelihood that it could result in providing a sufficient amount of breath.

    c. When the employee's attempts under paragraph C.2.b. of this section have failed to produce a sufficient amount of breath, the BAT must note the fact on the " Remarks" line of the ATF and immediately notify the DER.

    d. If the BAT is using an EBT that has the capability of operating manually, he/she may attempt to conduct the test in manual mode.

    e. If the collector is qualified to use an saliva ASD and the collector is in the screening test stage, the collector may change to a saliva ASD only to complete the screening test.

3. The company shall when notified by the BAT that the employee has not provided a sufficient amount of breath, the BAT must direct the employee to obtain, within five days, an evaluation from a licensed physician who is acceptable to the company and the physician has expertise in the medical issues raised by the employee's failure to provide a sufficient specimen.

    a. The company is required to provide the physician who will conduct the evaluation with the following information and instructions:

        (1) That the employee was required to take a DOT breath alcohol test, but was unable to provide a sufficient amount of breath to complete the test;

© Pipeline Testing Consortium, Inc. 2002

(2) The consequences of the appropriate DOT agency regulation for refusing to take the required alcohol test;

(3) That the physician must provide the company with a signed statement of his or her conclusions; and

(4) That the physician, in his or her reasonable medical judgment, must base those conclusions on one of the following determinations:

(a) A medical condition has, or with a high degree of probability could have, precluded the employee from providing a sufficient amount of breath. The physician must not include in the signed statement detailed information on the employee's medical condition. In this case, the test is cancelled.

(b) There is not an adequate basis for determining that a medical condition has, or with a high degree of probability could have, precluded the employee from providing a sufficient amount of breath. This constitutes a refusal to test.

(c) For purposes of paragraphs C.3.a.(4)(a) and (b) of this section, a medical condition includes an ascertainable physiological condition (e.*g.,* a respiratory system dysfunction) or a medically documented pre-existing psychological disorder, but does not include unsupported assertions of " situational anxiety" or hyperventilation.

b. The physician who makes evaluation must provide a written statement of his/her conclusions and the basis for them to the DER directly (and not through a C/TPA acting as an intermediary). The physician must not include in this statement detailed information on the employee's medical condition beyond what is necessary to explain his/her conclusion.

c. Upon receipt of the report from the examining physician the DER must immediately inform the employee and take appropriate action based upon the appropriate DOT agency regulations.

D. Problems Associated with Cancelled Alcohol Tests (§40.267).

1. The company, a BAT, or an STT, must cancel an alcohol test if any of the following problems occur. These are " fatal flaws. " He/she must inform the DER that the test was cancelled and must be treated as if the test never occurred. These problems are:

a. In the case of a screening test conducted on an saliva ASD or a breath tube ASD:

(1) The STT or BAT reads the result either sooner than or later than the time allotted by the manufacturer and 49 CFR 40 – Section §40.245(a)(8)) for the saliva ASD and Section §40.245(b)(8)) for the breath tube ASD.

(2) The saliva ASD does not activate (See §40.245(a)(7)); or

(3) The device is used for a test after the expiration date printed on the device or on its package (See §40.245(a)(1)) for the saliva ASD and (See §40.245(b)(1)) for the breath tube ASD.

b. In the case of a screening or confirmation test conducted on an EBT, the sequential test number or alcohol concentration displayed on the EBT is not the same as the sequential test number or alcohol concentration on the printed result (See § 40.253(c), (e) and (f)).

c. In the case of a confirmation test:

© Pipeline Testing Consortium, Inc. 2002

(1) The BAT conducts the confirmation test before the end of the minimum 15-minute waiting period (See §40.251(a)(1));

(2) The BAT does not conduct an air blank before the confirmation test (See §40.253(a));

(3) There is not a 0.00 result on the air blank conducted before the confirmation test (See §40.253(a)(1) and (2));

(4) The EBT does not print the result (see §40.253(f)); or

(5) The next external calibration check of the EBT produces a result that differs by more than the tolerance stated in the QAP from the known value of the test standard. In this case, every result of 0.02 or above obtained on the EBT since the last valid external calibration check is cancelled (See §40.233(1)(a) and (3)(c)).

E. Problems Associated with Cancelled Test & Corrective Action (§40.269) - Problems that cause an alcohol test to be cancelled unless they are corrected.

1. The BAT or STT, or company must cancel an alcohol test if any of the following problems occur, unless they are corrected. These are " correctable flaws. " These problems are:

   a. The BAT or STT does not sign the ATF (See §40.247(a)(1) and 40.255(a)(1)).

   b. The BAT or STT fails to note on the " Remarks" line of the ATF that the employee has not signed the ATF after the result is obtained (See §40.255(a)(3)).

   c. The BAT or STT uses a non-DOT form for the test (See §40.225(a)).

F. Correction of Alcohol Testing Problems (§40.271).

1. The BAT or STT has the responsibility of trying to complete successfully an alcohol test for each employee.

   a. If, during or shortly after the testing process the collector becomes aware of any event that will cause the test to be cancelled (See §40.267) they must try to correct the problem promptly, if practicable. They may repeat the testing process as part of this effort.

   b. If repeating the testing process is necessary the collector must begin a new test as soon as possible. They must use a new ATF, a new sequential test number, and, if needed, a new ASD and/ or a new EBT. It is permissible to use additional technical capabilities of the EBT (e.*g.,* manual operation) if they have been trained to do so in accordance with §40.213(c).

   c. If repeating the testing process is necessary, the collector is not limited in the number of attempts to complete the test, provided that the employee is making a good faith effort to comply with the testing process.

   d. If another testing device is not available for the new test at the testing site, the collector must immediately notify the DER and advise the DER that the test could not be completed. As the DER who receives this information, you must make all reasonable efforts to ensure that the test is conducted at another testing site as soon as possible.

2. If the STT, BAT, company or other service agent administering the testing process becomes aware of a “correctable flaw” (see § 40.269) that has not already been corrected, they must take all practicable action to correct the problem so that the test is not cancelled.

© Pipeline Testing Consortium, Inc. 2002

a. If the problem resulted from the omission of required information, the BAT or STT is responsible for providing the missing information in writing with a signed statement that it is true and accurate. For example, suppose a BAT or STT forgot to make a notation on the " Remarks" line of the ATF that the employee did not sign the certification. The BAT or STT, when the problem is called to his/her attention, must supply a signed statement that the employee failed or refused to sign the certification after the result was obtained, and that the collector's signed statement is true and accurate.

b. If the problem is the use of a non-DOT form, the BAT or STT must, as the person responsible for the use of the incorrect form, certify in writing that the incorrect form contains all the information needed for a valid DOT alcohol test. The BAT or STT must also provide a signed statement that the incorrect form was used inadvertently or as the only means of conducting a test, in circumstances beyond the BAT or STT control, and the steps taken to prevent future use of non-DOT forms for DOT tests. The BAT or STT must supply this information on the same business day on which notified of the problem, transmitting it by fax or courier.

3. If the BAT or STT cannot correct the problem they must cancel the test.

G. Effects of a Cancelled Alcohol Test (§40.273).

1. A cancelled alcohol test is neither positive nor negative.

   a. The company must not attach to a cancelled test the consequences of a test result that is 0.02 or greater (e.*g.,* removal from a safety-sensitive position).

   b. The company must not use a cancelled test in a situation where an employee needs a test result that is below 0.02 (e.g.*,* in the case of a return-to-duty or follow-up test to authorize the employee to perform safety-sensitive functions).

   c. The company must not direct a recollection for an employee because a test has been cancelled, except in the situations cited in paragraph 1.b. of this section or other provisions of this part.

2. A cancelled test does not count toward compliance with DOT requirements, such as a minimum random testing rate.

3. When a test must be cancelled the BAT, STT, or other person who determines that the cancellation is necessary he/she must inform the affected DER within 48 hours of the cancellation.

4. A cancelled DOT test does not provide a valid basis for the company to conduct a non-DOT test (i.*e.,* a test under company authority).

H. Effects of Procedural Problems that are not Sufficient to Cancel an Alcohol Test (§40.275).

1. The STT, BAT, company, or a service agent administering the testing process must document any errors in the testing process even if they are not " fatal flaws" or " correctable flaws" listed in this subpart. Decisions about the ultimate impact of these errors will be determined by administrative or legal proceedings, subject to the limitation of paragraph 2. of this section.

2. No person concerned with the testing process may declare a test cancelled based on a mistake in the process that does not have a significant adverse effect on the right of the employee to a fair and accurate test. For example, it is inconsistent with this part to cancel a test based on a minor administrative mistake (e.*g.,* the omission of the employee's middle initial) or an error that does not affect employee protections under this part. Nor does the failure of an employee to sign in Step 4 of the ATF result in the cancellation of the test. Nor is a test to be cancelled on the basis of a claim by an employee that he or she was improperly selected for testing.

3. When the company notes these errors, even though not sufficient to cancel an alcohol test result, the company may be subject to enforcement action under DOT agency regulations.

© Pipeline Testing Consortium, Inc. 2002

I. Criteria for Acceptable Alcohol Tests (§40.277) - Alcohol tests other than saliva or breath are not permitted under these regulations.

1. No other types of alcohol tests (e,*g.,* blood and urine) are authorized for testing done in conjunction with 49 CFR Part 40.

2. Only saliva or breath for screening tests and breath for confirmation tests using approved devices are permitted under 49 CFR Part 40.

VIII. EMPLOYEE WHO REFUSES ALCOHOL TEST (§199.223).

A. General.

1. Compliance with this AMPP is a condition of employment.

2. Each company shall require a covered employee to submit to a post-accident, reasonable suspicion, or follow-up alcohol test. No company shall permit a covered employee who refuses to submit to such a test to perform or continue to perform any covered functions.

B. Additional Requirements.

1. **The company may impose additional disciplinary actions, as they deem appropriate. This may include removal from performing covered functions, suspension (with or without pay), and even termination. Some examples of various types of disciplinary action are outlined in Section IX.**

IX. DISCIPLINARY ACTIONS (§199.243)

A. General.

1. A covered employee who has an alcohol test administered and the alcohol concentration is greater than 0.02 shall not be permitted to perform covered functions or not allowed to continue to perform covered functions. An employee who engages in prohibited conduct as outlined in the AMPP shall be advised of available resources to evaluate and resolve problems associated with alcohol misuse.

2. Removal from Covered Function (§199.233). Except as provided in sections 199.239 through 199.243, the company shall not permit any covered employee to perform covered functions if the employee has engaged in conduct prohibited by sections 199.215 through 199.223 or an alcohol misuse rule of another DOT agency.

3. Required Evaluation and Testing (§199.235). The company shall not permit a covered employee who has engaged in conduct prohibited by sections 199.215 through 199.223 to perform covered functions unless the employee has met the requirements of section 199.243 of this plan.

B. Required Referrals and Evaluations (§199.243).

1. The company shall ensure that employees who engage in prohibited conduct are made aware of potential resources to assist in the evaluation of their problems and to help resolve any problems associated with the misuse of alcohol. Employees who engage in prohibited conduct must be referred to a substance abuse professional for evaluation and/or treatment.

2. No covered employee who has violated the rules on alcohol misuse or refuses to submit to testing can perform any covered function unless and until that employee has:

   a. Been evaluated by a SAP to determine whether the employee is in need of assistance in resolving problems related to alcohol use.

© Pipeline Testing Consortium, Inc. 2002

b. Completed any treatment recommended by the SAP.

c. Been evaluated by a SAP to ensure that the employee has properly followed the treatment program.

d. **Entered into a company approved evaluation and/or treatment and/or rehabilitation program and successfully completed the treatment and/or program**.

e. Undergone a return-to-duty alcohol test with resulting alcohol concentration of less than 0.02.

f. Been advised of the follow-up testing provisions as specified in section III of this plan.

C. Evaluation, Treatment and Rehabilitation (§199.243).

1. A Substance Abuse Professional (SAP) is a licensed physician (medical doctor or doctor of osteopathy) or a licensed or certified psychologist, certified social worker, licensed or certified employee assistance professional, state-licensed or certified marriage and family therapist, or a drug and alcohol counselor certified by the National Association of Drug Abuse Counselors Commission (NAADAC) or by the International Certification Reciprocity Consortium/Alcohol and Other Drug Abuse (ICRC); or by the National Board for Certified Counselors, Inc. and Affiliates/Master Addictions Counselor (NBCC) with knowledge about and have clinical experience in the diagnosis and treatment of alcohol and controlled substances-related disorders.

2. The company shall not permit an employee to return to duty requiring the performance of a covered function after engaging in conduct prohibited in Section VI of this plan until the employee has undergone a return-to-duty alcohol test with a result indicating an alcohol concentration of less than 0.02.

3. The company shall ensure that a SAP who determines that a covered employee requires assistance in resolving problems associated with alcohol misuse does not refer the employee to the SAP's private practice or to a person or organization from which the SAP receives remuneration or has a financial interest. This does not prohibit a SAP from referring an employee for assistance to a public agency (State, county, or municipality); a person under contract with the company to provide treatment for alcohol on behalf of the company; the sole source of therapeutic treatment under the employee's health insurance policy; or sole source of therapeutic treatment reasonably accessible to the employee.

4. The employee's evaluation and rehabilitation may be provided by the company, a SAP under contract; or a SAP not affiliated with the company.

D. Levels of Disciplinary Actions. Disciplinary action as set forth below will be taken under each of the described circumstances

1. 0.02 - 0.039 Consequences.

a. When the results of an alcohol (screen/confirmation) test indicate an alcohol concentration of 0.02 or greater, but less than 0.04, the employee will be removed immediately from performing the covered function for the remainder of his/her shift and may be subject to loss of pay for that period of time.

b. When an employee has an alcohol (screen/confirmation) test conducted and the alcohol concentration is 0.02 or greater, but less than 0.04, on a second test, the employee will be removed immediately from performing the covered function and shall be suspended. The employee shall be referred to a substance abuse professional and must follow all the recommendations following completion of the assessment. Any subsequent test at 0.02 or greater will result in disciplinary action up to and including termination from the company.

© Pipeline Testing Consortium, Inc. 2002

c. **When the results of another alcohol (screen/confirmation) test indicate alcohol concentration 0.02 or greater, but less than 0.04 after an alcohol test which had produced an alcohol concentration of 0.04 or greater, then that employee will be removed immediately from performing the covered function. The employee shall be suspended and referred to the substance abuse professional and must follow all the recommendations following completion of the assessment. Any subsequent alcohol concentration 0.02 or greater will result in disciplinary action up to and including termination from the company.**

2. 0.04 or Greater Consequences.

a. **When an employee has tested for alcohol in a concentration of 0.04 or greater, the employee will be removed from performing the covered function and shall be suspended. The employee shall be referred to a substance abuse professional that shall determine what assistance, if any, the employee needs in resolving problems associated with alcohol misuse**.

b. **In all cases when an employee tests at an alcohol concentration of 0.04 or greater after an alcohol test which had on a previous occasion produced an alcohol concentration of 0.04 or greater, then the employee shall be removed immediately from performing the covered function. The employee shall be subject to disciplinary action up to and including immediate termination.**

3. Other Alcohol Consequences.

a. **When an employee refuses to report for assessment, evaluation, and/or referral for treatment with a substance abuse professional he/she will be removed immediately from performing the covered function and will be subject to disciplinary action up to and including termination**.

b. **When an employee, after assessment, is referred for rehabilitation and/or treatment and the employee refuses to enter or successfully complete such a rehabilitation and/or treatment assessment program, he/she will be removed immediately from performing the covered function and subject to disciplinary action up to and including termination.**

c. **An employee who refuses to provide an adequate breath for alcohol testing without a valid medical explanation after he/she has received notice of the requirement to be tested in accordance with the requirements of the AMPP, or who engages in conduct that clearly obstructs the testing procedure will be removed immediately from performing the covered function. The employee will be subject to disciplinary action up to and including termination from the company**.

d. **On duty use or possession of alcohol on company time, on company premises, or in company vehicles will result in immediate removal from performing the covered function. The employee will be subject to disciplinary action up to and including termination from the company**.

X. DISCLOSURE OF ALCOHOL INFORMATION / RECORDS (§199.231)

A. General.

1. The company, or the authorized agent, shall maintain all alcohol related testing information including all test results and other appropriate records in a secure manner to prevent the disclosure of such information to unauthorized personnel.

2. The APM/DER shall maintain a locked file system, which will contain the alcohol testing

© Pipeline Testing Consortium, Inc. 2002

information and records. The APM/DER shall provide all records whenever deemed necessary for inspection by any authorized agency or operator. The files shall be maintained as confidential. Employee files shall be handled on strict "need to know" basis.

3. Alcohol test results shall not be included in personnel files.

4. The company may disclose information without employee's consent as provided by DOT procedures 49 CFR Part 40 concerning certain legal proceedings.

B. Disclosure Provisions.

1. The company shall not release covered employee information that is contained in records as required to be maintained by the provisions of the AMPP and in accordance with federal requirements except as required by law or when expressly authorized or required by 49 CFR Parts 199 and 40.

2. A covered employee is entitled, upon written request, to obtain copies of any records pertaining to the employee's use of alcohol, including any records pertaining to his/her alcohol tests. The company shall promptly provide the requested records. Access to an employee's records shall not be contingent upon payment for records other than those specifically requested.

3. The company shall permit access to all facilities utilized in complying with the requirements of 49 CFR Parts 199 and 40 to the Secretary of Transportation or any DOT or state agency with regulatory authority over the company.

4. The company shall make available copies of all results for alcohol testing conducted under the AMPP as required by 49 CFR Parts 199 and 40 when requested by the Secretary of Transportation or any DOT or state agency with regulatory authority over the company. When specified by the agency the information shall include name-specific alcohol test results, records, and reports.

5. When requested by the National Transportation Safety Board as part of an accident investigation, the company shall disclose information related to its administration of any post-accident alcohol tests administered following the accident under investigation.

6. The company shall make records available to a subsequent employer upon receipt of the written request from the covered employee. Disclosure by the subsequent employer is permitted only as expressly authorized by the terms of the employee's written request.

7. The company may disclose required information pertaining to a covered employee to the employee or the decision maker in a lawsuit, grievance, or other proceeding initiated by or on behalf of the individual, and arising from the results of an alcohol test administered as required by the AMPP and the regulations set forth in 49 CFR Parts 199 and 40 or from the company's determination that the covered employee engaged in prohibited alcohol conduct including, but not limited to, a worker's compensation, unemployment compensation, or other proceeding relating to a benefit sought by the employee.

8. The company shall release information regarding a covered employee's records as directed by the specific, written consent of the employee authorizing release of the information to an identified person. Release of such information by the person receiving the information is permitted only in accordance with the terms of the employee's consent.

C. Drug and Alcohol Testing Information C/TPAs May Transmit to the Company.

1. The C/TPA may, acting as an intermediary, transmit the information in the following sections of 49 CFR Part 40 to the DER for the company, if the company chooses to do so. These are the only items that the C/TPA is permitted to transmit to the company as an intermediary. The use of C/TPA intermediaries is prohibited in all other cases, such as transmission of laboratory drug test results to MROs, the transmission of medical information from MROs to the company, the transmission of

© Pipeline Testing Consortium, Inc. 2002

SAP reports to the company, the transmission of positive alcohol test results, and the transmission of medical information from MROs to the company.

2. In every case, the C/TPA must ensure that, in transmitting the information, the C/TPA meets all requirements (e.g., concerning confidentiality and timing) that would apply if the party originating the information (e.g., an MRO or collector) sent the information directly to the company. For example, if the C/TPA transmitted MROs' drug testing results to DERs, the C/TPA must transmit each drug test result to the DER in compliance with the requirements for MROs set forth in §40.167.

