Canyon Hills Branch Anaheim Public Library	31.0 miles SW *(approximate)*

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history for the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Containment and recovery of any spilled material which might escape a diked area would be accomplished through the implementation of spill response activities by: (1) Facility personnel, or if necessary, (2) one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow south southeast through the Facility.

Vulnerability to a Natural Disaster

The Company has historical data that defines the low probability of seismic activity in the San Bernardino area. The construction of Facility has taken the possibility of some seismic activity into consideration; the location of Tank Farms away from slide prone areas, and constructing the Facility, including all subgrade soil preparation, along with slope and tank construction in accordance with appropriate building codes and industry guidelines.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL (Cont'd)

Other Factors (Cont'd)

The actions taken to lessen hazards at Facility petroleum tank farm reduce the probability to a low potential. Hazard reduction protective measures have been designed into tanks and into the construction of the Facility. Tanks were designed to industry standards which reduces the potential for hazards. Based on the care and construction of the tanks, the potential of any one tank rupturing and emptying product into the secondary containment is low. The potential of several tanks simultaneously rupturing is very low.

The Facility conforms to good engineering practices in the tank integrity inspection program. The inspection program reduces the likelihood of leaks. The Facility has not experienced a failure associated with a tank structure.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

Kinder Morgan maintains an online database of reportable spills available at all locations via the company's intranet. The database contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

FIGURE 8.5

DRAINAGE DIAGRAM

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Rail unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed in the Potential Spill Sources and Container Identification table in this Section.

Tanks

- Secondary Containment volumes for all bulk storage containers are detailed in the Potential Spill Sources and Container Identification table in this Section.

Loading Rack Containment System

The loading/unloading rack area is designed and operated as follows:

- Loading area drainage flows into a catchment basin or treatment facility, designed to handle discharges.
- The containment system is designed to hold the maximum capacity of any single compartment of a single tank truck loaded or unloaded at the Facility.
- A quick drainage system is not used for tank truck loading.
- Drainage from the truck rack loading facilities is contained in depressed areas (with curbs). Drainage is through area drains to two (2) 10,000 gallon sumps. The product is pumped through an oil/water separator to a transmix tank. The water phase is drained to an evaporation tank at the southwest corner of the Facility.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Drainage From the Diked Areas

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment area.

- In the unlikely event that stormwater does accumulate within the diked areas, and does not dissipate naturally, it will be removed in accordance with the stormwater drainage procedures.

- Flapper-type drain valves are not used to drain diked areas.

- Stormwater accumulating in diked storage areas will be visually inspected for evidence of oil or oil sheen. If no evidence of contamination is found the water will be discharged to natural drainage using a portable pump.

- Contaminated stormwater will be removed via vacuum truck and transported off site for processing.

Drainage From the Undiked Areas

Drainage from undiked areas is controlled as follows:

- Piping located outside the diked areas will flow south through the Facility across the paved areas to a natural depression between the drives in the southern part of the Facility.

- The risk of leaks originating from piping is low since it is observed frequently enough to detect excessive corrosion, defective pipe supports, or other anomalies which could compromise the integrity of the pipe.

- In the event that a spill did originate from undiked piping, the Facility would immediately activate its Contingency Plan to mitigate the spill before leaving the property.

- It is impractical to provide secondary containment for undiked piping because installation of secondary containment for undiked piping within the boundaries of the Facility would alter the overall stormwater management plan of the Facility.

- This section, due to its location, would be impracticable to contain and equivalent environmental measures have been developed as follows:

  - The piping is subject to routine inspections during operating rounds.
  - The piping is subject to hydrostatic testing.

- Drainage of stormwater from other undiked areas (non-storage) of the Facility is not controlled due to its origination from non-spill potential areas. Oil which may get into these areas would be cleaned up immediately and not allowed to drain off the property.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Drainage From the Undiked Areas (Cont'd)

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is as follows:

- Stormwater is not drained from the secondary containment areas.
- The Facility does have a wastewater treatment plant and it does chemically treat water prior to discharge off site.
- Uncontaminated rainwater is inspected to ensure compliance with applicable water quality standards and will not cause a harmful discharge as defined in 40 CFR 110.
- Adequate records are kept of such drainage events.
- Adequate records of drainage events are maintained at the Facility office.

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Las Vegas Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading rack has sufficient capability to handle any potential increase in transfer capacity. The loading racks operate 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of manual (personnel) detection systems. The Facility maintains separately from this Plan the following document Spill Prevention, Control, and Countermeasure (SPCC) Plan which details additional detection measures.

Detection by Personnel

- Facility personnel conduct monthly inspection of tank gauges and cathodic protection readings. Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds. Refer to Figures 8.5 and 8.6 for sample Tank Inspection and Secondary Containment Inspection Checklists.

8.2.2 FACILITY SELF-INSPECTIONS

Detection by Personnel

- Facility personnel conduct monthly inspection of tank gauges and cathodic protection readings. Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds. Refer to Figures 8.5 and 8.6 for sample Tank Inspection and Secondary Containment Inspection Checklists.

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valves locks and/or seals
  - Other appurtenances

- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement.

- Annually a Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained at the Orange office.

FIGURES 8.5 AND 8.6

Note: The following Kinder Morgan forms comprise the typical tank and secondary containment Inspection Checklists for this Facility. These forms may change over time to accommodate the specific operations of the Facility.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

The tank farm is protected with earthen berms designed to withstand pressure from freestanding product. The floors of the tanks have impervious linings. The berm is constructed to withstand a moderate earthquake without breaching the integrity of the secondary containment.

- The Facility is located in Las Vegas, Nevada approximately one (1) mile north of the Las Vegas Wash.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

(b) (7)(F), (b) (3)

(b) (3), (b) (7)(F)

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Residential Areas

Nellis Air Force Base housing areas are located approximately 0.5 miles south and west of the Facility.

Businesses

The area surrounding the Facility is for the most part commercial and industrial. There are various businesses and commercial establishments which may be potentially impacted by a discharge. Review of GIS Data determined that the following businesses are within the planning distance of the Facility:

Businesses	Distance from Facility
Rebel Oil Company Inc. Terminal	0.01 miles *(approximate)*
Foreland Trucking	0.08 miles *(approximate)*
River City Petroleum/Nevada Truck and Trailer Repair	0.12 miles *(approximate)*
US Fleet Services	0.08 miles *(approximate)*

Fish and Wildlife, Wetlands, and other Sensitive Environments

The area surrounding the Facility is host to a variety of species. The EPA Region 9 - Area Contingency Plan for this area details these categories. Refer to Figure 4.1 of this Volume for additional details.

No wetlands were identified within the planning distance.

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

Lakes and Streams

Review of GIS Data determined that the following lakes and streams are within the planning distance of the Facility:

Lakes and Streams	Location
Las Vegas Wash	1.0 miles S *(approximate)*
Socio Economic Sensitivities – Las Vegas Bay	17.58 miles SE *(approximate)*
Lake Mead	21.53 miles SE *(approximate)*

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Section 4 of this Volume.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Recreational Areas

Review of GIS Data determined that the following recreational areas are within the planning distance of the Facility:

Recreational Areas	Location
Lake Mead Natural Recreation Area	13.06 miles SE *(approximate)*

Additional details on the recreational areas that may be potentially impacted by a discharge originating at the Facility are more fully identified on the maps in Section 6.

Transportation Routes (air, land, and water)

The Facility is located south of I-15, with the Union Pacific Railroad running along the northwest side of the Facility. Review of GIS Data determined that the following transportation routes are within the planning distance of the Facility:

Transportation Route	Distance from Facility
North Las Vegas Blvd.	0.5 miles S *(approximate)*
I-15	1.5 miles N *(approximate)*

Utilities

There are no utilities located within the immediate vicinity of the Facility or in the areas that may be potentially impacted by a discharge originating from the Facility.

Other Areas of Economic Importance

Review of GIS Data determined that no terrestrially sensitive or unique environments such as wildlife refuges, management areas, or ecological reserves are within the planning distance of the Facility.

Other Areas of Economic Importance	Distance from the Facility
Nellis Air Force Base	4.36 miles E *(approximate)*
Socio Economic Sensitivities – Jamestown (historical)	25.54 miles *(approximate)*

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history of the Facility.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Any spilled material which might escape a diked area would be mitigated through the implementation of spill response activities by Facility personnel or, if necessary, one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow southwest through the Facility.

Vulnerability to a Natural Disaster

The Facility is located in a semi-active earthquake zone with occasional seismic activity.

The Company has historical data that defines the probability of seismic activity in the Northern California / Nevada area. The construction of the Facility has taken the possibility of some seismic activity into consideration; the location of tank farms away from slide prone areas, and constructing the Facility, including all subgrade soil preparation, along with slope and tank construction in accordance with appropriate building codes and industry guidelines.

Other Factors

The actions taken to lessen hazards at the Facility tank farm reduces the probability to a low potential. Hazard reduction protective measures have been designed into tanks and into the construction of the Facility. Tanks were designed to industry standards which reduces the potential for hazards. Based on the care and construction of the tanks, the potential of any one tank rupturing and emptying product into the secondary containment is low. The potential of several tanks simultaneously rupturing is very low.

The Facility conforms to good engineering practices in the tank integrity inspection program. The inspection program reduces the likelihood of leaks. The Facility has not experienced a failure associated with a tank structure.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

The Facility maintains a separate Oil Spill History file at the Orange, CA office. The Facility's file contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).

8.2.5 REPORTABLE OIL DISCHARGE HISTORY (Cont'd)

- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

Since the Facility was acquired by Kinder-Morgan Energy Partners, the Facility has experienced no reportable spills as defined by 40 CFR 110.

Date of Discharge	Location of Discharge	Cause of Discharge	Product Discharged	Amount Discharged
12/29/04	Oil/Water Separator	Overflow due to heavy rain	Crude Oil	(b) (7)(F), (b) (3)

Note: Additional information can be found at the Kinder Morgan corporate office located at 1100 Town & Country Road, Orange, CA 92868.

(b) (7)(F), (b) (3)

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. - Barstow Terminal is an EPA jurisdictional "Non-Transportation Related Onshore Facility" which operates in a Non-Higher Volume Port Area.

The EPA discharge volume calculations are described as follows:

EPA Discharge Volume Calculation

- **Worst Case Discharge**
  100% of the largest single tank

  WCD = (b) (7)(F),

- **Medium Discharge**
  Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD

  MD = 857 bbls

- **Small Discharge**
  Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD

  SD = 50 bbls

8.3 DISCHARGE SCENARIOS (Cont'd)

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack, or leaking piping.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. Preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the Facility could be diverted to the product tanks that are not at maximum capacity. Spills that enter the bar ditch can be handled by response contract vacuum truck, absorbent pad and boom, or other equipment.

The closest waterway is the Mojave River which is south of the Facility. The storage tanks have adequate secondary containment so it is unlikely that a spill would reach the river or travel very far if it did. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, as appropriate, include:

- 1,000' of containment boom and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a *Small Discharge* or greater which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a *Small Discharge* with the manpower and local contract resources as detailed in Sections 2 and 3 of Volume 2.

- A 50 bbls discharge typically will not escape the containment of the Facility.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Offsite Impact

- The closest waterway is the Mojave River, which is south of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the River. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be implemented at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)
Offsite Impact (Cont'd)
● Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.
Notes:
● Equipment and manpower resources are detailed in Section 3 of Volume 2.
● Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
● Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before a spill containment could begin. The spilled material would more than likely collect in the containment area sump system and be routed to the separator system. If a spill of this size escaped the property it could possibly enter the Mojave River. Adverse weather conditions would increase the chances of a discharge entering the river; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges.

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages can be referenced in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a medium discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

There are no waterways in the vicinity. The adjacent Mojave River is typically dry or with only minimal flow, so the potential for a spill of this size reaching navigable water does not exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the *Medium Discharge* volume that are capable of arriving on scene within 12 hours.
- Sufficient quantity of containment boom must arrive within 12 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 12 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 12 hours; Tier 2 = 36 hours; Tier 3 = 60 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 12 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage facilities.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the river.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed (b) (7)(F), (b) (3)

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to leave the Facility property, diking would have to be damaged or destroyed (breached).

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages can be located in the Potential Spill Sources and Container Identification table in Section 8.2.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow south and enter the Mojave River Bed which is located south of the property.

For a spill that is confined to the land along the pathway, Facility personnel would have at least two (2) options by which to contain the spill:

- Dams
- Trenches

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Ditch Containment

A spill may be contained in storm water ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located north of the Mojave River Bed (a normally dry river bed). The priority during larger spills is to prevent oil from reaching the river bed. OSROs are under contract with the Facility. The Company, however, will use Facility personnel and Facility owned equipment to initiate response actions within one hour. Several recreating areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by state and Federal trustees would likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.
- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage facilities.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. - Colton South Terminal is an EPA jurisdictional "Non-Transportation Related Onshore Facility" which operates in a Non-Higher Volume Port Area.

The agency discharge volume calculations are described as follows:

EPA Discharge Volume Calculation
• **Worst Case Discharge** *100% of the largest single tank* **WCD** = (b) (7)(F), (b) (2)
• **Medium Discharge** *Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD* **MD** = 857 bbls
• **Small Discharge** *Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD* **SD** = 50 bbls

8.3 DISCHARGE SCENARIOS (Cont'd)

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack, or leaking piping.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the loading rack would be diverted to the on-line oil/water separator.

The closest waterway is the Santa Ana River, which is south of the Facility. The storage tanks and truck loading racks, have adequate secondary containment so it is unlikely that a spill would reach the river or travel very far if it did. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, as appropriate, include:

- 1,000' of containment boom and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a *Small Discharge* or greater which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a *Small Discharge* with the manpower and local contract resources as detailed in Section 2 and 3 of Volume 2.

- A 50 bbls discharge typically will not escape the containment of the Facility.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Offsite Impact

- The closest waterway is the Santa Ana River, which is south of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the River. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be implemented at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)
Offsite Impact (Cont'd)
● Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.
Notes:
● Equipment and manpower resources are detailed in Section 3 of Volume 2.
● Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
● Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before a spill containment could begin. The spilled material would more than likely collect in the containment area sump system and be routed to the separator system. If a spill of this size escaped the property it could possibly enter the Santa Ana River. Adverse weather conditions would increase the chances of a discharge entering the river; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages can be referenced in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a medium discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

The closest waterway is the Santa Ana River so the potential for a spill of this size reaching navigable water does exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the *Medium Discharge* volume that are capable of arriving on scene within 12 hours.
- Sufficient quantity of containment boom must arrive within 12 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 12 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 12 hours; Tier 2 = 36 hours; Tier 3 = 60 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 12 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage facilities.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the river.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed (b) (7)(F), (b) (3)

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached).

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages can be located in the Potential Spill Sources and Container Identification table in Section 8.2.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow south and enter the Santa Ana River which is located south of the property.

For a spill that is confined to the land along the pathway, Facility personnel would have at least two (2) options by which to contain the spill:

- Dams
- Trenches

Ditch Containment

A spill may be contained in storm water ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located north of the Santa Ana River. The priority during larger spills is to prevent oil from reaching the waterway. OSROs are under contract with the Facility. The Company, however, will use Facility personnel and Facility owned equipment to initiate initial response actions within one hour. Several recreating areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by state and Federal trustees would likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Response Requirement (Cont'd)

- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage facilities.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of six (6) feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. - Las Vegas Terminal is an EPA jurisdictional "Non-Transportation Related Onshore Facility" which operates in a Non-Higher Volume Port Area.

The EPA discharge volume calculations are described as follows:

EPA Discharge Volume Calculation

- **Worst Case Discharge**
  100% of the largest single tank

  WCD = (b) (7)(F),

- **Medium Discharge**
  Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD

  MD = 857 bbls

- **Small Discharge**
  Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD

  SD = 50 bbls

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the truck rack, or leaking piping and would be Gasoline.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the Facility could be diverted to the product tanks.

The closest waterway is the Las Vegas Wash, which is south of the Facility. The storage tanks and truck loading racks have adequate secondary containment so it is unlikely that a spill would reach the river. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, as appropriate, include:

- 1,000' of containment boom and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a *Small Discharge* or greater which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a *Small Discharge* with the manpower and local contract resources as detailed in Section 2 and 3 of Volume 2.

- A 50 bbls discharge typically will not escape the containment of the Facility.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack while loading Gasoline. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the truck rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Offsite Impact

- The closest waterway is the Las Vegas Wash, which is south of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the river. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be deployed at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage tanks, as the situation demands.
- Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Spills of this size would likely be Gasoline. Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before a spill containment could begin. The spilled material would more than likely collect in the containment area sump system and be routed to the separator system. If a spill of this size escaped the property it could possibly enter the Las Vegas Wash. Adverse weather conditions would increase the chances of a discharge entering the river; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages are listed in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a Medium Discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

The closest waterway is the Las Vegas Wash so the potential for a spill of this size reaching navigable water does exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the Medium Discharge volume that are capable of arriving on scene within 12 hours.
- Sufficient quantity of containment boom must arrive within 12 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 12 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 12 hours; Tier 2 = 36 hours; Tier 3 = 60 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 12 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage tanks.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the river.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed [redacted]

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached). Spills of this size would likely be Gasoline.

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages are listed in the Potential Spill Sources and Container Identification table in Section 8.2.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow south toward the Las Vegas Wash.

For a spill that is confined to the land along the pathway, Facility personnel would contain the spill using dams or trenches.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Ditch Containment

A spill may be contained in storm water ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located north of the Las Vegas Wash. The priority during larger spills is to prevent oil from reaching the waterway. OSROs are under contract with the Facility. The Company, however, will use Facility personnel and Facility owned equipment to initiate initial boom deployment and anchoring at the waterway within a reasonable time. Several recreation areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by state and Federal trustees would likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.
- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage tanks.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the ICP, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Company Personnel (IC) assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 34277 Daggett/Yermo Road
Daggett, CA 92327
c. Activate the Facility's employee emergency alarm system (siren). (Notifications and announcements to be made to personnel via 2-way radio.)
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility.
h. Establish a Command Center immediately.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the front gate next to office. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel (IC) will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the outside gate at the end of driveway by the road or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility Main Office, or warehouse.

8.4 FACILITY EVACUATION (Cont'd)

4. Community Evacuation

The local Law Enforcement provides methods of warning the public of the need to evacuate. The current procedure for informing the public when there is a need to do so is by door-to-door notification, use of electronic media by direct contact to radio and television stations, or the employment of the Emergency Broadcast System (EBS). The local authorities will initiate and coordinate all efforts concerning the evacuation of the community.

5. Directions to Barstow Community Hospital

From the Facility take Daggett-Yermo road approximately 1.37 miles to I-40. Take I-40 west approximately 6.18 miles to East Main. Exit right or northwest onto east main and travel 0.86 miles to East Mountain View. Turn left onto East Mountain View and travel 0.88 miles to south 7th street. Turn right to Hospital.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gate located west of the office.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

8. Prevailing Winds

The prevailing winds in the Facility area generally come from the southwest at an average speed of 5-10 mph year round.

9. Water Currents

The Mojave River is dry most of the year.

TACTICAL PLAN

The following Tactical Plan has been provided to assist initial response to a spill incident from this Facility. The plan includes the following:

- Driving directions
- General pictures of the site and tactical response strategy
- General response equipment and personnel recommendations

Note: This Tactical Plan is provided as a general guidance tool for response to an incident emanating from this Facility. The selection of response strategy equipment, manpower and deployment site may vary based on actual field conditions (e.g. terrain, weather conditions, product type/volume) and incident details.

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the ICP, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Company Personnel (IC) assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 2359 South Riverside Ave.
Bloomington, CA 92316
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site if possible.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility and Southern Pacific Railroad, if applicable.
h. Staging area for Emergency Command post will be at the entrance to the Facility or where the Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the Control Building. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel (IC) will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the Secondary Emergency Response Command Center or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility Control Building.

8.4 FACILITY EVACUATION (Cont'd)

4. Community Evacuation

The local Law Enforcement provides methods of warning the public of the need to evacuate. The current procedure for informing the public when there is a need to do so is by door-to-door notification, use of electronic media by direct contact to radio and television stations, or the employment of the Emergency Broadcast System (EBS). The local authorities will initiate and coordinate all efforts concerning the evacuation of the community.

5. Directions to San Bernardino Community Hospital

Start out going north on S Riverside Ave. towards W Mindanao St. by turning right and travel 0.69 miles. Take the I-10E ramp towards San Bernardino and merge onto I-10E. Travel 3.44 miles and take the I-215 N/I-215 S exit towards San Bernardino/Barstow/Riverside. Then take the I-215 N exit on the left towards San Bernardino/Barstow. Proceed 0.81 miles and merge onto I-215 N. Travel 4.67 miles and then take the CA-30 W Highland Ave. Proceed 0.34 miles and stay straight to go onto W. Highland Ave. Travel 0.53 miles and turn left onto Medical Center Dr. Go 0.35 miles to the Hospital.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gates located west of the Control Building. If the situation permits, the Facility may also be accessed through the southern access road.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

8. Prevailing Winds

The prevailing winds in the Facility area generally come from the northwest at a speed of 5-10 mph year round.

9. Water Currents

The Santa Ana River in the vicinity of the Facility has no tidal influence.

(b) (7)(F), (b) (3)

FIGURE 8.9

TACTICAL PLAN

The following Tactical Plan has been provided to assist initial response to a spill incident from this Facility. The plan includes the following:

- Driving directions
- General pictures of the site and tactical response strategy
- General response equipment and personnel recommendations

Note: This Tactical Plan is provided as a general guidance tool for response to an incident emanating from this Facility. The selection of response strategy equipment, manpower and deployment site may vary based on actual field conditions (e.g. terrain, weather conditions, product type/volume) and incident details.

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Company Personnel IC assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 5049 N. Sloan Lane
Las Vegas, NV 89115
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility and Burlington Northern if applicable.
h. Establish a Command Center immediately at the entrance to the Facility or where the Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the Control Building. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel IC will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the secondary command center or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility Main Office, Control Building, or the north or south staging area.

8.4 FACILITY EVACUATION (Cont'd)

4. Community Evacuation

The Company has confirmed with the Clark County Fire Department that no Community Evacuation Plan currently exists for this area. However, the Fire Department does have Standard Guidelines that are followed in the event of an evacuation.

5. Directions to Lake Mead Hospital Medical Center

Leave the Facility heading south on North Sloan Lane. Turn right onto Las Vegas Boulevard North then left onto Bruce Street. Take another left onto East Lake Mead Boulevard. The hospital is located at 1409 East Lake Mead Boulevard.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gates located west of North Sloan Lane.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored in aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

8. Prevailing Winds

The prevailing winds in the Facility area generally come from the northeast or southwest, at an average speed of 5-10 mph year round.

9. Water Currents

The Las Vegas Wash is dry most of the year; however, it is prone to flash flood during heavy rains.

1.2 OPERATING ASSETS COVERED BY THIS PLAN

The following tables provide a general information summary for the pipeline sections, pipeline facilities, breakout stations and terminals in each of the Areas in this Region. Specific detail can be located in the following sections for the applicable area.

- Section 6 – Area Pipeline Sections (for DOT jurisdiction)
- Section 7 – Area Breakout Stations (for DOT jurisdiction)
- Section 8 – Area Terminals (for EPA and OSPR jurisdiction)

BARSTOW AREA		
PIPELINE SECTIONS	**LINE NO.**	**COUNTY / STATE**
Lenwood Junction – BNSF	ML5A	San Bernardino, CA
Adelanto Junction – Halloran 8”	ML1	San Bernardino, CA
Adelanto Junction – Halloran 14”	ML	San Bernardino, CA
Adelanto Junction – George AFB 6”	ML4	San Bernardino, CA
George Terminal – Edwards 6”	ED-001	San Bernardino, CA Los Angeles, CA Kern, CA
PIPELINE FACILITIES (Non-Storage)		
Barstow Pump Station (Booster)		San Bernardino, CA
Barstow Station (Piping Manifold Only)		San Bernardino, CA
Yermo Station (Meter Manifold Only)		San Bernardino, CA
Baker Pump Station (Booster)		San Bernardino, CA
Edwards Terminal (Meter Manifold Only)		Kern, CA
BREAKOUT STATIONS		
George AFB Breakout Station		San Bernardino, CA
TERMINALS		
Barstow Terminal		San Bernardino, CA

TERMINALS		
Las Vegas Terminal		Clark, NV

(b) (3), (b) (7)(F)

1.3 SUBSTANTIAL HARM

It is KMEP's goal to respond as quickly as possible to all uncontrolled releases of petroleum product, regardless of the source point location along the system. Based upon this goal, and the over breadth of the definitions provided in each of the applicable regulations, KMEP is compelled to consider all of the Facility's breakout stations, and active line sections listed above in this Section, as capable of a release potentially causing "significant and substantial harm". A summary of the Worst Case Discharge scenarios for these facilities is provided as follows:

SOUTHERN REGION CENTRAL WORST CASE DISCHARGE DOT JURISDICTION

Discharge Scenario	Planning Volume
(b) (7)(F), (b) (3)	

* DOT Worst Case Discharge volumes are based on 50% of the tank's maximum storage capacity and for pipelines based on an annual Integrity Management Program study, as follows:

Release volume prior to line shutdown and valve closures (Initial Loss):

- Full flow release due to rupture. This is computed at the maximum pumping rate the line segment.
- Detection time, analysis and pump shutdown in adverse weather conditions. This is based on a maximum of fifteen (15) minutes in the event of a full flow rupture, which would cause an instant alarm.
- Line segment valve closures. All line segments are equipped with remote activating isolation valves. Adverse weather would have no impact on line segment isolation, as isolation valves are not dependent on manual closure.

Line drainage following pump shutdown (Stabilization Loss) is computed the maximum potential line drainage between adjacent isolation or check valves, and incorporated pipeline elevation profiles to estimate how much of that total volume would escape at any release point along the line. The historic discharges have not approached either the breakout tank WCD volume or the pipeline WCD in the area.

SOUTHERN REGION CENTRAL WORST CASE DISCHARGE EPA JURISDICTION	
Discharge Scenario	**Planning Volume**
Small Discharge	
• Barstow Terminal	50 bbls
• Colton Terminal (SFPPL)	50 bbls
• Las Vegas Terminal	50 bbls
Medium Discharge	
• Barstow Terminal	857 bbls
• Colton Terminal (SFPPL)	857 bbls
• Las Vegas Terminal	857 bbls
Worst Case Discharge	
(b) (7)(F), (b) (3)	

Note: EPA Worst Case Discharge is based on the maximum storage capacity of the largest tank at each Facility.

These Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three-tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. Sections 6, 7, and 8 of this Plan demonstrate a series of calculations and planning volume determinations based on guidance provided by all applicable regulations. The inclusion of these calculations is for demonstration of the response planning volumes and response capability necessary for on-water and on-shore recovery requirements as the result of the discharge scenarios detailed in the table above.

1.4 FORMAT AND SCOPE OF PLAN

This Volume 2 of the Integrated Contingency Plan (ICP) is intended to guide emergency response activities throughout KMEPs Pacific Operation Southern Region – Central. This Region is divided into three (3) Areas (see Figure 1.1) each of which has its own tab in this document. These areas are as follows:

- Barstow Area
- Colton Area
- Las Vegas Area

Each of the Volume 2 plans in this area reflects identical Sections 1 through 5. Section 6 of each Area details the Pipeline Sections in the respective area, Section 7 of each Area details the Breakout Stations (DOT-jurisdictional) in the respective area, and Sections 8 of each Area details the Terminals (multi-jurisdictional) in the respective area*. The Area covered by this particular plan is identified on the front cover of this plan and on the footer of each page and on the maps provided in Figure 1.1.

Volume 1 of the Integrated Contingency Plan provides guidance which is consistent across the Pacific Operations. The two (2) documents are intended to work together as one seamless Integrated Contingency Plan for the various facilities/operations and agency jurisdictions in Pacific Operations.

2.0 NOTIFICATIONS

2.1 INTERNAL NOTIFICATIONS

Specific reference to all internal notifications is detailed in **Volume 1** Section 2.1 which provides the following:

- KM Employee or Agent Notification Process - California Only (Figure 2.1a)
- Operator Notification Process - Non-California (Figure 2.1b)
- KM Employee Other Than Operator Notification Process - Non-California (Figure 2.1c)
- Controller - Orange, CA Notification Process - California Only (Figure 2.1d-1)
- Controller - Orange, CA Notification Process - Non-California (Figure 2.1d-2)
- Controller - Houston, TX Notification Process (Figure 2.1e)
- Managers Internal Notification Process (Figure 2.1f)
- Field Notification Form (Figure 2.2)
- Northern Region Internal Notifications References (Figure 2.3a)
- Southern Region Internal Notifications References (Figure 2.3b)
- Crisis Support Team Internal Notifications References (Figure 2.3c)

2.2 EXTERNAL NOTIFICATIONS

Specific reference to all **"Regulatory Required"** external notifications is detailed in Volume 1, Section 2.2 and Figure 2.4. **With the exception of notification to 911 and/or local fire/police agencies which are handled by local area operations, the Environmental, Health and Safety (EHS) and/or Compliance, Codes and Standards is responsible for making all regulatory required external notifications in all states other than in California. In California and locations monitoring or controlling, pipeline sections in California, refer to Volume 1, Section 2.2 and Figure 2.4.**

The locally required notifications and additional external notification references which are detailed in the following Volume 2 Figure 2.1 provide for assistance/advisory notifications. Specific notifications for contacting OSRO's are found in Volume 2, Figure, 2.1, "Regional Contractors/Services".

3.0 RESPONSE RESOURCES

The following sections outline the various response equipment/resources available from the Facility, other Company facilities, and other outside resources.

3.1 AREA RESPONSE EQUIPMENT

This Area of the KMEP operations maintains response equipment readily available for spill response as detailed on the "Facility Response Equipment" lists provided in Figure 3.1 and the "Pipeline Repair Equipment" lists provided in Figure 3.2. The equipment is stored at locations in the Area as detailed on the equipment lists.

The preventative maintenance schedule requires a monthly inventory and visual inspection of spill response equipment. Maintenance and repair is performed as needed, following manufacturers recommended procedures. The equipment will be exercised as semi-annually (Terminal equipment) or annually (pipeline equipment) as required (PREP Guidelines). A sample form for documenting these Equipment Deployment Exercises is provided in Figure 3.4.

KMEP has contracts in place with Oil Spill Removal Organizations and other clean-up and response contractors that are capable of responding to all discharges within the Area and supplementing Area KMEP resources.

The Qualified Individual has the authority to activate these and other KMEP resources or that of private contractors and other experts and consultants as the situation demands.

3.2 OTHER COMPANY RESOURCES

Neighboring KMEP Areas have response resources similar to those provided in this Area (Figures 3.1 and 3.2). These resources as well as additional Company spill response equipment and manpower resources may be available to supplement the response operation.

3.3 CONTRACT RESOURCES

In the event of a discharge which is beyond the initial response capabilities of the Local Response Team, contract manpower and equipment resources can be obtained through Oil Spill Removal Organization(s) (OSRO). These OSROs can provide manpower and containment/clean-up equipment for the response operation. *The Company will ensure that each OSRO has a comprehensive maintenance program and applicable training / drills programs in place at contract renewal.*

Response resources will be secured from a Company approved contractor. Facility Management will typically handle notification/implementation of these resources. Section 2 of this Volume provides a quick reference to the OSROs and additional clean-up and response contract organizations. A detailed list of the "Pacific Region Open End and On-Call Contractors" is provided in Figure 2.2. Specific reference to their response capability (USCG OSRO classification) is provided in Figure 3.3.

These OSRO's have adequate equipment and personnel resources available within the Area to respond to the applicable regulatory planning volumes in the required time frames.

3.3 CONTRACT RESOURCES (Cont'd)

OSROs have the expertise to conduct and lead on water and shoreline containment and recovery efforts. KMEP personnel will oversee and coordinate with the OSRO to ensure their actions conform with overall incident objectives and established incident action plans.

OSROs also have extensive experience in using the Area Contingency Plans (ACPs) as a resource when responding to an incident that has affected a navigable waterway. The KMEP Incident Commander, Planning Officer and Operations Chief will employ the OSRO's experience to integrate applicable local ACPs into the overall incident action plans.

3.4 AREA CONTINGENCY PLANS (ACP)

Area Committees comprised of Federal, state and local agencies develop ACPs. Response efforts performed within a certain "area" should reference the ACPs for that specific area. ACPs include clean-up strategies and information on environmentally sensitive areas within a particular region. Some of the ACPs include maps, shoreline characteristics and booming strategies for specific areas while other ACPs offer priority lists of environmentally sensitive areas.

ACPs generally contain the following information:

- Physical features
- Seasonal concerns
- Resources of primary concern
- Containment, and cleanup strategies, including recommended techniques
- Equipment considerations
- Incident Command System Roles and Responsibilities (NIMS)

To identify specific spill response and protection strategies for the applicable region/area, ACP and Geographic Response Plan information can be found at: http://kmonline.kindermorgan.com/operations/products/pacific_icp/rmaplan.html Responders can navigate through the site to locate the region/area of interest and the appropriate response resources needed for the operation.

For all controlled copies of the Integrated Contingency Plan distributed to non-KMEP plan holders, a CD-ROM containing the same information as referenced above will be included in a CD-sleeve in Volume 1 (inside front cover) or in a separate folder in electronic copies and is referenced in Figure 4.2.

To determine adequate response resources, the Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three (3) tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. The tier requirements for high volume areas are for response in six (6) hours (Tier 1), 30 hours (Tier 2), and 54 hours (Tier 3). High volume areas are listed in 49 CFR 194. The tier requirements for all other areas are for response in 12 hours (Tier 1), 36 hours (Tier 2), and 60 hours (Tier 3).

3.5 COOPERATIVE/MUTUAL AID RESOURCES

Cooperative/mutual aid resources will be utilized when available and/or necessary.

3.6 EXPERTS AND CONSULTANTS

KMEP maintains a relationship with various environmental and technical consultants that can provide support in the event of an emergency incident. These consultants can provide expertise and support in the areas of emergency response management, environmental services, site assessment, permitting, waste treatment, recycling, dewatering, hazardous waste disposal, and remediation.

3.7 VOLUNTEERS

Volunteers will not be utilized by KMEP for the response operations. All volunteers will be referred to the state or Federal On-Scene Coordinator.

3.8 COMMUNICATIONS

Effective and efficient communications systems are essential for emergency response at every level. The communications system will be utilized to gather information and current status reports as well as to provide coordination and direction to widely separated work groups involved in search, containment / diversion, repair, traffic control, public control or evacuation, and restoration.

Communication of the overall spill response operation between KMEP and the responsible government agencies in the Federal Regional Response Team (RRT) will occur between the Incident Commander and the Federal On-Scene Coordinator.

3.8.1 Central Communications System

Prearranged communication channels are of the utmost importance in dealing with KMEP emergencies. The notification procedures and telephone contacts documented in Section 2 of Volume 1 and Volume 2 will be reviewed in accordance with the earlier documented updating procedures. The predetermined communications channels include the following:

- A list of required Federal and state emergency telephone numbers for the Orange Control Center and emergency response personnel (Volume 1; Section 2).
- A list of emergency telephone numbers for various external resources such as the fire and police department, medical, and regulatory agencies (Volume 2; Figure 2.1).
- A list of emergency telephone numbers for contract response resources (Volume 2; Figure 2.1).

3.8 COMMUNICATIONS (Cont'd)

3.8.2 Communications Equipment

Field communications during a spill response to a small or medium discharge will be handled via the existing KMEP communications network. This network will utilize existing radios, telephones, beepers, fax machines, and computers and will be maintained by KMEP personnel. In the event of a Worst Case Discharge, field communications will be enhanced with other KMEP and contract resources as the situation demands.

Each KMEP responder has, at a minimum, a cellular telephone. All KMEP response personnel also have access to other telephones, radios and satellite communications equipment that may be needed for effective response operations. Additionally, communications equipment is maintained in the KMEP spill response trailers. The Logistics Officer would create a communications plan based on the equipment immediately available and would identify the need for any additional equipment that may be needed throughout the response effort.

3.8.3 Communication Types

Radios - Handheld and vehicle mounted radio sets are the most effective means of communication for the field response operation. The units are battery operated, multi-channeled and have a typical range that will cover the area of the response operation. Each location maintains a minimum of 4 radio sets, functionally maintained per manufacturer's specifications and kept in designated KMEP response trailers. In addition, KMEP also utilizes radio sets provided by contract resources. Additional radio sets and battery packs/charges will be necessary in the event of a prolonged response operation. (Exception: CalNev no longer has any radios with the exception of satellite phones. Las Vegas Terminal does not have radios.)

Telephone (Conventional) - Conventional land line telephones are the most effective means of communication for regulatory and advisory notifications during a spill response operation. Additional telephone lines can be installed in the event of a prolonged response operation.

Telephone (Cellular) - Cellular telephones allow for added mobility and response effectiveness. Cellular phones are commonly maintained by certain KMEP personnel. Additional cellular phones can be secured in the event of a prolonged response operation.

Pagers - Pagers are used for rapid notification to field personnel when radio and telephone resources are limited.

FAX Machines - FAX machines allow for a rapid transfer of information/ documentation such as status reports/updates, written notifications, and purchase orders.

Computers - Computers are commonly used in networks which allow access to various other locations and KMEP personnel. Computers also speed the consolidation of information and preparation of written reports.

FIGURE 3.1
Facility Response Equipment
(Reserved)

Response to an oil spill incident will be conducted by KMEP contracted Oil Spill Removal Organizations as detailed in Figures 2.1 and 3.3

FIGURE 3.2a
PIPELINE REPAIR EQUIPMENT

1. Date(s) performed: _____

2. Terminal/Response Zone: _____

3. Exercise or actual response? _____
   If an exercise, announced or unannounced? _____

4. Deployment location(s):
   _____
   _____
   _____
   _____
   _____
   _____

5. Time started: _____
   Time completed: _____

6. Equipment deployed was:
   - ❑ Facility - owned
   - ❑ Oil spill removal organization - owned if so, which OSRO? _____
   - ❑ Both

7. List type and amount of all equipment (e.g., boom and skimmers) deployed and number of support personnel employed:
   _____
   _____
   _____
   _____

8. Describe goals of the equipment deployment and list any Area Contingency Plan strategies tested (Attach a sketch of equipment deployments and booming strategies):
   _____
   _____
   _____
   _____

9. For deployment of facility-owned equipment, was the amount of equipment deployed at least the amount necessary to respond to your facility's small/average most probable spill?
   _____
   _____

   Was the equipment deployed in its intended operating environment?
   _____
   _____

AGREEMENT FOR PROFESSIONAL EMERGENCY RESPONSE SERVICES

Agreement Number: 05-ER-45-064-ORG

THIS AGREEMENT is made as of the **22nd day of November , 2005**, by and between **Kinder Morgan Operating L.P. "D"** a Delaware Limited Partnership, and, to the extent of any Work Directive executed by any of its affiliates or subsidiaries, those affiliates and subsidiaries, respectively, acting as agent for Kinder Morgan and its affiliates and subsidiaries who are requiring such work as set forth in this Agreement and/or in **Exhibit A-1** (Work Directive) and who will be releasing payments for such work, with its principal place of business in **Houston, Texas**, hereinafter referred to as "**COMPANY**", and **National Response Corporation**, a Delaware corporation having its principal office at 3500 Sunrise Highway, Great River, New York 11739 hereinafter referred to as "**CONSULTANT**".

WITNESSETH:

WHEREAS, COMPANY desires the services of CONSULTANT and a network of subcontractors and/or Local Contractors (as defined in **Section 2.2** below), including NRC Environmental Services Inc., to provide OSRO Coverage Services and be available to provide Emergency Response Services for the containment and cleanup of oil, discharge of hazardous material and non-hazardous materials, and

WHEREAS, CONSULTANT represents that it is qualified and desires to provide OSRO Coverage Services and to perform such Emergency Response Service (as defined in **Section 2.4** below) for COMPANY.

NOW, THEREFORE, in consideration of the promises and mutual covenants contained herein, the parties do hereby agree as follows:

1.0 TERM

1.1 This Agreement becomes effective upon the date first above written and shall continue until December 31, 2008; (unless earlier terminated pursuant to Section 14.1 or 14.2 below); provided however this Agreement may be extended by agreement of the parties upon COMPANY's written notice given at least ninety (90) days prior to expiration of the then current term; and further provided that if a Work Directive issued under this Agreement is continuing beyond the expiration date, the term of this Agreement shall be extended automatically for ninety (90) days or until that Work Directive has been completed, whichever occurs first. All rates and fees under this agreement shall be subject to adjustment on an annual basis.

2.0 CONTRACT DOCUMENTS, SCOPE OF WORK AND ADMINISTRATION

2.1 This Agreement shall consist of the Contract Documents itemized below. In the event of a conflict between or among the provisions of the Contract Documents, the more or most specific provision shall control:

2.1.1 Agreement Number **05-ER-45-064-ORG**

2.1.2 **Exhibit A** Work Directive(s) as may be issued from time to time (including Scope of Work)

2.1.3 **Exhibit B** Schedule of Values

2.1.4 **Exhibit C** Certificate of Insurance

2.1.5 **Exhibit D** (1) United States Environmental Protection Agency Title III, List of Lists, Consolidated List of Chemicals Subject to the Emergency Planning and Community Right To Know Act (EPCRA) and Section 112(r) of the Clean Air Act, published April 1995, as amended

2.1.6 **Exhibit E** Project Scope Change Order

2.1.7 **Exhibit F** INTENTIONALLY OMITTED

2.1.8 **Exhibit G** Kinder Morgan Contractor Safety Rules & Regulations

2.1.9 **Exhibit H** Parent Guaranty

Note that any references to "CONTRACTOR" in an Exhibit, apply to CONSULTANT.

2.2 Definitions:

2.2.1 ""**Best Endeavors**" means, with respect to either party, the performance in good faith to the extent of its total capabilities;

2.2.2 "**Classification**" means classification or other governmental approval required or available under Federal Law and State Law for an Oil Spill Removal Organization to be designated as such in the Response Plan;

2.2.3 "**Contract Documents**" means all relevant documents described in **Section 2.1** of this Agreement.

2.2.4 ""**Day**" or "**Week**" means, respectively, a calendar day or seven (7) calendar days.

2.2.5 "**Designated Representative**" means the person identified as COMPANY'S Designated Representative in **Section 2.8** of this Agreement.

2.2.6 "**Discharge**" means any emission (other than natural seepage), including, but not limited to, spilling, leaking, pumping, pouring, emitting, emptying or dumping of Oil;

2.2.7 "**Drills**" means any drills, exercises, practices or other preparatory or simulated activities in connection with which the COMPANY has requested the CONSULTANT to mobilize or deploy Response Resources or to provide other services;

2.2.8 **"Emergency Response Services"** shall have the meaning given in **Section 2.4** below.

2.2.9 **"Environmental Law"** means any and all federal, state, and local laws, regulations and requirements pertaining to health, safety, or the environment, including the United States Oil Pollution Act (33 U.S.C. 2701, et seq.) ("OPA") and the Federal Water Pollution Control Act (33 U.S.C. 1321, et seq.) ("FWPCA") and any other laws regarding a Discharge and Emergency Response Services and regulations promulgated pursuant thereto;

2.2.10 "**Force Majeure**" has the meaning given in **Section 18.1** below.

2.2.11 "**Hazardous Material**" means (a) all elements or compounds that are contained in the list of hazardous substances adopted by the United States Environmental Protection Agency and the list of toxic pollutants designated by Congress or the Environmental Protection Agency or under any Environmental Laws; (b) any "hazardous waste," "hazardous substance" (including , but not limited to, petroleum and petroleum-related materials), "toxic substance," regulated substance," pollutant" or "contaminant", each as defined under any Environmental Laws and (c) oil of any kind or in any form when it is classified as a hazardous substance under any applicable State or Federal Law, including any and all substances defined or identified as oil under OPA.

2.2.12 "**Hereunder**," "**herein**" and words of similar import shall refer to this Agreement as a whole, rather than to a single provision.

2.2.13 "**Local Contractors**" means independent oil spill removal companies located near the Areas of Services, including NRC Environmental Services Inc., with whom the CONSULTANT has contracted to maintain and provide Response Resources in fulfillment of the CONSULTANT's obligations hereunder;

2.2.14 "**Oil**" means oil of any kind or in any form, including any and all substances defined or identified as oil under OPA, but shall not include substances defined or identified as Hazardous Substances;

2.2.15 "**Oil Spill Removal Organization**" means an entity established in a given geographic area to provide the personnel, equipment, supplies and other capability necessary to conduct Emergency Response Services;

2.2.16 "**Qualified Individual**" means an English-speaking shore-based representative of the COMPANY located in the United States, available on a 24-hour basis, familiar with implementation of the Response Plan and trained in his or her responsibilities under the plan, with full written authority to implement Emergency Response Services and to engage the CONSULTANT for services hereunder;

2.2.17 "**Removal Costs**" means the charges of the CONSULTANT for deploying Response Resources to a Discharge or threatened Discharge, including the charges for mobilization and demobilization of personnel, equipment and supplies; and containment, removal and storage of discharged Oil;

2.2.18 "**Responder Immunity Law**" means Federal Law or applicable State Law which provides immunity from liability to those who respond to Discharges for the purpose of attempting to contain and remove Oil from the water, beaches or shoreline;

2.2.19 "**Response Plan**" means any contingency plan or response plan regarding Discharges covering the Facility prepared by or on behalf of the COMPANY pursuant to Federal Law or State Law;

2.2.20 "**Response Resources**" means the trained personnel, equipment, supplies and other capability named in a Response Plan or mobilized to perform Emergency Response Services pursuant to Federal Law and State Law, other than personnel, equipment, supplies and other capability required to be stored at the Facility;

2.2.21 "**Site**" or "**Area of Service**" "**Facility**" or shall mean any, facility, pipeline, or other real property identified in an executed Work Directive on which CONSULTANT will be performing Work pursuant to the terms of the Contract Documents, whether or not owned by COMPANY.

2.2.22 "**Waste**" shall mean any form of material identified or determined by the COMPANY as having no beneficial value and is either a by-product of the COMPANY's operations or is generated during investigation and remediation activities (e.g. soils, debris) and includes personal or real property contaminated as a result of a Discharge.

2.2.23 "**Work**" or "**Services**", shall mean, collectively, any and all obligations, duties and responsibilities necessary to the successful completion of the project assigned to or undertaken by CONSULTANT under the Contract Documents, including the furnishing of all labor, services, materials, equipment and other incidentals necessary to perform Emergency Response Services.

2.3 CONSULTANT agrees to render **OSRO Coverage Services**, as more specifically defined in each applicable Work Directive executed by the COMPANY affiliate or subsidiary to whom the service will be provided and by CONSULTANT, in exchange for the Fee contained in the applicable Work Directive.

2.3.1 In performing OSRO Coverage Services, CONSULTANT shall:

2.3.1.1 obtain and maintain Classification as an Oil Spill Removal Organization as provided under Federal Law and State Law;

2.3.1.1.1 In the event Classification is not available, CONSULTANT warrants that it and its Local Contractors shall have sufficient Response Resources to enable the Client to meet the mandated levels of response capacity under Federal Law and State Law.

2.3.1.2 Subject to the California release notification requirements set forth in **Article 10.0** hereunder, provide sufficient Response Resources to enable the COMPANY to meet the requirements of Federal Law and State Law for precontracting for availability of Response Resources, except as provided in **Section 2.14**;

2.3.1.3 provide the training of the CONSULTANT's and Local Contractors' response personnel, in compliance with Federal Law and State Law requirements for Oil Spill Removal Organization Classification, and maintenance of records of such training;

2.3.1.4 ensure compliance by the CONSULTANT and Local Contractors with all applicable Federal Occupational Safety and Health Administration (OSHA) standards and similar State Laws and standards; and

2.3.1.5 provide all information regarding the CONSULTANT's and the Local Contractors' Response Resources which must be included in the Response Plan(s) of the Facility(ies) or to be filed with the U.S. Coast Guard or EPA or appropriate State authorities to obtain Classification, including any equipment that is out of service that would diminish CONSULTANT's Classification as an Oil Spill Removal Organization.

2.4 CONSULTANT agrees to render **Emergency Response Services,** as more specifically defined in each applicable Work Directive executed by the COMPANY affiliate or subsidiary to whom the service will be provided and by CONSULTANT, in exchange for the payment of Removal Costs as provided for in **Section 3.1**.

2.4.1 CONSULTANT agrees to provide or cause to be provided an on-call team of personnel and equipment (Response Resources) to perform Emergency Response Services in the location(s) designated on the applicable Work Directive and as directed by the Designated Representative (or his or her designee). Emergency Response Services may include: 1) containment, characterization, handling, transportation, treatment, processing, recovery, repackaging, removal, storage and transportation for disposal of oil (in accordance with **Section 19.8** hereunder), hazardous material and non-hazardous material; 2) site evaluation, decontamination and restoration; 3) technical services, including sampling, laboratory services, analysis, and other related services; 4) training and mock spill deployments; and 5) coordination with COMPANY'S Designated Representative or his or her designee. Specific description of the Emergency Response Services shall be set forth in the applicable Work Directive. When CONSULTANT needs specific clarification pertaining to the Work, it shall request the same from the Designated Representative.

2.4.2 It is understood and agreed that provision of Response Resources by CONSULTANT under this Agreement is incidental to the performance of the Services hereunder and are subject to CONSULTANT's continuing supervision, direction and control. All Response Resources utilized by CONSULTANT in performance of the Work as directed by the applicable Work Directive, shall be paid for by COMPANY in accordance with the terms, conditions and rates in Exhibit B.

CONSULTANT shall provide, supervise, direct, control and pay for all personnel provided hereunder, including, but not limited to, permanent or temporary personnel of CONSULTANT, and "Subcontractors" of CONSULTANT, including but not limited to, employees of third parties who are assigned to perform services for CONSULTANT on a contract basis, or employees of Local Contractors. CONSULTANT shall not be responsible for, and shall not be required to supervise, direct or control any personnel provided by COMPANY or temporary personnel hired by COMPANY to perform emergency response services unless agreed to in writing between the parties and specified in the applicable Work Directive. Similarly, all equipment utilized by CONSULTANT in the performance of the Work, whether owned, rented or under subcontract, including but not limited to all vessels, boom, and skimmers, shall be installed, operated, monitored, maintained, demobilized and decontaminated by CONSULTANT personnel, employees, agents, subcontractors or Local Contractors. Such equipment, and the labor hours associated with installing, operating, monitoring, maintaining, demobilizing and decontaminating the equipment, shall be paid for by COMPANY in accordance with Exhibit B.

2.5 COMPANY is responsible under this Agreement to:

2.5.1 designate an On-site Representative and provide CONSULTANT with the name, address, twenty four (24) hours-a-day telephone number and telefacsimile number of the Qualified Individual/On-site Representative, and shall amend or update this information as necessary;

2.5.2 deliver, or caused to be delivered, to the CONSULTANT such information concerning the Facility as the CONSULTANT may reasonably request for the performance of the Work;

2.5.3 pay for services and Removal Costs of the CONSULTANT in accordance with **Section 3.0**;

2.5.4 be responsible for deciding which Response Resources shall be requested from the CONSULTANT to conduct Emergency Response Services;

2.5.5 be responsible for coordinating and directing overall Emergency Response Services;

2.5.6 be responsible for disposal of all Oil,Hazardous Materals and Waste collected by the CONSULTANT;

2.5.7 give notice to the CONSULTANT of any significant increase in the volume of Oil movements or any significant changes in operation of the Facility;

2.5.8 obtain and provide CONSULTANT with the COMPANY'S Environmental Protection Agency identification number or other such authorization required by law for any Discharge or threatened Discharge classified as a Hazardous Material, or similar designation, prior to the CONSULTANT providing services hereunder.

2.5.9 Provide a Parent Guaranty to CONSULTANT in accordance with **Section 6.5**.

2.6 Notwithstanding this Agreement, COMPANY shall not be required to utilize CONSULTANT to deploy Response Resources for Emergency Response Services and may arrange for the supply and deployment of Response Resources for Emergency Response Services in the Area of Service by any other person.

2.7 Emergency Response Services Procedure.

2.7.1 COMPANY may initiate a request for the deployment of resources to perform Emergency Response Services by a direct telephone call to the CONSULTANT's Local Representative at (562) 432-1304 or 1-(800) 334-4755, and such telephone

call shall be deemed a request for the deployment of Response Resources by the COMPANY for purposes of this Agreement. A Work Directive for such Emergency Response Services will be executed between the parties as soon as practicable.

2.7.2 The person initiating Emergency Response Services on behalf of the COMPANY shall provide information to the CONSULTANT including:

2.7.2.1 the name of the COMPANY;

2.7.2.2 the caller's name and title;

2.7.2.3 the name and location of the Facility; if applicable, and

2.7.2.4 the location and description of the Discharge.

2.7.3 COMPANY shall be responsible to notify governmental authorities as required by Federal Law or State Law of the Discharge..

2.7.4 Upon CONSULTANT's arrival at the scene of the Discharge, the On-site Representative/Qualified Individual, or other authorized representative of COMPANY, shall give CONSULTANT written authorization to proceed with deployment of Response Resources. CONSULTANT thereafter shall continue to act in accordance with the instructions of the On-site Representative/Qualified Individual, or other authorized representative of COMPANY, subject to the terms of this Agreement.

2.7.5 COMPANY shall give the On-site Representative/Qualified Individual, or other authorized representative on scene, full authority to approve the daily worksheets submitted by CONSULTANT.

2.8 The Designated Representative/On-site Representative/Qualified Individual shall coordinate and sequence the Work with CONSULTANT. Notwithstanding the provisions set forth in **Section 2.5.5** above, it is understood and agreed between the parties hereto that the means or methods of implementing the directions of COMPANY, as well as managing the activities of the workers and crews provided by CONSULTANT, shall be under the exclusive charge and control of CONSULTANT, COMPANY being interested only in the results obtained. In addition to the On-site Representative/Qualified Individual for each Work Directive with on-site responsibility, matters of a technical nature should be directed to the COMPANY'S Designated Representative, **Steve Marositz**, **909-873-5146 x 146** (phone), **303-984-3620** (facsimile), **Steve_Marositz@kindermorgan.com** (electronic mail) or his or her designee(s). Matters of a commercial nature should be directed to the COMPANY'S Contract Administrator, **Sherry Z. Clifford, 714-560-4915** (phone), **714-560-6593** (facsimile), **sherry_clifford@kindermorgan.com** (electronic mail).

2.9 This Agreement is master services agreement governing OSRO Coverage Services requested by COMPANY and an on-call or as available contract for Emergency Response Services (depending whether the Emergency Response Services are pursuant to a Work Directive for OSRO Coverage Services or otherwise). As such, COMPANY may, from time to time and upon acceptance by CONSULTANT, issue Work Directives, substantially in the form attached hereto as **Exhibit A-1**, describing Work that COMPANY wishes CONSULTANT to perform, the location of the Work (the "**Site** or "**Facility**,"), and the compensation to be paid for performing such Work. The Scope of Work may include, without limitation, any modifications or specifications related to the Work, schedules, responsibilities for communications or meetings, and compensation to be paid. In case of emergency, COMPANY, may request CONSULTANT to provide Emergency Response Services prior to the execution of a Work Directive, under the terms and conditions of this Agreement.

2.10 Except as otherwise provided in this Agreement or in another applicable Contract Document, CONSULTANT shall furnish all of the supervision, materials, equipment, tools, supplies and

services required for the complete performance of all Work described in each Work Directive that has been signed and returned by CONSULTANT.

2.11 Time of Completion; Extensions.

2.11.1 For OSRO Coverage Services.

2.11.1.1 For a Work Directive to provide OSRO Coverage Services, CONSULTANT shall commence these services immediately upon request of the COMPANY'S Designated Representative or his or her designee, but in no event no later than as specified in the applicable Work Directive executed by the parties. CONSULTANT acknowledges that COMPANY may require completion of certain portions or phases of the Work ahead of others, and CONSULTANT shall diligently and expeditiously perform the Work in the sequence required by COMPANY. CONSULTANT shall also meet any and all applicable response requirements established by governmental agency orders, permits, or agreements, or by judicial decrees.

2.11.1.2 Under OSRO Coverage Services Work Directives, CONSULTANT understands and agrees that TIME IS OF THE ESSENCE in its provision of this coverage and each of its obligations under this Agreement. Pursuant to this Work Directive, CONSULTANT shall perform Emergency Response Services for COMPANY on an on-call basis, 24-hours per day, seven (7) days per week .

2.11.1.3 If CONSULTANT is delayed in the commencement or performance of OSRO Coverage Services by an act of the COMPANY, by COMPANY issuance of any Project Scope Change Order, by a Force Majeure event, or any other reason beyond the direct control of CONSULTANT, and, to the extent practicable, if the CONSULTANT immediately provides COMPANY with a written request for an extension of time, COMPANY shall extend the time required to respond and/or complete such OSRO Coverage Services by such reasonable time as possible.

2.11.2 For Emergency Response Services.

2.11.2.1 In addition to Emergency Response Services performed pursuant to an OSRO Coverage Work Directive, CONSULTANT is available to perform Emergency Response Services for COMPANY on an as-available basis, 24-hours per day, seven (7) days per week. If CONSULTANT is requested to deploy Response Resources for Emergency Response Services, and agrees to perform such Emergency Response Services, CONSULTANT shall commence the Work immediately upon request of the COMPANY'S Designated Representative or his or her designee, but in no event no later than as specified in the applicable Work Directive executed by the parties. CONSULTANT acknowledges that COMPANY may require completion of certain portions or phases of the Work ahead of others, and CONSULTANT shall diligently and expeditiously perform the Work in the sequence required by COMPANY to the extent practicable and, as applicable, as approved by state and federal On Scene Commanders (OSCs). CONSULTANT shall make a good faith effort to also meet any and all applicable response requirements established by governmental agency orders, permits, or agreements, or by judicial decrees.

2.11.2.2 If CONSULTANT is delayed in the commencement or performance of the Emergency Response Services by an act of the COMPANY, by COMPANY issuance of any Project Scope Change Order, by a Force Majeure event, or any other reason beyond the direct control of CONSULTANT, COMPANY

shall extend the time required to respond such Emergency Response Services by such reasonable time as possible.

2.11.2.3 In the event CONSULTANT is requested to deploy Response Resources for Emergency Response Services for more than one Discharge within the Area of Service, CONSULTANT and COMPANY shall make good faith efforts to agree on allocation of Response Resources between the spills. In the absence of such agreement, CONSULTANT shall allocate its Response Resources as directed by the OSCs for the concurrent spills. In the absence of such direction CONSULTANT shall not be obligated to remove or divert Response Resources from Emergency Response Services in connection with another spill initiated prior to the request for deployment of Response Resources by the COMPANY if CONSULTANT deems that such Response Resources are necessary for proper completion of the previously initiated Emergency Response Services. CONSULTANT shall give notice to the COMPANY if it will be unable to respond due to deployment of Response Resources for a discharge by another client.

2.11.2.4 Should the whole or any part of the Work be delayed or suspended by acts of regulators with jurisdiction over the event, late delivery of materials furnished by the COMPANY, by inability of the COMPANY to obtain necessary rights of access to the Site, by failure of other contractors of the COMPANY to complete work which is a prerequisite to the performance of the Work by CONSULTANT, or any other reason not under the direct control of CONSULTANT, then COMPANY shall extend the time of commencement by such reasonable time as possible under the circumstances.

2.11.3 CONSULTANT shall notify COMPANY in writing when the Work has been completed. If, in the sole good faith discretion of COMPANY, the Work conforms to all of the requirements of this Agreement, COMPANY shall accept the Work within 24 hours after receipt of such written notice. If, in the sole good faith discretion of COMPANY, the Work or any portion of the Work does not conform to all of the requirements of this Agreement, COMPANY shall give CONSULTANT notice of any non-conforming Work. Within five (5) working days after receiving such notice from COMPANY, CONSULTANT shall correct all non-conforming Work or provide a mutually accepted written plan of work for correction of the non-conforming Work. Corrected Work shall be resubmitted by CONSULTANT for acceptance by COMPANY and the above approval process will be repeated until the Work is acceptable. CONSULTANT shall continue to be paid for its services in accordance with the Work Directive unless COMPANY can demonstrate that the non-conforming Work resulted from the negligence or willful misconduct of CONSULTANT in performing the Services.

2.12 Damage or Injury to Subterranean Structures or Utilities

2.12.1 To the extent that Work pursuant to this Agreement requires any sampling, boring, excavation, ditching or other disruption of the soil or subsurface at the Site, COMPANY, prior to such activity shall be responsible for identifying, locating and marking, as necessary, any subterranean archaeological artifacts, structures or utilities (**"Underground Facilities"**). Thereafter, CONSULTANT shall take all reasonable precautions to avoid damage or injury to Underground Facilities which were identified by COMPANY. CONSULTANT will be liable for all costs and claims resulting from damage to such identified Underground Facilities arising out of the Work.

2.13 Both COMPANY and CONSULTANT acknowledge that the most current Kinder Morgan Contractor Safety Rules & Regulations is attached to this Agreement as **Exhibit G** and COMPANY's Contractor Safety Manual is available at all times on COMPANY's website at www.kindermorgan.com. Furthermore, COMPANY and CONSULTANT acknowledge that

COMPANY updates the regulations periodically. COMPANY will provide CONSULTANT with copies of any updated regulations that COMPANY requires CONSULTANT to follow.

2.14 Unless otherwise agreed to under a Work Directive, the CONSULTANT's obligations hereunder exclude providing Response Resources in accordance with U.S. Coast Guard and state planning standards for the average most probable discharge. The CONSULTANT shall arrange for COMPANY to contract with a Local Contractor for the purpose of meeting U.S. Coast Guard and/or state planning standards for the average most probable discharge on an as needed basis and upon request of the COMPANY. The terms and conditions of such engagement, including fees, shall be agreed between the COMPANY and Local Contractor at the time services are rendered. If the Client wants to use such service, it shall notify the CONSULTANT by telefacsimile at least twenty-four hours prior to any cargo transfer activity.

3.0 CONSIDERATION AND CHANGES TO THE WORK

3.1 COMPANY agrees to pay CONSULTANT, Removal Costs related to Emergency Response Services performed pursuant to this Agreement in accordance with CONSULTANT'S rates and terms in **Exhibit B**.

3.2 COMPANY agrees to pay CONSULTANT for OSRO Coverage Services the amount set forth in the applicable Work Directive as an Annual Retainer Fee, subject to annual adjustments.

3.3 Other Services:

3.3.1 The COMPANY shall pay the CONSULTANT for other services requested by the COMPANY and accepted by CONSULTANT in accordance with the time and materials rates specified in Exhibit B, or at such other rates as may be agreed at the time, plus all applicable sales and use taxes;

3.3.2 The fees and charges referred to in this **Article 3.0** shall be established annually and provided to the COMPANY. The CONSULTANT's Annual Retainer Fee shall remain fixed during each one year period of this contract. The CONSULTANT's Rates in Exhibit B shall remain fixed until February 18, 2006 and subject to annual adjustments thereafter. The COMPANY agrees to pay fees and charges in accordance with the fees and charges in effect at the time the Services are rendered.

3.4 COMPANY shall have the right to (i) make changes in any Work performed or to be performed, (ii) require additional Work, or (iii) require the deletion, stoppage or cancellation of Work previously ordered (other than OSRO Coverage Services for an unexpired term except as provided for in **Section 14.1.6** hereunder). The provisions of this Agreement shall apply to all changed and added Work to the same extent as they would have applied to the Work originally described in the applicable release.

3.5 COMPANY or CONSULTANT may generate a written draft Project Scope Change Order, substantially in the form attached hereto as **Exhibit E**, describing any changes, additions or deletions to the Work. COMPANY and CONSULTANT will mutually determine whether Project Scope Change Order is to be authorized or rejected. COMPANY shall not be required to furnish notice of such changes, additions or deletions to CONSULTANT's sureties. CONSULTANT shall perform the Work in accordance with an accepted written Project Scope Change Order. This provision does not relieve CONSULTANT of its obligation to perform such Work under the terms of this Agreement. The parties shall negotiate an equitable adjustment to the amount of compensation to be paid CONSULTANT in connection with the Work Directive to which the Project Scope Change Order applies.

3.6 COMPANY acknowledges that Emergency Responses and other Services that may be provided by CONSULTANT under this Agreement are governed and regulated by certain state, federal and local laws and the regulations and other requirements of various government agencies with jurisdiction over emergency events and other environmental matters (collectively referred to as "governmental requirements"). To the extent that any governmental requirement increases the

scope of the services to be rendered and the expenses associated with such Services, COMPANY will pay CONSULTANT for all such services and expenses as provided in this Article.

4.0 INSPECTION

4.1 Materials Inspections

4.1.1 COMPANY may from time to time, at its sole good faith option, inspect and test certain materials or equipment. Whether or not COMPANY conducts such inspection, COMPANY shall also have the right to reject all materials or equipment that, in the sole good faith discretion of COMPANY, fail to conform to either adequate manufacturing specifications, the specifications under which such materials or equipment were purchased or the specifications required for the performance of the Work, if applicable.

4.2 Field Inspection

4.2.1 Throughout the performance of the Work, COMPANY shall have the right to designate one or more inspectors or engineers to inspect and test the Site and the progress of the Work. CONSULTANT shall cooperate with such inspectors and engineers in order that the Work may be fully inspected and that COMPANY may at all times be fully advised of the progress of the Work and the manner in which it is being performed.

4.3 Inspection Not Acceptance

4.3.1 COMPANY shall verify that CONSULTANT maintains emergency response equipment offsite ready for performance under this Agreement. CONSULTANT expressly understands and agrees that any inspection of equipment by COMPANY for purposes of this Agreement shall be for COMPANY'S sole benefit and shall not be deemed an acceptance by COMPANY of all or any portion of the materials, equipment, or Work so inspected. CONSULTANT further understands and agrees that no inspection by COMPANY pursuant to this Agreement or approval or failure to object to any portion of the Work shall relieve or release CONSULTANT from any duties, obligations, or liabilities provided in this Agreement.

5.0 INSURANCE

5.1 CONSULTANT and/or its Local Contractors performing the Services, as appropriate, shall carry and maintain the following insurance, from carriers with an A.M. Best rating of at least A-/VIII:

5.1.1 Statutory Coverage Workers' Compensation Insurance (including Occupational Disease Coverage) in accordance with the laws of the states where the Work is to be performed;

5.1.1.1 If CONSULTANT performs Work on or adjacent to navigable waterways CONSULTANT shall furnish a certificate of insurance showing compliance with the provisions of the Federal Longshoremen's and Harbor Workers' Compensation Law.

5.1.2 Employer's Liability Insurance with limits of not less than **$1,000,000** per occurrence and **$1,000,000** per disease/each employee.

5.1.3 Commercial General Liability Insurance insuring the indemnity agreement set forth in this contract with a combined single limit of not less than **$1,000,000** per occurrence and **$2,000,000** in the aggregate. All policies shall include coverage for blanket contractual liability assumed hereunder.

5.1.4 Comprehensive Automobile Liability Insurance covering liability arising out of any auto (owned, hired and non-owned); with a combined single limit of not less than **$1,000,000** and including an MCS-90 endorsement. If necessary, the policy shall be endorsed to provide contractual liability coverage.

5.1.5 Umbrella Insurance may be used to satisfy the limit requirements for Employer's Liability Insurance, Commercial General Liability Insurance, and Comprehensive Automobile Liability Insurance set out in **paragraphs 5.1.2**, **5.1.3** and **5.1.4**, above. Such umbrella policy shall follow the form of those primary coverages, be in excess of those underlying policies without gaps in limits and provide coverage as broad as the underlying coverage.

5.1.6 Comprehensive Aircraft Liability Insurance with combined bodily injury, including passengers, and property damage liability single limits of not less than **$5,000,000** each occurrence. This coverage is necessary only when CONSULTANT uses owned or non-owned aircraft in connection with Work performed under this Agreement.

5.1.7 Contractor's Pollution Liability Insurance covering losses caused by pollution conditions that arise from the operations of CONSULTANT at the site, or of the Local Contractor, as appropriate. COMPANY agrees that the entity performing the actual on-site Emergency Response Services shall be the entity that provides this coverage. Insurance mentioned above shall apply to bodily injury, including death; loss or damage to property, including loss of use of damaged property or of property that has not been physically injured; cleanup and monitoring costs; and defense, including costs and expenses incurred in the investigation, defense, or settlement of claims. This coverage shall be maintained in force for the full period of this Agreement with available limits of not less than **$2,000,000** per occurrence.

5.1.8 Pollution Legal Liability Insurance. If the work contemplated under this Agreement includes the transportation of any Hazardous Materials, Oil or Waste from the Job Site(s) to a disposal facility selected by COMPANY, CONSULTANT shall endeavor to obtain for COMPANY evidence of pollution legal liability insurance maintained by the disposal site operator, covering losses arising from the insured facility accepting waste under this Agreement. Such coverage must be maintained in minimum amounts of **$5,000,000** per occurrence for bodily injury, including death, or loss or damage to property combined. If CONSULTANT transports any Hazardous Materials, Oil or Waste from the Job Site(s) to a disposal facility NOT designated by COMPANY, CONSULTANT MUST provide evidence of the coverage listed in this **Section 5.1.8**

5.1.9 Marine Liability Insurance with combined bodily injury and property damage liability single limits of not less than **$1,000,000** each occurrence.

5.2 All insurance policies carried by CONSULTANT hereunder, other than Workers Compensation, shall name the COMPANY (**Kinder Morgan Energy Partners, L.P.** and the contracting company), its affiliated and subsidiary companies, and its and their respective directors, officers, agents and employees as additional insureds with respect to liability arising out of work performed by CONSULTANT or subcontractor, as applicable.

5.3 All insurance policies of CONSULTANT, listed above, other than Contractors Pollution Liability shall include waiver of subrogation against **Kinder Morgan Energy Partners, L.P.** and its subsidiary or affiliated companies, successors, and assigns where permitted by law.

5.4 Before commencing any performance under this Agreement, CONSULTANT shall furnish COMPANY with Certificates of Insurance evidencing insurance coverage and provisions provided for in this Agreement. Failure of CONSULTANT to furnish such evidence of insurance coverage shall not be considered a waiver by COMPANY of such coverage. All insurance certificates shall include the following statement:

5.4.1 "**Kinder Morgan Energy Partners, L.P.** and its affiliated or subsidiary companies are named as additional insured on all above policies (except Worker's Compensation) and waiver of subrogation in favor of **Kinder Morgan Energy Partners, L.P.** and its affiliated or subsidiary companies, its and their respective directors, officers, agents and employees applies as required by written contract."

5.5 The insurance provided in accordance herewith shall apply as primary insurance with respect to any other insurance or self-insurance programs afforded to or maintained by COMPANY, and shall not require the exhaustion of any other coverage. Insurance coverage required under this Agreement shall not be deemed to limit the amount(s) of CONSULTANT'S liability under this Agreement, nor shall such requirements be considered by CONSULTANT as the limit of the amounts or types of insurance CONSULTANT should carry to protect itself adequately from the risks of its occupation; rather, CONSULTANT shall make its own independent determination in this regard.

5.6 All insurance policies shall provide that the insurance carrier will notify the COMPANY no less than thirty (30) days prior to the termination or cancellation of any policy.

5.7 CONSULTANT shall promptly notify COMPANY when any insurance policy required above is not reasonably available and shall state the reasons therefor.

5.8 All deductibles, self insured retentions and self insurance carried by the CONSULTANT under its insurance program are the sole responsibility of the CONSULTANT and will not be borne in any way by the COMPANY. The CONSULTANT will indemnify the COMPANY, in full, for any amounts related to the above.

5.9 In the event of the CONSULTANT's failure to carry out any of the provisions of this **Article 5.0**, the COMPANY shall, in addition to any right to recover damages or to obtain other relief, have the right to cancel this Agreement or any Work Order.

5.10 CONSULTANT shall require all of its subcontractors and/or Local Contractors to provide the foregoing coverage, as well as any other coverage that CONSULTANT may consider necessary. All subcontractor and/or Local Contractor policies shall be endorsed with the additional insured wording above.

6.0 PAYMENT, AND LIENS

6.1 Unless otherwise agreed in a Work Directive, COMPANY shall pay the Annual Retainer Fee for OSRO Coverage Services in advance at the beginning of the coverage period in accordance with the Work Directive.

6.1.1 COMPANY will accept one invoice upon completion of Emergency Response Services or Other Services per Work Directive or when the amount payable to CONSULTANT under such Work Directive reaches $100,000.00, whichever is sooner. Invoices shall be prepared and submitted to COMPANY in accordance with Exhibit B – Schedule of Values hereto and payable with Commercial Terms Net 60 Days after receipt of invoice. COMPANY will receive a 2% discount on invoices paid 30 Days after receipt of invoice. Discount will not apply to any amounts disputed and later paid over 30 days from date of original invoice.

6.1.2 CONSULTANT shall notify COMPANY in writing when more than one million dollars ($1,000,000.00) of response costs has been incurred under a Work Directive issued with respect to an individual response event. COMPANY shall pay CONSULTANT eighty percent (80%) of such response costs within ten (10) days of its receipt of CONSULTANT's invoice for said 80% progress payment. Further, if COMPANY fails to submit such payment within said ten (10) day period, CONSULTANT shall notify COMPANY in writing of non-receipt and thereupon COMPANY shall have five (5) business days from receipt of said notice to pay said 80% progress payment to CONSULTANT before CONSULTANT may exercise its rights under Section 6.7.1 of the Agreement.

6.1.3 Invoices will be sent to:

Kinder Morgan Operating L.P. "D"
Attn: **As specified in Section 6 of each Work Directive released**

6.2 For undisputed invoices submitted by CONSULTANT in accordance with Exhibit B – Schedule of Values, late payments to CONSULTANT by COMPANY shall earn interest at the rate of 1.5 % per month, or the maximum rate permitted by law, whichever is less, from the due date until paid. In addition to interest, COMPANY shall also be responsible for all costs incurred by CONSULTANT to collect overdue amounts, including collection fees, filing fees, court costs and attorney's fees. CONSULTANT reserves all legal rights and recourses against COMPANY and its property for failure of COMPANY to pay such invoices when due.

6.3 Invoices shall be submitted in such detail so as to delineate Work performed per job assignment described in the applicable Work Directive. For each job assignment, CONSULTANT shall include a description of services, number of hours expended per individual employee job classification, itemization of expenses, location(s) at which expended, receipts for expenses or other evidence in support of CONSULTANT's statement as may be requested by COMPANY, extended subtotals, applicable taxes and grand total.

6.4 Provided COMPANY pays all undisputed invoices in accordance with this Agreement, CONSULTANT covenants and agrees to protect and keep the Site, any and all interests and estates therein, and all improvements or materials now or hereafter placed thereon pursuant to this Agreement, free from any and all claims, liens, charges or encumbrances in the nature of mechanics, labor, or material liens or otherwise, arising out of or in connection with performance of the Work by CONSULTANT or any of its subtier contractors (including the furnishing of any materials hereunder), and to promptly have any such lien released by bond or otherwise. If CONSULTANT disputes in good faith any lien or claim or encumbrance of any laborer, materialman or subcontractor, in lieu of the immediate payment thereof, CONSULTANT shall post adequate security to protect COMPANY from liability for the payment thereof and from any expense of defending against that liability, until the dispute is finally resolved.

6.5 COMPANY shall provide and maintain a Parent Guaranty from Kinder Morgan Energy Partners, L.P. substantially in the form of Exhibit H attached hereto which shall be maintained so long as this Agreement or a Work Directive remains to be performed. If the financial assurance provided by the Parent Guaranty is exhausted during the term of this Agreement and this Agreement is not cancelled, a replacement Parent Guaranty shall be issued in an amount not less than $2,000,000.00. The requirement to maintain the parent guaranty for a Work Directive which is issued during the term of this Agreement but which is open at the expiration of this Agreement shall survive expiration of this Agreement.

6.6 Cessation of Services.

6.6.1 For Emergency Response Services. Notwithstanding any provision of this Agreement to the contrary, the CONSULTANT may, in its discretion, cease to deploy Response Resources for Emergency Response Services of COMPANY if COMPANY fails to make payment in accordance with, and within the time periods provided within this Agreement for such Emergency Response Services. The continuation of deployment of Response Resources after time periods for payment have elapsed shall not be deemed a waiver of the CONSULTANT's rights under this Agreement. If the CONSULTANT ceases to deploy Response Resources, or if COMPANY instructs the CONSULTANT to cease deployment of Response Resources, the CONSULTANT shall be entitled to enter into an agreement with any other party, including governmental authorities, to deploy Response Resources or provide other services in connection with the same Discharge. If COMPANY instructs the CONSULTANT to cease deployment due to Federalizing of a

spill or any other reason, COMPANY shall be responsible for the costs of reasonable and necessary measures taken by the CONSULTANT to demobilize, but not for costs incurred for the account of governmental authorities who may then engage the CONSULTANT.

6.6.2 For OSRO Coverage Services. Notwithstanding any provision of this Agreement to the contrary, the CONSULTANT may, in its discretion, cease to provide OSRO Coverage Services, if COMPANY fails (i) to make or secure payment in accordance with, and within the time periods provided within this Agreement for such OSRO Coverage Services. The continuation of OSRO Coverage Services after time periods for payment have elapsed shall not be deemed a waiver of the CONSULTANT's rights under this Agreement.

7.0 INDEPENDENT CONTRACTOR

7.1 CONSULTANT agrees to undertake the Work directed by COMPANY as an independent contractor, at its sole risk, and agrees to employ and direct any persons or subcontractors performing any Work hereunder, and such persons and subcontractors shall be and remain the sole employees or agents of CONSULTANT, subject to the sole direction and control of CONSULTANT, and shall not be subject to the direction or control of COMPANY nor shall they be employees of COMPANY. CONSULTANT shall comply with all applicable federal and state enactments regarding Employer's Liability, Workers' Compensation, Social Security, and Unemployment Compensation Insurance, as well as be responsible for all valid sales or other taxes levied on the Work performed by CONSULTANT, its employees and agents. CONSULTANT further agrees to indemnify and hold COMPANY harmless from any cost, expense, tax, interest or penalty which COMPANY may be required by law to pay on account of CONSULTANT's failure to comply with the aforementioned laws.

8.0 INDEMNIFICATION

8.1 CONSULTANT agrees to release, defend, and to protect, indemnify and hold harmless COMPANY, its parent, affiliates, and subsidiaries, and its and their respective directors, officers, agents and employees (collectively "COMPANY Indemnitees"), from every kind or character of damages, losses, liabilities, expenses, demands or claims, including any and all costs and fees arising out of litigation or settlement of any claims (collectively "Losses"), to the extent the Losses are related to the performance of the Work and caused by, arise from or relate to, directly to the gross negligence or willful misconduct of CONSULTANT, its agents, employees, Local Contractors or subcontractors or CONSULTANT's failure to observe or comply with and fulfill its obligations under this Agreement. The foregoing obligation of CONSULTANT shall not be diminished in any regard but shall also not extend to cover such Losses covered by **Section 8.2** below.. CONSULTANT further agrees that it shall, at its own expense, defend any suit or action brought against COMPANY Indemnitees where the CONSULTANT'S alleged gross negligent or willful acts or omissions are asserted by either the petitioner or COMPANY, and CONSULTANT shall pay, in proportion to its obligation pursuant to this **Section 8.1**, all damages, costs and expenses (including attorneys' fees) in connection therewith or any matter resulting therefrom. CONSULTANT shall not agree to settle any such suit or action without COMPANY'S prior written consent. **CONSULTANT'S obligations under this section shall survive termination of this Agreement.**

8.1.1 Provided however, CONSULTANT, its parent and affiliates, their directors, officers, agents, employees, Local Contractors and subcontractors (collectively "CONSULTANT Indemnitees") shall be entitled to the protection of Responder Immunity Law and nothing herein shall be construed to allow COMPANY to recover by way of contribution, indemnity or otherwise from CONSULTANT Indemnitees any amounts for which COMPANY is liable to or has paid to third parties and for which CONSULTANT Indemnitees would have no liability under the Responder Immunity Law applicable in the jurisdiction where the Discharge and/or Emergency Response Services have occurred. In no event shall CONSULTANT Indemnitees be liable for or obliged in any manner for damages suffered by COMPANY arising from services hereunder whether

damages to third parties or COMPANY directly, unless the damages were directly caused by the gross negligence or willful misconduct of CONSULTANT Indemnitees.

8.2 COMPANY agrees to release, defend, and to protect, indemnify and hold harmless CONSULTANT , its affiliates, their directors, officers, agents and employees, Local Contractors and subcontractors (collectively, "CONSULTANT Indemnitees"), from every kind or character of damages, losses, liabilities, expenses, demands or claims, including any and all costs and fees arising out of litigation or settlement of any claims (collectively "Losses"), to the extent the Losses are caused by, arise from or relate to, directly the gross negligence or willful misconduct of COMPANY, its agents, COMPANY's other contractors, or employees or COMPANY's failure to observe or comply with and fulfill its obligations under this Agreement. The foregoing obligation of COMPANY shall not be diminished in any regard but shall also not extend to cover such Losses covered by **Section 8.1** above. COMPANY further agrees that it shall at its own expense, defend any suit or action brought against CONSULTANT Indemnitees where the COMPANY'S alleged gross negligent or willful act or omissions are asserted by either the petitioner or CONSULTANT, and COMPANY shall pay, in proportion to its obligation pursuant to this **Section 8.2**, all damages, costs and expenses (including attorneys' fees) in connection therewith or any matter resulting therefrom. COMPANY shall not agree to settle any such suit or action without CONSULTANT'S prior written consent. **COMPANY'S obligations under this section shall survive termination of this Agreement.**

8.3 Subject to the provisions of **Section 8.1** above, COMPANY agrees to release, defend, and to protect, indemnify and hold harmless CONSULTANT Indemnitees from and against all Losses related to CONSULTANT's or its Local Contractor's performance of Emergency Response Services where the CONSULTANT Indemnitees demonstrate that COMPANY would have been liable if COMPANY was sued directly. **COMPANY'S obligations under this section survive termination of this Agreement.**

8.4 Subject to the provisions of **Section 8.1** above, COMPANY further agrees to release, defend, and to protect, indemnify, and hold harmless CONSULTANT Indemnitees from and against all Losses and causes of action for Removal Costs and damages under OPA §1002 or corresponding State Law which result from actions taken or omitted to be taken in the course of rendering care, assistance or advice in connection with a Discharge or threatened Discharge from a Site or Facility consistent with the National Contingency Plan (as defined therein) or as otherwise directed by the COMPANY, the U.S. Coast Guard, the U.S. Environmental Protection Agency or other governmental authorities, which the CONSULTANT Indemnitees, individually or collectively, may suffer, incur, or pay out, except to the extent that:

8.4.1 the CONSULTANT Indemnitee is entitled to immunity from liability under Responder Immunity Law;

8.4.2 Losses arise out of the gross negligence or willful misconduct of the CONSULTANT, its affiliates, officers, directors, employees or subcontractors;

8.4.3 the COMPANY would have been entitled to a complete defense to liability under Federal Law and any relevant State Law had such claim, demand or cause of action been made against the COMPANY or the Facility directly.

8.4.4 such payment or indemnification would result in a payment by the COMPANY in excess of the amount to which the COMPANY would have been entitled to limit its liability under Federal Law and any relevant State Law had such claim, demand or cause of action been made against the COMPANY or the Facility directly.

8.4.5 such liabilities, claims, demands and causes of action arise in respect of death or personal injury.

COMPANY's obligations under this section survive termination of this Agreement.

8.5 Subcontractor Indemnification

8.5.1 CONSULTANT shall, to the extent practicable, require each of its subcontractors and/or Local Contractors engaged for performance of the Work to provide express indemnities, enforceable by and for the benefit of the COMPANY Indemnitees, to the same extent required of CONSULTANT under **Section 8.1** above; provided, however, that no failure by CONSULTANT to obtain such indemnities shall relieve CONSULTANT of its obligations under this Agreement.

9.0 COMPLIANCE WITH LAWS

9.1 Subject to the provisions of section 19.4, CONSULTANT will, in the performance of the Work contemplated hereunder, comply with all valid, applicable federal, state and local laws, ordinances, codes, local and national standards and regulations including without limitation all environmental laws. When it appears during the course of CONSULTANT'S performance of the Work that any of the Work does not conform to the provisions of this Agreement, CONSULTANT at its sole expense, shall immediately make the necessary corrections so that its Work shall so conform.

9.2 CONSULTANT shall observe, and will require to the extent of its authority, its personnel to observe applicable safety laws and regulations and applicable COMPANY Safety policies and procedures. However, CONSULTANT and COMPANY understand that (i) actions carried out in an emergency response in an oil spill environment may be inherently dangerous and difficult, (ii) rules and requirements that may be appropriate and applicable under normal circumstances may not be appropriate or applicable in a particular emergency situation, as recognized by the considerable authority of Governmental or Regulatory Bodies to direct private actions in a response, and (iii) there are unresolved jurisdictional and applicability issues associated with emergency oil spill response that may make it difficult to determine the applicability of a particular requirement. Therefore, the provisions of this **Article 9.0** will not be interpreted in a manner that would hold CONSULTANT to a standard that would be unreasonable under the actual conditions of particular spill event, and all CONSULTANT actions carried out consistently with the directions of the OSC or with approval of applicable safety officials will be deemed to be in compliance with this Article. While on a COMPANY's Facilities, CONSULTANT shall comply with all instructions received by CONSULTANT from COMPANY concerning safety policies and procedures, and will require its employees, agents, subcontractors and/or Local Contractors to comply with all specific instructions given by COMPANY regarding safety and safety policies and procedures. COMPANY shall give such instructions with as much advance notice as is practicable under the circumstances.

10.0 CALIFORNIA RELEASE NOTIFICATION REQUIREMENTS.

10.1 For Work performed in the State of California, CONSULTANT shall ensure that its employees, agents, and subcontractors' employees engaged in CONSULTANT's activities in the performance of the Work:

10.1.1 Are notified, and when required, as determined by COMPANY, trained and instructed by COMPANY, either directly or through a train-the-trainer program instituted by COMPANY, concerning the order of actions to be taken upon discovery of a release or threatened release condition of a Hazardous Material or pollutant substance; and

10.1.2 understand that no Work or visit shall be undertaken to any COMPANY right-of-way or facility where there is no COMPANY representative onsite and readily accessible (a "Non-COMPANY Onsite Situation"), unless the training referred to in (i) above has occurred for CONSULTANT's employees, agents and subcontractors' employees who will be performing at such a site.

10.2 COMPANY has determined that CONSULTANT:

☐ will be working in a Non-COMPANY Onsite Situation and MUST complete the training

☒ Will be working in a COMPANY Onsite Situation and MUST ensure that its employees, agents and subcontractors' employees have been notified accordingly, and if deemed necessary by COMPANY, CONSULTANT will assure that prior to performing any Work CONSULTANT's employees, agents and subcontractors' employees will be trained relative to COMPANY's revised release reporting criteria.

10.2.1.1 Because of the obligation under this **Article 10.0** to delay actual Work under this Agreement until a COMPANY representative is on site, in the event that CONSULTANT arrives at a site of Discharge prior to the arrival of a COMPANY representative, CONSULTANT's response time shall be measured from the time of receipt of the request to deploy resources under **Section 2.7.1** and end upon CONSULTANT's arrival at the site of Discharge

11.0 DRUG/ALCOHOL/FIREARMS/OPERATOR QUALIFICATION POLICY AND TESTING

DOT Jurisdictional Work

☐ YES **Section 11.1** and **Section 11.2** apply.

☒ NO **Section 11.2** applies.

11.1 Drug/Alcohol/Operator Qualification Program and Testing

11.1.1 CONSULTANT represents and warrants that it has established, maintains, and enforces both a Drug and Alcohol Program and an Operator Qualification Program per requirements as outlined in **Exhibit F**.

11.2 COMPANY Policy Regarding Drugs/Alcohol/Weapons

11.2.1 CONSULTANT agrees to advise its employees and the employees of its subcontractors and agents that it is the policy of COMPANY that:

11.2.1.1 The use, possession and/or distribution of illegal or unauthorized drugs, drug-related paraphernalia or weapons on COMPANY's premises, right-of-way, or job site is prohibited and the use or possession of alcoholic beverages, except where authorized by COMPANY's management, is also prohibited;

11.2.1.2 Entry onto or presence on COMPANY's premises by any person, including CONSULTANT, CONSULTANT's employees, subcontractors, subcontractors' employees, contract personnel, temporary employees and visitors, constitutes consent to COMPANY to conduct searches, whether announced or unannounced, on COMPANY's premises of the person and his or her personal effects for such prohibited items, and consent to drug testing at any time while on COMPANY's premises; and

11.2.1.3 Any person suspected or found in violation of the policy or who refuses to permit a search or drug or alcohol test may be removed and barred from COMPANY's premises, at the sole discretion of COMPANY; and

11.2.1.4 CONSULTANT personnel who test positive for illegal drugs or unauthorized alcohol as a result of a test conducted on COMPANY premises, or upon request of COMPANY, will be removed from any further performance or services under this Agreement.

12.0 CONFIDENTIALITY

12.1

12.1.1 Subject to the provisions of **Section 12.1.3** below, unless required by court order or valid legal process, CONSULTANT agrees not to publish or disclose to any third party any information conclusion, recommendation, opinion or data or other matter used or arising in the performance of Work under this Agreement without prior written authorization of COMPANY and also agrees to require a similar agreement from any employee, agent, subcontractor and/or Local Contractor participating in the rendering of Work under this Agreement. **CONSULTANT's obligations under this section survive the termination of this Agreement.**

12.1.2 COMPANY agrees not to publish or disclose to any third party any information regarding the terms of this Agreement, Response Resources, Annual Retainer Fee, Rates or Local Contractors or any other information received from CONSULTANT under this Agreement without prior written authorization from CONSULTANT, except to the limited extent necessary to be included in its Contingency Plans. **COMPANY's obligations under this section survive the termination of this Agreement.**

12.1.3 In the event that a court order or valid legal process requires disclosure by CONSULTANT or any employee, agent, or Local Contractor, of any information or other matter used or arising in the performance or Work under this Agreement, or by COMPANY of information related to this Agreement, CONSULTANT'S Response Resources, the Annual Retainer Fee, Rates, Local Contractors or other information obtained from CONSULTANT, the party receiving the legal process shall notify the other party prior to disclosing such information in order to provide the owning party with the opportunity to challenge the court order or legal process.

12.2 All data, including but not limited to, drawings, designs, specifications, notebooks, computer programs, computer output, models, tracings, photographs, negatives, video and/or audio recordings, reports, findings, recommendations, and memoranda of every description relating to the Work under this Agreement, in whole or in part, shall be the property of COMPANY.

12.3 CONSULTANT may retain duplicate copies of the materials identified above for its records subject to the stipulation that such records shall be marked and treated as confidential and shall not be released to any third party or used for any other purpose without the prior written consent of COMPANY.

12.4 CONSULTANT shall not in any manner advertise, publish or release for publication or disclosure any statement mentioning this Agreement, or CONSULTANT's performance of, or contracting to perform the Work, without the prior written consent of COMPANY.

13.0 SUSPENSION

13.1 COMPANY may, at its sole option, by written notice to CONSULTANT, suspend at any time the performance of all or any portion of the Emergency Response Services being or to be performed under this Agreement. Upon receipt of any such notices, CONSULTANT shall immediately discontinue Work, including, without limitation, the placing of orders, contracts, and rental agreements to the extent they relate to Work suspended, on the date and to the extent specified in the notice; and unless otherwise specifically stated in the notice, CONSULTANT shall continue to protect and maintain the Work completed, including those portions on which Work has been suspended.

13.1.1 In the event of such suspension, CONSULTANT will be reimbursed for all costs, reasonably incurred, without duplication of any items, , including (i) all reasonable costs as mutually agreed associated with demobilization and relocation of CONSULTANT's plant, forces, and equipment, and (ii) costs which CONSULTANT is or will be legally obligated to pay related to the performance of the Work.

13.2 COMPANY may, at its option, suspend the Work for a full safety inspection and correction at any time the Designated Representative: 1) discovers a clear safety violation; 2) sees the

possibility of a dangerous condition in any Work area; or 3) notices a pattern by CONSULTANT of disregard for maintaining a safe jobsite.

14.0 TERMINATION AND RIGHT TO AUDIT

14.1 TERMINATION BY COMPANY.

14.1.1 If COMPANY observes a serious safety violation of an OSHA or other published safety requirement or of Exhibit G attached hereto on a Site which is capable of causing imminent serious injury or death, then such violation shall be grounds for immediate termination of this Agreement or all or any part of the Work performed under a Work Directive of this Agreement (including OSRO Coverage Services) at COMPANY's discretion. However, nothing herein shall relieve CONSULTANT of its sole responsibility and liability for safety at the Site.

14.1.2 If two (2) or more times during a six (6) month period, COMPANY suspends Work due to a pattern by CONSULTANT or its Local Contractor of disregard of statutory or other published safety requirements for maintaining a safe jobsite or of Exhibit G and CONSULTANT fails to correct or cause its Local Contractor to correct such pattern, then, upon the occurrence of a third such suspension, COMPANY may, at its discretion, immediately terminate this Agreement or all or any part of the Work performed under a Work Directive of this Agreement (including OSRO Coverage Services) or terminate such Local Contractor from performing Work hereunder.

14.1.3 All or any part of the Work (except for OSRO Coverage Services as provided in **Section 14.1.6** below) performed under the Work Directive of this Agreement may be canceled by COMPANY for its own convenience or for any reason or reasons whatsoever upon 24 hours notice to CONSULTANT (except as provided in **Section 14.1.1** and **Section 14.1.2** above). After the receipt of such notice, and except as otherwise directed by COMPANY, CONSULTANT shall, in good faith and to the best of its ability, do all things in light of such notice and of such request for implementation thereof as COMPANY may make, to assure the efficient, proper close out of canceled Work. Upon receipt of such notice, CONSULTANT shall reasonably cooperate with COMPANY in all matters including, potentially, transferring Work to another consultant.

14.1.4 Upon termination of any or all Work, CONSULTANT shall deliver to COMPANY all specifications, drawings, surveys, reports, plans, maps, calculations, bills of materials and any other data or documents pertaining to the Work which are in CONSULTANT's possession.

14.1.5 In the event COMPANY cancels any part of the Work to be performed hereunder, CONSULTANT shall be paid for Work performed through the date of cancellation or termination and including demobilization and restocking charges for which CONSULTANT has not been previously paid by COMPANY. In no case shall COMPANY be liable for payment to CONSULTANT for unrealized costs or anticipated profits hereunder. In the event termination by COMPANY is due to failure of CONSULTANT to fulfill its contractual obligations (including but not limited to failure to prosecute the Work in a safe manner), COMPANY may pursue any and all remedies available to it at law or in equity.

14.1.6 Except as provided in **Section 14.1.1 and Section 14.1.2** above, COMPANY may not terminate the provision of OSRO Coverage services under any Work Directive upon its convenience. COMPANY may only do so in the event CONSULTANT has materially breached this Agreement.

14.1.7 CONSULTANT shall be deemed to have materially breached this Agreement if (a) fails to prosecute the Work or any portion thereof as required by this Agreement ; (b) consistently fails to achieve milestones, if applicable, or fails to prosecute the

Work with such reasonable speed under the circumstances as in the judgment of COMPANY is necessary to complete the same within the necessary timeframe; (c) fails to make prompt payment to subcontractors or suppliers for materials or labor per the terms of their agreement with CONSULTANT; (d) fails to comply with any applicable laws, rules, regulations, ordinances or permits; (e) institutes or has instituted against it a proceeding seeking a judgment of insolvency or bankruptcy or any other relief under any bankruptcy or insolvency law or other similar law affecting creditors' rights, or a petition is presented for its winding-up or liquidation, and (i) this Agreement is not assumed or rejected within thirty (30) days of commencement of any such proceeding, or (ii) such proceeding or petition results in a judgment of insolvency or bankruptcy or the entry of an order for relief or the making of an order for CONSULTANT's winding-up or liquidation which judgment is not dismissed, discharged, stayed or restrained within thirty (30) days after entry of the action, and this Agreement is not assumed or rejected within such thirty (30) day period; (f) makes a general assignment, arrangement or composition with or for the benefit of its creditors; (g) becomes insolvent or is generally unable to pay its debts or fails or admits in writing its inability to pay its debts as they become due; (h) seeks or becomes subject to the appointment of an administrator, provisional liquidator, conservator, receiver, trustee, custodian or other similar official for all or substantially all of its assets; (i) otherwise seeks protection from creditors; (j) suspends OSRO Coverage Services or Emergency Response Services or the execution of the Work other than in accordance with the terms of this Agreement; or (k) fails to comply with the terms of this Agreement in all material respects..

14.2 TERMINATION BY CONSULTANT.

14.2.1 CONSULTANT may terminate this Agreement or a particular Work Directive (i) if payment has been made under the Parent Guaranty under two (2) separate occassions (ii) for COMPANY's breach of a material obligation hereunder by notifying COMPANY in writing of such occurrence or default as the case may be. In the case of (ii), COMPANY shall have ten (10) days from receipt of notice in which to cure its performance or begun expeditious efforts to cure as can be reasonably expected under the circumstances. COMPANY shall be deemed to have materially breached this Agreement if COMPANY defaults in the performance of its obligations under this Agreement and fails to cure or commence cure as the case may be, within such ten (10) day period, or fails to maintain the parent guaranty as required hereunder, or ceases doing business as a going concern, becomes insolvent, commits an act of bankruptcy, or becomes the subject of any proceeding under the Bankruptcy Act or other insolvency laws which is not dismissed or stayed within sixty (60) days, or is seized or nationalized by a government or government instrumentality. If such material breach by COMPANY occurs, then CONSULTANT may, without further notice and without relieving COMPANY of its obligations hereunder, terminate this Agreement, declare the balance of fees and charges for Emergency Response Services and charges for Work already performed under any current Work Directive(s) to be due and payable, and assert maritime or other liens against COMPANY's Facility as permitted by law. In such event, CONSULTANT shall be entitled, without liability to COMPANY, to provide to any governmental agency at any time notice of the status of COMPANY's relationship with CONSULTANT. Without limiting the generality of the foregoing, CONSULTANT is and shall continue to be entitled, upon termination of this Agreement, to notify any governmental agency that this Agreement has been terminated and that COMPANY is not entitled to name CONSULTANT in its contingency plans.

14.3 RIGHT TO AUDIT.

14.3.1 Throughout the term of this Agreement and for a period of three years following the completion or termination of this Agreement and for so long thereafter as there may remain any unresolved questions or disputes regarding any item, COMPANY shall, at all reasonable times and upon prior notice to CONSULTANT, have access to all

CONSULTANT's, subcontractors', and vendors' personnel, books, records, correspondence, instructions, plans, equipment maintenance records, drawings, receipts, vouchers, financial accounts and memoranda of every description pertaining to the Work for the purpose of auditing and verifying the application of the unit rates applicable to the work or reimbursable costs of the Work, CONSULTANT's safety performance under this Agreement or for any other reasonable purpose. COMPANY shall have the right to reproduce any of the aforesaid documents. In the event that any audit reveals an error or discrepancy of any nature whatsoever, such error or discrepancy will be corrected promptly, and any moneys owing and due either COMPANY or CONSULTANT will be paid promptly by the other party. CONSULTANT's obligations under this **Article 14.0** shall survive the termination of this Agreement.

15.0 ASSIGNMENT

15.1 CONSULTANT shall not assign this Agreement without first having obtained COMPANY's written approval. CONSULTANT shall be entitled to contract with Local Contractors to assist in the performance of OSRO Coverage and Emergency Response Services. Such contract will not, in any way, relieve CONSULTANT of its obligations hereunder.

15.2 The fees and costs of Local Contractors shall be calculated in the same manner as CONSULTANT's fees and costs as provided in Exhibit B.

16.0 NOTICES

16.1 Any notice required hereunder to be given to either party shall be deemed duly given when written and delivered personally or when sent by mail or facsimile, to such party at the following addresses:

16.2 The address for notices may be changed upon written notice to the other party. Notices shall be effective upon receipt.

17.0 CONFLICT OF INTEREST

17.1 During the term of this Agreement, for OSRO Coverage Services and Emergency Response Services authorized under a Work Directive, CONSULTANT will, with respect to response to any specific Discharge, act as consultant for and on behalf of the COMPANY only.

18.0 FORCE MAJEURE

18.1 Force Majeure, as used herein, shall mean acts of God, acts of public enemies, fire, war or civil disturbance, insurrection, blockades, strikes, riots, epidemics, landslides, lightning, earthquakes, floods, washouts, explosions, inability with reasonable diligence to obtain materials because of a Force Majeure event affecting a material supplier's performance, loss or shortage of transportation facilities, commandeering of raw materials or products or plants or facilities by a government, labor disputes involving a general stoppage of work on the job, rules or regulations or orders or acts of governmental authority, the unforeseeable inability to obtain necessary site access, authorization, permits, licenses, certifications and approvals and not involving the fault or negligence of COMPANY or CONSULTANT.

18.2 Nothing herein shall be construed to oblige the CONSULTANT to deploy Response Resources in connection with Emergency Response Services where, in the good faith judgment of the CONSULTANT's supervisory personnel on the scene and with the agreement of the Federal On Scene Coordinator, circumstances in which the Emergency Response Services are to be conducted present an unreasonable risk to life or property.

19.0 LIABILITIES, WARRANTIES AND TITLE

19.1 **IN NO EVENT, WHETHER AS A RESULT OF NEGLIGENCE OR OTHERWISE, SHALL CONSULTANT OR COMPANY BE LIABLE TO THE OTHER FOR ANY INDIRECT, INCIDENTAL, CONSEQUENTIAL, PUNITIVE, EXEMPLARY OR SPECIAL DAMAGES OF ANY KIND.**

19.2 CONSULTANT warrants and represents to COMPANY that:

19.2.1 CONSULTANT understands the known hazards and risks to human beings, property, and the environment associated with Emergency Response Services.

19.2.2 CONSULTANT is engaged in the business of Emergency Response Services, and has professional expertise in these areas. CONSULTANT represents to COMPANY that it has the skill and professional competence, expertise, experience with United States Coast Guard classification and all other necessary certification, licenses and approvals to undertake the obligations imposed by this Agreement. The service performed by CONSULTANT will be conducted using this skill, competence and expertise, as indicated by COMPANY.

19.2.3 CONSULTANT will perform Emergency Response Services and all other obligations under this Agreement in a safe manner consistent with Exhibit G and in full compliance with all applicable laws, statutes, ordinances, orders, rules, regulations and guidelines of the federal, state and local governments who have jurisdiction to regulate the activities performed under this Agreement.

19.3 THERE ARE NO WARRANTIES, INCLUDING A WARRANTY OF WORKMANLIKE SERVICE, WHICH EXTEND BEYOND THOSE EXPRESSLY SPECIFIED IN THIS AGREEMENT.

19.4 The COMPANY acknowledges that Response Resources deployed by the CONSULTANT under this Agreement will be deployed on an emergency basis and that the purpose of Emergency Response Services for which such Response Resources will be deployed is to remove, to the maximum extent practicable, Oil from a Discharge. The CONSULTANT does not warrant, by the terms of this Agreement or by undertaking, that Emergency Response Services conducted with Response Resources will render the scene of the Discharge, or areas affected by the Discharge, safe for any form of human activity, or in compliance with any Federal law or State Law.

19.5 CONSULTANT shall provide COMPANY with reasonable advance written notice if any license, permit, certificate or any other approval is necessary to perform the Work hereunder, or if any license, permit, certificate, or any other approval necessary to perform the Work is to expire and cannot be renewed during the term of the corresponding Work Directive or is the subject of any judicial or administrative action seeking to impose a penalty or fine or to revoke or suspend such license, permit, certificate or approval. Such notice shall also be provided if CONSULTANT decides not to obtain any necessary license, permit, certificate or approval which becomes required after execution of the corresponding Work Directive. Upon COMPANY's receipt of such notice or upon COMPANY's learning that CONSULTANT is performing the Work without a required license, permit, certificate or any other necessary approval, COMPANY shall be entitled to terminate the Work Directive upon written notice thereof to CONSULTANT as set forth in **Section 14.1** herein.

19.6 CONSULTANT shall provide each person whom CONSULTANT should reasonably foresee being exposed to Waste, oil, hazardous materials, or non-hazardous material (including, but not limited to, CONSULTANT's employees and subcontractors) with clear and reasonable warning of the hazards associated with the material or Waste, and shall take all actions necessary to protect such persons, property and the environment from such hazards. CONSULTANT shall comply with all applicable laws, statutes, ordinances, orders, rules, regulations and guidance of the federal, state or local government with respect to worker safety during CONSULTANT's activities at the Site.

19.7 COMPANY warrants and represents to CONSULTANT that COMPANY will make available to CONSULTANT all information in its possession or that comes into its possession during the term of this Agreement regarding the Waste, the known surface and subsurface conditions in the vicinity of the Work and the Site, applicable topographical surveys, chemical analysis or other relevant information that would assist CONSULTANT in properly evaluating the nature and character of the Waste and the Work to be performed.

19.8 Handling Hazardous Materials and Waste.

19.8.1 Nothing contained within this Agreement shall be construed or interpreted as requiring CONSULTANT to assume the status of a generator, or of an owner or operator of a treatment, storage and disposal ("TSD") facility as those terms appear within the Resource Conservation Recovery Act, 42 U.S.C. § 6901, et. seq. (hereinafter "RCRA") or within any federal or state statute governing the transportation, treatment, storage or disposal of (1) Hazardous Materials, (2) Oil, or (3) Waste (hereinafter referred to collectively as " Recovered Waste").

19.8.2 COMPANY shall assume the responsibility for compliance with the provisions of RCRA and any federal or state statute governing the transportation, treatment, storage and disposal of Recovered Waste. In the event COMPANY requires CONSULTANT' assistance in meeting its obligations, as set forth within this Paragraph, then CONSULTANT, as requested and directed by COMPANY, and at COMPANY's expense, will provide (a) enter into subcontracts for analytical testing to assist COMPANY in the proper characterization of the Recovered Waste for documentation purposes; and (b) assist COMPANY with completion of shipping papers, manifests and labels that are required for each shipment of Recovered Waste in accordance with all applicable requirements of the United States Department of Transportation, (DOT) and the United States Environmental Protection Agency (EPA) under the Toxic Substances Control Act (TSCA), the Resource Conservation and Recovery Act (RCRA), or any replacement or successor agency thereto, and all other federal, state and local statutes, regulations and ordinances.

19.8.3 If performance of this Agreement requires the treatment, storage or disposal of any Recovered Waste, CONSULTANT will transport the Recovered Waste, or cause it to be transported, only to a disposal or treatment facility selected by COMPANY. Any transportation undertaken or arranged by CONSULTANT under this Agreement

is undertaken or arranged by CONSULTANT solely as COMPANY's agent and under COMPANY's direction.

19.8.4 If any Recovered Waste is designated by any governmental authority as a hazardous waste (or any similar designation) then, as a condition precedent to CONSULTANT' performance under this Agreement with respect to such substance, COMPANY shall provide CONSULTANT with COMPANY's EPA identification number and any other identification or authorization required by law or assigned to COMPANY by any governmental authority for such substances.

19.8.5 Nothing contained within this Agreement shall be construed or interpreted as requiring CONSULTANT to take title to or otherwise own any Recovered Waste. COMPANY acknowledges that CONSULTANT has not taken and will not take title to or otherwise own such Recovered Waste, and that CONSULTANT is not, has not been and will not be in possession or control of any such Recovered Waste, except as COMPANY's agent.

20.0 WAIVER

20.1 Any waiver by either party of any provision or conditions of this Agreement shall not be construed or deemed to be a waiver of any other provision or condition of this Agreement, nor a waiver or subsequent breach of the same provision or condition, unless such waiver be so expressed in writing and signed by the party to be bound.

21.0 SPECIAL PROVISIONS

21.1 It is not the purpose or intention of this Agreement to create and the same shall not be construed as creating a joint venture, oil and gas partnership, commercial partnership or other partnership relation between the parties hereto.

21.2 CONSULTANT shall immediately notify COMPANY of all directions CONSULTANT receives from and all communication with any governmental body or agency with regard to the Emergency Response Services. CONSULTANT shall, to the extent practicable, under the circumstances, coordinate any response to a governmental body or agency's direction, request or other communication with COMPANY's Designated Representative or his or her designee.

21.3 COMPANY may obtain Emergency Response Services to substitute for or supplement those available under this Agreement at COMPANY's sole discretion, cost and expense.

22.0 DISPUTES

22.1 Without giving effect to choice of law rules, the laws of the jurisdiction where the Work is being performed shall govern any interpretations or constructions of this Agreement. Except as provided in **Section 2.11.3** hereof, any dispute between COMPANY and CONSULTANT arising from this Agreement shall be resolved first through discussions among upper management of the parties, and if the dispute cannot be resolved within sixty (60) days from the date the matter was first brought by the disputing party to the attention of the other party, then any party may elect to resolve the matter through litigation brought in a court having jurisdiction thereof.

22.2 Except for CONSULTANT's rights as provided in **Section 6.7** herein, if in COMPANY's sole reasonable discretion the Work cannot be suspended pending the resolution of a dispute, COMPANY may (a) request that CONSULTANT continue prosecuting the Work to completion pursuant to the terms and conditions of this Agreement, or (b) take over the Work and itself prosecute the same to completion.

22.3 It is understood that with respect to any goods and materials provided in the course of performing this Agreement the Uniform Commercial Code shall prevail as the basis for contractual obligations between COMPANY and CONSULTANT in the event that such obligations are not otherwise defined in this Agreement.

23.0 SEPARABILITY

23.1 If any section, subsection, sentence or clause of this Agreement shall be adjudged illegal, invalid or unenforceable, such illegality, invalidity or unenforceability shall not affect the legality, validity or enforceability of the Agreement as a whole or of any remaining sections, subsections, sentences or clauses.

24.0 SURVIVAL OF OBLIGATIONS

24.1 Without limiting the effect of any provisions in this Agreement, the warranties, limits of liability and indemnification provisions of this Agreement shall survive the termination or expiration of this Agreement.

25.0 SUCCESSORS AND ASSIGNS

25.1 The covenants and agreements contained in this Agreement shall apply to, inure to the benefit of and be binding upon the parties hereto and upon their respective heirs, executors, administrators, assigns and successors in interest.

26.0 LIABILITY OF GENERAL PARTNER

26.1 Kinder Morgan G.P., Inc., a Delaware corporation (the "**General Partner**"), is the general partner of COMPANY. CONSULTANT agrees that the General Partner shall not be liable, directly or indirectly, for any of COMPANY's obligations or liabilities under this Agreement. All such obligations and liabilities shall be non-recourse to the General Partner and shall not constitute debts or obligations of the General Partner. No judgment, attachment, execution or other writ or process shall be sought, issued, or levied in connection with this Agreement against the General Partner or any of its assets or properties to satisfy any such liabilities or obligations or any judgments rendered in connection therewith and all such liabilities and obligations shall be satisfied solely from the assets of COMPANY.

27.0 SERVICES FOR AFFILIATES

27.1 The services to be performed by CONSULTANT under this Agreement shall be performed, in certain cases, for one or more of COMPANY's Affiliates except Kinder Morgan, Inc. In the event an Affiliate requires CONSULTANT's services hereunder, a Work Directive for such service shall be issued in the Affiliate's name and executed by the Affiliate and CONSULTANT. Such Work Directive shall be in the form shown on **Exhibit A-1**, attached hereto and made a part hereof for all purposes. Upon execution of said Work Directive, CONSULTANT shall perform such Work for Affiliate in accordance with the Work Directive and the terms and conditions of this Agreement. By execution of the Work Directive, the Affiliate shall be entitled to all rights and privileges, and liable for all commitments and responsibilities held by COMPANY under this Agreement, as same applies to said Work Directive. Upon execution of said Work Directive, CONSULTANT's agreement to indemnify COMPANY pursuant to this Agreement, shall extend to both COMPANY and Affiliate for purposes of said Work Directive. Except as provided in **Section 6.5** hereunder and/or unless expressly provided in the Work Directive, the Kinder Morgan entity which executes the Work Directive shall be solely responsible for the liabilities and obligations set forth in this Agreement under which that Work Directive is being issued as the same apply to the Work to be performed pursuant to that Work Directive. All such liabilities and obligations, as they apply to that Work Directive, shall be non-recourse to the direct and indirect parents (or a general partner, as the case may be) and to the affiliates of the Kinder Morgan entity executing that Work Directive.

28.0 ENTIRE AGREEMENT

28.1 This Agreement, together with the exhibits attached hereto, constitutes the entire agreement between COMPANY and CONSULTANT and supersedes any prior written or oral agreements, or contemporaneous communications with respect to this subject matter. No subsequent amendment to this Agreement between the parties shall be binding on either party unless

reduced to writing and signed by an authorized representative of each of the parties. To the extent any Work Directive issued pursuant to this Agreement conflicts with this Agreement, the Work Directive shall prevail.

IN WITNESS WHEREOF, the parties hereto have executed this Agreement as of the day and year first above written.

Agreement Number: 05-ER-45-064-ORG

EXHIBIT A— WORK DIRECTIVE

A Work Directive substantially in the form attached hereto will be executed between the parties for any Work performed under this

Agreement.

Exhibit A—Work Directive No. _____

Attachment No. 01—Revised Release Reporting Criteria

Consultant shall ensure that its employees, agents, and subcontractors' employees engaged in Consultant's activities in the performance of the Work:

(i) are notified, and when required, as determined by COMPANY, trained and instructed by COMPANY, either directly or through a train-the-trainer program instituted by COMPANY, concerning the order of actions to be taken upon discovery of a release or threatened release condition of a Hazardous Material or pollutant substance; and

(ii) understand that no Work or visit shall be undertaken to any COMPANY right-of-way or facility where there is no COMPANY representative onsite and readily accessible (a "Non-COMPANY Onsite Situation"), unless the training referred to in (i) above has occurred for Consultant's employees, agents and subcontractors' employees who will be performing at such a site.

For purposes of this Exhibit A, "Hazardous Material" shall mean and include (a) all elements or compounds that are contained in the list of hazardous substances adopted by the United States Environmental Protection Agency and the list of toxic pollutants designated by Congress or the Environmental Protection Agency or under any Environmental Laws; and (b) any "hazardous waste," "hazardous substance" (including , but not limited to, petroleum and petroleum-related materials), "toxic substance," regulated substance," "pollutant" or "contaminant", each as defined under any Environmental Law. "Environmental Laws" shall mean any and all federal, state, and local laws, regulations and requirements pertaining to health, safety, or the environment.

Company has determined that Consultant:

☐ *Will be working in a Non-COMPANY Onsite Situation and MUST complete the training.*

☒ ***Will be working in a COMPANY Onsite Situation and MUST ensure that its employees, agents and subcontractors' employees have been notified accordingly, and if deemed necessary by COMPANY, CONSULTANT will assure that prior to performing any Work CONSULTANT's employees, agents and subcontractors' employees will be trained relative to COMPANY's revised release reporting criteria.***

Consultant shall certify its compliance with this training requirement upon Company request.

EXHIBIT B – SCHEDULE OF VALUES

1.0 OVERVIEW

1.1 The amounts set forth in the Agreement cover payment in full for all materials, work, tools, equipment, insurance, bonds, profit, overhead and all other costs and expense of every kind, character and nature for which the CONTRACTOR is entitled to payment. Unless specifically set forth in the Agreement, no additional payment of any kind will be contemplated.

1.1.1 COMPANY agrees to pay CONSULTANT, for Work performed pursuant to this Agreement either on a COST REIMBURSABLE BASIS or FIRM FIXED PRICE, LUMP SUM BASIS (The "**Contract Price**") as specified in each Work Directive.

1.1.2 COMPANY agrees to pay CONSULTANT for All Emergency Response Services in accordance with CONSULTANT's or Local Contractor's Rates as set forth on CONSULTANT's website, www.nrc.com. For purposes of example, Local Contractor, NRC Environmental Services' rates shall be billed for Work performed on the West Coast and are contained in this **Exhibit B**.

2.0 PROCESSING OF TIMESHEETS & REIMBURSABLE RECEIPTS PRIOR TO INVOICE SUBMITTAL

2.1 For Emergency Response Services, CONSULTANT shall submit the estimates of charges for labor, equipment, materials and expenses to the AUTHORIZED PROJECT REPRESENTATIVE on a daily basis for verification/acknowledgement of expenses and time spent on the project. Signature by these personnel does not preclude revision of the final invoice based on the final invoice not being in accordance with the actual labor, equipment, materials and expenses provided as verified/acknowledged in the daily estimates/timesheets.

3.0 INVOICING

3.1 Standard Invoice Procedure

3.1.1 CONSULTANT shall submit an original detailed invoice, together with one copy of such invoice and one set of supporting documentation to be sent to COMPANY for payment.

3.1.1.1 For OSRO Coverage Services, CONSULTANT shall submit invoice(s) in advance annually for OSRO Coverage Service to be performed during that contract year; and

3.1.1.2 For Emergency Response Services or Other Services, CONSULTANT shall submit invoice(s) upon completion of the Work performed pursuant to a Work Directive or when the total amount owed reaches $100,000, whichever is sooner, per Work Directive.

3.1.2 Reference each individual contract for the appropriate addressee and company name for the invoice to be submitted.

Company Name:	**Kinder Morgan Operating L.P. "D"**
Attn:	**As specified in Section 6 of each Work Directive released**
Address:	
	,
REFERENCE:	
Contract No.:	**05-ER-45-064-ORG**

Work Directive No.:	(Per the Work Directive (Exhibit A-1) Issued for Services)
Amendment / Change Order No.:	(Per the Amendment /Change Order Issued for Services)

3.2 Non-acceptance of Invoices

3.2.1 Invoices that do not relate to this Contract **will not be processed** and such invoices will not be accepted by COMPANY. All charges not in compliance with the stated terms and conditions of this Contract will be deducted from the invoice prior to payment processing.

3.3 Required Invoice Detail

3.3.1 Each of CONSULTANT's invoices shall contain the following information on its face:

3.3.1.1 An invoice date.

3.3.1.2 A reference number (invoice number) which is unique to the transaction

3.3.1.3 Site or project name (if applicable) and COMPANY.

3.3.1.4 Reference of COMPANY'S Project Representative.

3.3.1.5 Contract Number, Change Order Number and Directive Number (as applicable).

3.3.1.6 Billing period (time period of charges).

3.3.1.7 CONSULTANT's or Local Contractor's remittance address or electronic funds transfer routing information, (as applicable).

3.3.1.8 CONSULTANT's or Local Contractor's name and telephone number of contact to handle invoice related questions.

3.3.1.9 Amount due CONSULTANT.

3.3.1.10 Project Status Report

3.3.1.11 Summary of amount invoiced to date, this invoiced amount, retention (as applicable), and the amount remaining to be invoiced.

3.4 Supporting Documentation

3.4.1 Each of CONSULTANT's invoices shall be itemized and submitted to COMPANY together with receipts, time records, vouchers showing payments for itemized material and labor, and any other evidence of CONSULTANT's right to payment under this Contract as COMPANY may, in its sole good faith discretion, from time to time require.

3.5 Final Invoice

3.5.1 When CONSULTANT submits its final invoice to COMPANY for the Work, in addition to the requirements outlined above, CONSULTANT shall additionally include the following which shall be submitted no later than thirty (30) days after the project completion date:

3.5.2 Mechanics lien and stop notice releases executed by CONSULTANT and by each person or entity that furnished any labor, services or materials in connection with the Work;

3.5.3 Reasonable proof satisfactory to COMPANY that any claims for labor, materials or any other claim or potential claim for which COMPANY withheld compensation pursuant to the Contract have been paid or satisfied in a manner acceptable to COMPANY.

4.0 PAYMENT PROCEDURE

4.1 Processing of Approved Invoices

4.1.1 Provided that such invoice meets all of the requirements as explained, COMPANY shall pay all undisputed charges set forth in each invoice, within thirty (30) days after such invoice is received by COMPANY; provided that, if payment is not received by CONSULTANT within thirty (30) days, then CONSULTANT shall notify COMPANY in writing and COMPANY shall have five (5) business days following its receipt of said notice before CONSULTANT may exercise its rights under Section 6.7.1 of the Agreement.

4.1.2 CONSULTANT shall notify COMPANY in writing when more than one million dollars ($1,000,000.00) of response costs has been incurred under a Work Directive issued with respect to an individual response event. COMPANY shall pay CONSULTANT eighty percent (80%) of such response costs within ten (10) days of its receipt of CONSULTANT's invoice for said 80% progress payment. Further, if COMPANY fails to submit such payment within said ten (10) day period, CONSULTANT shall notify COMPANY in writing of non-receipt and thereupon COMPANY shall have five (5) business days from receipt of said notice to pay said 80% progress payment to CONSULTANT before CONSULTANT may exercise its rights under Section 6.7.1 of the Agreement.

4.2 Processing of Disputed Invoices

4.2.1 If COMPANY, in good faith, disputes and does not reasonably approve an item billed, COMPANY shall notify CONSULTANT in writing, of the item or portion of an item disputed including documentation for source of dispute, within ten (10) days of receipt of the invoice and withhold payment thereof until settlement of the dispute. Such right of COMPANY to withhold such payments shall be in addition, and not in any way in lieu of, any other right of COMPANY hereunder, including the right to raise disputes for the first time after audit. Payment shall be contingent upon COMPANY's review of the invoice and determination that the Work described in the invoice complies with all of the terms of this Contract. Interest penalties for disputed invoices will not be paid by COMPANY.

5.0 TIME AND MATERIALS RATES

CONSULTANT's current Rates and terms and conditions related to those rates are included below. Such rates are subject to annual adjustment on Price List anniversary date of February 18.

PERSONNEL

CODE	DESCRIPTION	RATE PER HR
SP	Senior Project Manager	125.00
PM	Project Manager	100.00
AM	Assistant Project Manager/Superintendent (Operations, Planning, Logistics, Finance)	85.00
IH	Industrial Hygienist (non-CIH)	100.00
HS	Health & Safety / Training Manager / Field Chemist	65.00
SM	Support Manager (Purchasing, Subcontracts, Communications, Transportation, Decon, Disposal)	72.00
CS	Chemist / Scientific Specialist	100.00
PR	Purchaser / Subcontracts Administrator	60.00
FS	Field Supervisor	60.00
MC	Mechanic / Welder	55.00
RT	Confined Space / Rescue Technician	50.00
SF	Site Foreman	50.00
VO	Vessel Operator	48.00
DH	Deckhand	45.00
TE	Technician – HAZWOPER	45.00
EO	Equipment Operator / Truck Driver/Tankerman	48.00
AS	Administrative Support	42.00
ST	Support Technician (Warehouser, Accounting, Personnel Coordinator)	42.00

Notes:

1. Minimum call out is 4 hours per person, except for projects over 50 miles from office location require 8-hour daily minimum.
2. Rates for FS, MC, RT, SF, VO, DH, TE, EO, AS and ST are subject to the following:
    a. Weekdays: Rate at time and one-half prior to 07:00 and/or after 15:00, up to 12 total hours; after 12 hours Rate at double-time.
    b. Saturday: Rate at time and one-half up to 8 hours; after 8 hours, Rate at double-time.
    c. Sundays and Holidays: Rate at double-time.
    d. The following are included holidays: New Years Day, Presidents Day, Good Friday, Memorial Day, Independence Day, Labor Day, day before Thanksgiving, Thanksgiving Day and Christmas Day.
    e. The above Rates are applied regardless of the number of hours worked for the Customer on any particular day. Rates for hours subsequent to a break of less than 8 hours are calculated as continuous to hours prior to break.
3. All project specific personnel, including accounting, administrative, personnel support, logistics and management, whether on site, at National Response Corporation offices, or at support locations, are chargeable per the above rates. All personnel are charged according to the above rates, regardless of full-time, part-time or third party labor source status, unless provided as part of a specified subcontracted service. Labor rates for remote sites and prevailing-wage projects may require a surcharge.
4. Time charges begin with equipment and personnel mobilization activities. Time charges terminate at the conclusion of the services, which includes transportation of equipment and personnel back to operations centers and any necessary demobilization activities. Personnel time is charged in half-hour increments for all personnel.
5. Transportation and any incidental costs for all emergency response personnel, both on site, at support locations and traveling to and from the site or support locations, are charged at cost plus 20%. Per Diem charges for food in metropolitan areas are $40.00 per person per day. Typical per diem rates for lodging, based on double occupancy, are $85.00 per person per day. Rates for premium areas and remote sites to be determined.

	SCBA	Day	125.00
	Tripod and Winch	Day	150.00

Notes:

1. Equipment prices do not include fuel, operator or mobilization unless otherwise stated. Non-mileage fuel charges will be charged at cost plus 20%. Vacuum truck washouts will be charged at cost plus 20%.
2. Time charges are calculated portal to portal, beginning with equipment mobilization activities from operations centers unless otherwise specified, including all time at the site. Time charges terminate at the conclusion of the operation, which includes transportation of equipment back to operations centers and completion of any necessary demobilization activities, including equipment cleaning, repair, replacement and/or delivery to National Response Corporation of restored equipment.
3. Day rates are based on 12 hours of continuous operation, to coincide with operational periods. If equipment exceeds the 12 hour continuous operations period, then excess time will be based on a prorated hourly basis.
4. Minimum call out for hourly equipment is four hours per day for local projects and eight hours per day for projects over 50 miles from mobilization site. Minimum charge for daily rate equipment is daily charge per day. Customers will be charged for unused requested equipment until released and returned to service per Note 3.
5. Mileage charges are $.50 per mile for cars, $.65 per mile for trucks/vans and $.85 per mile for commercial trucks.
6. Equipment not on price list will be charged per quote. Unless otherwise quoted, services not listed on price list, including equipment and freight, will be charged at cost plus 20%.
7. In addition to payment of rental charges, Customer agrees to pay National Response Corporation, in accordance with rates contained in this Price List, for any cleaning or repairs necessary to return all equipment to the same condition as at the commencement of services (with the exception of normal wear and tear). Customer is also responsible for the payment of all transportation and disposal charges for any waste generated during cleaning. Only National Response Corporation or its subcontractors shall perform any cleaning and decontamination operations on all equipment owned, rented or subcontracted by National Response Corporation. In the event National Response Corporation determines that equipment cannot be returned to the condition it was in at the commencement of the services, Customer shall pay for all costs at cost plus 20%, including freight and other expenses incurred by National Response Corporation to replace this equipment. All boom, whether new or used, that is damaged beyond repair shall be replaced by National Response Corporation with new boom at Customer's expense at cost plus 20%, including freight and other expenses.

MATERIALS AND SUPPLIES

	DESCRIPTION	UNIT	RATE

ATTACHMENT NO. 01 – CONTRACTOR EMPLOYEE SAFETY TRAINING DOCUMENT 65

INTRODUCTION

Contractors are required to comply with all applicable Federal, State and local safety, health, and environmental regulations including all site specific Kinder Morgan policies applicable to work scope. All Contractors must have and adhere to their own Health and Safety Plan. The guidelines presented in this document are not an exhaustive list of all applicable requirements and regulations for the Contractor to conduct work for Kinder Morgan. Instead, these guidelines highlight certain Kinder Morgan standards that may be applicable for the Contractor's scope of work for Kinder Morgan.

It is essential that these rules and safety responsibilities are understood before starting work on Kinder Morgan property and/or project. Violating safety standards could jeopardize the welfare of the Contractor and/or Kinder Morgan employees and could result in expulsion from Kinder Morgan property and/or project and deny the Contractor the opportunity to be considered for future Kinder Morgan work projects.

If these standards are not clearly understood, or if safety problems arise which are not covered by these standards, contact the company EHS representative before proceeding. This company representative will be designated at the pre-job meeting along with contact information.

All Contractors shall provide direct supervision of their employees. Contractors or subcontractors shall not be supervised by Kinder Morgan management or personnel.

All Contractors are required to have, and make available for Kinder Morgan's review, written compliance programs which address specific work related activities such as confined space entry and safe excavation plans. Providing written Health and Safety programs to Kinder Morgan does not constitute an express or implied approval of such programs by Kinder Morgan management.

Additional information specific to Contractor Safety may be accessed through the web site www.kindermorgan.com under "Work with KM". This web site allows access to the various forms available to achieve documentation requirements such as the Contractor Injury/Accident Report, etc.

1.0 DEFINITIONS

1.1 **ACCIDENT/INCIDENT INVESTIGATION**: An accident/incident investigation is an analysis of the factual information gathered by a thorough and conscientious examination of all factors involved. It is an objective evaluation of all facts, opinions, statements, and related information to determine the cause, as well as definite action steps to be taken to prevent reoccurrence.

1.2 **CARRIER ACCESS AGREEMENT**: A facility access agreement specifically developed for truck drivers and their employers (where applicable).

1.3 **CONFINED SPACE**: An area which has, by design, limited openings for entry and exit, unfavorable natural ventilation that could contain or produce dangerous levels of air contaminants, and which is not intended for continuous human occupancy.

1.3.1 Various recognized confined space areas on Kinder Morgan property fall under the OSHA definition of "Permit Required Confined Space". Kinder Morgan may choose to treat all confined space areas as "Permit Required Confined Spaces", depending on the type of work to be performed within the space.

1.4 **CONTRACTOR**: Any person contracted to perform short or long-term work for Kinder Morgan. With respect to this policy, references to "contractor" shall also include subcontractors and third party contractors, inspectors (e.g. customer contract personnel, and other contract personnel that may have an effect on facility safety).

1.5 **FIRE WATCH**: An individual who has been designated for monitoring the hot work site where open flames are present, where work on in-service equipment is being performed, or where sparks have the potential for landing on adjacent, in-service equipment. This individual is capable of evaluating unsafe conditions and who is capable of initiating emergency action in the event of a fire. Fire watch can have "no other assigned duties while conducting this task".

1.6 **HOT WORK**: Any work that involves the use of open flames or other sources of ignition.

1.7 **INSPECTORS/KINDER MORGAN REPRESENTATIVE**: Any person contracted or assigned to perform short or long-term work place inspections for Kinder Morgan. References to "inspector" in these guidelines shall also include company and third party contract inspectors.

1.8 **KINDER MORGAN PROPERTY**: Any Kinder Morgan Property and/or job site which may include terminals, facilities, stations, roads, parking lots, pipeline right-of-ways, common areas, compressor/pump station, offices, etc.

1.9 **WORK PERMIT**: A daily written authorization that describes the scope of the work to be completed, describes where and when the work is to be completed, special precautions, personal protective equipment required, and emergency information. To be valid, the permit must be signed by the designated permit issuer and it shall indicate the date and time of expiration.

2.0 GENERAL REQUIREMENTS

2.1 All contractors are required to participate in Kinder Morgan's Contractor Safety Evaluation Program. Each contractor will be required to complete a Standardized Contractor Questionnaire-Verified (SCQ-V) provided by ISN Software Corporation. The information shall be completed on ISN's online compliance database, ISNetworld. Based on safety performance and training, each contractor will be evaluated and placed on a "contractor" list if appropriate.

ISN Software Corporation

(214) 303-1303

www.isnetworld.com

2.2 Kinder Morgan will evaluate safety performance of contractors as the job progresses. At a minimum, this shall include periodic job site reviews.

2.3 Kinder Morgan has the right to review each contractor's safety data and supporting documentation submitted on the Standardized Contractor Questionnaire – Verified (SCQ-V).

2.4 Kinder Morgan reserves the right to request copies of all applicable procedures, plans and documentation specific to training, inspections, permitting and accident/injury reporting.

2.5 After the project is awarded, the contractor's employees must participate in the contractor employee orientation program consisting of the following elements:

2.5.1 Safety Orientation

2.5.1.1 Prior to beginning any work the Kinder Morgan Company job representative(s) and the General Contractor's representative(s) along with any applicable operations personnel and EHS staff shall conduct a pre-job meeting covering this contractor safety manual and any site specific procedures.

2.5.1.2 The contractor shall ensure all contractor employees and sub-contractors receive a safety orientation. This can be accomplished by viewing the "Contractor Safety Video" and reviewing all applicable requirements outlined in the contractor safety manual based on the scope of work, along with a review of any site specific procedures, emergency action plans and special circumstances associated with the project and/or site.

2.5.1.3 All Contractor employee orientations shall be documented with the content of the orientation on the Contractor Pre-Job Orientation Report CSM-003 (or equivalent form). Each Contractor employee shall sign the Contractor Employee Safety Summary Document (or equivalent form) to verify full

understanding of the covered topics. A copy of the completed form shall be provided to the Kinder Morgan job representative. Where applicable contractor employees shall be issued the current "contractor safety orientation" sticker for their hard hats.

2.5.1.4 The site specific orientation may include a review of procedures, restricted areas, security, hazards that contract personnel may encounter, warning signs, evacuation routes, other emergency procedures, rendezvous areas, emergency systems such as eye washes, safety showers, and contractor access ways and parking requirements.

2.5.1.5 All Contractor employees/visitors must sign in/out each time they enter/leave Kinder Morgan property.

2.6 Visitors shall not be granted entry without prior permission from Kinder Morgan site personnel.

2.7 All communication equipment used by Contractor's employees (radios, phones, computers, beepers) must be determined to be intrinsically safe where appropriate. No cell phones or pagers will be allowed in an area where a Hazardous Atmosphere may exist, unless a Hot Work Permit has been completed - no exceptions.

2.8 Pets are not allowed on Kinder Morgan property.

3.0 GENERAL INSURANCE REQUIREMENTS

3.1 All contractors shall have insurance that complies with Kinder Morgan Contract Administration Department and Procurement requirements. All changes in coverage of Contractor's insurance policies must be approved by the Kinder Morgan Corporate Contract Administrator.

4.0 ACCIDENT / INJURY REPORTING (29 CFR 1904)

4.1 The Contractors shall immediately report all accidents, spills, injuries, and near misses to the Kinder Morgan representative and the company EHS representative.

4.2 Contractors and inspectors are required to investigate and document all contractor incidents within 48hrs, use form CSM-OO1 or equivalent for proper documentation. This includes major property damage incidents, injuries, fires, and significant near misses. These reports shall be forwarded to the company EHS representative for review. Kinder Morgan may conduct investigations of any or all contractor incidents occurring on-site.

4.3 Contractors shall maintain a separate OSHA 300 log for their respective employees. Contractors may also be required to supply on a bi-weekly basis a safety and environmental performance report outlining any accidents, spills, injuries, and near misses that have occurred on the project.

4.4 The following are minimum first aid requirements for construction contract companies working at Kinder Morgan facilities:

4.4.1 First Aid Trained Personnel: Contractor shall have personnel trained and immediately available to provide first aid treatment at the job site. All trained personnel must possess a current (First Aid) certificate.

4.4.2 First Aid Kit: Each Contractor must supply each job site with a first aid kit appropriate for potential exposures and number of employees at the job site.

4.4.3 Emergency Procedures: Each Contractor must post a copy of the company's emergency medical procedures at the job site or have a copy immediately available, at all times, to each employee The procedure must include:

4.4.3.1 The name of the hospital or emergency care center where employees are to be transported for treatment of non life-threatening injuries.

4.4.3.2 Travel route to the hospital or emergency care center and emergency telephone numbers.

4.4.3.3 The statement "IN CASE OF SERIOUS INJURY CALL 911" (or a specified emergency number).

5.0 ASBESTOS (29 CFR 1926.1101 and1910.1001)

5.1 The likelihood of encountering asbestos-containing material while conducting maintenance on equipment in our facilities exists. It is the responsibility of the contractor to test for its existence prior to conducting work. All Contractors who perform any type of work where there is exposure to asbestos as well as maintenance or repair operations where there is exposure to asbestos shall comply with 29 CFR 1926.1101 & 1910.1001 as it relates to their particular scope of work. All Contractors are required to have a written Compliance Program that meets the minimum content requirements specified in 29 CFR 1926.1101 and 1910.1001. Training records and certificates shall be documented and maintained by the Contractor.

6.0 CONFINED SPACE ENTRY (29 CFR 1910.146)

6.1 All Contractors who perform any type of Confined Space Work, as it relates to their particular scope of work, shall comply with OSHA Standard 29 CFR 1910.146. All Contractors are required to have a written Confined Space Entry Program regardless of industry SIC designation (29 CFR 1910.146 (h)(9)(iii)). Contractor's written program must meet the minimum requirements of 29 CFR 1910.146(c)(4) and any applicable state and local Confined Space Entry regulations and requirements. Training records and certificates shall be documented and maintained by the Contractor.

7.0 CONTROL OF ALCOHOL, ILLEGAL DRUGS AND FIREARMS

7.1 The possession of firearms or other perceived dangerous weapons while on ANY Kinder Morgan property is strictly prohibited.

7.2 The use, sale, purchase, transfer, or possession of alcohol or any illegal drugs while on Kinder Morgan property is strictly prohibited.

7.3 Based on business unit or DOT requirements the Contractor and its subcontractors shall establish and maintain acceptable Anti-drug and Alcohol Misuse Programs. Acceptable means the Contractor has demonstrated to Kinder Morgan's satisfaction that the programs are conducted in accordance with the requirements of 49 CFR Parts 40 and 199. Such programs shall be reviewed and approved by National Compliance Management Systems (NCMS) before the Contractor or subcontractor is allowed to perform work that Kinder Morgan deems "Safety Sensitive". Positions that Kinder Morgan classifies as Safety Sensitive under 49 CFR Parts 40 and 199 must be included in an approved Anti-drug Plan and an Alcohol Misuse Plan.

7.4 If applicable National Compliance Management Systems (NCMS) shall evaluate the Contractor's drug/alcohol programs. Based on the above-mentioned drug testing requirements, if the contractor is required to have a drug/alcohol program. The plan shall be submitted to NCMS for evaluation and approval by Kinder Morgan.

National Compliance Management Systems

1-800-294-8758

www.nationalcompliance.com

8.0 ELECTRICAL SAFETY (29 CFR 1910 Subpart S and 1926 Subpart K)

8.1 Contractor shall be responsible for implementing all electrical safety requirements in accordance with 29 CFR 1910 Subpart S and 1926 Subpart K.

8.2 Prior to conducting operations near overhead power lines contractor shall contact the local utility company for specific requirements, and at a minimum, meet the following applicable guidelines:

- National Electric Safety Code - NESC
- National Association of Corrosion Engineers - NACE - Standard RP-01-77
- Occupational Safety and Health Administration - OSHA
- Federal, State, and Local requirements
- US D.O.T. Pipeline Safety Regulations - Parts 192 and 195 as applicable

8.3 Contractor shall identify all overhead power lines with signage where appropriate. When it is determined that electrical lines may be affected, the Contractor must take steps to elevate, cover, or otherwise protect such cables from incidental contact. The Contractor must advise his employees of the location of any power lines, the hazards involved, and the protective measures to be taken.

8.4 In work areas where the exact locations of the underground electrical power lines are unknown, the Contractor must locate and clearly identify all such lines prior to beginning excavation. Power cable systems within the work area must be de-energized during excavation whenever there is doubt about cable location.

8.5 The Contractor must protect his/her employees from electric shock while using power tools, appliances, and related equipment. Contractor must install ground fault interrupters on all power outlets that will be used during construction and maintenance.

9.0 EMERGENCY/EVACUATION PROCEDURES (29 CFR 1910.38, 1926.35)

9.1 The contractor and all of their personnel shall familiarize themselves with the KM site specific emergency action plan, including where assembly areas/evacuation areas are, that they are to be accounted for, and that they are to follow the direction of KM personnel in the event of fire or hazardous materials release or when otherwise directed by Kinder Morgan personnel:

9.1.1.1 Shut-off all equipment if doing so does not present a risk of bodily injury.

9.1.1.2 Evacuate the area. In the event of a fire or other emergency incident, contract employees are to immediately evacuate the area by the safest available route. Normally, evacuation routes shall be as specified by Kinder Morgan personnel.

9.1.1.3 Confirm all Contractor's employees are accounted for.

9.1.1.4 All Contractor employees shall remain at the rendezvous location until directed otherwise by Kinder Morgan.

9.2 If any Contractor employee suspects that an emergency condition exists, they shall immediately contact Kinder Morgan personnel or local authorities (e.g. call 911 or the particular emergency number in your area).

10.0 EXCAVATIONS/TRENCHING/SHORING (29 CFR 1926.650-.652, Subpart P)

10.1 All excavation (trenching/shoring) projects shall comply with the latest requirements as outlined in 29 CFR 1926 Subpart P. The contractor shall develop and have available for review a Site Specific Safe Excavation Plan based on the project scope. This plan will outline the contractors plan for excavation requirements, such as trenching, sloping and or shielding for the particular project.

10.2 The contractor's competent person shall conduct daily excavation inspections prior to anyone entering an excavation and this documentation shall be present at each excavation and retained in job files. Use form CSM-002 or equivalent to document these inspections.

10.3 See the facility or business unit's site specific procedures for any additional requirements.

11.0 FALL PROTECTION (29 CFR 1910.66 & 1926.500-.503)

11.1 Fall protection devices shall be used whenever fall hazards exist. Contractors are required to have a written Fall Protection Compliance Program that meets the minimum content requirements specified in 29 CFR 1910.66 App C & 1926.500-.503. Training records and certificates shall be documented and maintained by the Contractor.

11.2 The contractor shall provide a competent person to oversee fall protection and compliance.

11.3 Contractors shall provide a "rescue plan" wherever personal fall arrest equipment is employed.

12.0 FIRE PREVENTION AND PROTECTION (29 CFR 1910 Subpart L and 1926 Subpart F)

12.1 Contractors shall be required to provide fire prevention protection in accordance with the latest requirements outlined in 29 CFR 1910 Subpart L and 1926 Subpart F or any environmental regulatory requirements. Fire extinguishers shall be used only for the control of incipient stage fires.

12.2 Smoking is allowed only in designated areas. At some locations, there may be no designated areas. "Strike Anywhere" matches or uncovered and trigger-type lighters are not allowed within Kinder Morgan property.

13.0 HAZARD ASSESSMENTS - Task Analysis System

13.1 The contractor shall utilize a Task Analysis System daily, (e.g. Job Safety Analysis (JSA) to identify any Critical Tasks), based on the daily job scope and develop controls for any potential hazards. These controls shall be documented and utilized on a daily basis. The contractor shall communicate any controls required to the KM onsite representatives for review. In addition, the Contractor shall conduct pre-placement qualification checks for critical job tasks to ensure employees match up with the task requirements.

14.0 HAZARDOUS ENERGY CONTROL (LOCKOUT/TAGOUT) (29 CFR 1910.147 & 1926.417, & 1926.702)

14.1 Hazardous energy control procedures shall follow applicable guidelines as outlined in 29 CFR 1910.147. The Contractor's key individual responsible for Lockout/Tagout shall be identified to Kinder Morgan company personnel and/or KM Representative. All Lockout/Tagout must be coordinated with KM company personnel prior to the Contractor working in an area of hazardous or stored energy.

15.0 HOT WORK PERMITS (29 CFR 1910.252)

15.1 Hot Work Permit is required PRIOR to the start of any hot work and/or work that creates a source of ignition. Hot Work permits MUST be coordinated with Kinder Morgan management or designee prior to commencing any Hot Work. Contractors performing hot work shall be responsible for the safe execution of assigned tasks. If an unsafe condition (or potentially unsafe

condition) arises, work shall be stopped and the condition reported to Kinder Morgan management.

15.2 Work involving open flames or other sources of ignition on the exterior of tanks, pipelines, and other structures that contain flammable, combustible liquids, or any other hazardous atmosphere presents a wide variety of potential hazards. Adequate knowledge of the work to be performed is essential. Proper safeguards shall be established to guard against unsuspected changes in the situation that may alter the working conditions.

15.2.1 Hot work intended for "in-service" equipment shall follow procedures set forth for all hot work activities. Special precautions shall be identified in the hot work permit.

15.2.2 Persons welding and cutting shall be qualified in accordance with applicable codes and shall be thoroughly familiar with potential hazards of the operation and precautions necessary to ensure safety.

16.0 HYDROGEN SULFIDE (H2S)

16.1 All personnel working in an H2S environment shall have certificates to verify they have been properly trained and are proficient in the use of emergency air packs. All personnel working in an H2S environment shall be required to be clean-shaven in a manner consistent with accepted practices governing SCBA use with H2S gas.

17.0 IDENTIFICATION OF HAZARDOUS MATERIALS (29 CFR 1910.1200 & 1926.59)

17.1 Kinder Morgan shall inform the Contractor of known hazardous material(s) that may be present, how and where to locate material safety data sheets (MSDS) and any PPE requirements. Contractors are required to maintain copies of MSDS for any and all contractor-supplied materials requiring special handling on the job site. Each Contractor or sub-contactor is required to provide Kinder Morgan a copy of MSDS for all chemicals brought on site. Each Contractor or sub-contactor shall implement a Hazard Communication Program and document employee training.

17.2 All Contractor personnel who are likely to encounter or be exposed to hazardous materials as identified by DOT, shall be trained in hazardous material/waste handling per OSHA 1910.1200.

18.0 LEAD IN CONSTRUCTION (29 CFR 1926.62 and 1910.1025)

18.1 The likelihood of encountering lead while conducting maintenance on equipment in our facilities exists. It is the responsibility of the contractor to test for its existence prior to conducting work. All Contractors who perform any type of work where there is exposure to lead (excluding tetraethyl lead) as well as maintenance or repair operations where there is exposure to lead shall comply with 29 CFR 1926.62 and 1910.1025. Lead Exposure in Construction as it relates to their particular scope of work. All Contractors are required to have a written Compliance Program that meets the minimum content requirements specified in 29 CFR 1926.62 and 1910.1025. Training records and certificates shall be documented and maintained by the Contractor.

19.0 OPERATOR QUALIFICATION (OQ)

19.1 Contractors who perform Kinder Morgan defined covered tasks must be qualified to perform such tasks or be directly observed performing such covered tasks by a qualified individual. Workers or observers shall provide documentation of qualifications. (The contractor will supply this documentation from the ISNetworld database)

19.2 Contractor programs to train and qualify their employees to perform covered tasks must be reviewed and approved by Kinder Morgan's Operator Qualification Administrator prior to performing contracted covered tasks.

19.3 Contractors must supply a daily roster of qualified covered task workers to a Kinder Morgan representative unless the roster of covered task workers does not change from day to day during the project.

20.0 PERMIT TO BEGIN WORK

20.1 The Contractor is responsible for obtaining all appropriate agency required permits and or other notifications PRIOR to the start of work, unless otherwise obtained by Kinder Morgan. This includes "One Call" or excavation notices within required timelines.

20.2 Where applicable Kinder Morgan may require the Contractor to obtain general or safe work permits, on a daily basis, from facility management or a Kinder Morgan representative PRIOR to the start of work. The permits shall identify work to be completed, additional permits that may be required, potential hazards, and safety measures to be followed. Additional permits that may be required are discussed in the following two sections.

21.0 PERSONAL PROTECTIVE EQUIPMENT (29 CFR 1910 Subpart I)

21.1 Hazard Assessment - Proper Personal Protective Equipment (PPE) shall be determined by one of two methods:

21.1.1 The Contractor shall conduct a daily Job Safety Analysis (JSA), of the current work assignment area and confirm the existence of safe working conditions for its employees. The Contractor shall provide and insure proper use of personal protective equipment to its employees PRIOR to beginning work as required. The daily JSA, shall determine the minimum applicable PPE requirements and then those requirements shall be documented. The Contractor shall provide and insure proper use of personal protective equipment to its employees PRIOR to beginning work as required.

21.2 All personal protective equipment shall comply with the applicable standards specified for that equipment.

21.3 Kinder Morgan shall not supply any Personal Protective Equipment.

21.4 PPE Equipment includes but is not limited to:

21.4.1 Eye and Face Protection (29 CFR 1910.133 & 1926.102). Eye protection equipment shall comply with the latest revision of ANSI Z87.1.

21.4.2 Head Protection (29 CFR 1910.135 & 1926.100) – (HARDHATS). Head protection shall comply with the latest revision of ANSI Z89.1

21.4.3 Foot Protection (29 CFR 1910.136 & 1926.96). Foot protection shall comply with the latest revision of ANSI Z41. Open-toe footwear is prohibited

21.4.4 Hearing Protection (29 CFR 1910.95 & 1926.52). Hearing protection shall be worn in areas that have been identified or where there is a potential for exposure to high sound levels (in excess of 85 dB).

21.4.5 Hand Protection (29 CFR 1910.138). Gloves must be worn where appropriate for the performance of the work.

22.0 PROCESS SAFETY MANAGEMENT (PSM) (29 CFR 1910.119 & 1926.450-454)

22.1 Contractors who perform work in a facility that is under the jurisdiction of OSHA 29 CFR 1910.119, Process Safety Management, shall comply with all applicable requirements of 1910.119 in addition to the general requirements that may be specified by the scope of work.

23.0 RESPIRATORY PROTECTION (29 CFR 1910.134 & 1926.103)

23.1 Where applicable, all Contractors must follow an approved written program relating to respirator use during work activities. The Contractor's written respiratory protection program, training records and certificates, medical clearance to use respiratory protective equipment, and fit test records shall be documented and maintained by the Contractor.

24.0 RADIATION PRODUCING EQUIPMENT

24.1 Radiation Producing Equipment: Only properly trained, qualified personnel shall be allowed to use radiation producing equipment or materials at Kinder Morgan facilities. The Contractor shall maintain records of all training and qualifications.

24.2 When radiographic equipment is used, the Contractor shall ensure that the area is clear and that all personnel are at a safe distance from the radiation source. Radiation warning devices and signs containing the internationally recognized symbol for radiation must be placed around the perimeter of any area which may be affected by radiation. The contractor shall be in compliance with all State and Federal safety regulations dealing with radioactive materials. Only properly trained and qualified persons shall be allowed entrance to these restricted areas.

25.0 SCAFFOLDS AND LADDERS (29 CFR Part 1926 subpart L and 1910 Subpart D)

25.1 Scaffolds and ladders shall be installed and used in accordance with the latest requirements outlined under OSHA 29 CFR Part 1926 subpart L and 1910 Subpart D.

25.2 The contractor shall provide a competent person to oversee scaffold erection and use.

26.0 SECURITY REQUIREMENTS (FACILITY & CONTRACTOR)

(b) (7)(F), (b) (3)

[redacted]

(b) (7)(F), (b) (3)

[redacted]

28.0 SPILL PREVENTION, CONTROL & COUNTERMEASURES PLAN (SPCC)

28.1 All contractors who meet the requirements for needing an SPCC plan such to address any applicable "oil" spills that may develop during the course of a construction project.

28.2 Spills resulting from routine Contractor activity shall be reported to Kinder Morgan immediately and clean-up in accordance with state and federal regulations. Including, but not limited to reporting release to appropriate agencies. Report all environmental incidents to a Kinder Morgan representative and the company EHS representative. Contractors and inspectors are required to investigate and document all contractor incidents within 48hrs, use form CSM-OO1 or equivalent for proper documentation. These types of spills include, but are not limited to:

28.2.1 Small quantities of hydraulic fluid, motor oil, and fuel spilled during equipment refueling operations.

28.2.2 For spills of large quantities of petroleum product, chemicals, or other hazardous materials release, see Identification of Hazardous Materials, Section 17.

29.0 TRAINING REQUIREMENTS

29.1 The Contractor is obligated to perform the requisite safety training of its personnel relative to the scope of the subject work activities. Training and documentation for the proper use and care of applicable safety equipment shall be provided by the Contractor.

29.2 Training shall be documented by the Contractor for each employee involved in the subject work activities. The documentation shall include each training topics discussed, content, attendees, dates, and the name(s) of instructors or persons presiding and date training was completed.

29.3 The Contractor shall conduct safety meetings to instruct their personnel in the recognition and avoidance of hazards in the work place.

29.4 Safety meetings shall be conducted at a frequency appropriate, in light of the safety characteristics of the assignment, but no less than once per week. Safety meetings shall focus on the quality and not the quantity of daily and weekly safety meetings to ensure all contract employees understand the subjects discussed during this meeting. Kinder Morgan Inspectors should sit in during these meetings to evaluate their value and improve communications.

30.0 VEHICLE/MOBILE EQUIPMENT POLICY (29 CFR 1926.600, 1926.601 & 1926.20)

30.1 Permission is required for vehicular entry into all Kinder Morgan facilities. Special permission above and beyond the previous requirement is needed for vehicles to enter restricted areas such as dike areas.

30.2 All persons shall be transported to the job site in a safe manner. Each passenger shall have adequate seating. Standing up in a moving vehicle is strictly prohibited. Riding in the back of a pick-up or similar truck that has not been equipped with adequate seating and riding as passenger on a forklift is also prohibited.

30.3 All posted speed limits and traffic regulating signs shall be observed. Persons shall only drive on designated roads or rights of way.

30.4 Reckless driving and horseplay are prohibited.

30.5 Only properly trained, qualified personnel shall be permitted to operate equipment or machinery. The Contractor shall keep records of training and qualifications on file. Contractors are prohibited from operating Kinder Morgan owned equipment or machinery, except under specific written authorization by Kinder Morgan management.

30.6 When operating vehicles and equipment, whether on or off-road, proper PPE and safety equipment shall be used (such as helmets for off-road vehicles). The Contractor shall be responsible for providing such PPE and safety equipment.

30.7 All cranes shall meet applicable Federal, State and local requirements.

30.8 Mobile hydraulic and boom cranes shall meet Federal, State and local requirements.

30.9 Forklifts and Forklift operators must follow all applicable OSHA 29 CFR 1917.43 and 1910.178 requirements for the safe operations of the forklift.

31.0 WATER/DOCK OPERATIONS (29 CFR 1917 & 1918)

31.1 Contractors who perform work on marine docks or who are at risk of falling into water must be protected from the fall or shall use USCG-approved, personal floatation devices.

32.0 WORK CLOTHING

32.1 Normal Work Attire: Sleeved shirts and long pants are required at all times. Sleeveless shirts, tank top-type shirts, or shirtless attire are not allowed. Where hazards exist due to moving parts on machinery or equipment, clothing shall be maintained to avoid entanglement.

32.2 Special Work Clothing: Appropriate work clothing shall be worn where exposure to fire, extreme heat or cold, corrosive chemicals, body impacts, cuts from handled materials or other specialized hazards are possible. See the facility or business unit's site specific procedures for any additional requirements.

33.0 WORKSITE SAFETY (29 CFR 1910.22)Error! Bookmark not defined.

33.1 It is the responsibility of each Contractor to inspect each work area at the beginning of each shift and periodically thereafter to ensure safe working conditions exist. Contractor must inform each of its affected employees of any concealed dangers or changes in work conditions and must comply with all applicable regulations.

33.2 The Contractor shall provide illumination bright enough for work to proceed without risking personal injury or affecting the quality of work. Where hazardous atmospheres may be present, the Contractor shall use intrinsically safe equipment (lighting, communications, and computers) where appropriate.

33.3 All tools shall be used, maintained and inspected in accordance with the latest requirements as outlined in OSHA 29 CFR 1926 Subpart I.

33.4 The Contractor shall clean their work areas following the end of each work shift. Debris shall be placed in appropriate containers and properly disposed. All tools and equipment remaining at the job site shall be properly stored.

33.5 The Contractor shall provide, on a daily basis, an adequate supply of fresh drinking water for its employees. Portable rest room facilities may be required to be provided and maintained by the Contractor.

33.6 Right-Of-Way/Road-Side Work

33.6.1 The Contractor must follow an approved written plan relating to vehicular traffic control during road side work activities. This plan will be in compliance with 29 C.F.R. 1926.201(a) and 29 C.F.R. § 1926.202. This plan will be available on site for review by a KM Representative.

33.6.2 Employees working in a public road right-of-way or otherwise exposed to vehicular traffic, shall be provided and instructed to wear warning vests marked with or made of reflective or highly visible material.

33.6.3 Barricades, cones, flashers and warning signs shall be placed at strategic locations when working on or near roads and other areas where vehicular traffic may be a hazard. Signs and flashers must meet the requirements of applicable local and state traffic authorities.

ATTACHMENT NO. 01 – CONTRACTOR EMPLOYEE SAFETY TRAINING DOCUMENT

I have received instruction from my company regarding the Kinder Morgan Contractor Safety Program requirements. I shall conduct myself in a safe manner at all times while on Kinder Morgan property and shall comply with the Kinder Morgan Contractor Safety Manual/Site-specific rules. I understand and agree to comply with all requirements of this program.

Agreement Number: 05-ER-45-064-ORG

EXHIBIT H – PARENT GUARANTY

National Response Corporation
3500 Sunrise Highway
Great River, New York 11739

Gentlemen:

To induce National Response Corporation ("NRC") to enter into that certain Agreement for Professional Emergency Environmental Response Services between you and Kinder Morgan Operating L.P. "D" dated as of June 1, 2005 (the "Agreement"), the undersigned ("Guarantor") hereby unconditionally guarantees the punctual payment when due of (i) all obligations of Kinder Morgan Operating L.P. "D" and any of its affiliates and subsidiaries executing work directive(s) under the Agreement (Kinder Morgan Operating L.P. "D" and such affiliates and subsidiaries collectively and individually being referred to herein as "Kinder Morgan") to NRC now or hereafter existing from time to time in respect of Work (as defined in the Agreement) performed pursuant to the Agreement (the "Obligations"), as limited below; (ii) interest, if any, on such Obligations; and (iii) any and all reasonable expenses incurred by NRC in enforcing its rights under this Guaranty (including reasonable attorneys' fees and disbursements, court costs, and reasonable collection charges); provided, however, such fees and expenses shall be payable by Guarantor only to the extent that NRC is successful in enforcing payment of the Obligations pursuant to this Guaranty. This Guaranty is a guaranty of payment, and not of collection.

The liability of the undersigned under this Guaranty shall be unconditional irrespective of any and all circumstances which might otherwise constitute a defense available to, or a discharge of, Kinder Morgan or a guarantor, including without limitation (i) any lack of enforceability of any Obligation, (ii) any change of the time, manner, or place of payment, or any other term of any Obligation, (iii) any exchange, release or non-perfection of any collateral securing payment of any Obligation, (iv) any law, regulation or order of any jurisdiction affecting any term of any Obligation or your rights with respect thereto, and (v) any defense to liability under this Guaranty by virtue of any insolvency, bankruptcy, disability or lack of corporate power of Kinder Morgan or Guarantor, or lack of due authorization or execution by Guarantor.

The undersigned waives promptness, diligence, and notices with respect to any Obligation, notice of acceptance of this Guaranty, notice of obligations incurred under the Agreement and any action taken with regard thereto, and waives presentment, demand for payment, protest, notice of dishonor or non-payment of the Obligations, suit, or the taking of and failing to take other action by NRC against Kinder Morgan, Guarantor or others and any requirement that you exhaust any right or take any action against Kinder Morgan.

THIS GUARANTY SHALL BE GOVERNED AND CONSTRUED IN ACCORDANCE WITH THE LAWS OF THE STATE OF TEXAS (WITHOUT REGARD TO TEXAS STATUTES OR PRINCIPLES RELATING TO CONFLICTS OF LAWS) AND IS INTENDED TO BE PERFORMED IN ACCORDANCE WITH AND TO THE EXTENT PERMITTED BY SUCH LAWS.

This is a continuing guaranty and shall remain in full force and effect until the earlier of (i) December 31, 2008; or (ii) thirty (30) days after written notice is received by you from the undersigned that this Guaranty has been revoked, but (a) any notice shall not release the undersigned from any liability as to any Obligation existing at the time of receipt of such notice, and (b) if at the time that this Guaranty would expire or terminate by its terms, there is an open Work Directive in progress pursuant to the Agreement, then this Guaranty shall be automatically extended for ninety (90) days.

The liability of the undersigned under this Guaranty with respect to the aggregate principal amount of Obligations shall not exceed the lesser of the principal amount of Obligations outstanding from time to time or **US$8,000,000.00.**

Guarantor shall have no right to assert, enforce otherwise exercise any right of subrogation to any of the rights, security interests, claims or liens which NRC has in respect of the Obligations of Kinder Morgan Operating L.P. "D"

("KMOLPD") or any of its affiliates or subsidiaries executing a work directive(s) under the Agreement ("Qualifying Subsidiary"), as the case may be, until such time as all Obligations of KMOLPD or the Qualifying Subsidiary, as applicable, to NRC have been finally discharged and the payment thereof is not subject to being reimbursed by NRC.

If any provision of this Guaranty or the application thereof to any person or circumstances shall for any reason and to any extent be invalid or unenforceable, neither the remainder of this Guaranty nor the application of such provision to other person(s) or circumstances shall be affected thereby, but shall be enforced to the extent permitted by applicable law.

This Guaranty shall inure to the benefit of NRC and shall not be assignable without the express written consent of the undersigned, and can be modified only by a written instrument signed by Guarantor and NRC.

Guarantor hereby represents and warrants to NRC that:

a) The Guarantor is a partnership organized under the laws of the State of Delaware and has full power and authority to make and deliver this Guaranty,

b) The signing and delivery by the Delegate of the General Partner of the Guarantor and performance of this Guaranty by the Guarantor have been duly authorized by all necessary company or partnership action, as applicable, and do not violate the provisions of, or constitute a default under, any presently applicable law or Guarantor's partnership agreement or any agreement presently bind on it, and

c) This Guaranty has been duly signed and delivered by the authorized representative of the Guarantor and constitutes its lawful, binding and legally enforceable obligation, subject to applicable bankruptcy, reorganization, insolvency, moratorium, and other similar laws affecting creditors' rights and general principles of equity.

This Guaranty is the entire and only agreement between Guarantor and NRC with respect to the guaranty of the Obligations of Kinder Morgan by Guarantor. All representations, warranties, agreements, or undertakings heretofore or contemporaneously made, which are not set forth herein, are superseded hereby.

Work Directive No.: 477391-15-STAT

Agreement No.: 25286

Requisition No/ Accounting Information: 270505

This Work Directive is entered pursuant to the terms of the Emergency Response Services Agreement ("Agreement") dated 01/01/2011, by and between KINDER MORGAN ENERGY PARTNERS, L.P. ("COMPANY") and PATRIOT ENVIRONMENTAL SVCS INC ("CONSULTANT"). By its execution hereof, CONSULTANT agrees to perform for the Kinder Morgan ("KM") entity named below and executing this Work Directive pursuant to the terms, conditions and provisions of the Agreement, the following described Work which will additionally describe "Covered Tasks" as provided for under DOT Operator Qualification Requirements, and shall furnish all services, labor, supervision, technical capability, tools, equipment, vehicles, vessels, barges, transportation, materials, (except as set forth below), and other facilities and items necessary or convenient to complete the following work as further described and specified in the Specifications and/or Drawing(s) attached hereto or the Agreement and by this reference made a part of this Work Directive ("the Work"). If CONSULTANT'S proposal, quotation, or any other CONSULTANT document supplied to the KM entity named below is included as part of this Work Directive or another exhibit to the Agreement, then any terms or conditions provided by CONSULTANT which differ from or conflict with COMPANY'S terms and conditions are hereby rejected and shall be of no force or effect. The KM entity named below in this Work Directive shall be solely responsible for the liabilities and obligations set forth in the Agreement under which this Work Directive is being issued and this Work Directive arising out of or related to the Work to be performed pursuant hereto. All such liabilities and obligations, as they apply to this Work Directive, shall be non-recourse to the COMPANY (if the COMPANY is not the KM Entity executing this Work Directive) and all other related entities as further provided for and agreed in the Agreement. Payments made to CONSULTANT under this Work Directive shall include all taxes and similar charges except as otherwise agreed to herein or under the terms of the Agreement. Any capitalized term used in this Work Directive and not otherwise defined herein shall have the meaning as ascribed in the Agreement.

1.0 **Project Name and Work Location Details:** OSRO SERVICES / Barstow Terminal

2.0 **Scope of Work:** The following is a full and complete description of the Work (and goods) to be provided by CONSULTANT including, but not limited to specifications, conditions and referenced bids/proposals.

2.1 See EXHIBIT WD_A – SCOPE OF WORK

2.2 For Questions, contact ROSE, TINA at 909-873-5106

3.0 The COMPANY will not furnish any materials to the Work Site(s), unless previously approved by the Designated Representative.

4.0 CONSULTANT shall commence the Work by the 08/01/2013 and shall complete the Work on or before 07/31/2014.

5.0 CONSULTANT offers to complete the Work in accordance with the Agreement for the total Lump Sum Amount of **$9,000.00**, Nine Thousand Dollars and Zero Cents, which shall constitute full and complete payment.

6.0 The parties hereby agree to AMEND Agreement 25286 as follows (or if the Agreement has been thus amended previously, to repeat the following sections):

i) Under the Compliance with Laws section, a **new subsection** is hereby added to the Agreement which reads as follows:

CONSULTANT certifies that at the time of execution of this Agreement CONSULTANT is not included on any debarment list maintained by any federal, state or local governmental authority nor prevented from performing Work for COMPANY by virtue of any governmental order, proceeding or otherwise. If at any time during the term of this Agreement CONSULTANT cannot so certify to COMPANY, CONSULTANT shall promptly notify COMPANY as to CONSULTANT'S status.

ii) The following language is hereby added to the Termination section under the termination for default paragraphs:

-- violates any EHS law; or

iii) All other provisions of the Agreement shall continue in full force and effect.

7.0 **Retainage:** Waive 10% retainage.

8.0 CONSULTANT shall submit invoices in duplicate to:

CALNEV PIPE LINE LLC

2319 S Riverside Ave

Bloomington, CA 92316

Attn: ROSE, TINA
Phone: 909-873-5106
Fax: 909-877-9036

8.1 Invoices must clearly indicate the Agreement Number, Work Directive Number, as indicated above.

8.2 For Construction Projects, a Certificate of Final Completion must be completed, signed by an authorized representative, notarized, and attached to CONSULTANT'S final invoice.

9.0 CONSULTANT hereby certifies that it has downloaded, reviewed and understood the Kinder Morgan Contractor Safety Manual and shall, prior to the commencement of any Work hereunder, make the same available to its employees and subcontractors who will be performing work on premises owned and/or operated by the KM entity named below. If the English language is a communication barrier, CONSULTANT at its expense shall timely convert/translate the Kinder Morgan Contractor Safety Manual accurately into the appropriate language for its employees and subcontractors. Questions concerning the Manual should be directed to the Kinder Morgan Contractor Safety Indemnitees at: contractor_safety@kindermorgan.com prior to commencement of any Work.

10.0 Facsimile Signatures/Counterparts. This Work Directive may be executed in multiple original counterparts, each of which shall be deemed an original, and together they shall constitute one and the same agreement. Signature of this Work Directive may be effected by facsimile (with confirmation by transmitting machine) and/or transmitted by portable document format ("pdf") file which shall be treated as an original signature, and any such signature, facsimile, pdf file or copy of this signed Work Directive shall be construed and treated as the original and shall be binding as if it were the original.

11.0 For Work performed within the State of California, CONSULTANT shall certify within three working days of execution hereof that the requirements set forth in Exhibit B to this Work Directive have been satisfied. Failure by CONSULTANT to do so shall constitute a breach under Section 10 [for cause with no notice] of the Agreement.

In the **Agreement**, if there is a reference to "Kinder Morgan Kansas, Inc.," it shall now be deemed a reference to Kinder Morgan, Inc., a Delaware corporation. This change resulted from an internal corporate reorganization. Kinder Morgan, Inc. owns the same assets formerly owned by Kinder Morgan Kansas, Inc.

By signing below, COMPANY and CONSULTANT affirm that the individual signing below has the requisite authority to authorize the commitment described herein, and that this Work Directive No. 477391-15-STAT is by reference hereby made part of Agreement No. 25286 .

This Work Directive is hereby agreed to and accepted:

The following Exhibits shall be provided by COMPANY:

X	Exhibit WD_A	- Scope of Work
X	Exhibit WD_B	- Revised Release Reporting Criteria (California only)
___	Exhibit WD_C	- Work Directive Specific Schedule of Values/Rates
___	Exhibit WD_D	- Operator Qualification Form (as provided by the Designated Representative via electronic or hardcopy submission)

EXHIBIT WD_A – SCOPE OF WORK

Contractor will provide Calnev Pipe Line, LLC (Barstow Terimnal located at 34277 Daggett/Yermo Road, Barstow, California) with 24/7 Emergency Response capabilities under Section 3.3 to Appendix E of 40 DFR 112 for EPA Jurisdictional Facility's and Section Appendix E of 40CFR 112 for EPA Jurisdictional Facility's and Section 3 to Appendix C of 33CFR 154 for USCG Regulated Facility's This includes but is not limited to one thousand feet of containment boom, and a means of deploying it within one (1) hour of the discovery of a discharge.

Contractor will provide response equipment and manpower resources in accordance with the National Preparedness for Response Exercise Program (PREP) Guidelines. Specific reference for USCG regulated facilities is located on pages 3-18 and 3-19 of the August 2002 PREP Guideline. Specific reference for EPA regulated facilities is located on pages 4-9 and 4-10 of the August 2002 PREP Guideline. These requirements include, but are not limited to, an annual equipment deployment exercise in the operating environment of the Area of the Facility, a comprehensive OSRO personnel training program, and a maintenance program to ensure that the equipment is periodically inspected and maintained in good operating condition. The satisfactory completion of these PREP requirements must be documented and submitted annually to Kinder Morgan to Mr. Edward (Buzz) Fant, Director – Compliance/ Emergency Response Programs, c/o Kinder Morgan Energy Partners, L.P., 1001 Louisiana St, Suite 1000, Houston, TX 77002 or fante@kindermorgan.com.

EXHIBIT WD_B – REVISED RELEASE REPORTING CRITERIA

1.0 CONSULTANT shall ensure that its employees, agents, and subcontractors' employees engaged in CONSULTANT'S activities in the performance of the Work:

1.1 are notified, and when required, as determined by COMPANY, trained and instructed by COMPANY, either directly or through a train-the-trainer program instituted by COMPANY, concerning the order of actions to be taken upon discovery of a release or threatened release condition of a Hazardous Material or pollutant substance; and

1.2 understand that no Work or visit shall be undertaken to any COMPANY right-of-way or facility where there is no COMPANY representative onsite and readily accessible (a "Non-Company Onsite Situation"), unless the training referred to in (i) above has occurred for CONSULTANT'S employees, agents and subcontractors' employees who will be performing at such a site.

1.3 Will be working in a COMPANY Onsite Situation and MUST ensure that its employees, agents and subcontractors' employees have been notified accordingly, and if deemed necessary by COMPANY, CONSULTANT will assure that prior to performing any Work CONSULTANT'S employees, agents and subcontractors' employees will be trained relative to COMPANY'S revised release reporting criteria.

1.4 For purposes of this Exhibit "Hazardous Material(s)" shall mean and include (a) all elements or compounds that are contained in the list of hazardous substances adopted by the United States Environmental Protection Agency and the list of toxic pollutants designated by Congress or the Environmental Protection Agency or under any EHS Laws; and (b) any "hazardous waste," "hazardous substance" (including, but not limited to, petroleum and petroleum-related materials), "toxic substance," regulated substance," "pollutant" or "contaminant", each as defined under any EHS Law. "EHS Laws" shall mean any and all federal, state, and local laws, regulations and requirements pertaining to health, safety, or the environment.

CONSULTANT shall certify its compliance with this training requirement upon COMPANY request.

Acknowledged, agreed and accepted this 18 day of September, 20 13

Work Directive Origin: 1100 Town & Country Road, Orange, CA 92868

This Work Directive is entered pursuant to the terms of the EMERGENCY RESPONSE SERVICES Agreement ("Agreement") dated January 1, 2011, by and between KINDER MORGAN ENERGY PARTNERS, L.P. ("COMPANY") and PATRIOT ENVIRONMENTAL SVCS INC ("CONTRACTOR"). By its execution hereof, Contractor agrees to perform for the KM entity named below and executing this Work Directive pursuant to the terms, conditions and provisions of the Agreement, the following described Work, which will additionally describe "Covered Tasks" as provided for under DOT Operator Qualification Requirements, and shall furnish all services, labor, supervision, technical capability, tools, equipment, transportation, materials, (except as set forth below), and other facilities and items necessary or convenient to complete the following work as further described and specified in the Specifications and/or Drawing(s) attached hereto or the Agreement and by this reference made a part of this Work Directive ("the Work"). If Contractor's proposal, quotation, or any other Contractor document supplied to the KM entity named below is included as part of this Work Directive or another exhibit to the Agreement, then any terms or conditions provided by Contractor which differ from or conflict with Company's terms and conditions are hereby rejected and shall be of no force or effect. The KM entity named below in this Work Directive shall be solely responsible for the liabilities and obligations set forth in the Agreement under which this Work Directive is being issued, as the same apply to the Work to be performed pursuant hereto. All such liabilities and obligations, as they apply to this Work Directive, shall be non-recourse to the Company (if the COMPANY is not the KM Entity executing this Work Directive) and other related entities as further provided for and agreed in the Agreement. Payments made to Contractor under this Work Directive shall include all taxes and similar charges except as otherwise agreed to herein or under the terms of the Agreement. Any capitalized term used in this Work Directive and not otherwise defined herein shall have the meaning as ascribed in the Agreement.

1. Project Name:	PROVIDE OSRO RESPONSE FOR COLTON SOUTH TERMINAL	Location:	COLTON SOUTH TERMINAL
Description of Work:	PROVIDE OSRO RESPONSE FOR COLTON SOUTH TERMINAL PER BELOW For Questions, contact Mark Sandon at 714-560-4867		

2. The COMPANY shall furnish the following materials to the work site(s):	None, unless previously approved by the KM Entity's authorized representative.
3. The Work shall be performed at the following location:	Location where work will be performed, if different from Project Location indicated above.

4. CONTRACTOR shall commence the Work by August 1, 2011, and shall complete the Work on or before July 31, 2012.

5. CONTRACTOR offers to complete the Work in accordance with the Agreement for the following consideration, which shall constitute full and complete payment therefore:

(a) ☐ the total Lump Sum Amount	Fixed Price Of
(b) ☒ the total Time & Materials Amount	Not To Exceed $9,000.00 with rates specified in the Schedule of Values (Exhibit B to the Agreement)

(c) ☐ in accordance with the Schedule of Values (Exhibit _____ to the Agreement) or

(d) ☐ For this Work Directive only, the schedule of values/rate sheet dated _____, 20XX, attached hereto as Exhibit ___, shall supersede the Schedule of Values in the Agreement. All other terms and conditions of Agreement and its prior amendments will remain unchanged and in force.

SELECT WAIVER ACCORDING TO PROJECT'S TOTAL DOLLAR VALUE

☒ Waive 10% Retainage Fee; or ☐ Do not Waive 10% Retainage Fee

6. Contractor shall submit invoices in duplicate to:	SFPP, L.P. Mark Sandon 2319 S Riverside Ave Bloomington, CA 92316 Attn.: Mark Sandon Phone: 714-560-4867 Fax: 714-560-6601 **Invoices must clearly indicate the Agreement Number, Work Directive Number, and Work Order/ Account Coding, as indicated above.** For Construction Projects, a Certificate of Final Acceptance must be completed, signed by an authorized representative, notarized, and attached to CONTRACTOR'S final invoice.

7. CONTRACTOR hereby certifies that it has downloaded, reviewed and understood the Kinder Morgan Contractor Safety Manual and shall, prior to the commencement of any Work hereunder, make the same available to its employees and subcontractors who will be performing work on premises owned and/or operated by the Kinder Morgan entity named below. If the English language is a communication barrier, CONTRACTOR at its expense shall timely convert/translate the Kinder Morgan Contractor Safety Manual accurately into the appropriate language for its employees and subcontractors. Questions concerning the Manual should be directed to the Kinder Morgan Contractor Safety Group at: contractor_safety@kindermorgan.com prior to commencement of any Work.

8. Facsimile Signatures/Counterparts

This Work Directive may be executed in multiple original counterparts, each of which shall be deemed an original, and together they shall constitute one and the same agreement. Signature of this Work Directive may be effected by facsimile (with confirmation by transmitting machine) and/or transmitted by portable document format ("pdf") file which shall be treated as an original signature, and any such signature, facsimile, pdf file or copy of this signed Work Directive shall be construed and treated as the original and shall be binding as if it were the original.

In the Agreement, if there is a reference to "Kinder Morgan, Inc.," it shall now be deemed a reference to Kinder Morgan Kansas, Inc. This is not a change of entity, but merely a change of name only.

By signing below, KM Entity and CONTRACTOR affirm that the individual signing below has the requisite authority to authorize the commitment described herein, and that this Work Directive No. 477391-4-STAT is by reference hereby made part of Agreement No. 25286.

For Work performed within the state of California, the attached Exhibit B must be acknowledged and signed.

This Work Directive is hereby agreed to and accepted this September 8, 2011.

EXHIBIT WD_A – SCOPE OF WORK

SCOPE OF WORK OR SERVICES to be performed or provided by CONSULTANT:

Provide all trained personnel, labor, tools, and equipment necessary to provide Oil Spill Removal Organization (OSRO) services to meet the Federal OPA '90 requirements for contracted oil spill removal services for the Colton South Terminal located at 2359 S. Riverside Avenue, Bloomington, CA 92316 as follows:

- Sufficient Response Resources to enable the COMPANY to meet the requirements of OPA '90 for pre-contracted Response Resources at the commencement of the Agreement including:
  - Responding with 1,000 feet of containment boom and a means to deploy it or other appropriate equipment and materials, as identified in the Tactical Response Plans presented in Volume 2, Section 8.4, within one (1) hour of notification*;
  - Oil recovery devices with an effective daily recovery capability (EDRC) equal to the amount of oil discharged in a small discharge (2,100 gallons) and temporary storage capacity equal to two (2) times the EDRC within two (2) hours of notification*;
  - Documentation of equipment deployment exercises and personnel training must be submitted annually to Mr. Chuck Mathis, Manager Emergency Response Programs, c/o Kinder Morgan Energy Partners, L.P., 500 Dallas Street, Suite 1000, Houston, TX 77002, or charles_mathis@kindermorgan.com ;
  - Compliance by the CONSULTANT and CONSULTANT's subcontractors with all applicable Federal Occupational Safety and Health Administration (OSHA) standards and similar applicable State laws, rules and/or standards.

* Travel times are based on suitable safety conditions and travel time capability per the U.S. Coast Guard minimum response time calculation factor of 35 mph overland or five (5) knots on water.

Regulatory References: 29 CFR 1910.120 (OSHA); 40 CFR 112 Appendix E 3.3 (U.S. EPA)

EXHIBIT WD_B – Revised Release Reporting Criteria

CONTRACTOR shall ensure that its employees, agents, and subcontractors' employees engaged in CONTRACTOR'S activities in the performance of the Work:

(i) are notified, and when required, as determined by COMPANY, trained and instructed by COMPANY, either directly or through a train-the-trainer program instituted by COMPANY, concerning the order of actions to be taken upon discovery of a release or threatened release condition of a Hazardous Material or pollutant substance; and

(ii) understand that no Work or visit shall be undertaken to any COMPANY right-of-way or facility where there is no COMPANY representative onsite and readily accessible (a "Non-COMPANY Onsite Situation"), unless the training referred to in (i) above has occurred for CONTRACTOR'S employees, agents and subcontractors' employees who will be performing at such a site.

For purposes of this Exhibit A "Hazardous Material" shall mean and include (a) all elements or compounds that are contained in the list of hazardous substances adopted by the United States Environmental Protection Agency and the list of toxic pollutants designated by Congress or the Environmental Protection Agency or under any EHS Laws; and (b) any "hazardous waste," "hazardous substance" (including, but not limited to, petroleum and petroleum-related materials), "toxic substance," regulated substance," "pollutant" or "contaminant", each as defined under any EHS Law. "EHS Laws" shall mean any and all federal, state, and local laws, regulations and requirements pertaining to health, safety, or the environment.

COMPANY has determined that CONTRACTOR:

☐ Will be working in a Non-COMPANY Onsite Situation and MUST complete the training

☒ Will be working in a COMPANY Onsite Situation and MUST ensure that its employees, agents and subcontractors' employees have been notified accordingly, and if deemed necessary by COMPANY, CONTRACTOR will assure that prior to performing any Work CONTRACTOR'S employees, agents and subcontractors' employees will be trained relative to COMPANY'S revised release reporting criteria.

CONTRACTOR shall certify its compliance with this training requirement upon COMPANY request.

Acknowledged, agreed and accepted this 13 day of September 2011

7. CONSULTANT hereby certifies that it has downloaded, reviewed and understood the Kinder Morgan Consultant Safety Manual and shall, prior to the commencement of any Work hereunder, make the same available to its employees and Subcontractor who will be performing work on premises owned and/or operated by the Kinder Morgan entity named below. If the English language is a communication barrier, CONSULTANT at its expense shall timely convert/translate the Kinder Morgan Consultant Safety Manual accurately into the appropriate language for its employees and Subcontractor Providers. Questions concerning the Manual should be directed to the Kinder Morgan Consultant Safety Group at: Consultant_safety@kindermorgan.com prior to commencement of any Work.

8. Facsimile Signatures/Counterparts

This Work Directive may be executed in multiple original counterparts, each of which shall be deemed an original, and together they shall constitute one and the same agreement. Signature of this Work Directive may be effected by facsimile (with confirmation by transmitting machine) and/or transmitted by portable document format ("pdf") file which shall be treated as an original signature, and any such signature, facsimile, pdf file or copy of this signed Work Directive shall be construed and treated as the original and shall be binding as if it were the original.

By signing this Work Directive, CONSULTANT hereby confirms that neither it nor any of its affiliates has provided during the last twelve (12) months or is currently providing services to any third party undertaking which is competitive to the Work and or the project contemplated by this Work Directive, other than has already been disclosed in writing by CONSULTANT to Company.

Unless prior written approval is obtained from Company, until this Work Directive has been completed in accordance with the Agreement CONSULTANT will not directly, or indirectly through a subsidiary or affiliate,

a) Consult advise, counsel, or otherwise assist (i) any competitor of (A) Company, (B) an affiliate of Company, or (C) any entity in which Company holds an ownership interest (A, B, and C collectively being referred to herein as "Company Entity"), or (ii) any affiliate of such competitor, directly or indirectly, with regard to (x) any current or foreseeable competition to the Work and/or the project contemplated by this Work Directive, or (y) any potential assignment for a third party which could have or is likely to have an adverse effect on any Company Entity with respect to the Work and/or project contemplated by this Work Directive; or

b) Except to the extent required to comply with applicable law, consult, advise, counsel or otherwise assist any governmental authority, or Federal or State regulatory agency, in the United States or any other country (i) on any matter which could affect the Work and/or project contemplated by this Work Directive, or (ii) in a regulatory or any other forum or proceeding, which in any manner would have, or is likely to have, a reasonably foreseeable adverse effect upon a Company Entity.

In the Agreement, if there is a reference to "Kinder Morgan, Inc.," it shall now be deemed a reference to Kinder Morgan Kansas, Inc. This is not a change of entity, but merely a change of name only.

By signing below, KM Entity and CONSULTANT affirm that the individual signing below has the requisite authority to authorize the commitment described herein, and that this Work Directive No. 470296-1-CONT is by reference hereby made part of Agreement No. 11593.

For Work performed within the state of California, the attached Exhibit B must be acknowledged and signed.

This Work Directive is hereby agreed to and accepted this 9th day of March, 2011

EXHIBIT WD_A – SCOPE OF WORK

Provide OSRO coverage as required in KM Title 5 Regulations as detailed below:
State of Nevada
Description of Work:
Provide all trained personnel, labor, tools, and equipment necessary to provide Oil Spill Removal Organization (OSRO) services to meet the Federal OPA '90 requirements for contracted oil spill removal services for the Las Vegas Terminal located at 5049 N. Sloan Lane, Las Vegas, NV as follows:

- Sufficient Response Resources to enable the COMPANY to meet the requirements of OPA '90 for pre-contracted Response Resources at the commencement of the Agreement including:

- Responding with 1,000 feet of containment boom and a means to deploy it or other appropriate equipment and materials, as identified in the Tactical Response Plans presented in Volume 2, Section 8.4, within one (1) hour of notification*;

- Oil recovery devices with an effective daily recovery capability (EDRC) equal to the amount of oil discharged in a small discharge (2,100 gallons) and temporary storage capacity equal to two (2) times the EDRC within two (2) hours of notification*;

- Documentation of equipment deployment exercises and personnel training must be submitted annually to Mr. Chuck Mathis, Manager Emergency Response Programs, c/o Kinder Morgan Energy Partners, L.P., 500 Dallas Street, Suite 1000, Houston, TX 77002, or charles_mathis@kindermorgan.com ;

- Compliance by the CONSULTANT and CONSULTANT's subcontractors with all applicable Federal Occupational Safety and Health Administration (OSHA) standards and similar applicable State laws, rules and/or standards.

* Travel times are based on suitable safety conditions and travel time capability per the U.S. Coast Guard minimum response time calculation factor of 35 mph overland or five (5) knots on water.

Regulatory References: 29 CFR 1910.120 (OSHA); 40 CFR 112 Appendix E 3.3 (U.S. EPA).

4.0 SPILL IMPACT CONSIDERATIONS

4.1 CRITICAL AREAS TO PROTECT

The critical areas to protect are classified as high, moderate, and low sensitivity to oil. The Federal, state, and local authorities will further clarify these categories at the time of the response. The categories are defined as follows:

HIGH SENSITIVITY

- Areas which are high in productivity, abundant in many species, extremely sensitive, difficult to rehabilitate, or inhabited by threatened/endangered species.
- Areas which consist of vegetated low banks, freshwater/saltwater marshes, swamps, scrub-shrub wetlands and impact to threatened/endangered species.

MODERATE SENSITIVITY

- Areas of moderate productivity, somewhat resistant to the effects of oiling.
- Areas which consist of mixed sand, gravel beaches, bars, gently sloping banks, and no impact to threatened/endangered species.

LOW SENSITIVITY

- Areas of low productivity, man-made structures, and/or high energy.
- Areas which consist of gravel, sand, or clay material, barren/rocky shores or banks, man-made structures, concrete/compacted earthen drainage ditches and no impact to threatened/endangered species.

4.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES

Environmental/socio-economic sensitivities are of extreme importance when planning a response effort. The health and safety of the public and the environment, as well as the protection of the various socio-economic sensitivities, must be promptly addressed in order to mitigate the extent of damage and minimize the cost of the clean-up effort.

To determine adequate response resources, the Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three (3) tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. The tier requirements for high volume areas are for response in six (6) hours (Tier 1), 30 hours (Tier 2), and 54 hours (Tier 3). High volume areas are listed in 49 CFR 194. The tier requirements for all other areas are for response in 12 hours (Tier 1), 36 hours (Tier 2), and 60 hours (Tier 3).

4.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES (Cont'd)

All environmental/socio-economic sensitivities are worthy of protection, but must be prioritized during a response effort. When making decisions on which areas to designate as collection areas and which to protect, the following sources may be consulted:

- U.S. Fish and Wildlife Service and related state agencies
- Applicable Area Contingency Plans (see CD affixed to inside front cover of Volume 1 and the CD Navigation Summary in Figure 4.2)
- Other industry and private experts

The environmental and socio-economic sensitivities in the area have been broken down into specific categories and identified in this section.

4.3 WILDLIFE PROTECTION AND REHABILITATION

The Company will work with Federal, State, and local agency personnel to provide labor and transportation to retrieve, clean, and rehabilitate birds and wildlife affected by an oil spill, as necessary. Oversight of the Company's wildlife preservation activities and coordination with Federal, State, and local agencies during an oil spill is the responsibility of the Incident Commander.

Special consideration should be given to the protection and rehabilitation of endangered species and other wildlife and their habitat in the event of an oil spill and subsequent response. Jurisdictional authorities should be notified and worked with closely on all response/clean-up actions related to wildlife protection and rehabilitation. Laws with significant penalties are in place to ensure appropriate protection of these species.

4.3.1 Endangered/Threatened Species

The U.S. Fish and Wildlife Service (USFWS) and related state agencies classify the status of various wildlife species in the potentially effected states. A summary of critical birds, reptiles, mammals, and plant species status as related to the Facility's operating areas (area of highest oil spill potential) is presented in Figure 4.1.

4.3.2 Wildlife Rescue

The Company will work with Federal, State, and local agency personnel to provide labor and transportation to retrieve, clean, and rehabilitate wildlife affected by an oil spill, as the situation demands.

4.3 WILDLIFE PROTECTION AND REHABILITATION (Cont'd)

4.3.2 Wildlife Rescue (Cont'd)

The following are items which should be considered for wildlife rescue and rehabilitation during a spill response:

- Bird relocation can be accomplished using a variety of deterrents, encouraging birds to avoid areas of spilled oil. Bird relocation can be accomplished by utilizing deterrent methods including:
  - Use of visual stimuli, such as inflatable bodies, owls, stationary figures, or helium balloons, etc.
  - Use of auditory stimuli, such as propane cannons, recorded sounds, or shell crackers.
  - Use of herding with aircraft, boats, vehicles, or people (as appropriate).
  - Use of capture and relocation.

4.3.3 Search and Rescue - Points to Consider

- **The Company's involvement should be limited to offering assistance as needed or requested by the agencies.**
- Prior to initiating any organized search and rescue plan, **authorization must be obtained from the appropriate federal/state agency.**
- **Initial search and rescue efforts, if needed, should be left up to the appropriate agencies.** They have the personnel, equipment, and training to immediately begin capturing contaminated wildlife.
- With or without authorization it must be anticipated that volunteer citizens will aid distressed/contaminated wildlife of their own. It is important to communicate that it may be illegal to handle wildlife without express authority from appropriate agencies. Provisions should be made to support an appropriate rehabilitator, however, **no support should be given to any unauthorized volunteer rescue efforts.**
- The regulatory agencies and response personnel should be provided the name and location of a qualified rehabilitator in the event contaminated wildlife is captured.
- Resources and contacts that can assist with wildlife rescue and rehabilitation are provided in Section 2.0. This list includes:
  - Outside rehabilitation organizations
  - Local regulatory agencies
  - Other resources

4.4 STAGING AREAS

When establishing personnel and equipment staging areas for a response to a Facility discharge, the following criteria should be evaluated:

- Access to waterborne equipment launching facilities and/or land equipment.
- Access to open space for staging/deployment of heavy equipment and personnel.
- Access to public services utilities (electricity, potable water, public phone, restroom and washroom facilities, etc.)
- Access to the environmental and socio-economically sensitive areas which are projected for impact.

4.5 TRAJECTORY ANALYSIS

Oil spilled on water will react primarily to the effects of wind and current. The oil will tend to spread to a thin layer under the influence of gravity (primary) and chemical (secondary) forces. The following describes the behavior of oil on water:

- Oil will move in the direction and at the rate of the current under negligible wind conditions.
- Oil will move in the direction and at approximately 3.4 % of the velocity of the wind under negligible current conditions.
- The combined effects of wind and current on the oil should be carefully analyzed. A method of vector analysis can be performed to determine the net direction of movement (wind forces can work in addition to, against, or in many other combinations with the current).
- The primary method of surveillance for the Facility will be visual. Visual surveillance is not effective however in rain, fog, darkness, or heavy cloud cover. It is difficult to observe a slick on the water from a boat, dock or land due to the angle of observation. Aerial surveillance is the preferred method of visual surveillance because of the elevated view and the ability to cover a large area in a short period.

ENDANGERED/THREATENED SPECIES LISTING
Los Angeles County, CA

Group	Name	Population	Status	Lead Office	Recovery Plan Name	Recovery Plan Stage
Amphibians	California tiger Salamander	U.S.A. (CA - Sonoma County)	Endangered	Sacramento Fish And Wildlife		
Amphibians	Arroyo (=arroyo southwestern)		Endangered	Ventura Fish And Wildlife Office	Arroyo Southwestern Toad	Final
Amphibians	California red-legged frog (Rana	subspecies range clarified	Threatened	Sacramento Fish And Wildlife	Recovery Plan for the California	Final
Amphibians	Mountain yellow-legged frog	southern California DPS	Endangered	Carlsbad Fish And Wildlife		
Birds	California condor (Gymnogyps	U.S.A. only	Endangered	Ventura Fish And Wildlife Office	California Condor Recovery	Final Revision 3
Birds	Aleutian Canada goose (Branta		Recovery			
Birds	California least tern (Sterna		Endangered	Carlsbad Fish And Wildlife	Revised California Least Tern	Final Revision 1
Birds	Arctic peregrine Falcon (Falco		Recovery			
Birds	Light-footed clapper rail (Rallus	U.S.A. only	Endangered	Carlsbad Fish And Wildlife	Light-footed Clapper Rail	Final Revision 1
Birds	San Clemente loggerhead		Endangered	Carlsbad Fish And Wildlife	Recovery Plan for the	Final
Birds	San Clemente sage sparrow		Threatened	Carlsbad Fish And Wildlife	Recovery Plan for the	Final
Birds	Least Bell's vireo (Vireo bellii		Endangered	Carlsbad Fish And Wildlife	Draft Recovery Plan for the	Draft
Birds	Western snowy plover	Pacific coastal pop.	Threatened	Arcata Fish And Wildlife Office	Final Recovery Plan for the	Final
Birds	Marbled murrelet	CA, OR, WA	Threatened	Washington Fish And Wildlife	Recovery Plan for the	Final
Birds	Coastal California gnatcatcher		Threatened	Carlsbad Fish And Wildlife		
Birds	Southwestern willow flycatcher		Endangered	Arizona Ecological Services	Final Recovery Plan for the	Final
Crustaceans	California freshwater shrimp		Endangered	Sacramento Fish And Wildlife	California Freshwater Shrimp	Final
Crustaceans	Conservancy fairy shrimp		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Vernal Pool	Final
Crustaceans	Longhorn fairy shrimp		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Vernal Pool	Final
Crustaceans	Riverside fairy shrimp		Endangered	Carlsbad Fish And Wildlife	Vernal Pools of Southern	Final
Crustaceans	Vernal pool fairy shrimp		Threatened	Sacramento Fish And Wildlife	Recovery Plan for Vernal Pool	Final
Crustaceans	Vernal pool tadpole shrimp		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Vernal Pool	Final
Fishes	Unarmored threespine		Endangered	Ventura Fish And Wildlife Office	Unarmored Threespine	Final Revision 1
Fishes	Santa Ana sucker (Catostomus	3 CA river basins	Threatened	Carlsbad Fish And Wildlife		
Flowering Plants	Sonoma alopecurus		Endangered	Sacramento Fish And Wildlife		
Flowering Plants	Ione manzanita (Arctostaphylos		Threatened	Sacramento Fish And Wildlife		
Flowering Plants	Pallid manzanita		Threatened	Sacramento Fish And Wildlife	Draft Recovery Plan for	Draft
Flowering Plants	Braunton's milk-vetch		Endangered	Ventura Fish And Wildlife Office	Recovery Plan for Six Plants	Final
Flowering Plants	Clara Hunt's milk-vetch		Endangered	Sacramento Fish And Wildlife		
Flowering Plants	Ventura Marsh Milk-vetch		Endangered	Ventura Fish And Wildlife Office		
Flowering Plants	Coastal dunes milk-vetch		Endangered	Ventura Fish And Wildlife Office	Recovery Plan for Five Plants	Final
Flowering Plants	Nevin's barberry (Berberis		Endangered	Carlsbad Fish And Wildlife		
Flowering Plants	Thread-leaved brodiaea		Threatened	Carlsbad Fish And Wildlife		
Flowering Plants	Chinese Camp brodiaea		Threatened	Sacramento Fish And Wildlife		
Flowering Plants	Mariposa pussypaws		Threatened	Sacramento Fish And Wildlife		
Flowering Plants	Stebbins' morning-glory		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Gabbro Soil	Final
Flowering Plants	White sedge (Carex albida)		Endangered	Sacramento Fish And Wildlife		
Flowering Plants	Fleshy owl's-clover (Castilleja		Threatened	Sacramento Fish And Wildlife	Recovery Plan for Vernal Pool	Final
Flowering Plants	Pine Hill ceanothus (Ceanothus		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Gabbro Soil	Final
Flowering Plants	Catalina Island mountain-		Endangered	Carlsbad Fish And Wildlife		
Flowering Plants	Hoover's spurge (Chamaesyce		Threatened	Sacramento Fish And Wildlife	Recovery Plan for Vernal Pool	Final
Flowering Plants	San Fernando Valley		Candidate	Ventura Fish And Wildlife Office		
Flowering Plants	Suisun thistle (Cirsium		Endangered	Sacramento Fish And Wildlife	Draft Recovery Plan for the	Draft
Flowering Plants	Vine Hill clarkia (Clarkia		Endangered	Sacramento Fish And Wildlife		
Flowering Plants	Soft bird's-beak (Cordylanthus		Endangered	Sacramento Fish And Wildlife	Draft Recovery Plan for the	Draft
Flowering Plants	Baker's larkspur (Delphinium		Endangered	Sacramento Fish And Wildlife		
Flowering Plants	Yellow larkspur (Delphinium		Endangered	Sacramento Fish And Wildlife		

Group	Name	Population	Status	Lead Office	Recovery Plan Name	Recovery Plan Stage
Flowering Plants	Marcescent dudleya (Dudleya		Threatened	Ventura Fish And Wildlife Office	Recovery Plan for Six Plants	Final
Flowering Plants	Ione (incl. Irish Hill) buckwheat		Endangered	Sacramento Fish And Wildlife		
Flowering Plants	Red Mountain buckwheat		Candidate	Arcata Fish And Wildlife Office		
Flowering Plants	Pine Hill flannelbush		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Gabbro Soil	Final
Flowering Plants	El Dorado bedstraw (Galium		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Gabbro Soil	Final
Flowering Plants	Pitkin Marsh lily (Lilium		Endangered	Sacramento Fish And Wildlife		
Flowering Plants	San Clemente Island woodland-		Endangered	Carlsbad Fish And Wildlife	Recovery Plan for the	Final
Flowering Plants	Few-flowered navarretia		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Vernal Pool	Final
Flowering Plants	Many-flowered navarretia		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Vernal Pool	Final
Flowering Plants	Colusa grass (Neostapfia		Threatened	Sacramento Fish And Wildlife	Recovery Plan for Vernal Pool	Final
Flowering Plants	Hairy Orcutt grass (Orcuttia		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Vernal Pool	Final
Flowering Plants	Lake County stonecrop		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Vernal Pool	Final
Flowering Plants	Lyon's pentachaeta		Endangered	Ventura Fish And Wildlife Office	Recovery Plan for Six Plants	Final
Flowering Plants	Calistoga allocarya		Endangered	Sacramento Fish And Wildlife		
Flowering Plants	Napa bluegrass (Poa napensis)		Endangered	Sacramento Fish And Wildlife		
Flowering Plants	Hartweg's golden sunburst		Endangered	Sacramento Fish And Wildlife		
Flowering Plants	San Joaquin adobe sunburst		Threatened	Sacramento Fish And Wildlife		
Flowering Plants	Tahoe yellow cress (Rorippa		Candidate	Nevada Fish And Wildlife Office		
Flowering Plants	Layne's butterweed (Senecio		Threatened	Sacramento Fish And Wildlife	Recovery Plan for Gabbro Soil	Final
Flowering Plants	Santa Cruz Island rockcress		Endangered	Carlsbad Fish And Wildlife		
Flowering Plants	Keck's Checker-mallow		Endangered	Sacramento Fish And Wildlife		
Flowering Plants	Kenwood Marsh checker-mallow		Endangered	Sacramento Fish And Wildlife		
Flowering Plants	Presidio Manzanita		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Coastal	Final
Flowering Plants	Sonoma sunshine		Endangered	Sacramento Fish And Wildlife		
Flowering Plants	Tiburon mariposa lily		Threatened	Sacramento Fish And Wildlife	Recovery Plan for Serpentine	Final
Flowering Plants	San Clemente Island indian		Endangered	Carlsbad Fish And Wildlife	Recovery Plan for the	Final
Flowering Plants	Coyote ceanothus (Ceanothus		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Serpentine	Final
Flowering Plants	Sonoma spineflower		Endangered	Sacramento Fish And Wildlife	Seven Coastal Plants and the	Final
Flowering Plants	Fountain thistle (Cirsium		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Serpentine	Final
Flowering Plants	Presidio clarkia (Clarkia		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Serpentine	Final
Flowering Plants	Salt marsh bird's-beak		Endangered	Carlsbad Fish And Wildlife	Salt Marsh Bird's-beak	Final
Flowering Plants	Palmate-bracted bird's beak		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Upland	Final
Flowering Plants	San Clemente Island larkspur		Endangered	Carlsbad Fish And Wildlife	Recovery Plan for the	Final
Flowering Plants	Marin dwarf-flax (Hesperolinon		Threatened	Sacramento Fish And Wildlife	Recovery Plan for Serpentine	Final
Flowering Plants	Sebastopol meadowfoam		Endangered	Sacramento Fish And Wildlife		
Flowering Plants	San Clemente Island broom		Endangered	Carlsbad Fish And Wildlife	Recovery Plan for the	Final
Flowering Plants	San Clemente Island bush-		Endangered	Carlsbad Fish And Wildlife	Recovery Plan for the	Final
Flowering Plants	California Orcutt grass (Orcuttia		Endangered	Carlsbad Fish And Wildlife	Vernal Pools of Southern	Final
Flowering Plants	San Joaquin Orcutt grass		Threatened	Sacramento Fish And Wildlife	Recovery Plan for Vernal Pool	Final
Flowering Plants	Sacramento Orcutt grass		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Vernal Pool	Final
Flowering Plants	Metcalf Canyon jewelflower		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Serpentine	Final
Flowering Plants	Tiburon jewelflower		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Serpentine	Final
Flowering Plants	Hidden Lake bluecurls		Threatened	Carlsbad Fish And Wildlife		
Flowering Plants	Solano grass (Tuctoria		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Vernal Pool	Final

Group	Name	Population	Status	Lead Office	Recovery Plan Name	Recovery Plan Stage
Flowering Plants	San Mateo thornmint		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Serpentine	Final
Flowering Plants	Marsh Sandwort (Arenaria		Endangered	Ventura Fish And Wildlife Office	Recovery Plan for Marsh	Final
Flowering Plants	Tiburon paintbrush (Castilleja		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Serpentine	Final
Flowering Plants	Loch Lomond coyote thistle		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Vernal Pool	Final
Flowering Plants	Spreading navarretia		Threatened	Carlsbad Fish And Wildlife	Vernal Pools of Southern	Final
Flowering Plants	Red Hills vervain (Verbena		Threatened	Sacramento Fish And Wildlife		
Flowering Plants	Springville clarkia (Clarkia		Threatened	Sacramento Fish And Wildlife		
Flowering Plants	Pennell's bird's-beak		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Serpentine	Final
Flowering Plants	Verity's dudleya (Dudleya		Threatened	Ventura Fish And Wildlife Office	Recovery Plan for Six Plants	Final
Flowering Plants	Slender-horned spineflower		Endangered	Carlsbad Fish And Wildlife		
Flowering Plants	Kern mallow (Eremalche		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Upland	Final
Flowering Plants	San Mateo woolly sunflower		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Serpentine	Final
Flowering Plants	Butte County meadowfoam		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Vernal Pool	Final
Flowering Plants	Bakersfield cactus (Opuntia		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Upland	Final
Flowering Plants	Santa Clara Valley dudleya		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Serpentine	Final
Flowering Plants	Gambel's watercress (Rorippa		Endangered	Ventura Fish And Wildlife Office	Recovery Plan for Marsh	Final
Flowering Plants	San Francisco lessingia		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Coastal	Final
Flowering Plants	Santa Monica Mountains		Threatened	Ventura Fish And Wildlife Office	Recovery Plan for Six Plants	Final
Flowering Plants	Brand's phacelia (Phacelia		Candidate	Carlsbad Fish And Wildlife		
Insects	El Segundo blue butterfly		Endangered	Carlsbad Fish And Wildlife	Recovery Plan for the El	Final
Insects	Lange's metalmark butterfly		Endangered	Sacramento Fish And Wildlife	Revised Recovery Plan for	Final Revision 1
Insects	Mission blue butterfly (Icaricia		Endangered	Sacramento Fish And Wildlife	Recovery Plan for San Bruno	Final
Insects	Myrtle's silverspot butterfly		Endangered	Sacramento Fish And Wildlife	Seven Coastal Plants and the	Final
Insects	Quino checkerspot butterfly		Endangered	Carlsbad Fish And Wildlife	Recovery Plan for the Quino	Final
Insects	San Bruno elfin butterfly		Endangered	Sacramento Fish And Wildlife	Recovery Plan for San Bruno	Final
Insects	Callippe silverspot butterfly		Endangered	Sacramento Fish And Wildlife		
Insects	Palos Verdes blue butterfly		Endangered	Carlsbad Fish And Wildlife	Palos Verdes Blue Butterfly	Final
Insects	Delhi Sands flower-loving fly		Endangered	Carlsbad Fish And Wildlife	Delhi Sands Flower-Loving Fly	Final
Insects	Carson wandering skipper		Endangered	Nevada Fish And Wildlife Office	Final Recovery Plan for the	Final
Insects	Caseys June Beetle (Dinacoma		Proposed Endangered	Arcata Fish And Wildlife Office		
Mammals	Salt marsh harvest mouse		Endangered	Sacramento Fish And Wildlife	Draft Recovery Plan for the	Draft
Mammals	Santa Catalina Island Fox		Endangered	Carlsbad Fish And Wildlife		
Mammals	Tipton kangaroo rat (Dipodomys		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Upland	Final
Mammals	Southern sea otter (Enhydra	south of Pt. Conception, CA	Experimental Population, Non-	Ventura Fish And Wildlife Office		
Mammals	Pacific pocket mouse		Endangered	Carlsbad Fish And Wildlife	Recovery Plan for the Pacific	Final
Mammals	Riparian brush rabbit (Sylvilagus		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Upland	Final
Mammals	Buena Vista Lake ornate Shrew		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Upland	Final
Mammals	Riparian woodrat (=San Joaquin		Endangered	Sacramento Fish And Wildlife	Recovery Plan for Upland	Final
Mammals	San Bernardino Merriam's		Endangered	Carlsbad Fish And Wildlife		
Reptiles	Leatherback sea turtle		Endangered	Jacksonville Ecological Services	Recovery Plan for U.S. Pacific	Final Revision 1
Reptiles	Leatherback sea turtle		Endangered	Jacksonville Ecological Services	Recovery Plan for Leatherback	Final Revision 1
Reptiles	Green sea turtle (Chelonia	except where endangered	Threatened	Jacksonville Ecological Services	Recovery Plan for U.S.	Final Revision 1
Reptiles	Green sea turtle (Chelonia	except where endangered	Threatened	Jacksonville Ecological Services	Recovery Plan for U.S. Pacific	Final Revision 1
Reptiles	Loggerhead sea turtle (Caretta		Threatened	Jacksonville Ecological Services	Recovery Plan for U.S. Pacific	Final Revision 1

Group	Name	Population	Status	Lead Office	Recovery Plan Name	Recovery Plan Stage
Reptiles	Loggerhead sea turtle (Caretta		Threatened	Jacksonville Ecological Services	Recovery Plan for the Northwest	Final Revision 2
Reptiles	Olive ridley sea turtle	except where endangered	Threatened	Jacksonville Ecological Services	Recovery Plan for U.S. Pacific	Final Revision 1
Reptiles	Island night lizard (Xantusia		Threatened	Carlsbad Fish And Wildlife	Recovery Plan for the	Final
Reptiles	Desert tortoise (Gopherus	U.S.A., except in Sonoran	Threatened	Nevada Fish And Wildlife Office	Draft Revised Recovery Plan for	Draft Revision 1
Reptiles	Giant garter snake (Thamnophis		Threatened	Sacramento Fish And Wildlife	Draft Recovery Plan for the	Draft

ACP/GRP CD
NAVIGATION INSTRUCTIONS
(Excerpt from CD affixed to inside front cover of Volume 1)

The information contained herein is provided to identify specific spill response and protection strategies for the applicable Kinder Morgan Pacific Operations Regions. Navigating through the bookmark links provided on the CD will take you to the Environmentally Sensitive Sites and the Economically Significant Sites provided in the applicable Area Contingency Plans and Geographic Response Plans.

