1.0 INTRODUCTION

1.1 SUMMARY

Houston Refining LP (HRO) is required to document compliance with certain Federal and Texas agency mandated regulations. In addition, these regulatory agencies have determined that the facility, because of its location, could reasonably be expected to cause substantial harm to the environment by accidentally discharging oil into or on the navigable waters or adjacent shoreline. The plan contained here has been prepared to meet the following regulatory requirements as listed below:

REGULATORY AGENCY	AREA OF CONCERN	REGULATORY CITATION
United States Environmental Protection Agency (EPA)	Land	§40 CFR 112
United States Coast Guard (USCG)	Water	§33 CFR 153, 154, and 156
United States Department of Transportation (DOT) - Pipeline and Hazardous Materials Safety Administration (PHMSA)	Pipeline	§49 CFR 194
Texas General Land Office (GLO)	Coastal Waterways	§31 TAC 19

HRO ensures compliance with federal Spill Prevention Control and Countermeasure (SPCC) rules, discharge prevention regulations, and guidelines since they are more stringent than state requirements.

The HRO *SPCC Plan and Oil Spill Response Plan* have been combined to create the *Spill Response and Prevention Plan (SRPP)*. Specifically, this Plan:

- ✓ Identifies the Qualified Individual (QI) having full authority to implement removal actions;
- ✓ Specifies required immediate communication between those individuals and the appropriate Federal officials and the persons providing spill response personnel and equipment;
- ✓ Describes the storage capacity of the facility;
- ✓ Identifies, and provides by contract, or other means approved by the Vice President Manufacturing, the availability of private personnel and equipment necessary to:

- Remove to the maximum extent practicable a worst-case discharge (including a discharge resulting from fire or explosion);
 - Mitigate to prevent a substantial threat of such a discharge;
 - Mitigate or prevent damage to fish, wildlife and environmental sensitive areas.
- ✓ Describes the training, equipment testing, periodic drills, and response actions of persons at the facility.
 - ✓ Is consistent with the National Contingency Plan (NCP), the EPA Region VI Inland Area Contingency Plan (ACP), and the Galveston Bay ACP.

A cross-reference table for all the applicable regulations is provided in [Table 1-1](#), and definitions used in this document are provided in [Table 1-2](#).

1.2 COMPANION DOCUMENT

A companion HRO document, the [Emergency Action Plan \(EAP\)](#) is used in conjunction with this *Spill Responses and Prevention Plan (SRPP)*. The EAP contains all the facility procedures for handling various types of emergency situations, including fires, spills, medical, training, and communication. Since all that information is contained in the EAP, none of those details are repeated in this document to avoid any possibility of confusion and inconsistency in applying emergency procedures. Therefore, the EAP and the SRPP are complementary documents maintained electronically in LiveLink.

1.3 CERTIFICATION AND INFORMATION SUMMARY

The following figures meet the following certification requirements:

- ✓ [Figure 1-1](#) provides the Implementation Requirements for the Plan;
- ✓ [Figure 1-2](#) provides the Professional Engineer's Certification [§40 CFR 112.3(d)];
- ✓ [Figure 1-3](#) provides the Certification of the Applicability of Substantial Harm Criteria;
- ✓ [Figure 1-4](#) provides the Certification of Response Preparedness [§49 CFR 194.119(e)];
- ✓ [Figure 1-5](#) provides the Management Commitment Certification [§40 CFR 112.20];
- ✓ [Figure 1-6](#) provides the Management Approval of this Plan;
- ✓ [Figure 1-7](#) provides the Facility Information; and
- ✓ [Figure 1-8](#) provides the DOT PHMSA Operator's Statement of Significant and Substantial Harm