3. Drug Testing Information

Sec. 40.25: Previous two years' test results
Sec. 40.35: Notice to collectors of contact information for DER
Sec. 40.61(a): Notification to DER that an employee is a ``no show'' for a drug test
Sec. 40.63(e): Notification to DER of a collection under direct observation
Sec. 40.65(b)(6) and (7) and (c)(2) and (3): Notification to DER of a refusal to provide a specimen or an insufficient specimen
Sec. 40.73(a)(9): Transmission of CCF copies to DER (However, MRO copy of CCF must be sent by collector directly to the MRO, not through the C/TPA.)
Sec. 40.111(a): Transmission of laboratory statistical report to the company
Sec. 40.127(f): Report of test results to DER
Secs. 40.127(g), 40.129(d); 40.159(a)(4)(ii); 40.161(b): Reports to DER that test is cancelled
Sec. 40.129 (d): Report of test results to DER
Sec. 40.129(g)(1): Report to DER of confirmed positive test in stand-down situation
Secs. 40.149(b): Report to DER of changed test result
Sec. 40.155(a): Report to DER of dilute specimen
Sec. 40.167(b) and (c): Reports of test results to DER
Sec. 40.187(a)-(f) Reports to DER concerning the reconfirmation of tests
Sec. 40.191(d): Notice to DER concerning refusals to test
Sec. 40.193(b)(3): Notification to DER of refusal in shy bladder situation
Sec. 40.193(b)(4): Notification to DER of insufficient specimen
Sec. 40.193(b)(5): Transmission of CCF copies to DER (not to MRO)
Sec. 40.199: Report to DER of cancelled test and direction to DER for additional collection
Sec. 40.201: Report to DER of cancelled test

4. Alcohol testing information

§40.215: Notice to BATs and STTs of contact information for DER
§40.241(b)(1): Notification to DER that an employee is a "no show" for an alcohol test
§40.247(a)(2): Transmission of alcohol screening test results only when the test result is less than 0.02
§40.255(a)(4): Transmission of alcohol confirmation test results only when the test result is less than 0.02
§40.263(a)(3) and 263(b)(3): Notification of insufficient saliva and failure to provide sufficient amount of breath

XI. CONFIDENTIALITY AND RELEASE OF INFORMATION - PART 40 - SUBPART P

A. General Confidentiality Requirements (§40.321 - §40.323).

1. General confidentiality rules for drug and alcohol test information - Except as otherwise provided in this subpart the service agent or company participating in the DOT drug or alcohol testing process is prohibited from releasing individual test results or medical information about an employee to third parties without the employee's specific written consent.

   a. A " third party" is any person or organization to whom other subparts of this regulation do not explicitly authorize or require the transmission of information in the course of the drug or alcohol testing process.

© Pipeline Testing Consortium, Inc. 2002

b. "Specific written consent" means a statement signed by the employee that he or she agrees to the release of a particular piece of information to a particular, explicitly identified, person or organization at a particular time. " Blanket releases, " in which an employee agrees to a release of a category of information (e.g., all test results) or to release information to a category of parties (e.g., other employers who are members of a C/TPA, companies to which the employee may apply for employment), are prohibited under this part.

2. Criteria for program participant's release of drug or alcohol test information in connection with legal proceedings (§40.323).

a. The company may release information pertaining to an employee's drug or alcohol test without the employee's consent in certain legal proceedings.

(1) These proceedings include a lawsuit (e.g., a wrongful discharge action), grievance (e.g., an arbitration concerning disciplinary action taken by the company), or administrative proceeding (e. g., an unemployment compensation hearing) brought by, or on behalf of, an employee and resulting from a positive DOT drug or alcohol test or a refusal to test (including, but not limited to, adulterated or substituted test results).

(2) These proceedings also include a criminal or civil action resulting from an employee's performance of safety-sensitive duties, in which a court of competent jurisdiction determines that the drug or alcohol test information sought is relevant to the case and issues an order directing the company to produce the information. For example, in personal injury litigation following a truck or bus collision, the court could determine that a post-accident drug test result of an employee is relevant to determining whether the driver or the driver's employer was negligent. The company is authorized to respond to the court's order to produce the records.

b. The company may release the information to the decision-maker in the proceeding (e. g., the court in a lawsuit). The company may release the information only with a binding stipulation that the decision-maker to whom it is released will make it available only to parties to the proceeding.

c. If a service agent receives a company request for its employee's drug or alcohol-testing information from the service agent to use in a legal proceeding as authorized in paragraph 1.a. of this section (e.g., the laboratory's data package) the service agent must provide the requested information to the company.

d. The company or service agent must immediately notify the employee in writing of any information the company releases under this section.

B. Release of Medical Information in Verification Process (§40.327).

1. MRO procedures regarding release of medical information gathered in the verification process

a. The MRO must, except as provided in paragraph 1.c of this section, report drug test results and medical information learned as part of the verification process to third parties without the employee's consent if the MRO determines in their reasonable medical judgment, that:

(1) The information is likely to result in the employee being determined to be medically unqualified under an applicable DOT agency regulation; or

(2) The information indicates that continued performance by the employee of his or her safety-sensitive function is likely to pose a significant safety risk.

b. The third parties to whom the MRO is authorized to provide information by this section

© Pipeline Testing Consortium, Inc. 2002

include the company, a physician or other health care provider responsible for determining the medical qualifications of the employee under an applicable DOT agency safety regulation, a SAP evaluating the employee as part of the return to duty process (See § 40.293(g)), a DOT agency, or the National Transportation Safety Board in the course of an accident investigation.

c. If the law of a foreign country (e.g., Canada) prohibits the MRO from providing medical information to the company, the MRO may comply with that prohibition.

C. Release of Information to Employees & Other Parties (§40.329 - §40.331).

1. Information that laboratories, MROs, and other service agents must release to employees

   a. The MRO or service agent must provide, within 10 business days of receiving a written request from an employee, copies of any records pertaining to the employee's use of alcohol and/ or drugs, including records of the employee's DOT-mandated drug and/ or alcohol tests. The MRO or service agent may charge no more than the cost of preparation and reproduction for copies of these records.

   b. The laboratory must provide, within 10 business days of receiving a written request from an employee, and made through the MRO, the records relating to the results of the employee's drug test (i.e., laboratory report and data package). The laboratory may charge no more than the cost of preparation and reproduction for copies of these records.

   c. The SAP must make available to an employee, on request, a copy of all SAP reports (See § 40.311). However, the SAP must redact follow-up testing information before providing it to the employee.

2. Additional parties that the company and service agent must release information (§40.331) - The company or service agent must release information under the following circumstances:

   a. If the company or service agent receives a specific written consent from an employee authorizing the release of information about that employee's drug or alcohol tests to an identified person, the company or service agent must provide the information to the identified person. For example, as an company, when you receive a written request from a former employee to provide information to a subsequent company the company or service agent must do so. In providing the information the company or service agent must comply with the terms of the employee's consent.

   b. The company must, upon request of DOT agency representatives must provide the following:

      (1) Access to your facilities used for this part and DOT agency drug and alcohol program functions.

      (2) All written, printed, and computer-based drug and alcohol program records and reports (including copies of name-specific records or reports), files, materials, data, documents/documentation, agreements, contracts, policies, and statements that are required by 49 CFR part 40 and DOT agency regulations. The company must provide this information at the company's principal place of business in the time required by the DOT agency.

      (3) All items in paragraph 2.b.(2) of this section must be easily accessible, legible, and provided in an organized manner. If electronic records do not meet these standards, they must be converted to printed documentation that meets these standards.

   c. The service agent must, upon request of DOT agency representatives, provide the following:

      (1) Access to the service agent's facilities used for 49 CFR Part 40 and all DOT

© Pipeline Testing Consortium, Inc. 2002

agency drug and alcohol program functions.

(2) All written, printed, and computer-based drug and alcohol program records and reports (including copies of name-specific records or reports), files, materials, data, documents/documentation, agreements, contracts, policies, and statements that are required by 49 CFR Part 40 and DOT agency regulations. The company must provide this information at the company's principal place of business in the time required by the DOT agency.

(3) All items in paragraph 2.c.(2) of this section must be easily accessible, legible, and provided in an organized manner. If electronic records do not meet these standards, they must be converted to printed documentation that meets these standards.

d. If requested by the National Transportation Safety Board as part of an accident investigation the service agent must provide information concerning post-accident tests administered after the accident.

e. If requested by a Federal, state or local safety agency with regulatory authority over the company or service agent or the employee, company or service agent must provide drug and alcohol test records concerning the employee.

f. Except as otherwise provided in 49 CFR Part 40, the laboratory must not release or provide a specimen or a part of a specimen to a requesting party, without first obtaining written consent from ODAPC. If a party seeks a court order directing the release of a specimen or part of a specimen contrary to any provision of 49 CFR Part 40 the laboratory must take necessary legal steps to contest the issuance of the order (e.g., seek to quash a subpoena, citing the requirements of §40.13. The requirement of 49 CFR Part 40 does not require the laboratory to disobey a court order, however.

g. Notwithstanding any other provision of Part 40, as an employer of Commercial Motor Vehicle (CMV) drivers holding commercial driving licenses (CDLs) or as a third-party administrator for owner-operator CMV drivers with CDLs, you are authorized to comply with State laws requiring you to provide to State CDL licensing authorities information about all violations of DOT drug and alcohol testing rules (including positive tests and refusals) by any CMV driver holding a CDL.

D. Record-Keeping Requirements for the Company (§199.227).

1. Records that are maintained by the company (§40.333).

a. The company must keep the following records for the following periods of time:

(1) The company must keep the following records for five years:

(a) Records of employee alcohol test results indicating an alcohol concentration of 0.02 or greater;

(b) Records of employee verified positive drug test results;

(c) Documentation of refusals to take required alcohol and/ or drug tests (including substituted or adulterated drug test results);

(d) SAP reports; and

(e) All follow-up tests and schedules for follow-up tests.

(f) All Management Information System (MIS) Annual reports.

(2) The company must keep records for three years of information obtained from previous employers under § 40.25 concerning drug and alcohol test results of

© Pipeline Testing Consortium, Inc. 2002

employees.

(3) The company must keep records related to the collection process (except calibration of evidential breath testing devices) and training for a minimum of two years.

(4) The company must keep records of negative and cancelled drug test results and alcohol test results with a concentration of less than 0.02 for one year.

b. The company does not have to keep records related to a program requirement that does not apply to the company (e.g., a maritime company who does not have a DOT-mandated random alcohol testing program need not maintain random alcohol testing records).

c. The company must maintain the records in a location with controlled access.

d. A service agent may maintain these records for the company. However, the service agent must ensure that the service agent can produce these records at the company's principal place of business in the time required by the DOT agency. For example, as a motor carrier, when an FMCSA inspector requests your records the company must ensure that the service agent can provide them within two working days.

e. If the company stores records electronically, where permitted by 49 CFR Part 40, the company must ensure that the records are easily accessible, legible, and formatted and stored in an organized manner. If electronic records do not meet these criteria, the company must convert them to printed documentation in a rapid and readily auditable manner, at the request of the DOT agency.

XII. EMPLOYEE ASSISTANCE PROGRAM (EAP) (§199.241)

A. Scope of Program.

1. The EAP will provide education and training materials on alcohol misuse to all covered employees. The materials should include:

   a. Informational material displayed on bulletin boards, employee break rooms, locker rooms, etc. and distributed to employees.

   b. A community service hot-line telephone number for employees to obtain assistance regarding alcohol misuse should be displayed on bulletin boards and distributed to covered employees.

   c. Distribution of company's policy regarding alcohol misuse to all new employees. The policy should be displayed in prominent places throughout the company.

2. Each covered employee shall receive a copy of the information specified in section III- C. The employee should acknowledge receipt of this information.

3. The informational materials should address:

   a. The effects of alcohol misuse on the individual's health, work, and personal life.

   b. The signs and symptoms of an alcohol problem for an employee or co-worker.

   c. Procedures for intervening evaluations and assistance in resolving problems associated with the misuse of alcohol.

   d. Procedures for intervening when an alcohol problem is suspected, including confrontation and referral to management for assistance.

4. The company may provide optional information and provisions concerning the following:

© Pipeline Testing Consortium, Inc. 2002

a. Company policies with respect to the use or possession of alcohol.
b. Consequences for an employee who is found to have a prohibited alcohol level, based on the company's authority independent of Part 199 requirements.
c. Any additional policies or consequences shall be clearly identified or described as being based on the company authority.

B. Supervisor Training (§199.241).

1. Supervisory personnel responsible for those employees covered under Part 199 and 40 will receive training under the alcohol misuse prevention plan.

2. The training shall include at least *one 60-minute period of training* on the physical, behavioral, speech, and performance indicators of probable alcohol misuse.

3. The supervisory alcohol training materials should address the specific, contemporaneous, articulable observations concerning the appearance, behavior, speech, and body odors of the employee who may be subjected to reasonable suspicion alcohol testing. It shall also address the physical and performance indicators of probable alcohol misuse.

4. The required reasonable suspicion observations shall be made by a company supervisor who is trained in detecting the symptoms of alcohol misuse.

XIII. RECORD-KEEPING PROCEDURES (§199.227)

A. General.

1. The company APM or designee shall maintain the alcohol testing records in accordance with the provisions set out in the AMPP. The APM shall maintain all records under lock and key for the company.

2. Records shall be maintained for the specified periods of time as required in 49 CFR Parts 199 and 49 CFR Part 40.

B. Record Retention Provisions.

1. The following types of records shall be maintained for a minimum period of five years.

   a. Records of employee alcohol test results with results indicating an alcohol concentration of 0.02 or greater.
   b. Documentation of refusals to take required alcohol tests.
   c. Calibration documentation of each EBT used in alcohol testing, including records of the results of external calibration checks.
   d. Employee referrals and evaluations.
   e. MIS annual alcohol misuse report data.
   f. Documentation pertaining to any missed tests (Example of Form in Appendix E - a post-accident or reasonable suspicion test that could not be conducted within the prescribed time frame).

2. The following types of records shall be maintained for a minimum period of two years.

   a. Records related to the collection process (except calibration of EBT devices)
   b. Records related to training.
   c. Records of the inspection and maintenance of each EBT used in employee testing.
   d. Documentation of the company's compliance with the QAP for each EBT it uses for alcohol testing under the AMPP.
   e. Records of the training and proficiency testing of each BAT/STT used in employee testing.
   f. Log books used in conjunction with EBTs.

© Pipeline Testing Consortium, Inc. 2002

3. Records of all test results below 0.02 shall be maintained for a minimum period of one year.

C. Maintenance of Specific Types of Records.

1. The following types of records related to the collection process shall be maintained:

   a. Collection log books, if used.
   b. Calibration documentation for EBT devices.
   c. Documentation of BAT/STT training.
   d. Documents generated in connection with decisions to administer reasonable suspicion alcohol tests.
   e. Documents generated in connection with decisions to administer post-accident alcohol tests.
   f. Documents verifying existence of a medical explanation of the inability of a covered employee to provide adequate breath for alcohol testing.

2. The following types of records related to test results:

   a. Company's copy of the alcohol test form, including the test results.
   b. Documents related to the refusal of any covered employee to submit to a required alcohol test.
   c. Documents presented by a covered employee to dispute the result of an alcohol test administered under the AMPP.

3. Records related to other violations of Part 199 as outlined in the AMPP.

4. The following types of records related to referrals and evaluations:

   a. Records pertaining to a determination by a SAP concerning a covered employee's need for assistance.

   b. Records concerning a covered employee's compliance with the recommendations of the SAP.

5. The following types of records related to education and training of employees and supervisors:

   a. Materials on alcohol misuse awareness, including a copy of the company's policy on alcohol misuse.

   b. Documentation of compliance with the requirements for access to all company facilities and records.

   c. Documentation of training provided to supervisors for the purposes of qualifying the supervisors to make a determination concerning the need for alcohol testing based on reasonable suspicion.

   d. Certification that any training conducted under the AMPP compliance with the requirements of 40 CFR Part 199 and 40.

D. Management Information System (MIS) Requirements (§199.229).

a. Each large pipeline operator (having more than 50 covered employees) shall submit an annual MIS report to PHMSA of its anti-drug testing using the Management Information System (MIS) form and instructions as required by 49 CFR Part 40 (at 40.25 and Appendix H to Part 40), not later than March 15 of each year for the prior calendar year (January 1 through December 31). The Administrator shall require by written notice that small operators (50 or fewer covered employees) not otherwise required to submit annual MIS reports to prepare and submit such reports to PHMSA.

b. Each report, required under this section shall be submitted to the Office of Pipeline Safety, Pipeline Hazardous Materials and Safety Administration (PHMSA). The operators may submit a

© Pipeline Testing Consortium, Inc. 2002

paper report or data electronically using the version of the MIS form provided by DOT.

c. As a company, you may use a service agent (e.g., C/TPA) to perform random selections for your company; and your covered employees may be part of a larger random testing pool of covered employees. However, you must ensure that the service agent you use is testing at the appropriate percentage established for the industry and that only covered employees are in the random testing pool.

d. Each operator that has a covered employee who performs multi-DOT agency functions (e.g., an employee performs pipeline maintenance duties and drives a commercial motor vehicle), count the employee only on the MIS report for the DOT agency under which he or she is randomly tested. Normally, this will be the DOT agency under which the employee performs more than 50% of his or her duties. Operators may have to explain the testing data for these employees in the event of a DOT agency inspection or audit.

e. A service agent (e.g., Consortia/Third Party Administrator as defined in 49 CFR Part 40) may prepare the MIS report on behalf of the operator. However, each report shall be certified by the operator's anti-drug manager or designated representative for accuracy and completeness.

f. Specific pipeline covered employees information will be maintained to include the following elements:

- Company name, address, name of certifying official, e-mail address (if applicable), signature, telephone number, date certified, prepared by (if different) and consortium/TPA name and telephone number
- Check the appropriate DOT agency for which the reporting is being submitted
- Covered Employees: (A) Enter the total number of Safety-sensitive Employees in all employee categories and (B) enter the total number of employee categories.
- Enter "Employee Category" and "Total Number of Employees in this Category"
- Total Number of Test Results (Should equal the sum of columns 2,3,7,and 8) for Pre-employment, Post-Accident, Reasonable Suspicion/Cause, Return-to-Duty and Follow-up.
- Enter Number of Screening Tests With Results Below 0.02 for Pre-employment, Post-Accident, Reasonable Suspicion/Cause, Return-to-Duty and Follow-up
- Enter Number of Screening Tests With Results Below 0.02 for Pre-employment, Post-Accident, Reasonable Suspicion/Cause, Return-to-Duty and Follow-up
- Enter Number of Screening Tests With Results 0.02 or Greater for Pre-employment, Post-Accident, Reasonable Suspicion/Cause, Return-to-Duty and Follow-up
- Enter Number of Confirmation Tests Results for Pre-employment, Post-Accident, Reasonable Suspicion/Cause, Return-to-Duty and Follow-up
- Enter Number of Confirmation Tests With Results 0.02 Through 0.039 for Pre-employment, Post-Accident, Reasonable Suspicion/Cause, Return-to-Duty and Follow-up
- Enter Number of Confirmation Tests With Results 0.04 or Greater for Pre-employment, Post-Accident, Reasonable Suspicion/Cause, Return-to-Duty and Follow-up
- Enter Number of Tests for "Shy Lung" With No Medical Explanation
- Enter Number of Tests for Other Refusals to Submit to Testing for Pre-employment, Post-Accident, Reasonable Suspicion/Cause, Return-to-Duty and Follow-up
- Enter Number of Cancelled Tests for Pre-employment, Post-Accident, Reasonable Suspicion/Cause, Return-to-Duty and Follow-up

g. **The company shall prepare and submit to the appropriate pipeline operator and/or designated agent for contractor monitoring the proper statistical data report (as directed by the pipeline operator) twice a year. The first report shall cover the 1st and 2nd quarters of the company's testing program for the current calendar year and shall be due no later than 30-days after the end of the 2nd quarter (June 30). The second report shall cover the 3rd and 4th quarters of the company's testing program and shall be due no later than 30-days after the end of the 4th quarter (January 30 of the calendar year).**

E. Contractor Submission of DOT Management Information System (MIS) report to Pipeline Hazardous Materials & Safety Administration (PHMSA).