INSTRUCTIONS FOR USE

1. From the screen on the left, click on region of interest. The different regions are identified by the red font.
2. Once the appropriate region is accessed, click on the "+" to the left of the region name to display the various areas within each region. These are identified with blue font.
3. Once the appropriate area is accessed, the links to the Environmentally Sensitive Sites and the Economically Significant Sites will be available for selection.
   - ➢ It is important to note that once each Environmentally Sensitive Site and Economically Significant Site is accessed, the user will have to scroll to the desired location.
   - ➢ Use the zoom icon to zoom into each page for easier reading.

NOTES:

1. In those areas where the statement "No ACP Information Available" is made, it indicates that there is no ACP or GRP information which is specific to the particular region or area of interest.
2. EPA REGION IX: For areas without specific ACP/GRP information, the Region IX Contingency Plan (RCP) is used as the response guidance; however, this RCP is currently in revision.
3. EPA REGION X: Region X is covered by the Northwest Area Contingency Plan; however, inland facilities are not addressed.
4. Thus, the following areas are covered by specific area contingency or geographic response plans on this CD:
   - Northern Region—Northwest: Linnton-Willbridge, Washington Area
   - Northern Region—Bay: Brisbane, Concord, Richmond, San Jose
   - Southern Region—Central: Colton
   - Southern Region—West: Carson, Watson, Mission Valley
5. And, the following areas do not have specific area contingency or geographic response plans on this CD:
   - Northern Region—Northwest: Oregon Pipelines (inland)
   - Northern Region—Central: Fresno
   - Northern Region—CalNev: Sacramento, Rocklin, Reno
   - Southern Region—East: Imperial, Phoenix, Tucson
   - Southern Region—Central: Colton, Barstow, Las Vegas

5.0 DISPOSAL PLAN

5.1 OVERVIEW

A major oil spill response would generate significant quantities of waste materials ranging from oily debris and sorbent materials to sanitation water and used batteries. All these wastes need to be classified and separated (i.e., oily, liquid, etc.), transported from the site, and treated and/or disposed of at approved disposal sites. Each of these activities demands that certain health and safety precautions be taken, which are strictly controlled by federal and state laws and regulations. This section provides an overview of the applicable state regulations governing waste disposal, and a discussion of various waste classification, handling, transfer, storage, and disposal techniques. It is the responsibility of the Environmental Manager or their designee to manage the following:

- Coordinates waste disposal activities;
- Identifies appropriate interim storage methods and locations;
- Coordinates permitting activities needed to ensure proper disposal; and
- Documents compliance with appropriate local, State, and Federal handling of hazardous materials and/or wastes.

Material will be containerized or stored in a manner complying with applicable environmental regulations pertaining to the known or suspected materials characteristics. Upon characterization, waste, recyclable materials, or contaminated materials will be treated on-site, recycled, or transported and disposed of at an appropriate KMEP approved facility after appropriate regulatory approval.

5.2 WASTE CLASSIFICATION

Oily - Liquid Wastes

Oily liquid wastes (i.e., oily water and emulsions) that would be handled, stored, and disposed of during response operations are very similar to those handled during routine storage and transfer operations. The largest volume of oily liquid wastes would be produced by recovery operations (e.g., through the use of vacuum devices or skimmers). In addition, oily water and emulsions would be generated by vehicle operations (e.g., spent motor oils, lubricants, etc.), and equipment cleaning operations.

Non-Oily - Liquid Wastes

Response operations would also produce considerable quantities of non-oily liquid wastes. Water and other non-oily liquid wastes would be generated by the storage area and stormwater collection systems, vessel and equipment cleaning (i.e., water contaminated with cleaning agents), and office and field operations (i.e., sewage, construction activities).

Solid Wastes

A solid waste is defined as any discarded material provided that it is not specifically excluded under the regulations. These exclusions cover materials such as domestic sewage and mixtures of sewage discharged through a sewer system or industrial wastewater point source discharges.

A discarded material is any material which is abandoned (disposed of, burned or incinerated) or accumulated, stored or treated prior to being abandoned. A discarded material is also any material recycled or any material considered inherently wastelike. Recycled material is considered solid waste when used in a manner constituting disposal, placed on land or burned for energy recovery.

5.2 WASTE CLASSIFICATION (Cont'd)

Solid Wastes (Cont'd)

A solid waste may be considered a hazardous waste. A solid waste, as defined above, may be a hazardous waste if it is not excluded from regulation and is either a listed hazardous waste or exhibits the characteristics of a hazardous waste. A solid waste exhibits the characteristics of a hazardous waste if it exceeds the thresholds established in determining the following:

1) ignitability
2) corrosivity
3) reactivity
4) toxicity

A solid waste may also become a hazardous waste if it is mixed with a listed hazardous waste or, in the case of any other waste (including mixtures), when the waste exhibits any of the characteristics identified above.

Oily - Solid/Semi-Solid Wastes

Oily solid/semi-solid wastes that would be generated by containment and recovery operations include damaged or worn-out booms, disposable/soiled equipment, used sorbent materials, saturated soils, contaminated beach sediments, driftwood, and other debris.

Non-Oily - Solid/Semi-Solid Wastes

Non-oily solid/semi-solid wastes would be generated by emergency construction operations (e.g., scrap, wood, pipe, and wiring) and office and field operations (i.e., refuse). Vessel, vehicle, and aircraft operations also produce solid wastes.

5.3 WASTE HANDLING

A primary concern in the handling of recovered oil and oily debris is contaminating unaffected areas or recontaminating already cleaned areas. Oily wastes generated during the response operations would need to be separated by type and transferred to temporary storage areas and/or transported to incineration or disposal sites. Proper handling of oil and oily wastes is imperative to ensure personnel health and safety.

Safety Considerations

Care would be taken to avoid or minimize direct contact with oily wastes. All personnel handling or coming into contact with oily wastes would wear protective clothing. A barrier cream can be applied prior to putting on gloves to further reduce the possibility of oily waste absorption. Safety goggles would be worn by personnel involved in waste handling activities where splashing might occur. Any portion of the skin exposed to oily waste would be washed with soap and water as soon as possible. Decontamination zones would be set up during response operations to ensure personnel are treated for oil exposure.

5.3 WASTE HANDLING (Cont'd)

Waste Transfer

During response operations, it may be necessary to transfer recovered oil and oily debris from one point to another several times before the oil and oily debris are ultimately recycled, incinerated or disposed of at an appropriate disposal site. Depending on the location of response operations, any or all of the following transfer operations may occur:

- From portable or vessel-mounted skimmers into flexible bladder tanks, storage tanks of the skimming vessel itself, or a barge.
- Directly into the storage tank of a vacuum device.
- From a skimming vessel or flexible bladder to a barge.
- From a vacuum device storage tank to a barge.
- From a barge to a tank truck.
- From a tank truck to a processing system (e.g., oil/water separator).
- From a processing system to a recovery system and/or incinerator.
- Directly into impermeable bags that, in turn, are placed in impermeable containers.
- From containers to trucks.

There are four general classes of transfer systems that may be employed to affect oily waste transfer operations:

- **Pumps:** Rotary pumps, such as centrifugal pumps, may be used when transferring large volumes of oil, but they may not be appropriate for pumping mixtures of oil and water. The extreme shearing action of centrifugal pumps tends to emulsify oil and water, thereby increasing the viscosity of the mixture and causing low, inefficient transfer rates. The resultant emulsion would also be more difficult to separate into oil and water fractions. Lobe or "positive displacement" pumps work well on heavy, viscous oils, and do not emulsify the oil/water mixture. Double-acting piston and double acting diaphragm pumps are reciprocating pumps that may also be used to pump oily wastes.

- **Vacuum Systems**: A vacuum truck may be used to transfer viscous oils but they usually pick up a very high water/oil ratio.

- **Belt/Screw Conveyors:** Conveyors may be used to transfer oily wastes containing a large amount of debris. These systems can transfer weathered debris laden oil either horizontally or vertically for short distances (i.e., 10 feet) but are bulky and difficult to set up and operate.

- **Wheeled Vehicles:** Wheeled vehicles may be used to transfer liquid wastes or oily debris to storage or disposal sites. These vehicles have a limited transfer volume (i.e., 100 barrels) and require good site access.

Figure 5.1 provides a comparative evaluation of 16 types of transfer systems that could be available for transfer operations.

5.4 WASTE STORAGE

Interim storage of recovered oil, oily and non-oily waste would be considered to be an available means of holding the wastes until a final management method is selected. In addition, the segregation of wastes according to type would facilitate the appropriate method of disposal. The storage method used would depend upon:

- The type and volume of material to be stored.
- The duration of storage.
- Access.

During an oil spill incident, the volume of oil that can be recovered and dealt with effectively depends upon the available storage capacity. Typical short-term storage options are summarized in Figure 5.2. The majority of these options can be used either onshore or offshore.

If storage containers such as bags or drums are used, the container must be clearly marked and/or color-coded to indicate the type of material/waste contained and/or the ultimate disposal option. Bladder or pillow tanks would be acceptable, if the available space can support the weight of both the container and the product.

Fuel barges may be the best option for temporary storage of oil recovered in open waters. Depending on size, these vessels may be able to hold up to 6,000 barrels of oil and water. The barge deck can be used as a platform for operating oil spill clean-up equipment and storing containment boom.

Empty barges have four to six feet draft which would increase when these barges are filled with oil or loaded with cargo. Consequently, they may not be able to enter shallow, nearshore waters.

It may be difficult to offload recovered oil stored inside barges. Due to natural forces which affect spilled oil, recovered oil may be very viscous or emulsified, rather than free-flowing. It may be necessary to use steam to heat viscous oil before pumping it from the barge.

Steel or rubber tanks can be used to store oil recovered near the shoreline. To facilitate offloading, demulsifiers may be used to break emulsions prior to placing the recovered substance into the barges or storage tanks.

Use of any site for storage is dependent on the approval of the local authorities. The following elements affect the choice of a potential storage site:

- Geology.
- Ground water.
- Soil.
- Flooding.
- Surface water.
- Slope.
- Covered material.
- Capacity.
- Climatic factors.
- Land use.
- Toxic air emissions.
- Security.
- Access.
- Public contact.

5.4 WASTE STORAGE (Cont'd)

Temporary storage sites should use the best achievable technology to protect the environment and human health. They should be set up to prevent leakage, contact, and subsequent absorption of oil by the soil. The sites should be bermed (1 to 1.5 meters high) and double lined with plastic or visqueen sheets 6-10 mils or greater in thickness, without joints, prior to receiving loose and bagged debris. The edges of the sheet should be weighted with stones or earth to prevent damage by wind, and the sheet should be placed on a sand layer or an underfelt thick enough to prevent piercing. A reinforced access area for vehicles at the edge of the site should be provided. In addition, the oily debris should be covered by secured visqueen or tarps and an adequate stormwater runoff collection system for the size and location of the site would be utilized. Additionally, the sites should be at least three (3) meters above mean sea level.

Oily debris can be hauled to approved temporary storage sites in visqueen lined trucks or other vehicles. Burnable, non-burnable, treatable and re-usable materials can be placed in well defined separate areas at temporary storage sites.

When the last of the oily debris leaves a temporary storage site, the ground protection would be removed and disposed of with the rest of the oily debris. Any surrounding soil which has become contaminated with oil would also be removed for disposal or treatment. If the soils were removed for treatment, they may be replaced if testing proves acceptable levels have been achieved. Treatment and remediation is encouraged when feasible. The temporary storage should be returned to its original condition.

5.5 WASTE DISPOSAL

Techniques for Disposal of Recovered Oil

Recovery, reuse, and recycling are the best choices for remediation of a spill, thereby reducing the amount of oily debris to be bermed onsite or disposed of at a solid waste landfill. Treatment is the next best alternative, but incineration and burning for energy recovery have more options within the state. There are some limitations and considerations in incinerating for disposal. Environmental quality of incineration varies with the type and age of the Facility. Therefore, when incineration becomes an option during an event, local air quality authorities would be contacted for advice about efficiency and emissions of facilities within their authority. Approval of the local air authorities is a requirement for any incineration option. Landfilling is the last option. Final disposal at a solid or dangerous waste landfill is the least environmentally sound method of dealing with a waste problem such as oily debris.

During an oil spill incident, KMEP would consult with the federal and state On Scene Coordinator (OSC) to identify the acceptable disposal methods and sites appropriately authorized to receive such wastes. KMEP maintains a list of approved disposal sites that satisfy local, state, and federal regulations and KMEP requirements. This identification of suitable waste treatment and disposal sites would be prepared by the Environmental Manager or their designee in the form of an Incident Disposal Plan which must be authorized by the U.S. Coast Guard and/or the EPA. An Incident Disposal Plan would include predesignated interim storage sites, segregation strategies, methods of treatment and disposal for various types of debris, and the locations/contacts of all treatment and disposal site selections. Onsite treatment/disposal will be preferred.

5.5 WASTE DISPOSAL (Cont'd)

Techniques for Disposal of Recovered Oil (Cont'd)

In order to obtain the best overall Incident Disposal Plan, a combination of methods should be used. There is no template or combination of methods that can be used in every spill situation. Each incident should be reviewed carefully to ensure an appropriate combination of disposal methods are employed.

The different types of wastes generated during response operations would require different disposal methods. To facilitate the disposal of wastes, they should be separated by type for temporary storage, transport and disposal. Figure 5.3 lists some of the options that would be available to segregate oily wastes. The table also depicts methods that may be employed to separate free and/or emulsified water from the oily liquid waste.

The following is a brief discussion of some disposal techniques available for recovered oil and oily debris.

Recycling

This technique entails removing water from the oil and blending the oil with uncontaminated oil. Recovered oil can be shipped to refineries provided that it is exempt from hazardous waste regulations. There it can be treated to remove water and debris, and then blended and sold as a commercial product.

The Environmental Manager or their designee is responsible for ensuring that all waste materials be disposed of at an internally approved disposal site.

Incineration

This technique entails the complete destruction of the recovered oil by high temperature thermal oxidation reactions. There are licensed incineration facilities as well as portable incinerators that may be brought to a spill site. Incineration may require the approval of the local Air Pollution Control Authority. Factors to consider when selecting an appropriate site for onsite incineration would include:

- Proximity to recovery locations.
- Access to recovery locations.
- Adequate fire control.
- Approval of the local air pollution control authorities.

In Situ Burning/Open Burning

Burning techniques entail igniting oil or oiled debris and allowing it to burn under ambient conditions. These disposal techniques are subject to restrictions and permit requirements established by federal, state and local laws. They would not be used to burn PCBs, waste oil containing more than 1,000 parts per million of halogenated solvents, or other substances regulated by the EPA. Permission for *in situ* burning may be difficult to obtain when the burn takes place near populated areas.

5.5 WASTE DISPOSAL (Cont'd)

In Situ Burning/Open Burning

As a general rule, *in situ* burning would be appropriate only when atmospheric conditions will allow the smoke to rise several hundred feet and rapidly dissipate. Smoke from burning oil will normally rise until its temperature drops to equal the ambient temperature. Afterwards, it will travel in a horizontal direction under the influence of prevailing winds.

Landfill Disposal

This technique entails burying the recovered oil in an approved landfill in accordance with regulatory procedures. Landfill disposal of free liquids is prohibited by federal law in the United States.

With local health department approval, non-burnable debris which consists of oiled plastics, gravel and oiled seaweed, kelp, and other organic material may be transported to a licensed, lined, approved municipal or private landfill and disposed of in accordance with the landfill guidelines and regulations. Landfill designation would be planned only for those wastes that have been found to be unacceptable by each of the other disposal options (e.g., waste reduction, recycling, energy recovery). Wastes would be disposed of only at Company-approved disposal facilities. The Environmental Manager or their designee is responsible for ensuring that all waste materials are disposed of at a Company internally approved disposal site. Disposal at a non-approved facility would require approval by the Environmental Manager or their designee prior to sending any waste to such a facility.

5.6 REGULATORY REQUIREMENT AND PERMITS

The management of oil and oily wastes must comply with the standards set forth in.:

- Code of Federal Regulations (CFR) Parts 261 and 265 as mandated by the Resource Conservation and Recovery Act (RCRA).
- California Code of Regulations (CCR) Title 22, Division 4, Chapter 30.
- CCR, Title 14, Division 1, Subdivision 4, Chapter 7, Subchapter 2, Determining Amount of Petroleum Hydrocarbons Recovered.

To expedite removal of spilled oil, refined products, and contaminated material from marine waters during an emergency response, temporary storage sites may be erected at appropriate shore locations (22 CCR 66270.1(c)(3)). The transportation of oil and contaminated material to temporary storage sites during emergency response is exempt from handling and permitting requirements (22 CCR 66263.30 and/or 66263.43). The onsite California Environmental Protection Agency, Department of Toxic Substance Control (DTSC) representative or duty officer should be contacted for approval. If a Unified Command is established, OSPR will facilitate the contact with DTSC through their liaison function.

Kinder Morgan will maintain responsibility for recovered oil and oily wastes generated during recovery operations. A temporary storage site may require an emergency permit from the San Francisco Bay Conservation & Development Commission (BCDC) or the California Coastal Commission (CCC).

5.6 REGULATORY REQUIREMENT AND PERMITS (Cont'd)

Citing of the temporary facility must be done with the concurrence of the USCG and State OSC, DTSC, the local RQQCB, and the local health, fire and emergency services. If a Unified Command is established, OSPR will facilitate the contact of the state and local agencies through their liaison function.

The San Francisco Bay Conservation and Commission and the California Coastal Commission have created the Joint CCC/BCDC Oil Spill Program to respond to oil-spill-related matters in the San Francisco Bay area and along the coast. This program acts as the single point of contact, and requests for emergency permits (including waste management) should be directed to the following Joint CCC/BCDC Oil Spill Program staff:

Joint CCC/BCDC Oil Spill Program	(415) 904-5250 (phone)
45 Fremont Street, Suite 2000	(415) 904-5400 (fax)

The Incident Commander will coordinate activities to obtain the necessary permits to ensure proper disposal or recycling of recovered oil and debris.

KEY TO RATINGS: 5 = Best; 1 = Worst

KEY TO COMMENTS:

A. Normally require remote power sources, thus are safe around flammable fluids.
B. Should have a relief valve in the outlet line to prevent bursting hoses.
C. Air powered units tend to freeze up in sub-freezing temperatures.
D. Units with work ball valves are difficult to prime.
E. Some remotely powered types are designed to fit in a tanker's butterworth hatch.
F. Can also pump air at low pressure.
G. Transfer is batch-wise rather than continuous.
H. Waste must be in separate container for efficient transfer.
I. Transportable with its own prime mover.
J. High shear action tends to emulsify oil and water mixtures.

FIGURE 5.2

TEMPORARY STORAGE METHODS

CONTAINER	ONSHORE	OFFSHORE	SOLIDS	LIQUIDS	NOTES
Barrels	x	x	x	x	May require handling devices. Covered and clearly marked.
Tank Trucks	x	x		x	Consider road access. Barge-mounted offshore.

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
El Paso Area Lines	
• TX/NM State line – Lordsburg 16”	128
• El Paso Station – El Paso Breakout 8”	4
• El Paso Breakout – Lordsburg 8” (Out of Service)	4/5
• El Paso – TX/NM State Line 12”	17
• TX/NM State line – Deming 12”	18
• Deming – Lordsburg 12”	19
• El Paso – TX/NM State Line 16”	127
• Diamond Junction – El Paso Breakout 16”	132
Pipeline Facilities (non-storage)	
• Diamond Junction – piping manifold only	
• Alamogordo Junction – piping manifold only	
• Afton Station – piping manifold only (OOS)	
• Deming Pump Station (booster)	

- Figures 6.1a through 6.1h on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled “Worst Case Discharge Data” of the applicable Line Segment.

- The specific information summary for these pipeline sections is provided as follows:
  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps

- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.

- Northern and southern pipeline schematic diagrams are provided in Volume 1, Figure 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

TX/NM STATE LINE – LORDSBURG 16" (128)		
Pipe and Operational Data		
• Section Length:	142.48 Miles	752,294 Feet
• Line Diameter:	16.00 in., O.D.	15.438 in., I.D. (Note 1)
• Line Capacity:	1,222 bbls/mile (Note 2)	
• Product types:	Conventional Gas, EPA ULSD, Turbine, JP-8, Ethanol	
• Capacity of entire line section:	(b) (7)(F), (b) (3)	
• Maximum flow rate:	7,787 bph or 186,888 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Luna, Dona Ana, Hidalgo NM	
• Location Description:	From the TX/NM state line west generally parallel to the Union Pacific Railroad and I-10 to Lordsburg Station.	
Worst Case Discharge Data		
(b) (7)(F), (b) (3)		

FIGURE 6.1b

PIPELINE SECTION INFORMATION SUMMARY

EL PASO STATION –EL PASO BREAKOUT 8" (4)		
Pipe and Operational Data		
• Section Length:	16.16 Miles	85,324.8 Feet
• Line Diameter:	8.625 in., O.D.	8.125 in., I.D. (Note 1)
• Line Capacity:	339 bbls/mile (Note 2)	
• Capacity of entire line section:	(b) (7)(F), (b)	
• Maximum flow rate:	2,340 bpd or 56,160 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
• County(s)/State(s) Traversed:	El Paso, TX
• Location Description:	From El Paso Station generally northwest parallel to the Southern Pacific Railroad to the El Paso Breakout Station.

FIGURE 6.1c

PIPELINE SECTION INFORMATION SUMMARY

EL PASO BREAKOUT – LORDSBURG 8" (4/5) (Out of Service)		
Pipe and Operational Data		
Section Length:	164 Miles	752,407 Feet
Line Diameter:	8.625 in., O.D.	8.125 in., I.D. (Note 1)
Line Capacity:	339 bbls/mile (Note 2)	
Capacity of entire line section:	(b) (7)(F),	
Maximum flow rate:	0 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
County(s)/State(s) Traversed:	El Paso, TX	
Location Description:	From El Paso Breakout Station generally northwest parallel to the Southern Pacific Railroad to the TX/NM state line.	

FIGURE 6.1d

PIPELINE SECTION INFORMATION SUMMARY

EL PASO – TX/NM STATE LINE 12" (17)		
Pipe and Operational Data		
• Section Length:	21.55 Miles	113,807 Feet
• Line Diameter:	12.75 in., O.D.	12.374 in., I.D. (Note 1)
• Line Capacity:	785 bbls/mile (Note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	3,950 bph or 94,800 bpd	
Location Description		
• County(s)/State(s) Traversed:	El Paso, TX	
• Location Description:	From El Paso Breakout Station generally northwest parallel to the Southern Pacific Railroad to the TX/NM state line.	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

FIGURE 6.1e

PIPELINE SECTION INFORMATION SUMMARY

TX/NM STATE LINE - DEMING 12" (18)		
Pipe and Operational Data		
• Section Length:	85.99 Miles	454,027 Feet
• Line Diameter:	12.75 in., O.D.	12.374 in., I.D. (Note 1)
• Line Capacity:	785 bbls/mile (Note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	3,950 bph or 94,800 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Luna, Dona Ana, NM	
• Location Description:	From the TX/NM state line generally parallel to the Union Pacific Railroad and I-10 west to Deming Station.	

FIGURE 6.1f

PIPELINE SECTION INFORMATION SUMMARY

DEMING – LORDSBURG 12" (19)		
Pipe and Operational Data		
• Section Length:	51.22 Miles	270,439 Feet
• Line Diameter:	12.75 in., O.D.	11.75 in., I.D. (Note 1)
• Line Capacity:	708 bbls/mile (Note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	3,050 bph or 73,200 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Luna, Hidalgo, NM	
• Location Description:	From Deming Station west generally parallel to the Union Pacific Railroad and I-10 to Lordsburg Station.

HCA INDEX

Refer to Figure 6.1a through Figure 6.1h for specific information on line segments.

The following Index Map shows all the corresponding Line Segments for Figure 6.1.

Detailed HCA Maps are contained in the CD inside the front cover of Volume 2 (or in a separate folder on electronic copy CD).

The specific HCA maps for this area are:

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Niland Area Lines	
• Colton – Niland 20"	111
• Niland – AZ Line 20"	112
• Niland – Imperial 6"	58
• Niland – Imperial 10"	133
• Imperial – El Centro 4"	59
Yuma Area Lines	
• CA Line – Yuma 20"	113
• Yuma – Yuma MCAS Terminal 6"	61
• Yuma – Montezuma 20"	114
Pipeline Facilities (non-storage)	
• El Centro NAF Terminal – meter manifold only	

- Figures 6.1a through 6.1h on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled "Worst Case Discharge Data" of the applicable Line Segment.

- The specific information summary for these pipeline sections is provided as follows:
  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps

- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.

- Northern and southern pipeline schematic diagrams are provided in Volume 1, Figure 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

COLTON – NILAND 20" (111)

Pipe and Operational Data

- Section Length: 130.43 Miles 688,670 Feet
- Line Diameter: 20.0 in., O.D. 19.312 in., I.D. (note 1)
- Line Capacity: 1,913 bbls/mile (note 2)
- Product types: CARB ULSD, Gas, JP-8, Ethanol
- Capacity of entire line section: (b) (7)(F), (b) (3)
- Maximum flow rate: 12,500 bph or 300,000 bpd

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description

- County(s)/State(s) Traversed: Riverside, Imperial, CA
- Location Description: from Indio generally southeast following along the eastern edge of the Salton Sea to Niland Terminal in Niland.

Worst Case Discharge Data

(b) (7)(F), (b) (3)

FIGURE 6.1b

PIPELINE SECTION INFORMATION SUMMARY

NILAND – AZ LINE 20" (112)		
Pipe and Operational Data		
• Section Length:	65.82 Miles	347,518 Feet
• Line Diameter:	20.0 in., O.D.	19.312 in., I.D. (note 1)
• Line Capacity:	1,913 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F), (b)	
• Maximum flow rate:	12,000 bph or 288,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Imperial, CA	
• Location Description:	From Niland southeast to Glamis and the California-Arizona state line north of the Colorado River at Yuma. Crosses the Coachella and All-American Canal.	

FIGURE 6.1c

PIPELINE SECTION INFORMATION SUMMARY

NILAND – IMPERIAL 6" (58)		
Pipe and Operational Data		
• Section Length:	25.22 Miles	133,182 Feet
• Line Diameter:	6.625 in., O.D.	6.187 in., I.D. (note 1)
• Line Capacity:	196 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	1,600 bph or 38,400 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Imperial, CA	
• Location Description:	From a connection with line 133 in the Calipatria Area south to Imperial Terminal southeast of Imperial County Airport in Imperial.	

FIGURE 6.1d

PIPELINE SECTION INFORMATION SUMMARY

NILAND – IMPERIAL 10" (133)		
Pipe and Operational Data		
• Section Length:	4.26 Miles	22,497 Feet
• Line Diameter:	10.75 in., O.D.	10.25 in., I.D. (note 1)
• Line Capacity:	539 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	1,600 bph or 38,400 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Imperial, CA	
• Location Description:	From Niland south to a connection with line 58 in the Calipatria area.	

FIGURE 6.1e

PIPELINE SECTION INFORMATION SUMMARY

IMPERIAL – EL CENTRO 4" (59)		
Pipe and Operational Data		
● Section Length:	6.38 Miles	33,728 Feet
● Line Diameter:	4.50 in., O.D.	4.026 in., I.D. (note 1)
● Line Capacity:	83 bbls/mile (note 2)	
● Capacity of entire line section:	(b) (7) (F) (b)	
● Maximum flow rate:	650 bph or 15,600 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
● County(s)/State(s) Traversed:	Imperial, CA
● Location Description:	From Imperial Terminal west to the El Centro NAF Terminal.

FIGURE 6.1f

PIPELINE SECTION INFORMATION SUMMARY

CA LINE – YUMA 20" (113)		
Pipe and Operational Data		
• Section Length:	4.27 Miles	22,520 Feet
• Line Diameter:	20.0 in., O.D.	19.312 in., I.D. (note 1)
• Line Capacity:	1,913 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	12,000 bph or 288,000 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
• County(s)/State(s) Traversed:	Yuma, AZ
• Location Description:	From the California – Arizona state line east across the Colorado River to Yuma Station.

FIGURE 6.1g

PIPELINE SECTION INFORMATION SUMMARY

YUMA - YUMA MCAS 6" (61)		
Pipe and Operational Data		
● Section Length:	9.10 Miles	48,033 Feet
● Line Diameter:	6.265 in., O.D.	6.187 in., I.D. (note 1)
● Line Capacity:	196 bbls/mile (note 2)	
● Capacity of entire line section:	(b) (7)(F),	
● Maximum flow rate:	800 bph or 19,200 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
● County(s)/State(s) Traversed:	Yuma, AZ
● Location Description:	From Yuma Station south to near east 24th St., west to 3rd St., then south to the Yuma MCAS Station, crossing the Gila River.

FIGURE 6.1h

PIPELINE SECTION INFORMATION SUMMARY

YUMA – MONTEZUMA 20" (114)		
Pipe and Operational Data		
● Section Length:	87.33 Miles	461,124 Feet
● Line Diameter:	20.0 in., O.D.	19.312 in., I.D. (note 1)
● Line Capacity:	1,913 bbls/mile (note 2)	
● Capacity of entire line section:	(b) (7)(F), (b)	
● Maximum flow rate:	12,000 bph or 288,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
● County(s)/State(s) Traversed:	Yuma, AZ	
● Location Description:	From Yuma east to Welton then generally northeast to Montezuma station.	

FIGURE 6.2

HCA INDEX

Refer to Figure 6.1a through Figure 6.1h for specific information on line segments.

The following Index Maps show all the corresponding Line Segments for Figure 6.1.

Detailed HCA Maps are contained in the CD inside the front cover of Volume 2 (or in a separate folder on electronic copy CD).

The specific HCA maps for this area are:

6.0 AREA PIPELINE SECTIONS

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Phoenix Area Lines	
• Montezuma – Phoenix 20”	114
• Phoenix – Luke 6”	52
• Toltec – Phoenix 12”	117
Pipeline Facilities (Non-storage)	
Montezuma Pump Station - booster	

- Figures 6.1a through 6.1c on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled “Worst Case Discharge Data” of the applicable Line Segment.
- The specific information summary for these pipeline sections is provided as follows:
  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps
- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.
- Northern and southern pipeline schematic diagrams are provided in Volume 1, Figure 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

MONTEZUMA – PHOENIX 20" (114)	
Pipe and Operational Data	
• Section Length:	69.42 Miles 366,538 Feet
• Line Diameter:	20.0 in., O.D. 19.312 in., I.D. (note 1)
• Line Capacity:	1,913 bbls/mile (note 2)
• Product types:	Conventional Gas, CBG, AZRBOB, EPA DSL, EPA, ULSD, Turbine, JP-8, Ethanol
• Capacity of entire line section:	(b) (7)(F), (b) (3)
• Maximum flow rate:	12,500 bph or 300,000 bpd
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.	
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.	
Location Description	
• County(s)/State(s) Traversed:	Maricopa, AZ
• Location Description:	From Montezuma Station generally northeast paralleling the Union Pacific Railroad to Buckeye, then east to Phoenix Terminal near 51st Avenue and Van Buren. Crosses the Hassayampa River and the Agua Fria River.
Worst Case Discharge Data	
(b) (7)(F), (b) (3)	

FIGURE 6.1b

PIPELINE SECTION INFORMATION SUMMARY

PHOENIX - LUKE 6" (52)		
Pipe and Operational Data		
• Section Length:	18.18 Miles	95,970 Feet
• Line Diameter:	6.625 in., O.D.	6.187 in., I.D. (note 1)
• Line Capacity:	196 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	815 bph or 19,560 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
• County(s)/State(s) Traversed:	Maricopa, AZ
• Location Description:	From Phoenix Terminal west to 75th Ave, north to Thomas Road, west to Dysart Road, then north to Luke AFB. Crosses the Agua Fria River and the Roosevelt Canal.

FIGURE 6.1c

PIPELINE SECTION INFORMATION SUMMARY

TOLTEC – PHOENIX 12" (117)

Pipe and Operational Data

• Section Length:	39.8 Miles	210,141 Feet
• Line Diameter:	12.75 in., O.D.	12.25 in., I.D. (note 1)
• Line Capacity:	770 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	6,512.5 bph or 153,600 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description

• County(s)/State(s) Traversed:	Maricopa, Pinal, Az
• Location Description:	From Phoenix Terminal south to Pecos Road then generally southeast to Maricopa, then parallel to the Union Pacific Railroad to Toltec.

FIGURE 6.2

HCA INDEX

Refer to Figure 6.1a through Figure 6.1c for specific information on line segments.

The following Index Map shows all the corresponding Line Segments for Figure 6.1.

Detailed HCA Maps are contained in the CD inside the front cover of Volume 2 (or in a separate folder on electronic copy CD).

The specific HCA maps for this area are:

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Tucson Area Lines	
• Tucson – Davis Monthan 6”	54
• Tucson – Toltec 12”	117
• Lordsburg – AZ/NM 12”	21
• Lordsburg – AZ/NM 16”	128
• AZ/NM – Apache 12”	22
• Apache – Tucson 12”	22
• AZ/NM – Tucson 16”	131
Pipeline Facilities (non-storage)	
Davis Monthan AFB – Delivery Facilities to Military Storage	
Road Forks Junction – Delivery Facilities to Plant Shipper	

- Figures 6.1a through 6.1k on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled “Worst Case Discharge Data” of the applicable Line Segment.

- The specific information summary for these pipeline sections is provided as follows:
  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps

- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.

- Northern and southern pipeline schematic diagrams are provided in Volume 1, Figure 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

TUCSON – DAVIS MONTHAN 6" (54)		
Pipe and Operational Data		
• Section Length:	6.28 Miles	33,151 Feet
• Line Diameter:	6.625 in., O.D.	6.187 in., I.D. (Note 1)
• Line Capacity:	196 bbls/mile (Note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	550 bph or 13,200 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
• County(s)/State(s) Traversed:	Pima, AZ
• Location Description:	From Tucson Terminal south and southeast parallel to the Southern Pacific Railroad, then North to Davis Monthan AFB.

FIGURE 6.1b

PIPELINE SECTION INFORMATION SUMMARY

TUCSON – TOLTEC 12" (117)		
Pipe and Operational Data		
• Section Length:	63.55 Miles	335,529 Feet
• Line Diameter:	12.75 in., O.D.	12.25 in., I.D. (Note 1)
• Line Capacity:	770 bbls/mile (Note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	6,400 bph or 153,600 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Pima/Pinal, AZ	
• Location Description:	From Tucson to Toltec	

FIGURE 6.1e

PIPELINE SECTION INFORMATION SUMMARY

LORDSBURG – AZ/NM STATE LINE 12" (21)		
Pipe and Operational Data		
• Section Length:	25.73 Miles	135,854 Feet
• Line Diameter:	12.75 in., O.D.	12.374 in., I.D. (Note 1)
• Line Capacity:	785 bbls/mile (Note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	3,500 bph or 84,000 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
• County(s)/State(s) Traversed:	Hidalgo, NM
• Location Description:	From Lordsburg Station west generally parallel to I-10 at the AZ/NM state line.

FIGURE 6.1f

PIPELINE SECTION INFORMATION SUMMARY

LORDSBURG – AZ/NM STATE LINE 16" (128)		
Pipe and Operational Data		
• Section Length:	14.6 Miles	77,088 Feet
• Line Diameter:	16.00 in., O.D.	15.438 in., I.D. (Note 1)
• Line Capacity:	1,222 bbls/mile (Note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	6,900 bph or 165,600 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Hidalgo, NM	
• Location Description:	From Lordsburg Station west generally parallel to I-10 in the AZ/NM state line.	

FIGURE 6.1i

PIPELINE SECTION INFORMATION SUMMARY

AZ/NM STATE LINE – APACHE 12" (22)		
Pipe and Operational Data		
• Section Length:	29.86 Miles	157,660 Feet
• Line Diameter:	12.75 in., O.D.	11.75 in., I.D. (Note 1)
• Line Capacity:	708 bbls/mile (Note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	3,050 bph or 73,200 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Cochise, AZ	
• Location Description:	From AZ/NM state line to Apache Pass Scraper Station	

FIGURE 6.1j

PIPELINE SECTION INFORMATION SUMMARY

APACHE – TUCSON 12" (22)		
Pipe and Operational Data		
• Section Length:	97.36 Miles	514,060 Feet
• Line Diameter:	12.75 in., O.D.	11.75 in., I.D. (Note 1)
• Line Capacity:	708 bbls/mile (Note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	3,050 bph or 73,200 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Pima, Cochise, AZ	
• Location Description:	From AZ/NM state line west parallel to the Southern Pacific Railroad to Tucson Terminal	

FIGURE 6.1k

PIPELINE SECTION INFORMATION SUMMARY

AZ/NM STATE LINE – TUCSON 16" (131)

Pipe and Operational Data

• Section Length:	127.22 Miles	671,721.6 Feet
• Line Diameter:	16.00 in., O.D.	15,438 in., I.D. (Note 1)
• Line Capacity:	1,222 bbls/mile (Note 2)	
• Product types:	EPA ULSD, Conventional Gas, Turbine, JP-8, Ethanol	
• Capacity of entire line section:	(b) (7)(F), (b)	
• Maximum flow rate:	6,900 bph or 165,600 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description

• County(s)/State(s) Traversed:	Pima, Cochise, AZ
• Location Description:	From AZ/NM state line west parallel to the Southern Pacific Railroad to Tucson Terminal.

7.0 BREAKOUT STATIONS/TERMINALS

7.1 SCOPE

The scope of this section is to provide an information summary with specific data for the breakout stations/terminals that have storage (breakout tanks) connected to the pipeline sections described in the previous section of this Volume 2. The data is summarized as follows:

BREAKOUT STATION/ TERMINAL	LARGEST TANK (BBLS)	WCD (BBLS)
El Paso Station	(b) (7)(F), (b) (3)	
El Paso Yard EP-2		
El Paso Breakout EB-4		

- The largest Worst Case Discharge (WCD) for the breakout stations/terminals within this Area of Operation has been determined to be as follows:

(b) (7)(F), (b) (3)

  - The tanks in the breakout stations/terminals within this area have adequate secondary containment.

- The specific information summary for these breakout stations/terminals is provided as follows:

  - Breakout Station/Terminal Tank Information Summary (one per station/ terminal)
  - Facility Diagram

- Pipeline sections or terminaling operations associated with this Area of Operation are detailed in other sections of this Volume 2.

FACILITY DIAGRAM

8.1.1 CERTIFICATION OF SUBSTANTIAL HARM

CERTIFICATION OF THE APPLICABILITY OF THE SUBSTANTIAL HARM CRITERIA

FACILITY NAME: SFPP, L.P. Imperial Terminal
FACILITY ADDRESS: 345 W. Aten Road
El Centro, CA 92251

(Detailed Facility information, including data required for the Response Plan Cover Sheet, is provided in Figure 1.3)

1. Does the facility transfer *oil* over water to or from vessels ***and*** does the facility have a total *oil* storage capacity greater than or equal to 42,000 gallons?	Yes		No	✓
2. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area?	Yes		No	✓
3. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix or a comparable formula[1]) such that a discharge from the facility could cause injury to fish and wildlife and sensitive environments? For further description of fish and wildlife and sensitive environments, see Appendices I, II, and III to DOC/NOAA's "Guidance for Facility and Vessel Response Plans: Fish and Wildlife and Sensitive Environments" (59 FR 14713, March 29, 1994) and the applicable Area Contingency Plan.	Yes	✓	No	
4. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix or a comparable formula[1]) such that a discharge from the facility would shut down a public drinking water intake[2]?	Yes		No	✓
5. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the last 5 years?	Yes		No	✓

1 If a comparable formula is used, documentation of the reliability and analytical soundness of the comparable formula must be attached to this form.

2 For the purposes of 40 CFR part 112, public drinking water intakes are analogous to public water systems as described at 40 CFR 143.2(c).

CERTIFICATION

I hereby certify the following:

- Under penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe that the submitted information is true, accurate, and complete.
- The information and procedures contained herein are considered to be accurate as of this date and are consistent with the National Contingency Plan (NCP) and applicable Area Contingency Plans (ACP) as detailed in Section 1.5.

Signature — Area Manager (Title)

Gary Koehn (Name (please type or print)) — 12-9-04 (Date)

NOTE: The information and procedures in this Plan must be treated as guidelines only. The user should determine to what extent it is practical and advisable to follow them. This decision may involve considerations not discussed in this Plan. Response Management Associates, Inc. (RMA) provided consulting and plan development services in the preparation of this plan utilizing data provided by the owner/operator and/or the Facility. RMA assumes no liability for injury, loss, or damage of any kind resulting directly or indirectly from the use of the regulatory interpretation, response planning, or information contained in this plan.

8.1.2 INTRODUCTION

This Facility is a bulk distribution facility for refined petroleum products. Product is received via pipeline and is transported out of the Facility by tanker trucks and a 4" pipeline to El Centro NAS Station. The following Figure 8.1 provides Facility specific information, Figure 8.2 provides an Area Map for the Facility and Figure 8.3 provides a Facility Diagram.

This Section 8 is provided in order to document the following Facility-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- Facility Information (Figure 8.1)
- Area Map (Figure 8.2)
- Hazard Identification including Tank Tables (Section 8.2)
- Inspections (Section 8.2.2)
- Vulnerability Analysis (Section 8.2.3)
- Discharge Scenarios (Section 8.3)
- Evacuation (Section 8.4)

Latitude:	(b) (7)(F), (b) (3) [redacted]
Longitude:	
Area Map:	Provided in Figure 8.2
Facility Diagram:	Provided in Figure 8.3
Wellhead Protection Area:	None
Facility Distance to Navigable Water:	Greater than one mile
Landside Directions:	At the intersection of S. Imperial Ave. and I-8 W, start out going north on S. Imperial Ave. Proceed 1.57 miles where S. Imperial Ave. becomes N. Imperial Ave. Travel 0.01 miles and turn slightly right onto CA-86-N. Go 1.98 miles to W. Aten and turn right. Go 0.21 miles to the Facility.
Waterside Directions:	There is no water access to this Facility.

PHYSICAL DESCRIPTION - GENERAL

Description of Operation:

- This Facility is a bulk distribution facility for refined petroleum products.

(b) (7)(F), (b) (3) [redacted]

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL (Cont'd)

Description of Operation (Cont'd):

- The Facility normally operates 24 hours a day 7 days a week.
- The Facility's Worst Case Discharge amount is [redacted]

Products Handled:

- Gasoline
- Diesel
- JP-8
- Transmix
- Ethanol
- Additives

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

PHYSICAL DESCRIPTION – LOADING RACK

Description of Operation:

- The Facility is equipped with seven (7) loading spots which handle various refined petroleum products.
- A maximum of seven (7) tank trucks may load simultaneously.
- The loading operations are conducted 24 hours a day 7 days a week.
- The Facility handles an average of 90 trucks per day.

Loading Rate: 430 gpm (*per truck*)

Truck Capacity: 9,000 gallons (*maximum*)

Discharge Prevention:

- The curbed concrete slab drains directly to an oil water separator.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS

- The majority of the Facility was constructed in 1957. Seven tanks with a maximum capacity of 6,064,884 gallons date from this initial period. Three tanks were added in 1958, increasing maximum capacity to 7,954,884 gallons. Four additional tanks were constructed in 1961-62 and maximum capacity was increased to 9,723,714 gallons. In 1964 the addition of four more tanks increased maximum capacity to 12,176,514 gallons, and another expansion occurred in 1973. The latest expansion to the Facility occurred in 1999 – 2000, with the addition of a former ST Services terminal.

8.1.1 CERTIFICATION OF SUBSTANTIAL HARM

CERTIFICATION OF THE APPLICABILITY OF THE SUBSTANTIAL HARM CRITERIA		
Facility Name and Address: SFPP, L.P. Phoenix Terminal 49 N. 53rd Avenue Phoenix, AZ 85043 (Detailed Facility information, including data required for the Response Plan Cover Sheet, is provided in Figure 8.1)		
1. Does the facility transfer oil over water to or from vessels ***and*** does the facility have a total oil storage capacity greater than or equal to 42,000 gallons?	Yes:	No: X
2. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area?	Yes:	No: X
3. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix (40 CFR 112 Appendix C) or a comparable formula[1]) such that a discharge from the facility could cause injury (as defined in 40 CFR 112.2) to fish an wildlife and sensitive environments?	Yes: X	No:
4. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix (40 CFR 112 Appendix C) or a comparable formula[1]) such that a discharge from the facility would shut down a public drinking water intake[2]?	Yes:	No: X
5. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the past five (5) years?	Yes:	No: X
[1] If a comparable formula is used, documentation of the reliability and analytical soundness of the comparable formula must be attached to this form.		
[2] For the purposes of 40 CFR part 112, public drinking water intakes are analogous to public water systems as described at 40 CFR 143.2(c).		

CERTIFICATION

I hereby certify the following:

- Under penalty of law that I have personally examined and am familiar wit the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe the submitted information is true, accurate and complete.
- The information and procedures contained herein are considered to be accurate as of this date and are consistent with the National Contingency Plan (NCP) and applicable Area Contingency Plans (ACP) as detailed in Volume 1, Section 1.5.

8.1.2 INTRODUCTION

This Facility is a bulk distribution facility for refined petroleum products. The product is received via pipeline and is transported out of the Facility by tanker trucks and via pipeline. The following Figure 8.1 provides Facility specific information, Figure 8.2 provides an Area Map for the Facility and Figure 8.3 provides a Facility Diagram.

This Section 8 is provided in order to document the following Facility-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- Facility Information (Figure 8.1)
- Area Map (Figure 8.2)
- Hazard Identification including Tank Tables (Section 8.2)
- Inspections (Section 8.2.2)
- Vulnerability Analysis (Section 8.2.3)
- Discharge Scenarios (Section 8.3)
- Evacuation (Section 8.4)

PHYSICAL DESCRIPTION - GENERAL (Cont'd)

Description of Operation (Cont'd):

- The Facility normally operates 24 hours a day 7 days a week.
- The Facility's Worst Case Discharge amount is [redacted]

Products Handled:

- Additives
- Diesel
- Ethanol
- Gasoline
- Jet Fuel
- Transmix

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

PHYSICAL DESCRIPTION - LOADING RACK

Description of Operation:

- The Facility is equipped with ten (10) loading racks which handle various refined petroleum products.
- A maximum of 21 tank trucks may load simultaneously.
- The loading/unloading operations are conducted 24 hours a day 7 days a week.
- The Facility handles an average of 400 trucks per day.

Loading Rate: 600 gpm (*per truck*)

Truck Capacity: 9,000 gallons (*maximum*)

Discharge Prevention:

- The curbed concrete slab drains directly to an oil water separator.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION – RAIL CAR RACK

Description Of Operation:

There are three (3) rail car unloading spurs located at the Facility with capability to unload from 20 rail cars. One (1) spur is capable of unloading 10 rail cars and two (2) spurs are capable of unloading five (5) rail cars each.

- Ethanol is unloaded at this spot. There are no loading operations.

Unloading Rate: 1,750 gpm (*typical*)

Capacity: 30,100 gallons per rail car (*typical*)

Discharge Prevention:

- Personnel are stationed at the unloading area during unloading to monitor the operation.
- The rail car wheels are chocked and brakes set during unloading operations.
- Safe operating procedures are posted.
- Safe operating procedures are reviewed with all rack personnel.
- DOT loading/unloading procedures are followed.

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS

- The majority of the Facility was constructed in 1955-56 with 21 tanks containing a maximum capacity of 21,836,136 gallons. The Facility purchased five (5) tanks from Oasis Oil in 1984 and six (6) tanks from Shell in 1985-86. Tanks P-29 and P-30 were constructed in 1988-89, and an additional six (6) tanks were purchased between 1996 and 1998. Thirteen tanks were purchased from Shell Oil Company in October 2003.
- Acquired adjacent ConocoPhillips facility (11 tanks and two (2) truck racks) in December 2008.
- Acquired adjacent Chevron Terminal (17 tanks and one (1) truck rack) in October 2010.

Figures presented on the following pages include:

- Additives
- Diesel
- Ethanol
- Gasoline
- JP-8
- Transmix
- Turbine Fuel
- Contact Water

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

PHYSICAL DESCRIPTION - LOADING RACK

Description of Operation:

- The Facility is equipped with nine (9) loading spots and two (2) offloading spots which handle various refined petroleum products.
- A maximum of nine (9) tank trucks may load simultaneously.
- The loading/unloading operations are conducted 24 hours a day 7 days a week.
- The Facility handles an average of 174 trucks per day.

Loading Rate: 700 gpm (*per truck*)

Truck Capacity: 9,000 gallons (*maximum*)

Discharge Prevention:

- The curbed concrete slabs drain to an oil water separator.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS
● The majority of the Facility was constructed in 1953-57. Thirteen tanks with a maximum capacity of 12,282,648 gallons date from this initial period. The Facility has expanded through the years by constructing additional tanks and by the acquisition of adjacent terminal facilities, increasing the maximum capacity to 31,500,000 gallons. ● Acquired adjacent Chevron Terminal.
Figures presented on the following pages include: ● Figure 8.2 – Area Map ● Figure 8.3 – General Layout ● Figure 8.4 – Fire Protection Diagrams

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed on the Potential Spill Sources and Container Identification table in this Section.

Tanks:

- Secondary Containment volumes for all bulk storage tanks are detailed on the Potential Spill Sources and Container Identification table located in this Section.

Loading Rack Containment System:

The loading/unloading rack area is designed and operated as follows:

- Loading/Unloading area drainage flows into a catchment basin, oil /water separator and evaporation tank designed to handle discharges.
- The containment system is designed to hold the maximum capacity of any single compartment of a single tank truck loaded or unloaded at the Facility.
- A quick drainage system is not used for tank truck loading/unloading.
- Drainage from the loading rack loading and unloading facilities is contained in a depressed area (with curbs). Drainage is through area drains to an oil/water separator. The product is pumped using a skimming device from the oil/water separator to the transmix tank. The water phase is drained to an evaporation tank in the North Tank Farm.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Diked Areas:

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment area.
- Stormwater which does accumulate within the diked area, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures.
- Drainage from diked storage areas are restrained by manually controlled valves.
- Dike drain valves are secured in the closed position when not draining containment areas.
- Flapper-type drain valves are not used to drain diked areas.
- Stormwater from diked areas are emptied by gravity via manually activated valves.
- Accumulated stormwater from diked areas and loading racks is routed to the evaporation tank in the North Tank Farm.

Drainage From the Undiked Areas:

Drainage from undiked areas is controlled as follows:

- With the exception of the piping identified on the Potential Spill Sources and Container Identification table (see Appendix A), aboveground piping is enclosed by secondary containment that will drain to the evaporation tank in the North Tank Farm.
- Drainage from non-operational areas flows generally to the east to the local drainage ditch between the Facility and the Southern Pacific Railroad.
- The undiked piping does not present a threat to navigable water because the piping is located in areas away from vehicular traffic and the flat, sandy topography provide a conducive condition for keeping spills from traveling very far.
- The risk of leaks originating from piping is low since it is observed frequently enough to detect excessive corrosion, defective pipe supports, or other anomalies which could compromise the integrity of the pipe.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Undiked Areas (Cont'd):

- In the event that a spill did originate from undiked piping, the Facility would immediately activate its Contingency Plan to mitigate the spill before leaving the property.

General Drainage

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is as follows:

- All accumulated stormwater is drained to the evaporation tank in the North Tank Farm. The Facility does not discharge any stormwater.

- Accumulated liquids from the loading racks and tank bottoms are routed through the oil/water separator. The water phase is transferred to the evaporation tank and the oil phase is transferred to a transmix tank.

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Imperial Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading racks have sufficient capability to handle any potential increase in transfer capacity. The loading racks operate 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan which details additional detection methods.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Detection by Personnel

- Facility personnel conduct Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating rounds. Refer to Figures 8.5 and 8.6 for sample Tank Inspection and Secondary Containment Inspection Checklists.

- Facility personnel conduct monthly inspection of tank gauges and cathodic protection readings.

Automated Detection Systems

(b) (3), (b) (7)(F)

(b) (7)(F), (b) (3)

COMPLETELY AND PARTIALLY BURIED TANKS									
			There are no completely or partially buried tanks at this Facility.						

8.2.2 FACILITY SELF-INSPECTIONS

Container Testing and Inspections

- All aboveground containers are integrity tested on a regular schedule and when material repairs are made.
- The Engineering Department oversees the tank integrity "10-Year Program".
- Comparative records are maintained by the Engineering Department at the Orange office.
- The container inspection programs conducted and maintained by Facility personnel are as follows:
  - The containers are visually inspected by operating personnel for signs of deterioration, leaks, or the accumulation of liquids inside the containment areas.
  - Each storage container is inspected per Company policy, as required by age, condition, and service. (Refer to the "10-Year Program" and the storage tanks section (Section 11) of the Kinder Morgan Specification Manual).
  - Based on these conditions, the aboveground storage containers are professionally inspected and non-destructive thickness testing is performed.
- The required inspections are divided into three categories:
  - Routine, in-service inspections
  - In-service, external inspections
  - Out-of-service, internal inspections
- If a field-constructed aboveground container undergoes a repair, alteration, reconstruction, or change in service that might affect the risk of a discharge or failure due to brittle fracture, the container will be evaluated (see Sample Log in Appendix B).
- Drums or totes brought on-site are built or tested to the standard(s) established by the drum manufacturer or the drum recycler, as applicable.
- While on-site, drums and totes will be visually inspected at least monthly and ground contact will be minimized.
- Liquid level sensing devices are regularly tested.
- High level alarms are tested on a monthly basis.
- The bulk storage containers are equipped with ground-level gauges and are hand-gauged at regular intervals.

8.2.2 FACILITY SELF-INSPECTIONS (Cont'd)

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valves locks and/or seals
  - Other appurtenances

- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.

  Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement.

- Annually a Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

Documentation

- Records of the inspections and tests (including those maintained under usual and customary business practices), signed by the appropriate supervisor or inspector are retained on file at the Facility and/or other Corporate location for a minimum period of three (3) years.

- Sample inspection and test records are provided in Appendix B.

FIGURES 8.5 AND 8.6

Note: The following Kinder Morgan forms comprise the typical tank and secondary containment Inspection Checklists for this Facility. These forms may change over time to accommodate the specific operations of the Facility.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

- The Facility is situated in the northern portion of El Centro, CA.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Water Intakes

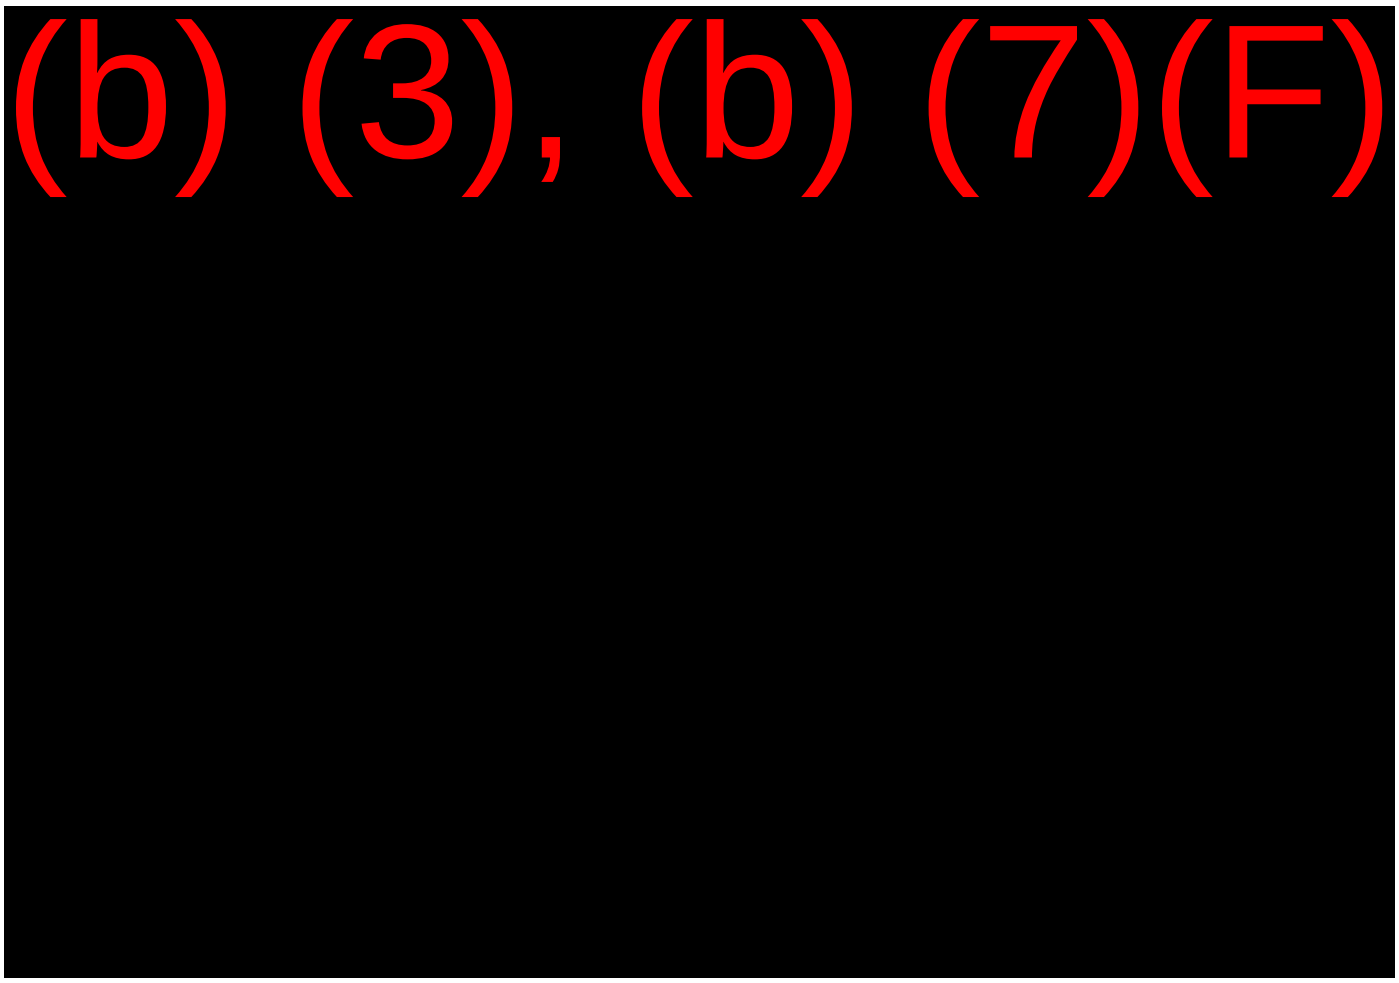
(b) (7)(F), (b) (3)

[redacted]

(b) (3), (b) (7)(F)

[redacted]

8.2.3 VULNERABILITY ANALYSIS (Cont'd)



Additional detail on the medical facilities within the area of the Facility are included on the maps in Section 6.

Residential Areas

Residential areas are located to the north and south of the Facility. These areas begin within one mile (approximately) of the Facility.

Additional detail on the residential areas within the area of the Facility are included on the maps in Section 6.

Businesses

The area surrounding the Facility is sparsely populated. Review of GIS Data determined that the following businesses are within the planning distance:

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Businesses

Businesses	Distance from Facility
Imperial Valley College	0.11 miles *(approximate)*
General Machine shop	0.16 miles *(approximate)*
Truck Stop 111	0.16 miles *(approximate)*

Additional detail on the general layout of businesses within the area of the Facility is included on the maps in Section 6.

Fish and Wildlife, Wetlands, and other Sensitive Environments

The area surrounding the Facility is host to a variety of species. The Company is using the Regional ACP as well as the NOAA Environmental Sensitivity Study for the San Francisco Bay Region, prepared by Research Planning Institute, Inc., Columbia, South Carolina, 1986, as a reference in determining the locations of wetlands, environmentally sensitive areas, fish and wildlife, and endangered flora and fauna. Refer to Volume 1, Figure 4.1 for threatened/endangered species.

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

Review of the USF&W Wetlands Mapper and Terraserver data indicates the following wetlands are within the planning distance of the Facility:

Wetlands	Latitude/Longitude
New River, Freshwater Emergent Wetlands	(b) (7)(F), (b) (3)
Salton Sea, Freshwater Emergent Wetland	

During a response situation the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact the agencies will be able to:

- Identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge.

- Identify potential environmental effects on fish and wildlife, wetlands, and other sensitive environments resulting from removal actions or countermeasures.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Lakes and Streams

Review of GIS Data determined that the following lakes and streams are within the planning distance:

Lakes and Streams	Location
Central Main Canal	2.0 miles W
New River	8.0 miles N
Westside Main Canal	11.0 miles NW
Salton Sea	21.0 miles N

Additional details on the lakes, streams, and rivers within the planning distance are found on the maps in Section 6.

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Section 4, Figure 4.1 of Volume 1.

Recreational Areas

Review of GIS Data determined that the following recreational areas are within the planning distance:

Recreational Area	Distance from Facility
California Midwestern Fairgrounds	1.0 mile N *(approximate)*
Del Rio Country Club	13.2 miles N *(approximate)*
Southend Sportsman Club	26.0 miles N *(approximate)*

Transportation Routes (air, land, and water)

There are various public roadways which may be potentially affected by a discharge originating from the Facility. Review of GIS Data determined that the following recreational areas are within the planning distance:

Transportation Route	Distance from Facility
Southern Pacific Railroad	50 yards E *(approximate)*
Imperial County Airport	Less than 1 miles NE *(approximate)*
Highway 86	0.5 mile W *(approximate)*
Imperial County Airport	0.7 miles NW *(approximate)*
Brawley Municipal Airport	12.3 miles NW (approximate)

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Utilities

No utilities were identified within the planning distance.

Other Areas of Economic Importance

Review of GIS Data determined that the following other areas of economic importance are within the planning distance:

Other Areas of Economic Importance	Distance from Facility
Wilsie Siding	2.5 miles N *(approximate)*
El Centro Naval Air FAC	5.4 miles W *(approximate)*
Tamarack Ranch	6.7 miles N *(approximate)*
Grape Siding	7.0 miles N *(approximate)*
Novley Siding	13.0 miles N *(approximate)*
Vail Ranch	21.0 miles N *(approximate)*
Hazard Headquarters	24.0 miles N*(approximate)*
Greer Ranch (historical)	30.0 miles N *(approximate)*

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history of the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Containment and recovery of any spilled material which might escape a diked area would be accomplished through the implementation of spill response activities by: (1) Facility personnel, or if necessary, (2) one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow north through the Facility.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL (Cont'd)

Vulnerability to a Natural Disaster

The Tank Farm location is relatively flat, therefore, unlikely to incur damage due to shifting and sliding. The seismic stability of the area is good, having no major earthquake faults in the vicinity. The possibility of a landslide or an earthquake is moderate.

Other Factors

The actions taken to lessen hazards at the Facility petroleum tank farm reduces the probability to a low potential. Hazard reduction protective measures have been designed into tanks and into the construction of the Facility. Tanks were designed to industry standards which reduces the potential for hazards. Based on the care and construction of the tanks, the potential of any one tank rupturing and emptying product into the secondary containment is low. The potential of several tanks simultaneously rupturing is very low.

The Facility conforms to good engineering practices in the tank integrity inspection program. The inspection program reduces the likelihood of leaks. The Facility has not experienced a failure associated with a tank structure.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

The Facility maintains a separate Oil Spill History file at the Orange, CA office. The Facility's file contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY (Cont'd)

- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

Since the Facility was acquired by Kinder Morgan Energy Partners, the Facility has experienced no reportable spills as defined by 40 CFR 110.

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed in the Potential Spill Sources and Container Identification table in this Section.

Tanks:

- Secondary Containment volumes for all bulk storage tanks are detailed in the Potential Spill Sources and Container Identification table located in this Section.

Loading Rack Containment System:

The loading/unloading rack area is designed and operated as follows:

- Company personnel hook up hose connections and monitor ethanol unloading operations at the rail and truck unloading spots in Areas V and IX.
- Loading area drainage flows into a catchment basin or treatment facility, designed to handle discharges.
- The containment system is designed to hold the maximum capacity of any single compartment of a single tank truck loaded at the Facility.
- A quick drainage system is not used for tank truck loading/unloading.
- Drainage from Racks 1, 2, 3, 4, 5, 6 and 7 are directed to the oil/water separator located in Area II. The oil phase is transferred to a transmix tank. Water is initially transferred to a Baker tank in Area II, then through two (2) carbon filter units before being discharged to the local POTW. Drainage from Racks 9 and 10 (former ConocoPhillips) is directed to an oil/water separator in Area XIII. The oil phase is transferred to a transmix tank and the water is transferred to 10,000 gallon holding tank in the Area. Drainage from Rack 11 (former Chevron) is directed to a 12,000 gallon underground water/product process tank in Area XIV.
- All transfers are in constant attendance by qualified personnel who are properly trained prior to conducting transfers.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Diked Areas:

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment area.
- Stormwater which does accumulate within the diked area, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures.
- Drainage from diked storage areas are restrained by manually controlled valves.
- Dike drain valves are secured in the closed position when not draining containment areas.
- Flapper-type drain valves are not used to drain diked areas.
- Stormwater from diked areas are emptied by gravity via manually controlled valves with the exception of Area IX (former Shell facility) where all stormwater is collected in a low area in the southwest corner of the containment area and allowed to evaporate.
- Stormwater is inspected by the operator for signs of oil or oil sheen. If none is present, and with the Area Manager's authorization, the drain valve is opened and the water is drained to the adjacent drainage ditch. Results of the inspection and drainage event are logged.
- Contaminated water is pumped to an oil/water separator. The oil phase is transferred to a transmix tank and the water phase to a Baker tank located in Area II. From this tank, the water is transferred through two carbon filter units located west of Area VI and discharged to the City of Phoenix POTW system.

Drainage From the Undiked Areas:

- The majority of the piping is contained within the diked areas except for the section noted in the Potential Spill Sources and Container Identification table in Appendix A.
- The manifold area is subject to routine inspection during operating rounds.
- (b) (7)(F), (b) (3) [redacted]

  In the event that a spill did originate from undiked piping, the Facility would immediately activate its Contingency Plan to mitigate the spill before leaving the property.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Undiked Areas (Cont'd):

- The manifold area is located in areas away from vehicular traffic.
- The risk of leaks originating from piping is low since it is observed frequently enough to detect excessive corrosion, defective pipe supports, or other anomalies which could compromise the integrity of the pipe.
- Drainage of stormwater from other undiked areas (non-storage) of the Facility is not controlled due to its origination from non-spill potential areas. Oil, which may get into these areas would be cleaned up immediately and not allowed to drain off the property.

General Drainage

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is as follows:

- Generally, rainwater is allowed to dissipate naturally unless it has accumulated in a large enough quantity to endanger tanks and structures or inhibit operations.
- Water is visually inspected for product and discharged only if no product sheen is visible.
- The Area Manager or Lead Operator must authorize discharge from containment areas.
- Facility drainage does not flow directly into an open watercourse.
- The Facility does not have a wastewater treatment plant nor does it chemically treat water prior to discharge off site:
- Uncontaminated rainwater is inspected to ensure compliance with applicable water quality standards and will not cause a harmful discharge as defined in 40 CFR 110.
- Adequate records of drainage events are at the Facility Office.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Phoenix Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading racks have sufficient capability to handle any potential increase in transfer capacity. The loading racks operate 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan which details additional detection methods.

Detection by Personnel

- Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds.
- Monthly inspection of tank gauges and cathodic protection readings.
- Annual Secondary Containment Inspection as part of the SPCC Plan.
- Tank Inspections as part of the SPCC Plan.
- The loading rack is equipped with warning and instruction signs.
- The entire plant is adequately illuminated to provide security and safe operations at night.

8.2.2 FACILITY SELF-INSPECTIONS

Container Testing and Inspections

- All aboveground containers are integrity tested on a regular schedule and when material repairs are made.
- The Engineering Department oversees the tank integrity program in accordance with the SPCC Plan and L O&M Procedure 2101.
- Comparative records are maintained by the Engineering Department at the Orange office.
- The container inspection programs conducted and maintained by Facility personnel are as follows:
  - The containers are visually inspected by operating personnel for signs of deterioration, leaks, or the accumulation of liquids inside the containment areas.
  - Each storage container is inspected per the SPCC Plan and L O&M Procedure 2101, as required by age, condition, and service.
  - Based on these conditions, the aboveground storage containers are professionally inspected and non-destructive thickness testing is performed.
- The required inspections are divided into three categories:
  - Routine, in-service inspections
  - In-service, external inspections
  - Out-of-service, internal inspections
- If a field-constructed aboveground container undergoes a repair, alteration, reconstruction, or change in service that might affect the risk of a discharge or failure due to brittle fracture, the container will be evaluated.
- Drums or totes brought on-site are built or tested to the standard(s) established by the drum manufacturer or the drum recycler, as applicable.
- While on-site, drums and totes will be visually inspected at least monthly and ground contact will be minimized.
- Liquid level sensing devices are regularly tested.
- Liquid level alarms are tested monthly. The alarm sensor is activated manually by an operator with results noted and logged by a second operator in the Control Room.

8.2.2 FACILITY SELF-INSPECTIONS(Cont'd)

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

- Flange joints
- Valve glands and bodies
- Pipe supports
- Metal surfaces
- Expansion joints
- Catch pans
- Valves locks and/or seals
- Other appurtenances

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement.

- An Area Corrosion Specialist conducts all required testing, inspection, record keeping and reporting in accordance with the KMEP Corrosion Manual.

Documentation

- Records of the inspections and tests (including those maintained under usual and customary business practices), signed by the appropriate supervisor or inspector are retained on file at the Facility and/or other Corporate location for a minimum period of three (3) years.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

- The Facility is located in western Phoenix, approximately 1 mile north of the Roosevelt Canal, which is the closest waterway.
- The canal is an irrigation ditch and is not considered a navigable waterway. There is no direct discharge to a water course.
- The Facility is connected by pipelines to other Company facilities in Los Angeles, California and El Paso, Texas.
- Petroleum products are stored in aboveground tanks at the Facility.
- Company customers lease space in these tanks for their individually owned products. This potential spill analysis is for Facility irrespective of the lessee products.
- The Facility consists of several portions including:

  Area I - Transmix Tank Farm
  Area I - Community Tank Farm
  Area II - South West Tank Farm
  Area III - South East Tank Farm
  Area IV - Community Tank Farm One
  Area VI - Community Tank Farm Two
  Area VIII - Formerly leased to Maricopa County
  Area IX - Former Shell Facility
  Area XIII - Former ConocoPhillips Facility
  Area XIV - Former Chevron Facility

- In addition, other areas of risk include:

  Terminal Manifold
  Terminal Loading Racks

The risk analysis for potential spills at the Facility incorporates the identification of hazards that have a potential to occur at the Facility. This analysis examines the major structures and systems within the Facility.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

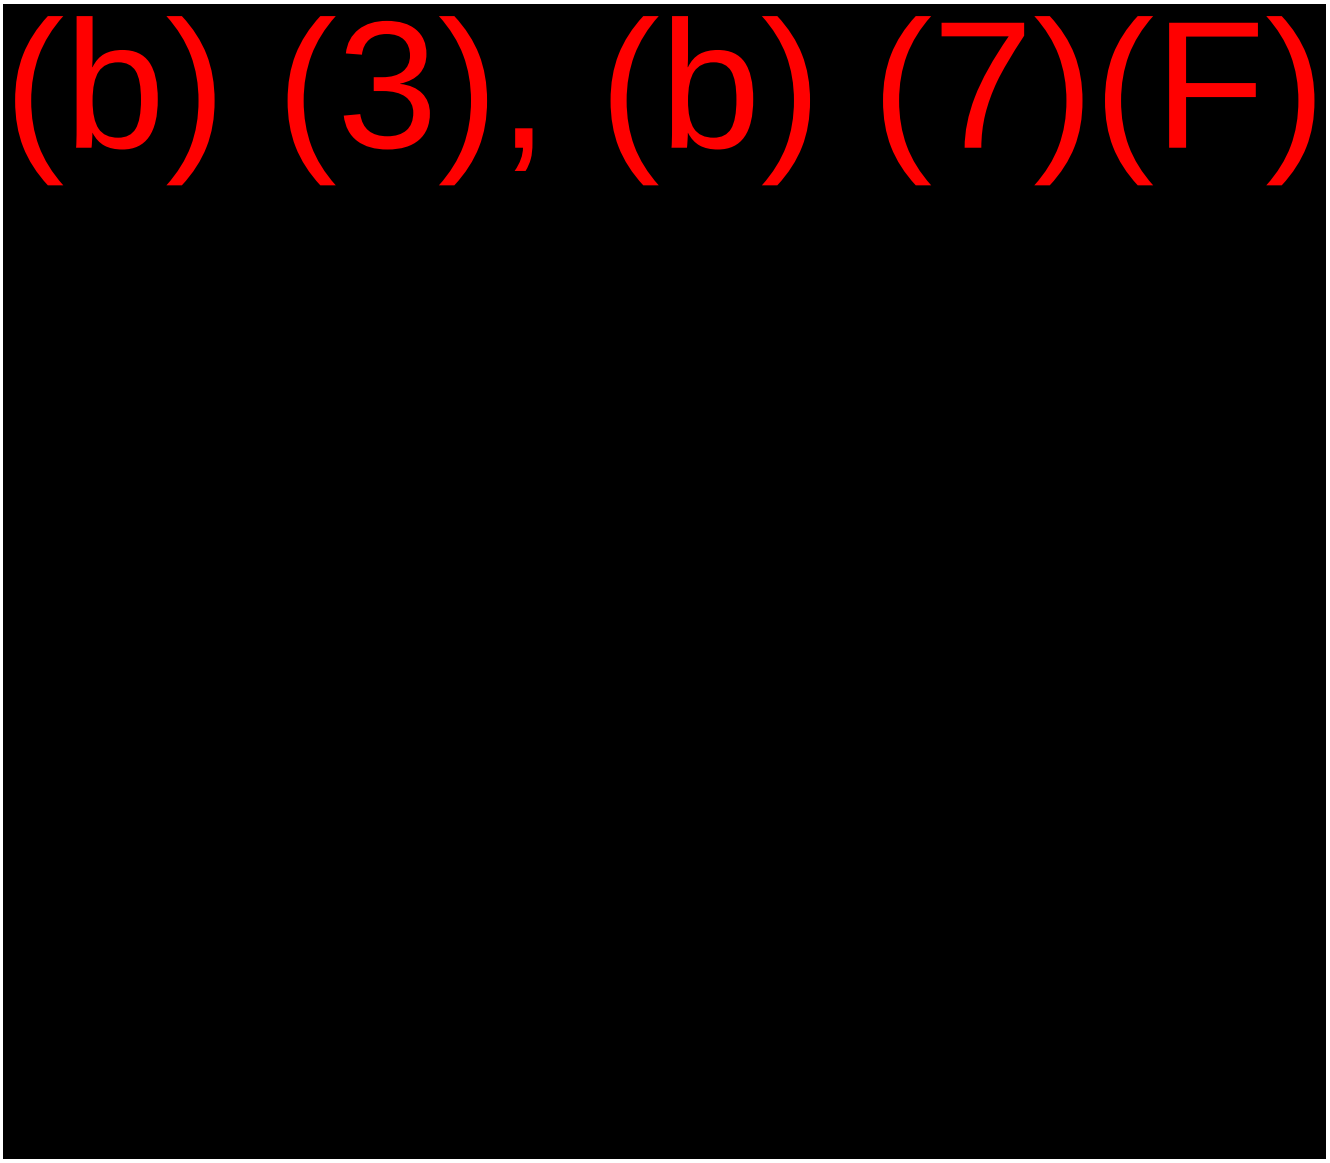
MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Drinking Water Intakes

(b) (7)(F), (b) (3) [redacted]

8.2.3 VULNERABILITY ANALYSIS (Cont'd)



Residential Areas

Residential areas are located in all directions from the Facility. The Facility is situated in western Phoenix. There are two (2) mobile home parks located in close proximity to the Facility.

The complete list of residential areas within the planning distance is too exhaustive to list here. A comprehensive list can be identified using internet (http://maps.google.com) or community resources.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Businesses

The complete list of businesses within the planning distance is too exhaustive to list here. A comprehensive list can be identified using internet (http://maps.google.com) or community resources. Review of GIS Data and public records determined that the following businesses are within the immediate vicinity of the Facility:

Businesses	Distance from Facility
EMJ	0.06 miles *(approximate)*
Jorgensen Steel & Aluminum	0.06 miles *(approximate)*
Caljet, Inc.	0.07 miles *(approximate)*
Allstate Rent-A-Fence, Inc.	0.16 miles *(approximate)*

Fish and Wildlife, Wetlands, and other Sensitive Environments

The area surrounding the Facility is host to a variety of species. The Company is using the Regional ACP as well as the NOAA Environmental Sensitivity Study for the San Francisco Bay Region, prepared by Research Planning Institute, Inc., Columbia, South Carolina, 1986, as a reference in determining the locations of wetlands, environmentally sensitive areas, fish and wildlife, and endangered flora and fauna. Refer to Volume 1, Figure 4.1 for threatened/endangered species.

No wetlands were identified within the planning distance.

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the areas most sensitive and susceptible to pollution.

During a response situation the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact the agencies will be able to:

- Identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge.
- Identify potential environmental effects on fish and wildlife, wetlands, and other sensitive environments resulting from removal actions or countermeasures.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Lakes and Streams

Review of GIS Data determined that the following lakes and streams are within the planning distance of the Facility:

Lakes and Streams	Location
Roosevelt Canal	1.0 miles S *(approximate)*
Salt River	4.8 miles SE *(approximate)*

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Section 4, Figure 4.1 of Volume 1.

Recreational Areas

No recreational areas were identified within the planning distance.

Transportation Routes (air, land, and water)

No transportation routes were identified within the planning distance.

Utilities

Review of GIS Data determined that the following utilities are within the planning distance of the Facility:

(b) (3), (b) (7)(F)

Other Areas of Economic Importance/Government Buildings

Review of GIS Data determined that the following other areas of economic importance/government buildings are within the planning distance of the Facility:

Name	Distance from Facility
Maricopa County Jail Annex	2.5 miles SE *(approximate)*
Maricopa County Highway Dept.	2.6 miles SE *(approximate)*
Maricopa County Juvenile Detention Home	2.7 miles SE *(approximate)*
Juvenile Court Center	3.15 miles SE *(approximate)*
Arizona Highway Maintenance	4.0 miles SE *(approximate)*
Phoenix Sewage Treatment Plant	4.2 miles SE *(approximate)*

8.2.4 VULNERABILITY ANALYSIS (Cont'd)

Any evacuation efforts necessary for these areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.), State Police, and other agencies as the situation demands.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history of the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL (Cont'd)

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Containment and recovery of any spilled material which might escape a diked area would be accomplished through the implementation of spill response activities by one of the spill response contractors listed in this Plan.

Vulnerability to a Natural Disaster

The Company has historical data that defines the probability of seismic activity in the Phoenix area. The construction of the Facility has taken seismic activity into consideration; the location of Tank Farms away from slide prone areas and constructing the Facility, including all subgrade soil preparation, along with slope and tank construction in accordance with appropriate building codes and industry guidelines.

Other Factors

Actions taken to lessen hazards at the Facility petroleum tank farm reduce the probability to a low potential. Hazard reduction protective measures have been designed into tanks and into the construction of the Facility. Tanks were designed to industry standards which reduces the potential for hazards. Based on the care and construction of the tanks, the potential of any one tank rupturing and emptying product into the secondary containment is low. The potential of several tanks simultaneously rupturing is very low.

The Facility conforms to good engineering practices in the tank integrity inspection program. The inspection program reduces the likelihood of leaks. The Facility has not experienced a failure associated with a tank structure.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

Kinder Morgan maintains an online database of reportable spills available at all locations via the company's intranet. The database contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY (Cont'd)

- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

Since the Facility was acquired by Kinder Morgan Energy Partners, the Facility has experienced no reportable spills as defined by 40 CFR 110.

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed in the Potential Spill Sources and Container Identification table located in this Section.

Tanks:

- Secondary Containment volumes for all bulk storage tanks are detailed on the Potential Spill Sources and Container Identification table located in this Section.

Loading Rack Containment System:

Main Loading/Unloading Racks

The loading/unloading rack areas are designed and operated as follows:

- Loading/Unloading area drainage flows into a catchment basin or treatment facility, designed to handle discharges.
- The containment system is designed to hold the maximum capacity of any single compartment of a single tank truck loaded or unloaded at the Facility.
- A quick drainage system is not used for tank truck loading/unloading.
- Racks 1, 2, 3, 4, and 5 are all equipped with curbed concrete pads with central drains. Drains for all racks flow to oil/water separator systems.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Main Loading/Unloading Racks (Cont'd)

- The oil phase from the oil/water separator is sent to either a transmix tank or a gasoline tank. The water phase is temporarily stored in a contact water or Baker tank prior to being transferred off site via controlled tank truck to a processing facility.

Additive Unloading Areas

- The Loading Rack 4 additive unloading area is not equipped with curbing or drains. However, hose connections are located within secondary containment provided for the additive tanks and additive transfers are constantly attended.

Drainage From the Diked Areas:

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment area.

- Accumulated stormwater that presents a hazard to tanks, structures or operations conducted in the containment areas is inspected for evidence of oil or oil sheen by the Area Manager or Lead Operator. If no evidence of oil or oil sheen is present the valve is opened and the water drained in a controlled manner so as to remain on terminal property.

- Drainage from diked storage areas is restrained by manually controlled valves where available.

- Dike drain valves are locked in the closed position when not draining containment areas.

- Flapper-type drain valves are not used to drain diked areas.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Undiked Areas:

Drainage from undiked areas is controlled as follows:

- Surface drainage from undiked areas of the Facility generally flows east, northwest or west.
- The majority of the piping at the Facility, with the exception of the community loading rack manifold, is located in diked or bermed areas. (Note: An implementation schedule has been established to provide containment for this area.)
- All undiked piping is located in areas away from vehicular traffic.
- The risk of leaks originating from piping is low since it is observed frequently enough to detect excessive corrosion, defective pipe supports, or other anomalies which could compromise the integrity of the pipe.
- In the event that a spill did originate from undiked piping, the Facility would immediately activate its Contingency Plan to mitigate the spill before leaving the property.

General Drainage

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is as follows:

- Accumulated stormwater is inspected for evidence of oil or oil sheen in the presence of the Area Manager or Lead Operator.
- With Area Manager or Lead Operator approval manual drain valves are opened and oil or oil sheen free stormwater is discharged onsite in a controlled manner.
- When stormwater has been reduced to an acceptable level the manual valve is closed and locked in the closed position.
- Contaminated stormwater is removed via contractor vacuum truck and transported to a processing facility.
- Adequate records are kept of drainage events at the Facility office.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Tucson Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading racks have sufficient capability to handle any potential increase in transfer capacity. The loading racks operate 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan which details additional detection methods.

Detection by Personnel

- Facility personnel conduct Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating rounds.
- Facility personnel conduct monthly inspection of tank gauges and cathodic protection readings.
- Annual Secondary Containment Inspections are part of the SPCC Plan.
- Tank Inspections are part of the SPCC Plan.

8.2.2 FACILITY SELF-INSPECTIONS

Container Testing and Inspections

- All aboveground containers are integrity tested on a regular schedule and when material repairs are made.
- The Engineering Department oversees the tank integrity program in accordance with the SPCC Plan and L O&M Procedure 2101.
- Comparative records are maintained by the Engineering Department at the Orange office.
- The container inspection programs conducted and maintained by Facility personnel are as follows:
  - The containers are visually inspected by operating personnel for signs of deterioration, leaks, or the accumulation of liquids inside the containment areas.
  - Each storage container is inspected per the SPCC Plan and L O&M Procedure 2101, as required by age, condition, and service.
  - Based on these conditions, the aboveground storage containers are professionally inspected and non-destructive thickness testing is performed.
- The required inspections are divided into three categories:
  - Routine, in-service inspections
  - In-service, external inspections
  - Out-of-service, internal inspections
- If a field-constructed aboveground container undergoes a repair, alteration, reconstruction, or change in service that might affect the risk of a discharge or failure due to brittle fracture, the container will be evaluated.
- Drums or totes brought on-site are built or tested to the standard(s) established by the drum manufacturer or the drum recycler, as applicable.
- While on-site, drums and totes will be visually inspected at least monthly and ground contact will be minimized.
- Liquid level sensing devices are regularly tested.
- High level alarms are tested on a monthly basis.
- The bulk storage containers are equipped with ground-level gauges and are hand-gauged at regular intervals.

8.2.2 FACILITY SELF-INSPECTIONS (Cont'd)

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valves locks and/or seals
  - Other appurtenances

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement.

- An Area Corrosion Specialist conducts all required testing, inspection, record keeping and reporting in accordance with the KMEP Corrosion Manual.

Documentation

- Records of the inspections and tests (including those maintained under usual and customary business practices) are retained on file at the Facility and/or other Corporate location for a minimum period of three (3) years.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics, which require consideration in the event of a discharge.

- The Facility is located in southern Arizona, approximately 4.7 miles east of the Santa Cruz River, which is the closest navigable waterway.
- The river is dry 90% of the time, but generally runs during the rainy season (July - August) and during periods of excessive rainfall.
- Petroleum products are stored in above ground tanks at the Facility.

Company customers lease space in these tanks for their individually owned products. This potential spill analysis is for Facility irrespective of the lessee products. The Facility consists of several portions including:

North Tank Farm
South Tank Farm
West Tank Farm (Community)
Tank Farm (former Shell)
Transmix Tank Farm
Southeast Tank Farm (Former Chevron)

In addition, other areas of risk include:

Terminal Manifold
Loading Racks 1 through 5
Vapor Burner and Vapor Recovery Unit

The risk analysis for potential spills at the Facility incorporates the identification of hazards that have a potential to occur at the Facility. This analysis examines the major structures and systems within the Facility.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

(b) (3), (b) (7)(F)

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

(b) (3), (b) (7)(F)

Residential Areas

Residential areas are located in all directions from the Facility.

The complete list of residential areas within the planning distance is too exhaustive to list here. A comprehensive list can be identified using internet (http://maps.google.com) or community resources.

Businesses

The complete list of businesses within the planning distance is too exhaustive to list here. Review of GIS Data and public records determined that the following businesses are within the immediate vicinity of the Facility:

Businesses	Distance from Facility
Desert Crank & Engine	0.01 miles S *(approximate)*
Bishop Auto Sales	0.02 miles *(approximate)*
Travis Helwig, Inc.	0.03 miles SE *(approximate)*
Frontier Towing Service	0.12 miles SE *(approximate)*
U-Haul Co.	0.14 miles *(approximate)*
ST Services	0.16 miles N *(approximate)*
Mechanical Systems, Inc.	0.2 miles N *(approximate)*
AZ Pro Fiber Glass	0.26 miles *(approximate)*
B&C RV Service	0.26 miles N *(approximate)*
Big Sky Collision Center	0.26 miles NE *(approximate)*
Copperstate Label Company	0.26 miles *(approximate)*
Unicom Grafix, Inc.	0.26 miles NE (approximate)
Tucson Fuel Company	0.29 miles NW (approximate)
Jack Furrier's Western Tire	0.3 miles NW (approximate)

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Fish and Wildlife, Wetlands, and other Sensitive Environments

The area surrounding the Facility is host to a variety of species. The Company is using the Regional ACP as well as the NOAA Environmental Sensitivity Study for the San Francisco Bay Region, prepared by Research Planning Institute, Inc., Columbia, South Carolina, 1986, as a reference in determining the locations of wetlands, environmentally sensitive areas, fish and wildlife, and endangered flora and fauna. Refer to Volume 2, Figure 4.1 for threatened/endangered species.

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

Review of the USF&W Wetlands Mapper and Terraserver data indicates the following wetlands are within the planning distance of the Facility:

Wetlands	Latitude/Longitude
Santa Cruz River Valley, Freshwater Emergent Wetland	(b) (7)(F), (b) (3)

During a response situation the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact the agencies will be able to:

- Identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge.

- Identify potential environmental effects on fish and wildlife, wetlands, and other sensitive environments resulting from removal actions or countermeasures.

Lakes and Streams

Review of GIS Data determined that the following lakes and streams are within the planning distance of the Facility:

Lakes and Streams	Location
Dam Drainage Channel	0.5 miles NW *(approximate)*
Julian Wash	1.8 miles SW *(approximate)*
Santa Cruz River	4.7 miles W *(approximate)*

The Facility is located 4.7 miles east of the Santa Cruz River. The river is dry 90% of the time, but generally runs during the rainy season (July - August) and during periods of excessive rainfall.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Volume 2, Figure 4.1.

Recreational Areas

There are several recreational areas within the planning distance from the Facility. Those in the immediate vicinity include:

Recreational Area	Distance from Facility
El Con Mall	2.6 miles N *(approximate)*
Randolph Municipal Golf Course	1.8 miles N *(approximate)*
Tucson Sports Center	7.0 miles NW *(approximate)*
El Rio Golf Course	8.3 miles NW *(approximate)*
El Rio Country Club	8.3 miles NW *(approximate)*
Tucson Elec. Park (Stadium)	1.0 mile W *(approximate)*

Transportation Routes (air, land, and water)

Review of GIS Data determined that the following transportation routes are within the planning distance of the Facility:

Transportation Route	Distance from Facility
Interstate 10 (I-10)	.75 miles S *(approximate)*

Utilities

No utilities were identified within the planning distance.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Other Areas of Economic Importance

Review of GIS Data determined that the following other areas of economic importance are within the planning distance of the Facility:

Name	Distance from Facility
Sam Lena Recreation Area	0.8 miles W *(approximate)*
Juvenile Court Center	1.4 miles W *(approximate)*
Tucson Greyhound Park	3.3 miles NNW
South Branch YMCA	3.7 miles SSW
El Pueblo Branch Library	4.0 miles SSW *(approximate)*
Tucson Rodeo Grounds	4.0 miles SSW
Tucson Convention Center	4.3 miles NNW

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history of the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification Table in this Section for details on tank age.

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Containment and recovery of any spilled material which might escape a diked area would be accomplished through the implementation of spill response activities by spill response contractors as detailed in this Plan.

Vulnerability to a Natural Disaster

The Facility is located in a semi-active earthquake zone with occasional seismic activity.

Other Factors

The actions taken to lessen hazards at the Facility petroleum tank farm reduces the probability to a low potential. Hazard reduction protective measures have been designed into tanks and into the construction of the Facility. Tanks were designed to industry standards which reduces the potential for hazards. Based on the care and construction of the tanks, the potential of any one tank rupturing and emptying product into the secondary containment is low. The potential of several tanks simultaneously rupturing is very low.

The Facility conforms to good engineering practices in the tank integrity inspection program. The inspection program reduces the likelihood of leaks.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

Kinder Morgan maintains an online database of reportable spills available at all locations via the company's intranet. The database contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

Since the Facility was acquired by Kinder Morgan Energy Partners, the Facility has experienced no reportable spills as defined by 40 CFR 110.

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. - Imperial Terminal is an EPA jurisdictional "Non-Transportation Related Onshore Facility" which operates in a Non-Higher Volume Port Area.

The EPA discharge volume calculations are described as follows:

EPA Discharge Volume Calculation

- **Worst Case Discharge**
  100% of the largest single tank

  WCD = (b) (7)(F),

- **Medium Discharge**
  Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD

  MD = 857 bbls

- **Small Discharge**
  Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD

  SD = 50 bbls

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack or leaking piping and would be Gasoline or JP-5.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the Facility could be diverted to the product tanks that are not at maximum capacity.

The closest waterway is the New River, which is west of the Facility. The storage tanks and truck loading racks, have adequate secondary containment so it is unlikely that a spill would reach the river or travel very far if it did. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Summary of EPA Regulatory Response Requirements for a Small Discharge

*The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, **AS APPROPRIATE**, include:*

- *1,000' of containment boom **and a means of deploying it** within one (1) hour of the discovery of a spill. [Guidance: The appropriate level of response resources to address a small discharge from this Facility should arrive on-scene; including the equipment and appropriately trained manpower necessary to deploy the response resources; within one (1) hour of discovery of the discharge.]*
- *Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a Small Discharge or greater which is available at the Facility within two (2) hours of the detection of an oil discharge. [Guidance: Oil recovery devices with a minimum of 50 bbls/day recovery capacity (or greater) should be on scene and ready to commence recovery of discharged oil within two (2) hours of discovery of the discharge. The response resources that arrived to the site in the first hour (noted in the first bullet above) should be deployed and actively containing discharged oil within this two (2) hour period.]*
- *Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate. [Guidance: Storage capacity for twice the effective daily recovery rate (2 times 50 bbls/day) is 100 bbls/day which should be available at the commencement of the recovery operations, therefore within two (2) hours of discovery of the discharge.]*

Facility Response Resources/Capability

Probable Scenario

- The Facility will respond to a *Small Discharge* with the manpower and local contract resources as detailed in Section 2 and 3 of Volume 2.
- A 50 bbls discharge typically will not escape the containment of the Facility.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack while loading Gasoline or JP-5. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Potential Offsite Impact

- The closest waterway is the New River, which is west of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the river. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Potential Offsite Impact (Cont'd)

- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be implemented at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.
- Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.

Appropriate Level of Response (in unlikely event of offsite impact)

- Under Section 3.3 to Appendix E of 40 CFR 112 – Determination and Evaluation of Required Response Resources for Facility Response Plans, it states, "The response resources shall, as appropriate, include: 3.3.1 One thousand feet of containment boom…" (59FR34112)
- "EPA recognizes that certain other elements may not be applicable in all cases. To provide flexibility for facilities with unique circumstances, certain elements are prefaced by use of the words 'shall, as appropriate' or modified by the use of the words 'or equivalent'."(59FR34074)
- **Accordingly, 1,000 ft of containment boom is not appropriate and would not be practicable for a response to a discharge from this facility. Based upon local topography, initial response will be accomplished with diking/damming, underflow dams and a minimal amount of containment and sorbent boom (approximately 50' of each). The response will be implemented utilizing local contract resources. These tactical response strategies have been pre-identified and documented. These Tactical PrePlans have been provided herein behind tab "Tactical PrePlans" located at the end of this Volume 2, Section 8.**
- The initial equipment for these response strategies will be provided by Nations Rental under an on call agreement with KMEP. An equipment list for Nations Rental is provided in volume 2, Section 3. In accordance with the two (2) hour response requirement for recovery equipment, Ancon Marine will also provide vacuum truck services under Contract 05-ER-45-060-ORG.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.
- Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture

Spills of this size would likely be Gasoline or JP-8. Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before a spill containment could begin. The spilled material would likely be routed to the separator system. If a spill of this size escaped the property it could possibly enter the New River. Adverse weather conditions would increase the chances of a discharge entering the river; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages can be referenced in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a medium discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

The closest waterway is the New River so the potential for a spill of this size reaching navigable water does exist. The area is sparsely populated so damage to ecologically sensitive habitats, recreational areas, etc. would be possible. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the *Medium Discharge* volume that are capable of arriving on scene within 12 hours.
- Sufficient quantity of containment boom must arrive within 12 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 12 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 12 hours; Tier 2 = 36 hours; Tier 3 = 60 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 12 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage facilities.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the river.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed (b) (7)(F), (b) (3)

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached). Spills of this size would likely be Gasoline.

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages can be located in the Potential Spill Sources and Container Identification table in Section 8.2.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow north through the Facility and south down the drainage ditch east of the Facility. Ultimately the flow will reach the New River which is located west of the property.

For a spill that is confined to the land along the pathway, Facility personnel would have at least two (2) options by which to contain the spill:

- Dams
- Trenches

Ditch Containment

A spill may be contained in storm water ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located east of the New River. The priority during larger spills is to prevent oil from reaching the waterway. OSROs are under contract with the Facility. The Company, however, will use Facility personnel and Facility owned equipment to initiate boom deployment and anchoring at the waterway within one hour. Several recreating areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by the state and Federal trustees would likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Response Requirement (Cont'd)

- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage facilities.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. - Phoenix Terminal is an EPA jurisdictional "Non-Transportation Related Onshore" Facility which operates in a Non-Higher Volume Port Area.

The EPA discharge volume calculations are described as follows:

EPA Discharge Volume Calculation
● **Worst Case Discharge** *100% of the largest single tank* **WCD** = (b) (7)(F), (b) (3)
● **Medium Discharge** *Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD* **MD** = 857 bbls
● **Small Discharge** *Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD* **SD** = 50 bbls

8.3 DISCHARGE SCENARIOS (Cont'd)

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack, or leaking piping and would be Gasoline.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the Facility could be diverted to the product tanks that are not at maximum capacity.

The closest waterway is the Roosevelt Canal, which is south of the Facility. The storage tanks and truck loading racks, have adequate secondary containment so it is unlikely that a spill would reach the canal or travel very far if it did. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Summary of EPA Regulatory Response Requirements for a Small Discharge

*The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, **AS APPROPRIATE**, include:*

- *1,000' of containment boom **and a means of deploying it** within one (1) hour of the discovery of a spill. [Guidance: The appropriate level of response resources to address a small discharge from this Facility should arrive on-scene; including the equipment and appropriately trained manpower necessary to deploy the response resources; within one (1) hour of discovery of the discharge.]*
- *Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a Small Discharge or greater which is available at the Facility within two (2) hours of the detection of an oil discharge. [Guidance: Oil recovery devices with a minimum of 50 bbls/day recovery capacity (or greater) should be on scene and ready to commence recovery of discharged oil within two (2) hours of discovery of the discharge. The response resources that arrived to the site in the first hour (noted in the first bullet above) should be deployed and actively containing discharged oil within this two (2) hour period.]*
- *Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate. [Guidance: Storage capacity for twice the effective daily recovery rate (2 times 50 bbls/day) is 100 bbls/day which should be available at the commencement of the recovery operations, therefore within two (2) hours of discovery of the discharge.]*

Facility Response Resources/Capability

Probable Scenario

- A 50 bbl discharge typically will not escape the containment of the Facility.
- If a 50 bbl discharge escaped the Facility it would likely occur as the result of an incident at or near the truck loading rack. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Potential Offsite Impact

- The closest waterway is Roosevelt Canal, which is south of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the canal. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Appropriate Level of Response (in unlikely event of offsite impact)

- Under Section 3.3 to Appendix E of 40 CFR 112 – *Determination and Evaluation of Required Response Resources for Facility Response Plans*, it states, "The response resources shall, **as appropriate**, include: 3.3.1 One thousand feet of containment boom…" (59FR34112)

- "EPA recognizes that certain other elements may not be applicable in all cases. To provide flexibility for facilities with unique circumstances, certain elements are prefaced by use of the words **'shall, as appropriate'** or modified by the use of the words **'or equivalent'.**"(59FR34074)

- **Accordingly, 1,000 ft of containment boom is not appropriate and would not be practicable for a response to a discharge from this facility. Based upon local topography, initial re`sponse will be accomplished with diking/damming, underflow dams and a minimal amount of containment and sorbent boom (approximately 50' of each). The response will be implemented utilizing local contract resources. These tactical response strategies have been pre-identified and documented. These Tactical PrePlans have been provided herein behind tab "Tactical PrePlans" located at the end of this Volume 2, Section 8.**

- The equipment for these response strategies will be provided by Arizona Pipeline Company with which KMEP has a contract (Contract 01-CE-20-361-ORG). In accordance with the two (2) hour response requirement for recovery equipment, M.P. Environmental will also provide vacuum truck services. M.P. Environmental's equipment list is provided in Volume 2, Section 3.

- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.

- Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.

- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.

- Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings and FRP reviews.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture

Spills of this size would likely be Gasoline. Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before a spill containment could begin. The spilled material would more than likely collect in the containment area sump system and be routed to the separator system. If a spill of this size escaped the property it could possibly enter the Roosevelt Canal. Adverse weather conditions would increase the chances of a discharge entering the river; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages can be referenced in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a medium discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO/Contractor to arrive, qualified Facility personnel would evacuate the Facility, as appropriate, and initiate "immediate response actions" (Section 4 of Volume 2).

The closest waterway is Roosevelt Canal so the potential for a spill of this size reaching navigable water, although minimal, does exist. The area is sparsely populated so damage to ecologically sensitive habitats, recreational areas, etc. would be possible. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Summary of EPA Regulatory Response Requirements for a Medium Discharge

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- *Oil recovery devices with an effective daily recovery capacity equal to 50% of the Medium Discharge volume that are capable of arriving on scene within 12 hours.*
- *Sufficient quantity of containment boom must arrive within 12 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.*
- *Temporary storage capacity equal to twice the daily recovery capacity.*

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 12 hours.

- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 12 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage facilities within 12 hours.
- In the event that the spill escapes the boundaries of the Facility and impacts the river, containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) within 12 hours.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed [redacted]

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached). Spills of this size would likely be Gasoline.

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages can be located in the Potential Spill Sources and Container Identification table in Section 8.2.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow southwest and enter Roosevelt Canal which is located south of the property.

For a spill that is confined to the land along the pathway, Facility personnel would have at least two (2) options by which to contain the spill:

- Dams
- Trenches

Ditch Containment

A spill may be contained in storm water ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located north of Roosevelt Canal. The priority during larger spills is to prevent oil from reaching the waterway. Response Contractors and OSROs are under contract with the Facility to address the response requirements for the small, medium and worst case discharges. Several recreating areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by state and Federal trustees would likely follow the response.

Summary of EPA Regulatory Response Requirements for a Worst Case Discharge

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- *All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 12 hours, Tier 2 = 36 hours, Tier 3 = 60 hours).*
- *Oil recovery devices with an effective daily recovery capacity equal to the lesser of the WCD Response Planning Volume Calculation or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.*

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Summary of EPA Regulatory Response Requirements for a Worst Case Discharge (Cont'd)

- *Temporary storage capacity equal to twice the daily recovery capacity.*
- *At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.*
- *Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.*
- *Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.*
- *The above Response Planning Volume requirements, including response times, are based on Attachment E-1 of Appendix E to 40 CFR Part 112.*

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate the "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) and contract resources will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers (Tier 1 = 12 hours, Tier 2 = 36 hours, Tier 3 = 60 hours) and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of the WCD Response Planning Volume Calculation (table located in this Section) or the response caps will be secured from the OSRO(s) and other contract resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other contract resources, or made available within the Facility's storage facilities.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other contract resources will be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other contract resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other contract resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. - Tucson Terminal is an EPA jurisdictional "Non-Transportation Related Onshore Facility" which operates in a Non-Higher Volume Port Area.

The EPA discharge volume calculations are described as follows:

EPA Discharge Volume Calculation

- **Worst Case Discharge**
  100% of the largest single tank

  WCD = (b) (7)(F),

- **Medium Discharge**
  Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD

  MD = 857 bbls

- **Small Discharge**
  Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD

  SD = 50 bbls

8.3 DISCHARGE SCENARIOS (Cont'd)

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack, or leaking piping and would be Gasoline.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the Facility could be diverted to the product tanks that are not at maximum capacity.

The closest waterway is the Santa Cruz River, which is west of the Facility. The storage tanks and truck loading racks, have adequate secondary containment so it is unlikely that a spill would reach the river or travel very far if it did. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Summary of EPA Regulatory Response Requirements for a Small Discharge

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, ***AS APPROPRIATE****, include:*

- *1,000' of containment boom* ***and a means of deploying it*** *within one (1) hour of the discovery of a spill. [Guidance: The appropriate level of response resources to address a small discharge from this Facility should arrive on-scene; including the equipment and appropriately trained manpower necessary to deploy the response resources; within one (1) hour of discovery of the discharge.]*
- *Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a Small Discharge or greater which is available at the Facility within two (2) hours of the detection of an oil discharge. [Guidance: Oil recovery devices with a minimum of 50 bbls/day recovery capacity (or greater) should be on scene and ready to commence recovery of discharged oil within two (2) hours of discovery of the discharge. The response resources that arrived to the site in the first hour (noted in the first bullet above) should be deployed and actively containing discharged oil within this two (2) hour period.]*
- *Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate. [Guidance: Storage capacity for twice the effective daily recovery rate (2 times 50 bbls/day) is 100 bbls/day which should be available at the commencement of the recovery operations, therefore within two (2) hours of discovery of the discharge.]*

Facility Response Resources/Capability

Probable Scenario

- A 50 bbl discharge typically will not escape the containment of the Facility.
- If a 50 bbl discharge escaped the Facility it would likely occur as the result of an incident at or near the truck loading rack. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Potential Offsite Impact

- The closest waterway is the Santa Cruz River, which is west of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the river. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Appropriate Level of Response (in unlikely event of offsite impact)

- Under Section 3.3 to Appendix E of 40 CFR 112 – *Determination and Evaluation of Required Response Resources for Facility Response Plans*, it states, "The response resources shall, **as appropriate**, include: 3.3.1 One thousand feet of containment boom…" (59FR34112)

- "EPA recognizes that certain other elements may not be applicable in all cases. To provide flexibility for facilities with unique circumstances, certain elements are prefaced by use of the words **'shall, as appropriate'** or modified by the use of the words **'or equivalent'.**"(59FR34074)

- **Accordingly, 1,000ft of containment boom is not appropriate and would not be practicable for a response to a discharge from this facility. Based upon local topography, initial response will be accomplished with diking/damming, underflow dams and a minimal amount of containment and sorbent boom (approximately 50 feet of each). The response will be implemented utilizing local contract resources. These tactical response strategies have been pre-identified and documented. These Tactical PrePlans have been provided herein behind tab "Tactical PrePlans" located at the end of this Volume 2, Section 8.**

- The equipment for these response strategies to be utilized for the small discharge will be provided by Chemical Transportation, Inc. with which KMEP has a contract (Contract HQ-05-4162). In accordance with the two (2) hour response requirement for recovery equipment, Chemical Transportation, Inc. will also provide vacuum truck services. Chemical Transportation, Inc. equipment list is provided in Volume 2, Section 3.

- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.

- Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.

- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.

- Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings and FRP reviews.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture

Spills of this size would likely be Gasoline. Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before spill containment could begin. If a spill of this size escaped the property it could possibly enter the Santa Cruz River. Adverse weather conditions would increase the chances of a discharge entering the river; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages can be referenced in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a medium discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO/Contractor to arrive, qualified Facility personnel would evacuate the Facility (as appropriate) and initiate "immediate response actions" (Section 4 of Volume 2).

The closest waterway is the Santa Cruz River so the potential for a spill of this size reaching navigable water, although minimal, does exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Summary of EPA Regulatory Response Requirements for a Medium Discharge

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- *Oil recovery devices with an effective daily recovery capacity equal to 50% of the Medium Discharge volume that is capable of arriving on scene within 12 hours.*
- *Sufficient quantity of containment boom must arrive within 12 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.*
- *Temporary storage capacity equal to twice the daily recovery capacity.*

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 12 hours.

- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 12 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage facilities within 12 hours.
- In the event that the spill escapes the boundaries of the Facility and impacts the river, containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) within 12 hours.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed (b) (7)(F), (b) (3)

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached). Spills of this size would likely be Gasoline.

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages can be located in the Potential Spill Sources and Container Identification table in Section 8.2.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow north and west to enter the Santa Cruz River which is located west of the property.

For a spill that is confined to the land along the pathway, Facility personnel would have at least two (2) options by which to contain the spill:

- Dams
- Trenches

Ditch Containment

A spill may be contained in storm water ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located east of the Santa Cruz River. The priority during larger spills is to prevent oil from reaching the waterway. Response Contractors and OSROs are under contract with the Facility to address the response requirements for the small, medium and worst case discharges. Several recreating areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by state and Federal trustees would likely follow the response.

Summary of EPA Regulatory Response Requirements for a Worst Case Discharge

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- *All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 12 hours, Tier 2 = 36 hours, Tier 3 = 60 hours).*

- *Oil recovery devices with an effective daily recovery capacity equal to the lesser of the WCD Response Planning Volume Calculation or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.*

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Summary of EPA Regulatory Response Requirements for a Worst Case Discharge (Cont'd)

- *Temporary storage capacity equal to twice the daily recovery capacity.*
- *At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.*
- *Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.*
- *Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.*
- *The above Response Planning Volume requirements, including response times, are based on Attachment E-1 of Appendix E to 40 CFR Part 112.*

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate the "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) and contract resources will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers (Tier 1 = 12 hours, Tier 2 = 36 hours, Tier 3 = 60 hours) and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of the WCD Response Planning Volume Calculation (table located in this Section) or the response caps will be secured from the OSRO(s) and other contract resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other contract resources, or made available within the Facility's storage facilities.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other contract resources will be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other contract resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other contract resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Company Personnel (IC) assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 345 W. Aten Road
El Centro, CA 92251
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility and Union Pacific Railroad, if applicable.
h. Staging area for Emergency Command Center will be at the entrance to the Facility or where the Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the main office. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel (IC) will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the southern office building or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility Office building.

8.4 FACILITY EVACUATION (Cont'd)

4. Community Evacuation

The Company has confirmed with the Imperial Police Department that no community evacuation plan currently exists for this area. However, the Police Department does have standard guidelines that are followed in the event of an evacuation.

5. Directions to El Centro Regional Medical Center

From the Facility, start out going west on W Aten for 0.21 miles. Proceed north on CA-86 N by turning right. Travel 0.55 miles and turn left onto Airport Rd. Go 0.01 miles and turn left onto CA-86 S. Proceed 2.52 miles on CA-86 S where it becomes N Imperial Ave/C-86. Go 0.1 miles and turn left onto CA-86 S/Adams Ave. Travel 1.06 miles to CA-86/Adams Ave where it becomes CA-86 S/N 4th St. Go 1.49 miles and turn left to take the I-8 E ramp. Go 0.19 miles to merge onto I-8 E. Proceed 2.78 miles and take the CA-111 N exit towards Brawley. Travel 0.19 miles and merge onto CA-111 N. Go 0.53 miles to Ross Ave. Take a right at Ross Ave and proceed 0.17 miles to El Centro Regional Medical Center on the right.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gates located northwest of the office.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

8. Prevailing Winds

The prevailing winds in the Facility area generally come from the southeast at an average speed of 5-10 mph year round.

9. Water Currents

Currents in the New River are minimal.

TACTICAL PLAN

The following Tactical Plan has been provided to assist initial response to a spill incident from this Facility. The plan includes the following:

- Driving directions
- General pictures of the site and tactical response strategy
- General response equipment and personnel recommendations

Note: This Tactical Plan is provided as a general guidance tool for response to an incident emanating from this Facility. The selection of response strategy equipment, manpower and deployment site may vary based on actual field conditions (e.g. terrain, weather conditions, product type/volume) and incident details.

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Company Personnel (IC) assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 49 N. 53rd Ave.
Phoenix, AZ 85043
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility, a Union Pacific Railroad, if applicable.
h. Staging area for emergency command post will be at the entrance to the Facility or where designated by Fire Department.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the Control Building. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel (IC) will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the secondary emergency response command center or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility Control Building, or the east or west staging area.

8.4 FACILITY EVACUATION (Cont'd)

4. Community Evacuation

A community evacuation plan currently exists for this area.

5. Directions to Maryvale Samaritan Hospital

From the Facility exit on 53rd Avenue, start out by turning right onto 53rd Avenue going north. Proceed 0.30 miles and turn right onto W. Van Buren St. Travel approximately 0.51 miles and turn left on N. 51st Avenue. Proceed north 3.52 miles to the Maryvale Hospital.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gate located Southwest of the Control Building. If the situation permits, the Facility may also be accessed through the eastern access road (Monroe Avenue off of 51st Ave.).

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

8. Prevailing Winds

The prevailing winds in the Facility area generally come from the southeast at speed of 5-10 mph year round.

9. Water Currents

Currents in the Roosevelt Canal are minimal.

TACTICAL PLAN

The following Tactical Plan has been provided to assist initial response to a spill incident from this Facility. The plan includes the following:

- Driving directions
- General pictures of the site and tactical response strategy
- General response equipment and personnel recommendations

Note: This Tactical Plan is provided as a general guidance tool for response to an incident emanating from this Facility. The selection of response strategy equipment, manpower and deployment site may vary based on actual field conditions (e.g. terrain, weather conditions, product type/volume) and incident details.

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the KMEP Emergency Plan, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Company Personnel (IC) assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 3841 E. Refinery Way
Tucson, AZ 85713
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility and Southern Pacific RR is applicable.
h. Staging area for Emergency Command Post will be at the entrance to the Facility or where designated by Fire Department.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the Administration Office. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel (IC) will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** – Employees unable to report to primary assembly area should report to either 2nd or 3rd response command centers. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility Main Office. The staging area for the emergency command post will be at the entrance to the Facility or the Fire Department designated area.

8.4 FACILITY EVACUATION (Cont'd)

4. Community Evacuation

A community evacuation plan currently exists for this area.

5. Directions to Kino Community Hospital

From the Facility, turn right going west on E. Refinery Way for 0.16 miles to S. Dodge Blvd. Turn right onto E. Ajo Way and travel approximately 1 mile to Kino Community Hospital.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gate located South of the Control Building. If the situation permits, the Facility may also be accessed through the northern access road.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

8. Prevailing Winds

The prevailing winds in the Facility area generally come from the Southeast, at an average speed of five to ten (5-10) mph year round.

9. Water Currents

Currents in the Santa Cruz River are only present during the rainy season (July-August).

1.2 OPERATING ASSETS COVERED BY THIS PLAN

The following tables provide a general information summary for the pipeline sections, pipeline facilities, breakout stations and terminals in each of the Areas in this Region. Specific detail can be located in the following sections for the applicable area.

- Section 6 - Area Pipeline Sections (for DOT jurisdiction)
- Section 7 - Area Breakout Stations (for DOT jurisdiction)
- Section 8 - Area Terminals (for EPA)

EL PASO AREA		
PIPELINE SECTIONS	**LINE NO.**	**COUNTY / STATE**
EL PASO AREA LINES		
Diamond Junction – El Paso Breakout	132	El Paso, TX
El Paso Station – El Paso Breakout 8”	4	El Paso, TX
El Paso Breakout - NM Line 8” (Out of Service)	4	El Paso, TX
El Paso - NM Line 12”	17	El Paso, TX
Chevron - UPRR 4”	49	El Paso, TX

PIPELINE FACILITIES (Non-Storage)		
Davis Monthan AFB – Delivery Facilities to Military Storage		
Road Forks Junction – Delivery Facilities to Plant Shipper		
BREAKOUT STATIONS		**COUNTY / STATE**
None		
TERMINALS		**COUNTY / STATE**
Tucson Terminal		Pima, AZ

1.3 SUBSTANTIAL HARM

It is Kinder Morgan Energy Partners, L.P. (KMEP)'s goal to respond as quickly as possible to all uncontrolled releases of petroleum product, regardless of the source point location along the system. Based upon this goal, and the overbreadth of the definitions provided in each of the applicable regulations, KMEP is compelled to consider all of the facility's breakout stations, and active line sections listed above in this Section, as capable of a release potentially causing "significant and substantial harm". A summary of the worst case discharge scenarios for these facilities is provided as follows:

SOUTHERN REGION - EAST WORST CASE DISCHARGE DOT JURISDICTION

Discharge Scenario	Planning Volume
(b) (7)(F), (b) (3)	

* DOT Worst Case Discharge volumes are based on 50% of the tank maximum storage capacity and for pipelines based on an annual Integrity Management Program study, as follows:

Release volume prior to line shutdown and valve closures (Initial Loss):

- Full flow release due to rupture. This is computed at the maximum pumping rate the line segment.
- Detection time, analysis and pump shutdown in adverse weather conditions. This is based on a maximum of fifteen (15) minutes in the event of a full flow rupture, which would cause an instant alarm.
- Line segment valve closures. All line segments are equipped with remote activating isolation valves. Adverse weather would have no impact on line segment isolation, as isolation valves are not dependent on manual closure.

Line drainage following pump shutdown (Stabilization Loss) is computed the maximum potential line drainage between adjacent isolation or check valves, and incorporated pipeline elevation profiles to estimate how much of that total volume would escape at any release point along the line. The historic discharges have not approached either the breakout tank WCD volume or the pipeline WCD in the area.

SOUTHERN REGION - EAST WORST CASE DISCHARGE EPA JURISDICTION	
Discharge Scenario	**Planning Volume**
Small Discharge	
• Imperial Terminal	50 Bbls
• Phoenix Terminal	50 Bbls
• Tucson Terminal	50 Bbls
Medium Discharge	
• Imperial Terminal	857 Bbls
• Phoenix Terminal	857 Bbls
• Tucson Terminal	857 Bbls
Worst Case Discharge	
(b) (7)(F), (b) (3)	

Note: EPA Worst Case Discharge is based on the maximum storage capacity of the largest tank at each terminal.

These Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three-tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. Sections 6, 7, and 8 of this Plan demonstrate a series of calculations and planning volume determinations based on guidance provided by all applicable regulations. The inclusion of these calculations is for demonstration of the response planning volumes and response capability necessary for on-water and on-shore recovery requirements as the result of the discharge scenarios detailed in the table above.

1.4 FORMAT AND SCOPE OF PLAN

This Volume 2 of the Integrated Contingency Plan is intended to guide emergency response activities throughout KMEPs Pacific Operation Southern Region - East. This Region (see Figure 1.1) is divided into four (4) areas each of which have their respective Volume 2. These areas are as follows:

- El Paso Area
- Imperial Area
- Phoenix Area
- Tucson Area

Each of the Volume 2 plans in this area reflects identical Sections 1 through 5. Section 6 of each plan details the Pipeline Sections in the respective area, Section 7 of each plan details the Breakout Stations/Terminals (DOT) in the respective area, and Sections 8 of each plan details the Terminals (multi-jurisdictional) in the respective area. The Area covered by this particular plan is identified on the front cover of this plan and on the footer of each page and on the maps provided in Figure 1.1.

Volume 1 of the Integrated Contingency Plan provides guidance which is consistent across the Pacific Operations. The two (2) documents are intended to work together as one seamless Integrated Contingency Plan for the various facilities/operations and agency jurisdictions in Pacific Operations.

2.0 NOTIFICATIONS

2.1 INTERNAL NOTIFICATIONS

Specific reference to all internal notifications is detailed in **Volume 1** Section 2.1 which provides the following:

- KM Employee or Agent Notification Process - California Only (Figure 2.1a)
- Operator Notification Process - Non-California (Figure 2.1b)
- Company Employee Other Than Operator Notification Process - Non-California (Figure 2.1c)
- Controller - Orange, CA Notification Process - California Only (Figure 2.1d-1)
- Controller - Orange, CA Notification Process - Non-California (Figure 2.1d-2)
- Controller - Houston, TX Notification Process (Figure 2.1e)
- Managers Internal Notification Process (Figure 2.1f)
- Initial Reporting Details Form (Figure 2.2)
- Northern Region Internal Notifications References (Figure 2.3a)
- Southern Region Internal Notifications References (Figure 2.3b)
- Crisis Support Team Internal Notifications References (Figure 2.3c)

2.2 EXTERNAL NOTIFICATIONS

Specific reference to all **"Regulatory Required"** external notifications is detailed in Volume 1, Figure 2.1 and Figure 2.4. **With the exception of notification to 911 and/or local fire/police agencies which are handled by local area operations, the Environmental, Health and Safety (EHS) and/or Compliance, Codes and Standards is responsible for making all regulatory required external notifications in all states other than in California. In California and locations monitoring or controlling, pipeline sections in California, refer to Volume 1, Section 2.2 and Figure 2.4.**

The locally required notifications and additional external notification references which are detailed in the following Volume 2, Figure 2.1 provide for assistance/advisory notifications. Specific notifications for contacting OSROs are found in Volume 2, Figure, 2.1, "_____ Terminal Response Contractors".

SOUTHERN REGION-EAST

3.0 RESPONSE RESOURCES

The following sections outline the various response equipment/resources available from the Facility, other KMEP facilities, and other outside resources.

3.1 AREA RESPONSE EQUIPMENT

This Area of the KMEP operations maintains response equipment readily available for spill response as detailed on the "Facility Response Equipment" lists provided in Figure 3.1 and the "Pipeline Repair Equipment" lists provided in Figure 3.2. The equipment is stored at locations in the Area as detailed on the equipment lists.

The preventative maintenance schedule requires a monthly inventory and visual inspection of spill response equipment. Maintenance and repair is performed as needed, following manufacturers recommended procedures. The equipment will be exercised as semi-annually (Facility equipment) or annually (pipeline equipment) as required (PREP Guidelines). A sample form for documenting these Equipment Deployment Exercises is provided in Figure 3.4.

KMEP has contracts in place with Oil Spill Removal Organizations and other clean-up and response contractors that are capable of responding to all discharges within the Area and supplementing Area KMEP resources.

The Qualified Individual has the authority to activate these and other KMEP resources or that of private contractors and other experts and consultants as the situation demands.

3.2 OTHER COMPANY RESOURCES

Neighboring KMEP Areas have response resources similar to those provided in this Area (Figures 3.1 and 3.2). These resources as well as additional KMEP spill response equipment and manpower resources may be available to supplement the response operation.

3.3 CONTRACT RESOURCES

In the event of a discharge which is beyond the initial response capabilities of the Local Response Team, contract manpower and equipment resources can be obtained through Oil Spill Removal Organization(s) (OSRO). These OSROs can provide manpower and containment/clean-up equipment for the response operation. *KMEP will ensure that each OSRO has a comprehensive maintenance program and applicable training / drills programs in place at contract renewal.*

Response resources will be secured from a KMEP approved contractor. Facility Management will typically handle notification/implementation of these resources. Section 2 of this Volume provides a quick reference to the OSROs and additional clean-up and response contract organizations. A detailed list of the "Pacific Region Open End and On-Call Contractors" is provided in Figure 2.2. Specific reference to their response capability (UCSG OSRO classification) is provided in Figure 3.3.

These OSRO's have adequate equipment and personnel resources available within the Area to respond to the applicable regulatory planning volumes in the required time frames.

3.3 CONTRACT RESOURCES (Cont'd)

OSROs have the expertise to conduct and lead on water and shoreline containment and recovery efforts. KMEP personnel will oversee and coordinate with the OSRO to ensure their actions conform with overall incident objectives and established incident action plans.

OSROs also have extensive experience in using the Area Contingency Plans (ACPs) as a resource when responding to an incident that has affected a navigable waterway. The KMEP Incident Commander, Planning Officer and Operations Officer will employ the OSRO's experience to integrate applicable local ACPs into the overall incident action plans.

3.4 AREA CONTINGENCY PLANS (ACP)

Area Committees comprised of Federal, state and local agencies develop ACPs. Response efforts performed within a certain "area" should reference the ACPs for that specific area. ACPs include clean-up strategies and information on environmentally sensitive areas within a particular region. Some of the ACPs include maps, shoreline characteristics and booming strategies for specific areas while other ACPs offer priority lists of environmentally sensitive areas.

ACPs generally contain the following information:

- Physical features
- Seasonal concerns
- Resources of primary concern
- Containment, and cleanup strategies, including recommended techniques
- Equipment considerations
- Incident Command System Roles and Responsibilities (NIMS)

To identify specific spill response and protection strategies for the applicable region/area, ACP and Geographic Response Plan information can be found at: http://kmonline.kindermorgan.com/operations/products/pacific_icp/pacific_icp.html Responders can navigate through the site to locate the region/area of interest and the appropriate response resources needed for the operation.

For all controlled copies of the Integrated Contingency Plan distributed to non-KMEP plan holders, a CD-ROM containing the same information as referenced above will be included in a CD-sleeve in Volume 1 (inside front cover) or in a separate folder in electronic copies and is referenced in Figure 4.2.

To assess adequate response resources, the Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three (3) tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. The tier requirements for high volume areas are for response in six (6) hours (Tier 1), 30 hours (Tier 2), and 54 hours (Tier 3). High volume areas are listed in 49 CFR 194. The tier requirements for all other areas are for response in 12 hours (Tier 1), 36 hours (Tier 2), and 60 hours (Tier 3).

3.5 COOPERATIVE/MUTUAL AID RESOURCES

Cooperative/mutual aid resources will be utilized when available and/or necessary.

3.6 EXPERTS AND CONSULTANTS

KMEP maintains a relationship with various environmental and technical consultants that can provide support in the event of an emergency incident. These consultants can provide expertise and support in the areas of emergency response management, environmental services, site assessment, permitting, waste treatment, recycling, dewatering, hazardous waste disposal, and remediation.

3.7 VOLUNTEERS

Volunteers will not be utilized by KMEP for the response operations. All volunteers will be referred to the state or Federal On-Scene Coordinator (EPA).

3.8 COMMUNICATIONS

Effective and efficient communications systems are essential for emergency response at every level. The communications system will be utilized to gather information and current status reports as well as to provide coordination and direction to widely separated work groups involved in search, containment/ diversion, repair, traffic control, public control or evacuation, and restoration.

Communication of the overall spill response operation between KMEP and the responsible government agencies in the Federal Regional Response Team (RRT) will occur between the Incident Commander and the Federal On-Scene Coordinator.

3.8.1 Central Communications System

Prearranged communication channels are of the utmost importance in dealing with KMEP emergencies. The notification procedures and telephone contacts documented in Section 2 of this Volume 1 and Volume 2 will be reviewed in accordance with the earlier documented updating procedures. The predetermined communications channels include the following:

- A list of required Federal and State emergency telephone numbers for the Orange Control Center and emergency response personnel (Section 2 of Volume 1).
- A list of emergency telephone numbers for various external resources such as the fire and police department, medical, and regulatory agencies (Figure 2.1).
- A list of emergency telephone numbers for contract response resources (Figure 2.1).

3.8 COMMUNICATIONS (Cont'd)

3.8.2 Communications Equipment

Field communications during a spill response to a small or medium discharge will be handled via the existing KMEP communications network. This network will utilize existing radios, telephones, beepers, fax machines, and computers and will be maintained by KMEP personnel. In the event of a Worst Case Discharge, field communications will be enhanced with other KMEP and contract resources as the situation demands.

Each KMEP responder has, at a minimum, a cellular telephone. All KMEP response personnel also have access to other telephones, radios and satellite communications equipment that may be needed for effective response operations. Additionally, communications equipment is maintained in the KMEP spill response trailers. The Logistics Officer would create a communications plan based on the equipment immediately available and would identify the need for any additional equipment that may be needed throughout the response effort.

3.8.3 Communication Types

Radios - Handheld and vehicle mounted radio sets are the most effective means of communication for the field response operation. The units are battery operated, multi-channeled and have a typical range that will cover the area of the response operation. Each location maintains a minimum of 4 radio sets, functionally maintained per manufacturer's specifications and kept in designated KMEP response trailers. In addition, KMEP also utilizes radio sets provided by contract resources. Additional radio sets and battery packs/charges will be necessary in the event of a prolonged response operation.

Telephone (Conventional) - Conventional land line telephones are the most effective means of communication for regulatory and advisory notifications during a spill response operation. Additional telephone lines can be installed in the event of a prolonged response operation.

Telephone (Cellular) - Cellular telephones allow for added mobility and response effectiveness. Cellular phones are commonly maintained by certain KMEP personnel. Additional cellular phones can be secured in the event of a prolonged response operation.

Telephone (Satellite) – Satellite telephones allow for communications regardless of location or coverage by other systems. A limited number of emergency satellite telephones are maintained by KMCP personnel in each location for emergency response purposes. Additional satellite telephones would be available as needed in the event of a prolonged response operation.

Pagers - Pagers are used for rapid notification to field personnel when radio and telephone resources are limited. Most response team members carry a pager.

FAX Machines - FAX machines allow for a rapid transfer of information/ documentation such as status reports/updates, written notifications, and purchase orders.

Computers - Computers are commonly used in networks which allow access to various other locations and KMEP personnel. Computers also speed the consolidation of information and preparation of written reports.

FIGURE 3.1

Facility Response Equipment
(Reserved)

Response to an oil spill incident will be conducted by KMEP contracted Oil Spill Removal Organizations as detailed in Figures 2.1 and 3.3

FIGURE 3.2

PIPELINE REPAIR EQUIPMENT

(This equipment is primarily for pipeline repair not terminal response.)

Qty.	Description	Comments
PHOENIX TERMINAL

CHEMICAL TRANSPORTATION, INC.

RESPONSE RESOURCE LIST

TUCSON TERMINAL

De-rating for Tier 1 - 12 hr Response for Chemical Transportation, Inc.:

- Frac Tanks - Six (6) 20,000 gallon Frac Tanks are immediately available plus an additional two (2) Frac Tanks (as needed) every four (4) hours.

- Skimming Capacity will be provided by Vacuum Trucks. Eight (8) 5,000 gallon vacuum trucks totaling 40,000 gallons are immediately available. Assuming a two (2) hour round trip for each vacuum truck, a gross skimming volume of 480,000 gallons is available

$$(8 \text{ trucks x } 5{,}000 \text{ gallon/truck x } 24 \text{ hr} \div \frac{1}{2hr(trip)} =$$

480,000 gallons = 11,428 bbls (gross))

- De-rating $\Rightarrow$ 11,428 bbls/day x 20% = 2,285 bbls/day

Work Directive No.: 4794913-2-STAT

Agreement No.: **55168**

Requisition No/ Accounting Information: 259686

This Work Directive is entered pursuant to the terms of the Engineering/Procurement/Project Management Agreement ("Agreement") dated 08/01/2012 , by and between KINDER MORGAN ENERGY PARTNERS, L.P. ("COMPANY") and CHEMICAL TRANSPORTATION, INC. ("SERVICE PROVIDER"). By its execution hereof, SERVICE PROVIDER agrees to perform for the Kinder Morgan ("KM") entity named below and executing this Work Directive pursuant to the terms, conditions and provisions of the Agreement, the following described Work which will additionally describe "Covered Tasks" as provided for under DOT Operator Qualification Requirements, and shall furnish all services, labor, supervision, technical capability, tools, equipment, vehicles, vessels, barges, transportation, materials, (except as set forth below), and other facilities and items necessary or convenient to complete the following work as further described and specified in the Specifications and/or Drawing(s) attached hereto or the Agreement and by this reference made a part of this Work Directive ("the Work"). If SERVICE PROVIDER'S proposal, quotation, or any other SERVICE PROVIDER document supplied to the KM entity named below is included as part of this Work Directive or another exhibit to the Agreement, then any terms or conditions provided by SERVICE PROVIDER which differ from or conflict with COMPANY'S terms and conditions are hereby rejected and shall be of no force or effect. The KM entity named below in this Work Directive shall be solely responsible for the liabilities and obligations set forth in the Agreement under which this Work Directive is being issued and this Work Directive arising out of or related to the Work to be performed pursuant hereto. All such liabilities and obligations, as they apply to this Work Directive, shall be non-recourse to the COMPANY (if the COMPANY is not the KM Entity executing this Work Directive) and all other related entities as further provided for and agreed in the Agreement. Payments made to SERVICE PROVIDER under this Work Directive shall include all taxes and similar charges except as otherwise agreed to herein or under the terms of the Agreement. Any capitalized term used in this Work Directive and not otherwise defined herein shall have the meaning as ascribed in the Agreement.

1.0 **Project Name and Work Location Details:** PROVIDE OSRO SERVICES / EL PASO BREAKOUT STATION, EL PASO, TX

2.0 **Scope of Work:** The following is a full and complete description of the Work (and goods) to be provided by SERVICE PROVIDER including, but not limited to specifications, conditions and referenced bids/proposals.

Provide all trained personnel, labor, tools, and equipment necessary to provide Oil Spill Removal Organization (OSRO) services to meet the Federal OPA '90 requirements for contracted oil spill removal services for the El Paso Breakout Station located at 11621 Railroad Drive, El Paso, Texas as follows:

- Sufficient Response Resources to enable the COMPANY to meet the requirements of OPA '90 for pre-contracted Response Resources at the commencement of the Agreement including:
    - Responding with 1,000 feet of containment boom and a means to deploy it or other appropriate equipment and materials, as identified in the Tactical Response Plans presented in Volume 2, Section 8.4, within one (1) hour of notification*;
    - Oil recovery devices with an effective daily recovery capability (EDRC) equal to the amount of oil discharged in a small discharge (2,100 gallons) and temporary storage capacity equal to two (2) times the EDRC within two (2) hours of notification*;

- Documentation of equipment deployment exercises and personnel training must be submitted annually to Mr. Chuck Mathis, Manager Emergency Response Programs, c/o Kinder Morgan Energy Partners, L.P., 500 Dallas Street, Suite 1000, Houston, TX 77002, or charles_mathis@kindermorgan.com ;

- Compliance by the CONSULTANT and CONSULTANT's subcontractors with all applicable Federal Occupational Safety and Health Administration (OSHA) standards and similar applicable State laws, rules and/or standards.

* Travel times are based on suitable safety conditions and travel time capability per the U.S. Coast Guard minimum response time calculation factor of 35 mph overland or five (5) knots on water.

Regulatory References: 29 CFR 1910.120 (OSHA); 40 CFR 112 Appendix E 3.3 (U.S. EPA)

For Questions, contact PALACIOS, JAMES at 915-822-7004

3.0 The COMPANY will not furnish any materials to the Work Site(s), unless previously approved by the Designated Representative.

4.0 SERVICE PROVIDER shall commence the Work by the 05/01/2013 and shall complete the Work on or before 04/30/2014.

5.0 SERVICE PROVIDER offers to complete the Work in accordance with the Agreement for the total Lump Sum Amount of **$23,700.00**, Twenty Three Thousand Seven Hundred Dollars and Zero Cents, which shall constitute full and complete payment.

6.0 The parties hereby agree to AMEND Agreement 55168 as follows (or if the Agreement has been thus amended previously, to repeat the following sections):

i) Under the Compliance with Laws section, a **new subsection** is hereby added to the Agreement which reads as follows:

SERVICE PROVIDER certifies that at the time of execution of this Agreement SERVICE PROVIDER is not included on any debarment list maintained by any federal, state or local governmental authority nor prevented from performing Work for COMPANY by virtue of any governmental order, proceeding or otherwise. If at any time during the term of this Agreement SERVICE PROVIDER cannot so certify to COMPANY, SERVICE PROVIDER shall promptly notify COMPANY as to SERVICE PROVIDER'S status.

ii) The following language is hereby added to the Termination section under the termination for default paragraphs:

-- violates any EHS law; or

iii) All other provisions of the Agreement shall continue in full force and effect.

7.0 **Retainage:** Waive 10% retainage.

8.0 SERVICE PROVIDER shall submit invoices in duplicate to:

SFPP, L.P.

11621 Railroad Dr

El Paso, TX 79934

Attn: PALACIOS, JAMES

Phone: 915-822-7004
Fax: 915-778-1111

8.1 Invoices must clearly indicate the Agreement Number, Work Directive Number, as indicated above.

8.2 For Construction Projects, a Certificate of Final Completion must be completed, signed by an authorized representative, notarized, and attached to SERVICE PROVIDER'S final invoice.

9.0 SERVICE PROVIDER hereby certifies that it has downloaded, reviewed and understood the Kinder Morgan Contractor Safety Manual and shall, prior to the commencement of any Work hereunder, make the same available to its employees and subcontractors who will be performing work on premises owned and/or operated by the KM entity named below. If the English language is a communication barrier, SERVICE PROVIDER at its expense shall timely convert/translate the Kinder Morgan Contractor Safety Manual accurately into the appropriate language for its employees and subcontractors. Questions concerning the Manual should be directed to the Kinder Morgan Contractor Safety Indemnitees at: contractor_safety@kindermorgan.com prior to commencement of any Work.

10.0 Facsimile Signatures/Counterparts. This Work Directive may be executed in multiple original counterparts, each of which shall be deemed an original, and together they shall constitute one and the same agreement. Signature of this Work Directive may be effected by facsimile (with confirmation by transmitting machine) and/or transmitted by portable document format ("pdf") file which shall be treated as an original signature, and any such signature, facsimile, pdf file or copy of this signed Work Directive shall be construed and treated as the original and shall be binding as if it were the original.

11.0 By signing this Work Directive, SERVICE PROVIDER hereby confirms that neither it nor any of its affiliates has provided during the last twelve (12) months or is currently providing services to any third party undertaking which is competitive to the Work and or the project contemplated by this Work Directive, other than has already been disclosed in writing SERVICE PROVIDER to COMPANY. Unless prior written approval is obtained from COMPANY, until this Work Directive has been completed in accordance with the Agreement, SERVICE PROVIDER will not directly, or indirectly through a subsidiary or affiliate,

11.1 Consult advise, counsel, or otherwise assist (i) any competitor of (A) COMPANY, (B) an affiliate of COMPANY; or (C) any entity in which COMPANY holds an ownership interest (A, B, and C collectively being referred to herein as "Company Entity"), or (ii) any affiliate of such competitor, directly or indirectly, with regard to (x) any current or foreseeable competition to the Work and/or the project contemplated by this Work Directive, or (y) any potential assignment for a third party which could have or is likely to have an adverse effect on any Company Entity with respect to the Work and/or project contemplated by this Work Directive; or

11.2 Except to the extent required to comply with applicable law, consult, advise, counsel or otherwise assist any governmental authority, or Federal or State regulatory agency, in the United States or any other country (i) on any matter which could affect the Work and/or project contemplated by this Work Directive, or (ii) in a regulatory or any other forum or proceeding, which in any manner would have, or is likely to have, a reasonably foreseeable adverse effect upon a Company Entity.

In the **Agreement**, if there is a reference to "Kinder Morgan Kansas, Inc.," it shall now be deemed a reference to Kinder Morgan, Inc., a Delaware corporation. This change resulted from an internal corporate reorganization. Kinder Morgan, Inc. owns the same assets formerly owned by Kinder Morgan Kansas, Inc.

By signing below, COMPANY and SERVICE PROVIDER affirm that the individual signing below has the requisite authority to authorize the commitment described herein, and that this Work Directive No. 4794913-2-STAT is by reference hereby made part of Agreement No. 55168

This Work Directive is hereby agreed to and accepted:

Re: Emergency Response, Availability and Response Time

Kinder Morgan Emergency Response

MP Environmental Services, Inc. (MPE) is pleased to provide Kinder Morgan (KM) with the following resources and response times following an emergency at the above listed terminal.

MPE will have personnel on KM site within 2 hours of an initial call out by KM. If needed a minimum of 5 personnel could respond. In addition to personnel the following equipment/containers can be provided, within reason, in the same 2 hours:

Vacuum Tankers
Super Vacs
Roll-off Containers
End Dumps
Excavators
Backhoes
Pressure Washers
Air Compressors
Light Plants
Booms/Absorbents

Thank you for your continued patronage.

PATRIOT ENVIRONMENTAL WORK DIRECTIVE

WORK DIRECTIVE

To PATRIOT ENVIRONMENTAL SVCS INC

P.O. BOX 1091

LONG BEACH, CA 90801
Attention: RICHRD YUKIHIRO

Phone: 562-436-2614
Fax: 563-436-3688
Email: ryukihiro@patriotenvironmental.com

Date: September 17, 2013

Work Directive No.: 477391-13-STAT

Agreement No.: 25286

Requisition No/ Accounting Information: 270507

This Work Directive is entered pursuant to the terms of the Emergency Response Services Agreement ("Agreement") dated 01/01/2011 , by and between KINDER MORGAN ENERGY PARTNERS, L.P. ("COMPANY") and PATRIOT ENVIRONMENTAL SVCS INC ("CONSULTANT"). By its execution hereof, CONSULTANT agrees to perform for the Kinder Morgan ("KM") entity named below and executing this Work Directive pursuant to the terms, conditions and provisions of the Agreement, the following described Work which will additionally describe "Covered Tasks" as provided for under DOT Operator Qualification Requirements, and shall furnish all services, labor, supervision, technical capability, tools, equipment, vehicles, vessels, barges, transportation, materials, (except as set forth below), and other facilities and items necessary or convenient to complete the following work as further described and specified in the Specifications and/or Drawing(s) attached hereto or the Agreement and by this reference made a part of this Work Directive ("the Work"). If CONSULTANT'S proposal, quotation, or any other CONSULTANT document supplied to the KM entity named below is included as part of this Work Directive or another exhibit to the Agreement, then any terms or conditions provided by CONSULTANT which differ from or conflict with COMPANY'S terms and conditions are hereby rejected and shall be of no force or effect. The KM entity named below in this Work Directive shall be solely responsible for the liabilities and obligations set forth in the Agreement under which this Work Directive is being issued and this Work Directive arising out of or related to the Work to be performed pursuant hereto. All such liabilities and obligations, as they apply to this Work Directive, shall be non-recourse to the COMPANY (if the COMPANY is not the KM Entity executing this Work Directive) and all other related entities as further provided for and agreed in the Agreement. Payments made to CONSULTANT under this Work Directive shall include all taxes and similar charges except as otherwise agreed to herein or under the terms of the Agreement. Any capitalized term used in this Work Directive and not otherwise defined herein shall have the meaning as ascribed in the Agreement.

1.0 **Project Name and Work Location Details:** OSRO Services / Imperial terminal

2.0 **Scope of Work:** The following is a full and complete description of the Work (and goods) to be provided by CONSULTANT including, but not limited to specifications, conditions and referenced bids/proposals.

2.1 See EXHIBIT WD_A – SCOPE OF WORK

2.2 For Questions, contact ROSE, TINA at 909-873-5106

3.0 The COMPANY will not furnish any materials to the Work Site(s), unless previously approved by the Designated Representative.

4.0 CONSULTANT shall commence the Work by the 08/01/2013 and shall complete the Work on or before 07/31/2014.

5.0 CONSULTANT offers to complete the Work in accordance with the Agreement for the total Lump Sum Amount of $9,000.00 Nine Thousand Dollars and Zero Cents, which shall constitute full and complete payment.

6.0 The parties hereby agree to AMEND Agreement 25286 as follows (or if the Agreement has been thus amended previously, to repeat the following sections):

i) Under the Compliance with Laws section, a **new subsection** is hereby added to the Agreement which reads as follows:

CONSULTANT certifies that at the time of execution of this Agreement CONSULTANT is not included on any debarment list maintained by any federal, state or local governmental authority nor prevented from performing Work for COMPANY by virtue of any governmental order, proceeding or otherwise. If at any time during the term of this Agreement CONSULTANT cannot so certify to COMPANY, CONSULTANT shall promptly notify COMPANY as to CONSULTANT'S status.

ii) The following language is hereby added to the Termination section under the termination for default paragraphs:

-- violates any EHS law; or

iii) All other provisions of the Agreement shall continue in full force and effect.

7.0 **Retainage:** Waive 10% retainage.

8.0 CONSULTANT shall submit invoices in duplicate to:

SFPP, L.P.

2319 S Riverside Ave

Bloomington, CA 92316

Attn: ROSE, TINA
Phone: 909-873-5106
Fax: 909-877-9036

8.1 Invoices must clearly indicate the Agreement Number, Work Directive Number, as indicated above.

8.2 For Construction Projects, a Certificate of Final Completion must be completed, signed by an authorized representative, notarized, and attached to CONSULTANT'S final invoice.

9.0 CONSULTANT hereby certifies that it has downloaded, reviewed and understood the Kinder Morgan Contractor Safety Manual and shall, prior to the commencement of any Work hereunder, make the same available to its employees and subcontractors who will be performing work on premises owned and/or operated by the KM entity named below. If the English language is a communication barrier, CONSULTANT at its expense shall timely convert/translate the Kinder Morgan Contractor Safety Manual accurately into the appropriate language for its employees and subcontractors. Questions concerning the Manual should be directed to the Kinder Morgan Contractor Safety Indemnitees at: contractor_safety@kindermorgan.com prior to commencement of any Work.

10.0 Facsimile Signatures/Counterparts. This Work Directive may be executed in multiple original counterparts, each of which shall be deemed an original, and together they shall constitute one and the same agreement. Signature of this Work Directive may be effected by facsimile (with confirmation by transmitting machine) and/or transmitted by portable document format ("pdf") file which shall be treated as an original signature, and any such signature, facsimile, pdf file or copy of this signed Work Directive shall be construed and treated as the original and shall be binding as if it were the original.

11.0 For Work performed within the State of California, CONSULTANT shall certify within three working days of execution hereof that the requirements set forth in Exhibit B to this Work Directive have been satisfied. Failure by CONSULTANT to do so shall constitute a breach under Section 10 [for cause with no notice] of the Agreement.

In the **Agreement**, if there is a reference to "Kinder Morgan Kansas, Inc.," it shall now be deemed a reference to Kinder Morgan, Inc., a Delaware corporation. This change resulted from an internal corporate reorganization. Kinder Morgan, Inc. owns the same assets formerly owned by Kinder Morgan Kansas, Inc.

By signing below, COMPANY and CONSULTANT affirm that the individual signing below has the requisite authority to authorize the commitment described herein, and that this Work Directive No. 477391-13-STAT is by reference hereby made part of Agreement No. 25286

This Work Directive is hereby agreed to and accepted:

The following Exhibits shall be provided by COMPANY:

X	Exhibit WD_A	- Scope of Work
X	Exhibit WD_B	- Revised Release Reporting Criteria (California only)
___	Exhibit WD_C	- Work Directive Specific Schedule of Values/Rates
___	Exhibit WD_D	- Operator Qualification Form (as provided by the Designated Representative via electronic or hardcopy submission)

EXHIBIT WD_A – SCOPE OF WORK

Contractor will provide Imperial Terminal located at 345 W. Aten Road, Imperial California with 24/7 Emergency Response capabilities under Section 3.3 to Appendix E of 40 DFR 112 for EPA Jurisdictional Facility's and Section Appendix E of 40CFR 112 for EPA Jurisdictional Facility's and Section 3 to Appendix C of 33CFR 154 for USCG Regulated Facility's This includes but is not limited to one thousand feet of containment boom, and a means of deploying it within one (1) hour of the discovery of a discharge.

Contractor will provide response equipment and manpower resources in accordance with the National Preparedness for Response Exercise Program (PREP) Guidelines. Specific reference for USCG regulated facilities is located on pages 3-18 and 3-19 of the August 2002 PREP Guideline. Specific reference for EPA regulated facilities is located on pages 4-9 and 4-10 of the August 2002 PREP Guideline. These requirements include, but are not limited to, an annual equipment deployment exercise in the operating environment of the Area of the Facility, a comprehensive OSRO personnel training program, and a maintenance program to ensure that the equipment is periodically inspected and maintained in good operating condition. The satisfactory completion of these PREP requirements must be documented and submitted annually to Kinder Morgan to Mr. Edward (Buzz) Fant, Director-Compliance/Emergency Response Programs, c/o Kinder Morgan Energy Partners, L.P., 1001 Louisiana St, Suite 1000
Houston, TX 77002, or fante@kindermorgan.com.

EXHIBIT WD_B – REVISED RELEASE REPORTING CRITERIA

1.0 CONSULTANT shall ensure that its employees, agents, and subcontractors' employees engaged in CONSULTANT'S activities in the performance of the Work:

1.1 are notified, and when required, as determined by COMPANY, trained and instructed by COMPANY, either directly or through a train-the-trainer program instituted by COMPANY, concerning the order of actions to be taken upon discovery of a release or threatened release condition of a Hazardous Material or pollutant substance; and

1.2 understand that no Work or visit shall be undertaken to any COMPANY right-of-way or facility where there is no COMPANY representative onsite and readily accessible (a "Non-Company Onsite Situation"), unless the training referred to in (i) above has occurred for CONSULTANT'S employees, agents and subcontractors' employees who will be performing at such a site.

1.3 Will be working in a COMPANY Onsite Situation and MUST ensure that its employees, agents and subcontractors' employees have been notified accordingly, and if deemed necessary by COMPANY, CONSULTANT will assure that prior to performing any Work CONSULTANT'S employees, agents and subcontractors' employees will be trained relative to COMPANY'S revised release reporting criteria.

1.4 For purposes of this Exhibit "Hazardous Material(s)" shall mean and include (a) all elements or compounds that are contained in the list of hazardous substances adopted by the United States Environmental Protection Agency and the list of toxic pollutants designated by Congress or the Environmental Protection Agency or under any EHS Laws; and (b) any "hazardous waste," "hazardous substance" (including, but not limited to, petroleum and petroleum-related materials), "toxic substance," regulated substance," "pollutant" or "contaminant", each as defined under any EHS Law. "EHS Laws" shall mean any and all federal, state, and local laws, regulations and requirements pertaining to health, safety, or the environment.

CONSULTANT shall certify its compliance with this training requirement upon COMPANY request.

Acknowledged, agreed and accepted this 18 day of September, 2013

ADDITIONAL RESPONSE RESOURCES

Universal Environmental, Inc.
Equipment List

November 14, 2005

Response Management Associates, Inc.
6620 Cypresswood Drive, Suite 200
Spring, TX 77379
Attn: Mr. Ed Cables

RE: Emergency Response Information

Dear Mr. Cables:

Universal Environmental, Inc. (UE) effective response area (1-2 hours) would be approximately 50 miles from Benicia. This would encompass Stockton to the East, Rancho Cordova to the North East, Contra Costa and Alameda, and Solano County.

Additional coverage's would be Stanislaus, San Joaquin, Sacramento, Marin, Sonoma, Napa and Lake Counties.

UE's Nevada office covers Sierra, Modoc, Nevada, Placer, Lasson, Plumas, and Modoc Butte Counties.

UE will travel as far as needed depending on the size of the project.

UE provides support to MSRC for spills involving navigable waterways. UE is a STAR contractor to MSRC. In areas MSRC does not operate UE would provide boom support as well as shoreline cleanup. On land based spills UE would provide any required resources including, soil removal, transportation and disposal services, etc…

UE's Benicia office is a shoreline, small rivers, creeks, ponds and streams OSRO. UE is not a Coast Guard certified OSRO.

UE Benicia utilizes MSRC as our OSRO per contract and MSRC has contracted UE Benicia as an OSRO for shoreline support, boat crews, vacuum trucks, etc… UE can rent boom from MSRC who has approximately 10,000' of boom.

UE Benicia has twelve Certificates of Owners Financial Responsibility (COFR) certificates from the California Department of Fish and Game for marine over-water transfer of petroleum. This is the largest certified vacuum truck fleet in California, almost 50% of all certified vacuum trucks.

If you have any questions or need any further information please feel free to contact me at (707) 747-6699.

Sincerely,

Sandra Stanford
Business Development

4.0 SPILL IMPACT CONSIDERATIONS

4.1 CRITICAL AREAS TO PROTECT

The critical areas to protect are classified as high, moderate, and low sensitivity to oil. The Federal, state, and local authorities will further clarify these categories at the time of the response. The categories are defined as follows:

HIGH SENSITIVITY
• Areas which are high in productivity, abundant in many species, extremely sensitive, difficult to rehabilitate, or inhabited by threatened/endangered species. • Areas which consist of vegetated low banks, freshwater/saltwater marshes, swamps, scrub-shrub wetlands and impact to threatened/endangered species.

MODERATE SENSITIVITY
• Areas of moderate productivity, somewhat resistant to the effects of oiling. • Areas which consist of mixed sand, gravel beaches, bars, gently sloping banks, and no impact to threatened/endangered species.

LOW SENSITIVITY
• Areas of low productivity, man-made structures, and/or high energy. • Areas which consist of gravel, sand, or clay material, barren/rocky shores or banks, man-made structures, concrete/compacted earthen drainage ditches and no impact to threatened/endangered species.

4.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES

Environmental/socio-economic sensitivities are of extreme importance when planning a response effort. The health and safety of the public and the environment, as well as the protection of the various socio-economic sensitivities, must be promptly addressed in order to mitigate the extent of damage and minimize the cost of the clean-up effort.

To assess adequate response resources, the Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three (3) tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. The tier requirements for high volume areas are for response in six (6) hours (Tier 1), 30 hours (Tier 2), and 54 hours (Tier 3). High volume areas are listed in 49 CFR 194. The tier requirements for all other areas are for response in 12 hours (Tier 1), 36 hours (Tier 2), and 60 hours (Tier 3).

4.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES (Cont'd)

All environmental/socio-economic sensitivities are worthy of protection, but must be prioritized during a response effort. When making decisions on which areas to designate as collection areas and which to protect, the following sources may be consulted:

- U.S. Fish and Wildlife Service and related state agencies
- Applicable Area Contingency Plans (see CD affixed to inside front cover of Volume 1 and the CD Navigation Summary in Figure 4.2)
- Other industry and private experts

The environmental and socio-economic sensitivities in the area have been broken down into specific categories and identified in this section.

4.3 WILDLIFE PROTECTION AND REHABILITATION

The Company will work with Federal, State, and local agency personnel to provide labor and transportation to retrieve, clean, and rehabilitate birds and wildlife affected by an oil spill, as necessary. Oversight of the Company's wildlife preservation activities and coordination with Federal, State, and local agencies during an oil spill is the responsibility of the Incident Commander.

Special consideration should be given to the protection and rehabilitation of endangered species and other wildlife and their habitat in the event of an oil spill and subsequent response. Jurisdictional authorities should be notified and worked with closely on all response/clean-up actions related to wildlife protection and rehabilitation. Laws with significant penalties are in place to ensure appropriate protection of these species.

4.3.1 Endangered/Threatened Species

The U.S. Fish and Wildlife Service (USFWS) and related state agencies classify the status of various wildlife species in the potentially effected states. A summary of critical birds, reptiles, mammals, and plant species status as related to the Facility's operating areas (area of highest oil spill potential) is presented in Figure 4.1.

4.3.2 Wildlife Rescue

The Company will work with Federal, State, and local agency personnel to provide labor and transportation to retrieve, clean, and rehabilitate wildlife affected by an oil spill, as the situation demands.

4.3 WILDLIFE PROTECTION AND REHABILITATION (Cont'd)

4.3.2 Wildlife Rescue (Cont'd)

The following are items which should be considered for wildlife rescue and rehabilitation during a spill response:

- Bird relocation can be accomplished using a variety of deterrents, encouraging birds to avoid areas of spilled oil. Bird relocation can be accomplished by utilizing deterrent methods including:
  - Use of visual stimuli, such as inflatable bodies, owls, stationary figures, or helium balloons, etc.
  - Use of auditory stimuli, such as propane cannons, recorded sounds, or shell crackers.
  - Use of herding with aircraft, boats, vehicles, or people (as appropriate).
  - Use of capture and relocation.

4.3.3 Search and Rescue - Points to Consider

- **The Company's involvement should be limited to offering assistance as needed or requested by the agencies.**
- Prior to initiating any organized search and rescue plan, **authorization must be obtained from the appropriate federal/state agency.**
- **Initial search and rescue efforts, if needed, should be left up to the appropriate agencies.** They have the personnel, equipment, and training to immediately begin capturing contaminated wildlife.
- With or without authorization it must be anticipated that volunteer citizens will aid distressed/contaminated wildlife on their own. It is important to communicate that it may be illegal to handle wildlife without express authority from appropriate agencies. Provisions should be made to support an appropriate rehabilitator, however, **no support should be given to any unauthorized volunteer rescue efforts.**
- The regulatory agencies and response personnel should be provided the name and location of a qualified rehabilitator in the event contaminated wildlife is captured.
- Resources and contacts that can assist with wildlife rescue and rehabilitation are provided in Section 2.0. This list includes:
  - Outside rehabilitation organizations
  - Local regulatory agencies
  - Other resources

4.4 STAGING AREAS

When establishing personnel and equipment staging areas for a response to a Facility discharge, the following criteria should be evaluated:

- Access to waterborne equipment launching facilities and/or land equipment.
- Access to open space for staging/deployment of heavy equipment and personnel.
- Access to public services utilities (electricity, potable water, public phone, restroom and washroom facilities, etc.)
- Access to the environmental and socio-economically sensitive areas which are projected for impact.

4.5 TRAJECTORY ANALYSIS

Oil spilled on water will react primarily to the effects of wind and current. The oil will tend to spread to a thin layer under the influence of gravity (primary) and chemical (secondary) forces. The following describes the behavior of oil on water:

- Oil will move in the direction and at the rate of the current under negligible wind conditions.
- Oil will move in the direction and at approximately 3.4 % of the velocity of the wind under negligible current conditions.
- The combined effects of wind and current on the oil should be carefully analyzed. A method of vector analysis can be performed to determine the net direction of movement (wind forces can work in addition to, against, or in many other combinations with the current).
- The primary method of surveillance for the Facility will be visual. Visual surveillance is not effective however in rain, fog, darkness, or heavy cloud cover. It is difficult to observe a slick on the water from a boat, dock or land due to the angle of observation. Aerial surveillance is the preferred method of visual surveillance because of the elevated view and the ability to cover a large area in a short period.

FIGURE 4.1

ENDANGERED SPECIES LISTING

The following a is list of endangered and threatened species with known or possible occurrence in the States of Arizona, California, New Mexico and Texas by county, (listed alphabetically by Scientific Name).

ANIMALS	
Common Name	**Scientific Name**
Cochise County	
Plover, Mountain	Charadrius Montanus
Rattlesnake, New Mexican Ridge-Nosed	Crotalus Willardi Obscurus
Pupfish, Desert	Cyprinodon Macularius
Flycatcher, Southwestern Willow	Empiodonax Traillii Extimus
Falcon, Northern Aplomado	Falco Femoralis Septentrionalis
Ocelot	Felis Pardalis
Jaguarundi	Felis Yagouaroundi Tolteca
Chub, Yaqui	Gila Purpurea
Pygmy-Owl, Cactus Ferruginous	Glaucidiumbrasilianum Cactorum
Eagle, Bald	Haliaeetus Leucocephalus
Catfish, Yaqui	Ictalurus Pricei
Bat, Lesser (=Sanborn's) Long-Nosed	Leptonycteris Sanborni
Shiner, Beautiful	Notropis Formosus
Jaguar	Panthera Onca
Frog, Chiricahua Leopard	Rana Chiricahuensis
Owl, Mexican Spotted	Strix Occidentalis Lucida
Dona Ana County	
Falcon, Northern Aplomado	Falco Femoralis Septentrionalis
Eagle, Bald	Haliaeetus Leucocephalus
Ferret, Black-Footed	Mustela Nigripes
Owl, Mexican Spotted	Strix Occidentalis Lucida
El Paso County	
Falcon, Northern Aplomado	Falco Femoralis Septentrionalis
Grant County	
Minnow, Loach	Dionda Diablo
Flycatcher, Southwestern Willow	Empiodonax Traillii Extimus
Falcon, Northern Aplomado	Falco Femoralis Septentrionalis
Chub, Chihuahua	Gila Nigrescens
Eagle, Bald	Haliaeetus Leucocephalus
Spikedace	Meda Fulgida
Ferret, Black-Footed	Mustela Nigripes
Shiner, Beautiful	Notropis Formosus
Frog, Chiricahua Leopard	Rana Chiricahuensis
Owl, Mexican Spotted	Strix Occidentalis Lucida
Hildalgo County	
Plover, Mountain	Charadrius Montanus
Rattlesnake, New Mexican Ridge-Nosed	Crotalus Willardi Obscurus
Flycatcher, Southwestern Willow	Empiodonax Traillii Extimus
Falcon, Northern Aplomado	Falco Femoralis Septentrionalis
Eagle, Bald	Haliaeetus Leucocephalus

FIGURE 4.2

ACP/GRP CD
NAVIGATION INSTRUCTIONS
(Excerpt from CD affixed to inside front cover of Volume 1)

KINDER MORGAN

The information contained herein is provided to identify specific spill response and protection strategies for the applicable Kinder Morgan Pacific Operations Regions. Navigating through the bookmark links provided on the CD will take you to the Environmentally Sensitive Sites and the Economically Significant Sites provided in the applicable Area Contingency Plans and Geographic Response Plans.

INSTRUCTIONS FOR USE

1. From the screen on the left, click on region of interest. The different regions are identified by the red font.
2. Once the appropriate region is accessed, click on the "+" to the left of the region name to display the various areas within each region. These are identified with blue font.
3. Once the appropriate area is accessed, the links to the Environmentally Sensitive Sites and the Economically Significant Sites will be available for selection.
   - ➢ It is important to note that once each Environmentally Sensitive Site and Economically Significant Site is accessed, the user will have to scroll to the desired location.
   - ➢ Use the zoom icon to zoom into each page for easier reading.

NOTES:

1. In those areas where the statement "No ACP Information Available" is made, it indicates that there is no ACP or GRP information which is specific to the particular region or area of interest.
2. EPA REGION IX: For areas without specific ACP/GRP information, the Region IX Contingency Plan (RCP) is used as the response guidance; however, this RCP is currently in revision.
3. EPA REGION X: Region X is covered by the Northwest Area Contingency Plan; however, inland facilities are not addressed.
4. Thus, the following areas are covered by specific area contingency or geographic response plans on this CD:
   - Northern Region—Northwest: Linnton-Willbridge, Washington Area
   - Northern Region—Bay: Brisbane, Concord, Richmond, San Jose
   - Southern Region—Central: Mission Valley-Orange
   - Southern Region—West: Carson, Watson
5. And, the following areas do not have specific area contingency or geographic response plans on this CD:
   - Northern Region—Northwest: Oregon Pipelines (inland)
   - Northern Region—Central: Fresno
   - Northern Region—CalNev: Sacramento, Rocklin, Reno
   - Southern Region—East: Imperial, Phoenix, Tucson
   - Southern Region—Central: Colton, Barstow, Las Vegas

Developed by:
Response Management Associates, Inc.

www.rmaworld.com

5.0 DISPOSAL PLAN

5.1 OVERVIEW

A major oil spill response would generate significant quantities of waste materials ranging from oily debris and sorbent materials to sanitation water and used batteries. All these wastes need to be classified and separated (i.e., oily, liquid, etc.), transported from the site, and treated and/or disposed of at approved disposal sites. Each of these activities demands that certain health and safety precautions be taken, which are strictly controlled by Federal and state laws and regulations. This section provides an overview of the applicable state regulations governing waste disposal, and a discussion of various waste classification, handling, transfer, storage, and disposal techniques. It is the responsibility of the Environmental Manager or their designee to:

- Coordinate waste disposal activities;
- Identify appropriate interim storage methods and locations;
- Coordinate permitting activities needed to ensure proper disposal; and
- Document compliance with appropriate local, state, and Federal handling of hazardous materials and/or wastes.

Material will be containerized or stored in a manner complying with applicable environmental regulations pertaining to the known or suspected materials characteristics. Upon characterization, waste, recyclable materials, or contaminated materials will be treated on-site, recycled, or transported and disposed of at an appropriate KMEP approved facility after appropriate regulatory approval.

5.2 WASTE CLASSIFICATION

Oily - Liquid Wastes

Oily liquid wastes (i.e., oily water and emulsions) that would be handled, stored, and disposed of during response operations are very similar to those handled during routine storage and transfer operations. The largest volume of oily liquid wastes would be produced by recovery operations (e.g., through the use of vacuum devices or skimmers). In addition, oily water and emulsions would be generated by vehicle operations (e.g., spent motor oils, lubricants, etc.), and equipment cleaning operations.

Non-Oily - Liquid Wastes

Response operations would also produce considerable quantities of non-oily liquid wastes. Water and other non-oily liquid wastes would be generated by the storage area and stormwater collection systems, vessel and equipment cleaning (i.e., water contaminated with cleaning agents), and office and field operations (i.e., sewage, construction activities).

Solid Wastes

A solid waste is defined as any discarded material provided that it is not specifically excluded under the regulations. These exclusions cover materials such as domestic sewage and mixtures of sewage discharged through a sewer system or industrial wastewater point source discharges.

A discarded material is any material which is abandoned (disposed of, burned or incinerated) or accumulated, stored or treated prior to being abandoned. A discarded material is also any material recycled or any material considered inherently wastelike. Recycled material is considered solid waste when used in a manner constituting disposal, placed on land or burned for energy recovery.

5.2 WASTE CLASSIFICATION (Cont'd)

Solid Wastes (Cont'd)

A solid waste may be considered a hazardous waste. A solid waste, as defined above, may be a hazardous waste if it is not excluded from regulation and is either a listed hazardous waste or exhibits the characteristics of a hazardous waste. A solid waste exhibits the characteristics of a hazardous waste if it exceeds the thresholds established in determining the following:

1) ignitability
2) corrosivity
3) reactivity
4) toxicity

A solid waste may also become a hazardous waste if it is mixed with a listed hazardous waste or, in the case of any other waste (including mixtures), when the waste exhibits any of the characteristics identified above.

Oily - Solid/Semi-Solid Wastes

Oily solid/semi-solid wastes that would be generated by containment and recovery operations include damaged or worn-out booms, disposable/soiled equipment, used sorbent materials, saturated soils, contaminated beach sediments, driftwood, and other debris.

Non-Oily - Solid/Semi-Solid Wastes

Non-oily solid/semi-solid wastes would be generated by emergency construction operations (e.g., scrap, wood, pipe, and wiring) and office and field operations (i.e., refuse). Vessel, vehicle, and aircraft operations also produce solid wastes.

5.3 WASTE HANDLING

A primary concern in the handling of recovered oil and oily debris is contaminating unaffected areas or recontaminating already cleaned areas. Oily wastes generated during the response operations would need to be separated by type and transferred to temporary storage areas and/or transported to incineration or disposal sites. Proper handling of oil and oily wastes is imperative to ensure personnel health and safety.

Safety Considerations

Care would be taken to avoid or minimize direct contact with oily wastes. All personnel handling or coming into contact with oily wastes would wear protective clothing. A barrier cream can be applied prior to putting on gloves to further reduce the possibility of oily waste absorption. Safety goggles would be worn by personnel involved in waste handling activities where splashing might occur. Any portion of the skin exposed to oily waste would be washed with soap and water as soon as possible. Decontamination zones would be set up during response operations to ensure personnel are treated for oil exposure.

5.3 WASTE HANDLING (Cont'd)

Waste Transfer

During response operations, it may be necessary to transfer recovered oil and oily debris from one point to another several times before the oil and oily debris are ultimately recycled, incinerated or disposed of at an appropriate disposal site. Depending on the location of response operations, any or all of the following transfer operations may occur:

- From portable or vessel-mounted skimmers into flexible bladder tanks, storage tanks of the skimming vessel itself, or a barge.
- Directly into the storage tank of a vacuum device.
- From a skimming vessel or flexible bladder to a barge.
- From a vacuum device storage tank to a barge.
- From a barge to a tank truck.
- From a tank truck to a processing system (e.g., oil/water separator).
- From a processing system to a recovery system and/or incinerator.
- Directly into impermeable bags that, in turn, are placed in impermeable containers.
- From containers to trucks.

There are four general classes of transfer systems that may be employed to affect oily waste transfer operations:

- **Pumps:** Rotary pumps, such as centrifugal pumps, may be used when transferring large volumes of oil, but they may not be appropriate for pumping mixtures of oil and water. The extreme shearing action of centrifugal pumps tends to emulsify oil and water, thereby increasing the viscosity of the mixture and causing low, inefficient transfer rates. The resultant emulsion would also be more difficult to separate into oil and water fractions. Lobe or "positive displacement" pumps work well on heavy, viscous oils, and do not emulsify the oil/water mixture. Double-acting piston and double acting diaphragm pumps are reciprocating pumps that may also be used to pump oily wastes.

- **Vacuum Systems**: A vacuum truck may be used to transfer viscous oils but they usually pick up a very high water/oil ratio.

- **Belt/Screw Conveyors:** Conveyors may be used to transfer oily wastes containing a large amount of debris. These systems can transfer weathered debris laden oil either horizontally or vertically for short distances (i.e., 10 feet) but are bulky and difficult to set up and operate.

- **Wheeled Vehicles:** Wheeled vehicles may be used to transfer liquid wastes or oily debris to storage or disposal sites. These vehicles have a limited transfer volume (i.e., 100 barrels) and require good site access.

Figure 5.1 provides a comparative evaluation of 16 types of transfer systems that could be available for transfer operations.

5.4 WASTE STORAGE

Interim storage of recovered oil, oily and non-oily waste would be considered to be an available means of holding the wastes until a final management method is selected. In addition, the segregation of wastes according to type would facilitate the appropriate method of disposal. The storage method used would depend upon:

- The type and volume of material to be stored.
- The duration of storage.
- Access.

During an oil spill incident, the volume of oil that can be recovered and dealt with effectively depends upon the available storage capacity. Typical short-term storage options are summarized in Figure 5.2. The majority of these options can be used either onshore or offshore.

If storage containers such as bags or drums are used, the container must be clearly marked and/or color-coded to indicate the type of material/waste contained and/or the ultimate disposal option. Bladder or pillow tanks would be acceptable, if the available space can support the weight of both the container and the product.

Fuel barges may be the best option for temporary storage of oil recovered in open waters. Depending on size, these vessels may be able to hold up to 6,000 barrels of oil and water. The barge deck can be used as a platform for operating oil spill clean-up equipment and storing containment boom.

Empty barges have four to six feet draft which would increase when these barges are filled with oil or loaded with cargo. Consequently, they may not be able to enter shallow, nearshore waters.

It may be difficult to offload recovered oil stored inside barges. Due to natural forces which affect spilled oil, recovered oil may be very viscous or emulsified, rather than free-flowing. It may be necessary to use steam to heat viscous oil before pumping it from the barge.

Steel or rubber tanks can be used to store oil recovered near the shoreline. To facilitate offloading, demulsifiers may be used to break emulsions prior to placing the recovered substance into the barges or storage tanks.

Use of any site for storage is dependent on the approval of the local authorities. The following elements affect the choice of a potential storage site:

- Geology.
- Ground water.
- Soil.
- Flooding.
- Surface water.
- Slope.
- Covered material.
- Capacity.
- Climatic factors.
- Land use.
- Toxic air emissions.
- Security.
- Access.
- Public contact.

5.4 WASTE STORAGE (Cont'd)

Temporary storage sites should use the best achievable technology to protect the environment and human health. They should be set up to prevent leakage, contact, and subsequent absorption of oil by the soil. The sites should be bermed (1 to 1.5 meters high) and double lined with plastic or visqueen sheets 6-10 mils or greater in thickness, without joints, prior to receiving loose and bagged debris. The edges of the sheet should be weighted with stones or earth to prevent damage by wind, and the sheet should be placed on a sand layer or an underfelt thick enough to prevent piercing. A reinforced access area for vehicles at the edge of the site should be provided. In addition, the oily debris should be covered by secured visqueen or tarps and an adequate stormwater runoff collection system for the size and location of the site would be utilized. Additionally, the sites should be at least 3 meters above mean sea level.

Oily debris can be hauled to approved temporary storage sites in visqueen lined trucks or other vehicles. Burnable, non-burnable, treatable and re-usable materials can be placed in well defined separate areas at temporary storage sites.

When the last of the oily debris leaves a temporary storage site, the ground protection would be removed and disposed of with the rest of the oily debris. Any surrounding soil which has become contaminated with oil would also be removed for disposal or treatment. If the soils were removed for treatment, they may be replaced if testing proves acceptable levels have been achieved. Treatment and remediation is encouraged when feasible. The temporary storage should be returned to its original condition.

5.5 WASTE DISPOSAL

Techniques for Disposal of Recovered Oil

Recovery, reuse, and recycling are the best choices for remediation of a spill, thereby reducing the amount of oily debris to be bermed onsite or disposed of at a solid waste landfill. Treatment is the next best alternative, but incineration and burning for energy recovery have more options within the state. There are some limitations and considerations in incinerating for disposal. Environmental quality of incineration varies with the type and age of the Facility. Therefore, when incineration becomes an option during an event, local air quality authorities would be contacted for advice about efficiency and emissions of facilities within their authority. Approval of the local air authorities is a requirement for any incineration option. Landfilling is the last option. Final disposal at a solid or dangerous waste landfill is the least environmentally sound method of dealing with a waste problem such as oily debris.

During an oil spill incident, KMEP would consult with the Federal and state On Scene Coordinator (OSC) to identify the acceptable disposal methods and sites appropriately authorized to receive such wastes. KMEP maintains a list of approved disposal sites that satisfy local, state, and federal regulations and company requirements. This identification of suitable waste treatment and disposal sites would be prepared by the Environmental Manager or their designee in the form of an Incident Disposal Plan which must be authorized by the U.S. Coast Guard and/or the EPA. An Incident Disposal Plan would include predesignated interim storage sites, segregation strategies, methods of treatment and disposal for various types of debris, and the locations/contacts of all treatment and disposal site selections. Onsite treatment/disposal will be preferred.

5.5 WASTE DISPOSAL (Cont'd)

Techniques for Disposal of Recovered Oil (Cont'd)

In order to obtain the best overall Incident Disposal Plan, a combination of methods should be used. There is no template or combination of methods that can be used in every spill situation. Each incident should be reviewed carefully to ensure an appropriate combination of disposal methods are employed.

The different types of wastes generated during response operations would require different disposal methods. To facilitate the disposal of wastes, they should be separated by type for temporary storage, transport and disposal. Figure 5.3 lists some of the options that would be available to segregate oily wastes. The table also depicts methods that may be employed to separate free and/or emulsified water from the oily liquid waste.

The following is a brief discussion of some disposal techniques available for recovered oil and oily debris.

Recycling

This technique entails removing water from the oil and blending the oil with uncontaminated oil. Recovered oil can be shipped to refineries provided that it is exempt from hazardous waste regulations. There it can be treated to remove water and debris, and then blended and sold as a commercial product.

The Environmental Manager or their designee is responsible for ensuring that all waste materials be disposed of at an internally approved disposal site.

Incineration

This technique entails the complete destruction of the recovered oil by high temperature thermal oxidation reactions. There are licensed incineration facilities as well as portable incinerators that may be brought to a spill site. Incineration may require the approval of the local Air Pollution Control Authority. Factors to consider when selecting an appropriate site for onsite incineration would include:

- Proximity to recovery locations.
- Access to recovery locations.
- Adequate fire control.
- Approval of the local air pollution control authorities.

In Situ Burning/Open Burning

Burning techniques entail igniting oil or oiled debris and allowing it to burn under ambient conditions. These disposal techniques are subject to restrictions and permit requirements established by federal, state and local laws. They would not be used to burn PCBs, waste oil containing more than 1,000 parts per million of halogenated solvents, or other substances regulated by the EPA. Permission for *in situ* burning may be difficult to obtain when the burn takes place near populated areas.

5.5 WASTE DISPOSAL (Cont'd)

In Situ Burning/Open Burning

As a general rule, *in situ* burning would be appropriate only when atmospheric conditions will allow the smoke to rise several hundred feet and rapidly dissipate. Smoke from burning oil will normally rise until its temperature drops to equal the ambient temperature. Afterwards, it will travel in a horizontal direction under the influence of prevailing winds.

Landfill Disposal

This technique entails burying the recovered oil in an approved landfill in accordance with regulatory procedures. Landfill disposal of free liquids is prohibited by federal law in the United States.

With local health department approval, non-burnable debris which consists of oiled plastics, gravel and oiled seaweed, kelp, and other organic material may be transported to a licensed, lined, approved municipal or private landfill and disposed of in accordance with the landfill guidelines and regulations. Landfill designation would be planned only for those wastes that have been found to be unacceptable by each of the other disposal options (e.g., waste reduction, recycling, energy recovery). Wastes would be disposed of only at Company-approved disposal facilities. The Environmental Manager or their designee is responsible for ensuring that all waste materials are disposed of at a Company internally approved disposal site. Disposal at a non-approved facility would require approval by the Environmental Manager or their designee prior to sending any waste to such a facility.

Comments	E,J	B	B	B,J		F	A	B	B,D	A,C,D	F,G,I	F,G,I	F,G			G,H,I

KEY TO RATINGS: 5 = Best; 1 = Worst

KEY TO COMMENTS:

A. Normally require remote power sources, thus are safe around flammable fluids.
B. Should have a relief valve in the outlet line to prevent bursting hoses.
C. Air powered units tend to freeze up in sub-freezing temperatures.
D. Units with work ball valves are difficult to prime.
E. Some remotely powered types are designed to fit in a tanker's butterworth hatch.
F. Can also pump air at low pressure.
G. Transfer is batch-wise rather than continuous.
H. Waste must be in separate container for efficient transfer.
I. Transportable with its own prime mover.
J. High shear action tends to emulsify oil and water mixtures.

FIGURE 5.2

TEMPORARY STORAGE METHODS

CONTAINER	ONSHORE	OFFSHORE	SOLIDS	LIQUIDS	NOTES
Barrels	x	x	x	x	May require handling devices. Covered and clearly marked.
Tank Trucks	x	x		x	Consider road access. Barge-mounted offshore.
Dump/Flat Bed Trucks	x		x		May require impermeable liner and cover. Consider flammability of vapors at mufflers.
Barges		x	x	x	Liquids only in tanks. Consider venting of tanks.
Oil Storage Tanks	x	x		x	Consider problems of large volumes of water in oil.
Bladders	x	x		x	May require special hoses or pumps for oil transfer.

FIGURE 5.3

OILY WASTE SEPARATION AND DISPOSAL METHODS

TYPE OF MATERIAL	SEPARATION METHODS	DISPOSAL METHODS
LIQUIDS		
Non-emulsified oils	Gravity separation of free water	Incineration Use of recovered oil as refinery/production facility feedstock
Emulsified oils	Emulsion broken to release water by: ● heat treatment ● emulsion breaking chemicals ● mixing with sand ● centrifuge ● filter/belt press	Use of recovered oil as refinery/production facility feedstock
SOLIDS		
Oil mixed with sand	Collection of liquid oil leaching from sand during temporary storage Extraction of oil from sand by washing with water or solvent Removal of solid oils by sieving	Incineration Use of recovered oil as refinery/production facility feedstock Direct disposal Stabilization with inorganic material Degradation through land farming or composting
Oil mixed with cobbles or pebbles	Screening Collection of liquid oil leaching from materials during temporary storage Extraction of oil from materials by washing with water or solvent	Incineration Direct Disposal Use of recovered oil as refinery/production facility feedstock
Oil mixed with wood, seaweed and sorbents	Screening Collection of liquid oil leaching from debris during temporary storage Flushing of oil from debris with water	Incineration Direct disposal Degradation through land farming or composting for oil mixed with seaweed or natural sorbents
Tar balls	Separation from sand by sieving	Incineration Direct disposal

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Harbor Terminal - Carson Lines:	
• Harbor to Carson Terminal 12”	GX-120
• Harbor to Sanford and I Street 8” (Out of Service)	GX-180
Other Carson Area Lines:	
• Arco to Carson Terminal 10”/12”	GX-32
• Arco to Carson Terminal 14” (Out of Service)	GX-64A
• Arco to Carson Terminal 12”/14”	GX-64B
• Chemoil to Carson Terminal 10”/12” (Out of Service)	GX-200
• Chemoil to Carson Terminal 12”/14”	GX-205
• Phillips 66 to Carson Terminal 24”	GX-124
• Phillips 66 to Carson Terminal 4”	GX-104
• Mobil to Carson Terminal 8”/10”	GX-190

Figures 6.1a through 6.1j on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled “Worst Case Discharge Data” of the applicable Line Segment.

.

- The specific information summary for these pipeline sections is provided as follows:
  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps
- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.
- Northern and southern pipeline schematic diagrams are provided in Volume 1, Figure 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

HARBOR TERMINAL - CARSON TERMINAL 12" (GX120)		
Pipe and Operational Data		
Section Length:	4.67 Miles	24,682 Feet
Line Diameter:	12.75 in., O.D.	12.0 in., I.D. (note 1)
Line Capacity:	739 bbls/mile (note 2)	
Product types:	CARB ULSD, Gas, Ethanol	
Capacity of entire line section:	(b) (7)(F),	
Maximum flow rate:	10,500 bph or 252,000 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
County(s)/State(s) Traversed:	Los Angeles, CA
Location Description:	From Harbor Terminal north to E St, east to Avalon Blvd, then generally northeast to Carson Terminal at Lomita Blvd and Alameda St.

Worst Case Discharge Data

(b) (7)(F), (b) (3) [redacted]

FIGURE 6.1b

PIPELINE SECTION INFORMATION SUMMARY

HARBOR TERMINAL – SANFORD AND I STREET 8" (GX180) (OUT OF SERVICE)		
Pipe and Operational Data		
• Section Length:	4.64 Miles	24,499 Feet
• Line Diameter:	8.625 in., O.D.	7.625 in., I.D. (note 1)
• Line Capacity:	298 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	3,000 bph or 72,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Los Angeles, CA	
• Location Description:	From Harbor Terminal north to E St. then east to Avalon Blvd., then generally northeast to a manifold at Sanford and I streets.	

FIGURE 6.1c

PIPELINE SECTION INFORMATION SUMMARY

ARCO - CARSON TERMINAL 10"/12" (GX32)		
Pipe and Operational Data		
• Section Length:	0.03 Miles	130 Feet
• Line Diameter:	10.75 in., O.D.	10.25 in., I.D. (note 1)
• Section Length:	0.01 Miles	68 Feet
• Line Diameter:	12.75 in., O.D.	12.25 in., I.D. (note 1)
• Line Capacity:	539 bbls/mile in 10 in. size (note 2) 770 bbls/mile in. 12 in. size (note 2)	
• Capacity of entire line section:	(b) (7)	
• Maximum flow rate:	3,500 bph or 84,000 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
• County(s)/State(s) Traversed:	Los Angeles, CA
• Location Description:	From Carson Terminal across Sepulveda Blvd to the Arco Facility.

FIGURE 6.1d

PIPELINE SECTION INFORMATION SUMMARY

ARCO - CARSON TERMINAL 14"/16"(GX64A)	
Pipe and Operational Data	
• Section Length:	0.76 Miles 4,022 Feet
• Line Diameter:	16.0 in., O.D. 15.5 in., I.D. (note 1)
• Section Length:	0.10 Miles 537 Feet
• Line Capacity:	1,232 bbls/mile in 16 in., I.D. (note 2)
• Capacity of entire line section:	(b) (7)(F),
• Maximum flow rate:	9,000 bph or 216,000 bpd
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.	
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.	
Location Description	
• County(s)/State(s) Traversed:	Los Angeles, CA

• Section Length:	1.60 Miles	8,473 Feet
• Line Diameter:	8.625 in., O.D.	8.071 in., I.D. (note 1)
• Line Capacity:	527 bbls/mile in 10 in. size (note 2) 334 bbls/mile in. 8 in. size (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	2,100 bph or 50,400 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Los Angeles, CA	
• Location Description:	From Mobil, near 190th and Crenshaw, east to about Main St, south to 223rd, east to near Lucerne St, south to Lomita, then east to Carson Terminal at Lomita and Alameda Blvd.	

FIGURE 6.2

HCA INDEX

Refer to Figure 6.1a through Figure 6.1j for specific information on line segments.

The following Index Map shows all the corresponding Line Segments for Figure 6.1.

Detailed HCA Maps are contained in the CD inside the front cover of Volume 2 (or in a separate folder on electronic copy CD).

The specific HCA maps for this area are:

D_HCA_INDEX_KMLT_001.pdf

494-D-HCA-LIQ-TERM-CA_006.pdf

6.0 AREA PIPELINE SECTIONS

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Mission Valley Area Lines	
• Highway 52 – Mission Valley 10”	122
• Mission Valley – Harbor Junction 10”	123
• Harbor Junction – Chevron/Arco 8”/10”	124
• Mission Valley Terminal – San Diego Terminal 8”	141/142/143
Facilities (Non-Storage)	
• Miramar Junction – Piping Manifold Only	
• Harbor Compound – Piping Manifold Only*	
• Harbor Junction – Piping Manifold Only	

* A small (approximately 10,000 gallon) relief tank is located at Harbor Compound.

Figures 6.1a through 6.1d on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled “Operational and Worst Case Discharge Data” of the applicable Line Segment.

- The specific information summary for these pipeline sections is provided as follows:
  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps
- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.
- Northern and southern pipeline schematic diagrams are provided in Volume 1, Figure 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

HIGHWAY 52 - MISSION VALLEY 10" (122)		
Pipe and Operational Data		
• Section Length:	6.52 Miles	34,450 Feet
• Line Diameter:	10.75 in., O.D.	10.312 in., I.D. (note 1)
• Line Capacity:	545 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	7,000 bph or 168,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Diego, CA	
• Location Description:	From connection with Line 126 north of the Highway 52 crossing to Mission Valley Terminal at Friars Road and I-15.	

FIGURE 6.1b

PIPELINE SECTION INFORMATION SUMMARY

MISSION VALLEY – HARBOR JUNCTION 10" (123)		
Pipe and Operational Data		
• Section Length:	7.64 Miles	40,339 Feet
• Line Diameter:	10.75 in., O.D.	10.312 in., I.D. (note 1)
• Line Capacity:	545 bbls/mile (note 2)	
• Product types:	CARB ULSD, Gas, Ethanol	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	4,500 bph or 108,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Diego, CA	
• Location Description:	From Mission Valley Terminal, I-15 and Friars Road, south across San Diego River to connection with Line #124 Bay Front Street near Coronado Bridge, adjacent to San Diego Bay.	
Worst Case Discharge Data		
(b) (7)(F), (b) (3)		

FIGURE 6.1c

PIPELINE SECTION INFORMATION SUMMARY

HARBOR JUNCTION - ARCO/CHEVRON 8"/10" (124)		
Pipe and Operational Data		
• Section Length:	0.64 Miles	3,401 Feet
• Line Diameter:	8.625 in., O.D.	8.249 in., I.D. (note 1)
• Line Capacity:	349 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7) (F) (b)	
• Maximum flow rate:	4,500 bph or 108,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	San Diego, CA	
• Location Description:	From connection to Line 123, Bay Front Street near Coronado Bridge, southeast to Bay Front Street near Sicard Street, ARCO and Chevron Terminals.	

FIGURE 6.1d

PIPELINE SECTION INFORMATION SUMMARY

MISSION VALLEY TERMINAL - SAN DIEGO TERMINAL 8" (141/142/143)	
Pipe and Operational Data	
• Section Length:	0.25 Miles 1320 Feet
• Line Diameter:	8" (note 1)
• Line Capacity:	33 bbls/mile (note 2)
• Capacity of entire line section:	(b) (7)(F),
• Maximum flow rate:	4,500 bph or 108,000 bpd
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.	
• Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.	
Location Description	
• County(s)/State(s) Traversed:	San Diego, CA
• Location Description:	From Mission Valley Terminal to San Diego Terminal (formerly Shell).

6.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the pipeline sections covered in this Area of Operation. The data is summarized as follows:

PIPELINE SECTION	LINE NO.
Watson Incoming Lines:	
• Dominguez Channel - Watson 10"	110
• Sepulveda Junction - Watson 16"	109
Watson Outgoing Lines:	
• Watson - Norwalk 16"	10
• Watson - Norwalk 16"	120
• Norwalk - Orange 16"	125
• Orange - Highway 5216"	126
• Watson - Norwalk 24"	105
Other Watson Area Lines:	
• Norwalk - Industry 24"	108
• Norwalk - Industry 16"	1
Pipeline Facilities (Non-Storage):	
• Sepulveda Junction - piping manifold only	
• Hynes Junction - piping manifold only	
• Norwalk - piping manifold only	
• Industry Pump Station (booster)	

Figures 6.1a through 6.1i on the following pages provide specific details on each pipeline segment within this Area of Operation. The Worst Case Discharge (WCD) for this Area is provided under the section entitled "Worst Case Discharge Data" of the applicable Line Segment.

- The specific information summary for these pipeline sections is provided as follows:
  - Pipeline Section Information Summary (one per section)
  - Pipeline High Consequence Area Maps
- Breakout stations or Terminaling operations associated with this Area of Operation are detailed in subsequent Sections in this Volume.
- Northern and southern pipeline schematic diagrams are provided in Volume 1, Figure 1.2 and 1.3.

FIGURE 6.1a

PIPELINE SECTION INFORMATION SUMMARY

DOMINGUEZ CHANNEL - WATSON 10" (110)		
Pipe and Operational Data		
• Section Length:	2.82 Miles	14,890 Feet
• Line Diameter:	10.75 in., O.D.	10.312 in., I.D. (note 1)
• Line Capacity:	545 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	8,083.3 bph or 194,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Los Angeles, CA	
• Location Description:	From Watson Station generally southeast to Dominguez west of Alameda, then parallel along Alameda south to Sepulveda Junction south of Sepulveda Blvd (parallels line 109).	

FIGURE 6.1b

PIPELINE SECTION INFORMATION SUMMARY

SEPULVEDA JUNCTION -WATSON 16" (109)		
Pipe and Operational Data		
• Section Length:	3.90 Miles	20,614 Feet
• Line Diameter:	16.0 in., O.D.	15.5 in., I.D. (note 1)
• Line Capacity:	1,232 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	10,000 bph or 240,000 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
• County(s)/State(s) Traversed:	Los Angeles, CA
• Location Description:	From Watson Station generally southeast to Dominguez west of Alameda, then parallel along Alameda south to Sepulveda Junction south of Sepulveda Blvd.

FIGURE 6.1c

PIPELINE SECTION INFORMATION SUMMARY

WATSON - NORWALK 16" (10)		
Pipe and Operational Data		
• Section Length:	12.17 Miles	64,258 Feet
• Line Diameter:	16.0 in., O.D.	15.5 in., I.D. (note 1)
• Line Capacity:	1,232 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	7,000 bph or 168,000 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
• County(s)/State(s) Traversed:	Los Angeles, CA
• Location Description:	From Watson north parallel to Alameda to the vicinity of Compton Creek, then generally east crossing Compton Creek and the Los Angeles and San Gabriel Rivers to Norwalk Blvd, then north to Norwalk Junction.

FIGURE 6.1d

PIPELINE SECTION INFORMATION SUMMARY

WATSON - NORWALK 16" (120)		
Pipe and Operational Data		
• Section Length:	14.61 Miles	77,131 Feet
• Line Diameter:	16.0 in., O.D.	15.376 in., I.D. (note 1)
• Line Capacity:	1,213 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F),	
• Maximum flow rate:	8,000 bph or 192,000 bpd	

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description	
• County(s)/State(s) Traversed:	Los Angeles, CA
• Location Description:	From Watson generally north to Compton Creek then east crossing the Los Angeles River to Garfield, north to Alondra, then generally east across the San Gabriel River to Norwalk Junction.

FIGURE 6.1e

PIPELINE SECTION INFORMATION SUMMARY

WATSON - NORWALK 24" (105)	
Pipe and Operational Data	
● Section Length:	12.82 Miles 67,690 Feet
● Line Diameter:	24.0 in., O.D. 23.0 in., I.D. (note 1)
● Line Capacity:	2,713 bbls/mile (note 2)
● Capacity of entire line section:	(b) (7)(F),
● Maximum flow rate:	15,000 bph or 360,000 bpd
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.	
● Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.	
Location Description	
● County(s)/State(s) Traversed:	Los Angeles, CA
● Location Description:	From Watson generally east across Compton Creek and the Los Angeles River, then generally east and north across the San Gabriel River to Norwalk Junction.

FIGURE 6.1f

PIPELINE SECTION INFORMATION SUMMARY

NORWALK - INDUSTRY 24" (108)

Pipe and Operational Data

- Section Length: 20.74 Miles 109,747 Feet
- Line Diameter: 24.0 in., O.D. 23.25 in., I.D. (note 1)
- Line Capacity: 2,773 bbls/mile (note 2)
- Product types: CARB ULSD, Gas, Ethanol
- Capacity of entire line section: (b) (7)(F),
- Maximum flow rate: 15,000 bph or 360,000 bpd

Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.

Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.

Location Description

- County(s)/State(s) Traversed: Los Angeles, CA
- Location Description: From Norwalk Junction generally northeast through Whittier, across Colima Road to the vicinity of Nogales and Valley, then east to Industry Station.

Worst Case Discharge Data

• Line Diameter:	16.0 in., O.D.	15.376 in., I.D. (note 1)
• Line Capacity:	1,213 bbls/mile (note 2)	
• Capacity of entire line section:	(b) (7)(F), (b)	
• Maximum flow rate:	7,000 bph or 168,000 bpd	
Note 1: The indicated inside diameter, used to calculate the line capacity, is based on the predominant wall thickness.		
Note 2: The line capacity is based on the indicated inside diameter. The reduced capacity that may result from some sections of line having thicker wall is ignored.		
Location Description		
• County(s)/State(s) Traversed:	Orange, San Diego, CA	
• Location Description:	From Orange Terminal, Orange, CA, generally southeast to connection with Line 122 north of Hwy 52 (east of I-805), crosses Santiago Creek, San Juan Creek, Santa Margarita River and San Dieguito River.	

FIGURE 6.2

HCA INDEX

Refer to Figure 6.1a through Figure 6.1i for specific information on line segments.

The following Index Map shows all the corresponding Line Segments for Figure 6.1.

Detailed HCA Maps are contained in the CD inside the front cover of Volume 2 (or in a separate folder on electronic copy CD).

The specific HCA maps for this area are:

7.0 BREAKOUT STATIONS / TERMINALS

7.1 SCOPE

The scope of this Section is to provide an information summary with specific data for the breakout stations and/or terminals that have storage (breakout tanks) connected to the pipeline sections described in the previous Section of this Volume. The data is summarized as follows:

BREAKOUT STATIONS / TERMINALS	LARGEST TANK (BBLS)	WCD (BBLS)
Carson Terminal (Tank 178016)	(b) (7)(F), (b) (3)	
LA Harbor Terminal (Tank 131736)		

- The largest Worst Case Discharge (WCD) for the terminal breakout tanks within this Area of Operation has been determined to be as follows:

(b) (7)(F), (b) (3)

  - The tanks in the breakout stations within this area have adequate secondary containment.

- The specific information summary for these breakout terminals are provided as follows:

  - Breakout Station / Terminals Tank Information Summary (one per station)
  - Facility Diagrams

- Pipeline sections or terminaling operations associated with this area of operation are detailed in other Sections of this Volume.

8.11 SPECIFIC LOGISTICAL RESOURCES

8.11.1 First Aid and Medical Services

First Aid
First Aid supplies are maintained in the Facility offices. KMEP field emergency responders have received First Aid and CPR training and will provide first response within the limits of their training. After first aid treatment, the injury will be evaluated for reference to, or transport to, medical professionals.

Urgent Care
Non-emergency medical care can be obtained through Urgent Care facilities. Transport to these facilities is usually provided through use of personal or company vehicles. Possible resources for this service include, but are not limited to, the following.

24 Hour-Emergency Room Service
St. Mary's Medical Center
1050 Linden
Long Beach, CA 90813
(562) 491-9000

7:00 am - 12:00 am (Monday - Friday)
Long Beach Medical Center
1250 Pacific Avenue
Long Beach, CA 90813
(562) 437-0831
(562) 624-2725 Fax

Emergency Medical Care
Emergency medical care will be secured from medical professionals. Possible resources for this service include but are not limited to, these listed above plus the following:

DIAL 911 - REQUEST ASSISTANCE FROM PARAMEDICS

San Pedro Peninsula Hospital
1300 W. 7th Street
San Pedro, CA 90732
(310) 832-3311

Long Beach Memorial Medical Center
2801 Atlantic Avenue
Long Beach, CA 90806
(562) 933-3000

Additional telephone references are provided in Figure 2.2 of this volume.

8.11 SPECIFIC LOGISTICAL RESOURCES (Cont'd)

8.11.2 Fire Services

Support from fire fighting professionals will be secured as needed. The services will be activated either by a call through 911 or directly to the nearest fire fighting resource. Possible resources for this service include but are not limited to, the following:

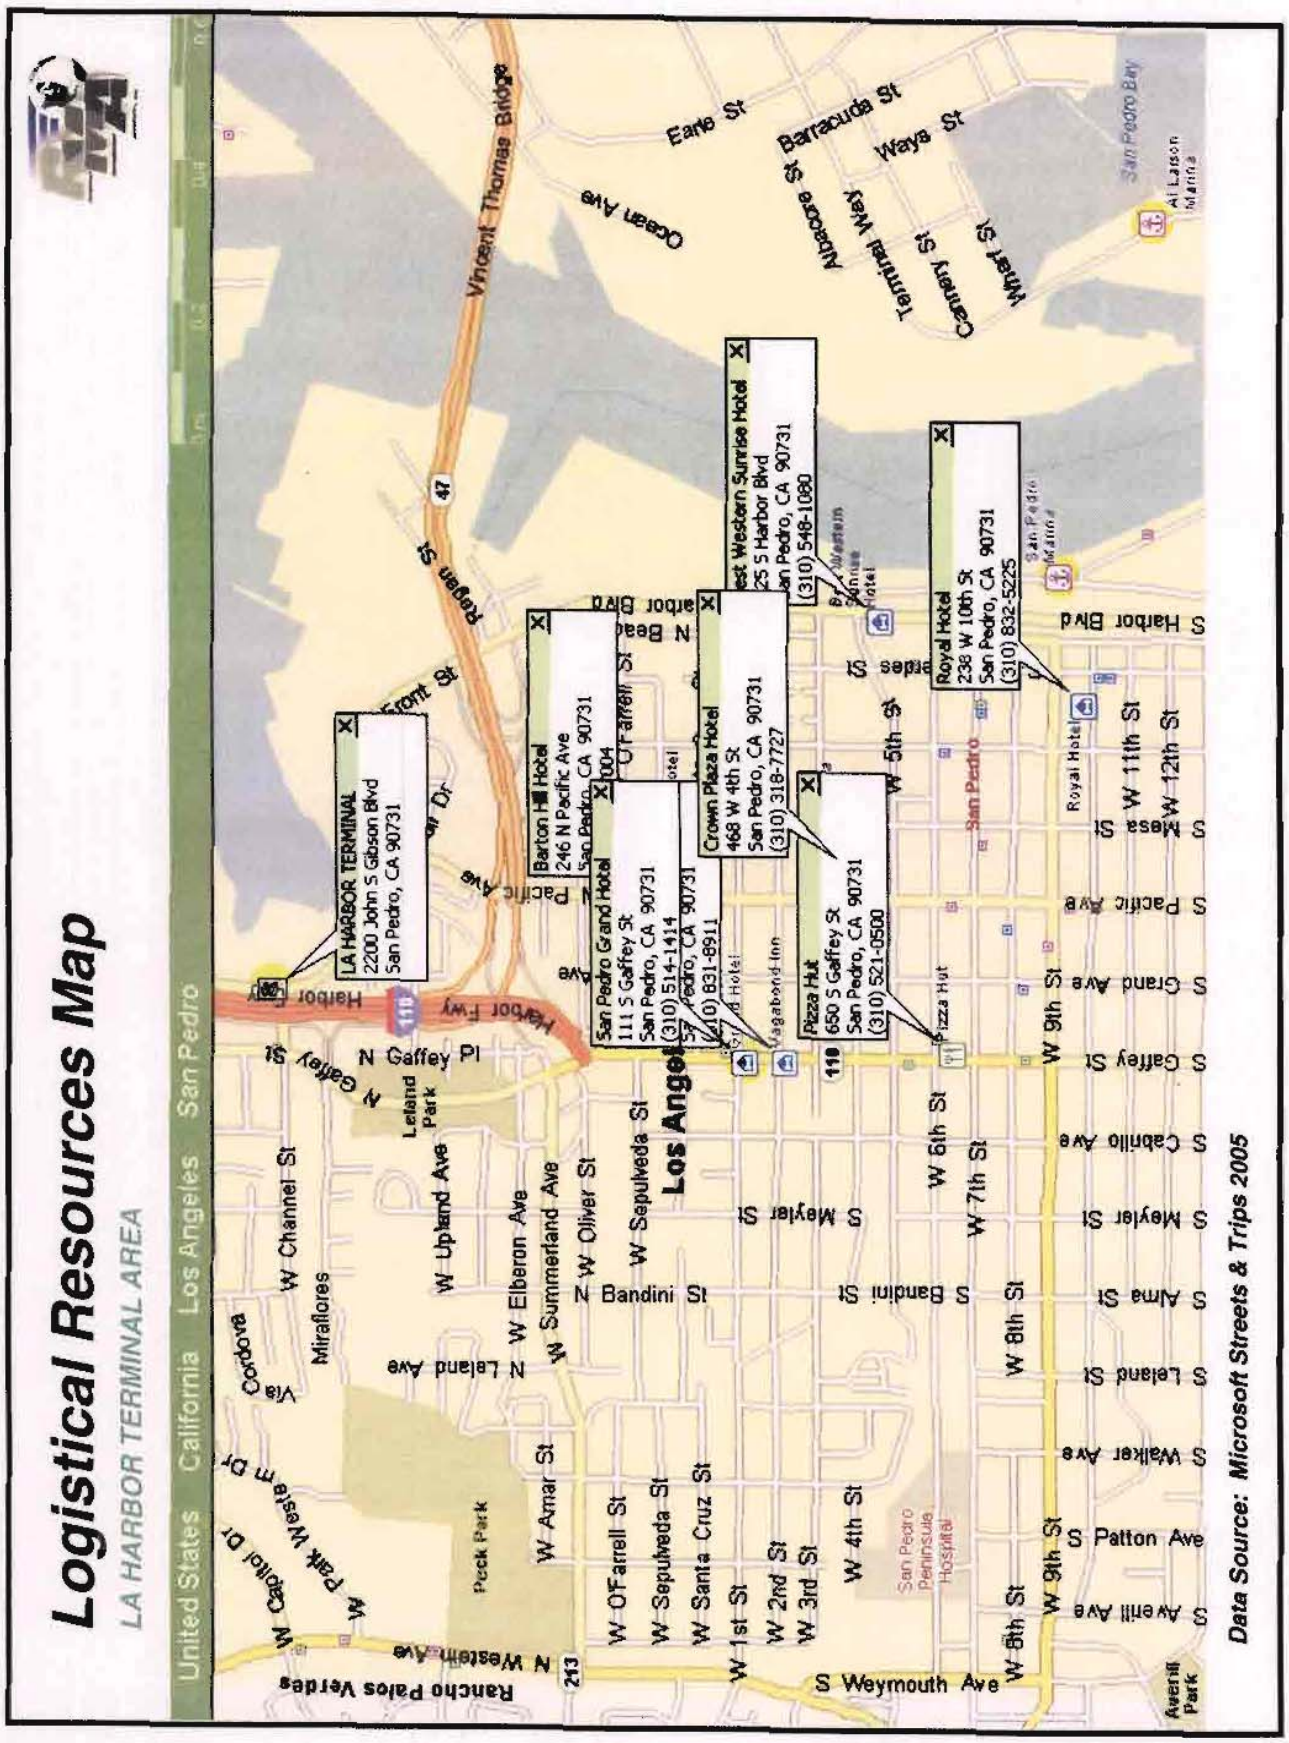
Long Beach Fire Dept
925 Harbor Plaza
Long Beach, CA
(562) 570-2500

LA County Fire Dept
4020 Candlewood Street
Lakewood, CA
(562) 634-1266

Carson Fire Dept
701 E. Carson Street, #B24
Carson, CA
(310) 830-9596

8.11.3 Lodging Services

Lodging will be secured for responders as appropriate. The following Figure provides an overview of the lodging services in the immediate vicinity of the Terminal. KM may select these or other Lodging Services as appropriate.



Kinder Morgan
ICP V-2

Southern Region – West
Carson Area-Los Angeles Harbor Terminal
July 2005

FIGURE 8.9

TACTICAL PLAN

The following Tactical Plan has been provided to assist initial response to a spill incident from this Facility. The plan includes the following:

- Driving directions
- General pictures of the site and tactical response strategy
- General response equipment and personnel recommendations

Note: This Tactical Plan is provided as a general guidance tool for response to an incident emanating from this Facility. The selection of response strategy equipment, manpower and deployment site may vary based on actual field conditions (e.g. terrain, weather conditions, product type/volume) and incident details.

(b) (7)(F), (b) (3)

8.1.1 CERTIFICATION OF SUBSTANTIAL HARM

CERTIFICATION OF THE APPLICABILITY OF THE SUBSTANTIAL HARM CRITERIA

Facility Name and Address: Kinder Morgan Liquids Terminals, LLC Carson Terminal
2000 E. Sepulveda Blvd.
Carson, CA 90810

(Detailed Facility information, including data required for the Response Plan Cover Sheet, is provided in Figure 8.1)

1.	Does the facility transfer oil over water to or from vessels ***and*** does the facility have a total oil storage capacity greater than or equal to 42,000 gallons?	Yes:	No: X
2.	Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area?	Yes:	No: X
3.	Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix (40 CFR 112 Appendix C) or a comparable formula[1]) such that a discharge from the facility could cause injury (as defined in 40 CFR 112.2) to fish an wildlife and sensitive environments?	Yes: X	No:
4.	Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix (40 CFR 112 Appendix C) or a comparable formula[1]) such that a discharge from the facility would shut down a public drinking water intake[2]?	Yes:	No: X
5.	Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the past five (5) years?	Yes: X	No:

[1] If a comparable formula is used, documentation of the reliability and analytical soundness of the comparable formula must be attached to this form.

[2] For the purposes of 40 CFR part 112, public drinking water intakes are analogous to public water systems as described at 40 CFR 143.2(c).