Figure 1-1 Implementation Requirements for the Plan

Implementation Requirements for Spill Response and Prevention Plan Houston Refining LP		
<p>Examination of the facilities covered by this SRPP has identified the need for corrective action to bring the Houston Refinery into compliance with the Spill Prevention, Control and Countermeasures Planning requirements detailed in §40 CFR 112.</p> <p>The Plan will be approved and certified by our staff Professional Engineer upon satisfactory completion and documentation of the corrective action items listed below. In accordance with §40 CFR 112.5 (a), the noted corrective actions must be completed within six (6) months.</p>		
Corrective Action Items	Scheduled Date	Completion Date*
1. For tanks located north and adjacent to former MEK Unit, permanently closed tanks per §112.2 OR construct a berm along the east side of the southeast corner of the heavy oils tank farm to ensure that drainage from the area flows into the in-plant drainage system per §112.8(b).	09/27/13	04/29/13
2. Contractor containers ≥55 gallons used to store oil are not identified in the SRPP. If contractor containers are listed in the SRPP, include documentation whether discharges flow into the in-plant drainage system or secondary containment is provided per §112.8(c).	04/30/13	04/16/13
3. Include list of oil-filled operational equipment as defined by §112.2 with capacities ≥55 gallons in SRPP and include documentation whether discharges flow into the in-plant drainage system or secondary containment is provided per §112.8(c).	04/30/13	04/10/13
MANAGEMENT APPROVAL OF THE COMPLETION OF IMPLEMENTION ITEMS		
Date: <u>5/1/2013</u>

Name and Title: <u>Todd C. Monett, Site Manager Houston Refining</u>		

Figure 1-2 Professional Engineering Certification

PROFESSIONAL ENGINEER CERTIFICATION

By means of this Professional Engineer Certification, I hereby attest, to the best of my knowledge and belief, to the following:

- ✓ I am familiar with the requirements of 40 CFR Part 112 and have verified that this Plan has been prepared in accordance with the requirements of this Part.
- ✓ I or my agent visited and examined the Facility on February 5, 2013. My certification is based upon the condition of the Facility as of this date. Any material changes to the Facility made subsequent to this date must be separately reviewed, documented and P.E. certified as a Technical Amendment, as appropriate.
- ✓ I have verified that this Plan has been prepared in accordance with good engineering practice, including consideration of applicable industry standards.
- ✓ I have verified that the required inspection and testing procedures have been established as described in this Plan.
- ✓ I have verified that the Plan is adequate for the Facility.
- ✓ My certification of this Plan in no way relieves the owner/operator of the Facility of their duty to prepare and fully implement the Plan in accordance with the requirements of 40 CFR Part 112. The attestations listed above are limited to only those facilities, programs, practices, and procedures pertaining to oil and oil products. I in no way assume any liability of whatsoever kind or nature by my certification.
- ✓ The owner/operator, by "Management Approval" located on the following page, acknowledges this certification and the compliance measures described herein.
- ✓ This certification is limited to the sections referenced in the Spill Prevention, Control, and Countermeasure Plan (40 CFR 112) cross reference.
- ✓ This Plan is valid only to the extent that the Facility Owner or Operator maintains, tests, and inspects equipment, containment, and other devices as prescribed in this Plan and completes any Implementation Requirements.

Figure 1-3 Certification of the Applicability of Substantial Harm Criteria

Facility Name: Houston Refining LP
 Facility Address: 12000 Lawndale, Houston, TX 77017

1. Does the facility transfer oil over water to or from vessels and does the facility have a total oil storage capacity greater than or equal to 42,000 gallons? YES NO
2. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area? YES NO
3. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix or a comparable formula ¹) such that a discharge from the facility could cause injury to fish and wildlife and sensitive environments? *For further description of fish and wildlife and sensitive environments, see Appendices I, II, and III to DOC/NOAA's "Guidance for Facility and Vessel Response Plans: Fish and Wildlife and Sensitive Environments" (see Appendix E to this part, section 13, for availability) and the applicable Area Contingency Plan.* YES NO
4. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix or a comparable formula ¹) such that a discharge from the facility would shut down a public drinking water intake ²? YES NO
5. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and has the facility experienced a reportable oil discharge in an amount greater than or equal to 10,000 gallons within the last 5 years? YES NO

Certification

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe that the submitted information is true, accurate, and complete.

Figure 1-7 Facility Information (continued)

Date of Storage Start-up: The refinery began operation under Sinclair in January 1920 and has been operated by several other companies over the years including Atlantic Richfield, Lyondell Petrochemical, Lyondell-Citgo Refining, and Lyondellbasell. When Sinclair and its subsidiaries merged with Atlantic Richfield Company (ARCO) in 1969, the refinery became part of ARCO Petroleum Products Company. In 1985, the refinery and a portion of ARCO Chemical Company's Channelview complex were combined to create the Lyondell Petrochemical division of ARCO. Two years later, Lyondell Petrochemical became a public company breaking away from ARCO. In 1993, Lyondell Petrochemical Company and CITGO Petroleum Corporation created a jointly-owned company to operate the Houston Refinery until August 2006 when Lyondell fully acquired Houston Refining from CITGO. Lyondell Petrochemical maintained sole ownership until December 2007 when the refinery became a wholly owned subsidiary of LyondellBasell Industries.