© Pipeline Testing Consortium, Inc. 2002

1. General. The contractor shall be required to submit to the Office of Pipeline Safety (OPS), Pipeline Hazardous Materials and Safety Administration (PHMSA) a copy of the contractor's statistical data report for the previous calendar year on the DOT Management Information System data collection form. This annual statistical data report can be submitted by mail or by online transmission.

2. DOT MIS Form. A copy of the MIS form is available on DOT's website at: **www.dot.gov/ost/dapc/testingpubs/**mis_form**.pdf**

F. Maintenance and Disclosure of Records Concerning EBTs and BAT/STTs.

1. The company or its designated agent shall maintain the following records for a minimum period of two years.

   a. All records pertaining to the inspection and maintenance of each EBT used in alcohol testing for its employees.
   b. Documentation of the company's compliance with the QAP for each EBT it uses for testing employees under the alcohol testing regulations as set forth in Part 199 and 40.
   c. All records pertaining to the training and proficiency testing of each BAT/STT used by the company or its designated alcohol testing sites for alcohol testing its employees.
   d. All log books, if applicable, used in conjunction with the alcohol testing provisions.

2. The company or its designated agent shall maintain for a minimum of five years records pertaining to the calibration procedures for each EBT used in conjunction with the alcohol testing as set forth in Part 199 and 40. These records shall also include documentation concerning the results of all external calibration checks conducted on each EBT.

3. The company shall maintain all records required by this section and shall release this information only under the terms as specified in Section XI of this plan. The company will ensure that records regarding the EBTs and BAT/STTs are maintained in a confidential manner and are released only in accordance with applicable federal regulations as outlined in this plan.

XIV. CONTRACTOR MONITORING (§199.245)

A. General. The contractor company will include a clause in the contracts that alcohol breath testing, education, and training may be addressed by the contractor/sub-contractor in accordance with Part 199 and Part 40 for covered functions. The company shall be responsible for ensuring compliance with the provisions of Part 199 and 40.

B. Records and Access.

1. Contractor/Sub-Contractors shall retain copies of appropriate alcohol testing records as required by 49 CFR Part 199 and Part 40.

2. The records and access to the contractor/sub-contractor's property shall be readily accessible for inspection by the pipeline operator, contractor, PHMSA, and representatives of those state agencies under which jurisdiction the company operates.

C. Contractor Coverage.

1. Confirmation of contractor compliance/monitoring - Specific guidance on how to develop an effective contractor compliance and monitoring program is outlined herein.

2. The company can, as an alternative to the above guidance provide coverage for the contractors employees by including them in the company's alcohol testing program for the duration of the contract or work project. When contractor employees are covered under the company's AMPP, the contractor shall ensure that their employees comply with all the provisions contained in the company's AMPP, unless some provisions for exempts are authorized.

© Pipeline Testing Consortium, Inc. 2002

D. Procedures for Determining Compliance.

1. Qualifying Potential Contractor(s). Qualifications of a potential contractor as it pertains to alcohol testing policies/procedures is assured by requesting the potential contractor to submit a copy of its AMPP for review and compliance with PHMSA/DOT regulations. After review of the AMPP is completed, written correspondence to the contractor will advise it whether or not the AMPP plan is acceptable or in need of further additions, deletions, revisions or clarifying language. The review of the contractor plan shall be completed utilizing the criteria established in the PHMSA Alcohol Misuse Inspection form. Addendum's made to the contractor's plan shall be attached to the previously submitted AMPP plan. Upon approval of the addendum, a letter of acceptance is then sent to the contractor. The contractor/sub-contractor is now eligible to bid on company contract work that would be covered under Parts 199 and 40.

2. Monitoring Contractor's Compliance. The contractor may be required to provide information on their employees who will perform covered functions for the operator. This information may include the name and job title of its employees who will perform any work or functions covered by Part 199 under that contract. A list of each contractor's covered employees may be distributed to appropriate company field management personnel and job sites.

3. Statistical Submission. All contractors will be required to submit AMPP testing statistical information on a periodical basis that may be based on the duration of the contract. Typically this requirement will be conducted on a monthly or quarterly basis. The company may require a more frequent schedule for submission of data should they determine a need for such statistics.

4. Statistical Record Retention. The company shall maintain a complete file on each contractor/s statistical alcohol testing data reports. The company shall make available these reports when requested by the PHMSA Administrator, designated representative, or representatives of those state agencies under which jurisdiction the company operates.

5. Access to Records/Property. The company, contractor will allow access to property and records by the operator, the Administrator, contractor, and if the operator is subject to the jurisdiction of a state agency, a representative of the state agency for the purpose of monitoring the operator's compliance with the requirements of the regulations.

APPENDIX C

I. Alcohol Testing Personnel - 49 CFR Part 40 – Subpart J

A. Conducting DOT alcohol tests (§40.211).

1. Screening test technicians (STTs) and breath alcohol technicians (BATs) meeting their respective requirements of 49 CFR Part 40 are the only people authorized to conduct DOT alcohol tests.

2. An STT can conduct only alcohol screening tests, but a BAT can conduct alcohol screening and confirmation tests.

3. The BAT or STT qualified immediate supervisor of a particular employee may not act as the STT or BAT when that employee is tested, unless no other STT or BAT is available and DOT agency regulations do not prohibit the company from doing so.

B. Training requirements for STTs and BATs (§40.213) – To be permitted to act as a BAT or STT in the DOT alcohol testing program the BAT or STT must meet the requirements of 49 CFR Part 40, Subpart J.

1. Basic information. The STT and/or BAT must be knowledgeable about the alcohol testing procedures in this part and the current DOT guidance.

2. Qualification training. The STT and/or BAT must receive qualification training meeting the requirements of this paragraph;

   a. Qualification training must be in accordance with the DOT Model BAT or STT Course, as applicable. The training can also be provided using a course of instruction equivalent to the DOT Model Courses. On request, ODAPC will review BAT and STT instruction courses for equivalency.

   b. Qualification training must include training to proficiency in using the alcohol testing procedures of this part and in the operation of the particular alcohol testing device(s) (i.e., the ASD(s) or EBT(s)) utilized.

   c. The training must emphasize that the BAT or STT is responsible for maintaining the integrity of the testing process, ensuring the privacy of employees being tested, and avoiding conduct or statements that could be viewed as offensive or inappropriate.

   d. The instructor must be an individual who has demonstrated necessary knowledge, skills, and abilities by regularly conducting DOT alcohol tests as an STT or BAT, as applicable, for a period of at least a year, who has conducted STT or BAT training, as applicable, under this part for a year, or who has successfully completed a " train the trainer" course.

3. Initial Proficiency Demonstration. Following the completion of qualification training under paragraph B.2. of this section, the BAT or STT must demonstrate proficiency in alcohol testing under this part by completing seven consecutive error-free mock tests (BATs) or five consecutive error-free tests (STTs).

   a. Another person must monitor and evaluate the BAT or STT performance, in person or by a means that provides real-time observation and interaction between the instructor and trainee, and attest in writing that the mock collections are " error-free. " This person must be an individual who meets the requirements of paragraph B.2.d. of this section.

   b. These tests must use the alcohol testing devices (e.g., EBT(s) or ASD(s)) that

© Pipeline Testing Consortium, Inc. 2002

will be utilized by the BAT or STT.

c. If the STT who will be using an ASD that indicates readings by changes, contrasts, or other readings in color, the STT must demonstrate as part of the mock test that the STT was able to discern changes, contrasts, or readings correctly.

4. Schedule for qualification training and initial proficiency demonstration. The following is the schedule for qualification training and the initial proficiency demonstration the BAT or STT must meet:

a. A collector who became a BAT or STT before August 1, 2001, was required to have met the requirements set forth in paragraphs B.2. and B.3. of this section, and the BAT or STT does not have to meet them again.

b. A collector who becomes a BAT or STT on or after August 1, 2001, must meet the requirements of paragraphs B.2 and B.3. of this section before performing BAT or STT functions.

5. Refresher training. No less frequently than every five years from the date on which the BAT or STT satisfactorily complete the requirements of paragraphs B.2. and B.3. of this section, the BAT or STT must complete refresher training that meets all the requirements of paragraphs B.2. and B.3. of this section. If you are a BAT or STT who completed qualification training before January 1, 1998, then the BAT or STT is not required to complete refresher training until January 1, 2003.

6. Error Correction Training. If the BAT or STT makes a mistake in the alcohol testing process that causes a test to be cancelled (i.e., a fatal or uncorrected flaw), the BAT or STT must undergo error correction training. This training must occur within 30 days of the date the BAT or STT is notified of the error that led to the need for retraining.

a. Error correction training must be provided and the BAT or STT proficiency documented in writing by a person who meets the requirements of paragraph (B)(2)(d) of this section.

b. Error correction training is required to cover only the subject matter area(s) in which the error that caused the test to be cancelled occurred.

c. As part of the error correction training, the BAT or STT must demonstrate his/her proficiency in the alcohol testing procedures of 49 CFR part 40 by completing three consecutive error-free mock tests. The mock tests must include one uneventful scenario and two scenarios related to the area(s) in which the BAT or STT error(s) occurred. The person providing the training must monitor and evaluate the BAT or STT performance and attest in writing that the mock tests were error-free.

7. Documentation. The BAT or STT must maintain documentation showing that he/she currently meet all requirements of this section. The BAT or STT must provide this documentation on request to DOT agency representatives and to the company and C/TPAs who are negotiating to use the BAT or STT services.

8. Other persons who may serve as BATs or STTs.

a. Anyone meeting the requirements of this section to be a BAT may act as an STT, provided that the individual has demonstrated initial proficiency in the operation of the ASD that he or she is using, as provided in paragraph B.3.

b. Law enforcement officers who have been certified by state or local governments to conduct breath alcohol testing are deemed to be qualified as BATs. They are not required to also complete the training requirements of this section in order to act as BATs. In order for a test conducted by such an officer to be accepted

© Pipeline Testing Consortium, Inc. 2002

under DOT alcohol testing requirements, the officer must have been certified by a state or local government to use the EBT or ASD that was used for the test.

C. Information about DER that company must provide to BATs and STTs (§40.215).

1. The company must provide to the STTs and BATs the name and telephone number of the appropriate DER (and C/ TPA, where applicable) to contact about any problems or issues that may arise during the testing process.

D. Additional information on the role of STTs and BATs may be found in the following areas of 49 CFR Part 40 (§40.217).

1. Other information on the role and functions of STTs and BATs can be found in the following sections of 49 CFR Part 40.

§ 40.3-Definitions.
§ 40.223-Responsibility for supervising employees being tested.
§ 40.225-40.227-Use of the alcohol testing form.
§ 40.241-40.245-Screening test procedures with ASDs and EBTs.
§ 40.251-40.255-Confirmation test procedures.
§ 40.261-Refusals to test.
§ 40.263-40.265-Insufficient saliva or breath.
§ 40.267-Problems requiring cancellation of tests.
§ 40.269-40.271-Correcting problems in tests.

II. Testing Sites, Forms, Equipment and Supplies Used in Alcohol Testing 49 CFR Part 40 – Subpart K

A. Procedure for conducting an alcohol test and location (§40.221).

1. A DOT alcohol test must take place at an alcohol testing site meeting the requirements of this section.

2. A collector operating an alcohol testing site must ensure that it meets the security requirements of §40.223.

3. A collector operating an alcohol testing site must ensure that it provides visual and aural privacy to the employee being tested, sufficient to prevent unauthorized persons from seeing or hearing test results.

4. A collector operating an alcohol testing site must ensure that it has all needed personnel, materials, equipment, and facilities to provide for the collection and analysis of breath and/ or saliva samples, and a suitable clean surface for writing.

5. If an alcohol testing site fully meeting all the visual and aural privacy requirements is not readily available, this part allows a reasonable suspicion or post-accident test to be conducted at a site that partially meets these requirements. In this case, the site must afford visual and aural privacy to the employee to the greatest extent practicable.

6. An alcohol testing site can be in a medical facility, a mobile facility (e.g., a van), a dedicated collection facility, or any other location meeting the requirements of this section.

B. Steps that must be taken to protect the security of alcohol testing sites (§40.223).

1. The BAT, STT, or other person operating an alcohol testing site, he/she must prevent unauthorized personnel from entering the testing site.

   a. The only people to be treated as authorized persons are employees being

© Pipeline Testing Consortium, Inc. 2002

tested, BATs, STTs, and other alcohol testing site workers, DERs, employee representatives authorized by the company (e.g., on the basis of company policy or labor-management agreement), and DOT agency representatives.

b. The BAT or STT must ensure that all persons are under the supervision of a BAT or STT at all times when permitted into the site.

c. The BAT or STT may remove any person who obstructs, interferes with, or causes unnecessary delay in the testing process.

2. The BAT or STT must not allow any person other than the BAT or STT, the employee, or a DOT agency representative to actually witness the testing process (See §40.241-40.255).

3. If the BAT or STT is operating an alcohol testing site he/she must ensure that when an EBT or ASD is not being used for testing, it is stored in a secure place.

4. If the BAT or STT is operating an alcohol testing site he/she must ensure that no one other than BATs or other employees of the site have access to the site when an EBT is unsecured.

5. The BAT or STT is to avoid distraction that could compromise security, he/she is limited to conducting an alcohol test for only one employee at a time.

a. When an EBT screening test on an employee indicates an alcohol concentration of 0.02 or higher, and the same EBT will be used for the confirmation test, the BAT is not allowed to use the EBT for a test on another employee before completing the confirmation test on the first employee.

b. The BAT who will conduct both the screening and the confirmation test is to complete the entire screening and confirmation process on one employee before starting the screening process on another employee.

c. The BAT or STT is not allowed to leave the alcohol testing site while the testing process for a given employee is in progress, except to notify a supervisor or contact a DER for assistance in the case an employee or other person who obstructs, interferes with, or unnecessarily delays the testing process.

C. Form to be used for an alcohol test (§40.225).

1. The DOT Alcohol Testing Form (ATF) must be used for every DOT alcohol test. Beginning February 1, 2002. The ATF must be a three-part carbonless manifold form. The ATF can be found in 49 CFR Part 40, Appendix G.

2. The company in using the DOT alcohol-testing program is not permitted to modify or revise the ATF except as follows:

a. The company may include other information needed for billing purposes, outside the boundaries of the form.

b. The company may use a ATF directly generated by an EBT which omits the space for affixing a separate printed result to the ATF, provided the EBT prints the result directly on the ATF.

c. The company may use an ATF that has the company's name, address, and telephone number preprinted. In addition, a C/TPA's name, address, and telephone number may be included, to assist with negative results.

d. The company may use an ATF in which all pages are printed on white paper. The company may modify the ATF by using colored paper, or have clearly discernable borders or designation statements on Copy 2 and Copy 3. When

© Pipeline Testing Consortium, Inc. 2002

colors are used, they must be green for Copy 2 and Blue for Copy 3.

e. The BAT or STT may add, on the " Remarks" line of the ATF, the name of the DOT agency under whose authority the test occurred.

f. The BAT or STT may use a ATF that has your name, address, and telephone number preprinted, but under no circumstances can your signature be preprinted.

3. The company may use an equivalent foreign-language version of the ATF approved by ODAPC. The company may use such a non-English language form only in a situation where both the employee and BAT/STT understand and can use the form in that language.

D. Company's use of ATF for non-DOT tests or non-DOT forms for DOT tests (§40.227).

1. The company, BAT, or STT is prohibited from using the ATF for non-DOT alcohol tests. The company, BAT, or STT are also prohibited from using non-DOT forms for DOT alcohol tests. Doing either will subject the company, BAT, or STT to enforcement action under DOT agency regulations.

2. If the STT or BAT, either by mistake, or as the only means to conduct a test under difficult circumstances (e.g., post-accident test with insufficient time to obtain the ATF), uses a non-DOT form for a DOT test, the use of a non-DOT form does not, in and of itself, require the company or service agent to cancel the test. However, in order for the test to be considered valid, a signed statement must be obtained from the STT or BAT in accordance with § 40.271(b).

E. Devices to be used to conduct alcohol screening tests (§40.229).

1. EBTs and ASDs on the NHTSA conforming products lists (CPL) for evidential and non-evidential devices are the only devices the BAT or STT is allowed to use to conduct alcohol screening tests under 49 CFR Part 40. The BAT or STT may use an ASD that is on the NHTSA CPL for DOT alcohol tests only if there are instructions for its use in 49 CFR Part 40. An ASD can be used only for screening tests for alcohol, and may not be used for confirmation tests.

F. Devices to be used to conduct alcohol confirmation tests (§40.231).

1. EBTs on the NHTSA CPL for evidential devices that meet the requirements of paragraph F.2. of this section are the only devices the company may use to conduct alcohol confirmation tests under this part. Note that, among devices on the CPL for EBTs, only those devices listed without an asterisk (*) are authorized for use in confirmation testing in the DOT alcohol testing program.

2. To conduct a confirmation test, you must use an EBT that has the following capabilities:

a. Provides a printed triplicate result (or three consecutive identical copies of a result) of each breath test;

b. Assigns a unique number to each completed test, which the BAT and employee can read before each test and which is printed on each copy of the result;

c. Prints, on each copy of the result, the manufacturer's name for the device, its serial number, and the time of the test;

d. Distinguishes alcohol from acetone at the 0.02 alcohol concentration level;

e. Tests an air blank; and

© Pipeline Testing Consortium, Inc. 2002

f. Performs an external calibration check.

G. Requirements for proper use and care of EBTs (§40.233).

1. An EBT manufacturer must submit, for NHTSA approval, a quality assurance plan (QAP) for the EBT before NHTSA places the EBT on the CPL.

   a. The manufacturer's QAP must specify the methods used to perform external calibration checks on the EBT, the tolerances within which the EBT is regarded as being in proper calibration, and the intervals at which these checks must be performed. In designating these intervals the manufacturer's QAP must take into account factors like frequency of use, environmental conditions (e.g., temperature, humidity, altitude) and type of operation (e.g., stationary or mobile).

   b. The manufacturer's QAP must also specify the inspection, maintenance, and calibration requirements and intervals for the EBT.

2. The manufacturer must include, with each EBT, instructions for its use and care consistent with the QAP.

3. The user of the EBT (e.g., company, service agent) must do the following:

   a. The user must follow the manufacturer's instructions, including performance of external calibration checks at the intervals the instructions specify.

   b. In conducting external calibration checks, the user must use only calibration devices appearing on NHTSA's CPL for " Calibrating Units for Breath Alcohol Tests. "

   c. If an EBT fails an external check of calibration, the user must take the EBT out of service. The user may not use the EBT again for DOT alcohol testing until it is repaired and passes an external calibration check.

   d. The user must maintain records of the inspection, maintenance, and calibration of EBTs as provided in §40.333(a)(2).

   e. The user must ensure that inspection, maintenance, and calibration of the EBT are performed by its manufacturer or a maintenance representative certified either by the manufacturer or by a state health agency or other appropriate state agency.