CERTIFICATION

I hereby certify the following:

- Under penalty of law that I have personally examined and am familiar wit the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe the submitted information is true, accurate and complete.
- The information and procedures contained herein are considered to be accurate as of this date and are consistent with the National Contingency Plan (NCP) and applicable Area Contingency Plans (ACP) as detailed in Volume 1, Section 1.5.

Signature: _____ Date: 30 - June 2010

Tom Hosler, Area Manager

8.1.2 INTRODUCTION

This Facility is a bulk liquid storage and distribution point for various refined petroleum products, ethanol and crude oil. The Facility has the capability to ship and receive products by tank truck and/or pipeline. The following Figure 8.1 provides Facility specific information, Figure 8.2 provides an Area Map for the Facility, and Figure 8.3 through 8.5 provides Facility General Layout and Fire Protection Diagrams.

This Section 8 is provided in order to document the following Facility-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- Facility Information (Figure 8.1)
- Area Map (Figure 8.2)
- Hazard Identification including Tank Tables (Section 8.2)
- Inspections (Section 8.2.2)
- Vulnerability Analysis (Section 8.2.3)
- Discharge Scenarios (Section 8.3)
- Evacuation (Section 8.4)

County:	Los Angeles County, CA
Latitude:	(b) (7)(F), (b) (3) [redacted]
Longitude:	
Area Map:	Provided in Figure 8.2
Facility Diagram:	Provided in Figure 8.3
Wellhead Protection Area:	None
Facility Distance to Navigable Water:	Less than 0.25 mile
Landside Directions:	From the intersection of I-710 and West Willow/47, take 47 west for approximately 0.74 miles when 47 turns south and East Sepulveda continues on west. Travel on East Sepulveda approximately 0.66 miles to the Facility on the left.
Waterside Directions:	There is no water access to this Facility.

PHYSICAL DESCRIPTION - GENERAL

Description of Operations:

- This Facility is a bulk distribution facility for refined petroleum products, ethanol and crude oil located on a 100 acre parcel in Carson, CA.

(b) (7)(F), (b) (3) [redacted]

- The Facility normally operates 24 hours a day 7 days a week.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL (Cont'd)

Products Handled:

- Alkylate
- Crude Oil
- Cutter Stock
- Diesel
- Gasoline
- Gasoline Additives
- Gas Oil
- Jet Fuel
- Naphtha
- Transmix

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

PHYSICAL DESCRIPTION - TRUCK RACK

Description of Operation:

- The Facility is equipped with ten (10) loading lanes and one (1) unloading lane which handle various refined petroleum products.
- A maximum of ten (10) tank trucks may load simultaneously.
- The loading/unloading operations are conducted 24 hours a day 7 days a week.
- The Facility handles an average of 210 trucks per day.

Loading Rate: 600 gpm (*per truck*)

Truck Capacity: 9,000 gallons (*maximum*)

Discharge Prevention:

- The curbed concrete slab drains directly to a sump and is pumped to an oily water treatment system.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS
• The Facility was built in 1923. Substantial expansions to the Facility occurred in 1933 when eight (8) tanks were added, 1980 when seven tanks were added, 1991-2 when a total of 11 tanks were added and in 1993-4 when 10 tanks were added. Four (4) new tanks were added in 2006 – 2008 and 13 older tanks removed. Six (6) new tanks constructed in 2010. Seven (7) new tanks constructed in 2011/2012. One (1) new tank constructed 2013.
Figures presented on the following pages include: • Figure 8.2 – Area Map • Figure 8.3 – General Layout (07-2013) • Figure 8.4 – Fire Protection Diagram – Foam System (07-2013) • Figure 8.5 – Fire Protection Diagram – Water System (07-2013)

8.1.4 INTRODUCTION

This Facility is a bulk storage and distribution facility for crude oil land refined petroleum products. Products are received via vessel and pipeline and distributed via tank truck, vessel and pipeline. The following Figure 8.1 provides Facility specific information and Figure 8.2 provides an Area Map for the Facility.

This Section 8 is provided in order to document the following Facility-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- Facility Information (Figure 8.1)
- Area Map (Figure 8.2)
- Hazard Identification including Tank Tables (Section 8.2)
- Inspections (Section 8.2.2)
- Vulnerability Analysis (Section 8.2.3)
- Discharge Scenarios (Section 8.3)
- Evacuation (Section 8.4)
- Risk and Hazard Analysis (Section 8.5)
- Offsite Consequence Analysis (Section 8.6)
- Risk Reduction Incentive Program (Section 8.7)
- Drug and Alcohol Policies (Section 8.8)
- Vessel Loading Procedures (Section 8.9)

FACILITY INFORMATION

GENERAL INFORMATION (Cont'd)	
Agent for Service:	CSC - Lawyers Incorporating Service 2730 Gateway Oaks Drive, Suite 100 Sacramento, CA 95833 (800) 222-2122 *(CA Toll Free)* (800) 927-9800 *(Toll Free)* (916) 641-5151 *(Fax)*
Telephone/FAX:	Additional telephone references, including 24 hour numbers, for the Facility, Owner, and QI/AQI are provided in Section 2 of Volume I.
FACILITY LOCATION	
County:	Los Angeles County, CA
Latitude:	(b) (7)(F), (b) (3) [redacted]
Longitude:	
Area Map:	Provided in Figure 8.2
Facility Diagram:	Provided in Figure 8.3
Wellhead Protection Area:	None
Facility Distance to Navigable Water:	Adjacent
Landside Directions:	From San Pedro take 110 North approximately 0.6 miles to John S. Gibson Road exit. Take John S. Gibson Road approximately 0.22 miles northeast to Wilmington San Pedro Road. Turn right on Wilmington San Pedro Road to Facility.
Waterside Directions:	Facility can be accessed from San Pedro Bay via Main Basin Channel turning westerly at the turning basis just north of the Vincent Thomas Bridge to the Southwest Slip.
Seasonal Weather Conditions:	
Air Temperature:	Ranges from 30° to 95°F
Water Temperature:	Ranges from 52° to 54°F
Winds:	Generally southwest at 15 to 25 mph in afternoons from April to September; calm in other months except during storms.
Rain:	Generally 18 to 20 inches per year during October to May.
Marine Tide/Current:	The tidal range is generally from 0 feet to +5 feet MLLW, with the extremes being -2.5 feet and +7.5 feet. Currents in the Santa Fe Channel are generally about 0.5 feet knot at flood and EBB, with the maximums somewhat above this.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL

Description of Operations:

- This Facility is a bulk distribution facility for refined petroleum products and crude oil located on a 12.4 acre parcel at Berths 118-119 on the west side of Main San Pedro Channel in Los Angeles Harbor.

(b) (7)(F), (b) (3)

[redacted]

- The Facility normally operates 24 hours a day 7 days a week.

Products Handled:

- Gasoline
- Diesel
- Jet Fuel
- Transmix
- Alkylate
- Crude Oil
- Naphtha
- Fuel Oil
- Gas Oil
- ISO Octane

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility Office.

Pipeline Leak or Rupture:

- All buried pipes under jurisdiction of the California State Fire Marshal are cathodically protected. New installations within the Terminal boundaries are routed above ground whenever practical. New installations which must be routed underground are coated and wrapped for additional corrosion protection. All subsurface pipelines currently in use are either cathodically protected or coated.

- A pumping report is kept during transfer operations. Volumes pumped and received are reconciled every two hours. If any large discrepancies are observed, the operation is shut down until the discrepancies can be resolved.

- Pipeline flow rates and pressures are monitored during transfer operations.

- High pressure shutdown trips are provided on the outlet of all pumps to ensure lines are not overpressured.

- If any damage or corrosion is found on the transfer systems, Kinder Morgan investigates the problem, initiates repairs, and performs any additional inspections deemed appropriate.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL (Cont'd)

Pipeline Leak or Rupture (Cont'd):

- Pipe supports allow for expansion and contraction. Many of the pipe supports are designed to minimize abrasion of the pipeline. Frequent inspections should minimize the spill potential from the pipelines that do not have supports with an abrasion control design.
- Above ground lines, valves, and fittings within Terminals are inspected daily by Terminal Operators.
- In areas with vehicular traffic, the aboveground piping is protected with barriers. Additionally, drivers are warned either verbally or by signage in areas with aboveground piping.
- Pipelines, when not in service for an extended period of time, are capped or blank-flanged and marked as out of service.

Pipeline Transfer Communications:

- The Terminal sites are in communication via telephone. Prior to transfer between Terminals, the Terminal Operators communicate to verify the operation. Communications between KMEP and outside parties are conducted via telephone. The outside operators are in radio communication with the Terminal Operator.
- (b) (7)(F), (b) (3) [redacted]

PHYSICAL DESCRIPTION - LOADING RACK

Description of Operation:

- The Facility is equipped with one (1) loading / two (2) unloading spots which handle various refined petroleum products.
- A maximum of three (3) tank trucks may load simultaneously.
- The loading/unloading operations are conducted 24 hours a day 7 days a week.
- The Facility handles an average of five (5) trucks per day.

Loading Rate: 600 gpm (*per truck*)

Truck Capacity: 9,000 gallons (*maximum*)

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - LOADING RACK (Cont'd)

Discharge Prevention:

- The curbed concrete slab drains directly to an oil water separator.
- Loading of refined products are only conducted by Facility Operators.
- Safe operating procedures are posted.

PHYSICAL DESCRIPTION – MARINE OPERATIONS

General Operation:

Although there are 32 pipelines at the Facility, only 12 of the pipelines to the dock are actively used. Due to logistical and operational constraints, only three (3) of the 12 pipelines are operated simultaneously:

- No. 32 Twelve-inch jet fuel pipeline
- No. 33 Twelve-inch diesel pipeline
- Sixteen-inch oil product fuel pipeline

Dock Detail:

- **Length:** 800 feet
- **Construction:** Los Angeles Harbor Berths 118, 119, and 120 are built on wood pilings with a curbed wood deck. Transfer manifolds are located over curbed concrete decks.
- **Transfer Rate:** 2,000 – 7,000 bph (maximum loading)
2,000 – 10,000 bph (maximum unloading)
- **Transfer Hoses:** Supplied by the Facility.
- **Draft:** Normal draft is 35 feet.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION – MARINE OPERATIONS (Cont'd)

Vessel Detail:

- **Type:** Vessel/Barge
- **Size:** The Facility uses three (3) berths capable of handling a vessel approximately 1,000 feet in length with a 150 foot beam and a 35 foot draft as well as a 525 foot tanker and a 250 foot barge or three (3) 250 foot barges.
- **Dead Weight** 90,000 DWT
- **Tow Quantity (Barge):** One (1)
- **Capacity:** 150,000 bbls *(maximum)*
- **Simultaneous Operations**: One (1) 1,000 foot vessel or one (1) 250 foot barge can be accommodated at a time. Typical operations are pumping to/from one vessel/barge at a time.

Vessel and Barge Operations:

Spills from loading/unloading vessels and barges are prevented in the following manner:

- An inspection is performed on all vessel piping and fittings before attaching to the vessel.
- A pumping report is kept during loading/unloading. Volumes shipped and received are reconciled hourly. If any large discrepancies are observed, the operation is shut down until the discrepancies can be resolved.
- Loading/unloading is continually monitored by one person on the dock, one or more persons on the vessel, and one person monitoring shoreside tankage.
- Loading/unloading hoses are visually inspected for damage before each use. Hoses are pressure tested when placed in service and annually thereafter.

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION – MARINE OPERATIONS (Cont'd)

Vessel and Barge Operations (Cont'd):

The following inspections are performed at the Facility:

- An annual hydro-test is conducted on the internal piping from each dock header to the onshore block valve at the manifold containment area.
- An annual test/re-set of the emergency shutdown motor that is operated on the onshore block valves is conducted.
- Each shift performs a dock inspection for any irregularities and an inspection of the pumps for leaking seals.

Vessel and Barge Communications:

- A Terminal Operator is on duty on the berth whenever a transfer operation is being conducted. The duties of this Operator are to monitor the transfer from the berth, visually inspect the loading arm and/or hose, and maintain radio communications with the Terminal Operator and vessel.
- Portable radios are the primary means of communications between the Terminal personnel. Telephones are also available for notification of an emergency situation. Telephones are located in the Terminal Offices, and on the docks. Pagers are also used for notification of Company management and off-duty personnel.

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS

- In 1931 two (2) tanks constructed.
- In 1935 four (4) tanks constructed.
- In 1949 three (3) tanks constructed.
- In 1959 seven (7) tanks constructed.

Figures presented on the following pages include:

8.1.1 CERTIFICATION OF SUBSTANTIAL HARM

CERTIFICATION OF THE APPLICABILITY OF THE SUBSTANTIAL HARM CRITERIA

Facility Name and Address: SFPP, L.P. Mission Valley Terminal
9950 San Diego Mission Road
San Diego, CA 92108

(Detailed Facility information, including data required for the Response Plan Cover Sheet, is provided in Figure 8.1)

1. Does the facility transfer oil over water to or from vessels ***and*** does the facility have a total oil storage capacity greater than or equal to 42,000 gallons?	**Yes:**	**No: X**
2. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area?	**Yes:**	**No: X**
3. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix (40 CFR 112 Appendix C) or a comparable formula[1]) such that a discharge from the facility could cause injury (as defined in 40 CFR 112.2) to fish an wildlife and sensitive environments?	**Yes: X**	**No:**
4. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix (40 CFR 112 Appendix C) or a comparable formula[1]) such that a discharge from the facility would shut down a public drinking water intake[2]?	**Yes:**	**No: X**
5. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the past five (5) years?	**Yes:**	**No: X**

[1] If a comparable formula is used, documentation of the reliability and analytical soundness of the comparable formula must be attached to this form.

[2] For the purposes of 40 CFR part 112, public drinking water intakes are analogous to public water systems as described at 40 CFR 143.2(c).

CERTIFICATION

I hereby certify the following:

- Under penalty of law that I have personally examined and am familiar wit the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe the submitted information is true, accurate and complete.
- The information and procedures contained herein are considered to be accurate as of this date and are consistent with the National Contingency Plan (NCP) and applicable Area Contingency Plans (ACP) as detailed in Volume 1, Section 1.5.

8.1.2 INTRODUCTION

Facility Overview

This Facility is a bulk distribution facility for refined petroleum products. Product is received via the Company's pipeline #122/126/125/10 into aboveground storage. The product is transported out of the Facility by tanker trucks. The following Figure 8.1 provides Facility specific information, Figure 8.2 provides an Area Map for the Facility and Figure 8.3 provides a Facility Diagram.

This Section 8 is provided in order to document the following Facility-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- Facility Information (Figure 8.1)
- Area Map (Figure 8.2)
- Hazard Identification including Tank Tables (Section 8.2)
- Inspections (Section 8.2.2)
- Vulnerability Analysis (Section 8.2.3)
- Discharge Scenarios (Section 8.3)
- Evacuation (Section 8.4)

PHYSICAL DESCRIPTION - GENERAL

Description of Operations:

- This Facility is a bulk distribution facility for refined petroleum products.

(b) (7)(F), (b) (3) [redacted]

- The Facility normally operates 24 hours a day 7 days a week.
- The Facility's Worst Case Discharge amount is (b) (7)(F), (b) (3) [redacted]

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL (Cont'd)

Products Handled:

- Gasoline
- Diesel
- Ethanol
- Transmix
- Additives
- Red Dye

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

PHYSICAL DESCRIPTION - LOADING RACK

Description of Operation:

- The Facility is equipped with twelve (12) loading and four (4) off-loading spots which handle various refined petroleum products.
- A maximum of twelve (12) tank trucks may load simultaneously, and a maximum of four (4) trucks may unload simultaneously.
- The loading/unloading operations are conducted 24 hours per day 7 days per week.
- The Facility handles an average of 230 trucks per day.

Loading Rate: 600 gpm (*per truck*)

Truck Capacity: 9,000 gallons (*maximum*)

Discharge Prevention:

- Full discharge prevention details are provided in Section 7 of the SPCC Plan.

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS

- The majority of the Facility was constructed in 1962 and 1963. Eight (8) tanks with a maximum capacity of 6,133,260 gallons were initially constructed. Five (5) new tanks were constructed in 1968 and 1969, another in 1979, and another in 1999. Six (6) tanks were purchased from Shell Oil Company in 2004.
- Shell San Diego Terminal purchased in 2010

Facility Diagram:	Provided in Figure 8.3
Wellhead Protection Area:	None
Facility Distance to Navigable Water:	Less than one quarter mile
Landside Directions:	At the intersection of I-5 and CA-57/Pomona, merge onto SR-57 (Orange Freeway North). Turn off onto ramp towards Katella Avenue. Turn right onto Katella Avenue. Turn left (north) onto N. Main Street. Arrive at 1350 N. Main Street, Orange.
Waterside Directions:	There is no water access to this Facility.

PHYSICAL DESCRIPTION - GENERAL

Description of Operation:

- This Facility is a bulk distribution facility for refined petroleum products.

(b) (7)(F), (b) (3) [redacted]

- The Facility normally operates 24 hours a day, 7 days a week.
- The Facility's Worst Case Discharge amount is (b) (7)(F), (b) (3) [redacted]

FIGURE 8.1

FACILITY INFORMATION (Cont'd)

PHYSICAL DESCRIPTION - GENERAL (Cont'd)

Products Handled:

- Gasoline
- Diesel
- Ethanol
- Transmix
- DRA (Drag Reducing Agents)
- Additives

Note: The Facility maintains a stand alone full encompassing MSDS reference binder in the Facility office.

PHYSICAL DESCRIPTION - LOADING RACK

Description of Operation:

- The Facility is equipped with three (3) loading/unloading bays.
- A maximum of two (2) tank trucks may load, and one (1) tank truck may unload, simultaneously.
- The loading/unloading operations are conducted 24 hours a day, 7 days a week.
- The Facility handles an average of 65 trucks per day.

Loading Rate: 600 gpm (*per truck*)

Truck Capacity: 9,000 gallons (*maximum*)

Discharge Prevention:

- The curbed concrete slab drains directly to an oil water separator.
- Loading of refined products are only conducted by the truck drivers.
- Safe operating procedures are posted.

DATES AND TYPES OF SUBSTANTIAL EXPANSIONS

- The majority of the Facility was constructed in 1962 and 1963. Seven (7) tanks with a maximum capacity of 6,453,720 gallons were initially constructed. One (1) new tank was constructed in 1965 and another in 1986.

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Rail car loading/unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed on the Potential Spill Sources and Containment Identification table in this Section.

Tanks

- Secondary Containment volumes for all bulk storage tanks are detailed on the Potential Spill Sources and Containment Identification table in this Section.

Loading Rack Containment System

The loading/unloading rack area is designed and operated as follows:

- Loading/Unloading area drainage flows into a catchment basin or treatment facility, designed to handle discharges.
- The containment system is designed to hold the maximum capacity of any single compartment of a single tank truck loaded or unloaded at the Facility.
- A quick drainage system is not used for tank truck loading/unloading.
- Drainage from the truck rack loading and unloading facilities is contained in a depressed area (with curbs). Drainage is through area drains to a sump. The product is pumped to the product interface tank (TK #16034). Periodically, the interface tank is pumped down and the oil returned to the Temporary Storage Disposal Facility (TSDF). The water phase is drained to a water treatment system, treated and released to the municipal sewer system.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Diked Areas

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/structures or inhibit operations conducted within the containment area.

- Stormwater which does accumulate within diked areas, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures.

- Drainage from diked storage areas is restrained by manually controlled valves.

- Dike drain valves are secured in the closed position when not draining containment areas.

- Flapper-type drain valves are not used to drain diked areas.

- Stormwater from diked areas is emptied by valves and pumps which are manually activated.

- Individually diked areas all drain to a common collection point located in the northeast corner separation ponds of the Facility area through normally closed butterfly valves.

- All interconnecting valves between tank dikes are manually operated.

- The Facility is located on a hillside with natural drainage to the north and east. This drainage pattern, however, has been substantially altered by the installation of secondary containment structures for the Facility tankage. Rainwater falling into these secondary containment areas is allowed to either percolate, evaporate, or it is drained through the Facility's stormwater drain system.

- The stormwater drain system utilizes catch basins, underground pipelines, and manually opened and closed isolation valves to remove the stormwater from within the secondary containment areas. The isolation valves in the drain system are in the closed position, except during discharges. Authorized personnel physically inspect the secondary containment areas to ensure that there is no sheen or oil contamination in the stormwater prior to opening the isolation valves to drain the water. Water which is determined to have oil contamination is not discharged and is either pumped to the slop tank (#16034) or it is cleaned up with absorbent material. Alternatively, the contaminated stormwater could be removed by vacuum truck and disposed of properly.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Diked Areas (Cont'd)

- At the Facility, there are two destinations for the stormwater that is drained from the secondary containment. The majority of the secondary containment areas discharge stormwater to the stormwater retention ponds located in the northeast corner of the Facility. Stormwater from the balance of the secondary containment areas is directed to the stormwater retention basin (commonly referred to as the "slough" in the southwest portion of the Facility).

- The two stormwater retention ponds function as oil water separators to ensure that the stormwater being discharged from the Facility to the Dominguez Channel meets discharge limitations. Discharges from the stormwater retention ponds are governed by the NPDES permit. Prior to discharging any water offsite from the retention ponds, personnel visually inspect the water for any sign of oil. During the discharge, a sample of the wastewater is collected and sent to a laboratory for analysis to verify that the fluid was in compliance with the NPDES permit. Facility personnel monitor all drainage operations.

- Drainage water collected from the highway tanker loading rack areas is routed to the Facility's 16,000 bbls slop tank (#16034). Additionally, drainage from pipeline areas within the Facility flows into either the tank secondary containment areas or the loading rack strip drains.

- Stormwater from outside of the operational areas, such as the office complex and parking lot and areas outside of the loading racks, is controlled using an earthen berm equipped with a gate valve. Clean stormwater can be discharged from this containment area via the gate valve. If the water is contaminated with oil, the water is either pumped to the slop tanks or it is cleaned up with absorbent material prior to discharge.

- Contaminants are routed to a collection tank (#16034) and trucked offsite.

Drainage From the Undiked Areas

Drainage from undiked areas is controlled as follows:

- Piping located outside the diked areas is contained by the in-plant drainage system and stormwater collection system.

- Surface drainage from undiked areas on the property flows to a Clean Water Line Stormwater Collection System. The water from this system is discharged from the property through one outfall.

- All undiked piping is located in areas away from vehicular traffic.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Drainage From the Undiked Areas (Cont'd)

- The risk of leaks originating from piping is low since it is observed frequently enough to detect excessive corrosion, defective pipe supports, or other anomalies which could compromise the integrity of the pipe.

- In the event that a spill did originate from undiked piping, the Facility would immediately activate its Contingency Plan to mitigate the spill before leaving the property.

General Drainage

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is as follows:

- The two stormwater retention ponds function as oil water separators to ensure that the stormwater being discharged from the Facility to the Dominguez Channel meets discharge limitations. Discharges from the stormwater retention ponds are governed by an NPDES permit. Prior to discharging any water offsite from the retention ponds, personnel visually inspect the water for any sign of oil. During the discharge, a sample of the wastewater is collected and sent to a laboratory for analysis to verify that the fluid was in compliance with the NPDES permit. Facility personnel monitor all drainage operations.

- Water is visually inspected for product and discharged only if no product sheen is visible.

- Facility drainage does flow directly into an open watercourse.

- When draining the containment area, water is discharged to the drainage ditch which drains ¼ mile to Dominguez Channel.

- The Facility does not have a wastewater treatment plant nor does it treat water prior to discharge off site.

- Uncontaminated rainwater is inspected to ensure compliance with applicable water quality standards and will not cause a harmful discharge as defined in 40 CFR 110.

- Adequate records are kept of such drainage events and records of drainage events are maintained at the Facility.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Carson Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading rack has sufficient capability to handle any potential increase in transfer capacity. The loading rack operates 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan which details additional detection measures.

Detection by Personnel

- Facility personnel conduct monthly inspection of tank gauges and cathodic protection readings. Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating rounds. *

		There are no Surface Impoundments				

8.2-23

8.2.2 FACILITY SELF-INSPECTIONS

Container Testing and Inspections

- All aboveground containers are integrity tested on a regular schedule and when material repairs are made.
- The Engineering Department oversees the tank integrity in accordance with the SPCC Plan and L O&M Procedure 2101.
- Comparative records are maintained by the Engineering Department at the Orange office.
- The container inspection programs conducted and maintained by Facility personnel are as follows:
  - The containers are visually inspected by operating personnel for signs of deterioration, leaks, or the accumulation of liquids inside the containment areas.
  - Each storage container is inspected per the SPCC Plan and L O&M Procedure 2101, as required by age, condition, and service.
  - Based on these conditions, the aboveground storage containers are professionally inspected and non-destructive thickness testing is performed.
- The required inspections are divided into three categories:
  - Routine, in-service inspections
  - In-service, external inspections
  - Out-of-service, internal inspections
- If a field-constructed aboveground container undergoes a repair, alteration, reconstruction, or change in service that might affect the risk of a discharge or failure due to brittle fracture, the container will be evaluated.
- Drums or totes brought on-site are built or tested to the standard(s) established by the drum manufacturer or the drum recycler, as applicable.
- While on-site, drums and totes will be visually inspected at least monthly and ground contact will be minimized.
- Liquid level sensing devices are regularly tested. Liquid level transmitters are tied to the Varec level gauge system. (b) (7)(F), (b) (3) [redacted]
- The bulk storage containers are equipped with ground-level gauges and are hand-gauged at regular intervals.

8.2.2 FACILITY SELF-INSPECTIONS (Cont'd)

Container Testing and Inspections (Cont'd)

- An inspection and maintenance program is in place to periodically test the level control, alarm, and gauging systems on the Facility tanks. Additionally, liquid level sensors are regularly checked against physical measurements during product transfers to verify accurate sensor readings. Liquid level sensors are calibrated if discrepancies are noted.

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valves locks and/or seals
  - Other appurtenances

- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, and replacement.

- Annually, a Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report, which recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

Documentation

- Records of the inspections and tests (including those maintained under usual and customary business practices), signed by the appropriate supervisor or inspector are retained on file at the Facility and/or other Corporate location for a minimum period of three (3) years.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

- The Facility is located approximately 250 feet from the Dominguez Channel which flows into the Los Angeles Inner Harbor, and is therefore also in a tidally influenced area.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Water Intakes

(b) (7)(F), (b) (3)

(b) (3), (b) (7)(F)

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

(b) (3), (b) (7)(F)

Residential Areas

Residential areas are located in all directions from the Facility. These areas begin within a half mile of the Facility and continue outward in all directions.

Businesses

The area surrounding the Facility is heavily commercialized. Review of GIS Data determined that the following businesses are within the planning distance of the Facility:

Businesses	Distance from Facility
Long Beach Naval Station	0.50 miles S *(approximate)*
Los Angeles Harbor Administration	3.35 miles SW *(approximate)*
Federal Correction Institution Terminal Island	3.90 miles SW *(approximate)*
USCG Sector Los Angeles/Long Beach	3.90 miles SW *(approximate)*

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Fish and Wildlife, Wetlands, and other Sensitive Environments

The immediate area surrounding the Facility is commercialized and supports only minor amounts of wildlife. The overall impact on fish and wildlife, wetlands, and other sensitive environments will happen upon impact of the Main Channel and San Pedro Bay area. The Dominguez Channel has a variable flow potential depending on weather conditions. The channel supports minor amounts of wildlife, primarily microbial and passing birds.

The coastal area along San Pedro Bay is home for a variety of migratory species during parts of the year. The common coastal inhabitants include shorebirds, wading birds, fish, reptiles, invertebrates, and various plants. The coastal shorelines have been divided into ten categories according to potential sensitivity to oil. The U.S. Coast Guard - Area Contingency Plan for Los Angeles, CA details these categories.

Review of the USF&W Wetlands Mapper and Terraserver data indicates the following wetlands are within the planning distance of the Facility:

Wetlands	Latitude/Longitude (b) (7)(F), (b) (3)
Dominguez Channel Riverine Habitat	

Wetland habitats are common throughout portions of the area. The size and diversity of the wetland environments vary with season and year.

The Seal Beach National Wildlife Refuge is located adjacent to Sunset Bay. This refuge lies along the coastline towards Huntington Beach (near 33° 44' 21" N 118° 07' 06" W

All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

During a response situation the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact the agencies will be able to:

- Identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge.

Lakes and Streams

Review of GIS Data determined that the following lakes and streams are within the planning distance of the Facility:

Lakes and Streams	Location
San Pedro Channel	1.00 miles S *(approximate)*
Los Angeles River	2.00 miles E *(approximate)*
San Gabriel River	11.50 miles SE *(approximate)*

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Figure 4.1 of this Volume.

Recreational Areas

Review of GIS Data determined that the following recreational areas are within the planning

Recreational Areas	Location
Harbor Highlands Park	2.50 miles SW *(approximate)*
Angels State Park	5.70 miles SW *(approximate)*
Point Fermin Park	5.70 miles SW *(approximate)*
Pacific Coast Club	7.50 miles SE *(approximate)*
Shoreline Aquatic Park	7.50 miles SE *(approximate)*
Bluff Park	9.00 miles SE *(approximate)*

The recreational areas that may be potentially impacted by a discharge originating at the Facility are more fully identified on the maps in Section 6.

Transportation Routes (air, land, and water)

Review of GIS Data determined that the following transportation routes are within the planning distance of the Facility:

Transportation Routes	Location
Long Beach / Daugherty Field Airport	5.00 miles E *(approximate)*

The San Pedro Bay supports vessel traffic and would require vessel traffic control in the event of a discharge impacting the bay.

Utilities

Review of GIS Data determined that the following utilities are within the planning distance of the Facility:

Utilities	Location
Harbor Steam Plant	0.50 miles S *(approximate)*

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Other Areas of Economic Importance

Review of GIS Data determined that no terrestrially sensitive or unique environments such as wildlife refuges, management areas, or ecological reserves are within the planning distance of the Facility.

Other Areas of Economic Importance	Distance from the Facility
Veterans Memorial	2.70 miles E *(approximate)*
Long Beach Public Library	2.75 miles E *(approximate0*
Los Angeles Maritime Museum	3.30 miles SW *(approximate)*
Fort MacArthur Military Museum	5.20 miles SW *(approximate)*
Cabrillo Marine Museum	5.70 miles SW *(approximate)*
Long Beach Arena	6.00 miles SE *(approximate)*
Long Beach Convention and Entertainment Center	6.00 miles SE *(approximate)*
Long Beach Museum of Art	9.30 miles SE *(approximate)*

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history of the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL (Cont'd)

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Containment and recovery of any spilled material which might escape a diked area would be accomplished through the implementation of spill response activities by: (1) Facility personnel, or if necessary, (2) one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow northeast and southwest to catchment basins.

Vulnerability to a Natural Disaster

All storage tanks and ancillary piping are fabricated in compliance with rigorous nationally recognized design specifications. The specifications include wind-load allowances and recognition of any applicable seismic considerations. These factors minimize the risk of vulnerability to natural disasters, including tornadoes.

In addition to the above referenced factors, it should also be noted that Facility inspection and response drills, as well as Standard Operating Procedures (SOPs) for loading operations and the like, contribute to minimization of spill potential at the Facility.

Other Factors

The Hector Mine Earthquake caused an Agency Reportable Spill on 10/16/99. All products were contained on site and no product left the Facility.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

Kinder Morgan maintains an online database of reportable spills available at all locations via the company's intranet. The database contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY (Cont'd)

- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

FIGURE 8.7

FACILITY DRAINAGE DIAGRAM

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Marine transfer operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed on the Potential Spill Sources and Container Identification table in this Section.

Tanks

- Secondary Containment volumes for all bulk storage tanks are detailed on the Potential Spill Sources and Container Identification form located in this Section.

Loading Rack Containment System

The loading/unloading rack area is designed and operated as follows:

- Loading/Unloading area drainage flows into a catchment basin or treatment facility, designed to handle discharges.
- The containment system is designed to hold the maximum capacity of any single compartment of a single tank truck loaded or unloaded at the Facility.
- A quick drainage system is not used for tank truck loading/unloading.
- Drainage from truck rack loading facility is contained by depressed area with curbs. Where it is held until removed by operating personnel. Containment is 330 bbls, maximum truck 180 bbls.
- Drainage from truck rack unloading facility is contained by depressed area with curbs. Product drains into a sump and is pumped from the sump to tank 5716 “Slop Tank”.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage from the Diked Areas

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment area.

- Stormwater which does accumulate within the diked area, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures. The Facility drainage system is constructed to aid in preventing oil from reaching navigable waters. Facility drainage is diverted to an oily water separator. The stormwater is discharged under an NPDES permit (No. CA0055816) to the Los Angeles Harbor/Pacific Ocean at the dock facility. Prior to being drained, contents of the separator are inspected and tested for compliance with NPDES permit/local water quality standards. Process water is pumped to the Slop Tank (M-5716).

- Drainage from diked storage areas is restrained by manually controlled valves.

- Dike drain valves are secured in the closed position when not draining containment areas.

- Flapper-type drain valves are not used to drain diked areas.

- Stormwater from diked areas is emptied by gravity or pumps which are manually activated.

- Drainage water collected at the collection point is inspected for any evidence of oil or oil sheen. After the determination of no evidence of oil or oil sheen is made, the stormwater is drained through an NPDES permitted outfall. The outfall drains directly into Los Angeles Harbor.

- The NPDES outfall is subject to inspection, sampling, and reporting requirements (Permit No. CA0055816).

- The stormwater treatment system consists of a 172,074 gallon capacity oil water separator.

- Contaminants are routed to a collection tank (TK 5716) and trucked offsite for processing.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage from the Undiked Areas

Drainage from undiked areas is controlled as follows:

- Piping located outside the diked areas is contained by the Facility drainage and stormwater collection system. The Facility drainage system is constructed to aid in preventing oil from reaching navigable waters. Facility drainage is diverted to an oily water separator. The stormwater is discharged under an NPDES permit (No. CA0055816) to the Los Angeles Harbor/Pacific Ocean at the dock facility. Prior to being drained, contents of the separator are inspected and tested for compliance with NPDES permit/local water quality standards. Process water is pumped to the Slop Tank (M-5716).

- All undiked piping is located in areas away from vehicular traffic.

- The risk of leaks originating from piping is low since it is observed frequently enough to detect excessive corrosion, defective pipe supports, or other anomalies which could compromise the integrity of the pipe.

- The majority of the piping is contained within the diked areas except for the sections noted on the Potential Spill Sources and Container Identification table in this Section.

- It is impractical to provide secondary containment for undiked piping due to the following reasons:

  - Piping is located directly over Los Angeles Harbor waterway.
  - Piping is located outside of the controlled boundary of the Facility (on third party property) and it is impracticable to provide secondary containment.

- This section, due to its location, would be impracticable to contain and equivalent environmental measures have been developed as follows:

  - The piping is subject to routine inspections during operating rounds.
  - The piping is subject to hydrostatic testing every three (3) years while transfer hose is tested annually.
  - The Facility maintains response equipment on site to utilize in the event that a spill did escape the facility.

- The risk of leaks originating from piping is low since it is observed frequently enough to detect excessive corrosion, defective pipe supports, or other anomalies which could compromise the integrity of the pipe.

- In the event that a spill did originate from undiked piping, the Facility would immediately activate its Contingency Plan to mitigate the spill before leaving the property.

- All undiked piping is located in areas away from vehicular traffic.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

General Drainage

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is as follows:

- Stormwater is not drained from the secondary containment areas.
- The Facility drainage system is constructed to aid in preventing oil from reaching navigable waters. Facility drainage is diverted to an oily water separator. The stormwater is discharged under an NPDES permit (No. CA0055816) to the Los Angeles Harbor/Pacific Ocean at the dock facility. Prior to being drained, contents of the separator are inspected and tested for compliance with NPDES permit/local water quality standards. Process water is pumped to the Slop Tank (M-5716).
- Water is visually inspected for product and discharged only if no product sheen is visible.
- Facility drainage does flow directly into an open watercourse.
- When draining the containment area, water is discharged to an oily water separator and then discharged under an NPDES permit to the Los Angeles Harbor/Pacific Ocean at the dock facility
- The Facility does not have a wastewater treatment plant nor does it treat water prior to discharge off site.
- Uncontaminated rainwater is inspected to ensure compliance with applicable water quality standards and will not cause a harmful discharge as defined in 40 CFR 110.
- Adequate records are kept of such drainage events. Records of drainage events are maintained at the Facility.

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Los Angeles Harbor Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Normal Daily Throughput (Cont'd)

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading rack has sufficient capability to handle any potential increase in transfer capacity. The loading rack operates 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan which details additional detection measures.

Detection by Personnel

- Facility personnel conduct monthly inspection of tank gauges and cathodic protection readings. Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds. Refer to Figure 8.5 and 8.6 for sample Tank Inspection and Secondary Containment Inspection Checklists.

8.2.2 FACILITY SELF-INSPECTIONS

Container Testing and Inspections

- All aboveground containers are integrity tested on a regular schedule and when material repairs are made.
- The Engineering Department oversees the tank integrity "10-Year Program".
- Comparative records are maintained by the Engineering Department at the Orange office.
- The container inspection programs conducted and maintained by Facility personnel are as follows:
  - The containers are visually inspected by operating personnel for signs of deterioration, leaks, or the accumulation of liquids inside the containment areas.
  - Each storage container is inspected per Company policy, as required by age, condition, and service. (Refer to the "10-Year Program" and the storage tanks section (Section 11) of the Kinder Morgan Specification Manual).
  - Based on these conditions, the aboveground storage containers are professionally inspected and non-destructive thickness testing is performed.
- The required inspections are divided into three categories:
  - Routine, in-service inspections
  - In-service, external inspections
  - Out-of-service, internal inspections
- If a field-constructed aboveground container undergoes a repair, alteration, reconstruction, or change in service that might affect the risk of a discharge or failure due to brittle fracture, the container will be evaluated (see Sample Log in Appendix B).
- Drums or totes brought on-site are built or tested to the standard(s) established by the drum manufacturer or the drum recycler, as applicable.
- While on-site, drums and totes will be visually inspected at least monthly and ground contact will be minimized.
- Liquid level sensing devices are regularly tested. Liquid level transmitters are tied to the Varec level gauge system. (b) (7)(F), (b) (3) [redacted]
- The bulk storage containers are equipped with ground-level gauges and are hand-gauged at regular intervals.

8.2.2 FACILITY SELF-INSPECTIONS (Cont'd)

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valves locks and/or seals
  - Other appurtenances

- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event. Hose – Yearly. All piping every three (3) years (Shore Pipe into first valve in containment).

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement.

- A Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

Documentation

- Records of the inspections and tests (including those maintained under usual and customary business practices), signed by the appropriate supervisor or inspector are retained on file at the Facility and/or other Corporate location for a minimum period of three (3) years.

FIGURES 8.5 AND 8.6

Note: The following Kinder Morgan forms comprise the typical tank and secondary containment Inspection Checklists for this Facility. These forms may change over time to accommodate the specific operations of the Facility.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

- The Facility is located on a 12.4 acre parcel at Berths 118-119 on the west side of Main San Pedro Channel in the Los Angeles Harbor.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Water Intakes

(b) (7)(F), (b) (3)

[redacted]

(b) (3), (b) (7)(F)

[redacted]

Residential Areas

Residential areas are located west from the Facility. These areas begin within one mile west of the Facility.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Businesses

Review of GIS Data determined that the following businesses are within the planning distance.

Businesses	Distance from Facility
American President Lines Ltd.	0.00 miles
Los Angeles City of Police Department, Business, Harbor Division, Desk-Information	0.00 miles
Police Departments Wilmington	0.00 miles
Yang Ming Lines	0.00 miles
Party Time Ice Co.	0.04 miles

Fish and Wildlife, Wetlands, and other Sensitive Environments

The immediate area surrounding the Facility is industrial and supports only minor amounts of wildlife. The overall impact on fish and wildlife, wetlands, and other sensitive environments will happen upon impact of the local waterways. Refer to Volume 1, Figure 4.1 for threatened/endangered species.

The local ecosystem is host to a variety of species including migratory as well as year round inhabitants. The general species found in the area of the Facility are detailed in the ACP. State and Federal agencies as well as contract resources will provide guidance on response and protection strategies during an actual response situation.

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

Review of the USF&W Wetlands Mapper and Terraserver data indicates the following wetlands are within the planning distance of the Facility:

Wetlands	Location
Estuarine Deep	L. A. Harbor
Point Fermin	L. A. Harbor
Cabrillo Beach	L. A. Harbor
Cabrillo Beach Wetlands	L. A. Harbor

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

There are wetland habitats near the Facility. Habitats that could potentially be impacted by a spill from the Facility into Southwest slip and Los Angeles Harbor are addressed in the ACP.

During a response situation the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact the agencies will be able to:

- Identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge.
- Identify potential environmental effects on fish and wildlife, wetlands, and other sensitive environments resulting from removal actions or countermeasures.

Lakes and Streams

Review of GIS Data determined that the following Lakes and Streams are within the planning distance.

Lakes and Streams	Location
San Pedro Channel	1.00 miles south

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Section 4, Figure 4.1 of Volume 1

Recreational Areas

Review of GIS Data determined that the following recreational areas are within the planning distance.

Recreational Areas	Distance from Facility
Harbor Highlands Park	0.50 miles southwest
Angels State Park	3.70 miles southwest
Point Fermin Park	3.70 miles southwest

The recreational areas that may be potentially impacted by a discharge originating at the Facility are more fully identified on the maps in Section 6.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Transportation Routes (air, land, and water)

Review of GIS Data determined that the following transportation routes are within the planning distance.

Transportation Route	Distance from Facility
John S. Gibson Boulevard	Adjacent to Facility
Harbor Belt Line Railroad	Adjacent to Facility
Long Beach/Daugherty Field Airport	5.00 miles east

The local emergency assistance agencies (police department, fire department, etc.) and the U.S. Coast Guard (as applicable) would be contacted for traffic control in the area of the discharge.

Utilities

Review of GIS Data determined that the following utilities are within the planning distance:

Utilities	Distance from Facility
Harbor Steam Plant	0.50 miles south

Other Areas of Economic Importance

Review of GIS Data determined that no terrestrially sensitive or unique environments such as wildlife refuges, management areas, or ecological reserves are within the planning distance of the Facility.

Other Areas of Economic Importance	Distance from the Facility
Long Beach Naval Station	0.50 miles south
Los Angeles Maritime Museum	1.30 miles southwest
Los Angeles Harbor Administration	1.35 miles southwest
Fed Corr Inst. Terminal Island	1.90 miles southwest
Fort MacArthur Military Museum	3.20 miles southwest
Cabrillo Marine Museum	3.70 miles southwest
Veterans Memorial	4.70 miles east
Long Beach Public Library	4.75 miles east

The local waterways are bordered by various dock facilities, other commercial facilities, industrial facilities and recreational/public use areas.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history for the life of the Facility.

Tank Age

Refer to the Potential Spill Source and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Containment and recovery of any spilled material which might escape a diked area would be accomplished through the implementation of spill response activities by: (1) Facility personnel, or if necessary, (2) one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow east through the Facility.

Vulnerability to a Natural Disaster

All storage tanks and ancillary piping are fabricated in compliance with rigorous nationally recognized design specifications. The specifications include wind-load allowances and recognition of any applicable seismic considerations. These factors minimize the risk of vulnerability to natural disasters, including tornadoes.

In addition to the above referenced factors, it should also be noted that Facility inspection and response drills, as well as Standard Operating Procedures (SOPs) for loading operations and the like, contribute to minimization of spill potential at the Facility.

Other Factors

The area in which the Facility is located is prone to minor earthquakes.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

The Facility maintains a separate Oil Spill History file in the Facility office. The Facility's file contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).

8.2.5 REPORTABLE OIL DISCHARGE HISTORY (Cont'd)

- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

DATE	REPORT #	LOCATION	PRODUCT TYPE	QTY	ON/OFF FACILITY	WATER IMPACTED (Y/N)
11-21-94		LAHT: By pump #10, hit vent valve on pipeline with pickup truck	Av. Jet	40 gal.	On	No
7-22-95		LAHT: Barge loading hose leak.	Gas Oil	1 cup of oil on water	On & Off	Yes - Harbor
7-22-95		LAHT: Barge loading hose leak.	Gas Oil	1 cup of oil on water	On & Off	Yes - Harbor
3-13-96		LAHT: Vessel "ERVOS". A small amount of oil believed to have originated from the vessel was noticed within the boomed area of the vessel.	Oil	2 gal.	Off	Yes - harbor
11-5-96	5519	LAHT: Ballast line underneath the center dock leaked.	Gas Oil	8-10 bbls.	On/Off	Yes - harbor

8.2.5 REPORTABLE OIL DISCHARGE HISTORY (Cont'd)

DATE	REPORT #	LOCATION	PRODUCT TYPE	QTY	ON/OFF FACILITY	WATER IMPACTED (Y/N)
4-17-97	5522	LAHT: Testing fire pimp, water went onto vessel and then water discharged from vessel deck and overflowed dock pan.	Slop product	5 gals.	On & Off	Yes - harbor
05-26-99	A-10#216	LAHT: A hose rope contacted product at the dock pan and dripped product into the water when later used.	Gasoline	5-10 drops	Off	Y
10-16-99		LAHT: Hector earthquake caused tank 67737 to spill over.	Gas Oil	1 barrel	On	No
5/6/04		LAHT: dock-pan drain line failure	Diesel	< a gallon	Off	Y
3/1/05		LAHT: sheen within remediation boom	Petroleum sheen	Sheen	Off	Y
5/1/05		LAHT: stain	Stain	1'x1'	On	N
5/18/05		LAHT: GX-120 stain	Stain	2'x3'	Off	N

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

- Secondary containment is provided for the bulk storage containers and transfer points at the Facility. Capacities for each of the storage tanks areas are listed in the Potential Spill Sources and Container Identification table in this Section.

Tanks

- Secondary Containment volumes for all bulk storage tanks are detailed in the Potential Spill Sources and Container Identification table located in this Section.

Loading Rack Containment System

Main Loading/Unloading Rack

The loading/unloading rack area is designed and operated as follows:

- Loading/Unloading area drainage flows into a catchment basin or treatment facility, designed to handle discharges.
- The containment system is designed to hold the maximum capacity of any single compartment of a single tank truck loaded or unloaded at the Facility.
- A quick drainage system is not used for tank truck loading/unloading.
- Drainage from Loading Racks 1-5 and loading /unloading areas is contained in a depressed area (with curbs). Drainage is through area drains to an oil/water separator. The product is pumped using a skimming device from the oil/water separator to a transmix tank. The water phase is drained to a 20,000 gallon Baker tank. Process water is hauled off to a TSDF by third-party trucks.
- Drainage from Loading Rack 6 and the Ethanol/Additive unloading areas (former Shell San Diego Terminal) is contained by curbed concrete pads with strip drains which drain to a 12,000 underground waste water tank (UG-1). Contents of this tank are hauled off to a TSDF by third-party trucks.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Drainage From the Diked Areas

Drainage of stormwater or other liquids accumulated within the Facility's diked storage areas is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment areas.
- Stormwater which does accumulate within the diked areas, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures.
- Drainage from diked storage areas is restrained by manually controlled valves.
- Dike drain valves are secured in the closed position when not draining containment areas.
- Flapper-type drain valves are not used to drain diked areas.
- Stormwater from diked areas is emptied by gravity via manually controlled valves.

Drainage From the Undiked Areas

Drainage from undiked areas is controlled as follows:

- Surface drainage from undiked areas on the east side of the property flows to the municipal storm sewer system.
- All undiked piping is located in areas away from vehicular traffic.

The risk of leaks originating from piping is low since it is observed frequently enough to detect excessive corrosion, defective pipe supports, or other anomalies which could compromise the integrity of the pipe.

General Drainage

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is as follows:

- Water is visually inspected for product and discharged only if no product sheen is visible.
- Facility drainage does not flow directly into an open watercourse.
- Stormwater accumulating in diked areas is visually inspected for evidence of oil or oil sheen. If no evidence of oil or oil sheen is found, the Area Manager or Lead Operator will authorize opening the manual valve and water is drained to the municipal storm sewer system.
- Contaminated stormwater is pumped to the oil/water separator system. Product is pumped to a transmix tank and water is pumped to a Baker tank.
- The Facility has an oil/water separator system but no other treatment system for water prior to discharge off site.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

- The Facility does not have a wastewater treatment plant nor does it chemically treat water prior to discharge off site:
- Uncontaminated rainwater is inspected to ensure compliance with applicable water quality standards and will not cause a harmful discharge as defined in 40 CFR 110.
- Records of drainage events are maintained at the Facility office.

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Mission Valley Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading rack has sufficient capability to handle any potential increase in transfer capacity. The loading rack operates 24 hours a day 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan. The Spill Prevention, Control, and Countermeasure (SPCC) Plan which details additional detection measures.

(b) (3), (b) (7)(F)

Detection by Personnel

- Facility personnel conduct monthly inspections of tank gauges and cathodic protection readings.
- Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating rounds.
- Annual Secondary Containment Inspection as part of the SPCC Plan.

8.2.2 FACILITY SELF-INSPECTIONS

Container Testing and Inspections

- All aboveground containers are integrity tested on a regular schedule and when material repairs are made.
- The Engineering Department oversees the tank integrity in accordance with the SPCC Plan and L O&M Procedure 2101.
- Comparative records are maintained by the Engineering Department at the Orange office.
- The container inspection programs conducted and maintained by Facility personnel are as follows:
  - The containers are visually inspected by operating personnel for signs of deterioration, leaks, or the accumulation of liquids inside the containment areas.
  - Each storage container is inspected per the SPCC Plan and L O&M Procedure 2101, as required by age, condition, and service.
  - Based on these conditions, the aboveground storage containers are professionally inspected and non-destructive thickness testing is performed.
- The required inspections are divided into three categories:
  - Routine, in-service inspections
  - In-service, external inspections
  - Out-of-service, internal inspections
- If a field-constructed aboveground container undergoes a repair, alteration, reconstruction, or change in service that might affect the risk of a discharge or failure due to brittle fracture, the container will be evaluated.
- Drums or totes brought on-site are built or tested to the standard(s) established by the drum manufacturer or the drum recycler, as applicable.
- While on-site, drums and totes will be visually inspected at least monthly and ground contact will be minimized.
- Liquid level sensing devices are regularly tested.
- High level alarms are on a monthly basis.
- The bulk storage containers are equipped with ground-level gauges and are hand-gauged at regular intervals.

8.2.2 FACILITY SELF-INSPECTIONS (Cont'd)

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valves locks and/or seals
  - Other appurtenances

- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation, or replacement.

- Leak detection testing is done on an annual basis using tracer gas tests.

- Annually a Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

Documentation

- Records of the inspections and tests (including those maintained under usual and customary business practices), signed by the appropriate supervisor or inspector are retained on file at the Facility and/or other Corporate location for a minimum period of three (3) years.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

- The Facility is located in northern San Diego approximately five (5) miles east of Mission Bay and 0.4 miles north of the San Diego River.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Water Intakes

(b) (7)(F), (b) (3)

[redacted]

(b) (3), (b) (7)(F)

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

(b) (3), (b) (7)(F)

Residential areas are located in all directions from the Facility. These areas begin within one mile of the Facility and continue outward in all directions.

Additional details on the residential areas within the area of the Facility are included on the maps in Section 6.

Businesses

The area surrounding the Facility is for the most part commercialized. Along the San Diego River there are various businesses and commercial establishments which may be potentially impacted by a discharge. Review of GIS Data determined that the following businesses are within the planning distance of the Facility:

Businesses	Distance from Facility
Beneto Tank Lines	0.02 miles *(approximate)*
Coastal Transport	0.02 miles *(approximate)*
Dedicated Transport, Inc.	0.02 miles *(approximate)*
Santa Fe Pacific Pipelines, Inc.	0.02 miles *(approximate)*
Shell Oil Products	0.03 miles *(approximate)*
Sunburst Transport	0.02 miles *(approximate)*

Additional detail on the general layout of businesses within the area of the Facility is included on the maps in Section 6.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Fish and Wildlife, Wetlands, and other Sensitive Environments

The area surrounding the Facility is host to a variety of species. The coastal area is home for a variety of migratory species during parts of the year. The common coastal inhabitants include shorebirds, wading birds, fish, reptiles, invertebrates, and various plants. The coastal shorelines have been divided into ten categories according to potential sensitivity to oil. The *Area Contingency Plan for this area (OSPR ACP 6 San Diego) details these categories. Refer to Volume 1, Figure 4.1 for details.

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

Review of the USF&W Wetlands Mapper and Terraserver data indicates the following wetlands are within the planning distance of the Facility:

Wetlands	Latitude/Longitude
San Diego River, Freshwater Emergent Wetland; Mission Bay, Estuarine and Marine	(b) (7)(F), (b) (3)
San Diego River, Freshwater Forested/Shrub Wetlands; San Diego River, Riverine Habitat;	

Wetland habitats, however, are common throughout portions of the area. The size and diversity of the wetland environments vary with season and year. Wetlands play a disproportionally large role in maintaining the stability of the global environment. Wetlands retain and gradually release large quantities of water and their dense vegetation traps sediments and consumes pollutants.

During a response situation the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact the agencies will be able to:

- Identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge.
- Identify potential environmental effects on fish and wildlife, wetlands, and other sensitive environments resulting from removal actions or countermeasures.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Lakes and Streams

Review of GIS Data determined that the following lakes and streams are within the planning distance of the Facility:

Lakes and Streams	Location
San Diego River	0.4 miles S *(approximate)*

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Figure 4.1 of this Volume.

Recreational Areas

There are several recreational areas within the planning distance from the Facility. Review of GIS Data determined that the following recreational areas are within the planning

Recreational Area	Distance from Facility
Driving Range	Adjacent (North of Facility)
Qualcomm Stadium	0.2 mile S *(approximate)*
Admiral Baker Golf Course	0.8 mile ENE *(approximate)*
Socio Economic Sensitivities – Mission Valley Shopping	3.37 miles W *(approximate)*
Socio Economic Sensitivities – Stardust Country Club	5.07 miles W *(approximate)*
River Valley Golf Club	5.45 miles W *(approximate)*
Presidio Hills Park	6.34 miles W *(approximate)*
Mission Bay Park	7.75 miles W *(approximate)*

Additional details on the recreational areas within the planning distance are found on the maps in Section 6.

Transportation Routes (air, land, and water)

There are various public roadways and waterways which may be potentially affected by a discharge originating from the Facility. Review of GIS Data determined that the following transportation routes are within the planning distance of the Facility:

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Transportation Routes (air, land, and water) (Cont'd)

Transportation Route	Distance from Facility
Interstate 15 (I-15)	200 yards E *(approximate)*
Interstate 8 (I-8)	0.5 mile S *(approximate)*
San Diego Trolley Line	0.5 mile S *(approximate)*
Mission Bay Entrance Channel	6.0 – 7.0 miles SW *(approximate)*

Utilities

There are utilities located within the planning distance that may be potentially impacted by a discharge originating from the Facility. These include SDG&E power lines, which traverse the Facility.

Other Areas of Economic Importance

The San Diego River and connecting waterways are bordered by various areas of economic importance other than those previously mentioned. Review of GIS Data determined that the following other areas of economic importance are within the planning

Name	Distance from Facility
Murphy Canyon	0.1 miles *(approximate)*
San Diego River	0.4 mile *(approximate)*
Richard Donovan Correctional Facility	1.55 miles W *(approximate)*
Public Building Juniper Sierra Museum	6.34 miles W *(approximate)*
Public Building International Area	7.32 miles W *(approximate)*
Mission Bay	5.0 miles W *(approximate)*
San Diego Recruit Depot	7.57 miles W *(approximate)*
Socio Economic Sensitivities – point Loma Junction	7.75 miles W *(approximate)*

Any evacuation efforts necessary for these areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.), State Police, U.S. Coast Guard, and other agencies as the situation demands.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Discharge History portion of this Section for details concerning spill history of the Facility.

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Containment and recovery of any spilled material which might escape a diked area would be accomplished through the implementation of spill response activities by: (1) Facility personnel, or if necessary, (2) one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow southwest through the Facility.

Vulnerability to a Natural Disaster

All storage tanks and ancillary piping are fabricated in compliance with rigorous nationally recognized design specifications. The specifications include wind-load allowances (must withstand minimum 100 mph wind) and recognition of any applicable seismic considerations. These factors minimize the risk of vulnerability to natural disasters, including tornadoes.

In addition to the above referenced factors, it should also be noted that Facility inspection and response drills, as well as Standard Operating Procedures (SOPs) for loading operations and the like, contribute to minimization of spill potential at the Facility.

Other Factors

The area in which the Facility is located is prone to landslides and minor earthquakes, however, none have resulted in a discharge.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

The Facility maintains a separate Oil Spill History file in the Area Manager's office. The Facility's file contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).

8.2.5 REPORTABLE OIL DISCHARGE HISTORY (Cont'd)

- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

*

(b) (7)(F), (b) (3)

8.2.1 HAZARD IDENTIFICATION

Day-to-Day Operations

The day-to-day operations at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck loading/unloading operations
- Pipeline transfer operations

Work such as piping replacement/repair is rare and would only be done on portions of the system that are isolated from the active system.

Secondary Containment Volumes

Secondary containment is provided for the bulk storage tanks and/or transfer points at the Facility. Capacities for each of the storage tank areas are listed in the Potential Spill Sources and Container Identification table in this Section.

- The North and South Tank Farms are surrounded by seal coated berms as secondary containment, which is sufficiently impervious to spilled oil.
- A combination seal coated berm and concrete block wall surrounds the West Tank Farm.

Tanks

- Secondary Containment volumes for all bulk storage tanks are detailed in the Potential Spill Sources and Container Identification table located in this Section.

Loading Rack Containment System

The loading/unloading rack areas are designed and operated as follows:

- Loading/Unloading area drainage flows into a catchment basin or treatment facility, designed to handle discharges.
- The containment system is designed to hold the maximum capacity of any single compartment of a single tank truck loaded or unloaded at the Facility.
- A quick drainage system is not used for tank truck loading/unloading.
- Drainage from the loading rack loading and unloading facilities is contained in a depressed area (with curbs). Drainage is through area drains to a 6,000 gallon oil/water separator. The product is pumped using a skimming device from the oil/water separator to a transmix tank. The water phase is drained to an 8,000 gallon visual inspection tank. Water is pumped to sock and carbon filter units before release to the municipal storm sewer system.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Secondary Containment Volumes (Cont'd)

Drainage From the Diked Areas

Drainage of stormwater or other liquids accumulated within the Facility's diked storage area is controlled as follows:

- The preferred method of removal of accumulated stormwater is by natural dissipation providing that the accumulation does not damage the equipment/ structures or inhibit operations conducted within the containment area.
- Stormwater which does accumulate within the diked area, and does not dissipate naturally, is removed in accordance with the stormwater drainage procedures.
- Drainage from diked storage areas is restrained by manually controlled valves.
- Dike drain valves are secured in the closed position when not draining containment areas.
- Flapper-type drain valves are not used to drain diked areas.
- Stormwater from diked areas is emptied by gravity through manually activated valves.

Drainage From the Undiked Areas

Drainage from undiked areas is controlled as follows:

- Piping located outside the diked areas is contained by asphalt curbs. The curbed area drains to a sump where liquids are pumped to the OWS. The product is pumped, using a skimming device from the OWS, to a transmix tank. The water phase is pumped to a 10,000 gallon holding tank. Water is pumped to two (2) 800 lbs. carbon vessels before release to the municipal sewer system.

General Drainage

The procedure for supervising the drainage of stormwater from secondary containment into a storm drain or an open watercourse is as follows:

- Water is visually inspected for product and discharged only if no product sheen is visible.
- Facility drainage does not flow directly into an open watercourse.
- When draining the containment area, water is discharged to the city storm sewer.
- The Facility does not have a wastewater treatment plant nor does it chemically treat water prior to discharge off site. Water is treated only through the use of a carbon filtration system.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Normal Daily Throughput

The Normal Daily Throughput for the Facility:

FACILITY	NORMAL DAILY THROUGHPUT	AVERAGE DAILY STORAGE	TOTAL STORAGE
Orange Terminal	Seasonal	(b) (7)(F), (b) (3)	

The rate of flow from the pipeline system to tankage and the filling rate of the trucks is essentially fixed, and not a function of daily throughput. Thus changes in daily throughput would have no effect on potential discharge volumes.

The Facility has sufficient tank volume to handle any potential increase in pipeline throughput and the loading rack has sufficient capability to handle any potential increase in transfer capacity. The loading rack operates 24 hours a day, 7 days a week.

Discharge Detection

The Facility has a discharge detection program which consists of both manual (personnel) and automated detection systems. The Facility maintains separately from this Plan the Spill Prevention, Control, and Countermeasure (SPCC) Plan which details additional discharge detection measures.

(b) (3), (b) (7)(F)

Detection by Personnel

- Facility personnel conduct monthly inspection of tank gauges and cathodic protection readings. Daily Visual Inspections (including tanks, loading rack, secondary containment, aboveground piping, etc.) during operating personnel rounds.
- Annual Secondary Containment Inspections are part of the SPCC Plan.
- Tank Inspections are part of the SPCC Plan.

8.2.1 HAZARD IDENTIFICATION (Cont'd)

Security

			There are no Underground Storage Tanks at this Facility.						

8.2.2 FACILITY SELF-INSPECTIONS

Container Testing and Inspections

- All aboveground containers are integrity tested on a regular schedule and when material repairs are made.
- The Engineering Department oversees the tank integrity in accordance with the SPCC Plan and L O&M Procedure 2101.
- Comparative records are maintained by the Engineering Department at the Orange office.
- The container inspection programs conducted and maintained by Facility personnel are as follows:
  - The containers are visually inspected by operating personnel for signs of deterioration, leaks, or the accumulation of liquids inside the containment areas.
  - Each storage container is inspected per the SPCC Plan and L O&M Procedure 2101, as required by age, condition, and service.
  - Based on these conditions, the aboveground storage containers are professionally inspected and non-destructive thickness testing is performed.
- The required inspections are divided into three categories:
  - Routine, in-service inspections
  - In-service, external inspections
  - Out-of-service, internal inspections
- If a field-constructed aboveground container undergoes a repair, alteration, reconstruction, or change in service that might affect the risk of a discharge or failure due to brittle fracture, the container will be evaluated.
- Drums or totes brought on-site are built or tested to the standard(s) established by the drum manufacturer or the drum recycler, as applicable.
- While on-site, drums and totes will be visually inspected at least monthly and ground contact will be minimized.
- Liquid level sensing devices are regularly tested. Liquid level transmitters are tied to the Varec level gauge system. (b) (7)(F), (b) (3) [redacted]
- The bulk storage containers are equipped with ground-level gauges and are hand-gauged at regular intervals.

Container Testing and Inspections (Cont'd)

- An inspection and maintenance program is in place to periodically test the level control, alarm, and gauging systems on the Facility tanks. Additionally, liquid level sensors are regularly checked against physical measurements during product transfers to verify accurate sensor readings. Liquid level sensors are calibrated if discrepancies are noted.

Aboveground Valves and Pipelines Inspections

The Facility's aboveground valves and pipelines are examined as follows:

- All aboveground valves and pipes/pipelines are regularly examined during operating personnel rounds. During these examinations, operating personnel assess the general condition and necessity for corrective actions of items such as:

  - Flange joints
  - Valve glands and bodies
  - Pipe supports
  - Metal surfaces
  - Expansion joints
  - Catch pans
  - Valves locks and/or seals
  - Other appurtenances

- Periodic pressure testing may be warranted for piping in areas where Facility drainage is such that a failure might lead to a spill event.

- Pipe supports are designed to minimize abrasion and corrosion and allow for expansion and contraction.

Buried Piping Inspections

- Buried piping is present at the Facility.

- Buried piping integrity and leak testing is performed at the time of installation, modification, construction, relocation or replacement.

- Annually a Corrosion Specialist visits the Facility to inspect all rectifiers, read earth potentials and conduct interference testing. An annual report recommending repairs and upgrades, if applicable, is prepared and maintained at the Facility.

Documentation

- Records of the inspections and tests (including those maintained under usual and customary business practices), signed by the appropriate supervisor or inspector are retained on file at the Facility and/or other Corporate location for a minimum period of three (3) years.

8.2.3 VULNERABILITY ANALYSIS

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

- The Facility is located approximately 300 yards east of the Santa Ana River.

The effects on critical areas listed in this Plan will be minimized by the Company's rapid containment and cleanup plans and arrangements with oil spill removal organizations.

MSDS sheets indicate possible exposure risks and are located in the Facility Office.

Any evacuation efforts for these critical areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Water Intakes

(b) (7)(F), (b) (3)

Well # 32	3.25 miles SW (*approximate*)
Well # 27	2.68 miles SE (*approximate*)
Well # 28	3.00 miles SE (*approximate*)
Well # 22	1.30 miles S (*approximate*)

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

(b) (3), (b) (7)(F)

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Residential Areas

Residential areas are located in all directions from the Facility.

Additional detail on the residential areas within the area of the Facility are included on the maps in Section 6.

Businesses

Review of GIS Data determined that the following businesses are within the planning distance of the Facility:

Businesses	Distance from Facility
Antiques Plus	0.04 miles
Katella Grill	0.05 miles
Uniform Center	0.06 miles
Carecraft, Inc.	0.06 miles
David Wilson's Ford of Orange	0.06 miles
Albertsons Shopping Center	11.0 miles SW

The area surrounding the Facility is for the most part commercialized. Along the Santa Ana River there are various businesses and commercial establishments which may be potentially impacted by a discharge.

Additional detail on the general layout of businesses within the area of the Facility is included on the maps in Section 6.

Fish and Wildlife, Wetlands, and other Sensitive Environments

The area surrounding the Facility is host to a variety of species. Refer to Figure 4.1 of this Volume for details.

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Review of the USF&W Wetlands Mapper and Terraserver data indicates the following wetlands are within the planning distance of the Facility:

Wetlands	Latitude/Longitude
Riverine (Santa Ana River)	(b) (7)(F), (b) (3)

Wetland habitats, however, are common throughout portions of the area. The size and diversity of the wetland environments vary with season and year. Wetlands play a disproportionally large role in maintaining the stability of the global environment. Wetlands retain and gradually release large quantities of water and their dense vegetation traps sediments and consumes pollutants.

During a response situation the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact the agencies will be able to:

- Identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge.
- Identify potential environmental effects on fish and wildlife, wetlands, and other sensitive environments resulting from removal actions or countermeasures.

Lakes and Streams

Review of GIS Data determined that the following lakes and streams are within the planning distance of the Facility:

Lakes and Streams	Location
Santa Ana River	0.1 miles W *(approximate)*
Santiago Creek Mouth	3.0 miles SW *(approximate)*
Unnamed Creek	9.5 miles SW *(approximate)*
Unnamed Creek	11.0 miles SW *(approximate)*
Talbert Flood Control Channel	13.3 miles SW *(approximate)*
Pacific Ocean	13.5 miles SW *(approximate)*

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Figure 4.1 of this Volume.

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Recreational Areas

There are several recreational areas within the planning distance from the Facility.

Review of GIS Data determined that the following recreational areas are within the planning

Recreational Area	Distance from Facility
Anaheim Convention Center	3.34 miles W *(approximate)*
Anaheim Stadium	1.31 miles SW *(approximate)*
Anaheim Pond	0.25 miles SW *(approximate)*
Crystal Cathedral	3.20 miles SW *(approximate)*
Anaheim Stadium	1.0 miles SW *(approximate)*
River View Golf Course	2.3 miles SW *(approximate)*
Willowick Municipal Golf Course	5.0 miles SW *(approximate)*
Spurgeon Park	5.0 miles SW *(approximate)*
Centennial Reg Park	6.5 miles SW *(approximate)*
Discovery Museum of Orange County	7.0 miles SW *(approximate)*
Suburbia Park	9.2 miles SW *(approximate)*
Mesa Verde Golf Course	10.0 miles SW *(approximate)*
Mesa Verde Country Club	10.2 miles SW *(approximate)*
Alevalos Park	10.5 miles SW *(approximate)*
Talbert Regional Park	11.0 miles SW *(approximate)*
Bard Park	11.3 miles SW *(approximate)*
Gisler Park	12.0 miles SW *(approximate)*
Huntington State Beach	13.5 miles SW *(approximate)*
Theaters/Restaurants	0.2 miles SW *(approximate)*

The recreational areas that may be potentially impacted by a discharge originating at the Facility are more fully identified on the maps in Section 6.

Transportation Routes (air, land, and water)

There are various public roadways and waterways which may be potentially effected by a discharge originating from the Facility.

Review of GIS Data determined that the following transportation routes are within the planning distance of the Facility:

Transportation Route	Distance from Facility
Interstate 57 (I-57)	0.5 miles W *(approximate)*
Union Pacific Railroad	Adjacent to Facility
Santa Ana River	300 yards W *(approximate)*

8.2.3 VULNERABILITY ANALYSIS (Cont'd)

Utilities

Review of GIS Data determined that the following utilities are within the planning distance of the Facility:

Utilities	Distance from Facility
SCE Power Lines	Adjacent to Facility

Other Areas of Economic Importance

The Santa Ana River is bordered by various areas of economic importance other than those previously mentioned.

Review of GIS Data determined that no terrestrially sensitive or unique environments such as wildlife refuges, management areas, or ecological reserves are within the planning distance of the Facility.

Name	Distance from Facility
Garden Grove Municipal Golf Course	6.74 miles *(approximate)*
Lacy Security Facility	2.3 miles SW *(approximate)*

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The area potentially affected by a spill originating from the Facility has a number of characteristics which require consideration in the event of a discharge.

- The Facility is located in an industrial area.
- The Facility is located in the western portion of Orange.
- The closest navigable water is the Santa Ana River, approximately 300 yards west of the Facility.
- The Facility is connected by pipelines to facilities in Los Angeles, California.

The Facility has taken considerable action to lessen the probability of the hazard occurring.

Potential hazards are identified below:

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL (Cont'd)

Earthquake	The Facility is located in a semi-active earthquake zone with occasional seismic activity.
Fire	Fire from an external source. Internal fire sources out of control are also a threat.
Terrorism	Bombing or malicious destruction could be directed at tanks, piping systems, or control systems by a third-party source.
Vehicular Accident	This would include any of the tank trucks that are visiting the Facility for loading or off-loading.
Material Failure	Tank plating, fittings, and piping, are all subject to failure from material corrosion, impact, or fatigue breakage.
Equipment Failure	Pumps, gauges, detectors, or controllers (mechanical or electrical) are all subject to failure.
Human Error	The wrong decision and or action by personnel may potentially cause a spill.

Investigation and Monitoring of Natural Hazards

- The Company has historical data that defines the low probability of seismic activity in the Orange County area.

- The construction of the Facility has taken the possibility of some seismic activity into consideration; the location of Tank Farms away from slide prone areas and constructing the Facility, including all subgrade soil preparation, along with slope and tank construction in accordance with appropriate building codes and industry guidelines.

Fire Protection Safety

The Facility has portable fire suppressant foam capability and adequate portable fire extinguishers to combat a moderate fire. The Facility is located close to a city and county fire departments that would respond to fires. The brush free zone surrounding the Facility will prevent brush fires from reaching the fuel storage tanks. The fuel piping and transfer systems have metal supports, fire walls, and additional protection including welded pipe joints within the fire walls. The Facility has a fire system serviced by a city water line.

Material Maintenance of Tanks, Piping Systems, and Valves

- The tanks are visually inspected daily on the outside and are inspected internally when the tanks are taken out of service. The piping is tested to 150% of working pressure.

The potential for a spill has been analyzed and deemed to be present, but unlikely. This is based on a review of the following factors:

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Section for details concerning spill history of the Facility.

8.2.4 ANALYSIS OF THE POTENTIAL FOR A SPILL (Cont'd)

Tank Age

Refer to the Potential Spill Sources and Container Identification table in this Section for the year of construction of each of the bulk storage containers at the Facility.

Horizontal Range of a Spill

Secondary containment dikes at the Facility will in almost all cases prevent the horizontal migration of a spill. Containment and recovery of any spilled material which might escape a diked area would be accomplished through the implementation of spill response activities by: (1) Facility personnel, or if necessary, (2) one of the spill response contractors listed in this Plan.

Should a spill escape containment, it would flow southwest through the Facility.

Vulnerability to a Natural Disaster

The Tank Farms' location is relatively flat, therefore, unlikely to incur damage due to shifting and sliding. The seismic stability of the area is good. The probability of a landslide or earthquake is low.

Other Factors

The area in which the Facility is located is prone to landslides and minor earthquakes, however, actions taken to lessen hazards at the Facility reduces the probability to a low potential. Hazard reduction protective measures have been designed into tanks and into the construction of the Facility. Tanks were designed to industry standards which reduces the potential for hazards. Based on the care and construction of the tanks, the potential of any one tank rupturing and emptying product into the secondary containment is low. The potential of several tanks simultaneously rupturing is very low.

The Facility conforms to good engineering practices in the tank integrity inspection program. The inspection program reduces the likelihood of leaks. The Facility has not experienced a failure associated with a tank structure.

8.2.5 REPORTABLE OIL DISCHARGE HISTORY

Kinder Morgan maintains an online database of reportable spills available at all locations via the company's intranet. The database contains the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s).
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

FIGURE 8.7
FACILITY DRAINAGE DIAGRAM

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. - Carson Terminal is classified as an "EPA jurisdictional non-transportation related Onshore Facility" which operates in a Higher Volume Port Area.

The agency discharge volume calculations are described as follows:

EPA Discharge Volume Calculation

- **Worst Case Discharge**
  100% of the largest single tank

  WCD = (b) (7)(F),

- **Medium Discharge**
  Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD

  MD = 857 bbls

- **Small Discharge**
  Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD

  SD = 50 bbls

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

8.3 DISCHARGE SCENARIOS (Cont'd)

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack, or leaking piping.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the Facility could be diverted to the product tanks that are not at maximum capacity. Spills that enter the bar ditch can be handled by response contract vacuum truck, absorbent pad and boom, or other equipment.

The closest waterway is the Dominguez Channel, which is east of the Facility. The storage tanks and truck loading racks, have adequate secondary containment so it is unlikely that a spill would reach the channel or travel very far if it did. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, as appropriate, include:

- 1,000' of containment boom and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a *Small Discharge* or greater which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a *Small Discharge* with the manpower and local contract resources as detailed in Section 2 and 3 of Volume 2.

- A 50 bbls discharge typically will not escape the containment of the Facility.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Offsite Impact

- The closest waterway is the Dominguez Channel, which is east of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the channel. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be implemented at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)
Offsite Impact (Cont'd)
● Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.
Notes:
● Equipment and manpower resources are detailed in Section 3 of Volume 2.
● Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
● Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before spill containment could begin. The spilled material would more than likely collect in the containment area sump system and be routed to the separator system. If a spill of this size escaped the property it could possibly enter the Dominguez Channel. Adverse weather conditions would increase the chances of a discharge entering the channel; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages can be referenced in the Potential Spill Sources and Container Identification table found in Section 8.2.

Additional Comments

In the event of a medium discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

The closest waterway is the Dominguez Channel so the potential for a spill of this size reaching navigable water does exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the *Medium Discharge* volume that are capable of arriving on scene within 6 hours.
- Sufficient quantity of containment boom must arrive within 6 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 6 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 6 hours; Tier 2 = 30 hours; Tier 3 = 54 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 6 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage facilities.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the channel.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed (b) (7)(F), (b) (3)

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached).

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages can be located in the Potential Spill Sources and Container Identification table found in Section 8.2.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow northeast and enter the Dominguez Channel which is located east of the property.

For a spill that is confined to the land along the pathway, Facility personnel would have at least two (2) options by which to contain the spill:

- Dams
- Trenches

Ditch Containment

A spill may be contained in storm water ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located west of the Dominguez Channel, which flows to the Los Angeles Harbor and into the Pacific Ocean. The priority during larger spills is to prevent oil from reaching the waterway. Oil spill response organizations (OSROs) are under contract with the Facility. The Company, however, will use Facility personnel and Facility owned equipment to initiate response actions within one hour. Several recreating areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by state and Federal trustees would likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Response Requirement (Cont'd)

- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage facilities.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of six (6) feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. – Los Angeles Harbor Terminal is classified as a "Complex Facility" which operates in a Higher Volume Port Area.

"Complex" means a facility possessing a combination of transportation-related and non-transportation-related components that is subject to the jurisdiction of more than one Federal agency under section 311(j) of the Clean Water Act (CWA).

Complexes must perform discharge calculations for each jurisdictional agency and plan for the largest Worst Case Discharge Volume pursuant to the respective regulations. The agency discharge volume calculations are described as follows:

EPA Discharge Volume Calculation

- **Worst Case Discharge**
  100% of the largest single tank

  WCD = (b) (7)(F),

- **Medium Discharge**
  Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD

  MD = 857 bbls

- **Small Discharge**
  Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD

  SD = 50 bbls

USCG Discharge Volume Calculation

(b) (7)(F), (b) (3)

8.3 DISCHARGE SCENARIOS (Cont'd)

OSPR Discharge Volume Calculation
● **Reasonable Worse Case Spill (RWCS)** *The portion of the total linefill capacity which could be lost during a spill, taking into account the availability and location of the emergency shut-off controls; plus the amount of additional spillage that could reasonably be expected to enter California marine waters during emergency shut-off, transfer or pumping operations if a hose or pipeline ruptures or becomes disconnected, or if some other incident occurs which could cause or increase the size of an oil spill.* *Total Linefill Capacity + Additional Spillage (during Shut Down) = RWCS.*

(b) (7)(F), (b) (3)

Note: The quantity associated with "the loss of the entire capacity of all in-line, break-out and portable storage tank(s)…" is excluded from the RWCS volume calculation since these tanks are under SPCC jurisdiction (i.e., tanks are subject to Chapter 6.67 or Chapter 6.7 of Div. 20, CA health and Safety Code and thus, exempt from this calculation.)

8.3 DISCHARGE SCENARIOS (Cont'd)

LA HARBOR TERMINAL
OSPR – RESPONSE PLANNING VOLUME CALCULATIONS

On-Water Planning Volume
(b) (7)(F), (b) (3) [redacted]

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack, or leaking Facility piping.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the Facility could be diverted to the product tanks that are not at maximum capacity. Spills that enter the bar ditch can be handled by response contract vacuum truck, absorbent pad and boom, or other equipment.

The closest waterway is the Los Angeles Harbor, which is south of the Facility. The storage tanks and truck loading racks, have adequate secondary containment so it is unlikely that a spill would reach the harbor or travel very far if it did. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall include:

- 1,000' of containment boom (or two times the length of the largest vessel that regularly conducts oil transfers to or from the facility, whichever is greater) and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a *Small Discharge* or greater which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a *Small Discharge* with the manpower and local contract resources as detailed in Section 2 and 3 of Volume 2.

- A 50 bbls discharge typically will not escape the containment of the Facility unless it occurred at the dock during transfer operations.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack or the dock. In the event of a spill at either location, shut down would begin immediately by manually activating one of the ESDs that are located at the rack or at the dock. For spill at the rack, Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading racks drainage system. The rack is contained by a curbed concrete slab which is slightly depressed. Another possible spill source is the dock.

Offsite Impact

- The closest waterway is the Los Angeles Harbor, which is south of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the harbor. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be implemented at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)
Offsite Impact (Cont'd)
● Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.
Notes:
● Equipment and manpower resources are detailed in Section 3 of Volume 2.
● Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
● Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (35,994 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge from a tank would leave the Facility property or reach a navigable waterway before a spill containment could begin. The spilled material would more than likely collect in the containment area sump system and be routed to the separator system. If a spill of this size escaped the property it would enter Los Angeles Harbor, as with the case of a Medium Discharge at the dock. Adverse weather conditions would increase the chances of a discharge entering the harbor; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages can be referenced in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a medium discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

The closest waterway is Los Angeles Harbor so the potential for a spill of this size reaching navigable water does exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the *Medium Discharge* volume that are capable of arriving on scene within 6 hours.
- Sufficient quantity of containment boom must arrive within 6 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 6 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 6 hours; Tier 2 = 30 hours; Tier 3 = 54 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 6 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage facilities.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the harbor.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed (b) (7)(F), (b) (3)

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached).

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages can be located in the Potential Spill Sources and Container Identification table in Section 3.2.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow south and enter the Los Angeles Harbor which is located south of the property.

For a spill that is confined to the land along the pathway, Facility personnel would have at least two (2) options by which to contain the spill:

- Dams
- Trenches

Ditch Containment

A spill may be contained in storm water ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located on Southwest Slip in Los Angeles Harbor north of San Pedro Bay which leads into the Pacific Ocean. The priority during larger spills is to prevent oil from reaching the waterway. OSROs are under contract with the Facility. The Company, however, will use Facility personnel and Facility owned equipment to initiate response actions within one hour. Several recreating areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by state and Federal trustees would likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Response Requirement (Cont'd)

- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage facilities.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. – Mission Valley Terminal is an EPA jurisdictional "Non-Transportation Related Onshore Facility" which operates in a Non-Higher Volume Port Area.

The EPA discharge volume calculations are described as follows:

EPA Discharge Volume Calculation
• **Worst Case Discharge** *100% of the largest single tank* **WCD** = (b) (7)(F), (b)
• **Medium Discharge** *Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD* **MD** = 857 bbls
• **Small Discharge** *Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD* **SD** = 50 bbls

8.3 DISCHARGE SCENARIOS (Cont'd)

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack, or leaking piping and would be diesel, gasoline or turbine fuel.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the Facility could be diverted to the product tanks that are not at maximum capacity. Spills that enter the bar ditch can be handled by response contract vacuum truck, absorbent pad and boom, or other equipment.

The closest waterway is the San Diego River which is south of the Facility. The storage tanks and truck loading racks, have adequate secondary containment so it is unlikely that a spill would reach the river or travel very far if it did. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, as appropriate, include:

- 1,000' of containment boom and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a *Small Discharge* or greater which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a *Small Discharge* with the manpower and local contract resources as detailed in Section 2 and 3 of Volume 2.

- A 50 bbls discharge typically will not escape the containment of the Facility. Severe rain and associated flooding would increase the chances.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Offsite Impact

- The closest waterway is the San Diego River, which is south of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the river. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be implemented at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Offsite Impact (Cont'd)

- Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before a spill containment could begin. If a spill occurred in the tank farm or manifold area, the product would be contained within the tank farm or manifold berms or dikes. If a spill occurred on the loading racks, the product would flow into system sumps and then to the oil/water separator. If a spill of this size escaped the property it could possibly enter the San Diego River. Adverse weather conditions would increase the chances of a discharge entering the river; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages can be referenced in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a medium discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

The closest waterway is the San Diego River so the potential for a spill of this size reaching navigable water does exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the *Medium Discharge* volume that are capable of arriving on scene within 12 hours.
- Sufficient quantity of containment boom must arrive within 12 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an OSRO as detailed in Section 3 of Volume 2 and will arrive within 12 hours.

- A 857 barrel discharge of gasoline could occur from Facility piping. Severe rain and associated flooding would increase the chances of an oil spill leaving the property.
- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 12 hours; Tier 2 = 36 hours; Tier 3 = 60 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 12 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage facilities.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the River.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed (b) (7)(F), (b) (3)

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached).

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility employees receive training periodically on the proper procedures to deal with a natural disaster. Employees are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages can be located in the Potential Spill Sources and Container Identification in Section 8.2.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow south and enter the San Diego River which is located south of the property.

For a spill that is confined to the land along the pathway, Facility personnel would have at least two (2) options by which to contain the spill:

- Dams
- Trenches

Ditch Containment

A spill may be contained in stormwater ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located north of the San Diego River, which flows to the Mission Valley Channel and into the Pacific Ocean. The priority during larger spills is to prevent oil from reaching the waterway. OSRO(s) are under contract with the Facility. The Company, however, will use Facility personnel and Facility owned equipment to initiate response actions within one hour. Several recreating areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by the state and federal trustees would more than likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Response Requirement (Cont'd)

- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage facilities.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of six (6) feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.3 DISCHARGE SCENARIOS

The Kinder Morgan Energy Partners, L.P. - Orange Terminal is an EPA jurisdictional "Non-Transportation Related Onshore Facility" which operates in a Non-Higher Volume Port Area.

The EPA discharge volume calculations are described as follows:

EPA Discharge Volume Calculation

- **Worst Case Discharge**
  100% of the largest single tank

  WCD = (b) (7)(F),

- **Medium Discharge**
  Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD

  MD = 857 bbls

- **Small Discharge**
  Discharge of less than or equal to 2,100 gallons (50 bbls), not to exceed the WCD

  SD = 50 bbls

8.3 DISCHARGE SCENARIOS (Cont'd)

The following planning volume calculations must be performed to determine the required response resources for a Worst Case Discharge:

Planning Volume for On-Shore Recovery (OSR)

OSR = WCD * % Oil On Shore * Emulsification Factor

Planning Volume for On-Water Recovery (OWR)

OWR = WCD * % Recovered Floating Oil * Emulsification Factor

Recovery Capacity (RC)

RC = OWR * On-Water Recovery Resource Mobilization Factors

The recovery capacity determined by these equations is compared to the appropriate response capability caps from the EPA tables, the actual contracted response amount is the lesser of the two values. If the calculated capacity exceeds the capability caps, sufficient response resources should be available for twice the amount of the caps or up to the total planning volume, whichever is less.

RESPONSE CAPABILITY SCENARIOS

The occurrence of a Small, Medium, or Worst Case Discharge could be the result of any number of scenarios at the Facility including:

- Tank overfill and/or failure
- Piping rupture
- Piping leak, under pressure and not under pressure
- Explosion or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers)

The response resources, including detail on equipment and manpower, are identified in Section 3 of Volume 2. Facility response personnel list/telephone numbers and other internal/external resources telephone numbers are detailed in Section 2 of Volume 1.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls

A small discharge at this Facility is considered to be a discharge that does not exceed 50 bbls (2,100 gallons).

Description

This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to,

- Pump seal leak
- Truck loading rack hose rupture
- Valve leak
- Container rupture
- Storage spill

The most likely location for a discharge of this size would be at the loading rack, or leaking piping.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by Facility personnel. These types of small spills are typically contained on the grounds of the Facility (earthen material or concrete). Adverse weather conditions would not hinder response efforts during a small discharge.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for the loading/ unloading of product to and from trucks. All truck loading is done by truck drivers who are trained prior to being allowed to load at the Facility. In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Also, old or worn parts are replaced as needed. Annual product transfer and pipeline testing is the most important of these measures.

Additional Comments

While the Facility's OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the loading rack would be diverted to the in line oil water separator.

The closest waterway is the Santa Ana River, which is west of the Facility. The storage tanks and truck loading racks, have adequate secondary containment so it is unlikely that a spill would reach the river or travel very far if it did. Therefore, the threat to sensitive areas is minimal. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, as appropriate, include:

- 1,000' of containment boom and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a *Small Discharge* or greater which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a *Small Discharge* with the manpower and local contract resources as detailed in Section 2 and 3 of Volume 2.

- A 50 bbls discharge typically will not escape the containment of the Facility.
- If a 50 bbls discharge escaped the Facility it would likely occur at the truck loading rack. In the event of a spill, the rack would immediately be shut down by manually activating one of the ESDs that are located at the rack. Facility management would immediately be notified and the situation would be assessed. The need for activating response contractors would be unlikely due to the design and containment capacity of the loading rack. The rack is contained by a curbed concrete slab which is slightly depressed.

Offsite Impact

- The closest waterway is the Santa Ana River, which is west of the Facility. The surface topography of the area around the Facility is relatively flat with a slight decrease in elevation toward the river. A spill of this size is not expected to migrate offsite, because the Facility possesses sufficient quantities of absorbent pads and granular material to effectively respond to a small discharge. The worst probable chain reaction to a spill of this type would be fires caused by accidental sparks. Weather impacts would be minimal since most of the product would not leave the site.
- Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 bbls) and can be implemented at the Facility, as the situation demands.
- A minimum of 100 bbls of oil storage capacity for recovered oily material can be secured from contractor resources or made available within the Facility's storage facilities, as the situation demands.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Small Discharge = 50 bbls (Cont'd)
Offsite Impact (Cont'd) ● Additional recovery and storage equipment may be secured from other Company and contract resources, as the situation demands.
Notes: ● Equipment and manpower resources are detailed in Section 3 of Volume 2. ● Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1. ● Facility personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, and actual spills.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls

A medium discharge at this Facility is considered to be a discharge that does not exceed 857 bbls (36,000 gallons).

Description

This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to,

- Line or flange rupture
- Valve rupture
- Tank failure
- Tank overfill
- Pipeline manifold rupture.

Because of dikes and other containment located throughout the Facility, it is very unlikely that the discharge would leave the Facility property or reach a navigable waterway before a spill containment could begin. The spilled material would more than likely collect in the containment area sump system and be routed to the separator system. If a spill of this size escaped the property it could possibly enter the Santa Ana River. Adverse weather conditions would increase the chances of a discharge entering the river; however, the following response actions would minimize the impacts on sensitive areas.

Prevention

Several steps can be taken to limit the number of occurrences and the amount of discharges. In particular, employees receive training periodically on the proper procedures for truck unloading/ loading and transfers to and from tanks (e.g. proper tank gauging procedures). This training includes what to do in the event of an unusual occurrence such as equipment rupture (i.e. how to transfer spilled material to the miscellaneous tank or product tanks).

In addition, preventive maintenance of equipment is performed at regularly scheduled intervals to ensure that any weaknesses are discovered. Old or worn parts are replaced as needed. Storage tank ages can be referenced in the Potential Spill Sources and Container Identification table in Section 8.2.

Additional Comments

In the event of a medium discharge, the OSRO or spill contractor would be notified. While waiting for the OSRO to arrive, qualified Facility personnel would evacuate the Facility and initiate "immediate response actions" located in Section 4 of Volume 2.

The closest waterway is the Santa Ana River so the potential for a spill of this size reaching navigable water does exist. The area is industrialized and commercialized so damage to ecologically sensitive habitats, recreational areas, etc. would be minimal. Finally, the most likely chain reaction of failure would be fires resulting from accidental spark or downed power lines.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Medium Discharge = 857 bbls (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the *Medium Discharge* volume that are capable of arriving on scene within 12 hours.
- Sufficient quantity of containment boom must arrive within 12 hours for oil collection and containment as well as for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

The Facility will initially respond to a *Medium Discharge* with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Section 3 of Volume 2 and will arrive within 12 hours.

- All resources shall be capable of arriving at the Facility within the applicable response tier requirements (Tier 1 = 12 hours; Tier 2 = 36 hours; Tier 3 = 60 hours).
- Oil recovery devices with an effective daily recovery capacity of 428 bbls (50% of the Medium Discharge volume) secured from the OSRO(s) will be on scene within 12 hours.
- 857 bbls of oil storage capacity for recovered oily material will be secured from the OSRO(s) and/or made available within the Facility's storage facilities.
- Containment boom for oil collection and containment as well as for protection of fish and wildlife, and sensitive areas will be secured from the OSRO(s) in the event that the spill escapes the boundaries of the Facility and impacts the river.
- Recovery of large spills in diked containment areas can be handled with the use of contractor vacuum trucks.

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, FRP reviews, HAZWOPER training, and other PREP training.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

A Worst Case Discharge (WCD) at this Facility is considered to be a discharge that does not exceed (b) (7)(F), (b) (3)

Description

This size discharge would most likely occur due to a natural disaster or catastrophic event. Examples may include, but not be limited to,

- Tank fire
- Earthquake-induced spills
- Catastrophic tank shell failure
- Wind-induced spills
- Pipeline manifold rupture

Diking and containment areas are located throughout the Facility. For a discharge this size to reach a navigable waterway, or leave the Facility property, diking would have to be damaged or destroyed (breached).

Prevention

For a WCD caused by a natural disaster, preparedness is more appropriate than prevention. The Facility personnel receive training periodically on the proper procedures to deal with a natural disaster. Personnel are also trained in steps to follow if the Facility must be evacuated (due to a tank fire or other emergency). In addition, preventive maintenance of tanks is performed at regularly scheduled intervals (to ensure that any weaknesses are discovered). Storage tank ages can be located in the Potential Spill Sources and Container Identification table in Section 8.2.

Worst Case Discharge and Adverse Weather

Severe rain events, tornadoes, and associated flooding would increase the chances of an oil spill leaving the property. Severe weather of this type could also negatively affect the response times of response contractors and other responders.

Probable chain reactions of failures would be induced by the weather conditions. They would include, but not be limited to, fires, health hazards, and discharges of more than one product.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Worst Case Spill Pathway Scenario

In the event of a tank rupture, the product may splash over the dike wall, flow southwest to the Santa Ana River which is located west of the property.

For a spill that is confined to the land along the pathway, Facility personnel would have at least two (2) options by which to contain the spill:

- Dams
- Trenches

Ditch Containment

A spill may be contained in stormwater ditches. Some practical containment methods are:

- A board skimming device
- Earth dam and weir
- Wire fence filter boom
- Culvert weir
- Under flow dam

These methods are simple to construct and effective for containment.

Spills that Reach the Waterway

The Facility is located east of the Santa Ana River. The priority during larger spills is to prevent oil from reaching the waterway. Oil spill response organizations (OSROs) are under contract with the Facility. The Company, however, will use Facility personnel and Facility owned equipment to initiate response actions within one hour. Several recreating areas and other ecologically sensitive areas could be potentially impacted by the spill and its associated response activities. A Damage Assessment by state and Federal trustees would likely follow the response.

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a WCD to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps. If the daily recovery rate exceeds the applicable contracting caps, then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Response Requirement (Cont'd)

- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.

Facility Response Resources/Capability

The Facility will respond to a WCD initially with a similar response as identified for a Small or Medium Discharge. Facility Management will initiate "immediate response actions" located in Section 3 of Volume 1 immediately upon discovering a spill. Additional OSRO(s) will be activated as the situation demands. The response resources will be capable of arriving within the required response tiers and will include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of 50% of the WCD or the response caps will be secured from the OSRO(s) and other Company resources. Any amount in excess of the required caps will be contracted for and responded to as part of the same response effort.
- Temporary storage capacity equal to twice the daily recovery capacity will be secured from OSRO(s), other Company resources, or made available within the Facility's storage facilities.
- At least 20% of the on-water response equipment secured from the OSRO(s) and other Company resources will be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive environments and socio-economic sensitivities will be secured from the OSRO(s) and other Company resources.
- Resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the shoreline will be secured from the OSRO(s) and other Company resources.
- Overall response operations will be conducted under the Incident Command System with adequate Facility and Contract Response personnel to continue operations for a minimum of seven (7) days.
- The local fire department will provide support for fires at the Facility.

RESPONSE CAPABILITY SCENARIOS (Cont'd)

Worst Case Discharge = (b) (7)(F), (b) (3)

Notes:

- Equipment and manpower resources are detailed in Section 3 of Volume 2.
- Telephone references are provided in Section 2 of Volume 2 and Section 2 of Volume 1.
- Spill response personnel, including Facility personnel, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, FRP reviews, and HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a WCD scenario.

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the ICP, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Emergency Director assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 2000 E. Sepulveda Blvd.
Carson, CA 90810
c. Activate the Facility's employee emergency alarm system (siren) from the Operations Coordinator's office . (Backup notifications and announcements to be made to personnel via 2-way radio.)
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility.
h. Establish a Command Center immediately.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the Administration Building or contractor parking lot near the main gate. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel (IC) will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility Administration, Operations, or Maintenance building, or the north or south staging areas.

8.4 FACILITY EVACUATION (Cont'd)

4. Community Evacuation

The local Law Enforcement provides methods of warning the public of the need to evacuate. The current procedure for informing the public when there is a need to do so is by door-to-door notification, use of electronic media by direct contact to radio and television stations, or the employment of the Emergency Broadcast System (EBS). The local authorities will initiate and coordinate all efforts concerning the evacuation of the community.

5. Directions to Little Company of Mary Hospital

Start out going east on E. Sepulveda Boulevard towards Intermodel Way. E. Sepulveda Boulevard becomes W. Willow Street. Take the CA-103 South ramp. Merge onto CA-103 South. CA-103 South becomes CA-47 South. CA-47 South becomes I-110 North ramp. Turn left onto N. Gaffey Street. N. Gaffey Street becomes N. Gaffey Street/CA-110. Turn right onto West 9th Street. Turn right onto S. Patton Avenue. Turn left onto West 7th Street.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gate located at the northern end of the Facility. If the situation permits, the Facility may also be accessed through the emergency gate on the southwestern side of the site adjacent to Alameda Street.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

8. Prevailing Winds

The prevailing winds in the Facility area are generally from the west, northwest at an average speed of 8 - 10 mph.

9. Water Currents

Currents in the Los Angeles Harbor and San Pedro Bay are usually no more than 0.1 to 0.2 knots and rotary in nature.

FIGURE 8.8

EVACUATION DIAGRAM

(b) (7)(F), (b) (3)

FIGURE 8.9

TACTICAL PLAN

The following Tactical Plan has been provided to assist initial response to a spill incident from this Facility. The plan includes the following:

- Driving directions
- General pictures of the site and tactical response strategy
- General response equipment and personnel recommendations

Note: This Tactical Plan is provided as a general guidance tool for response to an incident emanating from this Facility. The selection of response strategy equipment, manpower and deployment site may vary based on actual field conditions (e.g. terrain, weather conditions, product type/volume) and incident details.

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the ICP, which utilizes the Incident Command and Unified Command Systems.

The primary means of signaling an emergency evacuation will be the emergency evacuation sirens. These sirens can be heard in all outside locations within the Facility. The alarm activation button is located outside the operations office next to the main entrance of the building. Backup notification will be handled by use of two-way radios and/or employee runners. The evacuation sirens will be tested each Wednesday at 10:00 a.m.

All Facility personnel will evacuate as directed to the primary rendezvous location shown in the Evacuation Diagram in this Section. If it is not possible to reach the primary rendezvous location, employees must gather at one of the secondary rendezvous locations (see Evacuation Diagram). Contractors will be responsible for performing a head count for their personnel and communicating this information to the Incident Commander (or his designee). It is the Incident Commander's (or his/her designee's) responsibility to perform a "head count" at the rendezvous location to ensure that all Facility personnel, contractors and visitors are accounted for. All personnel will remain at the designated safe area until otherwise instructed by the Incident Commander of his designee.

The Company will notify the neighboring companies as necessary.

1. <u>First Responder until Emergency Director assumes control</u>

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 2200 John S. Gibson Blvd.
San Pedro, CA 90731
c. Activate the Facility's employee emergency alarm system (siren). (Notifications and announcements to be made to personnel via 2-way radio.)
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility.
h. Establish a Command Center immediately.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

8.4 FACILITY EVACUATION (Cont'd)

2. Assembly Area

a. **Primary Assembly Area** - See the Evacuation Diagram in this Section.

b. **Secondary Assembly Area** - See the Evacuation Diagram in this Section.

3. Location of Shelter at the Facility

See the Evacuation Diagram in this Section.

4. Community Evacuation

The local Law Enforcement provides methods of warning the public of the need to evacuate. The current procedure for informing the public when there is a need to do so is by door-to-door notification, use of electronic media by direct contact to radio and television stations, or the employment of the Emergency Broadcast System (EBS). The local authorities will initiate and coordinate all efforts concerning the evacuation of the community.

5. Directions to Little Company of Mary Hospital

Start out going south on John S. Gibson Blvd. towards N Pacific Avenue by turning left for 0.05 miles. Turn right onto W. Channel St. for 0.10 miles. Turn left onto N. Gaffey Street and travel 1.26 miles. N. Gaffey Street becomes N. Gaffey Street/CA-110. Turn right onto W. 9th Street and travel 0.76 miles. Turn right onto S. Patton Avenue for 0.12 miles to Hospital.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gate located on John S. Gibson Blvd. and also from the waterside via the main basin channel of Los Angeles Harbor.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 3.2.

8. Prevailing Winds

The prevailing winds in the Facility area are generally come from the northwest, west northwest at an average speed of eight (8) mph year round.

9. Water Currents

Currents in the Los Angeles Harbor and San Pedro Bay are usually no more than 0.1 to 0.2 knots and rotary in nature.

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the ICP, which utilizes the Incident Command and Unified Command Systems.

1. First Responder until Emergency Director assumes control

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location: 9950 San Diego Mission Road
San Diego, CA 92108
c. Activate the Facility's employee emergency alarm system (siren). (Notifications and announcements to be made to personnel via 2-way radio.)
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility.
h. Establish a Command Center immediately.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. Assembly Area

a. **Primary Assembly Area** - All employees will report to the Control Building. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel (IC) will conduct a headcount of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the Primary Assembly Area by the incident should proceed to the main office or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. Location of Shelter at the Facility

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility Main Office, Control Building, or the north or south staging area.

4. Mitigation Control Center

The initial mitigation command center will be established at the Control Building.

8.4 FACILITY EVACUATION (Cont'd)

5. Community Evacuation

The local Law Enforcement provides methods of warning the public of the need to evacuate. The current procedure for informing the public when there is a need to do so is by door-to-door notification, use of electronic media by direct contact to radio and television stations, or the employment of the Emergency Broadcast System (EBS). The local authorities will initiate and coordinate all efforts concerning the evacuation of the community.

6. Directions to Sharp Memorial Hospital

From the intersection of I-15 and Friars Rd travel west, southwest approximately 1.5 miles to I-805. Exit right (Northwest) onto I-805 and travel approximately 2 miles to Mesa College/Kearny Villa Rd. Exit off of I-805 right and turn left (South) onto Mesa College. Travel 0.3 miles to Sharp Memorial Hospital.

7. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gate located Southeast of the Control Building. If the situation permits, the Facility may also be accessed through the northern access road.

8. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with spilled refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

9. Prevailing Winds

The prevailing winds in the Facility area generally come from the northwest, west northwest at an average speed of eight (8) mph year round.

10. Water Currents

Currents in the San Diego River are minimal due to the number of dams located along the length of the river.

TACTICAL PLAN

The following Tactical Plan has been provided to assist initial response to a spill incident from this Facility. The plan includes the following:

- Driving directions
- General pictures of the site and tactical response strategy
- General response equipment and personnel recommendations

Note: This Tactical Plan is provided as a general guidance tool for response to an incident emanating from this Facility. The selection of response strategy equipment, manpower and deployment site may vary based on actual field conditions (e.g. terrain, weather conditions, product type/volume) and incident details.

8.4 FACILITY EVACUATION

The First Responder shall initiate evacuation for isolated emergencies when an immediate reason for evacuation exists (e.g., life-threatening condition). The local law enforcement will coordinate community evacuation activities if necessary and determine area of impact. Response activities would be handled in accordance with the ICP, which utilizes the Incident Command and Unified Command System.

1. <u>(First Responder until Company Personnel (IC) assumes control)</u>

a. In case of a major spill, make emergency notification calls.
b. Give Facility Location:1350 N. Main Street
Orange, CA 92667
c. Activate the Facility's employee emergency alarm system (siren).
d. Shut down pipeline and cease all loading. Do not start engines or move trucks. All drivers and employees go to the primary evacuation site if possible. If it is not possible to reach the primary site, proceed to the secondary site if possible. If it is not possible to reach the primary site, proceed to the secondary site.
e. Shut off power in the area of the spill.
f. Upon authorization from the Fire Department or Area Manager, all trucks are to leave the Facility area as directed. **DO NOT BLOCK ROADWAYS.**
g. Contact other oil company offices within or near the Facility and Southern Pacific Railroad, if applicable.
h. Staging area for Emergency Command Post will be at the entrance to the Facility or where the Fire Department selects.
i. Make the Command Center identifiable.
j. Report location & communication methods to responding help (public authorities, specialized contractors).
k. Assemble appropriate personnel, including outside response agencies.
l. Centralize all materials, including communications.
m. Set up staging areas.
n. Be ready to move off site if emergency conditions change.

2. <u>Assembly Area</u>

a. **Primary Assembly Area** - All employees will report to the Office Building. (Refer to the Evacuation Diagram in this Section for evacuation routes.) Company Personnel (IC) will conduct a head count of personnel (employee & contractor) that were in his area. The results of such headcount will be communicated to the Incident Commander immediately.
b. **Secondary Assembly Area** - Employees who find themselves isolated from the primary assembly area by the incident should proceed to the main gate or other safe area up wind of incident. (Refer to the Evacuation Diagram in this Section for evacuation routes.)

3. <u>Location of Shelter at the Facility</u>

Should a safe evacuation of the Facility become unlikely, shelter can be taken at the Facility Main Office.

8.4 FACILITY EVACUATION (Cont'd)

4. Community Evacuation

The local Law Enforcement provides methods of warning the public of the need to evacuate. The current procedure for informing the public when there is a need to do so is by door-to-door notification, use of electronic media by direct contact to radio and television stations, or the employment of the Emergency Broadcast System (EBS). The local authorities will initiate and coordinate all efforts concerning the evacuation of the community.

5. Directions to St. Joseph Medical Center

From the Facility start out going south on N. Main St. towards W. Katella Avenue 1.9 miles. Turn left onto W. Stewart Drive 0.1 miles. Turn right onto S. Pepper St. to the hospital.

6. Arrival Route of Emergency Response Personnel and Response Equipment

The Facility can be accessed via the main gate. If the situation permits, the Facility may also be accessed through the northern access road.

7. Location of Stored Material & Hazards Imposed by Those Materials

Materials are stored permanently in the bulk fuel aboveground storage tanks (ASTs) in the tank yard at the Facility. Hazards posed by any releases from this area include fire, direct contact with refined products, and inhalation of vapors associated with spilled refined products. Spill flow directions, outside the secondary containment areas, are shown on the Drainage Diagram found in Section 8.2.

8. Prevailing Winds

The prevailing winds in the Facility area generally come from the southeast at an average speed of five to ten (5 – 10) mph and the mean temperature is 60°F.

9. Water Currents

Currents in the Santa Ana River are minimal and have no tidal influence.

10. Evacuation Procedures

The Company has confirmed with the Orange Police Department that a Community Evacuation Plan currently exists for this area. A copy of the Plan will be forwarded to the Company for integration into the Facility's evacuation procedures.

8.5 RISK AND HAZARD ANALYSIS

8.6 CONSEQUENCE ANALYSIS

[Note: The Risk and Hazard Analysis and The Consequence Analysis for this Facility was performed during GATX ownership of the Facility and continues to be valid under KMEP ownership. This effort was performed on the GATX LA Complex operations in which the combined operations of LA Harbor Terminal (LAHT), Gaffey Street Terminal and Carson Terminal was evaluated. Since KMEP's acquisition of this complex, the Gaffey Street operations have been terminated and the LAHT and Carson Terminal operations have been segregated. Accordingly, the LAHT operations, which is the only Terminal with marine operations, is the OSPR jurisdictional facility and this Risk and Hazard Analysis and Consequence Analysis remains valid. These sections are incorporated herein and attached hereto in their entirety.]

6.1 Risk and Hazard Analysis

6.1.1 Spill History

A history of significant spills is provided for each terminal and pipeline operation in the site specific annexes (Annexes A.3.1, B.3.1, and C.3.1). Information on the type of oil, amount spilled, location, date and time of the incident, watercourses affected (if any), agencies notified and corrective actions taken is provided.

6.1.2 Hazard Analysis

Hazard analyses have been performed for all GATX Los Angeles Petroleum Complex facilities, to identify hazards associated with the facilities. A summary of the hazard analyses performed are described in the site specific annexes for the following:

- Annex A Carson Terminal
- Annex B Los Angeles Harbor Terminal
- Annex C Gaffey Street Terminal
- Annex D Pipeline Facilities

6.1.2.1 Hazard Analysis Methodology

The hazard studies were performed using one the following techniques, in accordance with Guidelines for Hazard Evaluation Procedures published by the American Institute of Chemical Engineers.

- What-If
- What-If / Checklist
- Hazard and Operability (HAZOP)

The studies identified hazards associated with the facilities, including:

- Operation of the facilities
- Operator or human error
- Potential equipment failure
- Maintenance
- Safety Systems
- External events (natural hazards) likely to cause a release

The hazard analysis teams were composed of representatives from operations, maintenance and a team leader with experience in the hazard analysis technique.

6.1.2.2 Summary of Findings and Corrective Actions

The studies concluded that safeguards and procedures are in place to prevent or substantially reduce the potential for a release. The level of risk posed by the hazards identified have been evaluated, and no scenarios were identified as having an "Unacceptable" or "Undesirable" level of risk.

The most severe consequence which can not be totally mitigated by safeguards, was the potential for a pipeline rupture due to third party damage. An underground service network is in operation to identify underground lines prior to excavation or boring operations. GATX inspects the work area to verify their pipelines are not in danger from external interference. In the event of a pipeline release, pipeline monitoring devices and procedures will quickly alert the operator to a pipeline failure.

A number of scenarios were identified during the hazards analyses as having an "Acceptable With Controls" or "Moderate" level of risk. These were primarily associated with the detection of releases. Release detection on a complex pipeline system requires regular pipeline flow and pressure measurements, and monitoring procedures. GATX have procedures to measure pipeline deliveries and receipts to detect discrepancies in pipeline in transfer quantities. During the hazards assessments, recommendations were made to improve the monitoring and integrity of the pipeline system. Since the studies were performed, GATX have implemented a number of risk reduction measures to further reduce the risk of a release or the impact of a potential release.

6.2 Off-Site Consequence Analysis

6.2.1 Trajectory Analysis

Planning Distances

The EPA and USCG require the determination of a planning distance for potential impact such as injury to fish and wildlife and sensitive environments, or disrupt operations at a public drinking water intake. Since the facilities are located in a tidally influenced area, the planning distance is 15 miles from the facility down current during ebb tide and 15 miles during flood tide for the persistent oils stored at the facility. For the non-persistent oils stored at the facility, the planning distance is 5 miles from the site down current during ebb tide and 5 miles during flood tide.

The Carson Terminal site is located approximately 250 feet from the Dominguez Channel which flows into the Los Angeles Inner Harbor, and is therefore also in a tidally influenced area.

Representative Worst Case Trajectory Analysis

(b) (7)(F), (b) (3) [redacted] The following is a brief discussion of this trajectory analysis.

An envelope of possible spill trajectories was calculated for a cluster of facilities located between the mouth of the Dominguez Channel and the middle of the main channel, including the Turning Basin, leading into the Los Angeles inner harbor. The trajectory analysis considered oil transport by wind stress, tidal currents, and spreading by physical processes including gravity, surface tension, and tidal dispersion.

Circulation (and spill transport) in the shallow waters of San Pedro Bay is dominated by wind stress. Tidal currents within the bay, usually no more than 0.1-to-0.2 knots and rotary in nature, are much less important than wind stress and probably would not contribute significantly to spill transport.

Tidal currents, wind stress, and spreading could transport oil either eastward of the mouth of the Dominguez Channel or southward towards the waters of the San Pedro Bay. Should the spill travel southward of the Los Angeles Harbor main channel entrance, westerly (i.e. blowing from the west) or northwesterly winds could drive the spill as far as the eastern end of the Long Beach breakwater. Under these conditions, it is possible for oil to be transported outside the San Pedro breakwater. Over a 3-day period, the spill could be transported as far south as Huntington Beach, and about 6 nautical miles southeast of the Long Beach breakwater.

These spill trajectory envelopes represent the outer perimeter of the shoreside areas that could receive oil in the event of any spill. The envelopes are based on regional extremes of climate, tide, current, and wind and assume pessimistic dispersion and other adverse weather conditions. These trajectory envelopes do not represent the trajectory of any one spill. A full discussion of the details used for preparing these spill envelopes is provided in Section 202.2 of the CCW Regional Resource Manual.

6.2.2 Oil Characteristics and Persistence

6.2.2.1 Impact on Biological Resources

In general, oil can be toxic to biological resources. Oil contamination of intertidal areas, waterfowl, and fur-bearing mammals can be severe. The following summarizes the potential toxicity from oil to biological resources as presented in the CCW Regional Resource Manual.

- ***Wildlife –*** Wildlife are susceptible to significant injury and mortality from contact with oil spills. In general, the degree of sensitivity to oil spills is based on habitat location and behavioral characteristics. For example, most waterfowl and shorebirds, particularly diving birds, are very sensitive to oil spills due to their extensive use of the water, whereas terrestrial birds may nest near the water but have a low sensitivity to oil spills if they do not frequent shoreline areas. Similarly, animals that frequent coastal areas may be impacted by oil spills if they feed on vegetation or dead animals along the shoreline that could become oiled.

  Wildlife impacts may result from the physical effects of the oil on their fur or feathers or through ingestion during preening or scavenging. Selected marine mammals (e.g., sea otters and fur seals) and birds (primarily waterfowl) rely on their fur or feathers for insulation and buoyancy, which can be adversely affected if they become oiled. Significantly oiled mammals or birds can perish from hypothermia and exhaustion or may become sick from the ingestion of the oil while preening. The effects of ingestion vary depending on the toxicity of the oil. In general, the lighter the crude oil or petroleum product, the more toxic it is to wildlife.

- ***Finfish and Shellfish*** – The sensitivity of various fish species to oil spills typically depends on their growth stage (juveniles are generally much more sensitive than adults), their feeding or migration habits, and the type of oil. Species that frequent shallow or near-surface areas will often be exposed to higher concentrations of dissolved hydrocarbons than those that reside primarily in deeper waters. Lighter crude oils and refined petroleum products have a greater impact on fish than heavier oils due to their generally greater solubility and higher concentrations of toxic compounds.

- ***Kelp and Eelgrass Beds*** – Kelp and eelgrass beds are valuable habitats for numerous finfish and shellfish. Eelgrass is much less abundant than kelp but is used as spawning grounds for some fish and as important sanctuary for a number of planktonic organisms. Eelgrass is very susceptible to the toxic and physical effects of oil spills. Kelp beds also serve as habitats and sanctuaries for a number of finfish, shellfish, and other marine organisms but are less susceptible to the effects of oil spills. Kelp fronds and blades are covered with mucous that inhibits the oil from sticking although a kelp forest canopy can trap substantial quantities of oil, resulting in the mortality of many of the organisms inhabiting the canopy. The effects of the oil are generally short-term due the kelp's rapid growth rate.

In general, the longer the oil is expected to persist on a shoreline, the higher the priority for protection. Long-term persistence can present chronic toxicity effects as well as affecting the natural sediment erosional and depositional processes. The potential persistence or residence time of stranded oil on a shoreline is primarily dependent on the degree of impact, the type of shoreline sediments, and the level of exposure to the elements.

Higher degrees of impact, coarser, well-sorted sediments, and lower levels of exposure to wind, waves, currents, and tidal flushing will increase the residence time of the oil on the shoreline. Coarser-grained sediments usually permit the oil to penetrate deeper into the shoreline but can also allow for greater tidal flushing and natural degradation. Fine-grained sediments typically inhibit penetration but if oil does become incorporated into the sediments, residence time will increase.

Lower levels of exposure, such as in protected inlets or bays, will increase the residence time due to the decreased natural abrasion caused by sediment movements and flushing action by wind, waves, and tides. Protected areas may also be shaded and calm, which could inhibit evaporation and photo-oxidation. General guidelines on the potential persistence of oil on a variety of shoreline types are provided in Table 303-1 of the CCW Regional Resource Response Manual.

The ACP for Los Angeles/Long Beach contains maps of the potentially affected shorelines, together with site strategy and site summary sheets that describe the characteristics of the shorelines and strategies to be used to protect the shoreline from oil and to clean up oil that reaches the shoreline (Section 4613 of the ACP).

The ACP also lists natural resources for each segment of shoreline. Environmental sensitivity rankings are presented on the maps to help prioritize response efforts. A list of sensitive areas is presented in Figure 6.3.1 and an inventory of potentially affected natural resources is presented in Figure 6.3.2 of this Plan.

The primary seasonal effect on biological resources is whether the specific resource is present at the time of the spill. This is especially true of birds and mammals. Plants may be affected differently depending on the timing of the spill relative to the plant's growing season. In general, oiling during the dormant winter season has the lowest impact, whereas oiling of vegetation during the summer growing season has longer effects.

6.2.2.2 Impact on Economic and Cultural Resources

Economic resources include marinas, mariculture operations, recreational and tourist facilities, parks, and the like. The ACP contains a discussion of economically significant areas in Section 4620 and 4622. The discussion describes the criteria for prioritizing response using three codes to indicate relative priority for protection. Codes A, B, and C apply to natural resources. The codes applicable to economic resources are defined below.

- D = Economic activities and resources that require high water quality for their operation or existence.
- E = Facilities, businesses, or resources that directly use coastal or bay waters within their economic activity, and which are at risk of oiling from a spill in marine waters.

- F = This category contains marine facilities, business, and resources.

The economic resources that may be affected are summarized in Figure 6.3.3.

6.2.2.3 Summary of Consequences

The consequences of oil spills on wildlife and shoreline habitats are well documented. Section 303 of the CCW Regional Resource Manual discusses sensitive resources and the potential effects of oil on key sensitive resources. Figure 6.2.1 summarizes the vulnerability of aquatic ecosystems to the toxic effects of oil. This summary is based on research conducted by the U.S. Fish and Wildlife Service National Wetlands Research Center.

Effects on economic resources are generally temporary. They include:

- Possible direct effects on mariculture operations and commercial fisheries such as contamination of fish, shellfish, or vegetation. These effects may impact the value of products or make them unfit for sale, and may thereby adversely impact the operator or fishermen. Fishermen may be compensated if they assist in oil spill response through cooperative vessel of opportunity programs that would offset reduced earnings from fishing.
- Possible damage or adverse aesthetic effects to boats, on-water equipment, shore-based industrial operations, marinas, piers, and the like. These effects generally require cleaning of the contaminated boats or equipment to remove the oil. In certain circumstances, oil may be taken into mechanical and cooling systems in vessels or shoreside equipment, and this may require cleaning or overhaul of the equipment prior to returning it to service.
- Possible reduced tourism and park attendance and reduced revenues for the local economy from tourism. The existence of a spill may deter potential visitors from visiting the area during and, for a period of time, after the spill. A spill may prevent visitors from engaging in some activities that require using beaches, harbors, piers, or other shoreside amenities while spill cleanup operations are in progress. However, spill cleanup does create a demand for local labor and temporary housing which may compensate somewhat for lost revenues.

Figure 6.2.1 Vulnerability of Aquatic Ecosystems to Spilled Oil

Habitat	Vulnerability To Oil Discharges
Intertidal Shore	
Sandy Beach	Moderate
Rocky Shore	High
Tidal Flat (bird nesting and feeding)	High
Intertidal Wetlands	
Marshes (breeding for nursery grounds)	Low – High
Subtidal Systems	
Seagrass (fish feeding and nursery)	High
Soft bottom stabilization	High
Rocky	Moderate
Fisheries	
Offshore Commercial Fisheries	Low (except spawning)
Nearshore	Moderate - High

Source: U.S. Department of the Interior, Fish and Wildlife Service, National Wetlands Center.

6.3 Sensitive Resources

6.3.1 Environmentally Sensitive Resources

Environmentally sensitive resources include:

- Shoreline types and associated marine resources.
- Presence of migratory and resident marine birds.
- Mammal migration routes and breeding, nursery, stopover, haul-out, and population concentration areas (seasonal).
- Presence of aquatic resources.
- Presence of natural terrestrial animals and plant resources in marine-associated environments.
- Presence of state/federal-listed rare, threatened, or endangered species.
- Commercial and recreational fisheries including aquaculture sites, kelp leases, and other harvest areas.

Sensitive resources are identified and mapped in the following documents:

1. Clean Coastal Waters (CCW) Regional Resource Manual.
2. Area Contingency Plan (ACP) for Los Angeles/Long Beach.

GATX maintains copies of these documents at its Carson facility. The response maps listed below cover the areas of concern for the GATX facilities. Copies of these response maps are provided in Section 6.7 of this plan to ensure that response personnel have access to the maps.

The CCW Regional Resource Manual sensitive area maps and corresponding tables are sequentially numbered from west to east. Resources of concern are identified on the following maps:

- CCW-06. San Pedro Bay
- CCW-07. Seal Beach Area.
- CCW-08. Huntington Beach Area.
- CCW-09. Newport Beach Area.

On each map, Areas of Special Significance are identified and prioritized with respect to sensitivity. Information provided on the map and in the corresponding table on the Area of Special Significance includes:

- Physical features,
- Biological features (e.g., the presence of spawning areas, fish, birds, marine mammals, sensitive, threatened, and/or endangered species).

- Primary, secondary, tertiary substrate.
- Primary response technique.
- Trustee Agency/Manager/Local Expert contacts.

The ACP for Los Angeles/Long Beach (Section 4613) presents similar and additional information on sensitive resource areas. Resources of concern are identified on ACP maps as follows:

- Map 119. San Pedro Channel and Bay.
- Map 121. San Pedro Bay.
- Map 122 - 123. Long Beach to Huntington Beach.
- Map 124 – 125. Huntington Beach to Laguna Beach.

Using OSPR maps, sensitive areas are mapped and prioritized (Codes A, B, and C) according to an environmental sensitivity ranking. A Site Summary Sheet is provided for each sensitive site and includes information on the site's:

- Location (USGS quad, longitude and latitude).
- Physical features.
- Access.
- Seasonal concerns.
- Resources of primary concern.
- Trustee Agency/Local Expert contacts.

A second sheet for each sensitive area, the Site Strategy Sheet, specifically addresses protection, containment, and cleanup strategies, including recommended techniques, equipment considerations, access and logistics information.

Sensitive areas and resources noted on the maps in the ACP are consistent with those listed in the CCW Regional Resource Manual's maps. A cross-reference for the sensitive sites called out on these maps is provided in Figure 6.3.1. Natural resources of concern in the area are summarized in Figure 6.3.2.

6.3.2 Economically and Culturally Sensitive Resources

Economic and cultural resources include:

- Public beaches, parks, marinas, boat ramps, and diving area.
- Industrial and drinking water intakes, power plants, salt pond intakes.
- Offshore oil and gas leases and associated drilling platforms.
- Historical/archaeological sites.
- Areas of cultural or economic significance for Native Americans.

6. Prevention Measures

- Major waterways and vessel traffic patterns that are likely to be impacted.

The ACP contains a discussion of economically significant areas similar to the manner addressed for environmentally sensitive areas. Priority ranking codes D, E, and F are used to signify lower priorities for protection.

The coastal economic resources that may be affected, along with the appropriate priority ranking code for each resource type, are summarized in Figure 6.3.3. Additional information can be obtained from the ACP, Sections 4620, 4622, and 4623. The CCW Regional Resource Manual also identified economic resources on its maps CCW-06 to CCW-09.

Cultural Resources	None identified. A cultural resources specialist would advise the spill response team as necessary. Refer to ACP Section 4624 for contact list.

Priority Rankings:
D = Economic activities and resources which require high water quality for their operation or existence.
E = Facilities, business, or resources which directly use coastal or bay waters within their economic activity and which are at risk of oiling from a spill in marine waters.
F = Marine-associated facilities, businesses, and resources.

B.3 Site Spill Prevention

Spill prevention is accomplished by a combination of engineered systems and continuous daily monitoring by company personnel. Spill prevention and mitigation measures for GATX Los Angeles facilities are described in the main plan in Section 6.4. The following section provides a description of the spill history and hazard analysis, specific to the Harbor Terminal.

B.3.1 Spill History

A history of reportable spills recorded at the Harbor Terminal is provided in Figure B.3.1, for spills from 1994 to 1999.

A reportable spill is defined as follows:

- Federal Reportable Quantity

  Cause a film or sheen upon or discoloration of the surface of the water or adjoining shorelines, or cause a sludge to be deposited beneath the surface of the water or upon adjoining shorelines, or

  Violates applicable water quality standards

- California Reportable Quantity

  Any petroleum spill to the waters of the State, or

  Any spill to land of one barrel (42 gallons) or more.

B.3.2 Risk and Hazard Analysis

B.3.2.1 Introduction

The GATX Los Angeles Harbor Terminal located at Berths 118-119 in Los Angeles, California functions as a petroleum liquids terminal for loading/unloading tankers and barges. Products are received into the site by tanker, barge, pipeline and tank truck and shipped from the site by tanker, barge, pipeline and tank truck. Rarely, some product is received into the site by tank truck.

This Hazard and Risk Analysis evaluates the varied operations performed at the site to accomplish the receipt, storage, and delivery of products; and assesses the potential for product discharges as a result of such operations.

This analysis is limited to the evaluation of product discharges at the site. It does not address potential discharges from vessels or vehicles calling at the site or from pipelines connected to the site except in conjunction with the terminal transfer operations. Neither does it address the potential for adverse incidents other than spills or discharges (fire, explosion, etc.).

B.3.2.2 Study Technique

This analysis evaluates the potential for a discharge from each of the several types of operations performed at the site:

- Vessels unloading to tankage

- Vessels loading from tankage
- Vessels unloading directly to pipeline
- Tank trucks unloading to tankage
- Tank trucks loading from tankage
- Pipeline receipts into tankage
- Pipeline deliveries from tankage

Where it is appropriate each of the above operations are evaluated under two operating modes - (1) during operation start-up and (2) during continuous operations. The potential for a discharge and the magnitude of such discharge may be different for each operating mode.

Additionally, an evaluation is made of the potential for a discharge from segments of the site during routine system maintenance, and when such segments are idle.

A series of "what if" questions were utilized to perform the analysis (Figure B.3.2). It was presumed that as long as operating conditions were normal and operating practices and procedures were being followed, then no hazard or risk existed.

The "what if" questions addressed deviations from normal operating conditions and variances from practices and procedures that could lead to adverse consequences or could be the result of adverse consequences.

For each "what if" event, the potential consequences were identified; and for each consequence, an evaluation was made of the safeguards in place to eliminate or reduce the impact of that consequence.

For any event where it was determined that the safeguards might not preclude all adverse consequences, the perceived level of risk of any remaining consequences was evaluated. The perceived level of risk was identified as being Very Minimal, Minimal, Moderate, or Major. For risks judged to be more than Minimal, recommendations for reducing the level of risk were offered for consideration.

B.3.2.3 Study Team

Vern Grimshaw, with the consulting firm of Robert J. Meyers and Associates, conducted the study. Mr. Grimshaw has over 39 years experience in engineering, operations, and management of petroleum pipelines and terminals, including risk analysis and spill response.

Mr. Grimshaw interviewed Mr. Steven Caddell, Terminal Superintendent (at the time of evaluation), and other site personnel regarding several elements of site operations. Operating procedures and practices for each specific operation were discussed; Written Operating Procedures for various site operations were reviewed and explained; and an assessment was made of the various control devices, monitoring systems, and alarm systems that are a part of the site design.

B.3.2.4 Study Conclusions

The study concluded that, except as described below, adequate safeguards are in place to either totally prevent, or substantially reduce the potential for a discharge resulting from site operations.

The site has adequate secondary containment for major tankage in the event of a tank failure or overfill. The drainage systems would adequately contain discharges from the tank truck loading and unloading areas and other un-diked areas of the site. Comprehensive written operating procedures are provided for operations routinely performed at the site.

Recommendations for reducing the potential risk of a discharge in certain operations are provided in Figure B.3.3 and described as follows:

1. For movements via pipeline in either direction between the terminal and the GATX Carson storage site, the risk of not rapidly detecting a pipeline leak or break is determined to be "Moderate". System balance between the two locations (comparing volume pumped with volume received) is typically accomplished by obtaining tank gauge readings and making a comparison.

   This risk could be reduced by:

   - utilizing meters to make a continuous comparison, or alternatively,
   - implementing procedures to make more frequent and more precise volume readings.

   Neither method would prevent the discharge, but either would reduce the potential volume of the discharge and reduce the potential adverse consequences.

2. The difficulty in rapidly detecting a pipeline leak or break on the lines between the terminal and the GATX Carson storage site is greater during the start-up phase of the operation, before the system reaches equilibrium. This potential risk could be reduced by placing a stand-up pressure on the system prior to the start of pumping to confirm integrity.

3. The possibility exists of over-pressuring the low pressure segments at the receiving end of the Carson-Harbor pipeline system in the event of a mis-alignment during start-up or a switching error during the operation.

   Alternatives for reducing the level of risk include:

   - utilizing pressure alarms or pressure shut-down devices,
   - utilizing physical relief systems, or
   - strengthening the operating procedures at the receiving end to emphasize proper initial line-up and to prevent erroneous switches during the movement.

   The worksheets and support data for this Hazard and Risk Analysis are available in the full hazard assessment report.

Figure B.3.1 GATX TERMINALS - SPILL REPORT DATABASE
LOS ANGELES HARBOR TERMINAL 1992 – 1999

DATE	REPORT #	LOCATION	PRODUCT TYPE	QUANTITY	ON/OFF FACILITY	WATER IMPACTED (Y/N)	AGENCIES NOTIFIED	STATUS (see codes)

* Status Codes:

1. liquid cleanup complete, no soil or water impacted
2. liquid cleanup complete, soil cleanup pending
3. liquid and soil cleanup complete, soil disposal pending
4. cleanup and disposal complete, no further action
5. ongoing groundwater cleanup
6. further investigation in progress

Figure B.3.2 Summary of "What If" Questions

Operations Related Events

- What if system pressure increases?
- What if system pressure decreases?
- What if flow rate increases?
- What if flow rate decreases?
- What if receiving tank volume is inadequate?
- What if product temperature increases? (see note)
- What if product temperature decreases? (see note)
- What if atmospheric temperature reaches extremes?

Maintenance Related Events

- What if system control devices fail?
- What if system monitoring devices fail?
- What if maintenance procedures are not followed?
- What if preventative maintenance program is not followed?
- What if piping integrity is less than design?

External Events

- What if third party damage occurs to connecting pipelines?
- What if earthquake occurs?
- What if storms/subsidence damages facilities?
- What if vandalism occurs?

Figure B.3.3 Summary of Recommendations

Item	Section	Recommendation	Level of Risk*
LAH-1	Vessel loading/unloading to tankage or pipeline – high temperature	The Operating Procedures for off-loading of heated products should emphasize the need to monitor off-loading temperature during the operation.	Minimal
LAH-2	Vessels unloading to tankage or pipeline– low temperature	The Operating Procedures for off-loading of products that require a minimum temperature should emphasize the need to monitor off-loading temperature during the operation.	Minimal
LAH-3	Vessels unloading to Carson pipelines, or transfer movements – line failure during startup	Consideration should be given to the procedure of placing a "stand-up" pressure on the pipeline prior to start-up to insure line integrity.	Moderate
LAH-4	Vessels unloading to Carson pipelines or transfer movements – line failure during normal operation	The potential level of risk could be reduced through an improved method of observing system volume balance.	Moderate
LAH-5	Pipeline movements to and from Carson – high pressure	A review of start-up procedures should be made, with emphasis on careful observance on the part of the operator at the receiving location to confirm product receipt into the appropriate receiving tank before excessive pressure build-up. High pressure alarms, high pressure shut down devices, and physical relief systems are alternatives.	Moderate

* Perceived level of risk: Very minimal, minimal, moderate or major.

8.7 RISK REDUCTION INCENTIVE PROGRAMS

The Facility participates in an annual safety awareness program which is administered at the Corporate level. The Facility has evaluated workplace hazards and how to prevent or mitigate them under workplace illness and injury prevention guidelines. The Facility conducts monthly safety meetings to discuss conditions, which could cause accidents or spills, and how to mitigate or prevent them from occurring. The Facility (through the Operations Review Committee) also conducts quarterly meetings for continuously improving the quality and effectiveness of operating practices and procedures.

8.8 DRUG AND ALCOHOL POLICIES

Kinder Morgan, Inc. and Kinder Morgan Energy Partners, L.P.

Human Resources Policy Manual

Drugs and Alcohol in the Workplace

(Effective 01/01/2000)

(Revised 01/01/2003)

Purpose

The purpose of this Policy is to maintain a safe and productive work environment for all employees, applicants, and the public by ensuring that employees on Company property, while conducting Company business, operating Company property, or during their employment with the Company may not possess or use illegal or unauthorized drugs. The Policy is also intended to promote worker and public safety, to comply with the Drug-Free Workplace Act of 1988, and to provide procedures for workplace-related searches of persons and property and the lawful drug and alcohol testing of employees. Kinder Morgan maintains a "Zero Tolerance" policy.

Scope

This Policy applies to all Company employees, applicants, contract workers, and employees of third-party contractors, including employees and contract workers who perform functions covered by regulations promulgated by the Department of Transportation (DOT). In the event of a contradiction between this Policy and the Company's Anti-Drug Plan and Alcohol Misuse Prevention Plan, the Company's Anti- Drug Plan and Alcohol Misuse Prevention Plan shall govern.

This Policy is broader in scope than the Company's Anti-Drug Plan and Alcohol Misuse Prevention Plan. For additional information refer to the Anti-Drug Plan and Alcohol Misuse Prevention Plan.

This Policy shall be administered in accordance with all applicable federal, state, and local laws and regulations.

Responsibilities and Prohibitions

Employees

All applicants and employees are reminded that the following actions are included as violations of this Policy: (1) use, possession, sale, distribution of illegal or unauthorized drugs on Company property, while operating any Company vehicle or equipment, or while conducting Company business; (2) use, possession, sale, distribution of alcohol on Company property. while operating any Company vehicle or equipment, or while conducting Company business, with the exception that use and possession of alcohol during Company sponsored business or social functions, where the use of alcohol remains moderate, will not be considered a violation of this Policy; (3) use of any drug, including prescribed drugs, which is unsafe to use while operating Company vehicles or equipment; (4) possession, sale or distribution of paraphernalia and equipment related to illegal or unauthorized drug use; and (5) refusal to test in any testable situation.

As a condition of employment, any employee whose work directly relates to the performance of a federal contract and who is or has been convicted of a criminal drug offense occurring in the workplace during employment must notify his/her supervisor and Human Resources representative in writing within five days of such conviction. Similarly, as a condition of employment, any employee that is required to possess a valid driver's license as a pre-requisite of their position, must notify his/her supervisor and Human Resources representative in writing within five days of either a drug and/or alcohol related criminal offense. Failure to provide notification will result in disciplinary action being taken, up to and including termination.

All employees while operating any Company vehicle or equipment, or while conducting Company business (either during or after regular business hours), cannot refuse to submit to drug and/or alcohol testing administered or ordered by the Company or a lawful authority. Refusal to submit to the testing will result in disciplinary action being taken, up to and including termination.

All employees taking a prescription or over-the-counter medication that could adversely affect performance of job-related functions or pose a direct threat to the health and safety of the employee or others in the workplace are responsible for notifying their supervisor. It is not the intent of the Company to interfere with the use of drugs legitimately prescribed by a physician. The Company's designated physician will be the sole person that the Company uses in making determinations concerning employees' fitness to perform the job.

All employees should notify a supervisor or Human Resources Representative of any behavior of co-workers or contract workers that may indicate a violation of this Policy.

Definitions

"Alcohol" means ethyl alcohol, an intoxicating element in fermented or distilled liquor or in any other compound, or other low molecular weight alcohol, including but not limited to, methyl and isopropyl alcohol, and including without limitation, beer, wine, and distilled liquors.

"Company property" is used in the broadest sense and includes, but is not limited to, all property, equipment, land, onshore and offshore platforms, buildings, structures, installations, facilities, locations, boats, aircraft, and vehicles which are owned, leased, used or operated by or on behalf of the Company for any purpose, or which are located on Company property, and any personal effects or items located thereon or therein. This includes, among other items, desks, lockers, and workstations, as well as privately owned vehicles and other personal belongings located on or in Company property,

"Possess" or "possession" means having any amount of illegal or unauthorized drugs or alcohol on one's person or belongings at any time during employment; on Company property; while conducting Company business; operating Company property; in one's personal belongings or vehicle while on Company property; in a vehicle or any mode of transportation owned or leased, or rented for Company use; or at any location used by the Company to conduct business.

"Drugs" means prescription drugs, inhalants, and other illegal, controlled, or unauthorized substances that may cause addiction and/or affect coordination of memory, or a drug that federal and state law makes illegal to distribute, use or possess.

"Use" with regard to drugs is defined as having any trace amount of drugs in the applicant's or employee's system, or physical consumption of drugs, "Use" with regard to alcohol is defined as the physical consumption of alcohol. "Use" with regard to drugs and alcohol is also defined as being under the influence of drugs or alcohol at any time during working hours.

"Zero Tolerance" means that if an employee tests positive for drugs or alcohol, as defined by this Policy, the resulting disciplinary action will be termination of employment for cause.

Testing for Types of Drugs/Alcohol and their Cutoff Levels

Drug/Alcohol tests will be conducted in a confidential manner according to procedures adopted by the Company and in compliance with applicable law. Below are the examples of illegal and unauthorized drugs for which Kinder Morgan tests and the, levels at which an employee will be considered as "testing positive for drugs": Employees who test at a alcohol concentration level of .04 or greater will be considered as "testing positive" for alcohol.

1. Marijuana	15 ng/ml
2. Cocaine	150 ng/ml
3. Amphetamines and Methamphetamines	500 ng/ml
4. Opiates (codeine, heroin, morphine)	2000 ng/ml
5. Phencyclidine (PCP or Angel Dust)	25 ng/ml

Types of Drug and Alcohol Testing

Kinder Morgan conducts the following types of drug and alcohol testing:

Drug Testing	Alcohol Testing
1. Pre-employment	1. Reasonable cause
2. Reasonable cause	2. Random (as permitted by federal and state law)
3. Random (as permitted by federal and state law)	3. Return to duty
4. Return to duty	4. Post-Accident
5. Post-Accident	

Searches and Tests

The Company reserves the right to have authorized personnel conduct searches of our employees, contract workers, and employees of third-party contractors without prior notice to determine if this Policy is being violated. Accordingly, all areas of Company property may be searched, including employee work locations, stations, areas, offices, desks, files, lockers, etc.; employees and their personal belongings, vehicles, etc. may also be searched if on or within Company property. Employee searches will be conducted in compliance with applicable law.

The Company reserves the right, at all times, to have authorized personnel conduct urinalyses, blood tests, or other types of tests of our applicants, employees, contract workers, and employees of third-party contractors for the purposes of determining if any such persons are in violation of this Policy. A urinalysis, blood test, or other type of test may be used in the following situations: (a) pre-employment testing, (b) testing based on reasonable cause or suspicion, (c) random or periodic testing, (d) testing following an accident or incident involving injury or property damage, and (e) testing that is consistent with the enforcement of this Policy.

The Company reserves the right to inspect and search Company property at any time without the presence or consent of any employee. An employee who, as a result of a search, has been found in violation of this Policy or other Company Policy will be subject to corrective action as described in the Corrective Action Policy.

Violations of Policy

Any violation of the Drugs and Alcohol in the Workplace Policy will result in disciplinary action being taken, up to and including termination.

Employee Assistance Program

The Employee Assistance Program (EAP) is available to all Company employees. Employees are encouraged to obtain professional help when needed by using the EAP . Employees may contact their supervisor or Human Resources for information about the EAP. The EAP is strictly confidential and available for use by telephoning:

- Magellan Behavioral Health 1-800-424-5654

Use of the EAP does not exempt or excuse a violation of this Policy.

Voluntary Rehabilitation

Any employee who voluntarily seeks counseling or rehabilitation in advance of failing any of the tests or who would otherwise be in violation of this policy must provide certification, in accordance with any applicable governmental requirements, of the credentials of the attending physician, psychologist, or psychiatrist, who is trained in substance abuse disorders.

When the employee successfully completes or is participating in a supervised substance-abuse or alcohol-related rehabilitation program and is no longer engaging in the use of illegal drugs or unauthorized alcohol, the Company requires certification from the substance abuse professional that the employee is fit to return to duty and perform the essential functions of his or her job.

An employee described in the paragraph above will be tested on a random basis by the Medical Review Officer and/or Substance Abuse Professional to ensure such employee is no longer engaging in the illegal use of drugs or unauthorized alcohol.

Interpretation and Exceptions

Questions regarding this Policy should be referred to the Vice President, Human Resources. Requests for exceptions should be submitted to Human Resources for review by Human Resources and the Legal Department to ensure regulatory requirements and appropriate test protocols and standards are met. The President and Chief Operating Officer must approve all exceptions.

This Policy does not constitute or imply a contract between the Company and its employees. This Policy creates no Company obligation nor any individual obligation, right, privilege, term, or condition of employment not otherwise established by law. The Company has voluntarily adopted this Policy for its sole and exclusive and may amend or withdraw it at any time without prior notice.

8.9 VESSEL LOADING PROCEDURES

[The following document is an excerpt of the Facility O&M Manual and is included here for regulatory reference only].

SECTION 4
Sizes, Types and Number of Vessels the Facility can Transfer Materials to or from simultaneously

The size and number of vessels that can be accommodated simultaneously at the facility will vary according to circumstances at the time: however, the following are offered normal maximums:

1) A single 90,000 d.w.t. vessel approximately 1,000 feet in length with 150' feet beam and 35' draft (or 39'-6" draft with fenders) at mean water (zero tide)
2) A type T-2 tanker approximately 525 feet in length and barge approximately 200 feet in length.
3) Two barges approximately 250 feet in length.
4) Kinder Morgan suggests 6" as a terminal Minimum Under Keel Clearance at all times for all vessels which call at the Los Angeles Harbor Terminal.

The normal vessel unloading procedures:

The vessel will have a certain amount of product which will out the GX-120 pipeline to Carson or other area refineries, we will give the vessel two 8" hoses and have three shore boosters pump to pump between 2,500-10,200 bph. (so if vessel has 300,000 bbls at 10,200 bph it will take about 29.5 hrs to unload)

The normal vessel loading procedures:

The vessel will come to the dock and load down the GX-120 pipeline we will give the vessel one 8" hose for cargos and one 6" hose for vapor recovery. Carson or some other area refinery will load at a max rate of 6,270 bph (so if the load calls for 80,000 bbls at 6,270 bph it will take about 12.5 hrs to load)

The normal pipeline procedures:

We would use the GX-120 pipeline which has a max. psi of 720 psi. The Carson terminal or another area refinery will pump to or from the LAHT tanks with various rates not exceeding 720 psi.

Section 17: Procedures for Operating Each Loading Arm including the Limitations of Each Loading Arm: Transferring Oil or Hazardous Materials; Completion of Pumping; and Emergencies

A.) Procedures for Operation of Each Loading Arm including the Limitations of Each Loading Arm

This facility has no loading arms.

B.) Procedures for Transferring Oil or Hazardous Materials

Oil transfer operations SHALL NOT START, or if started, SHALL STOP, if:

1.) Severe electrical storm occurs.

2.) Fire occurs at or near the facility.

3.) A break occurs in the system.

4.) English speaking personnel are not in position on the dock.

5.) Any unauthorized craft is brought alongside berthed vessel.

6.) Any disregard of safety regulations occur.

7.) Automatic or Emergency Shutdown of the Marine Vapor Control System at the Center Berth.

Transfer operations shall be controlled by the "Person in Charge", who shall INSURE THAT:

Before Unloading/Loading Starts:

1.) Warning signs in wharf are in place and visible.

2.) Communications system is tested (radio check).

3.) Loading/Unloading hose is equipped with a State Lands Required insullating flange..

4.) Drip pans are in place during cargo hose connections.

5.) Gaskets used to connect hoses are in good condition.

6.) Cargo hoses are in good condition.

7.) No visible leaks or weeping exists after hose is connected.

8.) Log book shows date and time of day for the following:
   a.) Vessel/Barge arrival time.
   b.) Time vessel was secured..
   c.) Time hoses connected.
   d.) Time fire department was notified.

9.) Dock watch is in effect.

10.) Declaration of Inspection form has been completed and signed by "Person in Charge" of vessel and facility operations.

11.) The Marine Vapor Control System at the Center Berth is tested per 33 CFR Coast Guard regulations before starting cargo loading. See the Marine Vapor Control System (MVCS) Operator Procedures Manual, Section 3.1 for the Pre-Loading Checklist.

During Transfer:

1.) Transfer is started slowly.

2.) Immediate check for leaks is made at all hose connections, valves, and piping in use.

3.) Log book shows date and time of day:
   a.) Transfer started.
   b.) Operating pressure in system at start.
   c.) Operating pressure in system at least every hour.

4.) Drip pans remain in place.

5.) Dock watch is maintained.

6.) Complete check of entire operations is made at least once each hour.

7.) Shore tank and ship/barge gauges are reconciled every 2 hours.

8.) Emergency action is taken as required.

9.) Marine Vapor Control System operation is continuously monitored.

C.) Procedures for Completion of Pumping

1.) Pumps are shut down.

2.) Hoses are disconnected and drained in a manner to prevent oil spillage.

3.) Drip pans are emptied and returned to position at block valves.

4.) Static cable is disconnected from vessel.

5.) Log book shows date and time of day:
   a.) Transfer was completed.
   b.) Cargo hose was disconnected.
   c.) Vessel/Barge departure time.

6.) Dock watch is removed.

D.) Procedures for Emergencies

(b) (7)(F), (b) (3)

[redacted]

(b) (7)(F), (b) (3)

[redacted]

Vessel Collision with Dock or Vessel to Vessel Collision:

NOTE; These steps should only be used as a guide, each situation must be evaluated and the appropriate action taken.

1.) The "Person In Charge" will follow the "EMERGENCY SHUT DOWN PROCEDURES". This will shut down transfer pumps, close on shore block valves, and shutdown the Marine Vapor Control System. All other valves that could result in loss of product will be manually closed. This will insure a minimum loss of product for pollution prevention.

2.) Notify proper authorities agencies.

3.) Evaluate dock area.

4) Evaluate situation, take proper action to prevent explosion or fire.

5) The highest ranking employee at the scene acts as the RESPONSE COORDINATOR until relieved by a higher ranking employee. In addition to coordinating the initial response, the following duties should also be performed.

a) Locate all Kinder Morgan personnel and secure status.
b) Set up a command center with adequate communications for coordinating response.
c) Open the gates for emergency vehicles and company responders.
d) Direct emergency crews to the incident and assist as needed.

Fire:

The highest ranking employee at the scene acts as the RESPONSE COORDINATOR until relieved by a higher ranking employee. In addition to coordinating the initial response, the following duties should also be performed.

1) Notification required for emergency response.

2) Locate all Kinder Morgan personnel and secure status.

3) Set up a command center with adequate communications for coordinating response.

4) Open the gate for emergency vehicles and company responders.

5) Direct emergency crews to the incident and assist as needed.

Earthquake:

There is an earthquake detector located outside the main office. This device is wired to the computer room and automatically shuts-down the Loading Truck Rack.

During an earthquake, the highest ranking employee at the scene acts as the Response Coordinator until relieved by a higher ranking employee. In addition to coordinating the initial response, the following duties should also be performed:

1) Notification required for emergency response.
2) Locate all Kinder Morgan personnel and secure status.
3) Set up a command center with adequate communications for coordinating response.
4) Open the gates for emergency vehicles and company responders.
5) Direct emergency crews to the incident and assist as needed.

See attached Map #8 for Emergency Exit Routes and Staging Area.

Maximum Loading Rate

The maximum loading rate is determined from a variety of factors including the dock line pressure; maximum MVCS back pressure, certified throughput rate, and vessel limitations.

If the marine vapor control system (MVCS) is used during cargo loading, the maximum rate at which a vessel may be loaded is the lesser of the 6,270 bbls/hr MVCS capacity or the maximum allowable vessel loading rate. The tankerman is responsible for determining the maximum allowable vessel loading rate. However, either the terminal PIC will inform the tankerman what the maximum MVCS back pressure will be before the tankerman can determine what the maximum allowable vessel loading rate is.

The maximum MVCS back pressure will be the greater of 0.1 psig or the maximum ship pressure controller set point plus 0.2 psi. Here are two examples of how to calculate the maximum MVCS back pressure.

Example 1. The pressure controller set point for an inerted ship will be 0.3 psig. 0.3 psig + 0.2 psi= 0.5 psig is greater then 0.1 psig so tell the tankerman the maximum MVCS back pressure will be 0.5 psig.

Example 2. The pressure controller set point for an non-inerted barge will be -0.2 psig. -0.2 psig + 0.2 psi= 0.0 psig is less then 0.1 psig so tell the tankerman the maximum MVCS back pressure will be 0.1 psig.

If the tankerman reports that the maximum allowable vessel loading rate is 5,000 bbl/hr, the ship loading rate must not exceed 5,000 bbls/hr. If the tankerman reports that the maximum allowable vessel loading rate is 10,000 bbls/hr, the ship loading rate must exceed the 6,270 bbls/hr MVCS capacity.

Whenever the capacity of the pumps used to load the vessel exceeds the maximum rate at which the vessel may be loaded, the loading rate must be monitored and, if necessary, restricted to ensure that the loading the loading rate does not become too high. A flow meter is used to monitor the loading rate. At the present time, Kinder Morgan loading facilities can only accommodate the loading of one cargo at a time. The procedure to monitor and restrict the cargo loading rate is in Section 17(F).

F.) Monitoring and Restricting Cargo Loading Rates

Kinder Morgan will monitor the cargo loading rate continuously using the continuous flow monitoring system in the dock house on the dock panel. Restriction of flow when required will be communicated via radio communications to OPCARD and in the future using the SCADA system communication.

Section 16: Maximum Relief Valve Setting for Each System

The **cargo** relief valve settings are set for 150 psig.

During **cargo** transfer operations, maximum pressure will be restricted to 150 psi.

Marine Vapor Control System at Center Berth

- The vapor line vacuum relief valve is set at 0.5 psig vacuum.

  The vapor line pressure relief valve is set at 0.9 psig.

Section 11: Description and Instruction - Drip, Discharge Collection, and Vessel Slop Retention Facilities

- Upon completion of transfer operations, the hose is vented and drained back to the Terminal's drain system (for unloading) or to the vessel (for loading). Once the hose is drained, either the terminal personnel or the vessel personnel will disconnect and blind. The hose will then be placed in the dock containment area.

  Spill catchment basins are located around each of the three dock manifolds. These catchment basins are drained via a sump pump to the slop tank. Additional portable drip pans are used under hose connections to handle small drips, thereby keeping the large pan clean for walkway purposes.

SECTION 9
Communication System

Emergency response communication is accomplished through three communication systems:

1) Telephone:
   The telephone is the primary means of notification of an emergency situation. Telephones are located in the Terminal Office and at Center Dock House. Due to the frequency of use, there is constant verification that the telephones are in good working order.

2) Portable Radios:
   Portable radios are the primary means of communication between terminal personnel. Radios are also used to communicate with vessels during transfer operations. These radios are tested every hour to ensure they are in good working order.

3) "P" Lines:
   "P" lines are a secondary means of communication between the dock and the various Kinder Morgan terminals. The dock at Berth 118 and 119 are equipped with a "P" line to the Kinder Morgan Gaffey St. Terminal. Center dock is equipped with a "P" line to the Kinder Morgan Carson Terminal and the Gaffey St. Terminal.

4) Pagers:
   Pagers are a secondary means of notification of company management and off-duty personnel. Pager numbers for each issued pager are listed on the emergency call-out sheet. Due to the frequency of use, there is constant verification that the pagers are in good working order.

5) Voice Megaphone or Air Horn:
   At Center Dock there is a voice megaphone and/or an air horn which can also be used as a secondary means of alerting personnel aboard a vessel or barge as to a problem.

EMERGENCY RESPONSE ACTION PLAN (ERAP)

The users of this Plan carry and maintain the complete Volume 1 and Volume 2 documents and the Plan has been designed for quick reference. Accordingly, the Emergency Response Action Plan (ERAP) for this Integrated Contingency Plan is addressed by cross-reference as follows:

• Qualified Individual	Volume 1 Figure 2.3; Volume 2 § 8.1.2
• Emergency Notification Phone List	Volume 1 §§ 2.1, 2.2; Volume 2 §§ 2.1, 2.2
• Spill Response Notification Form	Volume 1 Figure 2.2
• Response Equipment List and Location	Volume 2 § 3.1 and Figure 3.2
• Response Equipment Testing and Deployment	Volume 2 §§ 3.1, 3.2, 3.3, Figure 3.4
• Facility Response Team	Volume 1 § 2.0; Volume 2 § 2.0
• Evacuation Plan	Volume 2 § 8.4
• Immediate Actions	Volume 1 § 3.4
• Facility Diagram	Volume 2 § 8.1.2, Figure 8.3

ENERGY PARTNERS, L.P.

FACILITY EXECUTABILITY STATEMENT

I certify, to the best of my knowledge and belief, under penalty of perjury under the laws of the State of California, that the information contained in this contingency plan is true and correct and that the plan is both feasible and executable.

John W Thomann
Name

OPERATIONS MANAGER
Title

Nov 18, 2004
Date

The above certification statement, required by California Code of Regulations Title 14, Division 1, subdivision 4, Chapter 3, subchapter 3, §817.02(a)(1)(D), has been signed by an executive within the plan holder's management. The signer has training, knowledge, and experience in the area of oil spill prevention and response, has the authority to fully implement the oil spill contingency plan written within this Integrated Contingency Plan, and will review this Plan for accuracy, feasibility, and executability.

9.1.2 CERTIFICATE OF FINANCIAL RESPONSIBILITY

COFR INFORMATION

Office of Spill Prevention & Response

Certificate of Financial Responsibility

No.: 20044-01-004 Expires: March 31, 2013

Facility Owner or Operator

KINDER MORGAN LIQUID TERMINALS, LLC

has met the financial responsibility requirements set forth in Government Code Section 8670.37.53 as it applies to the operation of

(Name and Location of Facility)

SOUTHERN REGION - WEST

LINE NUMBERS GX120, GX180, GX32, GX64A, GX64B, GX104, GX124, GX190

The holder of this certificate is subject to the provisions of California Code of Regulations, Title 14, Sections 791-797, implementing the financial responsibility requirements set forth in the Lempert-Keene-Seastrand Oil Spill Prevention and Response Act (Act), see California Government Code Sections 8670.37.51 through 8670.37.57. Additionally, the holder of this certificate is subject to the conditions on the reverse of this certificate. For the purpose of determining liability pursuant to the Act, this certificate of financial responsibility is conclusive evidence that the person or entity holding the certificate is the party responsible for the specified marine facility.

Date Issued : April 1, 2011

CALIFORNIA CERTIFICATE OF FINANCIAL RESPONSIBILITY (CA COFR)

OWNER OR OPERATOR: SFPP, L.P.
meets the financial responsibility requirements specified in Government Code Section 8670.37.53 as it applies to the operation of

NAME AND LOCATION: Southern Region- Central Line No. 122, 123, 124, 126, 125

CERTIFICATE #: 2-0310-00-011 CONTROL #: FA076

ISSUE DATE: 01/01/2012 EXPIRATION DATE: 12/31/2013

The holder of this document named above is subject to the provisions of California Code of Regulations, Title 14, Sections 791-797, implementing the financial responsibility requirements set forth in the Lempert-Keene-Seastrand Oil Spill Prevention and Response Act (Act). This certificate holder has provided the necessary evidence of financial responsibility mandated by these requirements.

For the purpose of determining liability pursuant to the Act, this Certificate of Financial Responsibility is conclusive evidence that the person or entity holding the certificate is the party responsible for the specific Marine Facility.

No alterations of this certificate are permitted after issuance by the Administrator of OSPR. If there is a change in the name or ownership of the Marine Facility, the certificate holder must notify the Office of Spill Prevention and Response (OSPR) immediately. If the certificate expires, a new certificate will be required.

This certificate remains valid as long as the current method for demonstrating financial responsibility is maintained (eg. insurance). Any changes in this status must be reported to OSPR immediately.

It is the owner or operator's responsibility to ensure that this certificate number is also included in the owner or operator's marine oil spill contingency plan, which must be submitted to this office for approval, before operating in a location where a spill could impact California marine waters.

If you have any questions, please contact Farina Khan at 916-327-9937.

Sincerely,

Farina A. Khan

Financial Analyst

9.1.3 INTRODUCTION

KMEP, in compliance with CCR Title 14, Division 1, Sections 815-819, has elected to substitute its approved DOT Oil Spill Response Plan for a blanket California OSPR Contingency Plan supplemented by this section. A complete Cross Reference of OSPR regulations to this substitute plan is included in Volume 1.

This OSPR section for the Southern Region – West Areas provides additional spill planning and response information appropriate for use along identified OSPR line segments of the KMEP pipeline system in these Areas.

The line segments referenced in Figure 9.1 have been identified as subject to OSPR jurisdiction based on the likelihood of a worst case pipeline rupture potentially resulting in impact to California marine waters. Figure 9.1 lists valve or control point locations, distances to marine waters, and reasonable worst case spill (RCWS) volumes.

This Section 9 is provided in order to document the following OSPR pipeline segment-specific information in addition to the incident response and resource summary data provided in Volumes 1 and 2.

- OSPR Pipeline Segments Information (Figure 9.1)
- Area Map/HCA Index Map (Figure 9.2)
- Discharge Scenarios (Section 9.3)
- Reportable Oil Discharge History (Section 9.4)
- Risk Analysis Summary (Section 9.5)
- Offsite Consequence Analysis (Section 9.6)
- Risk Reduction Incentive Programs (Section 9.7)
- Drug and Alcohol Policies (Section 9.8)

9.2 OSPR LINE SEGMENTS

The pipeline segments identified in Figure 9.1 for this area have been identified as subject to OSPR contingency plan requirements. The segments were selected based on the likelihood of a worst case pipeline release potentially resulting in impacts to California marine waters. Some minor ephemeral drainages crossed at substantial distances from coastal waters are not included due to the sufficient time to respond and avoid marine water impacts.

OSPR JURISDICTIONAL PIPELINE SEGMENTS (Cont'd)

GENERAL INFORMATION	
Seasonal Weather Conditions:	
Air Temperature:	Ranges from 48° to 77°F
Winds:	Generally west-southwest at 7 to 9 mph.
Rain:	Generally 12 inches per year during November to April.
Site Descriptions:	
Carson, Watson and Mission Valley Areas:	The pipeline segments within the Carson, Watson and Mission Valley Areas include crossings of creeks, rivers and drainage channels within the Los Angeles and San Diego areas. The terrain for all crossings is flat. Most pipeline segments in this area reside within city and county roads and about half of the drainage crossings are buried, the other half suspended. Land uses intersected by these pipeline segments include primarily urban, commercial and residential developments, and military reservations. Figure 9.2 depicts the location of the line segments and general terrain/drainage channels in the area.

Reasonable Worst Case Spill Volume[3]					

Note[1]: This identifies the location of the segment of line within OSPR jurisdiction.

Note[2]: B = Block Valve, M = MOV, A = Automatic Pressure Valve, C = Check Valve.

Note[3]: Reasonable worst case spill volume based on annual Liquid Volume Release Modeling which takes into account maximum pumping rate, discovery/shutdown times and drainage volumes based on elevation changes between isolation points (EFRDs and/or endpoint block valves).

FIGURE 9.1 OSPR JURISDICTIONAL PIPELINE SEGMENTS (Cont'd)

PREVENTION MEASURES

KMEP Operations and Maintenance Manuals

KMEP facilities are built and maintained in accordance with all applicable codes and regulations as well as relevant API (American Petroleum Institute) standards. Pipelines are coated and cathodically protected. Any abnormalities found by periodic maintenance inspections and/or internal inspections are promptly repaired. The Company's operating practices meet or exceed industry standards.

KMEP Operations and Maintenance Manuals have been developed in accordance with DOT 49 CFR 195 and various aspects of the operations, inspection, and maintenance procedures have been summarized below for reference. The design and installation details of KMEP's pipelines are provided on large-scale alignment sheets which are revised and updated as needed.

Integrity testing of pipelines and leak detection equipment

Pipelines are hydrostatically pressure tested, in accordance with DOT Part 195 when installed. In addition, KMEP performs integrity testing of OSPR pipelines by utilizing internal inspection tools or pressure test every five years. The internal inspection log produces data which is read and interpreted by third party experts and KMEP designs its verification and repair program utilizing these results.

Line monitoring and leak detection is described in the Operations Manual.

Damage criteria for equipment repair or replacement.

Damage criteria for pipelines (which would require action to be taken, such as reducing the maximum operating pressure, pipeline repair or replacement) is included in the Maintenance Manual (and generally follows ASME B31G).

Protection measures for areas subject to flooding.

Certain sections of the pipeline cross streams, rivers and bays. Other areas may be subject to periodic flooding during periods of high rainfall.

- During initial pipeline construction, streambed profiles and pipe profiles are designed and installed to withstand or be protected from the effects of flooding. In addition, major waterway crossings are inspected periodically. For example, pipeline crossings are inspected every 5 years. If necessary, rip-rap or other protective covering is installed.

Describe any leak detection, spill prevention safety and alarm systems, devices, equipment or procedures.

9.3 DISCHARGE SCENARIOS

Reasonable worst case spill (RWCS) volumes were calculated for each OSPR Line Segment to determine the segments which had the largest potential spill volumes and impacts to marine waters. OSPR Line Segments are defined by the valve or control points on either side of drainage crossings. In parallel approaches along marine waters, the segment of the line with the longest distance between valves was used to calculate spill volumes, although in long approaches many valves may be present.

Drain down after a pipeline rupture generally contributes most of the spill volume from a significant pipeline rupture, since computer and operator monitoring normally shuts off all pumping within a reasonably brief time following a release. Precise predictions of drain down volumes is a function of the size of the pipe, topography, elevation of the break, and other variables. Motor operated remote valves and check valves effectively prevent drain down where present. Conservative assumptions were used to calculate reasonable worst case spill volumes.

Note: The quantity associated with "the loss of the entire capacity of all in-line, break-out and portable storage tank(s)…" is excluded from the RWCS volume calculation since these tanks are under SPCC jurisdiction (i.e., tanks are subject to Chapter 6.67 or Chapter 6.7 of Div. 20, CA health and Safety Code and thus, exempt from this calculation.)

The Reasonable Worst Case Spill (RWCS) volumes are consistent with the OSPR criteria as described below.

CALIFORNIA OSPR Discharge Volume Calculation

- **Reasonable Worst Case Spill (RWCS)**
  The largest volume (bbls) at the following:
  - *The pipeline's maximum release time in hours (i.e., the time between pipeline rupture and discovery, plus the maximum shut-down response time in hours based on historic discharge data or in the absence of such historic data, the operator's best estimate), multiplied by the maximum flow rate expressed in barrels per hour (based on the maximum daily capacity of the pipeline), plus the largest line drainage volume after a shutdown of the line section(s) in the response zone expressed in barrels. (As used in this subsection: line section means a continuous run of pipe that is contained between adjacent pressure pump stations, between a pressure pump station and a Facility or break-out tank, between a pressure pump station and block valve, or between adjacent block valves; response zone means a geographic area either along a length of pipeline or including multiple pipelines, containing one or more adjacent line sections, for which the operator must plan for the deployment of, and provide spill response capabilities. The size of the zone is determined by the operator after considering available capabilities, resources, and geographic characteristics); or*
  - *The largest foreseeable discharge for the line section(s) within a response zone, expressed in barrels, based on the maximum historic discharge, if one exists, adjusted for any subsequent corrective or preventive action taken.*

OSPR PERSISTENCE FACTORS

Oil Group	Group 1	Group 2	Group 3	Group 4
On-Water Volumes	(b) (7)(F), (b) (3)			

9.3 DISCHARGE SCENARIOS (Cont'd)

OSPR EMULSIFICATION FACTORS				
Oil Group	Group 1	Group 2	Group 3	Group 4
Emulsification	(b) (7)(F), (b) (3)			

OSPR DAILY RECOVERY RATES (Cap) (HIGH VOLUME PORTS)	
Delivery Time (Hrs)	(b) (7)(F), (b) (3)
Bbls/Day Capability	

OSPR DAILY RECOVERY RATES (Cap) FACILITY/TRANSFER AREAS AND SANTA BARBARA CHANNEL AREA	
Delivery Time (Hrs)	(b) (7)(F), (b) (3)
Bbls/Day Capability	

Realistic worst case spill volume based on 3 minute pumping plus 60% of volume between isolation points (EFRDs and/or endpoint block valves). The RWCS for each segment is referenced in Figure 9.1 and the largest RWCS for this Region is as follows:

- Largest RWCS in Region = (b) (7)(F), (b) (3)

The planning volumes based on the largest RWCS for the OSPR pipeline segments in this Region are provided below, based on a nearshore/inland environment and an emulsification factor of 1.8 for Group 2 Oil discharges of gasoline, diesel and jet fuel.

OSPR – RESPONSE PLANNING VOLUME CALCULATIONS

(b) (7)(F), (b) (3)

9.4 REPORTABLE OIL DISCHARGE HISTORY

A summary of significant spills that occurred prior to KMEP ownership is provided in Section 9.5. A summary of significant OSPR Line Segment spills that have been recorded in this Region is provided in the following table. (Note: A significant spill is a spill of one barrel or greater reported within control points of each OSPR line segment.)

Line Section	Pipeline Milepost	Date	Volume	Product	Cause
123	134.87	7/17/02	(b) (7)(F), (b) (3)	Gasoline/Turbine	Valve packing failure
1		07/11/03		Jet/Turbine Fuel	Third party damage
10	5	05/28/04		Gasoline	Third party damage
125	19.771	2/16/05		Gasoline/Diesel/Turbine	Valve packing failure
1	36	04/25/05		Diesel	Equip malfunction
120	3.07	05/02/05		Diesel	Cracked threads of 1" nipple
GX-120		05/18/05		Diesel	Leaky flange
126	49	8-25-05		Diesel	Vacuum truck hose
126	124.757	9-10-05		JP-5	Leaking valve "o" ring

9.5 RISK ANALYSIS SUMMARY

A summary of the Risk Analysis and the Offsite Consequence Analysis developed during October through December 2007 to address updated Company policies and procedures, and account for additional line segments and facilities not considered in previous efforts, is presented on pages 9-15 through 9-38.

A full version of this document is available on request.

9.6 OFFSITE CONSEQUENCE ANALYSIS

Refer to pages 9-15 through 9-38.

OSPR PIPELINE SEGMENTS – RISK ANALYSIS SUMMARY

Risk Analysis Summary

A Risk Analysis was conducted on segments of the Kinder Morgan Pacific Region Pipeline and some fixed facilities within California that are jurisdictional to OSPR regulations. The method used for the Risk Analysis consisted of both a "checklist" and "what if" scenarios. The Risk Analysis team consisted of various Subject Matter Experts (SMEs) as well as others knowledgeable as to the risk analysis process. During numerous SME sessions, the SMEs were asked to provide technical information within their field of knowledge or experience directly relating to specific risk issues. The information gathered from the various SMEs was presented to the Risk Analysis Team during team meetings conducted over an approximate two (2) month period, and compiled to gauge the level of risk facing the OSPR jurisdictional pipeline segments and facilities.

2.0 RISK ANALYSIS TEAM CONSENSUS REPORT

2.1 DIRECT IMPACT ISSUES:

The team has concluded policies, practices and procedures that are currently in place are adequate with respect to those issues having a direct affect on safe pipeline operations.

2.2 INDIRECT IMPACT ISSUES

The team has identified some opportunities for improvement with respect to the following issues in the categories that indirectly impact safe operations:

- Reinforce the procedures that are followed for updating alignment sheets to assure that revision submittals have been completed (Issues AM-1 and AM-2).

- Proceed with the program for "Continuing Risk Analysis to Identify Preventative and Mitigative Measures" (Procedure L-O&M 275) for the OSPR-jurisdictional pipelines in the Pacific Region (Issue AM-9).

- Proceed with the program to complete the Emergency Flow Restriction Device studies for the OSPR-jurisdictional pipelines in the Pacific Region, when those pipeline segments are next integrity inspected (Issue O-6).

- When reviewing some of the forms placed in use in recent months there was some uncertainty as to what data might be needed and what data might not be required under some circumstances. Updated instructions for preparation of these forms have been drafted. All locations should proceed to implement these instructions (Issue M-7).

The above summary of conclusions and the detailed conclusions of the several integrity issues addressed in Section 3.0 of this report represent a consensus of the following Subject Matter Experts participating in the analysis:

Edward (Buzz) Fant
Phil Vasquez
Larry Hosler
Ed Hahn
Bob Cote
Mike Outlaw
Mike Ortiz

3.0 SUBJECT MATTER EXPERT EVALUATIONS

The Risk Analysis Team, upon reviewing the comments by team SMEs developed in both group sessions and one-on-one with the Risk Analysis Coordinator, has reached consensus on the following conclusions and recommendations.

3.1 PIPELINE RISK ISSUES

ADMINISTRATIVE AND MANAGEMENT ISSUES	
The following two issues are related and were reviewed as a single issue by the SMEs.	
AM-1	Maps and drawings accuracy: Do pipeline maps and drawings reflect accurate pipeline and related information? Are pipeline locations based on GPS data? Have the drawings been digitized for reliable database reference?
AM-2	Maps and drawings current: Are procedures in place to insure that maps and drawing have up-to-date information? Are field drawings 'red-lined" pending engineering revisions?

Primary SMEs: Phil Vasquez, Larry Hosler, Bob Cote
Others offering comments: Steve Marositz, Curtis Parker, Pete Murphy, Grant McClellan

Comments: The current process for maintaining maps and records is reasonably good. Some areas maintain their master set of alignment sheets current by "red-lining" changes until revisions have been completed, while other locations do not. There is currently a substantial delay in getting revisions back, and no current procedure for confirming that revisions submitted by field personnel have been completed.

New procedures implemented in recent months have been reinforced to better assure accuracy and should improve revision turnaround time. The process for managing the preparation of all alignment sheets, which includes having all revision data entered electronically and having all current alignment sheets available to all users on line, is currently a "work-in progress".

Recommendation: There should be a procedure established to follow up on pending revisions to confirm they have been accurately made, and are received back on a timely basis. When the electronic version of the alignment sheet maintenance process has been completed the procedures that guide the process should be reviewed to confirm applicability; and they should include a procedure for the personnel submitting revisions to confirm that the electronic updating has been completed.

The following two issues are related and were reviewed as a single issue by the SMEs.	
AM-3	Qualified personnel for operations: Are all personnel involved in pipeline operations qualified? How is qualification determined?
AM-4	Qualified personnel for maintenance: Are all personnel involved in pipeline maintenance efforts qualified? How is qualification determined?

Primary SMEs: Buzz Fant, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: The OQ program as set forth in API 1162 is the guidance for this issue. It is monitored on a continuing basis to assure compliance. The SMEs that addressed this issue confirmed that regional personnel having oversight of the OQ program are knowledgeable in the OQ program requirements and follow them when covered tasks are being performed.

Recommendations: None

AM-5	Qualified personnel for line locates: Are all personnel involved in one call responses and line locates familiar with locate requirement, marking, pipe locator usage, documentation and follow-up?

Primary SMEs: Phil Vasquez, Larry Hosler, Buzz Fant
Others offering comments: Steve Marositz, Curtis Parker

Comments: The SMEs that addressed this issue have confirmed that all personnel associated with line locates are qualified under the OQ program and are thoroughly trained in line locate and marking requirements; and are adequately trained in the use of line locate equipment.

Recommendations: None

AM-6	Qualified contractor personnel: Are all contractor personnel involved in pipeline maintenance efforts qualified? How is qualification determined?

Primary SMEs: Phil Vasquez, Larry Hosler, Bob Cote
Others offering comments: Steve Marositz, Curtis Parker

Comments: We have a firm requirement in our contracts with contractors requiring them to fully comply with OQ guidelines. All contract personnel that may perform covered tasks must be pre-identified by name and must be in the ISNetworld database. The SMEs that addressed this issue confirmed that regional personnel having oversight of contractors performing covered tasks are knowledgeable in the OQ program requirements as they apply to contract personnel, and they follow them when contract work us being performed.

Recommendations: None

AM-7	Contractor supervision: Are all contractor personnel adequately supervised when performing maintenance work on or adjacent to pipeline facilities? Who determines level of supervision required? How is contractor performance verified?

Primary SMEs: Phil Vasquez, Larry Hosler, Bob Cote
Others offering comments: Steve Marositz, Curtis Parker

Comments: We have a firm requirement in our contracts that require full time supervision of all maintenance personnel by qualified contractor supervisors. The SMEs that addressed this issue confirmed that regional personnel having oversight of contract work are knowledgeable in this requirement. The KM contract inspector assigned to oversee the contract work determines the level of contrast supervision that the work may require. The KM contract inspectors enforce this requirement.

Recommendations: None

AM-8	Relief personnel: What is the source of relief personnel for routine operating and maintenance positions? Is there adequate depth of trained/qualified relief personnel?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: We have adequate qualified personnel to fill in as may be required for routine operations tasks and for maintenance work. Personnel are cross-trained in multiple disciplines so they can back stop any short time gaps that may develop. The SMEs that addressed this issue confirmed that all relief personnel that may be required to perform covered tasks have the requisite qualifications.

Recommendations: None

AM-9	Integrity Management Program (IMP): Has the operator established an Integrity Management Program for the pipeline systems that are subject to the PHMSA IMP program? Is it being followed at all locations where required? Are all elements of the program being adequately documented?

Primary SMEs: Mike Outlaw
Others offering comments: Buzz Fant

Comments: The IMP has been in place as required by the pipeline regulations. The SME that addressed this issue confirmed that baseline integrity assessments have been performed throughout the Pacific Region based on a priority schedule that was identified at the inception of the program. The baseline and follow-up inspections are administered by a risk management person in the Pacific Region.

The SME confirms that they have a program in place to conduct annual reviews of the risks associated with each segment. The follow up throughout the Pacific Region to address any corrective or mitigative efforts that may be required as a result of the annual reviews will be initiated in 2008.

Recommendations: Proceed with the program to follow up on any corrective or mitigative efforts required based on the annual reviews of Pacific Region pipeline segments.

AM-10	Management of Change: Has the operator adopted the "Management of Change" concept or something similar? If so, how has it been conveyed to all personnel? If no, what process is used to convey operating and procedural change information to personnel?

Primary SMEs: Buzz Fant, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: An extensive MOC procedure is in place and it is used to address all variety of changes. The SMEs that addressed this issue confirmed that regional personnel having responsibility for MOC initiation and processing are knowledgeable in the MOC requirements, and they follow them whenever any applicable change is being considered.

Recommendations: None

The following two issues are related and were reviewed as a single issue by the SMEs.

AM-11	Operations and Maintenance (O/M) Manual: Is the manual complete, used by all, relevant to current operations.
AM-12	Procedure amendments: Is there a process for amending operating and maintenance procedures when needed and conveying these changes to all personnel?

Primary SME: Buzz Fant

Comments: The L-O&M Manual is an extensive compilation of procedures that are relevant to all phases of operations and maintenance. It is accessible on-line for all personnel that have a need to refer to it. It is maintained current by a rigorous amendment process. Changes are made available to all personnel. The SMEs that addressed this issue confirmed that regional personnel are familiar with the on-line set of procedures and have ready access to them whenever necessary.

Recommendations: None

AM-13	Reference materials: Do all locations have copies of applicable regulations, standards, recommended practices that are applicable to those areas of operation? Are personnel sufficiently familiar with those documents?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Curtis Parker, Buzz Fant

Comments: All such references are available on-line. The SMEs that addressed this issue confirmed that regional personnel having a need to access such documents know where to obtain them.

Recommendations: None

OPERATIONS ISSUES

The following two issues are related and were reviewed as a single issue by the SMEs.

O-1	Segment MOP: Has the MOP for each segment of line been determined? Is it recorded and clearly identified for operators and controllers? Is it consistent with the pressure relief and pressure control settings?
O-2	Overpressure relief: Are the overpressure relief systems set at the appropriate level above MOP? Are they adequately sized? Are they tested and tagged as required?

Primary SMEs: Bob Cote

Comments: The MOP for each line segment has been established. It is known by those that have to apply the MOP in operations. (b) (7)(F), (b) (3) [redacted]

The SMEs that addressed this issue confirmed that the controllers and others responsible for pipeline operations understand the MOP and the MAOP of each line segment. The SMEs also confirmed that the relief pressure settings are properly set to assure that the MAOP is never exceeded in any portion of the line segment.

Recommendations: None

O-3	Personnel work hours: Are operator and controller work shifts designed to assure minimization of fatigue?

Primary SMEs: Phil Vasquez, Larry Hosler, Ed Hahn
Others offering comments: Gary Yates, Steve Marositz, Curtis Parker

Comments: The work shifts of all personnel (field personnel, station operators and controllers) are managed in a manner that the fatigue factor is controlled. The SME responsible for controller personnel emphasized that fatigue awareness and fatigue management is emphasized. Actions or incidents that may suggest fatigue could have been a contributing factor are investigated. Job performance is monitored to assure that if it appears to be an impending concern for any individual or group follow-up investigation would be conducted.

Recommendations: None

O-4	Fail-safe operations: Are line segments designed to fail safe in case of communications failure between the segment and the controllers?

Primary SME: Ed Hahn
Others offering comments: Gary Yates

Comments: (b) (7)(F), (b) (3) [redacted] Once communications has been restored the segment is restarted in accordance with normal start-up procedures.

Recommendations: None

O-5	Backup operations: Are personnel available to staff remote facilities in case of prolonged communications failures or other situations where remote monitoring may be inadequate? Are these personnel sufficiently trained to operate such facilities?

Primary SMEs: Ed Hahn, Phil Vasquez, Larry Hosler

Comments: The SMEs that addressed this issue confirmed that the standard practice is to shut down remotely operated facilities when prolonged communications failures persist, rather than arrange for remote staffing.

Recommendations: None

O-6	Has the EFRD evaluation been conducted on this segment? Were EFRD recommendations implemented? If not, was the rationale for not following the recommendations documented?

Primary SMEs: Mike Outlaw, Mike Ortiz

Comments: The program for EFRD evaluations in conjunction with the Integrity Management Program is currently in progress. It has not yet been initiated for the Pacific Region Pipelines. The SMEs that addressed this issue have confirmed that the EFRD studies are being programmed in conjunction with integrity inspections..

Recommendation: Perform the EFRD analyses for the Pacific Region segments when those segments are next integrity inspected.

MAINTENANCE ISSUES

The following five issues are related and were reviewed as a single issue by the SMEs.

M-1	Rights-of-Way visibility: Does the segment have adequate right-of-way visibility to assure effective aerial patrol surveillance?
M-2	Aerial Markers: Are they adequate, properly spaced, in good condition, visible from air?
M-6	Line marker maintenance: Are all markers maintained in good condition, with current operator information?
P-5	Line marker adequacy: Are line markers located at all appropriate locations (as required by regulations plus other locations where they may be needed to insure location awareness)?
P-6	Line marker alternatives: In areas where typical post type markers cannot be situated or kept, what alternatives are used?

Primary SMEs: Phil Vasquez, Larry Hosler

Comments: All rights-of-way that are covered by aerial patrol are adequately cleared for surveillance. We have a routine program for monitoring the condition of line and aerial markers and replace them as necessary. Where appropriate we have surface markers that can be used in place of post markers.

Recommendations: None

The following three issues are related and were reviewed as a single issue by the SMEs.	
M-3	Cathodic Protection: Does the line have cathodic protection? If not, what is the rationale?
M-4	Cathodic protection annual surveys: Have annual surveys been done on each line segment? If not, what is the survey frequency? Is the frequency deemed adequate?
M-5	Cathodic protection close interval surveys: Have CIS been done on each segment? What was the rationale for doing or not doing? Are alternatives to CIS being used and if so, what is rationale?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering Comments: CP technicians

Comments: Annual surveys are done regularly and the resulting data is reviewed by NACE certified CP technicians. The SMEs that addressed this issue confirmed that the decision to conduct a CIS would depend on the results of the annual survey; and where warranted a CIS would be performed.

Recommendations: None

M-7	Maintenance records: Are all records (routine and abnormal) that may be required to confirm and support routine maintenance retained and available as may be required by management and regulatory agencies?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Buzz Fant

Comments: All records required to confirm compliance and to assure continued compliance with the routine maintenance programs are being developed. The SMEs that addressed this issue advised that in recent months several forms that address routine inspection and maintenance information have been updated to include more comprehensive information. Revised procedures for completing the forms have been drafted.

Recommendation: Finalize the draft procedures.

M-8	Safety-related condition reports: Are these records being prepared and retained as may be required to meet agency requirements and to support corrective actions?

Primary SMEs: Buzz Fant, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: We have a program in place to address conditions that might warrant a safety-related condition report and procedures are in place to support corrective actions.

Recommendations: None

M-9	Pipe integrity discoveries: Are procedures adequate to identify and record instances of potential lack of pipe integrity, to meet agency requirements and to support corrective actions and future review?

Primary SMEs: Mike Outlaw, Mike Ortiz, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: The region SMEs advised that the Risk Management group addressed such issues. The Risk Management Group SMEs confirmed this, and advised that integrity discoveries stemming from the integrity inspections are handled on a timely basis as required by the regulations, and that any discoveries that might require a temporary reduction in segment MAOP or other temporary mitigative measures would be immediately addressed by the project managers that oversee the integrity inspection program.

Recommendations: None

PREVENTION ISSUES

The following two issues are related and were reviewed as a single issue by the SMEs.

P-1	Internal corrosion detection: Does the segment have test coupons for checking internal corrosion rates? Is there a routine monitoring program to confirm effectiveness?
P-2	Internal corrosion inhibition: Are inhibitors being used to prevent internal corrosion? Is there a routine monitoring program to confirm effectiveness?

Issues P-1 and P-2 (continued)	
Primary SMEs: Phil Vasquez, Larry Hosler Others offering comments: Steve Marositz, Buzz Fant, Curtis Parker Comments: There have been no apparent indications of internal corrosion concerns on the OSPR-jurisdictional systems. If such conditions were to appear as a result of internal inspections, action would be taken to identify and mitigate the problem. Recommendations: None	
P-3	Adjacent utilities awareness: Is operator pro-active in knowing exact location of all adjacent underground utilities in pipeline vicinity?
Primary SMEs: Phil Vasquez, Larry Hosler Others offering comments: Steve Marositz, Buzz Fant, Curtis Parker Comments: To the extent possible these are noted on our alignment sheets. The SMEs that addressed this issue confirmed that our line riders are instructed to be alert to any indication of adjacent utilities, and to arrange to have them included on our alignment sheets when they are discovered. Recommendations: None	
The following two issues are related and were reviewed as a single issue by the SMEs.	
P-4	Foreign excavation monitoring: Is operator representative always present when foreign excavations are made over or near pipelines? How is this requirement conveyed to operator personnel? To excavator personnel?
P-7	Excavation in close proximity to pipeline: Does operator demand hand excavation when opening ditch within close proximity to pipeline? How is this controlled?
Primary SMEs: Phil Vasquez, Larry Hosler Others offering comments: Steve Marositz, Buzz Fant, Curtis Parker Comments: Our personnel are to be on site whenever any subsurface work is being done on or around our lines. We have definite requirements that at any time an excavation is to be within 24 inches of the pipe it must be done by hand only. Recommendations: None	

P-8	Line locating instruments: Are all pipe locators calibrated as required by manufacture? Have all operators been trained in proper use of the instrument and been made aware of performance limitations?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Buzz Fant, Curtis Parker

Comments: Our personnel are trained in the use of this equipment. The SMEs that addressed this issue advised that the accuracy of the unit is verified at least daily by testing against a known section of buried pipe.

Recommendations: None

P-9	Post-Incident Review: Are such reviews conducted in manner that will identify and trigger corrective measures?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Buzz Fant

Comments: We have a formal procedure for conducting post-incident reviews, including where appropriate a root cause analysis; and follow through with corrective measures as necessary. The SMEs that addressed this issue advised that there is a rigorous procedure involving several staff personnel to discuss all aspect of the incident.

Recommendations: None

MONITORING AND CONTROL ISSUES

The following three issues are related and were reviewed as a single issue by the SMEs.

MC-1	Aerial patrol familiarity: Are the pilots sufficiently familiar with the exact line locations to insure proper surveillance?
MC-2	Local staff familiarity: Does local staff fly with aerial patrol periodically to insure pilots are adequately familiar with the line locations and to keep local staff familiar with line location and surface conditions?
MC-6	Are pilots directed to observe conditions beyond the pipeline right-of-way that suggest potential pending impact to the right-of-way? How is this information reported?

Issues MC-1; MC-2, MC-6 (Cont'd)

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Buzz Fant

Comments: Our patrol pilots are familiar with precise line locations; and we confirm this by having local personnel periodically fly with them. Pilots are directed to look beyond the right-of-way and report any signs of potential concern along with their other reporting priorities.

Recommendations: None

The following three issues are related and were reviewed as a single issue by the SMEs.

MC-3	Aerial patrol priorities: Have pilots been advised on notification priorities? Some may require immediate notice to local staff, while others may permit routine reporting. Do the pilots understand and follow any expedited reporting requirements?
MC-4	Aerial patrol routine notices: Are procedures set up to insure that routine reporting of patrol surveillance information goes to the right personnel? Is a log maintained of this? How is it used to follow up on potential problems?
MC-5	Aerial patrol reporting items: Do the pilots report only abnormal conditions, or do they also advise of the need for routine maintenance work (sign painting, marker repairs etc.)?

Primary SMEs: Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Buzz Fant

Comments: Our reporting priorities are clearly given to the patrol pilots. They have the ability to immediately contact our field personnel as necessary. The SMEs that addressed this issue confirmed that their line coverage records are thorough as to details that they report and this includes any situation where maintenance or potential encroachment should been evaluated.

Recommendations: None

The following four issues are related and were reviewed as a single issue by the SMEs.	
MC-7	Volume balance: Does this segment have adequate volume measurements for effective real time balance data?
MC-8	Volume deviations: Are volume balance deviation limits set to reflect the minimum possible deviations within reliable tolerances?
MC-9	Slack lines: Is the system designed and operated to eliminate slack line conditions for adequate volume balance? It is maintained packed to insure good balance during start-up?
MC-10	(b) (7)(F), (b) (3) [redacted]

Primary SMEs: Ed Hahn, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz, Gary Yates

Comments: All line segments have volume balance measurements and volume deviation alarm set points. The SMEs that reviewed these issues confirmed that:

- deviation tolerances are set sufficiently close to maximize the controller's ability promptly react to potential adverse conditions.
- Lines are maintained packed when shut down, thus slack line conditions are not experienced.
- (b) (7)(F), (b) (3) [redacted]

Recommendations: None

PUBLIC AWARENESS ISSUES	
The following three issues are related and were reviewed as a single issue by the SMEs.	
PA-1	Public awareness programs, conducted: Does operator have, or contract for an active awareness program?
PA-2	Public awareness programs, active participation: Does operator have local personnel actively participate in public awareness efforts? To what degree?
PA-3	Public awareness, excavator contacts: Is operator pro-active in making system known to excavators (area contractors, other utilities, private back-hoe operators)?

PA-1, PA-2, PA-3 (Cont'd)

Primary SMEs: Buzz Fant, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: Our public awareness is consistent with API 1162 guidelines. The region SMEs confirmed that area personnel participate in the programs involving local agencies, excavators and the public in close proximity to our pipelines, and they document this participation.

Recommendations: None

The following three issues are related and were reviewed as a single issue by the SMEs.

PA-4	One call systems, who are they forwarded to (local personnel or a central location)?
PA-5	One call systems, follow-up: How are calls followed up on by local personnel?
PA-6	Damage prevention program formalized: Is there a written program? Is it clearly conveyed to all applicable personnel? Is it followed by all personnel? Does it have clear support and mandate from upper management?

Primary SMEs: Buzz Fant, Phil Vasquez, Larry Hosler
Others offering comments: Steve Marositz

Comments: All locations participate in one-call programs at the local level. Information typically comes in by computer linkage with the one-call system, and can be followed by fax or phone as necessary. Local personnel follow up on all one call notices and evaluate the potential for impact to our systems. We have an active written damage prevention program with full support of upper management.

Recommendations: None

3.2 FIXED FACILITY RISK ASSESSMENT

Facility: **Richmond Terminal** Date: 12/19/2007

Subject Matter Expert: Mike Sudheimer

Recorder: Vern Grimshaw

Facility Operations:

The terminal handles vegetable oils and some petroleum products. Operations include marine vessel receipts and deliveries; and loading to tank trucks and rail cars. There are no pipeline movements of petroleum products into or out of the facility.

Potential Product Releases:

The two possible sources of a release of petroleum products from the facility would be:

- During marine transfer operations, and
- From facility storage facilities and related piping.

In the event of a product release during vessel transfer operations, or if any release from facility tanks or piping were to escape containment, an Integrated Contingency Plan (ICP) is in place to address the situation. The ICP addresses the potential off-site consequences of a release and the response capabilities of KM and contractor resources.

Marine Transfer Operations:

Vessel transfers typically occur at a maximum flow rate of approximately 1,900 barrels per hour. All transfers are constantly monitored by dock and vessel personnel. In the event of a major transfer line or hose failure the maximum probable (b) (3), (b) (7)(F) s.

All vessel transfer operations are performed in accordance with USCG and applicable state regulations. KM personnel responsible for transfer operations are familiar with the Dock Operations Manual and applicable regulations; and are trained in the response requirements of the ICP.

Facility Storage Facilities:

Spill prevention from any of the facility's tanks and related piping is addressed in the facility SPCC plan.

The largest tank within the facility that contains petroleum products is approximately (b) (3), (b) (7)(F) barrels. The secondary containment capacity available for that tank in the event of a total tank failure is approximately (b) (3), (b) (7)(F), sufficient to prevent the release from escaping the containment area.

Facility Storage Facilities (Cont'd):

All petroleum piping within the facility (except dock piping that is utilized during vessel transfer operations) is contained within curbing that would direct piping releases to a controlled area on site.

Surface drainage from areas that have the potential to contain petroleum is controlled on site and checked for potential petroleum contaminants before being released.

There is no buried piping within the facility. The tank bottoms are protected from corrosion by means of a cathodic protection system. There has been no indication of internal corrosion of any of the petroleum piping.

Release History:

There have been no petroleum releases from this facility in the past ten years.

Risk Assessment Conclusions:

Based on the information provided above, it can be concluded that all appropriate preventative and mitigative efforts for spill prevention are in place for this facility.

Facility: **Los Angeles Harbor Terminal** Date: 12/19/2007

Subject Matter Expert: Tom Hosler

Recorder: Vern Grimshaw

Facility Operations:

The terminal handles refined petroleum products and crude oil. Operations include marine vessel receipts and deliveries, loading to tank trucks, and pipeline movements of petroleum products out of the facility.

Potential Product Releases:

The two possible sources of a release of petroleum products from the facility would be:

- During marine transfer operations, and
- from facility storage facilities and related piping.

In the event of a product release during vessel transfer operations, or if any release from facility tanks or piping were to escape containment, an Integrated Contingency Plan (ICP) is in place to address the situation. The ICP addresses the potential off-site consequences of a release and the response capabilities of KM and contractor resources.

Marine Transfer Operations:

Vessel transfers typically occur at maximum flow rates of approximately 10,000 barrels per hour (offloading) and 7,000 barrels per hour (loading). All transfers are constantly monitored by dock and vessel personnel. In the event of a major transfer line or hose failure the maximum probable (b) (7)(F), (b) (3)

All vessel transfer operations are performed in accordance with USCG and applicable state regulations. KM personnel responsible for transfer operations are familiar with the Dock Operations Manual and applicable regulations; and are trained in the response requirements of the ICP.

Facility Storage Facilities:

Spill prevention from any of the facility's tanks and related piping is addressed in the facility SPCC plan.

The largest tank within the facility has a maximum capacity of approximately (b) (3), (b) (7)(F) 0 barrels. The secondary containment capacity available for that tank in the event of a total tank failure is (b) (3), (b) (7)(F), sufficient to prevent the release from escaping the containment area.

Facility Storage Facilities (Cont'd):

All above ground petroleum piping within the facility (except dock piping that is utilized during vessel transfer operations) is contained within curbing that would direct piping releases to a controlled area on site.

Surface drainage from areas that have the potential to contain petroleum is controlled on site and checked for potential petroleum contaminants before being released.

The buried piping within the facility and the tank bottoms are protected from corrosion by means of a cathodic protection system. There has been no indication of internal corrosion of any of the petroleum piping.

Release History:

There have been six petroleum releases from this facility in the past ten years:

- A one barrel release was the result of a tank spill-over during an earthquake. This was contained within the tank block.
- A release of less than one gallon that reached the water was the result of a leak in a dock pan drain line.
- Four others, reported as too small to measure (a few drops or less), resulted in minor stains on the ground surface or minor sheens on the water.

All releases were cleaned up in a timely manner.

Risk Assessment Conclusions:

Based on the information provided above, it can be concluded that all appropriate preventative and mitigative efforts for spill prevention are in place for this facility.

Appendix D

(Includes only events with a release amount of at least 42 gallons)

Line Section ID	Event Date	Event Description	Product	Cause	Amount Released (gallons)
95	8/23/1999	Outside Force Damage: Third Party: Cost: A foreign pipeline company was excavating their pipeline, which parallels and is in close proximity to Kinder Morgan's pipeline - L.S. 95. The trench was being backfilled.	Jet/turbine fuel	Excavation	(b) (7)(F), (b) (3)
25	5/17/2000	Failure in original seam defect combined with external corrosion.	Diesel Fuel	Material and Welds	
25	12/12/2000	Approximately 22:58 Concord personnel contacted the ORCC regarding the discovery of product in a slough next to the Carquinez Straight approximately 3.09 miles west of the Concord Station	Gasoline	Other	
	7/27/2001	Approximately 1300, Contra Costa personnel contacted ORCC regarding the release of Diesel. A 10'x10' stain on gravel had a diesel odor. Stain originated at HOV-3.	Diesel Fuel	Other	
45	12/7/2002	Approximately 1104 on 12/7/02 Stockton personnel contacted ORCC regarding a dripping Bypass Valve on the Rough & Ready Manifold.	Mix/Transmix	Equipment and Operations	
25	4/27/2004	At 1832 on 4/27/04 an abnormal operating condition was observed on LS 25 and the line was shut down and field personnel started conducting field surveys. Approximately at 1406 on 04/28/04 the field contacted ORCC confirming that a pipeline release had occurred.	Diesel Fuel	Corrosion	
47	11/7/2004	Approximately 1650 on 11/07/04 Concord personnel contacted ORCC regarding a release that occurred from third party mechanical damage. OES was advised at 1742, case number 04-5795 was given. NRC was contacted at 1750, case number 740716 was assigned.	Jet/turbine fuel	Excavation	
16	11/9/2004	Approximately 1326 on 11/09/04 Concord personnel contacted ORCC regarding a possible line hit on LS 16 between PLMP 7 and 11. Pressure Loss was observed and reports of possible explosion and fire in area of hit. NRC was advised at 1352, case number 740-9	Gasoline	Excavation	

Line Section ID	Event Date	Event Description	Product	Cause	Amount Released (gallons)
42	2/7/2005	On the evening of 02/07/05 PNR personnel contacted ORCC regarding a mysterious sheen and odor in the San Francisco Bay downstream of Oakland Tank that the USCG was investigating and had pre-determined that it was coming from LS 42.	Jet/turbine fuel	Other Outside Force	(b) (7)(F), (b) (3) [redacted]
	8/2/2005	Approximately 1557 on 08/02/05 Concord personnel contacted ORCC regarding a stain observed near Travis Line. OES, NRC, CUPA, and US BOR were notified.	Jet/turbine fuel		
Richmond Terminal	10/24/2007	Wax Kettle overflowed onto the ground resulting in reportable spill	Wax	Incorrect Operation	
123	6/17/2002	Approximately 1410 on 06/17/02 Mission Valley personnel contacted ORCC regarding a release that occurred from a weeping hole found on MOV 101. Advised OES (case # 02-3331).	Mix/Transmix	Equipment and Operations	
1	7/11/2003	Approximately 1958 on 07/11/03 Watson personnel contacted ORCC regarding a turbine release from third party damage on LS 1. OES and NRC were advised.	Jet/turbine fuel	Other Outside Force	
120	5/2/2005	Approximately 0650 on 05/02/05 Watson personnel contacted ORCC regarding the LA River West Block Valve leaking in valve box within Nursery. OES was advised at 0658, case number 05-2619 was assigned. NRC was advised at 0825, case number 757427 was given.	Diesel Fuel	Material and Welds	
108	12/8/2005	Approximately 0921 on 12/08/05 Carson personnel contacted ORCC regarding a release that occurred the seal failed on pump 63. OES, NRC, CUPA, and the US BOR were also notified.	Diesel Fuel		

9.7 RISK REDUCTION INCENTIVE PROGRAMS

The Facility participates in an annual safety awareness program which is administered at the Corporate level. The Facility has evaluated workplace hazards and how to prevent or mitigate them under workplace illness and injury prevention guidelines. The Facility conducts monthly safety meetings to discuss conditions, which could cause accidents or spills, and how to mitigate or prevent them from occurring. The Facility (through the Operations Review Committee) also conducts quarterly meetings for continuously improving the quality and effectiveness of operating practices and procedures.

9.8 DRUG AND ALCOHOL POLICIES

Kinder Morgan, Inc. and Kinder Morgan Energy Partners, L.P. Human Resources Policy Manual

Drugs and Alcohol in the Workplace

(Effective 01/01/2000)
(Revised 01/01/2003)

Purpose

The purpose of this Policy is to maintain a safe and productive work environment for all employees, applicants, and the public by ensuring that employees on Company property, while conducting Company business, operating Company property, or during their employment with the Company may not possess or use illegal or unauthorized drugs. The Policy is also intended to promote worker and public safety, to comply with the Drug-Free Workplace Act of 1988, and to provide procedures for workplace-related searches of persons and property and the lawful drug and alcohol testing of employees. Kinder Morgan maintains a "Zero Tolerance" policy.

Scope

This Policy applies to all Company employees, applicants, contract workers, and employees of third-party contractors, including employees and contract workers who perform functions covered by regulations promulgated by the Department of Transportation (DOT). In the event of a contradiction between this Policy and the Company's Anti-Drug Plan and Alcohol Misuse Prevention Plan, the Company's Anti- Drug Plan and Alcohol Misuse Prevention Plan shall govern.

This Policy is broader in scope than the Company's Anti-Drug Plan and Alcohol Misuse Prevention Plan. For additional information refer to the Anti-Drug Plan and Alcohol Misuse Prevention Plan. This Policy shall be administered in accordance with all applicable federal, state, and local laws and regulations.

Responsibilities and Prohibitions

Employees

All applicants and employees are reminded that the following actions are included as violations of this Policy: (1) use, possession, sale, distribution of illegal or unauthorized drugs on Company property, while operating any Company vehicle or equipment, or while conducting Company business; (2) use, possession, sale, and distribution of alcohol on Company property. while operating any Company vehicle or equipment, or while conducting Company business, with the exception that use and possession of alcohol during Company sponsored business or social functions, where the use of alcohol remains moderate, will not be considered a violation of this Policy; (3) use of any drug, including prescribed drugs, which is unsafe to use while operating Company vehicles or equipment; (4) possession, sale or distribution of paraphernalia and equipment related to illegal or unauthorized drug use; and (5) refusal to test in any testable situation.

As a condition of employment, any employee whose work directly relates to the performance of a federal contract and who is or has been convicted of a criminal drug offense occurring in the workplace during employment must notify his/her supervisor and Human Resources representative in writing within five days of such conviction. Similarly, as a condition of employment, any employee that is required to possess a valid driver's license as a pre-requisite of their position, must notify his/her supervisor and Human Resources representative in writing within five days of either a drug and/or alcohol related criminal offense. Failure to provide notification will result in disciplinary action being taken, up to and including termination.

All employees while operating any Company vehicle or equipment, or while conducting Company business (either during or after regular business hours), cannot refuse to submit to drug and/or alcohol testing administered or ordered by the Company or a lawful authority. Refusal to submit to the testing will result in disciplinary action being taken, up to and including termination.

All employees taking a prescription or over-the-counter medication that could adversely affect performance of job-related functions or pose a direct threat to the health and safety of the employee or others in the workplace are responsible for notifying their supervisor. It is not the intent of the Company to interfere with the use of drugs legitimately prescribed by a physician. The Company's designated physician will be the sole person that the Company uses in making determinations concerning employees' fitness to perform the job.

All employees should notify a supervisor or Human Resources Representative of any behavior of co-workers or contract workers that may indicate a violation of this Policy.

Definitions

"Alcohol" means ethyl alcohol, an intoxicating element in fermented or distilled liquor or in any other compound, or other low molecular weight alcohol, including but not limited to, methyl and isopropyl alcohol, and including without limitation, beer, wine, and distilled liquors.

"Company property" is used in the broadest sense and includes, but is not limited to, all property, equipment, land, onshore and offshore platforms, buildings, structures, installations, facilities, locations, boats, aircraft, and vehicles which are owned, leased, used or operated by or on behalf of the Company for any purpose, or which are located on Company property, and any personal effects or items located thereon or therein. This includes, among other items, desks, lockers, and workstations, as well as privately owned vehicles and other personal belongings located on or in Company property,

"Possess" or "possession" means having any amount of illegal or unauthorized drugs or alcohol on one's person or belongings at any time during employment; on Company property; while conducting Company business; operating Company property; in one's personal belongings or vehicle while on Company property; in a vehicle or any mode of transportation owned or leased, or rented for Company use; or at any location used by the Company to conduct business.

"Drugs" means prescription drugs, inhalants, and other illegal, controlled, or unauthorized substances that may cause addiction and/or affect coordination of memory, or a drug that federal and state law makes illegal to distribute, use or possess.

"Use" with regard to drugs is defined as having any trace amount of drugs in the applicant's or employee's system, or physical consumption of drugs, "Use" with regard to alcohol is defined as the physical consumption of alcohol. "Use" with regard to drugs and alcohol is also defined as being under the influence of drugs or alcohol at any time during working hours.

"Zero Tolerance" means that if an employee tests positive for drugs or alcohol, as defined by this Policy, the resulting disciplinary action will be termination of employment for cause.

Testing for Types of Drugs/Alcohol and their Cutoff Levels

Drug/Alcohol tests will be conducted in a confidential manner according to procedures adopted by the Company and in compliance with applicable law. Below are the examples of illegal and unauthorized drugs for which Kinder Morgan tests and the levels at which an employee will be considered as "testing positive for drugs": Employees who test at a alcohol concentration level of .04 or greater will be considered as "testing positive" for alcohol.

1. Marijuana	15 ng/ml
2. Cocaine	150 ng/ml
3. Amphetamines and Methamphetamines	500 ng/ml
4. Opiates (codeine, heroin, morphine)	2000 ng/ml
5. Phencyclidine (PCP or Angel Dust)	25 ng/ml

Types of Drug and Alcohol Testing

Kinder Morgan conducts the following types of drug and alcohol testing:

Drug Testing	Alcohol Testing
1. Pre-employment	1. Reasonable cause
2. Reasonable cause	2. Random (as permitted by federal and state law)
3. Random (as permitted by federal and state law)	3. Return to duty
4. Return to duty	4. Post-Accident
5. Post-Accident	

Searches and Tests

The Company reserves the right to have authorized personnel conduct searches of our employees, contract workers, and employees of third-party contractors without prior notice to determine if this Policy is being violated. Accordingly, all areas of Company property may be searched, including employee work locations, stations, areas, offices, desks, files, lockers, etc.; employees and their personal belongings, vehicles, etc. may also be searched if on or within Company property. Employee searches will be conducted in compliance with applicable law.

The Company reserves the right, at all times, to have authorized personnel conduct urinalyses, blood tests, or other types of tests of our applicants, employees, contract workers, and employees of third-party contractors for the purposes of determining if any such persons are in violation of this Policy. A urinalysis, blood test, or other type of test may be used in the following situations: (a) pre-employment testing, (b) testing based on reasonable cause or suspicion, (c) random or periodic testing, (d) testing following an accident or incident involving injury or property damage, and (e) testing that is consistent with the enforcement of this Policy.

The Company reserves the right to inspect and search Company property at any time without the presence or consent of any employee. An employee who, as a result of a search, has been found in violation of this Policy or other Company Policy will be subject to corrective action as described in the Corrective Action Policy.

Violations of Policy

Any violation of the Drugs and Alcohol in the Workplace Policy will result in disciplinary action being taken, up to and including termination.

Employee Assistance Program

The Employee Assistance Program (EAP) is available to all Company employees. Employees are encouraged to obtain professional help when needed by using the EAP. Employees may contact their supervisor or Human Resources for information about the EAP. The EAP is strictly confidential and available for use by telephoning:

- Magellan Behavioral Health 1-800-424-5654

Use of the EAP does not exempt or excuse a violation of this Policy.

Voluntary Rehabilitation

Any employee who voluntarily seeks counseling or rehabilitation in advance of failing any of the tests or who would otherwise be in violation of this policy must provide certification, in accordance with any applicable governmental requirements, of the credentials of the attending physician, psychologist, or psychiatrist, who is trained in substance abuse disorders.

When the employee successfully completes or is participating in a supervised substance-abuse or alcohol-related rehabilitation program and is no longer engaging in the use of illegal drugs or unauthorized alcohol, the Company requires certification from the substance abuse professional that the employee is fit to return to duty and perform the essential functions of his or her job.

An employee described in the paragraph above will be tested on a random basis by the Medical Review Officer and/or Substance Abuse Professional to ensure such employee is no longer engaging in the illegal use of drugs or unauthorized alcohol.

Interpretation and Exceptions

Questions regarding this Policy should be referred to the Vice President, Human Resources. Requests for exceptions should be submitted to Human Resources for review by Human Resources and the Legal Department to ensure regulatory requirements and appropriate test protocols and standards are met. The President and Chief Operating Officer must approve all exceptions.

This Policy does not constitute or imply a contract between the Company and its employees. This Policy creates no Company obligation nor any individual obligation, right, privilege, term, or condition of employment not otherwise established by law. The Company has voluntarily adopted this Policy for its sole and exclusive and may amend or withdraw it at any time without prior notice.

1.0 INTRODUCTION AND PLAN CONTENT

1.1 OPERATOR NAME, ADDRESS AND PHONE NUMBER

Kinder Morgan Energy Partners, L.P.

1.2 OPERATING ASSETS COVERED BY THIS PLAN

The following tables provide a general information summary for the pipeline sections, pipeline facilities, breakout stations and terminals in each of the Areas in this Region. Specific detail can be located in the following sections for the applicable area.