Current Operation: Houston Refining LP is a fully integrated petroleum refinery which produces gasoline, diesel, kerosene, jet fuel, gas oils, lubricants, coke, sulfur, and fuel gases. Most distillate products are ultimately sent to the East Coast and Midwest via the Colonial and Explorer pipelines.

Number of Oil Storage Vessels:	<u>259</u> (Aboveground Storage Tanks)
	<u>215</u> (Drum/Tote Storage), Approx.
	<u>0</u> (Underground Storage Tanks)
	<u>2,637</u> (Manufacturing and Operational)
	<u>6</u> (Surface Impoundments)

Maximum Oil Storage Capacity (Gallons):	(b) (7)(F), (b) (3)	(Aboveground Storage Tanks)
		(Contractor Drum/Tote Storage)
		(Underground Storage Tanks)
		(Manufacturing & Operational)
		(Surface Impoundments)
Worst Case Oil Discharge Amount	(b) (7)(F), (b) (3)	(Gallons)

Wellhead protection area: The facility is not located in a wellhead protection area.

Facility Distance to Navigable Water: 0 – 1/4 mile

Figure 1-7 Facility Information (continued)

EPA FRP ID Number: FRP-06-TX-00040
 Primary SIC Code: 2911 (Petroleum Refining)
 Primary NAICS Code: 324110 (Petroleum Refining)
 Dun & Bradstreet Number: 80--63-2-22 (DUNS Number)

Dates and Types of Substantial Expansions: Under operation by Sinclair, the refinery's 732 Fluidized Catalytic Cracking Unit (FCCU) and the 630/631 Hydrodesulfurization (HDS) units were commissioned in 1953 and 1958, respectively. In the early 1960s, the Lubes Complex was constructed for processing Grade A naphthenic crude oil and select feedstocks to produce several grades of white oils and lubricating oils. When Sinclair merged with ARCO in 1969, the 736 Coker was commissioned. In 1976, a major expansion of the refining occurred which included commissioning of the 230 Gas Plant, 633 HDS, 634 HDS, 635 HDS, 433 Claus, 434 Claus, 435 Tail Gas Unit, and 536 Crude. Just after the formation of Lyondell-CITGO Refining, another major expansion of the refining occurred in 1996/97 which included commissioning of the 439 Claus, 440 Tail Gas Unit, 636 HDS, 537 Crude, and 737 Coker. Following this last major expansion, the 637 HDS was placed into service in 2006 to meet ultra-low sulfur standards, and the 433 and 434 Claus were completely rebuilt with O₂ enrichment in 2011 and 2012, respectively.

Facility-Specific Information: Tanks used in marine transfer operations including the tank size, roof configuration, and maximum fill capacity is presented in [Table 2-1](#), and the line length, pipe diameter, and the product or feedstock transferred through each marine loading arm is presented in [Table 4-2](#). [Figure 2-2](#) indicates the locations of all mooring areas and transfer locations at HRO, and the layout of the Marine Transfer Operation is illustrated in [Figure 2-5](#). The refinery has four berths, designated as "Dock A," "Dock B," "Dock C," and "Dock D." These facilities can accommodate vessels ranging in size from a "lightered"

(b) (7)(F), (b) (3)

The product line layout and the various block valves separating the marine transfer manifold from the refinery piping system for Docks A, B, and C is illustrated in [Figure 2-6](#), [Figure 2-7](#), and [Figure 2-8](#), respectively. A complete set of Material Safety Data Sheets ([MSDS](#)) for all product streams, intermediates, and purchased chemicals used at the refinery is maintained electronically and available online through the HRO Health, Safety, Security, and Environmental (HSSE) webpage.

**Figure 1-8 DOT PHMSA Operator's Statement of
Significant and Substantial Harm**

1. Is the pipeline >6½ inches (168 mm) in outside nominal diameter, greater than 10 miles (16.1 km) in length? and YES NO
2. Has any line section experienced a release greater than 1,000 barrels (159 cubic meters) within the previous five years? or YES NO
3. Has any line section experienced two or more reportable releases, as defined in 49 CFR 195.50, within the previous five years? or YES NO
4. Does any line section contain any electric resistance welded pipe, manufactured prior to 1970 and operates at a maximum operating pressure established under 49 CFR 195.406 that corresponds to a stress level greater than 50 percent of the specified minimum yield strength of the pipe? or YES NO
5. Is any line located within a 5-mile (8 km) radius of potentially affected public drinking water intakes and could reasonably be expected to reach public drinking water intakes? or YES NO
6. Is any line located within a 1-mile (1.6 km) radius of potentially affected environmentally sensitive areas and could reasonably be expected to reach these areas? YES NO

Based on the U.S. DOT PHMSA criteria above, the Facility is not considered "Significant and Substantial Harm".