H. Requirements for proper use and care of ASDs (§40.235).

1. The ASD manufacturer must submit, for NHTSA approval, a QAP for the ASD before NHTSA places the ASD on the CPL. The manufacturer's QAP must specify the methods used for quality control checks, temperatures at which the ASD must be stored and used, the shelf life of the device, and environmental conditions (e.g., temperature, altitude, humidity) that may affect the ASD's performance.

2. The manufacturer must include with each ASD instructions for its use and care consistent with the QAP. The instructions must include directions on the proper use of the ASD, and, where applicable the time within which the device must be read, and the manner in which the reading is made.

3. The user of the ASD (e.g., company, STT) must follow the QAP instructions.

4. The user is not permitted to use an ASD that does not pass the specified quality control checks or that has passed its expiration date.

© Pipeline Testing Consortium, Inc. 2002

5. The company, with respect to breath ASDs, must also follow the device use and care requirements of §40.233.

III. Alcohol Screening Tests – 49 CFR Part 40 – Subpart L

A. First steps in alcohol screening test (§40.241).

1. The BAT or STT will take the following steps to begin all alcohol screening tests, regardless of the type of testing device the BAT or STT is using:

   a. When a specific time for an employee's test has been scheduled, or the collection site is at the employee's worksite, and the employee does not appear at the collection site at the scheduled time, contact the DER to determine the appropriate interval within which the DER has determined the employee is authorized to arrive. If the employee's arrival is delayed beyond that time, the DER must be notified that the employee has not reported for testing. In a situation where a C/TPA has notified an owner/operator or other individual employee to report for testing and the employee does not appear, the C/TPA must notify the employee that he or she has refused to test.

   b. Ensure that, when the employee enters the alcohol-testing site, the alcohol testing process begins without undue delay. For example, do not wait because the employee says he or she is not ready or because an authorized company or employee representative is delayed in arriving.

      (1) If the employee is also going to take a DOT drug test, ensure that the alcohol test is completed before the urine collection process begins.

      (2) If the employee needs medical attention (e.g., an injured employee in an emergency medical facility who is required to have a post-accident test), do not delay this treatment to conduct a test.

   c. Require the employee to provide positive identification. A photo ID issued by the company (other than in the case of an owner-operator or other self-employer individual) or a Federal, state, or local government (e.g., a driver's license). Faxes or photocopies of identification are not acceptable. Positive identification by a company representative (not a co-worker or another employee being tested) is also acceptable. If the employee cannot produce positive identification, the collector must contact the DER to verify the identity of the employee.

   d. If the employee asks, the BAT or STT must provide identification to the employee. The collector's identification must include name and company's name but is not required to include a picture, address, or telephone number.

   e. Explain the testing procedure to the employee, including showing the employee the instructions on the back of the ATF.

   f. Complete Step 1 of the ATF.

   g. Direct the employee to complete Step 2 on the ATF and sign the certification. If the employee refuses to sign this certification, you must document this refusal on the " Remarks" line of the ATF and immediately notify the DER. This is a refusal to test.

B. Procedure for alcohol screening test using EBT or non-evidential breath ASD (§40.243).

1. The BAT or STT must take the following steps:

   a. Select, or allow the employee to select, an individually wrapped or sealed

© Pipeline Testing Consortium, Inc. 2002

mouthpiece from the testing materials.

b. Open the individually wrapped or sealed mouthpiece in view of the employee and insert it into the device in accordance with the manufacturer's instructions.

c. Instruct the employee to blow steadily and forcefully into the mouthpiece for at least six seconds or until the device indicates that an adequate amount of breath has been obtained.

d. Show the employee the displayed test result.

e. If the device is one that prints the test number, testing device name and serial number, time and result directly onto the ATF, check to ensure that the information has been printed correctly onto the ATF.

f. If the device is one that prints the test number, testing device name and serial number, time and result, but on a separate printout rather than directly onto the ATF, affix the printout of the information to the designated space on the ATF with tamper-evident tape or use a self-adhesive label that is tamper-evident.

g. If the device is one that does not print the test number, testing device name and serial number, time, and result, or it is a device not being used with a printer, record this information in Step 3 of the ATF.

C. Procedure for an alcohol screening test using a saliva ASD (§40.245)

1. The STT or BAT must take the following steps when using the salvia ASD:

a. Check the expiration date on the device or on the package containing the device and show it to the employee. The STT or BAT may not use the device after its expiration date.

b. Open an individually wrapped or sealed package containing the device in the presence of the employee.

c. Offer the employee the opportunity to use the device. If the employee uses it, the STT or BAT must instruct the employee to insert it into his or her mouth and use it in a manner described by the device's manufacturer.

d. If the employee chooses not to use the device, or in all cases in which a new test is necessary because the device did not activate (See paragraph 1.g. of this section), the STT or BAT must insert the device into the employee's mouth and gather saliva in the manner described by the device's manufacturer. The STT or BAT must wear single-use examination or similar gloves while doing so and change them following each test.

e. When the device is removed from the employee's mouth the STT or BAT must follow the manufacturer's instructions regarding necessary next steps in ensuring that the device has activated.

f. Instructions to follow:

(1) If the STT or BAT was unable to successfully follow the procedures of paragraphs 1.c. through 1.e. of this section (e.g., the device breaks, you drop the device on the floor), the STT or BAT must discard the device and conduct a new test using a new device.

(2) The new device the STT or BAT uses must be one that has been under the STTs control or that of the company before the test.

(3) The STT or BAT must note on the " Remarks" line of the ATF the

© Pipeline Testing Consortium, Inc. 2002

reason for the new test. (Note: The STT or BAT may continue using the same ATF with which you began the test.)

(4) The STT or BAT must offer the employee the choice of using the device or having the STT or BAT use it unless the employee, in the opinion of the STT or BAT, was responsible (e.g., the employee dropped the device) for the new test needing to be conducted.

(5) If the STT or BAT is unable to successfully follow the procedures of paragraphs 1.c. through 1.e. of this section on the new test, you must end the collection and put an explanation on the " Remarks" line of the ATF.

(6) The STT or BAT must then direct the employee to take a new test immediately, using an EBT for the screening test.

g. If the STT or BAT is able to successfully follow the procedures of paragraphs 1.c. – 1.e. of this section, but the device does not activate the STT or BAT must discard the device and conduct a new test, in the same manner as provided in paragraph 1.f. of this section. In this case, the STT or BAT must place the device into the employee's mouth to collect saliva for the new test.

h. The STT or BAT must read the result displayed on the device no sooner than the device's manufacturer instructs. In all cases the result displayed must be read within 15 minutes of the test. The STT or BAT must then show the device and its reading to the employee and enter the result on the ATF.

i. The STT or BAT must never re-use devices, swabs, gloves or other materials used in saliva testing.

j. The STT or BAT must note the fact that you used a saliva ASD in Step 3 of the ATF.

2. As the STT or BAT, you must take the following steps when using the breath tube ASD.

a. Check the expiration date on the device or on the package containing the device and show it to the employee. The STT or BAT may not use the device after its expiration date.

b. Remove a device from the package and break the tube’s ampule in the presence of the employee.

c. Secure an inflation bag on to the appropriate end of the device, as directed by the manufacturer on the device’s instructions.

d. Offer the employee the opportunity to use the device. If the employee chooses to use (e.g. hold) the device, instruct the employee to blow forcefully and steadily into the lowing end of the device until the inflation bag fills with air (approximately 12 seconds).

e. If the employee chooses not to hold the device, you must hold it and provide the use instructions in paragraph 2.d. of this section.

f. When the employee completes the breath process, take the device from the employee (or if you were holding it, remove it from the employee’s mouth): remove the inflation bag: and either hold the device or place it on a clean flat surface while waiting for the reading to appear.

g. Instructions to follow:

(1) If you were unable to successfully follow the procedures of paragraphs

© Pipeline Testing Consortium, Inc. 2002

2.d. through 2.f. of this section (e.g., the device breaks apart, the employee did not fill the inflation bag), you must discard the device and conduct a new test using a new one.

(2) The new device you use must be one that has been under your control or that of the employee before the test.

(3) You must note on the "Remarks" line of the ATF the reason for the new test. (Note: You may continue using the same ATF with which you began the test).

(4) You must offer the employee the choice of holding the device or having you hold it unless the employee, in your opinion, was responsible (e.g., the employee failed to fill the inflation bag) for the new test needing to be conducted.

(5) If you were unable to successfully follow the procedures of paragraphs 2.d. through 2.f. of this section on the new test, you must end the collection and put an explanation on the "Remarks" line on the ATF.

(6) You must then direct the employee to take a new test immediately, using another type of ASD (e.g., saliva device) or an EBT.

h. If you were able to successfully follow the procedures of paragraphs 2.d. through 2.f. of this section, you must compare the color of the crystals in the device with the colored crystals on the manufacturer-produced control tube no sooner than the manufacturer instructs. In all cases color comparisons must take place within 15 minutes of the test.

i. You must follow the manufacturer's instructions for determining the result of the test. You must then show both the device and the control tube side-by-side to the employee and record the result on the ATF.

j. You must never re-use devices or gloves used in the breath tube testing. The inflation bag must be voided of air following removal from the device. One inflation bag can be used for up to 10 breath tube tests.

k. You must note the fact that you used a breath tube device in Step 3 of the ATF.

D. Procedures the BAT or STT is to follow after a screening test result (§40.247).

1. If the test result is an alcohol concentration of less than 0.02, the BAT or STT must do the following:

   a. Sign and date Step 3 of the ATF; and

   b. Transmit the result to the DER in a confidential manner, as provided in §40.255

2. If the test result is an alcohol concentration of 0.02 or higher the BAT or STT must direct the employee to take a confirmation test.

   a. The BAT who will conducts the confirmation test must then conduct the test using the procedures beginning at §40.251.

   b. If a different BAT will conduct the confirmation test, direct the employee to take a confirmation test, sign and date Step 3 of the ATF, and give the employee Copy 2 of the ATF.

   c. If the confirmation test will be performed at a different site from the screening test the BAT must take the following additional steps:

© Pipeline Testing Consortium, Inc. 2002

(1) Advise the employee not to eat, drink, put anything (e.g., cigarette, chewing gum) into his or her mouth, or belch;

(2) Tell the employee the reason for the waiting period required by section §40.251(a) (i.e., to prevent an accumulation of mouth alcohol from leading to an artificially high reading);

(3) Explain that following the BAT instructions concerning the waiting period is to the employee's benefit;

(4) Explain that the confirmation test will be conducted at the end of the waiting period, even if the instructions have not been followed;

(5) Note on the " Remarks" line of the ATF that the waiting period instructions were provided;

(6) Instruct the person accompanying the employee to carry a copy of the ATF to the BAT who will perform the confirmation test; and

(7) Ensure that the BAT or another BAT, STT, or company representative observe the employee as he or she is transported to the confirmation testing site. The BAT or STT must direct the employee not to attempt to drive a motor vehicle to the confirmation testing site.

3. If the screening test is invalid the BAT or STT must tell the employee the test is cancelled and note the problem on the " Remarks" line of the ATF. If practicable, repeat the testing process (See § 40.271).

IV. Alcohol Confirmation Tests - 49 CFR Part 40 – Subpart M

A. First steps in an alcohol confirmation test (§40.251). The BAT for an alcohol confirmation test must follow these steps to begin the confirmation test process:

1. The BAT must carry out a requirement for a waiting period before the confirmation test, by taking the following steps:

   a. The BAT must ensure that the waiting period lasts at least 15 minutes, starting with the completion of the screening test. After the waiting period has elapsed, the BAT should begin the confirmation test as soon as possible, but not more than 30 minutes after the completion of the screening test.

      (1) If the confirmation test is taking place at a different location from the screening test (See §40.247(b)(3)) the time of transit between sites counts toward the waiting period if the STT or BAT who conducted the screening test provided the waiting period instructions.

      (2) if the BAT cannot verify, through review of the ATF, that waiting period instructions were provided, then the BAT must carry out the waiting period requirement.

      (3) The BAT or another BAT or STT, or a company representative, must observe the employee during the waiting period.

   b. Concerning the waiting period, the BAT must tell the employee:

      (1) Not to eat, drink, put anything (e.g., cigarette, chewing gum) into his or her mouth, or belch;

      (2) The reason for the waiting period (i.e., to prevent an accumulation of mouth alcohol from leading to an artificially high reading);

© Pipeline Testing Consortium, Inc. 2002

(3) That following the BAT's instructions concerning the waiting period is to the employee's benefit; and

(4) That the confirmation test will be conducted at the end of the waiting period, even if the instructions have not been followed.

c. If the BAT becomes aware that the employee has not followed the instructions, the BAT must note this on the " Remarks" line of the ATF.

2. If the BAT did not conduct the screening test for the employee the BAT must require positive identification of the employee, explain the confirmation procedures, and use a new ATF. The BAT must note on the " Remarks" line of the ATF that a different BAT or STT conducted the screening test.

3. Complete Step 1 of the ATF.

4. Direct the employee to complete Step 2 on the ATF and sign the certification. If the employee refuses to sign this certification the BAT must document this refusal on the " Remarks" line of the ATF and immediately notify the DER. This is a refusal to test.

5. Even if more than 30 minutes have passed since the screening test result was obtained the BAT must begin the confirmation test procedures in §40.253, not another screening test.

6. The BAT must note on the " Remarks" line of the ATF the time that elapsed between the two events, and if the confirmation test could not begin within 30 minutes of the screening test, the reason why.

7. Beginning the confirmation test procedures after the 30 minutes have elapsed does not invalidate the screening or confirmation tests, but it may constitute a regulatory violation subject to DOT agency sanction.

B. Procedures for conducting an alcohol confirmation test (§40.253) - The BAT conducting an alcohol confirmation test must follow these steps in order to complete the confirmation test process:

1. In the presence of the employee the BAT must conduct an air blank on the EBT the BAT is using before beginning the confirmation test and show the reading to the employee.

(1) If the reading is 0.00, the test may proceed. If the reading is greater than 0.00, the BAT must conduct another air blank.

(2) If the reading on the second air blank is 0.00, the test may proceed. If the reading is greater than 0.00, the BAT must take the EBT out of service.

(3) If the BAT takes an EBT out of service for this reason, no one may use it for testing until the EBT is found to be within tolerance limits on an external check of calibration.

(4) The BAT must proceed with the test of the employee using another EBT, if one is available.

2. The BAT must open a new individually wrapped or sealed mouthpiece in view of the employee and insert it into the device in accordance with the manufacturer's instructions.

3. The BAT must ensure that both the BAT and the employee read the unique test number displayed on the EBT.

4. The BAT must instruct the employee to blow steadily and forcefully into the mouthpiece for at least six seconds or until the device indicates that an adequate amount of breath

© Pipeline Testing Consortium, Inc. 2002

has been obtained.

5. The BAT must show the employee the result displayed on the EBT.

6. The BAT must show the employee the result and unique test number that the EBT prints out either directly onto the ATF or onto a separate printout.

7. If the EBT provides a separate printout of the result, the BAT must attach the printout to the designated space on the ATF with tamper-evident tape, or use a self-adhesive label that is tamper-evident.

C. Procedure to follow after the next alcohol confirmation test result (§40.255).

1. After the EBT has printed the result of an alcohol confirmation test the BAT must take the following additional steps:

   a. Sign and date Step 3 of the ATF.

   b. If the alcohol confirmation test result is lower than 0.02, nothing further is required of the employee. The BAT must sign and date Step 3 of the ATF.

   c. If the alcohol confirmation test result is 0.02 or higher, direct the employee to sign and date Step 4 of the ATF. If the employee does not do so, the BAT must note this on the " Remarks" line of the ATF. However, this is not considered a refusal to test.

   d. If the test is invalid, tell the employee the test is cancelled and note the problem on the " Remarks" line of the ATF. If practicable, conduct a re-test. (See §40.271).

   e. Immediately transmit the result directly to the DER in a confidential manner.

      (1) The BAT may transmit the results using Copy 1 of the ATF, in person, by telephone, or by electronic means. In any case, the BAT must immediately notify the DER of any result of 0.02 or greater by any means (e.g., telephone or secure fax machine) that ensures the result is immediately received by the DER. The BAT must not transmit these results through C/TPAs or other service agents.

      (2) If the BAT does not make the initial transmission in writing, the BAT must follow up the initial transmission with Copy 1 of the ATF.

2. The company must take the following steps with respect to the receipt and storage of alcohol test result information:

   a. If the company receives any test results that are not in writing (e.g., by telephone or electronic means), the company must establish a mechanism to establish the identity of the BAT sending you the results.

   b. The company must store all test result information in a way that protects confidentiality.

APPENDIX E

REASONABLE CAUSE OBSERVATION CHECKLIST

(STRICTLY CONFIDENTIAL)

EMPLOYEE: _____ PERIOD OF EVALUATION: _____

SUPERVISOR #1, NAME AND TELEPHONE: _____

SUPERVISOR #2, NAME AND TELEPHONE: _____

****

This checklist is intended to assist a supervisor in referring a person for drug testing. Has the employee manifested any of the following behaviors? Indicate (D) if documentation exists.

A. QUALITY AND QUANTITY OF WORK

YES	NO	
___	___	1. Clear refusal to do assigned tasks
___	___	2 Significant increase in errors
___	___	3. Repeated errors in spite of increased guidance
___	___	4. Reduced quantity of work
___	___	5. Inconsistent, "up and down" quantity/quality of work
___	___	6. Behavior that disrupts workflow
___	___	7. Procrastination on significant decisions or task
___	___	8. More than usual supervision necessary
___	___	9. Frequent, unsupported explanations for poor work performance
___	___	10.Noticeable change in written or verbal communication
___	___	11.Other (please specify) _____

B. INTERPERSONAL WORK RELATIONSHIPS

YES	NO	
___	___	1. Significant change in relations with co-workers, supervisors
___	___	2 Frequent or intense arguments
___	___	3. Verbal abusiveness
___	___	4. Physical abusiveness
___	___	5. Persistently withdrawn or less involved with people
___	___	6. Intentional avoidance of supervisor
___	___	7. Expressions of frustration or discontent
___	___	8. Change in frequency or nature of complaints
___	___	9. Complaints by co-workers or subordinates
___	___	10. Cynical, "distrustful of human nature" comments
___	___	11. Unusual sensitivity to advice or critique of work
___	___	12. Unpredictable response to supervision
___	___	13. Passive-aggressive attitude or behavior, doing things "behind your back"

© Pipeline Testing Consortium, Inc. 2002

C. GENERAL JOB PERFORMANCE

YES	NO	
___	___	1. Excessive unauthorized absences-number in last 12 months
___	___	2. Excessive authorized absences-number in last 12 months
___	___	3. Excessive use of sick leave in last 12 months
___	___	4. Frequent Monday/Friday absence or other pattern
___	___	5. Frequent unexplained disappearances
___	___	6. Excessive "extension" of breaks or lunch
___	___	7. Frequently leaves work early-number of days per week or month
___	___	8. Increased concern about (actual incidents) safety offenses involving the employee
___	___	9.Experiences or causes job accidents
___	___	10. Major change in duties or responsibilities
___	___	11. Interferes with or ignores established procedures
___	___	12. Inability to follow through on job performance recommendation

D. PERSONAL MATTERS

YES	NO	
___	___	1. Changes in or unusual personal appearance (dress, hygiene)
___	___	2. Changes in or unusual speech (incoherent, stuttering, loud)
___	___	3. Changes in or unusual physical mannerisms (gesture, posture)
___	___	4. Changes in or unusual facial expressions
___	___	5. Changes in or unusual level of activity-much reduced/increased
___	___	6. Changes in or unusual topics of conversation
___	___	7. Engages in detailed discussions about death, suicide, harming others
___	___	8. Increasingly irritable or tearful
___	___	9. Persistently boisterous or rambunctious
___	___	10. Unpredictable or out-of-context displays of emotion
___	___	11. Unusual fears
___	___	12 Lacks appropriate caution
___	___	13. Engages in detailed discussion about obtaining/using drugs/alcohol
___	___	14. Has personal relationship problems (spouse, girl/boyfriend, children, in-laws)
___	___	15. Has received professional assistance for emotional or physical problems
___	___	16. Makes unfounded accusations toward others, i.e., has feelings of persecution
___	___	17. Secretive or furtive
___	___	18. Memory problems (difficulty recalling instructions, data, past behaviors)
___	___	19. Frequent colds, flu, excessive fatigue, or other illnesses
___	___	20. Makes unreliable or false statements
___	___	21. Unrealistic self-appraisal or grandiose statements
___	___	22. Temper tantrums or angry outbursts
___	___	23. Demanding, rigid, inflexible
___	___	24. Major change in physical health
___	___	25. Concerns about sexual behavior or sexual harassment

Other information/observations - (Please be specific & attach additional sheet as needed).