- Section 6 – Area Pipeline Sections (for DOT jurisdiction)
- Section 7 – Area Breakout Stations (for DOT jurisdiction)
- Section 8 – Area Terminals (for EPA, USCG and OSPR jurisdiction)
- Section 9 – Regional OSPR Line Segments (for OSPR jurisdiction)

CARSON AREA		
PIPELINE SECTIONS	**LINE NO.**	**COUNTY / STATE**

TERMINALS		**COUNTY / STATE**
Mission Valley Terminal		San Diego, CA

1.3 SUBSTANTIAL HARM

It is Kinder Morgan Energy Partners, L.P. (KMEP)'s goal to respond as quickly as possible to all uncontrolled releases of petroleum product, regardless of the source point location along the system. Based upon this goal, and the overbreadth of the definitions provided in each of the applicable regulations, KMEP is compelled to consider all of the Facility's breakout stations, and active line sections listed above in this Section, as capable of a release potentially causing "significant and substantial harm". A summary of the Worst Case Discharge scenarios for these facilities is provided as follows:

SOUTHERN REGION - WEST WORST CASE DISCHARGE DOT JURISDICTION	
Discharge Scenario	Planning Volume
(b) (7)(F), (b) (3)	

* DOT Worst Case Discharge volumes are based on 50% of the tank maximum storage capacity and for pipelines based on an annual Integrity Management Program study, as follows:

Release volume prior to line shutdown and valve closures (Initial Loss):

- Full flow release due to rupture. This is computed at the maximum pumping rate the line segment.
- Detection time, analysis and pump shutdown in adverse weather conditions. This is based on a maximum of fifteen (15) minutes in the event of a full flow rupture, which would cause an instant alarm.
- Line segment valve closures. All line segments are equipped with remote activating isolation valves. Adverse weather would have no impact on line segment isolation, as isolation valves are not dependent on manual closure.

Line drainage following pump shutdown (Stabilization Loss) is computed the maximum potential line drainage between adjacent isolation or check valves, and incorporated pipeline elevation profiles to estimate how much of that total volume would escape at any release point along the line. The historic discharges have not approached either the breakout tank WCD volume or the pipeline WCD in the area.

SOUTHERN REGION - WEST DISCHARGE SCENARIOS EPA JURISDICTION	
Discharge Scenario	**Planning Volume**
Small Discharge	
• Carson Terminal	50 bbls
• Harbor Terminal	50 bbls
• Mission Valley Terminal	50 bbls
• Orange Terminal	50 bbls
Medium Discharge	
• Carson Terminal	857 bbls
• Harbor Terminal	857 bbls
• Mission Valley Terminal	857 bbls
• Orange Terminal	857 bbls
Worst Case Discharge	
(b) (7)(F), (b) (3)	

NOTE: EPA Worst Case Discharge is based on the maximum storage capacity of the largest tank at each Facility.

SOUTHERN REGION-WEST DISCHARGE SCENARIOS USCG JURISDICTION	
Discharge Scenario	**Planning Volume**
(b) (7)(F), (b) (3)	

SOUTHERN REGION - WEST REASONABLE WORST CASE SPILL CALIFORNIA OSPR JURISDICTION
The Reasonable Worst Case Spills (RWCS) for the California OSPR jurisdictional Terminal (LA Harbor Terminal) is equal to those volumes depicted in the prior USCG table and is further detailed in the Terminal Section 8.3. The RWCS for the California OSPR jurisdictional pipelines are detailed in Section 9.3.

These Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three-tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. Sections 6, 7, 8 and 9 of this Plan demonstrate a series of calculations and planning volume determinations based on guidance provided by all applicable regulations. The inclusion of these calculations is for demonstration of the response planning volumes and response capability necessary for on-water and on-shore recovery requirements as the result of the discharge scenarios detailed in the table above.

1.4 FORMAT AND SCOPE OF PLAN

This Volume 2 of the Integrated Contingency Plan (ICP) is intended to guide emergency response activities throughout KMEP's Pacific Operation Southern Region – West. This region is divided into three (3) areas (see Figure 1.1) each of which has its own tab in this document. These areas are as follows:

- Carson Area
- Watson Area
- Mission Valley Area

Each of the Volume 2 plans in this ICP has identical Sections 1 through 5. Section 6 of each area details the Pipeline Sections in the respective area, Section 7 of each area details the Breakout Stations (DOT jurisdictional) in the respective area, Sections 8 of each area details the Terminals (multi-jurisdictional) in the respective area, and Section 9 details the OSPR jurisdictional lines in the respective area. The Area covered by this particular plan is identified on the front cover of this plan and on the footer of each page and on the maps provided in Figure 1.1.

Volume 1 of the Integrated Contingency Plan provides guidance which is consistent across the Pacific Operations. The two (2) documents are intended to work together as one seamless Integrated Contingency Plan for the various facilities/operations and agency jurisdictions in Pacific Operations.

2.0 NOTIFICATIONS

2.1 INTERNAL NOTIFICATIONS

Specific reference to all internal notifications is detailed in Volume 1 Section 2.1 which provides the following:

- KM Employee or Agent Notification Process - California Only (Figure 2.1a)
- Operator Notification Process - Non-California (Figure 2.1b)
- Company Employee Other Than Operator Notification Process - Non-California (Figure 2.1c)
- Controller - Orange, CA Notification Process - California Only (Figure 2.1d-1)
- Controller - Orange, CA Notification Process - Non-California (Figure 2.1d-2)
- Controller - Houston, TX Notification Process (Figure 2.1e)
- Managers Internal Notification Process (Figure 2.1f)
- Initial Reporting Details Form (Figure 2.2)
- Northern Region Internal Notifications References (Figure 2.3a)
- Southern Region Internal Notifications References (Figure 2.3b)
- Crisis Support Team Internal Notifications References (Figure 2.3c)

2.2 EXTERNAL NOTIFICATIONS

Specific reference to all **"Regulatory Required"** external notifications is detailed in Volume 1, Figure 2.1 and Figure 2.4. **With the exception of notification to 911 and/or local fire/police agencies which are handled by local area operations, the Environmental, Health and Safety (EHS) and/or Compliance, Codes and Standards is responsible for making all regulatory required external notifications in all states other than in California. In California and locations monitoring or controlling, pipeline sections in California, refer to Volume 1, Section 2.2 and Figure 2.4.**

The locally required notifications and additional external notification references which are detailed in the following Volume 2, Figure 2.1 provide for assistance/advisory notifications. Specific notifications for contacting OSROs are found in Volume 2, Figure, 2.1, "_____ Terminal Response Contractors".

3.0 RESPONSE RESOURCES

The following sections outline the various response equipment/resources available from the Facility, other Company facilities, and other outside resources.

3.1 AREA RESPONSE EQUIPMENT

This Area of the KMEP operations maintains response equipment readily available for spill response as detailed on the "Facility Response Equipment" lists provided in Figure 3.1 and the "Pipeline Repair Equipment" lists provided in Figure 3.2. The equipment is stored at locations in the Area as detailed on the equipment lists.

The preventative maintenance schedule requires a monthly inventory and visual inspection of spill response equipment. Maintenance and repair is performed as needed, following manufacturers recommended procedures. The equipment will be exercised as semi-annually (Terminal equipment) or annually (pipeline equipment) as required (PREP Guidelines). A sample form for documenting these Equipment Deployment Exercises is provided in Figure 3.4.

KMEP has contracts in place with Oil Spill Removal Organizations and other clean-up and response contractors that are capable of responding to all discharges within the Area and supplementing Area KMEP resources.

The Qualified Individual has the authority to activate these and other KMEP resources or that of private contractors and other experts and consultants as the situation demands.

3.2 OTHER COMPANY RESOURCES

Neighboring KMEP Areas have response resources similar to those provided in this Area (Figures 3.1 and 3.2). These resources as well as additional Company spill response equipment and manpower resources may be available to supplement the response operation.

3.3 CONTRACT RESOURCES

In the event of a discharge which is beyond the initial response capabilities of the Local Response Team, contract manpower and equipment resources can be obtained through Oil Spill Removal Organization(s) (OSRO). These OSROs can provide manpower and containment/clean-up equipment for the response operation. *The Company will ensure that each OSRO has a comprehensive maintenance program and applicable training / drills programs in place at contract renewal.*

Response resources will be secured from a Company approved contractor. Facility Management will typically handle notification/implementation of these resources. Section 2 of this Volume provides a quick reference to the OSROs and additional clean-up and response contract organizations. A detailed list of the "Pacific Region Open End and On-Call Contractors" is provided in Figure 2.2. Specific reference to their response capability (UCSG OSRO classification) is provided in Figure 3.3.

These OSRO's have adequate equipment and personnel resources available within the Area to respond to the applicable regulatory planning volumes in the required time frames.

3.3 CONTRACT RESOURCES (Cont'd)

OSROs have the expertise to conduct and lead on water and shoreline containment and recovery efforts. KMEP personnel will oversee and coordinate with the OSRO to ensure their actions conform with overall incident objectives and established incident action plans.

OSROs also have extensive experience in using the Area Contingency Plans (ACPs) as a resource when responding to an incident that has affected a navigable waterway. The KMEP Incident Commander, Planning Officer and Operations Chief will employ the OSRO's experience to integrate applicable local ACPs into the overall incident action plans.

3.4 AREA CONTINGENCY PLANS (ACP)

Area Committees comprised of Federal, state and local agencies develop ACPs. Response efforts performed within a certain "area" should reference the ACPs for that specific area. ACPs include clean-up strategies and information on environmentally sensitive areas within a particular region. Some of the ACPs include maps, shoreline characteristics and booming strategies for specific areas while other ACPs offer priority lists of environmentally sensitive areas.

ACPs generally contain the following information:

- Physical features
- Seasonal concerns
- Resources of primary concern
- Containment, and cleanup strategies, including recommended techniques
- Equipment considerations
- Incident Command System Roles and Responsibilities (NIMS)

To identify specific spill response and protection strategies for the applicable region/area, ACP and Geographic Response Plan information can be found at: http://kmonline.kindermorgan.com/operations/products/pacific_icp/rmaplan.html. Responders can navigate through the site to locate the region/area of interest and the appropriate response resources needed for the operation.

For all controlled copies of the Integrated Contingency Plan distributed to non-KMEP plan holders, a CD-ROM containing the same information as referenced above will be included in a CD-sleeve in Volume 1(inside front cover) or in a separate folder in electronic copies and is referenced in Figure 4.2.

To determine adequate response resources, the Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three (3) tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. The tier requirements for high volume areas are for response in six (6) hours (Tier 1), 30 hours (Tier 2), and 54 hours (Tier 3). High volume areas are listed in 49 CFR 194. The tier requirements for all other areas are for response in 12 hours (Tier 1), 36 hours (Tier 2), and 60 hours (Tier 3).

3.5 COOPERATIVE/MUTUAL AID RESOURCES

Cooperative/mutual aid resources will be utilized when available and/or necessary.

3.6 EXPERTS AND CONSULTANTS

The Company maintains a relationship with various environmental and technical consultants that can provide support in the event of an emergency incident. These consultants can provide expertise and support in the areas of emergency response management, environmental services, site assessment, permitting, waste treatment, recycling, dewatering, hazardous waste disposal, and remediation.

3.7 VOLUNTEERS

Volunteers will not be utilized by KMEP for the response operations. All volunteers will be referred to the state or Federal On-Scene Coordinator.

3.8 COMMUNICATIONS

Effective and efficient communications systems are essential for emergency response at every level. The communications system will be utilized to gather information and current status reports as well as to provide coordination and direction to widely separated work groups involved in search, containment/diversion, repair, traffic control, public control or evacuation, and restoration.

Communication of the overall spill response operation between KMEP and the responsible government agencies in the Federal Regional Response Team (RRT) will occur between the Incident Commander and the Federal On-Scene Coordinator.

3.8.1 Central Communications System

Prearranged communication channels are of the utmost importance in dealing with KMEP emergencies. The notification procedures and telephone contacts documented in Section 2 of Volume 1 and Volume 2 will be reviewed in accordance with the earlier documented updating procedures. The predetermined communications channels include the following:

- A list of required Federal and state emergency telephone numbers for the Orange Control Center and emergency response personnel (Volume 1; Section 2).
- A list of emergency telephone numbers for various external resources such as the fire and police department, medical, and regulatory agencies (Volume 2; Figure 2.1).
- A list of emergency telephone numbers for contract response resources (Volume 2; Figure 2.1).

3.8 COMMUNICATIONS (Cont'd)

3.8.2 Communications Equipment

Field communications during a spill response to a small or medium discharge will be handled via the existing KMEP communications network. This network will utilize existing radios, telephones, fax machines, and computers and will be maintained by KMEP personnel. In the event of a Worst Case Discharge, field communications will be enhanced with other KMEP and contract resources as the situation demands.

Each KMEP responder has, at a minimum, a cellular telephone. All KMEP response personnel also have access to other telephones, radios and satellite communications equipment that may be needed for effective response operations. Additionally, communications equipment is maintained in the KMEP spill response trailers. The Logistics Officer would create a communications plan based on the equipment immediately available and would identify the need for any additional equipment that may be needed throughout the response effort.

3.8.3 Communication Types

Radios - Handheld and vehicle mounted radio sets are the most effective means of communication for the field response operation. The units are battery operated, multi-channeled and have a typical range that will cover the area of the response operation. Each location maintains a minimum of 4 radio sets, functionally maintained per manufacturer's specifications and kept in designated KMEP response trailers. In addition, KMEP also utilizes radio sets provided by contract resources. Additional radio sets and battery packs/charges will be necessary in the event of a prolonged response operation.

Telephone (Conventional) - Conventional land line telephones are the most effective means of communication for regulatory and advisory notifications during a spill response operation. Additional telephone lines can be installed in the event of a prolonged response operation.

Telephone (Cellular) - Cellular telephones allow for added mobility and response effectiveness. Cellular phones are commonly maintained by certain KMEP personnel. Additional cellular phones can be secured in the event of a prolonged response operation.

FAX Machines - FAX machines allow for a rapid transfer of information/ documentation such as status reports/updates, written notifications, and purchase orders.

Computers - Computers are commonly used in networks which allow access to various other locations and KMEP personnel. Computers also speed the consolidation of information and preparation of written reports.

FIGURE 3.1
Facility Response Equipment

LA HARBOR TERMINAL		
Type of Equipment	**Location**	**Comments**
*Boom (24")	Deployed along dock	5500' - Harbor Boom
Sorbent Materials	Berth 119	Three (3) bales of sorbent pads Sausage boom & rags
*Boat (1)	Dock	19' Monson w/125 H.P. engine

***Note: Should this major response equipment be removed from service for a period of 24 hours or more for maintenance or repair, the OSPR Administrator shall be notified. A temporary replacement shall be furnished in such cases so that the ability to respond is not affected.**

FIGURE 3.2
Pipeline Repair Equipment

Mission Valley Terminal		
Qty.	**Description**	**Location**
	INCIDENT SUPPORT AND PIPELINE REPAIR EQUIPMENT	
	Leak sleeves - line size (2-1/2", 1-18", 1-24", 1-36")	Yard
	Neoprene cones and sheets	Warehouse
1	Skinner clamp (for temporary product control)	Emergency Trailer
6	Buckets: three - 5 gal., two - 2 gal., one - 1/2 tub	Response Vehicle/Emergency Trailer
	Halogen lights and stands, spare bulbs	
	Line-up clamps (line size)	Emergency Trailer
	Pipe cutter, spare blades (line size)	Emergency Trailer
2	Weld plus ends - (line size)	Warehouse
	Bonding cables and clamps	Response Vehicle/Emergency Trailer
	Line probes	Response Vehicle
1	Metrotech 850 (line finder)	Line Rider Truck
2	Taping machine, valves, plugs, fittings	Response Vehicle/Emergency Trailer
	Coating and primer, trimming knives, brushes, brass hammer	Response Vehicle/Emergency Trailer
	Spare diesel and oil, funnels, gas	
	Hand tools, hammer wrenches, sockets	Response Vehicle
	Spare 1-1/8" bolts and nuts (for clamp - 12 minimum)	
	Shovels, picks, sharp shooters	Response Vehicle
	Hydraulic jacks	Response Vehicle
	Burlap bags	Warehouse
	Skids 4" x 6" (8 to 10)	Yard
	Rope	Emergency Trailer
	Equipment for sleeve modification	
	Five lengths of 2" hose, foot valve, hose fittings	Warehouse
	Full oxygen and acetylene bottles, lines, torches	Response Vehicle/Welding
1	150# Ansul fire extinguisher	Warehouse
12	30# Ansul fire extinguishers	Emergency Trailer
6	Rubber boots and rain gear	Emergency Trailer
	Fans and compressor (if applicable)	Emergency Trailer/Yard
6	Fire blanket / water gel	Response Vehicle/Emergency Trailer
	Spare Ansul powder	Warehouse
	Spare CO^2 cartridges for 30# Ansuls	Warehouse
	Barricades	Yard
	"No Smoking" signs	Emergency Trailer
4	Flashlights, spare batteries, bulbs	Emergency Trailer
	Shop rags - soap	Response Vehicle/Emergency Trailer

NOTE: This inventory of equipment is intended for PIPELINE REPAIR ONLY. Response to an oil spill incident will be conducted by KMEP contracted Oil Spill Removal Organizations as detailed in Figures 2.1 and 3.3. This equipment will not be "deployed" for equipment deployment exercise purposes.

FIGURE 3.2a
PIPELINE REPAIR EQUIPMENT

Mission Valley Terminal (Cont'd)

Equipment Deployment Exercise

1. Date(s) performed: _____

2. Terminal/Response Zone: _____

3. Exercise or actual response? _____
   If an exercise, announced or unannounced? _____

4. Deployment location(s):

   _____
   _____
   _____
   _____
   _____
   _____

5. Time started: _____
   Time completed: _____

6. Equipment deployed was:
   - ☐ Facility - owned
   - ☐ Oil spill removal organization - owned if so, which OSRO? _____
   - ☐ Both

7. List type and amount of all equipment (e.g., boom and skimmers) deployed and number of support personnel employed:

   _____
   _____
   _____
   _____

8. Describe goals of the equipment deployment and list any Area Contingency Plan strategies tested (Attach a sketch of equipment deployments and booming strategies):

   _____
   _____
   _____
   _____

9. For deployment of facility-owned equipment, was the amount of equipment deployed at least the amount necessary to respond to your facility's small/average most probable spill?

   _____
   _____

   Was the equipment deployed in its intended operating environment?

   _____
   _____

OSRO Work Directives

WORK DIRECTIVE

To PATRIOT ENVIRONMENTAL SVCS INC

P.O. BOX 1091

LONG BEACH, CA 90801
Attention: RICHRD YUKIHIRO

Phone: 562-436-2614
Fax: 563-436-3688
Email: ryukihiro@patriotenvironmental.com

Date: September 17, 2013

Work Directive No.: 477391-16-STAT

Agreement No.: 25286

Requisition No/ Accounting Information: 270504

This Work Directive is entered pursuant to the terms of the Emergency Response Services Agreement ("Agreement") dated 01/01/2011 , by and between KINDER MORGAN ENERGY PARTNERS, L.P. ("COMPANY") and PATRIOT ENVIRONMENTAL SVCS INC ("CONSULTANT"). By its execution hereof, CONSULTANT agrees to perform for the Kinder Morgan ("KM") entity named below and executing this Work Directive pursuant to the terms, conditions and provisions of the Agreement, the following described Work which will additionally describe "Covered Tasks" as provided for under DOT Operator Qualification Requirements, and shall furnish all services, labor, supervision, technical capability, tools, equipment, vehicles, vessels, barges, transportation, materials, (except as set forth below), and other facilities and items necessary or convenient to complete the following work as further described and specified in the Specifications and/or Drawing(s) attached hereto or the Agreement and by this reference made a part of this Work Directive ("the Work"). If CONSULTANT'S proposal, quotation, or any other CONSULTANT document supplied to the KM entity named below is included as part of this Work Directive or another exhibit to the Agreement, then any terms or conditions provided by CONSULTANT which differ from or conflict with COMPANY'S terms and conditions are hereby rejected and shall be of no force or effect. The KM entity named below in this Work Directive shall be solely responsible for the liabilities and obligations set forth in the Agreement under which this Work Directive is being issued and this Work Directive arising out of or related to the Work to be performed pursuant hereto. All such liabilities and obligations, as they apply to this Work Directive, shall be non-recourse to the COMPANY (if the COMPANY is not the KM Entity executing this Work Directive) and all other related entities as further provided for and agreed in the Agreement. Payments made to CONSULTANT under this Work Directive shall include all taxes and similar charges except as otherwise agreed to herein or under the terms of the Agreement. Any capitalized term used in this Work Directive and not otherwise defined herein shall have the meaning as ascribed in the Agreement.

1.0 **Project Name and Work Location Details:** OSRO SERVICES / Carson Terminal and Watson Station

2.0 **Scope of Work:** The following is a full and complete description of the Work (and goods) to be provided by CONSULTANT including, but not limited to specifications, conditions and referenced bids/proposals.

2.1 See EXHIBIT WD_A – SCOPE OF WORK

2.2 For Questions, contact ROSE, TINA at 909-873-5106

3.0 The COMPANY will not furnish any materials to the Work Site(s), unless previously approved by the Designated Representative.

4.0 CONSULTANT shall commence the Work by the 08/01/2013 and shall complete the Work on or before 07/31/2014.

5.0 CONSULTANT offers to complete the Work in accordance with the Agreement for the total Lump Sum Amount of **$15,000.00,** Fifteen Thousand Dollars and Zero Cents, which shall constitute full and complete payment.

6.0 The parties hereby agree to AMEND Agreement 25286 as follows (or if the Agreement has been thus amended previously, to repeat the following sections):

i) Under the Compliance with Laws section, a **new subsection** is hereby added to the Agreement which reads as follows:

CONSULTANT certifies that at the time of execution of this Agreement CONSULTANT is not included on any debarment list maintained by any federal, state or local governmental authority nor prevented from performing Work for COMPANY by virtue of any governmental order, proceeding or otherwise. If at any time during the term of this Agreement CONSULTANT cannot so certify to COMPANY, CONSULTANT shall promptly notify COMPANY as to CONSULTANT'S status.

ii) The following language is hereby added to the Termination section under the termination for default paragraphs:

– violates any EHS law; or

iii) All other provisions of the Agreement shall continue in full force and effect.

7.0 **Retainage:** Waive 10% retainage.

8.0 CONSULTANT shall submit invoices in duplicate to:

KINDER MORGAN LIQUIDS TERMINALS LLC

2319 S Riverside Ave

Bloomington, CA 92316

Attn: ROSE, TINA
Phone: 909-873-5106
Fax: 909-877-9036

8.1 Invoices must clearly indicate the Agreement Number, Work Directive Number, as indicated above.

8.2 For Construction Projects, a Certificate of Final Completion must be completed, signed by an authorized representative, notarized, and attached to CONSULTANT'S final invoice.

9.0 CONSULTANT hereby certifies that it has downloaded, reviewed and understood the Kinder Morgan Contractor Safety Manual and shall, prior to the commencement of any Work hereunder, make the same available to its employees and subcontractors who will be performing work on premises owned and/or operated by the KM entity named below. If the English language is a communication barrier, CONSULTANT at its expense shall timely convert/translate the Kinder Morgan Contractor Safety Manual accurately into the appropriate language for its employees and subcontractors. Questions concerning the Manual should be directed to the Kinder Morgan Contractor Safety Indemnitees at: contractor_safety@kindermorgan.com prior to commencement of any Work.

10.0 Facsimile Signatures/Counterparts. This Work Directive may be executed in multiple original counterparts, each of which shall be deemed an original, and together they shall constitute one and the same agreement. Signature of this Work Directive may be effected by facsimile (with confirmation by transmitting machine) and/or transmitted by portable document format ("pdf") file which shall be treated as an original signature, and any such signature, facsimile, pdf file or copy of this signed Work Directive shall be construed and treated as the original and shall be binding as if it were the original.

11.0 For Work performed within the State of California, CONSULTANT shall certify within three working days of execution hereof that the requirements set forth in Exhibit B to this Work Directive have been satisfied. Failure by CONSULTANT to do so shall constitute a breach under Section10 [for cause with no notice] of the Agreement.

In the **Agreement**, if there is a reference to "Kinder Morgan Kansas, Inc.," it shall now be deemed a reference to Kinder Morgan, Inc., a Delaware corporation. This change resulted from an internal corporate reorganization. Kinder Morgan, Inc. owns the same assets formerly owned by Kinder Morgan Kansas, Inc.

By signing below, COMPANY and CONSULTANT affirm that the individual signing below has the requisite authority to authorize the commitment described herein, and that this Work Directive No. 477391-16-STAT is by reference hereby made part of Agreement No. 25286 .

This Work Directive is hereby agreed to and accepted:

X	Exhibit WD_B	- Revised Release Reporting Criteria (California only)
___	Exhibit WD_C	- Work Directive Specific Schedule of Values/Rates
___	Exhibit WD_D	- Operator Qualification Form (as provided by the Designated Representative via electronic or hardcopy submission)

EXHIBIT WD_A – SCOPE OF WORK

Provide OSRO response for Carson Terminal and Watson Station, detailed as follows:

Provide all trained personnel, labor, tools, and equipment necessary to provide Oil Spill Removal Organization (OSRO) services to meet the Federal OPA '90 requirements for contracted oil spill removal services for the Carson Terminal located at 2000 E. Sepulveda Blvd, Carson, CA 92108 and Watson Station located at 20410 S. Wilmington Ave., Long Beach, CA 90810 as follows:

- Sufficient Response Resources to enable the COMPANY to meet the requirements of OPA '90 for pre-contracted Response Resources at the commencement of the Agreement including:
    - Responding with 1,000 feet of containment boom and a means to deploy it or other appropriate equipment and materials, as identified in the Tactical Response Plans presented in Volume 2, Section 8.4, within one (1) hour of notification*;
    - Oil recovery devices with an effective daily recovery capability (EDRC) equal to the amount of oil discharged in a small discharge (2,100 gallons) and temporary storage capacity equal to two (2) times the EDRC within two (2) hours of notification*;
    - Documentation of equipment deployment exercises and personnel training must be submitted annually to Mr. Edward (Buzz) Fant, Director-Compliance/Emergency Response Programs, c/o Kinder Morgan Energy Partners, L.P., 1001 Louisiana St, Suite 1000 Houston, TX 77002 or fante@kindermorgan.com ;
    - Compliance by the CONSULTANT and CONSULTANT's subcontractors with all applicable Federal Occupational Safety and Health Administration (OSHA) standards and similar applicable State laws, rules and/or standards.

    * Travel times are based on suitable safety conditions and travel time capability per the U.S. Coast Guard minimum response time calculation factor of 35 mph overland or five (5) knots on water.

Regulatory References: 29 CFR 1910.120 (OSHA); 40 CFR 112 Appendix E 3.3 (U.S. EPA)

EXHIBIT WD_B – REVISED RELEASE REPORTING CRITERIA

1.0 CONSULTANT shall ensure that its employees, agents, and subcontractors' employees engaged in CONSULTANT'S activities in the performance of the Work:

1.1 are notified, and when required, as determined by COMPANY, trained and instructed by COMPANY, either directly or through a train-the-trainer program instituted by COMPANY, concerning the order of actions to be taken upon discovery of a release or threatened release condition of a Hazardous Material or pollutant substance; and

1.2 understand that no Work or visit shall be undertaken to any COMPANY right-of-way or facility where there is no COMPANY representative onsite and readily accessible (a "Non-Company Onsite Situation"), unless the training referred to in (i) above has occurred for CONSULTANT'S employees, agents and subcontractors' employees who will be performing at such a site.

1.3 Will be working in a COMPANY Onsite Situation and MUST ensure that its employees, agents and subcontractors' employees have been notified accordingly, and if deemed necessary by COMPANY, CONSULTANT will assure that prior to performing any Work CONSULTANT'S employees, agents and subcontractors' employees will be trained relative to COMPANY'S revised release reporting criteria.

1.4 For purposes of this Exhibit "Hazardous Material(s)" shall mean and include (a) all elements or compounds that are contained in the list of hazardous substances adopted by the United States Environmental Protection Agency and the list of toxic pollutants designated by Congress or the Environmental Protection Agency or under any EHS Laws; and (b) any "hazardous waste," "hazardous substance" (including, but not limited to, petroleum and petroleum-related materials), "toxic substance," regulated substance," "pollutant" or "contaminant", each as defined under any EHS Law. "EHS Laws" shall mean any and all federal, state, and local laws, regulations and requirements pertaining to health, safety, or the environment.

CONSULTANT shall certify its compliance with this training requirement upon COMPANY request.

Acknowledged, agreed and accepted this 18 day of September, 2013

Scope of Work or Services:

Provide OSRO response for Carson Terminal and Watson Station, detailed as follows:

Provide all trained personnel, labor, tools, and equipment necessary to provide Oil Spill Removal Organization (OSRO) services to meet the Federal OPA '90 requirements for contracted oil spill removal services for the Carson Terminal located at 2000 E. Sepulveda Blvd, Carson, CA 92108 and Watson Station located at 20410 S. Wilmington Ave., Long Beach, CA 90810 as follows:

- Sufficient Response Resources to enable the COMPANY to meet the requirements of OPA '90 for pre-contracted Response Resources at the commencement of the Agreement including:
    - Responding with 1,000 feet of containment boom and a means to deploy it or other appropriate equipment and materials, as identified in the Tactical Response Plans presented in Volume 2, Section 8.4, within one (1) hour of notification*;
    - Oil recovery devices with an effective daily recovery capability (EDRC) equal to the amount of oil discharged in a small discharge (2,100 gallons) and temporary storage capacity equal to two (2) times the EDRC within two (2) hours of notification*;
    - Documentation of equipment deployment exercises and personnel training must be submitted annually to Mr. Edward (Buzz) Fant, Director-Compliance/Emergency Response Programs, c/o Kinder Morgan Energy Partners, L.P., 1001 Louisiana St, Suite 1000 Houston, TX 77002 or fante@kindermorgan.com ;
    - Compliance by the CONSULTANT and CONSULTANT's subcontractors with all applicable Federal Occupational Safety and Health Administration (OSHA) standards and similar applicable State laws, rules and/or standards.

* Travel times are based on suitable safety conditions and travel time capability per the U.S. Coast Guard minimum response time calculation factor of 35 mph overland or five (5) knots on water.

Work Directive No.: 477391-14-STAT

Agreement No.: 25286

Requisition No/ Accounting Information: 270506

This Work Directive is entered pursuant to the terms of the Emergency Response Services Agreement ("Agreement") dated 01/01/2011, by and between KINDER MORGAN ENERGY PARTNERS, L.P. ("COMPANY") and PATRIOT ENVIRONMENTAL SVCS INC ("CONSULTANT"). By its execution hereof, CONSULTANT agrees to perform for the Kinder Morgan ("KM") entity named below and executing this Work Directive pursuant to the terms, conditions and provisions of the Agreement, the following described Work which will additionally describe "Covered Tasks" as provided for under DOT Operator Qualification Requirements, and shall furnish all services, labor, supervision, technical capability, tools, equipment, vehicles, vessels, barges, transportation, materials, (except as set forth below), and other facilities and items necessary or convenient to complete the following work as further described and specified in the Specifications and/or Drawing(s) attached hereto or the Agreement and by this reference made a part of this Work Directive ("the Work"). If CONSULTANT'S proposal, quotation, or any other CONSULTANT document supplied to the KM entity named below is included as part of this Work Directive or another exhibit to the Agreement, then any terms or conditions provided by CONSULTANT which differ from or conflict with COMPANY'S terms and conditions are hereby rejected and shall be of no force or effect. The KM entity named below in this Work Directive shall be solely responsible for the liabilities and obligations set forth in the Agreement under which this Work Directive is being issued and this Work Directive arising out of or related to the Work to be performed pursuant hereto. All such liabilities and obligations, as they apply to this Work Directive, shall be non-recourse to the COMPANY (if the COMPANY is not the KM Entity executing this Work Directive) and all other related entities as further provided for and agreed in the Agreement. Payments made to CONSULTANT under this Work Directive shall include all taxes and similar charges except as otherwise agreed to herein or under the terms of the Agreement. Any capitalized term used in this Work Directive and not otherwise defined herein shall have the meaning as ascribed in the Agreement.

1.0 **Project Name and Work Location Details:** OSRO Services / Los Angeles Harbor Terminal, Line sections GX 32, GX 64a, GX 104, GX 124, GX 190 Dominguez channel to Los Angeles Harbor and GX 120 West Basin Los Angeles harbor to East Basin Los Angeles Harbor.

2.0 **Scope of Work:** The following is a full and complete description of the Work (and goods) to be provided by CONSULTANT including, but not limited to specifications, conditions and referenced bids/proposals.

2.1 See EXHIBIT WD_A – SCOPE OF WORK

2.2 For Questions, contact ROSE, TINA at 909-873-5106

3.0 The COMPANY will not furnish any materials to the Work Site(s), unless previously approved by the Designated Representative.

4.0 CONSULTANT shall commence the Work by the 08/01/2013 and shall complete the Work on or before 07/31/2014.

5.0 CONSULTANT offers to complete the Work in accordance with the Agreement for the total Lump Sum Amount of **$10,000.00**, Ten Thousand Dollars and Zero Cents, which shall constitute full and complete payment.

6.0 The parties hereby agree to AMEND Agreement 25286 as follows (or if the Agreement has been thus amended previously, to repeat the following sections):

i) Under the Compliance with Laws section, a **new subsection** is hereby added to the Agreement which reads as follows:

CONSULTANT certifies that at the time of execution of this Agreement CONSULTANT is not included on any debarment list maintained by any federal, state or local governmental authority nor prevented from performing Work for COMPANY by virtue of any governmental order, proceeding or otherwise. If at any time during the term of this Agreement CONSULTANT cannot so certify to COMPANY, CONSULTANT shall promptly notify COMPANY as to CONSULTANT'S status.

ii) The following language is hereby added to the Termination section under the termination for default paragraphs:

-- violates any EHS law; or

iii) All other provisions of the Agreement shall continue in full force and effect.

7.0 **Retainage:** Waive 10% retainage.

8.0 CONSULTANT shall submit invoices in duplicate to:

KINDER MORGAN LIQUIDS TERMINALS LLC

2319 S Riverside Ave

Bloomington, CA 92316

Attn: ROSE, TINA
Phone: 909-873-5106
Fax: 909-877-9036

8.1 Invoices must clearly indicate the Agreement Number, Work Directive Number, as indicated above.

8.2 For Construction Projects, a Certificate of Final Completion must be completed, signed by an authorized representative, notarized, and attached to CONSULTANT'S final invoice.

9.0 CONSULTANT hereby certifies that it has downloaded, reviewed and understood the Kinder Morgan Contractor Safety Manual and shall, prior to the commencement of any Work hereunder, make the same available to its employees and subcontractors who will be performing work on premises owned and/or operated by the KM entity named below. If the English language is a communication barrier, CONSULTANT at its expense shall timely convert/translate the Kinder Morgan Contractor Safety Manual accurately into the appropriate language for its employees and subcontractors. Questions concerning the Manual should be directed to the Kinder Morgan Contractor Safety Indemnitees at: contractor_safety@kindermorgan.com prior to commencement of any Work.

10.0 Facsimile Signatures/Counterparts. This Work Directive may be executed in multiple original counterparts, each of which shall be deemed an original, and together they shall constitute one and the same agreement. Signature of this Work Directive may be effected by facsimile (with confirmation by transmitting machine) and/or transmitted by portable document format ("pdf") file which shall be treated as an original signature, and any such signature, facsimile, pdf file or copy of this signed Work Directive shall be construed and treated as the original and shall be binding as if it were the original.

11.0 For Work performed within the State of California, CONSULTANT shall certify within three working days of execution hereof that the requirements set forth in Exhibit B to this Work Directive have been satisfied. Failure by CONSULTANT to do so shall constitute a breach under Section 10 [for cause with no notice] of the Agreement.

In the **Agreement**, if there is a reference to "Kinder Morgan Kansas, Inc.," it shall now be deemed a reference to Kinder Morgan, Inc., a Delaware corporation. This change resulted from an internal corporate reorganization. Kinder Morgan, Inc. owns the same assets formerly owned by Kinder Morgan Kansas, Inc.

By signing below, COMPANY and CONSULTANT affirm that the individual signing below has the requisite authority to authorize the commitment described herein, and that this Work Directive No. 477391-14-STAT is by reference hereby made part of Agreement No. 25286

This Work Directive is hereby agreed to and accepted:

EXHIBIT WD_A – SCOPE OF WORK

Provide all trained personnel, labor, tools, and equipment necessary to provide Oil Spill Removal Organization (OSRO) services to meet the applicable State of California and Federal OPA '90 requirements for contracted oil spill removal services for the Los Angeles Harbor Terminal located at 1900 Wilmington - San Pedro Road, San Pedro, CA 90733 and pipeline sections GX 32, GX 64a, GX 104, GX 124, GX 190 Domguiz channel to Los Angeles harbor, and GX 120 West Basin Los Angeles harbor to East Basin Los Angeles harbor as follows:

- Sufficient Response Resources to enable the COMPANY to meet the requirements of the State of California and OPA '90 for pre-contracted Response Resources at the commencement of the Agreement including:

- Oil recovery devices with an effective daily recovery capability (EDRC) equal to the amount of oil discharged in a small discharge (2,100 gallons) and temporary storage capacity equal to two (2) times the EDRC within two (2) hours of notification*;

- Additional trained personnel, equipment and materials necessary to meet the State of California Response Planning Standards;

- Provide a copy of CA OSPR OSRO Rating Letter and documentation of annual equipment deployment exercises and personnel training to Mr. Edward (Buzz) Fant, Director-Compliance/Emergency Response Programs, c/o Kinder Morgan Energy Partners, L.P., 1001 Louisiana Street, Suite 000, Houston, TX 77002, or fante@kindermorgan.com ;

- CONSULTANT's personnel and subcontractors shall be trained to all applicable Federal Occupational Safety and Health Administration (OSHA) standards and similar State of California laws, rules and/or standards.

* Travel times are based on suitable safety conditions and travel time capability per the U.S. Coast Guard minimum response time calculation factor of 35 mph overland or five (5) knots on water.

Regulatory References: 29 CFR 1910.120 (OSHA); 33 CFR 154.1045 (c) (US Coast Guard); 40 CFR 112 Appendix E 3.3 (U.S. EPA); CCR Title 14, Division 1, Subdivision 4, Chapter 3, Subchapter 3, 815.07(a) and 820.01(10)(A) (State of California)

EXHIBIT WD_B – REVISED RELEASE REPORTING CRITERIA

1.0 CONSULTANT shall ensure that its employees, agents, and subcontractors' employees engaged in CONSULTANT'S activities in the performance of the Work:

1.1 are notified, and when required, as determined by COMPANY, trained and instructed by COMPANY, either directly or through a train-the-trainer program instituted by COMPANY, concerning the order of actions to be taken upon discovery of a release or threatened release condition of a Hazardous Material or pollutant substance; and

1.2 understand that no Work or visit shall be undertaken to any COMPANY right-of-way or facility where there is no COMPANY representative onsite and readily accessible (a "Non-Company Onsite Situation"), unless the training referred to in (i) above has occurred for CONSULTANT'S employees, agents and subcontractors' employees who will be performing at such a site.

1.3 Will be working in a COMPANY Onsite Situation and MUST ensure that its employees, agents and subcontractors' employees have been notified accordingly, and if deemed necessary by COMPANY, CONSULTANT will assure that prior to performing any Work CONSULTANT'S employees, agents and subcontractors' employees will be trained relative to COMPANY'S revised release reporting criteria.

1.4 For purposes of this Exhibit "Hazardous Material(s)" shall mean and include (a) all elements or compounds that are contained in the list of hazardous substances adopted by the United States Environmental Protection Agency and the list of toxic pollutants designated by Congress or the Environmental Protection Agency or under any EHS Laws; and (b) any "hazardous waste," "hazardous substance" (including, but not limited to, petroleum and petroleum-related materials), "toxic substance," regulated substance," "pollutant" or "contaminant", each as defined under any EHS Law. "EHS Laws" shall mean any and all federal, state, and local laws, regulations and requirements pertaining to health, safety, or the environment.

CONSULTANT shall certify its compliance with this training requirement upon COMPANY request.

Acknowledged, agreed and accepted this 18 day of September, 20 13

Work Directive No.: 402461-64-CONT

Agreement No.: **05ER45064ORG**

Requisition No/ Accounting Information: 242104

This Work Directive is entered pursuant to the terms of the Emergency Response Services Agreement ("Agreement") dated 06/01/2005, by and between KINDER MORGAN OPERATING L.P. "D" ("COMPANY") and NRC ENVIRONMENTAL SERVICES,INC ("CONSULTANT"). By its execution hereof, CONSULTANT agrees to perform for the Kinder Morgan ("KM") entity named below and executing this Work Directive pursuant to the terms, conditions and provisions of the Agreement, the following described Work which will additionally describe "Covered Tasks" as provided for under DOT Operator Qualification Requirements, and shall furnish all services, labor, supervision, technical capability, tools, equipment, vehicles, vessels, barges, transportation, materials, (except as set forth below), and other facilities and items necessary or convenient to complete the following work as further described and specified in the Specifications and/or Drawing(s) attached hereto or the Agreement and by this reference made a part of this Work Directive ("the Work"). If CONSULTANT'S proposal, quotation, or any other CONSULTANT document supplied to the KM entity named below is included as part of this Work Directive or another exhibit to the Agreement, then any terms or conditions provided by CONSULTANT which differ from or conflict with COMPANY'S terms and conditions are hereby rejected and shall be of no force or effect. The KM entity named below in this Work Directive shall be solely responsible for the liabilities and obligations set forth in the Agreement under which this Work Directive is being issued, as the same apply to the Work to be performed pursuant hereto. All such liabilities and obligations, as they apply to this Work Directive, shall be non-recourse to the COMPANY (if the COMPANY is not the KM Entity executing this Work Directive) and other related entities as further provided for and agreed in the Agreement. Payments made to CONSULTANT under this Work Directive shall include all taxes and similar charges except as otherwise agreed to herein or under the terms of the Agreement. Any capitalized term used in this Work Directive and not otherwise defined herein shall have the meaning as ascribed in the Agreement.

1.0 **Project Name and Work Location Details:** OSRO Services / Mission Valley Terminal, Orange Terminal, Line Sections 1, 10, 105, 109, and 110 from Watson Station to Norwalk Stations to Colton Terminal, South lines - LS 121, 122, 123, 124, 125 and 126 from Norwalk to San Diego, CA.

2.0 **Scope of Work:** The following is a full and complete description of the Work (and goods) to be provided by CONSULTANT including, but not limited to specifications, conditions and referenced bids/proposals.

2.1 See EXHIBIT WD_A – SCOPE OF WORK

2.2 Year one (1) of three (3) years under this Scope of Work & Rate.

2.3 For Questions, contact ROSE, TINA at 909-873-5106

3.0 The COMPANY will not furnish any materials to the Work Site(s), unless previously approved by the Designated Representative.

4.0 CONSULTANT shall commence the Work by the 09/01/2012 and shall complete the Work on or before 08/31/2013.

5.0 CONSULTANT offers to complete the Work in accordance with the Agreement for the total Lump Sum Amount of **$36,204.00**, Thirty Six Thousand Two Hundred Four Dollars and Eighteen Cents, which shall constitute full and complete payment.

6.0 The parties hereby agree to AMEND Agreement 05ER45064ORG as follows (or if the Agreement has been thus amended previously, to repeat the following sections):

i) Under the Compliance with Laws section, a **new subsection** is hereby added to the Agreement which reads as follows:

CONSULTANT certifies that at the time of execution of this Agreement CONSULTANT is not included on any debarment list maintained by any federal, state or local governmental authority nor prevented from performing Work for COMPANY by virtue of any governmental order, proceeding or otherwise. If at any time during the term of this Agreement CONSULTANT cannot so certify to COMPANY, CONSULTANT shall promptly notify COMPANY as to CONSULTANT'S status.

ii) The following language is hereby added to the Termination section under the termination for default paragraphs:

-- violates any EHS law; or

iii) All other provisions of the Agreement shall continue in full force and effect.

7.0 **Retainage:** Waive 10% retainage.

8.0 CONSULTANT shall submit invoices in duplicate to:

SFPP, L.P.

2319 S Riverside Ave

Bloomington, CA 92316

Attn: ROSE, TINA
Phone: 909-873-5106
Fax: 909-877-9036

8.1 Invoices must clearly indicate the Agreement Number, Work Directive Number, as indicated above.

8.2 For Construction Projects, a Certificate of Final Completion must be completed, signed by an authorized representative, notarized, and attached to CONSULTANT'S final invoice.

9.0 CONSULTANT hereby certifies that it has downloaded, reviewed and understood the Kinder Morgan Contractor Safety Manual and shall, prior to the commencement of any Work hereunder, make the same available to its employees and subcontractors who will be performing work on premises owned and/or operated by the KM entity named below. If the English language is a communication barrier, CONSULTANT at its expense shall timely convert/translate the Kinder Morgan Contractor Safety Manual accurately into the appropriate language for its employees and subcontractors. Questions concerning the Manual should be directed to the Kinder Morgan Contractor Safety Indemnitees at: contractor_safety@kindermorgan.com prior to commencement of any Work.

10.0 Facsimile Signatures/Counterparts. This Work Directive may be executed in multiple original counterparts, each of which shall be deemed an original, and together they shall constitute one and the same agreement. Signature of this Work Directive may be effected by facsimile (with confirmation by transmitting machine) and/or transmitted by portable document format ("pdf") file which shall be treated as an original signature, and any such signature, facsimile, pdf file or copy of this signed Work Directive shall be construed and treated as the original and shall be binding as if it were the original.

11.0 For Work performed within the State of California, CONSULTANT shall certify within three working days of execution hereof that the requirements set forth in Exhibit B to this Work Directive have been satisfied. Failure by CONSULTANT to do so shall constitute a breach under Section 10 [for cause with no notice] of the Agreement.

In the **Agreement**, if there is a reference to "Kinder Morgan Kansas, Inc.," it shall now be deemed a reference to Kinder Morgan, Inc., a Delaware corporation. This change resulted from an internal corporate reorganization. Kinder Morgan, Inc. owns the same assets formerly owned by Kinder Morgan Kansas, Inc.

By signing below, COMPANY and CONSULTANT affirm that the individual signing below has the requisite authority to authorize the commitment described herein, and that this Work Directive No. 402461-64-CONT is by reference hereby made part of Agreement No. 05ER45064ORG .

This Work Directive is hereby agreed to and accepted:

EXHIBIT WD_A – SCOPE OF WORK

Provide all trained personnel, labor, tools, and equipment necessary to provide Oil Spill Removal Organization (OSRO) services to meet the Federal OPA '90 requirements for contracted oil spill response services as follows:

A. Pipelines in the Orange California to San Diego California and Norwalk, California to Ontario, California areas as follows:

- Pipelines numbered Line Sections 121,122, 123, 124, 125 and 126 running from Kinder Morgan's Orange, CA facility to its Mission Valley Facility
- Pipelines numbered Line Section 1, 10, 105, 109 and 110 located in the Watson to Norwalk to Ontario Areas

B. SFPP, L.P. (Mission Valley Terminal, located at 9950 San Diego Mission Road, San Diego, CA 92108 and Orange Terminal located at 1350 Main Street, Orange, CA 92867).

Services to include:

□ Sufficient Response Resources to enable COMPANY to meet the requirements of the OPA '90 for pre-contracted Response Resources at the commencement of the Agreement, including:

- Prepositioning one thousand feet of containment boom at the Orange and Mission Valley facilities and responding with means to deploy it or other appropriate equipment and materials, as identified in the Tactical Response Plans presented in Volume 2, Section 8.4, within one (1) hour of notification;

- Oil recovery devices with an effective daily recovery capability (EDRC) equal to the amount of oil discharged in a small discharge (2100 gallons) and temporary storage capacity equal to two (2) times the EDRC within two (2) hours of notification. Travel times are based on suitable safety conditions and travel time capability per the U.S. Coast Guard minimum response time calculation factor of 35 mph overland and five (5) knots on water;

- Documentation of equipment deployment exercises and personnel training must be submitted annually to

Mr. Chuck Mathis
Manager Emergency Response Programs
c/o Kinder Morgan Energy Partners, L.P.
500 Dallas Street, Suite 1000
Houston, TX 77002
Or charles_mathis@kindermorgan.com

- Compliance by the CONSULTANT and CONSULTANT's subcontractors with all applicable Federal Occupational Safety and Health Administration (OSHA) standards and similar applicable State laws, rules and/or standards.

RE: RFP for OSRO Services dated June 14, 2012

Dear Mr. Vasquez:

NRC Environmental Services Inc. (NRC) is pleased to provide the following proposal to Kinder Morgan Energy Partners L.P. (KM) and its affiliated companies to act as KM's OSRO to respond to leaks and spill emergencies for KM's Office of Spill Prevention and Response (OSPR) facilities of Mission Valley Terminal, Orange Terminal and LA Harbor Terminal and their associated Pipeline Line Sections as outlined in the referenced Request for Proposals.

NRC, the leading oil spill response contractor operating in the United States, is fully qualified to provide the requested OSRO services. NRC is the only spill response contractor rated by OSPR as meeting all levels of OSRO rating requirements throughout the State of California, including all containment booming, recovery, temporary storage and shoreline protection capabilities. NRC is also rated by the USCG as meeting all OSRO Classification requirements for facilities, including MM, W1, W2, and W3 for all operating environments including rivers/canals, inland and oceans.

Mission Valley Terminal, San Diego, CA and Orange Terminal, Orange, CA

Including Pipeline Line Sections: 122, 123, 124, 125, 126 – Orange, CA to San Diego Harbor, CA; 1, 10, 105, 109, 110 – Watson Station (Carson, CA) to Norwalk Station (Norwalk, CA) to Colton Station (Bloomington, CA)

NRC has provided OSRO coverage to the Mission Valley and Orange Terminals and associated pipelines since 2005 pursuant to annual Work Directives with KM. As part of its coverage, NRC has pre-positioned 1000 feet of NRC containment boom at both the Mission Valley Terminal and the Orange Terminal in order to facilitate meeting KM's initial one-hour response requirement. NRC's OSRO coverage also meets all of KM's other state and federal

contingency planning requirements for contracted oil spill response capabilities, including containment, recovery and storage, as well as shoreline protection. NRC also provides two NRC response personnel to participate in annual tabletop drills for the facilities as requested by KM at no additional charge.

Based on continuing to provide the above OSRO coverage for a three-year term beginning September 1, 2012 through August 31, 2015, NRC offers the following proposal:

- Current annual retainer fee of $40,226.86 discounted by 10% to $36,204.17
- No CPI increase applied to second and third year annual retainers
- 10% discount on Price List rates for NRC equipment used on covered facility spills
- 20% annual rebate on planned projects up to annual retainer fee amount

LA Harbor Terminal, San Pedro

Including Pipeline Line Sections: GX32, GX64a, GX64b, GX 104, GX 124, GX, 190 – Dominguez Channel to Los Angeles Harbor; GX 120 – West Basin Los Angeles Harbor to East Basin Los Angeles Harbor

NRC has provided OSRO coverage to the LA Harbor Terminal for the past two years pursuant to pursuant to annual Work Directives with KM. However, coverage of the associated pipelines has not been specifically included in the WD. NRC's OSRO coverage for the Terminal includes a 2-hour initial response requirement, as well as capabilities to meet all of KM's state and federal contingency planning requirements for contracted oil spill response, including containment, recovery and storage, as well as shoreline protection. NRC also provides two NRC response personnel to participate in annual tabletop drills for the facilities as requested by KM at no additional charge.

NRC proposes to continue providing OSRO coverage to the LA Harbor Terminal – as well as add the OSRO coverage for the associated Pipeline Line Sections as outlined above – for a three-year term beginning September 1, 2012 through August 31, 2015, as follows:

- Current annual retainer fee of $37,573.62 discounted by 10% to $33,816.26
- No CPI increase applied to second and third year annual retainers
- 10% discount on Price List rates for NRC equipment used on covered facility spills
- 20% rebate on planned project NRC resources up to annual retainer fee amount

Proposal Details

The above proposals would provide KM's Mission Valley, Orange and LA Harbor Terminals and their associated Pipeline Line Sections with NRC's unmatched OSRO coverage in the most cost effective manner possible. With the longer coverage period of 3 years, NRC is offering a discount on the current rate with no CPI increase for the term of the contract.

In addition, to offering the extended term discount, the entire retainer amount could be rebated back to KM based on the proposed 20% rebate on NRCES labor, equipment and

materials utilized on planned projects at any of these covered terminals. For example, planned project revenues from the Mission Valley and/or Orange Terminals and/or Pipelines of $160,000 would yield a rebate of $32,000, effectively offsetting the annual retainer for those facilities. Each planned project invoice will reflect the rebate, so the KM facility would realize the offset savings immediately.

NRC appreciates the long standing relationship it has had in providing OSRO coverage and related services to KM and looks forward to continuing to provide KM and its affiliated companies with OSRO coverage services. If you have any questions regarding this proposal or about NRC's OSRO capabilities or services, please don't hesitate to contact me either by phone at 206-730-3993 or by email at sbarton@nrces.com. In addition, I would welcome an opportunity to discuss further cost savings that would result from NRC providing nationwide OSRO coverage services to KM.

Best Regards,

Stephanie Barton

EXHIBIT WD_B – REVISED RELEASE REPORTING CRITERIA

1.0 CONSULTANT shall ensure that its employees, agents, and subcontractors' employees engaged in CONSULTANT'S activities in the performance of the Work:

1.1 are notified, and when required, as determined by COMPANY, trained and instructed by COMPANY, either directly or through a train-the-trainer program instituted by COMPANY, concerning the order of actions to be taken upon discovery of a release or threatened release condition of a Hazardous Material or pollutant substance; and

1.2 understand that no Work or visit shall be undertaken to any COMPANY right-of-way or facility where there is no COMPANY representative onsite and readily accessible (a "Non-Company Onsite Situation"), unless the training referred to in (i) above has occurred for CONSULTANT'S employees, agents and subcontractors' employees who will be performing at such a site.

1.3 Will be working in a COMPANY Onsite Situation and MUST ensure that its employees, agents and subcontractors' employees have been notified accordingly, and if deemed necessary by COMPANY, CONSULTANT will assure that prior to performing any Work CONSULTANT'S employees, agents and subcontractors' employees will be trained relative to COMPANY'S revised release reporting criteria.

1.4 For purposes of this Exhibit "Hazardous Material(s)" shall mean and include (a) all elements or compounds that are contained in the list of hazardous substances adopted by the United States Environmental Protection Agency and the list of toxic pollutants designated by Congress or the Environmental Protection Agency or under any EHS Laws; and (b) any "hazardous waste," "hazardous substance" (including, but not limited to, petroleum and petroleum-related materials), "toxic substance," regulated substance," "pollutant" or "contaminant", each as defined under any EHS Law. "EHS Laws" shall mean any and all federal, state, and local laws, regulations and requirements pertaining to health, safety, or the environment.

CONSULTANT shall certify its compliance with this training requirement upon COMPANY request.

Acknowledged, agreed and accepted this day of , 20___

4.0 SPILL IMPACT CONSIDERATIONS

4.1 CRITICAL AREAS TO PROTECT

The critical areas to protect are classified as high, moderate, and low sensitivity to oil. The Federal, state, and local authorities will further clarify these categories at the time of the response. The categories are defined as follows:

HIGH SENSITIVITY

- Areas which are high in productivity, abundant in many species, extremely sensitive, difficult to rehabilitate, or inhabited by threatened/endangered species.
- Areas which consist of vegetated low banks, freshwater/saltwater marshes, swamps, scrub-shrub wetlands and impact to threatened/endangered species.

MODERATE SENSITIVITY

- Areas of moderate productivity, somewhat resistant to the effects of oiling.
- Areas which consist of mixed sand, gravel beaches, bars, gently sloping banks, and no impact to threatened/endangered species.

LOW SENSITIVITY

- Areas of low productivity, man-made structures, and/or high energy.
- Areas which consist of gravel, sand, or clay material, barren/rocky shores or banks, man-made structures, concrete/compacted earthen drainage ditches and no impact to threatened/endangered species.

4.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES

Environmental/socio-economic sensitivities are of extreme importance when planning a response effort. The health and safety of the public and the environment, as well as the protection of the various socio-economic sensitivities, must be promptly addressed in order to mitigate the extent of damage and minimize the cost of the clean-up effort.

To determine adequate response resources, the Worst Case Discharge volumes are utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three (3) tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified for the applicable response tier. The tier requirements for high volume areas are for response in six (6) hours (Tier 1), 30 hours (Tier 2), and 54 hours (Tier 3). High volume areas are listed in 49 CFR 194. The tier requirements for all other areas are for response in 12 hours (Tier 1), 36 hours (Tier 2), and 60 hours (Tier 3).

4.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES (Cont'd)

All environmental/socio-economic sensitivities are worthy of protection, but must be prioritized during a response effort. When making decisions on which areas to designate as collection areas and which to protect, the following sources may be consulted:

- U.S. Fish and Wildlife Service and related state agencies
- Applicable Area Contingency Plans (see CD affixed to inside front cover of Volume 1 and the CD Navigation Summary in Figure 4.2)
- Other industry and private experts

The environmental and socio-economic sensitivities in the area have been broken down into specific categories and identified in this section.

4.3 WILDLIFE PROTECTION AND REHABILITATION

The Company will work with Federal, State, and local agency personnel to provide labor and transportation to retrieve, clean, and rehabilitate birds and wildlife affected by an oil spill, as necessary. Oversight of the Company's wildlife preservation activities and coordination with Federal, State, and local agencies during an oil spill is the responsibility of the Incident Commander.

Special consideration should be given to the protection and rehabilitation of endangered species and other wildlife and their habitat in the event of an oil spill and subsequent response. Jurisdictional authorities should be notified and worked with closely on all response/clean-up actions related to wildlife protection and rehabilitation. Laws with significant penalties are in place to ensure appropriate protection of these species.

4.3.1 Endangered/Threatened Species

The U.S. Fish and Wildlife Service (USFWS) and related state agencies classify the status of various wildlife species in the potentially effected states. A summary of critical birds, reptiles, mammals, and plant species status as related to the Facility's operating areas (area of highest oil spill potential) is presented in Figure 4.1.

4.3.2 Wildlife Rescue

The Company will work with Federal, State, and local agency personnel to provide labor and transportation to retrieve, clean, and rehabilitate wildlife affected by an oil spill, as the situation demands.

4.3 WILDLIFE PROTECTION AND REHABILITATION (Cont'd)

4.3.2 Wildlife Rescue (Cont'd)

The following are items which should be considered for wildlife rescue and rehabilitation during a spill response:

- Bird relocation can be accomplished using a variety of deterrents, encouraging birds to avoid areas of spilled oil. Bird relocation can be accomplished by utilizing deterrent methods including:
  - Use of visual stimuli, such as inflatable bodies, owls, stationary figures, or helium balloons, etc.
  - Use of auditory stimuli, such as propane cannons, recorded sounds, or shell crackers.
  - Use of herding with aircraft, boats, vehicles, or people (as appropriate).
  - Use of capture and relocation.

4.3.3 Search and Rescue - Points to Consider

- **The Company's involvement should be limited to offering assistance as needed or requested by the agencies.**
- Prior to initiating any organized search and rescue plan, **authorization must be obtained from the appropriate federal/state agency.**
- **Initial search and rescue efforts, if needed, should be left up to the appropriate agencies.** They have the personnel, equipment, and training to immediately begin capturing contaminated wildlife.
- With or without authorization it must be anticipated that volunteer citizens will aid distressed/contaminated wildlife on their own. It is important to communicate that it may be illegal to handle wildlife without express authority from appropriate agencies. Provisions should be made to support an appropriate rehabilitator, however, **no support should be given to any unauthorized volunteer rescue efforts.**
- The regulatory agencies and response personnel should be provided the name and location of a qualified rehabilitator in the event contaminated wildlife is captured.
- Resources and contacts that can assist with wildlife rescue and rehabilitation are provided in Section 2.0. This list includes:
  - Outside rehabilitation organizations
  - Local regulatory agencies
  - Other resources

4.4 STAGING AREAS

When establishing personnel and equipment staging areas for a response to a Facility discharge, the following criteria should be evaluated:

- Access to waterborne equipment launching facilities and/or land equipment.
- Access to open space for staging/deployment of heavy equipment and personnel.
- Access to public services utilities (electricity, potable water, public phone, restroom and washroom facilities, etc.)
- Access to the environmental and socio-economically sensitive areas which are projected for impact.

4.5 TRAJECTORY ANALYSIS

Oil spilled on water will react primarily to the effects of wind and current. The oil will tend to spread to a thin layer under the influence of gravity (primary) and chemical (secondary) forces. The following describes the behavior of oil on water:

- Oil will move in the direction and at the rate of the current under negligible wind conditions.
- Oil will move in the direction and at approximately 3.4 % of the velocity of the wind under negligible current conditions.
- The combined effects of wind and current on the oil should be carefully analyzed. A method of vector analysis can be performed to determine the net direction of movement (wind forces can work in addition to, against, or in many other combinations with the current).
- The primary method of surveillance for the Facility will be visual. Visual surveillance is not effective however in rain, fog, darkness, or heavy cloud cover. It is difficult to observe a slick on the water from a boat, dock or land due to the angle of observation. Aerial surveillance is the preferred method of visual surveillance because of the elevated view and the ability to cover a large area in a short period.

ACP/GRP CD
NAVIGATION INSTRUCTIONS
(Excerpt from CD affixed to inside front cover of Volume 1)

KINDER MORGAN

The information contained herein is provided to identify specific spill response and protection strategies for the applicable Kinder Morgan Pacific Operations Regions. Navigating through the bookmark links provided on the CD will take you to the Environmentally Sensitive Sites and the Economically Significant Sites provided in the applicable Area Contingency Plans and Geographic Response Plans.

INSTRUCTIONS FOR USE

1. From the screen on the left, click on region of interest. The different regions are identified by the red font.
2. Once the appropriate region is accessed, click on the "+" to the left of the region name to display the various areas within each region. These are identified with blue font.
3. Once the appropriate area is accessed, the links to the Environmentally Sensitive Sites and the Economically Significant Sites will be available for selection.
   - ➢ It is important to note that once each Environmentally Sensitive Site and Economically Significant Site is accessed, the user will have to scroll to the desired location.
   - ➢ Use the zoom icon to zoom into each page for easier reading.

NOTES:

1. In those areas where the statement "No ACP Information Available" is made, it indicates that there is no ACP or GRP information which is specific to the particular region or area of interest.
2. EPA REGION IX: For areas without specific ACP/GRP information, the Region IX Contingency Plan (RCP) is used as the response guidance; however, this RCP is currently in revision.
3. EPA REGION X: Region X is covered by the Northwest Area Contingency Plan; however, inland facilities are not addressed.
4. Thus, the following areas are covered by specific area contingency or geographic response plans on this CD:
   - Northern Region—Northwest: Linnton-Willbridge, Washington Area
   - Northern Region—Bay: Brisbane, Concord, Richmond, San Jose
   - Southern Region—Central: Colton
   - Southern Region—West: Carson, Watson, Mission Valley
5. And, the following areas do not have specific area contingency or geographic response plans on this CD:
   - Northern Region—Northwest: Oregon Pipelines (inland)
   - Northern Region—Central: Fresno
   - Northern Region—CalNev: Sacramento, Rocklin, Reno
   - Southern Region—East: Imperial, Phoenix, Tucson
   - Southern Region—Central: Colton, Barstow, Las Vegas

5.0 DISPOSAL PLAN

5.1 OVERVIEW

A major oil spill response would generate significant quantities of waste materials ranging from oily debris and sorbent materials to sanitation water and used batteries. All these wastes need to be classified and separated (i.e., oily, liquid, etc.), transported from the site, and treated and/or disposed of at approved disposal sites. Each of these activities demands that certain health and safety precautions be taken, which are strictly controlled by federal and state laws and regulations. This section provides an overview of the applicable state regulations governing waste disposal, and a discussion of various waste classification, handling, transfer, storage, and disposal techniques. It is the responsibility of the Environmental Manager or their designee to manage the following:

- Coordinate waste disposal activities;
- Identify appropriate interim storage methods and locations;
- Coordinate permitting activities needed to ensure proper disposal; and
- Documents compliance with appropriate local, State, and Federal handling of hazardous materials and/or wastes.

Material will be containerized or stored in a manner complying with applicable environmental regulations pertaining to the known or suspected materials characteristics. Upon characterization, waste, recyclable materials, or contaminated materials will be treated on-site, recycled, or transported and disposed of at an appropriate KMEP approved facility after appropriate regulatory approval.

5.2 WASTE CLASSIFICATION

Oily - Liquid Wastes

Oily liquid wastes (i.e., oily water and emulsions) that would be handled, stored, and disposed of during response operations are very similar to those handled during routine storage and transfer operations. The largest volume of oily liquid wastes would be produced by recovery operations (e.g., through the use of vacuum devices or skimmers). In addition, oily water and emulsions would be generated by vehicle operations (e.g., spent motor oils, lubricants, etc.), and equipment cleaning operations.

Non-Oily - Liquid Wastes

Response operations would also produce considerable quantities of non-oily liquid wastes. Water and other non-oily liquid wastes would be generated by the storage area and stormwater collection systems, vessel and equipment cleaning (i.e., water contaminated with cleaning agents), and office and field operations (i.e., sewage, construction activities).

Solid Wastes

A solid waste is defined as any discarded material provided that it is not specifically excluded under the regulations. These exclusions cover materials such as domestic sewage and mixtures of sewage discharged through a sewer system or industrial wastewater point source discharges.

A discarded material is any material which is abandoned (disposed of, burned or incinerated) or accumulated, stored or treated prior to being abandoned. A discarded material is also any material recycled or any material considered inherently wastelike. Recycled material is considered solid waste when used in a manner constituting disposal, placed on land or burned for energy recovery.

5.2 WASTE CLASSIFICATION (Cont'd)

Solid Wastes (Cont'd)

A solid waste may be considered a hazardous waste. A solid waste, as defined above, may be a hazardous waste if it is not excluded from regulation and is either a listed hazardous waste or exhibits the characteristics of a hazardous waste. A solid waste exhibits the characteristics of a hazardous waste if it exceeds the thresholds established in determining the following:

1) ignitability
2) corrosivity
3) reactivity
4) toxicity

A solid waste may also become a hazardous waste if it is mixed with a listed hazardous waste or, in the case of any other waste (including mixtures), when the waste exhibits any of the characteristics identified above.

Oily - Solid/Semi-Solid Wastes

Oily solid/semi-solid wastes that would be generated by containment and recovery operations include damaged or worn-out booms, disposable/soiled equipment, used sorbent materials, saturated soils, contaminated beach sediments, driftwood, and other debris.

Non-Oily - Solid/Semi-Solid Wastes

Non-oily solid/semi-solid wastes would be generated by emergency construction operations (e.g., scrap, wood, pipe, and wiring) and office and field operations (i.e., refuse). Vessel, vehicle, and aircraft operations also produce solid wastes.

5.3 WASTE HANDLING

A primary concern in the handling of recovered oil and oily debris is contaminating unaffected areas or recontaminating already cleaned areas. Oily wastes generated during the response operations would need to be separated by type and transferred to temporary storage areas and/or transported to incineration or disposal sites. Proper handling of oil and oily wastes is imperative to ensure personnel health and safety.

Safety Considerations

Care would be taken to avoid or minimize direct contact with oily wastes. All personnel handling or coming into contact with oily wastes would wear protective clothing. A barrier cream can be applied prior to putting on gloves to further reduce the possibility of oily waste absorption. Safety goggles would be worn by personnel involved in waste handling activities where splashing might occur. Any portion of the skin exposed to oily waste would be washed with soap and water as soon as possible. Decontamination zones would be set up during response operations to ensure personnel are treated for oil exposure.

5.3 WASTE HANDLING (Cont'd)

Waste Transfer

During response operations, it may be necessary to transfer recovered oil and oily debris from one point to another several times before the oil and oily debris are ultimately recycled, incinerated or disposed of at an appropriate disposal site. Depending on the location of response operations, any or all of the following transfer operations may occur:

- From portable or vessel-mounted skimmers into flexible bladder tanks, storage tanks of the skimming vessel itself, or a barge.
- Directly into the storage tank of a vacuum device.
- From a skimming vessel or flexible bladder to a barge.
- From a vacuum device storage tank to a barge.
- From a barge to a tank truck.
- From a tank truck to a processing system (e.g., oil/water separator).
- From a processing system to a recovery system and/or incinerator.
- Directly into impermeable bags that, in turn, are placed in impermeable containers.
- From containers to trucks.

There are four general classes of transfer systems that may be employed to affect oily waste transfer operations:

- **Pumps:** Rotary pumps, such as centrifugal pumps, may be used when transferring large volumes of oil, but they may not be appropriate for pumping mixtures of oil and water. The extreme shearing action of centrifugal pumps tends to emulsify oil and water, thereby increasing the viscosity of the mixture and causing low, inefficient transfer rates. The resultant emulsion would also be more difficult to separate into oil and water fractions. Lobe or "positive displacement" pumps work well on heavy, viscous oils, and do not emulsify the oil/water mixture. Double-acting piston and double acting diaphragm pumps are reciprocating pumps that may also be used to pump oily wastes.

- **Vacuum Systems**: A vacuum truck may be used to transfer viscous oils but they usually pick up a very high water/oil ratio.

- **Belt/Screw Conveyors:** Conveyors may be used to transfer oily wastes containing a large amount of debris. These systems can transfer weathered debris laden oil either horizontally or vertically for short distances (i.e., 10 feet) but are bulky and difficult to set up and operate.

- **Wheeled Vehicles:** Wheeled vehicles may be used to transfer liquid wastes or oily debris to storage or disposal sites. These vehicles have a limited transfer volume (i.e., 100 barrels) and require good site access.

Figure 5.1 provides a comparative evaluation of 16 types of transfer systems that could be available for transfer operations.

5.4 WASTE STORAGE

Interim storage of recovered oil, oily and non-oily waste would be considered to be an available means of holding the wastes until a final management method is selected. In addition, the segregation of wastes according to type would facilitate the appropriate method of disposal. The storage method used would depend upon:

- The type and volume of material to be stored.
- The duration of storage.
- Access.

During an oil spill incident, the volume of oil that can be recovered and dealt with effectively depends upon the available storage capacity. Typical short-term storage options are summarized in Figure 5.2. The majority of these options can be used either onshore or offshore.

If storage containers such as bags or drums are used, the container must be clearly marked and/or color-coded to indicate the type of material/waste contained and/or the ultimate disposal option. Bladder or pillow tanks would be acceptable, if the available space can support the weight of both the container and the product.

Fuel barges may be the best option for temporary storage of oil recovered in open waters. Depending on size, these vessels may be able to hold up to 6,000 barrels of oil and water. The barge deck can be used as a platform for operating oil spill clean-up equipment and storing containment boom.

Empty barges have four to six feet draft which would increase when these barges are filled with oil or loaded with cargo. Consequently, they may not be able to enter shallow, nearshore waters.

It may be difficult to offload recovered oil stored inside barges. Due to natural forces which affect spilled oil, recovered oil may be very viscous or emulsified, rather than free-flowing. It may be necessary to use steam to heat viscous oil before pumping it from the barge.

Steel or rubber tanks can be used to store oil recovered near the shoreline. To facilitate offloading, demulsifiers may be used to break emulsions prior to placing the recovered substance into the barges or storage tanks.

Use of any site for storage is dependent on the approval of the local authorities. The following elements affect the choice of a potential storage site:

- Geology.
- Ground water.
- Soil.
- Flooding.
- Surface water.
- Slope.
- Covered material.
- Capacity.
- Climatic factors.
- Land use.
- Toxic air emissions.
- Security.
- Access.
- Public contact.

5.4 WASTE STORAGE (Cont'd)

Temporary storage sites should use the best achievable technology to protect the environment and human health. They should be set up to prevent leakage, contact, and subsequent absorption of oil by the soil. The sites should be bermed (1 to 1.5 meters high) and double lined with plastic or visqueen sheets 6-10 mils or greater in thickness, without joints, prior to receiving loose and bagged debris. The edges of the sheet should be weighted with stones or earth to prevent damage by wind, and the sheet should be placed on a sand layer or an underfelt thick enough to prevent piercing. A reinforced access area for vehicles at the edge of the site should be provided. In addition, the oily debris should be covered by secured visqueen or tarps and an adequate stormwater runoff collection system for the size and location of the site would be utilized. Additionally, the sites should be at least 3 meters above mean sea level.

Oily debris can be hauled to approved temporary storage sites in visqueen lined trucks or other vehicles. Burnable, non-burnable, treatable and re-usable materials can be placed in well defined separate areas at temporary storage sites.

When the last of the oily debris leaves a temporary storage site, the ground protection would be removed and disposed of with the rest of the oily debris. Any surrounding soil which has become contaminated with oil would also be removed for disposal or treatment. If the soils were removed for treatment, they may be replaced if testing proves acceptable levels have been achieved. Treatment and remediation is encouraged when feasible. The temporary storage should be returned to its original condition.

5.5 WASTE DISPOSAL

Techniques for Disposal of Recovered Oil

Recovery, reuse, and recycling are the best choices for remediation of a spill, thereby reducing the amount of oily debris to be bermed onsite or disposed of at a solid waste landfill. Treatment is the next best alternative, but incineration and burning for energy recovery have more options within the state. There are some limitations and considerations in incinerating for disposal. Environmental quality of incineration varies with the type and age of the facility. Therefore, when incineration becomes an option during an event, local air quality authorities would be contacted for advice about efficiency and emissions of facilities within their authority. Approval of the local air authorities is a requirement for any incineration option. Landfilling is the last option. Final disposal at a solid or dangerous waste landfill is the least environmentally sound method of dealing with a waste problem such as oily debris.

During an oil spill incident, the Company would consult with the federal and state On Scene Coordinator (OSC) to identify the acceptable disposal methods and sites appropriately authorized to receive such wastes. The Company maintains a list of approved disposal sites that satisfy local, state, and federal regulations and company requirements. This identification of suitable waste treatment and disposal sites would be prepared by the Environmental Manager or their designee in the form of an Incident Disposal Plan which must be authorized by the U.S. Coast Guard and/or the EPA. An Incident Disposal Plan would include predesignated interim storage sites, segregation strategies, methods of treatment and disposal for various types of debris, and the locations/contacts of all treatment and disposal site selections. Onsite treatment/disposal will be preferred.

5.5 WASTE DISPOSAL (Cont'd)

Techniques for Disposal of Recovered Oil (Cont'd)

In order to obtain the best overall Incident Disposal Plan, a combination of methods should be used. There is no template or combination of methods that can be used in every spill situation. Each incident should be reviewed carefully to ensure an appropriate combination of disposal methods are employed.

The different types of wastes generated during response operations would require different disposal methods. To facilitate the disposal of wastes, they should be separated by type for temporary storage, transport and disposal. Figure 5.3 lists some of the options that would be available to segregate oily wastes. The table also depicts methods that may be employed to separate free and/or emulsified water from the oily liquid waste.

The following is a brief discussion of some disposal techniques available for recovered oil and oily debris.

Recycling

This technique entails removing water from the oil and blending the oil with uncontaminated oil. Recovered oil can be shipped to refineries provided that it is exempt from hazardous waste regulations. There it can be treated to remove water and debris, and then blended and sold as a commercial product.

The Environmental Manager or their designee is responsible for ensuring that all waste materials be disposed of at an internally approved disposal site.

Incineration

This technique entails the complete destruction of the recovered oil by high temperature thermal oxidation reactions. There are licensed incineration facilities as well as portable incinerators that may be brought to a spill site. Incineration may require the approval of the local Air Pollution Control Authority. Factors to consider when selecting an appropriate site for onsite incineration would include:

- Proximity to recovery locations.
- Access to recovery locations.
- Adequate fire control.
- Approval of the local air pollution control authorities.

In Situ Burning/Open Burning

Burning techniques entail igniting oil or oiled debris and allowing it to burn under ambient conditions. These disposal techniques are subject to restrictions and permit requirements established by federal, state and local laws. They would not be used to burn PCBs, waste oil containing more than 1,000 parts per million of halogenated solvents, or other substances regulated by the EPA. Permission for *in situ* burning may be difficult to obtain when the burn takes place near populated areas.

5.5 WASTE DISPOSAL (Cont'd)

In Situ Burning/Open Burning

As a general rule, *in situ* burning would be appropriate only when atmospheric conditions will allow the smoke to rise several hundred feet and rapidly dissipate. Smoke from burning oil will normally rise until its temperature drops to equal the ambient temperature. Afterwards, it will travel in a horizontal direction under the influence of prevailing winds.

Landfill Disposal

This technique entails burying the recovered oil in an approved landfill in accordance with regulatory procedures. Landfill disposal of free liquids is prohibited by federal law in the United States.

With local health department approval, non-burnable debris which consists of oiled plastics, gravel and oiled seaweed, kelp, and other organic material may be transported to a licensed, lined, approved municipal or private landfill and disposed of in accordance with the landfill guidelines and regulations. Landfill designation would be planned only for those wastes that have been found to be unacceptable by each of the other disposal options (e.g., waste reduction, recycling, energy recovery). Wastes would be disposed of only at Company-approved disposal facilities. The Environmental Manager or their designee is responsible for ensuring that all waste materials are disposed of at a Company internally approved disposal site. Disposal at a non-approved facility would require approval by the Environmental Manager or their designee prior to sending any waste to such a facility.

5.6 REGULATORY REQUIREMENT AND PERMITS

The management of oil and oily wastes must comply with the standards set forth in.:

- Code of Federal Regulations (CFR) Parts 261 and 265 as mandated by the Resource Conservation and Recovery Act (RCRA).

- California Code of Regulations (CCR) Title 22, Division 4, Chapter 30.

- CCR, Title 14, Division 1, Subdivision 4, Chapter 7, Subchapter 2, Determining Amount of Petroleum Hydrocarbons Recovered.

To expedite removal of spilled oil, refined products, and contaminated material from marine waters during an emergency response, temporary storage sites may be erected at appropriate shore locations (22 CCR 66270.1(c)(3)). The transportation of oil and contaminated material to temporary storage sites during emergency response is exempt from handling and permitting requirements (22 CCR 66263.30 and/or 66263.43). The onsite California Environmental Protection Agency, Department of Toxic Substance Control (DTSC) representative or duty officer should be contacted for approval. If a Unified Command is established, OSPR will facilitate the contact with DTSC through their liaison function.

Kinder Morgan will maintain responsibility for recovered oil and oily wastes generated during recovery operations. A temporary storage site may require an emergency permit from the San Francisco Bay Conservation & Development Commission (BCDC) or the California

Coastal Commission (CCC).

5.6 REGULATORY REQUIREMENT AND PERMITS (Cont'd)

Citing of the temporary facility must be done with the concurrence of the USCG and State OSC, DTSC, the local RQQCB, and the local health, fire and emergency services. If a Unified Command is established, OSPR will facilitate the contact of the state and local agencies through their liaison function.

The San Francisco Bay Conservation and Commission and the California Coastal Commission have created the Joint CCC/BCDC Oil Spill Program to respond to oil-spill-related matters in the San Francisco Bay area and along the coast. This program acts as the single point of contact, and requests for emergency permits (including waste management) should be directed to the following Joint CCC/BCDC Oil Spill Program staff:

Joint CCC/BCDC Oil Spill Program	(415) 904-5250 (phone)
45 Fremont Street, Suite 2000	(415) 904-5400 (fax)

The Incident Commander will coordinate activities to obtain the necessary permits to ensure proper disposal or recycling of recovered oil and debris.

Comments	E,J	B	B	B,J		F	A	B	B,D	A,C,D	F,G,I	F,G,I	F,G			G,H,I

KEY TO RATINGS: 5 = Best; 1 = Worst

KEY TO COMMENTS:

A. Normally require remote power sources, thus are safe around flammable fluids.
B. Should have a relief valve in the outlet line to prevent bursting hoses.
C. Air powered units tend to freeze up in sub-freezing temperatures.
D. Units with work ball valves are difficult to prime.
E. Some remotely powered types are designed to fit in a tanker's butterworth hatch.
F. Can also pump air at low pressure.
G. Transfer is batch-wise rather than continuous.
H. Waste must be in separate container for efficient transfer.
I. Transportable with its own prime mover.
J. High shear action tends to emulsify oil and water mixtures.

FIGURE 5.2

TEMPORARY STORAGE METHODS

CONTAINER	ONSHORE	OFFSHORE	SOLIDS	LIQUIDS	NOTES
Barrels	x	x	x	x	May require handling devices. Covered and clearly marked.
Tank Trucks	x	x		x	Consider road access. Barge-mounted offshore.
Dump/Flat Bed Trucks	x		x		May require impermeable liner and cover. Consider flammability of vapors at mufflers.
Barges		x	x	x	Liquids only in tanks. Consider venting of tanks.
Oil Storage Tanks	x	x		x	Consider problems of large volumes of water in oil.
Bladders	x	x		x	May require special hoses or pumps for oil transfer.

FIGURE 5.3

OILY WASTE SEPARATION AND DISPOSAL METHODS

TYPE OF MATERIAL	SEPARATION METHODS	DISPOSAL METHODS
LIQUIDS		
Non-emulsified oils	Gravity separation of free water	Incineration Use of recovered oil as refinery/production facility feedstock
Emulsified oils	Emulsion broken to release water by: ● heat treatment ● emulsion breaking chemicals ● mixing with sand ● centrifuge ● filter/belt press	Use of recovered oil as refinery/production facility feedstock
SOLIDS		
Oil mixed with sand	Collection of liquid oil leaching from sand during temporary storage Extraction of oil from sand by washing with water or solvent Removal of solid oils by sieving	Incineration Use of recovered oil as refinery/production facility feedstock Direct disposal Stabilization with inorganic material Degradation through land farming or composting
Oil mixed with cobbles or pebbles	Screening Collection of liquid oil leaching from materials during temporary storage Extraction of oil from materials by washing with water or solvent	Incineration Direct Disposal Use of recovered oil as refinery/production facility feedstock
Oil mixed with wood, seaweed and sorbents	Screening Collection of liquid oil leaching from debris during temporary storage Flushing of oil from debris with water	Incineration Direct disposal Degradation through land farming or composting for oil mixed with seaweed or natural sorbents
Tar balls	Separation from sand by sieving	Incineration Direct disposal

4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

OPERATIONS

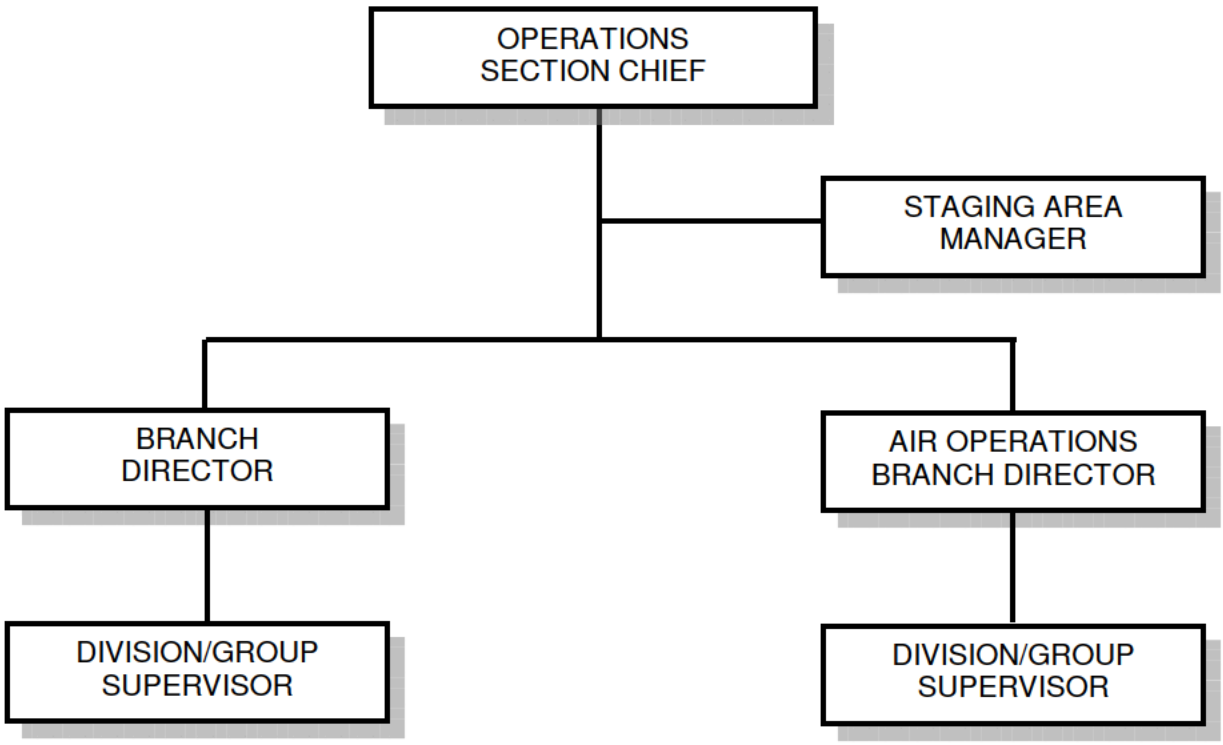
Operations Section Chief 4-21

Air Operations Branch Director 4-21

Staging Area Manager 4-25

Branch Director 4-25

Division/Group Supervisor 4-29



OPERATIONS SECTION CHIEF

The Operations Section Chief (OPS) is responsible for the management of all operations directly applicable to the primary mission (i.e. clean-up, recovery etc.). The OPS activates and supervises tactical response elements in accordance with the Incident Action Plan (IAP) and directs its execution. The OPS also requests or releases resources, makes expedient changes to the IAP, as necessary; and reports these actions to the IC.

Overall OPS Responsibilities

- Develop operations portion of IAP.
  This generally includes the designation of branches, divisions and groups, as well as input on required resources.
- Brief and assign Operations Section personnel in accordance with the IAP.
- Supervise Operations Section.
- Determine need and request additional resources.
- Review suggested list of resources to be released and initiate recommendation for release of resources.
- Assemble and disassemble strike teams assigned to the Operations Section.
- Report information about special activities, events, and occurrences to the IC.
- Respond to resource requests in support of NRDAR activities.

Additional KM Required OPS Responsibilities

- Directs KM personnel and emergency response contractors performing operations activities
- Review and ensure communication of the Site Specific H&S Plan to KM personnel and emergency response contractors performing operations activities
- Supervise the decontamination system
  - Ensure decontamination system is set-up and functional prior to Hot Zone entry
  - Request input from the Safety Officer, as necessary

AIR OPERATIONS BRANCH DIRECTOR

The Air Operations Branch Director (AIROPS), who is ground-based, is primarily responsible for preparing the air operations portion of the IAP. The plan will reflect agency restrictions that have an impact on the operational capability or utilization of resources (e.g., night flying, hours per pilot). After the plan is approved, the AIROPS is responsible for implementing its strategic aspects, which are those that relate to the overall incident strategy as opposed to those that pertain to tactical operations (specific target selection). Additionally, the AIROPS is responsible for providing logistical support to helicopters operating on the incident. The Air Tactical Group Supervisor, working in conjunction with ground and air resources, normally performs specific tactical activities, such as target selection and suggested modifications to specific tactical actions in the IAP.

Overall AIROPS Responsibilities:

- Organize preliminary air operations.
- Request declaration (or cancellation) of restricted air space
- Participate in preparation of the IAP through the OPS. Insure that the air operations portion of the IAP takes into consideration the Air Traffic Control requirements of assigned aircraft.
- Perform operational planning for air operations.

AIR OPERATIONS BRANCH DIRECTOR (Cont'd)

Overall AIROPS Responsibilities (Cont'd):

- Prepare and provide Air Operations Summary Worksheet (ICS Form 220) to the Air Support Group and Fixed-Wing Bases.
- Determine coordination procedures for use by air organization with ground Branches, Divisions, or Groups.
- Coordinate with appropriate Operations Section personnel.
- Supervise all air operations activities associated with the incident.
- Evaluate helibase locations.
- Establish procedures for emergency reassignment of aircraft.
- Schedule approved flights of non-incident aircraft in the restricted air space area.
- Coordinate with the Operations Coordination Center (OCC) through normal channels on incident air operations activities.
- Inform the Air Tactical Group Supervisor of the air traffic situation external to the incident.
- Consider requests for non-tactical use of incident aircraft.
- Resolve conflicts concerning non-incident aircraft.
- Coordinate with FAA.
- Update air operations plans.
- Report to the OPS on air operations activities.
- Report special incidents/accidents.
- Arrange for an accident investigation team when warranted.

Air Tactical Group Supervisor - The Air Tactical Group Supervisor is primarily responsible for the coordination of aircraft operations when fixed and/or rotary-wing aircraft are operating on an incident. These coordination activities are performed by the Air Tactical Group Supervisor while airborne. The Air Tactical Group Supervisor reports to the AIROPS.

Overall Air Tactical Group Supervisor Responsibilities:

- Determine what aircraft (air tankers and helicopters) are operating within the area of assignment.
- Manage air tactical activities based upon the IAP.
- Establish and maintain communications and Air Traffic Control, with pilots, Air Operations, Helicopter Coordinator, Air Tanker/Fixed Wing Coordinator, Air Support Group (usually Helibase Manager), and fixed-wing Support Bases.
- Coordinate approved flights of non-incident aircraft or non-tactical flights in restricted air space area.
- Obtain information about air traffic external to the incident.
- Receive reports of non-incident aircraft violating restricted air space area (OPS, Branch Director, or Division/Group Supervisor).
- Make tactical recommendations to approved ground contact.
- Inform AIROPS of tactical recommendations affecting the air operations portion of the IAP.
- Report on air operations activities to the AIROPS. Advise air operations immediately if aircraft mission assignments are causing conflicts in the Air Traffic Control System.
- Report on incidents/accidents.

AIR OPERATIONS BRANCH DIRECTOR (Cont'd)

Air Support Group Supervisor - The Air Support Group Supervisor is primarily responsible for supporting and managing helibase and helispot operations and maintaining liaison with fixed-wing air bases. This includes providing: 1) fuel and other supplies; 2) maintenance and repair of helicopters; 3) retardant mixing and loading; 4) keeping records of helicopter activity, and 5) providing enforcement of safety regulations. These major functions are performed at helibases and helispots. Helicopters during landing and take-off and while on the ground are under the control of the Air Support Groups Helibase or Helispot Managers. The Air Support Group Supervisor reports to the AIROPS.

Overall Air Support Group Supervisor Responsibilities:

- Obtain a copy of the IAP from the AIROPS including Air Operations Summary Worksheet (ICS Form 220).
- Participate in AIROPS planning activities.
- Inform AIROPS of group activities.
- Identify resources/supplies dispatched for the Air Support Group.
- Request special air support items from appropriate sources through Logistics Section.
- Identify helibase and helispot locations (from IAP) or from AIROPS.
- Determine need for assignment of personnel and equipment at each helibase and helispot.
- Coordinate special requests for air logistics.
- Maintain coordination with airbases supporting the incident.
- Coordinate activities with AIROPS.
- Obtain assigned ground-to-air frequency for helibase operations from the Communications Unit Leader (CUL) or Incident Radio Communications Plan (ICS Form 205).
- Inform AIROPS of capability to provide night flying service.
- Ensure compliance with each agency's operations checklist for day and night operations.
- Ensure dust abatement procedures are implemented at helibases and helispots.
- Provide crash-rescue service for helibases and helispots.
- Ensure that Air Traffic Control procedures are established between helibases and helispots and the Air Tactical Group Supervisor, the Helicopter Coordinator or the Air Tanker/Fixed-Wing Coordinator.

OIL SPILL

Air Tactical Group Supervisor - The coordination and scheduling of aircraft operations intended to locate, observe, track, surveil, support dispersant applications, or to be used for other deliverable response application techniques, or report on the incident situation when fixed and/or rotary-wing aircraft are airborne at an incident. These coordination activities are normally performed by the Air Tactical Group Supervisor while airborne.

Overall Air Tactical Group Supervisor Responsibilities:

- Obtain a briefing from the Air Operations Branch Director or the OPS.
- Coordinate dispersant, in-situ burning, and bioremediation application through the Air Operations Branch Director.

AIR OPERATIONS BRANCH DIRECTOR (Cont'd)

OIL SPILL (Cont'd)

- Coordinate air surveillance mission scheduling and observer assignments with the SUL.
- Identify remote sensing technology that may enhance surveillance capabilities.
- Coordinate air surveillance observations and provide reports by the most direct methods available.
- Report on air surveillance and operations activities to the Air Operations Branch Director.
- Coordinate application-monitoring requirements with the Helicopter and Fixed-Wing Coordinators and the Situation Unit.
- Report on air application activities to the Air Operation Branch Director.

Resource Request Message

ICS-213 RR CG (05/06)

Requestor

1. Incident Name:	2. Date/Time:	3. Resource Request No:

4. ORDER Note: Use additional forms when requesting different resource sources of supply

a. Qty.	b. Kind	c. Type	d. Detailed item description (Vital characteristics, brand, specs, experience, etc. & if applicable describe purpose/use, attach diagrams, & other amplifying info)	e. Requested Reporting Location:	e. Requested Reporting Date/Time:	f. ETA (LSC):	g. Cost (FSC):

5. Suggested source(s) of Supply - POC phone no. if known & suitable subtitutes:

18. Finance Section Signature:	19. Date/Time:

Full Instructions on back page. Requestor fills out # 1-9 & keeps yellow copy (bottom). If applicable, RESL reviews if resource available & signs # 10. Logistics fills in remainder of # 4 & # 10-15 & keeps pink copy. Finance, if needed fills out appropriate items & keeps green copy. Blue original is returned to RESL for tactical/personnel or requestor for non-tactical. White copy goes to DOCL.

Instructions for filling out the ICS-213RR CG Form (5/06)

REQUESTOR: The requestor must fill in Blocks 1 through 9:

Block # 1	Incident name: This is the same as the name stated on the ICS-201 Form and/or the Incident Action Plan (IAP).
Block # 2	Current date and time when submitting request
Block # 3	Resource Request Number: This is to be assigned by the Section submitting request (i.e. CMD, OPS, PLAN, LOG, FIN)
Block # 4	Fill in blocks 4a through 4e. Items requested: Must include Quantity, Kind and Type (if applicable) and detailed description of requirements. **BE SPECIFIC AS POSSIBLE**. The request should focus on capability rather than naming the brand or specific item (e.g. helicopter capable of carrying 4 personnel from location A to B rather than requesting a Coast Guard H-65 helicopter). This gives the logistics section the ability to find the best resource to meet the need. 4.e Requested Reporting Location/Date/Time: This is self-explanatory and is required for ordering official. Leave blocks 4.f. ETA (LSC) and 4.g. Cost (FSC) blank. These will be filled in later by Logistics and Finance.
Block # 5	Suggested sources of supply and suitable substitutes: Enter applicable information if known.
Block # 6 & 7	Requestor: Print Name and Signature and date/time.
Block # 8	Approval: This must be approved by the Section Chief or Deputy Section Chief.
Block # 9	Check box if request is for tactical or personnel resource(s) and submit request to Resources Unit Leader (RESL) to review and approve since RESL tracks all tactical and personnel resources.

Request goes to RESOURCES UNIT if requesting Tactical/Personnel Resource(s):

Block # 10	Resources reviews request and checks to see if resource is available. If the resource is available, reassigns resource as appropriate and sends request back to requester with information noted as to reporting time, etc. The request form is then sent to Documentation Unit Leader (DOCL) for filing. If the resource is not available, RESL sends request to Logistics.

LOGISTICS SECTION: The following blocks are to be filled out be the Supply Unit (SPUL).

Block # 11	Logistics Order Number: To be assigned by Supply Unit.
Block # 12	Supplier Point of Contact, Phone Number and Fax Number: This information is needed for Credit Card purchases and/or Purchase Orders.
Block # 13	Notes: Enter applicable information as need for request.
Block # 4	ETA and Cost: SPUL or PROC fills in Estimated time of arrival (ETA) when determined and cost if known.
Block # 14 & 15	Approval: This must be approved by the Logistics Section Chief or Deputy Logistics Section Chief, printed name and signature is required with Date and Time of approval. Bottom Copy (pink) is retained.

FINANCE SECTION: The following blocks are to be filled out be the Procurement Unit (PROC), if applicable.

Block # 16	Indicates who is to place order as necessary.
Block # 17	Comments concerning request from Finance Section Chief or Deputy Finance Section Chief.
Block # 18 & 19	Approval: This must be approved by the Finance Section Chief or Deputy Section Chief, printed name and signature is required with Date and Time of approval. Bottom copy (green) is retained.
FILING	Original blue copy is returned to RESL for tactical/personnel resources ordered, and the requester for non-tactical. RESL will inform requester of status of request when form received. The white copy is sent to DOCL.

Note: Cost associated requests will not be ordered without approval from the Finance Section Chief or Deputy Finance Section Chief.

Form Filing: Blue (Original) – final disposition to RESL or originator for non-tactical resources, White (copy 1) to DOCL, Green (copy 2) to FIN, Pink (copy 3) to LOG, Yellow (copy 4) to Originator

UNIT LOG (ICS FORM 214-CG)

Purpose. The Unit Log records details of unit activity, including strike team activity or individual activity. These logs provide the basic reference from which to extract information for inclusion in any after-action report.

Preparation. A Unit Log is initiated and maintained by Command Staff members, Division/Group Supervisors, Air Operations Groups, Strike Team/Task Force Leaders, and Unit Leaders. Completed logs are submitted to supervisors who forward them to the Documentation Unit.

Distribution. The Documentation Unit maintains a file of all Unit Logs. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Check-In Location	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Unit Name/Designators	Enter the title of the organizational unit or resource designator (e.g., Facilities Unit, Safety Officer, Strike Team).
4.	Unit Leader	Enter the name and ICS Position of the individual in charge of the Unit.
5.	Personnel Assigned	List the name, position, and home base of each member assigned to the unit during the operational period.
6.	Activity Log	Enter the time and briefly describe each significant occurrence or event (e.g., task assignments, task completions, injuries, difficulties encountered, etc.)
7.	Prepared By	Enter name and title of the person completing the log. Provide log to immediate supervisor, at the end of each operational period.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

14. Air Operation Support Equipment

15. Prepared by **Date / Time**

AIR OPERATIONS SUMMARY (ICS 220-CG)

Purpose. The Air Operations Summary provides the Air Operations Branch with the number, type, location, and specific assignments of aircraft.

Preparation. The Operations Section Chief or the Air Operations Branch Director completes the summary during each Planning Meeting. General air resource assignment information is obtained from the Operational Planning Worksheet (ICS 215-CG). The Air and Fixed-Wing Support Groups provide specific designators of the air resources assigned to the incident.

Distribution. After the summary is completed by Air Operations personnel (except item 11), the form is given to the Air Support Group Supervisor, who completes the form by indicating the designators of the helicopters and fixed-wing aircraft assigned missions during the specified operational period. This information is provided to Air Operations personnel who, in turn, give the information to the Resources Unit. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Distribution	Check the block and enter the time and date when ICS 220-CG and attachments were sent to all fixed-wing bases and helibases supporting the incident.
4.	Personnel and Communications	List the names of those assigned to each position, and the air-air and air-ground frequencies to be used.
5.	Remarks	Enter the special instructions or information, including safety notes, hazards, and priorities for Air Operations personnel.
6.	Location/Function	Enter the assigned location and function of the aircraft.
7.	Assignment	Enter the scope of work the aircraft is assigned to complete.
8.	Fixed Wing	Indicate the number and type of fixed-wing aircraft available for this Location / Function.
9.	Helicopters	Indicate the number and type of helicopters available for this Location / Function.
10.	Time	Indicate when aircraft will be available for use and when operations commence (use 24 hour clock).
11.	Aircraft Assigned	Enter the designators of the aircraft assigned. Gather information from Resources Unit, helibases, and fixed-wing bases.
12.	Operating Base	Enter the base (helibase, helispot, fixed-wing base) from which each air resource is expected to initiate operations.
13.	Totals	Enter the total number of fixed-wing and helicopter aircraft assigned to the incident in the Number columns. Enter the total number of each type of aircraft assigned in the Type columns.
14.	Air Operations Support Equipment	List the designators and location of other support resources assigned to Air Operations.
15.	Prepared By Date/Time	Enter name and title of the person preparing the form. Enter date (month, day, year) and time prepared (24-hour clock).

4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

FINANCE/ADMINISTRATION

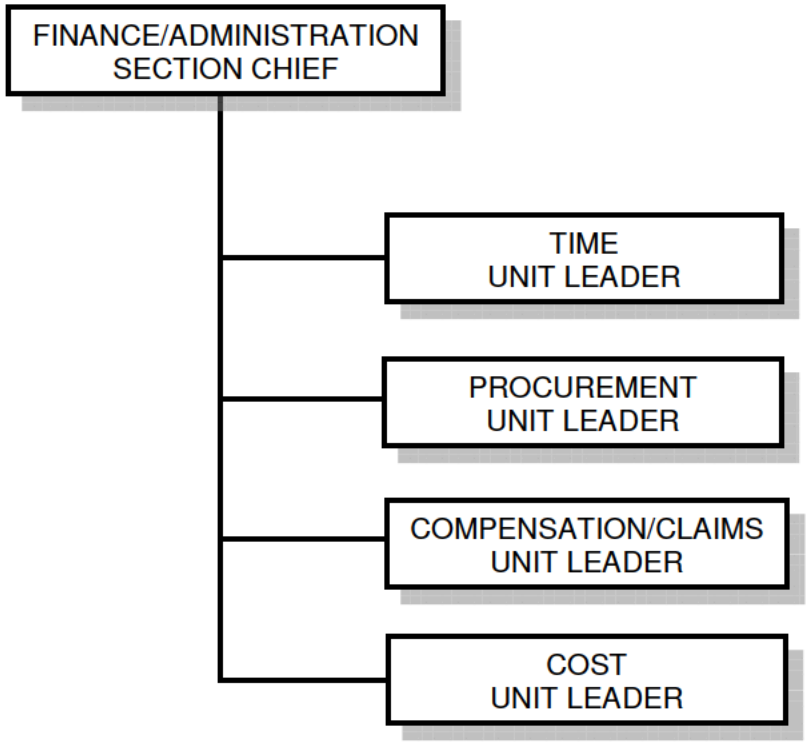
Finance/Administration Section Chief 4-51

Time Unit Leader 4-52

Procurement Unit Leader 4-52

Compensation/Claims Unit Leader 4-53

Cost Unit Leader 4-53



COMPENSATION/CLAIMS UNIT LEADER

The Compensation/Claims Unit Leader is responsible for the overall management and direction of all administrative matters pertaining to compensation for injury and claims related activities (other than injury) for an incident.

Overall Compensation/Claims Unit Leader Responsibilities:

- Obtain a briefing from the Finance/Administration Section Chief.
- Establish contact with the incident SO and LO (or Agency Representatives if no LO is assigned).
- Determine the need for Compensation for Injury and Claims Specialists and order personnel as needed.
- Establish a Compensation for Injury work area within or as close as possible to the Medical Unit.
- Review Incident Medical Plan (ICS Form 206).
- Ensure that Compensation/Claims Specialists have adequate workspace and supplies.
- Review and coordinate procedures for handling claims with the Procurement Unit.
- Brief the Compensation/Claims Specialists on incident activity.
- Periodically review logs and forms produced by the Compensation/Claims Specialists to ensure that they are complete, entries are timely and accurate and that they are in compliance with agency requirements and policies.
- Ensure that all Compensation for Injury and Claims logs and forms are complete and routed appropriately for post-incident processing prior to demobilization.
- Keep the Finance/Administration Section Chief briefed on Unit status and activity.
- Demobilize unit in accordance with the Incident Demobilization Plan.

COST UNIT LEADER

The Cost Unit Leader is responsible for collecting all cost data, performing cost effectiveness analyses and providing cost estimates and cost saving recommendations for the incident.

Overall Cost Unit Leader Responsibilities:

- Obtain a briefing from the Finance/Administration Section Chief.
- Coordinate cost reporting procedures.
- Collect and record all cost data.
- Develop incident cost summaries.
- Prepare resources-use cost estimates for the Planning Section.
- Make cost-saving recommendations to the Finance/Administration Section Chief.
- Ensure all cost documents are accurately prepared.
- Maintain cumulative incident cost records.
- Complete all records prior to demobilization.
- Provide reports to the Finance/Administration Section Chief.

DEMOBILIZATION UNIT LEADER

The Demobilization Unit Leader works with the Planning Section and is responsible for developing the Incident Demobilization Plan. This position will be activated in order to ensure that resources are effectively demobilized when they are no longer required.

Overall Demobilization Unit Leader Responsibilities:

- Participate in planning meetings as required.
- Review incident resource records to determine the likely size and extent of demobilization effort.
- Based on the above analysis, add additional personnel, workspace, and supplies as needed.
- Coordinate demobilization with Agency Representatives.
- Monitor the on-going Operations Section resource needs.
- Identify surplus resources and probable release time.
- Develop incident check-out function for all units.
- Evaluate logistics and transportation capabilities to support demobilization.
  Ensure that there is sufficient transportation to effectively demobilize resources.
- Establish communications with off-incident facilities, as necessary.
  Off-incident facilities can include locations where resources will be returned to and off-site locations that are assisting the response (i.e. laboratories, oiled wildlife care facilities, etc.). These facilities will eventually be demobilized as well.
- Develop an Incident Demobilization Plan detailing specific responsibilities and release priorities and procedures.
- Prepare appropriate directories (e.g., maps, instructions, etc.) for inclusion in the demobilization plan.
- Distribute demobilization plan (on and off-site).
- Provide status reports to appropriate requestors.
- Ensure that all Sections/Units understand their specific demobilization responsibilities.
- Supervise execution of the Incident Demobilization Plan.
- Brief the PSC on demobilization progress.

DEMOB. CHECK-OUT (ICS 221-CG)

Purpose. This form provides the Planning Section information on resource releases from the incident.

Preparation. The Demobilization Unit Leader or the Planning Section initiates this form. The Demobilization Unit Leader completes the top portion of the form after the resource supervisor has given written notification that the resource is no longer needed.

Distribution. The individual resource will have the unit leader initial the appropriate box(es) in item 5 prior to release from the incident. After completion, the form is returned to the Demobilization Unit Leader or the Planning Section. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Strike Team / Unit / Personnel Released	Enter name of Strike Team, Unit or personnel being released.
4.	Release Date/Time	Enter date (month, day, year) and time (24-hour clock) of anticipated release.
5.	Strike Team / Unit / Personnel	Demobilization Unit Leader will enter an "X" in the box to the left of those units requiring check-out. Identified Unit Leaders are to initial to the right to indicate release. NOTE: Blank boxes are provided for any additional unit requirements as needed, (e.g., Safety Officer, Agency Rep., etc.)
6.	Remarks	Enter any additional information pertaining to demobilization or release (e.g., transportation needed, destination, etc.).
7.	Prepared By	Enter name and title of the person preparing the form.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

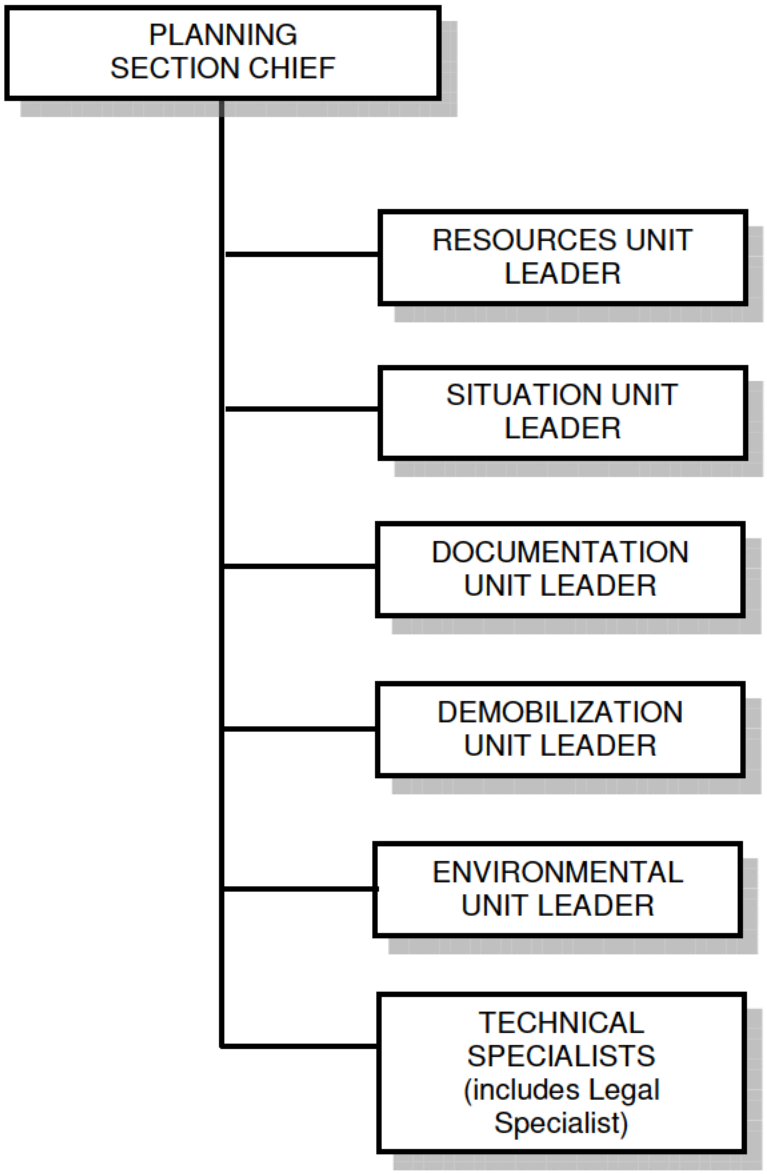
Situation Unit Leader 4-39

Documentation Unit Leader 4-40

Demobilization Unit Leader 4-41

Environmental Unit Leader 4-42

Technical Specialists 4-42



SITUATION UNIT LEADER (Cont'd)

Field Observer - The Display Processor is responsible for the display of incident status information obtained from Field Observers, resource status reports, aerial and other photographs, and infrared data.

Overall Field Observer Responsibilities:

- Determine:
  - Location of assignment
  - Type of information required
  - Priorities
  - Time limits for completion
  - Method of communication.
  - Method of transportation.
- Obtain a copy of the IAP for the Operational Period.
- Obtain necessary equipment and supplies.
- Perform Field Observer responsibilities to include but not limited to the following:
  - Perimeters of incident
  - Locations of hot spots
  - Unburned islands
  - Rates of spread
  - Weather conditions
  - Hazards including escape routes and safe areas
  - Progress of operations resources
- Be prepared to identify all facility locations (e.g., Helispots, Division and Branch boundaries).
- Report information to the SUL by established procedure.
- Report immediately any condition observed that may cause danger and a safety hazard to personnel.
- Gather intelligence that will lead to accurate predictions.

DOCUMENTATION UNIT LEADER

The Documentation Unit Leader (DUL) works within the Planning Section and is responsible for the maintenance of accurate, up-to-date incident files. The DUL should ensure that each section is maintaining and providing appropriate documents. The DUL will provide duplication and copying services for all other sections. The DUL will store incident files for legal, analytical and historical purposes.

Overall DUL Responsibilities

- Set up work area; begin organization of incident files.
- Establish duplication service; respond to requests.
- File all official forms and reports.
- Review records for accuracy and completeness; inform appropriate units of errors or omissions.
  Ensure ICS forms and documentation are dated and signed, as necessary.
- Provide incident documentation as requested.
- Store files for post-incident use.

UNIT LOG (ICS FORM 214-CG)

Purpose. The Unit Log records details of unit activity, including strike team activity or individual activity. These logs provide the basic reference from which to extract information for inclusion in any after-action report.

Preparation. A Unit Log is initiated and maintained by Command Staff members, Division/Group Supervisors, Air Operations Groups, Strike Team/Task Force Leaders, and Unit Leaders. Completed logs are submitted to supervisors who forward them to the Documentation Unit.

Distribution. The Documentation Unit maintains a file of all Unit Logs. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Check-In Location	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Unit Name/Designators	Enter the title of the organizational unit or resource designator (e.g., Facilities Unit, Safety Officer, Strike Team).
4.	Unit Leader	Enter the name and ICS Position of the individual in charge of the Unit.
5.	Personnel Assigned	List the name, position, and home base of each member assigned to the unit during the operational period.
6.	Activity Log	Enter the time and briefly describe each significant occurrence or event (e.g., task assignments, task completions, injuries, difficulties encountered, etc.)
7.	Prepared By	Enter name and title of the person completing the log. Provide log to immediate supervisor, at the end of each operational period.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

PLANNING

Planning Section Chief 4-38

Resources Unit Leader 4-38

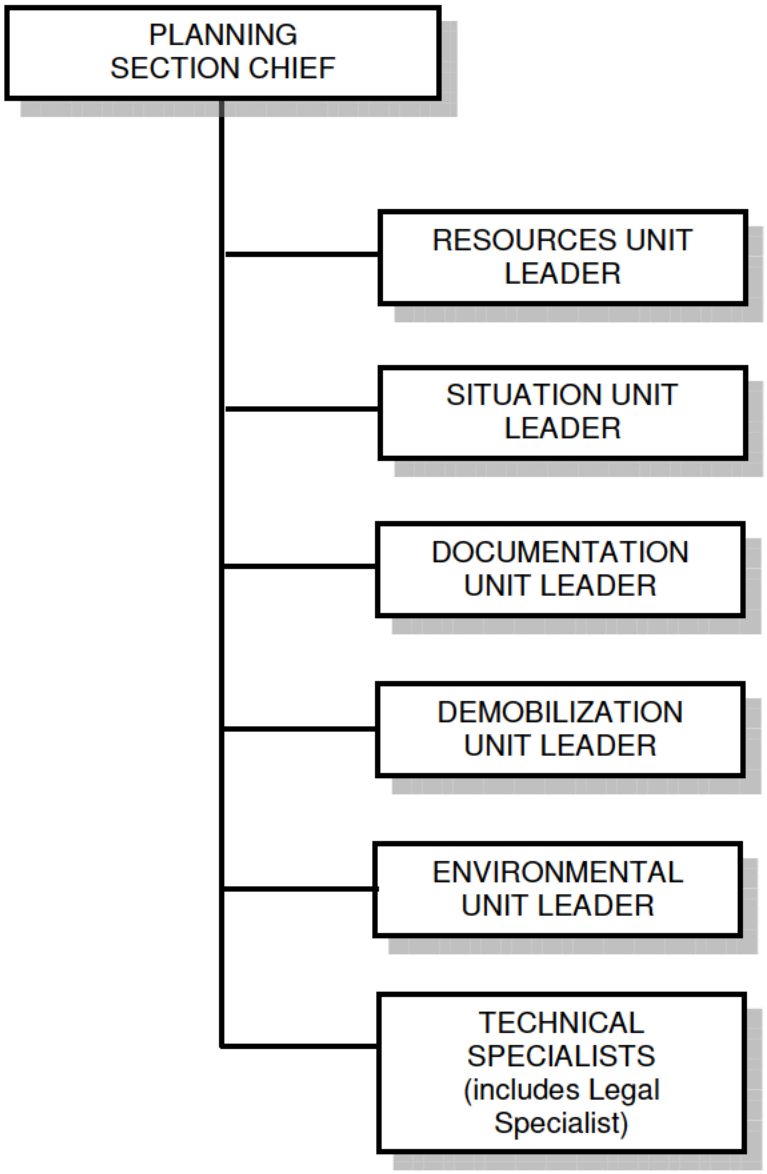
Situation Unit Leader 4-39

Documentation Unit Leader 4-40

Demobilization Unit Leader 4-41

Environmental Unit Leader 4-42

Technical Specialists 4-42



ENVIRONMENTAL UNIT LEADER

The Environmental Unit Leader (EUL) works with the Planning Section and is responsible for environmental matters associated with the response, including strategic assessment, modeling, surveillance, and environmental monitoring and permitting . The EUL prepares environmental data for the situation unit.

Overall Environmental Unit Leader Responsibilities:

- Obtain a briefing and special instructions from the PSC.
- Participate in Planning Section meetings.
- Identify sensitive areas and recommend response priorities.
  Utilize ICS Form 232.
- Following consultation with natural resource trustees, provide input on wildlife protection strategies (e.g., removing oiled carcasses, pre-emptive capture, hazing, and/or capture and treatment).
- Determine the extent, fate and effects of contamination.
- Acquire, distribute and provide analysis of weather forecasts.
- Monitor the environmental consequences of cleanup actions.
- Develop shoreline cleanup and assessment plans. Identify the need for, and prepare any special advisories or orders.
- Identify the need for, and obtain, permits, consultations, and other authorizations including Endangered Species Act (ESA) provisions.
- Following consultation with the FOSC's Historical/Cultural Resources Technical Specialist identify and develop plans for protection of affected historical/cultural resources.
- Evaluate the opportunities to use various response technologies.
- Develop disposal plans.
- Develop a plan for collecting, transporting, and analyzing samples.

TECHNICAL SPECIALISTS

Certain incidents or events may require the use of Technical Specialists who have specialized knowledge and expertise. Technical Specialists may function within the Planning Section, or be assigned wherever their services are required.

An example of a Technical Specialist is:

LEGAL SPECIALIST:

The Legal Specialist will act in an advisory capacity within the Planning Section.

Overall Legal Specialist Responsibilities:

- Participate in planning meetings, if requested.
- Advise on legal issues relating to in-situ burning, use of dispersants, and other alternative response technologies.
- Advise on legal issues relating to differences between Natural Resource Damage Assessment Restoration (NRDAR) and response activities.
- Advise on legal issues relating to investigations.
- Advise on legal issues relating to finance and claims.
- Advise on legal issues relating to response.
- Utilize ICS Form 214.

1. Incident Name	2. Operational Period (Date/Time) From: To:	UNIT LOG ICS 214-CG

UNIT LOG (ICS FORM 214-CG)

Purpose. The Unit Log records details of unit activity, including strike team activity or individual activity. These logs provide the basic reference from which to extract information for inclusion in any after-action report.

Preparation. A Unit Log is initiated and maintained by Command Staff members, Division/Group Supervisors, Air Operations Groups, Strike Team/Task Force Leaders, and Unit Leaders. Completed logs are submitted to supervisors who forward them to the Documentation Unit.

Distribution. The Documentation Unit maintains a file of all Unit Logs. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Check-In Location	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Unit Name/Designators	Enter the title of the organizational unit or resource designator (e.g., Facilities Unit, Safety Officer, Strike Team).
4.	Unit Leader	Enter the name and ICS Position of the individual in charge of the Unit.
5.	Personnel Assigned	List the name, position, and home base of each member assigned to the unit during the operational period.
6.	Activity Log	Enter the time and briefly describe each significant occurrence or event (e.g., task assignments, task completions, injuries, difficulties encountered, etc.)
7.	Prepared By	Enter name and title of the person completing the log. Provide log to immediate supervisor, at the end of each operational period.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

1. Incident Name	2. Operational Period (Date/Time) From: To:	**RESOURCES AT RISK SUMMARY** **ICS 232-CG**

3. Environmentally-Sensitive Areas and Wildlife Issues

Site #	Priority	Site Name and/or Physical Location	Site Issues

Narrative

4. Archaeo-cultural and Socio-economic Issues

Site #	Priority	Site Name and/or Physical Location	Site Issues

Narrative

5. Prepared by: (Environmental Unit Leader) **Date/Time**

RESOURCES AT RISK SUMMARY (ICS 232-CG)

Purpose. The Resources at Risk Summary provides information about sites in the incident area which are sensitive due to environmental, archaeo-cultural, or socio-economic resources at risk, and identifies incident-specific priorities and issues. The information recorded here may be transferred to ICS 232a-CG, which acts as a key to the Area Contingency Plan (ACP) or Geographic Response Plan (GRP) site numbers shown on the Situation Map.

Preparation. The Environmental Unit Leader, with input from resource trustees, will complete this form for each operational period. It should be updated prior to the Planning Meeting.

Distribution. This form must be forwarded to the Planning Section Chief for possible inclusion in the IAP. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Env- Sensitive Area & Wildlife Issues	
	Site Number	Enter site number. Can come from Area Contingency Plan (ACP) or Geographic Response Plan (GRP) or can be created during an incident.
	Priority	Priority specific to this incident. Can come from an ACP/GRP or can be created during an incident.
	Site Name and/or Physical Location	Name of the site (e.g., Marsh Pt., Glacier Creek, etc.) and/or physical location (e.g., address, lat/long, landmarks, etc.).
	Site Issues	Environmental concerns associated with this site and season.
	Narrative	Use the Narrative section to clarify any issues.
4.	Archaeo-cultural and Socio-economic Issues	
	Site Number	Enter site number. Can come from an ACP/GRP or can be created during an incident.
	Priority	Priority specific to this incident. Can come from an ACP/GRP or can be created during an incident.
	Site Name and/or Physical Location	Name of the site (e.g., Marsh Pt., Glacier Creek, etc.) and/or physical location (e.g., address, lat/long, landmarks, etc.).
	Site Issues	Archaeo-cultural or socio-economic concerns associated with this site and season.
	Narrative	Use the Narrative section to clarify any issues.
5.	Prepared By	Enter name and title of the person preparing the form (normally the Environmental Unit Leader).
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

1. Incident Name	2. Operational Period (Date/Time) From: To:	ACP Site Index ICS 232a-CG

3. Index to ACP/GRP sites shown on Situation Map

Site #	Priority	Site Name and/or Physical Location	Action	Status

Note: This form is designed to be posted next to the situation map. Use additional sheets, as needed.

4. Prepared by: **Date/Time**

ACP SITE INDEX (ICS 232a-CG)

Special Note. This optional form is designed to be a key to the site numbers or site names shown on the Situation Map. The information on priorities for environmentally-sensitive areas and archaeo-cultural and socio-economic issues from the ICS 232-CG may be transferred to ICS 232a-CG, which provides more information on the Area Contingency Plan (ACP) or Geographic Response Plan (GRP) site numbers or names shown on the Situation Map.

Purpose. If used, this form is posted next to the Situation Map, providing a key to the ACP/GRP sites shown on the map.

Preparation. The Situation Unit personnel responsible for the Situation Map prepare this form, using ICS 232-CG prepared by the Environmental Unit.

Distribution. This form is posted next to the Situation Map and copies of this form should accompany any distributed copies of the Situation Map. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Index to ACP/GRP sites	Enter site information from the Area Contingency Plan (ACP) or Geographic Response Plan (GRP) or other sources specific to this incident.
	Site Number	Can come from an Area Contingency Plan (ACP) or Geographic Response Plan (GRP) or can be created during an incident.
	Priority	Priority specific to this incident.
	Site Name and/or Physical Location	Name of the site (e.g., Marsh Pt., Glacier Creek, etc.) and/or physical location (e.g., address, lat/long, landmarks, etc.).
	Action	Actions to be taken for designated protection and collection strategies or for other sites identified specifically for this incident.
	Status	Status of site action implementation (e.g., scheduled, in progress, completed).
4.	Prepared By	Enter name and title of the person preparing the form.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

UNITED STATES COAST GUARD **Finance Section Activities**

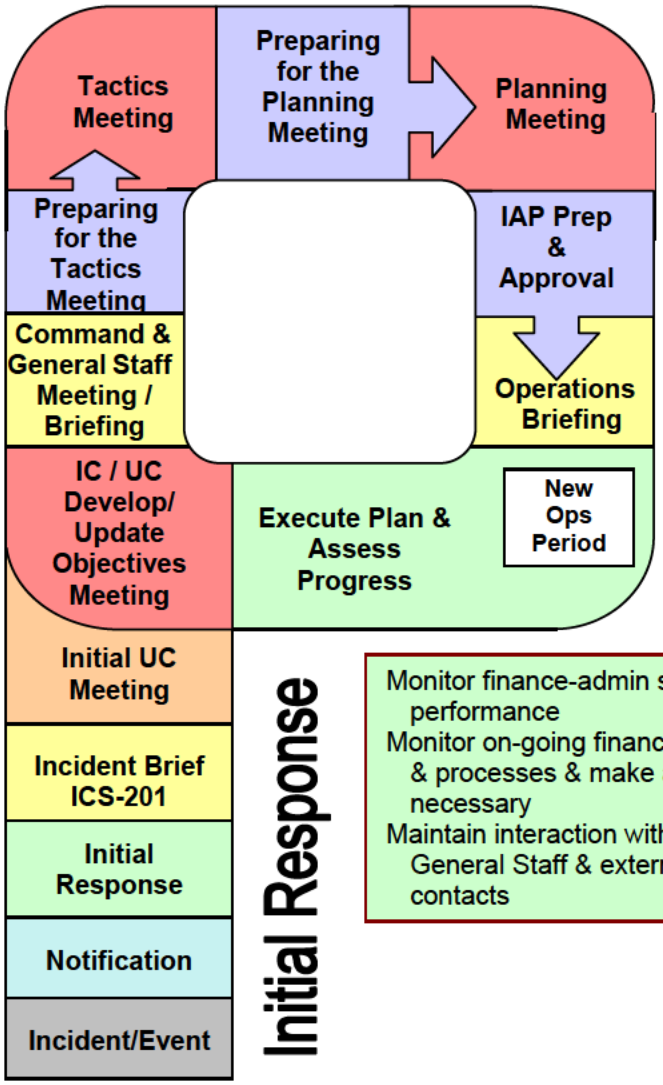
Finance "P"

Review resources assigned/ordered to determine proper use depending on funding source restrictions/regulations
Provide input on resource availability due to contracting/procurement issues
Procure necessary resources
Meet with Unit leaders to determine briefing topics

Verify support for upcoming plan
Brief on
- funding source(s)
- ceilings
- burn rate
- contract issues
- admin services
- claims & claims procedures

Provide estimates of future finance-admin requirements

As Necessary:
- Clarify resource requesting, approval & ordering process, as needed
- Identify contracting / procurement issues to be resolved
- Implement/Review Cost doc process



Receive IC/UC direction
- Priorities, limitations & constraints
- Objectives
- Key decisions

Provide feedback to IC/UC on focus/direction
Discuss interagency issues
Discuss resource requesting, approval, and ordering process
Discuss funding source & ceilings
Discuss Finance Section needs

Brief on funding issues as appropriate

Attend ICS-201 brief
-Current overview
-Anticipated Fin Section activities
-Indication of required support
Determine if funding is required based upon incident/event
Determine funding source (FPN, CPN, DPN, AFC-30) & estimate initial ceiling

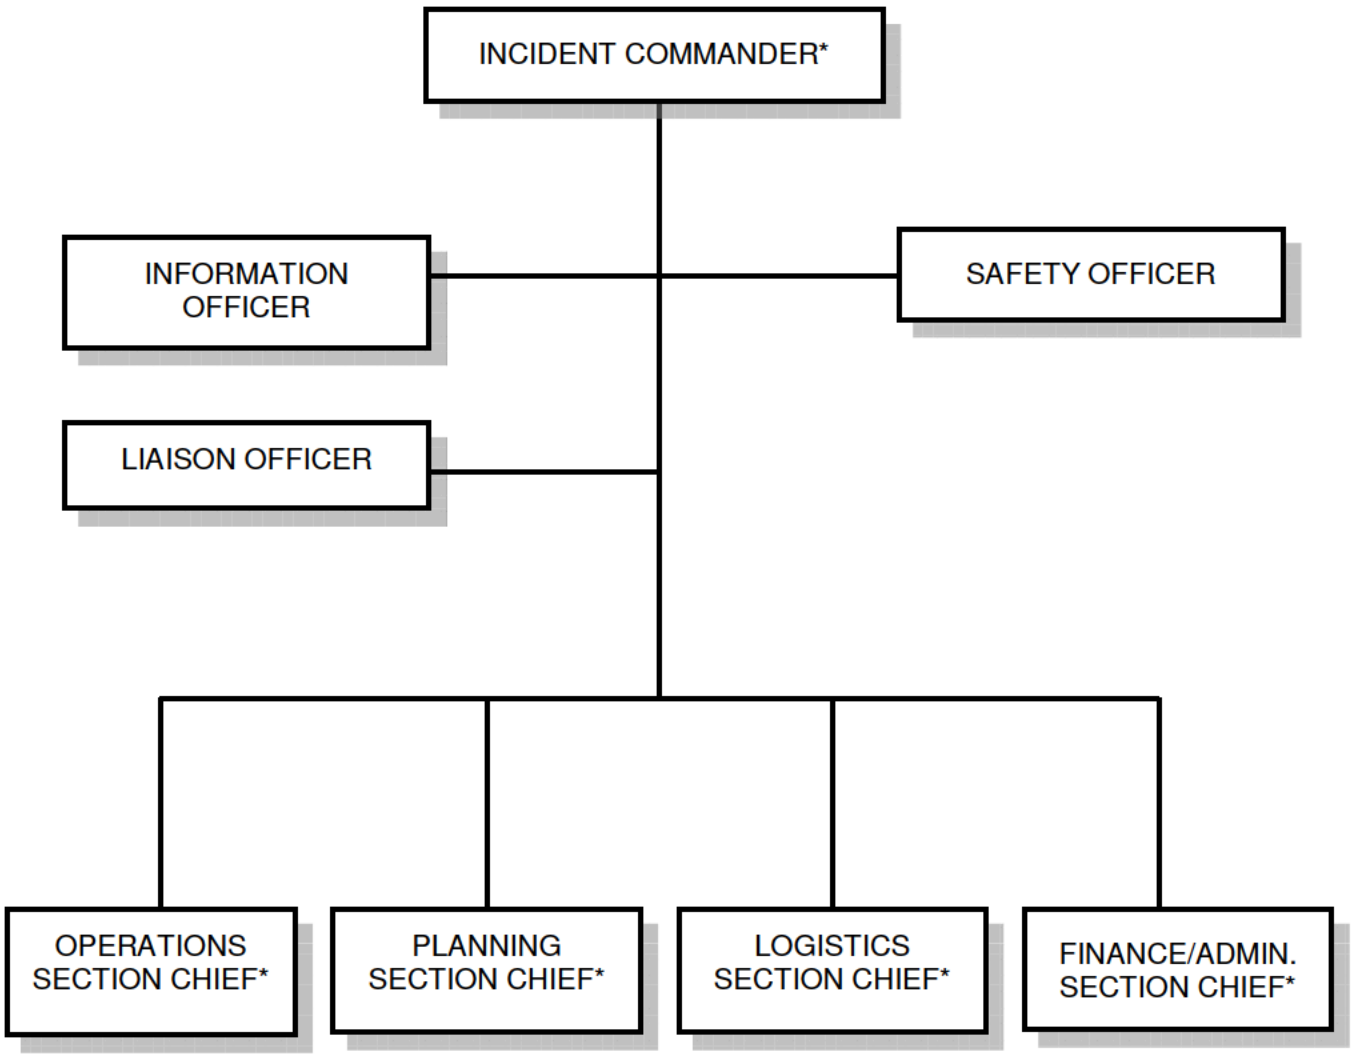
Monitor finance-admin section performance
Monitor on-going finance-admin support & processes & make adjustments as necessary
Maintain interaction with Command & General Staff & external financial contacts

Arrive & Check-in
Assess situation
Receive IC/UC briefing
Activate Finance Section
Organize & brief subordinates
Acquire work materials
Forecast Requirements

FIGURE 4.1

LOCAL RESPONSE TEAM

(For Initial Response and Tier I & II Incidents)



* NOTE: Local Response Team (LRT) personnel can assume any of these positions as necessary.

FIGURE 4.2

INCIDENT MANAGEMENT TEAM

4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

FINANCE/ADMINISTRATION

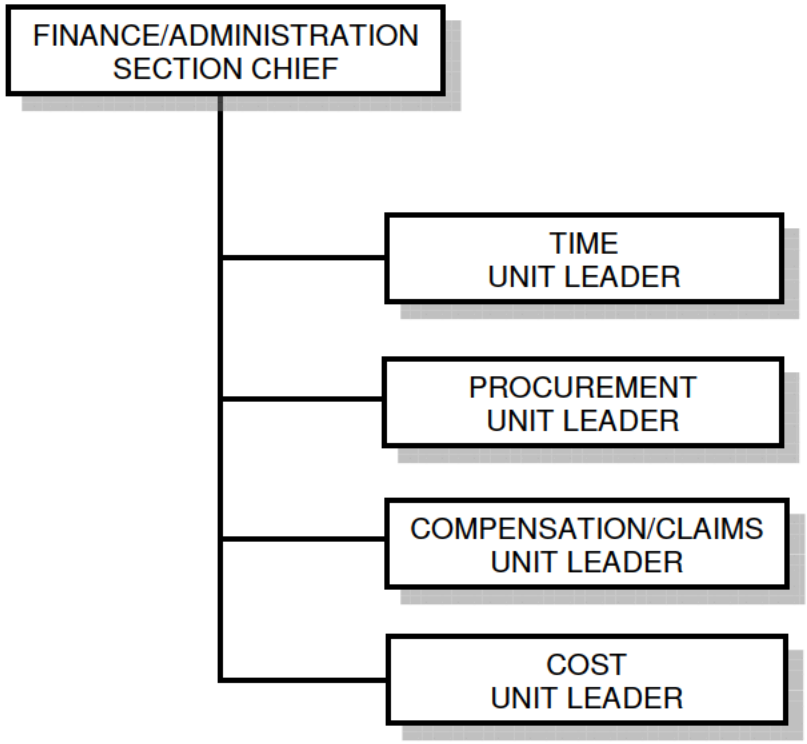
Finance/Administration Section Chief 4-51

Time Unit Leader 4-52

Procurement Unit Leader 4-52

Compensation/Claims Unit Leader 4-53

Cost Unit Leader 4-53



FINANCE/ADMINISTRATION SECTION CHIEF

The Finance/Administration Section Chief (FASC) is responsible for all financial, administrative, and cost analysis aspects of the incident and for supervising members of the Finance/Administration Section. Depending on the incident, the FASC position may or may not be assigned. Agencies within the Unified Command may require and staff the FASC position. In either case, it is always beneficial to establish a system to oversee financial aspects of an incident.

Overall FASC Responsibilities:

- Attend planning meetings as required.
- Manage all financial aspects of an incident.
- Provide financial and cost analysis information as requested.
- Gather pertinent information from briefings with responsible agencies.
- Develop an operating plan for the Finance/Administration Section; fill supply and support needs.
- Determine the need to set up and operate an incident commissary.
- Meet with Assisting and Cooperating Agency Representatives, as needed.
- Maintain daily contact with agency(s) administrative headquarters on Finance/Administration matters.
- Ensure that all personnel time records are accurately completed and transmitted, according to policy.
- Provide financial input to demobilization planning.
- Ensure that all obligation documents initiated at the incident are properly prepared and completed.
- Brief administrative personnel on all incident-related financial issues needing attention or follow-up prior to leaving incident.

Additional KM Required FASC Responsibilities:

- Ensure compensation/claims are being managed for the incident.
  If necessary or required by the agencies, establish a claims telephone number.
- Arrange on-site legal counsel.
- Work with insurance adjusters.
- Track and assess charges related to the related effort.
- Coordinating activities with other Section Chiefs
- Providing cost authorization.
- Supervising daily activities of the Finance Section.
- Analyzing contract bids, management and payroll.

The FASC may have a Time Unit Leader, Procurement Unit Leader, Compensation/Claim Unit Leader, and Cost Unit Leader reporting to him/her. However if not assigned, the FASC will be responsible for their functions.

TIME UNIT LEADER

The Time Unit Leader is responsible for equipment and personnel time recording and for managing the commissary operations.

Overall Time Unit Leader Responsibilities:

- Determine incident requirements for time recording function.
- Determine resource needs.
- Contact appropriate agency personnel/representatives.
- Ensure that daily personnel time recording documents are prepared and in compliance with policy.
- Establish time unit objectives.
- Maintain separate logs for overtime hours.
- Establish commissary operation on larger or long-term incidents as needed.
- Submit cost estimate data forms to the Cost Unit, as required.
- Maintain records security.
- Ensure that all records are current and complete prior to demobilization.
- Release time reports from assisting agency personnel to the respective Agency Representatives prior to demobilization.
- Brief the Finance/Administration Section Chief on current problems and recommendations, outstanding issues, and follow-up requirements.

PROCUREMENT UNIT LEADER

The Procurement Unit Leader is responsible for administering all financial matters pertaining to vendor contracts, leases, and fiscal agreements.

Overall Procurement Unit Leader Responsibilities:

- Review incident needs and any special procedures with Unit Leaders, as needed.
- Coordinate with local jurisdiction on plans and supply sources.
- Obtain the Incident Procurement Plan.
- Prepare and authorize contracts and land-use agreements.
- Draft memoranda of understanding as necessary.
- Establish contracts and agreements with supply vendors.
- Provide for coordination between the Ordering Manager, agency dispatch, and all other procurement organizations supporting the incident.
- Ensure that a system is in place that meets agency property management requirements. Ensure proper accounting for all new property.
- Interpret contracts and agreements; resolve disputes within delegated authority.
- Coordinate with the Compensation/Claims Unit for processing claims.
- Coordinate use of impress funds, as required.
- Complete final processing of contracts and send documents for payment.
- Coordinate cost data in contracts with the Cost Unit Leader.
- Brief the Finance/Administration Section Chief on current problems and recommendations, outstanding issues, and follow-up requirements.

COMPENSATION/CLAIMS UNIT LEADER

The Compensation/Claims Unit Leader is responsible for the overall management and direction of all administrative matters pertaining to compensation for injury and claims related activities (other than injury) for an incident.

Overall Compensation/Claims Unit Leader Responsibilities:

- Obtain a briefing from the Finance/Administration Section Chief.
- Establish contact with the incident SO and LO (or Agency Representatives if no LO is assigned).
- Determine the need for Compensation for Injury and Claims Specialists and order personnel as needed.
- Establish a Compensation for Injury work area within or as close as possible to the Medical Unit.
- Review Incident Medical Plan (ICS Form 206).
- Ensure that Compensation/Claims Specialists have adequate workspace and supplies.
- Review and coordinate procedures for handling claims with the Procurement Unit.
- Brief the Compensation/Claims Specialists on incident activity.
- Periodically review logs and forms produced by the Compensation/Claims Specialists to ensure that they are complete, entries are timely and accurate and that they are in compliance with agency requirements and policies.
- Ensure that all Compensation for Injury and Claims logs and forms are complete and routed appropriately for post-incident processing prior to demobilization.
- Keep the Finance/Administration Section Chief briefed on Unit status and activity.
- Demobilize unit in accordance with the Incident Demobilization Plan.

COST UNIT LEADER

The Cost Unit Leader is responsible for collecting all cost data, performing cost effectiveness analyses and providing cost estimates and cost saving recommendations for the incident.

Overall Cost Unit Leader Responsibilities:

- Obtain a briefing from the Finance/Administration Section Chief.
- Coordinate cost reporting procedures.
- Collect and record all cost data.
- Develop incident cost summaries.
- Prepare resources-use cost estimates for the Planning Section.
- Make cost-saving recommendations to the Finance/Administration Section Chief.
- Ensure all cost documents are accurately prepared.
- Maintain cumulative incident cost records.
- Complete all records prior to demobilization.
- Provide reports to the Finance/Administration Section Chief.

1.	Incident Name	Enter the name assigned to the incident.
2.	Check-In Location	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Unit Name/Designators	Enter the title of the organizational unit or resource designator (e.g., Facilities Unit, Safety Officer, Strike Team).
4.	Unit Leader	Enter the name and ICS Position of the individual in charge of the Unit.
5.	Personnel Assigned	List the name, position, and home base of each member assigned to the unit during the operational period.
6.	Activity Log	Enter the time and briefly describe each significant occurrence or event (e.g., task assignments, task completions, injuries, difficulties encountered, etc.)
7.	Prepared By	Enter name and title of the person completing the log. Provide log to immediate supervisor, at the end of each operational period.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

UNITED STATES COAST GUARD **Command Activities**

The Operational Planning "P"

During this time period:
- Meet one-on-one with Command & General Staff members for follow up on assignments.
- Prepare further guidance and clarification as needed
- Receive operations briefing

During this time period:
- Agree on who will present UC's response emphasis and motivation remarks
- Review task assignments, objectives, decisions & directions
- Receive operations briefing

Provide opening remarks
Review response plan as presented to ensure that Command's directions and objectives have been properly addressed
Provide further guidance and resolve issues
Give tacit approval of the proposed Plan
Agree when written plan will be ready for review & approval

Review IAP for completion and make changes as necessary
Approve Plan

Meet and brief Command & General Staff on IC/UC direction, objectives & priorities
Assign work tasks
Resolve problems & clarify staff roles and responsibilities

Establish priorities
Identify constraints & limitations
Develop incident objectives
Identify necessary SOP's
Agree on operating policy, procedures and guidelines
Identify staff assignments
Agree on division of UC workload

Finalize UC structure
Determine overall response organization
Identify and select support facilities
Clarify UC roles and responsibilities
Determine Operational period
Select OSC & Deputy OSC
Make key decisions

Determine ICS-201 briefing timeframe & receive briefing
Clarify/request additional information
Determine incident complexity
Provide interim direction
Initiate change of command
Determine UC players
Ensure interagency notifications
Brief superiors

Provide overall guidance and clarification
Provide leadership presence and motivational remarks
Emphasize response philosophy

Monitor on-going operations
Review progress of assigned tasks
Receive periodic situation briefings
Review work progress
Identify changes that need to be made during current and future operations
Prepare for UC Update Objectives Meeting

Ensure that an appropriate initial response is deployed
Provide direction as needed
Monitor initial response operations

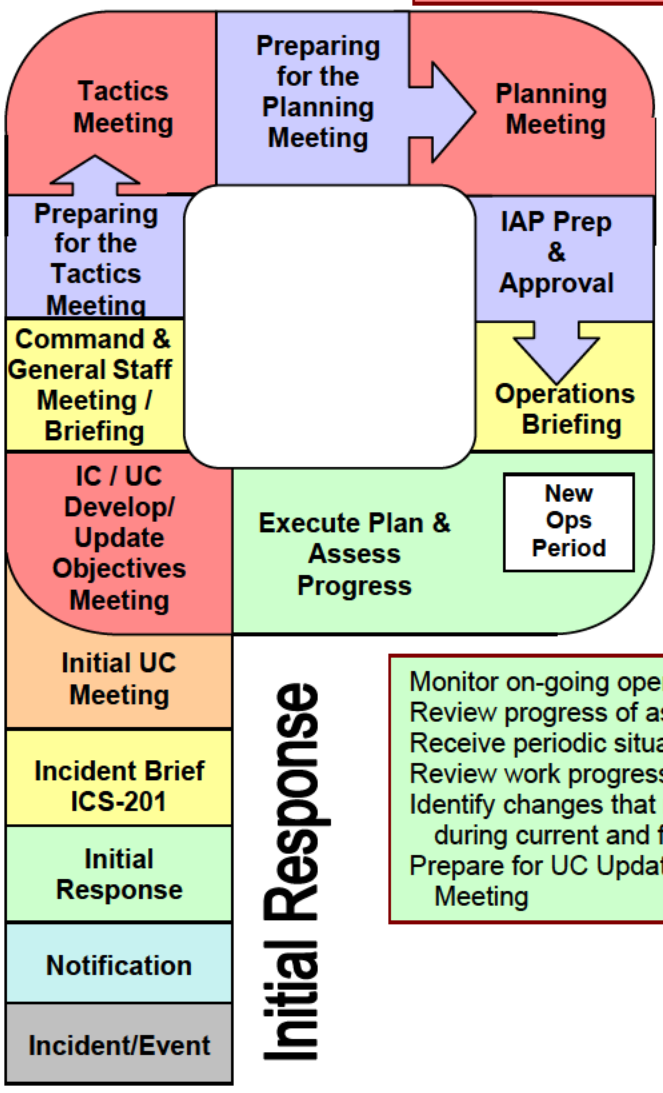

FIGURE 4.1

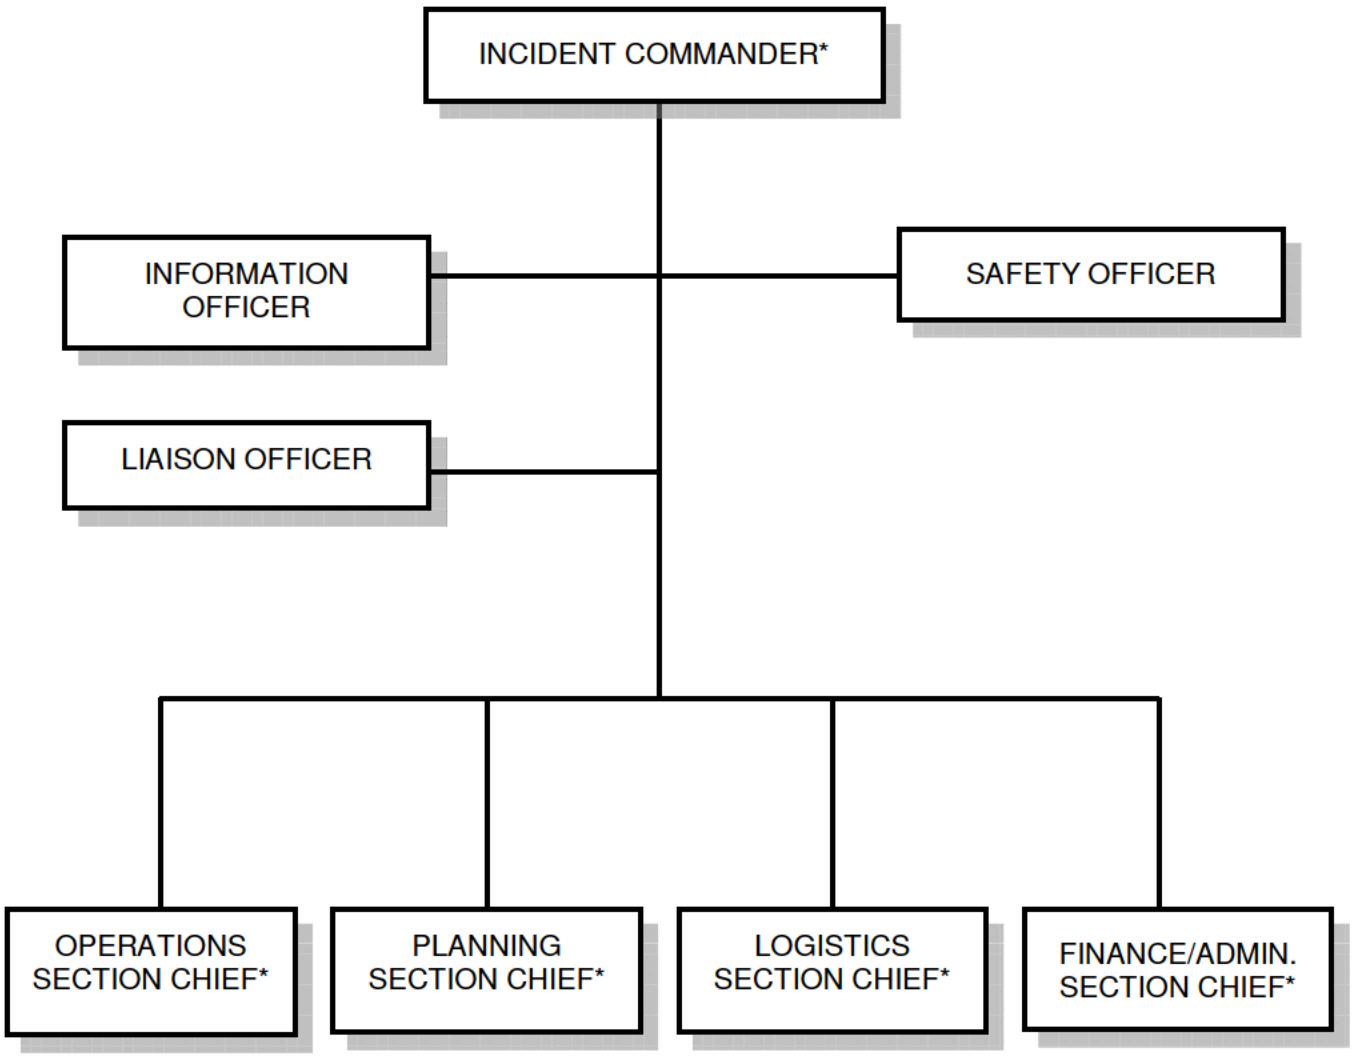
LOCAL RESPONSE TEAM

(For Initial Response and Tier I & II Incidents)



* NOTE: Local Response Team (LRT) personnel can assume any of these positions as necessary.

4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

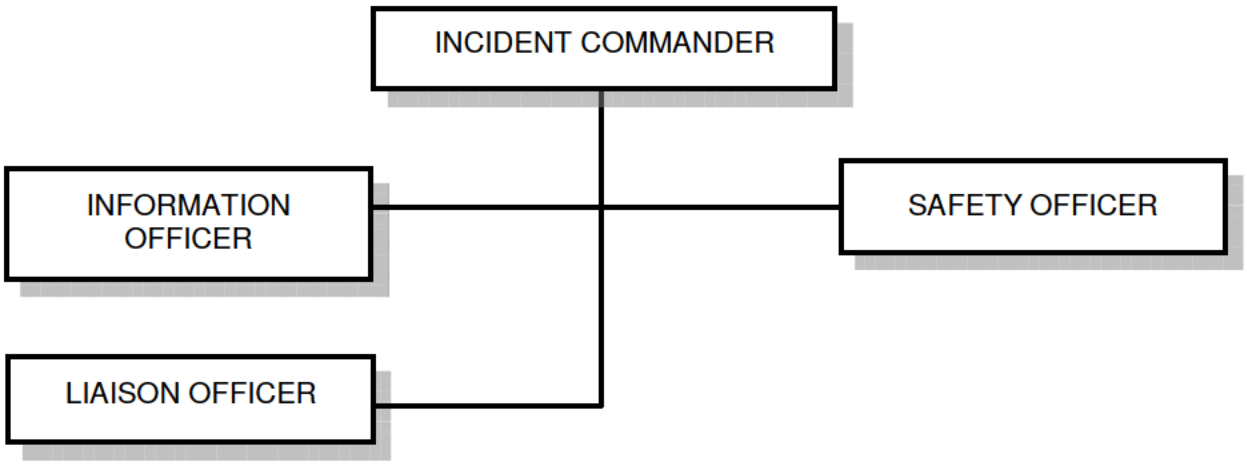
COMMAND

Incident Commander..... 4-12

Safety Officer 4-15

Liaison Officer 4-17

Information Officer 4-18



INCIDENT COMMANDER

The Incident Commander (IC) has responsibility for overall management of the incident. The KM IC has the authority to approve the use of a contractor even if no "open-end" contract exists, as well as the authority to commit monies to initiate response and clean-up activities. The first employee on-site will assume the responsibilities of IC until properly relieved. Generally, the most senior employee on-site will assume the IC position. The IC also has overall responsibility for the health and safety of responders.

KM Initial IC Responsibilities (During the first few hours):

- Make internal Company notifications
- Conduct initial site assessment
- Initiate Incident Command System (assign ICS roles & complete org. chart)
- Ensure Site Specific Health & Safety plan is being developed within the first hour
- Maintain site control (establish hazard zones and appropriate corridors)
- Request Unified Command with lead agencies as appropriate
- Establish immediate priorities (i.e. control the discharge, initiate containment, ensure safety, etc.)

Overall IC Responsibilities:

- Assess the situation and/or obtain a briefing from the prior IC.
- Determine Incident Objectives and strategy.
  Objectives and strategies should be documented on ICS form 201or 202 and used to communicate Unified Command's expectations for the next operational period
- Establish the immediate priorities.
- Establish an Incident Command Post.
- Brief Command Staff and Section Chiefs.
- Review meetings and briefings.
- Establish an appropriate organization.
  The organization should be documented on ICS forms 201, 203 or 207, depending on the level of response.
- Ensure planning meetings are scheduled as required.
- Approve and authorize the implementation of an IAP.
- Ensure that adequate safety measures are in place.
- Coordinate activity for all Command and General Staff.
- Coordinate with key people and officials.
- Approve requests for additional resources or for the release of resources.
  This is usually accomplished through the approval of the Incident Action Plan.
- Keep corporate offices and agency administrator(s) informed of incident status.
- Approve the use of trainees, volunteers, and auxiliary personnel.
- Authorize release of information to the news media.
- Ensure incident Status Summary (ICS Form 209) is completed and forwarded to appropriate higher authority.
- Order the demobilization of the incident when appropriate.

INCIDENT COMMANDER (Cont'd)

OIL SPILL

The IC for oil discharges will, whenever possible and practical, be organized under the Unified Command (UC) Structure that includes, but is not limited to:

- The pre-designated Federal On-Scene Incident Commander (FOSC)
- The pre-designated State On-Scene Incident Commander (SOSC)
- The representative of the Responsible Party (RP) IC

The UC is responsible for the overall management of the incident. The UC directs incident activities including the development and implementation of strategic decisions and approves the ordering and releasing of resources. The UC may assign a Deputy IC to assist in carrying out IC responsibilities. IC tasks specific to oil spill events are:

- Be cognizant of the primary objectives for oil spill response activities.
  - Ensure the safety of citizens and response personnel.
  - Control the source of the spill.
  - Manage a coordinated response effort.
  - Maximize protection of environmentally sensitive areas.
  - Contain and recover spilled material.
  - Recover and rehabilitate injured wildlife.
  - Remove oil from impacted areas.
  - Minimize economic impacts.
  - Keep stakeholders informed of response activities.
  - Keep the public informed of response activities.
  - Ensure that the source of a discharge is designated and that procedures by which claims may be presented are advertised.
  - All removal and damage claims must be handled appropriately.

HAZARDOUS SUBSTANCE RELEASE

Incident Commander and Safety Officer - The IC and SO for a hazardous substance incident will use the following guidance when preparing the Site Safety Plan:

- Assign site safety responsibility.
- Establish perimeter and restrict access.
- Characterize site hazards:
  - Identity pollutant
  - Obtain Material Safety Data Sheets
  - Conduct air monitoring
  - Identify physical and biological hazards i.e., slips, trips, falls, confined spaces, noise, weather conditions, poisonous insects, reptiles, plants and biological waste
- Establish control zones:
  - Exclusion zone
  - Contamination reduction zone
  - Support zone

INCIDENT COMMANDER (Cont'd)

***HAZARDOUS SUBSTANCE RELEASE** (Cont'd)*

- Assess training requirements:
  - Check HAZWOPER cards
  - Insure safety briefings
- Select personal protective equipment (PPE) Level A, B, C, or D.
- Establish decontamination stations.
- Establish Emergency Medical Plan Locate hospital, EMT(S) and first-aid stations; and List emergency numbers: fire, police, and ambulance.

UNIT LOG (ICS FORM 214-CG)

Purpose. The Unit Log records details of unit activity, including strike team activity or individual activity. These logs provide the basic reference from which to extract information for inclusion in any after-action report.

Preparation. A Unit Log is initiated and maintained by Command Staff members, Division/Group Supervisors, Air Operations Groups, Strike Team/Task Force Leaders, and Unit Leaders. Completed logs are submitted to supervisors who forward them to the Documentation Unit.

Distribution. The Documentation Unit maintains a file of all Unit Logs. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Check-In Location	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Unit Name/Designators	Enter the title of the organizational unit or resource designator (e.g., Facilities Unit, Safety Officer, Strike Team).
4.	Unit Leader	Enter the name and ICS Position of the individual in charge of the Unit.
5.	Personnel Assigned	List the name, position, and home base of each member assigned to the unit during the operational period.
6.	Activity Log	Enter the time and briefly describe each significant occurrence or event (e.g., task assignments, task completions, injuries, difficulties encountered, etc.)
7.	Prepared By	Enter name and title of the person completing the log. Provide log to immediate supervisor, at the end of each operational period.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

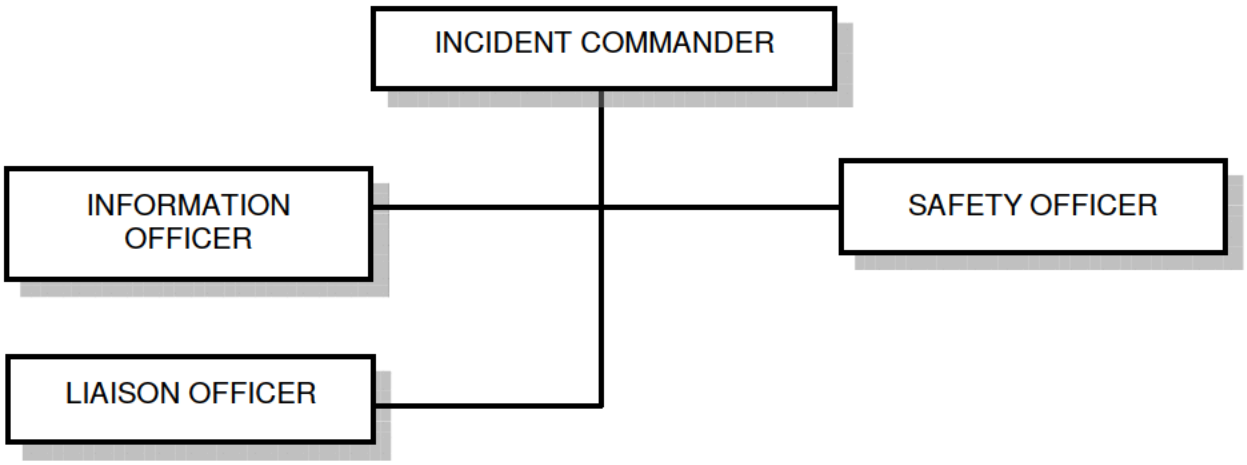
COMMAND

Incident Commander..... 4-12

Safety Officer 4-15

Liaison Officer 4-17

Information Officer 4-18



INFORMATION OFFICER

The Information Officer (IO) is responsible for developing and releasing information about the incident to the news media, incident personnel, and other appropriate agencies and organizations.

Only one IO will be assigned for each incident. The IO may have assistants as necessary. The assistants may represent assisting agencies, companies, or jurisdictions. The IO and assistants will establish a Joint Information Center to assist with developing information releases.

Overall IO Responsibilities:

- Determine from the IC if there are any limits on information release.
- Develop material for use in media briefings.
- Obtain IC approval of media releases.
- Inform media and conduct media briefings.
- Arrange for tours and other interviews or briefings that may be required.
- Obtain media information that may be useful to incident planning.
- Maintain current information summaries and/or displays on the incident and provide information on the status of the incident to assigned personnel.

Additional KM Required IO Responsibilities:

- Receive briefing of incident
- Anticipate need for and establish a Media Area
- Coordinate with the KMEP Corporate Communications Office for development and release of appropriate media information
- Maintain a log of agency IOs, news media, news releases, etc.

- Maintain unit records, including Unit/Activity Log (ICS Form 214).

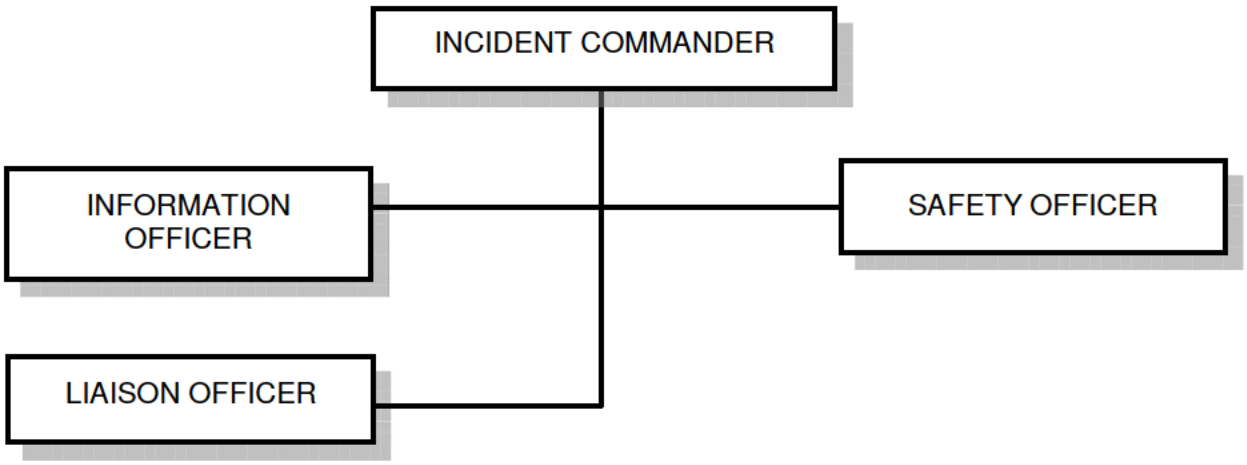
COMMAND

Incident Commander 4-12

Safety Officer 4-15

Liaison Officer 4-17

Information Officer 4-18



LIAISON OFFICER

The Liaison Officer (LO) serves as a "go-between" linking the IC to various agencies. These are agencies that do not have a direct tactical assignment within the Unified Command however, have an interest in the response activities or wish to offer assistance.

The Liaison Officer intercepts, greets and briefs agency representatives as they arrive on scene. It is the responsibility of the Liaison Officer to notify the IC before escorting anyone to the Command Post. A separate Liaison Area may need to be established to accommodate agency representatives not directly involved in the Unified Command.

Overall LO Responsibilities:

- Be a contact point for Agency Representatives.
  Agency Representatives are agency personnel who do not have direct tactical assignment but are present to assist in response efforts and have authority to make decision on matters affecting that agency's participation.

- Maintain a list of assisting and cooperating agencies and Agency Representatives.
  Obtain business cards or any other means of collecting contact information.

- Monitor check-in sheets daily to ensure that all Agency Representatives are identified.

- Assist in establishing and coordinating interagency contacts.
  Determine if there are any agencies that could assist in the response effort. Locate the contact information and make contact with the agencies.

- Keep agencies supporting the incident aware of incident status.

- Monitor incident operations to identify current or potential inter-organizational problems.
  Report any problems/conflicts to the IC.

- Participate in planning meetings, providing current resource status, including limitations and capability of assisting agency resources.

- Coordinate response resource needs for Natural Resource Damage Assessment and Restoration (NRDAR) activities with the OPS during oil and HAZMAT responses.
  This generally involves working with agencies to evaluate the impact the incident had on the environment and wildlife.

- Coordinate response resource needs for incident investigation activities with the OPS.

- Ensure that all required agency forms, reports and documents are completed prior to demobilization.

- Coordinate activities of visiting dignitaries.

- Have a debriefing session with the IC prior to departure.

4.	Unit Leader	Enter the name and ICS Position of the individual in charge of the Unit.
5.	Personnel Assigned	List the name, position, and home base of each member assigned to the unit during the operational period.
6.	Activity Log	Enter the time and briefly describe each significant occurrence or event (e.g., task assignments, task completions, injuries, difficulties encountered, etc.)
7.	Prepared By	Enter name and title of the person completing the log. Provide log to immediate supervisor, at the end of each operational period.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

UNITED STATES COAST GUARD — **Logistics Section Activities**

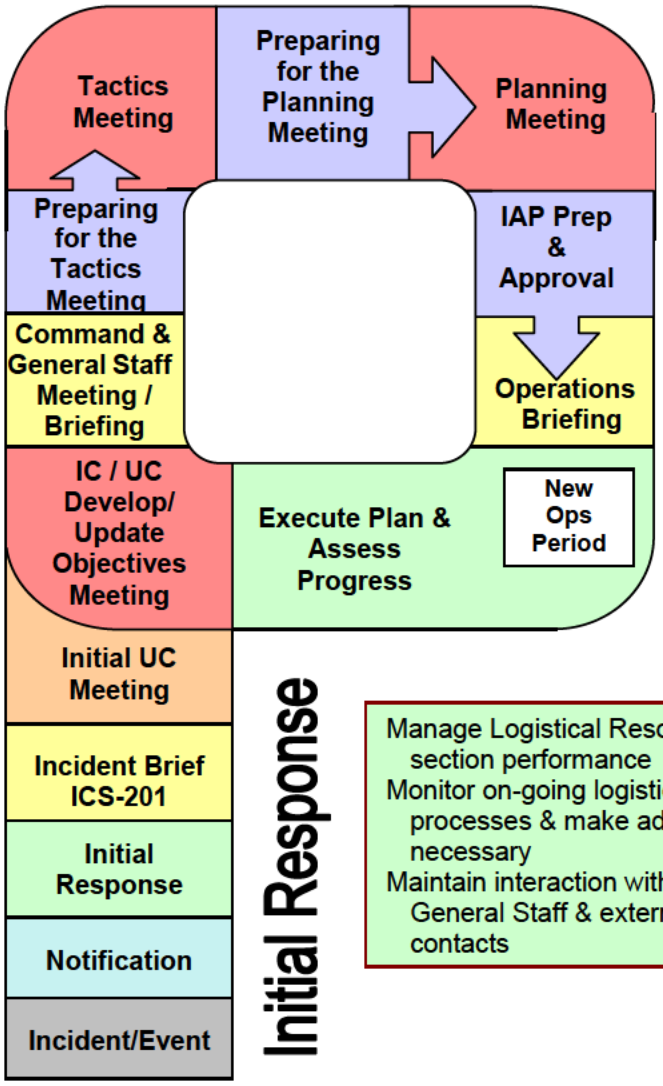
Logistics "P"

Review proposed tactics
Identify resource needs & reporting locations from ICS 215 and 215a
Discuss availability of needed resources
Identify resource shortfalls
Identify resource support requirements

Meet with Log Units to confirm status & availability of required resources
Determine additional resources necessary to support objectives
Order necessary resources
Update Ops on resource non-availability to meet reporting requirements & suggest alternatives if necessary
Order support for resources
Identify contingencies as needed

Confirm availability of required resources and timelines
Determine additional resources necessary to support objectives
Identify any contingencies as needed
Verify support for upcoming plan
Provide estimates of future service and support requirements

Survey availability of tactical resources
Obtain status of ordered resources
Summarize support capabilities, facilities, comms, etc.
If needed clarify resource requesting, approval & ordering process



Provide info for IAP [ICS-205, 206 & Transport Plan

Receive IC/UC direction
- Priorities, limitations & constraints
- Objectives
- Key decisions

Provide feedback to IC/UC on focus/direction
Discuss interagency issues
Discuss resource requesting, approval, and ordering process
Discuss Log Section needs
Discuss support facilities

Provide logistics information briefing to Operations Section personnel
Review Medical & Comms Plan, Transportation Plan, & Other logistical information to support field operations

Attend ICS-201 brief
-Current overview
-Anticipated Log Section activities
-Indication of required support

Arrive & Check-in
Assess situation
Receive IC/UC briefing
Activate Log Section
Organize & brief subordinates
Acquire work materials
Forecast Requirements
-transportation
-medical
-resources
-communications
-facilities
-resource requesting
-safety issues
-environmental issues
-food/shelter

Manage Logistical Resources & monitor section performance
Monitor on-going logistical support & processes & make adjustments as necessary
Maintain interaction with Command & General Staff & external logistical contacts

FIGURE 4.1

4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

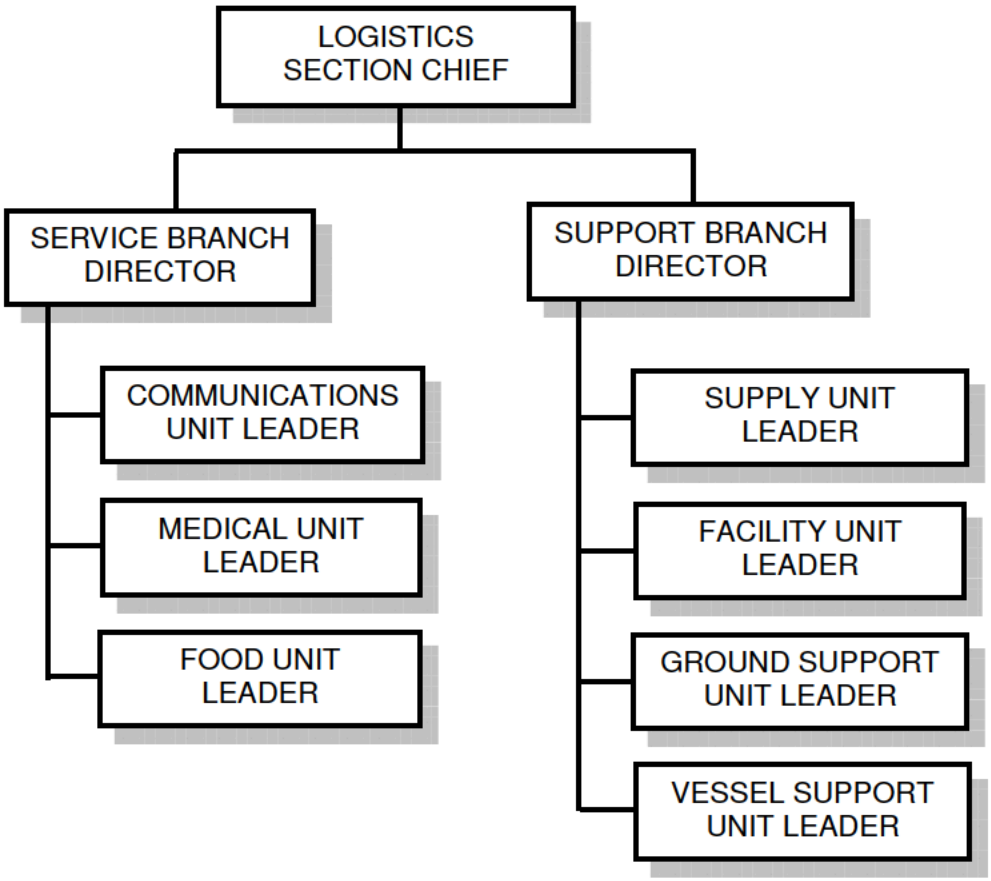
- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

LOGISTICS

Logistics Section Chief 4-44

Service Branch Director 4-44
- Communications Unit Leader 4-45
- Medical Unit Leader 4-45
- Food Unit Leader 4-46
- Hospital Coordination Unit 4-46

Support Branch Director 4-47
- Supply Unit Leader 4-47
- Facilities Unit Leader 4-47
- Ground Support Unit Leader 4-48
- Vessel Support Unit Leader 4-49



LOGISTICS SECTION CHIEF

The Logistics Section Chief (LSC) is responsible for providing facilities, services, and material in support of the incident. The LSC participates in the development and implementation of the Incident Action Plan (IAP). The LSC activates and supervises the Branches and Units within the Logistics Section.

Resources are divided into Support and Services. Support resources are used in support of the IAP (i.e. boom, vacuum trucks, skimmers etc.). Service resources include food/water, communication and medical resources.

Overall LSC Responsibilities:

- Plan the organization of the Logistics Section.
- Assign work locations and preliminary work tasks to Section personnel.
- Notify the Resources Unit of the Logistics Section units activated including names and locations of assigned personnel.
- Assemble and brief Branch Directors and Unit Leaders.
- Participate in preparation of the IAP.
- Identify service and support requirements for planned and expected operations.
- Provide input to and review the Communications Plan (ICS Form 205), Medical Plan (ICS Form 206) and Traffic Plan.
- Coordinate and process requests for additional resources.
- Review the IAP and estimate Section needs for the next operational period.
- Advise on current service and support capabilities.
- Prepare service and support elements of the IAP.
- Estimate future service and support requirements.
- Receive Incident Demobilization Plan from Planning Section.
- Recommend release of Unit resources in conformity with Incident Demobilization Plan.
- Ensure the general welfare and safety of Logistics Section personnel.

SERVICE BRANCH DIRECTOR

The Service Branch Director, when activated, is under the supervision of the LSC, and is responsible for the management of all service activities at the incident. The Branch Director supervises the operations of the Communications, Medical and Food Units.

Overall Service Branch Director Responsibilities:

- Determine the level of service required to support operations.
- Confirm dispatch of Branch personnel.
- Participate in planning meetings of Logistics Section personnel.
- Review the IAP.
- Organize and prepare assignments for Service Branch personnel.
- Coordinate activities of Branch Units.
- Inform the LSC of Branch activities.
- Resolve Service Branch problems.

1. Incident Name	2. Operational Period (Date / Time) From: To:	INCIDENT RADIO COMMUNICATIONS PLAN ICS 205-CG

3. BASIC RADIO CHANNEL USE

SYSTEM / CACHE	CHANNEL	FUNCTION	FREQUENCY	ASSIGNMENT	REMARKS

4. Prepared by: (Communications Unit) **Date / Time**

INCIDENT RADIO COMMUNICATIONS PLAN (ICS 205-CG)

Special Note. This form, ICS 205-CG, is used to provide, in one location, information on all radio frequency assignments down to the Division/Group level for each operational period; whereas, the Communications List, ICS 205a-CG is used to list methods of contact for personnel assigned to the incident (radio frequencies, phone numbers, pager numbers, etc.).

Purpose. The Incident Radio Communications Plan is a summary of information obtained from the Radio Requirements Worksheet (ICS 216) and the Radio Frequency Assignment Worksheet (ICS 217). Information from the Radio Communications Plan on frequency assignments is normally noted on the appropriate Assignment List (ICS 204-CG).

Preparation. The Incident Radio Communications Plan is prepared by the Communications Unit Leader and given to the Planning Section Chief. Detailed instructions on the preparation of this form may be found in ICS Publication 223-5, Communications Unit Position Manual.

Distribution. The Incident Radio Communications Plan is duplicated and given to all recipients of the Incident Objectives form, including the Incident Communications Center. Information from the plan is placed on Assignment Lists. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Basic Radio Channel	Enter the following information about radio channel use:
	System	Radio cache system(s) assigned and used on the incident.
	Channel	Radio channel numbers assigned.
	Function	Function each channel is assigned (e.g., command, support, division tactical, and ground-to-air).
	Frequency	Radio frequency tone number assigned to each specified function (e.g., 153.400)
	Assignment	ICS organization assigned to each of the designated frequencies (e.g., Branch I, Division A).
	Remarks	This section should include narrative information regarding special situations.
4.	Prepared By	Enter the name of the Communications Unit Leader preparing the form.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

1. Incident Name	2. Operational Period (Date / Time) From: To:	**COMMUNICATIONS LIST** **ICS 205A-CG**

3. Basic Local Communications Information

Assignment	Name	Method(s) of contact (radio frequency, phone, pager, cell #(s), etc.)

4. Prepared by: (Communications Unit) **Date / Time**

COMMUNICATIONS LIST (ICS 205a-CG)

Special Note. This optional form is used in conjunction with the Incident Radio Communications Plan, ICS 205-CG. Whereas the ICS 205-CG is used to provide information on all radio frequencies down to the Division/Group level, the Communications List, ICS 205a-CG, lists methods of contact for personnel assigned to the incident (radio frequencies, phone numbers, pager numbers, etc.), and functions as an incident directory.

Purpose. The Communications List records methods of contact for personnel on scene.

Preparation. The Communications List can be filled out during check-in and is maintained and distributed by Communications Unit personnel.

Distribution. The Communications List is distributed within the ICS and posted, as necessary. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Basic Local Comms Information	Enter the communications methods assigned and used for each assignment.
	Assignment	Enter the ICS Organizational assignment.
	Name	Enter the name of the contact person for the assignment.
	Method(s) of contact	Enter the radio frequency, telephone number(s), etc. for each assignment.
4.	Prepared By	Enter the name of the Communications Unit Leader preparing the form.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

1. Incident Name	2. Operational Period (Date / Time) From: To:	**MEDICAL PLAN** **ICS 206-CG**

3. Medical Aid Stations

Name	Location	Contact #	Paramedics On site (Y/N)

4. Transportation

Ambulance Service	Address	Contact #	Paramedics On board (Y/N)

5. Hospitals

Hospital Name	Address	Contact #	Travel Time		Burn Ctr?	Heli-Pad?

6. Special Medical Emergency Procedures

7. Prepared by: (Medical Unit Leader) **Date/Time**	**8. Reviewed by: (Safety Officer)** **Date/Time**

MEDICAL PLAN (ICS 206-CG)

Purpose. The Medical Plan provides information on incident medical aid stations, transportation services, hospitals, and medical emergency procedures.

Preparation. The Medical Plan is prepared by the Medical Unit Leader and reviewed by the Safety Officer.
Distribution. The Medical Plan may be attached to the Incident Objectives (ICS 202-CG), or information from the plan pertaining to incident medical aid stations and medical emergency procedures may be taken from the plan and noted on the Assignment List (ICS 204-CG) or on the Assignment List Attachment (ICS 204a-CG). All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Medical Aid Stations	Enter name, location, and telephone number of the medical aid station(s) (e.g., Cajon Staging Area, Cajon Camp Ground) and indicate if paramedics are located at the site.
4.	Transportation	List name and address of ambulance services. Provide phone number and indicate if ambulance company has paramedics.
5.	Hospitals	List hospitals that could serve this incident. Enter hospital name, address, phone number, the travel time by air and ground from the incident to the hospital, and indicate if the hospital has a burn center and/or a helipad.
6.	Medical Emergency Procedures	Note any special emergency instructions for use by incident personnel.
7.	Prepared By Date/Time	Enter the name of the Medical Unit Leader preparing the form. Enter date (month, day, year) and time prepared (24-hour clock).
8.	Reviewed By Date/Time	Enter the name of the Safety Officer who must review the plan. Enter date (month, day, year) and time reviewed (24-hour clock).

Full Instructions on back page. Requestor fills out # 1-9 & keeps yellow copy (bottom). If applicable, RESL reviews if resource available & signs # 10. Logistics fills in remainder of # 4 & # 10-15 & keeps pink copy. Finance, if needed fills out appropriate items & keeps green copy. Blue original is returned to RESL for tactical/personnel or requestor for non-tactical. White copy goes to DOCL.

Instructions for filling out the ICS-213RR CG Form (5/06)

REQUESTOR: The requestor must fill in Blocks 1 through 9:

Block # 1	Incident name: This is the same as the name stated on the ICS-201 Form and/or the Incident Action Plan (IAP).
Block # 2	Current date and time when submitting request
Block # 3	Resource Request Number: This is to be assigned by the Section submitting request (i.e. CMD, OPS, PLAN, LOG, FIN)
Block # 4	Fill in blocks 4a through 4e. Items requested: Must include Quantity, Kind and Type (if applicable) and detailed description of requirements. **BE SPECIFIC AS POSSIBLE**. The request should focus on capability rather than naming the brand or specific item (e.g. helicopter capable of carrying 4 personnel from location A to B rather than requesting a Coast Guard H-65 helicopter). This gives the logistics section the ability to find the best resource to meet the need. 4.e Requested Reporting Location/Date/Time: This is self-explanatory and is required for ordering official. Leave blocks 4.f. ETA (LSC) and 4.g. Cost (FSC) blank. These will be filled in later by Logistics and Finance.
Block # 5	Suggested sources of supply and suitable substitutes: Enter applicable information if known.
Block # 6 & 7	Requestor: Print Name and Signature and date/time.
Block # 8	Approval: This must be approved by the Section Chief or Deputy Section Chief.
Block # 9	Check box if request is for tactical or personnel resource(s) and submit request to Resources Unit Leader (RESL) to review and approve since RESL tracks all tactical and personnel resources.

Request goes to RESOURCES UNIT if requesting Tactical/Personnel Resource(s):

Block # 10	Resources reviews request and checks to see if resource is available. If the resource is available, reassigns resource as appropriate and sends request back to requester with information noted as to reporting time, etc. The request form is then sent to Documentation Unit Leader (DOCL) for filing. If the resource is not available, RESL sends request to Logistics.

LOGISTICS SECTION: The following blocks are to be filled out be the Supply Unit (SPUL).

Block # 11	Logistics Order Number: To be assigned by Supply Unit.
Block # 12	Supplier Point of Contact, Phone Number and Fax Number: This information is needed for Credit Card purchases and/or Purchase Orders.
Block # 13	Notes: Enter applicable information as need for request.
Block # 4	ETA and Cost: SPUL or PROC fills in Estimated time of arrival (ETA) when determined and cost if known.
Block # 14 & 15	Approval: This must be approved by the Logistics Section Chief or Deputy Logistics Section Chief, printed name and signature is required with Date and Time of approval. Bottom Copy (pink) is retained.

FINANCE SECTION: The following blocks are to be filled out be the Procurement Unit (PROC), if applicable.

Block # 16	Indicates who is to place order as necessary.
Block # 17	Comments concerning request from Finance Section Chief or Deputy Finance Section Chief.
Block # 18 & 19	Approval: This must be approved by the Finance Section Chief or Deputy Section Chief, printed name and signature is required with Date and Time of approval. Bottom copy (green) is retained.
FILING	Original blue copy is returned to RESL for tactical/personnel resources ordered, and the requester for non-tactical. RESL will inform requester of status of request when form received. The white copy is sent to DOCL.

Note: Cost associated requests will not be ordered without approval from the Finance Section Chief or Deputy Finance Section Chief.

Form Filing: Blue (Original) – final disposition to RESL or originator for non-tactical resources, White (copy 1) to DOCL, Green (copy 2) to FIN, Pink (copy 3) to LOG, Yellow (copy 4) to Originator

UNIT LOG (ICS FORM 214-CG)

Purpose. The Unit Log records details of unit activity, including strike team activity or individual activity. These logs provide the basic reference from which to extract information for inclusion in any after-action report.

Preparation. A Unit Log is initiated and maintained by Command Staff members, Division/Group Supervisors, Air Operations Groups, Strike Team/Task Force Leaders, and Unit Leaders. Completed logs are submitted to supervisors who forward them to the Documentation Unit.

Distribution. The Documentation Unit maintains a file of all Unit Logs. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Check-In Location	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Unit Name/Designators	Enter the title of the organizational unit or resource designator (e.g., Facilities Unit, Safety Officer, Strike Team).
4.	Unit Leader	Enter the name and ICS Position of the individual in charge of the Unit.
5.	Personnel Assigned	List the name, position, and home base of each member assigned to the unit during the operational period.
6.	Activity Log	Enter the time and briefly describe each significant occurrence or event (e.g., task assignments, task completions, injuries, difficulties encountered, etc.)
7.	Prepared By	Enter name and title of the person completing the log. Provide log to immediate supervisor, at the end of each operational period.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

UNITED STATES COAST GUARD **Operations Section Activities**

The Operational Planning "P"

Brief on current operations
Divide incident into manageable units
Develop work map
Develop strategy/tactics to deploy
Complete ICS-215
Identify resource needs
Identify contingencies
Develop operations org chart
Continue on-scene operations

Complete 8½" x 11" ICS-215
Continue to update work progress
Continue on-scene operations

Brief on planned strategy/tactics [ICS-215 & work map/chart]
Identify how incident will be subdivided into mgmt/work units
Identify resource needs & reporting locations
Identify any contingencies as needed
Identify organizational requirements

Develop draft strategies & tactics for each assigned objective, including alternative and/or contingency strategies using a Work Analysis Matrix
Outline work assignments and required resources using ICS-215
Develop/outline OPS Section organization for next operational period

Provide information for IAP [ICS-220]
Ensure ICS-204 taskings are clear
Communicate incident status changes
Continue on-scene operations

Receive direction from IC/UC
Clarify objectives & priorities
Clarify organizational issues
Identify any limitations & restrictions
Reach agreement on IC/UC focus and direction
Discuss interagency issues
Prepare for tactics meeting
Continue on-scene operations

Provide operations briefing to Ops Sec Personnel
Ensure support to operations in place
Deploy next operating period resources

Using ICS 201, brief on current operations
Clarify issues & concerns
Discuss planned operations & direction

Monitor on-going operations & make tactical adjustments
Measure/ensure progress against stated objectives
Debrief resources coming off shift
Prepare to brief UC/Planning on accomplishments

Assess situation
Develop ICS-201
- Develop initial tactics & priorities
- Develop sketch map
- Summarize actions
- Develop resource summary
- List current organization

Continue to update response using ICS-201

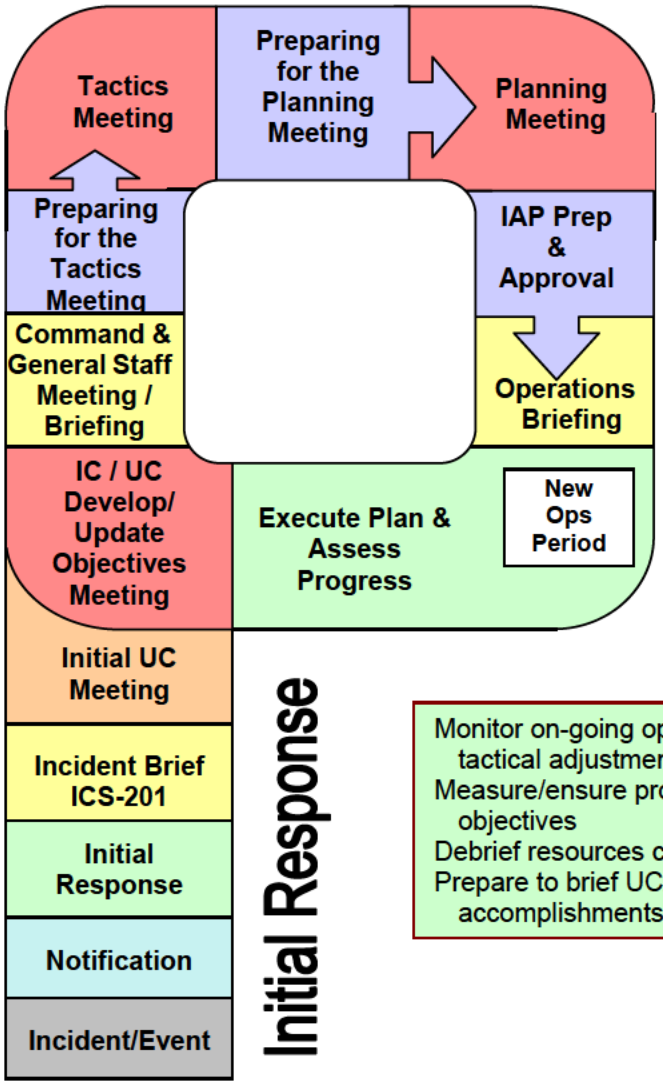

FIGURE 4.1

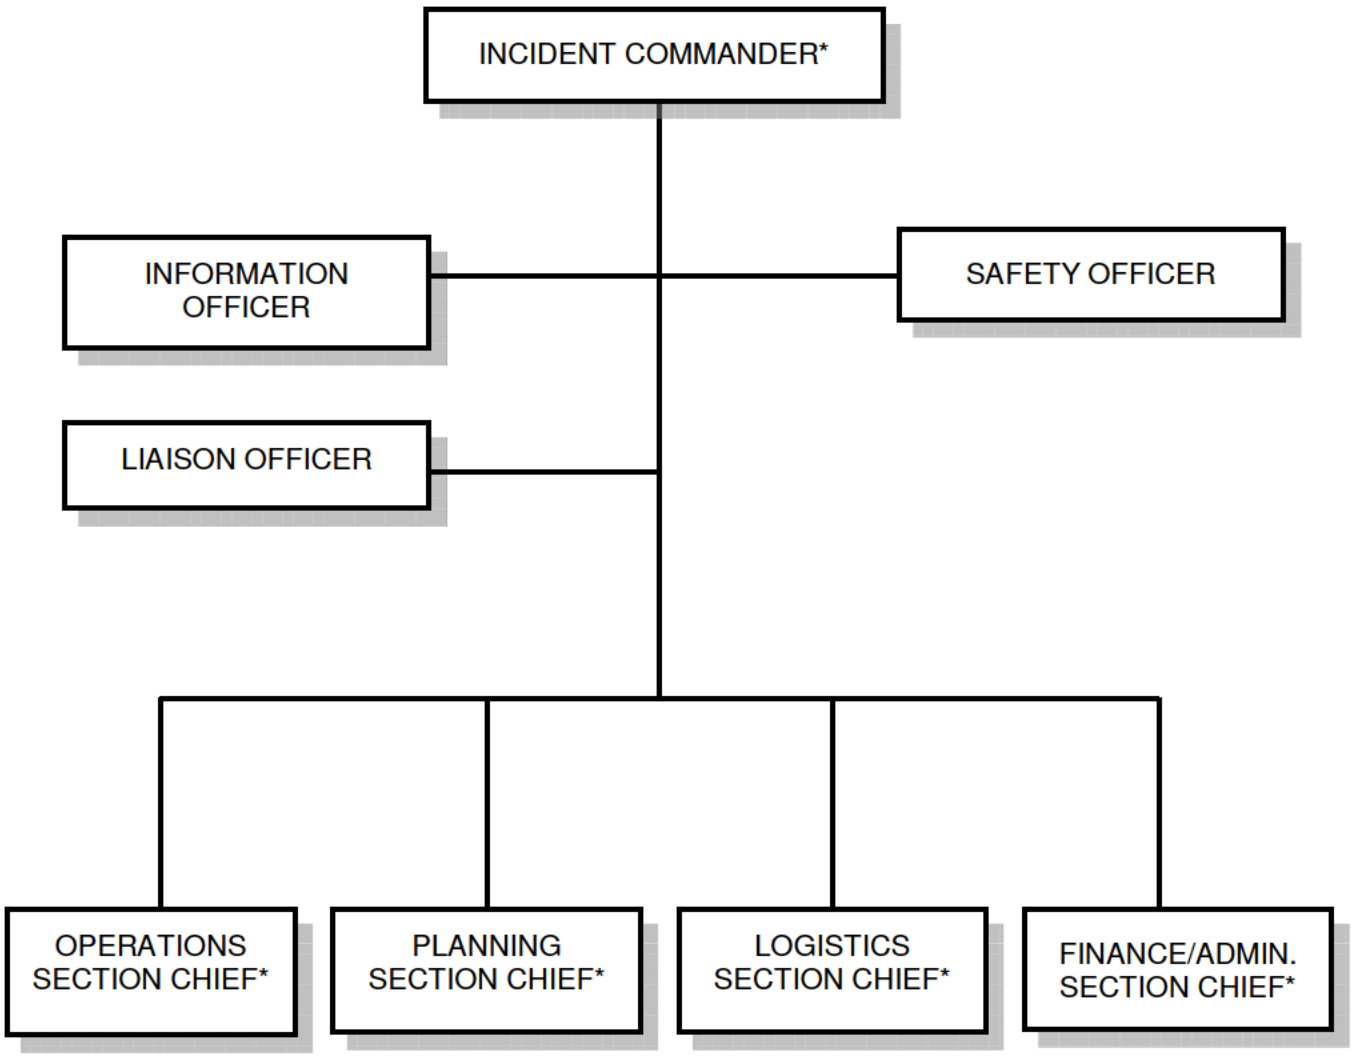
LOCAL RESPONSE TEAM

(For Initial Response and Tier I & II Incidents)

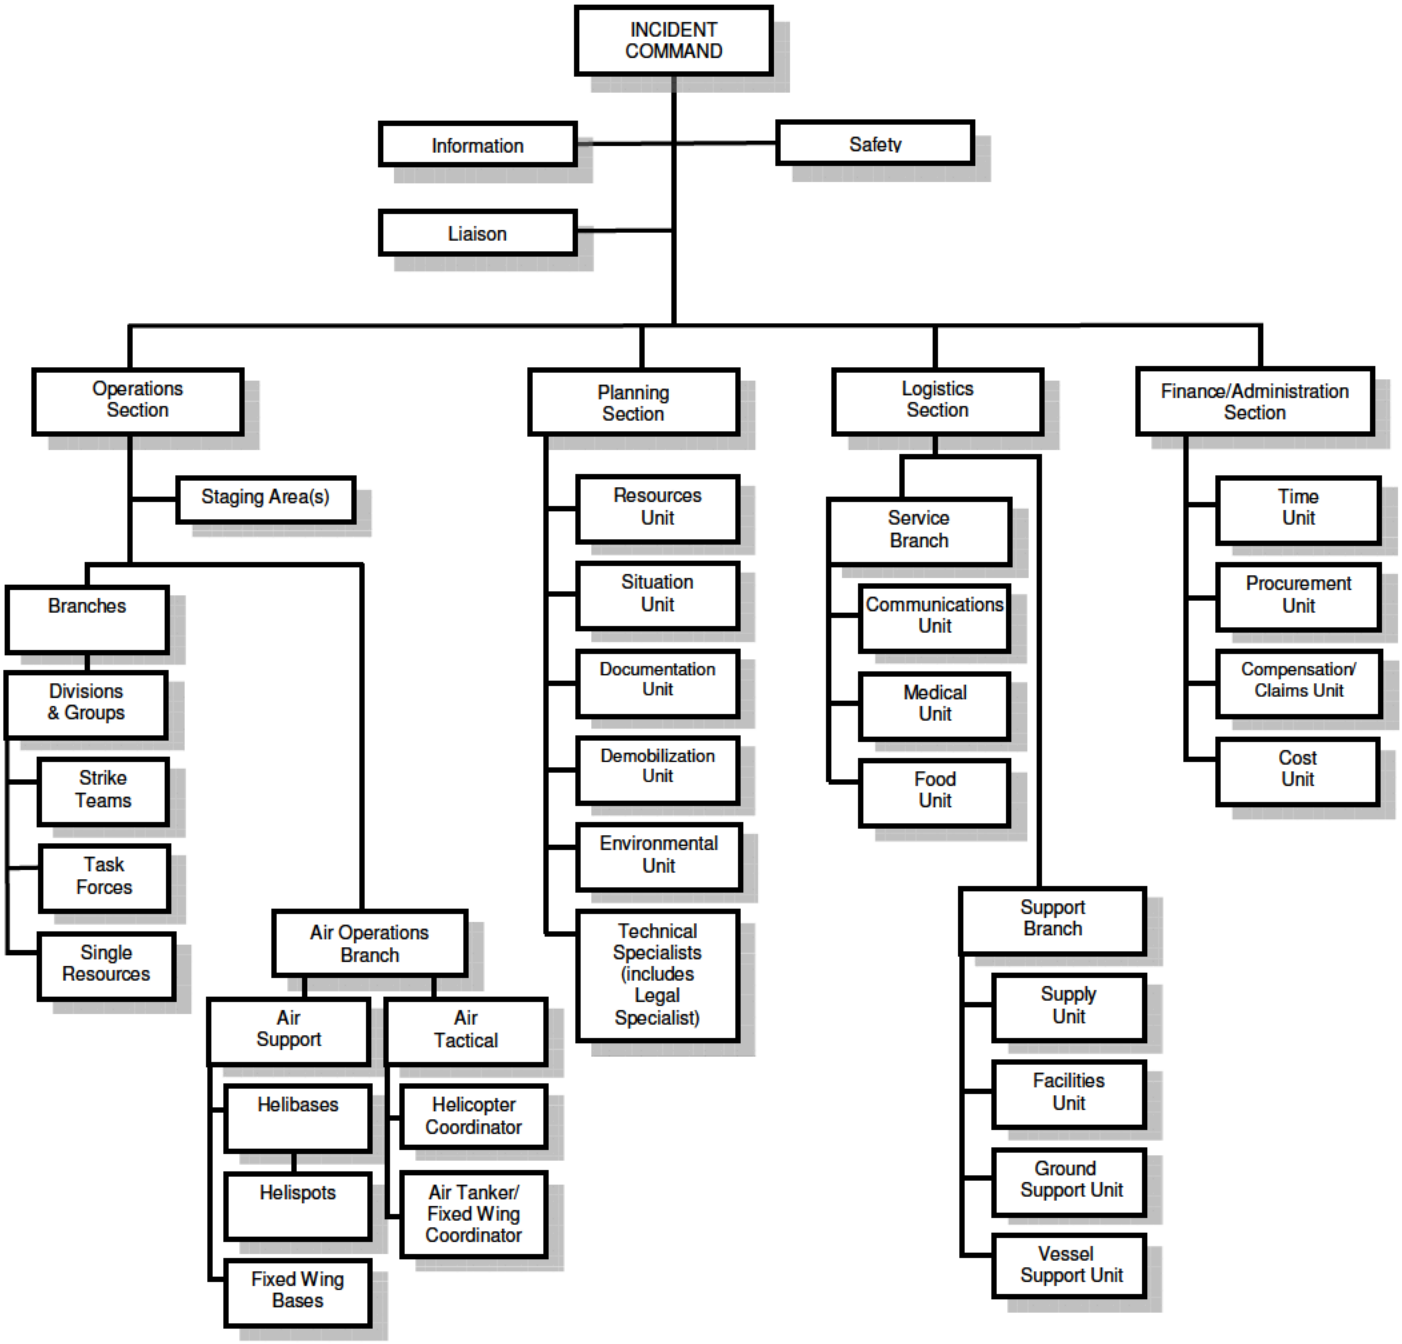


* NOTE: Local Response Team (LRT) personnel can assume any of these positions as necessary.

FIGURE 4.2

INCIDENT MANAGEMENT TEAM

(For incidents beyond the response capability of the Local Response Team)



4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

OPERATIONS

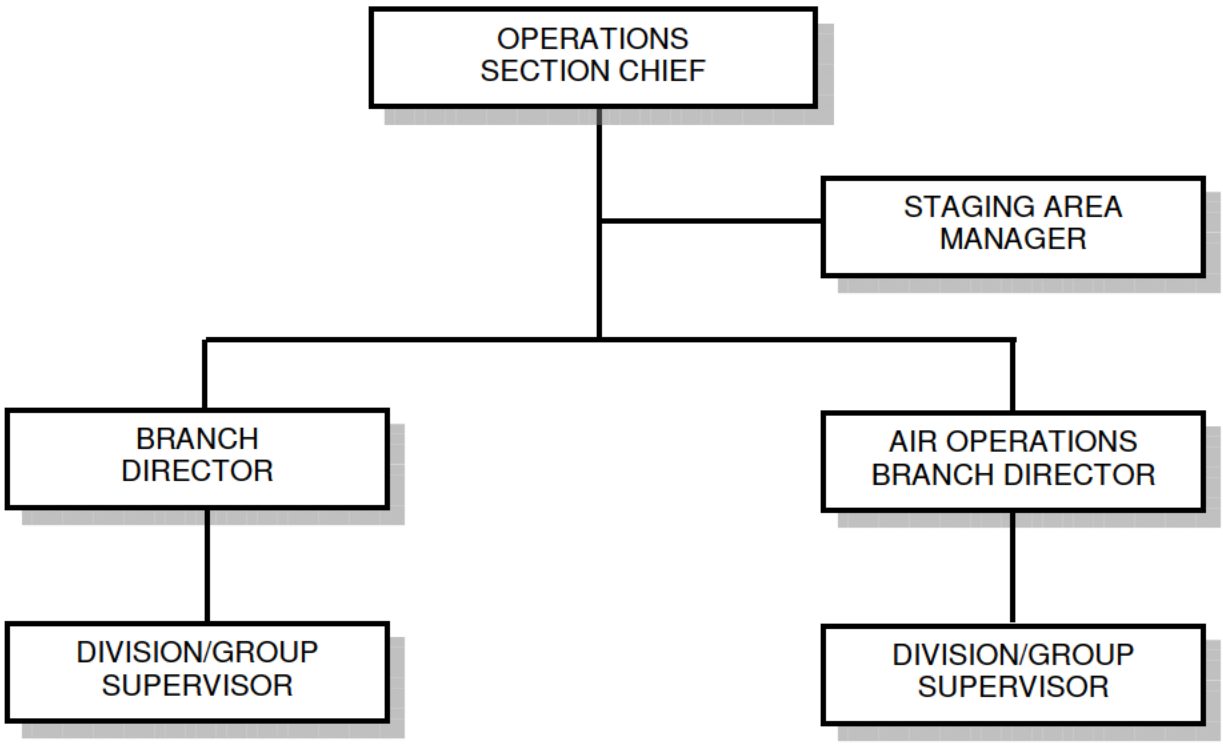
Operations Section Chief 4-21

Air Operations Branch Director 4-21

Staging Area Manager 4-25

Branch Director 4-25

Division/Group Supervisor 4-29



OPERATIONS SECTION CHIEF

The Operations Section Chief (OPS) is responsible for the management of all operations directly applicable to the primary mission (i.e. clean-up, recovery etc.). The OPS activates and supervises tactical response elements in accordance with the Incident Action Plan (IAP) and directs its execution. The OPS also requests or releases resources, makes expedient changes to the IAP, as necessary; and reports these actions to the IC.

Overall OPS Responsibilities

- Develop operations portion of IAP.
  This generally includes the designation of branches, divisions and groups, as well as input on required resources.
- Brief and assign Operations Section personnel in accordance with the IAP.
- Supervise Operations Section.
- Determine need and request additional resources.
- Review suggested list of resources to be released and initiate recommendation for release of resources.
- Assemble and disassemble strike teams assigned to the Operations Section.
- Report information about special activities, events, and occurrences to the IC.
- Respond to resource requests in support of NRDAR activities.

Additional KM Required OPS Responsibilities

- Directs KM personnel and emergency response contractors performing operations activities
- Review and ensure communication of the Site Specific H&S Plan to KM personnel and emergency response contractors performing operations activities
- Supervise the decontamination system
  - Ensure decontamination system is set-up and functional prior to Hot Zone entry
  - Request input from the Safety Officer, as necessary

AIR OPERATIONS BRANCH DIRECTOR

The Air Operations Branch Director (AIROPS), who is ground-based, is primarily responsible for preparing the air operations portion of the IAP. The plan will reflect agency restrictions that have an impact on the operational capability or utilization of resources (e.g., night flying, hours per pilot). After the plan is approved, the AIROPS is responsible for implementing its strategic aspects, which are those that relate to the overall incident strategy as opposed to those that pertain to tactical operations (specific target selection). Additionally, the AIROPS is responsible for providing logistical support to helicopters operating on the incident. The Air Tactical Group Supervisor, working in conjunction with ground and air resources, normally performs specific tactical activities, such as target selection and suggested modifications to specific tactical actions in the IAP.

Overall AIROPS Responsibilities:

- Organize preliminary air operations.
- Request declaration (or cancellation) of restricted air space
- Participate in preparation of the IAP through the OPS. Insure that the air operations portion of the IAP takes into consideration the Air Traffic Control requirements of assigned aircraft.
- Perform operational planning for air operations.

ASSIGNMENT LIST (ICS 204-CG)

Purpose. The Assignment List(s) informs Division and Group supervisors of incident assignments. Once the Unified Command and General Staff agree to the assignments, the assignment information is given to the appropriate Divisions and Groups.

Preparation. The Assignment List is normally prepared by the Resources Unit, using guidance from the Incident Objectives (ICS 202-CG), Operational Planning Worksheet (ICS 215-CG), and the Operations Section Chief. The Assignment List must be approved by the Planning Section Chief and Operations Section Chief. When approved, it is included as part of the Incident Action Plan (IAP). Specific instructions for specific resources may be entered on an ICS 204a-CG for dissemination to the field. A separate sheet is used for each Division or Group. The identification letter of the Division is entered in the form title. Also enter the number (roman numeral) assigned to the Branch.

Special Note. The Assignment List, ICS 204-CG submits assignments at the level of Divisions and Groups. The Assignment List Attachment, ICS 204a-CG shows more specific assignment information, if needed. The need for an ICS 204a-CG is determined by the Planning and Operations Section Chiefs during the Operational Planning Worksheet (ICS 215-CG) development.

Distribution. The Assignment List is duplicated and attached to the Incident Objectives and given to all recipients of the Incident Action Plan. In some cases, assignments may be communicated via radio/telephone/fax. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Branch	Enter the Branch designator.
4.	Division/Group/Staging	Enter the Division/Group/Staging designator.
5.	Operations Personnel	Enter the name of the Operations Chief, applicable Branch Director, and Division Supervisor.
6.	Resources Assigned	Each line in this field may have a separate Assignment List Attachment (ICS 204a-CG). Enter the following information about the resources assigned to Division or Group for this period:
	Identifier	List identifier
	Leader	Leader name
	Contact Information	Primary means of contacting this person (e.g., radio, phone, pager, etc.). Be sure to include area code when listing a phone number.
	# Of Persons	Total number of personnel for the strike team, task force, or single resource assigned.
	Reporting Info/Notes/ Remarks	Special notes or directions, specific to this strike team, task force, or single resource. Enter an "X" check if an Assignment List Attachment (ICS 204a-CG) will be prepared and attached. The Planning and Operations Section Chiefs determine the need for an ICS 204a-CG during the Operational Planning Worksheet (ICS 215-CG) development.
7.	Work Assignment	Provide a statement of the tactical objectives to be achieved within the operational period by personnel assigned to this Division or Group.
8.	Special Instructions	Enter a statement noting any safety problems, specific precautions to be exercised, or other important information.
9.	Communications	Enter specific communications information (including emergency numbers) for this division /group. If radios are being used, enter function (command, tactical, support, etc.), frequency, system, and channel from the Incident Radio Communications Plan (ICS 205-CG). Note: Phone numbers should include area code.
10.	Prepared By	Enter the name of the person completing the form, normally the Resources Unit Leader.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).
11.	Reviewed by (PSC)	
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).
12.	Reviewed by (OSC)	Enter the name of the operations person reviewing the form, normally the Operations Section Chief.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

Blue original is returned to RESL for tactical/personnel or requestor for non-tactical. White copy goes to DOCL.

Instructions for filling out the ICS-213RR CG Form (5/06)

REQUESTOR: The requestor must fill in Blocks 1 through 9:

Block # 1	Incident name: This is the same as the name stated on the ICS-201 Form and/or the Incident Action Plan (IAP).
Block # 2	Current date and time when submitting request
Block # 3	Resource Request Number: This is to be assigned by the Section submitting request (i.e. CMD, OPS, PLAN, LOG, FIN)
Block # 4	Fill in blocks 4a through 4e. Items requested: Must include Quantity, Kind and Type (if applicable) and detailed description of requirements. **BE SPECIFIC AS POSSIBLE**. The request should focus on capability rather than naming the brand or specific item (e.g. helicopter capable of carrying 4 personnel from location A to B rather than requesting a Coast Guard H-65 helicopter). This gives the logistics section the ability to find the best resource to meet the need. 4.e Requested Reporting Location/Date/Time: This is self-explanatory and is required for ordering official. Leave blocks 4.f. ETA (LSC) and 4.g. Cost (FSC) blank. These will be filled in later by Logistics and Finance.
Block # 5	Suggested sources of supply and suitable substitutes: Enter applicable information if known.
Block # 6 & 7	Requestor: Print Name and Signature and date/time.
Block # 8	Approval: This must be approved by the Section Chief or Deputy Section Chief.
Block # 9	Check box if request is for tactical or personnel resource(s) and submit request to Resources Unit Leader (RESL) to review and approve since RESL tracks all tactical and personnel resources.