1.4 SRPP AMENDMENTS

The Plan will be reviewed annually within one (1) month of the anniversary date of the Captain of the Port (COTP) approval of the Plan (USCG requirement). It will also be revised as necessary and resubmitted for approval within 60-days (30-days for pipeline related revisions) including at such time, if ever, as:

- ✓ Applicable regulations are revised;
- ✓ The plan fails in an emergency;
- ✓ The facility changes (in design, construction, operation, maintenance, etc.) in a way that materially increases the potential for fires, explosions, releases of hazardous waste, or changes the response necessary in an emergency and within 30 days of significant change in operating conditions.
- ✓ An extension of the existing pipeline(s) or construction of a new pipeline in a response zone not covered by the previously approved Plan;
- ✓ Relocation or replacement of the pipeline(s) in a way that substantially affects the information included in the response plan, such as a change to the worst-case discharge volume;
- ✓ A change in the QI;
- ✓ A change in the NCP or an ACP that has significant impact on the equipment appropriate for response activities;
- ✓ A change in the listings of fish and wildlife and sensitive areas identified in the ACP.
- ✓ The on-site spill control equipment or emergency response procedures significantly change;
- ✓ A change in the type of oil handled, stored or transferred that materially alters the required response resources;
- ✓ A review of drill critique information indicates Plan changes are needed;
- ✓ The list of approved oil spill contractors changes, or a material change in their capabilities; and
- ✓ Any other changes that materially affect the implementation of the response plan.
- ✓ Plan review opportunities may occur during response team tabletop exercises or actual emergency responses.

Since the Plan is available online throughout the facility, all revisions are made electronically and do not require internal distribution. Plan revisions are submitted to the DOT-PHMSA and EPA in electronic format (via data CD) and in hard copy to the USCG.

All amendments which could materially affect the facility's potential for discharge into navigable waters of the United States or adjoining shorelines, except for changes to personnel and telephone references, must be certified by a Registered Professional Engineer to satisfy the requirements of §40 CFR 112 (Refer to [Figure 1-2](#) for certification of this plan).

- ✓ SPCC technical amendments are certified by a Registered Professional Engineer and documented in the located in the Figure 1-2. Amendments will be detailed with a stand-alone certified technical PE Certification page behind the initial "Professional Engineer Certification".
- ✓ This Plan will be revised when there are changes in the Facility's design, construction, operation, or maintenance *that materially affects the Facility's potential for the discharge of oil into or upon the navigable waters of the United States or adjoining shorelines*. Such amendments shall be fully implemented as soon as possible, but not later than six (6) months after such change occurs.

Changes requiring revision may include, but are not limited to:

- ✓ Commissioning or decommissioning of containers.
- ✓ Replacement, reconstruction, or movement of containers.
- ✓ Reconstruction, replacement, or installation of non-transportation-related piping systems.
- ✓ Construction or demolition that might alter secondary containment structures and/or drainage systems.
- ✓ Revision of standard operating or maintenance procedures at the Facility.
- ✓ Non-technical amendments are not certified by a Registered Professional Engineer.

Changes requiring revision may include, but are not limited to:

- ✓ Phone numbers.
- ✓ Personnel changes.
- ✓ Non-technical text changes.

In addition to updating the Plan with technical and non-technical amendments, the Plan must be reviewed by Management no less than once every five (5) years for more effective prevention and control technology. Two (2) electronic copies of the Plan will be submitted to the DOT PHMSA Office of Pipeline Safety every 5 years from the last submission date as required by §49 CFR 194.121(a)(1).

- ✓ At least once each five (5) years, the Facility will complete a review and evaluation of the SRPP. Based upon the results, make any amendments within six (6) months of the review and implement amendments, as soon as possible, but not later than six (6) months following preparation of any amendment.
- ✓ This will include, at a minimum, a review of more effective prevention and control technology, which may significantly reduce the likelihood of a discharge event from the Facility, if such technology has been field-proven at the time of the review.