APPENDIX F

ALCOHOL SUPPLEMENT

A. Why You Should Get Involved.

1. Although (company) has not had a history of substance abuse problems, we recognize that alcoholism and alcohol misuse are problems throughout America.

2. There are three good reasons why you should be concerned if any of your coworkers is using drugs or alcohol on the job.

   a. Your health and safety may be at risk.
   b. Alcohol misuse costs you money.
   c. Alcohol creates a negative work environment.

3. According to the National Institute on Alcohol Abuse and Alcoholism, drug and alcohol use on the job costs society an estimated $102 billion a year. Since most of this cost is passed on to you in the form of higher health insurance rates or in consumer prices, drug and alcohol use on the job costs you and your fellow workers a significant amount of money.

4. Absenteeism among problem drinkers or alcoholics is 3.8 to 8.3 times greater than normal. If your fellow workers don't come to work, you may have to do their jobs in addition to your own.

5. Workers who misuse alcohol don't function at their full potential. Not only is absenteeism a problem, when they are at work these employees may have reduced capabilities and productivity. Since our product is the safe transportation of hazardous liquid (or natural gas), alcohol misuse is an especially serious issue.

6. No matter what your position is in the organization, there is something you can do to ensure that drug and alcohol use on the job never becomes a problem at the company. Acceptance of any misuse puts you, this company, and the public, at risk.

B. Effects of Alcohol Misuse on an Individual's Health, Work, and Personal Life.

1. Alcohol is a central nervous system depressant. Taken in large quantities, it causes not only the euphoria, associated with being drunk but also adversely affects your judgment, ability to think, and your motor functions. Drink enough alcohol fast enough and it can kill you.

2. Long term overuse of alcohol can cause liver damage, heart problems, sexual dysfunction, and other serious medical problems.

3. In some cases, alcohol use can lead to physical and psychological dependence on alcohol. Alcoholism is a serious chronic disease. Left untreated it will inevitably get worse.

4. Workers who use alcohol (and other drugs) affect everyone. Studies show that compared to alcohol-and drug-free workers, substance abusers are far less productive, miss more workdays, are more likely to injure themselves or someone else, and file more workers' compensation claims.

5. The measurable dollar costs of workplace substance abuse from absenteeism, overtime pay, tardiness, sick leave, insurance claims, and workers' compensation can be substantial. However, the hidden costs resulting from diverted supervisory and managerial time, friction among workers, damage to equipment, and damage to the company's public image mean that workplace substance abuse can further cut profits and competitiveness.

6. Alcohol can also destroy relationships, lead to serious problems with the law (e.g., drunk driving), and even cause harm to the people you love.

7. If drinking affects your work life, it could lead to job loss and all the financial problems that would follow.

© Pipeline Testing Consortium, Inc. 2002

C. Signs and Symptoms of Alcohol Misuse - Any One or More of the Following Signs May Indicate a Drinking Problem:

- Family or social problems caused by drinking
- Job or financial difficulties related to drinking
- Loss of a consistent ability to control drinking
- "Blackouts" or the inability to remember what happened while drinking
- Distressing physical and/or psychological reactions if you try to stop drinking.
- A need to drink increasing amounts of alcohol to get the desired effect.
- Marked changes in behavior or personality when drinking.
- Getting drunk frequently.
- Injuring yourself-or someone-else while intoxicated
- Breaking the law while intoxicated.
- Starting the day with a drink.

D. Available Methods of Evaluating and Resolving Problems Associated with the Misuse of Alcohol.

1. Outpatient programs exist in a variety of settings:

   a. Community mental health centers.
   b. Full service agencies
   c. Private physicians' and therapists' offices
   d. Occupational settings
   e. Specialized alcoholism treatment facilities

2. Inpatient services, designed for those with more serious alcohol problems, can be found in hospitals, residential care facilities, community halfway houses, and some alcoholism clinics.

3. Your local phone directory will list helpful referral organizations such as:

   a. Local council on alcoholism
   b. Alcoholics Anonymous
   c. Community alcoholism or mental health clinic
   d. Social services or human resources department
   e. County medical society

4. The SAP will perform an initial evaluation, recommend any additional treatment if necessary, and refer employees needing assistance for treatment covered under our health insurance program.

ACKNOWLEDGMENT AND AGREEMENT WITH RESPECT TO DRUG AND ALCOHOL TESTING

I, the undersigned employee of the Company, hereby certify that I have been furnished with a copy of the company's DOT Alcohol and Drug testing program, including its Employee Assistance Program, and that I have read and understand same. I further certify that I have been provided with informational material, education and training on the dangers and problems of drug and alcohol misuse.

I am fully aware, and agree that I may be discharged or otherwise disciplined for any violation by me of said DOT Alcohol and Drug Policy, for any failure or refusal to provide urine and /or breath specimens when requested by my employer, for the failure or refusal to identify and certify same, for the failure to cooperate with the forms and other documents, and/or for any other failure or refusal to cooperate with my employer in its said DOT Alcohol and Drug Testing Program.

© Pipeline Testing Consortium, Inc. 2002

Kinder Morgan 500 Dallas Street Houston, TX 77002 (713) 369-9480 Effective Date: April 1, 1997	Alcohol Misuse Prevention Plan U.S. Department of Transportation Pipeline & Hazardous Materials Safety Administration (PHMSA) Federal Motor Carrier Safety Administration (FMCSA) Plan Revision Date: October 1, 2010

APPENDIX I

FMCSA ATTACHMENT

FEDERAL MOTOR CARRIER SAFETY ADMINISTRATION (FMSCA)

THIS ATTACHMENT APPLIES ONLY TO COMMERCIAL DRIVER'S LICENSE (CDL) HOLDERS. THESE PROVISIONS ONLY APPLY IF THE CDL IS REQUIRED FOR WORK PURPOSES.

A. General.

1. A complete copy of the alcohol misuse prevention plan is available to all employees. This document only discusses the FMCSA provisions of the mandated alcohol testing regulations.

2. The provisions contained in the Company's Alcohol Misuse Prevention Plan (AMPP) are applicable to those Company employees who perform safety-sensitive trucking functions covered under 49 CFR Part 382.

3. Company employees who only perform trucking functions must be aware of the general testing provisions discussed in the Company's AMPP and must be aware of the specific highway regulations as set forth in this attachment.

4. The Company recognizes that the misuse of alcohol in today's society is a major problem, which has also found its way into the trucking industry. The purpose of this AMPP is to reduce highway accidents that result from driver misuse of alcoholic substances, thereby reducing fatalities, injuries, and property damage. The Department of Transportation, Federal Motor Carrier Safety Administration, has established extensive regulations requiring alcohol testing under certain circumstances. In light of the above, the Company has adopted this plan to specify the circumstances under which alcohol testing may be required, the procedures for conducting such testing and the methods and procedures for complying with the requirements of the Federal Motor Carrier Safety Administration regulations.

5. The Company will implement necessary and reasonable measures to maintain a work environment free of alcohol. Employees with alcohol misuse problems are strongly encouraged to seek assistance.

6. The Alcohol Misuse Prevention Plan herein sets forth the requirements of 49 CFR Parts 199, 382 and 40. Those areas of the plan that appear in bold and underlined print reflect this company's independent authority to require additional provisions with regard to the alcohol testing procedures.

B. Applicability.

1. This information is applicable to every Company employee who operates a commercial motor vehicle in interstate or intrastate commerce, and is subject to the commercial driver's license requirements of 49 CFR Part 383.

2. For purposes of these regulations the Company is considered an employer with regard to the Federal Motor Carrier Safety Administration alcohol regulations. As an employer who employs drivers, the Company must comply with the requirements outlined herein as they apply to the employer and to drivers. All Company employees who perform safety-sensitive trucking functions shall be subject to the alcohol misuse testing provisions.

3. The following exceptions apply with regard to the Company and their drivers:

© Pipeline Testing Consortium, Inc. 2002

a. When required to comply with the alcohol and /or controlled substances testing requirements of parts 655 of this title (Federal Transit Administration alcohol and controlled substances testing regulations); or

b. When granted a full waiver from the requirements of the commercial driver's license program; or

c. When granted an optional State waiver from the requirements of part 383 of this subchapter; or

d. When foreign domiciled operations, with respect to any driver whose place of reporting for duty (home terminal) for commercial motor vehicle transportation services is located outside the territory of the United States.

C. Policy.

1. Prohibited Alcohol - The presence in the body, possession, use, distribution, dispensing, and/or unlawful manufacture of alcohol or alcoholic products is not condoned while conducting Company business, or while in work areas or Company vehicles on or off Company premises. No employee will work under the influence of alcohol.

2. Drivers Subject to Alcohol Testing Covered Under This Plan - Company drivers and contract drivers under contract for 90 days or more in any period of 365 days, who perform safety sensitive trucking functions covered under 49 CFR Parts 382 and 383, and who meet the definition of "Driver" in D.2. of this section.

3. Alcohol Prohibitions.

   a. No driver shall be on duty, as defined in 395.2, if the driver uses alcohol.

   b. No driver shall be on duty, as defined in 395.2, if the driver tests positive for use of alcohol.

   c. A person who tests positive for the use of alcohol is medically unqualified to operate a commercial motor vehicle and will be not be permitted to perform covered functions and may be subject to disciplinary action up to and including termination.

   d. A person who refuses to be tested under the plan provisions shall not be permitted to operate a commercial motor vehicle. Such refusal shall be treated as a positive alcohol test and subject the driver to the restrictions contained in paragraph (c) above.

4. FMCSA Background Checks (40.25) - The company must request the information listed below from DOT-regulated companies who have employed the employee during any period during the three years before the date of the employee's application or transfer:

   a. Alcohol tests with a result of 0.04 or higher alcohol concentration;

   b. Verified positive drug tests;

   c. Refusals to be tested (including verified adulterated or substituted drug test results);

   d. Other violations of DOT agency drug and alcohol testing regulations; and

   e. With respect to any employee who violated a DOT drug and alcohol regulation, documentation of the employee's successful completion of DOT return-to-duty requirements (including follow-up tests). If the previous company does not have information about the return-do-duty process (e.g., a company who did not hire an employee who tested positive on a pre-employment test), the company must seek to obtain this information from the employee.

© Pipeline Testing Consortium, Inc. 2002

D. Definitions:

1. Commercial Motor Vehicle - means a motor vehicle or combination of motor vehicles used in commerce to transport passengers or property if the motor vehicle-

   a. Has a gross combination weight rating of 26,001 or more pounds inclusive of a towed unit with a gross vehicle weight rating of more than 10,000 pounds; or

   b. Has a gross vehicle weight rating of 26,001 or more pounds; or

   c. Is designed to transport 16 or more passengers, including the driver; or

   d. Is of any size and is used in the transportation of material found to be hazardous for the purposes of the Hazardous Materials Transportation Act and which require the motor vehicle to be placard under the Hazardous Materials Regulations (CFR part 172, subpart F).

2. Driver - means any person who operates a commercial motor vehicle. This includes, but is not limited to: full time, regularly employed drivers; casual, intermittent or occasional drivers; leased drivers and independent, owner-operator contractors who are either directly employed by or under lease to an employer or who operate a commercial motor vehicle at the direction of or with the consent of an employer. For the purposes of pre-employment/pre-duty testing only, the term *driver* includes a person applying to an employer to drive a commercial motor vehicle.

3. Employer - means any person (including the United States, a State, District of Columbia or a political subdivision of a State) who owns or leases a commercial motor vehicle or assigns persons to operate such a vehicle. The term employer includes an employer's agents, officers and representatives.

4. Interstate Commerce - means (1) any trade, traffic, or transportation within the jurisdiction of the United States between a place in a State and a place outside of such State, including a place outside of the United States, and (2) trade, traffic, and transportation in the United States which affects any trade, traffic, and transportation as described above in this definition.

5. Motor Carrier - means a for-hire motor carrier or a private motor carrier of property. The term "motor carrier" includes a motor carrier's agents, officers and representatives as well as employees responsible for hiring, supervising, training, assigning, or dispatching of drivers and employees concerned with the installation, inspection, and maintenance of motor vehicle equipment and/or accessories.

6. On-Duty Time - means all time from the time a driver begins to work or is required to be in readiness to work until the time he/she is relieved from work and all responsibility for performing work. On duty time shall include:

   a. All time at a carrier or shipper plant, terminal, facility, or other property, or on any public property, waiting to be dispatched, unless the driver has been relieved from duty by the motor carrier;

   b. All time inspecting equipment as required by 392.7 and 392.8 of this chapter or otherwise inspecting, servicing, or conditioning any commercial motor vehicle at any time;

   c. All driving time as defined in the term driving time in this section;

   d. All time, other than driving time, in or upon any commercial motor vehicle except time spent resting in a sleeper berth as defined by the term sleeper berth of this section;

   e. All time loading or unloading a vehicle, supervision, or assisting in the loading or unloading, attending a vehicle being loaded or unloaded, remaining in readiness to operate the vehicle, or in giving or receiving receipts from shipments loaded or unloaded;

   f. All time spent performing the driver requirements of 392.40 and 392.41 of this chapter

© Pipeline Testing Consortium, Inc. 2002

relating to accidents;

g. All time repairing, obtaining assistance, or remaining in attendance upon a disabled vehicle;

7. Performing (a safety-sensitive function) - means a driver is considered to be performing a safety-sensitive function during any period in which he/she is actually performing, ready to perform, or immediately available to perform any safety-sensitive functions.

8. Safety-Sensitive Function - means any of those on-duty functions as set forth in 49 CFR Part 395.2.

E. Alcohol Testing.

1. **Pre-Employment (Background Check Only – Alcohol Testing is Optional).**

The company must obtain and review the information listed below from any employer for whom the driver performed safety-sensitive functions in the previous three years. The information must be obtained and reviewed to later than 30 days after the driver performs safety-sensitive functions (driving).

(a) Information of the driver's alcohol test in which a breath alcohol concentration of 0.04 or greater was indicated.

(b) Information on the driver's controlled substances test in which a positive results was indicated.

(c) Any refusal to submit to a required alcohol or controlled substance test.

The company must provide to each of the driver's previous employers of the past three years a written authorization from the driver for the release of the required information. The company may not use a driver to perform safety-sensitive functions if the employer obtains information indicating the driver has tested positive for controlled substances, tested at or above .04 breath alcohol concentration, or refused to test unless the employer has evidence the driver has been evaluated by a SAP, completed any required counseling, passed a return-to-duty test, and been subject to follow-up testing.

2. Random Testing.

a. Employees in "covered" positions will be subject to random testing at any time with no advance notice. The random selection process will ensure each employee the same fair and equal chance of being selected.

b. An employee randomly selected will be notified by his/her supervisor of the selection and instructed to immediately go to the designated alcohol-testing site.

c. Random testing will be conducted quarterly and will be administered at a 10% annualized rate. This means that the total number of tests conducted during any 12-month period will be equal to at least 10 percent of the total pool of covered employees.

3. Reasonable Suspicion.

a. An employee/driver shall submit to testing, for reasonable suspicion, for the use of alcohol when requested to do so by the Company.

b. The employee’s conduct must be witnessed by at least one supervisor and company official. The supervisor or witnesses must have received training in the specific identification of actions, appearance, behavior, or conduct of a commercial motor vehicle driver, which are indicative of alcohol use.

c. The supervisor shall ensure that the employee is transported to the alcohol-testing site.

© Pipeline Testing Consortium, Inc. 2002

d. If an employee refuses to submit to the alcohol test or attempts to leave Company's premises and is impaired to the extent that he/she would present a danger to either him/herself or others, local law enforcement should be contacted immediately by the Company representative.

e. While waiting for an employee's alcohol test results, that employee will be removed from performing safety-sensitive functions and, if the test results are positive, may be subject to further disciplinary action up to and including termination. Specific disciplinary actions are described in detail in the AMPP.

4. Post-Accident Testing.

a. A driver shall submit to an alcohol test within 2 hours of a determination by the Company officials that a test is required and that circumstances indicate the accident is reportable under the FMSCA regulations. It must be determined that the driver received a citation for a moving traffic violation arising from the accident. A DOT reportable accident is defined in 49 CFR Part 382.303(a)(3).

(1) An occurrence involving a commercial motor vehicle operating on a public road in commerce:

Type of accident involved	Citation issued to the CMV driver	Test must be performed by company
Human fatality	YES NO	YES YES
Bodily injury with immediate medical treatment away from the scene.	YES NO	YES NO
Disabling damage to any motor vehicle requiring tow away.	YES NO	YES NO

b. A driver who is seriously injured and cannot be tested at the time of the accident should provide the necessary authorization for obtaining hospital reports and other documents that would indicate whether there was any alcohol in his/her system.

c. The results of a breath or blood test for the use of alcohol conducted by Federal, State, or Local law enforcement officials having independent authority to conduct such tests, shall be considered to meet the requirements of this section, provided such tests conform to the applicable Federal, State, or Local requirements. Company officials shall obtain such test results.

d. The Company shall provide drivers with necessary information and procedures so that the driver will be able to meet the requirement as set forth in this section.

e. While waiting for an employee's alcohol test results, that employee will be removed from performing safety-sensitive functions and, if the test results are positive, may be subject to further disciplinary action up to and including termination. Specific disciplinary actions are described in detail in the AMPP.

f. Employee Responsibility. As soon as practicable following an accident as defined in this plan, the employee shall make every attempt to contact his/her supervisor and the substance abuse program administrator.

(1) The employee will be given instructions for obtaining alcohol and substance abuse testing.

© Pipeline Testing Consortium, Inc. 2002

(2) An employee who is subject to post-accident testing must remain available for testing, or company may consider the employee to have refused to submit to testing.

(3) The employee subject to post-accident testing must refrain from consuming alcohol for eight hours following the accident, or until he or she submits to an alcohol test, whichever comes first.

g. Company Responsibility.

(1) Upon receiving a report of an accident, the company shall test the employee (if no a fatality) for alcohol and controlled substances as soon as practicable.

5. Return to Duty.

- **NOTE: A covered employee who refuses to take or has a positive alcohol test will be terminated. Therefore, return-to-duty testing is not an option, unless the employee meets the requirements of Section F of this appendix or is otherwise covered by a bargaining agreement.**

a. The requirements for return-to-duty testing must be performed in accordance with 49 CFR Part 40, Subpart O and that information can be found in Section V of the Alcohol Misuse Prevention plan.

6. Follow-up Testing.

- **NOTE: A covered employee who refuses to take or has a positive alcohol test will be terminated. Therefore, follow-up testing is not an option, unless the employee meets the requirements of Section F of this appendix or is otherwise covered by a bargaining agreement.**

a. The requirements for follow-up testing must be performed in accordance with 49 CFR Part 40, Subpart O and that information can be found in Section V of the Alcohol Misuse Prevention plan.