Request goes to RESOURCES UNIT if requesting Tactical/Personnel Resource(s):

Block # 10	Resources reviews request and checks to see if resource is available. If the resource is available, reassigns resource as appropriate and sends request back to requester with information noted as to reporting time, etc. The request form is then sent to Documentation Unit Leader (DOCL) for filing. If the resource is not available, RESL sends request to Logistics.

LOGISTICS SECTION: The following blocks are to be filled out be the Supply Unit (SPUL).

Block # 11	Logistics Order Number: To be assigned by Supply Unit.
Block # 12	Supplier Point of Contact, Phone Number and Fax Number: This information is needed for Credit Card purchases and/or Purchase Orders.
Block # 13	Notes: Enter applicable information as need for request.
Block # 4	ETA and Cost: SPUL or PROC fills in Estimated time of arrival (ETA) when determined and cost if known.
Block # 14 & 15	Approval: This must be approved by the Logistics Section Chief or Deputy Logistics Section Chief, printed name and signature is required with Date and Time of approval. Bottom Copy (pink) is retained.

FINANCE SECTION: The following blocks are to be filled out be the Procurement Unit (PROC), if applicable.

Block # 16	Indicates who is to place order as necessary.
Block # 17	Comments concerning request from Finance Section Chief or Deputy Finance Section Chief.
Block # 18 & 19	Approval: This must be approved by the Finance Section Chief or Deputy Section Chief, printed name and signature is required with Date and Time of approval. Bottom copy (green) is retained.
FILING	Original blue copy is returned to RESL for tactical/personnel resources ordered, and the requester for non-tactical. RESL will inform requester of status of request when form received. The white copy is sent to DOCL.

Note: Cost associated requests will not be ordered without approval from the Finance Section Chief or Deputy Finance Section Chief.

AIR OPERATIONS SUMMARY (ICS 220-CG)

Purpose. The Air Operations Summary provides the Air Operations Branch with the number, type, location, and specific assignments of aircraft.

Preparation. The Operations Section Chief or the Air Operations Branch Director completes the summary during each Planning Meeting. General air resource assignment information is obtained from the Operational Planning Worksheet (ICS 215-CG). The Air and Fixed-Wing Support Groups provide specific designators of the air resources assigned to the incident.

Distribution. After the summary is completed by Air Operations personnel (except item 11), the form is given to the Air Support Group Supervisor, who completes the form by indicating the designators of the helicopters and fixed-wing aircraft assigned missions during the specified operational period. This information is provided to Air Operations personnel who, in turn, give the information to the Resources Unit. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Distribution	Check the block and enter the time and date when ICS 220-CG and attachments were sent to all fixed-wing bases and helibases supporting the incident.
4.	Personnel and Communications	List the names of those assigned to each position, and the air-air and air-ground frequencies to be used.
5.	Remarks	Enter the special instructions or information, including safety notes, hazards, and priorities for Air Operations personnel.
6.	Location/Function	Enter the assigned location and function of the aircraft.
7.	Assignment	Enter the scope of work the aircraft is assigned to complete.
8.	Fixed Wing	Indicate the number and type of fixed-wing aircraft available for this Location / Function.
9.	Helicopters	Indicate the number and type of helicopters available for this Location / Function.
10.	Time	Indicate when aircraft will be available for use and when operations commence (use 24 hour clock).
11.	Aircraft Assigned	Enter the designators of the aircraft assigned. Gather information from Resources Unit, helibases, and fixed-wing bases.
12.	Operating Base	Enter the base (helibase, helispot, fixed-wing base) from which each air resource is expected to initiate operations.
13.	Totals	Enter the total number of fixed-wing and helicopter aircraft assigned to the incident in the Number columns. Enter the total number of each type of aircraft assigned in the Type columns.
14.	Air Operations Support Equipment	List the designators and location of other support resources assigned to Air Operations.
15.	Prepared By Date/Time	Enter name and title of the person preparing the form. Enter date (month, day, year) and time prepared (24-hour clock).

UNITED STATES COAST GUARD **Planning Section Activities**

The Operational Planning "P"

Facilitate meeting
Provide Situation Briefing
Review proposed strategy, tactics & resource requirements
Identify resource shortfalls
Assure the strategy & tactics comply with IC/UC objectives
Mitigate Logistics and Safety issues

Clean up ICS-215 & make hard copies for attendees
Notify participants of meeting location & time
Setup meeting room

Facilitate meeting
Provide Situation Briefing
Confirm availability of resources
Verify support for the proposed plan
Document decisions & assigned actions

Meet with Operations to determine strategies, tactics & resource requirements
Complete ICS-215
Notify meeting participants of scheduled meeting
Setup meeting room

Develop components of the IAP
Review completed IAP for correctness
Provide IAP to IC/UC for review and approval
Make copies of IAP for distribution

Setup meeting room
Facilitate meeting
Provide Situation Briefing
Receive work tasks & assignments
Resolve conflicts & clarify roles & responsibilities

Setup briefing area
Provide situation briefing
Distribute copies of IAP
Facilitate briefing
Make adjustments to IAP, if necessary

Setup Meeting Room
Facilitate meeting
Provide recorder to document decisions
Distribute and post decisions

Setup meeting room
Facilitate Meeting
Provide recorder to document discussion points

Monitor progress of implementing the IAP
Measure/ensure progress against stated objectives
Maintain Situation and Resource status
Debrief resources coming off shift
Maintain interaction with Command and General Staff

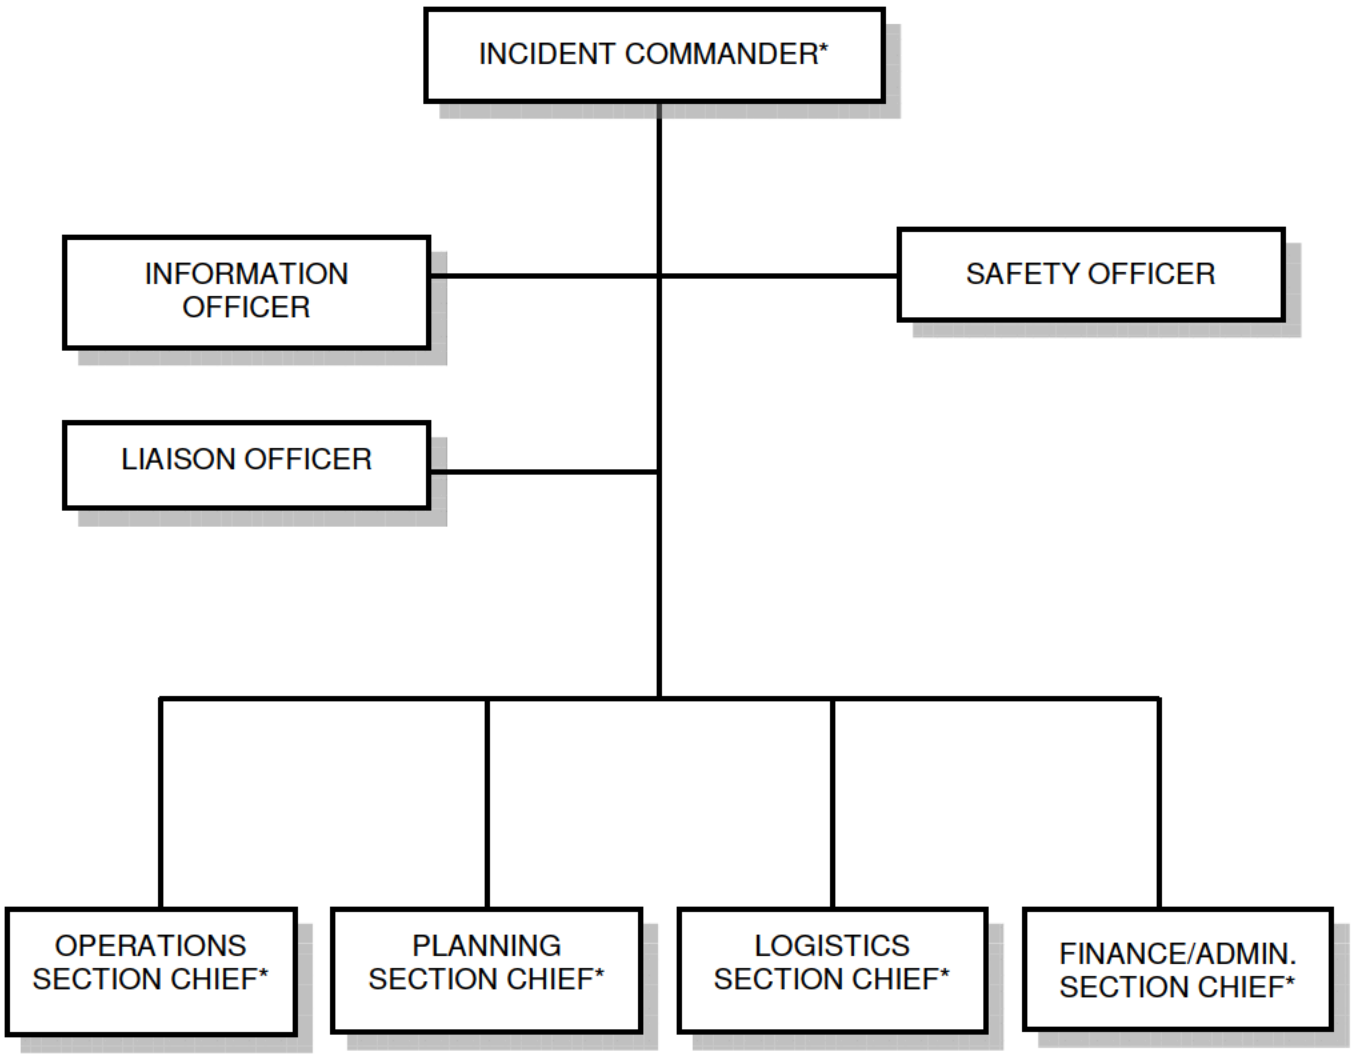
Facilitate ICS-201 brief
Obtain ICS-201 & distribute to RESL & SITL
Document results of ICS-201 briefing

Check-in
Receive IC/UC Briefing
Activate Plans Section
Organize & brief subordinates
Acquire work materials

FIGURE 4.1

LOCAL RESPONSE TEAM

(For Initial Response and Tier I & II Incidents)

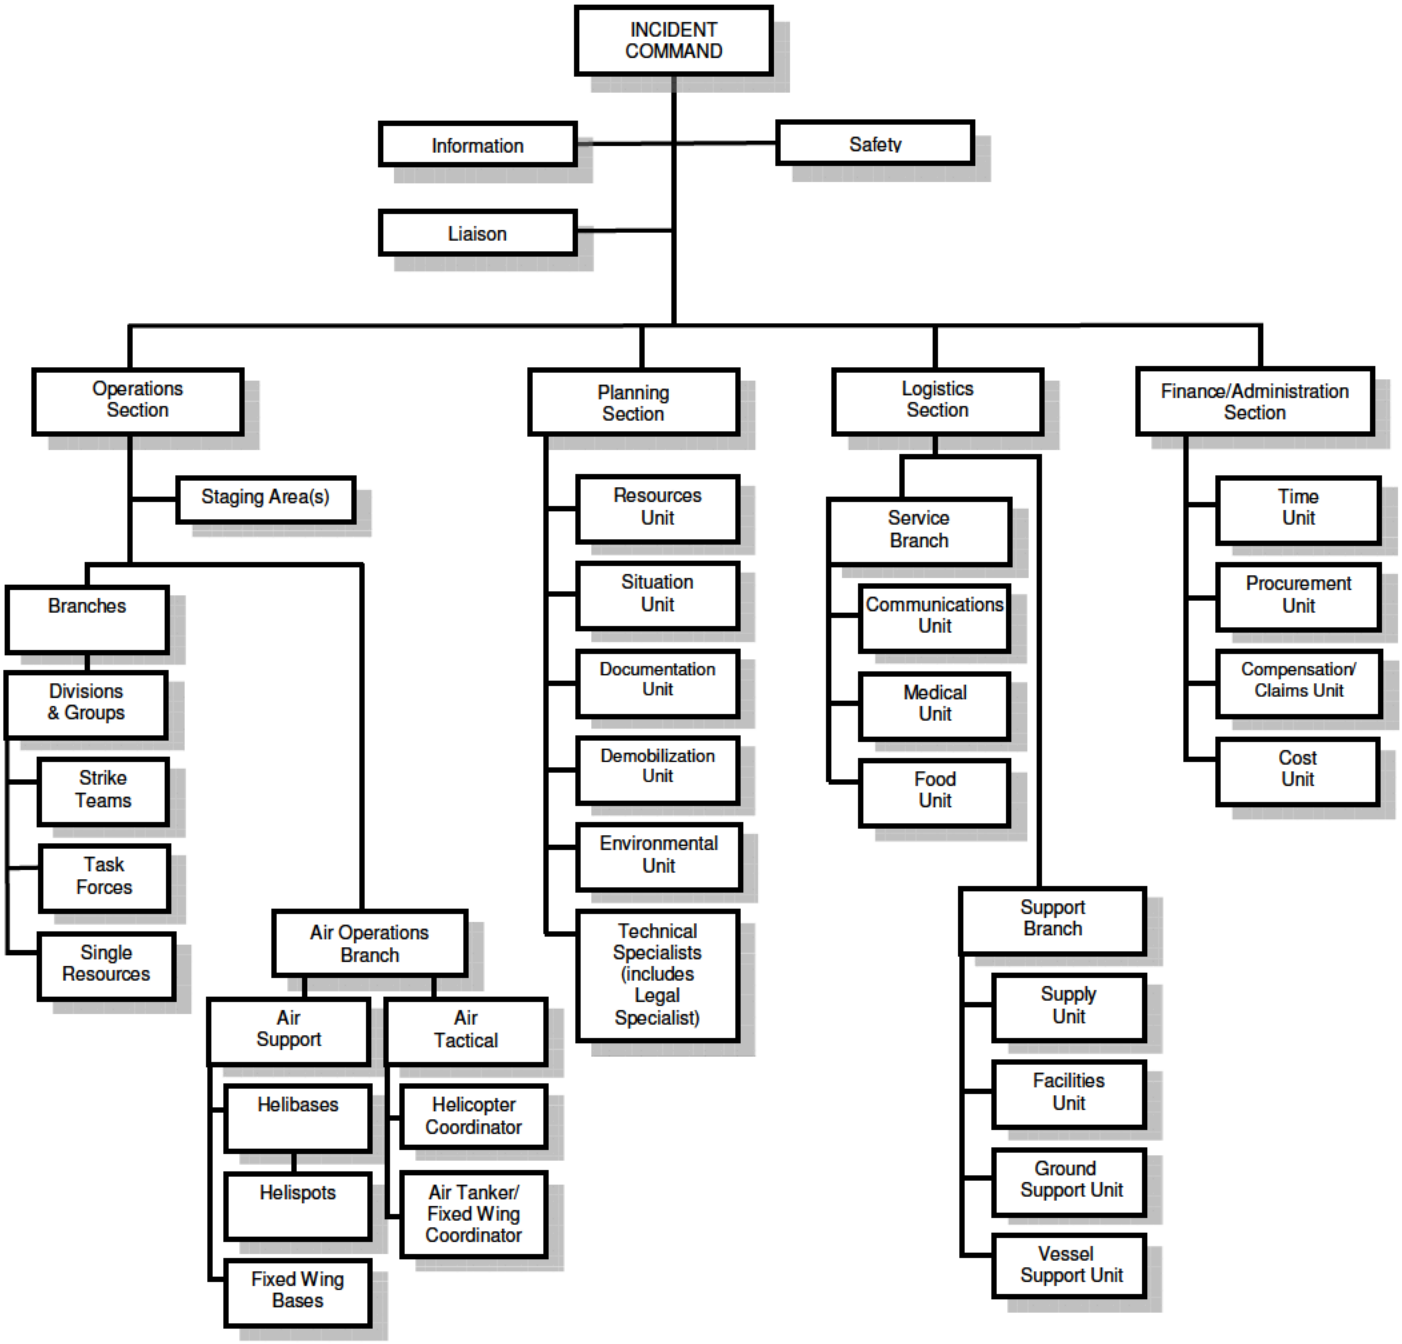


* NOTE: Local Response Team (LRT) personnel can assume any of these positions as necessary.

FIGURE 4.2

INCIDENT MANAGEMENT TEAM

(For incidents beyond the response capability of the Local Response Team)



4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

PLANNING

Planning Section Chief 4-38

Resources Unit Leader 4-38

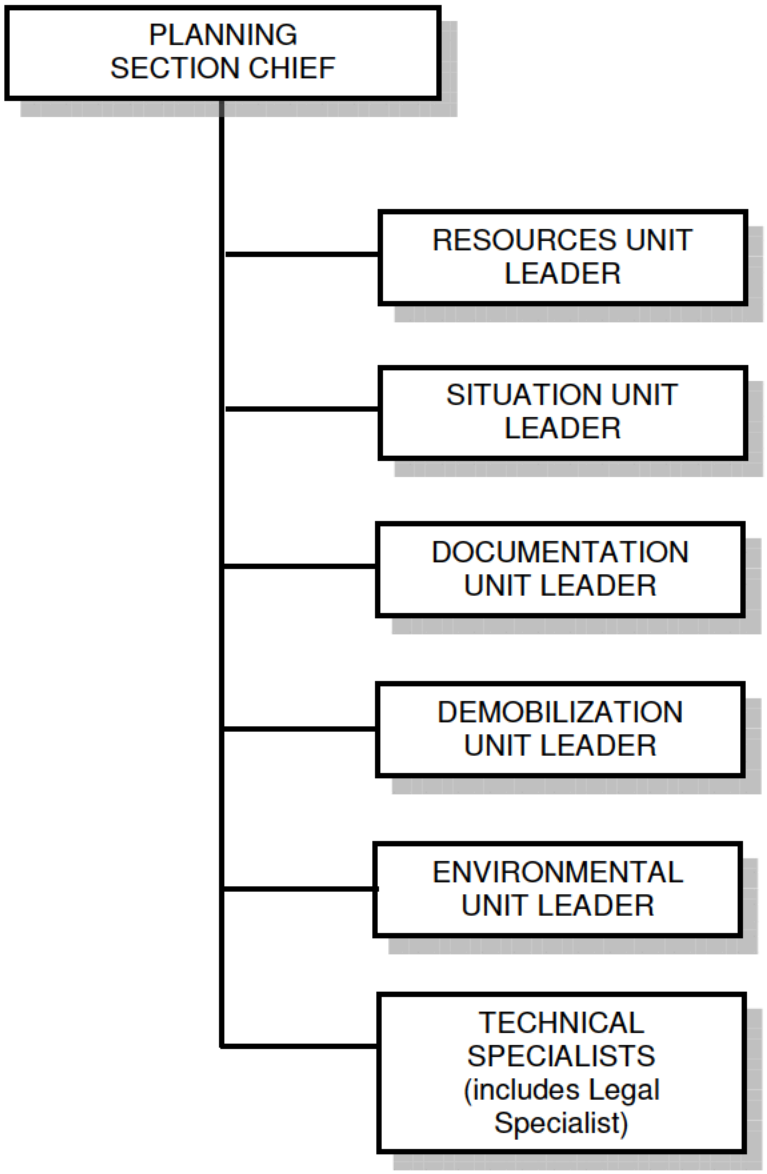
Situation Unit Leader 4-39

Documentation Unit Leader 4-40

Demobilization Unit Leader 4-41

Environmental Unit Leader 4-42

Technical Specialists 4-42



PLANNING SECTION CHIEF

The Planning Section Chief (PSC) is responsible for the collection, evaluation, dissemination and use of information; particularly with regard to the development of the incident and the status resources. This information is needed to: 1) understand the current situation, 2) predict the probable course of incident events; and 3) prepare alternative strategies for the incident.

Overall PSC Responsibilities:

- Collect and process situation information about the incident.
- Supervise preparation of the IAP.
- Provide input to the IC and the OPS in preparing the IAP.
- Chair planning meetings and participate in other meetings as required.
- Reassign out-of-service personnel already on-site to ICS organizational positions as appropriate.
- Establish information requirements and reporting schedules for Planning Section Units (e.g., Resources, Situation Units).
- Determine the need for any specialized resources in support of the incident.
- If requested, assemble and disassemble Strike Teams and Task Forces not assigned to Operations.
- Establish special information collection activities as necessary (e.g., weather, environmental, toxics, etc.).
- Assemble information on alternative strategies.
- Provide periodic predictions on incident potential.
- Report any significant changes in incident status.
- Compile and display incident status information.
- Oversee preparation and implementation of the Incident Demobilization Plan.
- Incorporate plans (e.g., Traffic, Medical, Communications, Site Safety) into the IAP.

RESOURCES UNIT LEADER

The Resource Unit Leader (RUL) works within the Planning Section and is responsible for maintaining the status of all assigned resources (primary and support) at an incident. This is achieved by overseeing the check in/out of all resources, maintaining a status-keeping system indicating current location and status of all resources, and maintenance of a master list of all resources (e.g. key supervisory personnel, primary and support resources, etc.).

Overall RUL Responsibilities:

- Establish the check-in function at incident locations.
  The Staging Area Manager may already be tracking this on ICS Form 211-p and 211-e. However, the RUL should verify that tracking is being conducted and is accurate. Additionally, the RUL should determine how to gather this resource information from Staging Areas.
- Prepare Organization Assignment List (ICS Form 203) and Organization Chart (ICS Form 207).
- Prepare appropriate parts of Division Assignment Lists (ICS Form 204).
- Prepare and maintain the ICP display (to include organization chart and resource allocation and deployment).

1. Incident Name	2. Operational Period to be covered by IAP (Date/Time) From: To:	CG IAP COVER SHEET

INCIDENT OBJECTIVES (ICS 202-CG)

Purpose. The Incident Objectives form describes the basic incident strategy, control objectives, command emphasis/priorities, and safety considerations for use during the next operational period.

Preparation. The Incident Objectives form is completed by the Planning Section following each Command and General Staff Meeting conducted in preparing the Incident Action Plan.

Distribution. The Incident Objectives form will be reproduced with the IAP and given to all supervisory personnel at the Section, Branch, Division/Group, and Unit levels. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Objective(s)	Enter clear, concise statements of the objectives for managing the response. These objectives are for the incident response for this operational period and for the duration of the incident. Include alternatives.
4.	Operational Period Command Emphasis	Enter clear, concise statements for safety message, priorities, and key command emphasis/decisions/directions. Enter information such as known safety hazards and specific precautions to be observed during this operational period. If available, a safety message should be referenced and attached. At the bottom of this box, enter the location where approved Site Safety Plan is available for review.
	Site Safety Plan	Note location of the approved Site Safety Plan.
5.	Prepared By	Enter the name of the Planning Section Chief completing the form.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

ORGANIZATION ASSIGNMENT LIST (ICS 203-CG) Instructions for filling out the form

Purpose. The Organization Assignment List provides ICS personnel with information on the units that are currently activated and the names of personnel staffing each position/unit. It is used to complete the Incident Organization Chart (ICS form 207-CG) which is posted on the Incident Command Post display. An actual organization will be event-specific. **Not all positions need to be filled.** The size of the organization is dependent on the magnitude of the incident and can be expanded or contracted as necessary.

Preparation. The Resources Unit prepares and maintains this list under the direction of the Planning Section Chief.

Note: Depending on the incident, the Intelligence and Information function may be organized in several ways: 1) within the Command Staff as the Intelligence Officer; 2) As an Intelligence Unit in Planning Section; 3) As an Intelligence Branch or Group in the Operations Section; 4) as a separate General Staff Intelligence Section; and 5) as an Intelligence Technical Specialist. The incident will drive the need for the Intelligence and Information function and where it is located in the ICS organization structure. The Intelligence and information function is described in significant detail in NIMS and in the Coast Guard Incident Management Handbook (IMH).

Distribution. The Organization Assignment List is duplicated and attached to the Incident Objectives form (ICS 202-CG) and given to all recipients of the Incident Action Plan. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Incident Commander and Staff	Enter the names of the Incident Commander and Staff. Use at least the first initial and last name.
4.	Agency Representative	Enter the agency names and the names of their representatives. Use at least the first initial and last name.
5. thru 8.	Section	Enter the name of personnel staffing each of the listed positions. Use at least the first initial and last name. For Units, indicate Unit Leader and for Divisions/ Groups indicate Division/Group Supervisor. Use an additional page if more than three branches are activated. If there is a shift change during the specified operational period, list both names, separated by a slash.
9.	Prepared By	Enter the name and position of the person completing the form
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

ASSIGNMENT LIST (ICS 204-CG)

Purpose. The Assignment List(s) informs Division and Group supervisors of incident assignments. Once the Unified Command and General Staff agree to the assignments, the assignment information is given to the appropriate Divisions and Groups.

Preparation. The Assignment List is normally prepared by the Resources Unit, using guidance from the Incident Objectives (ICS 202-CG), Operational Planning Worksheet (ICS 215-CG), and the Operations Section Chief. The Assignment List must be approved by the Planning Section Chief and Operations Section Chief. When approved, it is included as part of the Incident Action Plan (IAP). Specific instructions for specific resources may be entered on an ICS 204a-CG for dissemination to the field. A separate sheet is used for each Division or Group. The identification letter of the Division is entered in the form title. Also enter the number (roman numeral) assigned to the Branch.

Special Note. The Assignment List, ICS 204-CG submits assignments at the level of Divisions and Groups. The Assignment List Attachment, ICS 204a-CG shows more specific assignment information, if needed. The need for an ICS 204a-CG is determined by the Planning and Operations Section Chiefs during the Operational Planning Worksheet (ICS 215-CG) development.

Distribution. The Assignment List is duplicated and attached to the Incident Objectives and given to all recipients of the Incident Action Plan. In some cases, assignments may be communicated via radio/telephone/fax. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Branch	Enter the Branch designator.
4.	Division/Group/Staging	Enter the Division/Group/Staging designator.
5.	Operations Personnel	Enter the name of the Operations Chief, applicable Branch Director, and Division Supervisor.
6.	Resources Assigned	Each line in this field may have a separate Assignment List Attachment (ICS 204a-CG). Enter the following information about the resources assigned to Division or Group for this period:
	Identifier	List identifier
	Leader	Leader name
	Contact Information	Primary means of contacting this person (e.g., radio, phone, pager, etc.). Be sure to include area code when listing a phone number.
	# Of Persons	Total number of personnel for the strike team, task force, or single resource assigned.
	Reporting Info/Notes/ Remarks	Special notes or directions, specific to this strike team, task force, or single resource. Enter an "X" check if an Assignment List Attachment (ICS 204a-CG) will be prepared and attached. The Planning and Operations Section Chiefs determine the need for an ICS 204a-CG during the Operational Planning Worksheet (ICS 215-CG) development.
7.	Work Assignment	Provide a statement of the tactical objectives to be achieved within the operational period by personnel assigned to this Division or Group.
8.	Special Instructions	Enter a statement noting any safety problems, specific precautions to be exercised, or other important information.
9.	Communications	Enter specific communications information (including emergency numbers) for this division /group. If radios are being used, enter function (command, tactical, support, etc.), frequency, system, and channel from the Incident Radio Communications Plan (ICS 205-CG). Note: Phone numbers should include area code.
10.	Prepared By	Enter the name of the person completing the form, normally the Resources Unit Leader.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).
11.	Reviewed by (PSC)	
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).
12.	Reviewed by (OSC)	Enter the name of the operations person reviewing the form, normally the Operations Section Chief.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

INCIDENT STATUS SUMMARY (ICS FORM 209-CG)

Purpose. The Status Summary:
1. Is used by Situation Unit personnel for posting information on Status Boards or attaching as a file to the MISLE Case.
2. Is duplicated and provided to Command Staff members, giving them basic information for planning for the next operational period.
3. Provides information to the Information Officer for preparing news media releases.
4. Summarizes incident information for local and off-site coordination/operations centers.

Preparation. The Situation Unit prepares the Status Summary. Resources information should be obtained from the Resources Unit. It may be scheduled for presentation to the Planning Section Chief and other General Staff members prior to each Planning Meeting and may be required at more frequent intervals by the Unified Command or Planning Section Chief. Suggested sources of information are noted in brackets.
Note: The values on the ICS form 209-CG are the **best available estimates at the Time of Report** (Item # 2 on form). This form is usually in high demand and should be filled out early and often. A suggested source within the ICS organization is noted in brackets [ ] at the top right of each section of the form. **All fields need not be completed in order to distribute the form**.

Distribution. When completed, the form is duplicated and copies are distributed to the Unified Command and staff, and all Section Chiefs, Planning Section Unit Leaders, and the Joint Information Center. It is also posted on a status board located at the ICP. All completed original forms MUST be given to the Documentation Unit.

How to Save and Use the Word Template Form:
The 209 template (.dot file) can be edited to match most incident situations and can be saved into the Word template directory. Open the blank 209 (ICS 209 CG.dot) – do not add any content. Save the blank in the Templates directory. Create a new 209 from File>new picking the 209 template. Type in the file to add any desired content and use “save as” to save the work using a new file name. The file will automatically become a .doc file.

Comments: Please send comments/corrections about this form to the ICS Program Manager, Ms. Kristy Plourde, email: kplourde@tcyorktown.uscg.mil

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Period Covered by Report	Enter the date and time interval for which the report applies. Use 24-hour clock for all times.
	Time of Report	Enter time for which this information applies. Enter the Time (24-hour clock) the form was prepared.
3.	Type of Incident	Indicate (check box) and/or fill-in the type of incident(s).
4.	Situation Summary	Summary of current situation at time of report.
5.	Future Outlook	This section is for the IC/UC to discuss/project their future outlook, goals, requirements, needs and issues.
6.	Safety Status/Personnel Casualty	This information pertains to responders and assisted public personnel. Indicate the number of serious injuries, death, and missing. Values entered in the column labeled since Last Report are from the start of the

		Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
7.	Property Damage	Enter estimated dollar values for each item, if known.
8.	Attachments	Indicate (check box) and/or fill-in the attachment(s) the help further clarify the incident status.
9.	Equipment Resources	Indicate the number of each type of resource in each status category. There are blank lines below each general type of resource for additional equipment.
	Ordered	Ordered but not yet arrived/available.
	Available	Arrived on scene, stored in staging, not assigned to any task, available for use.
	Assigned	Assigned to a specific task.
	Out of Service	Not working and not assigned to any task (e.g., skimmer being repaired, boom broken, personnel off-duty for rest).
10.	Personnel Resources	Indicate, by agency, the numbers of personnel assigned. There are blank lines for additional personnel, as needed.
11.	Prepared By	Enter name and title of the person preparing the form, normally the Situation Unit Leader.

OIL/HAZMAT ATTACHMENT

1.	Incident Name	Enter the name assigned to the incident.
2.	Period Covered by Report	Enter the date and time interval for which the report applies. Use 24-hour clock for all times.
	Time of Report	Enter time for which this information applies. Enter the Time (24-hour clock) the form was prepared.
3.	Spill Status	This information is only tracked if there is spilled HAZMAT or Oil. Enter Common Name(s) of the released substance or spilled oil (i.e. Ethyl Alcohol/Ethanol or No. 2 Fuel Oil/Light Fuel Oil). Enter UN number and CAS Registry number, if known. Indicate whether the spill source is secured or unsecured (check box) and estimate the remaining potential and the rate of spillage discharge or release. Enter the estimated amounts in barrels for each category. Values entered in the column labeled Since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
	Mass Balance	This information is only tracked if there is spilled HAZMAT or Oil whether recovered, evaporated, dispersed, burned, floating, or on shore. The total of these estimates should approximate the total volume spilled, discharged, or released. Values for evaporation, dispersion, etc. can be obtained from the Environmental Unit and/or the Scientific Support Coordinator (SSC).
4.	Waste Management	This information is only tracked if there is spilled HAZMAT or Oil. Enter the estimated amounts in barrels or tons for each category. Total HAZMAT/ Oil (bbl) is the sum of the estimate of HAZMAT/oil in oily

		liquids and HAZAMT/oil in oily solids, and is the value to be entered under "Recovered HAZMAT/Oil" in Item 4.
5.	Shoreline Impacts	This information is only tracked if there is spilled HAZMAT or Oil. Enter the total miles in each category for each degree of oiling. Definitions for Light, Medium, and Heavy oiling can be obtained from the EUL/SSC and should be consistent throughout the incident.
6.	Wildlife Impacts	This information is only tracked after an animal is captured. Indicate the actual number of oiled wildlife in each category. Use numbers in parentheses to indicate the subtotal of threatened / endangered species included in the numbers given.
7.	Prepared By	Enter name and title of the person preparing the form, normally the Situation Unit Leader.

SAR/LE ATTACHMENT

1.	Incident Name	Enter the name assigned to the incident.
2.	Period Covered by Report	Enter the date and time interval for which the report applies. Use 24-hour clock for all times.
	Time of Report	Enter time for which this information applies. Enter the Time (24-hour clock) the form was prepared.
3.	Evacuation Status	This information is only tracked if the incident involves evacuation of personnel. Values entered in the column labeled Since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
4.	Migrant Interdiction Status	This information is only tracked if the incident involves Migrant Interdiction. Values entered in the column labeled Since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
5.	Sorties/Patrols	This information is only tracked if the incident involves sorties tracked in MISLE Incident Management Activity. List Sorties since last report both Air and Surface. Values entered in the column labeled since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
6.	Use of Force	This information is only tracked if the incident involves Use of Force activities. Values entered in the column labeled since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
7.	Operational Controls	This information is only tracked if the incident involves Operational Control activities initiated, in force and removed.
8.	Prepared By	Enter name and title of the person preparing the form, normally the Situation Unit Leader.

Resource Request Message

ICS-213 RR CG (05/06)

Requestor

1. Incident Name: | 2. Date/Time: | 3. Resource Request No:

4. ORDER Note: Use additional forms when requesting different resource sources of supply

a. Qty.	b. Kind	c. Type	d. Detailed item description (Vital characteristics, brand, specs, experience, etc. & if applicable describe purpose/use, attach diagrams, & other amplifying info)	e. Requested Reporting Location:	e. Requested Reporting Date/Time:	f. ETA (LSC):	g. Cost (FSC):

5. Suggested source(s) of Supply - POC phone no. if known & suitable subtitutes:

6. Requested by Name/Position/Phone: | 7. Date/Time: | 8. Section Chief Approval: | Date/Time:

☐ 9. Check box if request is for tactical/personnel resources & Submit to RESL, otherwise submit directly to Logistics

10. RESL Review/Signature:

☐ Resources as noted are Available ☐ Resources Not Available

Logistics

11. Logistics Order No.: | 12. Supplier Name/Phone/Fax/Email:

13. Notes:

14. Approval Signature of Auth Logistics Rep: | 15. Date/Time:

16. Order placed by (check box): ☐ SPUL ☐ PROC

Finance

17. Reply/Comments from Finance:

18. Finance Section Signature: | 19. Date/Time:

Full Instructions on back page. Requestor fills out # 1-9 & keeps yellow copy (bottom). If applicable, RESL reviews if resource available & signs # 10. Logistics fills in remainder of # 4 & # 10-15 & keeps pink copy. Finance, if needed fills out appropriate items & keeps green copy. Blue original is returned to RESL for tactical/personnel or requestor for non-tactical. White copy goes to DOCL.

Instructions for filling out the ICS-213RR CG Form (5/06)

REQUESTOR: The requestor must fill in Blocks 1 through 9:

Block # 1	Incident name: This is the same as the name stated on the ICS-201 Form and/or the Incident Action Plan (IAP).
Block # 2	Current date and time when submitting request
Block # 3	Resource Request Number: This is to be assigned by the Section submitting request (i.e. CMD, OPS, PLAN, LOG, FIN)
Block # 4	Fill in blocks 4a through 4e. Items requested: Must include Quantity, Kind and Type (if applicable) and detailed description of requirements. **BE SPECIFIC AS POSSIBLE**. The request should focus on capability rather than naming the brand or specific item (e.g. helicopter capable of carrying 4 personnel from location A to B rather than requesting a Coast Guard H-65 helicopter). This gives the logistics section the ability to find the best resource to meet the need. 4.e Requested Reporting Location/Date/Time: This is self-explanatory and is required for ordering official. Leave blocks 4.f. ETA (LSC) and 4.g. Cost (FSC) blank. These will be filled in later by Logistics and Finance.
Block # 5	Suggested sources of supply and suitable substitutes: Enter applicable information if known.
Block # 6 & 7	Requestor: Print Name and Signature and date/time.
Block # 8	Approval: This must be approved by the Section Chief or Deputy Section Chief.
Block # 9	Check box if request is for tactical or personnel resource(s) and submit request to Resources Unit Leader (RESL) to review and approve since RESL tracks all tactical and personnel resources.

Request goes to RESOURCES UNIT if requesting Tactical/Personnel Resource(s):

Block # 10	Resources reviews request and checks to see if resource is available. If the resource is available, reassigns resource as appropriate and sends request back to requester with information noted as to reporting time, etc. The request form is then sent to Documentation Unit Leader (DOCL) for filing. If the resource is not available, RESL sends request to Logistics.

LOGISTICS SECTION: The following blocks are to be filled out be the Supply Unit (SPUL).

Block # 11	Logistics Order Number: To be assigned by Supply Unit.
Block # 12	Supplier Point of Contact, Phone Number and Fax Number: This information is needed for Credit Card purchases and/or Purchase Orders.
Block # 13	Notes: Enter applicable information as need for request.
Block # 4	ETA and Cost: SPUL or PROC fills in Estimated time of arrival (ETA) when determined and cost if known.
Block # 14 & 15	Approval: This must be approved by the Logistics Section Chief or Deputy Logistics Section Chief, printed name and signature is required with Date and Time of approval. Bottom Copy (pink) is retained.

FINANCE SECTION: The following blocks are to be filled out be the Procurement Unit (PROC), if applicable.

Block # 16	Indicates who is to place order as necessary.
Block # 17	Comments concerning request from Finance Section Chief or Deputy Finance Section Chief.
Block # 18 & 19	Approval: This must be approved by the Finance Section Chief or Deputy Section Chief, printed name and signature is required with Date and Time of approval. Bottom copy (green) is retained.
FILING	Original blue copy is returned to RESL for tactical/personnel resources ordered, and the requester for non-tactical. RESL will inform requester of status of request when form received. The white copy is sent to DOCL.

Note: Cost associated requests will not be ordered without approval from the Finance Section Chief or Deputy Finance Section Chief.

Form Filing: Blue (Original) – final disposition to RESL or originator for non-tactical resources, White (copy 1) to DOCL, Green (copy 2) to FIN, Pink (copy 3) to LOG, Yellow (copy 4) to Originator

1. Incident Name	2. Operational Period (Date/Time) From: To:	UNIT LOG ICS 214-CG

7. Prepared by: **Date/Time:**

UNIT LOG (ICS FORM 214-CG)

Purpose. The Unit Log records details of unit activity, including strike team activity or individual activity. These logs provide the basic reference from which to extract information for inclusion in any after-action report.

Preparation. A Unit Log is initiated and maintained by Command Staff members, Division/Group Supervisors, Air Operations Groups, Strike Team/Task Force Leaders, and Unit Leaders. Completed logs are submitted to supervisors who forward them to the Documentation Unit.

Distribution. The Documentation Unit maintains a file of all Unit Logs. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Check-In Location	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Unit Name/Designators	Enter the title of the organizational unit or resource designator (e.g., Facilities Unit, Safety Officer, Strike Team).
4.	Unit Leader	Enter the name and ICS Position of the individual in charge of the Unit.
5.	Personnel Assigned	List the name, position, and home base of each member assigned to the unit during the operational period.
6.	Activity Log	Enter the time and briefly describe each significant occurrence or event (e.g., task assignments, task completions, injuries, difficulties encountered, etc.)
7.	Prepared By	Enter name and title of the person completing the log. Provide log to immediate supervisor, at the end of each operational period.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

1. Incident Name	2. Operational Period (Date/Time) From: To:	DAILY MEETING SCHEDULE ICS 230-CG

3. Meeting Schedule (Commonly-held meetings are included)

Date/ Time	Meeting Name	Purpose	Attendees	Location
	Unified Command Objectives Meeting	Review/ identify objectives for the next operational period.	Unified Command members	
	Command & General Staff Meeting	IC/UC gives direction to Command & General staff including incident objectives and priorities	IC/UC, Command & General Staff	
	Tactics Meeting	Develop/Review primary and alternate Strategies to meet Incident Objectives for the next Operational Period.	PSC, OSC, LSC, RESL & SITL	
	Planning Meeting	Review status and finalize strategies and assignments to meet Incident Objectives for the next Operational Period.	Determined by the IC/UC	
	Operations Briefing	Present IAP and assignments to the Supervisors / Leaders for the next Operational Period.	IC/UC, Command & General Staff, Branch Directors, Div/Gru Sups., Task Force/Strike Team Leaders and Unit Leaders	

4. Prepared by: (Situation Unit Leader) **Date/Time**

DAILY MEETING SCHEDULE (ICS 230-CG)

Purpose. The Daily Meeting Schedule records information about the daily scheduled meeting activities.

Preparation. This form is prepared by the Situation Unit Leader and coordinated through the Unified Command for each operational period or as needed. Commonly-held meetings are already included in the form. Additional meetings, as needed, can be entered onto the form in the spaces provided. Time and location for each meeting must be entered. If any of these standard meetings are not scheduled, they should be crossed out on the form.

Distribution. After coordination with the Unified Command, the Situation Unit Leader will duplicate the schedule and post a copy at the Situation Status Board and distribute to the Command Staff, Section Chiefs, and appropriate Unit Leaders. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Meeting Schedule	For each scheduled meeting, enter the date/time, meeting name, purpose, attendees, and location. Note: Commonly-held meetings are included in the form. Additional meetings, as needed, can be entered onto the form in the spaces provided. Time and location for each meeting must be entered. If any of the standard meetings are not scheduled, they should be deleted from the form (normally the Situation Unit Leader).
4.	Prepared By	Enter name and title of the person preparing the form, normally the Situation Unit Leader.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

Open Actions Tracker (ICS 233-CG)

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	No.	Enter number of task in sequential order (1, 2, 3, …).
3.	Item	Enter short descriptive of the task.
4.	For/POC	Enter responsible section/person.
5.	Briefed to POC	When the tasker has been briefed to the POC after initially assigned, an "X" is placed in the brief column. This was to ensure that taskers identified outsie of the POC's presence (during UC Meeting for example) were assigned the to identified POC.
6.	Start Date	Enter the date the tasker was initially assigned under "Start Date."
7.	Status	Enter status of item. This includes things like: "Awaiting LE Gear", "Update needed", "Awaiting Feedback". When the item is completed, the word "completed" is entered and if working in MS Excel, the task is cut and pasted into the worksheet labeled "COMPLETED."
8.	Target Date	Target date is another way of saying deadline. When the target date is one day away, the block turns yellow. When it is overdue it turns red. When it is yellow, it serves as a reminder to the UC that the target date needs to be changed or the responsible section needs to complete the task.
9.	Actual Date	The block to the right of the Target Date (Actual Date) will always have today's date. It is merely the formula "=today()" inserted into the cell.

NOTE: In order to ensure the red and yellow reminders work for new tasks, the user simply copies a task line, inserts it into the worksheet and overtypes the new task information.

4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

FINANCE/ADMINISTRATION

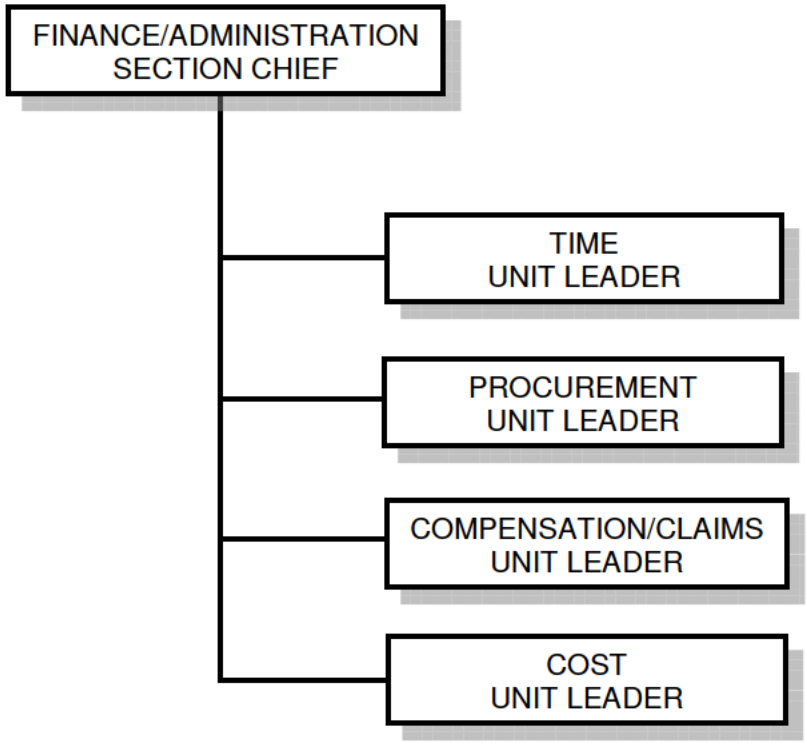
Finance/Administration Section Chief 4-51

Time Unit Leader 4-52

Procurement Unit Leader 4-52

Compensation/Claims Unit Leader 4-53

Cost Unit Leader 4-53



TIME UNIT LEADER

The Time Unit Leader is responsible for equipment and personnel time recording and for managing the commissary operations.

Overall Time Unit Leader Responsibilities:

- Determine incident requirements for time recording function.
- Determine resource needs.
- Contact appropriate agency personnel/representatives.
- Ensure that daily personnel time recording documents are prepared and in compliance with policy.
- Establish time unit objectives.
- Maintain separate logs for overtime hours.
- Establish commissary operation on larger or long-term incidents as needed.
- Submit cost estimate data forms to the Cost Unit, as required.
- Maintain records security.
- Ensure that all records are current and complete prior to demobilization.
- Release time reports from assisting agency personnel to the respective Agency Representatives prior to demobilization.
- Brief the Finance/Administration Section Chief on current problems and recommendations, outstanding issues, and follow-up requirements.

PROCUREMENT UNIT LEADER

The Procurement Unit Leader is responsible for administering all financial matters pertaining to vendor contracts, leases, and fiscal agreements.

Overall Procurement Unit Leader Responsibilities:

- Review incident needs and any special procedures with Unit Leaders, as needed.
- Coordinate with local jurisdiction on plans and supply sources.
- Obtain the Incident Procurement Plan.
- Prepare and authorize contracts and land-use agreements.
- Draft memoranda of understanding as necessary.
- Establish contracts and agreements with supply vendors.
- Provide for coordination between the Ordering Manager, agency dispatch, and all other procurement organizations supporting the incident.
- Ensure that a system is in place that meets agency property management requirements. Ensure proper accounting for all new property.
- Interpret contracts and agreements; resolve disputes within delegated authority.
- Coordinate with the Compensation/Claims Unit for processing claims.
- Coordinate use of impress funds, as required.
- Complete final processing of contracts and send documents for payment.
- Coordinate cost data in contracts with the Cost Unit Leader.
- Brief the Finance/Administration Section Chief on current problems and recommendations, outstanding issues, and follow-up requirements.

4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

PLANNING

Planning Section Chief 4-38

Resources Unit Leader 4-38

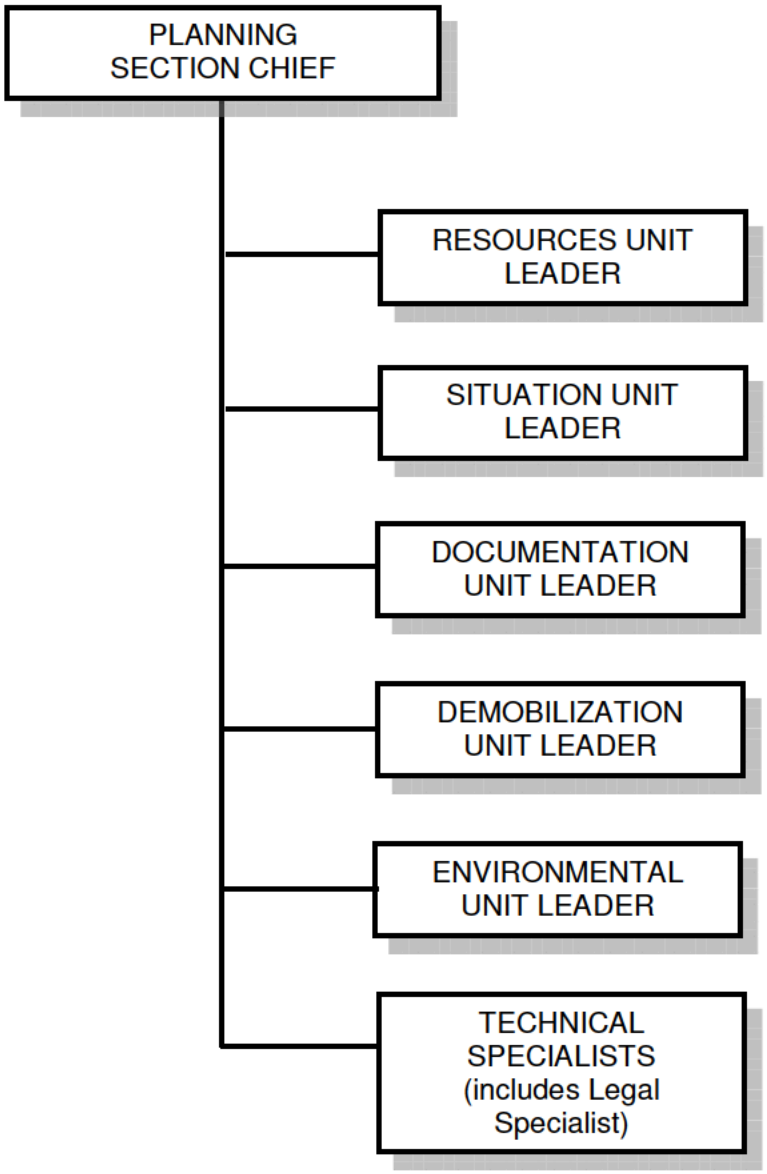
Situation Unit Leader 4-39

Documentation Unit Leader 4-40

Demobilization Unit Leader 4-41

Environmental Unit Leader 4-42

Technical Specialists 4-42



PLANNING SECTION CHIEF

The Planning Section Chief (PSC) is responsible for the collection, evaluation, dissemination and use of information; particularly with regard to the development of the incident and the status resources. This information is needed to: 1) understand the current situation, 2) predict the probable course of incident events; and 3) prepare alternative strategies for the incident.

Overall PSC Responsibilities:

- Collect and process situation information about the incident.
- Supervise preparation of the IAP.
- Provide input to the IC and the OPS in preparing the IAP.
- Chair planning meetings and participate in other meetings as required.
- Reassign out-of-service personnel already on-site to ICS organizational positions as appropriate.
- Establish information requirements and reporting schedules for Planning Section Units (e.g., Resources, Situation Units).
- Determine the need for any specialized resources in support of the incident.
- If requested, assemble and disassemble Strike Teams and Task Forces not assigned to Operations.
- Establish special information collection activities as necessary (e.g., weather, environmental, toxics, etc.).
- Assemble information on alternative strategies.
- Provide periodic predictions on incident potential.
- Report any significant changes in incident status.
- Compile and display incident status information.
- Oversee preparation and implementation of the Incident Demobilization Plan.
- Incorporate plans (e.g., Traffic, Medical, Communications, Site Safety) into the IAP.

RESOURCES UNIT LEADER

The Resource Unit Leader (RUL) works within the Planning Section and is responsible for maintaining the status of all assigned resources (primary and support) at an incident. This is achieved by overseeing the check in/out of all resources, maintaining a status-keeping system indicating current location and status of all resources, and maintenance of a master list of all resources (e.g. key supervisory personnel, primary and support resources, etc.).

Overall RUL Responsibilities:

- Establish the check-in function at incident locations.
  The Staging Area Manager may already be tracking this on ICS Form 211-p and 211-e. However, the RUL should verify that tracking is being conducted and is accurate. Additionally, the RUL should determine how to gather this resource information from Staging Areas.
- Prepare Organization Assignment List (ICS Form 203) and Organization Chart (ICS Form 207).
- Prepare appropriate parts of Division Assignment Lists (ICS Form 204).
- Prepare and maintain the ICP display (to include organization chart and resource allocation and deployment).

RESOURCES UNIT LEADER (Cont'd)

Overall RUL Responsibilities (Cont'd):

- Maintain and post the current status and location of all resources.
  The RUL is responsible for developing a system to best track the resource status. Ensure information is relayed to the Situation Unit Leader in order to update incident status information on the display board (ICS Form 209)
- Maintain master roster of all resources checked in at the incident.
- Assign an additional person to fill the "Check-in/status Recorder" position to assist with the accounting of all resources assigned to the incident.
  If a Check-in/status Recorder is not assigned, the RUL is responsible for all functions.

SITUATION UNIT LEADER

The Situation Unit Leader (SUL) works within the Planning Section and is responsible for collecting, processing and organizing all incident information. The SUL may prepare future projections of incident growth and maps.

Overall SUL Responsibilities:

- Begin collection and analysis of incident data as soon as possible.
- Prepare, post, or disseminate resource and situation status information as required, including special requests.
  Establish location for situation status boards and displays. This is where maps, charts, and other incident information will be posted for responders to view.
- Prepare periodic predictions or as requested by the PSC.
- Prepare the Incident Status Summary Form (ICS Form 209).
  Acquire the information from various Command and General ICS Staff.
- Provide photographic services and maps if required.

The SUL may have a Display Processor and Field Observer reporting to him/her. However, if not assigned, the SUL will be responsible for their functions

Display Processor - The Display Processor is responsible for the display of incident status information obtained from Field Observers, resource status reports, aerial and other photographs, and infrared data.

Overall Display Processor Responsibilities:

- Determine:
  - Location of work assignment
  - Numbers, types and locations of displays required
  - Priorities
  - Map requirements for the IAP
  - Time limits for completion
  - Field Observer assignments and communications means
- Obtain necessary equipment and supplies.
- Obtain a copy of the IAP for each operational period.
- Assist SUL in analyzing and evaluating field reports.
- Develop required displays in accordance with time limits for completion.

ORGANIZATION ASSIGNMENT LIST (ICS 203-CG) Instructions for filling out the form

Purpose. The Organization Assignment List provides ICS personnel with information on the units that are currently activated and the names of personnel staffing each position/unit. It is used to complete the Incident Organization Chart (ICS form 207-CG) which is posted on the Incident Command Post display. An actual organization will be event-specific. **Not all positions need to be filled.** The size of the organization is dependent on the magnitude of the incident and can be expanded or contracted as necessary.

Preparation. The Resources Unit prepares and maintains this list under the direction of the Planning Section Chief.

Note: Depending on the incident, the Intelligence and Information function may be organized in several ways: 1) within the Command Staff as the Intelligence Officer; 2) As an Intelligence Unit in Planning Section; 3) As an Intelligence Branch or Group in the Operations Section; 4) as a separate General Staff Intelligence Section; and 5) as an Intelligence Technical Specialist. The incident will drive the need for the Intelligence and Information function and where it is located in the ICS organization structure. The Intelligence and information function is described in significant detail in NIMS and in the Coast Guard Incident Management Handbook (IMH).

Distribution. The Organization Assignment List is duplicated and attached to the Incident Objectives form (ICS 202-CG) and given to all recipients of the Incident Action Plan. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Incident Commander and Staff	Enter the names of the Incident Commander and Staff. Use at least the first initial and last name.
4.	Agency Representative	Enter the agency names and the names of their representatives. Use at least the first initial and last name.
5. thru 8.	Section	Enter the name of personnel staffing each of the listed positions. Use at least the first initial and last name. For Units, indicate Unit Leader and for Divisions/ Groups indicate Division/Group Supervisor. Use an additional page if more than three branches are activated. If there is a shift change during the specified operational period, list both names, separated by a slash.
9.	Prepared By	Enter the name and position of the person completing the form
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

ASSIGNMENT LIST (ICS 204-CG)

Purpose. The Assignment List(s) informs Division and Group supervisors of incident assignments. Once the Unified Command and General Staff agree to the assignments, the assignment information is given to the appropriate Divisions and Groups.

Preparation. The Assignment List is normally prepared by the Resources Unit, using guidance from the Incident Objectives (ICS 202-CG), Operational Planning Worksheet (ICS 215-CG), and the Operations Section Chief. The Assignment List must be approved by the Planning Section Chief and Operations Section Chief. When approved, it is included as part of the Incident Action Plan (IAP). Specific instructions for specific resources may be entered on an ICS 204a-CG for dissemination to the field. A separate sheet is used for each Division or Group. The identification letter of the Division is entered in the form title. Also enter the number (roman numeral) assigned to the Branch.

Special Note. The Assignment List, ICS 204-CG submits assignments at the level of Divisions and Groups. The Assignment List Attachment, ICS 204a-CG shows more specific assignment information, if needed. The need for an ICS 204a-CG is determined by the Planning and Operations Section Chiefs during the Operational Planning Worksheet (ICS 215-CG) development.

Distribution. The Assignment List is duplicated and attached to the Incident Objectives and given to all recipients of the Incident Action Plan. In some cases, assignments may be communicated via radio/telephone/fax. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Branch	Enter the Branch designator.
4.	Division/Group/Staging	Enter the Division/Group/Staging designator.
5.	Operations Personnel	Enter the name of the Operations Chief, applicable Branch Director, and Division Supervisor.
6.	Resources Assigned	Each line in this field may have a separate Assignment List Attachment (ICS 204a-CG). Enter the following information about the resources assigned to Division or Group for this period:
	Identifier	List identifier
	Leader	Leader name
	Contact Information	Primary means of contacting this person (e.g., radio, phone, pager, etc.). Be sure to include area code when listing a phone number.
	# Of Persons	Total number of personnel for the strike team, task force, or single resource assigned.
	Reporting Info/Notes/ Remarks	Special notes or directions, specific to this strike team, task force, or single resource. Enter an "X" check if an Assignment List Attachment (ICS 204a-CG) will be prepared and attached. The Planning and Operations Section Chiefs determine the need for an ICS 204a-CG during the Operational Planning Worksheet (ICS 215-CG) development.
7.	Work Assignment	Provide a statement of the tactical objectives to be achieved within the operational period by personnel assigned to this Division or Group.
8.	Special Instructions	Enter a statement noting any safety problems, specific precautions to be exercised, or other important information.
9.	Communications	Enter specific communications information (including emergency numbers) for this division /group. If radios are being used, enter function (command, tactical, support, etc.), frequency, system, and channel from the Incident Radio Communications Plan (ICS 205-CG). Note: Phone numbers should include area code.
10.	Prepared By	Enter the name of the person completing the form, normally the Resources Unit Leader.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).
11.	Reviewed by (PSC)	
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).
12.	Reviewed by (OSC)	Enter the name of the operations person reviewing the form, normally the Operations Section Chief.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

INCIDENT STATUS SUMMARY (ICS FORM 209-CG)

Purpose. The Status Summary:
1. Is used by Situation Unit personnel for posting information on Status Boards or attaching as a file to the MISLE Case.
2. Is duplicated and provided to Command Staff members, giving them basic information for planning for the next operational period.
3. Provides information to the Information Officer for preparing news media releases.
4. Summarizes incident information for local and off-site coordination/operations centers.

Preparation. The Situation Unit prepares the Status Summary. Resources information should be obtained from the Resources Unit. It may be scheduled for presentation to the Planning Section Chief and other General Staff members prior to each Planning Meeting and may be required at more frequent intervals by the Unified Command or Planning Section Chief. Suggested sources of information are noted in brackets.
Note: The values on the ICS form 209-CG are the **best available estimates at the Time of Report** (Item # 2 on form). This form is usually in high demand and should be filled out early and often. A suggested source within the ICS organization is noted in brackets [ ] at the top right of each section of the form. **All fields need not be completed in order to distribute the form**.

Distribution. When completed, the form is duplicated and copies are distributed to the Unified Command and staff, and all Section Chiefs, Planning Section Unit Leaders, and the Joint Information Center. It is also posted on a status board located at the ICP. All completed original forms MUST be given to the Documentation Unit.

How to Save and Use the Word Template Form:
The 209 template (.dot file) can be edited to match most incident situations and can be saved into the Word template directory. Open the blank 209 (ICS 209 CG.dot) – do not add any content. Save the blank in the Templates directory. Create a new 209 from File>new picking the 209 template. Type in the file to add any desired content and use “save as” to save the work using a new file name. The file will automatically become a .doc file.

Comments: Please send comments/corrections about this form to the ICS Program Manager, Ms. Kristy Plourde, email: kplourde@tcyorktown.uscg.mil

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Period Covered by Report	Enter the date and time interval for which the report applies. Use 24-hour clock for all times.
	Time of Report	Enter time for which this information applies. Enter the Time (24-hour clock) the form was prepared.
3.	Type of Incident	Indicate (check box) and/or fill-in the type of incident(s).
4.	Situation Summary	Summary of current situation at time of report.
5.	Future Outlook	This section is for the IC/UC to discuss/project their future outlook, goals, requirements, needs and issues.
6.	Safety Status/Personnel Casualty	This information pertains to responders and assisted public personnel. Indicate the number of serious injuries, death, and missing. Values entered in the column labeled since Last Report are from the start of the

		Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
7.	Property Damage	Enter estimated dollar values for each item, if known.
8.	Attachments	Indicate (check box) and/or fill-in the attachment(s) the help further clarify the incident status.
9.	Equipment Resources	Indicate the number of each type of resource in each status category. There are blank lines below each general type of resource for additional equipment.
	Ordered	Ordered but not yet arrived/available.
	Available	Arrived on scene, stored in staging, not assigned to any task, available for use.
	Assigned	Assigned to a specific task.
	Out of Service	Not working and not assigned to any task (e.g., skimmer being repaired, boom broken, personnel off-duty for rest).
10.	Personnel Resources	Indicate, by agency, the numbers of personnel assigned. There are blank lines for additional personnel, as needed.
11.	Prepared By	Enter name and title of the person preparing the form, normally the Situation Unit Leader.

OIL/HAZMAT ATTACHMENT

1.	Incident Name	Enter the name assigned to the incident.
2.	Period Covered by Report	Enter the date and time interval for which the report applies. Use 24-hour clock for all times.
	Time of Report	Enter time for which this information applies. Enter the Time (24-hour clock) the form was prepared.
3.	Spill Status	This information is only tracked if there is spilled HAZMAT or Oil. Enter Common Name(s) of the released substance or spilled oil (i.e. Ethyl Alcohol/Ethanol or No. 2 Fuel Oil/Light Fuel Oil). Enter UN number and CAS Registry number, if known. Indicate whether the spill source is secured or unsecured (check box) and estimate the remaining potential and the rate of spillage discharge or release. Enter the estimated amounts in barrels for each category. Values entered in the column labeled Since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
	Mass Balance	This information is only tracked if there is spilled HAZMAT or Oil whether recovered, evaporated, dispersed, burned, floating, or on shore. The total of these estimates should approximate the total volume spilled, discharged, or released. Values for evaporation, dispersion, etc. can be obtained from the Environmental Unit and/or the Scientific Support Coordinator (SSC).
4.	Waste Management	This information is only tracked if there is spilled HAZMAT or Oil. Enter the estimated amounts in barrels or tons for each category. Total HAZMAT/ Oil (bbl) is the sum of the estimate of HAZMAT/oil in oily

		liquids and HAZAMT/oil in oily solids, and is the value to be entered under "Recovered HAZMAT/Oil" in Item 4.
5.	Shoreline Impacts	This information is only tracked if there is spilled HAZMAT or Oil. Enter the total miles in each category for each degree of oiling. Definitions for Light, Medium, and Heavy oiling can be obtained from the EUL/SSC and should be consistent throughout the incident.
6.	Wildlife Impacts	This information is only tracked after an animal is captured. Indicate the actual number of oiled wildlife in each category. Use numbers in parentheses to indicate the subtotal of threatened / endangered species included in the numbers given.
7.	Prepared By	Enter name and title of the person preparing the form, normally the Situation Unit Leader.

SAR/LE ATTACHMENT

1.	Incident Name	Enter the name assigned to the incident.
2.	Period Covered by Report	Enter the date and time interval for which the report applies. Use 24-hour clock for all times.
	Time of Report	Enter time for which this information applies. Enter the Time (24-hour clock) the form was prepared.
3.	Evacuation Status	This information is only tracked if the incident involves evacuation of personnel. Values entered in the column labeled Since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
4.	Migrant Interdiction Status	This information is only tracked if the incident involves Migrant Interdiction. Values entered in the column labeled Since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
5.	Sorties/Patrols	This information is only tracked if the incident involves sorties tracked in MISLE Incident Management Activity. List Sorties since last report both Air and Surface. Values entered in the column labeled since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
6.	Use of Force	This information is only tracked if the incident involves Use of Force activities. Values entered in the column labeled since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
7.	Operational Controls	This information is only tracked if the incident involves Operational Control activities initiated, in force and removed.
8.	Prepared By	Enter name and title of the person preparing the form, normally the Situation Unit Leader.

UNIT LOG (ICS FORM 214-CG)

Purpose. The Unit Log records details of unit activity, including strike team activity or individual activity. These logs provide the basic reference from which to extract information for inclusion in any after-action report.

Preparation. A Unit Log is initiated and maintained by Command Staff members, Division/Group Supervisors, Air Operations Groups, Strike Team/Task Force Leaders, and Unit Leaders. Completed logs are submitted to supervisors who forward them to the Documentation Unit.

Distribution. The Documentation Unit maintains a file of all Unit Logs. All completed original forms MUST be given to the Documentation Unit.

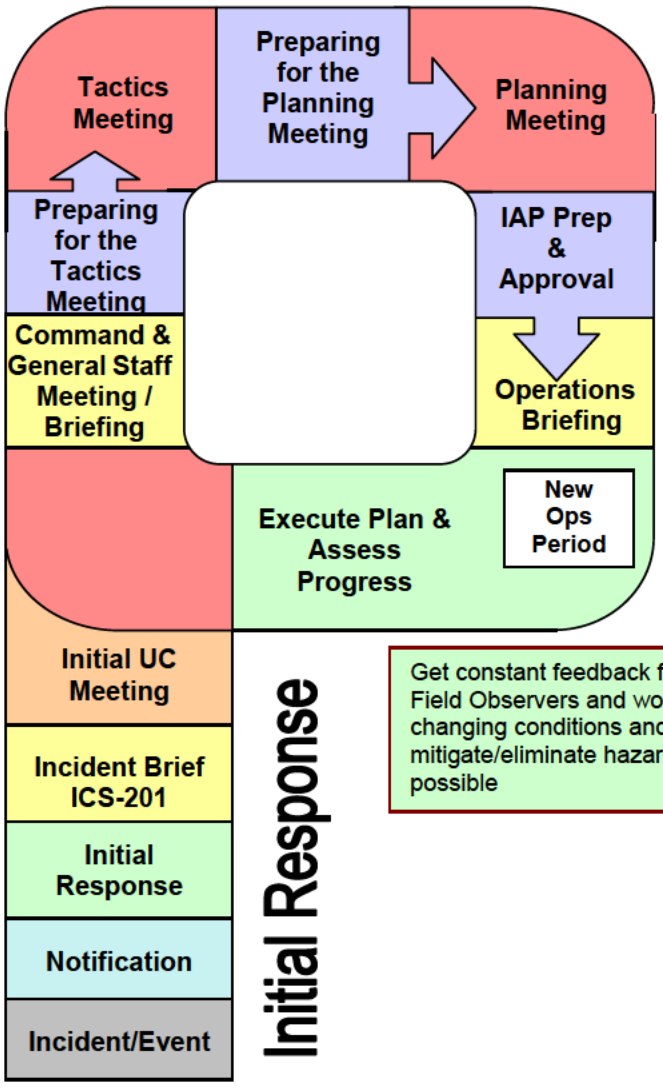
Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Check-In Location	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Unit Name/Designators	Enter the title of the organizational unit or resource designator (e.g., Facilities Unit, Safety Officer, Strike Team).
4.	Unit Leader	Enter the name and ICS Position of the individual in charge of the Unit.
5.	Personnel Assigned	List the name, position, and home base of each member assigned to the unit during the operational period.
6.	Activity Log	Enter the time and briefly describe each significant occurrence or event (e.g., task assignments, task completions, injuries, difficulties encountered, etc.)
7.	Prepared By	Enter name and title of the person completing the log. Provide log to immediate supervisor, at the end of each operational period.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

UNITED STATES COAST GUARD **General Activities**

The Safety Planning "P"

Agreement w/ OSC, PSC tactics and plan, enough safety gear being ordered, personnel reliefs are planned.

Takes work assignments and IDs safety measures/ resource types and #s needed to safely accomplish those assignments



Listen and assess
Be concise during safety brief

While OSC and PSC are developing Operational Tactics, SOFR concurrently conducts risk assessment on those tasks

Complete Safety Message on 204s
Site Safety Plan
Medical Plan

Confirm there is a Safety Objective

Keep short and to the point, focus on primary hazards

If invited, make sure there is a Safety Objective!

May not be invited to attend this meeting
Concentrate on "general tasks" for safety

Focus on Safety concerns

Get constant feedback from Ass't SOFRs, Field Observers and workers; be vigilant on changing conditions and act accordingly to mitigate/eliminate hazards as soon as possible

Check-in
Receive IC/UC Briefing
Organize & brief subordinates
Get asst' SOFRs into the fieldAcquire work materials

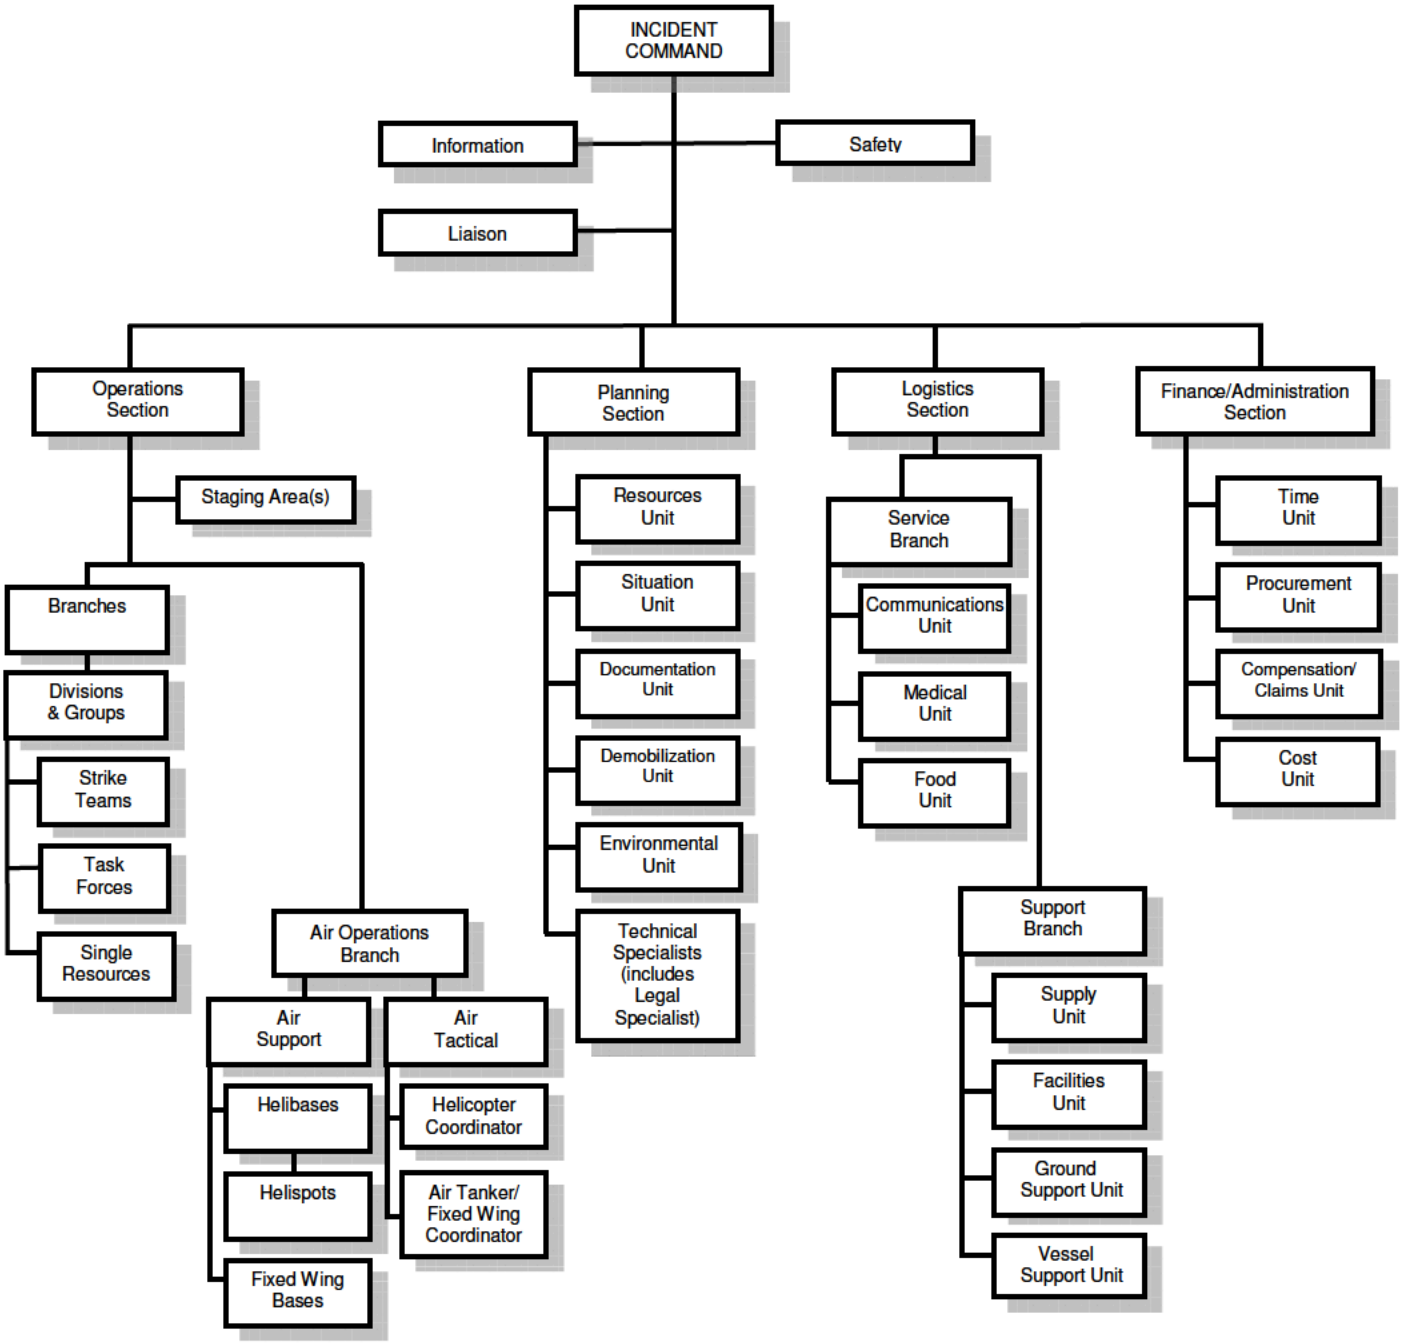
INCIDENT MANAGEMENT TEAM

(For incidents beyond the response capability of the Local Response Team)



4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

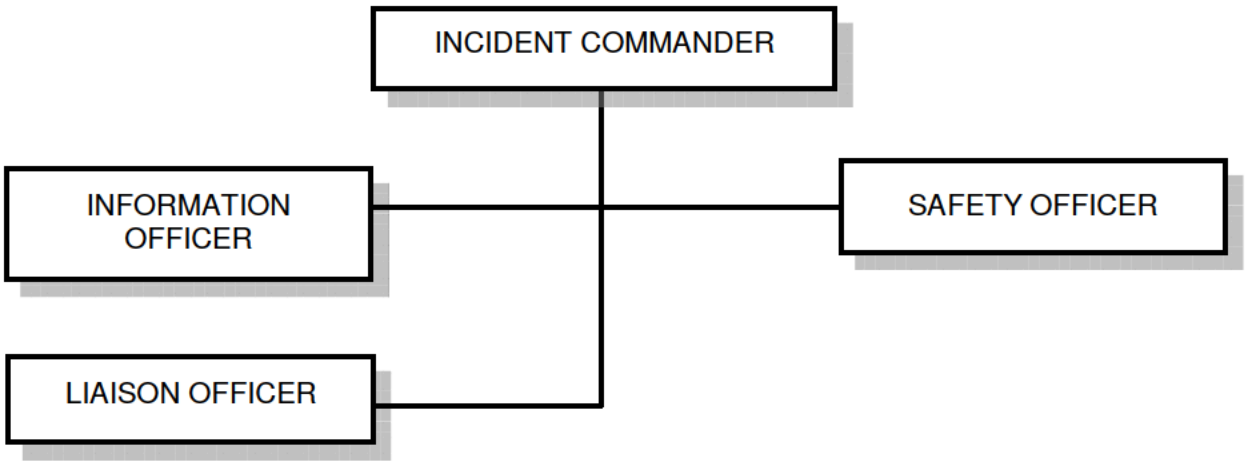
COMMAND

Incident Commander..... 4-12

Safety Officer 4-15

Liaison Officer 4-17

Information Officer 4-18



SAFETY OFFICER

The Safety Officer's (SO) function is to develop and recommend measures for assuring personnel safety, and to assess and/or anticipate hazardous and unsafe situations. Only one SO will be assigned for each incident; however, there may be assistants.

Overall SO Responsibilities:

- Participate in planning meetings.
- Identify hazardous situations associated with the incident.
- Review the IAP for safety implications.
- Exercise emergency authority to stop and prevent unsafe acts.
- Investigate accidents that have occurred within the incident area.
  Ensure information is relayed to the Situation Unit Leader in order to update incident status information (ICS form 209) on the display board.
- Review and approve the medical plan (ICS form 206).
- Develop the Site Safety Plan and publish Site Safety Plan summary (ICS Form 208) as required.
  This plan may be more detailed than the KM Site Specific Health and Safety Plan.

Additional KM Required SO Responsibilities:

- Ensure all initial response personnel are located in a safe location
- Complete the KM Site Specific Health and Safety Plan (**within the first hour**)
- Conduct initial briefing of the KM Site Specific Health and Safety Plan
- Establish regularly scheduled safety meetings
  - Ensure that an "attendance roster" is maintained during these meetings
  - Work with Staging Officer to conduct H&S Plan briefings with arriving response personnel
- Assess need for atmospheric monitoring – coordinate as needed
  - Ensure air monitoring results are accurately documented; use map of area to record results if necessary
- Coordinate with appropriate agencies to assess need for triage; suggest possible locations
- Establish smoking areas; communicate clearly
- Post "Proposition 65" signs (California only)
- Establish Emergency Medical Plan Locate hospital, EMT(S) and first-aid stations; and List emergency numbers: fire, police, and ambulance.
- Control access to an offsite incident site by working within the Unified Command Structure to effect the necessary control measures for air, (FAA), marine(USCG) and ground (local law enforcement) traffic.
- In the event of a need to control traffic before the arrival of local, state, or federal authorities, the following methods of traffic control may be considered:
  - Vehicular and/or pedestrian access to an offsite incident should be controlled to the extent possible prior to the arrival of local law enforcement or other agency personnel trained to handle traffic control.
  - Until agencies respond to the scene and take control of access and traffic, vehicles can be used to block traffic flow on streets leading to the spill site, if it is safe to do so. Do not operate vehicles at the scene of a gasoline or other light hydrocarbon spill where a flammable vapor cloud may be present.
  - For an on water spill, control of marine traffic may be attempted prior to the arrival of the US Coast Guard response vessel by alerting vessel operators of the spill hazard by radio where possible.
  - Control of air traffic may be necessary due to operations aircraft. The local Federal Aviation Administration (FAA) office can be contacted by the Incident Commander, or coordinated with local authorities, to establish safe operations.

SAFETY OFFICER (Cont'd)

HAZARDOUS SUBSTANCE RELEASE

Incident Commander and Safety Officer - The IC and SO for a hazardous substance incident will use the following guidance when preparing the Site Safety Plan:

- Assign site safety responsibility.
- Establish perimeter and restrict access.
- Characterize site hazards:
  - Identity pollutant
  - Obtain Material Safety Data Sheets
  - Conduct air monitoring
  - Identify physical and biological hazards i.e., slips, trips, falls, confined spaces, noise, weather conditions, poisonous insects, reptiles, plants and biological waste
- Establish control zones:
  - Exclusion zone
  - Contamination reduction zone
  - Support zone
- Assess training requirements:
  - Check HAZWOPER cards
  - Insure safety briefings
- Select personal protective equipment (PPE) Level A, B, C, or D.
- Establish decontamination stations.
- Establish Emergency Medical Plan Locate hospital, EMT(S) and first-aid stations; and List emergency numbers: fire, police, and ambulance.

Table 3. Secondary Hazards

Hazards	Recommended Precaution(s)
❑ Fire (potential)	• Remain safe distance away • Eliminate ignition sources • Keep upwind of vapor/smoke • Provide vapor suppression (if safe) • Do not impede Fire Dept. efforts
❑ Heavy Equipment	• Qualified operators only • Hardhats and safety boots needed around heavy equip. • Minimum 10ft. clearance from power lines • Make "one call" if excavating • Proper machine guarding in place
❑ Excavations	• Trenches/excavations equal to or greater than 5ft. deep must meet OSHA requirements • No one allowed to enter excavation > 5ft. unless shored, sloped or protected • Excavations < 5ft. and judged by competent person as cave-in hazard must also follow OSHA requirements
❑ Noise	• Portable generators & heavy equip. can generate potentially high noise levels • Hearing protection available to workers • Hearing protection must be worn in area with noise levels above 85dBA.
❑ Confined Spaces	• Site Safety Officer will determine whether confined space will be entered • All confined space entries must meet OSHA requirements (permits, atmospheric monitoring, attendants, etc.)
❑ Heat Stress	• Potential hazard when temp >80°F • Workers should take more breaks and drink plenty of appropriate liquids • More PPE = higher risk • Be aware of heat cramps (stomach cramps), heat exhaustion (excessive sweating, flushed/clammy skin) – treat with rest and liquids. Heat stroke (dry, hot, pale skin; no sweating) can be deadly – get medical help immediately, reduce core body temp by applying cold water to body & fanning.
❑ Cold Stress	• Skin takes on gray-glossy look • Appendages become non-responsive • Blisters or sores may appear • Do not rub • Submerse affected areas in warm water or wrap in warm cloth.
❑ Rain / Lightning	• Stop excavation activities during excessive rainfall • Avoid shock hazards by stopping work during thunderstorm or lightening • Prevent & control erosion & transport of soils out of incident area.
❑ General	• Slip, trip & fall hazards • Keep work area clear of debris • Smoking not permitted in work areas • Use hand tools safely
❑ Other:	

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS

KMEP employees who have received HAZWOPER training are familiar with how to complete and implement the H&S Plan. The following instructions are provided for those persons who have not received the same level of training.

The first 6 boxes of the H&S Plan are priority for filling out during the initial stages of an emergency.

BOX #1: Incident Information

This section is intended to provide general information about the incident.

Location can be a KMEP facility name, pipeline section, address with cross streets, etc.

Note the **date** (including year) and **approximate time** the incident occurred.

The "**Incident Name**" can be left blank until an appropriate name has been determined. Generally the name refers to the piece of equipment involved, location along the pipeline or some other way which will allow for easy recognition in the future. Fire Department responders may refer to the incident as the "Kinder Morgan Incident". However, avoid using this as the incident name because it is too generic and will not provide KMEP with adequate detail for future reference.

A description of **weather conditions** should be provided. Use simple and straightforward language (e.g. light rain, strong winds, sunny, etc.)

Check the appropriate "Incident Type" based on what has occurred. Some emergencies may involve one or more incident types. Check all that apply.

BOX #2: Chemical Hazards Involved

Most emergencies will involve the release of product. This section is intended to communicate what product involved in the particular incident. Most of the products KMEP handles or transports are listed. Place a check next to the products involved. Check "Other" if additional, unlisted chemicals are involved. In general, refined products pose a very low health risk. The first concern should be physical hazards (flash/fire/explosions).

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

There is a note referring to Table 1: Chemical & Physical Properties provided on the backside of the H&S Plan. This table lists the chemical and physical properties for several of KMEP products. Properties for some chemicals, such as fuel additive or DRA, are not provided because the products vary significantly in composition. In these cases, refer to the products Material Safety Data Sheet (MSDS).

Material Safety Data Sheet

A Material Safety Data Sheet (MSDS) is required for each chemical involved in the incident. Ensure that a copy of the MSDS is readily available. Later in the response effort, the MSDS can be attached to the H&S Plan. Check "Yes" once a MSDS has been made available.

Note: Table 1: Chemical & Physical Properties is intended as a reference but does not replace the need for a Material Safety Data Sheet (MSDS).

BOX #3: Physical / Health Hazards

The section is intended to inform responders or visitors of the **primary** physical or health hazards posed by the emergency situation. In general, refined products pose a very low health risk. The first concern should be physical hazards (flash/fire/explosions). Secondary hazards will be address in another part of the H&S Plan.

Physical Hazards	
Fire -	Check if the incident actually entails a fully involved fire.
Vapor -	Check if incident involves or has the likely potential to involve a vapor release and potential fire flashback.

Health Hazards	
Respiratory -	Check if incident involves a vapor release or if chemical involved poses specific inhalation hazard.
Skin -	Check if incident involves a splash hazard or if chemical involved poses specific skin hazard.

BOX #4: Personal Protective Equipment

The section is intended to designate what personal protective equipment (PPE) or what levels of PPE will be required within the various defined areas ("hazard zones") of the emergency site. It is important that the hazards zones are communicated to all responders so they understand the PPE requirements.

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

There is a note referring to Table 2: PPE Classes provided on the backside of the H&S Plan. This table describes the various levels of PPE. It should be used as a guideline when choosing PPE for personnel based on where they will be responding. KMEP's policy is that company employees may only respond in Level C or Level D. Mutual aid responders or emergency response contractors are permitted to don Level B or higher, according to their own SOP's.

All contractors shall wear the level of PPE required by the H&S Plan. It is the responsibility of the contractor to supply their personnel with the required PPE and ensure they are knowledgeable and skilled in its use. KMEP has the right to request proof of training, if deemed necessary.

The Table 2: PPE Classes is based on Appendix "B" of the HAZWOPER Standard. Therefore, it should be used as a guideline. All the pieces of PPE listed under a particular level may not be required (e.g. inner chemical resistant gloves, chemical resistant safety boots, etc.). However, the proper choice of respiratory protection is essential and should be used as a deciding factor when choosing between the different levels of PPE.

The following discussion will describe the different levels of PPE in greater detail:

Level A

KMEP personnel do not respond in Level A.

Level A is intended to provide the highest level of skin, eye and respiratory protection. It requires the use of a totally encapsulating chemical suit and SCBA. The product KMEP transports do not warrant the use of Level A. Should an incident involve such chemicals (e.g. train derailment), KMEP personnel are to remove themselves from the immediate area and assist in a defensive mode only.

Level B

KMEP personnel do not respond in Level B.

Level B is intended to provide the highest level of respiratory protection but a lower level of skin and eye protection than Level A. Respiratory protection can include an SCBA or airline. Skin protection will normally include fire resistant (Nomex) or Tyvex (splash resistant) coveralls. Nomex should be worn if the potential for ignition is greater than the potential for splashes. Tyvex, or equivalent, should be worn if the potential for splashes is greater than the potential for ignition. It is not recommended to wear both Nomex and Tyvex coveralls together.

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

Level B may also include the following PPE, as needed:

- Inner gloves and outer, chemical resistant (nitrile) gloves
- Safety boots (possibly chemical resistant)
- Hard hat
- Face shield / safety glasses
- Hearing Protection

Level C

Level C is the highest level of PPE KMEP personnel are permitted to wear.

Level C is a significant reduction in respiratory protection. Full- or half-face respirators should be selected when the type and concentration of the chemical(s) involved are known. Air monitoring is required to determine the amount of airborne chemical responders may be exposed to.

Once air monitoring is conducted, the appropriate respirator must be chosen. If the chemical hazard is in a gas/vapor form, the proper respirator cartridge must be identified. If the chemical poses a particulate/dust hazard, then a high efficiency particulate air (HEPA) filter is recommended. Cartridges and filters are universally color-coded:

Chemical Hazard	Universal Color Code
Organic vapors (petroleum products)	Black
Acid gases	Yellow
Particulate / dust (HEPA rated)	Bright Pink

If fitted properly, most full- and half-face respirators will provide protection up to 10 times (10x) the permissible exposure limit (PEL).

No person shall be required to wear a respirator or other PPE without proper training in its use and limitations. In the case of respiratory equipment, personnel must have:

Completed an annual, qualitative fit test (e.g. with irritant smoke)

Been trained on how to properly put on a respirator (e.g. field fit check)

Complete a medical evaluation form

Access to a new or properly cleaned and inspected respirator.

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

Level C skin protection may include fire resistant (Nomex) or Tyvex (splash resistant) coveralls. Do not enter Flash Area

Level C may also include the following PPE, as needed:

- Inner gloves and outer, chemical resistant (nitrile) gloves
- Safety boots (possibly chemical resistant)
- Hard hat
- Face shield / safety glasses
- Hearing Protection

BOX #5: Hot Zone Authorized Entrants

The intent of this section is to determine who is permitted to enter the Hot Zone. All other responders are not allowed to enter the Hot Zone without express permission from the Incident Commander. Place a check next to the responders permitted to enter the Hot Zone.

BOX #6: Site Map

The Site Map plays a key role in communicating essential incident information set forth in the H&S Plan. The open space in the center of the H&S Plan is intended for a hand-drawn version of the incident area. In the event the emergency occurs at a facility, a pre-printed facility plot plan can be used.

At a minimum, a Site Map should include:

Wind direction – Draw an arrow indicating wind direction. Include the actual bearing of the wind (N, S, E or W) and speed, if available

Hazard Zones

Hazard zones include the hot, warm and cold zones. These zones are utilized during an emergency to:

Outline the location of the greatest hazards, as well as, areas considered safe.

Communicate areas where certain personnel are (and are not) permitted to respond.

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

- Communicate areas where visitors are (and are not) permitted to access.
- Provide a means to control the "flow" of response personnel into and out of the hot zone.
- Contain the released product within the smallest area possible.

In the initial stages of an emergency, the hazard zones may only be established through the use of landmarks (e.g. trees, fences, roads, etc.). However, this process is important because it creates a visual "foot print" of the hazardous areas, which can be communicated to responding agencies or personnel.

Hot Zone

Only personnel with proper HAZWOPER training are allowed to enter the hot zone. The Hot zone is an established area that encircles the released product or primary hazard of emergency. The size of the hot zone will depend on product involved, wind direction, terrain, etc. During early stages of an emergency, the hot zone will be an estimate. When doing so, estimate a much larger are to include a margin of safety. You can always move closer, but it is difficult to pull responders back. Upon arrival at the scene, Fire Departments will often consider an entire facility as the hot zone. This is to ensure all personnel are evacuated and site reconnaissance can begin.

Warm Zone

Only personnel who have been HAZWOPER train are allowed to enter the warm zone. The warm zone is the area between the hot and cold zones. Like the hot zone, the size on the area depends on product involved, wind direction, terrain, etc. The warm zone should completely surround the hot zone. It acts as a buffer and transition area from the cold zone into the hot zone and visa versa. Whenever possible, the warm zone should be delineated with tape or barrier.

Cold Zone

The cold zone is a non-hazardous area where emergency management and support services are stationed. It is located beyond the Warm zone and does necessarily need to be delineated with tape or signs. The cold zone generally contains the Staging area and the Command Post. If the emergency warrants, the cold zone will also support a liaison area and a media area.

- **Staging** - The Staging Area is located within the cold zone and will serve as the first control point into the emergency. Although the Staging Area may not be established in the initial phase of the response, it is important for it to be included on the Site Map once it is established. Indicate the location of the Staging Area on the Site Map.

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

- **Command Post** - The Command Post is also located within the cold zone. It will serve as the main communication and action planning post for the duration of the emergency. Although the Command Post may not be established in the initial phase of the response, it is important for it to be included on the Site Map once it is established. More details regarding the Command Post and its role in the Incident Command System are provided. Indicate the location of the Command Post on the Site Map.

- **Decon** - A decontamination corridor ("decon area") is established at the edge of the hot zones and extends into the warm zone. Whenever possible, the decon area should be located upwind of the incident. Decontamination will be discussed further.

- **Cross Streets** - Identification of cross streets will provide a point of reference, particularly if the incident occurs along the pipeline.

- **Sensitive Receptors** - Sensitive receptors include creeks, storm channels, schools or any vulnerable conditions that could be impacted by the incident. Include the location of any sensitive receptors on the Site Map.

BOX #7: Secondary Hazards

This section is intended to communicate possible hazards that are secondary to the hazards directly posed by the incident. There is a note referring to Table 3: Secondary Hazards provided on the backside of the H&S Plan. This table lists possible secondary hazards that may deserve additional attention by the KMEP Safety Officer and provides some recommended precautions. Put a check next to all the secondary hazards that apply. Take the necessary precautions as they apply to each hazard. Use the "Other" box to describe additional secondary hazards, as necessary.

BOX #8: Evacuation Plan

This section is intended to clearly communicate where responders and/or visitors are to assemble in the event of an unexpected emergency or evacuation occurred during the response. The evacuation signal may be an existing facility alarm, three blasts of an air horn or any other easily identifiable and audible signal.

If the incident occurred at a facility and the existing evacuation areas are safe and appropriate (based on the established hazard zones), indicate these primary and secondary evacuation areas on the H&S Plan.

If the incident occurred outside a facility or along the pipeline, designate primary and secondary evacuation areas on the H&S Plan. These areas may be a simple as the Staging area or the corner of an intersection.

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

BOX #9: Nearest Hospital

Provide the address, phone number and driving directions for the hospital nearest to the incident area. It is advisable to contact the hospital and ask if they have an emergency room.

BOX #10: PROP 65 Notices

This section applies to incident occurring in California only. PROP 65 notices are required to warn people of potential toxicological effects of released products. At a minimum, PROP 65 notices are to be posted at the entrance to the incident (e.g. facility entrance or Staging area). PROP 65 notices do not need to be posted if they are already posted at facility entrances. Efforts also should be made to post them along the incident perimeter.

Check to appropriate box according to the incident location and posting needs.

BOX #11: KMEP ICS Organization

Fill-in and update the KMEP organization chart as responders arrive at the scene and assume ICS positions. See Section 4.0 for more details on ICS.

BOX #12: Enforcement / Regulatory Agencies (On-Site)

This section is intended to communicate what enforcement / regulatory agencies are on the scene. Include type of agency, representative's name and time of arrival. The KMEP Safety Officer may wish to coordinate with the KMEP Liaison Officer to complete and update this section.

BOX #13: Contractors (On Site)

This section is intended to keep track of the various contractors on site. The KMEP Safety Officer may wish to coordinate with the KMEP Operations and/or Logistics Officer(s) to complete and update this section. Check the type of contractor and fill-in the company name.

BOX #14: Hot Zone Entry Objectives

This section is intended to answer the following questions:

Why are "Hot Zone Authorized Entrants" (Box # 5) entering the Hot Zone?

FIGURE 3.7 (Cont'd)

SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

- What are they planning to do?
- Are the benefits of accomplishing objectives worth the risk of entering the Hot Zone?

Write the answer to the questions in the space provided. Use simple, straightforward language.

BOX #15: Decon Procedures

This section is to be used to develop decontamination procedures. Procedures need to be appropriate for the hazard involved.

During a response to a release, personnel and equipment may come into contact with the product. The purpose of decontamination is to minimize the spread of product. In order to accomplish this, it is important to practice effective decontamination that is appropriate to the hazards of the product. Decontamination includes the removal or neutralization of product from personnel and response equipment. The following are consideration for establishing an in-the-field decon system:

- Decon systems should be located up-wind of the Hot Zone. The decon system should extend from the edge of the Hot Zone into the Warm Zone.
- The decon system should be considered the entrance and exit (control point for personnel) into the Hot Zone.
- A secondary decon system should be considered for response equipment such as backhoes, vacuum trucks etc. Likewise, the "equipment" decon system should be used as the control point for response equipment.
- Design decon systems appropriate for the hazards involved. Refined petroleum products present a low health hazard. The approved Company decon system for refined petroleum products consists of the following components:

FIGURE 3.7 (Cont'd)

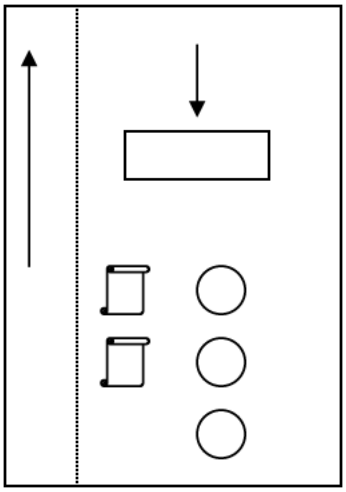
SITE SPECIFIC HEALTH & SAFETY PLAN INSTRUCTIONS (Cont'd)

- Plastic tarp floor to contain product
- Tub of kitty litter absorbent
- Boot brush
- Folding chairs
- Large plastic trash bags
- Entrant log and supervision

A sample decon system includes:

= Container with 4" of absorbent material (i.e. kitty litter) and a boot brush.

= Several folding chairs lined up with trash bags in front.



BOX #16: Atmospheric Monitoring

Air monitoring should be conducted to ensure that appropriate hazard zone areas have been designed. KMEP, fire department or contractor personnel may perform air monitoring to establish levels where appropriate. These times include:

- Ensure warm/cold zones free of vapor
- Need for respiratory protection
- Determine safe levels for confined space entry and hot work

Air monitoring to establish the hot zone perimeter should be delegated to the lead agencies (Fire Dept., HazMat teams, etc).

BOX # 17: Authorization Signatures

Once completed, have the KMEP Incident Commander and Safety Officer sign the H&S Plan.

1. Incident Name	2. Operational Period (Date / Time) From: To:	**MEDICAL PLAN** **ICS 206-CG**

3. Medical Aid Stations

Name	Location	Contact #	Paramedics On site (Y/N)

4. Transportation

Ambulance Service	Address	Contact #	Paramedics On board (Y/N)

5. Hospitals

Hospital Name	Address	Contact #	Travel Time		Burn Ctr?	Heli-Pad?
			Air	Ground		

6. Special Medical Emergency Procedures

7. Prepared by: (Medical Unit Leader) Date/Time	8. Reviewed by: (Safety Officer) Date/Time

MEDICAL PLAN (ICS 206-CG)

Purpose. The Medical Plan provides information on incident medical aid stations, transportation services, hospitals, and medical emergency procedures.

Preparation. The Medical Plan is prepared by the Medical Unit Leader and reviewed by the Safety Officer.
Distribution. The Medical Plan may be attached to the Incident Objectives (ICS 202-CG), or information from the plan pertaining to incident medical aid stations and medical emergency procedures may be taken from the plan and noted on the Assignment List (ICS 204-CG) or on the Assignment List Attachment (ICS 204a-CG). All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Medical Aid Stations	Enter name, location, and telephone number of the medical aid station(s) (e.g., Cajon Staging Area, Cajon Camp Ground) and indicate if paramedics are located at the site.
4.	Transportation	List name and address of ambulance services. Provide phone number and indicate if ambulance company has paramedics.
5.	Hospitals	List hospitals that could serve this incident. Enter hospital name, address, phone number, the travel time by air and ground from the incident to the hospital, and indicate if the hospital has a burn center and/or a helipad.
6.	Medical Emergency Procedures	Note any special emergency instructions for use by incident personnel.
7.	Prepared By Date/Time	Enter the name of the Medical Unit Leader preparing the form. Enter date (month, day, year) and time prepared (24-hour clock).
8.	Reviewed By Date/Time	Enter the name of the Safety Officer who must review the plan. Enter date (month, day, year) and time reviewed (24-hour clock).

Site Safety and Health Plan ICS-208-CG (rev 9/06)

Incident Name: _____ Date/Time Prepared: _____ Operational Period: _____

Purpose. The ICS Compatible Site Safety and Health Plan is designed for safety and health personnel that use the Incident Command System (ICS). It is compatible with ICS and is intended to meet the requirements of the Hazardous Waste Operations and Emergency Response regulation (Title 29, Code of Federal Regulations, Part 1910.120). The plan avoids the duplication found between many other site safety plans and certain ICS forms. It is also in a format familiar to users of ICS. Although primarily designed for oil and chemical spills, the plan can be used for all hazard situations.

Questions on the document should be addressed to the Coast Guard Office of Incident Management and Preparedness (G-RPP).

Table of Forms

FORM NAME	FORM #	USE	REQUIRED	OPTIONAL	ATTACHED
Emergency Safety and Response Plan	A	Emergency response phase (uncontrolled)	X		
Site Safety Plan	B	Post-emergency phase (stabilized, cleanup)	X		
Site Map	C	Post-emergency phase map of site and hazards	X		
Emergency Response Plan	D	Part of Form B, to address emergencies	X

EMERGENCY SAFETY AND RESPONSE PLAN (ICS-208-CG SSP-A)

Purpose: The Emergency Safety and Response Plan provides the Safety Officer and ICS personnel a plan for safeguarding personnel during the initial emergency phase of the response. *It is only used during the emergency phase of the response, which is defined as a situation involving an uncontrolled release.* It is also intended to meet the requirements of the Hazardous Waste Operations and Emergency Response (HAZWOPER) regulation, Title 29 Code of Federal Regulations Part 1910.120.

Preparation: The Safety Officer or his/her designated staff starts the Emergency Site Safety and Response Plan. They initially address the hazards common to all operations involved in the response (initial site characterization). Outside support organizations must be contacted to ensure the plan is consistent with other plans (local, state, other federal plans). Form ICS-208-CG SSP-G need not be completed if this form is used. When the operation proceeds into the post-emergency phase (site stabilized and cleanup operations begun) forms ICS-208-CG SSP-B and ICS-208-CG SSP-G should be used. For large incidents, the Emergency Site Safety and Response Plan complements the Incident Action Plan. For smaller incidents, the Emergency Site Safety and Response Plan complements ICS-201.

Distribution: The Emergency Safety and Response Plan completed by the Safety Officer is forwarded to the Planning Section Chief. Copies are made and attached to the Assignment List(s) (ICS Form 204). The Operations Section Chief, Directors, Supervisors or Leaders get a copy of the plan. They must ensure it is available on site for all personnel to review. The Safety Officer is responsible for ensuring that the Emergency Site Safety and Response Plan properly addresses the hazards of the operation. The Safety Officer accomplishes this through on site enforcement and feedback to the operational units.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Attachments	Enter attachments. Material Safety Data Sheets are mandatory under 1910.120. Safe Work Practices may also be attached.
5	Organization	List the personnel responsible for these positions. IC and Safety Officer are mandatory.
6	Physical Hazards & Protection	Check off the physical hazards at the site. Identify the major tasks involved in the response (skimming, lightering, overpacking, etc.). Check off the controls that would be used to safeguard workers from the physical hazards for each major task.
7	Chemical/Agent	List the chemicals involved in the response. Chemicals may be listed numerically. Check off the hazards, potential health effects, pathway of dispersion, and exposure route of the chemical. Numbers corresponding to the chemical may be entered into the check blocks to differentiate. Check off the PPE to be used. Identify the type of PPE selected (for example: gloves: butyl rubber).
8	Instruments	Indicate the instruments being used for monitoring. List the action levels adjacent to the instruments being used. Identify the chemicals being monitored (2). List the physical parameters of the chemicals. Use a separate form for additional chemicals monitored.

EMERGENCY SAFETY AND RESPONSE PLAN (FORM ICS-208-CG SSP-A) (Instructions Continued)

9	Decontamination	Check off the decontamination steps to be used. Numbers may be entered to indicate the preferred sequence. Identify any intervening steps necessary on the form or in a separate attachment.
10	Site Map	Draw a rough site map. Ensure all the information listed is identified on the map.
11	Potential Emergencies	Identify any potential emergencies that may occur. If none, so state. Check off the appropriate alarms that may be used. Identify emergency prevention and evacuation procedures in the space provided or on a separate attached sheet.
12	Communications	Indicate type of site communications (phone, radio). Indicate phone numbers or frequencies for the command, tactical and entry functions.
13	Site Security	Identify the personnel assigned. Identify security procedures in the space provided or on a separate attached sheet. Identify the equipment needed to support security operations.
14.	Emergency Medical	Identify the personnel assigned. Identify emergency medical procedures in the space provided or on a separate attached sheet. Identify the equipment needed to support security operations.
15.	Prepared by:	Enter the name and position of the person completing the worksheet.
16.	Date/time briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

11. Prepared By:	12. Date/Time Briefed:	***HAZARD LIST**: Physical/Safety, Toxic, Explosion/Fire, Oxygen Deficiency, Ionizing Radiation, Biological, Biomedical, Electrical, Heat Stress, Cold Stress, Ergonomic, Noise, Cancer, Dermatitis, Drowning, Fatigue, Vehicle, & Diving	**ICS-208-CG SSP-B (rev 9/06):** Page _____ of _____

SITE SAFETY PLAN (FORM ICS-208-CG SSP-B)

Purpose: The Site Safety Plan provides the Safety Officer and ICS personnel a plan for safeguarding personnel during the post-emergency phase of an incident. The post-emergency phase is when the situation is stabilized and cleanup operations have begun. ICS-208-CG SSP-B is intended to meet the requirements of the Hazardous Waste Operations and Emergency Response (HAZWOPER) regulation, Title 29 Code of Federal Regulations Part 1910.120.

Preparation: The Safety Officer or his/her designated staff starts the Site Safety Plan. They initially address the hazards common to all operations involved in the response (initial site characterization). The plan is then reproduced and as a minimum sent to ICS Group/Division Supervisors. They amend it according to unique job or on-scene hazards with support from the Safety Officer and/or his/her staff (detailed site characterization). The plan is continuously updated to address changing conditions. During the first hours of the response, where most response functions are in the emergency phase, the Safety Officer may chose to use the Emergency Safety and Response Plan (ICS-208-CG SSP-A) in place of the Site Safety Plan. For large incidents, ICS-208-CG SSP-B compliments the Incident Action Plan (IAP). For smaller incidents, ICS-208-CG SSP-B compliments ICS Form 201. The Safety Officer is encouraged to use the HAZWOPER Compliance Checklist (Form ICS-208-CG SSP-K) to ensure the IAP and the 201 address the requirements and all other pertinent ICS forms (203, 205, 206, etc.) are completed.

Distribution: The initial Site Safety Plan completed by the Safety Officer is forwarded to the Planning Section Chief. Copies are made and attached to the Assignment List(s) (ICS Form 204). The Operations Section Chief, Directors, Supervisors or Leaders get a copy and make on site amendments specific to their operation. They must also ensure it is available on site for all personnel to review. The Safety Officer provides personnel from his/her staff to assist in the detailed site characterization. The Safety Officer is responsible for ensuring that the Site Safety Plan for each assignment properly addresses the hazards of the assignment. The Safety Officer must ensure that the safety plans on site are consistent. The Safety Officer accomplishes this through on site enforcement and feedback to the operational units.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Group/Division Supv Strike Team/TF Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	Site Accessibility	Check the block(s) if the site is accessible by land, water, air, etc.
8	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
9	Attachments	Enter attachments. Material Safety Data Sheets are mandatory under 1910.120. Safe Work Practices may also be attached.
10	Job/Task Activity	Enter Job/Task & Activities, list hazards, list potential injury and health effects, check exposure routes and identify controls. If more detail is needed for controls, provided attachments.
11	Prepared by	Enter the name and position of the person completing the worksheet.
12	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

SITE MAP FOR SITE SAFETY PLAN (ICS-208-CG SSP-C)

Purpose: The Site Map for the Site Safety Plan is required by Title 29 Code of Federal Regulations Part 1910.120. It provides in 1 place a visual description of the site which can help ICS personnel locate hazards, identify evacuation routes and places of refuge.

Preparation: The Site Map for the Site Safety Plan can be completed by the Safety Officer, his/her staff or by ICS field personnel (Group Supervisors, Task Force/Strike Team Leaders) working at a site with unique and specific hazards. One or several maps may be developed, depending on the size of the incident and the uniqueness of the hazards. The key is to ensure that the workers using the map(s) can clearly identify the work zones, locations of hazards, evacuation routes and places of refuge.

Distribution: This form must be located with the Site Safety Plan (ICS-208-CG SSP-B). It therefore follows the same distribution route.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	Site Accessibility	Check the block(s) if the site is accessible by land, water, air, etc.
8	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
9	Include	Ensure the map includes the listed items provided in this block.
10	Sketch of Site	Sketch of site for work. May attach map or chart.
10	Prepared by	Enter the name and position of the person completing the worksheet.
11	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

EMERGENCY RESPONSE PLAN (ICS-208-CG SSP-D)

Purpose: The Emergency Response Plan provides information on measures to be taken in the event of an emergency. It is used in conjunction with the Site Safety Plan (Form ICS-208-CG SSP-B). It is also required by Title 29 Code of Federal Regulations Part 1910.120.

Preparation: The Safety Officer, his/her staff member or the Site Supervisor/Leader prepares the Emergency Response Plan. A copy of the Medical Plan (ICS Form 206) must always be attached to this form.

Distribution: This form must be located with Site Safety Plan (ICS-208-CG SSP-B). It therefore follows the same distribution route.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
8	Attachments	Enter attachments. ICS Form 206 must be included.
9	Emergency Alarm	Enter a description of the sound of the emergency alarm and it's location.
10	Backup Alarm	Enter a description of the sound of the emergency alarm and it's location.
11	Emergency Hand Signals	Enter the emergency hand signals to be used.
12	Emergency Personal Protective Equipment Required	Enter the emergency personal protective equipment that may be needed in the event of an emergency.
13	Emergency Notification Procedures	Enter the procedures for notifying the appropriate personnel and organizations in the event of an emergency.
14	Places of Refuge	Enter by name the place of refuge personnel can go to in the event of an emergency.
15	Emergency Decon & Evacuation Steps	Enter emergency decontamination steps and evacuation procedures.
16	Site Security Measures	Enter site security measures needed for emergencies.
17	Prepared by	Enter the name and position of the person completing the worksheet.
18	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

EXPOSURE MONITORING PLAN (FORM ICS-208-CG SSP-E)

Purpose: The Exposure Monitoring Plan provides plan of monitoring conducted during an incident. The plan is a supplement to the Site Safety Plan (ICS-208-CG SSP-B). It is only required when performing monitoring operations.

Preparation: The Safety Officer, his/her staff member or the Site Supervisor/Leader prepares the Exposure Monitoring Plan. If there is a decision not to monitor during a response, the reasons must be stated clearly in the Site Safety Plan (ICS-208-CG SSP-B).

Distribution: This form must be located with Site Safety Plan (ICS-208-CG SSP-B). It therefore follows the same distribution route.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Specific Task / Operation	Enter specific task or operation.
6	Survey Location	Enter the location to be monitored.
7	Survey Date/Time	Enter the date/time for the monitoring teams to survey.
8	Monitoring Methodology	Enter/Check the monitoring method to be used.
9	Direct-Reading Instrument	Enter the instrument model, manufacturer, last calibration date.
10	Air Sampling	Enter Air Sampling analysis method
11	Hazards to Monitor	Enter the hazards to monitor
12	Monitoring Duration	Enter duration of monitoring
13	Reasons to Monitor	Enter Reasons to Monitor
14	Laboratory Support for Analysis	Enter Laboratory Support needed for analysis of samples
15	Prepared by	Enter the name and position of the person completing the worksheet.
16	Date/Time Briefed	Enter the date/time the document was briefed to the appropriate workers and by whom.
17	Safety Officer Review	The Safety Officer must review and sign the form.

DAILY AIR MONITORING LOG (FORM ICS-208-CG SSP-E-1)

Purpose: The Exposure Monitoring Log provides documentation of air monitoring conducted during a spill. The log is a supplement to the Site Safety Plan (ICS-208-CG SSP-B). It is only required when performing air monitoring operations. The information used from the log can help update the Site Safety Plan.

Preparation: Persons conducting monitoring complete the Daily Air Monitoring Log. Normally these are air monitoring units under the Site Safety Officer. If there is a decision not to monitor during a spill, the reasons must be stated clearly in the Site Safety Plan (ICS-208-CG SSP-B).

Distribution: The Daily Air Monitoring Log when completed is copied and forwarded to the Site Safety Officer who must review and sign the form. The original form must be available on site, readily available and briefed to all impacted ICS personnel.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Location & size of site	Enter the geographical location of the site and the approximate square area.
6	Hazards of Concern	Enter the hazards being monitored.
7	Action Levels	Enter the action levels/readings for the monitoring teams.
8	Weather	Enter weather information. Ensure units of measure are listed.
9	Air Monitoring Data	Enter the instrument type and number, persons monitoring, results with appropriate units, location of reading, time of reading and interferences and comments.
10	Safety Officer Review	The Safety Officer must review and sign the form.

CG ICS SSP: PERSONAL PROTECTIVE EQUIPMENT	1. Incident Name	2. Date/Time Prepared	3. Operational Period	4. Safety Officer (include method of contact)
5. Supervisor/Leader	6. Location and Size of Site	7. Hazards Addressed:		8. For Emergencies Contact:

PERSONAL PROTECTIVE EQUIPMENT (ICS-208-CG SSP-F)

Purpose: The Personal Protective Equipment form is a list of personal protective equipment to be used in operations. The listing of personal protective equipment is required by Title 29 Code of Federal Regulations Part 1910.120.

Preparation: The Personal Protective Equipment form is completed by the Site Safety Officer, or his/her staff. Personal protective equipment common to all ICS Operations personnel is addressed first. Jobs with unique personal protective equipment requirements (fall protection) are addressed next. When the form is delivered on site, the ICS Director, Supervisor, or Leader may amend the list to ensure personnel are adequately protected from job hazards. It must be completed prior to the onset of any operations, unless addressed elsewhere by Standard Operating Procedures.

Distribution: This form must be located with Site Safety Plan (ICS-208-CG SSP-B). It therefore follows the same distribution route.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	Hazard(s) Addressed:	Enter the hazards that need to be safeguarded.
8	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
9	Equipment	List the equipment needed to address the hazards. If pre-designed Safe Work Practices are used, indicate here and attach to form.
10	References consulted	List the references used in making the selection for PPE.
11	Inspection Procedures	Enter the procedures for inspecting the Personal Protective Equipment prior to donning. If pre-designed Safe Work Practices are used, indicate here and attach to form.
12	Donning Procedures	Enter the procedures for putting on the PPE. If pre-designed Safe Work Practices are used, indicate here and attach to form.
13	Doffing Procedures	Enter the information for removing the PPE. If pre-designed Safe Work Practices are used, indicate here and attach to form.
14	Limitations and Precautions	List the limitations and precautions when using PPE. Include the maximum time to be inside the PPE, Heat Stress concerns, psychomotor skill detraction and other factors.
15	Prepared by	Enter the name and position of the person completing the worksheet.
16	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

DECONTAMINATION (ICS-208-CG SSP-G)

Purpose: The Decontamination form provides information on how workers can avoid contamination and how to get decontaminated. It is a supplemental form to the Site Safety Plan.

Preparation: The Decontamination Form can be completed by the Site Safety Officer, a member of his/her staff or by the Group/Division Supervisor, Task Force/Strike Team Leader on the site

Distribution: This form must be located with Site Safety Plan (ICS-208-CG SSP-B). It therefore follows the same distribution route.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
8	Hazard(s) Addressed:	Enter the hazards that need to be safeguarded.
9	Equipment	Enter the decontamination equipment needed for the site. If pre-designed Safe Work Practices are used, indicate here and attach to this form.
10	References consulted	List the references used in making the selection for PPE.
11	Contamination Avoidance Practices	Enter procedures for personnel to avoid contamination. If pre-designed Safe Work Practices are used, indicate here and attach to form.
12	Decon Diagram	Draw a diagram for the decontamination operation. If pre-designed Safe Work Practices are used, indicate here and attach to form.
13	Decon Steps	List the decontamination steps.
14	Prepared by	Enter the name and position of the person completing the worksheet.
15	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

UNIT LOG (ICS FORM 214-CG)

Purpose. The Unit Log records details of unit activity, including strike team activity or individual activity. These logs provide the basic reference from which to extract information for inclusion in any after-action report.

Preparation. A Unit Log is initiated and maintained by Command Staff members, Division/Group Supervisors, Air Operations Groups, Strike Team/Task Force Leaders, and Unit Leaders. Completed logs are submitted to supervisors who forward them to the Documentation Unit.

Distribution. The Documentation Unit maintains a file of all Unit Logs. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Check-In Location	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Unit Name/Designators	Enter the title of the organizational unit or resource designator (e.g., Facilities Unit, Safety Officer, Strike Team).
4.	Unit Leader	Enter the name and ICS Position of the individual in charge of the Unit.
5.	Personnel Assigned	List the name, position, and home base of each member assigned to the unit during the operational period.
6.	Activity Log	Enter the time and briefly describe each significant occurrence or event (e.g., task assignments, task completions, injuries, difficulties encountered, etc.)
7.	Prepared By	Enter name and title of the person completing the log. Provide log to immediate supervisor, at the end of each operational period.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

Action	Possibly Acceptable	Attention Needed	Correction Required	Immediate Correction	Discontinue/ Stop

9. Prepared by (Name and Position)

INCIDENT ACTION PLAN SAFETY ANALYSIS (ICS-215A-CG (rev 6/06))
Instructions for filling out the form

Purpose: The purpose of this worksheet is to aid the Safety Officer in completing an operational risk assessment to prioritize hazards and develop appropriate controls.

Preparation: During the Incident Action Planning cycle where the Operations Section Chief (OSC) is preparing for the tactics meeting, the Safety Officer works alongside the OSC and completes the Incident Action Plan Safety Analysis. This sheet mirrors the ICS 215 form. Work assignments are listed along with associated hazards. A calculation is made that determines what level of risk each work assignment poses. For those assignments having significant risk, controls are developed for safeguarding responders. The net risk is evaluated against the gain. The Incident Commander should be alerted to all safety hazards that receive an amber or red GAR rating after controls have been established.

Distribution: The Operational Hazard Worksheet is attached to the Incident Site Safety Plan and is distributed according to the instruction for Site Safety Plans.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) and time prepared.
3	Division/Group	Enter the Branch, Division or Group title in abbreviated form.
4	Work Assignment	List the work assignment for each Branch, Division or Group.
5	Gain	Check the gain that is achieved when the work assignment is accomplished.
6	Hazards	Using the IAP Safety Analysis Aid (page 2), list the type of hazards likely to be encountered for the work assignment. Place a check mark in the box below the hazard.
7	Controls	Using the IAP Safety Analysis Aid (page 2), list the type of controls likely to be used for addressing the hazards listed. Place a check mark in the box below the control.
8	GAR	Using the "Key", assign a number from 1 to 5 based on the level of severity, probability and exposure. Multiply all numbers together to get a total. Enter this number into the total column. Gar means **G**reen, **A**mber, **R**ed. Using the GAR scale on the bottom of the sheet, assign a color, risk level or action phrase in this block.
9	Prepared by	Enter the name of the person who completed this worksheet.

ICS-215A-CG INCIDENT ACTION PLAN SAFETY ANALYSIS AID

HAZARDS:

Physical	Chemical/Biological	Human
• Slipping	• Explosion	• Violence
• Tripping	• Flammable	• Poor Lifting
• Fall	• Air Reactive	• Repetition
• Overhead	• Water Reactive	• Excessive Force
• Heat Stress	• Chem Reactive	• Poor posture
• Cold Stress	• Alpha Rad	• Awkward motion
• Electrical	• Beta Rad	• Fatigue
• Blunt Objects	• Gamma Rad	• Poor hygiene
• Sharp Objects	• X Rad	• Illness
• Noise	• Bio-weapon	• Alcohol/Drugs
• Vehicle	• Chem-weapon	• Over crowding
• Fire	• Irritant	• Poor comms
• Sun/UV Glare	• Asphyxiant	• Noise interference
• Sun Burn	• Oxidizer	• Smoking
• Moving Pinch Points	• Carcinogen	• Driving
• Unguarded Machinery	• Corrosive	**Animal/Plant**
• Lightning	• Cryogenic	• Bites/Stings
• Drowning	• Toxic	• Poison
• Engulfment	• Biomed/pathogen	• Thorns/burrs
• Limited Egress/Access	• Particulates	• Swarms
	• Fumes (weld etc.)	• Disease
	• O2 Deficiency	• Feces/Coliforms

CONTROLS:

Types of Engineering Controls:

• Barriers	• Shields	• Dams
• Capping	• Covering	• Fencing
• Terminating	• Shutting	• Blocking
• Chocks	• Enclosures	• Diverters
• Flanging	• Guarding	• Substitution
• Anchoring	• Ventilation	• Blowing
• Scaffolding	• Grounding	• Substitution
• Bonding	• Insulation	• Lighting
• Locks, Tags	• Kill-switches	• Shut-off valves
• Taglines	• Circuit Breakers	• Process change
• Plugging, patching	• Sealing	• Absorbers

Types of Administrative Controls:

• Reduced work duration	• Worker rotation	• Safety plans
• Training	• Safety briefs	• Relief personnel
• Maintenance	• Drinking fluids	• Work/rest periods
• Good housekeeping	• Roving security	• Signs
• Warning lights	• Alarms	• Break areas
• Pre-inspections	• Field checks	• Buddy system
• Line of sight comms	• Comms schedule	• Equipt staging
• Load shifting	• Hazard marking	• Placarding
• Labeling	• Hand signals	• Safety observers
• Fendering	• Work plans	• Replenish fluids
• Handcarts/trolleys	• Fire extinguishers	• Drum bulking
• Eye Wash Station	• Hand washers	• Showers

Types of Personal Protective Equipment Controls:

• Hard hats	• Steel-toed shoes	• Safety glasses
• Safety goggles	• Face shields	• Hearing Protection
• Life jacket	• Fall arrests	• SCBA
• APRs	• Chemical suits	• Flash suits
• Fire resistant suits	• Work gloves	• Chemical gloves
• Sun glasses	• Sun-block	• Life rings
• Eye wash stations	• Night vision	• Thermal protection
• Dry/wet suits	• Hand warmers	• Wind breaker coat
• Knee pads	• Over garments	• Coveralls
• Booties	• Cooling vests	• Chap lip protection
• Hats for warming	• Gloves (warmth)	• Clothing (warmth)

4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

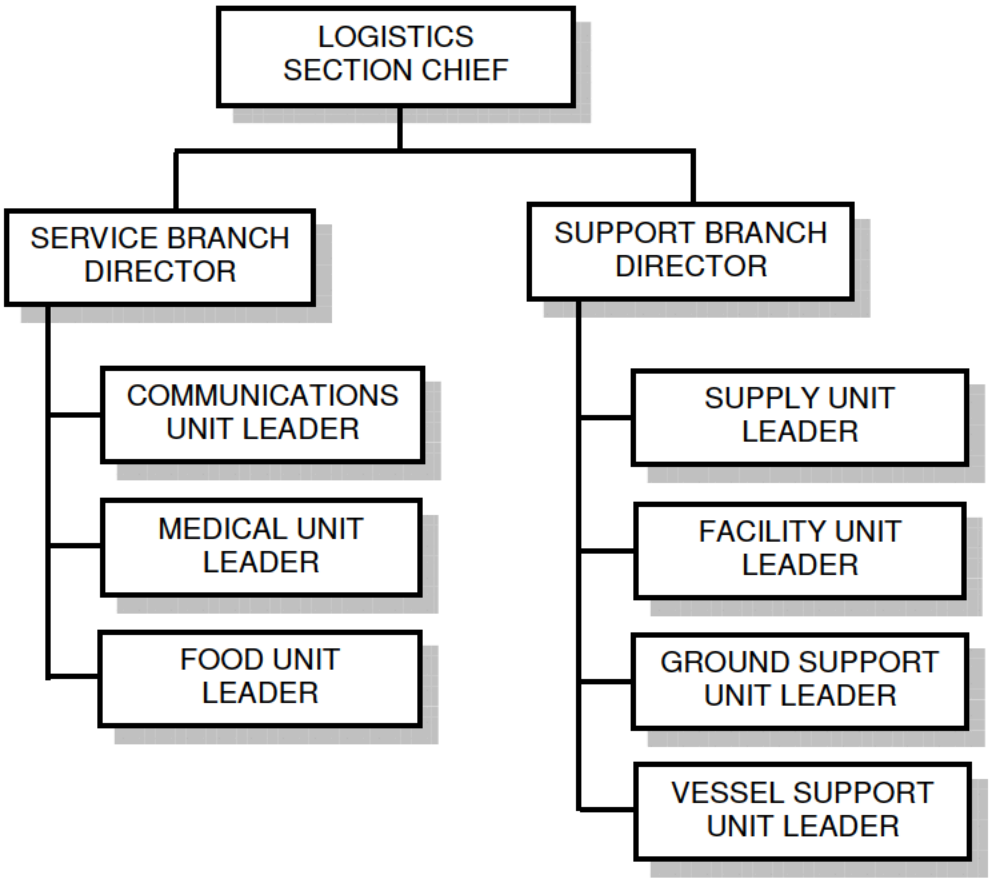
- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

LOGISTICS

Logistics Section Chief 4-44

Service Branch Director 4-44
- Communications Unit Leader 4-45
- Medical Unit Leader 4-45
- Food Unit Leader 4-46
- Hospital Coordination Unit 4-46

Support Branch Director 4-47
- Supply Unit Leader 4-47
- Facilities Unit Leader 4-47
- Ground Support Unit Leader 4-48
- Vessel Support Unit Leader 4-49



LOGISTICS SECTION CHIEF

The Logistics Section Chief (LSC) is responsible for providing facilities, services, and material in support of the incident. The LSC participates in the development and implementation of the Incident Action Plan (IAP). The LSC activates and supervises the Branches and Units within the Logistics Section.

Resources are divided into Support and Services. Support resources are used in support of the IAP (i.e. boom, vacuum trucks, skimmers etc.). Service resources include food/water, communication and medical resources.

Overall LSC Responsibilities:

- Plan the organization of the Logistics Section.
- Assign work locations and preliminary work tasks to Section personnel.
- Notify the Resources Unit of the Logistics Section units activated including names and locations of assigned personnel.
- Assemble and brief Branch Directors and Unit Leaders.
- Participate in preparation of the IAP.
- Identify service and support requirements for planned and expected operations.
- Provide input to and review the Communications Plan (ICS Form 205), Medical Plan (ICS Form 206) and Traffic Plan.
- Coordinate and process requests for additional resources.
- Review the IAP and estimate Section needs for the next operational period.
- Advise on current service and support capabilities.
- Prepare service and support elements of the IAP.
- Estimate future service and support requirements.
- Receive Incident Demobilization Plan from Planning Section.
- Recommend release of Unit resources in conformity with Incident Demobilization Plan.
- Ensure the general welfare and safety of Logistics Section personnel.

SERVICE BRANCH DIRECTOR

The Service Branch Director, when activated, is under the supervision of the LSC, and is responsible for the management of all service activities at the incident. The Branch Director supervises the operations of the Communications, Medical and Food Units.

Overall Service Branch Director Responsibilities:

- Determine the level of service required to support operations.
- Confirm dispatch of Branch personnel.
- Participate in planning meetings of Logistics Section personnel.
- Review the IAP.
- Organize and prepare assignments for Service Branch personnel.
- Coordinate activities of Branch Units.
- Inform the LSC of Branch activities.
- Resolve Service Branch problems.

SERVICE BRANCH DIRECTOR (Cont'd)

Communications Unit Leader – The Communications Unit Leader is responsible for developing plans for the effective use of incident communications equipment and facilities; installing and testing of communications equipment; supervision of the Incident Communications Center; distribution of communications equipment to incident personnel; and the maintenance and repair of communications equipment.

Overall Communications Unit Leader Responsibilities:

- Prepare and implement the Incident Radio Communications Plan (ICS Form 205).
- Ensure the Incident Communications Center and the Message Center is established.
- Establish appropriate communications distribution/maintenance locations within the Base/Camp(s).
- Ensure communications systems are installed and tested.
- Ensure an equipment accountability system is established.
- Ensure personal portable radio equipment from cache is distributed per Incident Radio Communications Plan.
- Provide technical information as required on:
  - Adequacy of communications systems currently in operation.
  - Geographic limitation on communications systems.
  - Equipment capabilities/limitations.
  - Amount and types of equipment available.
  - Anticipated problems in the use of communications equipment.
- Supervise Communications Unit activities.
- Maintain records on all communications equipment as appropriate.
- Ensure equipment is tested and repaired.
- Recover equipment from Units being demobilized.

Medical Unit Leader - The Medical Unit Leader, under the direction of the Service Branch Director or Logistics Section Chief, is primarily responsible for the development of the Medical Plan, obtaining medical aid and transportation for injured and ill incident personnel, and preparation of reports and records.

Overall Medical Unit Leader Responsibilities:

- Participate in Logistics Section/Service Branch planning activities.
- Prepare the Medical Plan (ICS Form 206).
- Prepare procedures for major medical emergency.
- Declare major emergency as appropriate.
- Respond to requests for medical aid, medical transportation, and medical supplies.
- Prepare and submit necessary documentation.

SERVICE BRANCH DIRECTOR (Cont'd)

Food Unit Leader - The Food Unit Leader is responsible for supplying the food needs for the entire incident, including all remote locations (e.g., Camps, Staging Areas), as well as providing food for personnel unable to leave tactical field assignments.

Overall Food Unit Leader Responsibilities:

- Determine food and water requirements.
- Determine the method of feeding to best fit each facility or situation.
- Obtain necessary equipment and supplies and establish cooking facilities.
- Ensure that well-balanced menus are provided.
- Order sufficient food and potable water from the Supply Unit.
- Maintain an inventory of food and water.
- Maintain food service areas, ensuring that all appropriate health and safety measures are being followed.
- Supervise caterers, cooks, and other Food Unit personnel as appropriate.

TERRORISM INCIDENT

(b) (7)(F), (b) (3)

[redacted]

1. Incident Name	2. Operational Period (Date / Time) From: To:	INCIDENT RADIO COMMUNICATIONS PLAN ICS 205-CG

3. BASIC RADIO CHANNEL USE

SYSTEM / CACHE	CHANNEL	FUNCTION	FREQUENCY	ASSIGNMENT	REMARKS

4. Prepared by: (Communications Unit) **Date / Time**

INCIDENT RADIO COMMUNICATIONS PLAN (ICS 205-CG)

Special Note. This form, ICS 205-CG, is used to provide, in one location, information on all radio frequency assignments down to the Division/Group level for each operational period; whereas, the Communications List, ICS 205a-CG is used to list methods of contact for personnel assigned to the incident (radio frequencies, phone numbers, pager numbers, etc.).

Purpose. The Incident Radio Communications Plan is a summary of information obtained from the Radio Requirements Worksheet (ICS 216) and the Radio Frequency Assignment Worksheet (ICS 217). Information from the Radio Communications Plan on frequency assignments is normally noted on the appropriate Assignment List (ICS 204-CG).

Preparation. The Incident Radio Communications Plan is prepared by the Communications Unit Leader and given to the Planning Section Chief. Detailed instructions on the preparation of this form may be found in ICS Publication 223-5, Communications Unit Position Manual.

Distribution. The Incident Radio Communications Plan is duplicated and given to all recipients of the Incident Objectives form, including the Incident Communications Center. Information from the plan is placed on Assignment Lists. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Basic Radio Channel	Enter the following information about radio channel use:
	System	Radio cache system(s) assigned and used on the incident.
	Channel	Radio channel numbers assigned.
	Function	Function each channel is assigned (e.g., command, support, division tactical, and ground-to-air).
	Frequency	Radio frequency tone number assigned to each specified function (e.g., 153.400)
	Assignment	ICS organization assigned to each of the designated frequencies (e.g., Branch I, Division A).
	Remarks	This section should include narrative information regarding special situations.
4.	Prepared By	Enter the name of the Communications Unit Leader preparing the form.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

1. Incident Name	2. Operational Period (Date / Time) From: To:	**COMMUNICATIONS LIST** **ICS 205A-CG**

3. Basic Local Communications Information

Assignment	Name	Method(s) of contact (radio frequency, phone, pager, cell #(s), etc.)

4. Prepared by: (Communications Unit) **Date / Time**

COMMUNICATIONS LIST (ICS 205a-CG)

Special Note. This optional form is used in conjunction with the Incident Radio Communications Plan, ICS 205-CG. Whereas the ICS 205-CG is used to provide information on all radio frequencies down to the Division/Group level, the Communications List, ICS 205a-CG, lists methods of contact for personnel assigned to the incident (radio frequencies, phone numbers, pager numbers, etc.), and functions as an incident directory.

Purpose. The Communications List records methods of contact for personnel on scene.

Preparation. The Communications List can be filled out during check-in and is maintained and distributed by Communications Unit personnel.

Distribution. The Communications List is distributed within the ICS and posted, as necessary. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Basic Local Comms Information	Enter the communications methods assigned and used for each assignment.
	Assignment	Enter the ICS Organizational assignment.
	Name	Enter the name of the contact person for the assignment.
	Method(s) of contact	Enter the radio frequency, telephone number(s), etc. for each assignment.
4.	Prepared By	Enter the name of the Communications Unit Leader preparing the form.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

1. Incident Name	2. Operational Period (Date / Time) From: To:	**MEDICAL PLAN** **ICS 206-CG**

3. Medical Aid Stations

Name	Location	Contact #	Paramedics On site (Y/N)

4. Transportation

Ambulance Service	Address	Contact #	Paramedics On board (Y/N)

5. Hospitals

Hospital Name	Address	Contact #	Travel Time		Burn Ctr?	Heli-Pad?
			Air	Ground		

6. Special Medical Emergency Procedures

7. Prepared by: (Medical Unit Leader) **Date/Time**	**8. Reviewed by: (Safety Officer)** **Date/Time**

MEDICAL PLAN (ICS 206-CG)

Purpose. The Medical Plan provides information on incident medical aid stations, transportation services, hospitals, and medical emergency procedures.

Preparation. The Medical Plan is prepared by the Medical Unit Leader and reviewed by the Safety Officer.
Distribution. The Medical Plan may be attached to the Incident Objectives (ICS 202-CG), or information from the plan pertaining to incident medical aid stations and medical emergency procedures may be taken from the plan and noted on the Assignment List (ICS 204-CG) or on the Assignment List Attachment (ICS 204a-CG). All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Medical Aid Stations	Enter name, location, and telephone number of the medical aid station(s) (e.g., Cajon Staging Area, Cajon Camp Ground) and indicate if paramedics are located at the site.
4.	Transportation	List name and address of ambulance services. Provide phone number and indicate if ambulance company has paramedics.
5.	Hospitals	List hospitals that could serve this incident. Enter hospital name, address, phone number, the travel time by air and ground from the incident to the hospital, and indicate if the hospital has a burn center and/or a helipad.
6.	Medical Emergency Procedures	Note any special emergency instructions for use by incident personnel.
7.	Prepared By Date/Time	Enter the name of the Medical Unit Leader preparing the form. Enter date (month, day, year) and time prepared (24-hour clock).
8.	Reviewed By Date/Time	Enter the name of the Safety Officer who must review the plan. Enter date (month, day, year) and time reviewed (24-hour clock).

1. Incident Name	2. Operational Period (Date/Time) From: To:	UNIT LOG ICS 214-CG
3. Unit Name/Designators	4. Unit Leader (Name and ICS Position)	

5. Personnel Assigned

6. Activity Log (Continue on Reverse)

TIME	MAJOR EVENTS

7. Prepared by: **Date/Time:**

UNIT LOG (ICS FORM 214-CG)

Purpose. The Unit Log records details of unit activity, including strike team activity or individual activity. These logs provide the basic reference from which to extract information for inclusion in any after-action report.

Preparation. A Unit Log is initiated and maintained by Command Staff members, Division/Group Supervisors, Air Operations Groups, Strike Team/Task Force Leaders, and Unit Leaders. Completed logs are submitted to supervisors who forward them to the Documentation Unit.

Distribution. The Documentation Unit maintains a file of all Unit Logs. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Check-In Location	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Unit Name/Designators	Enter the title of the organizational unit or resource designator (e.g., Facilities Unit, Safety Officer, Strike Team).
4.	Unit Leader	Enter the name and ICS Position of the individual in charge of the Unit.
5.	Personnel Assigned	List the name, position, and home base of each member assigned to the unit during the operational period.
6.	Activity Log	Enter the time and briefly describe each significant occurrence or event (e.g., task assignments, task completions, injuries, difficulties encountered, etc.)
7.	Prepared By	Enter name and title of the person completing the log. Provide log to immediate supervisor, at the end of each operational period.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

1. Incident Name	2. Operational Period (Date / Time) From: To:	DEMOB. CHECK-OUT ICS 221-CG
3. Unit / Personnel Released	4. Release Date / Time	

5. Unit / Personnel

DEMOB. CHECK-OUT (ICS 221-CG)

Purpose. This form provides the Planning Section information on resource releases from the incident.

Preparation. The Demobilization Unit Leader or the Planning Section initiates this form. The Demobilization Unit Leader completes the top portion of the form after the resource supervisor has given written notification that the resource is no longer needed.

Distribution. The individual resource will have the unit leader initial the appropriate box(es) in item 5 prior to release from the incident. After completion, the form is returned to the Demobilization Unit Leader or the Planning Section. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Strike Team / Unit / Personnel Released	Enter name of Strike Team, Unit or personnel being released.
4.	Release Date/Time	Enter date (month, day, year) and time (24-hour clock) of anticipated release.
5.	Strike Team / Unit / Personnel	Demobilization Unit Leader will enter an "X" in the box to the left of those units requiring check-out. Identified Unit Leaders are to initial to the right to indicate release. NOTE: Blank boxes are provided for any additional unit requirements as needed, (e.g., Safety Officer, Agency Rep., etc.)
6.	Remarks	Enter any additional information pertaining to demobilization or release (e.g., transportation needed, destination, etc.).
7.	Prepared By	Enter name and title of the person preparing the form.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

PLANNING

Planning Section Chief 4-38

Resources Unit Leader 4-38

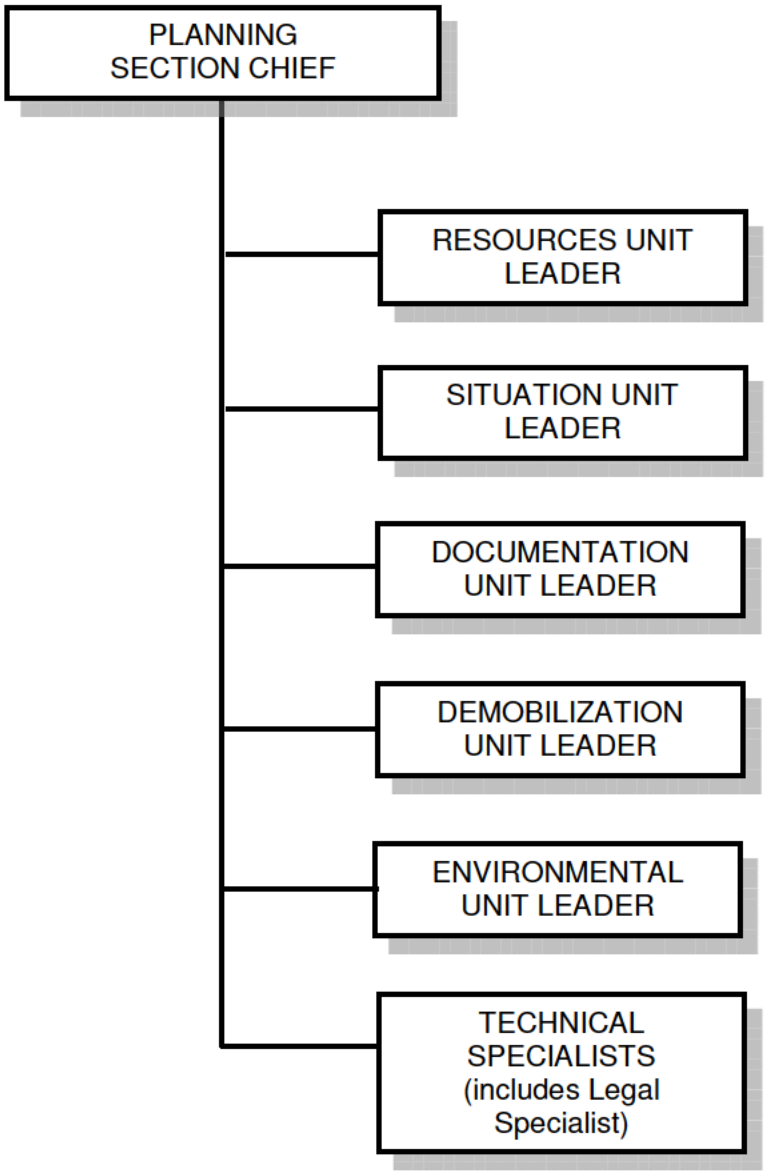
Situation Unit Leader 4-39

Documentation Unit Leader 4-40

Demobilization Unit Leader 4-41

Environmental Unit Leader 4-42

Technical Specialists 4-42



RESOURCES UNIT LEADER (Cont'd)

Overall RUL Responsibilities (Cont'd):

- Maintain and post the current status and location of all resources.
  The RUL is responsible for developing a system to best track the resource status. Ensure information is relayed to the Situation Unit Leader in order to update incident status information on the display board (ICS Form 209)
- Maintain master roster of all resources checked in at the incident.
- Assign an additional person to fill the "Check-in/status Recorder" position to assist with the accounting of all resources assigned to the incident.
  If a Check-in/status Recorder is not assigned, the RUL is responsible for all functions.

SITUATION UNIT LEADER

The Situation Unit Leader (SUL) works within the Planning Section and is responsible for collecting, processing and organizing all incident information. The SUL may prepare future projections of incident growth and maps.

Overall SUL Responsibilities:

- Begin collection and analysis of incident data as soon as possible.
- Prepare, post, or disseminate resource and situation status information as required, including special requests.
  Establish location for situation status boards and displays. This is where maps, charts, and other incident information will be posted for responders to view.
- Prepare periodic predictions or as requested by the PSC.
- Prepare the Incident Status Summary Form (ICS Form 209).
  Acquire the information from various Command and General ICS Staff.
- Provide photographic services and maps if required.

The SUL may have a Display Processor and Field Observer reporting to him/her. However, if not assigned, the SUL will be responsible for their functions

Display Processor - The Display Processor is responsible for the display of incident status information obtained from Field Observers, resource status reports, aerial and other photographs, and infrared data.

Overall Display Processor Responsibilities:

- Determine:
  - Location of work assignment
  - Numbers, types and locations of displays required
  - Priorities
  - Map requirements for the IAP
  - Time limits for completion
  - Field Observer assignments and communications means
- Obtain necessary equipment and supplies.
- Obtain a copy of the IAP for each operational period.
- Assist SUL in analyzing and evaluating field reports.
- Develop required displays in accordance with time limits for completion.

SITUATION UNIT LEADER (Cont'd)

Field Observer - The Display Processor is responsible for the display of incident status information obtained from Field Observers, resource status reports, aerial and other photographs, and infrared data.

Overall Field Observer Responsibilities:

- Determine:
  - Location of assignment
  - Type of information required
  - Priorities
  - Time limits for completion
  - Method of communication.
  - Method of transportation.
- Obtain a copy of the IAP for the Operational Period.
- Obtain necessary equipment and supplies.
- Perform Field Observer responsibilities to include but not limited to the following:
  - Perimeters of incident
  - Locations of hot spots
  - Unburned islands
  - Rates of spread
  - Weather conditions
  - Hazards including escape routes and safe areas
  - Progress of operations resources
- Be prepared to identify all facility locations (e.g., Helispots, Division and Branch boundaries).
- Report information to the SUL by established procedure.
- Report immediately any condition observed that may cause danger and a safety hazard to personnel.
- Gather intelligence that will lead to accurate predictions.

DOCUMENTATION UNIT LEADER

The Documentation Unit Leader (DUL) works within the Planning Section and is responsible for the maintenance of accurate, up-to-date incident files. The DUL should ensure that each section is maintaining and providing appropriate documents. The DUL will provide duplication and copying services for all other sections. The DUL will store incident files for legal, analytical and historical purposes.

Overall DUL Responsibilities

- Set up work area; begin organization of incident files.
- Establish duplication service; respond to requests.
- File all official forms and reports.
- Review records for accuracy and completeness; inform appropriate units of errors or omissions.
  Ensure ICS forms and documentation are dated and signed, as necessary.
- Provide incident documentation as requested.
- Store files for post-incident use.

INCIDENT STATUS SUMMARY (ICS FORM 209-CG)

Purpose. The Status Summary:
1. Is used by Situation Unit personnel for posting information on Status Boards or attaching as a file to the MISLE Case.
2. Is duplicated and provided to Command Staff members, giving them basic information for planning for the next operational period.
3. Provides information to the Information Officer for preparing news media releases.
4. Summarizes incident information for local and off-site coordination/operations centers.

Preparation. The Situation Unit prepares the Status Summary. Resources information should be obtained from the Resources Unit. It may be scheduled for presentation to the Planning Section Chief and other General Staff members prior to each Planning Meeting and may be required at more frequent intervals by the Unified Command or Planning Section Chief. Suggested sources of information are noted in brackets.
Note: The values on the ICS form 209-CG are the **best available estimates at the Time of Report** (Item # 2 on form). This form is usually in high demand and should be filled out early and often. A suggested source within the ICS organization is noted in brackets [ ] at the top right of each section of the form. **All fields need not be completed in order to distribute the form**.

Distribution. When completed, the form is duplicated and copies are distributed to the Unified Command and staff, and all Section Chiefs, Planning Section Unit Leaders, and the Joint Information Center. It is also posted on a status board located at the ICP. All completed original forms MUST be given to the Documentation Unit.

How to Save and Use the Word Template Form:
The 209 template (.dot file) can be edited to match most incident situations and can be saved into the Word template directory. Open the blank 209 (ICS 209 CG.dot) – do not add any content. Save the blank in the Templates directory. Create a new 209 from File>new picking the 209 template. Type in the file to add any desired content and use “save as” to save the work using a new file name. The file will automatically become a .doc file.

Comments: Please send comments/corrections about this form to the ICS Program Manager, Ms. Kristy Plourde, email: kplourde@tcyorktown.uscg.mil

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Period Covered by Report	Enter the date and time interval for which the report applies. Use 24-hour clock for all times.
	Time of Report	Enter time for which this information applies. Enter the Time (24-hour clock) the form was prepared.
3.	Type of Incident	Indicate (check box) and/or fill-in the type of incident(s).
4.	Situation Summary	Summary of current situation at time of report.
5.	Future Outlook	This section is for the IC/UC to discuss/project their future outlook, goals, requirements, needs and issues.
6.	Safety Status/Personnel Casualty	This information pertains to responders and assisted public personnel. Indicate the number of serious injuries, death, and missing. Values entered in the column labeled since Last Report are from the start of the

		Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
7.	Property Damage	Enter estimated dollar values for each item, if known.
8.	Attachments	Indicate (check box) and/or fill-in the attachment(s) the help further clarify the incident status.
9.	Equipment Resources	Indicate the number of each type of resource in each status category. There are blank lines below each general type of resource for additional equipment.
	Ordered	Ordered but not yet arrived/available.
	Available	Arrived on scene, stored in staging, not assigned to any task, available for use.
	Assigned	Assigned to a specific task.
	Out of Service	Not working and not assigned to any task (e.g., skimmer being repaired, boom broken, personnel off-duty for rest).
10.	Personnel Resources	Indicate, by agency, the numbers of personnel assigned. There are blank lines for additional personnel, as needed.
11.	Prepared By	Enter name and title of the person preparing the form, normally the Situation Unit Leader.

OIL/HAZMAT ATTACHMENT

1.	Incident Name	Enter the name assigned to the incident.
2.	Period Covered by Report	Enter the date and time interval for which the report applies. Use 24-hour clock for all times.
	Time of Report	Enter time for which this information applies. Enter the Time (24-hour clock) the form was prepared.
3.	Spill Status	This information is only tracked if there is spilled HAZMAT or Oil. Enter Common Name(s) of the released substance or spilled oil (i.e. Ethyl Alcohol/Ethanol or No. 2 Fuel Oil/Light Fuel Oil). Enter UN number and CAS Registry number, if known. Indicate whether the spill source is secured or unsecured (check box) and estimate the remaining potential and the rate of spillage discharge or release. Enter the estimated amounts in barrels for each category. Values entered in the column labeled Since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
	Mass Balance	This information is only tracked if there is spilled HAZMAT or Oil whether recovered, evaporated, dispersed, burned, floating, or on shore. The total of these estimates should approximate the total volume spilled, discharged, or released. Values for evaporation, dispersion, etc. can be obtained from the Environmental Unit and/or the Scientific Support Coordinator (SSC).
4.	Waste Management	This information is only tracked if there is spilled HAZMAT or Oil. Enter the estimated amounts in barrels or tons for each category. Total HAZMAT/ Oil (bbl) is the sum of the estimate of HAZMAT/oil in oily

		liquids and HAZAMT/oil in oily solids, and is the value to be entered under "Recovered HAZMAT/Oil" in Item 4.
5.	Shoreline Impacts	This information is only tracked if there is spilled HAZMAT or Oil. Enter the total miles in each category for each degree of oiling. Definitions for Light, Medium, and Heavy oiling can be obtained from the EUL/SSC and should be consistent throughout the incident.
6.	Wildlife Impacts	This information is only tracked after an animal is captured. Indicate the actual number of oiled wildlife in each category. Use numbers in parentheses to indicate the subtotal of threatened / endangered species included in the numbers given.
7.	Prepared By	Enter name and title of the person preparing the form, normally the Situation Unit Leader.

SAR/LE ATTACHMENT

1.	Incident Name	Enter the name assigned to the incident.
2.	Period Covered by Report	Enter the date and time interval for which the report applies. Use 24-hour clock for all times.
	Time of Report	Enter time for which this information applies. Enter the Time (24-hour clock) the form was prepared.
3.	Evacuation Status	This information is only tracked if the incident involves evacuation of personnel. Values entered in the column labeled Since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
4.	Migrant Interdiction Status	This information is only tracked if the incident involves Migrant Interdiction. Values entered in the column labeled Since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
5.	Sorties/Patrols	This information is only tracked if the incident involves sorties tracked in MISLE Incident Management Activity. List Sorties since last report both Air and Surface. Values entered in the column labeled since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
6.	Use of Force	This information is only tracked if the incident involves Use of Force activities. Values entered in the column labeled since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
7.	Operational Controls	This information is only tracked if the incident involves Operational Control activities initiated, in force and removed.
8.	Prepared By	Enter name and title of the person preparing the form, normally the Situation Unit Leader.

UNIT LOG (ICS FORM 214-CG)

Purpose. The Unit Log records details of unit activity, including strike team activity or individual activity. These logs provide the basic reference from which to extract information for inclusion in any after-action report.

Preparation. A Unit Log is initiated and maintained by Command Staff members, Division/Group Supervisors, Air Operations Groups, Strike Team/Task Force Leaders, and Unit Leaders. Completed logs are submitted to supervisors who forward them to the Documentation Unit.

Distribution. The Documentation Unit maintains a file of all Unit Logs. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Check-In Location	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Unit Name/Designators	Enter the title of the organizational unit or resource designator (e.g., Facilities Unit, Safety Officer, Strike Team).
4.	Unit Leader	Enter the name and ICS Position of the individual in charge of the Unit.
5.	Personnel Assigned	List the name, position, and home base of each member assigned to the unit during the operational period.
6.	Activity Log	Enter the time and briefly describe each significant occurrence or event (e.g., task assignments, task completions, injuries, difficulties encountered, etc.)
7.	Prepared By	Enter name and title of the person completing the log. Provide log to immediate supervisor, at the end of each operational period.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

Open Actions Tracker (ICS 233-CG)

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	No.	Enter number of task in sequential order (1, 2, 3, …).
3.	Item	Enter short descriptive of the task.
4.	For/POC	Enter responsible section/person.
5.	Briefed to POC	When the tasker has been briefed to the POC after initially assigned, an "X" is placed in the brief column. This was to ensure that taskers identified outsie of the POC's presence (during UC Meeting for example) were assigned the to identified POC.
6.	Start Date	Enter the date the tasker was initially assigned under "Start Date."
7.	Status	Enter status of item. This includes things like: "Awaiting LE Gear", "Update needed", "Awaiting Feedback". When the item is completed, the word "completed" is entered and if working in MS Excel, the task is cut and pasted into the worksheet labeled "COMPLETED."
8.	Target Date	Target date is another way of saying deadline. When the target date is one day away, the block turns yellow. When it is overdue it turns red. When it is yellow, it serves as a reminder to the UC that the target date needs to be changed or the responsible section needs to complete the task.
9.	Actual Date	The block to the right of the Target Date (Actual Date) will always have today's date. It is merely the formula "=today()" inserted into the cell.

NOTE: In order to ensure the red and yellow reminders work for new tasks, the user simply copies a task line, inserts it into the worksheet and overtypes the new task information.

4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

STAGING AREA MANAGER

The Staging Area Manager works for the Operations Section Chief and is responsible for managing all activities within a Staging Area or areas. Since there may be more than one Staging Area for an incident, all personnel and equipment should check-in at one of these Staging Areas (sometimes referred to as a "base camp").

Overall Staging Area Manager Responsibilities:

- Proceed to Staging Area.
- Establish Staging Area layout.
- Consider assigning Assistant Staging Managers at each area.
- Determine any support needs for equipment, feeding, sanitation and security.
- Establish check-in function as appropriate.
- Post areas for identification and traffic control.
- Request maintenance service for equipment at Staging Area as appropriate.
- Respond to request for resource assignments.
  (Utilize ICS Forms 211, 211p, 211e)
- Obtain and issue receipts for radio equipment and other supplies distributed and received at Staging Area.
- Track resources distributed from the Staging Area(s) and resources received at the Staging Area(s).
- Determine required resource levels from the OPS.
- Advise the OPS when reserve levels reach minimums.
- Maintain and provide status to Resource Unit of all resources in Staging Area.
- Demobilize Staging Area in accordance with the Incident Demobilization Plan.

Additional KM Required Staging Area Manager Responsibilities:

- Determine whether multiple Staging Areas will be required
- Consider assigning Assistant Staging Managers at each area
- Ensure Staging Area(s) are maintained in orderly condition.
- Work with KM Safety Officer to conduct H&S Plan briefings with arriving response personnel.

BRANCH DIRECTOR

The Branch Directors when activated, are under the direction of the OPS, and are responsible for the implementation of the portion of the IAP appropriate to the Branches.

Overall Branch Director Responsibilities:

- Develop with subordinates alternatives for Branch control operations.
- Attend planning meetings at the request of the OPS.
- Review Division/Group Assignment Lists (ICS Form 204) for Divisions/Groups within the Branch. Modify lists based on effectiveness of current operations.
- Assign specific work tasks to Division/Group Supervisors.
- Supervise Branch operations.
- Resolve logistic problems reported by subordinates.

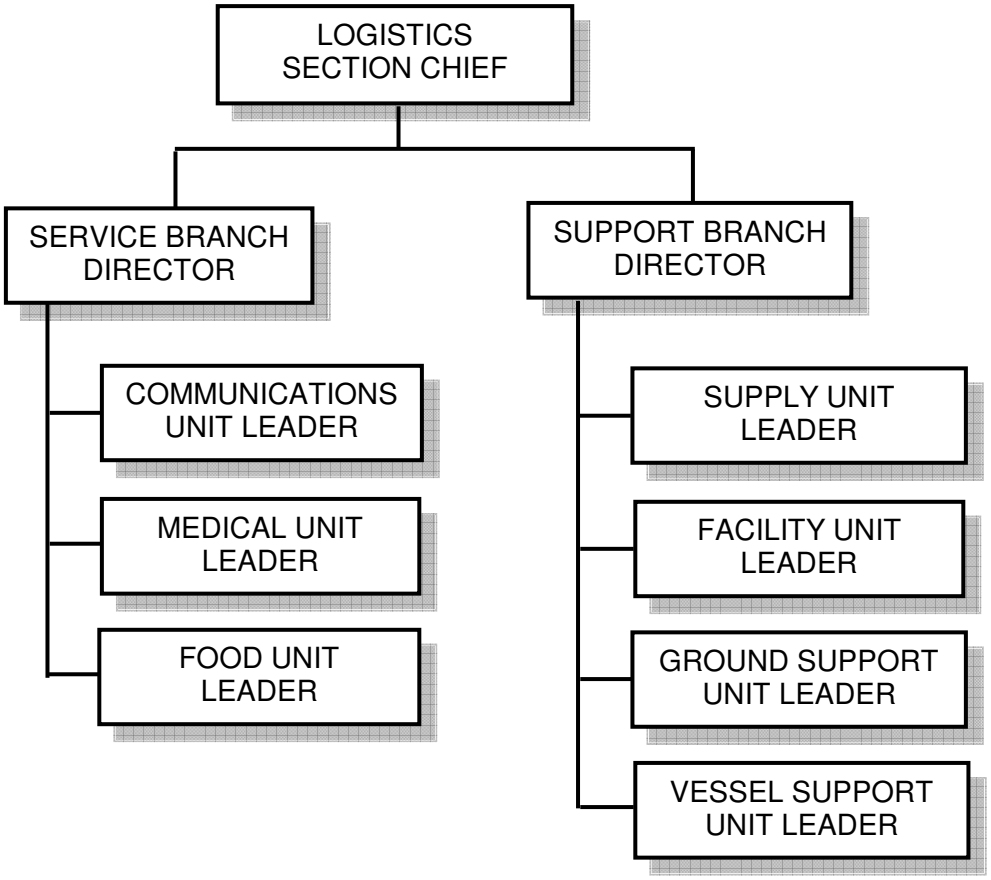
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

LOGISTICS

Logistics Section Chief 4-44

Service Branch Director 4-44
- Communications Unit Leader 4-45
- Medical Unit Leader 4-45
- Food Unit Leader 4-46
- Hospital Coordination Unit 4-46

Support Branch Director 4-47
- Supply Unit Leader 4-47
- Facilities Unit Leader 4-47
- Ground Support Unit Leader 4-48
- Vessel Support Unit Leader 4-49



SUPPORT BRANCH DIRECTOR

The Support Branch Director, when activated, is under the direction of the LSC, and is responsible for the development and implementation of logistics plans in support of the Incident Action Plan. The Support Branch Director supervises the operations of the Supply, Facilities and Ground Support Units.

Overall Support Branch Director Responsibilities:

- Obtain work materials.
- Identify Support Branch personnel dispatched to the incident.
- Determine initial support operations in coordination with the LSC and Service Branch Director.
- Prepare initial organization and assignments for support operations.
- Assemble and brief Support Branch personnel.
- Determine if assigned Branch resources are sufficient.
- Maintain surveillance of assigned units work progress and inform the LSC of their activities.
- Resolve problems associated with requests from the Operations Section.

Supply Unit Leader - The Supply Unit Leader is primarily responsible for ordering personnel, equipment and supplies; receiving and storing all supplies for the incident; maintaining an inventory of supplies; and servicing non-expendable supplies and equipment.

Overall Supply Unit Leader Responsibilities:

- Participate in Logistics Section/Support Branch planning activities.
- Determine the type and amount of supplies en route.
- Review the IAP for information on operations of the Supply Unit.
- Develop and implement safety and security requirements.
- Order, receive, distribute, and store supplies and equipment.
- Receive and respond to requests for personnel, supplies, and equipment.
- Maintain an inventory of supplies and equipment.
- Service reusable equipment.
- Submit reports to the Support Branch Director.

Facilities Unit Leader - The Facilities Unit Leader is primarily responsible for the layout and activation of incident facilities, (e.g., Base, Camp(s), and ICP). The Facilities Unit Leader provides sleeping and sanitation facilities for incident personnel and manages Base and Camp(s) operations. Each facility (Base, Camp) is assigned a manager who reports to the Facilities Unit Leader and is responsible for managing the operation of the facility. The basic functions or activities of the Base and Camp Managers are to provide security service and general maintenance. The Facility Unit Leader reports to the Support Branch Director.

SUPPORT BRANCH DIRECTOR (Cont'd)

Overall Facilities Unit Leader Responsibilities:

- Obtain a briefing from the Support Branch Director or the LSC.
- Receive and review a copy of the IAP.
- Participate in Logistics Section/Support Branch planning activities.
- Determine requirements for each facility, including the ICP.
- Prepare layouts of incident facilities.
- Notify Unit Leaders of facility layout.
- Activate incident facilities.
- Provide Base and Camp Managers and personnel to operate facilities.
- Provide sleeping facilities.
- Provide security services.
- Provide facility maintenance services (e.g., sanitation, lighting, clean up).
- Demobilize Base and Camp facilities.
- Maintain facility records

Ground Support Unit Leader - The Ground Support Unit Leader is primarily responsible for: 1) support out-of-service resources; 2) transportation of personnel, supplies, food, and equipment 3) fueling, service, maintenance, and repair of vehicles and other ground support equipment; and 4) implementing the Traffic Plan for the incident.

Overall Ground Support Unit Leader Responsibilities:

- Participate in Support Branch/Logistics Section planning activities.
- Develop and implement the Traffic Plan.
- Support out-of-service resources.
- Notify the Resources Unit of all status changes on support and transportation vehicles.
- Arrange for and activate fueling, maintenance, and repair of ground resources.
- Maintain Support Vehicle Inventory and transportation vehicles (ICS Form 218).
- Provide transportation services, IAW requests from the LSC or Support Branch Director.
- Collect information on rented equipment.
- Requisition maintenance and repair supplies (e.g., fuel, spare parts).
- Maintain incident roads.
- Submit reports to Support Branch Director as directed.

SUPPORT BRANCH DIRECTOR (Cont'd)

Vessel Support Unit Leader - The Vessel Support Unit Leader is responsible for implementing the Vessel Routing Plan for the incident and coordinating transportation on the water and between shore resources. Since most vessels will be supported by their own infrastructure, the Vessel Support Unit may be requested to arrange fueling, dockage, maintenance, and repair of vessels on a case-by-case basis.

Overall Vessel Support Unit Leader Responsibilities:

- Obtain a briefing from the Support Branch Director or the LSC.
- Participate in Support Branch/Logistics Section planning activities.
- Coordinate development of the Vessel Routing Plan.
- Coordinate vessel transportation assignments with the Protection and Recovery Branch or other sources of vessel transportation.
- Coordinate water-to-land transportation with the Ground Support Unit, as necessary.
- Maintain a prioritized list of transportation requirements that need to be scheduled with the transportation source.
- Support out-of-service vessel resources, as requested.
- Arrange for fueling, dockage, maintenance and repair of vessel resources, as requested.
- Maintain inventory of support and transportation vessels.

Resource Request Message

ICS-213 RR CG (05/06)

Requestor

1. Incident Name: | 2. Date/Time: | 3. Resource Request No:

4. ORDER Note: Use additional forms when requesting different resource sources of supply

a. Qty.	b. Kind	c. Type	d. Detailed item description (Vital characteristics, brand, specs, experience, etc. & if applicable describe purpose/use, attach diagrams, & other amplifying info)	e. Requested Reporting Location:	e. Requested Reporting Date/Time:	f. ETA (LSC):	g. Cost (FSC):

5. Suggested source(s) of Supply - POC phone no. if known & suitable subtitutes:

6. Requested by Name/Position/Phone: | 7. Date/Time: | 8. Section Chief Approval: | Date/Time:

☐ 9. Check box if request is for tactical/personnel resources & Submit to RESL, otherwise submit directly to Logistics

10. RESL Review/Signature:

☐ Resources as noted are Available ☐ Resources Not Available

Logistics

11. Logistics Order No.: | 12. Supplier Name/Phone/Fax/Email:

13. Notes:

14. Approval Signature of Auth Logistics Rep: | 15. Date/Time:

16. Order placed by (check box): ☐ SPUL ☐ PROC

Finance

17. Reply/Comments from Finance:

18. Finance Section Signature: | 19. Date/Time:

Full Instructions on back page. Requestor fills out # 1-9 & keeps yellow copy (bottom). If applicable, RESL reviews if resource available & signs # 10. Logistics fills in remainder of # 4 & # 10-15 & keeps pink copy. Finance, if needed fills out appropriate items & keeps green copy. Blue original is returned to RESL for tactical/personnel or requestor for non-tactical. White copy goes to DOCL.

Instructions for filling out the ICS-213RR CG Form (5/06)

REQUESTOR: The requestor must fill in Blocks 1 through 9:

Block # 1	Incident name: This is the same as the name stated on the ICS-201 Form and/or the Incident Action Plan (IAP).
Block # 2	Current date and time when submitting request
Block # 3	Resource Request Number: This is to be assigned by the Section submitting request (i.e. CMD, OPS, PLAN, LOG, FIN)
Block # 4	Fill in blocks 4a through 4e. Items requested: Must include Quantity, Kind and Type (if applicable) and detailed description of requirements. **BE SPECIFIC AS POSSIBLE**. The request should focus on capability rather than naming the brand or specific item (e.g. helicopter capable of carrying 4 personnel from location A to B rather than requesting a Coast Guard H-65 helicopter). This gives the logistics section the ability to find the best resource to meet the need. 4.e Requested Reporting Location/Date/Time: This is self-explanatory and is required for ordering official. Leave blocks 4.f. ETA (LSC) and 4.g. Cost (FSC) blank. These will be filled in later by Logistics and Finance.
Block # 5	Suggested sources of supply and suitable substitutes: Enter applicable information if known.
Block # 6 & 7	Requestor: Print Name and Signature and date/time.
Block # 8	Approval: This must be approved by the Section Chief or Deputy Section Chief.
Block # 9	Check box if request is for tactical or personnel resource(s) and submit request to Resources Unit Leader (RESL) to review and approve since RESL tracks all tactical and personnel resources.

Request goes to RESOURCES UNIT if requesting Tactical/Personnel Resource(s):

Block # 10	Resources reviews request and checks to see if resource is available. If the resource is available, reassigns resource as appropriate and sends request back to requester with information noted as to reporting time, etc. The request form is then sent to Documentation Unit Leader (DOCL) for filing. If the resource is not available, RESL sends request to Logistics.

LOGISTICS SECTION: The following blocks are to be filled out be the Supply Unit (SPUL).

Block # 11	Logistics Order Number: To be assigned by Supply Unit.
Block # 12	Supplier Point of Contact, Phone Number and Fax Number: This information is needed for Credit Card purchases and/or Purchase Orders.
Block # 13	Notes: Enter applicable information as need for request.
Block # 4	ETA and Cost: SPUL or PROC fills in Estimated time of arrival (ETA) when determined and cost if known.
Block # 14 & 15	Approval: This must be approved by the Logistics Section Chief or Deputy Logistics Section Chief, printed name and signature is required with Date and Time of approval. Bottom Copy (pink) is retained.

FINANCE SECTION: The following blocks are to be filled out be the Procurement Unit (PROC), if applicable.

Block # 16	Indicates who is to place order as necessary.
Block # 17	Comments concerning request from Finance Section Chief or Deputy Finance Section Chief.
Block # 18 & 19	Approval: This must be approved by the Finance Section Chief or Deputy Section Chief, printed name and signature is required with Date and Time of approval. Bottom copy (green) is retained.
FILING	Original blue copy is returned to RESL for tactical/personnel resources ordered, and the requester for non-tactical. RESL will inform requester of status of request when form received. The white copy is sent to DOCL.

Note: Cost associated requests will not be ordered without approval from the Finance Section Chief or Deputy Finance Section Chief.

Form Filing: Blue (Original) – final disposition to RESL or originator for non-tactical resources, White (copy 1) to DOCL, Green (copy 2) to FIN, Pink (copy 3) to LOG, Yellow (copy 4) to Originator

UNIT LOG (ICS FORM 214-CG)

Purpose. The Unit Log records details of unit activity, including strike team activity or individual activity. These logs provide the basic reference from which to extract information for inclusion in any after-action report.

Preparation. A Unit Log is initiated and maintained by Command Staff members, Division/Group Supervisors, Air Operations Groups, Strike Team/Task Force Leaders, and Unit Leaders. Completed logs are submitted to supervisors who forward them to the Documentation Unit.

Distribution. The Documentation Unit maintains a file of all Unit Logs. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Check-In Location	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Unit Name/Designators	Enter the title of the organizational unit or resource designator (e.g., Facilities Unit, Safety Officer, Strike Team).
4.	Unit Leader	Enter the name and ICS Position of the individual in charge of the Unit.
5.	Personnel Assigned	List the name, position, and home base of each member assigned to the unit during the operational period.
6.	Activity Log	Enter the time and briefly describe each significant occurrence or event (e.g., task assignments, task completions, injuries, difficulties encountered, etc.)
7.	Prepared By	Enter name and title of the person completing the log. Provide log to immediate supervisor, at the end of each operational period.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

1. Incident Name	2. Operational Period (Date / Time) From: To:	DEMOB. CHECK-OUT ICS 221-CG

DEMOB. CHECK-OUT (ICS 221-CG)

Purpose. This form provides the Planning Section information on resource releases from the incident.

Preparation. The Demobilization Unit Leader or the Planning Section initiates this form. The Demobilization Unit Leader completes the top portion of the form after the resource supervisor has given written notification that the resource is no longer needed.

Distribution. The individual resource will have the unit leader initial the appropriate box(es) in item 5 prior to release from the incident. After completion, the form is returned to the Demobilization Unit Leader or the Planning Section. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Strike Team / Unit / Personnel Released	Enter name of Strike Team, Unit or personnel being released.
4.	Release Date/Time	Enter date (month, day, year) and time (24-hour clock) of anticipated release.
5.	Strike Team / Unit / Personnel	Demobilization Unit Leader will enter an "X" in the box to the left of those units requiring check-out. Identified Unit Leaders are to initial to the right to indicate release. NOTE: Blank boxes are provided for any additional unit requirements as needed, (e.g., Safety Officer, Agency Rep., etc.)
6.	Remarks	Enter any additional information pertaining to demobilization or release (e.g., transportation needed, destination, etc.).
7.	Prepared By	Enter name and title of the person preparing the form.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

PLANNING

Planning Section Chief 4-38

Resources Unit Leader 4-38

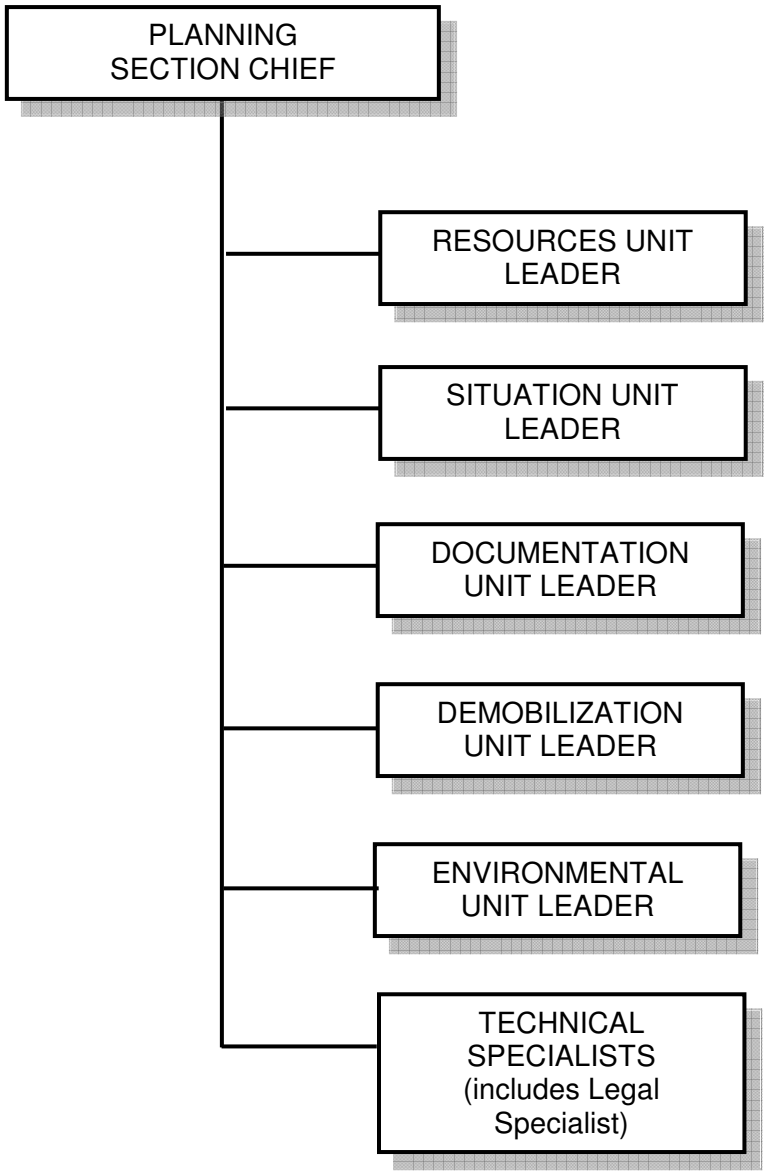
Situation Unit Leader 4-39

Documentation Unit Leader 4-40

Demobilization Unit Leader 4-41

Environmental Unit Leader 4-42

Technical Specialists 4-42



ENVIRONMENTAL UNIT LEADER

The Environmental Unit Leader (EUL) works with the Planning Section and is responsible for environmental matters associated with the response, including strategic assessment, modeling, surveillance, and environmental monitoring and permitting . The EUL prepares environmental data for the situation unit.

Overall Environmental Unit Leader Responsibilities:

- Obtain a briefing and special instructions from the PSC.
- Participate in Planning Section meetings.
- Identify sensitive areas and recommend response priorities.
  Utilize ICS Form 232.
- Following consultation with natural resource trustees, provide input on wildlife protection strategies (e.g., removing oiled carcasses, pre-emptive capture, hazing, and/or capture and treatment).
- Determine the extent, fate and effects of contamination.
- Acquire, distribute and provide analysis of weather forecasts.
- Monitor the environmental consequences of cleanup actions.
- Develop shoreline cleanup and assessment plans. Identify the need for, and prepare any special advisories or orders.
- Identify the need for, and obtain, permits, consultations, and other authorizations including Endangered Species Act (ESA) provisions.
- Following consultation with the FOSC's Historical/Cultural Resources Technical Specialist identify and develop plans for protection of affected historical/cultural resources.
- Evaluate the opportunities to use various response technologies.
- Develop disposal plans.
- Develop a plan for collecting, transporting, and analyzing samples.

TECHNICAL SPECIALISTS

Certain incidents or events may require the use of Technical Specialists who have specialized knowledge and expertise. Technical Specialists may function within the Planning Section, or be assigned wherever their services are required.

An example of a Technical Specialist is:

LEGAL SPECIALIST:

The Legal Specialist will act in an advisory capacity within the Planning Section.

Overall Legal Specialist Responsibilities:

- Participate in planning meetings, if requested.
- Advise on legal issues relating to in-situ burning, use of dispersants, and other alternative response technologies.
- Advise on legal issues relating to differences between Natural Resource Damage Assessment Restoration (NRDAR) and response activities.
- Advise on legal issues relating to investigations.
- Advise on legal issues relating to finance and claims.
- Advise on legal issues relating to response.
- Utilize ICS Form 214.

4.9 ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

UNIT LEADER RESPONSIBILITIES

In ICS, a Unit Leader's responsibilities are common to all units in all parts of the organization. Common responsibilities of Unit Leaders are listed below.

- Review common responsibilities.
- Receive briefing from Incident Commander, Section Chief or Branch Director, as appropriate.
- Participate in incident planning meetings, as required.
- Determine current status of unit activities.
- Order additional unit staff, as appropriate.
- Determine resource needs.
- Confirm dispatch and estimated time of arrival of staff and supplies.
- Assign specific duties to staff; supervise staff.
- Develop and implement accountability, safety and security measures for personnel and resources.
- Supervise demobilization of unit, including storage of supplies.
- Provide Supply Unit Leader with a list of supplies to be replenished.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).

FINANCE/ADMINISTRATION

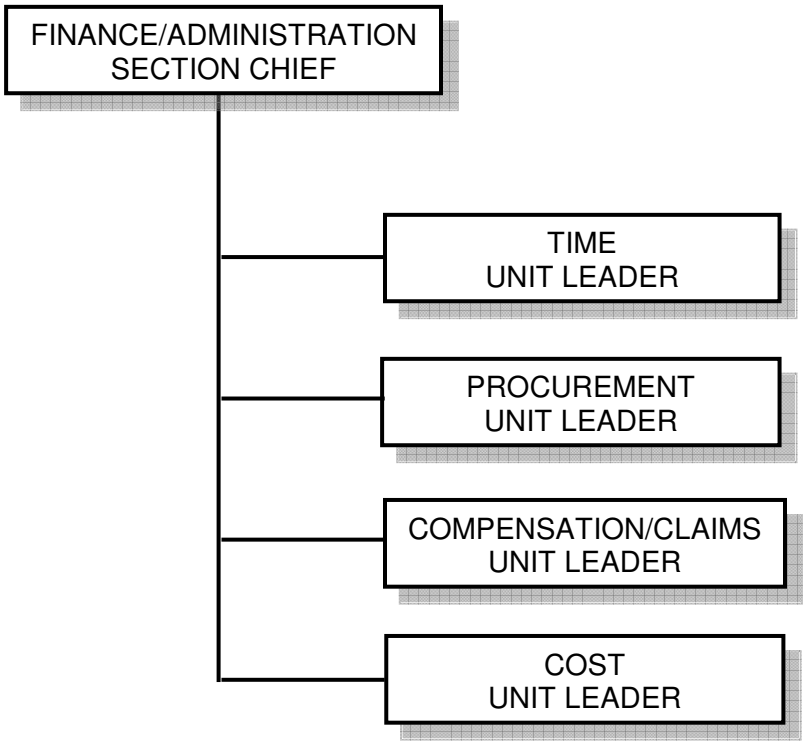
Finance/Administration Section Chief 4-51

Time Unit Leader 4-52

Procurement Unit Leader 4-52

Compensation/Claims Unit Leader 4-53

Cost Unit Leader 4-53



TIME UNIT LEADER

The Time Unit Leader is responsible for equipment and personnel time recording and for managing the commissary operations.

Overall Time Unit Leader Responsibilities:

- Determine incident requirements for time recording function.
- Determine resource needs.
- Contact appropriate agency personnel/representatives.
- Ensure that daily personnel time recording documents are prepared and in compliance with policy.
- Establish time unit objectives.
- Maintain separate logs for overtime hours.
- Establish commissary operation on larger or long-term incidents as needed.
- Submit cost estimate data forms to the Cost Unit, as required.
- Maintain records security.
- Ensure that all records are current and complete prior to demobilization.
- Release time reports from assisting agency personnel to the respective Agency Representatives prior to demobilization.
- Brief the Finance/Administration Section Chief on current problems and recommendations, outstanding issues, and follow-up requirements.

PROCUREMENT UNIT LEADER

The Procurement Unit Leader is responsible for administering all financial matters pertaining to vendor contracts, leases, and fiscal agreements.

Overall Procurement Unit Leader Responsibilities:

- Review incident needs and any special procedures with Unit Leaders, as needed.
- Coordinate with local jurisdiction on plans and supply sources.
- Obtain the Incident Procurement Plan.
- Prepare and authorize contracts and land-use agreements.
- Draft memoranda of understanding as necessary.
- Establish contracts and agreements with supply vendors.
- Provide for coordination between the Ordering Manager, agency dispatch, and all other procurement organizations supporting the incident.
- Ensure that a system is in place that meets agency property management requirements. Ensure proper accounting for all new property.
- Interpret contracts and agreements; resolve disputes within delegated authority.
- Coordinate with the Compensation/Claims Unit for processing claims.
- Coordinate use of impress funds, as required.
- Complete final processing of contracts and send documents for payment.
- Coordinate cost data in contracts with the Cost Unit Leader.
- Brief the Finance/Administration Section Chief on current problems and recommendations, outstanding issues, and follow-up requirements.

UNIT LOG (ICS FORM 214-CG)

Purpose. The Unit Log records details of unit activity, including strike team activity or individual activity. These logs provide the basic reference from which to extract information for inclusion in any after-action report.

Preparation. A Unit Log is initiated and maintained by Command Staff members, Division/Group Supervisors, Air Operations Groups, Strike Team/Task Force Leaders, and Unit Leaders. Completed logs are submitted to supervisors who forward them to the Documentation Unit.

Distribution. The Documentation Unit maintains a file of all Unit Logs. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Check-In Location	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Unit Name/Designators	Enter the title of the organizational unit or resource designator (e.g., Facilities Unit, Safety Officer, Strike Team).
4.	Unit Leader	Enter the name and ICS Position of the individual in charge of the Unit.
5.	Personnel Assigned	List the name, position, and home base of each member assigned to the unit during the operational period.
6.	Activity Log	Enter the time and briefly describe each significant occurrence or event (e.g., task assignments, task completions, injuries, difficulties encountered, etc.)
7.	Prepared By	Enter name and title of the person completing the log. Provide log to immediate supervisor, at the end of each operational period.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

Minimum Annual FRP/ICP Review Checklist

- For all Facilities – a review must be conducted each calendar year, not to exceed 15 months.
- For U.S. Coast Guard Jurisdictional Facilities – a review must be conducted annually within 30 days of the plan approval date.
- Federal and State Agency requirements for revisions and time line requirements for completing revisions are outlined in Section 1 of each FRP/ICP.

Review Date: _____

☐ **Operating Assets:** Review, confirm and update as needed operating assets (tanks added or removed, pipelines added or removed, truck racks added or removed, changes to dock operations, changes to products handled) covered by this plan. Any changes will also impact the facility Spill Prevention, Countermeasure, and Control Plan (SPCC) and Dock Operations Manual if applicable.

☐ **Qualified Individual:** Review, confirm and update as needed Qualified Individual and Alternate Qualified Individual name and contact information.

☐ **Notification Information:** Review, confirm by telephone call and update as needed telephone numbers for State, County, LEPC, and local contacts.

☐ **Company Owned Response Equipment:** Review, confirm and update as needed specific Kinder Morgan owned spill response equipment listed in the Plan (fire extinguishers, boom, sorbent pads, portable pumps, etc). Verify existence and location of response trailers and contents of those trailers.

☐ **Response Contractor Information:** Review, confirm and update as needed response contractors listed. Confirm by telephone call contact information for each response contractor listed. Note additional/new contract resources, if any.

☐ **Pipeline Information:** Review, confirm and update as needed applicable area pipeline information. Note any changes in line locations, flow rates, operating pressures, and/or products handled.

☐ **Breakout Tank/Pipeline Station Information:** Review, confirm and update as needed applicable breakout tankage and pipeline station information. Note any changes in tank configuration, capacity, and/or product service. Note any changes in station function, configuration and/or status. Any changes may also impact the facility Spill Prevention, Countermeasure, and Control Plan (SPCC) if applicable.

☐ **Storage Tank Information:** Review, confirm and update as needed applicable EPA jurisdictional tank information. Note any changes in tank configuration, capacity, and/or product service. Any changes will also impact the facility Spill Prevention, Countermeasure, and Control Plan (SPCC).

☐ **Products Handled:** Review, confirm and update as needed products handled. Any changes will also impact the facility Spill Prevention, Countermeasure, and Control Plan (SPCC) and Dock Operations Manual if applicable.

☐ **Evacuation Procedures:** Review, confirm and update as needed evacuation procedures, routes and muster locations.

☐ **Maps and Diagrams:** Review all maps and diagrams for accuracy.

Minimum Annual FRP/ICP Review Checklist (Cont'd)

Review Completed by Area Manager/Terminal Supervisor:

☐ I have reviewed the applicable FRP/ICP and no changes are needed.

☐ I have reviewed the applicable FRP/ICP and exceptions are noted on the attached pages.

Signature: _____ **Date:** _____

Name (printed): _____

Review Completed by Operations Manager:

Signature: _____ **Date:** _____

Name (printed): _____

Title: _____

Review Completed by Director of Operations:

Signature: _____ **Date:** _____

Name (printed): _____

Title: _____

Forward a copy of the completed checklist to Manager - Emergency Response Programs.
Retain completed Checklist for five (5) years.

EPA Unannounced Exercise Review Checklist

Records Review:

☐ Confirm most recent ICP revision date with Manager – Emergency Response Programs. Revision Date: _____ [1)]

☐ Confirm that Quarterly QI Notification Exercise records are available for the previous five (5) years. Backup copies are maintained by Manager – Emergency Response Programs and Region Offices.

☐ Confirm that Unannounced Exercise records[2)] are available for the previous five (5) years.

☐ Confirm that Spill Management Team Tabletop Exercise records are available for the previous five (5) years. Backup copies are maintained by Manager – Emergency Response Programs and TRC.

☐ Confirm that Facility Owned Response Equipment Deployment Exercise records are available for the previous five (5) years.

☐ Confirm that Personnel Response Training records are available for the previous five (5) years. HAZWOPER Training records are maintained by TRC. CBT records are maintained online.

☐ Confirm that Facility Owned Response Equipment Inspection records are available for the previous five (5) years.

☐ Confirm that Tank & Secondary Containment Inspection records are available for the previous five (5) years.

☐ Confirm that Discharge Prevention Meeting records are available for the previous five (5) years.

Notes:

1) ICP revisions dated after the date noted in the notification letter will be ignored by the EPA Inspectors.
2) Generally all our Tabletop Exercises are classified as Unannounced so these records are not maintained separately.

Exercise Preparations:

☐ Review Initial Notification requirements and contact information (Volume 1, Section 2 and Volume 2, Section 2). EPA Inspectors expect that required initial notifications will be completed within 30 minutes. Confirm with the Inspector which notifications may be simulated and which must be actually made.

☐ Review the Tactical Plans in Volume 2 Section 8.4 Figure 8.9 with your response contractor. The EPA Inspectors will expect that response equipment identified in Volume 2 Section 3 Figure 3.3 will be deployed within two (2) hours of the start of the exercise.

☐ Note that the EPA scenario may involve a pipeline related discharge some distance from the facility.

☐ Document notifications and initial response actions using the appropriate ICS forms from the ICP.

Exercise Follow-up:

☐ Forward copies of all exercise documentation to the Manager – Emergency Response Programs. Include EPA evaluation and note any recommendations for improvement or needed ICP revisions resulting from the exercise.

1. PURPOSE. The Coast Guard Incident Management Handbook (IMH) is designed to assist Coast Guard personnel in the use of the National Incident Management System (NIMS) Incident Command System (ICS) during multi-contingency response operations and planned events. The Incident Management Handbook is an easy reference job aid for responders. It is not a policy document, but rather guidance for response personnel.

2. ACTION. Area, district, maintenance and logistics commanders, commanding officers of headquarters units, assistant commandants for directorates, and commanding officers of all Coast Guard units should disseminate this as widely as possible to all Coast Guard personnel involved in response operations.

3. DIRECTIVES AFFECTED. U.S. Coast Guard Incident Management Handbook, COMDTPUB P3120.17, dated April 11, 2001 is cancelled.

4. BACKGROUND.

NON-STANDARD DISTRIBUTION: B:n 1500 copies

a. The Homeland Security Act of 2002 and Homeland Security Presidential Directive Five (HSPD-5), "Management of Domestic Incidents," fundamentally changed how the U.S. prepares for and responds to domestic incidents. As the primary documents for implementing HSPD-5, the NIMS and the National Response Plan (NRP) established a comprehensive approach to incident management and instituted a new national policy and procedures for response. The NIMS ICS is a standardized, all hazard – all risk approach to managing crisis response operations as well as non-crisis events whose principles can be applied to all types of incidents. The Department of Homeland Security (DHS) required all Federal departments and agencies to adopt and fully implement the NIMS ICS by September 2005 as outlined in references (a) through (d).

b. The IMH was revised to include information related to references (a) through (e) as well as small improvements and new tools for the user. The IMH is organized so that the generic information applicable to all types of responses is at the front of the document. For example, the duties and responsibilities of a Planning Section Chief are found in the generic planning section chapter since a Planning Section Chief's job description under ICS does not change from one type of incident to another. The remainder of the IMH is divided into supplements tailored to eight types of incidents the Coast Guard is likely to respond: Terrorism, Search and Rescue; Law Enforcement; Oil Spills; Hazardous Substance Releases (chemical, biological, radiological, and nuclear); Marine Fire; Multi-Casualty and Incidents of National Significance under the NRP.

5. JOB AID AVAILABILITY. USCG NIMS ICS job aids noted in the Handbook and can be found on the Internet at http://homeport.uscg.mil. Coast Guard training courses, if needed, will incorporate the USCG NIMS ICS standard forms since they can be used for the full range of contingencies.

6. FORMS AVAILABILITY. USCG NIMS ICS standard forms included in the Handbook and can be found on the Internet at http://homeport.uscg.mil. Coast Guard training courses, if needed, will incorporate the USCG NIMS ICS standard forms since they can be used for the full range of contingencies.

CHAPTER 1

INTRODUCTION

The U.S. Coast Guard Incident Management Handbook (IMH) is designed to assist Coast Guard personnel in the use of the National Incident Management System (NIMS) Incident Command System (ICS) during response operations. The IMH is intended to be used as an easy reference job aid for responders. It is not a policy document, but rather guidance for response personnel. During development of the IMH, it was recognized that eighty-percent of all response operations share common principles, procedures and processes. The other twenty-percent of response operations are unique to the type of incident, such as a search and rescue case or an oil spill. The handbook is laid out so that the generic information applicable to all responses is presented up-front. For example, the duties and responsibilities of the Planning Section Chief (PSC) are found in the generic section since a PSC's job description under ICS does not change from one type of incident to another. The remainder of the IMH is divided into eight types of incidents the Coast Guard is most likely to respond to. They are:

- Terrorism
- Search and Rescue
- Law Enforcement
- Oil Spills
- Hazardous Substance (Chemical, Biological, Radiological, Nuclear)
- Marine Fire Fighting and Salvage
- Event Management and National Special Security Event (NSSE)
- Multi-Casualty

Each of the scenario chapters pertain to a specific type of incident provides a situation from which to illustrate how an incident starts off with first responders and escalates to a large multi-agency response organization. The organizational charts in each chapter are only intended as **examples** of how an ICS organization may be developed to respond to that type of incident. Additionally, in each chapter are incident-specific job descriptions that have proven valuable in past response operations. An example of an incident-specific position would be the Vessel Disposition Group Supervisor located in the Law Enforcement chapter.

Coast Guard response personnel may come from any component of the Coast Guard (Active Duty, Reserve, Auxiliary, or Civilian Employees). Responders should have a basic understanding of NIMS and NIMS ICS to ensure they can effectively operate within the ICS organization and properly use and understand this IMH. Please note that acronyms are used extensively throughout this handbook and will not necessarily be identified when first used, however, an acronym list can be found in chapter 25.

CHAPTER 2

COMMON RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following checklist is applicable to all personnel in an ICS organization:

a. Receive assignment from your agency, including:
   - Job assignment (e.g. designation, position, etc.).
   - Brief overview of type and magnitude of incident.
   - Resource order number and request number/Travel Orders (TONO).
   - Travel instructions including reporting location and reporting time.
   - Any special communications instructions (e.g. travel, radio frequency).
   - Monitor incident related information from media, internet, etc., if available.
   - Assess personal equipment readiness for specific incident and climate (e.g. medications, money, computer, medical record, etc.). Maintain a checklist of items and possibly a personal Go-Kit.
   - Inform others as to where you are going and how to contact you.
   - Review Coast Guard Incident Management Handbook.
   - Take advantage of available travel to rest prior to arrival.

b. Upon arrival at the incident, check in at the designated check-in location. Check-in may be found at any of the following locations:
   - Incident Command Post (ICP).
   - Base.
   - Staging Areas.

- Helibases.

Note: If you are instructed to report directly to an on-scene assignment, check in with the Division/Group Supervisor or the Operations Section Chief.

c. Receive briefing from immediate supervisor.
d. Agency representatives from assisting or cooperating agencies report to the Liaison Officer (LNO) at the ICP after check-in.
e. Acquire work materials.
f. Abide by organizational code of ethics.
g. Participate in IMT meetings and briefings as appropriate.
h. Ensure compliance with all safety practices and procedures. Report unsafe conditions to the Safety Officer.
i. Supervisors shall maintain accountability for their assigned personnel with regard as to exact location(s), personal safety, and welfare at all times, especially when working in or around incident operations.
j. Organize and brief subordinates.
k. Know your assigned communication methods and procedures for your area of responsibility and ensure that communication equipment is operating properly.
l. Use clear text and ICS terminology (no codes) in all radio communications.
m. Complete forms and reports required of the assigned position and ensure proper disposition of incident documentation as directed by the Documentation Unit.
n. Ensure all equipment is operational prior to each work period.
o. Report any signs/symptoms of extended incident stress, injury, fatigue or illness for yourself or

coworkers to your supervisor.

p. Brief shift replacement on ongoing operations when relieved at operational periods or rotation out.
q. Respond to demobilization orders and brief subordinates regarding demobilization.
r. Prepare personal belongings for demobilization.
s. Return all assigned equipment to appropriate location.
t. Complete Demobilization Check-out process before returning to home base.
u. Participate in After-Action activities as directed.
v. Carry out all assignments as directed.
w. Upon demobilization, notify RESL at incident site and home unit of your safe return.

UNIT LEADER RESPONSIBILITIES

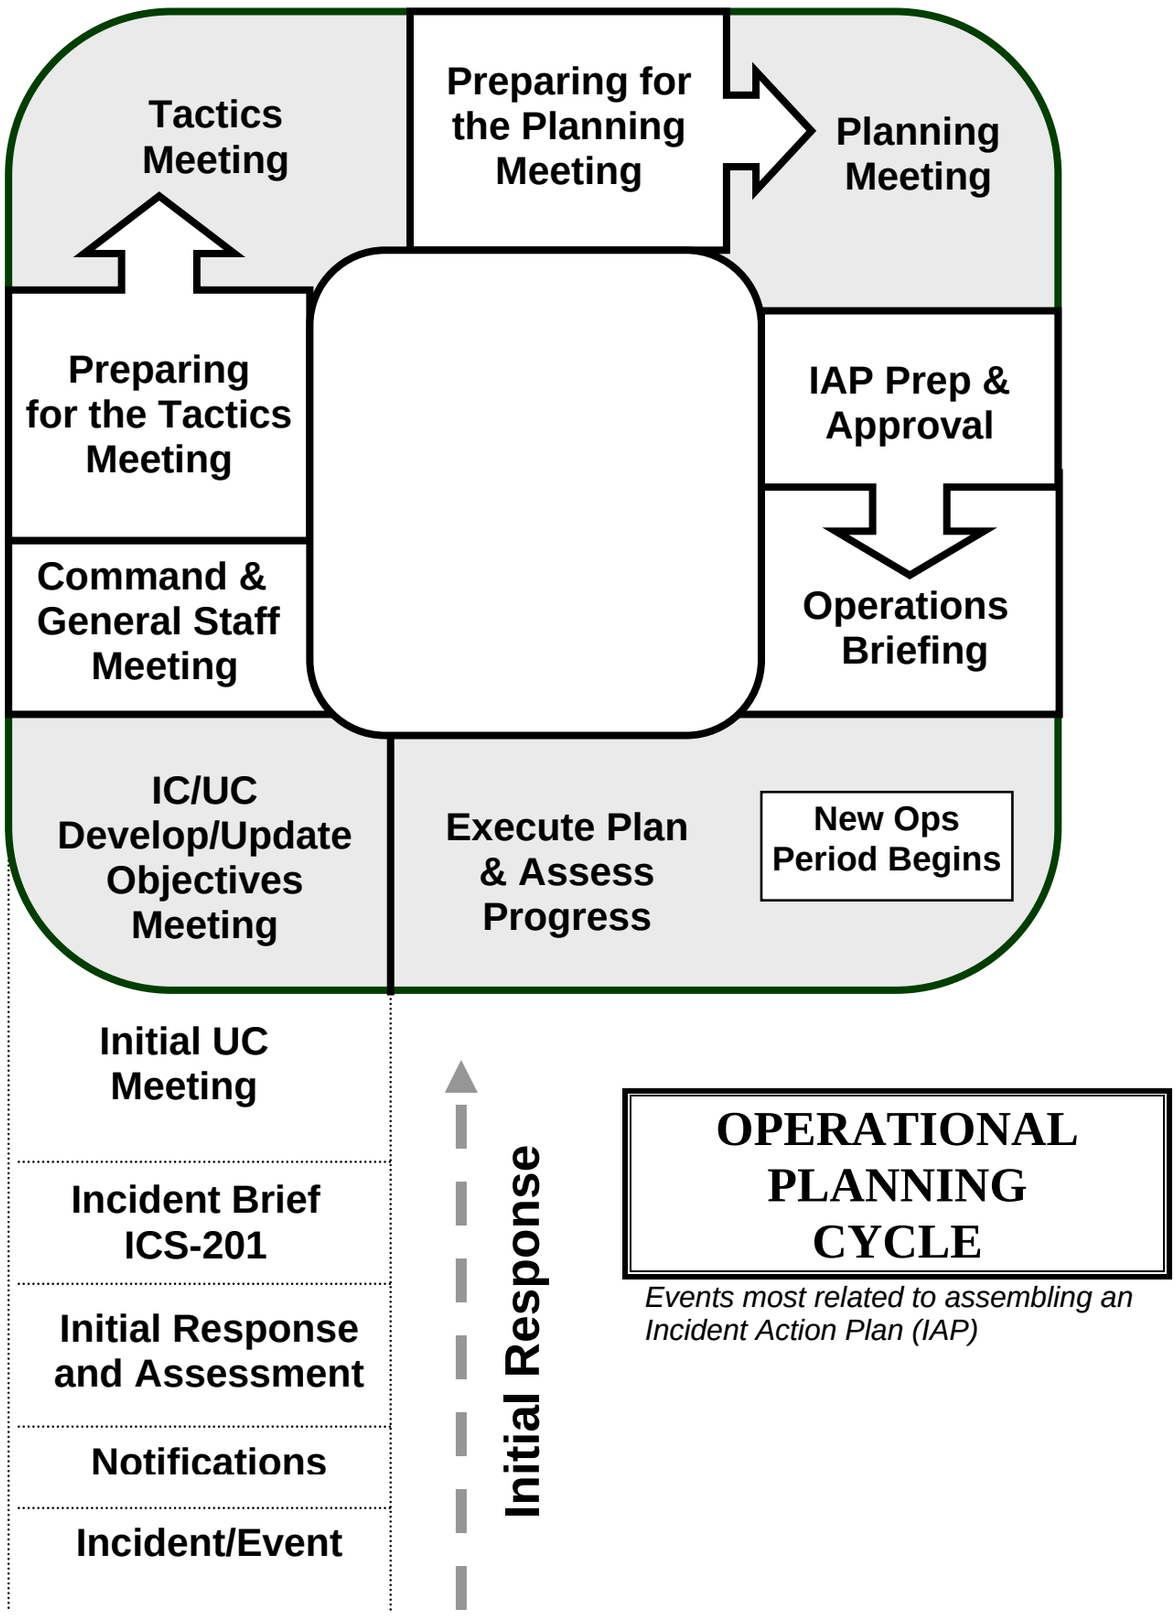
In NIMS ICS, a number of the Unit Leader's responsibilities are common to all functions within the ICS organization. Common responsibilities of Unit Leaders are listed below. These will not be repeated in Unit Leader Position Checklists in subsequent chapters.

a. Review Common Responsibilities in Chapter 2.
b. Upon check-in, receive briefing from Incident Commander, Section Chief, Unit Leader or Branch Director as appropriate.
c. Participate in incident meetings and briefings, as required.
d. Determine current status of unit activities.
e. Determine resource needs.
f. Order additional unit staff, as appropriate.
g. Confirm dispatch and estimated time of arrival of staff and supplies.
h. Assign specific duties to staff and supervise staff.
i. Develop and implement accountability, safety and security measures for personnel and resources.

j. Supervise demobilization of unit, including storage of supplies.
k. Provide Supply Unit Leader with a list of supplies to be replenished.
l. Maintain unit records, including Unit Log (ICS 214-CG).
m. Individual responders may want to maintain personal log of actions, decisions and events.
n. Carry out all assignments as directed.

CHAPTER 3

OPERATIONAL PLANNING CYCLE, MEETINGS, BRIEFINGS, AND THE ACTION PLANNING PROCESS



INITIAL RESPONSE AND ASSESSMENT - The period of Initial Response and Assessment occurs in all incidents. Short-term responses, which are small in scope and/or duration (e.g., a few resources working one operational period), can often be coordinated using only ICS-201-CG (Incident Briefing Form).

INCIDENT BRIEFING (ICS-201) - During the transfer-of-command process, an ICS-201-formatted briefing provides the incoming Incident Commander (IC)/Unified Command (UC) with basic information regarding the incident situation and the resources allotted to the incident. Most importantly it functions as the Incident Action Plan (IAP) for the initial response and remains in force and continues to develop (updated) until the response ends or the Planning Section generates the incident's first IAP. It is also suitable for briefing individuals newly assigned to the Command and General Staff, incoming tactical resources, as well as needed assessment briefings for the staff.

ICS-201-CG facilitates documentation of the current situation, initial response objectives, current and planned actions, resources assigned and requested, on-scene organization structure and incident potential. This form is essential for future planning and the effective management of initial response activities.

When:	New IC/UC; staff briefing as required
Facilitator:	Current IC/UC or (PSC if available)
Attendees:	Prospective IC/UC; Command and General Staff, as available

AUGUST 2006

General Tasks

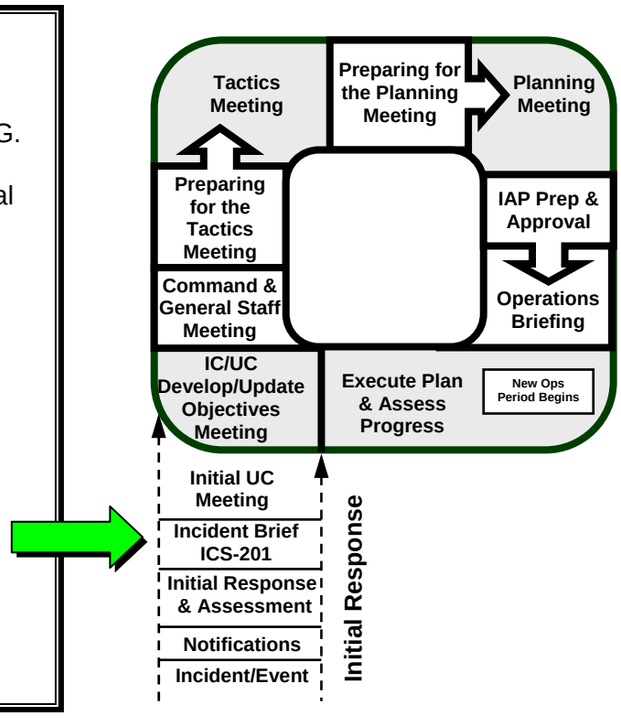
Incident Commander
- Obtains incident brief using ICS-201-CG.
- Assesses operational requirements.
- Determines current/future organizational and response requirements and objectives.

Operations
- Obtains briefing from IC.
- Considers available Contingency Plan.
- Develops strategies and tactics.
- Assembles additional resources.
- Manages response using ICS-201-CG.

Planning
- If available, facilitates briefing.
- If/when activated, orders staff.

Logistics
- If/when activated, orders staff.

Finance/Admin
- If/when activated, orders staff.



Incident Briefing (ICS-201) Agenda:

Using ICS-201-CG as an outline, include:

1. Current situation (note territory, exposures, safety concerns, etc.; use map/charts).
2. Initial objectives and priorities.
3. Current and planned actions.
4. Current on-scene organization.
5. Resource assignments.
6. Resources en-route and/or ordered.
7. Facilities established.
8. Incident potential.

INITIAL UNIFIED COMMAND MEETING - Provides UC officials with an opportunity to discuss and concur on important issues prior to the Unified Command Objectives Meeting. The meeting should be brief and all important decisions and direction documented. Prior to the meeting, IC's should have an opportunity to review and prepare to address the agenda items. The results of this meeting will help to guide the overall response efforts.

When: The UC is formed prior to the first meeting.
Facilitator: UC member or PSC (if available).
Attendees: Only ICs that will comprise the UC, DOCL.

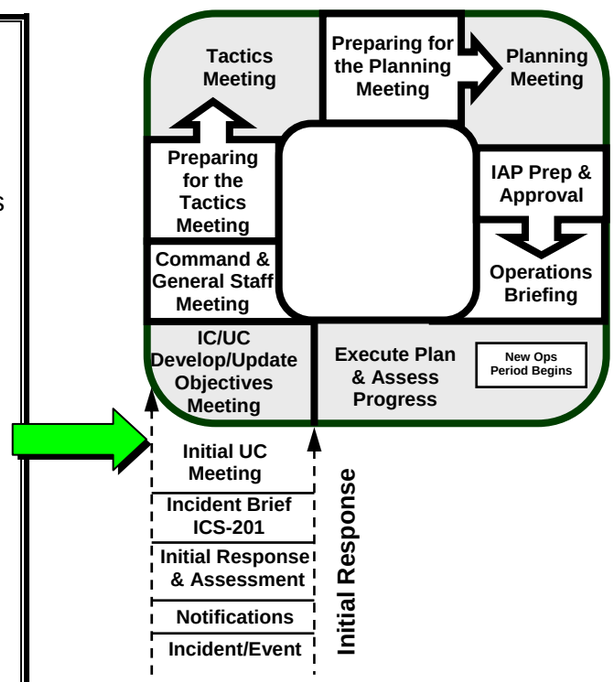
General Tasks

Incident Commander.
- Negotiates UC participation.
- Clarifies UC roles & responsibilities.
- Negotiates and agrees on key decisions including:
- AOR of Incident.
- Name of the incident.
- Overall response organization,
- Location of ICP, facilities, and support.
- Op Period length/start time and work shifts hours.
- OSC and Deputy OSC and
- other key Command and General staff and technical support as needed

Operations
- Briefs UC members on current operations.

Planning
- If available, facilitates and documents meeting.

Logistics & Finance/Admin
- May not be activated at this time.