1.5 RECORD OF CHANGE

Each change or update made to this Plan will be recorded on [Table 1-3](#). The persons reviewing and recording the change will initial the appropriate space.

2.0 FACILITY DESCRIPTION

2.1 LOCATION AND PROCESSES

2.1.1 Facility Location

Houston Refining LP (HRO) is located at 12000 Lawndale in Houston, Texas. The facility is sited on approximately 700 acres located in the City of Houston and the City of Pasadena on the south bank of the Houston Ship Channel. The refinery is located generally north of State Highway 225 between Scarborough and Allen-Genoa, approximately 3 miles east of IH610, and due east of Sims Bayou.

A location map of the refinery and surrounding area is provided in [Figure 2-1](#). In addition, the facility is located within the boundaries of the Houston Local Emergency Planning Committee (LEPC). The refinery is an active participant in the Pasadena, Galena Park, and Houston LEPCs.

2.1.2 Production Facilities

HRO is a large integrated petroleum refinery with a nominal crude oil (combined heavy sour crude and "Grade A" crude) processing capacity of around (b) (7)(F), (b) (3) per day and is comprised of numerous manufacturing process units. The processing units at HRO include: two heavy Crude Units, two Coker Units, a Sulfur Recovery Complex, a Fluidized Catalytic Cracking Unit, seven Hydro-desulfurization Units, two Reforming Units, a Lubes Complex, and various other production and treating units. The facility operates 24 hours per day, 7 days per week, and maintains a staff of approximately 850 people (excluding contractors). A facility site map depicting location of processes and equipment is provided in [Figure 2-2](#).

The facility is a full conversion refinery, which means that HRO has the capability to process virtually the entire barrel of varying types of crude oil into high-value products without producing lower-value residual fuel oil. The refinery has complete lubricating oil manufacturing facilities as well as finished blending facilities.

A major facility upgrade was completed in 1997 that significantly increased the amount of heavy crude that can be processed. Major components of the upgrade project include new coking, hydrotreating, sulfur recovery units, crude distillation unit, along with modifications to the facility's largest crude distillation unit. The refinery's processing capability now includes new hydrotreating units for meeting EPA ultra-low sulfur specifications for diesel and reformulated gasoline.

2.1.3 Refinery Products

Products from HRO include various types of gasoline, diesel fuel heating oil, jet fuel, sulfur, coke, and a comprehensive line of lubricants including automotive and industrial oils and greases, process oils, and refined white oils. The refinery also produces various aromatic streams including benzene and toluene as well as olefin feedstocks for polymer production. A complete set of Material Safety Data Sheets ([MSDS](#)) for all product streams, intermediates, and purchased chemicals used at the refinery is maintained electronically and available online through the HRO Health, Safety, Security, and Environmental (HSSE) webpage.

Production units no longer maintain hardcopy Hazard Communication Manuals at the unit since all PI&Ds, Process Flow Diagrams, and MSDSs for each refinery stream are maintained electronically and available online. A listing of the specific refinery streams (MSDS numbers) used in each production area can be found in LiveLink.

2.2 BULK STORAGE

2.2.1 Storage Capacity

(b) (7)(F), (b) (3)

. Most bulk storage in the refinery is dedicated single service tanks used for storing crude oil, finished fuels, lubricants, or various intermediates such as gas oils, naphtha, resid, chemicals, or other feedstocks. However, there are a few multi-service bulk storage tanks available to provide some operational flexibility.

A summary of tank capacities by tank number is provided in [Table 2-1](#). Included in this table is available information on materials stored, container roof design, and the year the tanks was built or re-built. Additionally, the top ten oils stored at the refinery by volume are listed in [Table 2-2](#).

2.2.2 Tank Farms

All bulk storage tanks are designed and constructed for maximum design pressure and operating temperature with materials compatible with the products being stored. Tanks used for oil storage are constructed of welded plate steel, and all applicable American Petroleum Institute (API) and American Society of Mechanical Engineers codes are followed during design and construction.

Most large bulk storage tanks at the refinery are located away from process operating area and aggregated together in tank farms whereas small storage tanks (day tanks) may be located near process operating areas. [Table 2-3](#) below lists the cost centers associated with various tank farms or areas where material are stored.