F. Employee Admission of Alcohol and Controlled Substances Use.

1. Employees who admit to alcohol misuse or controlled substances use are not subject to the referral, evaluation and treatment requirements of Part 382 and Part 40 of this title, provided that:

a. The admission is in accordance with a written employer-established voluntary self-identification program or policy that meets the requirements of paragraph (b) of this section;

b. The driver does not self-identify in order to avoid testing under the requirements of this part;

c. The driver makes the admission of alcohol misuse or controlled substances use prior to performing a safety sensitive function (i.e., prior to reporting for duty); and

d. The driver does not perform a safety sensitive function until the employer is satisfied that the employee has been evaluated and has successfully completed education or treatment requirements in accordance with the self-identification program guidelines.

2. A qualified voluntary self-identification program or policy must contain the following elements:

a. It must prohibit the employer from taking adverse action against an employee making a voluntary admission of alcohol misuse or controlled substances use within the parameters of the program or policy and paragraph (a) of this section;

© Pipeline Testing Consortium, Inc. 2002

b. It must allow the employee sufficient opportunity to seek evaluation, education or treatment to establish control over the employee's drug or alcohol problem;

c. It must permit the employee to return to safety sensitive duties only upon successful completion of an educational or treatment program, as determined by a drug and alcohol abuse evaluation expert, i.e., employee assistance professional, substance abuse professional, or qualified drug and alcohol counselor;

d. It must ensure that:

(1) Prior to the employee participating in a safety sensitive function, the employee shall undergo a return to duty test with a result indicating an alcohol concentration of less than 0.02; and/or

(2) Prior to the employee participating in a safety sensitive function, the employee shall undergo a return to duty controlled substance test with a verified negative test result for controlled substances use; and

e. It may incorporate employee monitoring and include non-DOT follow-up testing.

G. Disciplinary Action.

1. Violation of Policy.

a. **Any employee found in violation of the Company's AMPP would be subject to disciplinary action up to and including termination of employment. Any employee found in violation of this policy may be required to successfully complete a rehabilitation/ treatment program for alcohol misuse as a condition of continued employment with the Company.**

b. **Any transferring employee found in violation of the Company's AMPP will be subject to disciplinary action up to an including termination of employment.**

c. **Specific disciplinary actions and rehabilitation provisions are discussed in the AMPP.**

2. Refusal to Test.

a. No employee shall refuse to submit to a random, reasonable-suspicion, post-accident, or follow-up alcohol test as outlined in 49 CFR Part 382.211.

b. **An employee who refuses a return-to-duty test is not in violation of the plan; however, such refusal will result in not allowing the individual to perform safety-sensitive functions and may result in disciplinary action up to and including termination of employment.**

c. Employees who: (1) without a legitimate reason fail to report to the alcohol testing site; or (2) without a valid medical reason fail to provide an adequate breath sample under this policy **may be suspended without pay and be subject to disciplinary action up to and including termination of employment.**

3. Return to Duty.

a. An employee testing positive for alcohol may be allowed to return to a "safety-sensitive" position after successful completion of a rehabilitation/ treatment program, a return-to-duty test with an alcohol concentration of less than 0.02, and the recommendation from the substance abuse professional that the individual has completed any required assessment, evaluation and/or treatment provision.

© Pipeline Testing Consortium, Inc. 2002

b. After returning to work the employee will be subject to: 1) unannounced follow-up testing, as determined by the SAP and the Company officials; and 2) the other required types of testing which includes random.

H. Alcohol Testing Overview.

1. Alcohol Testing Procedures. All collection, transportation, testing procedures, test evaluation measures, quality control measures, substance abuse professionals, record keeping, and reporting of alcohol test results will conform to the Department of Transportation regulations as set forth in 49 CFR Part 40, Procedures for Transportation Workplace Drug and Alcohol Testing Programs.

I. Record Retention.

1. Record keeping.

a. The Company will retain the following records for a period of at least five (5) years:

(1) Records of driver alcohol test results with results indicating a level of greater than 0.02.
(2) Documentation of driver refusal to take required alcohol tests.
(3) Driver referral and evaluation records.

b. The Company will retain records regarding the alcohol collection process for two years.

c. The Company will retain test records of drivers with alcohol concentrations of less than 0.02 for a minimum of one year.

d. The Company will retain records confirming supervisory and employee training for at least three (3) years.

2. Driver Qualification Files.

These records are subject to the Company's current divided record keeping authority and are to be maintained at authorized record keeping locations. Below is a list of information to be maintained in these files regarding employee alcohol abuse.

a. The name of the employee submitted to an alcohol test;
b. Date the alcohol test was conducted;
c. Location of the alcohol test;
d. Test category;
e. Results of the alcohol test.

3. Record Confidentiality.

a. Except for the breath alcohol technician, substance abuse professional, and designated Company personnel with a need to know, the Company will not release information regarding an employee's alcohol use or rehabilitation/treatment records without the express written consent of the tested employee. The only exception is when information must be released, regardless of consent, to the Federal Motor Carrier Safety Administrator to examine all records related to the administration and results of controlled substance testing performed under this program.

b. To maintain confidentiality, written records regarding an employee's alcohol misuse and rehabilitation will be stored in a secured location. The employee's alcohol testing and/or rehabilitation/treatment records will not be made a part of the employee's personnel file.

J. Responsibility.

© Pipeline Testing Consortium, Inc. 2002

1. **Reservation of Rights - The Company reserves the right to interpret, modify, and/or revise this policy in whole or in part without notice. Nothing in this policy is to be construed as an employment contract nor does this alter an employee's employment at-will status. The employee remains free to resign his/her employment at any time for any or no reason, without notice. Similarly, the Company reserves the right to terminate any employee's employment, for any or no reason, without notice.**

2. Compliance with All Laws.
This policy will be amended from time to time to comply with changes in Federal and State Laws.

This policy is a general summary of the Company's Alcohol Misuse Prevention Plan and designed to highlight the more important general provisions. This attachment does not contain every detail but more detailed specific terms are discussed elsewhere in the plan. THEREFORE, IF THERE IS ANY QUESTION OR CONFLICT BETWEEN WHAT IS SAID IN THIS POLICY SUMMARY AND THE LANGUAGE IN THE PLAN, THE PLAN WILL PREVAIL. IF THERE IS ANY QUESTION OR CONFLICT BETWEEN WHAT IS SAID IN THE PLAN AND THE LANGUAGE IN THE DOT REGULATIONS AS CODIFIED AT 49 CFR PART 40 AND 382, THE DOT REGULATIONS WILL PREVAIL.

APPENDIX J

STATE REGULATORY REQUIREMENTS

02.1 **Nebraska**

Title 155 – STATE FIRE MARSHAL

Chapter 1 – REGULATION RURSUANT TO THE NEBRASKA NATURAL GAS PIPELINE SAFETY ACT OF 1969

001. Federal regulations adopted by reference are Title 49 of the Code of Federal Regulations, Parts 191, 192, 193, and 199, revised as of October 1, 2003.
  02.01. Natural Gas Pipeline Safety Act of 1968. Amendment number 192-87, 88, 89, 89A, 90, 93, and 95.
  002. Copies of the federal regulations are on file at the office of the Nebraska State Fire Marshal, 246 South 14th Street, Lincoln, NE or at the office of the Secretary of State, Division of Rules and Regulations in the Nebraska State Capital.

002. Within two (2) hours or as soon as practical, following the discovery of any reportable incident, an operator shall notify the Sate Fire Marshal Pipeline Safety Division, Lincoln, Nebraska at (402) 471-2027 during normal business hours. After hours, operators shall call the area Pipeline Safety Deputy.
  02.01. Reportable incidents, either before or past the meter are:
    02.01Ai. A death or person injury necessitating in-patient hospitalization; or
    02.01Aii. Estimated property damage, including cost of gas lost, of the operator or others, or both of $50,000 or more; or,
    02.01Aiii. Any failure which results in the explosion or ignition of natural gas.
    02.01B. An event that results in an emergency shutdown of an LNG facility.
    02.01C. An even that is significant in the judgment of the operator, even though it does not meet the criteria of .02.01A or .02.01B.

003. Each written report required by Title 49 of the Code of Federal Regulations, Part 191 adopted herein, shall be submitted in duplicate to the Nebraska Sate Fire Marshal Pipeline Safety Division.
  03.01. One copy of the reports submitted, pursuant to 003 above will be transmitted to the Information Resources Manager, Office of Pipeline Safety, PHMSA, Department of Transportation within 10 day of receipt by the State Fire Marshal.
  03.02. Annual reports shall be submitted to the State Fire Marshal by March 5th and shall be transmitted to the Department of Transportation no later than March 15th.

Post Accident or Reasonable Cause/Suspicion Supervisor Written Record

☐ **CDL (FMCSA)**
☐ **Pipeline (PHMSA)**

Employee's Name _____ Dept. _____ Date _____

Employee SSN _____ Job Title _____ Time _____

1. **EBT Breath Alcohol testing not completed within two (2) hours of the Accident or the Reasonable Cause/Suspicion situation because:** ***(Examples – received notification too late, Employee removed from the scene for medical treatment, EBT device not available, injuries precluded testing, Breath Alcohol Technician not available)***

   _____

   _____

2. **EBT Breath Alcohol testing not completed within eight (8) hours because:** ***(Examples – received notification too late, Employee removed from the scene for medical treatment, EBT (device not available, injuries precluded testing, Breath Alcohol Technician not available)***

   _____

   _____

3. **Urine Drug Testing not completed within 32 hours of the Accident or Reasonable Cause/Suspicion situation because:**

   _____

   _____

Supervisor's Name: _____ Date: _____

Supervisor's Signature

Second Supervisor's Signature (if applicable)

***** IMPORTANT *****

The above report is required in Post Accident or Reasonable Cause/Suspicion testing when the **test(s) times were not met.**

The written report of Post Accident or Reasonable Cause/Suspicion testing must be completed and signed by the supervisor within 48 hours of the incident and subsequently faxed to the Company Designated Employer Representative (DER).

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Barstow Area Lines	
• Adelanto Junction - Halloran 8”	ML1
• Adelanto Junction - Halloran 14”	ML
• Lenwood Junction – BNSF 12”	ML5A
• Adelanto - George AFB Breakout Station 4”/6”	ML4
• George AFB Breakout Station - Edwards AFB 6”	ED-001
Pipeline Facilities (non-storage)	
• Barstow Pump Station (Booster)	
• Barstow Station - Piping Manifold Only	
• Yermo Station - Meter Manifold Only	
• Baker Pump Station (Booster)	
• Edwards Terminal - Meter Manifold Only	

- Figures 6.1a through 6.1e on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled “Operational and Worst Case Discharge Data” of the applicable Line Segment.

- The specific information summary for these pipeline sections is provided as follows:
  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps.
- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.
- Northern and Southern Region pipeline schematic diagrams are provided in Volume 1, Figure 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

ADELANTO JUNCTION - HALLORAN 8" (ML1)		
Pipe and Operational Data		
Section Length:	114.0 Miles	602,130 Feet
Line Diameter:	8.625 in., O.D.	8.187 in., I.D. (note 1)
Line Capacity:	344 Bbls/mile (note 2)	
Capacity of entire line section:	(b) (7)(F), (b)	
Maximum flow rate:	1,300 Bbls/hr or 31,200 Bbls/day	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
County(s)/State(s) Traversed:	San Bernardino, CA	
Location Description:	From Adelanto Junction at the corner of Air Expressway Blvd and Adelanto Road generally northeast to Halloran Summit adjacent to I-15 east of Baker.	

FIGURE 6.1b

PIPELINE SECTION INFORMATION SUMMARY

ADELANTO JUNCTION - HALLORAN 14" (ML)

Pipe and Operational Data

- Section Length: 114.0 Miles 602,805 Feet
- Line Diameter: 14.0 in., O.D. 13.50 in., I.D. (note 1)
- Line Capacity: 935 Bbls/mile (note 2)
- Product types: CARB ULSD, Gas, JP-8, Turbine, Ethanol
- Capacity of entire line section: (b) (7)(F), (b) (3)
- Maximum flow rate: 7,000 Bbls/hr or 168,000 Bbls/day

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description

- County(s)/State(s) Traversed: San Bernardino, CA
- Location Description: From Adelanto Junction at the corner of Air Expressway Blvd and Adelanto Road generally northeast to Halloran Summit adjacent to I-15 east of Baker.

Worst Case Discharge Data

(b) (7)(F), (b) (3)

The historic discharges have not approached either the breakout tank WCD volume or the pipeline WCD in the area.

FIGURE 6.1c

PIPELINE SECTION INFORMATION SUMMARY

Lenwood Junction – BNSF (ML5A)		
Pipe and Operational Data		
• Section Length:	3.5 Miles	18,320 Feet
• Line Diameter:	12 in., O.D.	12 in., I.D. (note 1)
• Line Capacity:	732 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	4,400 bph or 105,600 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
• County(s)/State(s) Traversed:	San Bernardino, CA
• Location Description:	Lenwood Road, north to BNSF meter site.

FIGURE 6.1d

PIPELINE SECTION INFORMATION SUMMARY

ADELANTO - GEORGE AFB BREAKOUT STATION 4"/6" (ML4)		
Pipe and Operational Data		
• Section Length:	1.6 Miles	8,665 Feet
• Line Diameter:	6.625 in., O.D.	6.249 in., I.D. (note 1)
• Line Capacity:	200 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7) (F) (b)	
• Maximum flow rate:	2,000 bph or 48,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Bernardino, CA	
• Location Description:	From Adelanto Junction (Near Adelanto Road and Air Expressway) east to George AFB Breakout Station.	

FIGURE 6.1e

PIPELINE SECTION INFORMATION SUMMARY

GEORGE AFB BREAKOUT STATION - EDWARDS AFB 6" (ED-001)	
Pipe and Operational Data	
Section Length:	51.8 Miles 273,277 Feet
Line Diameter:	6.625 in., O.D. 6.281 in., I.D. (note 1)
Line Capacity:	202 bbls/mile (note 2)
Capacity of entire line section:	(b) (7)(F),
Maximum flow rate:	500 bph or 12,000 bpd
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.	
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.	
Location Description	
County(s)/State(s) Traversed:	San Bernardino, CA Kern, CA
Location Description:	From George AFB Breakout Station west to Adelanto Road, north to Mirage Road, west to 240 St East, then generally north and west to Edwards AFB.

FIGURE 6.2

HCA INDEX

Refer to Figure 6.1a through Figure 6.1e for specific information on line segments.

The following Index Map shows all the corresponding Line Segments for Figure 6.1.

Detailed HCA Maps are contained in the CD inside the front cover of Volume 2 (or in a separate folder on electronic copy CD).

The specific HCA maps for this area are:

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Colton Incoming Lines	
• Industry Station - Colton 16”	1
• Industry Station - Colton 20”	108
Colton Area Lines	
• Ontario - Ontario Airport 6”	102
• Colton - March 6”	51
Colton Inter-Facility Lines	
• Colton - CalNev Jet A 16” (Out of Service)	MLE
• Colton - CalNev Jet B 16”	MLD
• Colton - CalNev Diesel 20”	MLB
• Colton - CalNev Gasoline 20”	MLA
Colton Outgoing Lines	
• Colton - Indio Block 20”	111
• Colton - Adelanto Junction 8”	ML1
• Colton - Adelanto Junction 14”	ML
Pipeline Facilities (Non-Storage)	
• Cajon Pump Station (Booster)	
• March AFB Terminal - Meter Manifold Only	
• Roadway Junction - Piping Manifold Only (OOS)	
• Adelanto Junction - Piping Manifold Only	

- Figures 6.1a through 6.1k on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled “Operational and Worst Case Discharge Data” of the applicable Line Segment.

- The specific information summary for these pipeline sections is provided as follows:
  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps
- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.
- Northern and Southern Region pipeline schematic diagrams are provided in Volume 1, Figure 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

INDUSTRY STATION - COLTON 16" (1)		
Pipe and Operational Data		
• Section Length:	28.83 Miles	152,206 Feet
• Line Diameter:	16.0 in., O.D.	15.50 in., I.D. (note 1)
• Line Capacity:	1,232 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	8,000 bph or 192,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Bernardino, CA Los Angeles, CA	
• Location Description:	From Industry Station east generally adjacent to the SP Railroad to Colton Terminal east of Riverside Ave in Bloomington.	

FIGURE 6.1b

PIPELINE SECTION INFORMATION SUMMARY

INDUSTRY STATION - COLTON 20" (108)		
Pipe and Operational Data		
• Section Length:	48.77 Miles	257,506 Feet
• Line Diameter:	20.0 in., O.D.	19.376 in., I.D. (note 1)
• Line Capacity:	1,926 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	15,000 bph or 360,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Bernardino, CA Los Angeles, CA	
• Location Description:	From Industry Station east generally adjacent to the SP Railroad to Colton Terminal east of Riverside Ave in Bloomington.	

FIGURE 6.1c

PIPELINE SECTION INFORMATION SUMMARY

ONTARIO - ONTARIO AIRPORT 6" (102)		
Pipe and Operational Data		
• Section Length:	1.65 Miles	8,699 Feet
• Line Diameter:	6.625 in., O.D.	6.125 in., I.D. (note 1)
• Line Capacity:	192 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7) (F) (b)	
• Maximum flow rate:	2,000 bph or 48,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Bernardino, CA	
• Location Description:	From Ontario Breakout Station to Ontario Airport, where it connects to a pipeline owned by others.	

FIGURE 6.1d

PIPELINE SECTION INFORMATION SUMMARY

COLTON - MARCH 6" (51)		
Pipe and Operational Data		
• Section Length:	15.04 Miles	79,395 Feet
• Line Diameter:	6.625 in., O.D.	6.125 in., I.D. (note 1)
• Line Capacity:	192 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	750 bph or 18,000 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
• County(s)/State(s) Traversed:	San Bernardino, CA
• Location Description:	From Colton South Terminal south to the Santa Ana River then generally southeast to March AFB, Cactus Highway east of I-215.

FIGURE 6.1e

PIPELINE SECTION INFORMATION SUMMARY

COLTON - CALNEV JET A 16" (MLE) (Out of Service)		
Pipe and Operational Data		
• Section Length:	0.38 Miles	2,025 Feet
• Line Diameter:	16.0 in., O.D.	15.25 in., I.D. (note 1)
• Line Capacity:	1,192 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7) (F) (b)	
• Maximum flow rate:	0 bph or 0 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Bernardino, CA	
• Location Description:	Interconnecting Colton South and Colton North tank facilities.	

FIGURE 6.1f

PIPELINE SECTION INFORMATION SUMMARY

COLTON - CALNEV JET B 16" (MLD)		
Pipe and Operational Data		
• Section Length:	0.38 Miles	2,025 Feet
• Line Diameter:	16.0 in., O.D.	15.25 in., I.D. (note 1)
• Line Capacity:	1,192 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7) (F) (b)	
• Maximum flow rate:	10,000 bph or 240,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Bernardino, CA	
• Location Description:	Interconnecting Colton South and Colton North tank facilities.	

FIGURE 6.1g

PIPELINE SECTION INFORMATION SUMMARY

COLTON - CALNEV DIESEL 20" (MLB)		
Pipe and Operational Data		
• Section Length:	0.54 Miles	2,844 Feet
• Line Diameter:	20.0 in., O.D.	19.50 in., I.D. (note 1)
• Line Capacity:	1,950 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	10,000 bph or 240,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Bernardino, CA	
• Location Description:	Interconnecting Colton South and Colton North tank facilities.	