Initial Unified Command Meeting Agenda:

1. Meeting brought to order, cover ground rules and reviews agenda.
2. Validate makeup of newly formed UC, based on Chapter 5 criteria.
3. Clarify UC Roles and Responsibilities.
4. Review agency policies.
5. Negotiate and agree on Key Decisions which may

include:

a. UC jurisdictional boundaries and focus (Area of Responsibility (AOR)).
b. Name of incident.
c. Overall response organization, including integration of assisting and cooperating agencies.
d. Location of Incident Command Post (if not already identified) and other critical facilities, as appropriate.
e. Operational period length/start time and work shift hours.
f. Best-qualified Operations Section Chief and Deputy.
g. Other key Command and General staff assignments and technical support as needed.

6. Summarize and document key decisions.

UNIFIED COMMAND OBJECTIVES MEETING (Sometimes called STRATEGY MEETING) - The UC will set response priorities, identify any limitations and constraints, develop incident objectives and establish guidelines for the IMT to follow. For reoccurring meetings, all products will be reviewed and updated as needed. Products resulting from this meeting along with decisions and direction from the Initial UC meeting will be presented at the Command and General Staff Meeting.

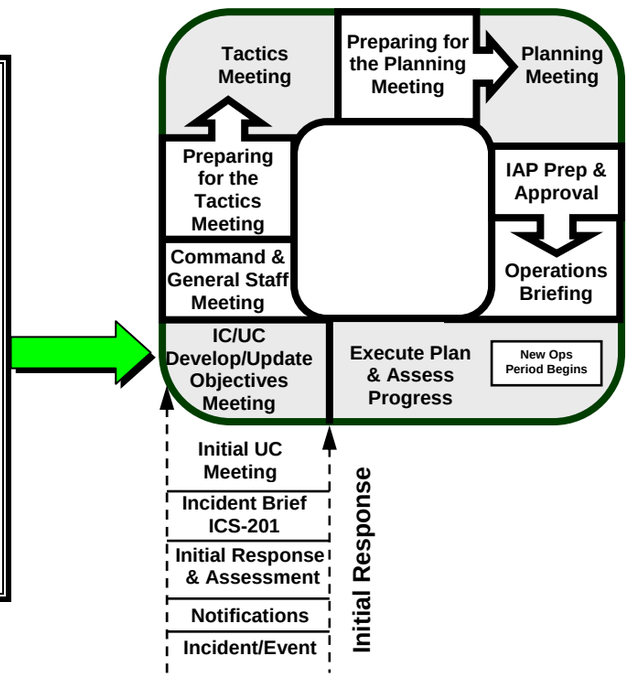
When:	Prior to Command and General Staff Meeting.
Facilitator:	IC/UC Member or PSC (if available).
Attendees:	IC/UC Members; Selected Command and General Staff as appropriate, DOCL.

General Tasks

Command
- Develops incident priorities
- Identifies Limitations and Constraints
- Develops Incident Objectives.
- Identifies Key Procedures
- Develops tasks for Command and General Staff.
- Agree on division of of UC workload

Operations
- May be present if required.

Planning
- Facilitates and documents meeting.
- Proposes draft objectives to Command.



Unified Command Objectives Meeting Agenda:

1. PSC brings meeting to order, conducts roll call, covers ground rules and reviews agenda.
2. Review and/or update key decisions.
3. Develop or review/update response Priorities, Limitations and Constraints.
4. Develop or review Incident Objectives.
5. Develop or review/update Key Procedures which may include:
   a. Managing sensitive information,
   b. Information flow
   c. Resource ordering,
   d. Cost sharing and cost accounting, and
   e. Operational security issues.
6. Develop or review/update tasks for Command and General Staff to accomplish (ICS-233-CG).
7. Review, document and/or resolve status of any open actions (ICS-233-CG).
8. Agree on division of UC workload.
9. Prepare for the Command and General Staff Meeting.

COMMAND AND GENERAL STAFF MEETING –
At the Command and General Staff Meeting, IC/UC will present their decisions and management direction to the Command and General Staff Members. This meeting should clarify and help to ensure understanding among the core IMT members on the decisions, objectives, priorities, procedures and functional assignments (tasks) that the UC has discussed and reached agreement on. Ensuing Command and General Staff Meetings will cover any changes in Command direction, review Open Actions and status of assigned tasks (ICS-233-CG).

When: Prior to Tactics Meeting.
Facilitator: PSC.
Attendees: IC/UC Members, Command and General Staff, SITL, and DOCL

General Tasks

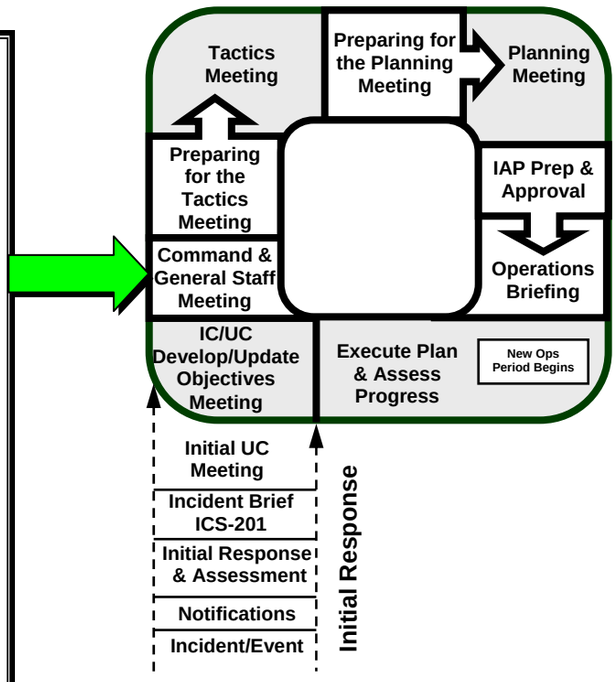
Command
- Reviews key decisions, priorities, constraints, limitations, objectives and procedures.
- Presents/reviews functional work assignments (tasks) to the Command and General Staff members.
- Reviews status of Open Actions, work assignments (tasks) from previous meetings.

Operations
- Provides update on current operations.

Planning
- Facilitates and documents meeting.
- Sets up meeting room.

Situation Unit Leader
- Provides update on current situation and projections if available.

Documentation Unit Leader
- Documents meeting and distributes meeting materials.



Command and General Staff Meeting Agenda:

1. PSC brings meeting to order, conducts roll call, covers ground rules and reviews agenda.
2. SITL conducts situation status briefing.
3. IC/UC
   a. Provides comments.

   b. Reviews key decisions, priorities, constraints and limitations (if new or changed).
   c. Discusses incident objectives,
   d. Reviews key procedures (if new or changed), and
   e. Assigns or reviews functional tasks/open actions (ICS-233-CG).
4. PSC facilitates open discussion to clarify priorities, objectives, assignments, issues, concerns and open actions/tasks.
5. IC/UC provides closing comments.

PREPARING FOR THE TACTICS MEETING – During this phase of the Operational Planning Cycle, the OSC/PSC begin the work of preparing for the upcoming Tactics Meeting. They review incident objectives to determine those that are OSC responsibility and consider Command priorities. They may draft a Work Analysis Matrix (ICS-334-CG) which helps document strategies and tactics to meet those objectives assigned, and should draft an Operational Planning Worksheet (ICS-215-CG) and an Operations Section organization chart for the next operational period. Also, the SOFR should begin to develop the Hazard Risk Analysis Worksheet (ICS-215a-CG). The PSC should facilitate/support this process to the greatest extent possible to ensure that the material, information, resources, etc. to be presented in the Tactics Meeting is organized and accurate.

When: Prior to Tactics Meeting.
Facilitator: PSC facilitates process.
Attendees: None. This is <u>not</u> a meeting but a period of time.

General Tasks

Operations

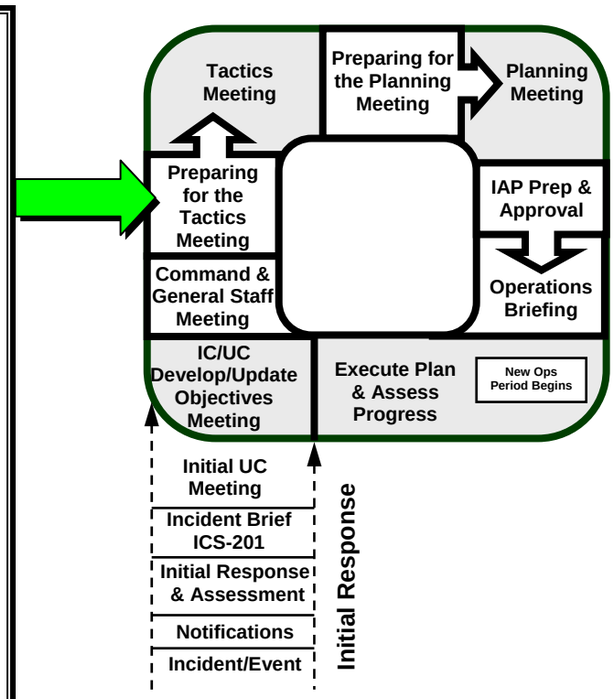
- Develops draft strategies and tactics for each operationally oriented incident objective May use Work Analysis Matrix, ICS-234-CG.
- Develops alternative and/or contingency strategies and tactics.
- Outlines work assignments (tactics) & required resources using ICS-215-CG.
- Develops/outlines Operations Section organization for next operational period.

Planning

- Facilitates process.
- Reviews incident objectives & agrees on those that are the responsibility of the Operations Section to complete.
- Ensures Technical Specialists are included and prepared to contribute as appropriate.
- Presents situation information and provides projections.

Safety Officer

- Begins to develop the Hazard Risk Analysis ICS-215a-CG.



TACTICS MEETING - This 30-minute meeting produces operational input needed to support the IAP. The OSC may present the Work Analysis Matrix (ICS-234-CG), if completed and will present the draft Operational Planning Worksheet (ICS-215-CG). The proposed Operations Section organization will also be presented by OSC and solidified. The SOFR will present the draft Hazard Risk Analysis Worksheet (ICS-215a-CG). OSC/PSC will solicit input of attendees in order to refine these draft products for full staff approval at the Planning Meeting.

When: Prior to Planning Meeting.
Facilitator: PSC.
Attendees: PSC, OSC, LSC, RESL, SITL, SOFR, DOCL, COML, THSP (as needed).

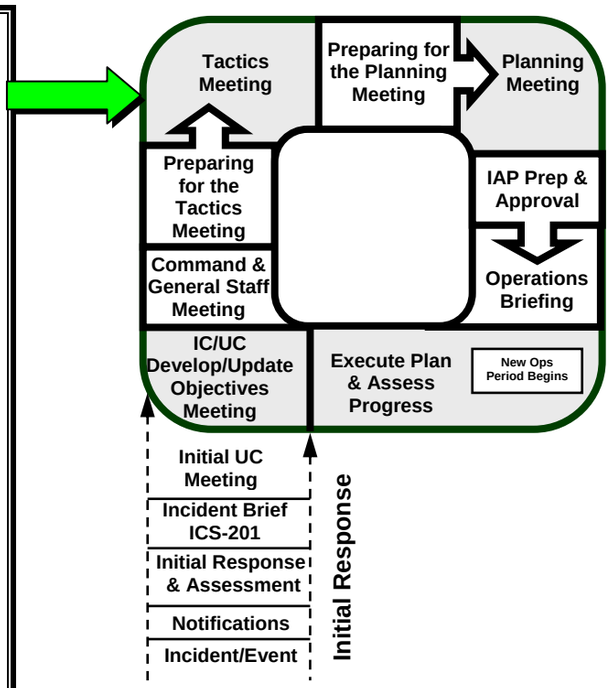
General Tasks

Operations:
- Briefs current operations.
- Presents strategies, tactics and resource needs using ICS-215-CG.
- Identifies alternative strategies.
- Presents Operations Section Organization.

Planning
- Sets up meeting room.
- Facilitates meeting.
- Presents current situation and provides projections.
- Presents resources status.
- Documents meeting.

Safety
- Identifies potential hazards and recommends mitigation measures.
- Presents the Hazard Risk Analysis ICS-215a-CG.

Logistics
- Contributes logistics information as necessary.
- Determines support requirements based on the ICS-215-CG (i.e. facilities and other logistical infrastructure).
- Prepares to order needed resources.



Tactics Meeting Agenda:

1. PSC brings meeting to order, conducts roll call, covers ground rules and reviews agenda.
2. SITL reviews the current & projected incident situation.
3. PSC reviews incident operational objectives and ensures accountability for each.
4. OSC reviews, if completed, the Work Analysis Matrix (ICS-234-CG) strategy and tactics.
5. OSC reviews and/or completes the Operational Planning Worksheet (ICS-215-CG) which addresses work assignments, resource commitments, contingencies and needed support facilities, i.e., Staging Areas.
6. OSC reviews and/or completes Operations Section organization chart.
7. SOFR reviews and/or completes the Hazard Risk Analysis Worksheet (ICS-215a-CG) and identifies and resolves any critical safety issues.

8. LSC discusses and resolves any logistics issues.
9. PSC validates connectivity of tactics and operational objectives.

PREPARING FOR THE PLANNING MEETING

The Command and General Staffs prepare for the upcoming Planning Meeting. The PSC ensures the material, information, resources, etc., used or discussed in the Planning Meeting are prepared and ready for presentation during the meeting.

When: Prior to the Planning Meeting.
Facilitator: PSC facilitates process.
Attendees: None. This is <u>not</u> a meeting but a period of time.

General Tasks

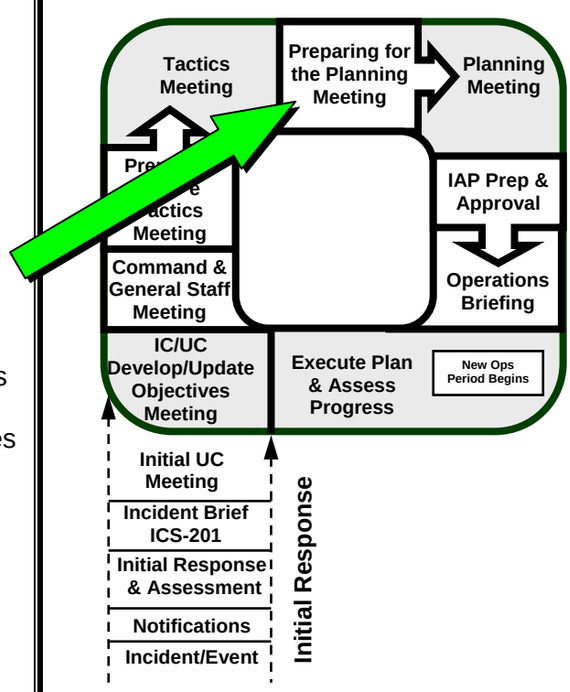
<u>Command</u>
- Prepares further guidance/clarification.
- As needed, meets informally with appropriate staff members.

<u>Operations</u>
- Prepares on-going operations update.
- Prepares final draft ICS-215-CG.
- Coordinates with other staff as needed.

<u>Planning</u>
- Sets up meeting room.
- Develops resource, support and overhead requests and submits to Logistics.
- Publishes/distributes meeting schedule and ensures attendees are prepared.
- Duplicates documents for Command that are needed to support presentations.

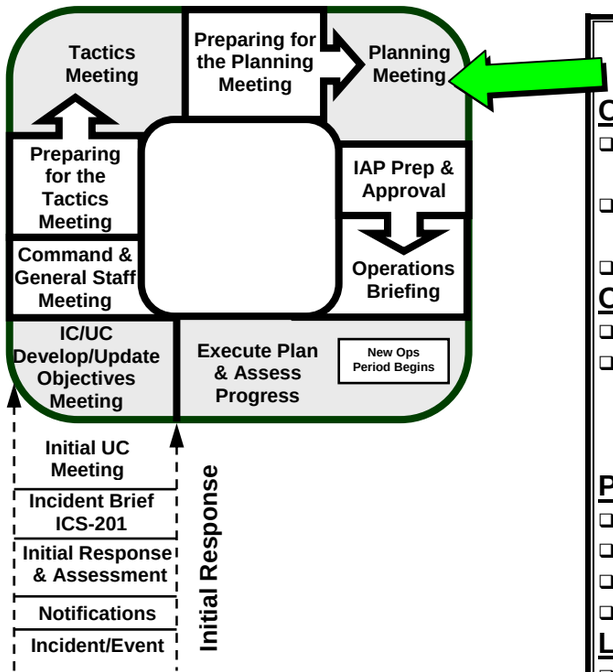
<u>Logistics</u>
- Orders resources to support IAP.
- Considers and orders support requirements, including communications, transportation, medical, etc.
- Prepares for Planning Meeting.
- Verifies support requirements.

<u>Finance/Admin</u>
- Prepares for Planning Meeting.
- Verifies financial and administrative requirements.



PLANNING MEETING - This meeting provides an overview of the tactical plan to achieve Command's current direction, priorities and objectives. The OSC will present the proposed plan to the Command and General Staff for review and comment. OSC will discuss strategy and tactics that were considered and chosen to best meet command's direction for the next operational period. The OSC will also briefly discuss how the incident will be managed along with work assignments and resources and support required to implement the proposed plan. This meeting provides the opportunity for Command and General Staff to discuss and resolve any issues and concerns prior to assembling the IAP. After review and updates are made, planning meeting attendees commit to support the plan.

When: After the Tactics Meeting.
Facilitator: PSC.
Attendees: IC/UC, Command Staff, General Staff, SITL, DOCL and THSP (as required).



General Tasks

Command
- Ensures all of Command's direction, priorities and objectives have been met.
- Provides further direction and resolves differences as needed.
- Gives tacit approval of proposed plan.

Operations
- Provides overview of current OPS.
- Presents plan of action including; strategies, tactics, contingencies, resources, organization structure and overall management considerations i.e. divisions/groups etc.

Planning
- Facilitates meeting.
- Briefs current situation.
- Provides projections.
- Documents meeting.

Logistics
- Briefs logistical support/services and resource ordering status.
- Discusses operational facility issues.

Finance/Admin
- Briefs administrative and financial status/projections, etc.

Command Staff
- Discusses and resolves any Safety, Liaison and Media considerations and issues.

Planning Meeting Agenda:

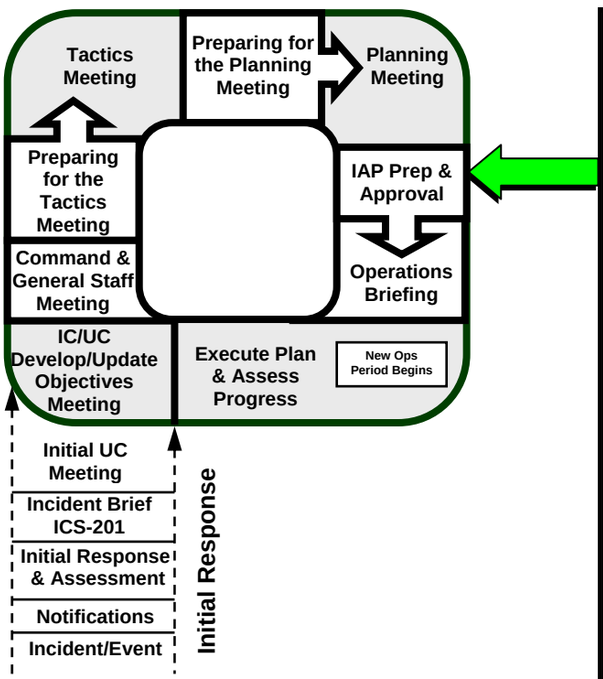
1. PSC brings meeting to order, conducts roll call, covers ground rules and reviews agenda.
2. IC/UC provides opening remarks.
3. SITL provides briefing on current situation, resources at risk, weather/sea forecast and incident projections.
4. PSC reviews Command's incident priorities, decisions and objectives.
5. OSC provides briefing on current operations followed with an overview on the proposed plan including strategy, tactics/work assignments (ICS-215-CG), resource commitment, contingencies, Operations Section organization structure and needed support facilities, i.e., Staging Areas.
6. PSC reviews proposed plan to ensure that Command's priorities and operational objectives are met.
7. PSC reviews and validates responsibility for any open actions/tasks (ICS-233-CG) and management objectives.
8. PSC conducts round robin of Command and General Staff members to solicit their final input and commitment to the proposed plan:
   a. LSC covers transport, communications and supply updates and issues,
   b. FSC covers fiscal issues.
   c. SOFR covers safety issues,
   d. PIO covers public affairs and public information issues,
   e. LNO covers interagency issues and
   f. INTO covers intelligence issues.
9. PSC requests Command's tacit approval of the plan as presented. IC/UC may provide final comments.
10. PSC issues assignments to appropriate IMT members for developing IAP support documentation along with deadlines.

INCIDENT ACTION PLAN PREPARATION AND APPROVAL – Appropriate IMT members must immediately complete the assigned task/products that are needed to include in the IAP. These products must meet the deadline as set by the PSC so that planning can assemble the IAP components. The deadline must be early enough to permit timely IC/UC review, approval, and duplication of sufficient copies for the Operations Briefing and other IMT members.

When: Immediately following the Planning Meeting, the PSC assigns the deadline for products.

Facilitator: PSC facilitates process.

Attendees: None. This is <u>not</u> a meeting but a period of time.



General Tasks

<u>Command</u>
- Reviews, approves and signs IAP.

<u>Operations</u>
- Provides required information for inclusion into IAP (ICS-220-CG).
- Works with Planning to ensure that the chart and ICS-204(s) are complete.

<u>Planning</u>
- Facilitates gathering of required documents and assembles IAP.
- Reviews IAP for completeness.
- Provides completed IAP to IC/UC for review/approval.
- Makes sufficient copies of the IAP.
- Distributes IAP to appropriate team members and files original.

<u>Logistics</u>
- Reviews Logistics Section products for completeness (ICS-205-CG, ICS-206-CG, etc.).
- Provides logistics information for IAP.
- Verifies resources ordered/status.

<u>Finance/Admin</u>
- Verifies financial and administrative requirements for IAP.

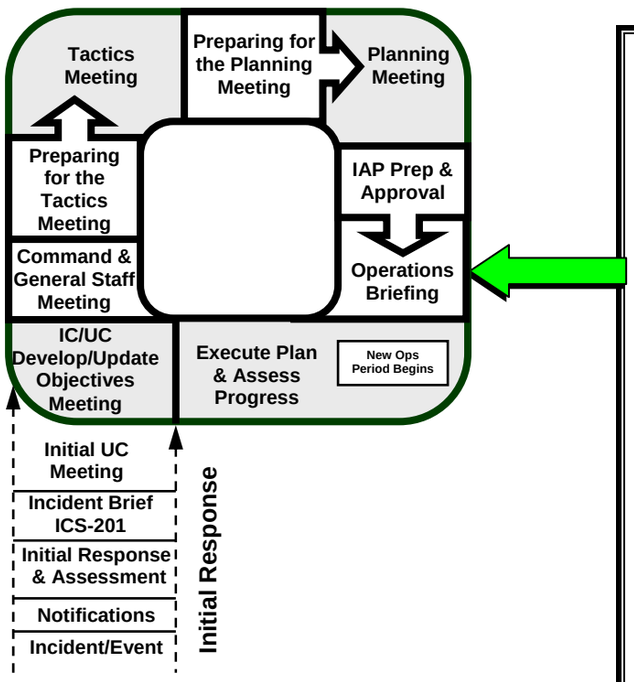
IAP Common Components	Primary Responsibility
1. Incident Objectives (ICS-202-CG).	RESL
2. Organization List/Chart (ICS-203/207-CG).	RESL
3. Assignment List (ICS-204-CG).	RESL
4. Communication Plan (ICS-205-CG).	COML
5. Medical Plan (ICS-206-CG).	MEDL
6. Site Safety Plan (ICS-208-CG).	SOFR
7. Incident Map/Chart.	SITL
8. Weather, tide forecast	SITL

Optional Components (use as pertinent):

1. Air Operations Summary (ICS-220-CG)	AOBD
2. Demobilization Plan	DMOB
3. Transportation Plan	GSUL
4. Decontamination Plan	THSP
5. Waste Management or Disposal Plan	THSP
6. Other Plans and/or documents, as required	

OPERATIONS BRIEFING - This 30-minute, or less, briefing presents the IAP to the Operations Section oncoming shift supervisors. After this briefing has occurred and during shift change, off-going supervisors should be interviewed by their relief and by OSC in order to validate IAP effectiveness. The Division/Group Supervisor may make last minute adjustments to tactics over which they have purview. Similarly, a supervisor may reallocate resources within that Division/Group to adapt to changing conditions.

When: Approximately one hour prior to shift change.
Facilitator: PSC.
Attendees: IC/UC, Command and General Staff, Branch Directors, Division/Group Supervisors, Task Force/Strike Team Leaders (if possible), Unit Leaders, others as appropriate.



General Tasks

Command
- Provides guidance/clarification.
- Provides leadership presence and motivational remarks.

Operations
- Provides Operations Briefing for next operational period.
- Ensures ICS-204 tasking is clear.

Planning
- Sets up briefing area.
- Facilitates Command and General Staff and attendees briefing responsibilities.
- Resolves questions.
- Explains support plans as needed.

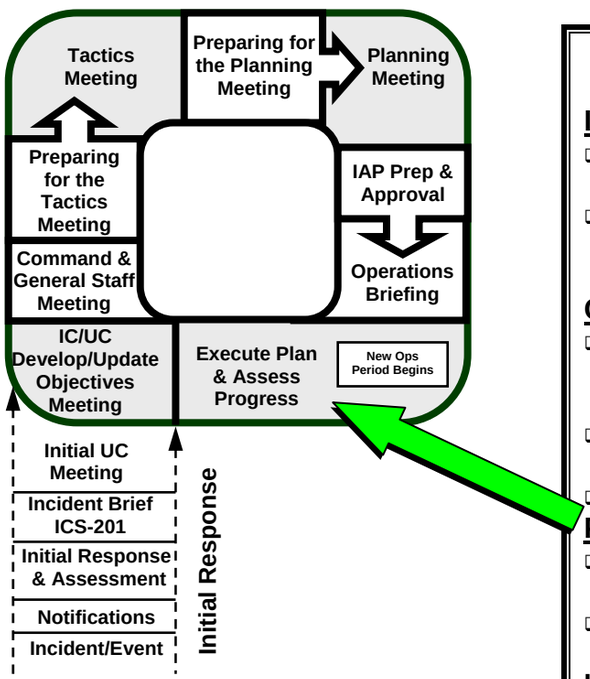
Logistics
- Briefs transportation, communication, and supply issues.

Finance/Admin
- Briefs administrative issues and provides financial report.

Operations Briefing Agenda:

1. PSC opens briefing, covers ground rules, agenda and takes roll call of Command and General Staff and Operations personnel required to attend.
2. PSC reviews IC/UC objectives and changes to the IAP, i.e., pen and ink changes.
3. IC/UC provides remarks.
4. SITL conducts Situation Briefing.
5. OSC discusses current response actions and accomplishments.
6. OSC briefs Operations Section personnel.
7. LSC covers transport, communications and supply updates.
8. FSC covers fiscal issues.
9. SOFR covers safety issues, PIO covers public affairs and public information issues, LNO covers interagency issues and INTO covers intelligence issues.
10. PSC solicits final comments and adjourns briefing.

ASSESS PROGRESS – Assessment is an on-going continuous process to help adjust current operations and help plan for future operations. Following the briefing, and shift change, all Command and General Staff Section Chiefs will review the incident response progress and make recommendations to the IC/UC in preparation for the next IC/UC Objectives Meeting. This feedback/information is continuously gathered from various sources, including Field Observers, responder debriefs, stakeholders, etc. IC/UC should encourage Command and General Staff to get out of the ICP and view first hand the areas of the incident they are supporting.



General Tasks

Incident Commander (IC/UC)
- Monitors on-going incident management activities.
- Considering Best Response practices, evaluates prior decisions, direction, priorities and task assignments.

Operations (OPS)
- Monitors on-going operations and make strategic and tactical changes as necessary.
- Measures/ensures progress against assigned objectives.
- Briefs Command on a scheduled basis.

Planning
- Ensures on-going operational information is being collected and documented.
- Develops new/revised incident objectives and provides to IC/UC.

Logistics
- Evaluates logistical support effectiveness and makes organizational and procedural adjustments as needed.

Finance/Admin
- Monitors ongoing operations to ensure accurate and timely administrative and financial reporting.

Safety Officer
- Monitors ongoing operations and corrects unsafe practices.
- Evaluates effectiveness of the Risk Hazard Analysis (ICS-215a-CG) and Site Safety Plan.

SPECIAL PURPOSE MEETINGS

Special Purpose meetings are most applicable to larger incidents requiring an **Operational Period Planning Cycle**, but may also be useful during the **Initial Response Phase**.

BUSINESS MANAGEMENT MEETING – The purpose of this meeting is to develop and update the Business Management Plan for finance and logistical support. The agenda could include: documentation issues, cost sharing, cost analysis, finance requirements, resource procurement, and financial summary data. Attendees normally include: FSC, COST, PROC, LSC, SITL, and DOCL.

AGENCY REPRESENTATIVE MEETING - This meeting is held to update Agency Representatives and ensure that they can support the IAP. It is conducted by the LNO, and attended by Agency Representatives. It is most appropriately held shortly after the Planning Meeting in order to present the plan (IAP) for the next operational period. It allows for minor changes should the plan not meet the expectations of the Agency Representatives.

MEDIA BRIEFING - This meeting is normally conducted at the Joint Information Center (JIC). Its purpose is to brief the media and the public on the most current and accurate facts. It is set up by the PIO, moderated by a UC spokesperson, and features selected spokespersons. Spokespersons should be prepared by the PIO to address anticipated issues. The briefing should be well-planned, organized, and scheduled to meet media's needs.

TECHNICAL SPECIALIST MEETING – Meetings to gather THSP input to IAP.

DEMOBILIZATION PLANNING MEETING – This meeting is held to gather functional requirements from Command, Command Staff and General Staff that would be included in the incident Demobilization Plan. Functional requirements would include: safety, logistic, and fiscal considerations and release priorities that would be addressed in the plan. Attendees normally include: Command, OSC, PSC, LSC, FSC, LNO, SOFR, INTO PIO and DMOB. The DMOB then prepares a draft Demobilization Plan to include the functional requirements and distributes to Command, Command Staff and General Staff for review and comment.

CHAPTER 4

KEY DECISIONS, PRIORITIES, RESPONSE OBJECTIVES AND STAFF ASSIGNMENTS

References:

(a) Incident Commander Job Aid
(b) Area Command Job Aid

INTRODUCTION

Incident Commander(s) are responsible for providing direction and guidance to the Incident Management Team (IMT). Command must analyze the overall requirements of the incident and determine the most appropriate direction for the management team to follow during the response. This is accomplished by making key decisions, setting priorities, developing response objectives and assigning work (tasks) to primary staff within the IMT. This chapter can be used by Command to help facilitate their responsibilities. The information/ examples provided can be used as is or modified in response to specific risk applications. See Reference (a) for more information on key Command decisions, priorities, response objectives and staff assignments.

Example Decisions:

- Incident name.
- Organizations/agencies that will be represented in Unified Command.
- Integration of other supporting and cooperating organizations/agencies.
- Support facilities and locations (ICP, Base, JIC etc.).
- Operational period and hours of operation.
- Issuing delegation of authority to staff.
- Critical information reporting process.
- Managing sensitive information.
- Resource ordering, cost sharing and cost accounting.
- Operational security issues.
- Staffing of primary positions (OSC and Deputy).
- Incident Response Priorities.
- IMT Procedures/function.
- How Command will function.

Example Incident Priorities:

- Safety of responders and the public.
- Threat to Homeland Security.
- Minimize adverse impact on the environment.
- Restoration of the transportation infrastructure/ maritime commerce.
- Minimize further loss of property.
- Investigation and apprehension of those responsible.
- Reduce/prevent further threat/attack.

Example Incident Objectives

Safety:

- Provide for the safety and welfare of citizens and response personnel.
- Provide for the safety and security of responders as well as maximize the protection of public health and welfare.
- Identify safety and risk management factors and monitor for compliance for both the public and responders.
- Implement practices that allow for the safety and welfare of the passengers and non-essential crew.
- Conduct Operational Risk Assessment and ensure controls are in place to protect responders and the public.

Search and Rescue:

- Locate and evacuate all passengers and crew.
- Evacuate victims to medical transfer areas or facilities once rescued from immediate peril.
- Establish medical triage along with transport to hospital.
- Complete triage of injured passengers and crew and transport to hospital.
- Conduct joint agency SAR efforts.
- Conduct Urban Search and Rescue.
- Account for and provide temporary shelter for displaced passengers and crew.
- Complete accountability for all passengers and crew.

Fire/Salvage:

- Commence fire fighting operations and contain, extinguish and overhaul fire.
- Conduct damage/stability assessment; develop and implement a salvage plan.
- Implement the salvage and tow plan.

Port, Waterways, and Coastal Security/Law Enforcement:

- Implement security awareness measures including evaluation of changes in incident effects, response conditions, and secondary threats, including potential targeting of first responders and contamination.
- Implement measures to isolate, contain and stabilize the incident, including establishment and adjustment of security perimeters.
- Implement agency and maritime community security plans, including Area Maritime Security Plans (AMSP), to deter and prevent multiple security incidents.
- Establish incident security plan including identification badges and other scene control measures.
- Implement scene integrity and evidence preservation procedures.
- Implement procedures that ensure a coordinated effort is in place for investigation, evidence collection, storage and disposal.
- Investigate cause of incident.
- Identify and implement witness/passenger recovery location(s).
- Establish incident security plan including access documentation (e.g. badge control procedures) and other access control measures.
- Establish and continue enforcement of safety/ security zones.
- Establish/conduct shoreline security to coincide with incident activities and enhanced prevention requirements.
- Perform maritime law enforcement as required.
- Request FAA Implement air space closure and monitoring for compliance.

Waterways Management:

- Conduct port assessment and establish priorities for facilitating commerce.
- Develop/implement transit plan to include final destination/berth for vessel(s).
- Identify safe refuge/berth for impacted vessels.
- Establish and maintain close coordination for possible movement of Homeland or National Security assets (Navy).

Oil/HAZMAT Spills:

- Initiate actions to control the source and minimize the volume released.
- Determine oil/hazmat fate and effect (trajectories) identify sensitive areas, develop strategies for protection and conduct pre-impact shoreline debris removal.
- Contain and recover spilled material (Oil/Hazmat).
- Conduct an assessment and initiate shoreline cleanup efforts.
- Remove product from impacted areas.
- Conduct efforts to effectively contain, clean up, recover and dispose of spilled product.

Environmental:

- Provide protection of environmental sensitive areas including wildlife and historic properties.
- Identify and maximize the protection of environmental sensitive areas.
- Identify threatened species and prepare to recover and rehabilitate injured wildlife.
- Investigate the potential for and if feasible, utilize alternative technologies to support response efforts.

Management:

- Manage a coordinated interagency response effort that reflects the makeup of Unified Command.
- Establish an appropriate IMT organization that can effectively meet the initial and long term challenges required to mitigate the incident.
- Identify all appropriate agency/organization mandates, practices, and protocols for inclusion in the overall response effort.
- Identify and minimize social, political and economic adverse effects.
- Implement a coordinated response with law enforcement and other responding agencies including EOC(s) and the JFO.
- Evaluate all planned actions to determine potential impacts on social, political and economic entities.
- Identify competing response activities (LE and Mitigation) to ensure that they are closely coordinated.
- Identify and establish incident support facilities to support interagency response efforts.
- Keep the public, stakeholders and the media informed of response activities.
- Ensure appropriate financial accounting practices are established and adhered to.
- Establish internal/external resource ordering procedures are established and adhered to.
- Establish an incident documentation system.
- Establish an appropriate structure to facilitate communications with stakeholders and agency/organization coordination facilities.

Example Tasks/Work Assignments:

Incident Management Team members expect Command to assign them specific tasks based on the unique characteristics of an incident. Common tasks

that are normally performed by the staff during responses should not be addressed as tasks. The Operations Section Chief normally receives tasks (work assignments) from Command in the form of incident objectives. Some examples of common tasks (work assignments):

Safety Officer:

- Develop a site safety plan, including support facilities and monitor for compliance.
- Report any serious incidents, accidents, or injuries immediately to command.
- Work closely with Logistics to ensure that appropriate communications are in place to support the response effort.

Public Information Officer:

- Develop a media strategy, Review strategy with Command prior to implementation.
- Establish contact with other Public Information personnel.
- Locate and establish a JIC.
- Provide talking points to Command for press briefings, VIP visits and town hall meetings.
- Keep Command informed of any potential adverse political, social, and economic impacts.

Liaison Officer:

- Develop an action plan to ensure communication and coordination with appropriate stakeholders and submit draft of plan to Command for review and approval.
- Keep Command informed of any stakeholder adverse feelings/relationships that may develop.

Intelligence Officer:

- Identify critical intelligence needs and develop intelligence flow plan and brief IMT.

- Ensure that all requests for information (RFI's) are sent and the Command is briefed on all Field Intelligence Reports (FIR).
- Be central point of coordination for all interagency intelligence organizations: Field Intelligence Support Teams, Joint Terrorism Task Forces, Intelligence Fusion Centers, etc.
- Screen intelligence information for OPSEC/Security Sensitive Information (SSI) classification.

Planning:

- Ensure that all off-site information reporting is approved by Command prior to release.
- Develop a contingency plan for sustaining long-term IMT staffing.
- Brief IMT staff on document control system, including handling and storing secure documents.
- Provide all documents that need review or approval by Command at least one hour prior to implementation or release.

Finance/Admin:

- Provide Command with a summary daily cost estimate.
- Establish a claims system and brief the IMT on the process.
- Advise Command of unusual high cost specialized equipment use.

Logistics:

- Develop and brief the IMT on the internal/external resource ordering process and monitor for compliance.
- Ensure that appropriate security is established at each incident support facility.
- Develop a plan; establish secure communication for both internal and external use and brief IMT staff.

CHAPTER 5

UNIFIED COMMAND

Reference:

(a) Incident Commander Job Aid

INTRODUCTION

Unified Command (UC) is an expansion of the ICS organization. To be a member of the UC you must have authority and jurisdiction. UC members may also include agencies, organizations or private industries bringing large amounts of tactical and support resources to the table. The need for UC is brought about when an incident impacts the jurisdictional or functional responsibility of more than one agency. As a component of ICS, the UC is a structure that brings together the "Incident Commanders" of all major organizations that have jurisdictional responsibility for the incident to coordinate an effective response while carrying out their own agencies jurisdictional responsibilities. UC links the responding organizations to the incident and provides a forum for these agencies to make consensus decisions. Under UC, the various jurisdictions and/or agencies and non-government responders may blend together throughout the organization to create an integrated response team.

The need for UC arises when incidents:

- Cross geographic boundaries (e.g., two states, international boundaries);
- Involve various governmental levels (e.g., Federal, state, local,);
- Impact functional responsibilities (e.g., Search and Rescue, fire, oil spill, EMS); or
- Some combination of the above.

UC Make Up:
Actual UC makeup for a specific incident will be determined on a case-by-case basis taking into account:

(1) The specifics of the incident;
(2) Determinations outlined in existing response plans; or
(3) Decisions reached during the initial meeting of the UC. The makeup of the UC may change as an incident progresses in order to account for changes in the situation.

UC is a team effort, but to be effective the number of personnel should be kept as small as possible. A well-defined process requires the UC to set clear objectives to guide the on-scene response resources.

UC is responsible for overall management of the incident. UC directs incident activities, including development and implementation of overall objectives and strategies, and approves ordering and releasing of resources. UC is not a “decision by committee”. The principals are there to command the response to an incident. Time is of the essence. UC should develop synergy based on the significant capabilities that are brought by the various representatives. There should be personal acknowledgement of each representative’s unique capabilities, a shared understanding of the situation, and agreement on the common objectives. With the different perspectives on UC comes the risk of disagreements, most of which can be resolved through the understanding of the underlying issues. Contentious issues may arise, but the UC framework provides a forum and a process to resolve problems and find solutions.

A cooperative attitude and a thorough understanding are essential. as is a thorough understanding of the ICS Operating Cycle. Nevertheless, situations may arise where consensus agreement may not be reachable. In such instances, the UC member representing the agency with the most jurisdictional responsibility would normally be deferred to for the final decision.

The bottom line is that UC has certain responsibilities as noted above. Failure to provide clear incident objectives and response direction means that UC has failed. While the UC structure is an excellent vehicle (and the only nationally recognized vehicle) for coordination, cooperation, and communication, the duly authorized representatives must make the system work successfully. A strong Command – a single IC or UC – is essential to an effective response.

In order to keep the UC small in numbers; and therefore efficient, it is recommended that one agency in the State or Federal government should be the lead agency to coordinate activities and actions within the State/Federal agencies involved. Specific representatives of various agencies should be encouraged to participate on the response team in the functions that best suit their expertise.

The UC may assign Deputy Incident Commander(s) to assist in carrying out IC and/or UC responsibilities. UC members may also be assigned individual legal and administrative support from their own organizations.

To be considered for inclusion as a UC representative, the involved organization:

1. Must have jurisdictional authority or functional responsibility under a law or ordinance for the incident; and,
2. Must have incident or response operations impact on your organization's Area Of Responsibility (AOR); and,
3. Must be specifically charged by law or ordinance with commanding, coordinating or managing a major aspect of the incident response; and,
4. Should have the resources to support participation in the response organization.

UC representatives must be able to:

- Agree on incident objectives and priorities;
- Have the capability to sustain a 24-hour-7-day-a-week commitment to the incident;
- Have the authority to commit agency or company resources to the incident;
- Have the authority to spend agency or company funds;
- Agree on constraints/limitations, priorities, decisions and procedures;
- Agree on an incident response organization;
- Agree on the appropriate Command and General Staff position assignments to ensure clear direction for on-scene tactical resources;
- Commit to speak with "one voice" through the PIO or JIC, if established;
- Agree on managing sensitive information and operational security issues;
- Agree on logistical support including resource ordering procedures; and
- Agree on cost-sharing and cost accounting procedures, as appropriate.

It is important to note that participation in UC occurs without any agency abdicating authority, responsibility, or accountability.

What if your agency is not represented in UC but is involved in the response effort?
Here is how to ensure your organization's concerns or issues are addressed:

- Serve as an agency or company representative who has direct contact with the Liaison Officer (LNO).
- Provide stakeholder input to the LNO (for environmental, economic, social, or political issues).
- Serve as a Technical Specialist in the Planning Section.
- Provide input directly to a member of UC.

(f) Intelligence Officer Job Aid

POSITION CHECKLISTS

INCIDENT COMMANDER (IC) – The IC‘s responsibility is the overall management of the incident. On many incidents, the command activity is carried out by a single IC. The IC is selected based on qualifications and experience. The IC Job Aid (reference (a)) should be reviewed regarding the responsibilities and duties of the IC.

The IC may have Deputy IC’s, who may be from the same agency or from an assisting agency. The Deputy IC must have the same qualifications as the person for whom they work, as they must be ready to take over that position at any time. When span of control becomes an issue for the IC, a Deputy IC/Chief of Staff may be assigned to manage the Command Staff.

The major responsibilities of the IC are:

a. Review Common Responsibilities in Chapter 2.
b. Obtain a briefing from the prior IC (201 Briefing).
c. Determine Incident Objectives and general direction for managing the incident.
d. Establish priorities.
e. Establish an ICP.
f. Brief Command Staff and Section Chiefs.
g. Establish an appropriate organization.
h. Ensure planning meetings are scheduled as required.
i. Approve and authorize the implementation of an IAP.
j. Ensure that adequate safety measures are in place.
k. Coordinate activity for all Command and General Staff.
l. Coordinate with key people and officials.
m. Approve requests for additional resources or for

the release of resources.

n. Keep agency administrator informed of incident status.
o. Approve the use of trainees, volunteers, and auxiliary personnel.
p. Authorize release of information to the news media.
q. Ensure Incident Status Summary (ICS 209-CG) is completed and forwarded to appropriate higher authority.
r. Order the demobilization of the incident when appropriate.
s. Maintain Unit Log (ICS 214-CG).

PUBLIC INFORMATION OFFICER (PIO) – The PIO is responsible for developing and releasing information about the incident to the news media, to incident personnel, and to other appropriate agencies and organizations.

Only one primary PIO will be assigned for each incident, including incidents operating under UC and multi-jurisdiction incidents. The PIO may have assistants as necessary, and the assistants may also represent assisting agencies or jurisdictions. The PIO and Joint Information Center (JIC) Job Aids (references (b) and (c)) should be reviewed regarding the organization and duties of the PIO.

Agencies have different policies and procedures relative to the handling of public information. The following are the major responsibilities of the PIO, which would generally apply on any incident.

The major responsibilities of the PIO are:

a. Review Common Responsibilities in Chapter 2.
b. Determine from the IC if there are any limits on information release.

c. Develop material for use in media briefings.
d. Obtain IC approval of media releases.
e. Inform media and conduct media briefings.
f. Arrange for tours and other interviews or briefings that may be required.
g. Manage a Joint Information Center (JIC) if established.
h. Obtain media information that may be useful to incident planning.
i. Maintain current information summaries and/or displays on the incident and provide information on the status of the incident to assigned personnel.
j. Ensure that all required agency forms, reports and documents are completed prior to demobilization.
k. Brief Command on PIO issues and concerns.
l. Have debriefing session with the IC prior to demobilization.
m. Maintain Unit Log (ICS 214-CG).

LIAISON OFFICER (LNO) – Incidents that are multi-jurisdictional, or have several agencies involved, may require the establishment of the LNO position on the Command Staff. Only one primary LNO will be assigned for each incident, including incidents operating under UC and multi-jurisdiction incidents.

The LNO may have assistants as necessary, and the assistants may also represent assisting agencies or jurisdictions. The LNO is assigned to the incident to be the contact for assisting and/or cooperating Agency Representatives. The LNO Job Aid (reference (d)) should be reviewed regarding the organization and duties of the LNO.
The major responsibilities of the LNO are:

a. Review Common Responsibilities in Chapter 2.

b. Be a contact point for Agency Representatives.
c. Maintain a list of assisting and cooperating agencies and Agency Representatives, including name and contact information. Monitor check-in sheets daily to ensure that all Agency Representatives are identified.
d. Assist in establishing and coordinating interagency contacts.
e. Keep agencies supporting the incident aware of incident status.
f. Monitor incident operations to identify current or potential inter-organizational problems.
g. Participate in planning meetings, providing limitations and capability of assisting agency resources.
h. Coordinate response resource needs for Natural Resource Damage Assessment and Restoration (NRDAR) activities with the OSC during oil and HAZMAT responses.
i. Coordinate response resource needs for incident investigation activities with the OSC.
j. Coordinate activities of visiting dignitaries.
k. Ensure that all required agency forms, reports and documents are completed prior to demobilization.
l. Brief Command on agency issues and concerns.
m. Have debriefing session with the IC prior to demobilization.
n. Maintain Unit Log (ICS 214-CG).

AGENCY REPRESENTATIVE (AREP) – In many multi-jurisdiction incidents, an agency or jurisdiction may send an AREP who is not on direct tactical assignment, but is there to assist in coordination efforts.

An AREP is an individual assigned to an incident from an assisting or cooperating agency who has been

delegated authority to make decisions on matters affecting that agency's participation at the incident. AREP's report to the LNO or to the IC in the absence of a LNO.

The major responsibilities of the AREPs are:

a. Review Common Responsibilities in Chapter 2.
b. Ensure that all agency resources are properly checked in at the incident.
c. Obtain briefing from the LNO or IC.
d. Inform assisting or cooperating agency personnel on the incident that the AREP position for that agency has been filled.
e. Attend briefings and planning meetings as required.
f. Provide input on the use of agency resources unless resource Technical Specialists (THSP) are assigned from the agency.
g. Cooperate fully with the IC and the General Staff on agency involvement at the incident.
h. Ensure the well-being of agency personnel assigned to the incident.
i. Advise the LNO of any special agency needs or requirements.
j. Report to home agency dispatch or headquarters on a pre-arranged schedule.
k. Ensure that all agency personnel and equipment are properly accounted for and released prior to departure.
l. Ensure that all required agency forms, reports and documents are completed prior to demobilization.
m. Have a debriefing session with the LNO or IC before demobilization.
n. Maintain Unit Log (ICS 214-CG).

SAFETY OFFICER (SOFR) – The SOFR function is to develop and recommend measures for assuring

personnel safety and to assess and/or anticipate hazardous and unsafe situations. Only one primary SOFR will be assigned for each incident. The SOFR Job Aid (reference (e)) should be reviewed regarding the organization and duties of the SOFR.

The SOFR may have assistants, as necessary, and the assistants may also represent assisting agencies or jurisdictions. Safety assistants may have specific responsibilities, such as air operations, hazardous materials, etc.

The major responsibilities of the SOFR are:

a. Review Common Responsibilities in Chapter 2.
b. Participate in tactics and planning meetings, and other meetings and briefings as required.
c. Identify hazardous situations associated with the incident.
d. Review the IAP for safety implications.
e. Provide safety advice in the IAP for assigned responders.
f. Exercise emergency authority to stop and prevent unsafe acts.
g. Investigate accidents that have occurred within the incident area.
h. Assign assistants, as needed.
i. Review and approve the Medical Plan (ICS 206-CG).
j. Develop the Site Safety Plan and publish Site Safety Plan Summary (ICS 208-CG) as required.
k. Develop the Work Safety Analysis Worksheet (ICS-215a-CG) as required.
l. Ensure that all required agency forms, reports and documents are completed prior to demobilization.
m. Brief Command on safety issues and concerns.
n. Have debriefing session with the IC prior to demobilization.

o. Maintain Unit Log (ICS 214-CG).

INTELLIGENCE OFFICER (INTO) – For the U.S. Coast Guard, the intelligence function has been determined to best fit as the INTO. For more information on the Intelligence function, see Chapter 11. The responsibility of the INTO is to provide Command intelligence information that can have a direct impact on the safety of response personnel and influence the disposition of maritime security assets involved in the response.

The major responsibilities of the INTO are:

a. Review Common Responsibilities in Chapter 2.
b. Participate in meetings and briefings as required.
c. Collect and analyze incoming intelligence information from all sources.
d. Determine the applicability, significance, and reliability of incoming intelligence information.
e. As requested, provide intelligence briefings to the IC/UC.
f. Provide intelligence briefings in support of the ICS Planning Cycle.
g. Provide Situation Unit with periodic updates of intelligence issues that impact the incident response.
h. Review the IAP for intelligence implications.
i. Answer intelligence questions and advise Command and General Staff as appropriate.
j. Supervise, coordinate, and participate in the collection, analysis, processing, and dissemination of intelligence.
k. Assist in establishing and maintaining systematic, cross-referenced intelligence records and files.
l. Establish liaison with all participating law enforcement agencies including the CGIS, FBI/JTTF, State and Local police departments.

m. Conduct first order analysis on all incoming intelligence and fuse all applicable incoming intelligence with current intelligence holdings in preparation for briefings.
n. Prepare all required intelligence reports and plans.
o. As the incident dictates, determine need to implant Intelligence Technical Specialists in the Planning and Operations Sections.
p. Ensure that all required agency forms, reports and documents are completed prior to demobilization.
q. Have debriefing session with the IC prior to demobilization.
r. Maintain Unit Log (ICS 214-CG).

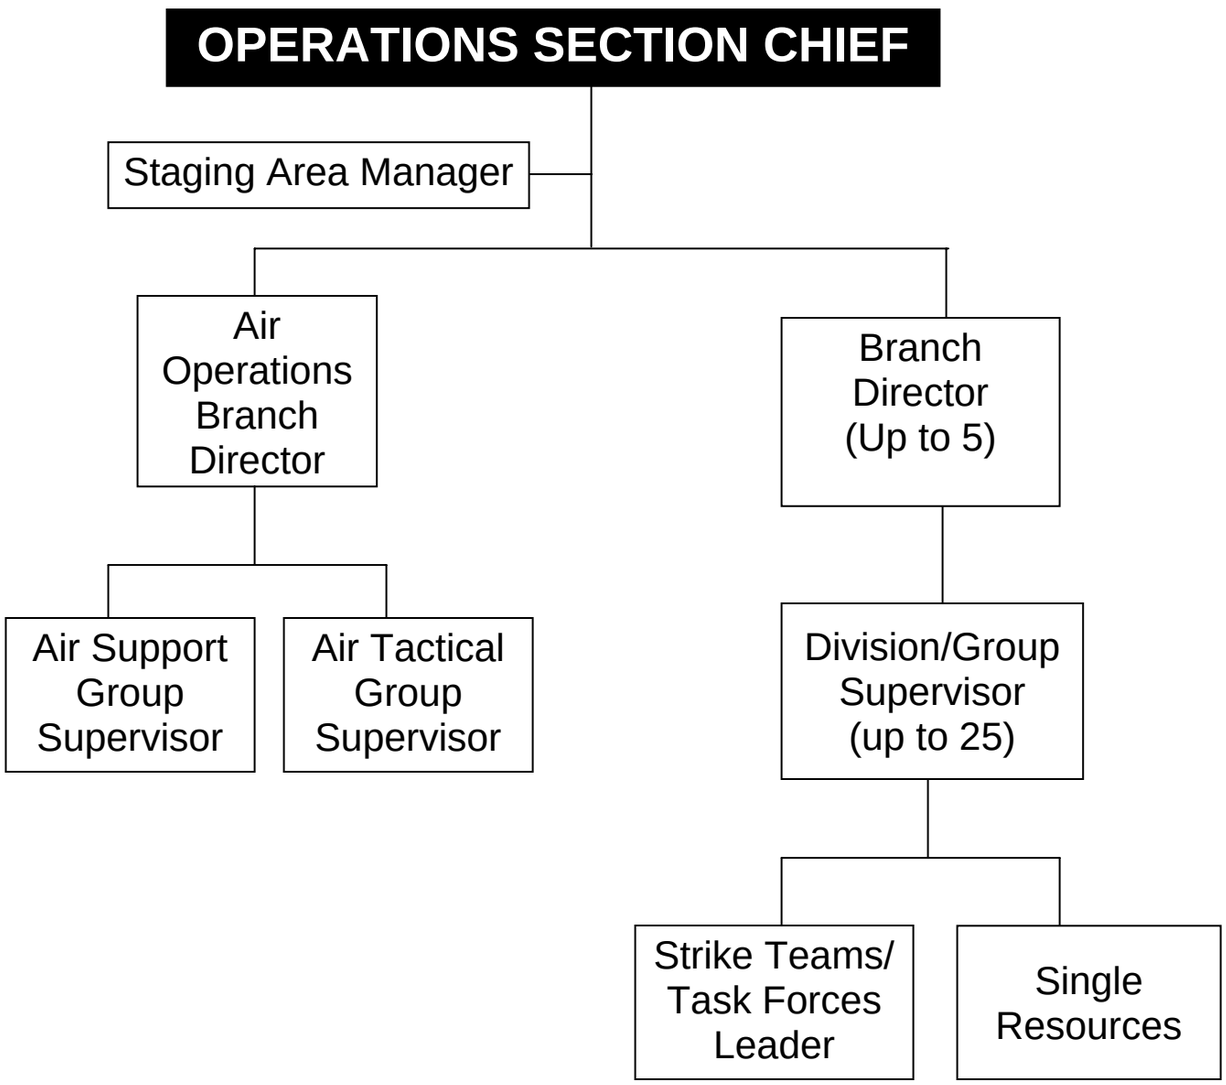
THIS PAGE INTENTIONALLY LEFT BLANK

AUGUST 2006

CHAPTER 7

OPERATIONS SECTION

ORGANIZATION CHART



Reference:

(a) Operations Section Chief Job Aid

POSITION CHECKLISTS

OPERATIONS SECTION CHIEF (OSC) – The OSC, a member of the General Staff, is responsible for the management of all tactical operations directly applicable to the primary mission. The OSC will normally be selected from the organization/agency with the most jurisdictional responsibility for the incident.

The OSC activates and supervises organization elements in accordance with the IAP and directs its execution. The OSC also directs the preparation of operational plans; requests or releases resources, monitors operational progress and makes expedient changes to the IAP, as necessary; and reports such to the IC. The OSC Job Aid, Reference (a), should be reviewed regarding the organization and duties of the OSC.

The OSC may have Deputy OSC's, who may be from the same agency or from an assisting agency. The Deputy OSC must have the same qualifications as the person for whom they work, as they must be ready to take over that position at any time. In complex incidents, the OSC may assign a Deputy OSC to supervise on-scene operations (major responsibilities (d) through (k) listed below) while the OSC participates in the incident planning process (major responsibilities (l) through (w) listed below).

The major responsibilities of the OSC are:

a. Review Common Responsibilities in Chapter 2.
b. Obtain briefing from IC.
c. Evaluate and request sufficient Section supervisory staffing for both operational and planning activities.
d. Supervise Operations Section field personnel.

e. Implement the IAP for the Operations Section.
f. Evaluate on-scene operations and make adjustments to organization, strategies, tactics, and resources as necessary.
g. Ensure the Resources Unit is advised of changes in the status of resources assigned to the section.
h. Ensure that Operations Section personnel execute work assignments following approved safety practices.
i. Monitor need for and request additional resources to support operations as necessary.
j. Assemble/dissemble task force/strike teams as appropriate.
k. Identify/utilize staging areas.
l. Evaluate and monitor current situation for use in next operational period planning.
m. Convert operational incident objectives into strategic and tactical options. These options may be documented on a Work Analysis Matrix (ICS-234-CG).
n. Coordinate and consult with the PSC, SOFR technical specialists, modeling scenarios, trajectories, etc., on selection of appropriate strategies and tactics to accomplish objectives.
o. Identify kind and number of resources required to support selected strategies.
p. Subdivide work areas into manageable units.
q. Develop work assignments and allocate tactical resources based on strategic requirements (i.e. develop the ICS-215-CG).
r. Coordinate planned activities with the SOFR to ensure compliance with safety practices.
s. Participate in the planning process and the development of the tactical portions (ICS 204-CG and ICS 220-CG) of the IAP.
t. Assist with development of long-range strategic, contingency, and demobilization plans.

u. Develop recommended list of Section resources to be demobilized and initiate recommendation for release when appropriate.
v. Receive and implement applicable portions of the incident Demobilization Plan.
w. Participate in operational briefings to IMT members as well as briefings to media, and visiting dignitaries.
x. Maintain Unit Log (ICS 214-CG).

BRANCH DIRECTOR (OPBD) – The OPBD's when activated, are under the direction of the OSC and are responsible for the implementation of the portion of the IAP appropriate to the Branches.

The major responsibilities of the OPBD are:

a. Review Common Responsibilities in Chapter 2.
b. Obtain briefing from person relieving.
c. Receive briefing from the OSC.
d. Identify Divisions, Groups, and resources assigned to the Branch.
e. Ensure that Division and/or Group Supervisors (DIVS) have a copy of the IAP.
f. Implement IAP for the Branch.
g. Develop with subordinates alternatives for Branch control operations.
h. Review Division/Group Assignment Lists (ICS 204-CG) for Divisions/Groups within the Branch. Modify lists based on effectiveness of current operations.
i. Assign specific work tasks to DIVS.
j. Supervise Branch operations.
k. Resolve logistic problems reported by subordinates.
l. Attend planning meetings as requested by the OSC.
m. Ensure through chain of command that Resources Unit is advised of changes in the

status of resources assigned to the Branch.

n. Report to OSC when: the IAP is to be modified; additional resources are needed; surplus resources are available; or hazardous situations or significant events occur.
o. Approve accident and medical reports (home agency forms) originating within the Branch.
p. Consider demobilization well in advance.
q. Debrief with OSC and/or as directed at the end of each shift.
r. Maintain Unit Log (ICS 214-CG).

DIVISION/GROUP SUPERVISOR (DIVS) – The DIVS reports to the OSC (or OPBD when activated). The DIVS is responsible for the implementation of the assigned portion of the IAP, assignment of resources within the Division/Group, and reporting on the progress of control operations and status of resources within the Division/Group.

The major responsibilities of the DIVS are:

a. Review Common Responsibilities in Chapter 2.
b. Obtain briefing from person relieving.
c. Receive briefing from supervisor.
d. Identify resources assigned to the Division/ Group.
e. Provide the IAP to subordinates, as needed.
f. Review Division/Group assigned tasks and incident activities with subordinates.
g. Implement IAP for Division/Group.
h. Supervise Division/Group resources and make changes as appropriate.
i. Ensure through chain of command that Resources Unit is advised of all changes in the status of resources assigned to the Division/ Group.
j. Coordinate activities with adjacent Division/ Group.

k. Determine need for assistance on assigned tasks.
l. Submit situation and resources status information to the Branch Director or the OSC as directed.
m. Report hazardous situations, special occurrences, or significant events, e.g., accidents, sickness, discovery of unanticipated sensitive resources, to the immediate supervisor.
n. Maintain Unit Log (ICS 214-CG).
o. Ensure that assigned personnel and equipment get to and from assignments in a timely and orderly manner.
p. Resolve logistics problems within the Division/ Group.
q. Participate in the development of Branch plans for the next operational period, as requested.
r. Consider demobilization well in advance.
s. Debrief as directed at the end of each shift.
t. Maintain Unit Log (ICS 214-CG).

STRIKE TEAM/TASK FORCE LEADER (STCR/TFLD) – The STCR/TFLD reports to an OPBD or DIVS and is responsible for performing tactical assignments assigned. The Leader reports work progress, resources status, and other important information and maintains work records on assigned personnel.
The major responsibilities of the STCR/TFLD are:

a. Review Common Responsibilities in Chapter 2.
b. Review Common Unit Leader Responsibilities in Chapter 2.
c. Obtain briefing from person you are relieving.
d. Obtain briefing from supervisor.
e. Review assignments with subordinates and assign tasks.
f. Monitor work progress and make changes when necessary.
g. Keep supervisor informed of progress and any changes.

h. Coordinate activities with adjacent Strike Teams, Task Forces and single resources.
i. Travel to and from active assignment area with assigned resources.
j. Retain control of assigned resources while in available or out-of-service status.
k. Submit situation and resource status information through chain of command DIVS/OPBD/OSC as appropriate.
l. Debrief as directed at the end of each shift.
m. Maintain Unit Log (ICS 214-CG).

SINGLE RESOURCE – The person in charge of a single tactical resource.

The major responsibilities of the Single Resource Leader are:

a. Review Common Responsibilities in Chapter 2.
b. Review assignments.
c. Obtain briefing from person you are relieving.
d. Obtain necessary equipment and supplies.
e. Review weather/environmental conditions for assignment area.
f. Brief subordinates on safety measures.
g. Monitor work progress.
h. Ensure adequate communications with supervisor and subordinates.
i. Keep supervisor informed of progress and any changes.
j. Inform supervisor of problems with assigned resources.
k. Brief relief personnel, and advise them of any change in conditions.
l. Return equipment and supplies to appropriate unit.
m. Complete and turn in all time and use records on personnel and equipment.
n. Debrief as directed at the end of each shift.

o. Maintain Unit Log (ICS 214-CG).

STAGING AREA MANAGER (STAM) – The STAM is under the direction of the OSC and is responsible for managing all activities within a Staging Area.
The major responsibilities of the STAM are:

a. Review Common Responsibilities in Chapter 2.
b. Proceed to Staging Area.
c. Obtain briefing from person you are relieving.
d. Establish Staging Area layout.
e. Determine any support needs for equipment, feeding, sanitation and security.
f. Establish check-in function as appropriate.
g. Ensure security of staged resources.
h. Post areas for identification and traffic control.
i. Request maintenance service for equipment at Staging Area as appropriate.
j. Respond to request for resource assignments. (Note: This may be direct from the OSC or via the Incident Communications Center.)
k. Obtain and issue receipts for radio equipment and other supplies distributed and received at Staging Area.
l. Determine required resource levels from the OSC.
m. Advise the OSC when reserve levels reach minimums.
n. Maintain and provide status to Resource Unit of all resources in Staging Area.
o. Maintain Staging Area in orderly condition.
p. Demobilize Staging Area in accordance with the Incident Demobilization Plan.
q. Debrief with OSC or as directed at the end of each shift.
r. Maintain Unit Log (ICS 214-CG).

AIR OPERATIONS BRANCH DIRECTOR (AOBD) – The AOBD is ground-based and is primarily responsible for preparing the Air Operations Summary Worksheet (ICS 220-CG), the air operations portion of the IAP and for providing logistical support to incident aircraft. The Air Operations Summary Worksheet (ICS 220-CG) serves the same purpose as the Work Assignment (ICS 204-CG) does for other operational resources, by assigning and managing aviation resources on the incident. The Air Operations Summary Worksheet (ICS-220-CG) may or may not be completed depending on the needs of the incident. The AOBD will ensure that agency directives, to include Coast Guard Air Operations Manual, COMDTINST M3710.1(series), flight manuals, unit restrictions, and other agency directives will not be violated by incident aircraft, e.g., flight hours, hoist limitations, night flying, etc. Individual aircrews retain primary responsibility to ensure their aircraft are operated in accordance with their own agency's restrictions and directives. It is also the responsibility of individual aircrews to keep the AOBD informed of their agency’s restrictions and directives that may affect their ability to execute incident assignments. After the IAP is approved, the AOBD is responsible for overseeing the tactical and logistical assignments of the Air Operations Branch. In coordination with the Logistics Section, the AOBD is responsible for providing logistical support to aircraft operating on the incident.

The major responsibilities of the AOBD are:

a. Review Common Responsibilities in Chapter 2.
b. Organize preliminary air operations.
c. Coordinate airspace use with the FAA. Request declaration (or cancellation) of Temporary Flight Restriction (TFR) IAW FAR 91.173 and post Notice to Airmen (NOTAM) as required.
d. Attend the tactics meeting and planning meeting to

obtain information for completing the Air Operations Summary Worksheet (ICS 220-CG), if needed.

e. Participate in preparation of the IAP through the OSC. Insure that the air operations portion of the IAP takes into consideration the Air Traffic Control requirements of assigned aircraft.
f. Coordinate with the COML to designate air tactical and support frequencies.
g. Perform operational planning for air operations.
h. Prepare and provide Air Operations Summary Worksheet (ICS 220-CG), if completed, to the Air Support Group and Fixed-Wing Bases.
i. Supervise all air operations activities associated with the incident.
j. Evaluate helibase and helispot locations.
k. Establish procedures for emergency reassignment of aircraft.
l. Coordinate approved flights of non-incident aircraft in the TFR.
m. Coordinate Coast Guard air assets with the appropriate Command Center(s) through normal channels on incident air operations activities.
n. Consider requests for logistical use of incident aircraft.
o. Report to the OSC on air operations activities.
p. Report special incidents/accidents.
q. Develop Aviation Site Safety Plan in concert with SOFR.
r. Arrange for an accident investigation team when warranted.
s. Debrief with OSC as directed at the end of each shift.
t. Maintain Unit Log (ICS 214-CG).

AIR TACTICAL GROUP SUPERVISOR (ATGS) – The ATGS is primarily responsible for tactical operations of

aircraft and aircrews. This includes: 1) providing fuel and other supplies; 2) providing maintenance and repair of aircraft; 3) keeping records of aircraft activity, and 4) providing enforcement of safety regulations. The ATGS reports to the AOBD.

The major responsibilities of the ATGS are:

a. Review Common Responsibilities in Chapter 2.
b. Obtain a copy of the IAP from the AOBD, including Air Operations Summary Worksheet (ICS 220-CG), if completed.
c. Participate in AOBD planning activities.
d. Inform AOBD of group activities.
e. Identify resources/supplies dispatched for the Air Tactical Group.
f. Request special air tactical items from appropriate sources through Logistics Section.
g. Coordinate activities with AOBD.
h. Obtain assigned ground-to-air frequency for airbase operations from the Communications Unit Leader (COML) or Incident Radio Communications Plan (ICS 205-CG).
i. Inform AOBD of capability to provide night flying service.
j. Ensure compliance with each agency's operations checklist for day and night operations.
k. Debrief as directed at the end of each shift.
l. Maintain Unit Log (ICS 214-CG).

AIR SUPPORT GROUP SUPERVISOR (ASGS) – The ASGS is primarily responsible for supporting aircraft and aircrews. This includes: 1) providing fuel and other supplies; 2) providing maintenance and repair of aircraft; 3) keeping records of aircraft activity, and 4) providing enforcement of safety regulations. The ASGS reports to the AOBD.

The major responsibilities of the ASGS are:

a. Review Common Responsibilities in Chapter 2.

b. Obtain a copy of the IAP from the AOBD, including Air Operations Summary Worksheet (ICS 220-CG), if completed.
c. Participate in AOBD planning activities.
d. Inform AOBD of group activities.
e. Identify resources/supplies dispatched for the Air Support Group.
f. Request special air support items from appropriate sources through Logistics Section.
g. Determine need for assignment of personnel and equipment at each airbase.
h. Coordinate activities with AOBD.
i. Obtain assigned ground-to-air frequency for airbase operations from the Communications Unit Leader (COML) or Incident Radio Communications Plan (ICS 205-CG).
j. Inform AOBD of capability to provide night flying service.
k. Ensure compliance with each agency's operations checklist for day and night operations.
l. Ensure dust abatement procedures are implemented at helibases and helispots.
m. Provide crash-rescue service for helibases and helispots.
n. Debrief as directed at the end of each shift.
o. Maintain Unit Log (ICS 214-CG).

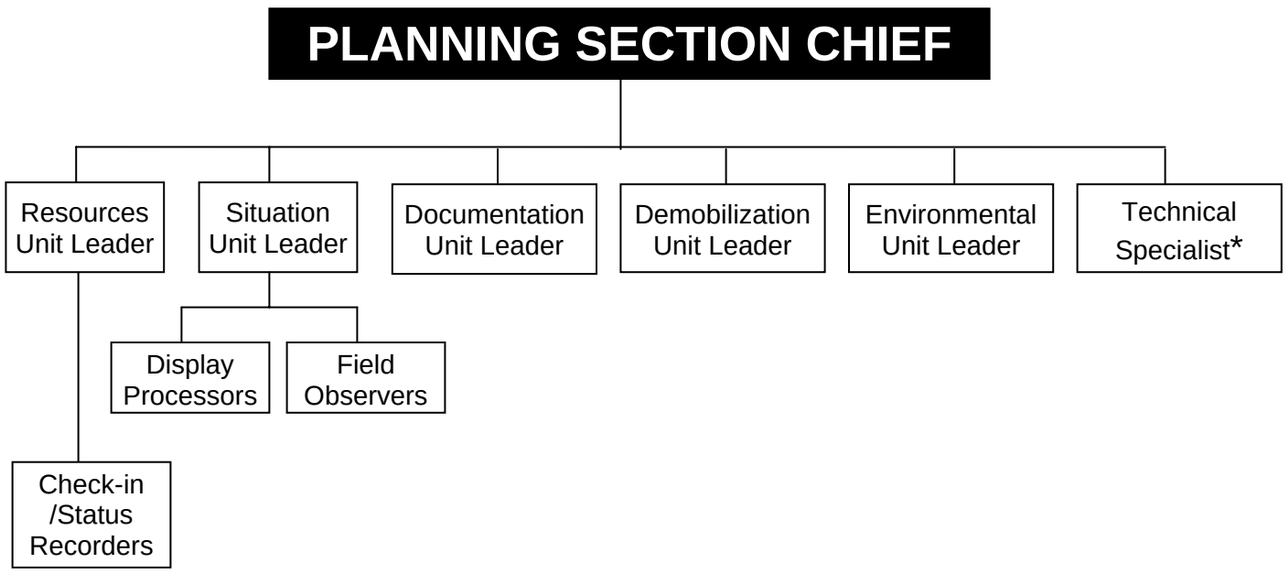
TECHNICAL SPECIALISTS (THSP) – Certain incidents or events may require the use of THSP’s who have specialized knowledge and expertise. THSP’s may function within the Planning Section or be assigned wherever their services are required. See chapter 8 and the THSP Job Aid for more detailed information on THSP’s.

AUGUST 2006

CHAPTER 8

PLANNING SECTION

ORGANIZATION CHART



*** May be assigned wherever their services are required.**

References:

(a) Planning Section Chief Job Aid
(b) Resource Unit Leader Job Aid
(c) Situation Unit Leader Job Aid
(d) Documentation Unit Leader Job Aid
(e) Demobilization Unit Leader Job Aid
(f) Environmental Unit Leader Job Aid
(g) Technical Specialist Job Aid

POSITION CHECKLISTS

PLANNING SECTION CHIEF (PSC) – The PSC, a member of the General Staff, is responsible for the collection, evaluation, dissemination and use of incident information and maintaining status of assigned resources. Information is needed to:

1) Understand the current situation;
2) Predict the probable course of incident events;
3) Prepare strategies, plans and alternative strategies and plans for the incident; and
4) Submit required incident status reports.

The PSC Job Aid, reference (a), should be reviewed regarding the organization and duties of the PSC.

The PSC may have Deputy PSC's, who may be from the same agency or from an assisting agency. The Deputy PSC must have the same qualifications as the person for whom they work, as they must be ready to take over that position at any time.

The major duties of the PSC are:

a. Review Common Responsibilities in Chapter 2.
b. Collect, process, and display incident information.
c. Assist OSC in the development of response strategies.
d. Supervise preparation of the IAP.
e. Facilitate planning meetings and briefings.
f. Supervise the tracking of incident personnel and resources through the Resources Unit.
g. Assign personnel already on-site to ICS organizational positions as appropriate.
h. Establish information requirements and reporting schedules for Planning Section Units (e.g., Resources, Situation).
i. Determine the need for any specialized resources in support of the incident.

j. Establish special information collection activities as necessary (e.g., weather, environmental, toxics, etc.).
k. Assemble information on alternative strategies.
l. Provide periodic predictions on incident potential.
m. Keep IMT apprised of any significant changes in incident status.
n. Compile and display incident status information.
o. Oversee preparation and implementation of the Incident Demobilization Plan.
p. Incorporate plans (e.g., Traffic, Medical, Communications, and Site Safety) into the IAP.
q. Develop other incident supporting plans (e.g., salvage, transition, security).
r. Review PSC Job Aid.
s. Maintain Unit Log (ICS 214-CG).

RESOURCE UNIT LEADER (RESL) – The RESL is responsible for maintaining the status of all assigned tactical resources and personnel at an incident. This is achieved by overseeing the check-in of all tactical resources and personnel, maintaining a status-keeping system indicating current location and status of all these resources. The RESL Job Aid, Reference (b), should be reviewed regarding the organization and duties of the RESL.

The major responsibilities of the RESL are:

a. Review Common Responsibilities in Chapter 2.
b. Review Unit Leader Responsibilities in Chapter 2.
c. Establish the check-in function at incident locations.
d. Prepare Organization Assignment List (ICS 203-CG) and Organization Chart (ICS 207-CG).
e. Prepare appropriate parts of Division Assignment Lists (ICS 204-CG).
f. Maintain and post the current status and location of all tactical resources.

g. Maintain master roster of all tactical resources checked in at the incident.
h. Attend meetings and briefings as required by the PSC.
i. Review Resource Unit Leader Job Aid.
j. Maintain Unit Log (ICS 214-CG).

CHECK-IN/STATUS RECORDER (SCKN) – SCKN's are needed at each check-in location to ensure that all resources assigned to an incident are accounted for. The major responsibilities of the SCKN are:

a. Review Common Responsibilities in Chapter 2.
b. Obtain required work materials, including Check-in Lists (ICS 211-CG), Resource Status Cards (ICS-219) and status display boards or T-card racks.
c. Post signs so that arriving resources can easily find incident check-in location(s).
d. Record check-in information on Check-in Lists (ICS 211-CG).
e. Transmit check-in information to the RESL.
f. Forward completed ICS 211-CG and Status Change Cards (ICS-210) to the RESL.
g. Receive, record, and maintain resource status information on Resource Status Cards (ICS-219) for incident-assigned tactical resources, and overhead personnel.
h. Maintain files of Check-in Lists (ICS 211-CG).
i. Maintain Unit Log (ICS 214-CG).

SITUATION UNIT LEADER (SITL) – The Situation Unit Leader is responsible for collecting, processing and organizing incident information relating to the growth, mitigation or intelligence activities taking place on the incident. The SITL may prepare future projections of incident growth, maps and intelligence information. The

SITL Job Aid, reference (c), should be reviewed regarding the organization and duties of the SITL.
The major responsibilities of the SITL are:

a. Review Common Responsibilities in Chapter 2.
b. Review Unit Leader Responsibilities in Chapter 2.
c. Begin collection and analysis of incident data as soon as possible.
d. Prepare, post, or disseminate resource and situation status information as required, including special requests.
e. Prepare periodic predictions or as requested by the PSC.
f. Prepare the Incident Status Summary Form (ICS 209-CG).
g. Provide photographic services and maps if required.
h. Conduct situation briefings at meetings and briefings as required by the PSC.
i. Develop and maintain master chart(s)/map(s) of the incident.
j. Maintain chart/map of incident in the common area of the ICP for all responders to view.
k. Maintain Unit Log (ICS 214-CG).

DISPLAY PROCESSOR (DPRO) – The DPRO is responsible for the display of incident status information obtained from Field Observers (FOBS), resource status reports, aerial and other photographs, and infrared data.
The major responsibilities of the DPRO are:

a. Review Common Responsibilities in Chapter 2.
b. Determine:
    - Location of work assignment
    - Numbers, types and locations of displays required
    - Priorities

- Map requirements for the IAP
- Time limits for completion

c. Obtain necessary equipment and supplies.
d. Assist SITL in analyzing and evaluating field reports.
e. Develop required displays in accordance with time limits for completion. Examples of displays include:
   - GIS information
   - Demographic information
   - Incident projection data
   - Enlargement of ICS forms
f. Maintain Unit Log (ICS 214-CG).

FIELD OBSERVER (FOBS) – The FOBS is responsible for collecting situation information from personal observations at the incident and provides this information to the SITL. The major responsibilities of the FOBS are:

a. Review Common Responsibilities in Chapter 2.
b. Determine:
   - Location of assignment
   - Type of information required
   - Priorities
   - Time limits for completion
   - Method of communication
   - Method of transportation
c. Obtain necessary equipment and supplies.
d. Perform FOBS responsibilities to include but not limited to the following:
   - Perimeters of incident
   - Locations of trouble spots
   - Weather conditions
   - Hazards
   - Progress of operations resources
e. Be prepared to identify all facility locations (e.g.,

Helispots, Division and Branch boundaries).

f. Report information to the SITL by established procedure.
g. Report immediately any condition observed that may cause danger and a safety hazard to personnel.
h. Gather intelligence that will lead to accurate predictions.
i. Maintain Unit Log (ICS 214-CG).

DOCUMENTATION UNIT LEADER (DOCL) – The DOCL is responsible for the maintenance of accurate, up-to-date incident files. Examples of incident documentation include: Incident Action Plan(s), incident reports, communication logs, injury claims, situation status reports, etc. Thorough documentation is critical to post-incident analysis. Some of the documents may originate in other sections. The DOCL shall ensure each section is maintaining and providing appropriate documents. The DOCL will provide duplication and copying services for all other sections. The Documentation Unit will store incident files for legal, analytical, and historical purposes. The DOCL Job Aid, reference (d), should be reviewed regarding the organization and duties of the DOCL.

The major responsibilities of the DOCL are:

a. Review Common Responsibilities in Chapter 2.
b. Review Unit Leader Responsibilities in Chapter 2.
c. Set up work area; begin organization of incident files.
d. Establish duplication service; respond to requests.
e. File all official forms and reports.
f. Review records for accuracy and completeness; inform appropriate units of errors or omissions.
g. Provide incident documentation as requested.
h. Organize files for submitting final incident

documentation package.

i. Maintain Unit Log (ICS 214-CG).

DEMOBILIZATION UNIT LEADER (DMOB) – The DMOB is responsible for developing the Incident Demobilization Plan. On large incidents, demobilization can be quite complex, requiring a separate planning activity. Note that not all agencies require specific demobilization instructions. The DMOB Job Aid, reference (e), should be reviewed regarding the organization and duties of the DMOB.

The major responsibilities of the DMOB are:

a. Review Common Responsibilities in Chapter 2.
b. Review Unit Leader Responsibilities in Chapter 2.
c. Review incident resource records to determine the likely size and extent of demobilization effort and develop a resource matrix.
d. Coordinate demobilization with Agency Representatives.
e. Monitor the on-going Operations Section resource needs.
f. Identify surplus resources and probable release time.
g. Establish communications with off-incident facilities, as necessary.
h. Develop an Incident Demobilization Plan that should include:
    - General information section
    - Responsibilities section
    - Release priorities
    - Release procedures
    - Demobilization Checkout Form (ICS-221-CG)
    - Directory
i. Prepare appropriate directories (e.g., maps, instructions, etc.) for inclusion in the demobilization plan.

j. Distribute demobilization plan (on and off-site).
k. Provide status reports to appropriate requestors.
l. Ensure that all Sections/Units understand their specific demobilization responsibilities.
m. Supervise execution of the Incident Demobilization Plan.
n. Brief the PSC on demobilization progress.
o. Review DMOB Job Aid.
p. Maintain Unit Log (ICS 214-CG).

The following are examples of optional Unit Leader positions that can be established and used as needed during an incident:

ENVIRONMENTAL UNIT LEADER (ENVL) – The ENVL is responsible for environmental matters associated with the response, including strategic assessment, modeling, surveillance, and environmental monitoring and permitting. The ENVL prepares environmental data for the Situation Unit. Technical Specialists frequently assigned to the Environmental Unit may include the Scientific Support Coordinator and Sampling, Response Technologies, Trajectory Analysis, Weather Forecast, Resources at Risk, Shoreline Cleanup Assessment, Historical/ Cultural Resources, and Disposal Technical Specialists. The ENVL Job Aid, reference (f), should be reviewed regarding the organization and duties of the ENVL.
The major responsibilities of the ENVL are:

a. Review Common Responsibilities in Chapter 2.
b. Review Unit Leader Responsibilities in Chapter 2.
c. Obtain a briefing and special instructions from the PSC.
d. Identify sensitive areas and recommend response priorities.
e. Following consultation with natural resource trustees, provide input on wildlife protection

strategies (e.g., removing oiled carcasses, pre-emptive capture, hazing, and/or capture and treatment).

f. Determine the extent, fate, and effects of contamination.
g. Acquire, distribute, and provide analysis of weather forecasts.
h. Monitor the environmental consequences of response actions.
i. Develop shoreline cleanup and assessment plans. Identify the need for, and prepare any special advisories or orders.
j. Identify the need for, and obtain, permits, consultations, and other authorizations, including Endangered Species Act (ESA) provisions.
k. Following consultation with the FOSC's Historical/Cultural Resources Technical Specialist identify and develop plans for protection of affected historical/cultural resources.
l. Evaluate the opportunities to use various response technologies.
m. Develop disposal plans.
n. Develop a plan for collecting, transporting, and analyzing samples.
o. Review ENVL Job Aid.
p. Maintain Unit Log (ICS 214-CG).

MARINE TRANSPORTATION SYSTEM RECOVERY UNIT LEADER (MTSL) – The MTSL is responsible for planning infrastructure recovery for Transportation Security Incidents (TSI) (see chapter 16) and other incidents that significantly impact the Marine Transportation System (MTS). The MTSL will track and report on the status of the MTS, understand critical recovery pathways, recommend courses of action, and provide all MTS stakeholders with an avenue of input to the response organization. The MTSL prepares

transportation data for the Situation Unit and daily situation briefs applying core Essential Elements of Information (EEIs). Sample EEIs include Deep draft shipping, Aids to Navigation, Bulk liquid facilities, Intermodal connections, Bridges, Vessel Salvage, etc. The major responsibilities of the MTSL are:

a. Review Common Responsibilities in Chapter 2.
b. Review Unit Leader Responsibilities in Chapter 2.
c. Obtain a briefing and special instructions from the PSC.
d. Support Operation Section Staff elements that are established for MTS Recovery.
e. Identify, track and report impacts to the MTS in accordance with EEIs.
f. Coordinate and consult with MTS stakeholders. Solicit periodic and standardized feedback from impacted industries/stakeholders.
g. Identify resources, agencies involved, and courses of action for the recovery of public infrastructure such as ATON, communications systems, and federal channels.
h. Prioritize recovery operations (including ATON, dredging, salvage, cleanup, repair, etc), as appropriate.
i. Monitor the economic consequences of recovery actions.
j. Develop traffic management plans. Identify the need for, and prepare any special advisories or orders (i.e. Safety/Security Zone).
k. Assess the need for MTS relief measures outside the impacted area. Implement measures (i.e. redirect cargos, establish alternate transportation modes) as necessary.
l. Liaise with MTS Response Branch Director (TRBD) to execute operational objectives.
m. Maintain Unit Log (ICS 214-CG).

INTELLIGENCE UNIT LEADER (IUL) – See Chapter 11.

TECHNICAL SPECIALISTS (THSP) – Certain incidents or events may require the use of THSP's who have specialized knowledge and expertise. THSP's may function within the Planning Section or be assigned wherever their services are required. The THSP Job Aid, reference (g), should be reviewed for more detailed information. The major responsibilities of the THSP are:

a. Review Common Responsibilities in Chapter 2.
b. Provide technical expertise and advice to Command and General Staff as needed.
c. Attend meetings and briefings as appropriate to clarify and help to resolve technical issues within area of expertise.
d. Maintain Unit Log (ICS 214-CG).

Other major responsibilities that might apply to the THSP as appropriate:

e. Provide technical expertise during the development of the IAP and other support plans.
f. Work with the Safety Officer to mitigate unsafe practices.
g. Work closely with Liaison Officer to help facilitate understanding among stakeholders and special interest groups.
h. Be available to attend press briefings to clarify technical issues.
i. Research technical issues and provide findings to decision makers.
j. Trouble shoot technical problems and provide advice on resolution.
k. Review specialized plans and clarify meaning.

The following are examples of Technical Specialists. This is not a complete list but examples of the many

kinds of THSP's that may be used with a possible location for the position in the ICS organization. However, the IC may assign THSP's to any location within the ICS organization based on incident need. For example, the CISM Specialist is normally assigned in Logistics under the Medical Unit Leader; however, an additional CISM Specialist is often assigned in the Command Staff working directly for the IC. Please see the THSP job aid for more information on each of the positions.

Command Staff:

- Auxiliary Liaison Specialist
- Legal specialist
- Volunteer Specialist/Coordinator

Operations:

- Air Tanker/Fixed Wing Coordinator
- Helicopter Coordinator
- Helibase Manager
- Helispot Manager

Planning:

- Documentation Specialist
- Environmental Specialist
- Geographic Information System Specialist
- Historian
- Public Health Specialist
- Salvage and Engineering Technical Specialist
- Situation Report Specialist
- Training Specialist
- Weather Observer

Logistics:

- Berthing Manager
- Camp Manager
- Cashier Manager
- Communications Restoration Manager
- Contingency Communications Manager

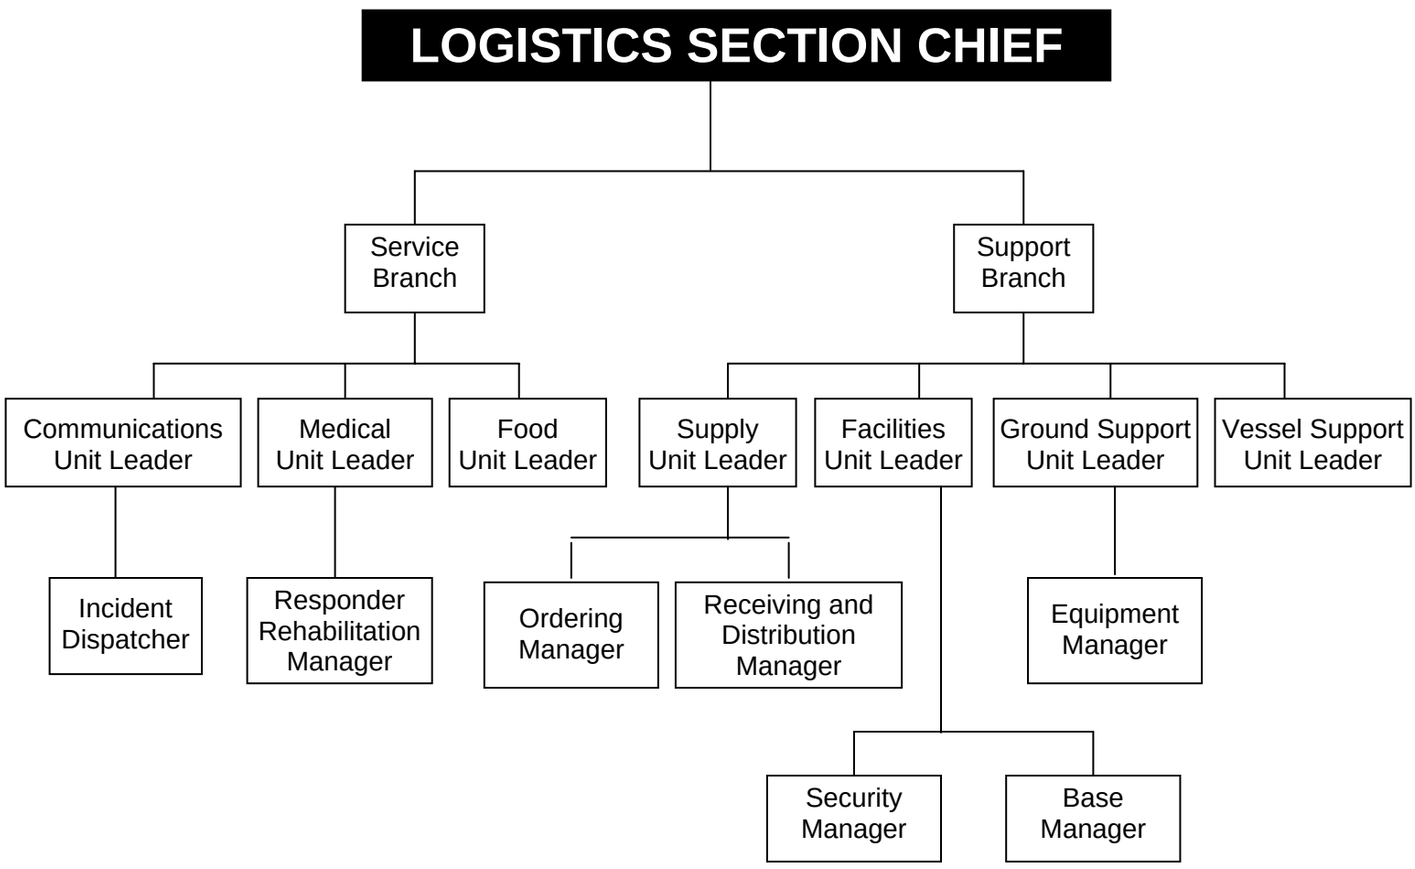
- Chaplain
- Critical Incident Stress Management (CISM) Specialist/Coordinator
- Damage Assessment Teams
- Evacuation Teams/Specialists
- Entitlement Specialist
- Facility Repair and Reconstruction Manager
- Facility Maintenance/Repair Teams/Specialists
- Family Assistance Specialist/Coordinator
- Food Teams/Specialists
- Human Resource Specialist
- Receiving and Distribution Manager
- Legal Support Teams/Specialists
- Medical Teams/Specialists
- Personnel Accountability Manager
- Personnel Support Teams/Specialists

AUGUST 2006

CHAPTER 9

LOGISTICS SECTION

ORGANIZATION CHART



Reference:

(a) Logistics Section Chief Job Aid

POSITION CHECKLISTS

LOGISTICS SECTION CHIEF (LSC) – The LSC, a member of the General Staff, is responsible for providing facilities, services, and material in support of the incident. The LSC participates in the development and implementation of the IAP and activates and supervises the Branches and Units within the Logistics Section. The LSC Job Aid, reference (a), should be reviewed regarding the organization and duties of the LSC.

The LSC may have Deputy LSC's, who may be from the same agency or from an assisting agency. The Deputy LSC must have the same qualifications as the person for whom they work, as they must be ready to take over that position at any time.

The major responsibilities of the LSC are:

a. Review Common Responsibilities in Chapter 2.
b. Plan the organization of the Logistics Section.
c. Assign work locations and preliminary work tasks to Section personnel.
d. Notify the Resources Unit of the Logistics Section Units activated, including names and locations of assigned personnel.
e. Assemble and brief Logistics Branch Directors and Unit Leaders.
f. Determine and supply immediate incident resource and facility needs.
g. In conjunction with Command, develop and advise all Sections of the IMT resource approval and requesting process.
h. Review proposed tactics for upcoming operational period for ability to provide resources and logistical support.
i. Identify long-term service and support

requirements for planned and expected operations.

j. Advise Command and other Section Chiefs on resource availability to support incident needs.
k. Provide input to and review the Communications Plan, Medical Plan and Traffic Plan.
l. Identify resource needs for incident contingencies.
m. Coordinate and process requests for additional resources.
n. Track resource effectiveness and make necessary adjustments.
o. Advise on current service and support capabilities.
p. Request and/or set up expanded ordering processes as appropriate to support incident.
q. Develop recommended list of Section resources to be demobed and initiate recommendation for release when appropriate.
r. Receive and implement applicable portions of the incident Demobilization Plan.
s. Ensure the general welfare and safety of Logistics Section personnel.
t. Maintain Unit Log (ICS 214-CG).

SERVICE BRANCH DIRECTOR (SVBD) – The SVBD, when activated, is under the supervision of the LSC and is responsible for the management of all service activities at the incident. The Branch Director supervises the operations of the Communications, Medical and Food Units.

The major responsibilities of the SVBD are:

a. Review Common Responsibilities in Chapter 2.
b. Review Unit Leader Responsibilities in Chapter 2.
c. Obtain working materials.
d. Determine the level of service required to support operations.

e. Confirm dispatch of Branch personnel.
f. Participate in planning meetings of Logistics Section personnel.
g. Review the IAP.
h. Organize and prepare assignments for Service Branch personnel.
i. Coordinate activities of Branch Units.
j. Inform the LSC of Branch activities.
k. Resolve Service Branch problems.
l. Maintain Unit Log (ICS 214-CG).

COMMUNICATIONS UNIT LEADER (COML) – The COML is responsible for developing plans for the effective use of incident communications equipment and facilities; installing and testing of communications equipment; supervision of the Incident Communications Center; distribution of communications equipment to incident personnel; and the maintenance and repair of communications equipment.

The major responsibilities of the COML are:

a. Review Common Responsibilities in Chapter 2.
b. Review Unit Leader Responsibilities in Chapter 2.
c. Determine Unit personnel needs.
d. Prepare and implement the Incident Radio Communications Plan (ICS 205-CG).
e. Ensure the Incident Communications Center and the Message Center is established.
f. Establish appropriate communications distribution/maintenance locations within the Base.
g. Ensure communications systems are installed and tested.
h. Ensure an equipment accountability system is established.
i. Ensure personal portable radio equipment from cache is distributed per Incident Radio Communications Plan.

j. Provide technical information as required on:
   - Adequacy of communications systems currently in operation.
   - Geographic limitation on communications systems.
   - Equipment capabilities/limitations.
   - Amount and types of equipment available.
   - Anticipated problems in the use of communications equipment.

k. Supervise Communications Unit activities.
l. Maintain records on all communications equipment as appropriate.
m. Ensure equipment is tested and repaired.
n. Recover equipment from Units being demobilized.
o. Maintain Unit Log (ICS 214-CG).

INCIDENT DISPATCHER (INCM) – The INCM is responsible for receiving and transmitting radio and telephone messages among and between personnel and to provide dispatch services at the incident.
The major responsibilities of the INCM are:

a. Review Common Responsibilities in Chapter 2.
b. Ensure adequate staffing.
c. Obtain and review the IAP to determine the incident organization and Incident Radio Communications Plan.
d. Set up Incident Radio Communications Center; check-out equipment.
e. Request service on any inoperable or marginal equipment.
f. Set-up Message Center location, as required.
g. Receive and transmit messages within and external to the incident.
h. Maintain files of ICS-210 and General Messages (ICS 213-CG).
i. Maintain a record of unusual incident

occurrences.

j. Provide a briefing to relief personnel on:
   - Current activities.
   - Equipment status.
   - Any unusual communications situations.

k. Turn in appropriate documents to the Communications Unit Leader.

l. Demobilize the Communications Center in accordance with the Incident Demobilization Plan.

m. Maintain Unit Log (ICS 214-CG).

MEDICAL UNIT LEADER (MEDL) – The MEDL, under the direction of the Service Branch Director or Logistics Section Chief, is primarily responsible for the development of the Medical Plan; providing medical care and overseeing health aspects of response personnel; obtaining medical aid and transportation for injured and ill response personnel; coordinating with other functions to resolve heath and safety issues; and preparation of reports and records.

The major responsibilities of the MEDL are:

a. Review Common Responsibilities in Chapter 2.

b. Review Unit Leader Responsibilities in Chapter 2.

c. Participate in Logistics Section/Service Branch planning activities.

d. Establish the Medical Unit.

e. Prepare the Medical Plan (ICS 206-CG).

f. Provide any relevant medical input into the planning process for strategy development.

g. Coordinate with Safety Officer, Operations, hazmat specialists, and others on proper personnel protection procedures for incident personnel.

h. Prepare procedures for major medical emergency.

i. Develop transportation routes and methods for

injured incident personnel.

j. Ensure incident personnel patients are tracked as they move from origin, care facility and disposition.
k. Provide continuity of medical care for incident personnel.
l. Declare major medical emergency as appropriate.
m. Provide or oversee medical and rehab care delivered to incident personnel.
n. Monitor health aspects of incident personnel including excessive incident stress.
o. Respond to requests for medical aid, medical transportation and medical supplies.
p. In conjunction with Finance/Admin Section, prepare and submit necessary authorizations, reports and administrative documentation related to injuries, compensation or death of incident personnel.
q. Coordinate personnel and mortuary affairs for incident personnel fatalities.
r. Provide oversight and liaison as necessary for incident victims among emergency medical care, medical examiner and hospital care.
s. Provide for security and proper disposition of incident medical records.
t. Maintain Unit Log (ICS 214-CG).

RESPONDER REHABILITATION MANAGER (REHB) – The REHB reports to the Medical Unit Leader and is responsible for the rehabilitation of incident personnel who are suffering from the effects of strenuous work and/or extreme conditions.

The major responsibilities of the REHB are:

a. Review Common Responsibilities in Chapter 2.
b. Designate the responder rehabilitation location and have the location announced on the radio with radio designation "Rehab".

c. Coordinate with MEDL to request necessary medical personnel to evaluate the medical condition of personnel being rehabilitated.
d. Request necessary resources for rehabilitation of personnel, e.g., water, juice, personnel.
e. Request food through the Food Unit or LSC, as necessary, for personnel being rehabilitated.
f. Release rehabilitated personnel for reassignment.
g. Maintain appropriate records and documentation.
h. Maintain Unit Log (ICS 214-CG).

FOOD UNIT LEADER (FDUL) – The FDUL is responsible for supplying the food needs for the entire incident, including all remote locations, e.g., Staging Areas, as well as providing food for personnel unable to leave tactical field assignments.
The major responsibilities of the FDUL are:

a. Review Common Responsibilities in Chapter 2.
b. Review Unit Leader Responsibilities in Chapter 2.
c. Determine food and water requirements.
d. Determine the method of feeding to best fit each facility or situation.
e. Obtain necessary equipment and supplies.
f. Ensure that well-balanced menus are provided.
g. Order sufficient food and potable water from the Supply Unit.
h. Maintain an inventory of food and water.
i. Maintain food service areas, ensuring that all appropriate health and safety measures are being followed.
j. Supervise Food Unit personnel as appropriate.
k. Maintain Unit Log (ICS 214-CG).

SUPPORT BRANCH DIRECTOR (SUBD) – The SUBD, when activated, is under the direction of the LSC, and is responsible for the development and implementation of logistics plans in support of the

Incident Action Plan. The SUBD supervises the operations of the Supply, Facilities, Ground Support and Vessel Support Units.
The major responsibilities of the SUBD are:

a. Review Common Responsibilities in Chapter 2
b. Review Unit Leader Responsibilities in Chapter 2.
c. Obtain work materials.
d. Identify Support Branch personnel dispatched to the incident.
e. Determine initial support operations in coordination with the LSC and SVBD.
f. Prepare initial organization and assignments for support operations.
g. Assemble and brief Support Branch personnel.
h. Determine if assigned Branch resources are sufficient.
i. Maintain surveillance of assigned Units work progress and inform the LSC of their activities.
j. Resolve problems associated with requests from the Operations Section.
k. Maintain Unit Log (ICS 214-CG).

SUPPLY UNIT LEADER (SPUL) – The SPUL is primarily responsible for receiving, storing and distributing all supplies for the incident; maintaining an inventory of supplies; and storing, disbursing and servicing non-expendable supplies and equipment.
The major responsibilities of the SPUL are:

a. Review Common Responsibilities in Chapter 2.
b. Review Unit Leader Responsibilities in Chapter 2.
c. Participate in Logistics Section/Support Branch planning activities.
d. Determine the type and amount of supplies enroute.
e. Review the IAP for information on operations of the Supply Unit.
f. Develop and implement safety and security

requirements.

g. Order, receive, distribute and store supplies and equipment.
h. Receive and respond to requests for personnel, supplies and equipment.
i. Maintain an inventory of supplies and equipment.
j. Service reusable equipment.
k. Submit reports to the SUBD.
l. Maintain Unit Log (ICS 214-CG).

ORDERING MANAGER (ORDM) – The ORDM is responsible for placing all orders for supplies and equipment for the incident. The ORDM reports to the SPUL. The major responsibilities of the ORDM are:

a. Review Common Responsibilities in Chapter 2.
b. Obtain necessary agency(s) order forms.
c. Establish ordering procedures.
d. Establish name and telephone numbers of agency(s) personnel receiving orders.
e. Set up filing system.
f. Obtain roster of incident personnel who have ordering authority.
g. Obtain list of previously ordered supplies and equipment.
h. Ensure order forms are filled out correctly.
i. Place orders in a timely manner.
j. Consolidate orders, when possible.
k. Identify times and locations for delivery of supplies and equipment.
l. Keep RCDM informed of orders placed.
m. Submit all ordering documents to the Documentation Control Unit through the SPUL Leader before demobilization.
n. Maintain Unit Log (ICS 214-CG).

RECEIVING AND DISTRIBUTION MANAGER (RCDM) – The RCDM is responsible for receiving and

distributing all supplies and equipment (other than primary resources) and the service and repair of tools and equipment. The RCDM reports to the SPUL.
The major responsibilities of the RCDM are:

a. Review Common Responsibilities in Chapter 2.
b. Order required personnel to operate supply area.
c. Organize the physical layout of the supply area.
d. Establish procedures for operating the supply area.
e. Set up a filing system for receiving and distributing supplies and equipment.
f. Maintain inventory of supplies and equipment.
g. Develop security requirement for supply area.
h. Establish procedures for receiving supplies and equipment.
i. Submit necessary reports to the SPUL.
j. Notify ORDM of supplies and equipment received.
k. Provide necessary supply records to SPUL. Leader.
l. Maintain Unit Log (ICS 214-CG).

FACILITIES UNIT LEADER (FACL) – The FACL is primarily responsible for the set up, maintenance and demobilization of incident facilities, e.g., Base, ICP and Staging Areas, as well as security services required to support incident operations. The FACL provides sleeping and sanitation facilities for incident personnel and manages Base operations. Each facility is assigned a manager who reports to the FACL and is responsible for managing the operation of the facility.
The FACL reports to the SUBD.
The major responsibilities of the FACL are:

a. Review Common Responsibilities in Chapter 2.
b. Review Unit Leader Responsibilities in Chapter 2.
c. Obtain a briefing from the SUBD or the LSC.
d. Receive and review a copy of the IAP.

e. Participate in Logistics Section/Support Branch planning activities.
f. In conjunction with the Finance/Admin Section, determine locations suitable for incident support facilities and secure permission to use through appropriate means.
g. Inspect facilities prior to occupation and document conditions and preexisting damage.
h. Determine requirements for each facility, including the ICP.
i. Prepare layouts of incident facilities.
j. Notify Unit Leaders of facility layout.
k. Activate incident facilities.
j. Provide Facility Managers and personnel to operate facilities.
k. Provide sleeping facilities.
l. Provide security services.
m. Provide food and water service.
n. Provide sanitation and shower service, as needed.
o. Provide facility maintenance services, e.g., sanitation, lighting, clean up, trash removal, etc.
p. Inspect all facilities for damage and potential claims.
q. Demobilize incident facilities.
r. Maintain facility records.
s. Maintain Unit Log (ICS 214-CG).

SECURITY MANAGER (SECM) – The SECM is responsible for providing safeguards needed to protect personnel and property from loss or damage.
The major responsibilities of the SECM are:

a. Review Common Responsibilities in Chapter 2.
b. Establish contacts with local law enforcement agencies, as required.
c. Contact the Resource Use Specialist for crews or Agency Representatives to discuss any special

custodial requirements that may affect operations.

d. Request required personnel support to accomplish work assignments.
e. Ensure security of classified material and/or systems.
f. Ensure that support personnel are qualified to manage security problems.
g. Develop Security Plan for incident facilities.
h. Adjust Security Plan for personnel and equipment changes and releases.
i. Coordinate security activities with appropriate incident personnel.
j. Keep the peace, prevent assaults and settle disputes through coordination with Agency Representatives.
k. Prevent theft of all government and personal property.
l. Document all complaints and suspicious occurrences.
m. Maintain Unit Log (ICS 214-CG).

BASE MANAGER (BCMG) – The BCMG is responsible for ensuring that appropriate sanitation, security and facility management services are conducted at the Base. The major responsibilities of the BCMG are:

a. Review Common Responsibilities in Chapter 2.
b. Determine personnel support requirements.
c. Obtain necessary equipment and supplies.
d. Ensure that all facilities and equipment are set up and properly functioning.
e. Supervise the establishment of
   - Sanitation facilities, including showers, and
   - Sleeping facilities.
f. Make sleeping area assignments.
g. Adhere to all applicable safety and health standards and regulations.
h. Ensure that all facility maintenance services are

provided.

i. Maintain Unit Log (ICS 214-CG).

GROUND SUPPORT UNIT LEADER (GSUL) – The GSUL is primarily responsible for ensuring: repair of primary tactical equipment, vehicles, mobile ground support equipment and fueling services; transportation of personnel, supplies, food and equipment in support of incident operations; recording all ground equipment usage time, including contract equipment assigned to the incident; and implementing the Traffic Plan for the incident. The major responsibilities of the GSUL are:

a. Review Common Responsibilities in Chapter 2.
b. Review Unit Leader Responsibilities in Chapter 2.
c. Participate in Support Branch/Logistics Section planning activities.
d. Develop and implement the Traffic Plan.
e. Support out-of-service resources.
f. Notify the Resources Unit of all status changes on support and transportation vehicles.
g. Arrange for and activate fueling, maintenance and repair of ground resources.
h. Maintain Support Vehicle Inventory and transportation vehicles (ICS-218).
i. Provide transportation services IAW requests from the LSC or SUBD.
j. Collect use information on rented equipment.
k. Requisition maintenance and repair supplies, e.g., fuel, spare parts.
l. Maintain incident roads.
m. Submit reports to SUBD as directed.
n. Maintain Unit Log (ICS 214-CG).

EQUIPMENT MANAGER (EQPM) – The EQPM provides service, repair and fuel for all apparatus and equipment; provides transportation and support vehicle services; and maintains records of equipment use and

service provided.
The major responsibilities of the EQPM are:

a. Review Common Responsibilities in Chapter 2.
b. Obtain the IAP to determine locations for assigned resources, Staging Area locations and fueling and service requirements for all resources.
c. Obtain necessary equipment and supplies.
d. Provide maintenance and fueling according to schedule.
e. Prepare schedules to maximize use of available transportation.
f. Provide transportation and support vehicles for incident use.
g. Coordinate with AREP on service and repair policies, as required.
h. Inspect equipment condition and ensure coverage by equipment agreement.
i. Determine supplies (e.g., gasoline, diesel, oil and parts needed to maintain equipment in an efficient operating condition) and place orders with the Supply Unit.
j. Maintain Support Vehicle Inventory (ICS-218).
k. Maintain equipment rental records.
l. Maintain equipment service and use records.
m. Check all service repair areas to ensure that all appropriate safety measures are being taken.
n. Maintain Unit Log (ICS 214-CG).

VESSEL SUPPORT UNIT LEADER (VESS) – The VESS is responsible for implementing the Vessel Routing Plan for the incident and coordinating transportation on the water and between shore resources. Since most vessels will be supported by their own infrastructure, the Vessel Support Unit may be requested to arrange fueling, dockage, maintenance and repair of vessels on a case-by-case basis.
The major responsibilities of the VESS are:

a. Review Common Responsibilities in Chapter 2.
b. Review Unit Leader Responsibilities in Chapter 2.
c. Obtain a briefing from the SUBD or the LSC.
d. Participate in Support Branch/Logistics Section planning activities.
e. Coordinate development of the Vessel Routing Plan.
f. Coordinate vessel transportation assignments with the Protection and Recovery Branch or other sources of vessel transportation.
g. Coordinate water-to-land transportation with the Ground Support Unit, as necessary.
h. Maintain a prioritized list of transportation requirements that need to be scheduled with the transportation source.
i. Support out-of-service vessel resources, as requested.
j. Arrange for fueling, dockage, maintenance and repair of vessel resources, as requested.
k. Maintain inventory of support and transportation vessels.
l. Maintain Unit Log (ICS 214-CG).

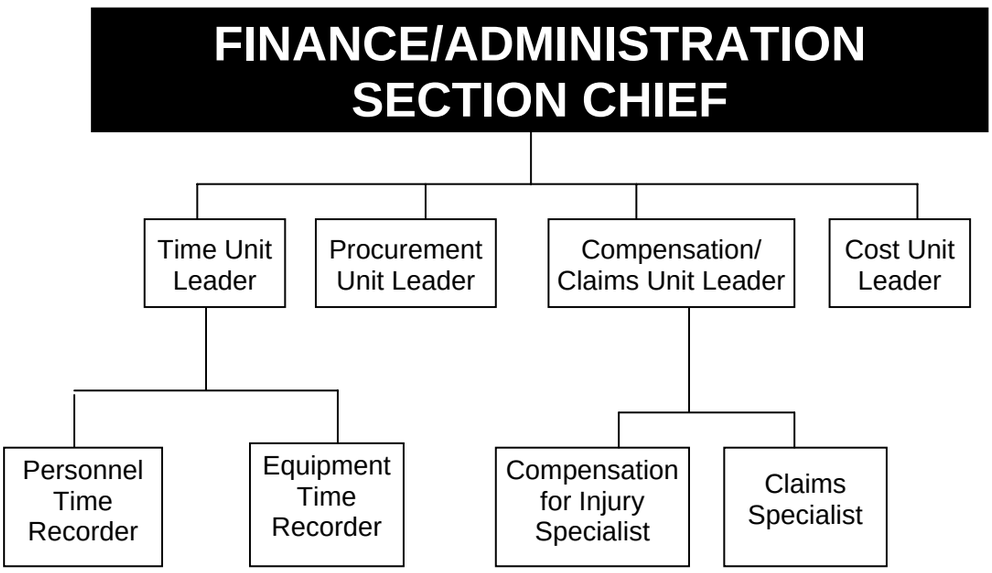
TECHNICAL SPECIALISTS (THSP) – Certain incidents or events may require the use of THSP's who have specialized knowledge and expertise. THSP's may function within the Planning Section or be assigned wherever their services are required. See chapter 8 and the THSP Job Aid for more detailed information on THSP's.

AUGUST 2006

CHAPTER 10

FINANCE/ADMINISTRATION SECTION

ORGANIZATION CHART



Reference:

(a) Finance/Administration Section Chief Job Aid

POSITION CHECKLISTS

FINANCE/ADMINISTRATION SECTION CHIEF (FSC)

- The FSC, a member of the General Staff, is responsible for all financial, administrative and cost analysis aspects of the incident and for supervising members of the Finance/Admin Section. The FSC Job Aid (reference (a)) should be reviewed regarding the organization and duties of the FSC.

The FSC may have Deputy FSC's, who may be from the same agency or from an assisting agency. The Deputy FSC must have the same qualifications as the person for whom they work, as they must be ready to take over that position at any time.

The major responsibilities of the FSC are:

a. Review Common Responsibilities in Chapter 2.
b. Participate in incident planning meetings and briefings as required.
c. Review operational plans and provide alternatives where financially appropriate.
d. Manage all financial aspects of an incident.
e. Provide financial and cost analysis information as requested.
f. Gather pertinent information from briefings with responsible agencies.
g. Develop an operating plan for the Finance/ Admin Section; fill supply and support needs.
h. Determine the need to set up and operate an incident commissary.
i. Meet with Assisting and Cooperating Agency Representatives, as needed.
j. Maintain daily contact with agency(s) administrative headquarters on Finance/Admin matters.
k. Ensure that all personnel time records are

accurately completed and transmitted to home agencies, according to policy.

l. Provide financial input to demobilization planning.
m. Ensure that all obligation documents initiated at the incident are properly prepared and completed.
n. Brief agency administrative personnel on all incident-related financial issues needing attention or follow-up prior to leaving incident.
o. Develop recommended list of Section resources to be demobed and initial recommendation for release when appropriate.
p. Receive and implement applicable portions of the incident Demobilization Plan.
q. Maintain Unit Log (ICS 214-CG).

TIME UNIT LEADER (TIME) - The TIME is responsible for equipment and personnel time recording and for managing the commissary operations.

The major responsibilities of the TIME are:

a. Review Common Responsibilities in Chapter 2.
b. Review Unit Leader Responsibilities in Chapter 2.
c. Determine incident requirements for time recording function.
d. Determine resource needs.
e. Contact appropriate agency personnel/ representatives.
f. Ensure that daily personnel time recording documents are prepared and in compliance with agency(s) policy.
g. Establish time unit objectives.
h. Maintain separate logs for overtime hours.
i. Establish commissary operation on larger or long-term incidents, as needed.
j. Submit cost estimate data forms to the Cost Unit, as required.
k. Maintain records security.

l. Ensure that all records are current and complete prior to demobilization.
m. Release time reports from assisting agency personnel to the respective Agency Representatives prior to demobilization.
n. Brief the FSC on current problems and recommendations, outstanding issues and follow-up requirements.
o. Maintain Unit Log (ICS 214-CG).

EQUIPMENT TIME RECORDER (**EQTR)** - Under supervision of the TIME, the EQTR is responsible for overseeing the recording of time for all equipment assigned to an incident.

The major responsibilities of the EQTR are:

a. Review Common Responsibilities in Chapter 2.
b. Set up the EQTR function in location designated by the Time Unit Leader.
c. Advise Ground Support Unit, Vessel Support Unit, Facilities Unit and Air Support Group of the requirement to establish and maintain a file for maintaining a daily record of equipment time.
d. Assist Units in establishing a system for collecting equipment time reports.
e. Post all equipment time tickets within 4 hours after the end of each operational period.
f. Prepare a use and summary invoice for equipment, as required, within 12 hours after equipment arrival at the incident.
g. Submit data to TIME for cost effectiveness analysis.
h. Maintain current posting on all charges or credits for fuel, parts and services.
i. Verify all time data and deductions with owner/ operator of equipment.
j. Complete all forms according to agency specifications.

k. Close out forms prior to demobilization.
l. Distribute copies per agency and incident policy.
m. Maintain Unit Log (ICS 214-CG).

PERSONNEL TIME RECORDER (PTRC) - Under supervision of the TIME, the PTRC is responsible for overseeing the recording of time for all personnel assigned to an incident.

The major responsibilities of the PTRC are:

a. Review Common Responsibilities in Chapter 2.
b. Establish and maintain a file for incident personnel time reports within the first operational period.
c. Initiate, gather or update a time report from all applicable personnel assigned to the incident for each operational period.
d. Ensure that all employee identification information is verified to be correct on the time report.
e. Post personnel travel and work hours, transfers, promotions, specific pay provisions and terminations to personnel time documents.
f. Ensure that time reports are signed.
g. Close-out time documents prior to personnel leaving the incident.
h. Distribute all time documents according to agency policy.
i. Maintain a log of excessive hours worked and give to the TIME daily.
j. Maintain Unit Log (ICS 214-CG).

PROCUREMENT UNIT LEADER (PROC) - The PROC is responsible for administering all financial matters pertaining to vendor contracts, leases and fiscal agreements.

The major responsibilities of the PROC are:

a. Review Common Responsibilities in Chapter 2.

b. Review Unit Leader Responsibilities in Chapter 2.
c. Review incident needs and any special procedures with Unit Leaders, as needed.
d. Coordinate with local jurisdiction on plans and supply sources.
e. Obtain the Incident Procurement Plan.
f. Prepare and authorize contracts, building and land-use agreements.
g. Draft memoranda of understanding as necessary.
h. Establish contracts and agreements with supply vendors.
i. Provide for coordination between the ORDM and all other procurement organizations supporting the incident.
j. Ensure that a system is in place that meets agency property management requirements. Ensure proper accounting for all new property.
k. Interpret contracts and agreements; resolve disputes within delegated authority.
l. Coordinate with the Compensation/Claims Unit for processing claims.
m. Complete final processing of contracts and send documents for payment.
n. Coordinate cost data in contracts with the COST.
o. Brief the FSC on current problems and recommendations, outstanding issues and follow-up requirements.
p. Maintain Unit Log (ICS 214-CG).

COMPENSATION/CLAIMS UNIT LEADER (COMP) - The COMP is responsible for the overall management and direction of all administrative matters pertaining to compensation for injury and claims related activities (other than injury) for an incident.

The major responsibilities of the COMP are:

a. Review Common Responsibilities in Chapter 2.
b. Review Unit Leader Responsibilities in Chapter 2.

c. Obtain a briefing from the FSC.
d. Establish contact with the incident MEDL, SOFR and LNO (or Agency Representatives if no LNO is assigned).
e. Determine the need for Compensation for Injury and Claims Specialists and order personnel as needed.
f. Establish a Compensation for Injury work area within or as close as possible to the Medical Unit.
g. Review Incident Medical Plan(ICS 206-CG)
h. Ensure that CLMS's have adequate workspace and supplies.
i. Review and coordinate procedures for handling claims with the Procurement Unit.
j. Brief the CLMS's on incident activity.
k. Periodically review logs and forms produced by the CLMS's to ensure that they are complete, entries are timely and accurate, and that they are in compliance with agency requirements and policies.
l. Ensure that all Compensation for Injury and Claims logs and forms are complete and routed to the appropriate agency for post-incident processing prior to demobilization.
m. Keep the FSC briefed on Unit status and activity.
n. Demobilize unit in accordance with the Incident Demobilization Plan.
o. Maintain Unit Log (ICS 214-CG).

COMPENSATION FOR INJURY SPECIALIST (INJR) - Under the supervision of the COMP, the Compensation for Injury Specialist is responsible for administering financial matters resulting from serious injuries and fatalities occurring on an incident. Close coordination is required with the Medical Unit.

The major responsibilities of the INJR are:

a. Review Common Responsibilities in Chapter 2.

b. Collocate Compensation for Injury Specialist with the Medical Unit when possible.
c. Establish procedure with Medical Unit Leader on prompt notification of injuries or fatalities.
d. Obtain a copy of Incident Medical Plan (ICS 206-CG).
e. Provide written authority for persons requiring medical treatment.
f. Ensure that correct agency forms are being used.
g. Provide correct billing forms for transmittal to doctor and/or hospital.
h. Coordinate with MEDL to keep informed on status of injured and/or hospitalized personnel.
i. Obtain all witness statements from SOFR and/or MEDL and review for completeness.
j. Maintain a log of all injuries occurring at the incident.
k. Coordinate/handle all administrative paperwork on serious injuries or fatalities.
l. Coordinate with appropriate agency(s) to assume responsibility for injured personnel in local hospitals after demobilization.
m. Maintain Unit Log (ICS 214-CG).

CLAIMS SPECIALIST (CLMS) - Under the supervision of the COMP, the CLMS is responsible for managing all claims-related activities (other than injury) for an incident.

The major responsibilities of the CLMS are:

a. Review Common Responsibilities in Chapter 2.
b. Develop and maintain a log of potential claims.
c. Coordinate a claims prevention plan with applicable incident functions.
d. Initiate an investigation on all claims other than personnel injury.
e. Ensure that site and property involved in an investigation are protected.

f. Coordinate with the investigation team as necessary.
g. Obtain witness statements pertaining to claims other than personnel injury.
h. Document any incomplete investigations.
i. Document follow-up action needs by the local agency.
j. Keep the COMP advised on the nature and status of all existing and potential claims.
k. Ensure the use of correct agency forms.
l. Maintain Unit Log (ICS 214-CG).

COST UNIT LEADER (COST) - The COST is responsible for collecting all cost data, performing cost effectiveness analyses and providing cost estimates and cost saving recommendations for the incident. The major responsibilities of the COST are:

a. Review Common Responsibilities in Chapter 2.
b. Review Unit Leader Responsibilities in Chapter 2.
c. Obtain a briefing from the FSC.
d. Coordinate with agency headquarters on cost reporting procedures.
e. Collect and record all cost data.
f. Develop incident cost summaries.
g. Prepare resources-use cost estimates for the Planning Section.
h. Make cost-saving recommendations to the FSC.
i. Ensure all cost documents are accurately prepared.
j. Maintain cumulative incident cost records.
k. Complete all records prior to demobilization.
l. Provide reports to the FSC.
m. Maintain Unit Log (ICS 214-CG).

TECHNICAL SPECIALISTS (THSP) – Certain incidents or events may require the use of THSP's who have specialized knowledge and expertise. THSP's

may function within the Planning Section or be assigned wherever their services are required. See chapter 8 and the THSP Job Aid for more detailed information on THSP's.

CHAPTER 11

INTELLIGENCE

References:

(a) National Response Plan (NRP)
(b) National Incident Management System (NIMS)
(c) Intelligence Officer Job Aid

INTRODUCTION

This is a brief summary of the Intelligence function as used in NIMS ICS. The Intelligence Function has been described in more detail in references (a) and (b) and a Job Aid has been developed to assist Coast Guard Intelligence Officers (reference (c)). The analysis and sharing of information and intelligence are important elements of ICS. In this context, intelligence includes not only national security or other types of classified information but also other operational information, such as risk assessments, medical intelligence (i.e., surveillance), weather information, geospatial data, structural designs, toxic contaminant levels, and utilities and public works data that may come from a variety of different sources. Traditionally, information and intelligence functions are located in the Situation Unit under the Planning Section. However, in exceptional situations, the IC/UC may need to assign the information and intelligence functions to other parts of the ICS organization. In any case, information and intelligence must be appropriately analyzed and shared with personnel, designated by the IC, who have proper clearance and a “need-to-know" to ensure that they support decision-making.

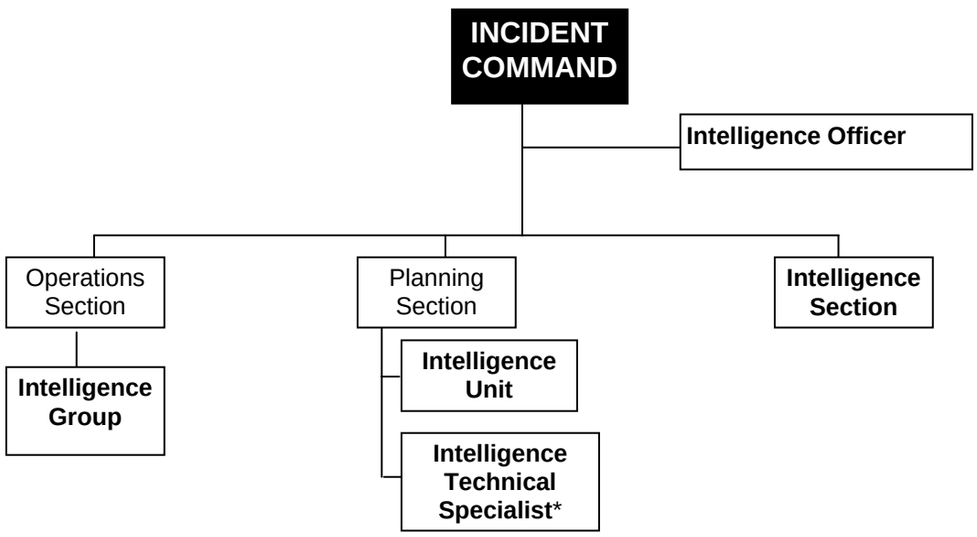
The intelligence and information function may be organized in one of the following ways:

a. Within the Command Staff as the Intelligence Officer (INTO). This option may be most appropriate in incidents in which incident-related intelligence is provided through real-time reach-back capabilities.
b. As an Intelligence Unit within the Planning Section. This option may be most appropriate in an incident with some need for tactical intelligence that can be handled by the Planning Section but requires a separate unit from the Situation Unit to handle it.
c. As an Intelligence Branch or Group within the Operations Section. This option may be most appropriate in incidents with a high need for **tactical** intelligence actions.
d. As a separate General Staff Intelligence Section. This option may be most appropriate when an incident is heavily influenced by intelligence factors or when there is a need to manage and/or analyze a large volume of classified or highly sensitive intelligence or information. This option is particularly relevant to a terrorism incident, for which intelligence plays a crucial role throughout the incident life cycle.
e. As an Intelligence Technical Specialist. This option can be used for any situation because a technical specialist can be assigned where most needed to in the ICS organization but may be most appropriate when little intelligence information is required by the incident.

Regardless of how it is organized, the information and intelligence function is also responsible for developing, conducting, and managing information- related security plans and operations as directed by the IC. These can include information security and operational security activities, as well as the complex task of ensuring that sensitive information of all types (e.g., classified

information, sensitive law enforcement information, proprietary and personal information, or export-controlled information) is handled in a way that not only safeguards the information but also ensures that it gets to those who need access to it so that they can effectively and safely conduct their missions. The information and intelligence function also has the responsibility for coordinating information-security and operational-security matters with public awareness activities that fall under the responsibility of the PIO, particularly where such public awareness activities may affect information or operations security.

ORGANIZATION CHART
Locations where Intelligence may be located in the ICS Organization



* May be assigned wherever their services are required.

For the U.S. Coast Guard, the intelligence function often fits best as the Intelligence Officer because of the Sector organization and other reasons noted in reference (c). See references (a) and (b) for more information on intelligence function and Chapter 6 and reference (c) for more information on the INTO duties and responsibilities.

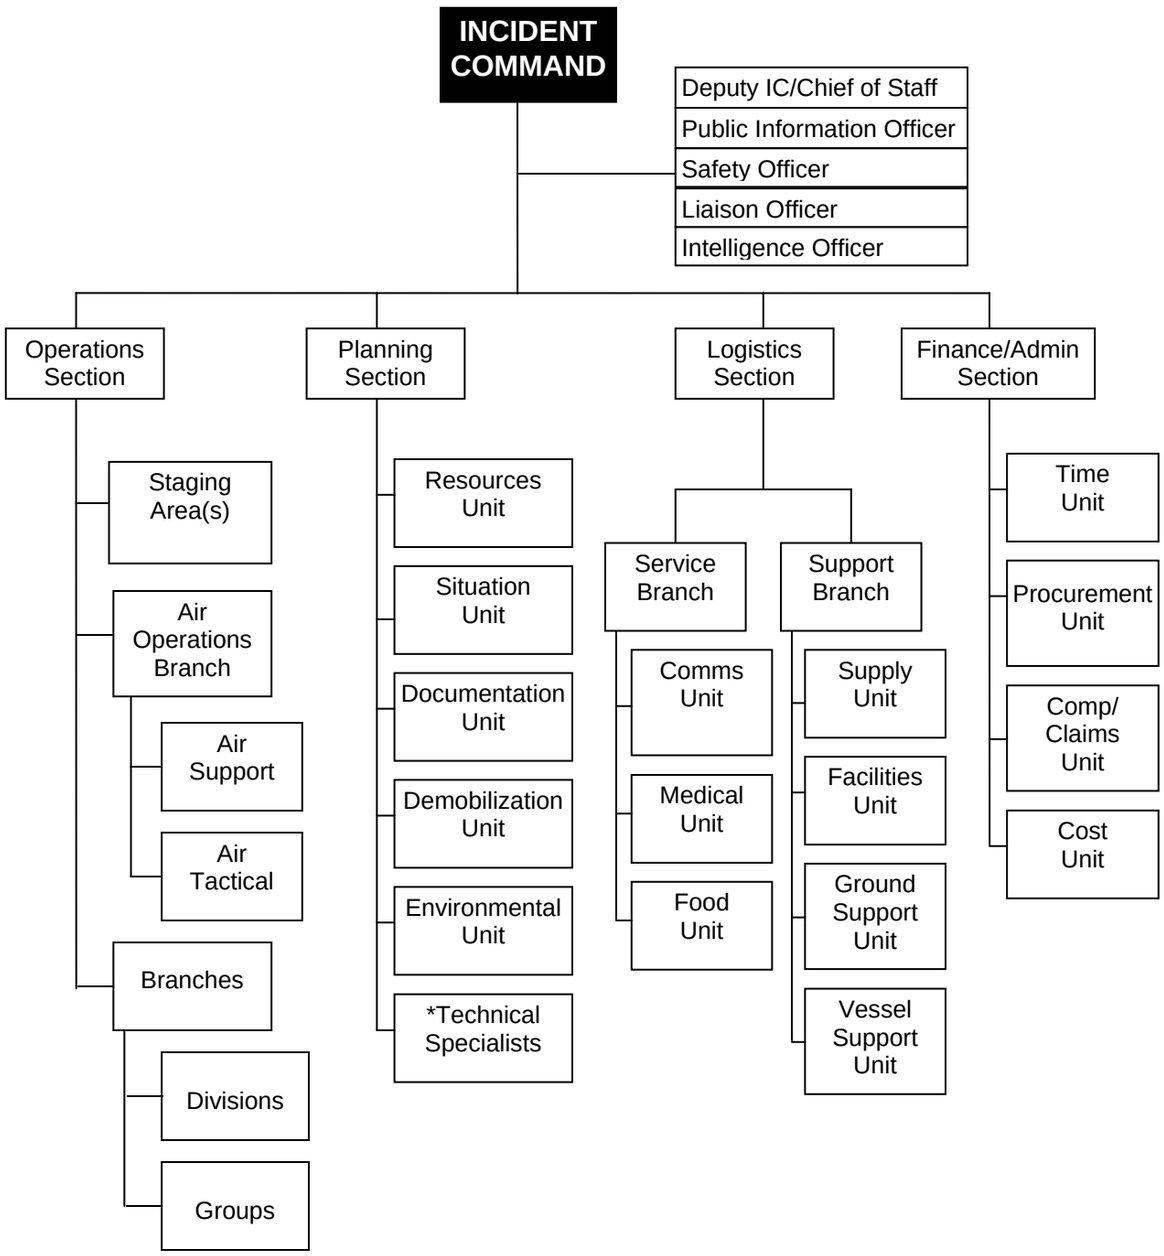
CHAPTER 12

ORGANIZATIONAL GUIDES

INCIDENT COMMAND SYSTEM ORGANIZATION CHART



* May be assigned wherever their services are required.

ICS ORGANIZATION GUIDE

COMMAND

1. Incident Commander - one per incident. Unless incident is multi-jurisdictional.
2. Multi-jurisdictional incidents establish Unified Command with each jurisdiction supplying an individual to represent agency in Unified Command Structure.
3. Incident Commander may have Deputy IC's as needed.
4. Command Staff Officer - one per function per incident.
5. Command Staff may have assistants as needed.
6. Agency Representatives report to Liaison Officer on Command Staff.

INCIDENT BASE RECOMMENDED MINIMUM PERSONNEL REQUIREMENTS
(**PER TWELVE (12) HOUR OPERATIONAL PERIOD or SHIFT**)

(If camps are established, the minimum personnel requirements for the Base may be modified or additional personnel may be added to support camps.)

	UNIT POSITION	SIZE OF INCIDENT (NUMBER OF DIVISIONS/GROUPS)				
		2	5	10	15	25
OPERATIONS	Operations Section Chief	One Per Operational Period				
	Deputy Operations Section Chief	1	1	1	2	3
	Branch Director		2	3	4	6
	Division/Group Supervisor	2	5	10	15	25
	Strike Team Leaders	As Needed				
	Task Force Leaders	As Needed				
	Air Operations Director		1	1	1	1
	Air Tactical Group Supervisor	1	1	1	1	1
	Helicopter Coordinator	As Needed				
	Air Support Group Supervisor	1	1	1	1	1
	Helibase Manager	One Per Helibase				
	Helispot Manager	One Per Helispot				
	Staging Area Manager	One Per Staging Area				
PLANNING	Planning Section Chief	One Per Incident				
	Deputy Planning Section Chief	1	1	1	2	3
	Resource Unit Leader	1	1	1	1	1
	Assistant Resource Unit Leader			1	1	2
	Status Recorders	1	2	3	3	4
	Check-In Recorders	As Needed				
	Technical Specialists	As Needed				
	Situation Unit Leader	1	1	1	1	1
	Assistant Situation Unit Leader			1	1	2
	Display/Report Processor		1	1	1	2
	SITREP/OPSUM Processors	1	1	1	2	2
	Field Observer		1	2	2	4
	Weather Observer	As Needed				
	Aerial/Ortho Photo Analyst	As Needed				
	Computer Terminal Operator		1	1	1	1
	Environmental Unit Leader	1	1	1	1	1
	Documentation Unit Leader		1	1	1	1
	Demobilization Unit Leader			1	1	1
	Demob Recorders from Resources	As Needed				

ICS Organization Guide continued

	UNIT POSITION	SIZE OF INCIDENT (NUMBER OF DIVISIONS/GROUPS)				
		2	5	10	15	25
LOGISTICS	Logistics Section Chief	One Per Incident				
	Deputy Logistics Section Chief				1	2
	Service Branch Director	As Needed				
	Communications Unit Leader	1	1	1	1	1
	Assistant Communications Unit Leader			1	1	2
	Incident Communications Manager	1	1	1	1	1
	Incident Dispatcher	1	2	3	3	4
	Message Center Operator		1	1	2	2
	Messenger		1	2	2	2
	Communications Technician		1	2	4	4
	Medical Unit Leader	1	1	1	1	1
	Assistant Medical Unit Leader	As Needed				
	Food Unit Leader		1	1	1	1
	Food Unit Assistant (each camp)	As Needed				
	Support Branch Director	As Needed				
	Supply Unit Leader		1	1	1	1
	Camp Supply Assistant (each camp)	As Needed				
	Ordering Manager			1	1	1
	Receiving/Distribution Manager		1	1	1	1
	Recorders		1	1	2	2
	Supply Unit Staff		2	2	2	2
	Facility Unit Leader		1	1	1	1
	Base Manager		1	1	1	1
	Camp Manager (each camp)	As Needed				
	Facility Maintenance Specialist		1	1	1	1
	Security Manager		1	1	1	1
	Facility Unit Staff		6	6	12	12
	Ground Support Unit Leader	1	1	1	1	1
	Equipment Manager		1	1	1	1
	Assistants	As Needed				
	Equipment Timekeeper		1	1	1	1
	Mechanics	1	1	3	5	7
	Drivers	As Needed				
	Operators	As Needed				
	Vessel Support Unit Leader	As Needed				
FIN-ADMIN	Finance/Administration Section Chief	One Per Incident				
	Deputy Finance/Admin Section Chief					1
	Time Unit Leader		1	1	1	1
	Time Recorder, Personnel		1	3	3	5
	Time Recorder, Equipment		1	2	2	3
	Procurement Unit Leader		1	1	1	1
	Compensation/Claims Unit Leader		1	1	1	1
	Compensation Specialist	As Needed				
	Claims Specialist	As Needed				
	Cost Unit Leader		1	1	1	1
	Cost Analyst			1	1	1

JOINT-STAFF (J-Staff)/ICS ORGANIZATION CORRELATION CHART

Coast Guard personnel may find themselves working in a Joint-Staff (J-Staff) organization in support of DOD operations, or DOD personnel may find themselves working in support of a Federal or State Agency within an ICS organization. The following table is provided to enable those trained in an ICS position to identify where their ICS skills best fit in a J-Staff Organization. Conversely, if J-Staff qualified individuals find themselves working in an ICS organization in support of a response they can use the table to find where their J-Staff training and experience will best fit in the ICS organization.

For example, if an individual is trained as a Resources Unit Leader in ICS and they report to a J-Staff organization, their skills in ICS would best fit under J-1 (Manpower and Personnel).

* It is important to remember that the J-Staff was not intended to be an emergency response organization.

J Staff	J Staff Responsibilities	Proposed ICS Position Equivalents
Commander, Deputy Commander, Chief of Staff	♦ Plan and conduct military operations in response, including the security of the command and protection of the United States, its possessions and bases against attack or hostile incursion. ♦ Maintain the preparedness of the command to carry out missions assigned to the command. ♦ Carry out assigned missions, tasks, and responsibilities.	**Incident Commander** – the IC's responsibility is the overall management of the incident. On most incidents, a single IC carries out the command activity. The IC is selected by qualifications and experience. **Unified Command** – A unified team that manages an incident by establishing a common set of incident objectives and strategies. This is accomplished without loss or abdication of agency or organizational authority, responsibility or accountability.
Special Staff	♦ Gives technical, Administrative & tactical advice ♦ Prepares parts of plans, estimates & orders ♦ Coordinates & supervises staff active Responsible directly to the Commander	**Technical Specialists**- Personnel with special skills who can be used anywhere within the ICS Organization.
Personal Staff	♦ Gives technical, Administrative & tactical advice ♦ Prepares parts of plans, estimates & orders ♦ Coordinates & supervises staff active Responsible directly to the Commander ♦ Special Matters over which commander chooses to exercise close personal control ♦ Usually includes the political adviser ties	**Information Officer**- is responsible for developing and releasing information about the incident to the news media, to incident personnel, and to other appropriate agencies and organizations. **Liaison Officer**- is assigned to the incident to be the contact for assisting and/or cooperating Agency Representatives **Safety Officer**- to develop and recommend measures for assuring personnel safety, and to assess and/or anticipate hazardous and unsafe situations. Only the SOFR will be assigned for each incident. **Intelligence Officer**- Command Staff Officer who Determines Intelligence gaps and intelligence Requirements during the planning phase, analyzes and shares intelligence among ICS functions and involved partners, and processes classified and unclassified request for intelligence.

J Staff	J Staff Responsibilities	Proposed ICS Position Equivalents
J-1: Manpower & Personnel	♦ All matters concerning human resources and, ♦ Unit Personnel strength and readiness status ♦ Monitors and assesses elements of personnel administration & management **Receives information for coordinating, advising, and planning to assist the CG Commander in accomplishing the mission**	**Resources Unit**: Maintains status of all assigned resources at an incident (key supervisory personnel, primary & support resources, etc.). *(Planning Section)* **Documentation Unit**: Maintains accurate, up-to-date incident files. *(Planning Section)* **Time Unit**: Accurate recording of daily personnel time, compliance with time recording policies, and managing commissary operations. *(Finance/Administration Section)*
J-2: Intelligence	♦ All matters concerning military and contingency intelligence. ♦ Acquires various intelligence information and data. ♦ Analyzes and evaluates intelligence and data. ♦ Provides analyzed information and data to CG Commander with recommendations.	**Intel Officer** - Command Staff Officer who Determines Intelligence gaps and intelligence Requirements during the planning phase, analyzes and shares intelligence among ICS functions and involved partners, and processes classified and unclassified request for intelligence. The INTO manages operational information such as risk assessments, affects on public and responders, utilities and infrastructure affects, and develops strategic assessment vs. specific targeted. (Command Staff)
J-3: Operations	♦ All matters concerning contingency operations, tactical plans, tactical response organization and training ♦ Maintains current operations estimate of situation in coordination with other staff elements ♦ Coordinates & develops the operations & tactical plans, and OPORDERS ♦ Responsible for all tactical activities ♦ All personnel and unit training within Command organization	**Operations Section Chief**: Manages tactical operations, requests resources as needed, supervises execution of the Incident Action Plan for Operations, approves release of resources from assigned status. *(Operations Section)* Other Branches, Task Forces, Single Resources, Staging Area Manager, Air Operations, Air Tactical Group, etc**.** Assigned duties, as directed under the standard ICS organization. *(Operations Section)*

J Staff	J Staff Responsibilities	Proposed ICS Position Equivalents
J-4: Logistics	♦ All matters concerning the response organization supplies, maintenance, transportation, and services ♦ Determines supply requirements and coordinates/processes supply requests. Ensures supply security. ♦ **Supervises collection, staging, distribution and transportation of supplies**	**Logistics Section Chief**: All incident support (exception being aviation support). (*Logistics Section)* **Demobilization Unit**: Develops Incident demobilization plan. *(Planning Section)* **Medical Unit**: Procedures for managing major medical emergencies, provide medical aid, and assist with processing injury-related claims (determine level of emergency medical activities prior to activation, acquire and manage medical support, establish procedures for handling serious injuries). *(Logistics Section)* **Food Unit**: Supplies food needs for the entire incident (determine food & water requirements, obtain necessary equipment and supplies, order sufficient food and potable water, etc.). *(Logistics Section)* **Supply Unit**: Orders, receives, processes, stores all incident-related resources. Provides supplies to planning, logistics and finance/admin sections, determines type and amount of supplies en route, orders, receives, distributes, and stores supplies and equipment, maintains inventory of supplies and equipment. *(Logistics Section)* **Facilities Unit**: Sets up, maintains and demobilizes all incident support facilities. Determines requirements for each incident facility, activates incident facilities, provides security services, etc. *(Logistics Section)* **Ground Support Unit:** Maintenance, service, and fueling of all mobile equipment & vehicles. Ground transportation of personnel, supplies and equipment. Support services for mobile equipment & vehicles, order maintenance & repair supplies, etc. *(Logistics Section)*

J Staff	J Staff Responsibilities	Proposed ICS Position Equivalents
J-4: Logistics (continued)	*(continued from previous page)*	**Procurement Unit**: All matters pertaining to vendor contracts, leases, and fiscal agreements. Coordinate with local jurisdiction on plans and supply sources, draft memoranda of understanding, establish contracts & agreements with supply vendors. *(Finance/Administration Section)*
J-5: Plans & Policy	♦ All matters concerning the long range response organization planning. ♦ Prepares mission, concept, and overall operations plans for the contingency. ♦ Prepares the recommended Course of Action (COA) and Commander's Estimates (CE), and provides response recommendations. ♦ Coordinates and facilitates all planning functions and processes.	**Planning Section Chief**: Evaluates, processes, and disseminates information for use at the incident. Reassigns out-of-service personnel already on-site to ICS organizational positions, as appropriate, establishes information requirements, and reporting schedules, determines need for any specialized resources, assembles information on alternative strategies, provides periodic predictions on incident potential, reports any significant changes in incident status. *(Planning Section)*
J-6: Command, Control & Communications	♦ All matters concerning Command, Control, and Communications. ♦ Handles command responsibilities for communications. ♦ Coordinates tactical communications planning and execution. ♦ Manages and develops the electronics and automatic information systems.	**Communications Unit**: Develops plans for the use of incident communications equipment and facilities, installs and tests the communications equipment, supervises the Incident Communications Center, distributes and maintains communications equipment. *(Communications Section)*

J-7 Operational Plans and Interoperability	♦ Prepares appropriate strategic and theater force structure recommendations and alternatives for use in the development of military plans. ♦ Prepares the appropriate JSPS documents to support implementation of Joint Staff force structure recommendations including force apportionment and assignment. ♦ Conducts tradeoff analyses between force effectiveness and alternative resource distributions. ♦ Conducts tradeoff analyses of joint force capabilities and requires, including assessments of the projected readiness, sustainability, modernization, and force structure aspects of current and programmed forces.	**Planning Section Chief**: Evaluates, processes, and disseminates information for use at the incident. Reassigns out-of-service personnel already on-site to ICS organizational positions, as appropriate, establishes information requirements, and reporting schedules, determines need for any specialized resources, assembles information on alternative strategies, provides periodic predictions on incident potential, reports any significant changes in incident status. *(Planning Section)*

J-8 **Force Structure, Resources and Assessment**	♦ Pursues joint force development through joint doctrine, training, war plans, and assessments ♦ Through the Joint Training System, joint exercise program, CJCS Assessment Program, and review of conventional war plans, assists the combatant commands, Joint Staff, Services, and OSD to exercise and improve the capability of US forces and combat support agencies to achieve strategic goals. ♦ Facilitates addressing warfighting requirements needed in war plans, joint education, training, and doctrine.	**Finance Section Chief**- is responsible for all financial, administrative, and cost analysis aspects of the incident and for supervising members of the Finance/Administration Section. ♦ **Compensation/Claims**: Oversees completion of all forms required by workers' compensation and local agencies. Also maintains file of injuries and illnesses, associated with the incident. Close coordination with the Medical Unit. Claims are responsible for investigating all claims involving property associated with or involved in incident. *(Finance/Administration Section)* ♦ **Cost Unit**: Provides all incident cost analysis. Insures proper identification of all equipment and personnel requiring payment, prepares estimates of incident costs, and maintains accurate records of incident costs. *(Finance/Administration Section)* ♦ **Procurement Unit**: All matters pertaining to vendor contracts, leases, and fiscal agreements. Coordinate with local jurisdiction on plans and supply sources, draft memoranda of understanding, establish contracts 7 agreements with supply vendors. *(Finance/Administration Section*

JOPES and ICS Interaction

Anyone who has participated in the Joint Operational Planning and Execution System (JOPES) or ICS planning processes will understand the value of *Process*. Process is as important as and sometimes more important than the plan. The process itself drives critical information and communication of that information where it needs to go. JOPES consists of two planning processes; Crisis Action Planning (CAP) and Deliberate Planning. ICS delineates between *Unplanned Incidents* and *Planned Events*. Although ICS has been utilized for large scale Planned Events, by design, it is a CAP process.

The JOPES and ICS Interaction diagram takes the *linear* process for producing JOPES OPLANS and Orders and *bends* it around the ICS Operational Planning "P". This works because the basic functional activities are essentially the same for all planning processes. The diagram translates between JOPES and ICS functions, phases, and tools. Both JOPES and ICS practitioners can now see that the processes flow in the same sequence; how by implication, portions of a JOPES plan or order relate to ICS tools; and that continuous improvement of ICS can be incorporated into JOPES OPLANS and Orders.

Current Coast Guard doctrine dictates JOPES for some of its Deliberate Planning and ICS for most CAP responses. The Deliberate OPLANS and Contingency Plans prepare units for response and directly feed into the development of ICS Incident Action Plans when they do.

(c) Area Command Job Aid
(d) Logistics Section Chief Job Aid

INTRODUCTION

The purpose of an Area Command (AC) is to oversee the management of the incident(s), focusing primarily on strategic assistance and direction and resolving competition for scarce response resources. An Area Command (AC) is activated only if necessary, depending on the complexity of the incident and incident management span-of-control considerations. This organization does not supplant the Incident Commanders (IC's) and Unified Commands (UC's), but supports and provides strategic direction. Execution of tactical operations and coordination remains the responsibility of the on-scene incident command/unified command structure.

Area Command is an organization activated by the Sector, District, or Area Commander to ensure coordination for Command, Planning, Logistical and Fiscal matters. For example, the need for an AC may arise when there are multiple incidents and/or a spill of national significance (SONS). The AC will determine critical resource allocation. For multiple incidents, AC may also establish incident prioritization.

NOTE: For further details on operating procedures refer to the Area Command Job Aid.

AREA COMMAND
CONCEPT OF OPERATIONS

AC Activation Criteria

A District/Area Commander or the Commandant can determine when an incident(s) is of such magnitude, complexity or operational intensity that it would benefit from the activation of an AC. Also, there may be times when multiple incidents occur within one Sector Commander zone where incidents are competing for the same resources. The AC may be designated by the Sector Commander or the Sector Commander may fulfill the AC role. Factors to consider when deciding to activate an AC include but are not limited to:

1. Complex incident overwhelming local and regional Coast Guard assets;
2. An incident that overlaps Coast Guard districts;
3. An incident that crosses international borders;
4. The existence of, or the potential for, a high level of national political and media interest;
5. Significant threat or impact to the public health and welfare, natural environment, property or economy over a broad geographic area; or
6. More than one active incident where incidents are competing for the same resources.

AC Activation Guidance

When the decision is made to activate an AC, the following actions should occur:

1. An Area Commander is designated by the Sector Commander, District Commander, Area Commander or the Commandant.
2. Designated Area Commander and deputy/deputies will be delegated clear succession of command authority.
3. If an incident(s) is multi-jurisdictional, the AC shall be established using Unified Command (UC)

concepts and principles. When Unified Area Command (UAC) is established, representatives will typically consist of executives possessing the highest level of response authority as possible.

4. Determine appropriate location for the Area Command Post (ACP).

AC Responsibilities

AC has the overall responsibility for strategic management of the incident(s) and will:

1. Establish AC strategic objectives.
2. Establish overall response priorities.
3. Rank incidents in order of priority.
4. Identify and allocate critical resources based on incident needs.
5. Ensure that the incident(s) is properly managed;
6. Ensure that the on-scene incident(s) objectives are met.
7. Minimize conflict with supporting agency's/ stakeholder and public concerns.
8. Coordinate acquisition of critical or specialized resources.
9. In the event that a Joint field Office (JFO) is activated, coordinate acquisition of national assets to support the incident(s) between AC and the JFO. (See reference (a) or Chapter 14 for detailed description of a JFO.)

AC Staffing

The AC organization should be kept as small as possible. The size of the AC organization will be determined by the authorities and support requirements of the incident(s) and follows standard ICS principles like flexibility and scalability. Under normal circumstances, AC staffing will consist of:

1. Area Commander(s) and Deputy/Deputies
2. AC Liaison Officer (AC LNO)

3. AC Safety Officer (AC SOFR)
4. AC Public Information Officer (AC PIO)
5. AC Intelligence Officer (AC INTO)
6. AC Logistics Chief (AC LC)
7. AC Communication Unit Leader (AC COML)
8. AC Information Technology Specialist (AC ITS)
9. AC Facility Unit Leader (AC FACL)
10. AC Planning Chief (AC PC)
11. AC Documentation Unit Leader (AC DOCL)
12. AC Critical Resources Unit Leader (AC CRESL)
13. AC Situation Unit Leader (AC SITL)
14. AC Finance/Administration Chief (AC FC)

Optional Staffing
1. Legal Specialist
2. Security Specialist
3. Intel Specialist
4. Aviation Coordinator
5. Documentation Specialist/Executive Assistant
6. Legislative Affairs Officer

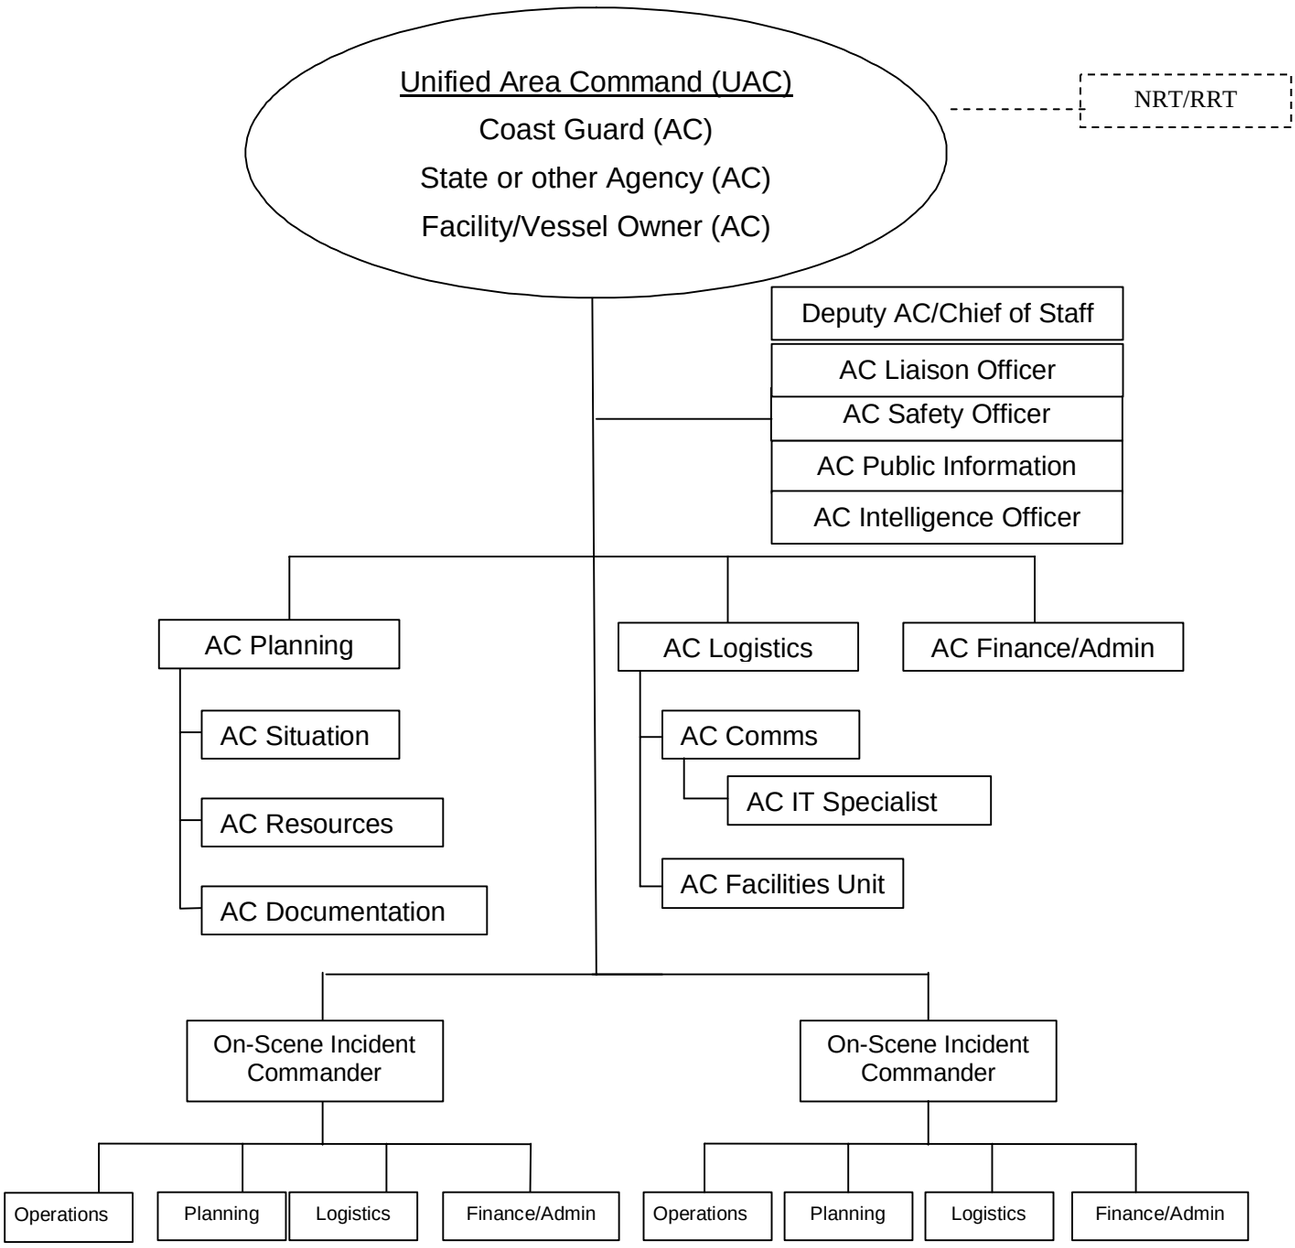
The Area Command organization does not, in any way, replace the on-scene incident organization(s) or functions. The above positions, if established, are strictly related to supporting the AC functional responsibilities. Tactical operations continue to be directed at the on-scene IC/UC command level.

In addition, **Expanded Ordering** may be set up outside of the local incident(s) and outside of Area Command to assist with non-critical resource ordering. See more about expanded ordering process in reference (d), the Logistics Section Chief Job Aid.

AC REPORTING RELATIONSHIPS

It is envisioned that the role of Area Commander for Incidents of National Significance (INS) will be filled by a Flag Officer (or their designee) with the ability to set priorities and objectives on behalf of the entire Coast Guard. When established, the Area Commander reports through normal Coast Guard reporting channels to the Commandant. If a JFO or other Multiagency Coordination Centers (MACS) are established, the AC will need to determine the appropriate level of coordination and liaison required to support the incident(s).

AREA COMMAND ORGANIZATION



Note: NIIMS Area Command includes an Aviation Coordinator position. This position was intentionally left out for Coast Guard AC. The AC can add the position anytime they determine a need for special aviation coordination.

AREA COMMAND
POSITION CHECKLISTS

AREA COMMANDER (AC)

The Area Commander is responsible for providing the overall direction to the on-scene IC(s). This responsibility includes ensuring that conflicts are resolved, incident objectives are established and strategies are selected to meet AC priorities and strategic objectives.

The Area Commander responsibilities are as follows:

1. Review Common Responsibilities in Chapter 2.
2. Obtain authorities and policy guidance from agency executive(s).
3. Provide briefings to the next level of command through normal reporting channels.
4. If operating within a UAC, develop a working agreement with all UAC participants to ensure that jurisdictional authorities are not compromised or neglected.
5. In coordination with on-scene IC's/UC's determine level of effort AC will need to support.
6. Based on the scope of the job, ensure the AC organization is capable of meeting their functional responsibility.
7. Identify location and establish an appropriate Area Command Post.
8. Establish authorities and policy guidance and communicate to AC team members.
9. Develop overall direction, priorities, and strategic objectives and convey to on-scene IC's/UC's.
10. Ensure that the incident response strategies address the direction set by the AC.
11. Establish priorities for assignment and demobilization of critical resources.
12. Coordinate demobilization of critical resources.

13. Establish a media strategy (plan) for release of information to the media, the public, etc.
14. Serve as public spokesperson for the overall response.
15. Manage the AC organization to ensure the on-scene IC's/UC's are appropriately supported.
16. Maintain AC log of strategic decisions.
17. Monitor and evaluate AC Incident management Team (AC IMT) performance.
18. Anticipate and analyze long term big picture potential consequences and develop strategic response alternatives.

DEPUTY AREA COMMANDER (DAC)

The AC may have Deputy AC's, who may be from the same agency or from an assisting agency. The Deputy AC must have the same qualifications as the person for whom they work, as they must be ready to take over that position at any time. When span of control becomes an issue for the AC, a Deputy AC/Chief of Staff may be assigned to manage the AC Command Staff.

The major responsibilities of the DAC are:

1. Review Common Responsibilities in Chapter 2.
2. Assist the AC in executing their responsibilities.
3. Perform Area Commander Duties in the absence of the designated Area Commander.
4. Oversee and facilitate the overall operation of the AC Staff and General Staff functions on behalf of the Area Commander.
5. Administer special projects as assigned.

AC LIAISON OFFICER (AC LNO)

Establish liaison, as needed, with representatives of assisting and cooperating agencies. This will often be with the same agencies represented at the IC level, but

will typically be a link to a more senior organizational level than that represented on-scene.

The major responsibilities of the AC LNO are:

1. Review Common Responsibilities in Chapter 2.
2. Review the LNO Job Aid.
3. Establish liaison, as needed, with stakeholders, such as environmental, economic, and political groups. It is expected, however, that the majority of stakeholder service and support will be handled at the on-scene command level.
4. Support on-scene LNO(s) efforts to establish strong ties with assisting/cooperating agencies and stakeholders.
5. When appropriate coordinate with the National Response Team (NRT)/Regional Response Team (RRT) to identify and resolve issues and concerns.
6. Maintain communications with stakeholders and assisting and cooperating agencies and keep AC advised of their issues and concerns.
7. Liaise with all investigating agencies, to minimize impact on incident response operations.
8. Coordinate AC site visits with on-scene command.

AC PUBLIC INFORMATION OFFICER (AC PIO)

The AC PIO is responsible for developing and releasing information about the incident to the news media, to incident personnel, and to other appropriate agencies and organizations. Normally, detailed information regarding response specifics will be referred to and handled by the appropriate on-scene PIO. The AC PIO will generally provide information on overall progress and status of the response from a regional or national perspective.

The major responsibilities of the AC PIO are:

1. Review Common Responsibilities in Chapter 2.
2. Review the PIO and JIC Job Aids.

3. Provide information on the incident(s) to the media and other interested parties.
4. Identify and communicate to AC organization and on-scene IMT, the Area Command's policy and procedures for release of information.
5. As directed, establish and manage the AC Joint Information Center (AC JIC).
6. Coordinate with the on-scene PIO(s) to obtain information and to ensure consistency in release of information.
7. Closely coordinate with on-scene PIO's to develop and establish an effective public information strategy.
8. Evaluate public and media perception of the response effectiveness and keep AC and on-scene command informed.
9. Keep the AC and AC staff informed of news releases, press conferences, town meetings, etc., to be conducted at the AC level.
10. Prepare briefing materials and coordinate the conduct of press conferences, town meetings, etc.
11. Provide speaker preparation and coaching to members of the AC staff.
12. Carry out the protocol function for visiting dignitaries, including coordination and conduct of briefs and site visits. As much as possible, AC will coordinate VIP site visits in an effort to minimize the impact on the on-scene IMT's.

AC SAFETY OFFICER (AC SOFR)

The SOFR function is to develop and recommend measures for assuring personnel safety and to assess and/or anticipate hazardous and unsafe situations. Normally, detailed information regarding response specifics will be referred to and handled by the appropriate on-scene SOFR. The AC SOFR will generally provide information on overall safety issues

and progress/status of the response from a regional or national perspective.

The major responsibilities of the AC SOFR are:

1. Review Common Responsibilities in Chapter 2.
2. Review the SOFR Job Aid.
3. Develop AC Facility Safety Plan and monitor for compliance.
4. Evaluate thoroughness of the on-scene Site Safety Plan(s).
5. As requested, provide assistance to on-scene SOFR and on-scene IMT's in investigating accidents, injuries, fatalities, etc.
6. Review on-scene Incident Action Plans (IAP's) for safety implications.

AC INTELLIGENCE OFFICER (AC INTO)

For the U.S. Coast Guard, the intelligence function has been determined to best fit as the INTO. For more information on the Intelligence function, see Chapter 11. The responsibility of the AC INTO is to provide Command intelligence information for the AC that can have a direct impact on the response personnel and influence the disposition of maritime security assets involved in the response. Normally, detailed information regarding incident intelligence specifics will be referred to and handled by the appropriate on-scene INTO. The AC INTO will generally provide information on overall intelligence issues and progress/status of the response from a regional or national perspective.

The major responsibilities of the AC INTO are:

1. Review Common Responsibilities in Chapter 2.
2. Review the INTO Job Aid.
3. Working with AC, determine the level and complexity of Intelligence needed to support their efforts.

4. Reach agreement with AC on where the intelligence position will be located within the AC organization.
5. Determine Intelligence gaps and Intelligence requirements needed to support AC's decision making process and the development of the Operating Guide.
6. Analyze and share intelligence among AC organization, involved partners and the on-scene IMT(s).
7. Manage and process classified and unclassified requests for intelligence.
8. Ensure that intelligence is properly used and filed.
9. Coordinate intelligence gathering activities with other external agencies and organizations (i.e. FBI, State and local law enforcement, etc).

AC PLANNING CHIEF (AC PC)

The AC Planning Chief is responsible for collecting, evaluating, managing, and disseminating information at the AC level. The responsibility of the AC PC is to provide AC planning information for the AC that can have a direct impact on the response personnel and influence the disposition of maritime security assets involved in the response. Normally, detailed information regarding incident planning specifics will be referred to and handled by the appropriate on-scene PSC. The AC PC will generally provide information on overall planning issues and progress/status of the response from a regional or national perspective.

The major responsibilities of the AC PC are:

1. Review Common Responsibilities in Chapter 2.
2. Review the PSC Job Aid.
3. Review on-scene incident action plans for purposes of assessing potential conflicts with AC direction.
4. Oversee the preparation and dissemination of the AC Operating Guide (OG).

5. Facilitate/conduct AC meetings and briefings.
6. Prepare material and conduct special situation briefings for AC.
7. Assure appropriate displays are developed, maintained and posted.
8. Ensure all off-site reporting requirements are met, i.e., ICS 209-CG.
9. Ensure a documentation process is in place for collecting, duplicating and filing information, including intelligence.
10. Brief Operating Guide to AC staff, Agency Executives, on-scene commanders and VIP's.
11. Ensure that the on-scene commander(s) are adequately anticipating and developing contingencies for addressing future response needs.
12. Assist AC in the development of strategies, objectives, priorities, operating procedures and protocols.
13. Coordinate with Logistics on the identification of, ordering, assignment and demobilization of critical resources.
14. Ensure accurate status of critical resources.
15. Prepare and distribute the AC policies, procedures and decisions to the AC staff and the on-scene IC's/UC's.
16. Ensure a check-in process is in place to ensure accountability of visitors and command post personnel.
17. Develop recommendation for standing down the AC organization (demobilization).

AC SITUATION UNIT LEADER (AC SITL)

The AC SITL is responsible for collecting, processing and organizing incident information relating to the growth, mitigation or intelligence activities taking place on the incident. The SITL may prepare future

projections of incident growth, maps and intelligence information. The responsibility of the AC SITL is to provide situational information for the AC that can have a direct impact on the response personnel and influence the disposition of maritime security assets involved in the response. The AC SITL will generally provide information on overall issues and progress/status of the response from a regional or national perspective.

The major responsibilities of the AC PC are:

1. Review Common Responsibilities in Chapter 2.
2. Review the SITL Job Aid.
3. Develop and implement procedures for collecting and displaying the current operational picture that reflects AC overall response emphasis.
4. Collect and analyze intelligence gathered from on-scene command, external entities, AC staff, and brief AC on the potential implications.
5. Maintain current situation status displays.
6. Prepare incident situation information for support of, and use in, meetings, briefings and reporting documents.
7. Prepare for and conduct situation briefings.
8. Establish and maintain a task/action tracking process (ICS-234-CG).
9. Develop and maintain ICS 209AC-CG, Incident Status Summary.
10. As scheduled, provide frequent/timely incident status updates (ICS 209AC-CG) to Coast Guard Headquarters, the parent Coast Guard District, and other agencies and entities.
11. Be prepared to respond to real-time critical information requests.
12. As required, provide incident status updates to stakeholders or other external organizations on an unscheduled basis.

13. Develop and post a briefing and meeting schedule ICS 230AC-CG.
14. Develop a list of critical information elements.

AC CRITICAL RESOURCES UNIT LEADER (AC CRESL)

The AC CRESL is responsible for maintaining the status of all critical tactical resources and personnel. The AC CRESL will generally provide information on critical resources issues and progress/status of the response from a regional or national perspective.
The major responsibilities of the AC CRESL are:

1. Review Common Responsibilities in Chapter 2.
2. Review RESL Job Aid.
3. Maintain resource status for all critical resources.
4. Maintain resource status on all AC organization.
5. Establish and maintain a check-in process to ensure accountability of visitors and command post personnel.
6. Develop and post an AC organization chart ICS AC207-CG.
7. Assist Planning Chief in the development and assembling of the AC Operating Guide.
8. Support/assist the AC Planning Chief in assigning and demobilizing critical resources.
9. Develop 24 hr watch schedule.
10. Working with the on-scene commanders, submit critical resource needs to the AC Logistics Chief.
11. Coordinate with the AC Finance/Administration Chief to track response costs for AC.
12. Develop and maintain the Resource Allocation and Prioritization worksheet ICS AC215-CG.
13. Set-up meeting and briefing area using the meeting room layout (Refer to Area Command job aid for room layout).

AC DOCUMENTATION UNIT LEADER (AC DOCL)

The DOCL is responsible for the maintenance of accurate, up-to-date incident files.

The major responsibilities of the AC DOCL are:

1. Review Common Responsibilities in Chapter 2.
2. Review the DOCL Job Aid.
3. Establish a process for collecting, analyzing and storing AC documentation both non-secure and secure information.
4. Establish duplication service and respond to requests.
5. File all official memos, forms and reports.
6. Enforce confidentiality policies on release of documents.
7. Monitor accuracy of completeness of records submitted for filing.
8. Provide duplicates of forms and reports to authorized requesters.
9. Obtain approval for release of any documents or reports.
10. Prepare final files for hand-off to appropriate official for future use.

AC LOGISTICS CHIEF (AC LC)

The responsibility of the AC LC is responsible to provide facilities, services, and material in support of the AC.

The major responsibilities of the AC LC are:

1. Review Common Responsibilities in Chapter 2.
2. Review the LSC Job Aid.
3. Establish and maintain an appropriate ACP for the AC organization.
4. Provide services, and support for the AC organization, including billeting, transportation, feeding, etc.
5. Respond to requests to meet AC organization staffing requirements.

6. Establish and maintain a resource ordering process for the AC organization.
7. Work with on-scene IMT's to identify and respond to critical resource needs.
8. Identify list of potential critical/specialized resource suppliers.
9. Source, order and track critical and specialized resources from point of departure to incident check-in.
10. Support/assist the Planning Chief, in developing recommendations for establishing priorities to govern the assignment and demobilization of critical resources.
11. Plan for, and establish secure and non-secure voice and data communication for internal and external needs of the AC organization.
12. As appropriate, provide security services for the ACP.
13. When directed by AC, take charge of the expanded supply network to support the on-scene commanders.
14. Develop AC Communication Plan, ICS AC205-CG.
15. Establish and maintain an accountable-property tracking system.
16. Coordinate directly with the Finance/Administration Chief, for procurement and accounting purposes.

AC FACILITIES UNIT LEADER (AC FACL)

The AC FACL is primarily responsible for the set up, maintenance and demobilization of AC facilities.
The major responsibilities of the AC FACL are:

1. Review Common Responsibilities in Chapter 2.
2. Determine space requirements for ACP.
3. Prepare ACP footprint and assist AC staff in setting up individual work areas.
4. Coordinate with Safety Officer in conducting Site Safety Inspection of ACP.

5. If required, provide for billeting and feeding of AC personnel.
6. Provide for facility maintenance (e.g. sanitation, janitorial services, lighting, etc.).
7. Ensure facility is maintained in a safe condition.
8. Restore facility to its pre-occupancy condition.
9. If required, develop Facility Security Plan and manage security activities including staff parking area.
10. Ensure that all facility equipment is acquired, setup and properly functioning (i.e. furniture, display boards, copy machines, faxes, etc).
11. Establish property accountability system for issued equipment.

AC COMMUNICATIONS UNIT LEADER (AC COML)

The AC COML is responsible for developing plans for the effective use of AC communications equipment and facilities; installing and testing of communications equipment; supervision of the AC Communications Center.

The major responsibilities of the AC COML are:

1. Review Common Responsibilities in Chapter 2.
2. Review COML Job Aid.
3. Prepare and implement AC Communications Plan for both internal and external needs.
4. Provide input into the AC Operating guide as it relates to communications, ICS AC205-CG.
5. Ensure communications systems are installed and tested and maintained including ACP internal telephone system.
6. Coordinate with on-scene communication Unit Leaders and assist with acquisition of specialized equipment and frequency management issues.
7. Provide technical information to both the ACP staff and incident(s).

8. Establish accountability system for issued communications equipment.
9. If required, install secure communication network.

AC INFORMATION TECHNOLOGY SPECIALIST (AC ITS)

The major responsibilities of the AC ITS are:

1. Review Common Responsibilities in Chapter 2.
2. Analyze the requirements for data processing to support the ACP for both internal and external data transmission needs (for both secure and non-secure).
3. Install and maintain ACP LAN and stand alone system including laptops, printers and plotters.
4. Brief user group on system operations.
5. Based on requirements, determine need for specialized expertise to operate and maintain systems.

AC FINANCE CHIEF (AC FC)

The AC FC is responsible for all financial, administrative and cost analysis aspects of the AC and for supervising members of the AC Finance/Admin Section.

The major responsibilities of the AC FC are:

1. Review Common Responsibilities in Chapter 2.
2. Review the FSC Job Aid.
3. Determine Area Command requirements for cost accounting.
4. Coordinate with on-scene Finance/Admin Section Chief(s) to determine methodology for reporting cost information.
5. Collect, analyze and summarize cost data.
6. Keep AC briefed on response costs.
7. Ensure that response costs are managed within the established financial ceilings and guidelines.

8. Coordinate and advise AC on ceiling adjustments when necessary.
9. For oil and hazardous materials incidents: keep the AC advised as to the impact on the Oil Spill Liability Trust Fund (OSLTF) or CERCLA Fund and potential/projected time for reaching liability limits of the Facility/Vessel owner .
10. Establish a Pollution Removal Funding Authorization (PRFA) or other interagency agreements and ensure compliance with all cost documentation requirements of interagency fiscal agreements.
11. For oil spills: Coordinate the overall processing of claims with the Facility/Vessel owner and on-scene Finance/Admin Section Chiefs.
12. Coordinate with JFO for Stafford Act funding sources.
13. If required, develop cost sharing agreements with member of AC.
14. Monitor use of high cost specialized equipment and keep AC advised.
15. If required, coordinate processing of claims resulting from response actions.

OPTIONAL POSITIONS/TECHNICAL SPECIALISTS

LAW SPECIALIST

1. Review Common Responsibilities in Chapter 2.
2. Review Technical Specialist Job Aid.
3. Advise the AC on legal issues.
4. Establish links with the Facility/Vessel owner, state, and other applicable legal representatives. This is primarily a responsibility during Spills of National Significance (SONS).
5. Review documents developed by AC or AC staff to ensure they meet the legal requirements of participating agencies and organizations.

6. Ensure AC documentation control system is appropriate.
7. Identify what documents and/or information can or cannot be released during the response.
8. Monitor compliance of agreements being used during the response (i.e. MEXUS, etc.).

SECURITY SPECIALIST

1. Review Common Responsibilities in Chapter 2.
2. Review Technical Specialist Job Aid.
3. Determine security requirements of the Area Command Post (ACP).
4. Develop and implement ACP Security Plan.
5. Obtain assets to monitor and enforce security.
6. If required, determine need for ACP identification badge system and provide this service.
7. Evaluate and recommend to AC the need for secure communications for both voice and data.
8. Coordinate with on-scene security specialist(s) as needed to ensure security requirements are met.
9. If needed, establish a list of ACP personnel levels of security clearance.

AVIATION COORDINATOR

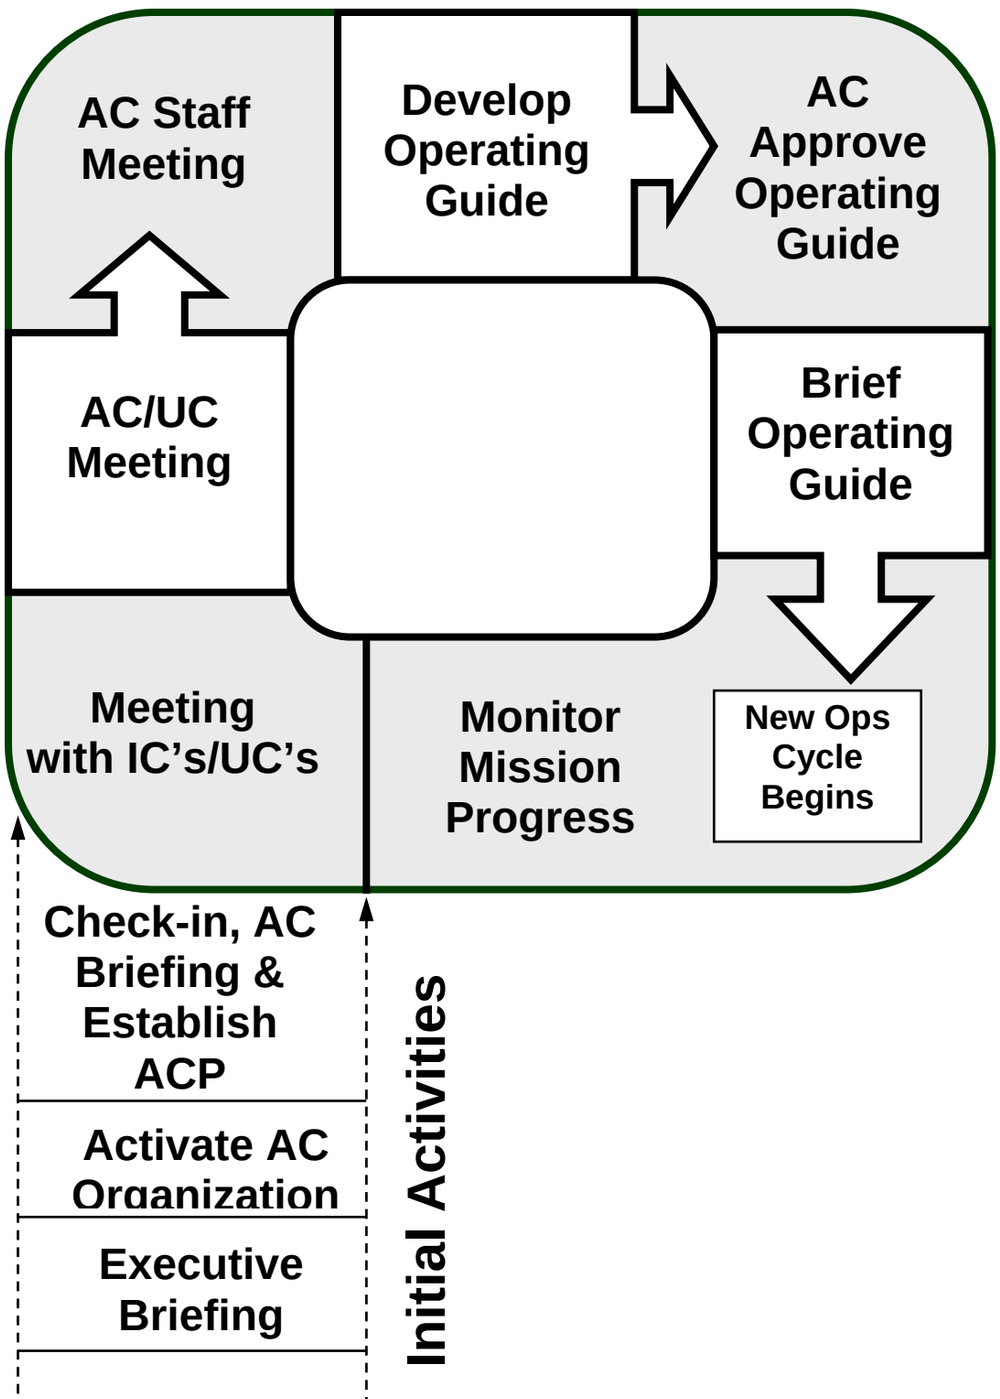
1. Review Common Responsibilities in Chapter 2.
2. Determine where in the AC organization this function will be assigned.
3. Determine AC requirements for use of aviation assets.
4. If aviation assets are determined to be a critical resource, coordinate with the Planning and Logistics Chief on ordering, assigning and demobilizing these assets.
5. Schedule the use of aviation assets assigned to support AC and their staff.
6. Coordinate with the On-scene Air Operations Director for multi- incident utilization of air assets.

7. Provide technical expertise on the use of specialized air assets to both AC and on-scene IMT(s).
8. If needed, develop an ICS 220-CG, Air Operations Summary Work Sheet.

DOCUMENTATION SPECIALIST/EXECUTIVE ASSISTANT

1. Review Common Responsibilities in Chapter 2.
2. Review Technical Specialist and DOCL Job Aids.
3. Determine AC requirements for documenting meeting and briefing.
4. Prepare Decision Memos for AC and primary staff review and approval.
5. Ensure AC meeting notes accurately reflect what was said.
6. Ensure that AC meeting notes, memos and reports are provided to the Documentation Unit Leader.
7. Develop and maintain chronological Log of AC decisions, direction and actions.
8. Perform other administractive duties as may be assigned (i.e. runner, expeditor, etc.).

AREA COMMAND OPERATING CYCLE MEETINGS, BRIEFINGS, AND THE OPERATING GUIDE PROCESS



The period of initial activation of the AC organization is when a determination is made to establish an AC organization to support on-scene IMT's. Senior Agency Representatives/Agency Executive(s) determine and designate who will represent the Coast Guard and other appropriate organizations within the AC structure.

EXECUTIVE BRIEFING – This is the first activity where the representatives in Area Command are briefed by senior agency executives on the overall situation which includes:

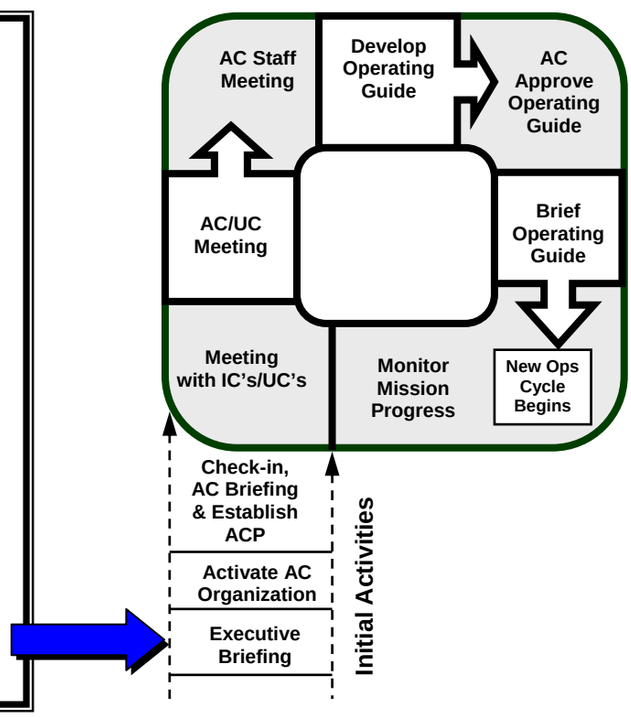
- Establish authorities.
- Receive policy guidance.
- Reach agreement on the scope of the job.
- Identify Area Command Post location.

When: Selected Area Commander(s) gather for the first time
Facilitator: Senior Agency Executive or designee
Attendees: Selected Area Commanders and deputies

General Tasks

Senior Agency Executives
- ☐ Provide situation briefing.
- ☐ Establish authorities.
- ☐ Review agency policies.
- ☐ Discuss scope of effort.
- ☐ Convey reporting requirements and relationships.
- ☐ Reach agreement on Command Post location.

Area Commanders
- ☐ Obtain briefing.
- ☐ Clarify scope of effort and issues.
- ☐ Agree on critical information reporting.
- ☐ Define any social, political, environmental and economic issues.
- ☐ Identify any cost constraints.
- ☐ Identify on-scene commanders



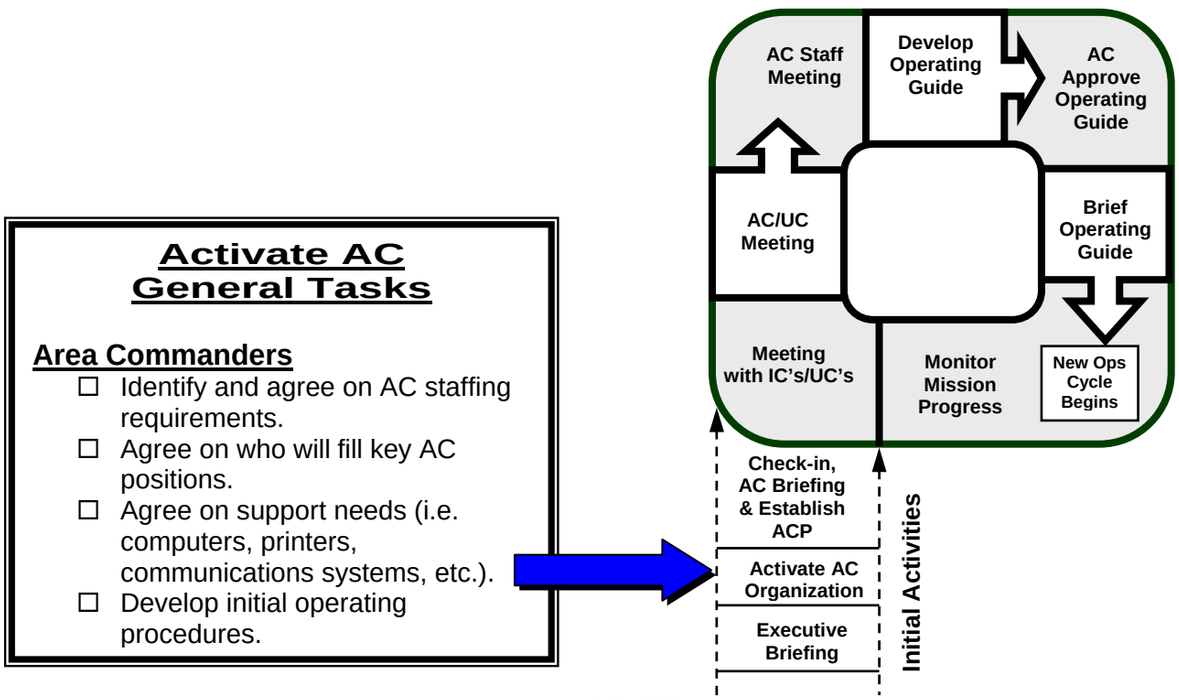
EXECUTIVE BRIEFING AGENDA

1. Brief on the need and requirements for AC organization.
2. Discuss prior communications between executives and IC's/UC's.
3. Brief on current situation.
4. Brief on AC authorities, duties and responsibilities.

5. Discuss overarching political, social, economic and environmental issues affecting the mission.
6. Clarify reporting and briefing requirements and lines of authority.
7. Discuss and reach agreement on overall AC staffing and Area Command Post (ACP) location.
8. Discuss plans and agreements that may be in place.
9. Close out meeting with concurrence from Area Commanders that their concerns have been addressed.

ACTIVATE AC ORGANIZATION/INITIAL AC MEETING – Provides Area Commander(s) the opportunity to determine the size of the Area Command organization based on the scope of effort and agreements reached at the Executive Briefing. This time block could also be used to evaluate the suitability of the proposed ACP location to meet AC organizational needs. Area Commander(s) come to agreement on AC staffing.

When: Shortly after the Executive Briefing
Facilitator: AC Member or AC PC (if available)
Attendees: Area Commanders



ACTIVATE AC ORGANIZATION/INITIAL AC MEETING AGENDA:

1. Facilitator brings meeting to order, covers ground rules and reviews agenda.
2. Validate makeup of newly formed UAC, based on Chapter 5 criteria.
3. Clarify UAC Roles and Responsibilities.
4. Review agency policies.
5. Establish and document response Priorities, Limitations and Constraints.
6. Define and document the UAC jurisdictional boundaries and focus (Area of Responsibility (AOR)).
7. Determine location of Area Command Post (ACP).
8. Determine AC period length/start time and work shift hours.
9. Designate lead organization for AC Planning Chief, Information, Safety, Intelligence and Liaison Officers as needed.
10. Designate other AC key staff assignments as needed.
11. Discuss and agree on managing sensitive information, resource ordering, cost sharing, cost accounting, and operational security issues.
12. Summarize and document key decisions, procedures and guidance.

CHECK-IN, AC STAFF BRIEFING & ESTABLISH ACP – Area Commanders will conduct initial briefing with AC personnel. Briefing will include expectations from Area Commanders and any limitations or issues the AC will be expected to address. Establishment of the ACP may also be addressed at this time.

When: At the time AC staff begins to arrive and ACP is being established

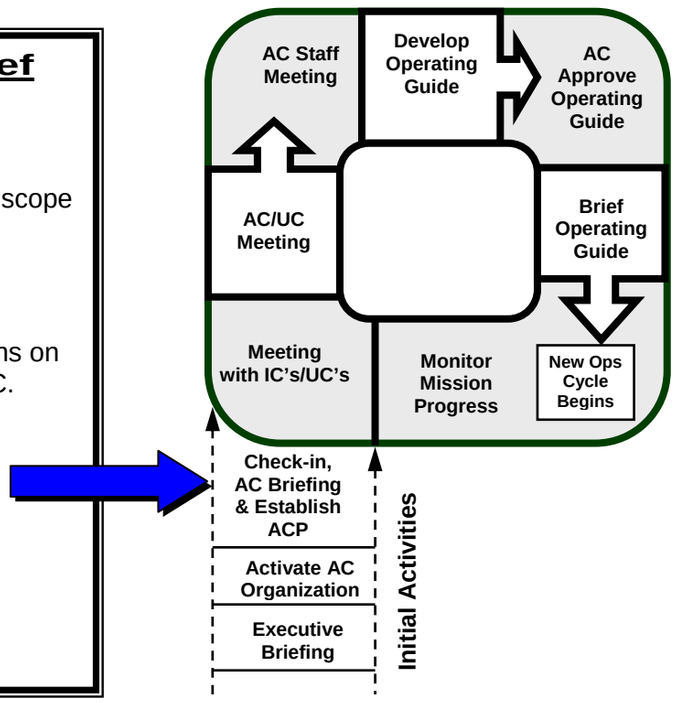
Facilitator: AC PC or Area Commander(s) with participation from Planning and Logistics Chiefs
Attendees: All AC personnel

Check-In and AC Brief General Tasks

Area Commanders
- ☐ Provide guidance to AC staff on scope of assignment.
- ☐ Convey agency executives' expectations, policy guidance, authorities, etc.
- ☐ Convey Area Command decisions on staffing and support needs of AC.
- ☐ Assign tasks, if necessary (i.e., preparing for the on-scene IC meeting).

AC Planning Chief
- ☐ Facilitate briefing.
- ☐ Document open actions.

AC Staff
- ☐ Clarify individual roles and responsibilities.



AC STAFF MEETING AGENDA:

1. AC PC brings meeting to order, conducts roll call, covers ground rules and reviews agenda.
2. AC SITL conducts situation status briefing.
3. AC provides initial comments, expectations, initial assignments, and closing comments.

MEETING WITH ON-SCENE INCIDENT COMMANDERS/UNIFIED COMMANDS – Provides Area Commander(s) the opportunity to dialogue with on-scene IC's/UC's and receive on-scene IC's/UC's current situation, strategies and issues confronting them.

When: As soon as possible after AC becomes operational
Facilitator: AC PC

AUGUST 2006

Attendees: Area Commanders, Planning, Logistics and Finance/Admin Chiefs, On-scene IC's/UC's and their Planning Section Chiefs

Meeting with IC/UCs General Tasks

Area Commanders

- ☐ Clarify AC roles and expectations.
- ☐ Provide policy and direction.
- ☐ Cover AC operating procedures.
- ☐ Provide ground rules or procedures for on-scene IC's/UC's to follow.
- ☐ Area Commanders and on-scene IC's/UC's reach agreement on division of responsibility (i.e., media relations, stakeholder meetings, etc.).

AC Planning Chief

- ☐ Provide reporting requirements, formats and time frames.
- ☐ Collect incident IAP's and/or 201's.

AC Logistics Chief

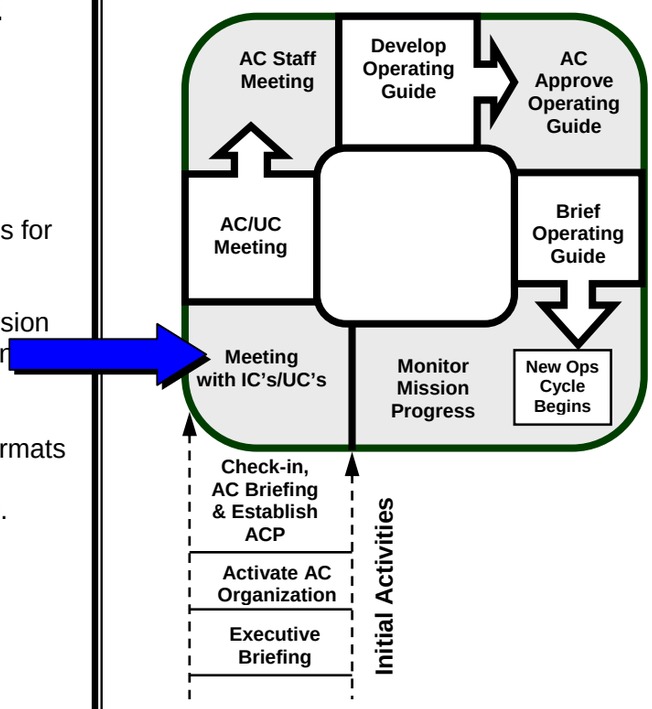
- ☐ Provide procedures for ordering specialized or critical resources.
- ☐ Explain process for sharing or re-assigning specialized and critical resources.
- ☐ Explain demobilization of specialized and critical resources.

AC Finance/Admin Chief

- ☐ Explain process for cost tracking.
- ☐ Explain notification procedures for responder illnesses, injuries or accidents.

On-scene Incident Commanders/UC's

- ☐ Provide overall situation report for their individual incident.
- ☐ Identify resources at risk.
- ☐ Specify current incident objectives.
- ☐ Provide response priorities.
- ☐ Provide long-term projections and existing and anticipated problems.
- ☐ Provide list of resource requirements and shortfalls.
- ☐ Identify probability of success if resource needs are met.
- ☐ Identify consequences if resource requirements are not met.
- ☐ Identify for Area Commanders, areas that AC can provide assistance to them



AC IC/UC MEETING AGENDA

1. AC PC brings meeting to order, conducts role call, And reviews agenda.
2. AC's provide opening remarks along with providing policy direction, Executives' expectations, AC interim operating procedures, expectations and ground rules.
3. AC PC provides guidance on information reporting to include timeframes, units of measure and formats along with critical information reporting.
4. AC LC provides guidance on ordering and sharing of specialized and critical resources, including demobilization of these resources.
5. AC FC provides guidance on cost accounting and reporting of injuries and accidents.
6. IC's/UC's report on their individual situation to include resources at risk, incident objectives, incident priorities, resource requirements and consequences if resource requirements are not met.
7. Resolve oustanding issues or concerns.
8. AC PC solicits final comments and adjourns the meeting.

AREA COMMANDERS MEETING – During this 1-hour meeting, the AC(s) will use the information derived from the IC meeting and develop overall strategies, objectives, priorities and identify any critical resource needs or issues AC will have to deal with. As needed, AC's will prioritize among incidents. AC(s) will also finalize the AC operating procedures.

When: As soon as possible after adjournment of IC/UC meeting
Facilitator: AC Planning Chief
Attendees: Area Commanders, AC Planning Chief, other staff upon AC request

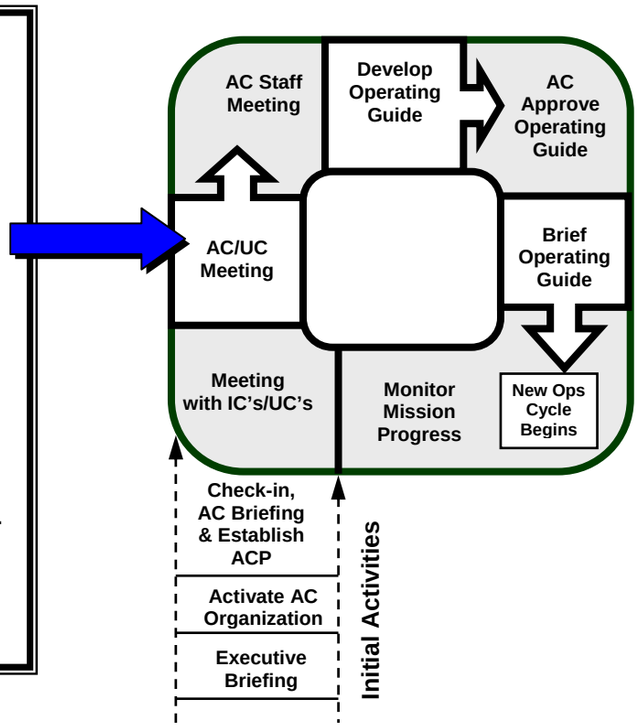
AC/UC Meeting General Tasks

Area Commanders

- ☐ Reach agreement on what are critical resources.
- ☐ Discuss limitations and constraints.
- ☐ Prioritize incidents.
- ☐ Develop overall priorities, objectives and strategies.
- ☐ AC will also finalize the AC operating procedures, i.e., core hours of operation, night watch, staffing requirements, meeting schedules, reporting timeframes, etc.
- ☐ Identify any specific tasks for AC staff.

AC Planning Chief

- ☐ Set up meeting room using meeting room layout.
- ☐ Facilitate meeting.



AREA COMMANDERS MEETING AGENDA

1. AC PC brings meeting to order.
2. AC addresses any policies, limitations and constraints.
3. AC reaches agreement on criteria for identifying critical resources.
4. AC discusses and prioritizes incidents.
5. AC PC facilitates discussion and develops overall response priorities.
6. AC PC leads discussion on development of strategic objectives.
7. AC will also finalize the AC operating procedures, i.e., core hours of operation, night watch, staffing requirements, meeting schedules, reporting timeframes, etc.
8. AC identifies any specific tasks for AC staff.
9. AC addresses any critical issues derived from the IC/UC Meeting or Agency Executive Briefing.

AC STAFF MEETING/BRIEFING – During this 1-hour meeting, the AC(s) will present their decisions and management direction to the AC staff. This meeting should clarify and help to insure understanding among

the core AC staff as to decisions, objectives, priorities, procedures and functional assignments (tasks) that the AC has discussed and reached agreement.

When: Following AC meeting
Facilitator: AC Planning Chief
Attendees: Area Commanders and AC staff to include Unit Leaders and Technical Specialists, if needed

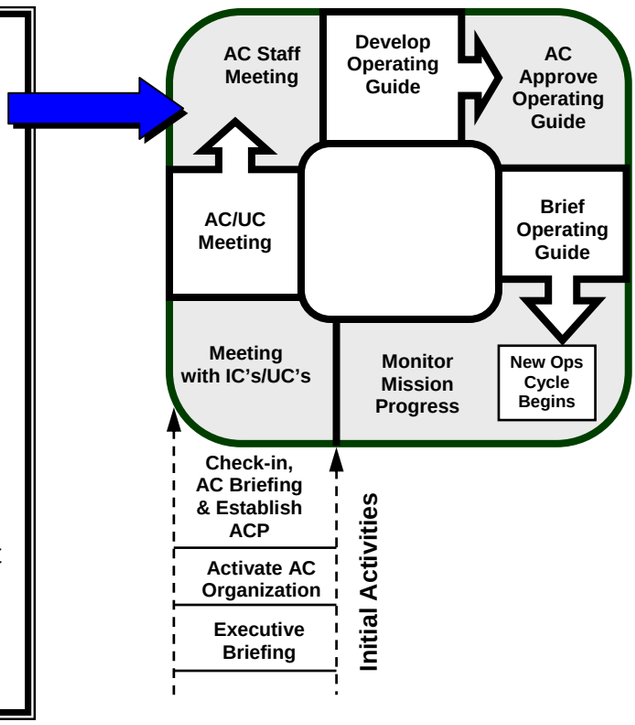
AC Staff Meeting General Tasks

Area Commanders
- ☐ Present AC decisions, directions, and priorities.
- ☐ Present AC operating procedures.
- ☐ Discuss overall response emphasis including any limitations and constraints.
- ☐ Present functional work assignments (tasks).

AC Planning Chief
- ☐ Set-up meeting/briefing area.
- ☐ Facilitates and documents meeting.

AC Situation Unit Leader
- ☐ Provide updates on the overall current situation and projections if available.

AC Staff
- ☐ Review and clarify functional work assignments (tasks).

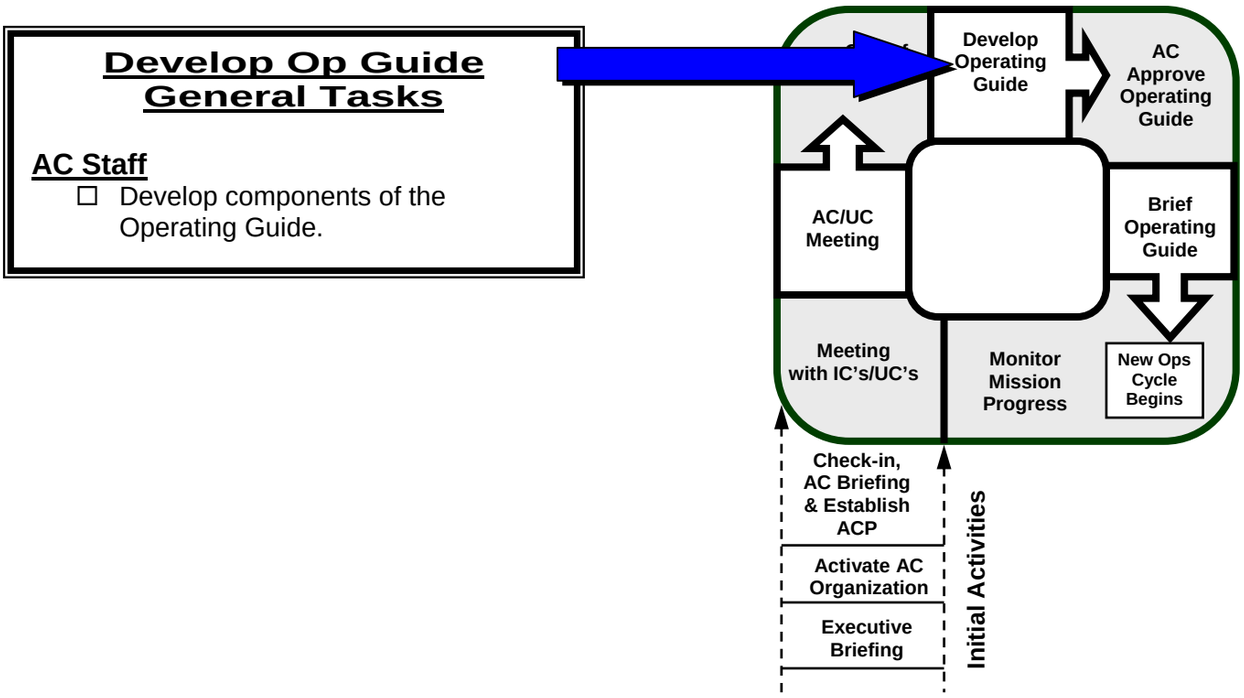


AC STAFF MEETING/BRIEFING AGENDA

1. AC PC brings meeting to order, conducts role call, covers ground rules and reviews agenda.
2. AC SITL conducts situation status briefing.
3. AC provides comments.
4. AC presents
   a. Decisions, directions, and priorities.
   b. Operating procedures.
   c. Overall response emphasis, including limitations and constraints.
   d. Functional work assignments (tasks) to staff members.
5. AC PC facilitates a short discussion on issues and concerns and adjourns meeting.

DEVELOP OPERATING GUIDE – During this block of time, AC staff develops components that are to be included in the Operating Guide. These components must meet the deadlines set by the PC so Planning can assemble the Operating Guide. Deadline must be early enough to permit timely AC review, approval and duplication.

When: Following AC staff meeting
Facilitator: Planning Chief facilitates process
Attendees: None. This is not a meeting but a period of time.



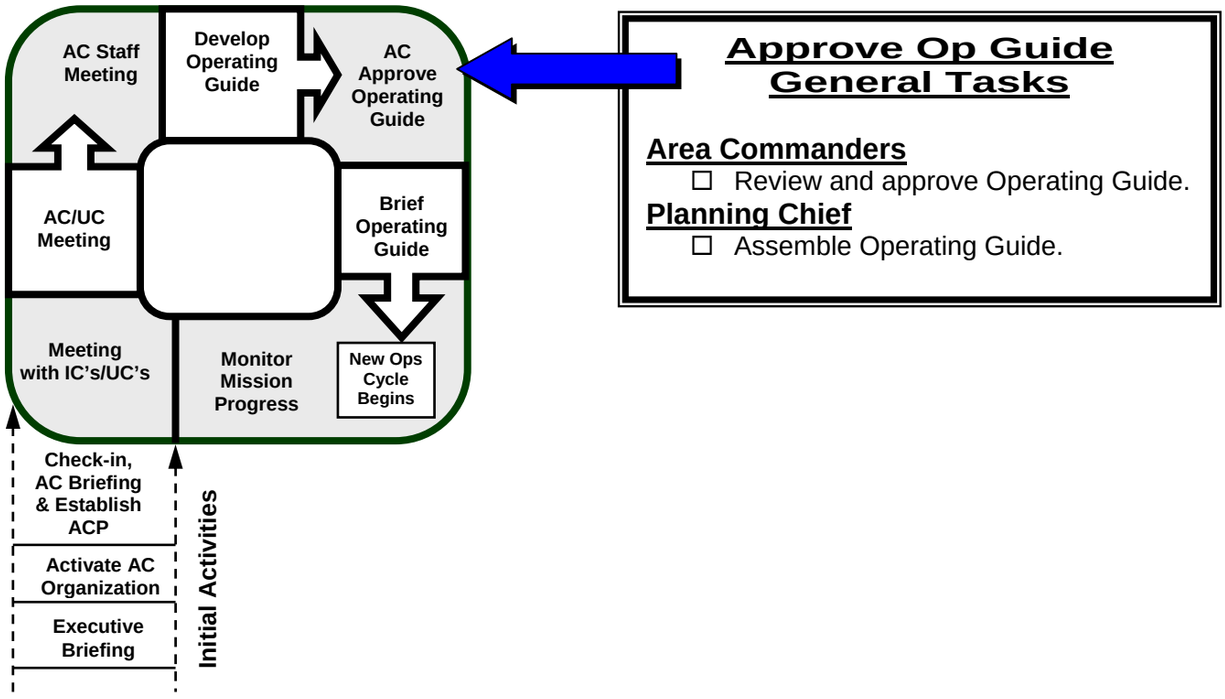
OP GUIDE COMPONENTS	PRIMARY RESPONSIBILITY
1. AC Priorities & Objectives (ICS AC202-CG)	AC CRESL
2. AC Organization List/Chart (ICS AC207-CG)	AC CRESL
3. Critical Resource Summary (ICS AC215-CG)	AC CRESL
4. AC Meeting & Briefing Schedule (ICS AC230-CG)	AC SITL
5. AC Communication Plan (ICS AC205-CG)	AC COML
6. Information Management Plan	AC PIO
7. Critical Information Reporting	AC SITL
8. AC Staffing Schedule	AC CRESL
9. AC Policies, Procedures & Decisions	AC PC

OPTIONAL COMPONENTS (Use as Pertinent)

1. Air Operations Summary (ICS 220-CG)	AC AVSP
2. AC Demobilization Plan	AC PC
3. AC Facility Safety Plan	AC SOFR
4. AC Security Plan	AC SCSP
5. Other AC Plans or documents as required	AC Staff

AC APPROVE OPERATING GUIDE – During this block of time, AC PC assembles Operating Guide, reviews content, makes adjustments if necessary, and provides to AC for review and approval. Following approval duplicates required copies for distribution.