Table 2-2 Top Ten Oils Stored by Volume

Rank	Material	MSDS	Volume (bbls)
1	Crude Petroleum Oil	AP0001	(b) (7)(F), (b) (3)
2	Finished Gasoline	AP0817, AP1175	
3	Natural Gasoline/Condensate	AP0730, RS0153	
4	No. 2 Fuel Oil	AP0741	
5	Cracking Stock	AP0248, AP0883	
6	Heavy Straight Run Naphtha	RS0125	
7	Coker Feed	AP0381	
8	Jet A Fuel	AP0463	
9	Carbon Black Oil	AP0701	
10	OP-400 Naphtha	RS0152	

Table 2-3 Bulk Storage Tank Farm and Areas

Cost Center	Tank Farm / Area	Materials Stored
133	225 Tank Farm	Heavy Crude
134	West Tank Farm	Heavy Crude, Intermediates
135	South & Allendale Tank Farms	Gasoline, Diesel, Kerosene
136	East Tank Farm	Heavy Crude, Intermediates
137	Central Tank Farm	Intermediates, Aromatics
138, 831, 833	Heavy Oil Tank Farm	Lubricants, Grade A Crude
430, 432	Environmental	Wastewater, Sour Water
930, 933, 934, 935, 940	Aromatics Recovery Complex	Aromatics

2.2.3 Secondary Containment

For bulk storage tanks and oil-filled operational equipment located within process areas north of Lawndale and not adjacent to a property boundary, public area, or navigable waterway, HRO utilizes the facility drainage systems and surface impoundments to control potential oil releases as specified in §112.8(b). For bulk storage tanks and oil-filled operational equipment adjacent to a property boundary, public area, or navigable waterway, HRO utilizes the facility drainage system as described above or has designed secondary

containments to contain the volume of the largest tank in the containment plus sufficient freeboard for precipitation as specified in §112.8(c). Construction materials are either earthen dikes or concrete walls which are sufficiently impervious to contain a catastrophic release of oil. A common industry standard is to use either a 24 hour rainfall amount associated with a 25 year rain event or 110% of the largest tank in the containment. A list of Oil-Filled Electrical Equipment in the facility is provided in [Table 2-4](#), the Cathodic Protection Rectifier Location Plan is provided in [Figure 2-3a](#), and Contractor Oil Storage Locations are illustrated in [Figure 2-3b](#).

Estimates of volumes contained by tank basins adjacent to a property boundary, public area, or navigable waterway are based on areas and dike height obtained from an aerial topographic survey conducted in May 2011 and partially from a dike survey conducted in 2001 by Parsons Energy and Chemicals Group Inc. The volume calculation for secondary containment is based 110% of the largest tank in the containment and includes the available volume below the lowest point of the diked containment.

Some secondary containment perimeters contain low interior dikes lying close to individual tanks or groups of tanks. These low tank dikes were not considered the basin boundaries. The secondary containment perimeters satisfy the regulations for the largest tank within the containment area. A tank containment basins summary is provided in [Table 2-5](#).

The design of tank dike walls conforms to National Fire Protection Association codes and Occupational Safety and Health Administration (OSHA) standards. Based on the soils types, drainage records, and field observations, secondary containment areas are sufficiently impervious to contain a discharge from an aboveground facility with line of sight inspection capability (tanks, containers, piping, etc.) until clean up occurs. A summary of secondary containment areas for bulk storage tanks is provided in [Table 2-6](#).

Aboveground tanks within secondary containment are subjected to integrity testing every 20 years and when major repairs are performed. The integrity testing takes into account the tank design (i.e., floating roof, fixed roof, etc.), material stored, and the intended operation. As appropriate at the time of the test, integrity testing techniques may include hydrostatic testing, radiographic testing, visual inspections, ultrasonic testing, acoustic emission testing, or a system of non-destructive shell testing. Comparison records are kept, and tank support and foundation documents are included in these inspection records.

The Secondary Containment systems are inspected against the following checklist:

Dike or Berm System

- ✓ Level of precipitation in dike/available capacity
- ✓ Operational status of drainage valves
- ✓ Dike or berm permeability
- ✓ Debris

- ✓ Erosion
- ✓ Permeability of the earthen floor of diked area
- ✓ Location/status of pipes, inlets, drainage beneath tanks, etc.