FIGURE 6.1h

PIPELINE SECTION INFORMATION SUMMARY

COLTON - CALNEV GASOLINE 20" (MLA)		
Pipe and Operational Data		
• Section Length:	0.54 Miles	2,844 Feet
• Line Diameter:	20.0 in., O.D.	19.50 in., I.D. (note 1)
• Line Capacity:	1,950 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	10,000 bph or 240,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Bernardino, CA	
• Location Description:	Interconnecting Colton South and Colton North tank facilities.	

FIGURE 6.1i

PIPELINE SECTION INFORMATION SUMMARY

COLTON - (b) (3), (b) (7)(F)

Pipe and Operational Data

• Section Length:	72.58 Miles	383,217 Feet
• Line Diameter:	20.0 in., O.D.	19.312 in., I.D. (note 1)
• Line Capacity:	1,913 bbls/mile (note 2)	
• Product types:	CARB ULSD, Gas, Turbine, JP-8, Ethanol	
• Capacity of entire line section:	(b) (7)(F), (b) (3)	
• Maximum flow rate:	12,500 bph or 300,000 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description

• County(s)/State(s) Traversed:	San Bernardino, CA
• Location Description:	From Colton South Terminal generally east to Indio then south along the east side of the Salton Sea.

Worst Case Discharge Data

(b) (7)(F), (b) (3)

FIGURE 6.1j

PIPELINE SECTION INFORMATION SUMMARY

COLTON – ADELANTO JUNCTION 8" (ML1)		
Pipe and Operational Data		
• Section Length:	45.226 Miles	238,793.28 Feet
• Line Diameter:	8.625 in., O.D.	8.187 in., I.D. (note 1)
• Line Capacity:	344 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F), (b) (3)	
• Maximum flow rate:	1,300 bph or 31,200 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Bernardino, CA	
• Location Description:	From Colton South Terminal generally north through Cajon Pass to Adelanto Junction at the corner of Air Expressway Blvd and Adelanto Road.	

FIGURE 6.1k

PIPELINE SECTION INFORMATION SUMMARY

COLTON - ADELANTO JUNCTION 14" (ML)		
Pipe and Operational Data		
• Section Length:	44.994 Miles	237568.32 Feet
• Line Diameter:	14.0 in., O.D.	13.50 in., I.D. (note 1)
• Line Capacity:	935 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F), (b)	
• Maximum flow rate:	7,000 bph or 168,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
• Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Bernardino, CA	
• Location Description:	From Colton South Terminal generally north through Cajon Pass to Adelanto Junction at the corner of Air Expressway Blvd and Adelanto Road.

HCA INDEX

Refer to Figure 6.1a through Figure 6.1k for specific information on line segments.

The following Index Map shows all the corresponding Line Segments for Figure 6.1.

Detailed HCA Maps are contained in the CD inside the front cover of Volume 2 (or in a separate folder on electronic copy CD).

The specific HCA maps for this area are:

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Las Vegas Incoming Lines	
• Halloran - Las Vegas 8"	ML1
• Halloran - Las Vegas 14"	ML
Las Vegas Area Lines	
• Bracken-McCarran 6" - 12"	MC
• Las Vegas – Nellis 8"	NE
Facilities (Non-Storage)	
• Valley Wells Pump Station (Booster)	
• Bracken Junction - Piping Manifold Only	
• McCarran AP Station	
• Nellis AFB Station	

- Figures 6.1a through 6.1d on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled "Worst Case Discharge Data" of the applicable Line Segment.

- The specific information summary for these pipeline sections is provided as follows:
  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps

- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.

- Northern and Southern Region pipeline schematic diagrams are provided in Volume 1, Figure 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

HALLORAN - LAS VEGAS 8" (ML1)		
Pipe and Operational Data		
• Section Length:	88.32 Miles	466,330 Feet
• Line Diameter:	8.625 in., O.D.	8.187 in., I.D. (note 1)
• Line Capacity:	344 Bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F), (b)	
• Maximum flow rate:	1,300 Bbls/hr or 31,200 Bbls/day	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Bernardino, CA Clark, NV	
• Location Description:	From Halloran Summit adjacent to I-15, generally northeast adjacent to I-15 to North Las Vegas, NV.	

FIGURE 6.1b

PIPELINE SECTION INFORMATION SUMMARY

HALLORAN - LAS VEGAS 14" (ML)	
Pipe and Operational Data	
• Section Length:	93.87 Miles 495,647 Feet
• Line Diameter:	14.0 in., O.D. 13.50 in., I.D. (note 1)
• Line Capacity:	935 Bbls/mile (note 2)
• Product types:	CARB ULSD, Gas, Turbine, JP-8, Ethanol
• Capacity of entire line section:	(b) (7)(F),
• Maximum flow rate:	7,000 Bbls/hr or 168,000 Bbls/day
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.	
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.	
Location Description	
• County(s)/State(s) Traversed:	San Bernardino, CA Clark, NV
• Location Description:	From Halloran Summit adjacent to I-15, generally northeast adjacent to I-15 to north Las Vegas, NV.
Worst Case Discharge Data	
(b) (7)(F), (b) (3)	

FIGURE 6.1c

PIPELINE SECTION INFORMATION SUMMARY

BRACKEN - McCARRAN 6" - 12" (MC)		
Pipe and Operational Data		
• Section Length:	0.227 Miles 1.152 Miles	1,200 Feet of 12" 6,083 Feet of 6"
• Line Diameter:	12.625 in., O.D. 6.625 in., O.D.	12.312 in., I.D. (note 1) 6.125 in., I.D. (note 1)
• Line Capacity:	777 bbls/mile (12") (note 2) 192 bbls/mile (6") (note 2)	
• Capacity of entire line section:	(b) (7) (F) (b)	
• Maximum flow rate:	1,800 bph or 43,200 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Clark, NV	
• Location Description:	From Bracken Junction (south of Tropicana Ave., west of I-15) in south Las Vegas, east to McCarran Terminal at McCarran Airport.

7.0 BREAKOUT STATIONS

7.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the breakout stations and/or terminals that have storage (breakout tanks) connected to the pipeline sections described in the previous Section of this Volume. The data is summarized as follows:

BREAKOUT STATION	LARGEST TANK (BBLS)	WCD (BBLS)
George Terminal - Tank 212	(b) (7)(F), (b) (3)	
Barstow Terminal - Tank 321		

- The largest Worst Case Discharge (WCD) for the breakout stations/terminals within this Area of Operation has been determined to be as follows:

(b) (7)(F), (b) (3)

  - The tanks in the breakout station/terminal within this area have adequate secondary containment.

- The specific information summary for these breakout stations/terminals is provided in this Section as follows:

  - Breakout Station/Terminal Tank Information Summary (one per station)
  - Facility Diagram

- Pipeline sections or terminaling operations associated with this Area of Operation are detailed in other Sections of this Volume

FIGURE 7.1a

7.0 BREAKOUT STATIONS / TERMINALS

7.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the breakout stations and/or terminals that have storage (breakout tanks) connected to the pipeline sections described in the previous Section of this Volume. The data is summarized as follows:

BREAKOUT STATION	LARGEST TANK (BBLS)	WCD (BBLS)
Colton North Terminal	(b) (7)(F), (b) (3)	
Ontario Station		
Colton South Terminal (Tank C29)		

- The largest Worst Case Discharge (WCD) for the breakout stations/terminals within this Area of Operation has been determined to be as follows:

(b) (7)(F), (b) (3)

  - The tanks in the breakout station/terminal within this area have adequate secondary containment.

- The specific information summary for these breakout stations/terminals is provided in this Section as follows:

  - Breakout Station/Terminal Tank Information Summary (one per station)
  - Facility Diagram

- Pipeline sections or terminaling operations associated with this Area of Operation are detailed in other Sections of this Volume.

8.1.1 CERTIFICATION OF SUBSTANTIAL HARM

FACILITY NAME: CalNev Pipe Line, LLC Barstow Terminal
FACILITY ADDRESS: 34277 Daggett/Yermo Road
Barstow, CA 92327

(Detailed Facility Information, including data required for the Response Plan Cover Sheet, is provided in Figure 1.3)

1. Does the facility transfer oil over water to or from vessels ***and*** does the facility have a total oil storage capacity greater than or equal to 42,000 gallons?	Yes [ ]	No [✓]
2. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area?	Yes [ ]	No [✓]
3. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix or a comparable formula[1]) such that a discharge from the facility could cause injury to fish and wildlife and sensitive environments? For further description of fish and wildlife and sensitive environments, see Appendices I, II, and III to DOC/NOAA's "Guidance for Facility and Vessel Response Plans: Fish and Wildlife and Sensitive Environments" (59 FR 14713, March 29, 1994) and the applicable Area Contingency Plan.	Yes [✓]	No [ ]
4. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix or a comparable formula[1]) such that a discharge from the facility would shut down a public drinking water intake[2]?	Yes [ ]	No [✓]
5. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the last 5 years?	Yes [ ]	No [✓]

[1] If a comparable formula is used, documentation of the reliability and analytical soundness of the comparable formula must be attached to this form.

[2] For the purposes of 40 CFR part 112, public drinking water intakes are analogous to public water systems as described at 40 CFR 143.2(c).

CERTIFICATION

I hereby certify the following:

- Under penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe that the submitted information is true, accurate, and complete.
- The information and procedures contained herein are considered to be accurate as of this date and are consistent with the National Contingency Plan (NCP) and applicable Area Contingency Plans (ACP) as detailed in Section 1.5.

R L Brown — Signature

Area Manager — Title

Robert Brown — Name (please type or print)

12-08-04 — Date

NOTE: The information and procedures in this Plan must be treated as guidelines only. The user should determine to what extent it is practical and advisable to follow them. This decision may involve considerations not discussed in this Plan. Response Management Associates, Inc. (RMA) provided consulting and plan development services in the preparation of this plan utilizing data provided by the owner/operator and/or the Facility. RMA assumes no liability for injury, loss, or damage of any kind resulting directly or indirectly from the use of the regulatory interpretation, response planning, or information contained in this plan.

8.1.2 INTRODUCTION

This Facility is a bulk distribution facility for refined petroleum products. Product is received via the Company's pipelines ML into above ground storage. The product is transported out of the Facility by tanker trucks. Offloading of products at the Facility occurs infrequently, since essentially all product is received via pipeline. Product additives and ethanol are received via truck into aboveground tanks. The additives are blended into the product as it is loaded into trucks. The following Figure 8.1 provides Facility specific information, Figure 8.2 provides an Area Map for the Facility, and Figure 8.3 provides a Facility Diagram.

(Note: ML-1 is not connected to Barstow Terminal. The line does run through the terminal but KMEP does not have a connection into tankage.)

This Section 8 is provided in order to document the following Facility-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- Facility Information (Figure 8.1)
- Area Map (Figure 8.2)
- Hazard Identification including Tank Tables (Section 8.2)
- Inspections (Section 8.2.2)
- Vulnerability Analysis (Section 8.2.3)
- Discharge Scenarios (Section 8.3)
- Evacuation (Section 8.4)

FACILITY INFORMATION

GENERAL INFORMATION	
Facility Name:	Kinder Morgan Energy Partners, L.P.
Physical Address:	Barstow Terminal 34277 Daggett/Yermo Road Barstow, CA 92327 (760) 254-2616 (760) 254-2446 *(Fax)*
NAICS Code:	493190
EPA FRP Number:	FRP09A0366
Dun & Bradstreet Number:	618 450-886
Date of Initial Storage:	July 1962
Owner/Operator:	See Volume 1, Section 1.1
Qualified Individual (Emergency Coordinator):	See Volume 1, Volume 1.1
Telephone/FAX:	Additional telephone references, including 24 hour numbers, for the Facility, Owner, and QI/AQI are provided in Section 2 of Volume I.
FACILITY LOCATION	
County:	San Bernardino County, CA
Latitude:	(b) (7)(F), (b) (3) [redacted]
Longitude:	
Area Map:	Provided in Figure 8.2
Facility Diagram:	Provided in Figure 8.3
Wellhead Protection Area:	None
Facility Distance to Navigable Water:	Not applicable
Landside Directions:	Take I-40 East 7.34 miles to the Daggett/Yermo Road / Pendleton Road intersection. Turn left on Daggett/Yermo Road and travel 1.37 miles to the Facility on the right.
Waterside Directions:	There is no water access to this Facility.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL

Description of Operation:

- This Facility is a bulk distribution facility for refined petroleum products.

(b) (7)(F), (b) (3) [redacted]

Description of Operation (Cont'd):

- The Facility normally operates 24 hours a day 7 days a week.
- The Facility's Worst Case Discharge amount is (b) (7)(F), (b) (3) [redacted]

Products Handled:

- Gasoline
- Diesel
- Transmix
- Ethanol
- JP-8

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

PHYSICAL DESCRIPTION - LOADING RACK

Description of Operation:

- The Facility is equipped with four (4) loading bays and four (4) unloading connections which handle various refined petroleum products.
- A maximum of four (4) tank trucks may load and three (3) tank trucks unload simultaneously.
- The loading/unloading operations are conducted 24 hours a day 7 days a week.
- The Facility handles an average of 90 trucks per day.

Loading Rate: 600 gpm (*per truck*)

Truck Capacity: 9,000 gallons (*maximum*)

Discharge Prevention:

- The curbed concrete slab drains directly to a sump and into the oil water container.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

8.1.2 INTRODUCTION

This Facility is a bulk distribution facility for refined petroleum products. Product is received via the Company's pipelines #1/125 and #108/105 into aboveground storage. The product is transported out of the Facility by tanker trucks. Offloading of products at the Facility occurs infrequently, since essentially all product is received via pipeline. Gasoline additives are received via truck into aboveground tanks. The additives are blended into the product as it is loaded into trucks. Product is pumped from the Facility via the Company's pipeline #111 east to Imperial Terminal and pipeline #51 to March AFB. Product is also transferred to the Colton North Terminal for deliveries on lines ML, ML-1, CN-8 and CNP toward Las Vegas Terminal. The following Figure 8.1 provides Facility specific information, Figure 8.2 provides an Area Map for the Facility, and Figure 8.3 provides a Facility Diagram.

This Section 8 is provided in order to document the following Facility-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- Facility Information (Figure 8.1)
- Area Map (Figure 8.2)
- Hazard Identification including Tank Tables (Section 8.2)
- Inspections (Section 8.2.2)
- Vulnerability Analysis (Section 8.2.3)
- Discharge Scenarios (Section 8.3)
- Evacuation (Section 8.4)

Waterside Directions:	There is no water access to this Facility.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL

Description of Operations:

- This Facility is a bulk storage/distribution facility for refined petroleum products.

(b) (7)(F), (b) (3) [redacted]

Description of Operation (Cont'd):

- The Facility normally operates 24 hours a day 7 days a week.
- The Facility's Worst Case Discharge amount is (b) (7)(F), (b) (3) [redacted]

Products Handled:

- Gasoline
- Diesel
- Jet Fuel
- Transmix

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

PHYSICAL DESCRIPTION - LOADING RACK

Description of Operation:

- The Facility is equipped with nine (9) loading spots which handle various refined petroleum products.
- A maximum of nine (9) tank trucks may load simultaneously.
- The loading/unloading operations are conducted 24 hours a day 7 days a week.
- This Facility handles an average of 350 trucks per day.

Loading Rate: 600 gpm (*per truck*)

Truck Capacity: 9,000 gallons (*maximum*)

Discharge Prevention:

- The curbed concrete slab drains directly to an oil water separator.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS
● The majority of the Facility was constructed in 1955-56 with three (3) tanks and a maximum capacity of 5,838,000 gallons. The Facility expanded storage capacity by constructing three (3) to four (4) tanks about every three (3) years.

8.1.2 INTRODUCTION

Description of Facility

This Facility is a bulk distribution facility for refined petroleum products. The Facility receives product via 8”/14” pipeline, ethanol via railcar and additives via tank truck and railcar. Product is transported out of the Facility by tank trucks and 8”/6” pipeline.

The following Figure 8.1 provides Facility specific information, Figure 8.2 provides an Area Map for the Facility, and Figure 8.3 provides a Facility Diagram.

This Section 8 is provided in order to document the following Facility-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- Facility Information (Figure 8.1)
- Area Map (Figure 8.2)
- Hazard Identification including Tank Tables (Section 8.2)
- Inspections (Section 8.2.2)
- Vulnerability Analysis (Section 8.2.3)
- Discharge Scenarios (Section 8.3)
- Evacuation (Section 8.4)

Waterside Directions:	There is no water access to this Facility.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL

Description of Operation:

- This Facility is a bulk storage/distribution facility for refined petroleum products. The stored product arrives through the main Company pipeline to aboveground storage tanks, transfers to loading racks through pipelines, and moves out of the Facility by tank trucks. All tank trucks are owned by others. Ethanol is received via rail car and additives via tank truck and railcar.

- The aboveground storage tanks are contained in bermed secondary containment areas. The tanks are filled or drawn down through a system of aboveground and underground pipes that connect this Facility into the Company distribution network.

(b) (7)(F), (b) (3) [redacted]

- The Facility normally operates 24 hours a day 7 days a week.

- The Facility's Worst Case Discharge amount is (b) (7)(F), (b) (3) [redacted]

Products Handled:

- Gasoline
- Diesel
- Jet Fuel
- Transmix
- Ethanol
- Additives

- **Note**: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - LOADING RACK

Description of Operation:

- The Facility is equipped with 13 loading spots which handle various refined petroleum products.
- A maximum of 13 tank trucks may load simultaneously.
- The loading/unloading operations are conducted 24 hours a day 7 days a week.
- The Facility handles an average of 400-500 trucks per day.

Loading Rate: 600 gpm (*per arm connection*)

Truck Capacity: 12,000 gallons (*maximum*)

Discharge Prevention:

- The curbed concrete slab drains directly to a holding tank which is pumped to an oil/water separator.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

PHYSICAL DESCRIPTION - RAIL CAR RACK

Description of Operation:

- The Facility is equipped with one (1) rail car unloading area with 12 unloading spots.
- The Facility can unload from eight (8) tank cars simultaneously.

Unloading Rate: 500 gpm *(typical)*

Railcar Capacity: 29,000 gallons

Discharge Prevention:

- The catch pans drain directly to a containment basin adjacent to the unloading area.
- Unloading events are performed by qualified Company personnel only.

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS

- Since 1999, the Facility has added six (6) tanks, a truck loading rack and a remediation incinerator and water treater. The Facility has also upgraded its VRU.

Figures presented on the following pages include:

- Figure 8.2 – Area Map
- Figure 8.3 – General Layout
- Figure 8.4 – Fire Protection Diagram

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed in the Potential Spill Sources and Container Identification table in this Section.

Tanks

- Secondary Containment volumes for all bulk storage tanks are detailed on the Potential Spill Sources and Container Identification table located in this Section.

Loading Rack Containment System

The loading/unloading rack area is designed and operated as follows:

- Loading/Unloading area drainage flows into a catchment basin or treatment facility, designed to handle discharges.
- The containment system is designed to hold the maximum capacity of any single compartment of a single tank truck loaded or unloaded at the Facility.
- A quick drainage system is not used for tank truck loading/unloading.
- Drainage from the loading rack loading and unloading facilities (transmix, pump-off, additive) is contained in a depressed area (with curbs). Drainage from the north loading rack is through area drains to a 10,000 gallon underground retention tank, which leads to an oil/water separator. Drainage from the south loading rack is through area drains to a 100 barrel sump. Product is then transferred to a transmix tank. Periodically transmix is removed by truck for processing water is pumped to an evaporation tank and allowed to evaporate.
- Due to the location of the transfer area, it is impracticable to provide containment that meets or exceeds the largest compartment of the largest truck. Equivalent environmental protection is provided as follows:
- In the event that a spill did originate from the transfer area, the Facility would immediately activate its Contingency Plan to mitigate the spill before leaving the property.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Drainage From the Diked Areas

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment areas.
- Stormwater which does accumulate within diked areas, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures.
- Drainage from diked storage areas is not restrained by manually controlled valves.
- Flapper-type drain valves are not used to drain diked areas.
- Stormwater from diked areas is removed, if necessary, by pumping over the dikes.
- Valves used to discharge stormwater are manually activated.