When: Following Operating Guide Development
Facilitator: PC and AC facilitates process
Attendees: None. This is a block of time



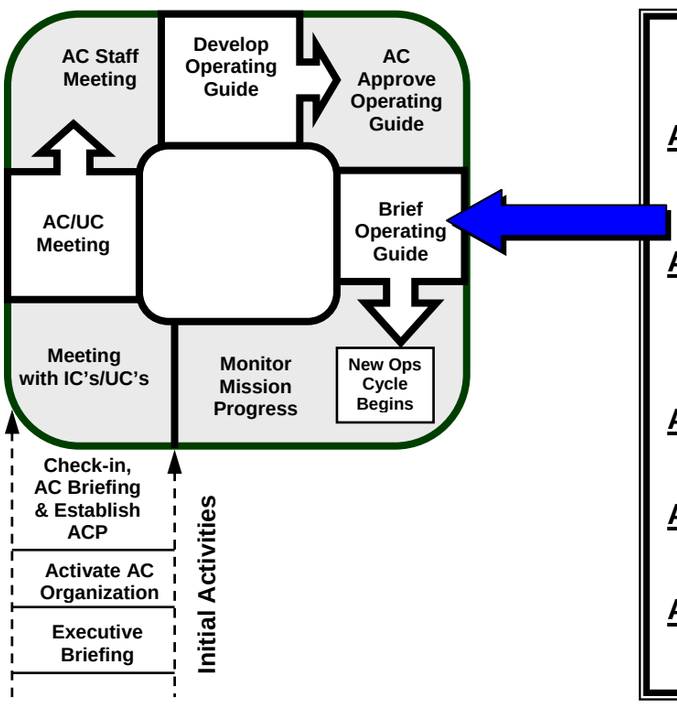
BRIEF OPERATING GUIDE – This 30-minute or less briefing presents the Operating Guide to the AC staff and on-scene IC's/UC's. Briefing to on-scene IC's/UC's may be accomplished by video conferencing or some other medium. Copies are either faxed or sent electronically to on-scene IC's/UC's and Agency Executives.

AUGUST 2006

When: At or as close as possible to AC shift change

Facilitator: AC Planning Chief

Attendees: All AC staff and if possible On-scene IC's/UC's, and Agency Executives



Brief Op Guide General Tasks

Area Commanders
- ☐ Provide leadership presence and motivational remarks.
- ☐ Provide guidance/clarification.

AC Planning Chief
- ☐ Set up briefing area
- ☐ Prepares briefing materials
- ☐ Facilitates Briefing
- ☐ Provide status on critical resources

AC Situation Unit Leader
- ☐ Provides Situation Briefing
- ☐ Review status of open actions/tasks

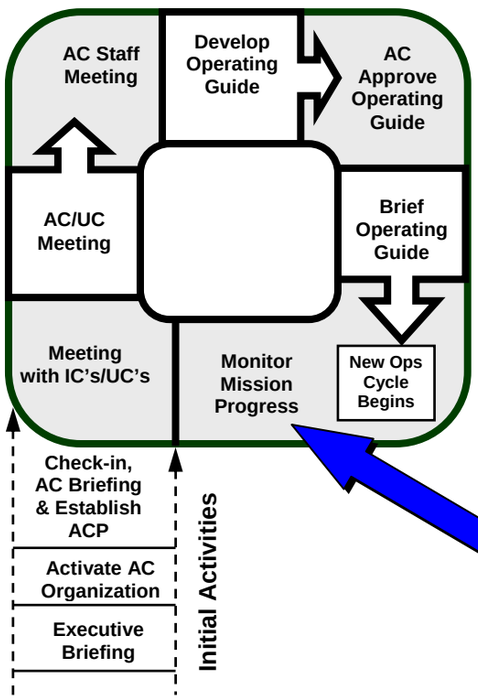
AC Logistics Chief
- ☐ Address logistical support/service issues

AC Finance/Admin Chief
- ☐ Address finance/admin issues

OPERATING GUIDE BRIEFING AGENDA

1. AC PC opens meeting, conducts role call and reviews agenda.
2. AC SITL conducts situation status briefing and provides projections as needed.
3. AC provides opening remarks.
4. AC PC presents Operating Guide.
5. AC LC presents status of specialized and critical resources.
6. AC FC presents status of cost tracking and other cost accounting issues.
7. AC PC conducts round robin to clarify and resolve open issues with participants.
8. AC PC adjourns briefing.

MONITOR MISSION PROGRESS – Assessment is an on-going continuous process to help determine needed adjustments to the operating guide and assist in planning future support to the on-scene operations. Following the AC Operating Guide briefing, and shift change, all AC staff will review mission progress and make recommendations to the AC(s). This feedback/information is continuously gathered from various sources.



General Tasks

Area Commanders

- ☐ Keeps superiors informed of progress and issues.
- ☐ Evaluates overall AC effectiveness.
- ☐ Resolves problems as they occur.
- ☐ Follows up on staff work assignments / open actions.
- ☐ Communicates with IC's/UC's and assists as needed.
- ☐ Attends planned meetings and briefings.
- ☐ Evaluates staff effectiveness and orders additional resources as needed.
- ☐ Provides leadership presence and motivational remarks.
- ☐ Provides guidance/clarification.

AC Planning Chief

- ☐ Evaluates Planning Section effectiveness.
- ☐ Evaluates staffing requirements for next operational period.
- ☐ Prepares briefing materials.
- ☐ Conducts a Planning Section meeting.
- ☐ Ensures that document control system is functioning properly.
- ☐ Provides status on critical resources.

AC Logistics Chief

- ☐ Addresses ongoing logistical support/service issues.
- ☐ Ensure appropriate communications is in place.
- ☐ Evaluate space requirements and make adjustments as needed.
- ☐ Monitor Command Post security.
- ☐ Source critical and specialized resources.
- ☐ Evaluate logistics staffing needs and order as needed.

AC Finance/Admin Chief

- ☐ Continue to address finance/admin issues.
- ☐ Investigate any unusual claims and briefs Command.
- ☐ Develop cost sharing agreements as needed.
- ☐ Monitor AC procurement procedures.
- ☐ Briefing Command on any unusual high cost items being requested.

THIS PAGE INTENTIONALLY LEFT BLANK

CHAPTER 14

JOINT FIELD OFFICE AND INCIDENTS OF NATIONAL SIGNIFICANCE

References:

(a) National Response Plan (NRP)
(b) National Incident Management System (NIMS)
(c) Joint Field Office Standard Operating Guide (SOP)
(d) Alignment with the National Incident Management System and National Response Plan, COMDTINST 16000.27 (series)

NOTE: This chapter provides a very brief overview of the National Response Plan (NRP), Incidents of National Significance (INS), and activation of the Joint Field Office (JFO). For more information and more detailed guidance, please see references (a) through (d).

INTRODUCTION

For a potential or actual Incident of National Significance (INS), DHS may establish a Joint Field Office (JFO). The purpose of a JFO is to provide support to local Incident Command structures and coordinate efforts to address broader regional impacts of the incident. As part of the Multi-agency Coordination System (MACS), the JFO does not supplant the on-scene Incident Command(s)/Area Command(s), but supports and provides broader coordination of incident-related activities. Execution of tactical operations and coordination remains the responsibility of the IC(s)/AC(s).

Activation of a Joint Field Office

When DHS determines that a JFO is necessary, DHS will identify agencies with primary responsibility for incident management to serve a part of the JFO Coordination Group. The JFO Coordination Group will coordinate (usually by teleconference) to define situationally appropriate requirements for a JFO. DHS tasks Emergency Support Function (ESF) #5 (led by FEMA) to stand up a JFO and provide core staffing. Other agencies provide additional staffing of the JFO based on the nature of the incident, typically through the activation of various ESF's. The Principal Federal Official (PFO), PFO Support Staff, and other Senior Federal Officials (SFO's) may operate from an Interim Operating Facility (IOF) until a fully functional JFO is established.

Responsibilities of the JFO Coordination Group

The JFO Coordination Group is comprised of the PFO, who serves as the Secretary of Homeland Security's local representative and agencies with primary responsibility for incident management, such as FEMA's Federal Coordinating Officer (FCO). For incidents that fall largely in Coast Guard jurisdiction, the Coast Guard will participate in the JFO Coordination Group as a SFO. The JFO Coordination Group is responsible for:

a. Overall coordination of Federal incident management and assistance activities across the spectrum of prevention, preparedness, response, and recovery.
b. Ensuring the seamless integration of Federal activities in support of and in coordination with State, local, and tribal organizations.
c. Providing needed resources as requested by the Incident Command and/or relevant EOC's.
d. Providing strategic guidance to Federal entities.

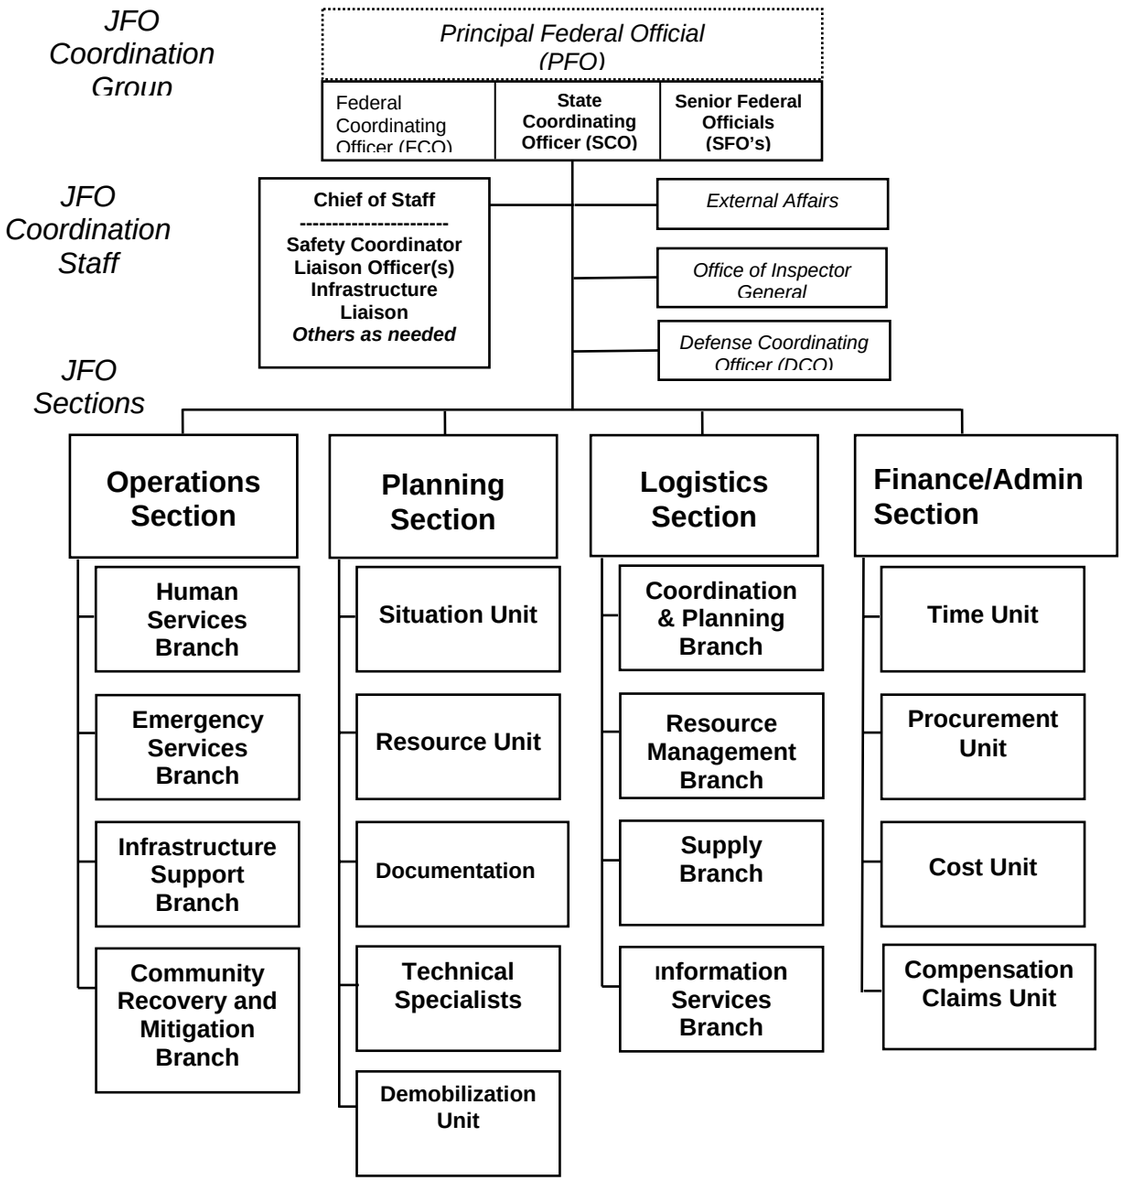
e. Facilitating interagency conflict resolution as necessary.
f. Serving as a primary, although not exclusive, point of contact for Federal interface with State, local, and tribal senior elected/appointed officials, the media, and the private sector.
g. Providing real-time incident information to the Secretary of Homeland Security through the HSOC and the IIMG.
h. Coordinating response resource needs between multiple incidents as necessary.
i. Coordinating the overall Federal public communications strategy locally to ensure consistency of Federal interagency communications to the public.
j. Ensuring that adequate connectivity is maintained between the Incident Command structures; JFO; HSOC; local, county, State, and regional EOC's; nongovernmental EOC's; and relevant elements of the private sector.

Organization of the Joint Field Office

Although the JFO is not an Incident Command structure, it uses an Incident Management Team (IMT) organization to facilitate the integration of multi-agency staffing, provide a robust structure and process for coordinating its activities, and provide a planning cycle for the development of a Coordination Plan. The JFO organization adapts to the magnitude, complexity and nature of the incident. The following diagram is an example JFO organization for natural disasters. For terrorist incidents, the FBI's Joint Operations Center (JOC) is incorporated as a branch within the Operations Section. Likewise, for National Special Security Events (NSSE's), the US Secret Service Multi-agency Command Center (MACC) is also incorporated as a

branch within Operations. See chapter 23 for more info about NSSE's.

Example JFO Organization for Natural Disasters



Note: Depending on the magnitude of the disaster, a PFO may not always be designated, in which case the FCO will provide the Federal lead.

The SCO represents the State, and in some instances, the JFO Coordination Group may include local and/or tribal representatives as well as NGO and private-sector representatives, as appropriate.

Coordination between the Incident Command and Joint Field Office

In a response where there is no federal presence in the Unified Command, the JFO primarily works with the involved State EOC's to provide federal assistance. In situations where there is a federal presence in the Unified Command (such as terrorist incidents and oil/hazmat releases), the JFO will coordinate directly with the Unified Command/Area Command. For an effective response, the JFO and the on-scene Incident Command must work together in a cooperative environment. Coordination will take place both at the senior level (i.e., between the Unified Command and JFO Coordination Group) and at the staff levels (e.g., between ICP Planning Section and the JFO Planning Section, Safety Officer and Safety Coordinator, etc.). Based on the incident objectives and Incident Action Plan established by the Unified Command, the JFO establishes broader objectives and creates a Coordination Plan. While developing the broader objectives and Coordination Plan, the JFO Coordination Group must also consider the national strategy and concerns of the Interagency Incident Management Group (IIMG). The Coordination Plan includes objectives established by the JFO Coordination Group, synopsis of agency and Incident Command actions, assigned coordination activities, information-sharing procedures, and a safety plan.

Facilitation Between the JFO and Unified Command

To facilitate cooperation, the on-scene Unified Command should provide to the JFO:

a. Incident Priorities.
b. Copy of Incident Action Plan (IAP) per operational period.
c. Progress updates with identified hindrances.
d. Critical needs/Critical resource shortfalls (and impact of not receiving required resources).
e. Political, social, economic, and environmental impacts.
f. Long term projections.
g. Contact directory.
h. Meeting schedules.

In turn, the JFO:

a. Provides requested resources.
b. Coordinates broader objectives with those established by the UC.
c. Addresses resource and policy issues raised by the UC.
d. Synchronizes planning cycle with UC planning cycle, as appropriate.
e. Distributes an overall contact directory.
f. Provides copy of the Coordination Plan.

TERRORISM

1. Table of Contents 15-1

2. Introduction 15-2

3. Terrorism Incident Specific NIMS ICS Positions and Task Descriptions 15-5

4. Terrorism Incident Technical Teams 15-14

CHAPTER 15

TERRORISM

References:

(a) National Response Plan (NRP)
(b) National Incident Management System (NIMS)
(c) Coast Guard Hazmat Response Special Teams and Capabilities Contact Handbook
(d) U.S. Coast Guard Maritime Law Enforcement Manual (MLEM), COMDTINST 16247.1 (series)

INTRODUCTION

A nuclear, biological, or chemical Weapon of Mass Destruction (WMD) type terrorist incident is inherently a hazardous substance incident. As such it should be responded to under the National Response System (NRS). As applicable, consult Chapter 20 Hazardous Substance (Chemical, Biological, Radiological and Nuclear) and Chapter 22 (Multi-Casualty) of this Incident Management Handbook (IMH) regarding establishment and use of the Incident Command System when a terrorist incident precipitates a hazardous materials release and/or mass casualty.

The UC responding to an incident where terrorism is involved have to be acutely aware of the unique nature of the Federal Government's response mechanism for these types of incidents. All agencies must use the National Plan (NRP) structures and the National Incident Management System (NIMS) to coordinate all Federal assistance to State and local governments for response activities to Incidents of National Significance (INS). During a terrorism incident, the UC may work for the Federal Bureau of Investigation (FBI) and/or FEMA and will be guided by the NRP

If an incident occurs without warning that produces major consequences and appears to be caused by an act of terrorism, then FEMA and the FBI will initiate response actions concurrently. FBI will have the lead in this incident because of the possible terrorism link and all agencies will be guided by the NRP.

With the exception of the U.S. Coast Guard National Strike Force (NSF), upon notification of WMD/Terrorism incident, USCG policy is to stay clear of the contaminated area and to provide command, control and support only. NSF Strike Teams are the only units within the Coast Guard who are currently trained and have a mission to respond to chemical incidents for either Coast Guard or the U.S. Environmental Protection Agency (USEPA) Federal On-Scene Coordinators. For personnel responding to WMD/Terrorism events, certain guidelines should be followed:

- Hesitate – don't rush in and ask questions later! Take time to decide what to do.
- Evaluate the situation – size up the situation - think about what's happening and what you should do.
- Isolate – after evaluating where the hot zone is, don't let anyone other than a responder enter the hot zone, and don't let other responders enter the hot zone without proper equipment. Set up a barrier line, even if you have only simple yellow emergency tape.
- Evacuate – get people out of the hot zone without risking your own life. Don't go into the hot zone without proper equipment. Keep victims and others who might have been exposed from getting too far away – medical and police will want to talk to them.

- Decontaminate – but only if you can do it without endangering yourself. Use a fire hose if possible so you won't have to get close to the victims; in some cases a victim can self decontaminate.
- Cooperate – when other responders arrive, follow standard organizational principles. But above all cooperate; there'll be time later to argue who's boss; right now try to save lives.
- Communicate – let other emergency and medical authorities know what your situation is and what you're doing. But if you think there might be a flammable vapor around, don't use your radios (or any other electrical equipment) near the incident. Retreat to a vapor free area to use that radio.
- Investigate – actually, the first responder won't do any real criminal investigation, but you must remember this is a crime scene and responders and others shouldn't disturb crime scenes. Preserve the crime scene (for all terrorism is a crime as well as an act of war); observe, remember, and report to police.
- Be aware of possible secondary devices, including explosive, radiological, chemical and biological. Be cognizant of surroundings, especially of containers, or packages that appear misplaced. A tactic terrorist's use involves setting off a device designed to draw in first responders and then setting off a secondary device to maximize casualties.
- Ask qualified authorities, typically the FBI, if the area has been cleared of secondary devices.
- Again, be aware that in a WMD incident terrorists generally have a singular purpose and that is to cause fear, death and destruction. A defensive stance should always be maintained for a WMD incident.

TERRORISM INCIDENT SPECIFIC NIMS ICS POSITIONS AND TASK DESCRIPTIONS

Only those ICS positions and tasks specific and unique to Terrorist Incident missions will be described in this section. Persons assigned the common positions consistent with the NIMS organization should refer to position job aids and Chapters 5 through 11 of this Manual for their position/task descriptions and checklists.

INCIDENT COMMANDER - Tasks specific to a Terrorist Incident are to:

a. Review Incident Commander responsibilities in Chapter 6.
b. Assesses the need for additional resources and assist in obtaining their assistance. Some of these resources are listed in the Terrorism Special Teams section of this chapter.
c. Ensure that the following have been established:
    - HAZMAT Group – which is responsible for deploying a reconnaissance team, produce sampling/identification, assisting with victim rescue, setting up decontamination for responders and developing a plan of action for containment and control of hazardous agents.
    - Medical Group – which is responsible for initiating victim rescue, patient decontamination, and emergency medical care for NBC victims.
    - Hospital Coordination – which establishes communication links with area hospitals, provides them with situation reports, and information on agent identification, and determines pharmacology needs.

- Medical Information & Research – which begins to research agent characteristics based upon victim signs and symptoms, victims' descriptions of agent, sample characteristics, and other information as it becomes available. Establishes communication with Poison Control Centers (ATSDR and CDC).
- Law Enforcement Group – which coordinates law enforcement agencies to establish incident security, establishes evidence collection and control, and obtains intelligence information.

d. Work to identify and address strategic and tactical issues.
e. Work with city and county mental health resources to assure that Critical Incident Stress Management services are provided to victims, their families, first responders, and the general public.
f. Coordinate with the County Medical Examiner/Coroner to establish appropriate forensic and mortuary services for deceased victims.
g. Assist the Safety Officer in establishing a site safety plan; implementing an accountability system; and establishing hot, warm, and cold zones if not already established.

PUBLIC INFORMATION OFFICER - Tasks specific to a terrorist incident are:

a. Review Public Information Officer Responsibilities in Chapter 6.
b. Establish safe media conference areas distant from the Incident Command Post.
c. During the Event:
   1. Determine what information is appropriate to

release to avoid panic.

2. Promote optimum community response.
3. Develop information releases that support response activities:
   - Medical treatment sites that the victims can report to.
   - Transportation avenues and other areas that are closed off.
   - Immediate first aid measures that can be taken.
   - Location of shelter facilities where evacuated personnel have been moved to.

d. After the Event:
   1. Release non-sensitive information.
   2. Provide basic information regarding the event:
      - Where, what, why, how.
      - Units responding.
      - Number of casualties.
   3. Examples of types of information that should not be released:
      - Names of fatalities.
      - Specific type/name of agent involved (until after incident is terminated).
      - Dispersal method(s) used.
      - Specific law enforcement activities.
      - Condition of victims.

EVENT SITE BRANCH DIRECTOR - Tasks specific to terrorist incidents are:

a. Review Branch Director Responsibilities in Chapter 7.
b. Coordinate for site control around the vicinity where the event occurred.
c. Determine hazards presented by the event (monitoring/detection).

d. Establish a safe refuge and a casualty collection area.
e. Establish emergency decontamination capability.
f. Coordinate with Medical Unit for medical treatment and transport capability, including requesting county transit buses.
g. Coordinate with Safety Officer for a site safety and control plan.
h. Determine containment and control procedures to be used.
i. Coordinate with other agencies (investigative/ evidence gathering).

COMMUNITY IMPACT BRANCH DIRECTOR - Tasks specific to terrorist incidents are:

a. Review Branch Director Responsibilities in Chapter 7.
b. Coordinate for perimeter security and traffic control.
c. Determine hazards presented to the community through detection/monitoring.
d. Determine best protective actions to use:
   - Rescue
   - Shelter-in-place (SIP)
   - Evacuation
   - Establish shelters
e. Establish emergency decontamination capability for off site personnel and public.
f. Establish a medical treatment and transport capability for off-site personnel and the public.
g. Coordinate with Safety Officer for site safety and control plan.
h. Coordinate with Information Officer to develop emergency broadcast messages to alert and update the community.
i. Determine re-entry procedures to be used

j. Coordination with other agencies and notify the County Health Officer.

HAZARDOUS SUBSTANCE/MATERIALS GROUP - Tasks specific to terrorist incidents are:

a. Review the Division/Group Supervisor Responsibilities in Chapter 7.
b. Review the Chemical tasks in Chapter 19 of this document.
c. Ensure the implementation of defensive mitigation practices when indicated.
d. Ensure that information regarding the agent(s) and patient symptoms is passed to the Medical Group.
e. Ensure patients are properly decontaminated.

MEDICAL GROUP - Tasks specific to terrorist incidents are:

a. Review Common Responsibilities in Chapter 2.
b. Direct medical care delivery to response personnel and incident victims.

HOSPITAL COORDINATION UNIT - The Medical Group usually performs these responsibilities and duties, but this unique unit is established to assist at terrorist incident responses. Their tasks are:

a. Review Unit Leader Responsibilities in Chapter 2.
b. Serve as liaison for local medical facilities receiving patients.
c. Ensure vital incident management information is communicated to each receiving hospital.
d. Provide the medical communities with the needed patient care information for the agent(s) involved, in cooperation with the Technical Specialist-Medical Information & Research.
e. Implement a system of patient tracking in concert with the on-scene EMS personnel and facilities

receiving patients.

f. When requested, serve as clinical consultants to the medical staff at each medical facility-receiving patients by providing advice on patient care, personnel safety, or facility protection, in cooperation with the Technical Specialist-Medical Information & Research.

TECHNICAL SPECIALIST-MEDICAL INFORMATION & RESEARCH - The Medical Group performs these responsibilities in collaboration with National Response Center (NRC), an emergency communication infrastructure designed to assist Federal responses to incidents.

a. Identify needed research materials that will assure optimum access to the most current, complete, and accurate information available on nuclear, biological, or chemical (NBC) agents.

b. Perform the research needed to identify the agent(s) involved, physical characteristics, appropriate PPE, and information about possible signs and symptoms to be observed, treatments to be initiated, antidotes to be utilized, and possible long-term effects. This activity will be completed by assimilating information from several sources including:
   - Technical Specialist-Reference & Resources in the Hazardous Substance Group.
   - Regional Poison Control Center.
   - CHEMTREC.
   - Various special teams listed on page 15-14.

c. Communicate vital mitigation and clinical management information to the Medical Group including:
   - Needed patient care information for the agent(s) involved.

- Antidote needs of each facility and assist them in obtaining the needed items from the regional cache, government agencies, or vendors. Serve as clinical consultants to the medical staff at each facility receiving patients, by providing advice on patient care, personnel safety, or facility protection.

LAW ENFORCEMENT GROUP - Tasks specific to terrorist incidents are:

a. Review Division/Group Supervisor Responsibilities in Chapter 7.
b. Review Law Enforcement Group Tasks in Chapter 17 of this Manual.
c. Review Appendix J of reference (d).
d. Obtain pertinent law enforcement information in order to coordinate the operational response from the following:
   - FBI field office.
   - Local law enforcement agencies.
   - State law enforcement/traffic agencies.
   - Local fire and rescue agencies, including HAZMAT teams.
   - Local Emergency Operations Centers.
   - Pertinent NBC information discussed at intelligence sharing forums.
   - Current national and international events involving terrorist group activities.
   - Intelligence from all sources.
e. Advise the IC of law enforcement related issues and latest intelligence information.
f. Be familiar with local law enforcement resources available (Bomb Squads, etc.).
g. Assist in obtaining needed resources from law enforcement operations.
h. Assure incident security issues are identified and

addressed.

i. Verify the incident. Determine if a terrorist act has occurred.
j. Respond to the scene with sufficient personnel to address the incident.
k. Initiate appropriate callback of additional personnel as needed.
l. Establish inner and outer perimeters, based on the nature of the incident.
m. Provide security for the Command Post.
n. Verify the identification of the responding personnel.
o. Coordinate incident site evacuation.
p. Coordinate evacuation of surrounding areas as needed.
q. Coordinate traffic flow, especially ingress and egress of emergency/rescue
r. Provide evidence identification, collection and control, including:
    - Establish control and protection of the crime scene.
    - Coordinate the collection/preservation of evidence with the FBI.
    - Mapping/photographing of all evidence locations.
    - Collection of non-contaminated evidence.
    - Coordination of collection, chain of custody, and safe storage of contaminated evidence with the Hazardous Substance/HAZMAT Group.
    - Provide secure, safe storage for collected evidence.
s. Affect the arrest and transportation of the perpetrators when possible.

MEDICAL TECHNICAL SPECIALIST (Planning Section) - The Medical Group usually performs these responsibilities and duties, but this unique position is established to assist at terrorist incident responses in the planning section. This position (preferably filled by a physician) is responsible for:

a. Review Common Responsibilities in Chapter 2.
b. Review Medical Group tasks in Chapter 19 of this manual.
c. Serve as medical advisor to the Incident Commander and Operations Section Chief.
d. Develop and implement the medical action plan in conjunction with the Medical and Hazardous Substance/HAZMAT Groups.
e. Assure effective liaison with local EMS agencies and medical facilities.
f. Perform additional tasks and duties as assigned during an incident.

MENTAL HEALTH COORDINATION - First responders will receive Critical Incident Stress Management services through departmental resources. Victims, their families, and the general community will receive Critical Incident Stress Management services through established sources, including the Airport Chaplains, American Red Cross Disaster Mental Health Services and County Mental Health Services.

CORONER COORDINATION - The City/County Medical Examiner/Coroner staff, according to the Mass Casualty Incident Plan, will process deceased victims once the FBI has released the scene. The City/County Examiner/Coroner will assist the law enforcement branch with collecting evidence from deceased victims upon request. Federal mortuary resources are also available, if requested.

TERRORISM INCIDENT TECHNICAL TEAMS

Resources for a WMD/Terrorism incident response are similar to that of a chemical incident response. The NIMS ICS should be followed and the State and local responders who normally respond to a chemical incident will also respond to a WMD incident. However, the FBI should be notified during a WMD event, and due to the extreme nature of a WMD incident, DOD resources may also be needed.

The FBI is the lead agency for a WMD incident. If upon arriving on scene and USCG personnel suspect the incident to be WMD related, the FBI and NRC should be contacted through proper channels. FEMA is also a lead agency under the NRP to support the incident response.

There are several Special Teams that have response capabilities for WMD/Terrorism incidents and are listed in more detail in reference (c), Coast Guard Hazmat Response Special Teams and Capabilities Contact Handbook which can be found at the following website: http://homeport.uscg.mil/ and are listed here:

- Agency for Toxic Substances and Disease Registry (ATSDR) Emergency Response Teams
- U.S. Marine Corps Chemical Biological Incident Response Force (CBIRF)
- Department of Energy Nuclear Emergency Support Team (DOE NEST)
- USEPA Environmental Response Team (EPA ERT)
- USEPA Office of Enforcement, Compliance, and Assurance (OECA), National Counter-terrorism Evidence Response Team (NCERT)

- USEPA Radiological Emergency Response Team (EPA RERT)
- Federal Bureau of Investigation, Laboratory Division, Hazardous Materials Response Unit (FBI HMRU)
- National Oceanic and Atmospheric Administration Office of Response and Restoration (NOAA OR&R) Hazardous Materials Response Division (HAZMAT)
- USCG National Pollution Funds Center (USCG NPFC)
- USCG National Strike Force (USCG NSF)
- Occupational Safety and Health Administration Health Response Team (OSHA HRT)
- United States Navy (USN) Supervisor of Salvage and Diving (SUPSALV)
- United States Army Corps of Engineers Rapid Response Program (USACE RR)
- Department of Defense (DOD) Joint Director of Military Support (JDOMS)
- Department of Homeland Security (DHS), Federal Emergency Management Agency, Metropolitan Medical Response System (MMRS)
- USEPA Diving Program
- USEPA Emergency Communications and Outreach Team (ECOT)
- USEPA Emergency Response Peer Support and Critical Incident Stress Management (Peer Support/CISM) Team
- USEPA Ocean Survey Vessel, Peter W. Anderson
- United States National Guard Civil Support Teams (USNG CST)

INTRODUCTION

Maritime Security. Maritime security, as used in this Chapter, refers to Area Maritime Security (AMS) antiterrorism measures (i.e., prevention and defensive-oriented protection) that are used to reduce the vulnerability of the Marine Transportation System (MTS), individuals and property to terrorist acts, to include limited response and containment by local

forces. Maritime security/antiterrorism also includes immediate measures for initial MTS support response and thereafter to facilitate recovery required to reestablish MTS functions, and cargo flow in particular. Maritime security antiterrorism activities for the MTS and its components are continuously conducted from pre-incident through incident response and through immediate recovery actions to completion of recovery operations in order to deter or prevent multiple incidents, to protect critical maritime infrastructure, and to support MTS recovery. Law enforcement (LE) and counterterrorism aspects of maritime security are addressed in Chapters 15 and 17. Where LE or counterterrorism response is required during incident management, AMS antiterrorism measures are a supporting activity.

Please see the Maritime Security/Antiterrorism Job Aid, reference (a), for more information.

Continuing Antiterrorism Requirement During Incident Management. Antiterrorism security requirements are a continuing responsibility during incident management in support of references (b) through (f), and must be effectively represented, coordinated, and conducted regardless of the initiating hazard or cause of an incident. An incident that occurs which is or threatens to become a Transportation Security Incident (TSI) triggers prearranged enhanced antiterrorism security measures within the affected area to protect the MTS, with emphasis on critical maritime infrastructure. Such an event would likely also result in the Commandant, U.S. Coast Guard, implementing additional security measures, as well as changes in maritime security (MARSEC) and force protection levels within the MTS but outside of the area that is immediately impacted by the incident. This action would

be guided by reference (g) and the known elements of the incident.

An incident that begins as other than a security event may nevertheless require enhanced antiterrorism security measures to protect the MTS. These measures are in addition to force protection measures. During incident management, enhanced local antiterrorism security measures may also be mandated from the national level in response to another incident in another location or through proactive changes in MARSEC levels. The maritime security component of antiterrorism, as discussed below, must be incorporated into the operations and planning sections of the incident command structure.

Maritime Security Activities. A maritime security framework with antiterrorism measures that respond to mandated requirements and a risk-based management strategy has been established for each port area within that area's Maritime Transportation Security Act (MTSA)-mandated Area Maritime Security Plan (AMSP) per references (e), (h) and (i).

Maritime Security (MARSEC) Levels. Maritime security emphasis is governed by MARSEC levels that are set by the Commandant, U.S. Coast Guard, in coordination with the Department of Homeland Security. The Commandant sets the MARSEC level consistent with the Homeland Security Advisory System (HSAS) and that Threat Condition's scope of application. The Commandant retains the discretion to adust the MARSEC level when necessary to address particular security concerns or circumstances related to the marine transportation system. The lowest MARSEC level, MARSEC 1, is generally comparable with the level of risk associated with HSAS Threat Levels LOW

through ELEVATED (GREEN/BLUE/YELLOW) , thereby accommodating the continually higher baseline level of risk associated with marine operations. This correlation reflects the continually higher baseline level of risk associated with marine operations. The Coast Guard Sector Commander, serving as Coast Guard Captain of the Port (COTP), has been delegated authority to unilaterally increase the local MARSEC level under exceptional circumstances according to criteria contained in reference (k).

AREA MARITIME SECURITY

Area Maritime Security (AMS). AMS under MTSA, reference (e), and implementing regulations, reference (h), and covers the full preparedness continuum of prevention, protection, response, and recovery and develops details, measures, procedures and strategies for preventing and responding to a TSI, and facilitating recovery of the MTS after a TSI. AMS activities are coordinated locally by the Coast Guard Captain of the Port (COTP) as the Federal Maritime Security Coordinator (FMSC). Actual operations and responses are conducted under applicable organization, community-based and incident-specific operating, contingency and response plans, as available.

AMS During Incident Management. AMS provides an existing local maritime security foundation, including coordination and communications arrangements with the port community for initiating incident management by a unified command for a large-scale local transportation emergency, Transportation Security Incident (TSI), or Incident of National Significance. An incident in any of these categories could originate from or involve one or a combination of hazards including terrorism, natural disaster, civil disturbance, or

oil/hazardous material spill. Consequently, it is essential to correlate and coordinate the continuing and enhanced AMS activities across ICS groups (e.g., Maritime Security, Law Enforcement (LE), Oil and Hazardous Materials, Search and Rescue (SAR), and MTS Response and Recovery) and maritime-related support of Emergency Support Functions (ESF).

AMS activities at MARSEC 1 provide a framework and pre-established coordination and communications arrangements for providing prevention and protection of maritime resources during an incident, initiating incident management for local marine transportation security emergencies, and supporting prevention and protection for effects of other emergencies. Facility and vessel-specific security plans also provide critical information to support response to an incident involving one or more of these assets. Maritime security and marine safety activities also provide some of the core and supporting resources in varying degrees of capability for responding to any category of hazard affecting the MTS, and within the immediate area around ports and waterways. Immediate MTS recovery activities within the impacted area also provide essential elements of information (EEI) needed by the Coast Guard, Customs and Border Patrol (CBP), Transportation Security Administration (TSA), and Department of Transportation (DOT) to facilitate recovery and restoration of cargo flow outside of the impacted areas per reference (l).

Area Maritime Security Committee (AMSC). Preparedness is co-developed with port stakeholders. Preparedness activities include formation and coordination of Area Maritime Security Committees selected per criteria in reference (i); identification of critical port infrastructure and operations; identification of risks (threats, vulnerabilities, and consequences)

through risk-based assessments; determination of mitigation strategies and implementation methods; development and description of the process by which to continually evaluate overall port security; preparation of AMS plans including details of additional security measures for increases in MARSEC levels, incident unified command, response and recovery structure, responsibilities and capabilities, procedures for security response and for facilitating MTS recovery. The AMSC provides planning and coordination support; it is not considered a response entity for the purposes of crisis management..

Area Maritime Security Plans (AMSP). Antiterrorism measures are enumerated in AMSPs, which are supported by facility-specific and vessel-specific security and response plans. These plans are designated as Sensitive Security Information (SSI) and are restricted from public access. The AMSPs are supporting plans to references (a), (c), (e), (h) and (j). Plan content is specified by reference (i). An AMSP is not a first responder plan, but an awareness, preparedness and prevention plan as well as a supporting plan for response and MTS recovery. AMSP development considers possible roles, responsibilities, and resources very broadly and is generally limited to determining who will respond, what their roles will be, what resources they can provide, and procedures that they will use. The AMSP provides a framework for communication and coordination amongst port stakeholders and law enforcement and public officials to:

- Identify and reduce vulnerabilities to security threats in and near the MTS.
- Implement special procedures to ensure marine safety, and the safety and readiness of personnel, installations, and equipment,

- Coordinate implementation of prevention and protection procedures during response, and
- Facilitate and support coordinated MTS recovery and restoration activities.

AMS planning is supported or supplemented on a port-by-port, case-by-case basis by local plans and other materials (e.g. underwater port security plans, maritime counterterrorism plans, response and recovery job aids). AMSPs and Area Contingency Plans (ACP) for oil and hazardous materials typically involve many of the same stakeholders, and may be implemented concurrently based on the prevailing circumstances.

MTS Recovery This section addresses measures that are needed within the area impacted by a TSI to provide initial recovery and to provide the basis to facilitate long-term recovery and mitigation activities as characterized below:

- Initial Recovery – MTS infrastructure has been returned to service and is capable of operations at some level. Activities, policies or mitigation strategies aimed at recovery are considered to be achievable in 90 days or less.
- Long-term recovery – MTS infrastructure has been returned to pre-incident condition or has the capacity to operating at pre-incident levels. Activities, policies or mitigation strategies aimed at long-term recovery may take longer than 90 days. Generally parallels long-term recovery measures associated with Emergency Support Function (ESF) #14.

The Coast Guard is responsible for recovery of agency infrastructure and for MTS infrastructure that it directly administers (e.g. aids to navigation). Sector

Commanders, as Captains of the Port (COTP) and FMSC, are responsible for developing coordinated initial recovery activities in consultation with AMSCs for MTS infrastructure that is subject to references (d) and (g). MTS recovery should also be coordinated with mitigation measures covered by ACPs that are related to the MTS.

MARITIME SECURITY-ANTITERRORISM SPECIFIC NIMS ICS POSITIONS AND TASK DESCRIPTIONS

Only those ICS positions and tasks specific and unique to Maritime Security antiterrorism responsibilities will be described in this section. Persons assigned the common positions consistent with the NIMS organization should refer to position job aids and Chapters 5 through 11 of this Manual for their position/task descriptions and checklists.

Area Maritime Security includes immediate operational measures as well as planning for security and recovery operations. Area maritime security antiterrorism is addressed in the Operations Section. MTS security and recovery activities are planned in the Planning Section and conducted through the Operations Section.

INCIDENT COMMANDER - Tasks specific to an Incident are to:

a. Review Incident Commander (IC) responsibilities.
b. Review Maritime Security responsibilities as delineated in AMSPs.
c. Determine HSAS threat level and MARSEC level and required maritime security measures.
d. Determine if unilateral local-area increase in MARSEC level is necessitated by the incident.
e. Comply with critical incident communications requirements in reference (m)
f. Ensure that the following have been established:
    - Maritime Security Group in Operations Section – which coordinates implementation of MARSEC measures, coordinates maritime security activities with the law enforcement (LE), oil and hazardous materials, search and rescue (SAR), and MTS recovery groups.
g. Implement supporting plans as applicable.

h. Work to identify and address tactical and strategic issues.
i. Assist the Coast Guard component commander in coordinated maritime security and MTS response and recovery operations and activities consistent with the AMSP, site safety plan, law enforcement, oil and hazardous materials, and search and rescue operations.
j. Determine antiterrorism support required for military outloads in or through the affected area.

AREA MARITIME SECURITY GROUP - Tasks specific to security incidents are:

a. Review the Division/Group Supervisor Responsibilities in Chapter 7.
b. Coordinate implementation of MARSEC levels changes.
c. Monitor and report attainment of MARSEC measures and deficiencies, ensuring the implementation of MARSEC requirements.
d. Assist the Incident Commander in meeting critical incident communications requirements of reference (m).
e. Implement AMSP contingency arrangements and procedures.
f. Coordinate AMS oversight and support with AMSC.
g. Coordinate AMS support for LE, oil and hazardous materials, SAR and MTS recovery activities.
h. Coordinate implementation of supporting plans (e.g. underwater port security).
i. Arrange for, document and report MTS damage assessments.
j. Coordinate AMS support for MTS Recovery.
k. Coordinate AMS support for ESF activities.
l. Coordinate AMS support for military outload

operations in or through the affected area.

MTS RECOVERY UNIT - Tasks specific to recovery of the MTS are:

a. Review MTS Unit Leader responsibilities in Chapter 8.
b. Activate MTS recovery unit assist team (where available).
c. Be familiar with the AMSC and AMSP and associated recovery procedures and priorities.
d. Identify and implement supporting MTS recovery plans, where available.
e. Incorporate MTS security and recovery into ICS planning cycle.
f. Advise the IC and PSC of maritime security issues associated with MTS recovery and latest EEI from port community stakeholders in coordination with the Maritime Security, LE, oil and hazardous materials and SAR Groups.
g. As needed, assist IC, PSC and OSC in prioritization of critical infrastructure needed to be brought to operational status.
h. Determine and advise the IC and PSC of relevant pre-scripted FEMA mission assignments under the Stafford Act, reference (j), related to or required for MTS recovery.
i. Coordinate with IC, PSC, FEMA and pertinent ESFs for FEMA/Stafford Act mission assignments through the Joint Field Office (JFO) in support of MTS response to reestablish a basic capability for long-term recovery.
j. Assess and advise IC and PSC of unified command capability to perform any FEMA mission assignment requests received through the JFO.
k. Coordinate with the LE Group to determine the relationship of evidence protection requirements

to recovery operations.

l. Identify short and long term issues affecting or potentially affecting the MTS with supporting materials.
m. Identify supporting requirements.
n. Review and apply as applicable reference (k) recommendations for MTS Recovery.
o. For incidents impacting more than one Coast Guard Sector, provide information to support management of regional issues, including local area impacts that will be felt outside of the immediate response area, such as export delays.
p. Make recommendations to the IC and PSC on short term (impact felt within 90 days) recovery priorities and actions.

(d) National Incident Management System (NIMS)

INTRODUCTION

The organization for a major Law Enforcement Operation (Counter Drug or Alien Migrant Interdiction) is designed to show an organizational structure that could provide supervision and control for the essential functions required during such an operation.

It must be emphasized that this guide is not a substitute for law enforcement planning as outlined in the references (a) and (b). The Commandant and Area manuals, operation orders and policies that could include plans for such major multi-agency/multi-nation that would lead major Counter Drug or Alien Migrant Interdiction Operations should identify the organizations, resources, and command and control structure that would be utilized in the operation. Exercising these plans will develop and fine-tune national and agency roles in the IC/UC and ICS.

The normal law enforcement action for Coast Guard units will be single unit activities. Reference (b) identifies the structure for these normal single unit operations and dictates in detail how the operation is to

be carried out. Since NIMS ICS is the primary system used by most Federal, State, and Local government agencies, and is required by references (c) and (d) to be used in response to incidents, it is advantageous to use and understand the ICS process in a large multi-agency and multi-national operation where the incident brings numerous agencies together with overlapping jurisdictions, responsibilities, and capabilities. In these situations, Coast Guard Law Enforcement personnel may be expected to fill Command and General Staff positions, with other agencies in the role of IC an/or within an UC. In this IMH, the goal is to build upon the structure identified in reference (b), and demonstrate how the IC/UC and ICS organization may be used when a Law Enforcement Operation grows from a single unit operation to a Multi-Agency/Multi-National Operation.

For example, an alien migrant interdiction operation such as the Mariel Boat Lift can generate a huge multiple-agency response with a limited command and control structure. Because the Coast Guard is usually the first unit on-scene and because of its mission responsibilities and capabilities, it will be instrumental in building the final overall command and control team.

Although there are many types of law enforcement activities, a major multi-agency Alien Migrant Interdiction Operation was selected to demonstrate how the expanding modular ICS organization might be used to manage a Law Enforcement Operation. Commandant and Area instructions, manuals and operation orders include references, plans and policies that dictate overall U.S. Coast Guard Law Enforcement operations policy. For example, OPLAN VIGILANT SENTRY provides the overall Department of Homeland Security response to a mass migration in the Caribbean.

LAW ENFORCEMENT ACTIVITY SCENARIO AND MODULAR ORGANIZATION DEVELOPMENT

MODULAR DEVELOPMENT - A series of examples of modular development are included to illustrate one method of expanding the ICS organization.

INITIAL RESPONSE ORGANIZATION - A U.S. Coast Guard cutter is on normal patrol when it intercepts a small boat fitting the profile of an undocumented migrant vessel. The Coast Guard cutter carries out the standard boarding operation procedures for the vessel. See Page 17-7 for an example of the Initial Response Organization.

REINFORCED RESPONSE ORGANIZATION - Upon boarding the profiled vessel, the boarding party discovers a large number of undocumented migrants. During the boarding party's search and investigation, the interpreter overhears one of the undocumented migrants express his concern for relatives aboard another vessel. The Commanding Officer of the cutter relays this information to the U.S. Coast Guard District with operational control over his mission, and a Coast Guard aircraft is deployed to search for the other vessel. The District Commander assumes the role of lead agency and IC for the interdiction operation, and requests the appropriate U.S. Coast Guard Area Commander to direct an additional cutter to his operational control to assist in the search for other possible undocumented migrant vessels. The District Commander also notifies local DOD units that there is a possibility of additional undocumented migrant vessels in the operational area. The second cutter has additional Law Enforcement Detachments (LEDETs) assigned before sailing. See Page 17-8 for an example of the Reinforced Response Organization.

MULTI-DIVISION/GROUP ORGANIZATION - Within a day of searching, the Coast Guard aircraft and JIATF resources have identified numerous vessels of all sizes that fit the undocumented migrant vessel profile. This information is relayed to the District, who in turn notifies the Area Commander and Coast Guard Headquarters. Coast Guard Headquarters notifies the Immigration and Customs Enforcement (ICE) and other federal law enforcement agencies. Upon notification to these agencies by Coast Guard Headquarters, the Commandant will normally give authorization for direct communication to the District Commander. The Area Commander orders all available cutters (WHEC, WMEC) to the area for interdiction operations under the operational control of the District Commander. DOD lends its resources to assist in the search for undocumented migrant vessels. See Page 17-9 for an example of the Multi-Division/Group Organization.

The Department of Homeland Security assigns a representative to assist and coordinate its activities with the District Commander. The District Commander's Staff and Agency Representatives are tasked with developing the resource requirements for the extended interdiction operation, and determining the resources that will have to be obtained from outside the District. The District Chief of Operations is assigned as the OSC. The operational area is divided into geographical divisions and a Coast Guard cutter is assigned to each division for patrol and boarding operations. A Navy vessel is directed to the scene to serve as an undocumented migrant holding area. ICE provides aircraft for additional search patrols.

Since many of the vessels being used to carry undocumented migrants are sailing under the flag of other nations, the U.S. Coast Guard has requested through the Department of State that representatives of those governments be assigned as ship riders to Coast Guard vessels, allowing them to carry out boardings on the applicable nations vessels in international waters.

The IC/UC establishes a JIC to handle the intense media interest that is developing over the operation.

MULTI-BRANCH ORGANIZATION - As the situation develops, the number of undocumented migrants discovered and detained by the Coast Guard has grown beyond the capability of vessels to safely and humanly hold them offshore. The IC/UC has determined that holding facilities must be prepared on shore. The IC/UC identify Federal, State and Local resources to assist in planning and implementing the shoreside facilities. See Page 17-10 for an example of the Multi-Branch Organization.

LAW ENFORCEMENT

LAW ENFORCEMENT ACTIVITY SPECIFIC ICS POSITIONS AND TASK DESCRIPTIONS

Only those ICS positions and tasks specific and unique to Law Enforcement missions will be described in this section. Persons assigned the common positions consistent with the NIMS ICS organization should refer to position job aids and Chapters 5 through 11 of this IMH for their position/task descriptions and checklists.

ASYLUM PRESCREENING OFFICER (APSO) - The APSO is responsible for conducting initial screenings of individuals who have made asylum claims or come from a nation with a history of political persecution, human rights violations, or torture. APSOs are full time asylum officers deployed to the field. The APSO will normally be assigned to the LO as an Agency Representative or directly to the Command Staff.

These prescreening interviews determine if an individual has a credible fear of persecution upon return to his/her home nation. APSO interviews are transmitted to CIS Headquarters in Washington, D.C., for review by asylum specialists. If it is determined that an individual has a credible fear of persecution, the person is taken to another location for more extensive interviews. While the APSO may be assigned in various locations within the ICS, he/she needs to have direct access to communications with Washington, D.C. The contents of APSO interviews may be confidential and not available for intelligence or general use. Additional duties include:

a. Review the Agency Representative Responsibilities in Chapter 6.
b. Advise the IC/UC on the procedures for asylum interviews, specific support required, and the separation of those claiming asylum.

c. Liaise with CIS Headquarters on asylum issues.
d. Conduct additional interviews as necessary.
e. Advise the IC on trends in asylum claims and indicators that those within the IC/UC may need to be aware of.

VESSEL DISPOSITION GROUP SUPERVISOR - The Vessel Disposition Group Supervisor is responsible for the disposal of vessels seized in the course of Law Enforcement Operations. In some cases this will involve warning the return of the vessel to the flag state, but in many situations the vessel will be seized for forfeiture (either because it is stateless or because it was used in the commission of a crime). In drug interdiction missions, this task is usually performed by Immigration and Customs Enforcement (ICE). In all other cases, the U.S. Marshal Service performs this function.

If an asset is seized for forfeiture, all hazardous materials must be removed and all safety violations must be corrected before the vessel can be disposed of. The lead agency will contract out for removal and disposal of hazardous materials from the vessel using private contractors. U.S. Coast Guard Sectors may be asked to assist the lead agency in assessing the condition of the vessel, the applicable environmental laws that may apply to the vessels condition, and steps needed to correct the assessed violations. Addition duties included:

a. Review the Division/Group Supervisor Responsibilities in Chapter 7.

LAW ENFORCEMENT DETACHMENT TEAM LEADER - Law Enforcement Detachment Team (LEDET) Leaders are responsible for separate teams of individuals trained in boarding vessels for conducting law enforcement operations. LEDETs typically deploy to U.S. Navy and foreign naval vessels to provide them with law enforcement capability. They can also be used in various situations to augment Coast Guard Cutter Boarding Teams, and in these cases should not be confused with the Cutter's Boarding Team, which is made up of individuals permanently assigned to the Cutter's crew. Addition duties included:

a. Review the Strike Team Leader/Task Force Responsibilities in Chapter 7.

MARITIME SAFETY AND SECURITY TEAMS - Maritime Safety and Security Teams (MSSTs) were created under the Maritime Transportation Security Act (MTSA) 2002, in direct response to the terrorist attacks on Sept. 11, 2001, and are a part of the Department of Homeland Security's layered strategy directed at protecting our seaports and waterways. MSSTs provide waterborne and a modest level of shoreside antiterrorism force protection for strategic shipping, high interest vessels and critical infrastructure. MSSTs are a quick response force capable of rapid, nationwide deployment via air, ground or sea transportation in response to changing threat conditions and evolving Maritime Homeland Security (MHS) mission requirements. Multi-mission capability facilitates augmentation for other selected Coast Guard missions.

SEARCH AND RESCUE

References:

(a) IMO/ICAO International Aeronautical and Maritime Search and Rescue Manual, Vols. I & II
(b) U.S. National Search and Rescue Supplement (NSS) to the International Aeronautical and Maritime Search and Rescue Manual (IMSAR)
(c) National Search and Rescue Plan, 1999
(d) U.S. Coast Guard Addendum to the National Search and Rescue Supplement (NSS) to the International Aeronautical and Maritime Search and Rescue Manual (IMSAR), COMDTINST 16130.2 (series)
(e) National Response Plan (NRP)
(f) National Incident Management System (NIMS)

INTRODUCTION

Search and Rescue (SAR) efforts primarily focus on finding and assisting persons in actual or apparent distress and are carried out within a well-defined SAR response system as per references (a) – (d). These references have their basis in international law that U.S. SAR services are obligated to follow, and they have practical benefits that are intended to maximize the effectiveness of SAR operations, particularly when working with other military services, SAR authorities of other nations, and with ships or aircraft at sea. When an emergency warrants responses in addition to SAR, the NIMS ICS organizational structure shall be used for overall response management in accordance with reference (e) and (f). Examples of other activities that are not SAR, but are often closely associated with a SAR incident, include search and recovery, salvage,

investigation, fire-fighting, pollution response, etc. This chapter describes an example ICS organizational structure that will provide supervision and control of essential functions during a SAR incident that includes, or will include, non-SAR response activities.

For incidents that actually or potentially involve both SAR and non-SAR response activities, the SAR Mission Coordinator (SMC), who is designated by the SAR response system, will initiate action and coordinate the overall SAR response in accordance with references (a) through (d). When the Incident Commander (IC) is designated, the SMC function will be placed under the umbrella of the ICS organizational structure, typically as the SAR Branch Director or SAR Group Supervisor in the Operations Section. Simply put, the SAR response system "plugs into" the ICS organizational structure, where the SMC (or someone designated by the SMC to carry out this function) serves as the "plug" or link. The SAR response may also include a SAR On-Scene Coordinator (SAR OSC) and an Aircraft Coordinator (ACO). In some cases the person serving as the Incident Commander (IC) or Operations Section Chief (OSC) may also be designated as the SMC, but the terms "Incident Commander" or "Operations Section Chief" are not interchangeable with titles associated with SAR response functions. For the majority of incidents, the SAR response will be completed/suspended by the time the ICS structure is fully in place. As the SAR mission winds down and other missions take precedence (i.e., search and recovery), the IC may designate the SMC or SAR OSC in the SAR response system to continue as a Branch Director or Group Supervisor in the ICS structure to manage on-scene operations other than SAR. Likewise, Search and Rescue Units (SRUs) may also be reassigned to other groups in the ICS structure once the SAR mission is concluded. In general, Coast Guard

personnel with SAR responsibilities should receive sufficient ICS training to enable them to carry out their respective duties in ICS response organizations.

SEARCH AND RESCUE BEST RESPONSE

KEY AREAS TO A SUCCESSFUL SAR RESPONSE

Success of response operations can often be found in how well the management team focused on key response areas. ICs and their Command and General Staff should consider, if applicable, the following key response areas during ICS activation in conjunction with or following a search and rescue operation.

OPERATIONAL

Search Planning & Operations
Rescue Planning & Operations
Medical/Triage
Fire Fighting
Shoreline Search & Recovery
On-Water Search & Recovery

SUPPORT/COORDINATION

Safety
Stress Management
Liaison with Victim's Families
Security
Investigations
Resources
Political
Assisting & Cooperating Agencies
Public Information
Command Post Needs

IC's and their Command and General Staff need to closely monitor how well the incident objectives, strategies, and tactics are addressing the key response areas identified above and adjust, as necessary, to ensure the maximum potential for the best possible response.

SEARCH AND RESCUE INCIDENT SCENARIO AND MODULAR ORGANIZATION DEVELOPMENT

MODULAR DEVELOPMENT - A series of examples of modular development are included to illustrate one method of expanding the major airline crash incident organization.

INITIAL RESPONSE ORGANIZATION (MAJOR AIRLINE CRASH) - The SAR Mission Coordinator (SMC), initiates emergency response actions and designates the best-qualified and most capable unit on-scene as SAR OSC. The SMC may also designate an ACO to manage air assets on-scene if there are too many for the SAR OSC to effectively manage or communications between surface and air assets prove challenging. The first to arrive on scene would likely be USCG vessels and aircraft, police/fire boats, fishing vessels, and hosts of recreational boats. The FAA will be requested to establish air space restrictions and issue the appropriate Notice to Airmen (NOTAMs). The cognizant Sector Commander or District Commander may be designated the IC, at which time the SMC function is placed under the umbrella of the ICS organizational structure. Rescue and emergency medical treatment will take priority during this phase. Recovery and identification of the deceased, accident investigation, and cleanup will take priority later in the incident. Initial responders will be heavily involved in the rescue, triage, and transportation of survivors. A PIO is immediately assigned to provide initial information to the media and establish a JIC. CERT and/or CISM support should be considered early. See Page 18-9 for an example of the initial response organization.

REINFORCED RESPONSE ORGANIZATION (MAJOR AIRLINE CRASH) - An ICP is established and initially

staffed with personnel from the Coast Guard; local, state, and federal law enforcement and emergency response/management agencies; and local medical institutions/organizations. The JIC should be staffed for 24-hour operations, if need be. A LNO is also designated to coordinate the large numbers of responding and interested government agencies and public organizations. The SOFR is assigned to assess the safety hazards/situation and develop a Site Safety Plan (ICS-208). The NTSB and the FBI may be added to the UC upon their representative's physical arrival on-scene. See Page 18-10 for an example of the reinforced response organization.

The Operations Section Chief (OSC) is designated to manage the growing number of operational activities (e.g., SAR, medical care, security, and evidence collection). This may be the Sector Commander if the District Commander assumes the role of IC. The following Groups are established to organize the operational activities:

- The SAR Group continues to carry out the SAR response under the function of the SMC. Additional surface and air assets have arrived from different jurisdictions. Tactical control of some or all of the response assets may be shifted to the SAR Group for tasking by the SAR OSC or ACO.
- The Medical Group, supported heavily by local EMS and hospital personnel and resources, coordinates triage and treatment areas, as well as transporting survivors. A Patient Transportation Unit may be established to efficiently move survivors from the staging/triage areas to medical facilities.
- The Law Enforcement Group begins the task of

securing the scene; providing shore-side security for staging areas and the ICP, establishing evidence collection and control; and conducting the investigation. If criminal activity is not suspected, the NTSB may have primary investigative responsibilities. If terrorism is suspected, the FBI will take the lead. NTSB and FBI representatives will participate in the UC and brief the UC concerning their needs regarding investigation and recovery operations. A Traffic Control Unit may be needed to keep tremendous number of shore-side curiosity seekers from impairing the access of EMS/rescue personnel to critical Staging Areas.

- An Air Tactical Group Supervisor may be designated to coordinate assignments and air assets and manage air tactical activities.
- Consideration should be given to establishing a Demobilization Unit.

MULTI-DIVISION/GROUP ORGANIZATION (MAJOR AIRLINE CRASH) - The UC and Command Staff are functional and fully staffed. The District may be designated as the Coast Guard IC to be on the same level as the NTSB and FBI representative(s). The Sector Commander may assume the role of OSC, if he or she has not already done so. Deputies from the fire, law enforcement, and emergency medical service agencies could assist the OSC. The Rescue, Medical, and Law Enforcement Groups are fully developed. The rescue is nearly complete, if not already completed, and the operation is shifting to search and recovery of bodies and aircraft debris. Surface and air assets are shifted to other groups, such as the Search and Recovery and Law Enforcement Groups. See page 18-11 for an example of the Multi-Division/Group Organization.

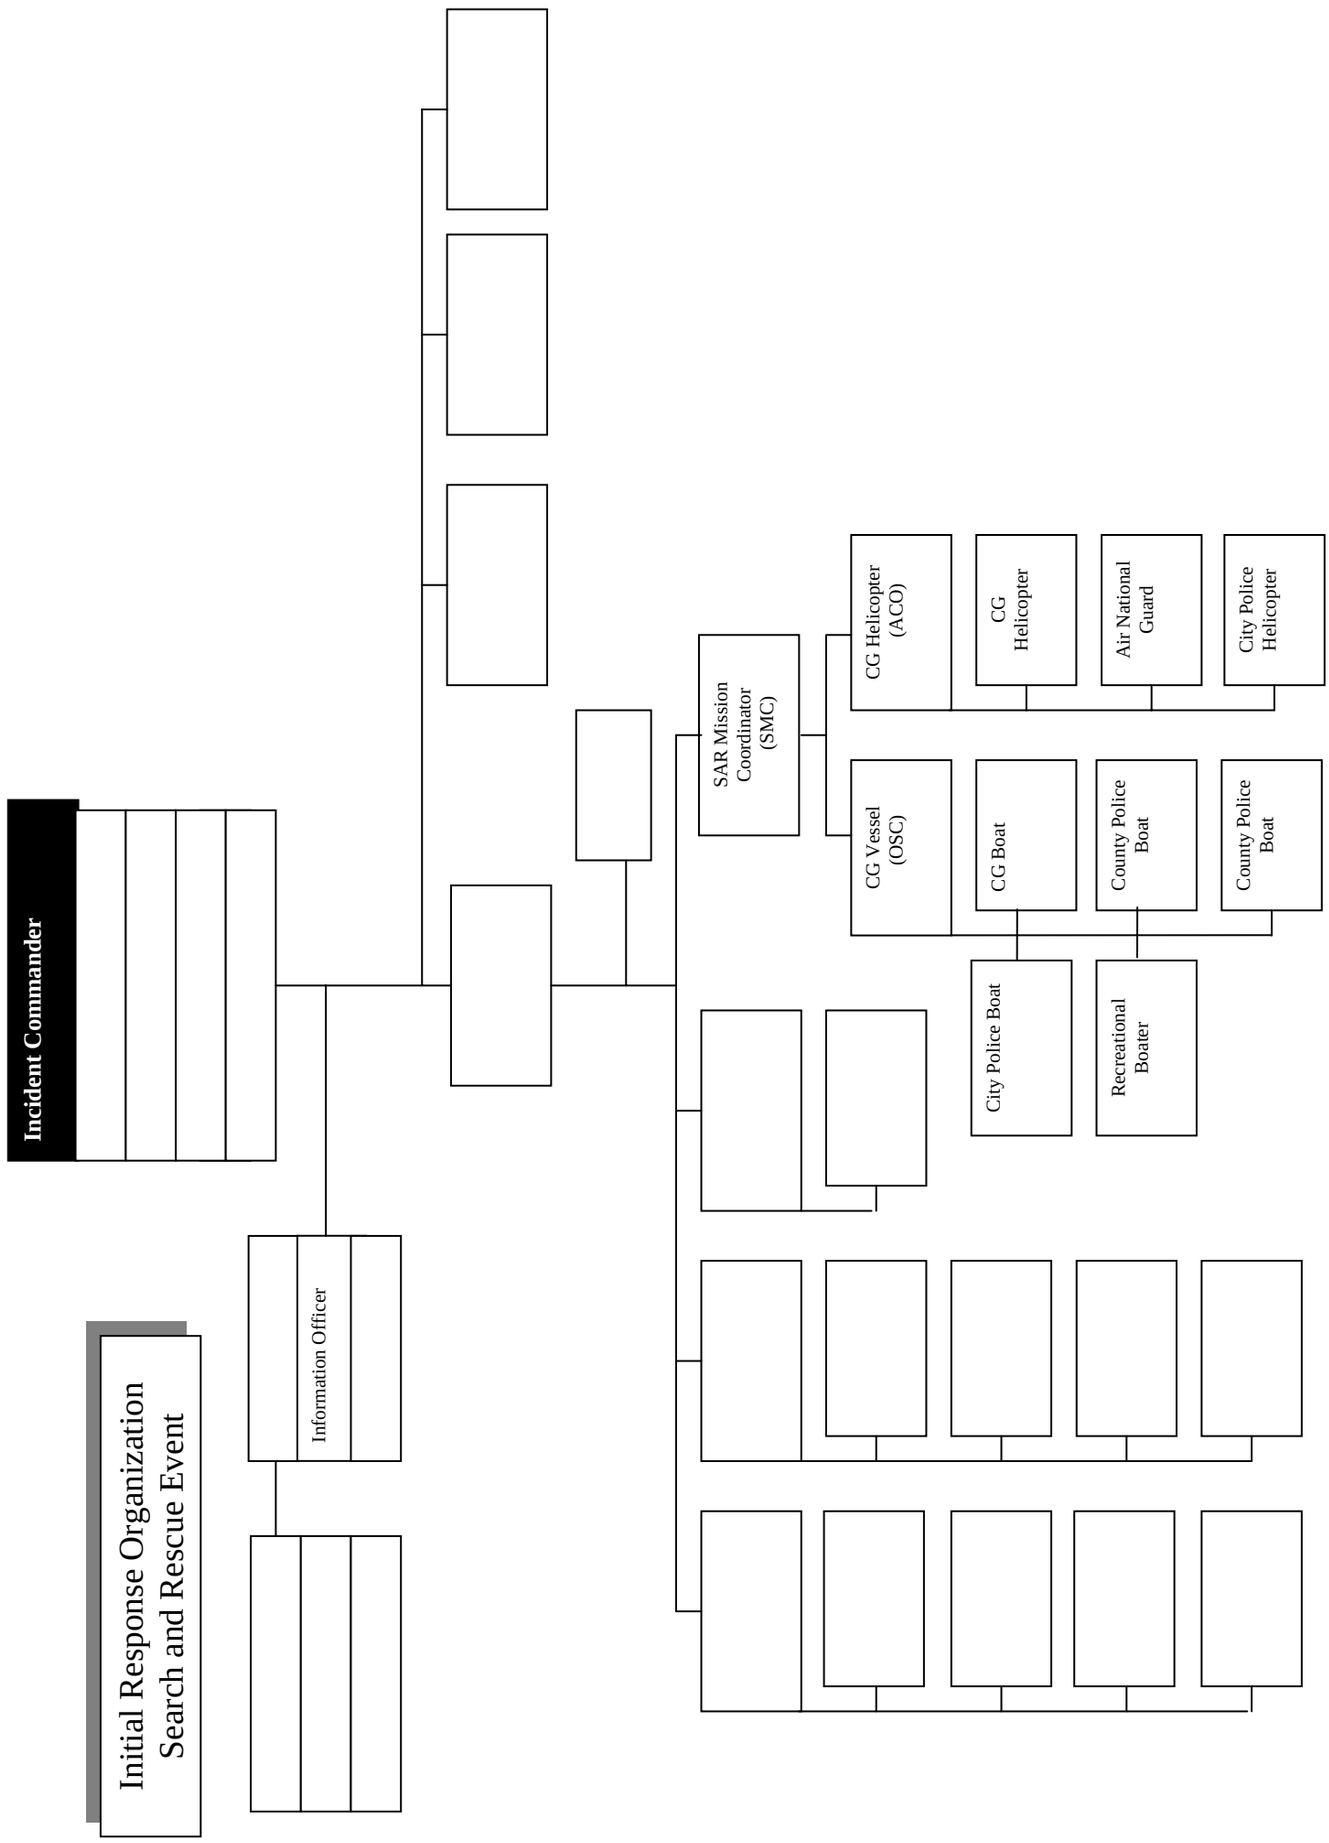
The focus of the UC's efforts is shifting to the NTSB and law enforcement agencies, including city/county/state coroner. A Body Recovery Team has been added and is working closely with the coroner who has jurisdiction. An Underwater Recovery Group has been initiated and may be led by the Navy or other qualified agencies. The FBI, NTSB and local/state law enforcement agencies are coordinating the investigation and recovery of wreckage.

The JIC continues to be fully staffed. Additional assets may be needed to accommodate the political dignitaries and next of kin that would want to view the accident site or have direct briefings from the Command Staff.

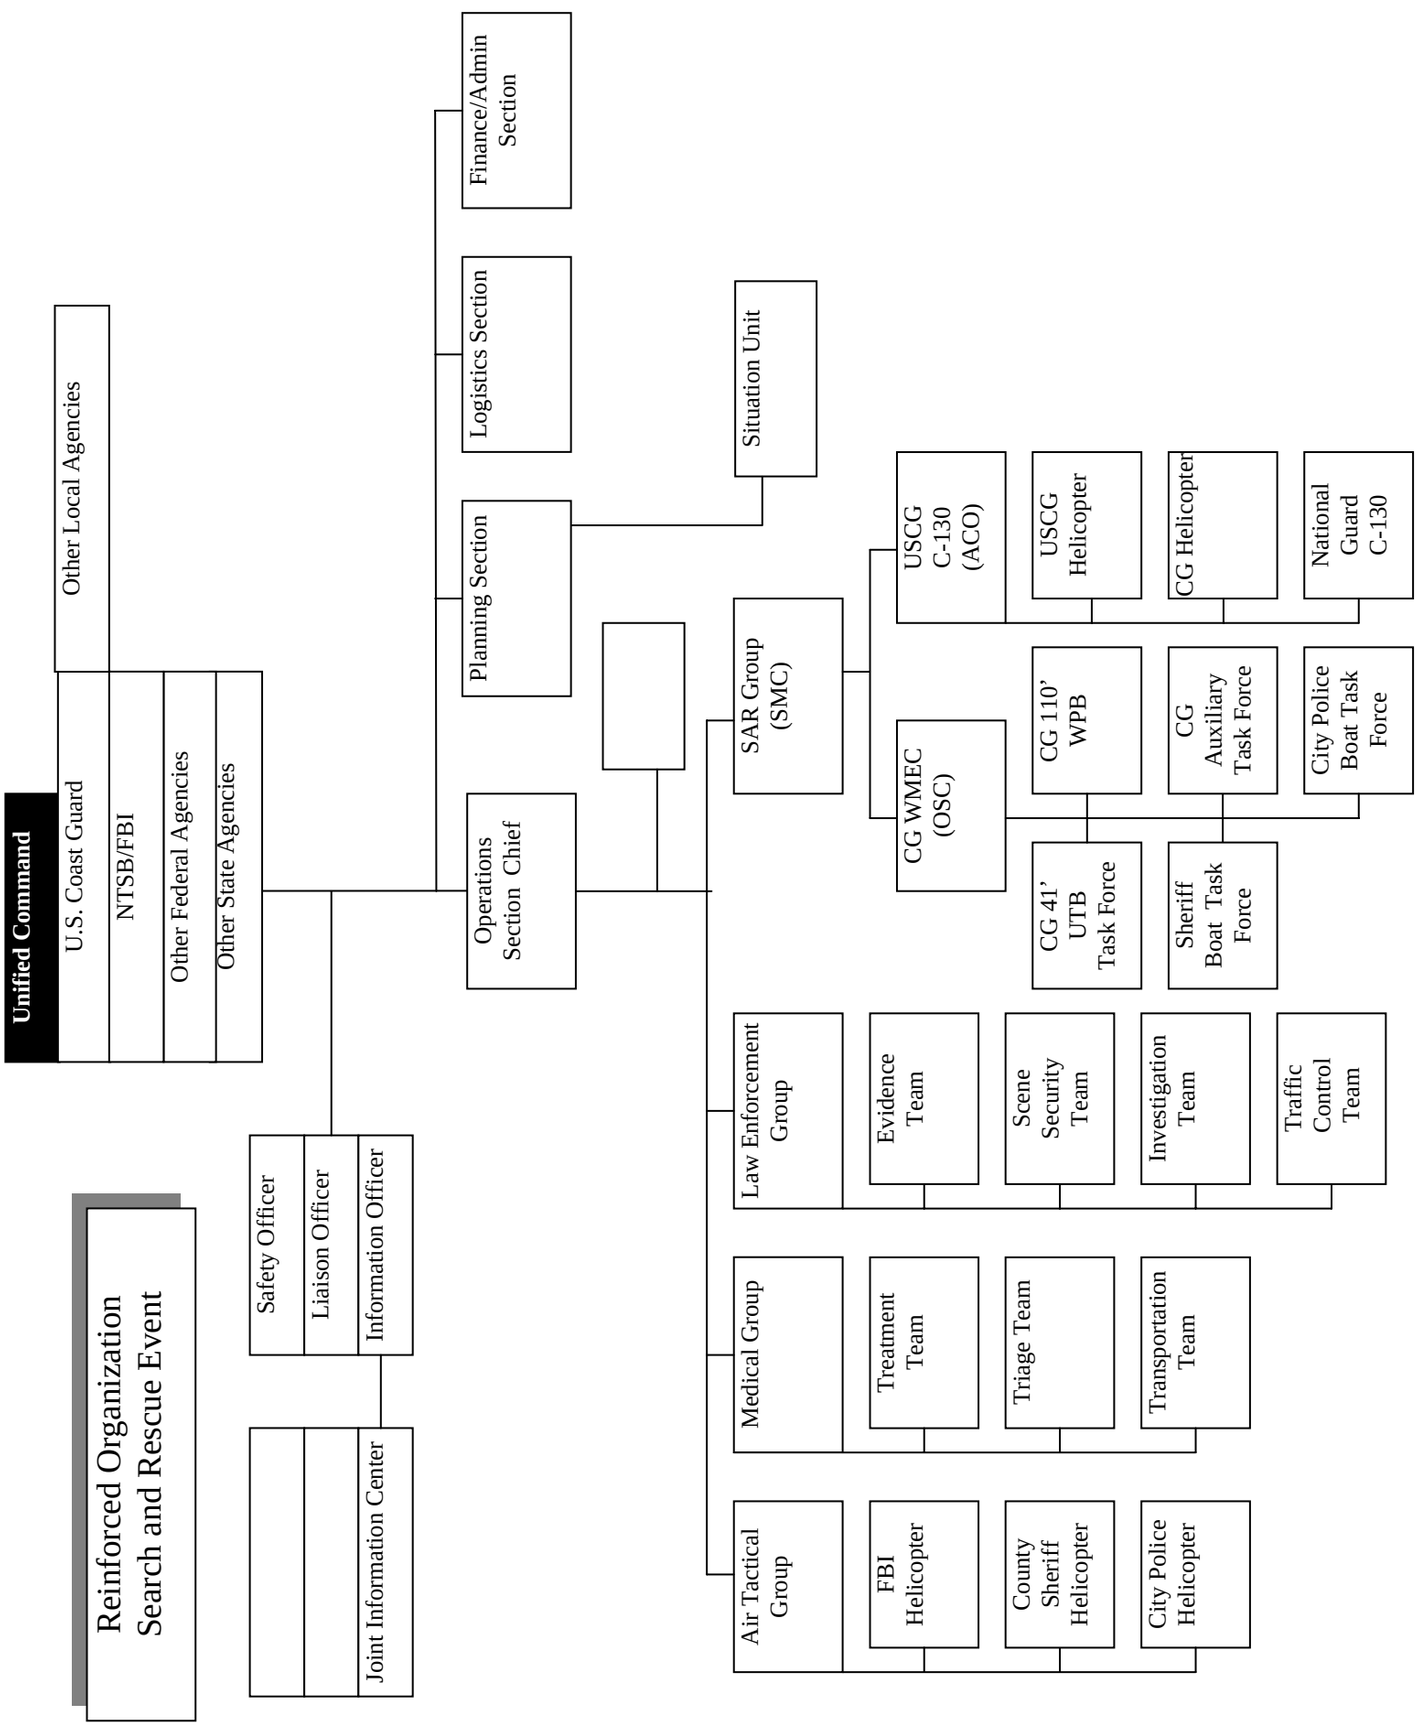
MULTI-BRANCH ORGANIZATION (MAJOR AIRLINE CRASH) - The UC is fully functional and staffed. UC efforts are focused on NTSB and FBI concerns. The Coast Guard is now primarily assisting with search and recovery activities, as well as providing host/landlord support. The appropriate deputies and assistants have been designated to ensure an integrated and coordinated operation at the Section, Branch, Division, and Group levels. See Page 18-12 for an example of the Multi-Branch Organization.

The recovery operation has been divided into three branches (i.e., Surface, Underwater, and Shore-side). Geographic divisions have been created to divide the search and recovery into manageable areas.

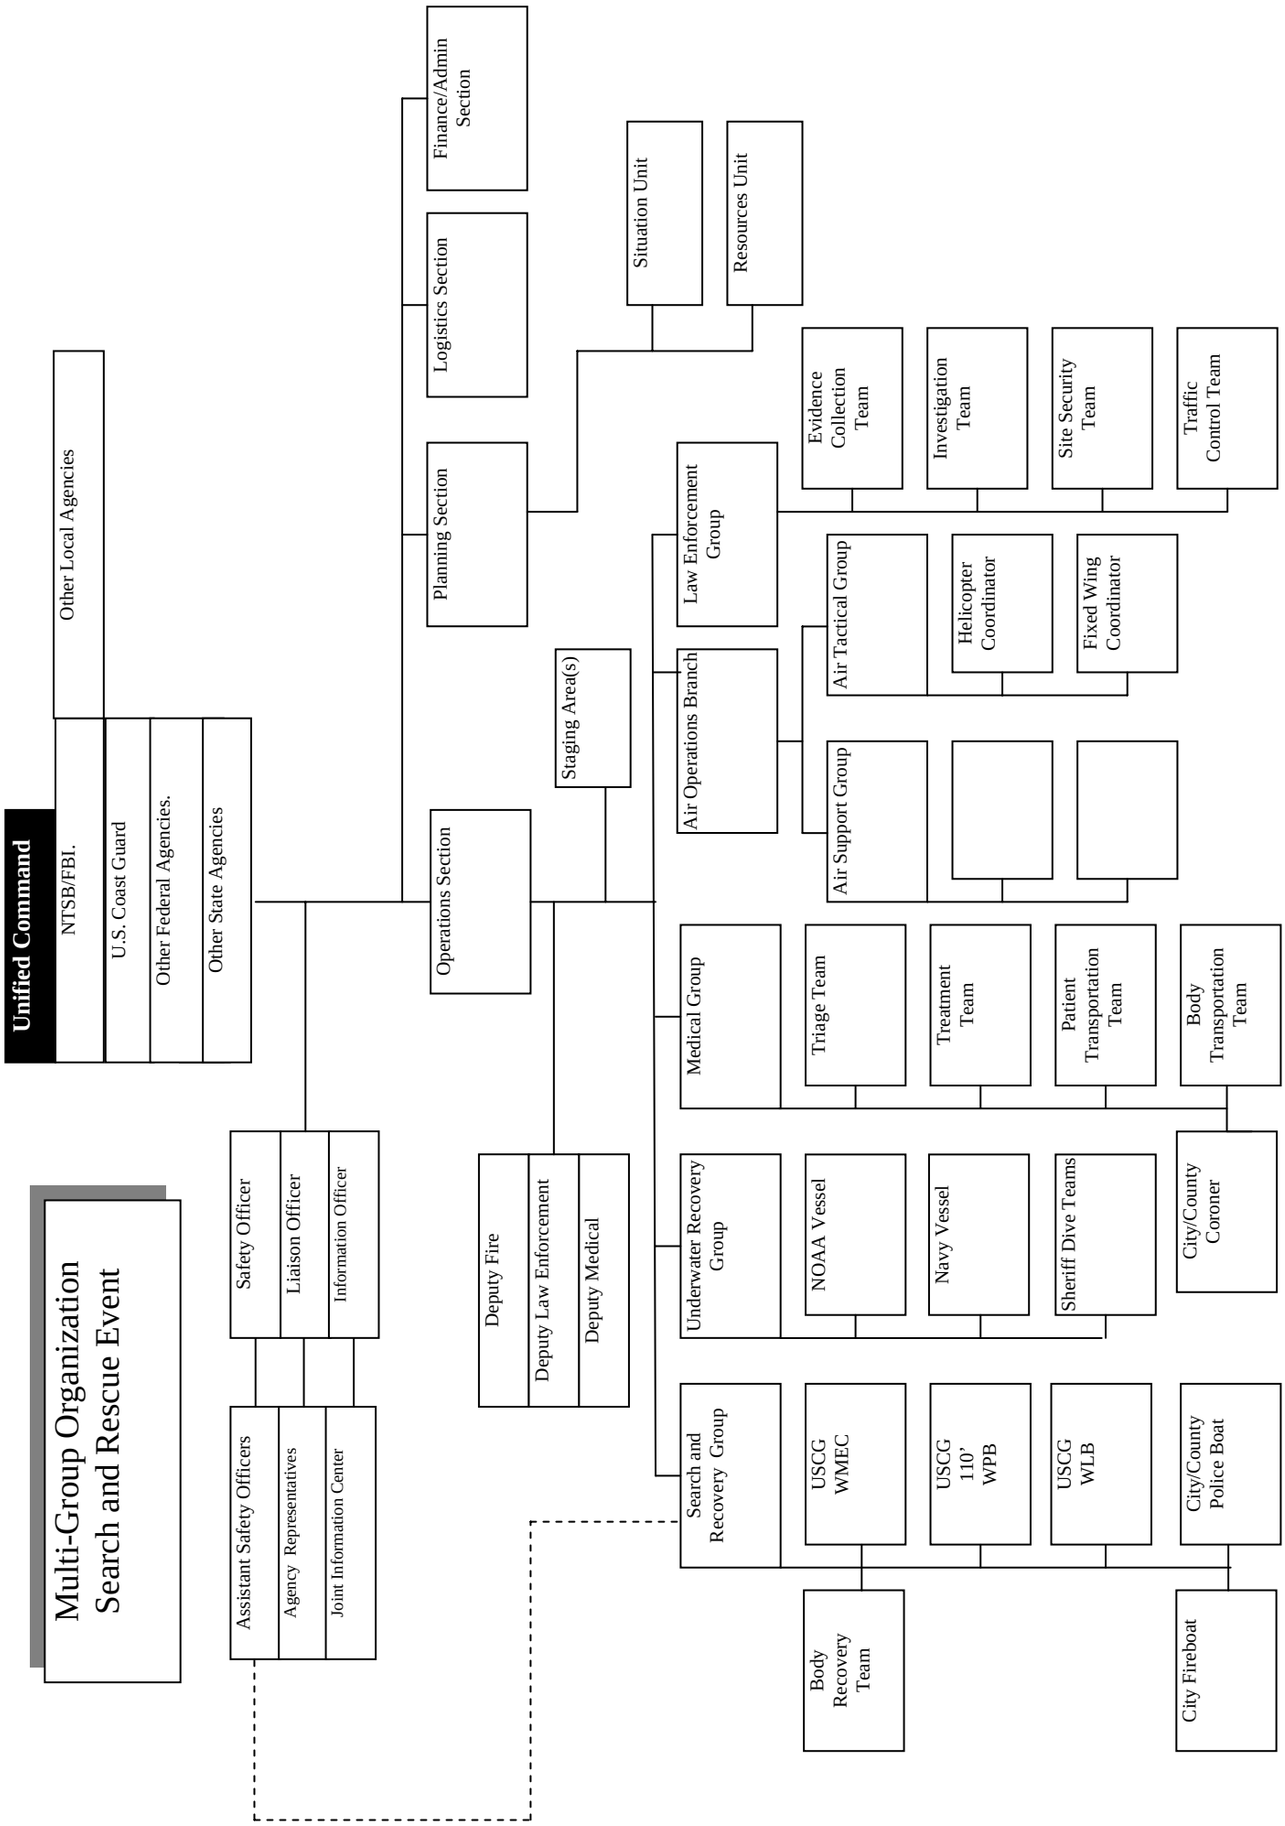
Although not shown on the organization chart, a Demobilization Unit may be established in the Planning Section to develop an Incident Demobilization Plan. This plan should include the Chaplain and/or CISM.



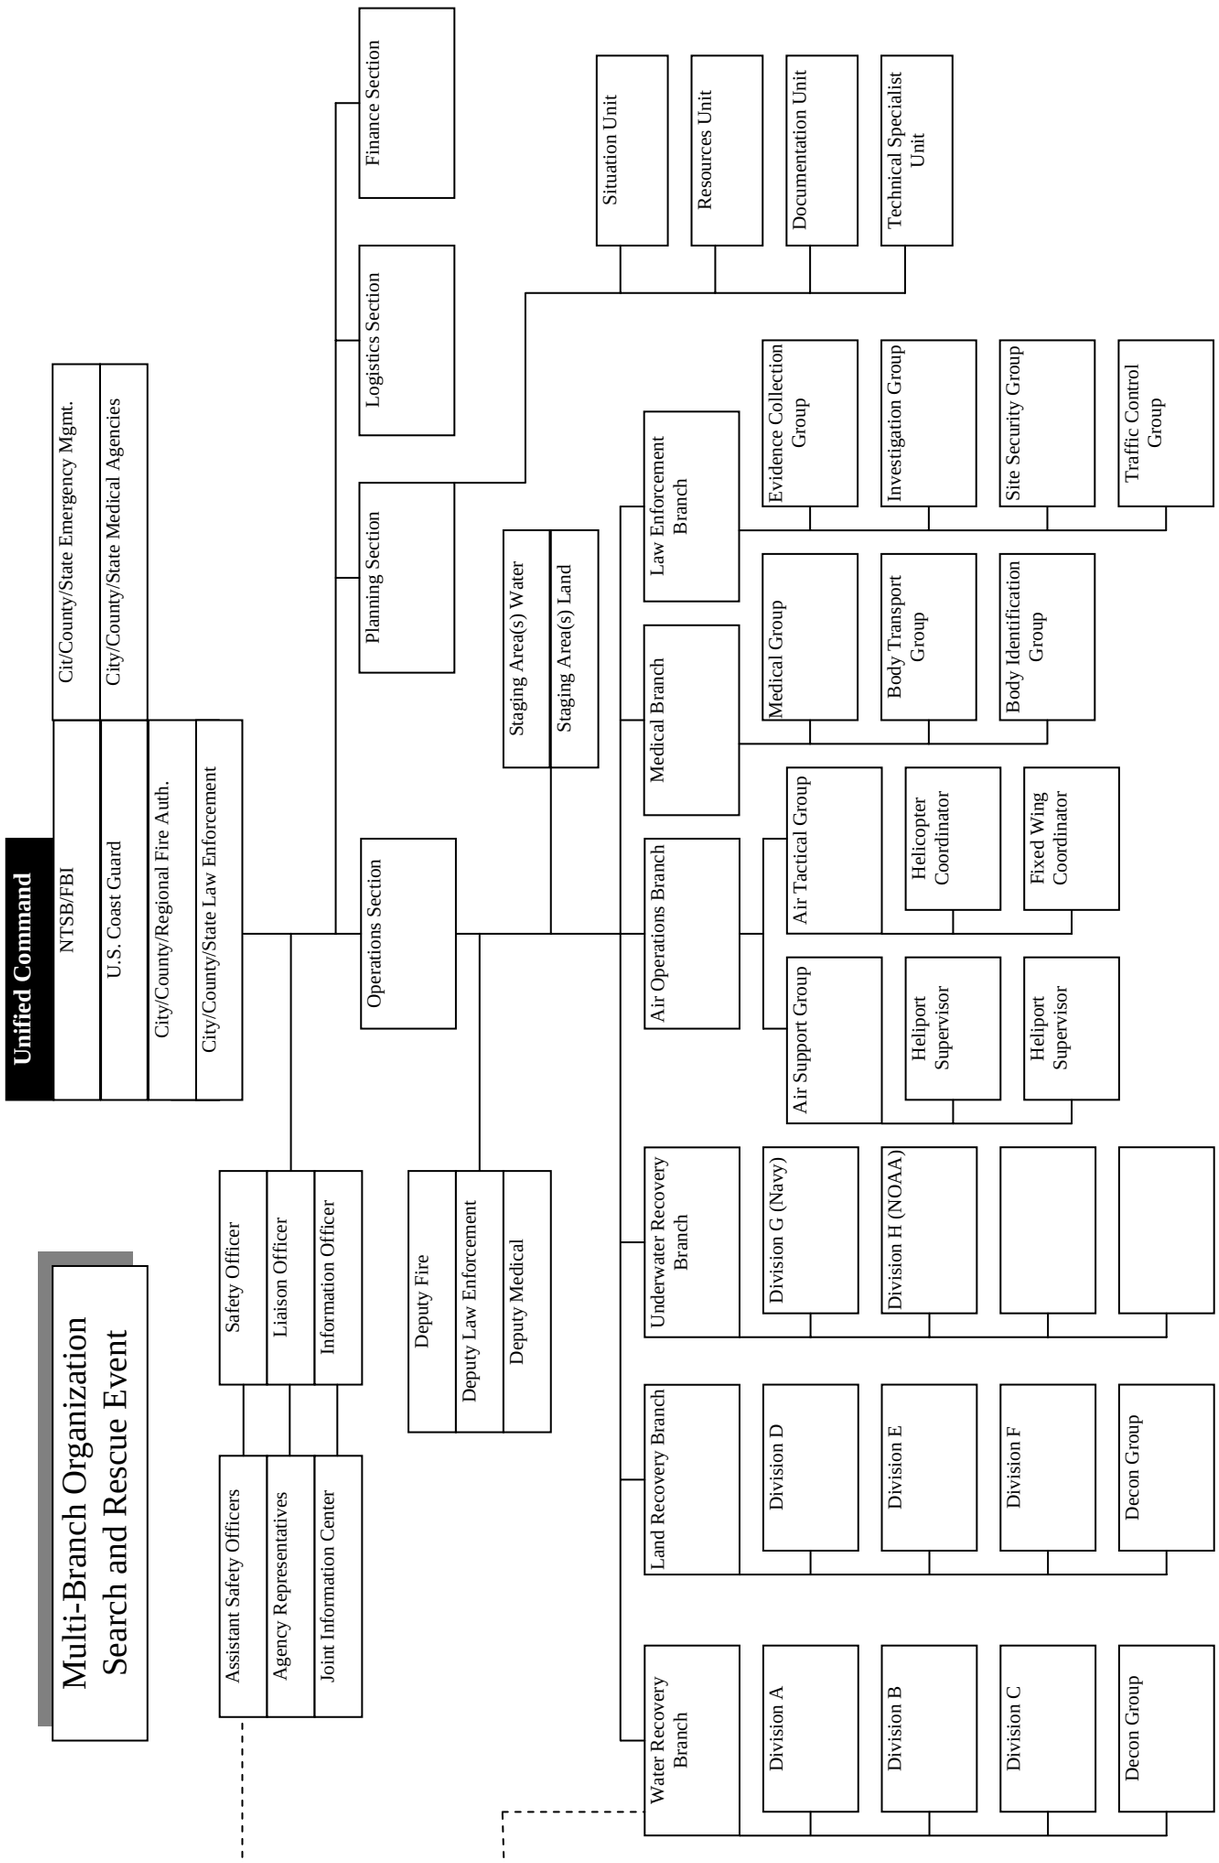
SEARCH & RESCUE



SEARCH & RESCUE



SEARCH & RESCUE



SEARCH & RESCUE

SEARCH AND RESCUE SPECIFIC ICS POSITIONS AND TASK DESCRIPTIONS

Only those ICS positions and tasks specific and unique to Search and Rescue (SAR) missions will be described in this section. A general description of SAR Response System Specific functions is also included. Persons assigned the common positions consistent with the NIMS ICS organization should refer to the position job aids and Chapters 5-13 of this IMH for their position/task descriptions and checklists.

INCIDENT COMMANDER (IC) - In addition to the responsibilities outlined in Chapter 2, the IC (and the OSC if one is designated) of an incident that includes a SAR mission must recognize that the SAR Mission Coordinator (SMC) is obligated to carry out the SAR mission in accordance with references (a) – (d). The SMC (or someone designated by the SMC for this function) serves as the link between the SAR Response System and the ICS organization and is best placed at the Branch Director or Group Supervisor level (for further description and duties of the SMC, see SAR System Specific Functions below). The IC may also be designated as the SMC; however, separate individuals should carry out the IC and SMC functions if the operational tempo and/or span of control warrant it or the IC is not thoroughly familiar with all SAR system processes. For SAR incidents that actually or potentially include other non-SAR activities (i.e. search and recovery, salvage, investigation, pollution response, fire-fighting, etc.), carry out the following tasks as appropriate:

a. Establish a suitable ICP, preferably at a site separate from the OPCEN, and stand-up ICS organization apart from initial response operations.

- Assign personnel to establish the ICP and stand-up ICS organization that are not responsible for initial response actions (i.e., personnel not coordinating or prosecuting the SAR case).
- Establish an ICP, and accommodate to the best extent possible and as necessary the following four components: (1) at-sea command and control; (2) reconstruction, investigation and human remains transfer (primarily involving mass casualties); (3) family briefings; and (4) media briefings and access.
- Activate/request Incident Management Assist Team (IMAT) augmentation.
- If it is not operationally feasible for the SMC to be physically located at the ICP, the SMC should assign a liaison to the ICP to represent the SMC.

b. Mobilize additional appropriate resources as soon as possible to stabilize the situation or assist in the recovery, salvage, pollution response, firefighting, etc. (i.e., tugs, fireboats, charter boats, salvage vessels, etc.).

c. Have the District Command Center contact the FAA to establish a Temporary Flight Restriction (TFR) for the airspace over the area of incident/operations.

d. Ensure the following Groups are established, if necessary:
   - Medical Group to coordinate emergency medical care, including transportation to medical facilities, for Person On Board (POB) of a distressed vessel or craft (descriptions of these functions are found in Chapter 19).

- Law Enforcement Group to coordinate law enforcement agencies to provide shore-side security of Staging Areas and the ICP, establish evidence collection and control, and assist with enforcement of safety and/or security zones (descriptions of these functions are found in Chapter 14).

e. Immediately assign or request a PIO to provide initial information to the media and establish a JIC to provide timely information and updates on progress of SAR efforts and outline of future actions.
   - Ensure that the JIC is staffed for 24-hour operations, if necessary, to meet the demands for information by the media, community groups, and public in general.
   - Be available, as the IC, to provide press briefings. If the SAR response is on-going, ensure the SMC is aware of all press briefing plans

f. Coordinate with the SMC to notify Next of Kin (NOK) as soon as possible and maintain daily contact with them to provide progress of SAR efforts and outline future actions. The IC shall ensure the greatest possible sensitivity in interacting with family and friends of the victims. Note: For cases involving airline crashes, the airlines are responsible for making NOK notifications.
   - For SAR incidents involving large numbers of victims, especially in cases of mass casualties or prolonged searches, ensure that lodging is centrally located and/or easily accessible for those NOK who arrive in the area. This will facilitate daily briefings.

- Establish an area where families of victims can receive daily mission briefings. For incidents involving large numbers of POB, this should be at the place where NOK are centrally lodged.
- If the operational tempo does not allow the IC to provide the NOK briefings personally, assign a senior officer who is disengaged operationally from the SAR incident to provide this as a primary task.
- Provide information on mission progress and future actions to the NOK before releasing it to the media.
- Notify NOK of a decision to suspend SAR efforts prior to suspending search for missing POB.

g. The SMC or SAR Coordinator may continue the SAR mission beyond the time when a case would normally be suspended due to humanitarian considerations, large number of people involved, or forecast of greatly improved search conditions.

However, when the potential for saving life is minimal, Search and Rescue Units (SRUs) will not be put at unnecessary risk. Nor should they continue searching in that situation when their use may preclude their availability for other missions.

NOTE: Only those agencies designated as U.S. SAR Coordinators (i.e., the USCG for maritime regions) have the authority to suspend a SAR case.

h. When scheduling surface and air SRUs, utilize fatigue standards found in Appendix K of reference (d) and applicable policies of the

operational commander.

i. For incidents involving firefighting, establish a Firefighting Group to coordinate local authorities responsible for fighting fires on vessels or at waterfront facilities. Note: This should be coordinated prior to an incident. During marine firefighting situations, CG units shall adopt a conservative response posture and focus actions on those traditional Coast Guard activities not requiring CG personnel to enter into a hazardous environment.
   - The CG Captain of the Port (COTP) is the USCG entity responsible for coordinating firefighting activities.
   - As per reference (d), CG personnel shall not actively engage in firefighting (other than fires on CG vessels) except in support of a regular firefighting agency under the supervision of a qualified fire officer. CG assistance is available only to the degree of training level and adequacy of equipment.
   - CG personnel shall not engage in independent firefighting, except to save a life or in the early stages of a fire to avert a significant threat without undue risk.

OPERATIONS SECTION CHIEF (OSC) – In addition to the responsibilities outlined in Chapter 7, the OSC of an incident must recognize that the SMC is obligated to carry out the SAR mission in accordance with references (a) – (d). The OSC may also be designated, and perform the function of the SMC, if operational tempo and/or span of control allow it, and the person is thoroughly familiar with all SAR system processes (for further description and duties of the SMC see SAR Response System Specific Functions below).

SAR SYSTEM SPECIFIC FUNCTIONS

(Note: These functions are provided for information of the IC. SMC's and SAR OSCs are to use established guides and procedures set forth in references (a) - (d) and in standard operating procedures.

SAR MISSION COORDINATOR (SMC) - The SMC is designated (usually pre-designated) by the SAR Response System for each specific SAR mission and coordinates the overall response to a SAR incident in accordance with references (a) – (d). In the U.S. Coast Guard, the SMC designation is done by a responsible Command Center that serves as a Rescue Coordination Center (RCC) or Rescue Sub-Center (RSC). SMC responsibilities typically include:

a. Gathering detailed information relating to the distress situation.
b. Issuing an Urgent marine Information Braodcast (UMIB) to inform mariners in the area of the distress situation and to instruct them to either keep clear of the area or to request their assistance.
c. Conduct SAR operations in accordance with standard SAR procedures and standards as set forth in references (a) – (c).
d. Assign a SAR On-Scene Coordinator (SAR OSC) as appropriate to improve on-scene coordination.
e. Use search planning tools to develop search plans that optimally use available resources.
f. Ensure all documentation from the SAR mission, to include copies of SITREP's, logs, SAR Action Plans, photo/video film, etc., are provided to the Documentation Unit Leader.

SAR On-Scene Coordinator (SAR OSC) - The SAR OSC coordinates the SAR mission on-scene using the resources made available by SMC and should safely

carry out the SAR Action Plan in accordance with references (a) - (d). The SAR OSC may serve as a Branch Director or Group Supervisor to manage on-scene operations after the SAR mission is concluded and other missions continue, such as search and recovery. SAR OSC responsibilities typically include:

a. Establish and maintain communications with the SMC.
b. Assume operational control and coordination of all SRUs assigned until relieved or mission is completed.
    - Establish and maintain communications with all SRUs using assigned on-scene channels.
    - Require all aircraft to make “operations normal” reports to the SAR OSC.
    - Establish a common altimeter setting for all on scene aircraft.
    - Obtain necessary information from arriving SRU’s, provide initial briefing and search instructions, and provide advisory air traffic service to aid pilots in maintaining separation from one another.
c. Carry out SAR action plans.
    - Receive and evaluate all sighting reports, and divert SRUs to investigate sightings.
    - Obtain search results from departing SRUs.
d. Submit sequentially numbered situation reports (SITREPs) to the SMC at regular intervals.

TECHNICAL SPECIALISTS/EQUIPMENT

PARARESCUEMAN (PJ) TECHNICAL SPECIALIST - These members of the USAF are specialists in the rescue, stabilization, and recovery of personnel from remote areas, often under extremely hazardous

conditions, including combat. PJs provide emergency medical treatment (at the paramedic level) necessary to stabilize and evacuate injured personnel.

a. PJ's often provide worldwide search, rescue and recovery assistance associated with aircraft accidents, disaster relief, humanitarian evacuation, and contingency landing support for NASA missions.
b. If deployed from fixed-wing assets, they jump with a Rigged Alternate Method Zodiac (RAMZ), providing them with a small boat to help facilitate rescues.

FLIGHT SURGEON - The flight surgeon is a physician that has attended a special course that has prepared them to provide medical support in the aviation community. They are qualified to fly or provide medical consultation.

COAST GUARD RESCUE SWIMMER – All Coast Guard Air Stations with helicopters have highly trained helicopter rescue swimmers who are EMT qualified. They are trained to deploy from the helicopter to recover an incapacitated victim from the water, day or night.

SELF-LOCATING DATUM MARKER BUOYS (SLDMB's) – All Coast Guard Air Stations and many Coast Guard surface units and small boat stations are equipped with self-locating datum marker buoys (SLDMB) which can provide high quality, extended duration current information. SLDMB's provide frequent, high-resolution (GPS-based) position information independent of any on-scene unit. Section 4.11 of Ref (d) provides detailed information on SLDMB's.

INTRODUCTION

The Coast Guard is a regulatory agency for industries involved in the transport of oil, routinely supports other agencies in their response to oil spills, and may become involved in oil spills when responding or supporting responses to other incidents such as terrorist actions, hazardous materials releases from chemical carriers, accidents at non-transportation related facilities that may be located within a COTP Zone, etc. It is impossible to address the possible ICS organizations that may result from the above scenarios. It is important to note that the majority of oil spills are small events that will not and should not result in a response beyond that of an initial or reinforced response organization. It should also be noted that the capabilities in various COTP zones throughout the country vary greatly. The COTP must have knowledge of the local government response capability and be familiar with the local and state ICs as this will affect the degree of leadership and control that the Coast Guard will be expected to take in oil spill response. In areas where the state and local government have a strong oil spill response program,

the Coast Guard may be primarily in a support role during the emergency phases. In areas where there is no oil spill response capability, the Coast Guard may be expected to take a much stronger leadership role.

In this regard, there may also be reasons to expand the UC beyond the FOSC, SOSC, and Responsible Party IC (RPIC) participation that has become the standard for oil spill response. The organizations reflect that under OPA 90 regulations, the responsible party (RP) who has had the oil spill is mandated to follow an approved Facility Response Plan (FRP) or Vessel Response Plan (VRP), to provide a spill management team for managing the oil spill, and to become a member of the UC. For a full description of a specific ICS position assignment or task, the reader should refer to the appropriate task assignment provided in Chapters 5 -11.

OIL SPILL BEST RESPONSE
DELIVERING "BEST RESPONSE"

IC's and their Command and General Staffs need to closely monitor how well the incident objectives, strategies, and tactics are addressing "Best Response" and key response functions, and to make appropriate adjustments where necessary to ensure the maximum potential for success.

The term "Best Response" means that a response organization will effectively, efficiently, and safely respond to oil spills, minimizing the consequences of pollution incidents and to protect our national environmental and economic interests.

"Best Response" equals a successful response based on achievement of certain key success factors (i.e. the

things that a response must accomplish to be considered successful) as follows:

- **Human Health**
  - No public injuries
  - No worker injuries
- **Natural Environment**
  - Source of discharge minimized
  - Source contained
  - Sensitive areas protected
  - Resource damage minimized
- **Economy**
  - Economic impact minimized
- **Public Communication**
  - Positive media coverage
  - Positive public perception
- **Stakeholders Support**
  - Minimize stakeholder impact
  - Stakeholders well informed
  - Positive meetings
  - Prompt Handling of claims
- **Organization**
  - Standard Response Mgmt Syst
  - Sufficient/Efficient resources

When conducting an oil spill response, ICs and their Command and General Staffs should always consider the “Best Response” concept while managing operational and support/coordination functions.

OPERATIONAL	SUPPORT/COORDINATION
Search and Rescue	Public Information
Fire Fighting	Assisting and Cooperating Agencies
Salvage and Lightering	Environmental
Protection	Economic
Shoreline recovery	Political
On-Water recovery	Claims
Dispersants	Natural Resource Damage
Assessment	Investigations
In-Situ Burning	Safety
Wildlife	Command Post Needs
Disposal	
Hazardous Substance	

OIL SPILL ACTIVITY SCENARIO AND MODULAR ORGANIZATION DEVELOPMENT

MODULAR DEVELOPMENT

A series of examples of Modular Development are included to illustrate one method of expanding the Incident Organization at an oil spill incident. The examples shown are not meant to be restrictive, nor imply that these are the only ways to build an ICS organizational structure from an initial response to a multi-branch organization.

INITIAL RESPONSE ORGANIZATION - Initial Response resources are managed by the IC who will handle all Command and General Staff responsibilities. A UC is established. See Page 19-6 for an example of an oil spill initial response organization.

REINFORCED RESPONSE ORGANIZATION - The UC has established a Protection Group and a Recovery Group to manage on-water activities and a shoreline division to manage land-based resources. An SOFR and IO have been assigned. See Page 19-7 for an example of a reinforced response.

MULTI-DIVISION/GROUP ORGANIZATION - The UC has assigned all Command Staff positions and established a number of Divisions and Groups as well as an OSC and PSC. Some Logistic Units are established. See Page 19-8 for an example of a multi-division/group organization.

MULTI-BRANCH ORGANIZATION - The IC has established all Command and General Staff positions and has established four branches. See Page 19-9 for an example of an oil spill multi-branch organization.

OIL SPILL

OIL SPILL SPECIFIC ICS POSITIONS AND TASK DESCRIPTIONS

INCIDENT COMMANDER – The IC for oil discharges will, whenever possible and practical, be organized under the UC Structure that includes, but is not limited to:

- The pre-designated FOSC
- The pre-designated State On-Scene Incident Commander (SOSC)
- The representative of the RP IC

The UC is responsible for the overall management of the incident. The UC directs incident activities including the development and implementation of strategic decisions and approves the ordering and releasing of resources. The UC may assign a Deputy IC to assist in carrying out IC responsibilities. IC tasks specific to oil spill events are:

a. Review IC Responsibilities in Chapter 6.
b. Review IC Job Aid.
c. Be cognizant of the primary objectives for oil spill response activities.
    - Ensure the safety of citizens and response personnel.
    - Control the source of the spill.
    - Manage a coordinated response effort.
    - Maximize protection of environmentally sensitive areas.
    - Contain and recover spilled material.
    - Recover and rehabilitate injured wildlife.
    - Remove oil from impacted areas.
    - Minimize economic impacts.
    - Keep stakeholders informed of response activities.
    - Keep the public informed of response

activities.

- Ensure that the source of a discharge is designated and that the RP advertises procedures by which claims may be presented or that the National Pollution Fund Center (NPFC) assumes this role.
- Inform the NPFC regarding the source of the discharge. NPFC will issue the required Notice of Designation.
- Refer all removal and damage claims to the RP or, if no identifiable RP, to the NPFC Claims Adjudication division.

FINANCE/ADMINISTRATION SECTION CHIEF – Refer to Page 10-2 for the Finance/Administration Section Chief position responsibilities. In addition, consult the References (d) and (e) for guidance on oil spill financial issues.

NRDAR REPRESENTATIVE - The Natural Resource Damage Assessment and Restoration (NRDAR) Representatives are responsible for coordinating NRDAR needs and activities of the trustee team. NRDAR activities generally do not occur within the structure, processes, and control of the ICS. However, particularly in the early phases of a spill response, many NRDAR activities overlap with the environmental assessment performed for the sake of spill response. Therefore, NRDAR Representatives should remain coordinated with the spill response organization through the LO, and they may need to work directly with the UC, Planning Section, Operations Section, and the NOAA SSC to resolve any problems or address areas of overlap. This includes close coordination with the LO for obtaining timely information on the spill and injuries to natural resources.

While NRDAR resource requirements and costs may fall outside the responsibility of the Logistics and Finance/Administrative Sections, coordination is important. The NRDAR Representative will coordinate NRDAR or injury determination activities.

a. Review Common Responsibilities in Chapter 2.
b. Review Agency Representative Responsibilities in Chapter 6.
c. Attend appropriate meetings to facilitate communication between NRDAR Team and IC/UC.
d. Provide status reports.
e. Coordinate with the LO, or the UC in the absence of an LO, to assure that NRDAR field activities do not conflict with response activities and to request logistical support for NRDAR field activities.
f. Seek the FOSC's cooperation in acquiring response-related samples or results of sample analysis applicable to NRDAR; (e.g., spilled petroleum product from source and/or oil from contaminated wildlife).
g. Support the UCs information needs through the IO.
h. Interact with appropriate units to collect information requested by the NRDAR Team.
i. Obtain necessary safety clearances for access to sampling sites.
j. Coordinate with other organizations to identify personnel available for NRDAR.

AIR TACTICAL GROUP SUPERVISOR - Air Tactical Group Supervisor tasks specific to oil spill events are: The coordination and scheduling of aircraft operations intended to locate, observe, track, surveil, support dispersant applications, or to be used for other deliverable response application techniques, or report

on the incident situation when fixed and/or rotary-wing aircraft are airborne at an incident. These coordination activities are normally performed by the Air Tactical Group Supervisor while airborne.

a. Review Air Tactical Group Supervisor Responsibilities in Chapter 7.
b. Obtain a briefing from the Air Operations Branch Director or the OPS.
c. Coordinate dispersant, in-situ burning, and bioremediation application through the Air Operations Branch Director.
d. Coordinate air surveillance mission scheduling and observer assignments with the SUL.
e. Identify remote sensing technology that may enhance surveillance capabilities.
f. Coordinate air surveillance observations and provide reports by the most direct methods available.
g. Report on air surveillance and operations activities to the Air Operations Branch Director.
h. Coordinate application-monitoring requirements with the Helicopter and Fixed-Wing Coordinators and the Situation Unit.
i. Report on air application activities to the Air Operation Branch Director.

HELICOPTER COORDINATOR - Helicopter Coordinator tasks specific to oil spill events are: The coordination and scheduling of helicopter operations intended to locate, observe, track, surveil, or report on the incident situation. The Helicopter Coordinator coordinates the application of dispersants, in-situ burning agents and bioremediation agents.

AIR TANKER/FIXED-WING COORDINATOR – The Air Tanker/Fixed-Wing Coordinator tasks specific to oil spill events are: The scheduling of fixed wing operations

intended to locate, observe. track, surveil, or report on the incident situation. The Air Tanker/Fixed-Wing Coordinator coordinates the aerial application of dispersants, in-situ burning agents and bioremediation agents.

RECOVERY AND PROTECTION BRANCH DIRECTOR - The Recovery and Protection Branch Director is responsible for overseeing and implementing the protection, containment and cleanup activities established in the IAP.

a. Review Branch Director responsibilities in Chapter 7.

PROTECTION GROUP SUPERVISOR - The Protection Group Supervisor is responsible for the deployment of containment, diversion, and adsorbent/absorbent materials in designated locations. Depending on the size of the incident, the Protection Group may be further divided into Teams, Task Forces and Single Resources.

a. Review Division/Group Supervisor responsibilities in Chapter 7.
b. Implement Protection Strategies in the IAP.
c. Direct, coordinate, and assess the effectiveness of protective actions.
d. Modify protective actions, as needed.
e. Maintain Unit/Activity Log (ICS Form 214).

ON WATER RECOVERY GROUP SUPERVISOR - The On Water Recovery Group Supervisor is responsible for managing on water recovery operations in compliance with the IAP. The Group may be further divided into Teams, Task Forces and Single Resources.

a. Review Division/Group Supervisor responsibilities in Chapter 7.
b. Implement Recovery Strategies in the IAP.
c. Direct, coordinate, and assess the effectiveness

of on water recovery actions.
d. Modify recovery actions as needed.
e. Maintain Unit Log (ICS 214-CG).

DISPERSANT OPERATIONS GROUP SUPERVISOR - The Dispersants Operations Group Supervisor is responsible for coordinating all aspects of a dispersant operation. For aerial applications, the Group works closely with the Air Tactical Group Supervisor.

a. Review Division/Group Supervisor responsibilities in Chapter 7.
b. Determine resource needs.
c. Assist the Planning Section in the development of dispersant operations and monitoring plans.
d. Implement approved dispersant operations and monitoring plans.
e. Manage dedicated dispersant resources and coordinate required monitoring.
f. Coordinate required monitoring.
g. Maintain Unit (ICS 214-CG).

IN-SITU BURN OPERATIONS GROUP SUPERVISOR The In-Situ Burn Operations Group Supervisor is responsible for coordinating all aspects of an in-situ burn operation. For aerial ignition, the Group works closely with the Air Tactical Group Supervisor.

a. Review Division/Group Supervisor responsibilities in Chapter 7.
b. Determine resource needs.
c. Assist the Planning Section in the development of in-situ burn operations and monitoring plans.
d. Implement approved in-situ burn operations and monitoring plans.
e. Manage dedicated in-situ burning resources.
f. Coordinate required monitoring.
g. Maintain Unit Log (ICS 214-CG).

SHORESIDE RECOVERY GROUP SUPERVISOR - The Shoreside Recovery Group Supervisor is responsible for managing shoreside cleanup operations in compliance with the IAP. The Group may be further divided into Strike Teams, Task Forces, and Single Resources.

a. Review Division/Group Supervisor responsibilities in Chapter 7.
b. Implement Recovery Strategies in the IAP.
c. Direct, coordinate, and assess effectiveness of shoreside recovery actions.
d. Modify protective actions, as needed.
e. Maintain Unit Log (ICS 214-CG).

DISPOSAL GROUP SUPERVISOR - The Disposal Group Supervisor is responsible for coordinating the on-site activities of personnel engaged in collecting, storing, transporting, and disposing of waste materials. Depending on the size and location of the spill, the Disposal Group may be further divided into Teams, Task Forces, and Single Resources.

a. Review Division/Group Supervisor responsibilities in Chapter 7.
b. Implement the Disposal Portion of the IAP.
c. Ensure compliance with all hazardous waste laws and regulations.
d. Maintain accurate records of recovered material.
e. Maintain Unit Log (ICS 214-CG).

DECONTAMINATION GROUP SUPERVISOR - The Decontamination Group Supervisor is responsible for decontamination of personnel and response equipment in compliance with approved statutes.

a. Review Division/Group Supervisor responsibilities in Chapter 7.
b. Implement Decontamination Plan.
c. Determine resource needs.

d. Direct and coordinate decontamination activities.
e. Brief Site SOFR on conditions.
f. Maintain Unit Log (ICS 214-CG).

EMERGENCY RESPONSE BRANCH DIRECTOR - The Emergency Response Branch Director is primarily responsible for overseeing and implementing emergency measures to protect life, mitigate further damage to the environment, and stabilize the situation.

a. Review Branch Director responsibilities in Chapter 7.

SALVAGE/SOURCE CONTROL GROUP SUPERVISOR - Under the direction of the Emergency Response Branch Director, the Salvage/Source Control Group Supervisor is responsible for coordinating and directing all salvage/source control activities related to the incident.

a. Review Division/Group Supervisor responsibilities in Chapter 7.
b. Coordinate the development of Salvage/Source Control Plan.
c. Determine Salvage/Source Control resource needs.
d. Direct and coordinate implementation of the Salvage/Source Control Plan.
e. Manage dedicated salvage/Source Control resources.
f. Maintain Unit Log (ICS 214-CG).

WILDLIFE BRANCH DIRECTOR - The Wildlife Branch Director is responsible for minimizing wildlife injuries during spill responses; coordinating early aerial and ground reconnaissance of the wildlife at the spill site and reporting results to the SUL; advising on wildlife protection strategies, including diversionary booming placements, in-situ burning, and chemical

countermeasures; removing of oiled carcasses, employing wildlife hazing measures as authorized in the IAP; and recovering and rehabilitating impacted wildlife. A central Wildlife Processing Center should be identified and maintained for, evidence tagging, transportation, veterinary services, treatment and rehabilitation storage, and other support needs. The activities of private wildlife care groups, including those employed by the RP, will be overseen and coordinated by the Wildlife Branch Director.

a. Review Branch Director responsibilities in Chapter 7.
b. Develop the Wildlife Branch portion of the IAP.
c. Supervise Wildlife Branch operations.
d. Determine resource needs.
e. Review the suggested list of resources to be released and initiate recommendation for release of resources.
f. Assemble and disassemble teams/task forces assigned to the Wildlife Branch.
g. Report information about special activities, events, and occurrences to the OPS.
h. Assist the Volunteer Coordinator in determining training needs of wildlife recovery volunteers.
i. Maintain Unit Log (ICS 214-CG)

WILDLIFE RECOVERY GROUP SUPERVISOR - The Wildlife Recovery Group Supervisor is responsible for coordinating the search for collection and field tagging of dead and live impacted wildlife and transporting them to the processing center(s). This group should coordinate with the Planning Situation Unit in conducting aerial and group surveys of wildlife population in the vicinity of the spill. They should also deploy acoustic and visual wildlife hazing equipment, as needed.

a. Review Division/Group Supervisor responsibilities

in Chapter 7.
b. Determine resource needs.
c. Establish and implement protocols for collection and logging of impacted wildlife.
d. Coordinate transportation of wildlife to processing stations(s).
e. Maintain Unit Log (ICS 214-CG).

WILDLIFE REHABILITATION CENTER MANAGER - The Wildlife Rehabilitation Center Manager is responsible for the oversight of facility operations, including: receiving oiled wildlife at the processing center, recording essential information, collecting necessary samples, and conducting triage, stabilization, treatment, transport and rehabilitation of oiled wildlife. The Wildlife Rehabilitation Center Manager is responsible for assuring appropriate transportation to appropriate treatment centers for oiled animals requiring extended care and treatment.

a. Review Common Responsibilities in Chapter 2.
b. Determine resource needs and establish a processing station for impacted wildlife.
c. Process impacted wildlife and maintain logs.
d. Collect numbers/types/status of impacted wildlife and brief the Wildlife Branch Operations Director.
e. Coordinate the transport of wildlife to other facilities.
f. Coordinate release of recovered wildlife.
g. Implement Incident Demobilization Plan.
h. Maintain Unit Log (ICS 214-CG).

SCIENTIFIC SUPPORT COORDINATOR - The Scientific Support Coordinator (SSC) is a technical specialist and is defined in the NCP as the principal advisor to the FOSC for scientific issues. The SSC is responsible for providing expertise on chemical hazards, field observations, trajectory analysis,

resources at risk, environmental tradeoffs of countermeasures and cleanup methods, and information management. The SSC is also charged with gaining consensus on scientific issues affecting the response, but also ensuring that differing opinions within the scientific community are communicated to the incident command. Additionally, the SSC is responsible for providing data on weather, tides, currents, and other applicable environmental conditions. The SSC can serve as the Environmental Unit Leader.

a. Review Common Responsibilities in Chapter 2.
b. Review Technical Specialist Job Aid.
c. Attend planning meetings.
d. Determine resource needs.
e. Provide overflight maps and trajectory analysis, including the actual location of oil, to the Situation Unit.
f. Provide weather, tidal and current information.
g. Obtain consensus on scientific issues affecting the response.
h. In conjunction with Natural Resource Trustee Representatives and the FOSC's Historical/Cultural Resources Specialist, develop a prioritized list of resources at risk, including threatened and endangered species.
i. Provide information on chemical hazards.
j. Evaluate environmental tradeoffs of countermeasures and cleanup methods, and response endpoints.
k. Maintain Unit Log (ICS 214-CG)

SAMPLING TECHNICIAL SPECIALIST - The Sampling Technical Specialist is responsible for providing a sampling plan for the coordinated collection, documentation, storage, transportation, and submittal to appropriate laboratories for analysis or storage.

a. Review Common Responsibilities in Chapter 2.

b. Review Technical Specialist Job Aid.
c. Determine resource needs.
d. Participate in planning meetings as required.
e. Identify and alert appropriate laboratories.
f. Meet with team to develop an initial sampling plan and strategy, and review sampling and labeling procedures.
g. Set up site map to monitor the location of samples collected and coordinate with GIS staff. Coordinate sampling activities with the NRDAR Representative, Investigation Team, and legal advisors.
h. Provide status reports to appropriate requesters.
i. Maintain Unit Log (ICS 214-CG).

RESPONSE TECHNOLOGIES SPECIALIST - The Response Technologies Specialist is responsible for evaluating the opportunities to use various response technologies, including mechanical containment and recovery, dispersant or other chemical countermeasures, in-situ burning, and bioremediation. The specialist will conduct the consultation and planning required by deploying a specific response technology, and by articulating the environmental tradeoffs of using or not using a specific response technique.

a. Review Common Responsibilities in Chapter 2.
b. Review Technical Specialist Job Aid.
c. Participate in planning meetings, as required.
d. Determine resource needs.
e. Gather data pertaining to the spill, including spill location, type and amount of petroleum spilled, physical and chemical properties, weather and sea conditions, and resources at risk.
f. Identify the available response technologies (RT) that may be effective on the specific spilled petroleum.
g. Make initial notification to all agencies that have

authority over the use of RT.
h. Keep the PSC advised of RT issues.
i. Provide status reports to appropriate requesters.
j. Establish communications with the RRT to coordinate RT activities.
k. Maintain Unit Log (ICS 214-CG).

TRAJECTORY ANALYSIS TECHNICAL SPECIALIST - The Trajectory Analysis Technical Specialist is responsible for providing to the UC, projections and estimates of the movement and behavior of the spill. The specialist will combine visual observations, remote sensing information, and computer modeling, as well as observed and predicted tidal, current, and weather data to form these analyses.

Additionally, the specialist is responsible for interfacing with local experts (weather service, academia, researchers, etc.) in formulating these analyses. Trajectory maps, over-flight maps, tides and current data, and weather forecasts will be supplied by the specialist to the Situation Unit for dissemination throughout the ICP.

a. Review Common Responsibilities in Chapter 2.
b. Review Technical Specialist Job Aid.
c. Schedule and conduct spill observations/over-flights, as needed.
d. Gather pertinent information on tides, currents and weather from all available sources.
e. Provide a trajectory and over-flight maps, weather forecasts, and tidal and current information.
f. Provide briefing on observations and analyses to the proper personnel.
g. Demobilize in accordance with the Incident Demobilization Plan.
h. Maintain Unit Log (ICS 214-CG).

WEATHER FORECAST TECHNICAL SPECIALIST - The Weather Forecast Technical Specialist is responsible for acquiring and reporting incident-specific weather forecasts. The specialist will interpret and analyze data from NOAA's National Weather Service and other sources. This person will be available to answer specific weather related response questions and coordinate with the Scientific Support Coordinator and Trajectory Analysis Specialist as needed. The specialist will provide weather forecasts to the Situation Unit for dissemination throughout the ICP.

a. Review Common Responsibilities in Chapter 2.
b. Gather pertinent weather information from all appropriate sources.
c. Provide incident-specific weather forecasts on an assigned schedule.
d. Provide briefings on weather observations and forecasts to the proper personnel.
e. Maintain Unit Log (ICS 214-CG).

RESOURCES AT RISK (RAR) TECHNICAL SPECIALIST - The Resources at Risk (RAR) Technical Specialist is responsible for the identification of resources thought to be at risk from exposure to the spilled oil through the analysis of known and anticipated oil movement, and the location of natural, economic resources, and historic properties. The RAR Technical Specialist considers the relative importance of the resources and the relative risk to develop a priority list for protection.

a. Review Common Responsibilities in Chapter 2.
b. Review Technical Specialist Job Aid.
c. Participate in planning meetings as required.
d. Determine resource needs.
e. Obtain current and forecasted status information from the Situation Unit.

f. Following consultation with Natural Resource Trustee Representatives, identify natural RAR, including threatened and endangered species, and their critical habitat.
g. Following consultation with the FOSC's Historical/Cultural Resources Specialist, identify historic properties at risk.
h. Identify socio-economic resources at risk.
i. In consultation with Natural Resource Trustee Representatives, Land Management Agency Representatives, and the FOSC's Historical/Cultural Resources Specialist, develop a prioritized list of the resources at risk for use by the Planning Section.
j. Provide status reports to appropriate requesters.
k. Maintain Unit Log (ICS 214-CG).

SHORELINE CLEANUP ASSESSMENT TECHNICAL SPECIALIST The Shoreline Cleanup Assessment Technical Specialist is responsible for providing appropriate cleanup recommendations as to the types of the various shorelines and the degree to which they have been impacted. This technical specialist will recommend the need for, and the numbers of, Shoreline Cleanup Assessment Teams (SCATs) and will be responsible for making cleanup recommendations to the Environmental Unit Leader. Additionally, this specialist will recommend cleanup endpoints that address the question of "**How clean is clean?"**

a. Review Common Responsibilities in Chapter 2.
b. Review Technical Specialist Job Aid.
c. Obtain a briefing and special instructions from the Environmental Unit Leader.
d. Participate in Planning Section meetings.
e. Recommend the need for and number of SCATs.
f. Describe shoreline types and oiling conditions.
g. Identify sensitive resources (ecological,

recreational, historical properties, economic).

h. Recommend the need for cleanup. In consultation with Natural Resource Trustee Representatives, Land Management Agency Representatives, and the FOSC's Historical/Cultural Resources Specialist.
i. Recommend cleanup priorities. In consultation with Natural Resource Trustee Representatives, Land Management Agency Representatives, and the FOSC's Historical/Cultural Resources Specialist.
j. Monitor cleanup effectiveness.
k. Recommend shoreline cleanup methods and endpoints
l. Maintain Unit Log (ICS 214-CG).

HISTORICAL/CULTURAL RESOURCES TECHNICAL SPECIALIST - The Historical/Cultural Resources Technical Specialist is responsible for identifying and resolving issues related to any historical or cultural sites that are threatened or impacted during an incident. The Specialist must understand and be able to implement a "Programmatic Agreement on Protection of Historic Properties" (Consult NRT's document "Programmatic Agreement on the Protection of Historic Properties During Emergency Response under the NCP" for guidance) as well as consulting with State Historic Preservation Officers (SHPO), land management agencies, appropriate native tribes and organizations, and other concerned parties. The technical specialist must identify historical/cultural sites and develop strategies for protection and cleanup of those sites in order to minimize damage.

a. Review Common Responsibilities in Chapter 2.
b. Review Agency Representative Responsibilities in Chapter 6.
c. Review Technical Specialist Job Aid.

d. Implement the Programmatic Agreement (PA) for the FOSC.
e. If a PA is not used, coordinate Section 106 consultations with the SHPO.
f. Consult and reach consensus with the concerned parties on affected historical/cultural sites.
g. Identify and prioritize threatened or impacted historical/cultural sites.
h. Develop response strategies to protect historical/cultural sites.
i. Participate in the testing and evaluation of cleanup techniques used on historical/cultural sites.
j. Ensure compliance with applicable Federal/State regulations.
k. Maintain Unit Log (ICS 214-CG).

DISPOSAL (WASTE MANAGEMENT) TECHNICAL SPECIALIST - The Disposal (Waste Management) Technical Specialist is responsible for providing the OSC with a Disposal Plan that details the collection, sampling, monitoring, temporary storage, transportation, recycling, and disposal of all anticipated response wastes.

a. Review Common Responsibilities in Chapter 2.
b. Review Technical Specialist Job Aid.
c. Determine resource needs.
d. Participate in planning meetings as required.
e. Develop a Pre-Cleanup Plan and monitor pre-cleanup operations, if appropriate.
f. Develop a detailed Waste Management Plan.
g. Calculate and verify the volume of petroleum recovered, including petroleum collected with sediment/sand, etc.
h. Provide status reports to appropriate requesters.
i. Maintain Unit Log (ICS 214-CG).

CHAPTER 20

HAZARDOUS SUBSTANCE
(Chemical, Biological, Radiological, and Nuclear)

CHAPTER 20

HAZARDOUS SUBSTANCE
(Chemical, Biological, Radiological, and Nuclear)

References:

(a) National Response Plan (NRP)
(b) National Incident Management System (NIMS)
(c) National Contingency Plan (NCP)
(d) Technical Specialist Job Aid

INTRODUCTION

There are numerous scenarios that provide an opportunity for the Coast Guard to become involved in Hazardous Substance/Material (CBRN- Chemical, Biological, Radiological, Nuclear) releases. The Coast Guard is a regulatory agency for industries involved in the transport of hazardous substances, routinely supports other agencies in their response to hazardous substance releases, and may become involved in hazardous substance releases when responding or supporting responses to other incidents such as terrorist actions, oil spills from refrigerated cargo ships, accidents at non-transportation related facilities that may be located within a COTP Zone, etc. It is impossible to address all possible ICS organizations that may result from the above scenarios. Therefore, this chapter will review two possible scenarios involving hazardous substances/materials. One will be a land based facility type event, and the second a will be marine type incident in an offshore area. Both will show the modular development of the ICS organization.

It is important to note that the majority of hazardous substance releases, like oil spills, are small events that will not and should not result in a response beyond that

of an initial or reinforced response organization. It should also be noted that the capabilities in various COTP zones throughout the country vary greatly. The COTP must have knowledge of the local government response capability and be familiar with their ICs as this will affect the degree of leadership and control that the Coast Guard will be expected to take in hazardous substance/material events. In areas where the state and local government have a strong hazardous substance/materials response program, the Coast Guard may be primarily in a support role during the emergency phases. In areas where there is no hazardous substance capability, the Coast Guard may be expected to take a much stronger leadership role.

In this regard, there may also be reasons to expand the UC beyond the FOSC, SOSC, and Responsible Party IC (RPIC) participation that has become the standard for oil spill response. The UC represented in this chapter reflects the possible levels of participation that may be seen in some locations and situations for hazardous substance incidents. Annual pre-incident planning meetings of all possible stakeholders are essential and highly recommended for determining the response capabilities and personalities that may be involved in the real event for a specific local area or region. These annual meetings will assist the FOSC in determining what level of UC participation will be required for his/her area.

There are different definitions used for hazardous response throughout the transportation, response and regulatory communities. Hazardous substances are referred to as hazardous materials, noxious substances, chemicals, biological, radiological, nuclear, CBRN, and other names. In this section, you will find “hazardous substances” referred to as hazardous

substance/material.

This is in consideration of the fact that in laws that are the basis for Coast Guard response authority (OPA-90, CERCLA, RCRA) the term hazardous substance is used, however, fire and police departments nationwide refer to chemical response activity as hazardous materials response. Since most hazardous substance responses will include City, County, Regional, and State Fire and Law Enforcement Agencies, the ICS organizations in this section will include both terms.

The organizations have been modified in this section to reflect that under OPA 90 regulations, the responsible party (RP) who has had the release is mandated to follow an approved Facility Response Plan (FRP) or Vessel Response Plan (VRP), to provide a spill management team for managing the release, and to become a member of the UC.

Response to a biological incident in the coastal zone can range from the illegal disposal of medical waste to the intentional release of a disease-causing organism. Initial response actions to a biological incident will depend on the type of incident and the cause/or suspected cause of the incident (i.e. terrorist act).

The Coast Guard Incident Commander’s response to biological incidents most likely will involve the use of both the Captain of the Port and Federal On-scene Coordinator (FOSC) authorities. The FOSC role is limited to disease causing agents that exist outside a host for a period of time and which can be physically removed from the environment.

If the biological incident is suspected or confirmed to be the result of a terrorist act, response to the incident

should be initiated using this Chapter, the Terrorism Chapter, the National Response Plan, and the Area Maritime Security Plan.

A radiological incident involves the release or potential release of radioactive material that poses an actual or perceived hazard to public safety, national security and/or the environment.

The U.S. Coast Guard's jurisdiction as the Coordinating Agency for a radiological incident is limited in both geographic area and authority. In radiological incidents where the Coast Guard has jurisdiction and there is no involvement of terrorism the Coast Guard Incident Commander responds under the NCP. For any radiological incidents where terrorism is involved, the Department of Energy is the Coordinating Agency responding under the NRP and the Coast Guard is a cooperating agency. The National Response Plan limits the Coast Guard's Coordinating Agency role for radiological incidents to "*certain areas of the coastal zone.*" In addition to geographic limitations, the scope of the Coast Guard's jurisdiction as the Coordinating Agency is limited to those radiological incidents that do not involve a terrorist act.

The role of Coordinating Agency for radiological incidents in the maritime environment can reside with several different federal agencies depending on geographic location, accountability for the radiological source, and the suspected or actual involvement of terrorism.

For any terrorist event involving non-Department of Defense or non-Nuclear Regulatory Committee (NRC) radioactive material, the Department of Energy (DOE) will assume the role of Coordinating Agency to address

the radiological aspects of the response. Please see the NRP for more information.

The Hazardous Substance/Materials organization module is designed to provide an organization structure that will provide necessary supervision and control for the essential functions required at virtually all Hazardous Substance/Materials incidents. This is based on the premise that controlling the tactical operations of companies and movement of personnel and equipment will provide a greater degree of safety and also reduce the probability of spreading of contaminants. The Hazardous Substance/Materials Group Supervisor will direct the primary functions, and all resources that have a direct involvement with hazardous materials will be supervised by one of the functional leaders, the Hazardous Substances/Materials Group Supervisor, or when activated the Hazardous Substances/Materials Branch Director.

Since the Logistics Section and Finance Sections, if formed during a hazardous substance response, will reflect the same functional requirements as in the generic ICS organization, they have not been included in the organizational charts for this chapter.

UNIFIED COMMAND

A hazardous substances/materials release may bring together a greater number and a wider variety of agencies than any other single incident the Coast Guard may face. It is assumed that all hazardous materials incidents will be managed under UC principles because in virtually all cases, fire, law enforcement, and public health agencies will have some statutory functional responsibility for IC and Control and mitigation.

Depending on incident factors, several other agencies will respond to a hazardous materials incident. The best method of ensuring effective information flow and coordination between the responding agencies at the scene of a multi-agency incident is to establish an ICP and the use of a UC. Each key response agency should provide a representative to remain at the ICP who will have authority to speak for and commit agency resources. The Assisting Agencies Section of this document lists some of the typical functional responsibilities of law enforcement and health agencies.

HAZARDOUS SUBSTANCE SCENARIO AND MODULAR ORGANIZATION DEVELOPEMENT

MODULAR DEVELOPMENT FOR A LAND BASED TYPE EVENT - A series of examples of modular development are included to illustrate one method of expanding the incident organization.

INITIAL RESPONSE ORGANIZATION (LAND BASED TYPE EVENT) - The ICs will handle all Command and General Staff responsibilities and manage initial response resources. See Page 20-9 for an example of an Initial Response Organization.

REINFORCED RESPONSE ORGANIZATION (LAND BASED TYPE EVENT) - The two IC's have met and have established a UC. They have established a Hazardous Materials Group to manage all activities around the Control Zones and have organized Law Enforcement Units into a Task Force to isolate the Operational Area. The IC's have decided to establish a Planning Section, a Staging Area and a SO. See Page 20-10 for an example of a Reinforced Response Organization.

MULTI-DIVISION/GROUP ORGANIZATION (LAND BASED TYPE EVENT) - The UC has activated most Command and General Staff positions and has established a combination of Divisions and Groups. See Page 20-11 for an example of a Multi-Division/Group Organization

MULTI BRANCH ORGANIZATION FOR A LAND BASED TYPE EVENT - The UC has activated all Command and General Staff positions and has established four branches in the OPS. See Page 20-12 for an example of a Multi-Branch Organization.

MODULAR DEVELOPMENT (MARINE TYPE EVENT)

INITIAL RESPONSE ORGANIZATION (MARINE TYPE EVENT) - A vessel offshore suffers a casualty that releases a hazardous substance. The initial IC will be the vessel's master, and the ship's crew will carry out initial response activities. The Coast Guard will be involved from a notification perspective and will begin assessment of the situation based on information from the master. See Page 20-14 for an example of an Initial Response Organization.

REINFORCED RESPONSE ORGANIZATION (MARINE TYPE EVENT) - The FOSC and the vessel's QI/owner representative have met and have established a UC. They have established two Hazardous Materials Groups to fully assess the situation and plan a response. See Page 20-15 for an example of a Reinforced Response Organization.

MULTI-DIVISION/GROUP ORGANIZATION (MARINE TYPE EVENT) - The UC has activated most Command and General Staff positions and has molded the RP and government resources into a combination of Groups tasked with assessing and responding to the incident. See Page 20-16 for an example of a Multi-Division/Group Organization.

MULTI BRANCH ORGANIZATION (MARINE TYPE EVENT) - The UC has activated all Command and General Staff positions and has established four branches within the OPS. Since the event may require action to bring the vessel into port for offloading, firefighting, or salvage and repair, the UC includes state and city representation. See Page 20-17 for an example of a Multi-Branch Organization.

HAZARDOUS SUBSTANCE/HAZMAT RELEASE SPECIFIC ICS POSITIONS AND TASK DESCRIPTIONS

Only those positions and tasks specific and unique to Hazardous Substance/Material Release response missions will be described in this section. Persons assigned to positions common and consistent with the NIIMS organization should refer to the position job aids and Chapter 5-11 of this IMH for their position/task description checklists.

INCIDENT COMMANDER and SAFETY OFFICER - In addition to the specific tasks assigned to the IC and SOFR on Page 6-2 and Page 6-6, respectively, the IC and SOFR for a hazardous substance incident will use the following guidance when preparing the Site Safety Plan:

a. Assign site safety responsibility.
b. Establish perimeter and restrict access.
c. Characterize site hazards:
    - Identity pollutant.
    - Obtain Material Safety Data Sheets.
    - Conduct air monitoring.
    - Identify physical and biological hazards i.e.: slips, trips, falls, confined spaces, noise, weather conditions, poisonous insects, reptiles, plants and biological waste.
d. Establish control zones:
    - Exclusion zone.
    - Contamination reduction zone.
    - Support zone.
e. Assess training requirements:
    - Check HAZWOPER cards.
    - Insure safety briefings.

f. Select personal protective equipment (PPE):
   - Level A, B, C, or D.
g. Establish decontamination stations.
h. Establish Emergency Medical Plan:
   - Locate and list: hospital, EMT(S) and first-aid stations.
   - List emergency numbers: fire, police, and ambulance.

ASSISTANT SAFETY OFFICER – HAZARDOUS MATERIALS - The Assistant Safety Officer coordinates with the Hazardous Substance/Material Group Supervisor (or Hazardous Materials Branch Director, (if activated). The Assistant Safety Officer Hazardous Substance/Material coordinates safety related activities directly relating to the Hazardous Substance/Material Group operations as mandated by 29 CFR Part 1910.120 and applicable State and local laws. The person in this position advises the Hazardous Substance/Material Group Supervisor (or Hazardous Substance/Material Branch Director) on all aspects of health and safety and has the authority to stop or prevent unsafe acts. In a multi-activity incident the Assistant Safety Officer Hazardous Substance/Material does not act as the Safety Officer for the overall incident. Assistant Site Safety Officer-Hazardous Substance/Material tasks include:

a. Review SOFR Responsibilities in Chapter 6.
b. Obtain a briefing from the Hazardous Substance/Material Group Supervisor.
c. Participate in the preparation and implementation of a Site Safety and Control Plan.

d. Advise the Hazardous Substance/Material Group Supervisor (or Hazardous Substance/Material Branch Director) of deviations from the Site Safety and Control Plan (ICS Form 208-HM) or any dangerous situations.
e. Alter, suspend, or terminate any activity that is judged to be unsafe.
f. Ensure the protection of the Hazardous Substance/Material Group personnel from physical, environmental, and chemical hazards/exposures.
g. Ensure the provision of required emergency medical services for assigned personnel and coordinate with the Medical Unit Leader.
h. Ensure that medical related records for the Hazardous Substance/Material Group personnel are maintained.
i. Maintain Unit Log (ICS 214-CG).

FINANCE/ADMINISTRATION SECTION CHIEF - Refer to Page 10-2 for the Finance/Administration Section Chief position responsibilities. In addition, consult the NPFC user reference Guides (TOPS) and the FFARM Field Guide for guidance on hazardous material financial issues.

HAZARDOUS SUBSTANCE/MATERIAL GROUP SUPERVISOR - The Hazardous Substance/Material Group Supervisor is responsible for the implementation of the phases of the IAP dealing with the Hazardous Material Group operations. The Hazardous Substance/Material Group Supervisor is responsible for the assignment of resources within the Hazardous Substance/Material Group, reporting on the progress of control operations and the status of resources within the Group. The Hazardous Substance/Material Group Supervisor directs the overall operations of the

Hazardous Substance/Materials Group; Additional tasks include:

a. Review Division/Group Supervisor Responsibilities in Chapter 7.
b. Ensure the development of Control Zones and Access Control Points and the placement of appropriate control lines.
c. Evaluate and recommend public protection action options to the OSC or Branch Director (if activated).
d. Ensure that current weather data and future weather predictions are obtained.
e. Establish environmental monitoring of the hazard site for contaminants.
f. Ensure that a Site Safety and Control Plan (ICS Form 208-HM) is developed and implemented.
g. Conduct safety meetings with the Hazardous Substance/Material Group.
h. Participate, when requested, in the development of the IAP.
i. Ensure that recommended safe operational procedures are followed.
j. Ensure that the proper Personal Protective Equipment is selected and used.
k. Ensure that the appropriate agencies are notified through the Incident Commander.
l. Maintain Unit/Activity Log (ICS Form 214).

ENTRY LEADER - Reports to the Hazardous Substance/Material Group Supervisor. The Entry Leader is responsible for the overall entry operations of assigned personnel within the Exclusion Zone; Additional tasks include:

a. Review Unit Leader Responsibilities in Chapter 2.
b. Supervise entry operations.
c. Recommend actions to mitigate the situation within the Exclusion Zone.

d. Carry out actions, as directed by the Hazardous Substance/Material Group Supervisor.
e. Maintain communications and coordinate operations with the Decontamination Leader.
f. Maintain communications and coordinate operations with the Site Access Control Leader and the Safe Refuge Area Manager (if activated).
g. Maintain communications and coordinate operations with the Technical Specialist Hazardous Substance/Material Reference.
h. Maintain control of the movement of people and equipment within the Exclusion Zone, including contaminated victims.
i. Direct rescue operations, as needed, in the Exclusion Zone.
j. Maintain Unit Log (ICS 214-CG).

DECONTAMINATION GROUP SUPERVISOR - The Decontamination Group Supervisor is responsible for the operations of the decontamination element and for providing decontamination, as required by the ICP; Additional tasks include:.

a. Review Division/Group Supervisor Responsibilities in Chapter 7.
b. Establish the Contamination Reduction Corridor(s).
c. Identify contaminated people and equipment.
d. Supervise the operations of the decontamination element in the process of decontaminating people and equipment.
e. Maintain control of movement of people and equipment within the Contamination Reduction Zone.
f. Maintain communications and coordinate operations with the Entry Leader.
g. Maintain communications and coordinate operations with the Site Access Control Leader

and the Safe Refuge Area Manager (if activated).

h. Coordinate the transfer of contaminated patients requiring medical attention (after decontamination) to the Medical Group.
i. Coordinate handling, storage, and transfer of contaminants within the Contamination Reduction Zone.
j. Maintain Unit Log (ICS 214-CG).

SITE ACCESS CONTROL LEADER - The Site Access Control Leader is responsible for the control of the movement of all people and equipment through appropriate access routes at the hazard site and ensures that contaminants are controlled and records are maintained.

a. Review Unit Leader Responsibilities in Chapter 2.
b. Organize and supervise assigned personnel to control access to the hazard site.
c. Oversee the placement of the Exclusion Control Line and the Contamination Control Line.
c. Ensure that appropriate action is taken to prevent the spread of contamination.
d. Establish the Safe Refuge Area within the Contamination Reduction Zone. Appoint a Safe Refuge Area Manager (as needed).
e. Ensure that injured or exposed individuals are decontaminated prior to departure from the hazard site.
f. Track the movement of persons passing through the Contamination Control Line to ensure that long-term observations are provided.
g. Coordinate with the Medical Group for proper separation and tracking of potentially contaminated individuals needing medical attention.
h. Maintain observations of any changes in climatic conditions or other circumstances external to the

hazard site.

i. Maintain communications and coordinate operations with the Entry Leader.
j. Maintain communications and coordinate operations with the Decontamination Leader.
k. Maintain Unit Log (ICS 214-CG).

SAFE REFUGE AREA MANAGER - The Safe Refuge Area Manager reports to the Site Access Control Leader and coordinates with the Decontamination Leader and the Entry Leader. The Safe Refuge Area Manager is responsible for evaluating and prioritizing victims for treatment, collecting information from the victims, and preventing the spread of contamination by these victims. If there is a need for the Safe Refuge Area Manager to enter the Contamination Reduction Zone in order to fulfill assigned responsibilities then the appropriate PPE shall be worn.

a. Maintain Common Responsibilities in Chapter 2.
b. Establish the Safe Refuge Area within the Contamination Reduction Zone adjacent to the Contamination Reduction Corridor and the Exclusion Control Line.
c. Monitor the hazardous substance/materials release to ensure that the Safe Refuge Area is not subject to exposure.
d. Assist the Site Access Control Leader by ensuring the victims are evaluated for contamination.
e. Manage the Safe Refuge Area for the holding and evaluation of victims who may have information about the incident, or if they are suspected of having contamination.
f. Maintain communications with the Entry Leader to coordinate the movement of victims from the Refuge Area(s) in the Exclusion Zone to the Safe Refuge Area.
g. Maintain communications with the

Decontamination Leader to coordinate the movement of victims from the Safe Refuge Area into the Contamination Reduction Corridor, if needed.

h. Maintain Unit Log (ICS 214-CG).

SAMPLING GROUP SUPERVISOR - The Sampling Group is assigned to the Operations Section because of the immediate communication and coordination they must have with the other field groups. The Field Sampling Group will normally include an Air Monitoring Team, Water Sampling Team, and a Soil Sampling Team. They will normally be responsible for perimeter monitoring and sampling, and will either coordinate sampling within the hot zone and warm zones with the Entry Group, or if properly trained and outfitted with PPE, they may take samples within the hot/warm zones themselves. They will be responsible for:

a. Conducting all sampling required for immediate operation activity and communicating sampling data, such as results of routine air monitoring to on-site operational and safety personnel.
b. Conducting air, water, and soil sampling as directed by the regulatory agencies and other interested parties through the Sampling Protocol Team.
c. Ensuring that all samples are obtained following appropriate sample protocol and other special instructions they may obtain.
d. Ensuring that all samples taken are properly documented and following the chain of custody procedures.
e. Ensuring that the samples are properly transferred to the Sample Documentation and Tracking Teams for proper documentation, analysis, and final dissemination.

SCIENTIFIC SUPPORT COORDINATOR SPECIALIST - The Scientific Support Coordinator (SSC) is a technical specialist and is defined in the NCP as the principal advisor to the FOSC for scientific issues. The SSC is responsible for providing expertise on chemical hazards, field observations, trajectory analysis, resources at risk, environmental trade-offs of countermeasures and cleanup methods, and information management. The SSC is also charged with gaining consensus on scientific issues affecting the response and ensuring that differing opinions within the scientific community are communicated to the IC/UC. Additionally, the SSC is responsible for providing data on weather, tides, and currents, and other applicable environmental conditions. The SSC can serve as the Environmental Unit Leader.

a. Review Common Responsibilities in Chapter 2.
b. Attend planning meetings.
c. Determine resource needs.
d. Provide overflight maps and trajectory analysis to the Situation Unit.
e. Provide weather, tidal and current information.
f. Obtain consensus on scientific issues affecting the response.
g. Develop a prioritized list of the resources at risk.
h. Provide information on chemical hazards.
i. Evaluate environmental tradeoffs of countermeasures and cleanup methods, and response endpoints.
j. Maintain Unit Log (ICS 214-CG).

TECHNICAL SPECIALIST GROUP SUPERVISOR - There are a number of specialist positions that will be required for hazardous substance response operations. Because of their field locations and requirement for close coordination with the Operations Section Field Personnel, they are assigned to the Technical Group.

The Technical Specialist Group Supervisor is responsible for coordinating the activities of these various specialists and ensuring that their services and information are made available to the appropriate field and command post activities. The Technical Group Supervisor will:

a. Review the Division/Group Supervisor responsibilities in Chapter 7.
b. Will oversee the activities of the following identified specialists.

TECHNICAL SPECIALIST-HAZARDOUS SUBSTANCE/MATERIALS REFERENCE - This position provides technical information and assistance to the Hazardous Substances/Material Group using various reference sources such as computer databases, technical journals, CHEMTREC, and phone contact with facility representatives. The Technical Specialist Hazardous Substances/Materials Reference may provide product identification using hazardous categorization tests and/or any other means of identifying unknown materials.

a. Review Common Responsibilities in Chapter 2.
b. Obtain a briefing from the PSC.
c. Provide technical support to the Hazardous Substance/Materials Group Supervisor.
d. Maintain communications and coordinate operations with the Entry Leader.
e. Provide and interpret environmental monitoring information.
f. Provide analysis of hazardous material samples. Determine PPE compatibility to hazardous material.
g. Provide technical information of the incident for documentation.
h. Provide technical information management with public and private agencies (i.e.; Poison Control

Center, Toxicology Center, CHEMTREC, State Department of Food and Agriculture, National Response Team).

i. Assist the Planning Section with projecting the potential environmental effects of the release.
j. Maintain Unit Log (ICS 214-CG).

TOXICOLOGIST – The Toxicologist Specialist is a trained, certified professional that can determine the toxic effects of the released hazardous substance on responders, the public, and the environment. This position is required by regulation for Coast Guard approved FRP and VRP and will be on-scene on behalf of the RP.

INDUSTRIAL HYGIENIST – An Industrial Hygienist Specialist is a trained and certified professional that can assist the SOFR in determining appropriate protective measures to be taken by responders in complex hazardous substances responses to ensure the workers health and safety.

CHEMICAL ENGINEER – A Chemical Engineer is a trained and licensed professional that is knowledgeable in the development and application of manufacturing processes in which materials undergo changes in properties and that deals especially with the design and operation of plants and equipment to perform such work.

PRODUCT EXPERT – The Product Expert is a trained professional that is knowledgeable about the specific hazardous substance product that is released, and in particular the chemical changes that may occur when it is released into the environment, such as water, air, etc.

MARINE CHEMIST – A Marine Chemist Specialist is a

trained professional, usually a chemist or industrial hygienist certified for declaring confined spaces as gas free for entry.

ASSISTING AGENCIES

LAW ENFORCEMENT – The local law enforcement agency will respond to most Hazardous Substance/Material incidents. Depending on incident factors, law enforcement may be a partner in UC or may participate as an assisting agency. Some functional responsibilities that may be handled by law enforcement are:

a. Isolate the incident area.
b. Manage crowd control.
c. Manage traffic control.
d. Manage public protective action.
e. Provide scene management for on-highway incidents.
f. Manage criminal investigations.

ENVIRONMENTAL HEALTH AGENCIES – In most cases the local or State environmental health agency will be at the scene as a partner in UC. Some functional responsibilities that may be handled by environmental health agencies are:

a. Determine the identity and nature of the Hazardous Substances/Materials.
b. Establish the criteria for clean up and disposal of the Hazardous Substances/Materials.
c. Declare the site safe for re-entry by the public.
d. Provide the medical history of exposed individuals.
e. Monitor the environment.
f. Supervise the clean up of the site.
g. Enforce various laws and acts.
h. Determine legal responsibility.

i. Provide technical advice.
j. Approve funding for the clean up, if required.

TECHNICAL SPECIALISTS

SAMPLING PROTOCOL TEAM - During a significant hazardous substance/Material release incident, there will be numerous requirements for sampling under the ICS UC umbrella. Unless control is taken immediately, there is the possibility for each entity with regulatory or legal interest to begin a sampling regimen independent of each other. The Sampling Protocol team under the Planning Section would be responsible for:

a. Determining the overall sampling protocol for the incident.
b. Coordinating within the interested parties what analysis is required for overall samples.
c. Coordinating procedures for split samples between all parties.
d. Providing special instructions to the field sampling teams operating under the OPS.
e. Coordinate with appropriate agencies and the RP, and determine independent laboratories to be used for analysis, and coordinating the contracting of their services with the Logistics Section and Finance Section.
f. Providing specific special instructions to the laboratories for analytical work.

SAMPLE TRACKING TEAM – As indicated above for sample documentation, there is the possibility of thousands of samples to be taken for analysis during a significant hazardous substance release incident. The Sample Tracking Team will be responsible for:

a. Ensuring that all samples are collected from Field Sampling Teams.
b. Coordinate preferred turn around times for

specific samples being analyzed.

c. Ensuring that proper chain of custody documents are prepared and logged for all samples.
d. Assign control numbers to all samples.
e. Ensure samples are properly transferred to the appropriate laboratory, and documented.
f. Track samples to ensure that sample analysis are completed according to requested schedule, and determine reasons for delays.

SAMPLE DISSEMINATION TEAM – During a significant Hazardous Substance release there are many occasions when several parties will need the information obtained from a sample analysis. It will be the responsibility of this team to ensure that all parties with a legitimate need for a copy of an analysis obtain it as soon as the information is available. They will coordinate this activity with the Sample Documentation Team and the Sample Tracking Team to ensure that the original analysis document is retained in the Documentation Section for the historical event file.

HUMAN HEALTH ASSESSMENT TEAM – The effects of the release on human health will be a primary concern during the incident. The Human Health Assessment Team will be responsible for:

a. Coordinating activities involving the release to determine the risk to humans, including acute and chronic public health threats, and to advise the UC on their findings.
b. They will coordinate and provide advice to city/county and state health agencies having responsibility for human and public health.

CLEANUP TECHNICAL TEAM – During the emergency phase of the release incident, the primary goal for the operation will be to secure the source of the release,

and to minimize effects of the release on the public and environment. These efforts will usually involve firefighting, plugging and patching tanks, evacuation of threatened persons, search and rescue, etc. However, it is important that while these efforts are in progress, work begins on determining appropriate cleanup methods for the effected areas. This team will:

a. Research the state of the art approaches for mitigating the hazardous substance product released.
b. Determine the most reasonable and economical approach for remediating the effects of the release.
c. Determine the most qualified and reasonable contractor(s) for accomplishing the remediation work and coordinate obtaining their services with the Logistics and Finance Sections.
d. Develop a Remediation Plan for approval by the UC.
e. Review information obtained throughout the emergency phase, and modify the remediation plan as required so it is up to date at the time of implementation.

CHAPTER 21

MARINE FIRE

References:
(a) National Response Plan (NRP)
(b) National Incident Management System (NIMS)

INTRODUCTION

The marine fire chapter is designed to provide an organization structure that will provide supervision and control for the essential functions required at marine fire incidents. The response and organizational structure to a marine fire can vary widely depending on the location of the vessel and proximity to fire fighting resources, capabilities of the municipal and industrial fire departments, type of vessel, and nature of the cargo and source of the fire.

UNIFIED COMMAND

A marine fire can bring together a variety of entities depending on the variables discussed above. Although the Coast Guard does not directly conduct fire fighting, it does have a major role in coordination and support. For this reason, a vessel fire would most likely be managed under UC. A marine fire could bring to the scene fire departments, law enforcement, public health, technical cargo experts, industrial fire departments, and private fire fighting and salvage experts. If pollution and hazardous materials were involved, the agencies and complexity would escalate dramatically.

MARINE FIRE SCENARIO AND MODULAR ORGANIZATION DEVELOPMENT

MODULAR DEVELOPMENT - A series of examples of modular development are included to illustrate methods of expanding the incident organization.

INITIAL RESPONSE ORGANIZATION - The first to arrive Fire Department Company Officer will assume command of the incident as the IC. The IC will assume all Command and General Staff functions and responsibilities and manages initial response resources. See Page 21-4 for an example of the Initial Response Organization.

TRANSITIONED RESPONSE ORGANIZATION - The Coast Guard and Fire Department IC have met and established a UC. They have established Fire and Medical Groups. Waterborne resources have arrived and a SOFR has been assigned. See Page 21-5 for an example of the Transitioned Response Organization.

MULTI-DIVISION/GROUP ORGANIZATION - The UC has activated most Command and General Staff positions and has established a combination of divisions and groups. A water division and land staging area have been established. See Page 21-6 for an example of the Multi-Division/Group Organization.

MULTI-ALARM ORGANIZATION - The UC has activated all Command and General Staff positions and has established multiple divisions. Branches would be created if span of control issues warranted. Water staging and stability/salvage groups were implemented. A Coast Guard Officer may serve as Deputy OSC. See Page 21-7 for an example of a Multi-Alarm Organization.

MARINE FIRE SPECIFIC ICS POSITIONS AND TASK DESCRIPTIONS

Only those ICS positions and tasks specific and unique to Marine Firefighting missions will be described in this section. Persons assigned the common positions consistent with the NIMS organization should refer to the position job aids and Chapters 5 through 11 of this Manual for their position/task descriptions and checklists.

ACCOUNTABILITY TEAM – The Accountability Team is responsible for signing in and out all personnel that board a vessel. There must be team members at each entry point to log the entry and exit of all personnel that board the vessel during an incident. Accountability for all resources is the responsibility of the IC/UC and is typically delegated to the Planning Section.

FIRE SUPPRESSION BRANCH - The Fire Suppression Branch Director, when activated, is under the direction of the OSC. The Fire Department's initial Operations Section Chief at a maritime fire is often re-designated the Fire Suppression Branch Director under a UC. The Director is responsible for the assigned portion of the IAP that deals with fire suppression activities, assignment of resources within the branch, and reporting progress of control activities, and status of resources within the branch.

SHORESIDE DIVISION - The Shoreside Division Supervisor is responsible for all shoreside fire suppression activities under the Fire Suppression Branch. The supervisor is responsible for the assigned portion of the IAP that deals with fire suppression activities and exposure protection on shore, assignment of resources within the division, and reporting progress

of control of activities, and status of resources within the division.

VESSEL DIVISION - The Vessel Division Supervisor is responsible for all vessel fire suppression activities under the Fire Suppression Branch. The supervisor is responsible for the assigned portion of the IAP that deals with fire suppression activities and exposure protection on a vessel, assignment of resources within the division, and reporting progress of control of activities, and status of resources within the division.

WATERSIDE DIVISION - The Waterside Division Supervisor is responsible for all waterside fire suppression activities under the Fire Suppression Branch. The supervisor is responsible for the assigned portion of the IAP that deals with fire suppression activities and exposure protection on the water, assignment of resources within the division, and/or group, and reporting progress of control of activities and status of resources within the division and/or group. This includes all fireboat activities.

VENTILATION GROUP - The Ventilation Group Supervisor is responsible for coordination of vessel CO_2 suppression systems, coordinating the securing of ventilation, use of positive and/or negative pressure ventilation strategies in coordination with the vessel's crew, as required by the Fire Suppression Branch Director reference in the IAP.

RAPID INTERVENTION TEAM - The Rapid Intervention Team (RIT) is contingency team responsible for performing search and rescue of trapped or injured fire fighters. A RIT will normally be assigned in each area the fire activities are taking place, including Shoreside, Vessel and Waterside Branches. On a vessel, a RIT

will be assigned at each separate entry point where below deck activities are being conducted. The RIT leader is responsible for the assigned portion of the IAP that deals with fire fighter rescue activities.

RIT TEAM LEADER – The RIT Team Leader is responsible for development and implementation of rescue strategies pertaining to each assigned area.

SALVAGE/DEWATERING BRANCH - The Salvage/Dewatering Branch Director, when activated, is under the supervision of the OSC. This branch is responsible for development of a plan to stabilize the vessel, identify equipment/resources needed, and remove water that is being used in suppression activities. The Salvage/Dewatering Branch should be established as soon as firefighting activities are initiated to ensure control of vessel stability. The Salvage/Dewatering Branch Director is responsible for the assigned portion of the IAP that deals with salvage and dewatering activities, the status of assigned resources within the Branch, and reporting progress to the OSC.

DEWATERING TASK FORCE - The Dewatering Task Force is responsible for implementing the dewatering plan developed for the incident. This may include pumping water using portable pumps, draining of water through scuppers made in the vessel, or transferring water to other areas of the vessel.

SITUATIONS REQUIRING SPECIAL ATTENTION

There will be times where special situations develop that will require actions at either a reduced or more elevated level than the previously addressed conditions. In order to facilitate understanding of these situations brief descriptions are provided without organizational structure charts. The descriptions in this section will address several of the situations that have been identified.

MARITIME INCIDENT RESPONSE TEAM – ADVANCE MFF RESPONSE TEAM:

There will be incidents where the Coast Guard will be notified of a fire that may or may not have been contained by the crew on board a vessel enroute to a local port. This will provide the Coast Guard and Fire Department the opportunity to plan for the response. It is often advantageous to send an Advance MFF Response Team to the vessel as soon as possible, and PRIOR to it entering port. This will permit the UC to collect the information needed to make informed decisions, to mitigate the impact of incident, and have adequate appropriate resources available prior to the vessel entering port. The nature of the incident will determine the specific makeup of the team and equipment needed for evaluation.

MULTI-JURSIDICTIONAL RESPONSE – UNIFIED COMMAND:

There may be incidents that, due to the magnitude of the fire or outside influences (e.g. flood, earthquake, hurricane), extend the fire incident outside the original jurisdiction. This will require the rapid establishment of a UC and organization that includes all affected states, counties, jurisdictions, agencies, and organizations. While this organization will be very similar to the Oil Spill

response organizations listed in Chapter 19, the rapid spread of fire into other jurisdictions requires an organization that can manage often limited and scarce specialized resources, within a region, and/or in a timely fashion. Establishment of appropriate divisions, groups, and branches will be required to coordinate activities over a large area.

CHAPTER 22

MULTI-CASUALTY

TABLE OF CONTENTS

(e) National Search and Rescue Plan, 1999
(f) Addendum to the National Search and Research Manual, COMDTINST 16130.2 (series)

INTRODUCTION

The Coast Guard may become involved in various incidents where the casualty may result in the need to handle numerous medical patients or victims. This situation may apply to any of the incidents covered in the previous chapters. The Multi-Casualty Branch Structure is designed to provide the Incident Commander with a basic expandable system for handling any number of patients in a multi-casualty incident.

One or more additional Medical Group/Divisions may be established under the Multi-Casualty Branch Director, if geographical or incident conditions warrant. The degree of implementation will depend upon the complexity of the incident.

MULTI-CASUALTY SCENARIO AND MODULAR ORGANIZATION DEVELOPMENT

MODULAR DEVELOPMENT

A series of examples of modular development are included to illustrate one possible method of expanding the incident organization to deal with multi-casualty, mass patient and victim incidents.

INITIAL RESPONSE ORGANIZATION

Initial response resources are managed by the IC who will handle all Command and General Staff responsibilities. The first arriving resource with the appropriate communications capability should establish communications with the appropriate hospital or other coordinating facility and become the Medical Communications Coordinator. Other first arriving resources would become triage personnel. See Page 22-5 for an example of the Initial Response Organization.

REINFORCED RESPONSE ORGANIZATION

In addition to the initial response, the IC designates a Triage Supervisor, a Treatment Supervisor, Treatment Teams and a Ground Ambulance Coordinator. See Page 22-6 for an example of the Reinforced Response Organization.

MULTI-LEADER RESPONSE ORGANIZATION

The IC has now established an OSC who has in turn established a Medical Supply Coordinator, a Manager for each treatment category and a Patient Transportation Group Supervisor. The Patient Transportation Group Supervisor was needed in order for the OSC to maintain a manageable span of control, based on the assumption that other operations are concurrently happening in the Operations Section. See

Page 22-7 for an example of the Multi-Leader Response Organization.

MULTI-GROUP RESPONSE ORGANIZATION

All positions within the Medical Group and Patient Transportation Group are now filled. The Air Operations Branch is shown to illustrate the coordination between the Air Ambulance Coordinator and the Air Operations Branch. An Extrication Group is freeing trapped victims. See Page 22-8 for an example of the Multi-Group Response Organization.

COMPLETE INCIDENT RESPONSE ORGANIZATION

The complete incident response organization shows the Multi-Casualty Branch and other Branches with which there may be interaction. The Multi-Casualty Branch now has three (3) Medical Divisions (geographically separate), but only one Patient Transportation Group. This is because all patient transportation must be coordinated through one point to avoid overloading hospitals or other medical facilities. See Page 22-9 for an example of the Complete Incident Response Organization.

MULTI-CASUALTY

MULTI-CASUALTY SPECIFIC ICS POSITIONS AND TASK DESCRIPTIONS

Only those ICS positions and tasks specific and unique to multi-casualty missions will be described in this section. Persons assigned the common positions consistent with the NIMS organization should refer to the position job aids and Chapters 5 through 11 of this Manual for their position/task descriptions and checklists.

MULTI-CASUALTY BRANCH DIRECTOR - The Multi-Casualty Branch Director is responsible for the implementation of the IAP within the Branch. This includes the direction and execution of branch planning for the assignment of resources within the Branch.

a. Review Branch Director Responsibilities in Chapter 7.
b. Review Group/Division Assignments for effectiveness of current operations and modify as needed.
c. Provide input to OSC for the IAP.
d. Supervise Branch Activities.
e. Maintain Unit Log (ICS 214-CG).

MEDICAL GROUP/DIVISION SUPERVISOR - The Medical Group/Division Supervisor supervises the Triage Team Leader, Treatment Team Leader and Medical Supply Coordinator. The Medical Group/Division Supervisor establishes command and controls the activities within a Medical Group/Division, in order to assure the best possible emergency medical care to patients during a multi-casualty incident.

a. Review Division Group responsibilities in Chapter 7.
b. Participate in Multi-Casualty Branch/Operations Section Planning Activities.

c. Establish Medical Group/Division with assigned personnel. Request additional personnel and resources sufficient to handle the magnitude of the incident.
d. Designate Treatment Team Leaders and treatment area locations as appropriate.
e. Isolate Morgue and Minor Treatment Area from Immediate and Delayed Treatment Areas.
f. Request law enforcement/coroner involvement as needed.
g. Determine amount and types of additional medical resources and supplies needed to handle the magnitude of the incident (medical caches, backboards, litters, cots).
h. Establish communications and coordination with the Patient Transportation Group Supervisor.
i. Ensure activation of hospital alert system, local EMS/health agencies.
j. Direct and/or supervise on-scene personnel from agencies such as Coroner's Office, Red Cross, law enforcement, ambulance companies, county health agencies, and hospital volunteers.
k. Ensure proper security, traffic control, and access for the Medical Group/Division area.
l. Direct medically trained personnel to the appropriate team leader.
m. Maintain Unit Log. (ICS 214-CG).

TRIAGE TEAM LEADER - The Triage Team Leader supervises Triage Personnel/Litter Bearers and the Morgue Manager. The Triage Team Leader assumes responsibility for providing triage management and movement of patients from the triage area. When triage has been completed, the Triage Team Leader may be reassigned as needed.

a. Review Common Responsibilities in Chapter 2.

b. Develop organization sufficient to handle assignment.
c. Inform Medical Group/Division Supervisor of resource needs.
d. Implement triage process.
e. Coordinate movement of patients from the Triage Area to the appropriate Treatment Area.
f. Give periodic status reports to the Medical Group/Division Supervisor.
g. Maintain security and control of the Triage Area.
h. Establish Morgue.

TRIAGE PERSONNEL - Triage Personnel appropriately treat patients on-scene and assign them to treatment areas.

a. Review Common Responsibilities in Chapter 2.
b. Report to designated on-scene triage location.
c. Triage and tag injured patients. Classify patients while noting injuries and vital signs if taken.
d. Direct movement of patients to proper Treatment Areas.
e. Provide appropriate medical treatment (ABC's) to patients prior to movement as incident conditions dictate.

TREATMENT TEAM LEADER - The Treatment Team Leader supervises the Treatment Managers and the Treatment Dispatch Manager. The Treatment Team Leader assumes responsibility for treatment, preparation for transport, and coordination of patient treatment in the Treatment Areas and directs movement of patients to loading location(s).

a. Review Common Responsibilities in Chapter 2.
b. Develop organization sufficient to handle assignment.
c. Direct and supervise Treatment Dispatch, Immediate Delayed, and Minor Treatment Areas.

d. Coordinate movement of patients from Triage Area to Treatment Areas with Triage Team Leader.
e. Request sufficient medical caches and supplies as necessary.
f. Establish communications and coordination with Patient Transportation Group.
g. Ensure continual triage of patients throughout Treatment Areas.
h. Direct movement of patients to ambulances loading area(s).
i. Give periodic status reports to Medical Group/Division Supervisor.

TREATMENT DISPATCH MANAGER - The Treatment Dispatch Manager is responsible for coordinating with Patient Transportation Group, the transportation of patients out of the Treatment Area.

a. Review Common Responsibilities in Chapter 2.
b. Establish communications with the Immediate, Delayed, and Minor Treatment Managers.
c. Establish communications with Patient Transportation Group.
d. Verify that patients are prioritized for transportation.
e. Advise Medical Communications Coordinator of patient readiness and priority for dispatch.
f. Coordinate transportation of patients with the Medical Communications Coordinator.
g. Assure that appropriate patient tracking information is recorded.
h. Coordinate ambulance loading with Treatment Manager and ambulance personnel.

IMMEDIATE TREATMENT MANAGER - The Immediate Treatment Manager is responsible for

treatment and re-triage of patients assigned to Immediate Treatment Area.

a. Review Common Responsibilities in Chapter 2.
b. Request or establish Medical Teams as necessary.
c. Assign treatment personnel to patients received in the Immediate Treatment Area.
d. Ensure treatment of patients triaged to the Immediate Treatment Area.
e. Assure that patients are prioritized for transportation.
f. Coordinate transportation of patients with Treatment Dispatch Manager.
g. Notify Treatment Dispatch Manager of patient readiness and priority for transportation.
h. Assure that appropriate patient information is recorded.

DELAYED TREATMENT MANAGER - The Delayed Treatment Manager is responsible for treatment and re-triage of patients assigned to the Delayed Treatment Area.

a. Review Common Responsibilities in Chapter 2.
b. Request or establish Medical Teams as necessary.
c. Assign treatment personnel to patients received in the Delayed Treatment Area.
d. Assure that patients are prioritized for transportation.
e. Coordinate transportation of patients with Treatment Dispatch Manager.
f. Notify Treatment Dispatch Manager of patient readiness and priority for transportation.
g. Assure that appropriate patient information is recorded.

MINOR TREATMENT MANAGER - The Minor Treatment Manager is responsible for treatment and re-triage of patients assigned to the Minor Treatment Area.

a. Review Common Responsibilities in Chapter 2.
b. Request or establish Medical Teams as necessary.
c. Assign treatment personnel to patients received in the Minor Treatment Area.
d. Assure that patients are prioritized for transportation.
e. Coordinate transportation of patients with Treatment Dispatch Manager.
f. Notify Treatment Dispatch Manager of patient readiness and priority for transportation.
g. Assure that appropriate patient information is recorded.
h. Coordinate volunteer personnel/organizations through Agency Representatives and Treatment Team Leader.

PATIENT TRANSPORTATION GROUP SUPERVISOR

The Patient Transportation Group Supervisor supervises the Medical Communications Coordinator and the Air and Ground Ambulance Coordinators. The Patient Transportation Group Supervisor is responsible for the coordination of patient transportation and maintenance of records relating to patient identification, injuries, mode of off-incident transportation and destination.

a. Review Common Responsibilities in Chapter 2.
b. Review Division Group Supervisor responsibilities in Chapter 7.
c. Establish communications with hospital(s).
d. Designate ambulance staging area(s).
e. Direct the transportation of patients as determined by Treatment Team Leaders.

f. Assure that patient information and destination is recorded.
g. Establish communications with Ambulance Coordinator(s).
h. Request additional ambulances, as required.
i. Notify Ambulance Coordinator(s) of ambulance requests.
j. Coordinate requests for air ambulance transportation through the Air Operations Director.
k. Establish Air Ambulance Helispot with the Multi-Casualty Branch Director and Air Operation Director.
l. Maintain Unit Log (ICS 214-CG).

MEDICAL COMMUNICATION COORDINATOR - The Medical Communications Coordinator supervises the Transportation Recorder and maintains communications with the hospital alert system and/or other medical facilities to assure proper patient transportation and destination. The Medical Communication Coordinator coordinates information through the Patient Transportation Group Supervisor and the Transportation Recorder.

a. Review Common Responsibilities in Chapter 2.
b. Establish communications with hospital alert system.
c. Determine and maintain current status of hospital/medical facility availability and capability.
d. Receive basic patient information and injury status from Treatment Dispatch Manager.
e. Communicate hospital availability to Treatment Dispatch Manager.
f. Coordinate patient off-incident destination with the hospital alert system.
g. Communicate patient transportation needs to the Ambulance Coordinators based upon requests from Treatment Dispatch Manager.

h. Maintain appropriate records.

AIR/GROUND AMBULANCE COORDINATOR - The Air/Ground Ambulance Coordinators are responsible for managing the Air/Ground Ambulance Staging Areas, and for dispatching ambulances as requested.

a. Review Common Responsibilities in Chapter 2
b. Establish appropriate staging area for ambulances.
c. Establish routes of travel for ambulances for incident operations.
d. Establish and maintain communications with the Air Operations Branch Director.
e. Establish and maintain communications with the Medical Communications Coordinator and the Treatment Dispatch Manager. Provide ambulances upon request from the Medical Communications Coordinator.
f. Maintain records as required.
g. Assure that necessary equipment is available in the ambulance for patient needs during transportation.
h. Establish immediate contact with ambulance agencies at the scene.
i. Request additional transportation resources as appropriate.
j. Provide an inventory of medical supplies at the ambulance staging area for use at the scene.

FAMILY ASSISTANCE BRANCH – The Family Assistance Branch provides services to the victims' family members; coordinates activities, lodging, food, spiritual and emotional needs, and transportation to special events (press conferences, memorial services to the scene of the incident when authorized, etc.), and any special needs that arise during the incident that may assist the victims' family members. NOTE: The

National Transportation Safety Board (NTSB) typically provides this assistance for major transportation disasters.

The major responsibilities of the Family Assistance Branch are:

a. Review Common Responsibilities in Chapter 2.
b. Review Branch Director responsibilities in Chapter 7.
c. Coordinate with local and state authorities, to include the medical examiner, local law enforcement, emergency management, hospitals, and other emergency support personnel.
d. Conduct daily coordination meetings with the local and Federal government representatives to review daily activities, resolve problem areas, and synchronize future family support operations and activities.
e. Coordinate and provide briefings to families at the site and those who decide not to be at the site.
f. Ensure adequate number of Family Assistance Team members present at all times to allow for rest, exercise and proper rotation.
g. Establish and maintain working relationship with the CERT and CISM teams to cross-reference needs of the victims' families.
h. Attend all staff briefings and planning meetings as required.
i. Request necessary equipment and supplies through LSC.
j. Ensure adequate lodging and/or sleeping arrangements.
k. Ensure that security needs for the victims' family members are addressed.
l. Ensure that all communications are centrally coordinated.
m. Ensure that all transportation scheduling is centrally coordinated.

n. Maintain Unit Log (ICS 214-CG).
o. The following agencies provide similar assistance during emergencies and may be of assistance:
   - American Red Cross (ARC)
   - Department of Health and Human Services (DHHS)
   - Federal Emergency Management Agency (FEMA)
   - NTSB

MEDICAL SUPPLY COORDINATOR - The Medical Supply Coordinator is responsible for acquiring and maintaining control of appropriate medical equipment and supplies from units assigned to the Medical Group.

a. Review Common Responsibilities in Chapter 2.
b. Acquire, distribute and maintain status of medical equipment and supplies within the Medical Group/Division.
c. Request additional medical supplies (medical caches). If the Logistics Section is established, the Medical Supply Coordinator will coordinate needs with the Supply Unit Leader.
d. Distribute medical supplies to Treatment and Triage Teams.
e. Maintain Unit Log (ICS 214-CG).

MORGUE MANAGER - The Morgue Manager is responsible for Morgue Area activities until relieved of that responsibility by the Office of the Coroner.

a. Review Common Responsibilities in Chapter 2.
b. Assess resource/supply needs and order as needed.
c. Coordinate all Morgue Area activities.
d. Keep area off limits to all but authorized personnel.

e. Coordinate with law enforcement and assist the Coroners Office as necessary.
f. Keep identity of deceased persons confidential.
g. Maintain appropriate records.
h. Maintain Unit Log (ICS 214-CG).

HOSPITAL EMERGENCY RESPONSE TEAM (HERT)

A Hospital Emergency Response Team is recommended to consist of a minimum of three (3) medical personnel, optimum of five (5) medical personnel, which includes a team leader and any combination of physicians, nurses or physicians' assistants. HERT Teams will be requested through the Incident Commander. HERT Teams report to the Treatment Team Leader and assume responsibility for patient assessment and treatment as assigned.

a. Review Common Responsibilities in Chapter 2.
b. Report to the Incident Command Post for assignment.
c. Perform medical treatment and other duties as assigned.
d. Remain at assigned Treatment Area unless otherwise reassigned.
e. Respond to scene with appropriate emergency medical equipment.
f. Maintain Unit Log (ICS 214-CG).

CHAPTER 23

EVENT MANAGEMENT AND NATIONAL SPECIAL SECURITY EVENTS (NSSEs)

TABLE OF CONTENTS

3.	Multi-Casualty Specific ICS Positions and Task Descriptions	23-5

AUGUST 2006

EVENT MANAGEMENT AND NATIONAL SPECIAL SECURITY EVENTS (NSSEs)

References:

(a) Presidential Decision Directive 62 (PDD-62), May 1998
(b) Homeland Security Presidential Directive 5 (HSPD – 5)
(c) Homeland Security Presidential Directive 7 (HSPD – 7)
(d) National Response Plan (NRP)
(e) National Incident Management System (NIMS)
(f) Event Management Job Aid

NOTE: This chapter provides a very brief overview of Natiional Special Security Event (NSSE) and Event Management. For more information, please see references (a) through (c).

INTRODUCTION

Event Management is becoming more significant in daily operations. Planned Events can vary from a local Opsail to large scale National Special Security Events (NSSE's) as described in reference (a). Events while in they may require a significant organization to run; the possible contingencies associated with events must also be planned for (such as protests and terrorist actions). Because of the flexibility and structure of NIMS ICS, planning and executing Events using NIMS ICS can make the event run smoother and make contingency execution simpler.

Presidential Decision Directive 62 (PDD – 62) established NSSE's as a designated event that by virtue of its political, economic, social, or religious significance

may be the target of terrorism or criminal activity. Homeland Security Presidential Directive 5 (HSPD – 5) directs DHS responsibility for domestic incident management and coordination of the Federal Government's operational response resources in preparing for and responding to terrorist attacks. Under Homeland Security Presidential Directive 7 (HSPD-7), the Secretary of DHS will make the final determination to designate an event as an NSSE in consultation with the Homeland Security Council.

The NSSE designation process is initiated by a formal request from the governor of the state hosting the event to the Secretary of the Department of Homeland Security (DHS). In situations where the event is federally sponsored (e.g., State of the Union Address), an appropriate federal official will make the request. Additionally, Secretary DHS retains full authority to directly designate NSSE events.

Formal requests are reviewed by the NSSE Working Group, comprised of representatives from the US Secret Service (USSS), Federal Bureau of Investigation (FBI), DHS Emergency Preparedness and Response (EP&R), Federal Emergency Management Agency (FEMA), Department of Defense (DOD) and other DHS agencies with USCG members from COMDT (G-RPC). The NSSE Working Group provides a consensus recommendation to the Secretary DHS regarding NSSE designation. Factors typically considered:

- Federal participation.
- Anticipated attendance by dignitaries.
- Size, significance, and duration of the event.
- Location and recurring nature of the event.
- Anticipated media coverage.

- State and local resources available to support the event.
- Multiplicity of jurisdictions.
- Adequacy of security absent NSSE designation.
- Available threat assessments.

Once NSSE designation has been made, the USSS contacts the relevant federal, state, and local officials to begin planning, coordinating, and implementing a comprehensive security plan for the event. Events that fail to meet required criteria for NSSE designation are considered Special Event Homeland Security (SEHS) under categorized levels I thru IV. The SEHS Working Group is comprised of all DHS agencies including USCG members from COMDT (G-RPC). The SEHS process is similar to NSSE designation for determining the level and thereby the appropriate support given to an event.

NSSE and SEHS working groups provide lists of designated events to their membership identified on the Prioritized Special Event List compiled by DHS. When COMDT (G-RPC) receives the list of events, the list is then forwarded to the Areas for review and action to continue support as required. A designated Federal Coordinator (FC) directs jointly conducted detailed planning and coordination of all assets and resources allocated from participating organizations throughout event execution until conclusion, by way of submitting a consolidated final report to DHS.

When activated to support an NSSE or other security coordination function, the DHS/U.S. Secret Service (USSS) Multi-agency Command Center (MACC) and the FBI JOC are collocated at the JFO when possible.

These agencies work together using the principles of Unified Command, with a pre-designated PFO facilitating interagency incident management coordination during NSSE planning and execution. For these situations, the JFO combines the functions of the DHS/USSS MACC, the FBI JOC, and the Response and Recovery Operations Branch.

EVENT MANAGEMENT AND NATIONAL SPECIAL SECURITY EVENT (NSSE) SPECIFIC ICS POSITIONS AND TASK DESCRIPTIONS

Figure 9 of the NRP (reference (a)) shows the structure for an NSSE.

For NSSE's, a third branch, the Security Operations Branch, may be added to coordinate protection and security efforts.

Security Operations Branch: The Security Operations Branch coordinates protection and site security efforts, and incorporates the functions of the DHS/USSS MACC during NSSE's.

Multi-agency Command Center (MACC). An interagency coordination center established by DHS/USSS during NSSE's as a component of the JFO. The MACC serves as the focal point for interagency security planning and coordination, including the coordination of all NSSE-related information from other intra-agency centers (e.g., police command posts, Secret Service security rooms) and other interagency centers (e.g., intelligence operations centers, joint information centers).

Operational supplements typically are detailed plans relating to specific incidents or events. Operational supplements routinely are developed to support NSSE's.

NOTE: For more information on Event Management, please see references (a) through (c).

CHAPTER 24

COAST GUARD NIMS ICS FORMS LIST
For Incident Management Team and Area Command

Note: Forms noted with * have NIIMS equivalent forms

Incident Management Team Forms

ICS Form #	Form Title	Prepared By
ICS 201-CG*	Incident Briefing	Initial Incident Commander
ICS 202-CG*	Incident Objectives	Planning Section Chief
ICS 203-CG*	Organization Assignment List	Resources Unit Leader
ICS 204-CG*	Assignment List	Resources Unit Leader & Operations Section Chief
ICS 204a-CG	Assignment List Attachments	Operations & Planning Sections Staff
ICS 205-CG*	Incident Radio Communications Plan	Communications Unit Leader
ICS 205a-CG	Communications List	Communications Unit Leader
ICS 206-CG*	Medical Plan	Medical Unit Leader
ICS 207-CG*	Incident Organization Chart	Resources Unit Leader
ICS-208-CG	Site Safety Plan	Safety Officer
ICS 209-CG	Incident Status Summary	Situation Unit Leader
ICS-210	Status Change Card	On-scene Incident Dispatcher

ICS Form #	Form Title	Prepared By
ICS 211-CG*	Check-In List	Resources Unit/ Check-in Recorder
ICS 213	General Message	Any message originator
ICS-213 RR CG	Resource Request Message	Any Resource Requester
ICS 214-CG*	Unit Log	All Sections and Units
ICS 215-CG*	Operational Planning Worksheet	Operations Section Chief
ICS 215a-CG	Hazard/Risk Analysis Worksheet	Safety Officer
ICS 218	Support Vehicle/Vessel Inventory	Ground/Vessel Support Unit Leaders
ICS-219	Resource Status Card	Resources Unit Leader
ICS 220-CG*	Air Operations Summary Worksheet	Operations Section Chief or Air Branch Director
ICS 221-CG*	Demobilization Checkout	Demobilization Unit Leader
ICS 230-CG	Daily Meeting Schedule	Situation Unit Leader
ICS 232-CG	Resources at Risk Summary	Environmental Unit Leader
ICS 233-CG	Open Action Tracking	Situation Unit Leader
ICS 234-CG	Work Analysis Matrix	Operations & Planning Section Chiefs

Area Command Team Forms

ICS Form #	Form Title	Prepared By
ICS AC202-CG	Area Command Objectives/Priorities	Planning Section Chief
ICS AC205-CG	Area Command Communications List	Communications Unit Leader
ICS AC207-CG	Area Command Organization Chart	Resource Unit Leader
ICS AC209-CG	Area Command Status Summary	Situation Unit Leader
ICS 211-CG*	Check-in List	Resource Unit Leader
ICS 214-CG*	Unit Log	All Sections and Units
ICS AC215-CG	Resource Allocation & Prioritization Worksheet	Command & Planning Section Chief
ICS AC230-CG	Area Command Daily Meeting Schedule	Situation Unit Leader
ICS 233-CG	Open Action Tracking	Situation Unit Leader
ICS AC235-CG	Area Command Log Of significant Events	Planning Section Chief

THIS PAGE INTENTIONALLY LEFT BLANK

CHAPTER 25

GLOSSARY AND ACRONYMS

ACCESS CONTROL POINT – The point of entry and exit from control zones at a Hazardous Substance Incident. This physical location is controlled by response personnel limiting access to and from work areas.

AGENCY – A division of government with a specific function, or a non-governmental organization.

AGENCY REPRESENTATIVE (AREP) – Individual assigned to an incident from an assisting or cooperating agency that has been delegated full authority to make decisions on all matters affecting their agency's participation at the incident. Agency Representatives report to the incident LNO.

ALL RISK – Any incident or event, natural or human caused, that warrants action to protect life, property, environment, public health or safety to minimize disruption of government, social, or economic activities.

ALL-HAZARD – Any incident or event, natural or human caused, that requires an organized response by a public, private, and/or governmental entity in order to protect life, public health and safety, values to be protected, and to minimize any disruption of governmental, social, and economic services.

ALTERNATIVE RESPONSE TECHNOLOGIES (ART) – Response methods or techniques other than mechanical containment or recovery. ART may include use of chemical dispersants, in-situ burning,

bioremediation, or other alternatives. Application of ART must be authorized and directed by the OSC.

AREA COMMAND – An organization established to: (1) oversee the management of multiple incidents that are each being handled by an ICS Incident Management Teams (IMT) organization or (2) oversee the management of large or multiple incidents to which several IMTs have been assigned. Area Command has the responsibility to set overall strategy and priorities, allocate critical resources according to priorities, ensure that incidents are properly managed, and ensure that objectives are met and strategies followed. (See also: Unified Area Command).

ASSIGNED RESOURCES – Resources checked-in and assigned work tasks on an incident.

ASSIGNMENTS – Tasks given to resources to perform within a given operational period, based upon tactical objectives in the IAP.

ASSISTANT – Title for subordinates of the Command Staff positions assigned to assist the Command Staff person manage their workload. In some cases, assistants are also assigned to unit leader positions in the planning, logistics, and finance/administration sections.

ASSISTING AGENCY – Is an agency directly contributing or providing tactical or service resources to another agency.

AVAILABLE RESOURCES – Incident-based resources that are immediately available for assignment.

BASE – That location at which the primary logistics functions are coordinated and administered. (Incident name or other designator will be added to the term "Base.") The ICP may be collocated with the Base. There is only one Base per incident.

BRANCH – The organizational level having functional and/or geographic responsibility for major incident operations. The Branch level is organizationally between Section and Division/Group in the Operations Section and between Section and Units in the Logistics Section. Branches are identified by roman numerals or by functional name (e.g. service, support).

BUYING TEAM – A team that supports incident procurement and is authorized to procure a wide range of services, supplies, and equipment rentals.

CACHE – A pre-determined complement of tools, equipment, and/or supplies stored in a designated location, and available for incident use.

CAMP – Geographical site(s) within the general incident area, separate from the incident base, equipped and staffed to provide sleeping, food, water, and sanitary services to incident personnel.

CHECK-IN – Process whereby resources first report to incident response. Check-in locations include: Incident Command Post (Resources Unit), Incident Base, Camps, Staging Areas, Helibases, Helispots, or Division/Group Supervisors (for direct tactical assignments).

CHIEF – The ICS title for individuals responsible for the command of functional Sections: Operations, Planning, Logistics, and Finance/Administration.

CLEAR TEXT – The use of plain English in radio communications transmission. Neither 10 Codes nor agency-specific codes are used when using Clear Text.

COMMAND – The act of directing, ordering, and/or controlling resources by virtue of explicit legal, agency, or delegated authority. May also refer to an IC or to the UC.

COMMAND POST – See Incident Command Post.

COMMAND STAFF – The Command Staff consists of the PIO, SOFR, and LNO, who report directly to an IC. May also include Intelligence Officer. They may have an assistant or assistants, as needed.

COMMON OPERATING PICTURE – Is a broad view of the overall situation as reflected by situation reports, aerial photography and other information and intelligence.

COMPLEX – Two or more individual incidents located in the same general proximity, which are assigned to a single IC or UC to facilitate management.

CONTAMINANT – See Pollutant.

CONTAMINATION CONTROL LINE (CCL) – The established line around the Contamination Reduction Zone that separates the Contamination Reduction Zone from the Support Zone.

CONTAMINATION REDUCTION CORRIDOR (CRC) – A CRC is that area within the Contamination Reduction Zone where the actual decontamination is to take place. Exit from the Exclusion Zone is through the

Contamination Reduction Corridor (CRC). The CRC will become contaminated as people and equipment pass through to the decontamination stations.

CONTAMINATION REDUCTION ZONE (CRZ) – That area between the Exclusion Zone and the Support Zone. This zone contains the Personnel Decontamination Station. This zone may require a lesser degree of personnel protection than the Exclusion Zone. This area separates the contaminated area from the clean area and acts as a buffer to reduce contamination of the clean area.

CONTINGENCY PLAN – The portion of an IAP or other plan that identifies possible but unlikely events and the contingency resources needed to mitigate those events.

CONTROL ZONES – The geographical areas within the control lines set up at a hazardous substance incident. The three zones most commonly used are the Exclusion Zone, Contamination Reduction Zone, and Support Zone.

COOPERATING AGENCY – An agency supplying assistance other than direct tactical or support functions or resources to the incident control effort (e.g., Red Cross, law enforcement agency, telephone company, etc.).

COORDINATION CENTER – Term used to describe any facility that is used for the coordination of agency or jurisdictional resources in support of one or more incidents.

COST SHARING AGREEMENTS – Agreements between agencies or jurisdictions to share designated costs related to incidents. Cost sharing agreements are

normally written but may also be verbal between an authorized agency or jurisdictional representatives at the incident.

CRITICAL INFRASTRUCTURES – Systems and assets, whether physical or virtual, so vital to the United States that the incapacity or destruction of such systems and assets would have a debilitating impact on security, national economic security, national public health or safety, or any combination of those matters.

DEMOBILIZATION – Release of resources from an incident in strict accordance with a detailed plan approved by the IC/UC.

DEPUTY – A fully qualified individual who, in the absence of a superior, could be delegated the authority to manage a functional operation or perform a specific task. In some cases, a Deputy could act as relief for a superior and, therefore, **must be fully qualified** in the position. Deputies can be assigned to the Incident Commander, General Staff, and Branch Directors.

DIRECTOR – ICS title for individuals responsible for supervision of a Branch.

DIVISION – Organization level used to divide an incident into geographical areas of operation. The Division level is established when the number of resources exceeds the span-of-control of the OSC and is organizationally between the Task Force/Team and the Branch. (See also: Group.)

EMERGENCY OPERATIONS CENTER (EOC) – The pre-designated facility established by an agency or jurisdiction to coordinate the overall agency or jurisdictional response and support to an emergency.

The EOC coordinates information and resources to support domestic incident management activities.

EMERGENCY SUPPORT FUNCTION (ESF) – The National Response Plan (NRP) details 15 ESFs in place to coordinate operations during Federal involvement in an incident including transportation, communications, public works, engineering, firefighting, information and planning, mass care, resource support, health and medical services, urban search and rescue, hazardous materials, food, and energy.

EVENT – A planned, non-emergency activity. ICS can be used as the management system for a wide range of events, e.g. NSSES, Opsail, parades, concerts, or sporting activities. The event IAP usually includes contingency plans for possible incidents that might occur during the event.

EXCLUSION ZONE – The area immediately around a spill or release where contamination does or could occur. The innermost of the three zones of a hazardous substance/material incident. Special protection is required for all personnel while in this zone.

EXPANDED ORDERING – An organization that is authorized to set up outside of the ICP to assist the Logistics Section with ordering supplies, services and resources to support the incident. The expanded ordering does not decide allocation of critical resources because they are dealt with by Area Command.

FACILITY OWNER (FO) – FO is the owner/operator of the facility or source which precipitated an incident.

FEDERAL COORDINATING OFFICER (FCO) – The Federal officer who is appointed to manage Federal

resource support activities related to Stafford Act disasters and emergencies. The FCO is responsible for coordinating the timely delivery of Federal disaster assistance resources and programs to the affected State and local governments, individual victims, and the private sector.

FEDERAL ON-SCENE COORDINATOR (FOSC) – The Federal official pre-designated by the EPA or the USCG to coordinate responses under subpart D of the NCP (40 CFR 300) or the government official designated to coordinate and direct removal actions under subpart E of the NCP. A FOSC can also be designated as the Incident Commander.

FEDERAL RESOURCE COORDINATOR (FRC) – The Federal official appointed to manage Federal resource support activities related to non-Stafford Act incidents. The FRC is responsible for coordinating support from other Federal departments and agencies using interagency agreements and MOU's.

FEDERAL INCIDENT RESPONSE SUPPORT TEAM (FIRST) – A forward component of the ERT-A that provides on-scene support to the local Incident Command or Area Command structure.

FINANCE/ADMINISTRATION SECTION – The section responsible for all administrative and financial considerations on an incident.

GENERAL STAFF – The group of incident management personnel reporting to the IC and are comprised of: OSC, PSC, LSC, and FSC. They may each have a deputy/deputies.

GEOGRAPHIC INFORMATION SYSTEM (GIS) – A GIS is an electronic information system, which provides a geo-referenced database to support management decision-making.

GROUP – An organizational level established to divide the incident into functional areas of operation. Groups are composed of resources assembled to perform a special function not necessarily within a single geographic division. A Group is located between Branches (when activated) and Resources in the Operations Section. (See also: Division)

HAND CREW – A number of individuals that have been organized and trained and are supervised principally for operational assignments on an incident.

HAZARDOUS CATEGORIZATION TEST (HAZ CAT) – A field analysis to determine the hazardous characteristics of an unknown substance.

HAZARDOUS MATERIAL – For the purposes of ESF #1, hazardous material is a substance or material, including a hazardous substance, that has been determined by the Secretary of Transportation to be capable of posing an unreasonable risk to health, safety, and property when transported in commerce, and which has been so designated (see 49 CFR 171.8). For the purposes of ESF #10 and the Oil and Hazardous Materials Incident Annex, the term is intended to mean hazardous substances, pollutants, and contaminants as defined by the NCP.

HAZARDOUS SUBSTANCE – As defined by the NCP, any substance designated pursuant to section 311(b)(2)(A) of the Clean Water Act; any element, compound, mixture, solution, or substance designated

pursuant to section 102 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA); any hazardous waste having the characteristics identified under or listed pursuant to section 3001 of the Solid Waste Disposal Act (but not including any waste the regulation of which under the Solid Waste Disposal Act (42 U.S.C. § 6901 et seq.) has been suspended by act of Congress); any toxic pollutant listed under section 307(a) of the Clean Water Act; any hazardous air pollutant listed under section 112 of the Clean Air Act (42 U.S.C. § 7521 et seq.); and any imminently hazardous chemical substance or mixture with respect to which the EPA Administrator has taken action pursuant to section 7 of the Toxic Substances Control Act (15 U.S.C. § 2601 et seq.).

HELIBASE – A location within the general incident area for parking, fueling, maintenance, and loading of helicopters.

HELISPOT – A location where a helicopter can take off and land. Some helispots may be used for temporary loading.

INCIDENT– An occurrence either human-caused or natural phenomenon, that requires action or support by emergency service personnel to prevent or minimize loss of life or damage to property and/or natural resources.

INCIDENT ACTION PLAN (IAP) – An oral or written plan containing general objectives reflecting the overall strategy for managing an incident. It may include the identification of operational resources and assignments. It may also include attachments that provide direction and important information for management of the incident during one or more operational periods.

INCIDENT BASE – Location at the incident where the primary logistics functions are coordinated and administered. The ICP may be collocated with the base. There is only one base per incident.

INCIDENT COMMANDER (IC) – The individual responsible for all incident activities, including the development of strategies and tactics and the ordering and release of resources. The IC has overall authority and responsibility for conducting incident operations and is responsible for the management of all incident operations at the incident site. (See also: Unified Command).

INCIDENT COMMAND POST (ICP) – The field location at which the primary tactical-level, on-scene incident command functions are performed. The ICP may be collocated with the incident base or other incident facilities.

INCIDENT COMMAND SYSTEM (ICS) – A standardized on-scene emergency management concept specifically designed to allow its user(s) to adopt an integrated organizational structure equal to the complexity and demands of single or multiple incidents, without being hindered by jurisdictional boundaries.

INCIDENT MANAGEMENT TEAM (IMT) – The Incident Commander and appropriate Command and General Staff personnel assigned to an incident.

INCIDENT OF NATIONAL SIGNIFICANCE (INS) – An actual or potential high-impact event that requires a coordinated and effective response by an appropriate combination of Federal, State, local, tribal, non-governmental, and/or private-sector entities in order to

save lives and minimize damage and provide the basis for long-term community recovery and mitigation activities.

INCIDENT OBJECTIVES – Statements of guidance and direction necessary for the selection of appropriate strategies, and the tactical direction of resources. Tactical incident objectives address the tactical response issues while management incident objectives address the incident management issues. Tactical incident objectives are based on realistic expectations of what can be accomplished when all allocated resources have been effectively deployed. Incident objectives must be achievable and measurable, yet flexible enough to allow for strategic and tactical alternatives.

INCIDENT OVERHEAD – All supervisory positions described in the Incident Command System.

INCIDENT SUPPORT ORGANIZATION – Includes any off-incident support provided to an incident. Examples would be EOCs, airports, expanded ordering, etc.

INCIDENT SITUATION DISPLAY – The Situation Unit is responsible for maintaining a display of status boards, which communicate critical incident information vital to establishing an effective command and control environment.

INITIAL ACTION – The actions taken by the first resources to arrive at the incident. Initial actions may be to size up, patrol, monitor, withhold from any action, or take aggressive initial measures.

INITIAL RESPONSE – Resources initially committed to an incident.

INLAND ZONE – As defined in the NCP, the environment inland of the coastal zone excluding the Great Lakes and specified ports and harbors on the inland rivers. The term “coastal zone” delineates an area of Federal responsibility for response action. Precise boundaries are determined by EPA/USCG agreements and identified in Regional Contingency Plan’s (RCPs).

INTELLIGENCE AND INFORMATION – National security, classified information, or other operational information necessary for incident decision making. Traditionally located in the Planning Section but may be moved to other parts of the ICS organization based on Command needs.

JOINT FIELD OFFICE (JFO) – A temporary Federal facility established locally to provide a central point for Federal, State, local, and tribal executives with responsibility for incident oversight, direction, and/or assistance to effectively coordinate protection, prevention, preparedness, response, and recovery actions. The JFO will combine the traditional functions of the JOC, the FEMA DFO, and the JIC within a single Federal facility.

JOINT INFORMATION CENTER (JIC) – A facility established within or near the ICP where the PIO and staff can coordinate and provide information on the incident to the public, media, and other agencies. The JIC is normally staffed with representation from the FOSC, SOSC, and FO.

JOINT INFORMATION SYSTEM (JIS) – Integrates incident information and public affairs into a cohesive organization designed to provide consistent,

coordinated, timely information during a crisis or incident operations.

JOINT OPERATIONS CENTER (JOC) – The JOC is the focal point for all Federal investigative law enforcement activities during a terrorist or potential terrorist incident or any other significant criminal incident, and is managed by the SFLEO. The JOC becomes a component of the JFO when the NRP is activated.

JURISDICTION – The range or sphere of authority. Public agencies have jurisdiction at an incident related to their legal responsibilities and authority for incident mitigation. Jurisdictional authority at an incident can be political/geographical (e.g., city, county, state or federal boundary lines) or functional (e.g., police department, health department, etc.). (See also: Multi-jurisdiction Incident.)

LEADER – The ICS title for an individual responsible for a Task Force/Strike Team or functional unit.

LOGISTICS SECTION – The Logistics Section is responsible for providing facilities, services, and materials in support of the incident.

MAJOR DISASTER – As defined by the Stafford Act, any natural catastrophe (including any hurricane, tornado, storm, high water, wind-driven water, tidal wave, tsunami, earthquake, volcanic eruption, landslide, mudslide, snowstorm, or drought) or, regardless of cause, any fire, flood, or explosion, in any part of the United States, which in the determination of the President causes damage of sufficient severity and magnitude to warrant major disaster assistance under this act to supplement the efforts and available

resources of States, local governments, and disaster relief organizations in alleviating the damage, loss, hardship, or suffering caused thereby.

MANAGEMENT BY OBJECTIVES – In ICS, this is a top-down management activity which involves the following steps to achieve the incident goal: (1) establishing incident objectives, (2) selection of appropriate strategy(s) to achieve the objectives, and (3) the tactical direction associated with the selected strategy.

MANAGERS – Individuals within ICS organizational units that are assigned specific managerial responsibilities (e.g., Staging Area Manager).

MESSAGE CENTER – The Message Center is part of the Communications Center and collocated with or adjacent to it. It receives, records, and routes information about resources reporting to the incident, resource status, and handles administration, and tactical traffic.

MISSION ASSIGNMENT – The vehicle used by DHS/EPR/FEMA to support Federal operations in a Stafford Act major disaster or emergency declaration. It orders immediate, short-term emergency response assistance when an applicable State or local government is overwhelmed by the event and lacks the capability to perform, or contract for, the necessary work.

MITIGATE – Any action to contain, reduce, or eliminate the harmful effects of a spill or release of a hazardous substance/material.

MOBILIZATION CENTER – An off-incident location at which emergency service personnel and equipment are temporarily located pending assignment, release, or reassignment.

MORGUE (Temporary On-Incident) – Is an area designated for temporary placement of the dead. The Morgue is the responsibility of the Coroner's Office when a Coroner's Representative is on-scene.

MULTI-AGENCY COORDINATION (MAC) – A generalized term which describes the functions and activities of representatives of involved agencies and/or jurisdictions who come together to make decisions regarding the prioritizing of incidents, and the sharing and use of critical resources. The MAC organization is not a part of the on-scene ICS and is not involved in developing incident strategy or tactics.

MULTI-AGENCY INCIDENT – Is an incident where one or more agencies assist a jurisdictional agency or agencies. May be single or Unified Command.

MULTIJURISDICTIONAL INCIDENT – Is an incident requiring action from multiple agencies that each have jurisdiction to manage certain aspects of an incident. In ICS, these incidents will be managed under Unified Command.

NATIONAL INFRASTRUCTURE COORDINATING CENTER (NICC) – Managed by the DHS Information Analysis and Infrastructure Protection Directorate, the NICC monitors the Nation's critical infrastructure and key resources on an ongoing basis. In the event of an incident, the NICC provides a coordinating vehicle to share information with critical infrastructure and key resources information-sharing entities.

NATIONAL RESPONSE CENTER (NRC) – A national communications center for activities related to oil and hazardous substance response actions. The NRC, located at DHS/USCG Headquarters in Washington, DC, receives and relays notices of oil and hazardous substances releases to the appropriate Federal OSC.

NATIONAL RESPONSE PLAN (NRP) – A document that describes the structure and processes comprising a national approach to domestic incident management designed to integrate the efforts and resources of Federal, State, local, tribal, private-sector, and nongovernmental organizations.

NATIONAL RESPONSE SYSTEM (NRS) – Pursuant to the NCP, the NRS is a mechanism for coordinating response actions by all levels of government (40 CFR § 300.21) for oil and hazardous substances spills and releases.

NATIONAL RESPONSE TEAM (NRT) – The NRT, comprised of the 16 Federal agencies with major environmental and public health responsibilities, is the primary vehicle for coordinating Federal agency activities under the NCP. The NRT carries out national planning and response coordination and is the head of a highly organized Federal oil and hazardous substance emergency response network. EPA serves as the NRT Chair, and DHS/USCG serves as Vice Chair.

NATIONAL SPECIAL SECURITY EVENT (NSSE) – A designated event that, by virtue of its political, economic, social, or religious significance, may be the target of terrorism or other criminal activity.

NATIONAL STRIKE FORCE (NSF) – The NSF consists of three strike teams established by DHS/USCG on the Pacific, Atlantic, and Gulf coasts. The strike teams can provide advice and technical assistance for oil and hazardous substances removal, communications support, special equipment, and services.

NOAA WEATHER STATION – A mobile weather data collection and forecasting facility (including personnel) provided by the National Oceanic and Atmospheric Administration (NOAA), which can be utilized within the incident area.

NONGOVERNMENTAL ORGANIZATION (NGO) – A nonprofit entity that is based on interests of its members, individuals, or institutions and that is not created by a government, but may work cooperatively with government to serve a public purpose, i.e., faith-based charity organizations, American Red Cross.

NUCLEAR INCIDENT RESPONSE TEAM (NIRT) – Created by the Homeland Security Act to provide DHS with a nuclear/radiological response capability. When activated, the NIRT consists of specialized Federal response teams drawn from DOE and/or EPA.

OFFICER – The ICS title for personnel responsible for the Command Staff positions of Safety, Liaison, and Public Information.