Secondary containment

- ✓ Cracks
- ✓ Discoloration
- ✓ Presence of spilled or leaked material (standing liquid)
- ✓ Corrosion
- ✓ Valve conditions

Retention and drainage ponds (as applicable)

- ✓ Erosion
- ✓ Available capacity
- ✓ Presence of spilled or leaked material
- ✓ Debris
- ✓ Stressed vegetation

Several tanks at the refinery are heated to ensure adequate viscosity of the stored material. Steam condensate from internal heating coils is collected and rerouted to either the boiler feed water system or the wastewater treatment system. Effluent from the facility wastewater collection system is visually observed at least once every 4 hours for indications of possible upsets (e.g., a floating phase).

Area operators conduct visual inspections of bulk storage tanks, secondary containment dike walls, and dike valves during the normal course of their duties. When deficiencies are found, operators write work notifications for repairs. In addition, equipment leaks or spills are immediately reported to the Shift Management Team so appropriate clean-up and repairs can be initiated.

Operators maintain communications with each other via radio when pumping materials and drawing water from tanks. When drawing water to wastewater systems (e.g., OWS or NESHAP), the operator is in attendance at the water draw continuously, never leaving the water draw unattended, in order to continuously monitor the material being drained and any sump levels, as they may apply. The operator will close the water draw valve before leaving the area if called away.

2.2.4 Aboveground Fuel Storage Tanks

(b) (7)(F), (b) (3)

The tanks primary containment is a monolithic vault constructed of continuous and seamless concrete with no cold joints or heat sinks on the bottom or sides.

The tanks secondary containment consists of a 30 mil high-density polyethylene membrane protected by exterior concrete. These tanks are located at the north end of the Maintenance Shop and Store House. The two tanks replaced two underground storage tanks that were emptied and removed from the facility in February 2007. The Facility does not have completely or partially buried metallic storage tanks or bunkered metallic tanks for the storage of oil.

2.3 PIPELINES

Buried pipelines are wrapped and coated to reduce corrosion, and cathodic protection is provided where appropriate. Buried pipelines, which have been exposed for any reason, are periodically inspected for deterioration and appropriate action taken. Pipe supports are designed and constructed of steel or concrete independently supported by concrete foundations, are designed to appropriate engineering standards for minimizing abrasion and corrosion, and allow for expansion and contraction. Drivers of vehicles granted entry into the plant are routinely cautioned regarding safe practices. There is no leak detection system on the pipelines.

Pipelines that contain oil are capped at all unused terminal locations and are either tagged with "Line in Service" signs or blinded. Pipeline terminal connections are blank flanged when:

- ✓ It is necessary to isolate leaks,
- ✓ Maintenance requirements dictate opening some in line equipment, or
- ✓ It is necessary to isolate and clear a vessel to which the pipeline is connected.

As defined by §49 CFR 194.5, HRO has designated its "Response Zone" as the refinery facility plus the "line sections" owned or operated by HRO which are not protected by secondary containment or the refinery drainage system including but not limited to those lines which run off site to other locations. A complete listing of these line sections is provided in [Table 2-7](#). These lines connect the 225 Tank Farm via a tunnel under State Highway 225. [Figure 2-4](#) shows the locations of HRO's designated line sections.

2.4 VESSEL DATA AND DOCK INFORMATION

[Figure 2-2](#) shows the locations of all mooring areas and transfer locations at HRO. The refinery has four berths, designated as "Dock A," "Dock B," "Dock C," and "Dock D." These facilities can accommodate vessels ranging in size from a "lightered" (450,000 bbl), 80,000 dead weight tons (550,000 bbl) tanker at Dock B to 5,000 bbl barges.

Because of the shallow water (approximately 15 feet), Dock A services only barges. The six loading arms (two 10-inch arms, four flinch arms) permit transfer of crude oil, fuel oils and

aromatics. Secondary containment for Dock A is provided by a sump located at the block valves to the dock; additional secondary containment is provided by the Dock Road, which is curbed and drains to HRO's surface impoundments. Also, Dock A has a concrete base, with six-inch curbs, which drains by underground line to the sump. Rainfall and/or spills can also drain to the Dock Road.

Dock B, which is off the channel and in the Clinton Island Turning Basin, handles the largest ships (38 feet) at the refinery. Dock B has seven loading arms (two 12-inch arms, three 10-inch arms, two 8-inch arms) for crude oil, fuel oils, lube oils, and aromatics. A sump located at the block valves to the dock provides secondary containment for Dock B; the Dock Road, which is curbed and drains to HRO's internal storm water basins, provides additional secondary containment. Also, Dock B has a concrete base, with six-inch curbs, which drains by underground line to the sump. Rainfall and/or spills can also drain to the Dock Road.