Drainage From the Undiked Areas

Drainage from undiked areas is controlled as follows:

- Piping located outside the diked areas is contained by a perimeter dike that surrounds the west and south sides of the Facility.
- All undiked piping is located in areas away from vehicular traffic.
- The risk of leaks originating from piping is low since it is observed frequently enough to detect excessive corrosion, defective pipe supports, or other anomalies which could compromise the integrity of the pipe.
- In the event that a spill did originate from undiked piping, the Facility would immediately activate its Contingency Plan to mitigate the spill before leaving the property.

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is as follows:

- Stormwater is not normally drained from the secondary containment areas.
- The Facility has several additive, pump off, and transmit loading/unloading areas that drain to the main loading rack containment system.
- If it becomes necessary to drain stormwater from secondary containment areas, it would be pumped manually over the dike walls.
- Uncontaminated rainwater is inspected to ensure compliance with applicable water quality standards and will not cause a harmful discharge as defined in 40 CFR 110.
- In the event that drainage of secondary containment is required, records of the drainage event will be stored at the Facility.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Barstow Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading rack has sufficient capability to handle any potential increase in transfer capacity. The loading rack operates 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan which details additional detection measures.

Automated Detection Systems

(b) (3), (b) (7)(F)

Security

COMPLETELY AND PARTIALLY BURIED TANKS							

There are no Underground Storage Tanks.

8.2.2 FACILITY SELF-INSPECTIONS

Detection by Personnel

- Facility personnel conduct monthly inspection of tank gauges and cathodic protection readings. Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating rounds in accordance with the SPCC Plan.

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valves locks and/or seals
  - Other appurtenances

- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement.

- Annually a Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

- The Facility is located in a rural area in San Bernardino County, California.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Water Intakes

(b) (7)(F), (b) (3)

[redacted]

(b) (3), (b) (7)(F)

Additional detail on the medical facilities within the area of the Facility are included on the maps in Section 6.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Residential Areas

No residential areas were identified within the planning distance.

Businesses

The area surrounding the Facility is for the most part sparsely populated.

Review of GIS Data determined that the following businesses are within the planning distance of the Facility:

Businesses	Distance from Facility
Yermo Marine Corp. Logistics Base	0.25 miles NE *(approximate)*
Barstow MC Logistics Base	3.0 miles West
Barstow Mall Shopping Center	6.0 miles West
Trinity Assembly of God	0.09 miles
Hi Desert Fire Protection Service, Inc.	0.10 miles
Hertz	0.14 miles
U-Haul Co.	0.16 miles
Post Office – Daggett	0.20 miles

Fish and Wildlife, Wetlands, and other Sensitive Environments

The area surrounding the Facility is host to a variety of species. Refer to Figure 4.1 of this Volume for threatened/endangered species.

No wetlands were identified within the planning distance.

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

During a response situation the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact the agencies will be able to:

- Identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge.
- Identify potential environmental effects on fish and wildlife, wetlands, and other sensitive environments resulting from removal actions or countermeasures.

Lakes and Streams

The Mojave River is located south of the Facility. This river is dry most of the year.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Figure 4.1 of this Volume.

Recreational Areas

Review of GIS Data determined that the following recreational areas are within the planning

Recreational Areas	Location
Lilian Park	6.3 miles West
John Struncale Park	6.3 miles West
Waterman Park	8.5 miles West
Edglesong Park	8.5 miles West
Jasper Park	13.0 miles West
Lenwood Park	13.0 miles West

Transportation Routes (air, land, and water)

There are various public roadways which may be potentially effected by a discharge originating from the Facility.

Review of GIS Data determined that the following transportation routes are within the planning distance

Transportation Route	Distance from Facility
Interstate 15 (I-15)	4.0 miles NW
Interstate 40 (I-40)	2.5 miles S

Utilities

No utilities were identified within the planning distance.

Other Areas of Economic Importance

Review of GIS Data determined that no terrestrially sensitive or unique environments such as wildlife refuges, management areas, or ecological reserves are within the planning distance of the Facility. However, the following areas of economic importance are within the planning distance.

Other Areas of Economic Importance	Distance from the Facility
Logistics Base Golf Course	4.0 miles West
Mountview Cemetery	8.3 miles West
Barstow Branch Library	8.7 miles West
Barstow City Hall	8.7 miles West
Hinkley Valley Grange	14.0 miles West
Sun Valley Country Club	17.0 miles Southwest

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history of the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Containment and recovery of any spilled material which might escape a diked area would be accomplished through the implementation of spill response activities by: (1) Facility personnel, or if necessary, (2) one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow south through the Facility.

Vulnerability to a Natural Disaster

The Facility has historical data that defines the low probability of seismic activity in the Facility area. The construction of the Facility has taken the possibility of some seismic activity into consideration.

Other Factors

The area in which the Facility is located is prone to minor earthquakes, however, none have resulted in a discharge.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

Kinder Morgan maintains an online database of reportable spills available at all locations via the company's intranet. The database contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

Since the Facility was acquired by Kinder Morgan Energy Partners, the Facility has experienced no reportable spills as defined by 40 CFR 110.

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed in the Potential Spill Sources and Container Identification table in this Section.

Tanks

- Secondary Containment volumes for all bulk storage tanks are detailed in the Potential Spill Sources and Container Identification table in this Section.

Loading Rack Containment System

The loading/unloading rack areas are designed and operated as follows:

- Loading/Unloading area drainage flows into catchment basins, sumps or oil/water separators designed to handle discharges.
- The containment systems are designed to hold the maximum capacity of any single compartment of a single tank truck loaded or unloaded at the Facility.
- A quick drainage system is not used for tank truck loading/unloading.
- Details of the drainage systems for each truck loading/unloading rack is provided in the Potential Spill Sources and Container Identification tables in this Section.

Drainage From the Diked Areas

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment area.
- Stormwater which does accumulate within the diked area, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Diked Areas (Cont'd)

- Drainage from diked storage areas is restrained by manually controlled valves.
- Dike drain valves are secured in the closed position when not draining containment areas.
- Flapper-type drain valves are not used to drain diked areas.
- Individually diked areas all drain to a common collection point located in the corner of the tank area through normally closed and locked butterfly valves.

Drainage From the Undiked Areas

Drainage from undiked areas is controlled as follows:

- The majority of the piping is contained within the diked area(s) except for the section noted on the Potential Spill Sources and Container Identification table in Appendix A. These areas would be contained by a depressed area in an open field due to natural topography.
- All undiked piping is located in areas away from vehicular traffic.
- The risk of leaks originating from piping is low since it is observed frequently enough to detect excessive corrosion, defective pipe supports, or other anomalies which could compromise the integrity of the pipe.
- In the event that a spill did originate from undiked piping, the Facility would immediately activate its Contingency Plan to mitigate the spill before leaving the property.

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is as follows:

- Water is visually inspected for product and discharged only if no product sheen is visible.
- Facility drainage flows directly into an open watercourse.
- When draining the containment area, water is discharged to an open field north of the Facility and east of the Facility.
- The Facility does not have a wastewater treatment plant nor does it treat water prior to discharge off site.
- Uncontaminated rainwater is inspected to ensure compliance with applicable water quality standards and will not cause a harmful discharge as defined in 40 CFR 110.
- Adequate records are kept of such drainage events and are maintained at the Facility.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Colton South Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading rack has sufficient capability to handle any potential increase in transfer capacity. The loading racks operate 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan which details additional detection measures.

Detection by Personnel

- Facility personnel conduct monthly inspections of tank gauges and cathodic protection readings.
- Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating rounds.
- Annual Secondary Containment Inspection as part of the SPCC Plan.

Automated Detection Systems

(b) (3), (b) (7)(F)

OTHER POTENTIAL SPILL SOURCES								
Terminal Manifold	Gasoline	(b) (7)(F), (b) (3)	Manifold	Leak/Rupture/ Overflow	11,200 gpm	None	Southeast to military tank farms area & to berms along east side of facility	(b) (7)(F), (b) (3)
Transmix Processing Area	Transmix		Piping	Leak/Rupture/ Overflow	-----	None	Northeast to skid catch basin and oily water separator	
Chevron Pump Back Area (3 lines used, others OOS)	Gasoline		Piping	Leak/Rupture/ Overflow	10,000 gpm	None	South to low spot in drive (bermed); would not leave property	
Mobil L/R Pump Back Line	Gasoline		Piping	Leak/Rupture/ Overflow	300 gpm	None	South to low spot in drive (bermed); would not leave property	
Pipeline across San Bernardino flood control channel (which flows to Santa Ana River)	Gasoline		Piping	Leak/Rupture/ Overflow	10,500 gpm	None	Down	

POTENTIAL SPILL SOURCES AND CONTAINER IDENTIFICATION

Rack I.D.	Substance Transferred *(Oil & Haz. Substance)*	Truck Maximum Capacity *(Gallons)*	Potential Failure *(Equipment Failure/ Rupture/Leak/Overfill)*	Rate of Flow	Failure / Cause *(Record cause and date of any Tank failure which has resulted in a loss of tank contents)*	Direction of Flow	Secondary Containment Capacity *(Volume – Gallons) (Construction Material) (Drainage Type)*
TRUCK OR RAIL LOADING/UNLOADING AREAS							
Loading Rack #1 (2 lanes)	Gasoline/Diesel	10,000	Rupture/Leak/Overflow	Instantaneous	None	East to catch basin	Bermed, curbed, drains to catch basin oily water separator
Loading Rack #2 (Chevron) (2 lanes)	Diesel	10,000	Rupture/Leak/Overflow	Instantaneous	None	East to catch basin	Bermed, curbed, drains to catch basin oily water separator
Loading Rack #3 (Chevron) (2 lanes)	Transmix/B-100	10,000	Rupture/Leak/Overflow	Instantaneous	None	East to catch basin	Bermed, curbed, drains to catch basin oily water separator
Loading Rack #4 (Mobil) (2 lanes)	Gasoline/Diesel	10,000	Rupture/Leak/Overflow	Instantaneous	None	South to catch basin	Bermed, curbed, drains to catch basin oily water separator
Loading Rack #5 (1 lane)	Ethanol	10,000	Rupture/Leak/Overflow	Instantaneous	None	East to catch basin	Bermed, curbed, drains to catch basin oily water separator
Loading Rack #6 (2 lanes)	Gasoline/Diesel	10,000	Rupture/Leak/Overflow	Instantaneous	None	North to catch basin	Bermed, curbed, drains to catch basin oily water separator
Loading Rack #7 (2 lanes)	Gasoline/Diesel	10,000	Rupture/Leak/Overflow	Instantaneous	None	East	Bermed, curbed, drains to 10,000 gallon sump

HAZARD IDENTIFICATION TANKS
UNDERGROUND STORAGE TANKS

Tank Number	Substance Stored *(Oil & Haz. Substance)*	Quantity Stored *(Gallons)*	Maximum Capacity *(Gallons)*	Tank Type *(i.e. floating roof, fixed roof, etc.)*	Year Built	Failure / Cause *(Record cause and date of any Tank failure which has resulted in a loss of tank contents)*	Containment Capacity *(Gallons)*
		There are no Underground Storage Tanks.					

HAZARD IDENTIFICATION SURFACE IMPOUNDMENTS
(*Surface Impoundment = natural topographic depression, man-made excavation*)

SI Number	Substance Stored	Quantity Stored *(Gallons)*	Maximum Capacity *(Gallons)*	Surface Area	Year Built	Failure / Cause *(Record cause and date of any SI failure which has resulted in the loss of SI contents)*
		There are no Surface Impoundments.				

8.2.2 FACILITY SELF-INSPECTIONS

Container Testing and Inspections

- All aboveground containers are integrity tested on a regular schedule and when material repairs are made.
- The Engineering Department oversees the tank integrity in accordance with the SPCC Plan and L O&M Procedure 2101.
- Comparative records are maintained by the Engineering Department at the Orange office.
- The container inspection programs conducted and maintained by Facility personnel are as follows:
  - The containers are visually inspected by operating personnel for signs of deterioration, leaks, or the accumulation of liquids inside the containment areas.
  - Each storage container is inspected per the SPCC Plan and L O&M Procedure 2101, as required by age, condition, and service.
  - Based on these conditions, the aboveground storage containers are professionally inspected and non-destructive thickness testing is performed.
- The required inspections are divided into three categories:
  - Routine, in-service inspections
  - In-service, external inspections
  - Out-of-service, internal inspections
- If a field-constructed aboveground container undergoes a repair, alteration, reconstruction, or change in service that might affect the risk of a discharge or failure due to brittle fracture, the container will be evaluated.
- Drums or totes brought on-site are built or tested to the standard(s) established by the drum manufacturer or the drum recycler, as applicable.
- While on-site, drums and totes will be visually inspected at least monthly and ground contact will be minimized.
- Liquid level sensing devices are regularly tested.
- High level alarms are on a monthly basis.
- The bulk storage containers are equipped with ground-level gauges and are hand-gauged at regular intervals.

8.2.2 FACILITY SELF-INSPECTIONS (Cont'd)

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds twice a day. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valves locks and/or seals
  - Other appurtenances

- Periodic pressure testing may be warranted for piping in areas where facility drainage is such that a failure might lead to a spill event.

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement.

- A Corrosion Specialist visits the Facility annually to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

- The Facility is located in the southeastern portion of the City of Rialto, approximately 48 miles east of Los Angeles.

- The Facility is bi-sected by the Rialto Flood Control Channel, which discharges to the West Riverside Canal, which in turn discharges several miles downstream to the Santa Ana River.

- The Santa Ana River is the closest navigable waterway. It is located about ¼ mile south of the Facility.

- Facility is connected by pipelines to other Company facilities in California, Arizona and Nevada. Petroleum products are stored in aboveground tanks at the Facility. Company customers lease space in these tanks for their individually owned products. This potential spill analysis is for Facility irrespective of the lessee products. The Facility consists of several portions including:

  Area 1 – Transmix Tank Farm
  Area 2 – Military Tank Farm
  Area 3 – Shell Tank Farm
  Area 4 – Chevron Tank Farm
  Area 5 – Breakout Tank Farm
  Area 6 – Texaco Tank Farm
  Area 10 – Community Tank Farm
  Area 11
  Area 12 – Transmix Processing Facility

  In addition two other areas of risk include:

  – Terminal Manifold
  – Transmix Loading Rack area

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Drinking Water Supplies (intakes and wells)

(b) (7)(F), (b) (3)

[redacted]

(b) (3), (b) (7)(F)

maps in Section 6.

Residential Areas

The immediate area around the Facility (within approximately one mile) is sparsely populated; however, beyond that distance to the north and the east, the area becomes more heavily populated.

Additional details on the residential areas within the area of the Facility are included on the maps in Section 6.

8.2.3 VUNERABILITY ANALYSIS (Cont'd)

Businesses

The area surrounding the Facility is for the most part commercialized. Along the Santa Ana River there are various businesses and commercial establishments which may be potentially impacted by a discharge. Review of GIS Data determined that the following businesses are within the planning distance of the Facility:

Businesses	Distance from Facility
Grand Terrace Shopping Center	1.0 miles S *(approximate)*
Jurupa Grand Center Shopping Center	6.2 miles SW *(approximate)*
Pedley Square Shopping Center	9.3 miles SW *(approximate)*
Butterfield Stage Square Shopping Center	20.0 miles SW *(approximate)*
Canyon Plaza Shopping Center	31.0 miles SW *(approximate)*
Esperanza Village Shopping Center	31.0 miles SW *(approximate)*

Additional detail on the general layout of businesses within the area of the Facility is included on the maps in Section 6.

Fish and Wildlife, Wetlands, and other Sensitive Environments

The area surrounding the Facility is host to a variety of species. The Company is using the Regional ACP as well as the NOAA Environmental Sensitivity Study for the San Francisco Bay Region, prepared by Research Planning Institute, Inc., Columbia, South Carolina, 1986, as a reference in determining the locations of wetlands, environmentally sensitive areas, fish and wildlife, and endangered flora and fauna. Refer to Figure 4.1 of this Volume for threatened/endangered species.

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

Currently there are no specifically identified wetlands in the area of the Facility. Wetland habitats, however, are common throughout portions of the area. The size and diversity of the wetland environments vary with season and year. Wetlands play a disproportionally large role in maintaining the stability of the global environment. Wetlands retain and gradually release large quantities of water and their dense vegetation traps sediments and consumes pollutants.

During a response situation the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact the agencies will be able to:

- Identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge.
- Identify potential environmental effects on fish and wildlife, wetlands, and other sensitive environments resulting from removal actions or countermeasures.

8.2.3 VUNERABILITY ANALYSIS (Cont'd)

Lakes and Streams

The lakes, streams, and rivers that may be potentially impacted by a discharge originating at the Facility are identified on the maps in Section 6.

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Figure 4.1 of this Volume.

Recreational Areas

Review of GIS Data determined that the following recreational areas are within the planning

Recreational Areas	Location
Avalon Park	2.0 miles SW *(approximate)*
Fairmont Park	3.0 miles SW *(approximate)*
Fairmont Park Golf Course	3.0 miles SW *(approximate)*
Camp Evans	3.9 miles SW *(approximate)*
Agricultural Park	8.9 miles SW *(approximate)*
Fairview Park	20.0 miles SW *(approximate)*
Butterfield Stage Trail Park	20.5 miles SW *(approximate)*
Chino Hills State Park	21.2 miles SW *(approximate)*
Eucalyptus Park	32.0 miles SW *(approximate)*
Riverside Golf Course	2.0 miles S (approximate)
Jensen Alvarado Historical Ranch	5.0 miles SW (approximate)
Mount Bibidoux Park	5.0 miles SW (approximate)
Santa Ana River Reg. Park	5.0 miles SW (approximate)
Jurupa Hills Golf Course	6.8 miles SW (approximate)
Jurupa Hills Country Club	7.0 miles SW (approximate)
Nichols Park	7.0 miles SW (approximate)
Paradise Knolls Golf Course	10.0 miles SW (approximate)
River Trails Park	13.0 miles SW (approximate)
Norco Park	15.5 miles SW (approximate)
Wayne Makin Park	15.8 miles SW (approximate)
Prado Basin Park	16.2 miles SW (approximate)
Prado Reg. Park	20.0 miles SW (approximate)
Green River Golf Course	22.0 miles SW (approximate)
Prado Tiro Shooting Range	22.0 miles SW (approximate)
Rancho Santa Ana Botanic Gardens	25.3 miles SW (approximate)
Yorba Reg. Park	29.0 miles SW (approximate)

8.2.3 VUNERABILITY ANALYSIS (Cont'd)

Recreational Areas (Cont'd)

The recreational areas that may be potentially impacted by a discharge originating at the Facility are more fully identified on the maps in Section 6.

Transportation Routes (air, land, and water)

There are various public roadways and waterways within the planning distance of the Facility. The Interstate 10 Freeway is located approximately one-half mile north of Facility with the Santa Fe Railroad running between the freeway and the Facility.

Transportation Route	Distance from Facility
Interstate 10 (I-10)	0.71 miles N
Santa Fe Railroad	0.5 miles N

Utilities

No utilities were identified within the planning distance.

Other Areas of Economic Importance

Review of GIS Data determined that no terrestrially sensitive or unique environments such as wildlife refuges, management areas, or ecological reserves are within the planning distance of the Facility.