OPERATIONAL PERIOD – The period of time scheduled for execution of a given set of operation actions as specified in the IAP. Operational Periods can be various lengths, usually not over 24 hours. The Operational Period coincides with the completion of one planning “P” cycle (see Chapter 3 planning cycle).

OPERATIONS COORDINATION CENTER (OCC) – The primary facility of the Multi-Agency Coordination System. It houses staff and equipment necessary to perform MAC functions.

OPERATIONS SECTION – The Section responsible for all operations directly applicable to the primary mission. Directs the preparation of Branch, Division, and/or Unit operational plans, requests or releases resources, makes expedient changes to the IAP as necessary and reports such to the IC.

OUT-OF-SERVICE RESOURCES – Resources assigned to an incident, but they are unable to respond for mechanical, rest, or personnel reasons.

OVERHEAD PERSONNEL – Personnel who are assigned to supervisory positions that includes: Incident Commander, Command Staff, General Staff, Directors, Supervisors, and Unit Leaders.

PERSONAL PROTECTIVE EQUIPMENT (PPE) – That equipment and clothing required to shield or isolate personnel from the chemical, physical, and biological hazards that may be encountered at a hazardous substance/material incident. 33 CFR 154.1026, 33 CFR 155.1026

PLANNING SECTION – The section that is responsible for the collection, evaluation, and dissemination of tactical information related to the incident, and for the preparation and documentation of incident action plans. The section also maintains information on the current and forecasted situation, and on the status of resources assigned to the incident.

POLLUTANT OR CONTAMINANT – As defined in the NCP, includes, but is not limited to, any element, substance, compound, or mixture, including disease-causing agents, which after release into the environment and upon exposure, ingestion, inhalation, or assimilation into any organism, either directly from the environment or indirectly by ingestion through food chains, will or may reasonably be anticipated to cause death, disease, behavioral abnormalities, cancer, genetic mutation, physiological malfunctions, or physical deformations in such organisms or their offspring.

PRINCIPAL FEDERAL OFFICIAL (PFO) – The Federal official designated by the Secretary of Homeland Security to act as his/her representative locally to oversee, coordinate, and execute the Secretary's incident management responsibilities under HSPD-5 for Incidents of National Significance.

QUALIFIED INDIVIDUAL (QI) – The person authorized by the responsible party to act on their behalf, authorize expenditures, and obligate resources.

RADIOLOGICAL EMERGENCY RESPONSE TEAMS (RERT's) – Teams provided by EPA's Office of Radiation and Indoor Air to support and respond to incidents or sites containing radiological hazards. These teams provide expertise in radiation monitoring, radionuclide analyses, radiation health physics, and risk assessment.

REGIONAL RESPONSE TEAMS (RRT's) – Regional counterparts to the National Response Team, the RRT's comprise regional representatives of the Federal agencies on the NRT and representatives of each State within the region. The RRT's serve as planning and preparedness bodies before a response, and provide

coordination and advice to the Federal OSC during response actions.

REGIONAL RESPONSE COORDINATION CENTERS (RRCC) – A standing facility operated by DHS/EPR/FEMA that is activated to coordinate regional response efforts, establish Federal priorities, and implement local Federal program support until a JFO is established in the field and/or the PFO, FCO or FRC can assume their NRP coordination responsibilities.

REPORTING LOCATION – Any one of six facilities/locations where incident assigned resources may check-in. The locations are: Incident Command Post-Resources Unit, Base, Staging Area, Helibase, or Division/Group Supervisors (for direct line assignments). Check-in occurs at one location only.

RESOURCES – All personnel and major items of equipment available, or potentially available, for assignment to incident tasks on which status is maintained.

RESPONDER REHABILITATION – Also known as "rehab", a treatment of incident personnel who are suffering from the effects of strenuous work and/or extreme conditions.

SAR ON-SCENE COORDINATOR (SAR OSC) – The SAR OSC coordinates the SAR mission on-scene using the resources made available by SMC and should safely carry out the SAR Action Plan. The SAR OSC may serve as a Branch Director or Group Supervisor to manage on-scene operations after the SAR mission is concluded and other missions continue, such as search and recovery.

SECTION – That organization level having functional responsibility for primary segments of an incident such as: Operations, Planning, Logistics and Finance. The Section level is organizationally between Branch and Incident Commander.

SENIOR FEDERAL OFFICIAL (SFO) – A SFO is an individual representing a Federal department or agency with primary statutory responsibility for incident management.

SINGLE RESOURCE – Is an individual, a piece of equipment and its personnel complement, or a crew or team of individuals with an identified work supervisor that can be used on an incident.

SITE SAFETY AND HEALTH PLAN (SSHP) – Site-specific document required by state and Federal OSHA regulations and specified in the Area Contingency Plan. The SSHP, at minimum, addresses, includes, or contains the following elements: health and safety hazard analysis for each site task or operation, comprehensive operations work plan, personnel training requirements, PPE selection criteria, site-specific occupational medical monitoring requirements, air monitoring plan, site control measures, confined space entry procedures (if needed), pre-entry briefings (tailgate meetings, initial and as needed), pre-operations commencement health and safety briefing for all incident participants, and quality assurance of SSHP effectiveness.

SITUATION ASSESSMENT – The evaluation and interpretation of information gathered from a variety of sources (including weather information and forecasts, computerized models, GIS data mapping, remote sensing sources, ground surveys, etc.) that, when

communicated to emergency managers and decision makers, can provide a basis for incident management decision making.

SPAN OF CONTROL – A Command and Control term that means how many organizational elements may be directly managed by one person. Span of Control may vary from one to seven, and a ratio of five reporting elements is optimum.

STAGING AREA – That location where incident personnel and equipment are assigned awaiting tactical assignment. Staging Areas are managed by the OSC.

STAKEHOLDERS – Any person, group, or organization affected by and having a vested interest in the incident and/or the response operation.

STRATEGIC GOALS – Strategic goals are broad, general statements of intent.

STRATEGY – The general plan or direction selected to accomplish incident objectives.

STRATEGIC PLAN – Is a plan that addresses long-term issues such as impact of weather forecasts, time–phased resource requirements, and problems such as permanent housing for displaced disaster victims, environmental pollution, and infrastructure restoration.

STRIKE TEAM – Are specified combinations of the **same kind and type** of resources with common communications and a leader.

SUPERVISOR – ICS title for individuals responsible for command of a Division or Group.

SUPPORT ZONE – In a hazardous substance response, the clean area outside of the Contamination Control Line is a support zone. Equipment and personnel are not expected to become contaminated in this area. Special protective clothing is not required. This is the area where resources are assembled to support the hazardous substances/materials release operation.

SUPERVISOR OF SALVAGE AND DIVING (SUPSALV) – A salvage, search, and recovery operation established by the Department of Navy with experience to support response activities, including specialized salvage, firefighting, and petroleum, oil, and lubricants offloading.

TACTICAL DIRECTION – Directions given by the OSC that includes: the tactics appropriate for the selected strategy, the selection and assignment of resources, tactics implementation, and performance monitoring for each operational period.

TACTICS – Deploying and directing resources during an incident to accomplish the objectives designated by strategy.

TASK FORCE – A group of resources with common communications and a leader assembled for a specific mission.

T-CARD – Cards filled out with essential information for each resource they represent. The cards are color-coded to represent different types of resources.

TECHNICAL SPECIALISTS (THSP) – Personnel with special skills who can be used anywhere within the ICS organization.

TEMPORARY FLIGHT RESTRICTIONS (TFR) –TFRs are established by the Federal Aviation Administration (FAA) to ensure aircraft safety in the vicinity of the incident which restricts the operation of non-essential aircraft in the airspace around that incident.

TERRORISM – Any activity that: (1) involves an act that (a) is dangerous to human life or potentially destructive of critical infrastructure or key resources and (b) is a violation of the criminal laws of the United States or of any State or other subdivision of the United States; and (2) appears to be intended (a) to intimidate or coerce a civilian population, (b) to influence the policy of a government by intimidation or coercion, or (c) to affect the conduct of a government by mass destruction, assassination, or kidnapping.

UNACCEPTABLE RISK – Level of risk as determined by the risk management process which cannot be mitigated to an acceptable safe level.

UNIFIED COMMAND (UC) – An application of ICS used when there is more than one agency with incident jurisdiction or when incidents cross political jurisdictions. Agencies work together through the designated members of the Unified Command to establish their designated Incident Commanders at a single ICP and to establish a common set of objectives and strategies and a single Incident Action Plan. This is accomplished without losing or abdicating authority, responsibility, or accountability.

UNIFIED AREA COMMAND (UAC) – A unified area command is established when incidents under an area command are multi-jurisdictional.

UNIT – That organizational element having functional responsibility for a specific incident planning, logistics, or finance/administration activity.

VESSEL OWNER (VO) – VO is the owner/operator of the vessel or source which precipitated the incident.

VOLUNTEER – Any individual accepted to perform services by an agency that has authority to accept volunteer services when the individual performs services without promise, expectation, or receipt of compensation for services performed.

WATERSHED REHABILITATION – Is also known as "rehab"; restoration of watershed to as-near-as-possible its pre-incident condition, or to a condition where it can recover on its own.

WEAPON OF MASS DESTRUCTION (WMD) – As defined in Title 18, U.S.C. § 2332a: (1) any explosive, incendiary, or poison gas, bomb, grenade, rocket having a propellant charge of more than 4 ounces, or missile having an explosive or incendiary charge of more than one-quarter ounce, or mine or similar device; (2) any weapon that is designed or intended to cause death or serious bodily injury through the release, dissemination, or impact of toxic or poisonous chemicals or their precursors; (3) any weapon involving a disease organism; or (4) any weapon that is designed to release radiation or radioactivity at a level dangerous to human life.

ACRONYMS

AC	Area Command
A/C	Aircraft
ACO	Aircraft or Fixed-Wind Coordinator
ACP	Area Contingency Plan
ADCON	Administrative Control
AMS	Area Maritime Security
AMSC	Area Maritime Security Committee
AMSP	Area Maritime Security Plan
AMIO	Alien Migrant Interdiction Operations
AMVER	Automated Mutual-Assistance Vessel Rescue
AOBD	Air Operations Branch Director
AOIC	Assistant Officer In Charge
APSO	Asylum Pre-Screening Officer (INS)
ARC	American Red Cross
AREP	Agency Representative
ART	Alternate Response Technologies
ASGS	Air Support Group Supervisor
ATMWU	Air Transportable Mobile Weather Unit
ATOI	Air Target of Interest
ATC	Air Traffic Control
ATGS	Air Tactical Group Supervisor
BCMG	Base Manager
BO	Boarding Officer
BTM	Boarding Team Member
C2	Command and Control
C3	Command, Control, and Communications
CANUS	Canadian United States Joint Marine Pollution Contingency Plan
CAP	Civil Air Patrol
CASP	Computer-Assisted Search Planning
CASPER	C-130 Airborne Surveillance with Palletized Electronic Reconnaissance

CBDR	Constant Bearing, Decreasing Range
CBP	U.S. Customs and Border Protection
CC	Contributing Command
CCL	Contamination Control Line
CD	Counter Drug
CHET	Customs High Endurance Tracker (Cheyenne III aircraft)
CIC	Combat Information Center
CJCS	Chairman of the Joint Chiefs of Staff
CLMS	Claims Specialist
CO	Commanding Officer
COML	Communication Unit Leader
COMP	Compensation /Claims Unit Leader
COST	Cost Unit Leader
COTP	Captain of the Port
CRA	Coordinating Review Authority
CRC	Contamination Reduction Corridor
CRWD	Crew Boss/Crew Supervisor
CRZ	Contamination Reduction Zone
CSC	Combat Support Center
CTF	Commander Task Force
CTU	Commander Task Unit
D&M	Detention and Monitoring
DAN	Divers Alert Network
DCM	Dangerous Cargo Manifest
DEA	Drug Enforcement Administration
DFM	Diesel Fuel Marine
DHHS	Department of Health & Human Services
DHS	Department of Homeland Security
DIVS	Division/Group Supervisor
DMB	Datum Marker Buoy
DMOB	Demobilization Unit Leader
DOCL	Documentation Unit Leader
DOD	Department of Defense
DOT	Department of Transportation
DOSC	Deputy Operations Section Chief

DPIC	Deputy Incident Commander
DPRO	Display Processor
EEI	Essential Elements of Information
EEZ	Exclusive Economic Zone
ELT	Emergency Locator Transmitter
EMCON	Emission Control
EMS	Emergency Medical Services
EMT	Emergency Medical Technician
ENSP	Environmental Specialist
EOC	Emergency Operations Center
EOP	Emergency Operations Plan
EPA	Environmental Protection Agency, US
EPIC	El Paso Intelligence Center
EPIRB	Emergency Position Indicating Radio Beacon
EQPM	Equipment Manager
EQTR	Equipment Time Recorder
ERT	Emergency Response Team
ES	Electronic Surveillance
ESF	Emergency Support Functions
EUL	Environmental Unit Leader
EXCOM	Extended Communication Search
FAA	Federal Aviation Administration
FACL	Facilities Unit Leader
FC	Federal Coordinator
FDUL	Food Unit Leader
FEMA	Federal Emergency Management Agency
FLIR	Forward-Looking Infrared
FMSC	Federal Maritime Security Coordinator
FO	Facility Owner
FOB	Field Observer
FOD	Foreign Object Damage
FOG	Field Operations Guide
FOSC	Federal On-Scene Coordinator
FSC	Finance/Administration Section Chief

F/V	Fishing Vessel
GIS	Geographic Information System
GMDSS	Global Maritime Distress and Safety System
GSUL	Ground Support Unit Leader
H/C	Historic/Cultural
HAZ CAT	Hazardous Categorization Test
HAZMAT	Hazardous Materials
HAZSUB	Hazardous Substances
HCO	Helicopter Coordinator
HF	High Frequency
HLSA	Homeland Security Act
HSAS	Homeland Security Advisory System
HSPD-5	Homeland Security Presidential Directive No. 5
HSPD-7	Homeland Security Presidential Directive No. 7
HSPD-8	Homeland Security Presidential Directive No. 8
IAP	Incident Action Plan
IC	Incident Commander
ICE	U.S. Immigration and Customs Enforcement
ICP	Incident Command Post
ICS	Incident Command System
IECO	Immigration Emergency Coordinating Officer
IG	Immune Globulin
IMAT	Incident Management Assist Team
INCM	Incident Dispatcher
INJR	Compensation for Injury Specialist
INS	Incident of National Significance
IR	Infrared
ISB	In-situ Burn

JFO	Joint Field Office
JIC	Joint Information Center
JIS	Joint Information System
JRCC	Joint (aeronautical and maritime) Rescue Coordination Center
JRSC	Joint Rescue Sub-center
KIAS	Knots Indicated Air Speed
KT	Knot(s)
LCPL	Landing Craft Personnel, Large
LCU	Landing Craft, Utility
LE	Law Enforcement
LEA	Law Enforcement Agency
LEDET	Law Enforcement Detachment (USCG)
LEL	Lower Explosive Limit
LEU	Law Enforcement Unit
LKP	Last Known Position
LLLTV	Low Light Level Television
LNO	Liaison Officer
LPOC	Last Port of Call
LSC	Logistics Section Chief
M/V	Motor Vessel
MAC	Multi-agency Coordination
MARSEC	Maritime Security
MEDEVAC	Medical Evacuation
MEDICO	Medical Advice, Usually By Radio
MEDL	Medical Unit Leader
MEXUS	Mexican United States Joint Marine Pollution Contingency Plan
MINIRAD	Minimum Radiation
MLB	Motor Lifeboat
MLE	Maritime Law Enforcement
MOA	Memorandum of Agreement
MOOTW	Military Operations Other Than War

MOU	Memorandum of Understanding
MPA	Maritime Patrol Craft
MRCC	Maritime Rescue Coordination Center
MSST	Maritime Safety and Security Team
MTS	Marine Transportation System
MTSL	Marine Transportation System Recovery Unit
NCP	National Oil and Hazardous Substances Pollution Contingency Plan (40 CFR 300)
NDP	Naval Doctrine Publication
NIC	NIMS Integration Center
NIIMS	National Interagency Incident Management System
NIMS	National Incident Management System
NM	Nautical Mile
NMMSS	Naval Mast Mounted Sight System
NOAA	National Oceanic and Atmospheric Administration
NOTAM	Notice to Airmen
NPFC	National Pollution Funds Center
NPOC	Next Port of Call
NRC	National Response Center (Phone number (800)424-8802)
NRP	National Response Plan
NRDAR	Natural Resource Damage Assessment
NRS	National Response System
NSSE	National Special Security Event
NTSB	National Transportation Safety Board
NVD	Night Vision Devices
NVG	Night Vision Goggles
NWP	Naval Warfare Publication
OC	Oleoresin Capsicum (Pepper Spray)
OCC	Operations Coordination Center
OIC	Officer-In-Charge

OPA 90	Oil Pollution Act of 1990
OPBD	Operations Branch Director
OPCEN	USCG Operations Center
OPCON	Operational Control
OPLAN	Operation Plan
OPORDER	Operation Order
OPSEC	Operations Security
ORDM	Ordering Manager
O/S	On-Scene
OSC	Operations Section Chief
OSC	SAR On-Scene Coordinator
OSHA	Occupational Safety and Health Administration
P/C	Pleasure Craft
PA	Programmatic Agreement (Historical/ Cultural Protection)
PD-27	Presidential Directive 27
PDW	Personal Defense Weapon
PFD	Personal Flotation Device
PIO	Public Information Officer
PIW	Person(s) in Water
PML	Personal Marker Light
POB	Persons On Board
POC	Point-of-Contact
POD	Probability of Detection
POS	Probability of Success
PPE	Personal Protective Equipment
PQS	Personnel Qualification Standard
PRA	Primary Review Authority
PRECOM	Preliminary Communication Search
PRFA	Pollution Removal Funding Authorization
PROC	Procurement Unit Leader
PSC	Planning Section Chief
PTRC	Personnel Time Recorder
PWCS	Ports, Waterways and Coastal Security

QI	Qualified Individual
QRT	Quick Reaction Team
R&A	Rescue and Assistance
RAR	Resources at Risk
RB-M	Response Boat - Medium
RB-S	Response Boat - Small
RBDF	Royal Bahamian Defense Force
RCC	Rescue Coordination Center
RCP	Regional Response Plan
RCDM	Receiving and Distribution Manager
RDD	Radiological Dispersal Device
REHB	Responder Rehabilitation Manager
RESL	Resource Unit Leader
RIB/RHIB	Rigid Hull Inflatable Boat
RIT	Rapid Intervention Team
ROE	Rules of Engagement
RRBT	Rapid Response Boarding Team
RRD	Radiological Dispersion Devise
RRT	Regional Response Team
RSC	Rescue Sub-Center
SAR	Search and Rescue
SART	Search and Rescue Transponder
SARTEL	SAR Telephone (private hotline)
SATCOM	Satellite Communications
SC	SAR Coordinator
SCAT	Shoreline Cleanup Assessment Team
SCKN	Status/Check-In Recorder
SECM	Security Manager
SEHS	Special Event Homeland Security
SELEX	Selected Exercise
SITL	Situation Unit Leader
SLAR	Side Looking Airborne Radar
SLDMB	Self-Locating Datum Marker Buoy
SMC	SAR Mission Coordinator
SNO	Statement of No Objection

SOFR	Safety Officer
SOLAS	Safety of Life at Sea
SONS	Spill of National Significance
SOSC	State On-Scene Coordinator
SPUL	Supply Unit Leader
SRA	Safe Refuge Area
SRB	Surf Rescue Boat
SRIE	Safety Rules of Engagement
SROE	Standing Rules of Engagement
SRR	Search and Rescue Region
SRU	Search Rescue Unit
SS	Expanding Square Search
SSI	Sensitive Security Information
SSC	Scientific Support Coordinator
SSHP	Site Safety and Health Plan
STAM	Staging Area Manager
STVE	Strike Team Leader, Vessel
SUBD	Support Branch Director
SURPIC	Surface Picture
S/V	Sailing Vessel
SVBD	Service Branch Director
T/V	Tank Vessel
TACLET	Tactical Law Enforcement Team
TACON	Tactical Control
TB	Tuberculosis
TDS	Time, Distance and Shielding
TFLD	Task Force Leader
TFR	Temporary Flight Restrictions
THC	Tetrahydrocannibanol
THSP	Technical Specialist

TOI	Target of Interest
TRACEM	Thermal, Radioactive, Asphyxiation, Chemical, Etiological, and Mechanical
TSA	Transportation Security Administration
TSI	Transportation Security Incident

TTP	Tactics, Techniques, and Procedures
UAC	Unified Area Command
UC	Unified Command
UHF	Ultra-High Frequency
UMIB	Urgent Marine Information Broadcast
USC	United States Code
USCG	United States Coast Guard
USMC	United States Marine Corps
USN	United States Navy
UTL	Utility Boat
VERTREP	Vertical Replenishment
VESS	Vessel Support Unit Leader
VHF	Very High Frequency
VO	Vessel Owner
VS	Sector Search
WTD	Water-Tight Door

CONVERSIONS AND EQUIVALENTS

AREA- (s=statute, n=nautical)		
Multiply	by	to derive
meters^2	10.76	feet^2
feet^2	0.0929	meters^2
kilometers^2	0.386	s. miles^2
s. miles^2	2.59	kilometers^2
s. miles^2	0.7548	n. miles^2
n. miles^2	1.325	s. miles^2
kilometers^2	0.2916	n. miles^2
n. miles^2	3.430	kilometers^2

TEMPERATURE-	
Calculate	To derive
5/9(°F-32°)	°C
9/5°C+32°	°F

VOLUME		
multiply	by	to derive
barrels	42	gallons
barrels	5.615	feet^3
barrels	158.9	liters
barrels	0.1589	meters^3
feet^3	7.481	gallons
gallons	3.785	liters

WEIGHT-		
multiply	by	to derive
kilograms	2.205	pounds
metric tons	0.984	long tons
metric tons	1,000	kilograms
metric tons	2,205	pounds
long tons	1,016	kilograms
long tons	2240	pounds
short tons	907.2	kilograms
short tons	2,000	pounds

DENSITY ESTIMATIONS-

	Barrels/Long Ton	
	Range	Average
Crude Oils	6.7 - 8.1	7.4
Aviation Gasolines	8.3 - 9.2	8.8
Motor Gasolines	8.2 - 9.1	8.7
Kerosenes	7.7 - 8.3	8.0
Gas Oils	7.2 - 7.9	7.6
Diesel Oils	7.0 - 7.9	7.5
Lubricating Oils	6.8 - 7.6	7.2
Fuel Oils	6.6 - 7.0	6.8
Asphaltic Bitumens	5.9 - 6.5	6.2

Notes:

- 1 Long Ton equals 2,200 lbs.
- As a general approximation, use 7 bbl. (300 U.S. gallons) per metric ton of oil.
- 6.4 barrels/long ton is neutrally buoyant in fresh water. Open ocean neutral buoyancy values are generally in the 6.21-6.25 barrels/long ton range.

Specific Gravity of 1 or an API of 10 equals the density of fresh water.
Specific Gravity < 1 or an API > 10 indicates product is lighter than fresh water.
API Gravity = (141.5/Specific Gravity) – 131.5

Weight of Fresh Water: pounds/gallon	8.3
Weight of Sea Water: pounds/gallon	8.5

Note: Exact weight depends on temperature and salinity.

OIL THICKNESS ESTIMATIONS-

Standard Term	Approx. Film Thickness		Approx. Quantity of Oil in Film	
	Inches	Mm		
Barely Visible	0.0000015	0.00004	25 gals/mile^2	44 liters/km^2
Silvery	0.000003	0.00008	50 gals/mile^2	88 liters/km^2
Slight Color	0.000006	0.00015	100 gals/mile^2	176 liters/km^2
Bright Color	0.000012	0.0003	200 gals/mile^2	351 liters/km^2
Dull	0.00004	0.001	666 gals/mile^2	1,168 liters/km^2
Dark	0.00008	0.002	1,332 gals/mile^2	2,237 liters/km^2

Thickness of light oils: 0.0010 inches to 0.00010 inches.
Thickness of heavy oils: 0.10 inches to 0.010 inches.

COMMONLY-USED EQUATIONS-

Circle:
Area = 3.14 x radius^2
Circumference = 3.14 x diameter

Sphere/Tank
Area = 4 x 3.14 x radius^2
Volume = 1.33 x 3.14 x radius^3

Cylinder/Pipe/Tank
Volume = 3.14 x radius^2 x length

Rectangle/Square
Area = length x width

Cube/Block/Tank
Volume = length x width x height

EMERGENCY RESPONSE SITE SPECIFIC HEALTH & SAFETY PLAN

Date / Time:_____/_____

1. Incident Information:

Incident Type:

- ❑ **Fire / Explosion**
- ❑ **Spill / Release**
- ❑ **Rescue**
- ❑ **Injury**

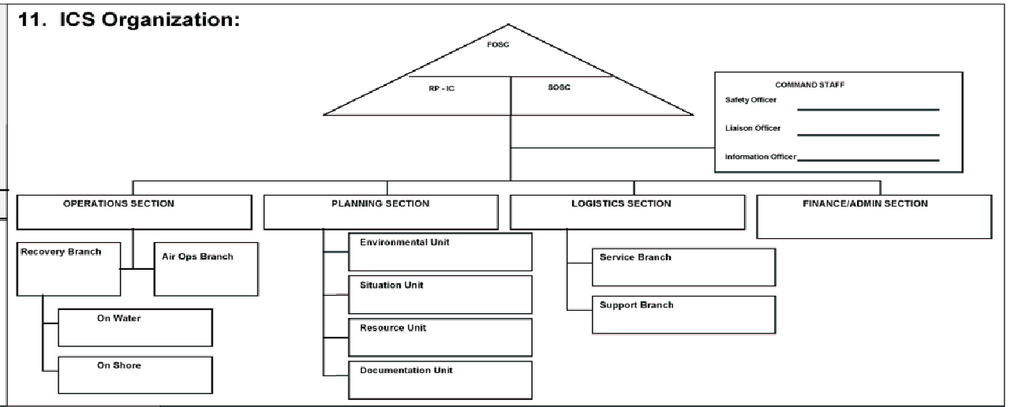
Date: _____
Location: _____
_____
Time of Incident: _____
Incident Name: _____
_____

2. Products / Chemical Involved:

❑ Gasoline ❑ Diesel ❑ Jet Fuel ❑ Methanol ❑ DRA
❑ Fuel Additive ❑ Ethanol ❑ Ethane ❑ Butane
❑ Natural Gas ❑ Isobutane ❑ MCC Lubricity
❑ Crude Oil ❑ Propane ❑ Ethyl Mercaptan
❑ Other _____
(see Table 1 on back for chemical & physical properties)

MSDS available and reviewed: ❑ Yes

11. ICS Organization:



3. Primary Hazards:

❑ Fire ❑ Vapor ❑ Respiratory ❑ Skin

4. Personal Protective Equipment:

Cold Zone / Staging - ❑ Hardhat ❑ Safety Boots ❑ Traffic Vest
Warm Zone / Decon - Level ❑ A ❑ B ❑ C ❑ D
Hot Zone - Level ❑ A ❑ B ❑ C ❑ D
(see Table 2 on back for description of PPE by Level)

Incident Priority Checklist:

- ❑ 1. Evacuate self and others
- ❑ 2. Secure area/restrict access
- ❑ 3. Notification: Internal/External
- ❑ 4. Eliminate ignition sources
- ❑ 5. Initiate ICS
- ❑ 6. Conduct Site Assessment (H&S Plan)
- ❑ 7. Meet with arriving authorities
- ❑ 8. Mobilize response resources

5. Hot Zone Authorized Entrants:

❑ Fire Dept. ❑ KM
❑ Agency Reps. ❑ Contractors

6. Site Map:

Wind Direction (out of the ___)

❑ Weather Conditions: _____ ❑ Wind Direction ❑ Hazard Zones ❑ Staging
❑ Command Post ❑ Decon ❑ Cross streets ❑ Sensitive receptors (drainage, roadways, environmental sensitivity)

7. Secondary Hazards:

- ❑ Fire
- ❑ Excavations
- ❑ Confined Spaces
- ❑ Cold Stress
- ❑ Heavy Equipment
- ❑ Noise
- ❑ Heat Stress
- ❑ Rain/Lightning
- ❑ General (slip, trip, fall, established smoking area)
- ❑ Other: _____

(see Table 3 on back for secondary hazard precautions)

8. Evacuation Plan:

Evacuation signal : _____
Primary Evac. Area: _____
Secondary Evac. Area: _____

9. Nearest Hospital: Notified: ❑ Yes ❑ No

Address: _____
_____
Phone #: _____
Directions: _____
_____

10. PROP 65 Notices: (California only)

- ❑ Incident is within Terminal or Station; notice(s) are posted at facility entrance(s).
- ❑ Incident of outside KM property; notice(s) are posted along incident site boundaries.

12. Enforcement / Regulatory Agencies (On Site):

Table 3. Secondary Hazards

Hazards	Recommended Precaution(s)
❑ Fire (potential)	• Remain safe distance away • Eliminate ignition sources • Keep upwind of vapor/smoke • Provide vapor suppression (if safe) • Do not impede Fire Dept. efforts
❑ Heavy Equipment	• Qualified operators only • Hardhats and safety boots needed around heavy equip. • Minimum 10ft. clearance from power lines • Make "one call" if excavating • Proper machine guarding in place
❑ Excavations	• Trenches/excavations equal to or greater than 5ft. deep must meet OSHA requirements • No one allowed to enter excavation > 5ft. unless shored, sloped or protected • Excavations < 5ft. and judged by competent person as cave-in hazard must also follow OSHA requirements
❑ Noise	• Portable generators & heavy equip. can generate potentially high noise levels • Hearing protection available to workers • Hearing protection must be worn in area with noise levels above 85dBA.
❑ Confined Spaces	• Site Safety Officer will determine whether confined space will be entered • All confined space entries must meet OSHA requirements (permits, atmospheric monitoring, attendants, etc.)
❑ Heat Stress	• Potential hazard when temp >80°F • Workers should take more breaks and drink plenty of appropriate liquids • More PPE = higher risk • Be aware of heat cramps (stomach cramps), heat exhaustion (excessive sweating, flushed/clammy skin) – treat with rest and liquids. Heat stroke (dry, hot, pale skin; no sweating) can be deadly – get medical help immediately, reduce core body temp by applying cold water to body & fanning.
❑ Cold Stress	• Skin takes on gray-glossy look • Appendages become non-responsive • Blisters or sores may appear • Do not rub • Submerse affected areas in warm water or wrap in warm cloth.
❑ Rain / Lightning	• Stop excavation activities during excessive rainfall • Avoid shock hazards by stopping work during thunderstorm or lightening • Prevent & control erosion & transport of soils out of incident area.
❑ General	• Slip, trip & fall hazards • Keep work area clear of debris • Smoking not permitted in work areas • Use hand tools safely

UNIT LOG (ICS FORM 214-CG)

Purpose. The Unit Log records details of unit activity, including strike team activity or individual activity. These logs provide the basic reference from which to extract information for inclusion in any after-action report.

Preparation. A Unit Log is initiated and maintained by Command Staff members, Division/Group Supervisors, Air Operations Groups, Strike Team/Task Force Leaders, and Unit Leaders. Completed logs are submitted to supervisors who forward them to the Documentation Unit.

Distribution. The Documentation Unit maintains a file of all Unit Logs. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Check-In Location	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Unit Name/Designators	Enter the title of the organizational unit or resource designator (e.g., Facilities Unit, Safety Officer, Strike Team).
4.	Unit Leader	Enter the name and ICS Position of the individual in charge of the Unit.
5.	Personnel Assigned	List the name, position, and home base of each member assigned to the unit during the operational period.
6.	Activity Log	Enter the time and briefly describe each significant occurrence or event (e.g., task assignments, task completions, injuries, difficulties encountered, etc.)
7.	Prepared By	Enter name and title of the person completing the log. Provide log to immediate supervisor, at the end of each operational period.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

CHECK-IN LIST (Personnel) June 2000 ICS 211p-OS

Electronic version: NOAA 1.0 June 1, 2000

CHECK-IN LIST Personnel (ICS FORM 211p-OS)

Special Note. This form is used for personnel check-in only.

Purpose. Personnel arriving at the incident can be checked in at various incident locations. Check-in consists of reporting specific information that is recorded on the form.

Preparation. The Check-In List is initiated at a number of incident locations including staging areas, base, camps, helibases, and ICP. Managers at these locations record the information and give it to the Resources Unit as soon as possible.

Distribution. Check-In Lists are provided to both the Resources Unit and the Finance/Administration Section. The Resources Unit maintains a master list of all equipment and personnel that have reported to the incident. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Check-in Location	Check the box for the check-in location.
4.	Name	Enter the name of the person.
5.	Company/Agency	Enter the company or agency with which the individual is associated.
6.	ICS Section / Assignment / Quals.	Enter ICS Section and assignment, if known, and note any other ICS qualifications, if needed.
7.	Contact Information	Enter the contact information for the person.
8.	Initial Incident Check-in?	Check if this is the first time a person has checked in for this incident.
9.	Time In/Out	Enter the time the person checks in and/or out (24-hour clock).
10.	Prepared By Date/Time Prepared	Enter name and title of the person preparing the form. Enter date (month, day, year) and time prepared (24-hour clock).
11.	Date/Time Sent to Resources Unit	Enter date (month, day, year) and time (24-hour clock) the form is sent to the Resources Unit.

1. Incident Name	2. Operational Period (Date/Time) From: To:	DAILY MEETING SCHEDULE ICS 230-CG

3. Meeting Schedule (Commonly-held meetings are included)

Date/ Time	Meeting Name	Purpose	Attendees	Location
	Unified Command Objectives Meeting	Review/ identify objectives for the next operational period.	Unified Command members	
	Command & General Staff Meeting	IC/UC gives direction to Command & General staff including incident objectives and priorities	IC/UC, Command & General Staff	
	Tactics Meeting	Develop/Review primary and alternate Strategies to meet Incident Objectives for the next Operational Period.	PSC, OSC, LSC, RESL & SITL	
	Planning Meeting	Review status and finalize strategies and assignments to meet Incident Objectives for the next Operational Period.	Determined by the IC/UC	
	Operations Briefing	Present IAP and assignments to the Supervisors / Leaders for the next Operational Period.	IC/UC, Command & General Staff, Branch Directors, Div/Gru Sups., Task Force/Strike Team Leaders and Unit Leaders	

4. Prepared by: (Situation Unit Leader) **Date/Time**

DAILY MEETING SCHEDULE (ICS 230-CG)

Purpose. The Daily Meeting Schedule records information about the daily scheduled meeting activities.

Preparation. This form is prepared by the Situation Unit Leader and coordinated through the Unified Command for each operational period or as needed. Commonly-held meetings are already included in the form. Additional meetings, as needed, can be entered onto the form in the spaces provided. Time and location for each meeting must be entered. If any of these standard meetings are not scheduled, they should be crossed out on the form.

Distribution. After coordination with the Unified Command, the Situation Unit Leader will duplicate the schedule and post a copy at the Situation Status Board and distribute to the Command Staff, Section Chiefs, and appropriate Unit Leaders. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Meeting Schedule	For each scheduled meeting, enter the date/time, meeting name, purpose, attendees, and location. Note: Commonly-held meetings are included in the form. Additional meetings, as needed, can be entered onto the form in the spaces provided. Time and location for each meeting must be entered. If any of the standard meetings are not scheduled, they should be deleted from the form (normally the Situation Unit Leader).
4.	Prepared By	Enter name and title of the person preparing the form, normally the Situation Unit Leader.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

1. Incident Name	2. Operational Period (Date/Time) From: To:	INCIDENT OBJECTIVES ICS 202-CG

3. Objective(s)

Ensure the safety of citizens and response personnel;

Control the source of the spill;

Manage a coordinated response effort;

Maximize protection of environmentally sensitive areas;

Contain and recover spilled material;

Recover and rehabilitate injured wildlife;

Remove oil from impacted areas;

Minimize economic impacts;

Keep stakeholders and public informed of response actions.

4. Operational Period Command Emphasis (Safety Message, Priorities, Key Decisions/Directions)

Approved Site Safety Plan Located at:

5. Prepared by: (Planning Section Chief) **Date/Time**

INCIDENT OBJECTIVES (ICS 202-CG)

Purpose. The Incident Objectives form describes the basic incident strategy, control objectives, command emphasis/priorities, and safety considerations for use during the next operational period.

Preparation. The Incident Objectives form is completed by the Planning Section following each Command and General Staff Meeting conducted in preparing the Incident Action Plan.

Distribution. The Incident Objectives form will be reproduced with the IAP and given to all supervisory personnel at the Section, Branch, Division/Group, and Unit levels. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Objective(s)	Enter clear, concise statements of the objectives for managing the response. These objectives are for the incident response for this operational period and for the duration of the incident. Include alternatives.
4.	Operational Period Command Emphasis	Enter clear, concise statements for safety message, priorities, and key command emphasis/decisions/directions. Enter information such as known safety hazards and specific precautions to be observed during this operational period. If available, a safety message should be referenced and attached. At the bottom of this box, enter the location where approved Site Safety Plan is available for review.
	Site Safety Plan	Note location of the approved Site Safety Plan.
5.	Prepared By	Enter the name of the Planning Section Chief completing the form.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

NOTE: ICS 202-CG, Incident Objectives, serves as part of the Incident Action Plan (IAP)

ORGANIZATION ASSIGNMENT LIST (ICS 203-CG) Instructions for filling out the form

Purpose. The Organization Assignment List provides ICS personnel with information on the units that are currently activated and the names of personnel staffing each position/unit. It is used to complete the Incident Organization Chart (ICS form 207-CG) which is posted on the Incident Command Post display. An actual organization will be event-specific. **Not all positions need to be filled.** The size of the organization is dependent on the magnitude of the incident and can be expanded or contracted as necessary.

Preparation. The Resources Unit prepares and maintains this list under the direction of the Planning Section Chief.

Note: Depending on the incident, the Intelligence and Information function may be organized in several ways: 1) within the Command Staff as the Intelligence Officer; 2) As an Intelligence Unit in Planning Section; 3) As an Intelligence Branch or Group in the Operations Section; 4) as a separate General Staff Intelligence Section; and 5) as an Intelligence Technical Specialist. The incident will drive the need for the Intelligence and Information function and where it is located in the ICS organization structure. The Intelligence and information function is described in significant detail in NIMS and in the Coast Guard Incident Management Handbook (IMH).

Distribution. The Organization Assignment List is duplicated and attached to the Incident Objectives form (ICS 202-CG) and given to all recipients of the Incident Action Plan. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Incident Commander and Staff	Enter the names of the Incident Commander and Staff. Use at least the first initial and last name.
4.	Agency Representative	Enter the agency names and the names of their representatives. Use at least the first initial and last name.
5. thru 8.	Section	Enter the name of personnel staffing each of the listed positions. Use at least the first initial and last name. For Units, indicate Unit Leader and for Divisions/ Groups indicate Division/Group Supervisor. Use an additional page if more than three branches are activated. If there is a shift change during the specified operational period, list both names, separated by a slash.
9.	Prepared By	Enter the name and position of the person completing the form
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

Open Actions Tracker (ICS 233-CG)

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	No.	Enter number of task in sequential order (1, 2, 3, …).
3.	Item	Enter short descriptive of the task.
4.	For/POC	Enter responsible section/person.
5.	Briefed to POC	When the tasker has been briefed to the POC after initially assigned, an "X" is placed in the brief column. This was to ensure that taskers identified outsie of the POC's presence (during UC Meeting for example) were assigned the to identified POC.
6.	Start Date	Enter the date the tasker was initially assigned under "Start Date."
7.	Status	Enter status of item. This includes things like: "Awaiting LE Gear", "Update needed", "Awaiting Feedback". When the item is completed, the word "completed" is entered and if working in MS Excel, the task is cut and pasted into the worksheet labeled "COMPLETED."
8.	Target Date	Target date is another way of saying deadline. When the target date is one day away, the block turns yellow. When it is overdue it turns red. When it is yellow, it serves as a reminder to the UC that the target date needs to be changed or the responsible section needs to complete the task.
9.	Actual Date	The block to the right of the Target Date (Actual Date) will always have today's date. It is merely the formula "=today()" inserted into the cell.

NOTE: In order to ensure the red and yellow reminders work for new tasks, the user simply copies a task line, inserts it into the worksheet and overtypes the new task information.

INCIDENT ACTION PLAN SAFETY ANALYSIS

November 2003

ICS 215A-OS

Electronic version: NOAA 1.0 November 1, 2003

INCIDENT ACTION PLAN SAFETY ANALYSIS (ICS FORM 215A-OS)

Purpose. This form communicates to the the Operations and Planning Section Chiefs safety and health issues identified by the Safety Officer. The Worksheet is used by the Planning section Chief to complete Operations briefings.

Preparation. This form is principally crafted by the Safety Officer. Use additional sheets, as needed.

Distribution. When the safety analysis is completed, the form is distributed to the Planning Section Chief to help prepare Operations briefing packages. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Date	Enter date (MMDDYYYY) prepared.
4.	Time	Enter time prepared (24-hour clock).
	Division/Group	Enter Division/Group indentifiers.
	Blank Risk Header	Enter appropriate title for risk.
	Blank Risk Mitigation Header	Enter appropriate information for risk mitigation.
	Blank Risk Cells	Enter an X to indicate a risk type of concern in a division/group.
	Blank Risk Mitigation Cells	Enter an X to indicate mitigation for risk to division/group.
	Prepared By	Enter name and title of the person preparing the form.

1. Incident Name	2. Operational Period (Date/Time) From: To:	ACP Site Index ICS 232a-CG

3. Index to ACP/GRP sites shown on Situation Map

Site #	Priority	Site Name and/or Physical Location	Action	Status

Note: This form is designed to be posted next to the situation map. Use additional sheets, as needed.

4. Prepared by: **Date/Time**

ACP SITE INDEX (ICS 232a-CG)

Special Note. This optional form is designed to be a key to the site numbers or site names shown on the Situation Map. The information on priorities for environmentally-sensitive areas and archaeo-cultural and socio-economic issues from the ICS 232-CG may be transferred to ICS 232a-CG, which provides more information on the Area Contingency Plan (ACP) or Geographic Response Plan (GRP) site numbers or names shown on the Situation Map.

Purpose. If used, this form is posted next to the Situation Map, providing a key to the ACP/GRP sites shown on the map.

Preparation. The Situation Unit personnel responsible for the Situation Map prepare this form, using ICS 232-CG prepared by the Environmental Unit.

Distribution. This form is posted next to the Situation Map and copies of this form should accompany any distributed copies of the Situation Map. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Index to ACP/GRP sites	Enter site information from the Area Contingency Plan (ACP) or Geographic Response Plan (GRP) or other sources specific to this incident.
	Site Number	Can come from an Area Contingency Plan (ACP) or Geographic Response Plan (GRP) or can be created during an incident.
	Priority	Priority specific to this incident.
	Site Name and/or Physical Location	Name of the site (e.g., Marsh Pt., Glacier Creek, etc.) and/or physical location (e.g., address, lat/long, landmarks, etc.).
	Action	Actions to be taken for designated protection and collection strategies or for other sites identified specifically for this incident.
	Status	Status of site action implementation (e.g., scheduled, in progress, completed).
4.	Prepared By	Enter name and title of the person preparing the form.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

1. Incident Name	2. Operational Period (Date/Time) From: To:	**RESOURCES AT RISK SUMMARY** **ICS 232-CG**

3. Environmentally-Sensitive Areas and Wildlife Issues

Site #	Priority	Site Name and/or Physical Location	Site Issues

Narrative

4. Archaeo-cultural and Socio-economic Issues

Site #	Priority	Site Name and/or Physical Location	Site Issues

Narrative

5. Prepared by: (Environmental Unit Leader) **Date/Time**

RESOURCES AT RISK SUMMARY (ICS 232-CG)

Purpose. The Resources at Risk Summary provides information about sites in the incident area which are sensitive due to environmental, archaeo-cultural, or socio-economic resources at risk, and identifies incident-specific priorities and issues. The information recorded here may be transferred to ICS 232a-CG, which acts as a key to the Area Contingency Plan (ACP) or Geographic Response Plan (GRP) site numbers shown on the Situation Map.

Preparation. The Environmental Unit Leader, with input from resource trustees, will complete this form for each operational period. It should be updated prior to the Planning Meeting.

Distribution. This form must be forwarded to the Planning Section Chief for possible inclusion in the IAP. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Env- Sensitive Area & Wildlife Issues	
	Site Number	Enter site number. Can come from Area Contingency Plan (ACP) or Geographic Response Plan (GRP) or can be created during an incident.
	Priority	Priority specific to this incident. Can come from an ACP/GRP or can be created during an incident.
	Site Name and/or Physical Location	Name of the site (e.g., Marsh Pt., Glacier Creek, etc.) and/or physical location (e.g., address, lat/long, landmarks, etc.).
	Site Issues	Environmental concerns associated with this site and season.
	Narrative	Use the Narrative section to clarify any issues.
4.	Archaeo-cultural and Socio-economic Issues	
	Site Number	Enter site number. Can come from an ACP/GRP or can be created during an incident.
	Priority	Priority specific to this incident. Can come from an ACP/GRP or can be created during an incident.
	Site Name and/or Physical Location	Name of the site (e.g., Marsh Pt., Glacier Creek, etc.) and/or physical location (e.g., address, lat/long, landmarks, etc.).
	Site Issues	Archaeo-cultural or socio-economic concerns associated with this site and season.
	Narrative	Use the Narrative section to clarify any issues.
5.	Prepared By	Enter name and title of the person preparing the form (normally the Environmental Unit Leader).
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

ASSIGNMENT LIST (ICS 204-CG)

Purpose. The Assignment List(s) informs Division and Group supervisors of incident assignments. Once the Unified Command and General Staff agree to the assignments, the assignment information is given to the appropriate Divisions and Groups.

Preparation. The Assignment List is normally prepared by the Resources Unit, using guidance from the Incident Objectives (ICS 202-CG), Operational Planning Worksheet (ICS 215-CG), and the Operations Section Chief. The Assignment List must be approved by the Planning Section Chief and Operations Section Chief. When approved, it is included as part of the Incident Action Plan (IAP). Specific instructions for specific resources may be entered on an ICS 204a-CG for dissemination to the field. A separate sheet is used for each Division or Group. The identification letter of the Division is entered in the form title. Also enter the number (roman numeral) assigned to the Branch.

Special Note. The Assignment List, ICS 204-CG submits assignments at the level of Divisions and Groups. The Assignment List Attachment, ICS 204a-CG shows more specific assignment information, if needed. The need for an ICS 204a-CG is determined by the Planning and Operations Section Chiefs during the Operational Planning Worksheet (ICS 215-CG) development.

Distribution. The Assignment List is duplicated and attached to the Incident Objectives and given to all recipients of the Incident Action Plan. In some cases, assignments may be communicated via radio/telephone/fax. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Branch	Enter the Branch designator.
4.	Division/Group/Staging	Enter the Division/Group/Staging designator.
5.	Operations Personnel	Enter the name of the Operations Chief, applicable Branch Director, and Division Supervisor.
6.	Resources Assigned	Each line in this field may have a separate Assignment List Attachment (ICS 204a-CG). Enter the following information about the resources assigned to Division or Group for this period:
	Identifier	List identifier
	Leader	Leader name
	Contact Information	Primary means of contacting this person (e.g., radio, phone, pager, etc.). Be sure to include area code when listing a phone number.
	# Of Persons	Total number of personnel for the strike team, task force, or single resource assigned.
	Reporting Info/Notes/ Remarks	Special notes or directions, specific to this strike team, task force, or single resource. Enter an "X" check if an Assignment List Attachment (ICS 204a-CG) will be prepared and attached. The Planning and Operations Section Chiefs determine the need for an ICS 204a-CG during the Operational Planning Worksheet (ICS 215-CG) development.
7.	Work Assignment	Provide a statement of the tactical objectives to be achieved within the operational period by personnel assigned to this Division or Group.
8.	Special Instructions	Enter a statement noting any safety problems, specific precautions to be exercised, or other important information.
9.	Communications	Enter specific communications information (including emergency numbers) for this division /group. If radios are being used, enter function (command, tactical, support, etc.), frequency, system, and channel from the Incident Radio Communications Plan (ICS 205-CG). Note: Phone numbers should include area code.
10.	Prepared By	Enter the name of the person completing the form, normally the Resources Unit Leader.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).
11.	Reviewed by (PSC)	
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).
12.	Reviewed by (OSC)	Enter the name of the operations person reviewing the form, normally the Operations Section Chief.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

INCIDENT RADIO COMMUNICATIONS PLAN (ICS 205-CG)

Special Note. This form, ICS 205-CG, is used to provide, in one location, information on all radio frequency assignments down to the Division/Group level for each operational period; whereas, the Communications List, ICS 205a-CG is used to list methods of contact for personnel assigned to the incident (radio frequencies, phone numbers, pager numbers, etc.).

Purpose. The Incident Radio Communications Plan is a summary of information obtained from the Radio Requirements Worksheet (ICS 216) and the Radio Frequency Assignment Worksheet (ICS 217). Information from the Radio Communications Plan on frequency assignments is normally noted on the appropriate Assignment List (ICS 204-CG).

Preparation. The Incident Radio Communications Plan is prepared by the Communications Unit Leader and given to the Planning Section Chief. Detailed instructions on the preparation of this form may be found in ICS Publication 223-5, Communications Unit Position Manual.

Distribution. The Incident Radio Communications Plan is duplicated and given to all recipients of the Incident Objectives form, including the Incident Communications Center. Information from the plan is placed on Assignment Lists. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Basic Radio Channel	Enter the following information about radio channel use:
	System	Radio cache system(s) assigned and used on the incident.
	Channel	Radio channel numbers assigned.
	Function	Function each channel is assigned (e.g., command, support, division tactical, and ground-to-air).
	Frequency	Radio frequency tone number assigned to each specified function (e.g., 153.400)
	Assignment	ICS organization assigned to each of the designated frequencies (e.g., Branch I, Division A).
	Remarks	This section should include narrative information regarding special situations.
4.	Prepared By	Enter the name of the Communications Unit Leader preparing the form.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

COMMUNICATIONS LIST (ICS 205a-CG)

Special Note. This optional form is used in conjunction with the Incident Radio Communications Plan, ICS 205-CG. Whereas the ICS 205-CG is used to provide information on all radio frequencies down to the Division/Group level, the Communications List, ICS 205a-CG, lists methods of contact for personnel assigned to the incident (radio frequencies, phone numbers, pager numbers, etc.), and functions as an incident directory.

Purpose. The Communications List records methods of contact for personnel on scene.

Preparation. The Communications List can be filled out during check-in and is maintained and distributed by Communications Unit personnel.

Distribution. The Communications List is distributed within the ICS and posted, as necessary. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Basic Local Comms Information	Enter the communications methods assigned and used for each assignment.
	Assignment	Enter the ICS Organizational assignment.
	Name	Enter the name of the contact person for the assignment.
	Method(s) of contact	Enter the radio frequency, telephone number(s), etc. for each assignment.
4.	Prepared By	Enter the name of the Communications Unit Leader preparing the form.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

1. Incident Name	2. Operational Period (Date / Time) From: To:	**MEDICAL PLAN** **ICS 206-CG**

MEDICAL PLAN (ICS 206-CG)

Purpose. The Medical Plan provides information on incident medical aid stations, transportation services, hospitals, and medical emergency procedures.

Preparation. The Medical Plan is prepared by the Medical Unit Leader and reviewed by the Safety Officer.
Distribution. The Medical Plan may be attached to the Incident Objectives (ICS 202-CG), or information from the plan pertaining to incident medical aid stations and medical emergency procedures may be taken from the plan and noted on the Assignment List (ICS 204-CG) or on the Assignment List Attachment (ICS 204a-CG). All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Medical Aid Stations	Enter name, location, and telephone number of the medical aid station(s) (e.g., Cajon Staging Area, Cajon Camp Ground) and indicate if paramedics are located at the site.
4.	Transportation	List name and address of ambulance services. Provide phone number and indicate if ambulance company has paramedics.
5.	Hospitals	List hospitals that could serve this incident. Enter hospital name, address, phone number, the travel time by air and ground from the incident to the hospital, and indicate if the hospital has a burn center and/or a helipad.
6.	Medical Emergency Procedures	Note any special emergency instructions for use by incident personnel.
7.	Prepared By Date/Time	Enter the name of the Medical Unit Leader preparing the form. Enter date (month, day, year) and time prepared (24-hour clock).
8.	Reviewed By Date/Time	Enter the name of the Safety Officer who must review the plan. Enter date (month, day, year) and time reviewed (24-hour clock).

Resource Request Message

5. Suggested source(s) of Supply - POC phone no. if known & suitable subtitutes:

6. Requested by Name/Position/Phone: | 7. Date/Time: | 8. Section Chief Approval: | Date/Time:

☐ 9. Check box if request is for tactical/personnel resources & Submit to RESL, otherwise submit directly to Logistics

10. RESL Review/Signature:

☐ Resources as noted are Available ☐ Resources Not Available

Logistics

11. Logistics Order No.: | 12. Supplier Name/Phone/Fax/Email:

13. Notes:

14. Approval Signature of Auth Logistics Rep: | 15. Date/Time:

16. Order placed by (check box): ☐ SPUL ☐ PROC

Finance

17. Reply/Comments from Finance:

18. Finance Section Signature: | 19. Date/Time:

Full Instructions on back page. Requestor fills out # 1-9 & keeps yellow copy (bottom). If applicable, RESL reviews if resource available & signs # 10. Logistics fills in remainder of # 4 & # 10-15 & keeps pink copy. Finance, if needed fills out appropriate items & keeps green copy. Blue original is returned to RESL for tactical/personnel or requestor for non-tactical. White copy goes to DOCL.

Instructions for filling out the ICS-213RR CG Form (5/06)

REQUESTOR: The requestor must fill in Blocks 1 through 9:

Block # 1	Incident name: This is the same as the name stated on the ICS-201 Form and/or the Incident Action Plan (IAP).
Block # 2	Current date and time when submitting request
Block # 3	Resource Request Number: This is to be assigned by the Section submitting request (i.e. CMD, OPS, PLAN, LOG, FIN)
Block # 4	Fill in blocks 4a through 4e. Items requested: Must include Quantity, Kind and Type (if applicable) and detailed description of requirements. **BE SPECIFIC AS POSSIBLE**. The request should focus on capability rather than naming the brand or specific item (e.g. helicopter capable of carrying 4 personnel from location A to B rather than requesting a Coast Guard H-65 helicopter). This gives the logistics section the ability to find the best resource to meet the need. 4.e Requested Reporting Location/Date/Time: This is self-explanatory and is required for ordering official. Leave blocks 4.f. ETA (LSC) and 4.g. Cost (FSC) blank. These will be filled in later by Logistics and Finance.
Block # 5	Suggested sources of supply and suitable substitutes: Enter applicable information if known.
Block # 6 & 7	Requestor: Print Name and Signature and date/time.
Block # 8	Approval: This must be approved by the Section Chief or Deputy Section Chief.
Block # 9	Check box if request is for tactical or personnel resource(s) and submit request to Resources Unit Leader (RESL) to review and approve since RESL tracks all tactical and personnel resources.

Request goes to RESOURCES UNIT if requesting Tactical/Personnel Resource(s):

Block # 10	Resources reviews request and checks to see if resource is available. If the resource is available, reassigns resource as appropriate and sends request back to requester with information noted as to reporting time, etc. The request form is then sent to Documentation Unit Leader (DOCL) for filing. If the resource is not available, RESL sends request to Logistics.

LOGISTICS SECTION: The following blocks are to be filled out be the Supply Unit (SPUL).

Block # 11	Logistics Order Number: To be assigned by Supply Unit.
Block # 12	Supplier Point of Contact, Phone Number and Fax Number: This information is needed for Credit Card purchases and/or Purchase Orders.
Block # 13	Notes: Enter applicable information as need for request.
Block # 4	ETA and Cost: SPUL or PROC fills in Estimated time of arrival (ETA) when determined and cost if known.
Block # 14 & 15	Approval: This must be approved by the Logistics Section Chief or Deputy Logistics Section Chief, printed name and signature is required with Date and Time of approval. Bottom Copy (pink) is retained.

FINANCE SECTION: The following blocks are to be filled out be the Procurement Unit (PROC), if applicable.

Block # 16	Indicates who is to place order as necessary.
Block # 17	Comments concerning request from Finance Section Chief or Deputy Finance Section Chief.
Block # 18 & 19	Approval: This must be approved by the Finance Section Chief or Deputy Section Chief, printed name and signature is required with Date and Time of approval. Bottom copy (green) is retained.
FILING	Original blue copy is returned to RESL for tactical/personnel resources ordered, and the requester for non-tactical. RESL will inform requester of status of request when form received. The white copy is sent to DOCL.

Note: Cost associated requests will not be ordered without approval from the Finance Section Chief or Deputy Finance Section Chief.

Form Filing: Blue (Original) – final disposition to RESL or originator for non-tactical resources, White (copy 1) to DOCL, Green (copy 2) to FIN, Pink (copy 3) to LOG, Yellow (copy 4) to Originator

INCIDENT STATUS SUMMARY (ICS FORM 209-OS)

Purpose. The Status Summary:
1. Is used by Situation Unit personnel for posting information on Status Boards.
2. Is duplicated and provided to Command Staff members, giving them basic information for planning for the next operational period.
3. Provides information to the Information Officer for preparing news media releases.
4. Summarizes incident information for local and off-site coordination centers.

Preparation. The Status Summary is prepared by the Situation Unit. Resources information should be obtained from the Resources Unit. It may be scheduled for presentation to the Planning Section Chief and other General Staff members prior to each Planning Meeting and may be required at more frequent intervals by the Unified Command or Planning Section Chief. Suggested sources of information are noted in brackets.
Note: The values on the ICS form 209-OS are the best available estimates at the Time of Report (Item # 2 on form). This form is usually in high demand and should be filled out early and often. A suggested source within the ICS organization is noted in brackets [ ] at the top right of each section of the form. All fields need not be completed in order to distribute the form.
Distribution. When completed, the form is duplicated and copies are distributed to the Unified Command and staff, and all Section Chiefs, Planning Section Unit Leaders, and the Joint Information Center. It is also posted on a status board located at the ICP. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Period Covered by Report	Enter the date and time interval for which the report applies. Use 24-hour clock for all times. Enter time for which this information applies.
	Time of Report	Enter the Time (24-hour clock) the form was prepared.
3.	Spill Status [Ops & EUL/SSC]	Indicate whether the spill source is secured or unsecured and estimate the remaining potential and the rate of spillage discharge or release. Enter the estimated amounts in barrels for each category. Values entered in the column labeled Since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
4.	Mass Balance/Oil Budget	These fields are designed to account for all spilled oil whether recovered, evaporated, dispersed, burned, floating, or on shore. The total of these estimates should approximate the total volume spilled, discharged, or released. Values for evaporation, dispersion, etc. can be obtained from the Environmental Unit and/or the Scientific Support Coordinator.
5.	Waste Management [Ops/Disposal]	Enter the estimated amounts in barrels or tons for each category. Oil (bbl) is the sum of the estimate of oil in oily liquids and oil in oily solids, and is the value to be entered under "Total Recovered Oil" in Item 3.
6.	Shoreline Impacts [PSC/EUL/SSC]	Enter the total miles in each category for each degree of oiling. Definitions for Light, Medium, and Heavy oiling can be obtained from the EUL/SSC and should be consistent throughout the incident.

Item #	Item Title	Instructions
7.	Wildlife Impacts [Ops/Wildlife Br.]	This information is only tracked after an animal is captured. Indicate the actual number of oiled wildlife in each category. Use numbers in parentheses to indicate the subtotal of threatened / endangered species included in the numbers given.
	Safety Status [Safety Officer]	Indicate the number of serious injuries. Values entered in the column labeled Since Last Report are from the start of the Period Covered by Report (Item 2) to the time entered in the Time of Report (Item 2).
8.	Equipment Resources [RUL]	Indicate the number of each type of resource in each status category. There are blank lines below each general type of resource for additional equipment.
	Ordered	Ordered but not yet arrived/available.
	Available/Staged	Arrived on scene, stored in staging, not assigned to any task, available for use.
	Assigned	Assigned to a specific task.
	Out of Service	Not working and not assigned to any task (e.g., skimmer being repaired, boom broken, personnel off-duty for rest).
9.	Personnel Resources [RUL]	Indicate, by agency, the numbers of personnel assigned. There are blank lines for additional personnel, as needed.
10.	Special Notes	Use this area for any special notes or other information related to this reporting period. This could include financial/cost information, specific endangered species notes, significant events that occurred, etc.
11.	Prepared By	Enter name and title of the person preparing the form, normally the Situation Unit Leader.

AIR OPERATIONS SUMMARY (ICS 220-CG)

Purpose. The Air Operations Summary provides the Air Operations Branch with the number, type, location, and specific assignments of aircraft.

Preparation. The Operations Section Chief or the Air Operations Branch Director completes the summary during each Planning Meeting. General air resource assignment information is obtained from the Operational Planning Worksheet (ICS 215-CG). The Air and Fixed-Wing Support Groups provide specific designators of the air resources assigned to the incident.

Distribution. After the summary is completed by Air Operations personnel (except item 11), the form is given to the Air Support Group Supervisor, who completes the form by indicating the designators of the helicopters and fixed-wing aircraft assigned missions during the specified operational period. This information is provided to Air Operations personnel who, in turn, give the information to the Resources Unit. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Distribution	Check the block and enter the time and date when ICS 220-CG and attachments were sent to all fixed-wing bases and helibases supporting the incident.
4.	Personnel and Communications	List the names of those assigned to each position, and the air-air and air-ground frequencies to be used.
5.	Remarks	Enter the special instructions or information, including safety notes, hazards, and priorities for Air Operations personnel.
6.	Location/Function	Enter the assigned location and function of the aircraft.
7.	Assignment	Enter the scope of work the aircraft is assigned to complete.
8.	Fixed Wing	Indicate the number and type of fixed-wing aircraft available for this Location / Function.
9.	Helicopters	Indicate the number and type of helicopters available for this Location / Function.
10.	Time	Indicate when aircraft will be available for use and when operations commence (use 24 hour clock).
11.	Aircraft Assigned	Enter the designators of the aircraft assigned. Gather information from Resources Unit, helibases, and fixed-wing bases.
12.	Operating Base	Enter the base (helibase, helispot, fixed-wing base) from which each air resource is expected to initiate operations.
13.	Totals	Enter the total number of fixed-wing and helicopter aircraft assigned to the incident in the Number columns. Enter the total number of each type of aircraft assigned in the Type columns.
14.	Air Operations Support Equipment	List the designators and location of other support resources assigned to Air Operations.
15.	Prepared By Date/Time	Enter name and title of the person preparing the form. Enter date (month, day, year) and time prepared (24-hour clock).

DEMOB. CHECK-OUT (ICS 221-CG)

Purpose. This form provides the Planning Section information on resource releases from the incident.

Preparation. The Demobilization Unit Leader or the Planning Section initiates this form. The Demobilization Unit Leader completes the top portion of the form after the resource supervisor has given written notification that the resource is no longer needed.

Distribution. The individual resource will have the unit leader initial the appropriate box(es) in item 5 prior to release from the incident. After completion, the form is returned to the Demobilization Unit Leader or the Planning Section. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies.
3.	Strike Team / Unit / Personnel Released	Enter name of Strike Team, Unit or personnel being released.
4.	Release Date/Time	Enter date (month, day, year) and time (24-hour clock) of anticipated release.
5.	Strike Team / Unit / Personnel	Demobilization Unit Leader will enter an "X" in the box to the left of those units requiring check-out. Identified Unit Leaders are to initial to the right to indicate release. NOTE: Blank boxes are provided for any additional unit requirements as needed, (e.g., Safety Officer, Agency Rep., etc.)
6.	Remarks	Enter any additional information pertaining to demobilization or release (e.g., transportation needed, destination, etc.).
7.	Prepared By	Enter name and title of the person preparing the form.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

1. Incident Name	2. Meeting Date / Time	MEETING SUMMARY ICS 231-OS

3. Meeting Name

4. Meeting Location

5. Facilitator

6. Attendees

7. Notes (with summary of decisions and action items)

8. Prepared by: **Date / Time**

MEETING SUMMARY (ICS FORM 231-OS)

Purpose. The Meeting Summary provides more detailed information concerning the attendees and notes from a particular meeting.

Preparation. This form is prepared under the direction of the facilitator of the meeting and coordinated through the Unified Command.

The following lists the usual facilitator for each meeting:
Unified Command Meeting - Facilitated by a member of the Unified Command.
Initial Incident ICS 201 Briefing - Facilitated by the initial Incident Commander.
Tactics Meeting - Facilitated by the Planning Section Chief.
Planning Meeting - Facilitated by the Planning Section Chief.
Operations Briefing - Facilitated by the Planning Section Chief.
Command Staff Meeting - Facilitated by a member of the Unified Command.
Business Management Meeting - Facilitated by a member of the Unified Command.
Agency Representative Meeting - Facilitated by the Liaison Officer.
Press Briefing - Facilitated by the Information Officer.

Distribution. After completion and approval by Unified Command, the Situation Unit Leader will distribute a copy of the Meeting Summary to the attendees and post it at the Situation Display. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Meeting Date/Time	Enter date and time of meeting.
3.	Meeting Name	Enter name of meeting.
4.	Meeting Location	Enter location of meeting.
5.	Facilitator	Enter the name and position of the meeting facilitator.
6.	Attendees	List the personnel who need to attend the meeting.
7.	Notes	List a summary of decisions and action items addressed in the meeting.
8.	Prepared By Date/Time	Enter name and title of the person preparing the form. Enter date (month, day, year) and time prepared (24-hour clock).

EXECUTIVE SUMMARY

Purpose. The Executive Summary communicates significant response issues during the current operational period, summarizing the daily activities for all sections in a brief format to Senior Managers, Administrators, Senior Agency Staff, and Civic Leaders.

Preparation. The Situation Unit Leader prepares this form with input from Section Chiefs. Final authorization is provided by the Unified Command prior to dissemination outside the ICS organization.

Distribution. After authorization by the Unified Command, the Documentation Unit Leader will duplicate and post a copy on the Situation Status Display Board in the Command Post. Single copies may then be distributed to the Unified Command, Command Staff, Joint Information Center, and Section Chiefs. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Operational Period	Enter the time interval for which the form applies. Record the start and end date and time.
3.	Operations	Operations Section Chief will summarize the tactical accomplishments for the previous operational period.
4.	Environmental	Environmental Unit Leader will summarize any significant impacts identified or mitigated during the previous operational period.
5.	Planning	Planning Section Chief will summarize the critical actions to be carried out during the next operational period.
6.	Other	Situation Unit Leader will indicate any anomalies to previous Executive Summaries, special meetings, community impacts, or items of special interest.
7.	Prepared By	Enter name and title of the person preparing the form, normally the Situation Unit Leader.
	Date/Time	Enter date (month, day, year) and time prepared (24-hour clock).

GENERAL PLAN-OS

Purpose. The General Plan form displays the progress and planned start and end dates for various incident response activities. Some standard activities have been listed on the form and blank lines are provided at the bottom of the form for planning and tracking additional incident-specific activities.

Preparation. The Planning Section completes the General Plan form when requested by the Unified Command.

Distribution. The General Plan form will be given to the Unified Command and all General Staff as part of the incident summary. All completed original forms MUST be given to the Documentation Unit.

Item #	Item Title	Instructions
1.	Incident Name	Enter the name assigned to the incident.
2.	Prepared By	Enter the name of the Planning Section Chief completing the form.
3.	Date/Time	Enter the Date (month, day, year) and Time (24-hour clock) the form was prepared.
4.	Operational Period	Enter the time interval for which the form applies. Record the start and end date and time.
5.	Notification	Enter the date and time that required notifications were completed.
6.	Response Initiation Plan Item and Timeframe	Enter the date and time that the Response Initiation is completed. Enter specific dates, or day number or week number in the top row to indicate the timeframe being covered by this form. Then enter either descriptive text or shading to the right of each activity to indicate the beginning and estimated end for that activity during this incident response.

Site Safety and Health Plan ICS-208-CG (rev 9/06)

Incident Name: _____ Date/Time Prepared: _____ Operational Period: _____

Purpose. The ICS Compatible Site Safety and Health Plan is designed for safety and health personnel that use the Incident Command System (ICS). It is compatible with ICS and is intended to meet the requirements of the Hazardous Waste Operations and Emergency Response regulation (Title 29, Code of Federal Regulations, Part 1910.120). The plan avoids the duplication found between many other site safety plans and certain ICS forms. It is also in a format familiar to users of ICS. Although primarily designed for oil and chemical spills, the plan can be used for all hazard situations.

Questions on the document should be addressed to the Coast Guard Office of Incident Management and Preparedness (G-RPP).

Table of Forms

FORM NAME	FORM #	USE	REQUIRED	OPTIONAL	ATTACHED
Emergency Safety and Response Plan	A	Emergency response phase (uncontrolled)	X		
Site Safety Plan	B	Post-emergency phase (stabilized, cleanup)	X

EMERGENCY SAFETY AND RESPONSE PLAN (ICS-208-CG SSP-A)

Purpose: The Emergency Safety and Response Plan provides the Safety Officer and ICS personnel a plan for safeguarding personnel during the initial emergency phase of the response. *It is only used during the emergency phase of the response, which is defined as a situation involving an uncontrolled release.* It is also intended to meet the requirements of the Hazardous Waste Operations and Emergency Response (HAZWOPER) regulation, Title 29 Code of Federal Regulations Part 1910.120.

Preparation: The Safety Officer or his/her designated staff starts the Emergency Site Safety and Response Plan. They initially address the hazards common to all operations involved in the response (initial site characterization). Outside support organizations must be contacted to ensure the plan is consistent with other plans (local, state, other federal plans). Form ICS-208-CG SSP-G need not be completed if this form is used. When the operation proceeds into the post-emergency phase (site stabilized and cleanup operations begun) forms ICS-208-CG SSP-B and ICS-208-CG SSP-G should be used. For large incidents, the Emergency Site Safety and Response Plan complements the Incident Action Plan. For smaller incidents, the Emergency Site Safety and Response Plan complements ICS-201.

Distribution: The Emergency Safety and Response Plan completed by the Safety Officer is forwarded to the Planning Section Chief. Copies are made and attached to the Assignment List(s) (ICS Form 204). The Operations Section Chief, Directors, Supervisors or Leaders get a copy of the plan. They must ensure it is available on site for all personnel to review. The Safety Officer is responsible for ensuring that the Emergency Site Safety and Response Plan properly addresses the hazards of the operation. The Safety Officer accomplishes this through on site enforcement and feedback to the operational units.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Attachments	Enter attachments. Material Safety Data Sheets are mandatory under 1910.120. Safe Work Practices may also be attached.
5	Organization	List the personnel responsible for these positions. IC and Safety Officer are mandatory.
6	Physical Hazards & Protection	Check off the physical hazards at the site. Identify the major tasks involved in the response (skimming, lightering, overpacking, etc.). Check off the controls that would be used to safeguard workers from the physical hazards for each major task.
7	Chemical/Agent	List the chemicals involved in the response. Chemicals may be listed numerically. Check off the hazards, potential health effects, pathway of dispersion, and exposure route of the chemical. Numbers corresponding to the chemical may be entered into the check blocks to differentiate. Check off the PPE to be used. Identify the type of PPE selected (for example: gloves: butyl rubber).
8	Instruments	Indicate the instruments being used for monitoring. List the action levels adjacent to the instruments being used. Identify the chemicals being monitored (2). List the physical parameters of the chemicals. Use a separate form for additional chemicals monitored.

EMERGENCY SAFETY AND RESPONSE PLAN (FORM ICS-208-CG SSP-A) (Instructions Continued)

9	Decontamination	Check off the decontamination steps to be used. Numbers may be entered to indicate the preferred sequence. Identify any intervening steps necessary on the form or in a separate attachment.
10	Site Map	Draw a rough site map. Ensure all the information listed is identified on the map.
11	Potential Emergencies	Identify any potential emergencies that may occur. If none, so state. Check off the appropriate alarms that may be used. Identify emergency prevention and evacuation procedures in the space provided or on a separate attached sheet.
12	Communications	Indicate type of site communications (phone, radio). Indicate phone numbers or frequencies for the command, tactical and entry functions.
13	Site Security	Identify the personnel assigned. Identify security procedures in the space provided or on a separate attached sheet. Identify the equipment needed to support security operations.
14.	Emergency Medical	Identify the personnel assigned. Identify emergency medical procedures in the space provided or on a separate attached sheet. Identify the equipment needed to support security operations.
15.	Prepared by:	Enter the name and position of the person completing the worksheet.
16.	Date/time briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

11. Prepared By:	12. Date/Time Briefed:	***HAZARD LIST**: Physical/Safety, Toxic, Explosion/Fire, Oxygen Deficiency, Ionizing Radiation, Biological, Biomedical, Electrical, Heat Stress, Cold Stress, Ergonomic, Noise, Cancer, Dermatitis, Drowning, Fatigue, Vehicle, & Diving	**ICS-208-CG SSP-B (rev 9/06):** Page _____ of _____

SITE SAFETY PLAN (FORM ICS-208-CG SSP-B)

Purpose: The Site Safety Plan provides the Safety Officer and ICS personnel a plan for safeguarding personnel during the post-emergency phase of an incident. The post-emergency phase is when the situation is stabilized and cleanup operations have begun. ICS-208-CG SSP-B is intended to meet the requirements of the Hazardous Waste Operations and Emergency Response (HAZWOPER) regulation, Title 29 Code of Federal Regulations Part 1910.120.

Preparation: The Safety Officer or his/her designated staff starts the Site Safety Plan. They initially address the hazards common to all operations involved in the response (initial site characterization). The plan is then reproduced and as a minimum sent to ICS Group/Division Supervisors. They amend it according to unique job or on-scene hazards with support from the Safety Officer and/or his/her staff (detailed site characterization). The plan is continuously updated to address changing conditions. During the first hours of the response, where most response functions are in the emergency phase, the Safety Officer may chose to use the Emergency Safety and Response Plan (ICS-208-CG SSP-A) in place of the Site Safety Plan. For large incidents, ICS-208-CG SSP-B compliments the Incident Action Plan (IAP). For smaller incidents, ICS-208-CG SSP-B compliments ICS Form 201. The Safety Officer is encouraged to use the HAZWOPER Compliance Checklist (Form ICS-208-CG SSP-K) to ensure the IAP and the 201 address the requirements and all other pertinent ICS forms (203, 205, 206, etc.) are completed.

Distribution: The initial Site Safety Plan completed by the Safety Officer is forwarded to the Planning Section Chief. Copies are made and attached to the Assignment List(s) (ICS Form 204). The Operations Section Chief, Directors, Supervisors or Leaders get a copy and make on site amendments specific to their operation. They must also ensure it is available on site for all personnel to review. The Safety Officer provides personnel from his/her staff to assist in the detailed site characterization. The Safety Officer is responsible for ensuring that the Site Safety Plan for each assignment properly addresses the hazards of the assignment. The Safety Officer must ensure that the safety plans on site are consistent. The Safety Officer accomplishes this through on site enforcement and feedback to the operational units.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Group/Division Supv Strike Team/TF Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	Site Accessibility	Check the block(s) if the site is accessible by land, water, air, etc.
8	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
9	Attachments	Enter attachments. Material Safety Data Sheets are mandatory under 1910.120. Safe Work Practices may also be attached.
10	Job/Task Activity	Enter Job/Task & Activities, list hazards, list potential injury and health effects, check exposure routes and identify controls. If more detail is needed for controls, provided attachments.
11	Prepared by	Enter the name and position of the person completing the worksheet.
12	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

SITE MAP FOR SITE SAFETY PLAN (ICS-208-CG SSP-C)

Purpose: The Site Map for the Site Safety Plan is required by Title 29 Code of Federal Regulations Part 1910.120. It provides in 1 place a visual description of the site which can help ICS personnel locate hazards, identify evacuation routes and places of refuge.

Preparation: The Site Map for the Site Safety Plan can be completed by the Safety Officer, his/her staff or by ICS field personnel (Group Supervisors, Task Force/Strike Team Leaders) working at a site with unique and specific hazards. One or several maps may be developed, depending on the size of the incident and the uniqueness of the hazards. The key is to ensure that the workers using the map(s) can clearly identify the work zones, locations of hazards, evacuation routes and places of refuge.

Distribution: This form must be located with the Site Safety Plan (ICS-208-CG SSP-B). It therefore follows the same distribution route.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	Site Accessibility	Check the block(s) if the site is accessible by land, water, air, etc.
8	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
9	Include	Ensure the map includes the listed items provided in this block.
10	Sketch of Site	Sketch of site for work. May attach map or chart.
10	Prepared by	Enter the name and position of the person completing the worksheet.
11	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

EMERGENCY RESPONSE PLAN (ICS-208-CG SSP-D)

Purpose: The Emergency Response Plan provides information on measures to be taken in the event of an emergency. It is used in conjunction with the Site Safety Plan (Form ICS-208-CG SSP-B). It is also required by Title 29 Code of Federal Regulations Part 1910.120.

Preparation: The Safety Officer, his/her staff member or the Site Supervisor/Leader prepares the Emergency Response Plan. A copy of the Medical Plan (ICS Form 206) must always be attached to this form.

Distribution: This form must be located with Site Safety Plan (ICS-208-CG SSP-B). It therefore follows the same distribution route.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
8	Attachments	Enter attachments. ICS Form 206 must be included.
9	Emergency Alarm	Enter a description of the sound of the emergency alarm and it's location.
10	Backup Alarm	Enter a description of the sound of the emergency alarm and it's location.
11	Emergency Hand Signals	Enter the emergency hand signals to be used.
12	Emergency Personal Protective Equipment Required	Enter the emergency personal protective equipment that may be needed in the event of an emergency.
13	Emergency Notification Procedures	Enter the procedures for notifying the appropriate personnel and organizations in the event of an emergency.
14	Places of Refuge	Enter by name the place of refuge personnel can go to in the event of an emergency.
15	Emergency Decon & Evacuation Steps	Enter emergency decontamination steps and evacuation procedures.
16	Site Security Measures	Enter site security measures needed for emergencies.
17	Prepared by	Enter the name and position of the person completing the worksheet.
18	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

15. Prepared By:	16. Date/Time Briefed:	**HAZARD LIST**: Potential Health Effects: Bruise/Lacerations, Organ Damage, Central Nervous System Effects, Cancer, Reproductive Damage, Low Back Pain, Temporary Hearing Loss, Dermatitis, Respiratory Effects, Bone Breaks, & Eye Burning
18. Safety Officer Review:	Reporting: Monitoring results shall be logged in the ICS-208-CG SSP-E-1 form (Air Monitoring Log) and attached as part of a current Site Safety Plan and Incident Action Plan. Significant Exposures shall be immediately addressed to the IC and General Staff for immediate correction.	**ICS-208-CG SSP-E (rev 9/06)** Page _____ of _____

EXPOSURE MONITORING PLAN (FORM ICS-208-CG SSP-E)

Purpose: The Exposure Monitoring Plan provides plan of monitoring conducted during an incident. The plan is a supplement to the Site Safety Plan (ICS-208-CG SSP-B). It is only required when performing monitoring operations.

Preparation: The Safety Officer, his/her staff member or the Site Supervisor/Leader prepares the Exposure Monitoring Plan. If there is a decision not to monitor during a response, the reasons must be stated clearly in the Site Safety Plan (ICS-208-CG SSP-B).

Distribution: This form must be located with Site Safety Plan (ICS-208-CG SSP-B). It therefore follows the same distribution route.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Specific Task / Operation	Enter specific task or operation.
6	Survey Location	Enter the location to be monitored.
7	Survey Date/Time	Enter the date/time for the monitoring teams to survey.
8	Monitoring Methodology	Enter/Check the monitoring method to be used.
9	Direct-Reading Instrument	Enter the instrument model, manufacturer, last calibration date.
10	Air Sampling	Enter Air Sampling analysis method
11	Hazards to Monitor	Enter the hazards to monitor
12	Monitoring Duration	Enter duration of monitoring
13	Reasons to Monitor	Enter Reasons to Monitor
14	Laboratory Support for Analysis	Enter Laboratory Support needed for analysis of samples
15	Prepared by	Enter the name and position of the person completing the worksheet.
16	Date/Time Briefed	Enter the date/time the document was briefed to the appropriate workers and by whom.
17	Safety Officer Review	The Safety Officer must review and sign the form.

CG ICS SSP: AIR MONITORING LOG	1. Incident Name	2. Date/Time Prepared	3. Operational Period	4. Safety Officer (include method of contact)	
5. Site Location	6. Hazards of Concern	7. Action Levels (include references):		8. Weather: Temperature: Precipitation: Wind: Relative Humidity: Cloud Cover:	
9.a. Instrument, ID Number Calibrated? Indicate below.	9.b. Monitoring Person Name(s)	9.c. Results (units)	9.d. Location	9 f. Time	9.g. Interferences and Comments
10. Safety Officer Review:		Potential Health Effects: Bruise/Lacerations, Organ Damage, Central Nervous System Effects, Cancer, Reproductive Damage, Low Back Pain, Temporary Hearing Loss, Dermatitis, Respiratory Effects, Bone Breaks, & Eye Burning		**ICS-208-CG SSP-E-1 (rev 9/06):** Page _____ of _____	

DAILY AIR MONITORING LOG (FORM ICS-208-CG SSP-E-1)

Purpose: The Exposure Monitoring Log provides documentation of air monitoring conducted during a spill. The log is a supplement to the Site Safety Plan (ICS-208-CG SSP-B). It is only required when performing air monitoring operations. The information used from the log can help update the Site Safety Plan.

Preparation: Persons conducting monitoring complete the Daily Air Monitoring Log. Normally these are air monitoring units under the Site Safety Officer. If there is a decision not to monitor during a spill, the reasons must be stated clearly in the Site Safety Plan (ICS-208-CG SSP-B).

Distribution: The Daily Air Monitoring Log when completed is copied and forwarded to the Site Safety Officer who must review and sign the form. The original form must be available on site, readily available and briefed to all impacted ICS personnel.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Location & size of site	Enter the geographical location of the site and the approximate square area.
6	Hazards of Concern	Enter the hazards being monitored.
7	Action Levels	Enter the action levels/readings for the monitoring teams.
8	Weather	Enter weather information. Ensure units of measure are listed.
9	Air Monitoring Data	Enter the instrument type and number, persons monitoring, results with appropriate units, location of reading, time of reading and interferences and comments.
10	Safety Officer Review	The Safety Officer must review and sign the form.

CG ICS SSP: PERSONAL PROTECTIVE EQUIPMENT	1. Incident Name	2. Date/Time Prepared	3. Operational Period	4. Safety Officer (include method of contact)
5. Supervisor/Leader	6. Location and Size of Site	7. Hazards Addressed:		8. For Emergencies Contact:

11. Inspection Procedures:	12. Donning Procedures:	13. Doffing Procedures:	14. Limitations and Precautions (include maximum stay time in PPE):

15. Prepared By:	16. Date/Time Briefed:	Potential Health Effects: Bruise/Lacerations, Organ Damage, Central Nervous System Effects, Cancer, Reproductive Damage, Low Back Pain, Temporary Hearing Loss, Dermatitis, Respiratory Effects, Bone Breaks, Eye Burning	**ICS-208-CG SSP-F: (Rev 9/06)** Page _____ of _____

PERSONAL PROTECTIVE EQUIPMENT (ICS-208-CG SSP-F)

Purpose: The Personal Protective Equipment form is a list of personal protective equipment to be used in operations. The listing of personal protective equipment is required by Title 29 Code of Federal Regulations Part 1910.120.

Preparation: The Personal Protective Equipment form is completed by the Site Safety Officer, or his/her staff. Personal protective equipment common to all ICS Operations personnel is addressed first. Jobs with unique personal protective equipment requirements (fall protection) are addressed next. When the form is delivered on site, the ICS Director, Supervisor, or Leader may amend the list to ensure personnel are adequately protected from job hazards. It must be completed prior to the onset of any operations, unless addressed elsewhere by Standard Operating Procedures.

Distribution: This form must be located with Site Safety Plan (ICS-208-CG SSP-B). It therefore follows the same distribution route.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	Hazard(s) Addressed:	Enter the hazards that need to be safeguarded.
8	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
9	Equipment	List the equipment needed to address the hazards. If pre-designed Safe Work Practices are used, indicate here and attach to form.
10	References consulted	List the references used in making the selection for PPE.
11	Inspection Procedures	Enter the procedures for inspecting the Personal Protective Equipment prior to donning. If pre-designed Safe Work Practices are used, indicate here and attach to form.
12	Donning Procedures	Enter the procedures for putting on the PPE. If pre-designed Safe Work Practices are used, indicate here and attach to form.
13	Doffing Procedures	Enter the information for removing the PPE. If pre-designed Safe Work Practices are used, indicate here and attach to form.
14	Limitations and Precautions	List the limitations and precautions when using PPE. Include the maximum time to be inside the PPE, Heat Stress concerns, psychomotor skill detraction and other factors.
15	Prepared by	Enter the name and position of the person completing the worksheet.
16	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

CG ICS SSP: DECONTAMINATION	1. Incident Name	2. Date/Time Prepared	3. Operational Period	4. Safety Officer (include method of contact)
5. Supervisor/Leader	6. Location and Size of Site	7. For Emergencies Contact:		8. Hazard(s) Addressed:

9. Equipment:				10. References Consulted:

11. Contamination Avoidance Practices:	12. Decon Diagram: ☐ Attached, ☐ Drawn below	13. Decon Steps

14. Prepared By:	15. DECONTAMINATION (ICS-208-CG SSP-G)

Purpose: The Decontamination form provides information on how workers can avoid contamination and how to get decontaminated. It is a supplemental form to the Site Safety Plan.

Preparation: The Decontamination Form can be completed by the Site Safety Officer, a member of his/her staff or by the Group/Division Supervisor, Task Force/Strike Team Leader on the site

Distribution: This form must be located with Site Safety Plan (ICS-208-CG SSP-B). It therefore follows the same distribution route.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
8	Hazard(s) Addressed:	Enter the hazards that need to be safeguarded.
9	Equipment	Enter the decontamination equipment needed for the site. If pre-designed Safe Work Practices are used, indicate here and attach to this form.
10	References consulted	List the references used in making the selection for PPE.
11	Contamination Avoidance Practices	Enter procedures for personnel to avoid contamination. If pre-designed Safe Work Practices are used, indicate here and attach to form.
12	Decon Diagram	Draw a diagram for the decontamination operation. If pre-designed Safe Work Practices are used, indicate here and attach to form.
13	Decon Steps	List the decontamination steps.
14	Prepared by	Enter the name and position of the person completing the worksheet.
15	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

CG ICS SSP: ENFORCEMENT LOG	1. Incident Name	2. Date/Time Prepared	3. Operational Period	4. Safety Officer (include method of contact)	
5. Supervisor/Leader	6. For Emergencies Contact:			7. Attachments:

SITE SAFETY ENFORCEMENT LOG (ICS-208-CG SSP-H)

Purpose: The Site Safety Plan Enforcement Log is used to help enforce safety during an incident.

Preparation: The Safety Officer and/or his/her staff complete the Site Safety Plan Enforcement Log. The log is completed as Safety personnel are on scene reviewing the site. It should be completed at a minimum once per day. The number of enforcement logs to be completed depends on the size of the incident. Enough should be completed to ensure that site safety is being adequately enforced.

Distribution: The Site Safety Plan enforcement log when completed is delivered to the Safety Officer. The Safety Officer can use the form to amend the Site Safety Plan (ICS-208-CG SSP-A or B).

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact
5	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
6	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
7	Attachments	List any attached supporting documentation.
8 a	Job/Task Activity	Enter only those Job Task/activities for which a deficiency is noted.
8 b	Hazards	Enter the hazard not being sufficiently addressed.
8 c	Deficiency	Enter the deficiency.
8 d	Action Taken	Enter the corrective action taken to address the deficiency.
8 e	Safety Plan Amended?	Enter whether the on site safety plan was amended.
8 f	Signature of Supervisor/Leader	Ensure the Supervisor/Leader signs the form to acknowledge the deficiency.
9	Prepared by	Enter the name and position of the person completing the worksheet.
10	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

CG ICS SSP WORKER ACKNOWLEDGEMENT FORM	1. Incident Name	2. Site Location:	3. Attachments:	
4. Type of Briefing	5. Presented By:		6. Date Presented	7. Time Presented
Safety Plan/Emergency Response Plan ☐ Start Shift ☐ Pre-Entry ☐ Exit ☐ End of Shift ☐ Specify Other:				
8.a. Worker Name (Print)	8.b. Signature*****		8.c. Date	8.d. Time

***** *By signing this document, I am stating that I have read and fully understand the plan and/or information provided to me.*

WORKER ACKNOWLEDGEMENT FORM (ICS-208-CG SSP-I)

Purpose: The Worker Acknowledgement form is used to document workers who have received safety briefings.

Preparation: Those personnel responsible for conducting safety briefings complete this form initially. Once the briefings are completed, workers who were briefed print their name, sign, date and indicate the time of the briefing.

Distribution: This form is returned to the Safety Officer or designated representative at the end of each operational period.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Site Location	Indicate the location where the briefings are held.
3	Attachments	Indicate any attachments used as part of the briefings.
4	Type of briefing	Check the block next to the type of briefing.
5	Presented by	Enter the name of the person conducting the briefing.
6	Date Presented	Enter the date of the briefing.
7	Time Presented	Enter the time of the briefing.
8	Worker Name, Signature, Date and Time	Workers receiving the briefing print their name, sign, date and enter the time they acknowledge the briefing.

(ix)	Are appropriate decontamination procedures implemented?	N/A	☐	Performance based

Emergency Safety & Response Plan Compliance Checklist Form A (ICS-208-CG SSP-J)

Purpose: The Emergency Safety and Response Plan 1910.120 Compliance Checklist is to ensure that incident response operations are in compliance with Title 29, Code of Federal Regulations Part 1910.120, Hazardous Waste Operations and Emergency Response. It also identifies how form ICS-208-CG SSP-J can be used to satisfy the HAZWOPER requirements. This checklist is an optional form.

Preparation: The Emergency Safety and Response Plan 1910.120 Compliance Checklist is completed by the Safety Officer or his/her staff as frequently as necessary whenever the Safety Officer wants to ensure regulatory compliance. It is best used in conjunction with the Site Safety Plan Enforcement Log (ICS-208-CG SSP-H). Many of the requirements are performance based and are best evaluated on scene by the Safety Officer or his/her staff.

Distribution: The Safety Officer should maintain The Emergency Safety and Response Plan (ERP) 1910.120 Compliance Checklist.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
5	Location of Site	Enter the site location.
6 a	Cites	These are the regulatory cites within 1910.120. The major headings are highlighted in bold. Informational cites or cites that are duplicative are not included.
6 b	Requirement	This lists the requirement in a question format. Some require documentation or some form of action.
6 c	ICS Form	Lists those requirements covered by ICS-208-CG SSP-A.
6 d	Check Block	Enter the check if the site satisfies the requirement.
6 f	Comments	This provides additional information on the requirement. The user may also enter comments.
7	Prepared by	Enter the name and position of the person completing the worksheet.

(**n**)(2)(i)	Are non-potable water containers clearly marked?		IAP	☐	
(**n**)(3)(i)	Are their sufficient toilets available?		IAP	☐	
(**n**)(4)	Have food handling issues been addressed?		IAP	☐	
(**n**)(6)	Have adequate wash facilities been provided outside hazard zone?		IAP	☐	
(**n**)(7)	If response is greater than 6 months, have showers been provided?		IAP	☐	

HAZWOPER 1910.120 COMPLIANCE CHECKLIST FORM B (ICS-208-CG SSP-K)

Purpose: The HAZWOPER 1910.120 Compliance Checklist is to ensure that incident response operations are in compliance with Title 29, Code of Federal Regulations Part 1910.120, Hazardous Waste Operations and Emergency Response. It also identifies how other ICS forms can be used to satisfy the HAZWOPER requirements. This is an optional form.

Preparation: The HAZWOPER 1910.120 Compliance Checklist is completed by the Safety Officer or his/her staff as frequently as necessary whenever the Safety Officer wants to ensure regulatory compliance. It is best used in conjunction with the Site Safety Plan Enforcement Log (ICS-208-CG SSP-H). The Site Safety Plan Forms (A-G) best meet some of the requirements. The Incident Action Plan is suited to address other requirements, and the Safety Officer should ensure the IAP addresses them. Other requirements are performance based and are best evaluated on scene by the Safety Officer or his/her staff.

Distribution: The HAZWOPER 1910.120 Compliance Checklist should be maintained by the Safety Officer.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
5	Location of Site	Enter the site location.
6.a.	Cites	These are the regulatory cites within 1910.120. The major headings are highlighted in bold. Informational cites or cites that are duplicative are not included.
6.b.	Requirement	This lists the requirement in a question format. Some require documentation or some form of action.
6.c.	ICS Form	Lists those ICS Forms that cover the requirement. **IAP designations means it should be covered in IAP, it does not guarantee it is covered. The Safety Officer must ensure this.**
6.d.	Check Block	Enter the check if the site satisfies the requirement.
6.e.	Comments	This provides information on where else the requirement may be met. The user may also enter comments.
7	Prepared by	Enter the name and position of the person completing the worksheet.

CG ICS SSP: 1910.120 DRUM COMPLIANCE CHECKSHEET	1. Incident Name	2. Date/Time Prepared	3. Operational Period	4. Safety Officer (include method of contact)
5. Supervisor/Leader	6. Location and Size of Site	7. For Emergencies Contact:		8. Note: tanks and vaults should also be treated in the same manner as described below [1910.120(j)(9)]. Many can also pose confined space hazards.

9.a. Cite: 1910.120 (Cites that duplicate or explain requirements are omitted)	9.b. Requirement	9.c. Check	9.d. Comments
(**j**)(1)(ii)	Drums meet DOT, OSHA, EPA regs for waste they contain, including shipment?	☐	
(iii)	Drums inspected and integrity ensured prior to movement?	☐	
(iii)	Or drums moved to an accessible location (staging area) prior to movement?	☐	
(iv)	Unlabelled drums treated as unknown until properly identified and labeled?	☐	
(v)	Site activities organized to minimize drum handling?	☐	
(vi)	Employers properly warned about the hazards of moving and handling drums?	☐	
(vii)	Suitable overpack drums are available for addressing leaking and ruptured drums?	☐	
(viii)	Leaking materials from drums properly contained?	☐	
(ix)	Are drums that cannot be moved, emptied of contents with transfer equipment?	☐	
(x)	Are suspect buried drums surveyed with underground detection system?	☐	
(xi)	Are soil and covering material above buried drums removed with caution?	☐	
(xii)	Is the proper extinguishing equipment on scene to control incipient fires?	☐	
(**j**)(2)(i)	Are airlines on supplied air systems protected from leaking drums?	☐	
(ii)	Are employees at a safe distance, using remote equipment, when handling explosive drums?	☐	
(iii)	Are explosive shields in plane to protect workers opening explosive drums?	☐	
(iv)	Is response equipment positioned behind shields when shields are used?	☐	
(v)	Are non-sparking tools used in flammable or potentially flammable atmospheres?	☐	
(vi)	Are drums under extreme pressure opened slowly & workers protected by shields/distance?	☐	
(vii)	Are workers prohibited from standing and working on drums?	☐	
(**j**)(3)	Is the drum handling equipment positioned and operated to minimize sources of ignition?	☐	
(**j**)(5)(i)	For shock sensitive drums, have all non-essential employees been evacuated?	☐	
(ii)	For shock sensitive drums: is handling equipment provided with shields to protect workers?	☐	
(iii)	Are alarms that announce start/finish of explosive drum handling actions in place?	☐	
(iv)	Are continuous communications in place between the drum handling site & command post?	☐	
(v)	Are drums under pressure properly controlled for prior to handling?	☐	
(vi)	Are drums containing packaged laboratory wastes treated as shock sensitive?	☐	
(**j**)(6)(i)	Are lab packs opened by trained and experienced personnel?	☐	
(ii)	Are lab packs showing crystallization treated as shock sensitive?	☐	
(**j**)(8)(ii-iii)	Are drum staging areas manageable with marked access and egress?	☐	
(iv)	Is bulking of drums conducted only after drum contents have been properly identified?	☐

HAZWOPER 1910.120 DRUM COMPLIANCE CHECKLIST (ICS-208-CG SSP-L)

Purpose: The HAZWOPER 1910.120 Drum Compliance Checklist is to ensure that incident response operations are in compliance with Title 29, Code of Federal Regulations Part 1910.120, Hazardous Waste Operations and Emergency Response whenever drums are encountered during an incident. This is an optional form.

Preparation: The HAZWOPER 1910.120 Drum Compliance Checklist is completed by the Safety Officer or his/her staff as frequently as necessary whenever the Safety Officer wants to ensure regulatory compliance. It is best used in conjunction with the Site Safety Plan Enforcement Log (ICS-208-CG SSP-H). The Site Safety Plan Forms (A-G) best meet some of the requirements. Other requirements are performance based and are best evaluated on scene by the Safety Officer or his/her staff.

Distribution: The HAZWOPER 1910.120 Drum Compliance Checklist should be maintained by the Safety Officer.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
8	Note	Tanks and vaults should also be treated in the same manner as described in the checklist (1910.120((j)(9)).
9.a.	Cites	These are the regulatory cites within 1910.120. The major headings are highlighted in bold. Informational cites or cites that are duplicative are not included.
9.b.	Requirement	This lists the requirement in a question format. Some require documentation or some form of action.
9.c.	Check Block	Enter the check if the site satisfies the requirement.
9.d.	Comments	This provides information on where else the requirement may be met. The user may also enter comments.
10	Prepared by	Enter the name and position of the person completing the worksheet.

NATIONAL PREPAREDNESS

FOR

RESPONSE EXERCISE PROGRAM

(PREP)

GUIDELINES

DEPARTMENT OF TRANSPORTATION
U.S. Coast Guard
Research and Special Programs Administration

ENVIRONMENTAL PROTECTION AGENCY

DEPARTMENT OF THE INTERIOR
Minerals Management Service

August 2002

To the “Response Community”:

This is the first revision since August 1994 to the Preparedness for Response Exercise Program (PREP) when we set out together to design an effective and coordinated exercise program under the Oil Pollution Act of 1990. As before, the revisions are the result of an open dialogue and the incorporation of lessons learned over the past 8 years. We considered issues identified in public meetings and in written comments received to the Department of Transportation regulatory docket (2000-7514). The PREP will evolve as the government and industry continue to meet the challenge of protecting the environment, public health and welfare. We look forward to working with all parties as we continue to improve the PREP process.

SECTION 1: INTRODUCTION

Purpose

The National Preparedness for Response Exercise Program (PREP) was developed to establish a workable exercise program which meets the intent of section 4202(a) of the Oil Pollution Act of 1990 (OPA 90), amending section 311 (j) of the Federal Water Pollution Control Act (FWPCA), by adding a new subsection (6) and a new subsection (7) for spill response preparedness [33 U.S.C. 1321 (j)]. The PREP was developed to provide a mechanism for compliance with the exercise requirements, while being economically feasible for the government and oil industry to adopt and sustain. The PREP is a unified federal effort and satisfies the exercise requirements of the Coast Guard, the Environmental Protection Agency (EPA), the Research and Special Programs Administration (RSPA) Office of Pipeline Safety, and the Minerals Management Service (MMS). Completion of the PREP exercises will satisfy all OPA 90 mandated federal oil pollution response exercise requirements.

PREP addresses the exercise requirements for oil pollution response. At this time, Coast Guard is the only one of the four participating federal agencies considering regulations requiring HAZSUB response planning and exercises under the Federal Water Pollution Control Act and the Oil Pollution Act of 1990. Therefore, the HAZSUB exercise standards described in Section 3 of the Guidelines apply only to CG-regulated vessels and facilities in accordance with 33 CFR 154/155. There are additional industry planning and exercise requirements contained in other federal statutes, which are not addressed in these Guidelines.

The PREP represents the **minimum** guidelines for ensuring adequate response preparedness. If personnel within an organization believe additional exercises or an expansion of the scope of the PREP exercises are warranted to ensure enhanced preparedness, they are **highly encouraged** to conduct these exercises.

The PREP exercises should be viewed as an opportunity for continuous improvement of the response plans and the response system. **Plan holders are responsible for addressing any issues that arise from evaluation of the exercises and for making changes to the response plans necessary to ensure the highest level of preparedness.**

Participation in PREP

Plan holders are required to meet the pollution response exercise requirements mandated by the federal agency with regulatory oversight for the specific type of industry involved (e.g., vessels, marine transportation-related facilities, onshore and certain offshore non transportation-related facilities, pipelines, offshore facilities). The PREP satisfies these requirements. **The PREP is a voluntary program**. Plan holders are not required to follow the PREP guidelines and, if they choose not to, may develop their own exercise program that complies with the regulatory exercise requirements.

All plan holders, whether participating in the PREP or following the exercise mandates of relevant agency regulations, will be subject to government -initiated unannounced exercises. Unannounced exercises are mandated by OPA 90. These exercises are further described in these guidelines.

Applicability

The PREP is applicable to all industry response plan holders who elect to follow these guidelines. Area Contingency Plan holders are required to follow the PREP guidelines.

Industry plan holders electing not to adopt the PREP as their exercise program will be responsible for developing and documenting an exercise program that satisfies the appropriate federal oversight agency.

If an industry plan holder has developed one response plan that covers a fleet of vessels or regional operations of offshore platforms, this plan holder would only be required to conduct one "set" of exercises for the plan, with the exception of the qualified individual notification exercises and the emergency procedures exercises, which are required for all manned vessels and unmanned barges (as specified in 33 CFR155.101 5).

Effective Date

THE PREP GUIDELINES BECAME EFFECTIVE JANUARY 1,1994. THE PREP FOLLOWS THE CALENDAR YEAR - THE EXERCISE YEAR IS JANUARY 1 TO DECEMBER 31.

Definitions

- **Area** - That geographic area for which a separate and distinct Area Contingency Plan has been prepared, as described in the Oil Pollution Act of 1990. For EPA Areas with sub - area plans or annexes to the Area Contingency Plan, the EPA Regional Administrator shall decide which sub-area plan is to be exercised within the triennial cycle.

- **Area Committee -** Area Committees are those committees comprised of federal, state and local officials, formed in accordance with section 4202 of the Oil Pollution Act of 1990, whose task is to prepare an Area Contingency Plan for the area for response to a discharge of oil or hazardous substance.

- **Area Spill Management Team -** The Area Spill Management Team is the group of individuals within the Coast Guard or EPA On-Scene Coordinator organization with responsibility for spill response management within the respective area. The Area Spill Management Team should include state and local personnel whenever possible.

- **Barge Custodian -** A barge custodian is the individual that has custody of an unmanned barge. The barge custodian may be affiliated with the towing vessel, fleeting area or facility at which the barge may be moored. The custodian can be the towing vessel operator, the facility operator, the fleet operator, or whoever may be in charge of the entity that has custody of the barge.

- **Certification -** Certification is the act of confirming that an exercise (1) was completed; (2) was conducted in accordance with the PREP guidelines, meeting all objectives listed; and (3) was evaluated using a mechanism that appraised the effectiveness of the response or contingency plan.

- **Complex -** A complex is a facility regulated under section 311 (j) of the Federal Water Pollution Control Act [33 U.S.C. 1321 (j)] by two or more federal agencies.

- **Equipment deployment exercise -** An equipment deployment exercise is an exercise where response equipment is deployed to a specific site and operated in its normal operating medium.

- **Equipment activation -** Equipment activation is the movement, staging, deployment or operation of response equipment, as determined by the plan holder in consultation with the exercise design team.

- **Exercise Design Team -** This team is comprised of federal, state and industry representatives who have responsibility for designing an Area Exercise.

⌑ **Hazardous Substance -** For the purposes of PREP Section 3, the chemicals for which plan holders are required to prepare response plans by the Coast Guard under 33 CFR 154, 155 .

⌑ **Hazardous Substance Response Organization (HSRO) -** For the purposes of PREP Section 3, HSRO refers to companies involved with hazardous substance response, removal, and remediation. This acronym does not suggest the same classification standards that are required by OSROs.

⌑ **Industry -** For the purpose of these guidelines, industry means the vessels, marine transportation-related (MTR) facilities, onshore and certain offshore non - transportation-related facilities, pipelines, and Outer Continental Shelf platforms for which response plans for oil spill response are required to be submitted by owners or operators. The response plan requirements and regulations for these entities are administered by the Coast Guard, EPA, RSPA, and MMS.

⌑ **National Response System -** Under 40 CFR part 300 (The National Oil and Hazardous Substances Pollution Contingency Plan), the National Response System (NRS) includes the National Response Team, Regional Response Teams, Area Committees, On-Scene Coordinators, and state and local government entities involved with response planning and coordination. The PREP, consistent with OPA 90 objectives, specifically involves the private sector with the NRS in order to ensure effective exercise development, delivery and coordination.

⌑ **Oil Spill Removal Organization (OSRO) -** An oil spill removal organization is an entity that provides response resources. An oil spill removal organization includes, but is not limited to, any for-profit or not-for-profit contractor, cooperative, or in-house response resources established in a geographic area to provide required response resources.

⌑ **On-Scene Coordinator (OSC) -** The On-Scene Coordinator is the federal official predesignated by EPA or the USCG prior to an oil spill to coordinate and direct federal responses under subpart D of the National Contingency Plan, or the official designated by the lead agency to coordinate and direct removal actions under subpart E of the National Contingency Plan.

⌑ **Operating Environments -** For the purposes of PREP, there are three types of operating environments [33 CFR 154, 33 CFR 155, 40 CFR 112]:

- River and canals
- Great Lakes/ Inland
- Ocean (nearshore, offshore, and open ocean)

If an OSRO operates in all three environments, the OSRO is required to conduct an exercise of the minimum amount of equipment in each of the environments. If the OSRO only operates in two of the environments, it must conduct the exercises in the two environments.

⌑ **Plan Holder -** The plan holder is the industry (e.g., vessels, MTR facilities, onshore and certain offshore non-transportation-related facilities, pipelines, or offshore facilities) for which a response plan is required by federal regulation to be submitted by a vessel or facility's owner or operator. If an owner or operator is authorized to prepare one plan for a fleet of vessels, that owner or operator is considered to be the plan holder.

Planning Volumes for Oil :

1. **Average Most Probable (USCG) / Small (EPA) Discharge: -** This definition is agency-dependent, and the appropriate definitions are detailed as follows:
   - For Coast Guard-regulated vessels, a discharge of 50 barrels [2,100 gallons] of oil from the vessel during oil transfer operations [33 CFR 155.1020].
   - For Coast Guard-regulated facilities, a discharge of the lesser of 50 barrels [2,100 gallons] or 1 percent of the volume of the worst-case discharge [33 CFR 154.1020].
   - For EPA regulated facilities, a small discharge is a volume of 2,100 gallons [50 barrels]or less, provided this amount is less than the worst-case discharge [40 CFR 112.20].
   - For RSPA - Not applicable
   - For MMS - Not applicable
2. **Maximum Most Probable (USCG) / Medium (EPA) Discharge: -** This definition is agency-dependent, and the appropriate definitions are detailed as follows:

- For Coast Guard-regulated vessels, a discharge of 2,500 barrels [105,000 gallons] of oil for vessels with an oil cargo capacity equal to or greater than 25,000 barrels [1,050,000 gallons], or 10 percent of the vessel's oil cargo capacity for vessels with a capacity of less than 25,000 barrels [1,050,000 gallons] [33 CFR 155.1020].

- For Coast Guard-regulated facilities, a discharge of the lesser or 1,200 barrels [50,400 gallons]or 10 percent of the volume of a worst-case discharge [33 CFR 154.1020].

- For EPA-regulated facilities, a discharge greater than 2,100 gallons [50 barrels] and less than or equal to 36,000 gallons [858 barrels] or 10 percent of the capacity of the largest tank at the facility, whichever is less [40 CFR 112.20].

- For RSPA-Not applicable.

- For MMS-Not applicable.

***Although this type of spill is not included as a spill to be used in any of the exercises, the definition is included to remind the program participants that this spill type is included in the planning process and can be used when conducting the various exercises.**

3. **Worst Case Discharge -** This definition is agency-dependent, and the appropriate definitions are detailed as follows:

   - For Coast Guard-regulated vessels, a discharge in adverse weather conditions of a vessel's entire cargo as defined in 33 CFR 155.1020.

   - For Coast Guard-regulated facilities, the size of the discharge as defined in 33 CFR 154.1020 (in the case of an onshore facility and deepwater port, the largest foreseeable discharge in adverse weather conditions meeting the requirements of 33 CFR 154.1029).

   - For EPA-regulated facilities, the size of the discharge described in 40 CFR 112.20.

   - For RSPA-regulated pipelines, the size of the discharge as defined in applicable regulations [49 CFR 194].

   - For MMS-regulated offshore facilities, the size of the discharge as defined in applicable regulations [30 CFR 254].

   - For Areas, the size of the discharge as defined in the Area Contingency Plan.

   - For complexes regulated by more than one federal agency, the largest of the worst-case discharges calculated for the various regulated components.

   - Planning Volumes for HAZSUB – Applies to Section 3 only.

4. **Worst Case Discharge (vessel)** - means a discharge of a vessel's entire hazardous substance cargo during adverse weather conditions [33 CFR 155. 3030].In addition, planning contingencies should also anticipate situations where a vessel does not lose the entire cargo but the consequences of the release present a significant and substantial risk to human health or the environment. Furthermore, a company must be prepared to respond to any individual chemical it is authorized to carry.

5. **Worst Case Discharge (Coast Guard-regulated facility)** – means a discharge of the entire volume of the largest hazardous substance cargo line (including the content of any associated breakout tanks) measured from the transfer manifold on the dock to the first valve inside the secondary containment of the facility.

⌑ **Personal Protective Equipment** - equipment that meets the requirements contained in OSHA Hazardous Waste Regulations 29 CFR 1910.120.

⌑ **Primary Oversight Agency -** The primary oversight agency is the agency with regulatory authority over a particular industry. For the purposes of the PREP, the four primary oversight agencies and the industries they regulate are the U.S. Coast Guard (vessels, MTR facilities), the Environmental Protection Agency (onshore and certain offshore non transportation-related facilities), the Research and Special Programs Administration (pipelines), and the Minerals Management Service (offshore facilities).

⌑ **Qualified Individual -** A qualified individual is the person located in the United States who meets the requirements identified in the respective federal regulations (USCG, EPA, RSPA, MMS), and who is authorized to do

the following: (1) activate and engage in contracting with oil spill removal organizations; (2) act as a liaison with the On-Scene Coordinator; and (3) obligate funds required to effectuate response activities. The qualified individual will be the individual or a designee identified in the response plan.

- **Self-Certification -** Self-certification is where the plan holder declares he or she has met the following standards: (1) completion of the exercise; (2) conducting of the exercise in accordance with the PREP guidelines, meeting all objectives listed; and (3) evaluation of the exercise using a mechanism that appraises the effectiveness of the response or contingency plan.

- **Self-Evaluation -** Self-evaluation means that the plan holder is responsible for carefully examining the effectiveness of the plan for response during the exercise. The plan holder may choose the mechanism for conducting this appraisal, as long as it appropriately measures the plan effectiveness. The plan holder is responsible for addressing issues that arise in the exercise that would lead to improvements in the response plan or any aspect of preparedness for spill response. The plan holder is responsible for incorporating necessary changes to the response plan as a result of the exercise.

- **Spill Management Team -** The spill management team is the group of personnel identified to staff the appropriate organizational structure to manage spill response implementation in accordance with the response plan.

- **Tabletop Exercise** - For the purpose of the PREP, a tabletop exercise is an exercise of the response plan and the spill management team's response efforts without the actual deployment of response equipment.

- **Timely -** (as used in relation to CG and EPA government-initiated unannounced exercise programs) means the times established in the appropriate response planning regulations issued by the EPA and USCG for providing response resources to a small or average most probable spill.

- **Unified Command -** This entity is a command structure consisting of the On-Scene Coordinator, the State, the Responsible Party and other parties as appropriate. The Unified Command is utilized during a spill response to achieve the coordination necessary to carry out an effective and efficient response.

- **Verification -** Verification is the act of ensuring that an exercise was properly documented and certified. Verification would be conducted by the Coast Guard, EPA, RSPA, or MMS. Verification of the exercise records may be conducted through normal operations of the regulatory agency, such as inspections, boarding, spot checks, or other systems developed to ensure exercises are being conducted and properly documented.

- **Vessel -** For the purpose of the oil spills, a "vessel" is any vessel required by 33 CFR 155.1015 to submit a response plan. For the purpose of hazardous substance releases, a “vessel” is any vessel required by 33 CFR 155. 3030 to submit a response plan. A "vessel" includes unmanned barges.

SECTION 2: GUIDING PRINCIPLES

Internal and External Exercises

→ **Internal Exercises.**

Internal exercises are those that are conducted wholly within the plan holders organization. While the internal exercises include personnel such as the qualified individual and those affiliated with the plan holder's spill management team, OSRO, the internal exercises usually do not involve other members of the response community. The internal exercises are designed to examine the various components of the response plan to ensure the plan is adequate to meet the needs of the organization for spill response.

The **Internal** exercises include --

- Qualified individual notification exercises;
- Emergency procedures exercises for vessels and barges;
- Emergency procedures exercises for facilities (optional);
- Spill management team tabletop exercises; and
- Equipment deployment exercises.

All internal exercises should be **self-evaluated** and **self-certified.**

→ **External Exercises.**

External exercises are exercises that extend beyond the internal focus of the plan holder's organization, and involve other members of the response community. The external exercises are designed to examine the response plan and the plan holder's ability to coordinate with the response community to conduct an effective response to a pollution incident.

The **external** exercises include--

- Area exercises; and
- Government-initiated unannounced exercises.

While the government-initiated unannounced exercises will not usually involve all members of the response community, the involvement of an agency outside of the plan holders' organization places it in the category of an external exercise.

Qualified Individual Notification Exercises

The purpose of the qualified individual notification exercise is to ensure that the qualified individual (or designee, as designated in the response plan) is able to be reached in a spill response emergency to carry out his or her required duties. Contact by telephone, radio, message-pager, or facsimile must be made with the qualified individual, and confirmation must be received from him or her to satisfy the requirements of this exercise.

The qualified individual notification exercise is not intended to verify phone numbers, points of contact or the notification list contained in the plan. The plan holder is expected to update the notification list periodically (recommended at least once every 6 months) as part of the normal course of conducting business.

At least once a year, the qualified individual notification exercise should be conducted during non-business hours.

→ **Vessels.**

For vessels, it is the responsibility of the plan holder to ensure that the qualified individual notification exercise is conducted. If a plan holder has a fleet of vessels covered by one response plan, the plan holder must ensure that each vessel in the fleet conducts this exercise.

For vessels, a telex will be acceptable, but the baseline should be voice communication. If a telex is used for this exercise, confirmation from the qualified individual must be received to properly satisfy the requirements of this exercise.

→ **Unmanned Barges.**

For unmanned barges, it is the responsibility of the plan holder to ensure that the qualified individual notification exercise is conducted. If a plan holder has a fleet of unmanned barges covered by one response plan, during each quarter the plan holder should randomly choose a barge in the fleet to conduct the qualified individual notification exercise.* The plan holder should have the barge custodian of the chosen barge conduct the exercise. The plan holder should choose the barges and the various custodians randomly. This method

will ensure that all barges and custodians are ultimately included in the exercises.

***To require each unmanned barge in a fleet to conduct this exercise quarterly would be extremely difficult and unwieldy to manage.**

Emergency Procedures Exercises

The purpose of the emergency procedures exercises is to ensure that personnel are capable of conducting the initial actions necessary to mitigate the effects of a spill.

→ **Vessels.**

For vessels, it is the responsibility of the plan holder to ensure that the emergency procedures exercise is conducted. If a plan holder has a fleet of vessels covered by one response plan, the plan holder must ensure that each vessel in the fleet conducts this exercise. Since vessels do not always sail with the same crews, it is important that each vessel conducts this exercise quarterly to ensure that the personnel on board are familiar with the procedures for mitigating a spill occurring from that vessel.

→ **Unmanned barges.**

For unmanned barges, it is the responsibility of the plan holder to ensure the emergency procedures exercise is conducted.

***To require each unmanned barge in a fleet to conduct this exercise quarterly would be extremely difficult and unwieldy to manage.**

If a plan holder has a fleet of unmanned barges covered by one response plan, during each quarter the plan holder should randomly choose a barge in the fleet to conduct the emergency procedures exercise. The plan holder should have the barge custodian of the chosen barge conduct the exercise. The plan holder should choose the barges and the various custodians randomly to ensure that all barges and custodians will ultimately be included in the exercises.

→ **Facilities (optional).**

Facilities have the option of conducting emergency procedures exercises. For the purpose of the PREP, emergency procedures for facilities are the procedures established at the facility to mitigate or prevent any discharge or a substantial threat of such discharge of oil resulting from facility operational activities associated with cargo transfers . An emergency procedures exercise conducted unannounced would satisfy the facility's requirement for the annual unannounced exercise.

Spill Management Team Tabletop Exercises

The response plan holder must identify a spill management team in the response plan. This spill management team shall conduct an annual tabletop exercise, in accordance with the PREP guidelines. The response plan must be utilized in the exercise to ensure the spill management team is familiar with the plan and is able to use it effectively to conduct a spill response. At least one spill management team tabletop exercise in a triennial cycle shall involve a worst-case discharge scenario.

If a response plan lists different types of spill management teams for varying sizes of spills - for example a local spill management team for small spills, a regional team for larger spills, and a national team for major spills-each team identified would be required to conduct an annual spill management team tabletop exercise.

→ **Examples of Variations in Spill Management Team Organizations**.

If an organization has one national spill management team identified for all plans within the organization, that spill management team would only have to conduct one spill management team tabletop exercise annually, as long as the TTX addresses individual responses to spill scenarios for all type of industry plan holders covered by the SMT, i.e. vessels, facilities, pipelines and offshore facilities. For the annual spill management team tabletop exercise, the spill management team may use core response management procedures that would cover all plan holders, but the SMT must ensure it is familiar with each response plan for the vessels, facilities, pipelines and offshore facilities for which they are responsible, including the specific spill scenarios identified in each of the plans as well as the specific operations of each of the vessels, facilities, pipelines and offshore facilities. All plan holders that cite this national team in their response plans should take credit for this exercise.

Likewise, if regional spill management teams are set up within the organization, each regional team would only have to conduct one spill management team tabletop exercise annually, as long as the TTX addresses individual responses to spill scenarios for all types of industry plan holders covered by the SMT, i.e. vessels, facilities, pipelines and offshore facilities. The spill management team may utilize core response management procedures that would cover all plan holders, but the spill management team must ensure it is familiar with each response plan for which they are

responsible, including the specific spill scenarios identified in each of the plans as well as the specific operations and unique characteristics of each of the vessels, facilities, pipelines and offshore facilities. All plan holders that cite this regional team in their response plans should take credit for this exercise.

If a plan holder uses a core spill management team to handle most spills and adds personnel to the team as the size of the spill increases, either locally or from regional locations, the entire expanded spill management team must be exercised annually.

The spill management team tabletop exercises should take into account shift changes to ensure that all personnel serving as part of the spill management team during an actual spill have participated in an exercise.

If a plan holder cites a spill management team that is not part of the plan holder's organization, i.e. "SMT for hire", that spill management team would only be required to conduct one spill management team tabletop exercise annually, as long as the TTX addresses individual responses to spill scenarios for all types of industry plan holders covered by the SMT, i.e. vessels, facilities, pipelines and offshore facilities. One or more representatives from each plan holder organization that the spill management team represents must participate in the exercise. During the spill management team tabletop exercise, the spill management team must utilize each response plan to ensure familiarity with the spill scenarios identified in each of the plans as well as the specific operations of each vessel, facility, pipeline, and offshore facility the spill management team represents. The spill management team must also work with each plan holder representative to ensure the spill management team is able to incorporate the response management operations into the plan holder's organization during spill response. The spill management team should provide all plan holders with documentation upon completion of the spill management team tabletop exercise, and each plan holder should take credit for the exercise.

→ **Vessels.**

For vessels, if a plan holder has one response plan for a fleet of vessels and cites the same spill management team for more than one or all of the plans, the spill management team would only have to conduct one spill management team tabletop exercise annually, as long as the core response plan is used in the exercise and the spill management team demonstrates knowledge of the geographic specific annexes of the vessels during the exercise. All vessel plan holders in the fleet citing this spill management team should take credit for the annual exercise.

→ **Pipelines.**

For pipelines, the spill emergency response team is the spill management team.

Equipment Deployment Exercises

The equipment deployment exercise applies to all plan holders. It is the responsibility of the plan holder to ensure that the Equipment Deployment Exercise requirement is met.

The two primary requirements for the equipment deployment exercise are:

1. The personnel that would normally operate or supervise the operation of the response equipment must participate in the exercise. The personnel must demonstrate their ability to deploy and operate the equipment, while wearing appropriate personal protective equipment. All personnel involved in equipment deployment and equipment operators must be involved in a training program.

2. The response equipment must be in good operating condition. The equipment must be appropriate for the intended-operating environment. The equipment must operate during the exercise. All response equipment must be included in a maintenance program.

Although not required as part of the equipment deployment exercises, plan holders are encouraged to use these exercises as an opportunity to validate response strategies detailed in response/contingency plans for the geographic area where the exercise is being conducted.

A plan holder is responsible for ensuring exercise of all equipment types cited in the plan whether plan holder owned or provided through an OSRO.

The purpose of the equipment deployment exercise is to validate that the equipment is appropriate for the operating environment in which it is intended to be used and that operating personnel are trained and capable of its deployment and operation. Thus it is not necessary to deploy every piece of each type of equipment as long as all equipment is included in a periodic inspection and maintenance program intended to ensure the equipment remains in good working order. However, all operating personnel must participate in exercises or responses on an annual basis in order to ensure they remain trained and qualified to operate equipment in the operating environment.

Note that the CG applies the same standards to HSRO owned equipment deployment exercises as described below for OSROs.

→ **OSRO Involvement in Equipment Deployment Exercises.**

The PREP guidelines identify the minimum amount of equipment that must be deployed in an equipment deployment exercise. This amount is considered to be a representative sample of the equipment. The rationale for this approach is that if the representative sample works, then the rest of the equipment could be expected to work since it would be part of the company's maintenance program. For the personnel, if a representative sample of the OSRO's personnel are involved in the deployment exercise and handle their responsibilities effectively, the rest of the personnel could be expected to be knowledgeable and effective since they would be a part of the company's training program. *When selecting the equipment and personnel for the exercise, the* OSRO *should ensure that the same equipment and personnel are not used repeatedly for each exercise. The equipment should be selected on a rotational basis, as with the personnel, with the ultimate goal of eventually exercising all of the* OSRO's *equipment and personnel.*

If an OSRO has separate field response facilities located throughout the country in areas that do not lend themselves to regional consolidation, each staffed field response facility, for the purpose of the PREP, will be considered a separate OSRO and will be required to conduct an annual equipment deployment exercise of the minimum amount of equipment specified in the in the PREP.

In both cases, if the OSRO is classified to deploy equipment to more than one type of operating environment, the OSRO must conduct a deployment exercise in each of the environments.

A few of the larger OSROs have small field response facilities. A field response facility is defined as a location where personnel and equipment are staged. Some of these OSROs have divided their operations into regional response facilities. In some instances, a regional facility will be responsible for several small field response facilities or equipment stockpiles. For the purpose of the equipment deployment exercises under the PREP, **each regional facility** will be considered a separate OSRO and will be required to conduct an annual equipment deployment exercise of the minimum amount of equipment specified in the PREP. The OSRO regional facility would be responsible for coordinating resources from all field facilities within the region for the exercise. In such instances, equipment may be drawn from one or more field facilities, but personnel from each field facility must participate in the equipment deployment exercise. If the OSRO operates using regional facilities, the OSRO will be responsible for defining its regional boundaries and providing information to its plan holders. Generally, however regions should be reasonable in geographic size. At a minimum, plan holders must ensure their OSRO(s) conduct annual equipment deployment exercises in each operating environment in which they expect to operate for each CG District or Regional Response Team Regions and EPA Area Contingency Planning area, or EPA sub-area (where identified), unless adjoining areas or sub-areas authorize an alternative. For example, if an OSRO is located in the First CG District, and provides response assets to the Fifth CG District as well those two might mutually agree to allow the OSRO to conduct fewer exercises due to similarity of operating environments in those areas and opportunity to observe the exercises. The OSRO should request this consideration in writing from the appropriate Contingency Planning Area and sub-area.

If the OSRO is cited in a response plan outside of its normal equipment staging and operating areas (i.e. as a Tier 2 responder), the plan holder citing that OSRO must ensure that the OSRO has the local knowledge relevant to an effective, efficient response in the plan holder's operating area. The plan holder must describe arrangements for providing the OSRO with information such as equipment launching locations, tides and currents of the local area, and any other logistical problems or information specific to the particular area.

The OSRO should provide documentation of completion of the exercise requirements to each plan holder covered by that OSRO. It is the plan holder's responsibility to ensure that the OSRO has completed the equipment deployment exercise requirements and has obtained the necessary documentation. All plan holders identifying an OSRO in their response plans as providing response resources should take and document their credit for completing the equipment deployment exercise requirements once documentation is received from the OSRO. All plan holders must remember that merely citing an OSRO in their response plan is not sufficient to ensure credit for the equipment deployment exercise.

→ **Cooperatives (Co-ops).**

For co-ops that are comprised of several OSROs, **each separate OSRO** that makes up the co-op would be required to conduct an annual equipment deployment exercise of the minimum amount of equipment listed below.

For co-ops that are comprised of facility equipment and personnel pooled together, **for the purposed of the PREP, this type of co-op is considered an OSRO** and would be required to conduct the equipment deployment exercise as outlined in the OSRO section. This co-op, which is formed by a

number of facilities pooling their response equipment and personnel together, would be required to conduct an equipment deployment exercise of the minimum amount of equipment listed below annually. Each facility and the personnel will not have to conduct the exercise individually. The co-op as a whole would conduct one equipment deployment exercise per year. Representatives from all of the facilities comprising this co-op must participate in this exercise.

Co-op personnel that are responsible for deploying the response equipment must be involved in a training program, which prepares them for operating the response equipment. Likewise, the Co-op must have a maintenance program for all of the response equipment.

→ **Vessel and Facility Plan Holder Owned and Operated Equipment.**

Plan holder owned and operated equipment is that equipment owned by a plan holder and operated either by the plan holder's own personnel or other personnel hired by the plan holder to operate this equipment. Whoever operates this equipment must be involved in the equipment deployment exercises.

Plan holders that have plan holder owned and operated equipment, and have this equipment identified in their response plan for spill response, would be required to deploy this equipment twice a year (semiannually). The plan holder would be required to deploy the minimum amount of equipment for deployment specified below or the total amount of equipment that plan holder has available for response, whichever is less. The requirement for semiannual equipment deployment is based on the fact that this equipment is not deployed routinely and that the personnel operating it do not do this as a part of the vessel's or facility's normal operations. The semiannual requirement is necessary to ensure adequate preparedness for spill response.

The plan holder's personnel responsible for deploying the response equipment must be involved in a training program which prepares them for operating the response equipment. Likewise, the vessel/facility plan holder must have a maintenance program for all of the response equipment.

→ **Plan Holders Using a Combination of OSRO Equipment and Plan Holder Owned and Operated Equipment**

Plan holders citing both OSRO equipment and their own equipment in their response plans would be required to exercise both types of equipment at the above described intervals.

→ **Minimum Amount of Equipment to be Deployed in Internal Equipment Deployment Exercises.**

I. Hazardous Substance Incident Assessment Equipment used in the initial assessment and response to hazardous substance releases. Note that this type of equipment is not required by regulation for oil spill response.

a) Monitoring- Air, surface and subsurface plume monitoring equipment.

b) Personal Protective Equipment-Protective clothing, protective breathing apparatus appropriate to protecting responders in the environments to which they might be exposed in responding to a release

c) Technical Equipment - Used for trajectory analysis.

→ **Oil and Hazardous Substance Response Systems.**

A) Mechanical - Skimming/Recovery Systems - One of each type of Skimming System as listed in the plan. A Skimming System includes containment boom, hoses, piping, pumps, prime movers, support vessels, etc. necessary for the effective operation of that system.

Types of Skimming/Recovery Systems include:

- Oleophilic - Brush
- Oleophilic - DiscOleophilic - Paddle Belt
- Oleophilic - Rope Mop
- Oleophilic - Sorbent Lifting Belt
- Oleophilic - Submersion Belt
- Oleophilic - Submersion Plane
- Suction (including vacuum trucks)
- Weir
- Advancing Weir

- Special Purpose skimmers (e.g. fast water)

B) In-Situ Burn Systems – Each ISB package listed in the plan and relied on by the plan holder in meeting response equipment capability requirements - including boom, method of ignition, support vessels and smoke plume monitoring equipment. Deployment or use of in situ-burning should not occur during the exercise unless directed by the Federal On-Scene Coordinator.

C) Dispersant Systems – Each dispersant package listed in the plan and relied on by the plan holder in meeting response equipment capability requirements , including dispersant delivery vehicles, application equipment, and dispersed oil plume monitoring equipment. Deployment or use of the actual dispersant should not occur during the exercise unless directed by the Federal On-Scene Coordinator.

II. Booming Systems (includes protective and containment boom not exercised as part of a skimming or in-situ burning system described above) 1,000 feet (or total amount of boom listed in plan, whichever is less) of each protective or containment boom system listed in the plan and relied on by the plan holder in meeting response equipment capability requirements. Protective boom systems (boom and means of deploying and anchoring) include the following types:

- Fence Boom
- Curtain Boom: internal foam; external foam, self-inflatable and pressure inflatable.
- External Tension Boom
- Tidal Seal Boom **(Only 50 feet of this type of boom need be deployed.)**
- Special Purpose
- -Ice Booms

***Fast Water Booms (Equipment and/or techniques intended to improve spill containment, control in fast water situations).**

→ **Area Equipment Deployment. (Oil only).**

The area equipment deployment exercise involves Coast Guard and EPA "first aid" response equipment and the Coast Guard's prepositioned equipment. All of the "first aid" equipment or that which is necessary to respond to an average most probable discharge in the area, whichever is less, would be deployed annually.

Internal Unannounced Exercises

THIS IS NOT A SEPARATE EXERCISE. THIS SECTION OUTLINES THE REQUIREMENT THAT ONE OF THE PREP EXERCISES USED BELOW MUST BE CONDUCTED UNANNOUNCED.

Annually, each plan holder should ensure that one of the following exercises is conducted unannounced:

- Emergency procedures exercise for vessels and barges;
- Emergency procedures exercise for facilities (optional);
- Spill management team tabletop exercise; or
- Equipment deployment exercise.

An unannounced exercise is where the exercise participants do not have prior knowledge of the exercise, as would be the situation in an actual spill incident.

To ensure that the nation maintains an adequate posture for response preparedness, and to satisfy the OPA 90 requirement for unannounced exercises, it is necessary to have an exercise program, which is comprised of both announced and unannounced exercises. The requirement for the annual unannounced exercise is necessary to maintain the level of preparedness necessary to effectively respond to a spill.

Response to an actual spill should be taken as credit for the unannounced exercise requirement, if the response was evaluated.

The emergency procedures exercise is being offered as an option for facilities, to provide an additional exercise that may be conducted unannounced.

Government-Initiated Unannounced Exercises

The government-initiated unannounced exercises are designed to give the agency with primary regulatory oversight over a particular industry the opportunity to evaluate, on a random basis, the response preparedness of that industry. The PREP has attempted to make this requirement as reasonable as possible. The frequency of these drills for the noted Agencies are as follows:

- For Coast Guard regulated vessels and facilities, the government - initiated unannounced exercises are limited to four per area per year.
- For EPA-regulated facilities, the government-initiated unannounced exercises are limited to 10% of the plan holders per EPA region per year.
- For RSPA-regulated pipelines, the government-initiated unannounced exercises are limited to 20 annually across the nation.
- For MMS-regulated offshore facilities, the number of government-initiated unannounced exercises are determined by the Regional Supervisor and may exceed 50 per year nationally. A facility will not face an MMS unannounced exercise more than once per year, unless the results of previous exercises indicate that follow-up drills are warranted due to poor performance during a drill.

A plan holder directed to participate in a government-initiated unannounced exercise is required to participate as directed unless specific conditions exist that may result in safety hazards. The cost of the unannounced exercise will be borne by the response plan holder.

For complex facilities that are regulated by two or more agencies, it is the responsibility of the exercising agency to notify and invite the participation of the other agency and the responsible On-Scene Coordinator in advance, so as to minimize the possibility of the facility being exercised multiple times during a compressed time period.

A plan holder that has successfully completed a government-initiated unannounced exercise would not be required to participate in another Federal government - initiated unannounced exercise for at least 36 months from the time of the last exercise provided that the drill protocols and method of evaluation are equivalent. The plan holder must maintain documentation of this participation.

Guidelines for determining successful completion of an exercise and for determining enforcement actions (including but not limited to civil penalties) for an unsuccessful exercise are the responsibility of the individual oversight agencies, based on application of their individual agency regulations.

→ **Successful Completion of Government-Initiated Unannounced Exercises.**

A government-initiated unannounced exercise must be successfully completed as determined by the initiating authority. Failure to successfully complete an exercise indicates that either the plan holder could not properly implement its response plan, that the response resources were not available or not in operating condition, or that response personnel were not adequately trained in implementing the response plan. These are all causes for corrective action that may include but is not limited to additional unannounced exercises and revisions to the submitted response plan. For an exercise to be successful it is intuitive that it must meet the Scope and Objectives of the exercise element. It is the responsibility of the agency with oversight of the regulated entity to develop specific guidelines for determining the successful completion of an exercise and for determining appropriate enforcement actions (including but not limited to civil penalties) for an unsuccessful exercise.

One of the objectives for successful completion of an exercise is the concept of demonstrating that the response can be conducted in a timely manner. Note that the connotation of timely remains a planning rather than a performance standard. Timely is **defined** in Section 1 of these guidelines and is further discussed in specific portions of the Guiding Principles and in those sections of the Guidelines which address specific exercise elements for vessels and facilities.

Marine Transportation-Related Facilities and Vessels Regulated by the U.S. Coast Guard.

Coast Guard personnel conducting USCG-initiated unannounced exercises will be guided by the following concepts when determining success of an exercise. Keeping in mind that response time frames in the regulations are planning standards and not performance standards, and that the government initiated unannounced exercise program focuses on average most probable discharges, successful completion cannot be determined by a stopwatch, but by subjective evaluation of a variety of factors including:

1. Response resources located within 17-mile radius of transfer site (boom - 1 hour response time over the road given half hour for mobilization) and 52-mile radius of transfer site (recovery equipment -

2 hour response time over the road given half hour for mobilization) if response personnel are standing by with the equipment during any plan holder transfer operation.

2. For lightering, bunkering etc, on water, Response resources located within 2.5 nautical mile radius of transfer site (boom - 1 hour response time over the road given half hour for mobilization) and 7.5 nautical mile radius of transfer site (recovery equipment - 2 hour response time over the road given half hour for mobilization) if response personnel are standing by with the equipment during any plan holder transfer operation.

3. Personnel to operate the equipment need not be co-located with the equipment, as long as those personnel are located within the same response radii and personnel needed to mobilize and transport the equipment are co-located with the equipment.

4. If plan holder notifies and orders OSRO equipment quickly and the OSRO demonstrates it's capability to mobilize the equipment immediately then the precise time the equipment arrives on scene is not important. USCG exercise personnel may opt to send a team to the OSRO site to observe mobilization as part of the exercise. (E.g., Boom is 7 miles away from transfer site - at 35 miles per hour that boom can be on scene in 12 minutes, so if notification and mobilization can be completed in 45 minutes, it is reasonable to assume that the boom will be on scene in less than one hour. If boom is 17 miles away notification and mobilization must be completed in 30 minutes. If it is 28 miles away, mobilization must be complete in 15 minutes, and so on.).

5. Under the above circumstances is does not matter how soon the equipment and personnel arrive on scene because any delay can reasonably be presumed to have been caused by the instant conditions rather than the average conditions on which the planning travel times are based.

6. Once the equipment is delivered on scene, personnel should be able to deploy and operate the equipment without significant difficulty (people should generally be aware of locations of equipment launch sites, anchoring points and deployment strategies.) However, because specific conditions vary at every site, deployments are not likely to be entirely seamless and deployment personnel may need to make adjustments that will delay completion of deployment. In fact, the ability to adjust to these differing environmental conditions may be an indicator of the competence of response personnel.

7. While it is intended that equipment be in the water and operational before the end of 4-hour exercise period, there are circumstances, particularly related to safety and non-interference with actual operations that may delay completion of deployment beyond that time. In such a case, exercise should continue until equipment is deployed and operated satisfactorily.

→ **Non-transportation-Related Facilities Regulated by the Environmental Protection Agency.**

The measure of an effective unannounced government-initiated exercise will be the overall ability of the responders identified in the facility response plan to rapidly and effectively control a small discharge with particular attention to those actions that afford the best chances to control a spill and minimize its impact in the first few hours of the incident. While recognizing that an effective response to an oil discharge entails the rapid deployment of proper equipment, it is not the intention of the EPA to use timeliness as the sole factor when evaluating the response to a government-initiated unannounced exercise for a small discharge. EPA personnel will evaluate whether the response equipment specified in the response plan arrives at the specified times. These times are listed in the response plan and are based on the response planning requirements in 40 CFR 112 or alternative response times when approved by the Regional Administrator. Whether the containment boom and recovery devices specified in the response plan arrive precisely at the specified times is less relevant than the overall conduct of the exercise and the successful achievement of the exercise objective described in PREP. The objective of a government-initiated unannounced exercise for a small discharge includes the following sub-objectives:

- Conducting proper notifications;
- Arrival of containment boom as specified in the approved response plan within one hour of detection of the discharge and the subsequent successful deployment;
- Arrival of oil recovery devices as specified in the approved response plan within two hours of detection of the discharge and the subsequent successful operation/simulated recovery;

- Demonstrating the availability of adequate storage capacity for recovered oil; and

- Properly conducting the exercise considering the size of a small discharge including skill and competency of responders and material readiness of response equipment.

The failure to achieve any one sub-objective should not automatically indicate that an exercise is a failure. EPA personnel evaluating the exercise should assess: the plan holders ability to conduct proper notifications; material readiness of response equipment; and the overall ability of responding personnel to mobilize, arrive on scene in a timely manner, properly deploy the containment boom, simulate recovery of oil, and demonstrate skill and competency during the 4 hour exercise window.

The EPA exercise evaluator will have a subjective role in determining the success of the exercise based on the achievement of the exercise objectives within the specific time. These evaluations will be dependent on spill site and circumstances. EPA personnel may request to review records of previous facility response plan exercises when there is a concern that the response time is excessive. As the result of an unsuccessful exercise the EPA may require the plan holder to participate in additional unannounced exercises, revise the existing response plan, or both. Unsuccessful unannounced exercises may also result in enforcement action against the plan holder.

→ **Safety During Exercises and Responses.**

The responsibility for safely conducting an exercise or an actual response remains with the plan holder and responding personnel. The response plan should comply with all the regulatory requirements while considering safety factors. Plan holders and responders are never expected to operate in an unsafe or illegal manner during an exercise or actual response. The plan holder is responsible to confirm that the resources identified in the response plan can mount an effective response while operating within all applicable laws and regulations. In short, there is no expectation or justification for placing people at risk during an exercise or response. Conducting the exercise in an unsafe manner is likely to contribute to an unsatisfactory exercise.

Triennial Exercise of the Entire Response Plan.

Every 3 years all components of the entire response plan must be exercised. Rather than requiring each plan holder to conduct a major-exercise every 3 years, the PREP allows for the individual components to be exercised in portions through the required exercises.

The following are the basic types of plan components that must be exercised at least once every 3 years:

Organizational Design

(1) Notifications
(2) Staff mobilization
(3) Ability to operate within the response management system described in the plan

Operational Response

(4) Discharge control
(5) Assessment of discharge
(6) Containment of discharge
(7) Recovery of spilled material
(8) Protection of sensitive areas
(9) Disposal of recovered material and contaminated debris

Response Support

(10) Communications
(11) Transportation
(12) Personnel support
(13) Equipment maintenance and support
(14) Procurement
(15) Documentation

While not all of these components would necessarily be contained in each plan, the plan holder should identify those that are applicable from the list above, and add or delete other components as appropriate. The plan holder would then be responsible for ensuring that all components of the plan are exercised within each 3-year exercise cycle.

To satisfy the requirement of the triennial exercise of the entire response plan, it is not necessary to exercise the entire plan all at one time. The plan may be exercised in segments over a period of 3 years, as long as each component of the plan is exercised at least once within the 3-year period. The required exercises should be developed to ensure that each component is addressed and exercised in the triennial cycle. Appendix A

includes a template for use by plan holders tacking exercise completion over the 3-year PREP cycle.

The plan holder is responsible for documenting the components completed in the exercises.

→ **Triennial Cycle.**

In the triennial cycle, the following internal exercises must be conducted

- **12 qualified individual notification exercises;**
- **12 emergency procedures exercises**--manned vessels and unmanned barges (optional for facilities);
- **3 spill management team tabletop exercises--**one must involve a worst case discharge scenario;
- **3 unannounced exercises--**any of the exercises, with the exception of the qualified individual notification exercise, if conducted unannounced, would satisfy this requirement;
- **Equipment deployment exercises as described below:**
  - For vessel/facility owned and operated equipment-
    - 6 plan holder owned and operated equipment deployment exercises (for plan holders with vessel/facility owned and operated equipment identified in their response plan)
  - For vessels and facilities with OSROs identified for response equipment-
    - 3 OSROs equipment deployment exercises
  - For pipelines -
    - 3 pipeline equipment deployment exercises (using either OSRO and/or operator owned equipment
  - For offshore facilities
    - 3 equipment deployment exercises (for equipment staged onshore)
    - 6 equipment deployment exercises (for equipment staged offshore); and
- **Triennial Exercise of Entire Response Plan -** Each component of the response plan must be exercised at least once in the triennial cycle.

Area Exercises

The purpose of the area exercise is to exercise the entire response community in a particular area. An area is defined as that geographic area for which a separate and distinct Area Contingency Plan has been prepared, as described in OPA 90. The response community includes the federal, state and local government and industry. The area exercises are designed to exercise the government and industry interface for spill response.

The goal of the PREP is to conduct 20 area exercises per year nationwide, 60 within a triennial cycle. This method should ensure that all areas of the country are exercised triennially. Six of the 20 annual area exercises would be led by the government, that is the Area Committee, with a single industry plan holder as exercise partner. Industry plan holders would lead the other 14 with the Area Committee as exercise partner. An exercise design team will develop all of the area exercises. The exercise design team is comprised of representatives from the federal, state, and local government agencies, the local response community and the industry plan holder. A lead plan holder would lead each area exercise. The lead plan holder is the organization (government or industry) that is responsible for the primary plan that is exercised in the area exercise. The lead plan holder would have the final word on designing the scope and scenario of the exercise. The U.S. Coast Guard or the EPA, as Area Committee chair, would be the lead plan holder for the 6 government led exercises, with RSPA and MMS participating as appropriate.

A *suggested* mix of participants for the industry led area exercises would include:

- Vessels (6 exercises);
- Marine transportation-related (MTR) facilities (2 exercises);
- Onshore and certain offshore non-transportation-related facilities (2 exercises)
- Pipelines (2 exercises); and

- Offshore facilities (2 exercises).

The area exercises do not necessarily have to be large-scale productions. The scenario does not always have to involve a worst-case discharge. However at a minimum, the scenario must involve exercise of Tier I Worst-Case discharge capability. The primary purpose of the area exercise is to activate and observe the response infrastructure in the area, and the ability of the entire response community to effectively conduct a spill response. The focus should be on the interaction between the responsible party and the federal, state and local government to exercise both the Area Contingency Plan and the responsible party's response plan. The following are recommendations for the area exercises:

- Each exercise should be approximately 8-12 hours in duration. The exercises may be longer, if agreed to by the exercise design team.

- The area response mechanism would be evaluated in each area exercise. The unified command would be exercised.

- The lead plan holder will have the primary voice and final decision authority in the exercise design. However, exercise design should be conducted as a cooperative effort of the entire exercise design team.

- The exercise scenario will involve some amount of equipment deployment. The extent of equipment deployment should be determined by the lead plan holder after consulting with the exercise design team.

Area exercise equipment deployment should include testing adequacy of various response strategies contained in the plan, including but not limited to: protective booming for shoreline, fish, wildlife, and sensitive environment; fast-water, open-water, or shallow water containment and collection; or dispersant or in-situ burn operations. If the exercise spill scenario involves a maximum most probable or larger spill, a minimum of tier 1 equipment deployment should be conducted.

Equipment deployment need not be conducted simultaneously with the tabletop portion of the exercise. It may be done several weeks or even months prior to or after the tabletop to allow more efficient allocation of exercise planning and execution resources.

An Industry plan holder that participates in an Area Exercise would not be required to participate in another area exercise for a minimum of 6 years.

Plan holders are responsible for funding their participation in the area exercises.

An evaluation report should be completed not later than 60 days after completion of the area exercise. The evaluation report is completed by the joint evaluation team. For USCG Area Exercises, results of these joint evaluations will be entered in CGSAILS.

Area Exercise Scheduling

Scheduling of area exercises will be done under a nationally coordinated system that involves the federal, state and local governments and industry plan holders, and that recognizes the unique needs of specific geographic regions of the country.

→ **NSCC.**

A National Schedule Coordination Committee (NSCC) has been established for scheduling the area exercises. The NSCC is comprised of personnel representing the four federal regulating agencies - the Coast Guard, EPA, RSPA, and MMS.

→ **Scheduling Process.**

The NSCC is charged with developing and publishing a proposed area exercise schedule for each upcoming triennial period. This proposed schedule will be published in the Federal Register annually. The reason the exercises are scheduled three years in advance is to allow both area committees and industry plan holders to allocate sufficient funds and personnel. The NSCC will solicit comments on the proposed schedule and industry plan holders to lead and participate in the Area Exercises. It is important to note that the NSCC only proposes which area plans will be exercised over the three-year period. It is incumbent on the Regional Response Teams and Area Committees with jurisdiction over an area, to validate the proposed timeframe and to identify the industry plan holder who will participate in the exercise. Each Regional Response Team and Area Committee should work with the local industry to identify industry plan holders three years in advance of the scheduled exercise. Industry plan holders may also provide input to the scheduling process through the Area Committees.

Other Credit Issues

→ **Credit for Spill Response.**

Plan holders may take credit for internal exercises conducted in response to actual spills. The spill response must be evaluated. The plan holder must determine which exercises were completed in the spill response. This determination should be based on whether the response effort would meet the objectives of the exercise as listed in the PREP guidelines. The plan holder must document the exercises completed.

The NSCC is responsible for authorizing credit for area exercises, based on the recommendations of the On-Scene Coordinator. Credit should be given to a plan holder for participation in an area exercise if the following circumstances exist (1) the response plan was utilized in an actual spill response; (2) the response involved the entire response community; (3) the objectives of the area exercise were met as outlined in the PREP guidelines; (4) the response was evaluated; and (5) the spill response was properly documented and certified. Note that actual spills must involve, at minimum, deployment of worst-case discharge tier 1 capabilities to be eligible for this credit.

→ **Proper Documentation for Self-Certification.**

Proper documentation for self-certification should include, as a minimum, the following information:

- The type of exercise.
- Date and time of the exercise.
- A description of the exercise.
- The objectives met in the exercise.
- The components of the response plan exercised.
- Lessons learned.

This documentation must be in writing and signed by an individual empowered by the plan holder organization.

Sample documentation forms are attached as Appendix A to the PREP Guidelines.

As a general rule, exercise records should be completed within 30-60 days of the exercise, although this may vary depending on exercise complexity.

Special Issues

→ **Complexes.**

Complexes are facilities that must meet the requirements of more than one federal agency. For example, a facility that has oil storage tanks, a pipeline and a waterfront oil transfer dock is considered a complex since it must meet the requirements of EPA, RSPA and the Coast Guard.

Complexes would only be required to conduct one exercise to meet all agency requirements for that particular type of exercise. For example, if a quarterly notification exercise is required by all three agencies regulating the complex, one notification exercise per quarter would satisfy the requirements for all three regulatory agencies.

→ **Vessels Serving as Secondary Carriers of Oil.**

Vessels serving as secondary carriers of oil should comply with the exercise requirements in 33 CFR 155.1045(h).

→ **TAPAA Vessels and Facilities.**

Trans-Alaska Pipeline Authorization Act (TAPAA) vessels and facilities, in addition to complying with the primary exercise requirements, must comply with the additional exercise requirements identified in the vessel and facility response plan regulations at 33 CFR 155.1125(a)(2) and 33 CFR 154.1125(a)(2), respectively.

→ **LEPC Drill Credit.**

Local Emergency Planning Committees (LEPCs) are required to conduct hazardous substance exercises periodically. Industry plan holders should coordinate their exercises with the LEPCs, whenever possible, and should take credit, as long as the PREP exercise objectives are met.

→ **Foreign Vessels Calling Only Occasionally at U.S. Ports.**

If a vessel plan holder has a response plan, prepared with the intent that the vessel would be calling at U.S. ports, even if only occasionally, the vessel plan

holder must have an exercise program in place and be conducting the required exercises. If the plan holder is following the PREP guidelines, all exercises must be conducted at the frequency listed in the PREP guidelines. The only exception to this requirement is the qualified individual notification exercise, which is only required to be conducted quarterly while operating in U.S. waters, otherwise upon entry into U.S. waters.

If a vessel comes into U.S. waters for the first time, but intends to continue trading, it must conduct the qualified individual notification exercise immediately, and then begin its exercise program. Since the PREP follows the calendar year, the triennial cycle should begin as soon as the vessel enters U.S. waters. The vessel should remain on the calendar year schedule, with the following January 1 beginning the next year of the vessel's triennial cycle. In such cases, the plan holder will only be expected to complete 2 full years of internal exercises during the first triennial cycle. For the first year, the plan holder must complete one QI notification and one emergency procedures exercise each quarter during that year. Spill management team and equipment deployment exercises are recommended as soon as possible, but can be held up to 11 months after the date of the first entry into U.S. Waters.

If the vessel only intends to make one voyage into U.S. waters, the vessel must conduct the qualified individual notification exercise immediately upon entry. If the vessel intends to reenter the U.S. at any time, it must comply with all exercise requirements.

→ Railroad Tank Cars and Motor Vehicle Tank Trucks

There are few individual railroad tank cars or motor vehicle tank trucks transporting sufficient volumes of oil to be subject to the response planning requirements of OPA 90. For additional information on response planning requirements for individual railroad tank cars and motor vehicle tank trucks transporting oil, including training, equipment testing, and drills, see 49 CFR 130. A railroad tank car or a tank truck which transfers oil to or from certain vessels may be considered to be a mobile marine transportation-related facility and may be subject to the response planning requirements in 33 CFR 154. Loading and offloading of railroad tank cars and tank trucks at certain non-transportation related facilities may be covered by response plans prepared by a facility owner or operator subject to the requirements contained in 40 CFR 112.

Section 3:

U.S. Coast Guard – Regulated Vessels and Marine Transportation-Related Facilities

QI Notification Exercise

Coast Guard Marine Transportation-Related (MTR) Facilities

Applicability: Facility.

Frequency: Quarterly.

Initiating Authority: Company policy.

Particip. Elements: Facility personnel, qualified individual.

Scope: Exercise communications between facility personnel and qualified individual.

Objectives: Contact must be made with a qualified individual or designee, as designated in the response plan.

Certification: Self-certification.

Verification: U.S. Coast Guard.

Records:

Retention: 3 years.

Location: Records to be kept at the facility.

Evaluation: Self-Evaluation.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises, as long as all objectives are met, the exercise is evaluated and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

For plan holders handling both oil and hazardous substances, a single QI notification will

satisfy exercise requirement for both plans, if both plans rely on the same QI. If the plan holder uses two different QIs, the plan holder is required to exercise each separately,

QI Notification Exercise

Manned Vessels

Applicability: Manned vessels.

Frequency: Quarterly while operating in U.S. waters, including the exclusive economic zone (EEZ); otherwise upon entry into U.S. waters, not to exceed four times per year. The qualified individual notification exercise would not be required for ships outside U.S. waters.

Initiating Authority: Master or designee according to plan.

Particip. Elements: Vessel personnel, plan designated shore side personnel, and a vessel's qualified individual.

Scope: Exercise communication between vessel personnel and qualified individual.

Objectives: Contact by telephone, radio, message-pager or facsimile a confirmation must be made with a qualified individual or designee as designated in the plan. A telex may be used only if the other means are not available

Certification: Self-certification.

Verification: U.S. Coast Guard.

Records:

Retention: 3 years.

Location: Logbook entry indicating time of qualified individual notification as provided at 33 CFR 155.1060(e)(1).

Evaluation: Owner or operator should conduct review to determine if objectives have been met.

Self-evaluation.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises, as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated and a proper record is generated.

For plan holders handling both oil and hazardous substances, a single QI notification will satisfy exercise requirement for both plans, if both plans rely on the same QI. If the plan holder uses two different QIs, the plan holder is required to exercise each separately,

QI Notification Exercise

Unmanned Barges

Applicability: Unmanned barge.

Frequency: Quarterly while operating in U.S. waters, including the exclusive economic zone; otherwise upon entry into U.S. waters, not required to exceed four times per year. The qualified individual notification exercise would not be required for barges outside U.S. waters.

Initiating Authority: Barge owner or operator or towing vessel captain.

Particip.. Elements: Barge custodian and qualified individual.

Scope: Exercise communication between barge custodian and qualified individual.

Objectives: Contact-by telephone, radio, message-pager, or facsimile and confirmation must be made with the qualified individual or designee, as designated in the response plan.

Exercises should be conducted randomly to ensure that all barge custodians have an equal chance for participation in the notification exercises.

Certification: Self-certification.

Verification: U.S. Coast Guard.

Records:

Retention: 3 years.

Location: Records to be kept on board the barge or with the response plan for the barge.

Evaluation: Self-evaluation.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises, as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

For plan holders handling both oil and hazardous substances, a single QI notification will satisfy exercise requirement for both plans, if both plans rely on the same QI. If the plan holder uses two different QIs, the plan holder is required to exercise each separately,

On Board Emergency Procedures Exercise

Manned Vessels

Applicability: Manned vessels.

Frequency: Quarterly.

Initiating Authority: Master or designee according to plan.

Particip. Elements: Vessel personnel.

Scope: Exercise the emergency procedures for the vessel crew to mitigate or prevent any discharge or a substantial threat of such discharge of oil/HAZSUB resulting from shipboard operational activities associated with internal or external cargo transfers.

Objectives: Conduct an exercise of the vessel's emergency procedures to ensure crew knowledge of actions to be taken to mitigate a spill. This exercise may be a walk-through of the crews' actions.

Exercise should involve one or more of the sections of the emergency procedures for spill mitigation. For example -

> Simulation of response to a collision.

> Simulation of response to an oil spill on the deck of the vessel.

> Simulation of response to a vessel fire.

Annually ensure that spill mitigation procedures for all contingencies identified in the response plan have been exercised.

Certification: Self-certification.

Verification: U.S. Coast Guard.

Records:

Retention: 3 years.

Location: Logbook entry as provided at 33 CFR 155.1060(e)(1).

Evaluation: Self-evaluation.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises, as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

On vessels covered by both oil and hazardous substance plans, separate oil and hazardous substance exercises are not required. However, the shipboard personnel should alternate oil and hazardous substance scenarios each quarter.

Emergency Procedures Exercises

Unmanned Barges

Applicability: Unmanned barge(s).

Frequency: Quarterly.

Initiating Authority: Barge owner or operator.

Particip. Elements: Barge custodian.

Scope: Exercise the emergency procedures to be taken for an oil/HAZSUB discharge or substantial threat of such discharge. Such procedures are outlined at33 CFR 155.1040 (a).

Objectives: Conduct a walk-through of the emergency procedures.

Ensure barge custodians know proper actions to take in the event of an oil discharge or substantial threat of such discharge.

Certification: Self-certification.

Verification: U.S. Coast Guard.

Records:

Retention: 3 years.

Location: Records to be kept on board the barge or with the response plan for the barge.

Evaluation: Self-evaluation.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit

should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

On vessels covered by both oil and hazardous substance plans, separate oil and hazardous substance exercises are not required. However, the shipboard personnel should alternate oil and hazardous substance scenarios each quarter.

Emergency Procedures Exercises

Facilities (Optional)*

Applicability: Facility.

Frequency: Quarterly.

Initiating Authority: Facility owner or operator.

Particip. Elements: Facility personnel.

Scope: Exercise the emergency procedures for the facility to mitigate or prevent any discharge or a substantial threat of such discharge of oil/HAZSUB resulting from facility operational activities associated with oil transfers.

Objectives: Conduct an exercise of the facility's emergency procedures to ensure personnel knowledge of actions to be taken to mitigate a spill. This exercise may be a walk-through of the emergency procedures.

Exercise should involve one or more of the sections of the emergency procedures for spill mitigation. For example, the exercise should involve a simulation of a response to an oil spill.

The facility should ensure that spill mitigation procedures for all contingencies at the facility are addressed at some time.

Certification: Self-certification.

Verification: U.S. Coast Guard.

Records:

Retention: 3 years.

Location: At each facility.

Evaluation: Self-evaluation.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises, as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

***This section describes an optional exercise to provide facilities with an exercise that may be conducted unannounced to fulfill the internal unannounced exercise requirement.**

At facilities covered by both oil and hazardous substance plans, separate oil and hazardous substance exercises are not required. However, the shipboard personnel should alternate oil and hazardous substance scenarios each quarter.

Spill Management Team Tabletop Exercise

U.S. Coast Guard MTR Facilities

Applicability: Facility spill management team

Frequency: Annually.

Initiating Authority: Company policy.

Particip. Elements: Spill management team as established in the response plan.

Scope: Exercise the spill management team's organization, communication, and decision-making in managing a spill response.

Objectives:

Exercise the spill management team in a review of -

> Knowledge of the response plan;

> Proper notifications;

> Communications system;

> Ability to access an OSRO/HSRO;

> Coordination of internal organization personnel with responsibility for spill response;

> An annual review of the transition from a local team to a regional, national, and international team, as appropriate;

> Ability to effectively coordinate spill response activity with the National Response System (NRS) infrastructure. (If personnel from the NRS are not participating in the exercise, the spill management team should demonstrate knowledge of response coordination with the NRS);

> Ability to access information in the Area Contingency Plan for location of sensitive areas, resources available within the area, unique conditions of area, etc

> At least one spill management team tabletop exercise in a triennial cycle would involve simulation of a worst-case discharge scenario.

Certification: Self-certification.

Verification: U.S. Coast Guard.

Records:

Retention: 3 years.

Location: At each facility.

Evaluation: Self-evaluation.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

Plan holders are responsible for ensuring that SMTs are familiar with Area Committees/Regional Response Teams (*RRTs) and Area Contingency Plans in every area in which the plan holder operates. While it is not practicable to require an SMT to exercise in every area/region in which they offer cover each year, each SMT is expected to review ACPs annually and the make-up of Area Committees/RRTs in all areas in which they offer coverage. Self-certification for exercise credit should include SMT certification that the SMT has completed annual review and is familiar with the ACPs and Area

Spill Management Team Tabletop Exercise

Vessels

Applicability: Vessel spill management team.

Frequency: Annually.

Initiating Authority: Company policy.

Particle. Elements: Spill management team as established in the response plan.

Scope: Exercise the spill management team's organization, communication, and decision-making in managing a spill response.

Objectives:

Exercise the spill management team in a review of -

> Knowledge of the response plan;

> Proper notifications;

> Communications system

> Ability to access an OSRO/HSRO;

> Coordination of internal organization personnel with responsibility for spill response;

> An annual review of the transition from a local team to a regional, national, and international team, as appropriate;

> Ability to effectively coordinate spill response activity with the National Response System (NRS) infrastructure. (If personnel from the NRS are not participating in the exercise, the spill management team should demonstrate knowledge of response coordination with the NRS.); and

> Ability to access information in the Area Contingency Plan for location of sensitive areas, resources available within the Area, unique conditions of Area, etc.

At least one Spill Management Team Tabletop Exercise in a triennial cycle would involve simulation of a worst-case discharge scenario.

Certification: Self-certification.

Verification: U.S. Coast Guard.

Records:

Retention: 3 years.

Location: In accordance with 33 CFR 155.1060(e) (2).

Evaluation: Self-evaluation.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

Plan holders are responsible for ensuring that SMTs are familiar with Area Committees and Area Contingency Plans in every area in which the plan holder operates. While it is not practicable to require an SMT to exercise in every area in which they offer cover each year, each SMT is expected to review ACPs annually and the make-up of Area Committees in all areas in which they offer coverage. Self-certification for exercise credit should include SMT certification that the SMT has completed annual review and is familiar with the ACPs and Area Committees in all areas in which the plan holder operates.

For plan holders who handle both oil and hazardous substances, if the same spill management team handles all oil and hazardous substance incidents, only one SMT exercise is required annually. In such cases, at least 1 of the exercises should focus on oil and 1 on hazardous substances every three years. Over the course of six years, at least one worst-case hazardous substance and one worst-case oil scenario should be exercised.

For plan holders who handle both oil and hazardous substances, if the spill management teams are not the same, separate spill management team exercises are required.

Equipment Deployment Exercises

U.S. Coast Guard MTR Facilities

Applicability: Facilities with facility owned and operated response equipment.

Frequency: Semiannually.

Initiating Authority: Company policy.

Particip. Elements: Facility personnel.

Scope: Deploy and operate facility owned and operated response equipment identified in the response plan. The equipment to be deployed would be either (1) the minimum amount of equipment for deployment as described in "Guiding Principles", or (2) the equipment necessary to respond to an average most probable discharge at the facility, whichever is less.

All of the facility's personnel involved in equipment deployment operations must be included in a comprehensive training program. All of the facility's equipment must be included in a comprehensive maintenance program. Credit should be taken for deployment conducted during training. The maintenance program must ensure that the equipment is periodically inspected and maintained in good operating condition in accordance with the manufacturer's recommendations and best commercial practices. All inspection and maintenance must be documented by the owner.

Objectives: Demonstrate ability of facility personnel to deploy and operate equipment.

Ensure equipment is in proper working order.
deployment should also include testing ACP containment, protection and diversion strategies.

Certification: Self-certification.

Verification: U.S. Coast Guard.

Records:

Retention: 3 years.

Location: Records to be kept at facility.

Evaluation: Self-evaluation.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

Note: If a facility with facility owned and operated equipment also identifies OSRO equipment in its response plan, the OSRO equipment must also be deployed and operated in accordance with the equipment deployment requirements for OSRO owned equipment.

Equipment Deployment Exercises

U.S. Coast Guard MTR Facilities

Applicability: Facilities with OSRO/HSRO response equipment cited in their response plan.

Frequency: Annually.

Initiating Authority: Company policy.

Particip. Elements: Facility owner or operator and OSRO/HSRO.

Scope: Deploy and operate response equipment identified in the response plan. The equipment to be deployed would be the minimum amount of equipment as described in "Guiding Principles.

All of the OSRO/HSRO personnel involved in equipment deployment operations must be included in a comprehensive training program. All of the OSRO/HSRO equipment must be Included in a comprehensive maintenance program. Credit should be taken for equipment deployment conducted during training. The maintenance program must ensure that the equipment is periodically inspected and maintained in good operating condition in accordance with the manufacturers recommendations and best commercial practices. The facility owner or operator must ensure that inspection and maintenance by the OSRO/HSRO is documented. The OSRO/HSRO must provide inspection and maintenance information to the owner or operator.

Plan holders must ensure that when a regional OSRO/HSRO is identified in the response plan, the OSRO/HSRO conducts annual equipment deployment exercises in each operating environment for each CG Contingency Planning Area.

Objectives: Demonstrate the ability of the personnel to

deploy and operate equipment.

Ensure the response equipment is in proper working order.

Whenever feasible, equipment deployment should also include testing ACP containment, protection and diversion strategies.

Certification: The facility owner or operator should ensure that the OSRO/HSRO identified in the response plan provides adequate documentation that the requirements for this exercise have been met.

Verification: U.S. Coast Guard.

Records:

Retention: 3 years.

Records to be kept at the facility.

Evaluation: Self-evaluation.

Credits: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when the objectives are met, the response is evaluated, and a proper record is generated.

Equipment Deployment Exercises

Vessels

Applicability: Vessels.

Frequency: Annually.

Initiating Authority: Company policy.

Particip. Elements: Vessel owner or operator, and OSRO/HSRO.

Scope: Deploy and operate response equipment identified in the response plan. The equipment to be deployed would be the minimum amount of equipment for deployment as described in "Guiding Principles."

All of the OSRO personnel involved in equipment deployment operations must be included in a comprehensive training program. All of the OSRO/HSRO equipment must be included in a comprehensive maintenance program. Credit should be taken for equipment deployment conducted during training. The maintenance program must ensure that the equipment is periodically inspected and maintained in good operating condition in accordance with the manufacturer's recommendations and best commercial practices. The vessel owner or operator must ensure that inspection and maintenance by the OSRO/HSRO is documented. The OSRO/HSRO must provide inspection and maintenance information to the vessel owner or operator.

Plan holders must ensure that when a regional OSRO is identified in the response plan, the OSRO conducts annual equipment deployment exercises in each operating environment for each CG Contingency Planning Area.

Objective: Demonstrate the ability of the personnel to deploy and operate response equipment.

Ensure the response equipment is in proper working order.

Whenever feasible, equipment deployment should also include testing ACP containment, protection and diversion strategies.

Certification: The vessel owner or operator should ensure that the OSRO/HSRO identified in the response plan provides adequate documentation that the requirements for this exercise have been met.

Verification: U.S. Coast Guard.

Records:

Retention: 3 years (see 33 CFR 155.1060 (e)(2)).

Evaluation: Self-evaluation.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when the objectives are met, the response is evaluated, and a proper record is generated.

Government-Initiated Unannounced Exercises

Vessels and MTR Facility Response Plan Holders

Applicability: Vessel and MTR facility response plan holders within the area.

Frequency: Triennially, if successfully completed. A facility deemed by the CG/EPA not to have successfully completed the exercise may be required to participate in another government initiated unannounced exercise at the discretion of the exercising agency. (Plan holders who have successfully completed a PREP government-initiated unannounced exercise will not be required to participate in another one for at least 36 months from the date of the exercise.)

Initiating Authority: U.S. Coast Guard.

Particip. Elements: Vessel and MTR facility response plan holders.

Scope: Unannounced exercises are limited to a maximum of four exercises per area per year.

Exercises are limited to approximately 4 hours in duration.

Exercises must involve response to an average most probable discharge scenario.

RSPA and MMS would cover unannounced exercises for pipelines and offshore facilities <u>not a part of a complex</u> in their exercise programs.

Objectives: Conduct proper notifications to respond to unannounced scenario of an average most probable discharge.

Demonstrate response is -

> Timely- As a general rule, the regulatory planning standard is containment equipment (e.g., booms)

on scene within one hour of notification and recovery equipment (skimmers and temporary storage) on scene within two hours. Therefore in an government initiated unannounced exercise, plan holder should be able to initiate simulated clean up within approximately two hours of exercise commencement.

> Conducted with adequate amount of equipment for scenario; and

> Properly conducted.

Whenever feasible, equipment deployment should also include testing ACP containment, protection and diversion strategies.

Certification: U.S. Coast Guard.

Verification: U.S. Coast Guard.

Records:

Retention 3 years.

For facilities, at the facility.
For vessels, in accordance with 33 CFR 155.1060(e)(2).

Evaluation: Evaluation to be conducted by initiating agency.

Credit: Credit may be granted by the initiating authority for an actual spill response when the PREP objectives are met, the response is evaluated by the initiating authority and a proper record is generated. Plan holders participating in this exercise may take credit for notification and equipment deployment exercises, if criteria for those exercises are met, the response is evaluated by the plan holder and a proper record is generated.

Section 4

EPA-Regulated Onshore And Certain Offshore Non Transportation-Related Facilities

PREP Guidelines do not create binding legal requirements.

While the PREP Guidelines have been developed with the regulated community, they cannot be considered to be legally binding substantive rules. Plan holders can accept the PREP Guidelines to fulfill the exercise requirements of the Oil Pollution Act of 1990. An alternative program can also be acceptable subject to approval by the Regional Administrator. (See 40 CFR 112.21) Either the PREP Guidelines or the EPA-approved exercise program developed by the plan holder become binding when referenced in the submitted response plan.

QI Notification Exercises

EPA-Regulated Facilities

Applicability: Facility.

Frequency: Quarterly.

Initiating Authority: Company policy.

Particip. Elements: Facility personnel and qualified individual.

Scope: Exercise communications between facility personnel and qualified individual.

Objectives: Contact must be made with a qualified individual or designee, as designated in the response plan.

Certification: Self-certification.

Verification: Environmental Protection Agency (EPA)

Records:

Retention: 5 years.

Location: Records to be kept at the facility.

Evaluation: Self-evaluation.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

Emergency Procedures Exercises

Facilities (Optional)*

Applicability: Facility.

Frequency: Quarterly.

Initiating Authority: Facility owner or operator.

Partlcip. Elements: Facility personnel.

Scope: Exercise the emergency procedures for the facility to mitigate or prevent any discharge or a substantial threat of such discharge of oil resulting from facility operational activities associated with oil transfers.

Objectives: Conduct an exercise of the facility's emergency procedures to ensure personnel knowledge of actions to be taken to mitigate a spill. This exercise may be a walk-through of the emergency procedures.

Exercise should involve one or more of the sections of the emergency procedures for, spill mitigation. For example, the exercise may involve a simulation of a response to an oil spill.

The facility should ensure that spill mitigation procedures for all contingencies at the facility are addressed at some time.

Certification: Self-certification.

Verification: EPA.

Records:

Retention: 5 years.

Location: At each facility.

Evaluation: Self-evaluation.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises, as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

***This is offered as an optional exercise to provide facilities with an exercise that may be conducted <u>unannounced</u> to fulfill the internal unannounced exercise requirement.**

Spill Management Team Tabletop Exercise

EPA-Regulated Facilities

Applicability: Facility spill management team.

Frequency: Annually.

Initiating Authority: Company policy.

Particip. Elements: Spill management team as established in the response plan.

Scope: Exercise the spill management team's organization, communication, and decision- making in managing a spill response.

Objectives: Exercise the spill management team in a review of-

> Knowledge of the response plan;

> Proper notifications;

> Communications system;

> Ability to access an OSRO;

> Coordination of internal organization personnel with responsibility for spill response;

> An annual review of the transition from a local team to a regional, national, and international team, as appropriate;

> Ability to effectively coordinate spill response activity with the National Response System (NRS) infrastructure. (If personnel from the NRS are not participating in the exercise, the spill management team should demonstrate knowledge of response coordination with the NRS.)

> Ability to access information in Area Contingency

Plan for location of sensitive areas, resources available within the area, unique conditions of area, etc.

At least one spill management team tabletop exercise in a triennial cycle would involve simulation of a worst-case discharge scenario.

Certification: Self-certification.

Verification: EPA.

Records:

Retention: 5 years.

Location: At each facility.

Evaluation: Self-evaluation.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

Equipment Deployment Exercises

EPA-Regulated Facilities

Applicability: Facilities with facility owned and operated response equipment.

Frequency: Semiannually.

Initiating Authority: Company policy.

Particip. Elements: Facility personnel.

Scope: Deploy and operate facility owned and operated response equipment identified in the response plan. The equipment to be deployed would be either (1) the minimum amount of equipment for deployment as described in "Guiding Principles", or (2) the equipment necessary to respond to a small discharge at the facility, whichever is less.

All of the facility personnel involved in equipment deployment operations must be included in a comprehensive training program. All of the facility equipment must be included in a comprehensive maintenance program. Credit should be taken for deployment conducted during training. The maintenance program must ensure that the equipment is periodically inspected and maintained in good operating condition in accordance with the manufacturers recommendations and best commercial practices. All inspection and maintenance must be documented by the owner.

Objectives: Demonstrate ability of facility personnel to deploy and operate equipment.

Ensure equipment is in proper working order.

Certification: Self-certification.

Verification: EPA.

Records:

Retention: 5 years.

Location: Records to be kept at the facility.

Evaluation Self–Evaluation.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

Note: If a facility with facility owned and operated equipment also identifies OSRO equipment in its response plan, the OSRO equipment must also be deployed and operated in accordance with the equipment deployment requirements for OSRO owned equipment.

Equipment Deployment Exercises

EPA-Regulated Facilities

Applicability: Facilities with OSRO response equipment cited in their response plan.

Frequency: Annually.

Initiating Authority: Company policy.

Particip. Elements: Facility owner or operator and OSRO.

Scope: Deploy and operate response equipment identified in the response plan. The equipment to be deployed would be the minimum amount of equipment for deployment as described in "Guiding Principles."

All of the OSRO personnel involved in equipment deployment operations must be included in a comprehensive training program. All of the OSRO equipment must be included in a comprehensive maintenance program. Credit should be taken for equipment deployment conducted during training. The maintenance program must ensure that the equipment is periodically inspected and maintained in good operating condition in accordance with the manufacturer's recommendations and best commercial practices. The facility owner or operator must ensure that inspection and maintenance by the OSRO is documented. The OSRO must provide inspection and maintenance information to the owner or operator.

Plan holders must ensure that when a regional OSRO is identified in the response plan, the OSRO conducts annual equipment deployment exercises in each operating environment for each CG or EPA Contingency Planning Area, or EPA sub-area

(where identified).

Objectives: Demonstrate the ability of the personnel to deploy and operate response equipment.

Ensure the response equipment is in proper working order.

Certification: The facility owner or operator should ensure that the OSRO identified in the response plan provides adequate documentation that the requirements for this exercise have been met.

Verification: EPA.

Records:

Retention 5 years, kept at the facility.

Evaluation: Self-evaluation.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when the objectives are met, the response is evaluated, and a proper record is generated.

Government-Initiated Unannounced Exercises

EPA—Regulated Facility Response Plan Holders

Applicability: EPA-regulated facility response plan holders within the region.

Frequency: Triennially, if successfully completed. A facility deemed by the CG/EPA not to have successfully completed the exercise may be required to participate in another government initiated unannounced exercise at the discretion of the exercising agency. (Plan holders who have successfully completed a PREP government-initiated unannounced exercise will not be required to participate in another one for at least 36 months from the date of the exercise).

Initiating Authority: EPA.

Partlcip. Elements: EPA-regulated facility response plan holders.

Scope: Unannounced exercises are limited to a maximum of 10% of response plan holders per EPA Region per year.

Exercises are limited to approximately 4 hours in duration.

Exercises should involve response to a small discharge scenario (assume 2,100 gallons outside secondary containment and discharged into or on navigable waters and adjoining shorelines).

Exercise would involve deployment of response equipment identified in the facility response plan to respond to spill scenario.

RSPA and MMS will cover unannounced exercises for pipelines and offshore facilities not

a part of a complex in their exercise programs.

Objectives: Conduct proper notifications to respond to unannounced scenario of a small discharge.

Demonstrate that the response is -

> Timely as defined in section 1 of these Guidelines;

> Conducted with adequate amount of equipment for scenario; and

> Properly conducted.

Certification: EPA.

Verification: EPA.

Records Retention: 5 years, kept at the facility.

Evaluation: Evaluation to be conducted by initiating agency.

Credit: Credit may be granted by the initiating authority for an actual spill response when the PREP objectives are met, the response is evaluated by the initiating authority and a proper record is generated. Plan holders participating in this exercise may take credit for notification and equipment deployment exercises, if criteria for those exercises are met, the response is evaluated by the plan holder and a proper record is generated.

Section 5

Onshore Transportation-Related Pipelines

Owner or Operator Internal Notification Exercises

Onshore Transportation-Related Pipelines

Applicability: Pipeline owner or operator.

Frequency: As indicated by the response plan and, at a minimum, consistent with the triennial cycle (quarterly).

Party Initiating Exercise: As indicated in response plan.

Participants: Facility response personnel and the facility's qualified individual.

Scope: Exercise notification process between key facility personnel and the qualified individual to demonstrate the accessibility of the qualified individual.

Objectives: Contact by telephone, radio, message-pager, or facsimile and confirmation established as indicated in response plan.

Format: As indicated in response plan.

Certification: Self-certification as indicated in response plan. Each plan should have a written description of the company's certification process.

Verification: Verification conducted by Research and Special Programs Administration (RSPA) during regular inspections* or RSPA tabletop exercises.

*** Verification will not be done by inspections in the near term.**

Records:

Retention: 3 years.

Location: Owner or operator shall retain records as indicated in response plan.

RSPA to retain verification records.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

Internal Tabletop Exercises

Onshore Transportation-Related Pipelines

Applicability: Pipeline owner or operator.

Frequency: As indicated by the response plan and, at a minimum consistent with the triennial cycle (annually).

Party Initiating Exercise: As indicated in response plan.

Participants: Designated spill emergency response team members.

Scope: Demonstration of the response team's ability to organize, communicate, and make strategic decisions regarding population and environmental protection during a spill event.

Objectives: Designated emergency response team members should demonstrate -

> Knowledge of facility response plan;

> Ability to organize team members to effectively interface with a unified command;

> Communication capability; and

> Coordination for response capability as outlined in response plan.

Format: Internal tabletop exercise as outlined in response plan.

Certification: Self-certification as indicated in response plan or as defined in the "Guiding Principles" section of this document, whichever is more stringent. Each plan should have a written description of the company's certification process.

Verification: Verification conducted by RSPA during regular inspections* or RSPA tabletop exercises.

*** Verification will not be done by inspections in the near term.**

Records:

Retention: 3 years.

Location: Owner or operator shall retain records as indicated in response plan.

RSPA to retain verification records.

Credits: Plan holders should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

Owner/Operator Equipment Deployment Exercises

Onshore Transportation-Related Pipelines

Applicability: Pipeline owner or operator.

Frequency: As indicated by the response plan and, at a minimum, as consistent with the triennial cycle (annually).

***The number of equipment deployment exercises should be such that equipment and personnel assigned to each response zone are exercised at least once per year. If the same personnel and equipment respond to multiple zones, they need only exercise once per year. If different personnel and equipment respond to various response zones, each must participate in an annual equipment deployment exercise.**

Party Initiating Exercises: As indicated in response plan.

Participants: Designated spill emergency response team members.

Scope: Demonstrate ability to deploy spill response equipment* Identified in the FRP.

***May consist entirely of operator owned equipment, or a combination of OSRO and operator equipment.**

Objectives: Designated emergency response personnel should demonstrate---

> (1) Ability to organize; and

> (2) Ability to deploy and operate representative types of key response equipment as described in response plan.

Format: Announced deployment exercise indicated in response plan.

Certification: Self-certification as indicated in response plan. Each plan should have a written description of the company's certification process.

Verification: Verification conducted by RSPA during regular inspections* or RSPA tabletop exercises.

***Verification will not be done by inspection in the near term.**

Records:

Retention: 3 years.

Location: Owner or Operator shall retain records as indicated in response plan.

RSPA to retain verification records.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

Unannounced Exercises

Onshore Transportation-Related Pipelines

Applicability: Pipeline owner/operator.

Frequency: Maximum of 20 unannounced RSPA exercises conducted annually for the pipeline industry as a whole. A single owner or operator will not be required to participate in a RSPA- initiated unannounced exercise, if they have already participated in one within the previous 36 months.

Party Initiating Exercise: RSPA.

Participants: Designated spill emergency response team members.

Operations staff.

On-Scene Coordinator (optional).

State and local government (optional).

Scope: Demonstrate ability to respond to a worst-case discharge spill event.

Objectives: Designated emergency response team members should demonstrate adequate knowledge of their facility response plan and the ability to organize, communicate, coordinate, and respond in accordance with that plan.

Format: Unannounced tabletop exercise to discuss strategic issues.

Operations will provide the owner or operator the following information at least 10 working days in advance (1) date, time, and location of exercise; (2) expected exercise duration; and (3) response zone to be exercised.

On the day of the exercise, the pipeline owner or operator will be provided the scenario and post-spill events. This information will be used to explore and discuss strategic issues that will help operators evaluate their response plans.

Certification: Certification can be effectuated by RSPA personnel conducting the exercise. RSPA will provide written certification of the exercise date, participants, and response zone exercised.

Verification: Verification can be made by RSPA personnel conducting the exercise.

Records:

Retention Time: 3 years.

Location: Owner or Operator shall retain records as indicated in response plan.

RSPA to retain verification records.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

Section 6

Offshore Facilities

Notification Exercises

Offshore Facilities

Applicability: Offshore facilities.

Frequency: Annual.

Initiating Authority: Owner or operator.

Participating Elements: Facility personnel and qualified individual.

Scope: Exercise and test communications between personnel on each facility manned on a 24-hour basis and qualified individual; information to be provided in the event of a spill must be simulated during this exercise.

Objectives: Voice contact must be made with the qualified individual.

Certification: Self-certification.

Verification: Verification by MMS inspection personnel during site visits.

Records:

Retention: 3 years.

Location: Records to be maintained at the facility or at a corporate location designated in the spill response plan.

Evaluation: Self-evaluation.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

UNANNOUNCED EXERCISES

Offshore Facilities

Applicability: Offshore Facilities.

Frequency: Frequency will be determined by the Regional Supervisor. A facility will not face an agency unannounced exercise more than once per year, unless the results of previous exercises warrant more frequency.

Initiating Authority: MMS.

Participating Elements: Facility personnel, qualified individual, spill management team, oil spill removal organization (OSRO), state and local government and other federal agencies (optional).

Scope: Exercise will require that the owner or operator respond to a spill scenario posed by the MMS Regional Supervisor.

Objectives: Conduct proper notifications to respond to unannounced scenario.

Demonstrate ability to mobilize adequate equipment to respond to scenario.

Demonstrate ability to conduct timely deployment of equipment.

Demonstrate ability to conduct proper deployment to respond to scenario.

Certification: MMS.

Verification: Verification by MMS personnel.

Records:

Retention: 3 years.

Location: MMS will maintain records at the MMS Regional Office. The owner or operator will maintain records at a corporate location identified in the approved spill response plan.

Evaluation: Evaluation to be conducted by MMS.

Credits Plan holder may receive credit for other required exercises if the unannounced exercise is successfully completed, objectives of the other exercise(s) are met, and a proper record is generated.

Spill Management Team Tabletop Exercise

Offshore Facilities

Applicability: Spill management team.

Frequency: Annually.

Initiating Authority: Owner or operator.

Participating Elements: Spill management team as established in response plan.

Scope: Exercise the spill management team annually.

Objectives: Exercise the spill management team's organization, communication, and decision-making in managing a spill response to an unannounced scenario.

Exercise the spill management team in a review of-

> Knowledge of response plan;

> Proper notifications;

> Communications system;

> Ability to access an OSRO;

> Coordination of OSRO containment and recovery activity;

> Coordination of organization or agency personnel with responsibility for spill response;

> Ability to effectively coordinate spill response activity with National Response System infrastructure; and

> Ability to access information in Area Contingency Plan for location of sensitive areas, resources available within the area, unique conditions of area, etc.

Certification: Self-certification.

Verification: Verification by MMS personnel.

Records:

Retention: 3 years.

Location: Records to be maintained at a corporate location designated in the spill response plan.

Evaluation: Self-evaluation. The MMS may evaluate if the exercise is witnessed.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

Equipment Deployment Exercises

Offshore Facilities-Equipment Staged Offshore

Applicability: OSRO or owner or operator response equipment required to be staged offshore.

Frequency: Semiannually.

Initiating Authority: OSRO, or owner or operator.

Participating Elements: Facility or OSRO personnel.

Scope: Deploy and operate response equipment that is required to be staged offshore and identified in the response plan. Each type of this equipment is to be deployed annually. Each type need not be deployed at each exercise. Credit will be given for any government-initiated deployment exercise or exercises initiated by OSRO member companies.*

Objectives: Demonstrate ability of spill response personnel to deploy and operate equipment.

Evaluate deployment strategies under various spill scenarios.

Certification: Self-certification (OSRO for OSRO equipment and owner or operator for owner or operator equipment).

Verification: Verification by MMS inspection personnel.

Records:

Retention: 3 years.

Location: Records to be kept at the OSRO or at the facility or a corporate location designated in approved response plan for owner or operator equipment.

Evaluation: Self-evaluation. The MMS may evaluate if the exercise is witnessed.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

***For exploratory wells being drilled from Mobile Offshore Drilling Units (MODUs), at least one deployment exercise will be conducted during drilling of each well, as directed by the Regional Supervisor, if staged response equipment is required by the Regional Supervisor.**

Equipment Deployment Exercises

Offshore Facilities – Equipment Staged Onshore

Applicability: OSRO, or owner or operator response equipment stored at an onshore location.

Frequency: Annually.

Initiating Authority: OSRO, or owner or operator.

Participating Elements: OSRO, or owner or operator personnel.

Scope: Deploy and operate response equipment that is stored onshore and identified in the response plan. Each type of equipment must be exercised during each triennial period. It is not necessary to deploy each piece of equipment.

Objectives: Demonstrate ability of spill response personnel to deploy and operate equipment.

Evaluate deployment strategies under various spill scenarios.

Certification: Self-certification (OSRO for OSRO equipment and owner or operator for owner or operator equipment).

Verification: Verification by MMS inspection personnel.

Records:

Retention: 3 years.

Location: Records to be kept at the OSRO or at the facility or a corporate location designated in approved response plan for owner or operator equipment.

Evaluation: Self-evaluation. The MMS may evaluate if the exercise is witnessed.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

Section 7

Area Exercises

Notification Exercise

Area

Applicability: Area.

Frequency: Quarterly.

Initiating Authority: On-Scene Coordinator.

Participating Elements: Key Elements of the unified command (appropriate federal, state and local government agencies).

Scope: Exercise and test communication between On-Scene Coordinator and key elements of the unified command.

Objectives: Ensure that the key elements of the unified command know whom to call in the event of a discharge within the area.

Ensure contact by telephone, radio, message-pager, or facsimile and confirmation is made between the On-Scene Coordinator and key elements of the unified command.

Certification: Self-certification.

Verification: Verification to be conducted by the District or Region.

Records:

Retention: 3 years (USCG).

5 years (EPA).

Location: With the On-Scene Coordinator.

Evaluation: By Area Committee.

Credit: Plan holder should take credit for this exercise when conducted in conjunction with other exercises, as long as all exercise objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

Spill management Team Tabletop Exercise

Area

Applicability: Area spill management team.

Frequency: Annually.

Initiating Authority: U.S. Coast Guard District (m) or EPA Region.

Participating Elements: Spill management team for the area (U.S. Coast Guard or EPA and respective response team) and state(s).

Scope: Exercise the spill management team's organization, communication, and decision-making in managing a spill response.

Objectives: Exercise the spill management team in a review of

> Knowledge of the Area Contingency Plan;

> Proper notifications;

> Communications system

> Ability to access response equipment

> Coordination of organization or agency personnel with responsibility for spill response;

> Ability to effectively coordinate spill response activity with National Response System infrastructure;

> Ability to access information in Area Contingency Plan for location of sensitive areas, resources available within the area, unique conditions of the area, etc.; and

Exercise the response management system identified in the ACP and to the extent possible the unified command.

At least one spill management team tabletop exercise in a triennial cycle would involve simulation of a worst-case discharge scenario.

Certification: Self- Certification.

Verification: Verification to be conducted by District or Region.

Records

Retention 3 years (USCG).

5 years (EPA).

Location: With On-Scene Coordinator.

Evaluation: Self-evaluation.

Credit: Credit should be taken for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

Equipment Deployment Exercises

Area

Applicability: Area Committee.

Frequency: Annually.

Initiating Authority: On-Scene Coordinator.

Participating Elements: Local area response community (appropriate federal, state and local response agencies).

Scope: Deploy and operate Coast Guard and EPA "first aid" response equipment and the Coast Guard's prepositioned equipment. All of the "first aid" equipment or that which is necessary to respond to an average most probable discharge in the Area, whichever is less, should be deployed annually.

All response personnel must be included in a comprehensive training program, and all response equipment in a comprehensive maintenance program. Credit should be taken for deployment of equipment during training. The maintenance program must ensure that the equipment is periodically inspected and maintained in good operating condition in accordance with the manufacturer's recommendations and best commercial practices.

Objectives: Demonstrate the ability of the response personnel to deploy and operate the equipment.

Ensure that the response equipment is in proper working order.

Certification: Self-certification.

Verification: District or Region.

Records:

Retention: 3 years (USCG).

5 years (EPA).

With On-Scene Coordinator.

Evaluation: Self-evaluation.

Credits: Plan holder should take credit for this exercise when conducted in conjunction with other exercises as long as all objectives are met, the exercise is evaluated, and a proper record is generated. Credit should be taken for an actual spill response when these objectives are met, the response is evaluated, and a proper record is generated.

Area Exercises

Area

Applicability: Area Response community.

Frequency: Triennially for each area.

Initiating Authority: U.S. Coast Guard, EPA and Industry.

Participating Elements: Appropriate Federal, state, and local government, and industry and other members of the response community.

Scope: Area exercises will exercise the Area Response Community.

Objectives: Exercise the Area Contingency Plan, along with selected industry response plans.

Exercise the response management system identified in the ACP and, to the extent possible, the unified command with the appropriate participants.

Exercise the area and industry spill management teams.

Deploy adequate response equipment for the exercise scenario. At a minimum, the scenario must involve exercise of Tier I Worst Case discharge capability.

Format: Total annual exercises would consist of the following-

> 6 government-led exercises; and

> 14 industry-led.

Total = 20 Area Exercises Per Year.

Area exercises should be *approximately* 8 - 12

hours in duration.

Exercise scenario to be developed by the exercise design team.

To simulate realism, the exercise should be conducted in the command post that would be utilized for a spill response, whenever possible.

Exercise may be in real or limited compressed time, and may start at any point during an incident, as determined by the Exercise Design Team. Flexibility should be allowed, to ensure the exercise objectives are met.

Lessons learned from the exercise should be incorporated into the PREP Lessons Learned System (e.g., CGSAILS), whenever possible.

Certification: The On-Scene Coordinator will certify completion of the area exercise. In certifying the area exercise, the On-Scene Coordinator will consider the following-

> The area exercise was conducted.

> The area exercise met the objectives outlined in the PREP guidelines.

> The area response community was exercised for spill response preparedness.

Industry plan holders should take credit for all of the exercises completed during the area exercise. These exercises shall be self-certified by the plan holder.

Verification: Verification to be done by the National Scheduling Coordinating Committee.

Records

Retention: 3 years (USCG).

5 years (EPA).

Location: On Scene Coordinator.

Evaluation: Joint evaluation team to be comprised of the federal government (U.S. Coast Guard, EPA, RSPA or MMS) state and industry.

Scheduling: Scheduling of area exercises will be done by the NSCC, utilizing input from the On-Scene Coordinator, Area Committee and Regional Response Team, in consultation with the industry. A 3-year schedule of PREP Area exercises will be published in the federal register as a public forum for government and industry input to the scheduling process.

Appendix A: Internal Exercise Documentation Forms

The following sample documentation forms are provided to give plan holders an idea of how to document the internal PREP exercises. These sample forms, are provided only as guidance. Plan holders do not have to include all of the information presented on these forms nor do they have to use these exact forms. Plan holders may choose to develop their own forms. Documentation should be completed within 60 days of exercise completion. Documentation should include, as a minimum, the following information:

- The type of exercise;
- Date and time of the exercise;
- A description of the exercise;
- The objectives met in the exercise;
- The components of the response plan exercised; and
- Lessons learned along with procedures and schedules for implementing lessons learned.

Internal Exercise Documentation Form

Notification Exercise

1. Date performed:_____

2. Exercise or actual response?_____

3. Vessel/Facility/Pipeline/Offshore Facility initiating exercise: _____

4. Name of person notified_____
   Is this person identified in your response plan as qualified individual Or designee?_____

5. Time initiated: _____
   Time in which qualified individual or designee responded _____

6. Method used to contact:
   ____Telephone
   ____Pager
   ____Radio
   ____Other _____

7. Description of notification procedure:
   _____
   _____
   _____
   _____
   _____

8. Identify which of the 15 core components of your response plan were exercised during this particular exercise:
   _____
   _____
   _____
   _____

_____
Certifying Signature

Retain this form for a minimum of 3 years (for USCG/RSPA/MMS) or 5 years (for EPA).

For vessel qualified individual notification, ensure log entry is also made and retained for a minimum of 3 years.

Internal Exercise Documentation Form

Emergency Procedures Exercise

1. Date performed: _____
2. Exercise or actual response ? _____
   If an exercise, announced or unannounced? _____
3. Location: _____
4. Vessel/Barge/Facility name: _____
5. Time started: _____
   Time completed: _____
6. Sections of Vessel/Barge/Facility emergency procedures exercised (i.e., response to collision, response to oil spill on deck, response to vessel fire, etc.)? _____
   _____
   _____
   _____
7. Description of exercise: _____
   _____
   _____
   _____
8. Identify which of the 15 core components of your response plan were exercised during this particular exercise: _____
   _____
   _____
   _____
   _____
   _____

Emergency Procedures Exercise (continued)

9. Attach a description of lesson(s) learned, procedures and schedule for implementation, and person(s) responsible for follow up of corrective measures.

_____
Certifying Signature

Retain this form for a minimum of 3 years (for USCG/RSPA/MMS) and 5 years (for EPA).

For manned vessels, ensure log entry is made and retained for 3 years.

Internal Exercise Documentation Form

Spill Management Team Tabletop Exercise

1. Date(s) performed: _____

2. Exercise or actual response? _____
If an exercise, announced or unannounced? _____

3. Location of tabletop: _____

4. Time started: _____
Time completed: _____

5. Response plan scenario used (check one):
_____Average most probable discharge
_____ Maximum most probable discharge
_____ Worst case discharge
_____ Size of (simulated) spill-bbls/gals

6. Describe how the following objectives were exercised:

a) Spill management team's knowledge of oil-spill response plan:
_____
_____
_____
_____
_____
_____

b) Proper notifications:
_____
_____
_____
_____
_____
_____

Spill Management Team Tabletop Exercise (continued)

c) Communications system:

_____
_____
_____
_____
_____
_____
_____
_____
_____
_____

d) Spill management team's ability to access contracted oil spill removal organizations:

_____
_____
_____
_____
_____
_____
_____
_____

e) Spill management team's ability to coordinate spill response with On-Scene Coordinator, state and applicable agencies:

_____
_____
_____
_____
_____
_____
_____
_____

f) Spill management team's ability to access sensitive site and resource information in the Area Contingency Plan:

_____
_____
_____
_____

Spill Management Team Tabletop Exercise (continued)

_____
_____

7. Identify which of the 15 core components of your response plan were exercised during this particular exercise:

_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____

8. Attach a description of lesson(s) learned, procedures and schedule for implementation, and person(s) responsible for follow up of corrective measures.

_____
Certifying Signature

Retain this form for a minimum of 3 years (for USCG/RSPA/MMS) or 5 years (for EPA).

Internal Exercise Documentation Form

Equipment Deployment Exercise

1. Date(s) performed: _____

2. Exercise or actual response? _____
   If an exercise, announced or unannounced? _____

3. Deployment location(s):

_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____

4. Time started: _____
   Time OSRO/HSRO called_____
   Time on-scene_____
   Time boom deployed_____
   Time recovery equipment arrives on-scene_____

   Time completed: _____

5. Equipment deployed was:
_____Facility-owned
_____OSRO/HSRO-owned if so, which OSRO/HSRO?_____
_____Both

Equipment Deployment Exercise (continued)

6. List type and amount of all equipment (e.g., boom and skimmers) deployed and number of support personnel employed:

_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____

7. Describe goals of the equipment deployment and list any Area Contingency Plan strategies tested. (Attach a sketch of equipment deployments and booming strategies):

_____
_____
_____
_____
_____
_____
_____

8. For deployment of facility-owned equipment, was the amount of equipment deployed at least the amount necessary to respond to your facility's average most probable spill?

_____
_____

   Was the equipment deployed in its intended operating environment?

_____
_____
_____
_____
_____

Equipment Deployment Exercise (continued)

9. For deployment of OSRO/HSRO-owned equipment, was a representative sample (at least 1000 feet of each boom type and at least one of each skimmer type) deployed?

_____
_____
_____
_____

Was the equipment deployed in its intended operating environment?

_____
_____
_____

10. Are all facility personnel that are responsible for response operations involved in a comprehensive training program, and all pollution response equipment involved in a comprehensive maintenance program? _____

_____
_____
_____

If so, describe the program:_____

_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____

Date of last equipment inspection: _____

11. Was the equipment deployed by personnel responsible for its deployment in the event of an actual spill? _____

12. Was all deployed equipment operational? If not, why not?

_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____

13. Identify which of the 15 core components of your response plan were exercised during this particular exercise: _____

_____
_____
_____
_____
_____
_____
_____
_____

14. Attach a description of lesson(s) learned, procedures and schedule for implementation, and person(s) responsible for follow up of corrective measures.

_____ _____
Certifying Signature

Retain this form and other documentation related to this exercise on file for a minimum of 3 years (for USCG/RSPA/MMS) or for a minimum of 5 years (for EPA).

Triennial CYLCLE Documentation FORM

Area Exercise																											

For each quarter in which an exercise was completed, mark that with an "X" then mark each core component tested during an exercise.

APPENDIX B:
RESPONSE PLAN CORE COMPONENTS

During each triennial cycle, all components of a plan holder's response plan must be exercised at least once. The purpose of this requirement is to ensure that all plan components function adequately for response to an oil spill.

The 15 core components listed below are the types of components that must be exercised. However, these components may not be contained in each response plan. As such, the plan holder shall identify those that are applicable from this list, adding or deleting as appropriate.

1. Notifications: Test the notifications procedures identified in the Area Contingency Plan and the associated Responsible Party Response Plan.

2. Staff Mobilization: Demonstrate the ability to assemble the spill response organization identified in the Area Contingency Plan and associated Responsible Party Response Plan.

3. Ability to Operate Within the Response Management System Described in the Plan:

   3.1 **Unified Command:** Demonstrate the ability of the spill response organization to work within a unified command

   3.1.1 Federal Representation: Demonstrate the ability to consolidate the concerns and interests of the other members of the unified command into a unified strategic plan with tactical operations.

   3.1.2 State Representation: Demonstrate the ability to function within the unified command structure.

   3.1.3 Local Representation: Demonstrate the ability to within the unified command structure.

   3.1.4 Responsible Party Representation: Demonstrated(to function within the unified command structure

RESPONSE PLAN CORE COMPONENTS (continued)

   3.2. **Response Management System:** Demonstrate the ability of the response organization to operate within the framework of the response management system identified in their respective plans.

   3.2.1 Operations: Demonstrate the ability to coordinate or direct operations related to the implementation of action plans contained in the respective response and contingency plans developed by the unified command.

   3.2.2 Planning: Demonstrate the ability to consolidate the various concerns of the members of the unified command into joint planning recommendations and specific long-range strategic plans. Demonstrate the ability to develop short-range tactical plans for the operations division.

   3.2.3 Logistics: Demonstrate the ability to provide the necessary support of both the short-term and long-term action plans.

   3.2.4 Finance: Demonstrate the ability to document the daily expenditures of the organization and provide cost estimates for continuing operations.

   3.2.5 Public Affairs: Demonstrate the ability to form a joint information center and provide the necessary interface between the unified command and the media.

   3.2.6 Safety Affairs: Demonstrate the ability to monitor all field operations and ensure compliance with safety standards.

   3.2.7 Legal Affairs: Demonstrate the ability to provide the unified command with suitable legal advice and assistance.

4. **Source Control:** Demonstrate the ability of the spill response organization to control and stop the discharge at the source.

   4.1 Salvage: Demonstrate the ability to assemble and deploy salvage resources identified in the response plan.

   4.2 Firefighting: Demonstrate the ability to assemble and deploy the firefighting resources identified in the response plan.

RESPONSE PLAN CORE COMPONENTS (continued)

4.3 Lightering: Demonstrate the ability to assemble and deploy the lightering resources identified in the response plan.

4.4 Other salvage equipment and devices: (electrical and manual controls and barriers to control the source) Demonstrate the ability to assemble and deploy the other salvage devices identified in the response plan

5. **Assessment:** Demonstrate the ability of the spill response organization to provide an initial assessment of the discharge and provide continuing assessments of the effectiveness of the tactical operations.

6. **Containment:** Demonstrate the ability of the spill response organization to contain the discharge at the source or In various locations for recovery operations.

7. **Recovery:** Demonstrate the ability of the spill response organization to recover, mitigate, and remove the discharged product. Includes mitigation and removal activities, e.g. dispersant use, ISB use, and bioremediation use.

   7.1 On-Water Recovery: Demonstrate the ability to assemble and deploy the on-water response resources identified In the response plans.

   7.2 Shore-Based Recovery: Demonstrate the ability to assemble and deploy the shoreside response resources identified in the response plans.

8. **Protection:** Demonstrate the ability of the spill response organization to protect the environmentally and economically sensitive areas identified in the Area Contingency Plan and the respective industry response plan.

   8.1 Protective Booming: Demonstrate the ability to assemble and deploy sufficient resources to implement the protection strategies contained in the Area Contingency Plan and the respective industry response plan.

RESPONSE PLAN CORE COMPONENTS (continued)

8.2 Water Intake Protection: Demonstrate the ability to quickly identify water intakes and implement the proper protection procedures from the Area Contingency Plan or develop a plan for use.

8.3 Wildlife Recovery and Rehabilitation: Demonstrate the ability to quickly identify these resources at risk and implement the proper protection procedures from the Area Contingency Plan to develop a plan for use.

8.4 Population Protection (Protect Public Health and Safety): Demonstrate the ability to quickly identify health hazards associated with the discharged product and the population at risk from these hazards, and to implement the proper protection procedures from the Area Contingency Plan or develop a plan for use.

9. **Disposal:** Demonstrate the ability of the spill response organization to dispose of the recovered material and contaminated debris.

10. **Communications:** Demonstrate the ability to establish an effective communications system for the spill response organization.

    10.1 Internal Communications: Demonstrate the ability to establish an intra-organization communications system. This encompasses communications at the command post and between the command post and deployed resources.

    10.2 External Communications: Demonstrate the ability to establish communications both within the response organization and other entities (e.g., RRT, claimants, media, regional or HQ agency offices, non-governmental organizations, etc.).

11. **Transportation:** Demonstrate the ability to provide effective multi-mode transportation both for execution of the discharge and support functions.

    11.1 Land Transportation: Demonstrate the ability to provide effective land transportation for all elements of the response.

RESPONSE PLAN CORE COMPONENTS (continued)

11.2 Waterborne Transportation: Demonstrate the ability to provide effective waterborne transportation for all elements of the response.

11.3 Airborne Transportation: Demonstrate the ability to provide the necessary support of all personnel associated with the response.

12. **Personnel Support:** Demonstrate the ability to provide the necessary support of all personnel associated with the response.

12.1 Management: Demonstrate the ability to provide administrative management of all personnel involved in the response. This requirement includes the ability to move personnel into or out of the response organization with established procedures.

12.2 Berthing: Demonstrate the ability to provide overnight accommodations on a continuing basis for a sustained response.

12.3 Messing: Demonstrate the ability to provide suitable feeding arrangements for personnel involved with the management of the response.

12.4 Operational and Administrative Spaces: Demonstrate the ability to provide suitable operational and administrative spaces for personnel involved with the management of the response.

12.5 Emergency Procedures: Demonstrate the ability to provide emergency services for personnel involved in the response.

13. **Equipment Maintenance and Support:** Demonstrate the ability to maintain and support all equipment associated with the response.

13.1 Response Equipment: Demonstrate the ability to provide effective maintenance and support for all response equipment.

RESPONSE PLAN CORE COMPONENTS (continued)

13.2 Response Equipment: Demonstrate the ability to provide effective maintenance and support for all equipment that supports the response. This requirement includes communications equipment, transportation equipment, administrative equipment, etc.

14. **Procurement:** Demonstrate the ability to establish an effective procurement system.

14.1 Personnel: Demonstrate the ability to procure sufficient personnel to mount and sustain an organized response. This requirement includes insuring that all personnel have qualifications and training required for their position within the response organization.

14.2 Response Equipment: Demonstrate the ability to procure sufficient response equipment to mount and sustain an organized response.

14.3 Support Equipment: Demonstrate the ability to procure sufficient support equipment to support and sustain an organized response.

15. **Documentation:** Demonstrate the ability of the spill response organization to document all operational and support aspects of the response and provide detailed records of decisions and actions taken

Quarterly QI Notification Exercise

- **Scope:** Exercise communication between facility personnel and the QI(s) and/or designated alternate(s).

  At least once each year, one notification exercise should be conducted during non-business hours.

  CA OSPR jurisdictional location Notification Exercises must include the OSRO.

- **Objective:** Contact must be made with a QI or designated alternate, as identified in the Plan (Volume 1, Figure 2.3; Volume 2, Figure 8.1 for OSPR/USCG jurisdictional terminals; Volume 2, Figure 9.1 for OSPR jurisdictional pipelines).

- **General:** All personnel receiving notification shall respond to the notification and verify their receipt of the notification. Personnel who do not respond should be contacted to determine whether or not they received the notification.

Notification Drill Form Instructions

- Enter the location conducting the drill.

- Enter the date and time the drill was started.

- Enter the name of the person conducting the drill.

- Enter the telephone number of the person conducting the drill.

- Enter the names and titles of the individuals contacted while conducting the drill.

- Enter the time each individual was contacted or responded to pages or voice mails.

- Select from the drop down menu the contact method used for each individual.

- For OSPR jurisdictional terminals and pipelines (Carson Area, Concord Area, LA Harbor Terminal, Mission Valley Area, Richmond Brisbane Area, Richmond Terminal, Sacramento Area, and Watson Area) the OSRO must be included.

- Note any issues that arise during the drill.

- Print a copy for local records.

- Click the ‘Submit’ button to generate and email form data file to the Manager - Emergency Response Programs. If email is not available, fax to (713) 369-9215.