Because Dock C is on the channel (north of the C&P Building), wide ships would extend into the channel; therefore, the berth has restrictions on the ship's beam. This dock can move aromatics, lube oils, crude oil, and fuel oils. The dock has 11 loading arms (one 12-inch arm, ten 6-inch arms) and seven hoses. Secondary containment for Dock C consists of a concrete pad with curbs ranging in height from six inches to twelve inches. This curbed area drains by underground pipeline to a large sump that receives drainage from the sumps along Dock Road; from this sump, material is pumped to HRO's wastewater treatment area.

Sulfur (molten) is loaded into barges at Dock D, which is east of Dock C. Some products to the docks have dedicated lines (restricted to a particular service). Multiple service lines require line displacements to protect product quality.

Flow to and from the docks is controlled by block valves located at the end of the loading arm (pneumatic), the manifold to the loading arms (pneumatic), the end of the pipe before the manifold (main block valve, manually operated) the pumps (manual or motor operated gate valve) one each for the suction and discharge, and the discharge or receiving tank outlet (manual or motor operated gate valve). The pneumatically actuated valves are for emergency shutdown situations and can be closed quickly. The location of these valves are depicted in [Figure 2-5](#), [Figure 2-6](#), [Figure 2-7](#), and [Figure 2-8](#). Residual material in each loading arm is drained into a "closed" dry slop containment sump and subsequently pumped to the slop oil system for reprocessing. Each loading arm and the transfer piping system must not leak under static liquid pressure at least 1.5 times the maximum allowable working pressure. The USCG granted approval for alternate compliance to §33 CFR 156.170(c)(4) as indicated in [Figure 2-9](#) such that testing of the transfer piping system need only be performed back to the first block valve on shore.

2.5 SITE DRAINAGE INFORMATION

At HRO, extensive curbing, surface grading, and underground piping directs potentially contaminated surface runoff, process unit wastewater, and tank water draws into the plant oily water treatment system. Block valves that remain in the closed position until opened to drain storm water control drainage from diked oil storage areas. Oil spilled or leaked within the dikes is contained and then removed by vacuum trucks. Storm water runoff from the diked areas is drained through the plant's two storm water sewer systems. Drainage from un-diked areas flows through the same sewer systems.

The drainage watershed within the refinery can be divided into the west drainage area and the east drainage area. Storm water runoff from the rainfall events within the west drainage area is collected and impounded in the West Guard Basin (WGB) and West Impoundment Basin (WIB). Runoff within the east drainage area is impounded in Dock B (No. 4) Guard Basin, C&P Guard Basin, East Guard Basin (EGB) and the East Impoundment Basin (EIB).

Under conditions of moderate rainfall, storm water is retained within the respective Impoundment and Guard basins only until it can be pumped to storm water storage tanks where any oil will be separated from the storm water. The storm water is then pumped to Gulf Coast Authority (GCA) Washburn Tunnel facility for further primary and secondary treatment and disposal.

If an overflow of the basin becomes imminent during a heavy rainfall event (four inches/hour), underflow weirs are provided to divert water from the basins directly to the Houston Ship Channel. These underflow weirs should retain any oil that may be in the storm water retention Guard Basins. The discharges from the three emergency storm water outfalls are regulated by a TPDES permit. Storm water that overflows from the WGB goes to Outfall 003. Storm water overflow from the EGB goes to Outfall 001. Storm water overflow from the Old GCA Sump goes to Outfall 002. Flow measurements and samples are taken during a storm water discharge event in order to provide a record of the quantity and quality of water discharged as required by the discharge permit.

Oil retaining booms will be deployed to contain oil sheens that may reach the ship channel, and vacuum trucks are utilized to recover the oil, if any.

2.6 IDENTIFICATION OF FACILITIES

Several facilities are used for transferring, shipping, or receiving petroleum or other products at HRO. Some loading/unloading areas are not required to be in the Plan (for example: the Sulfur Loading Rack) but were included due to their proximity to other loading areas. Concerning all highway and railway related transportation; the Refinery Secondary Containment System protects the following loading/unloading areas:

- ✓ Tank car Loading rack (TCLR), Tracks 1 and 2
- ✓ Tank truck loading rack, west of TCLR
- ✓ Tufflo tank truck rack (west of former MEK Unit)
- ✓ Tufflo tank car loading rack (southeast of former NMP Unit)
- ✓ Sulfur tank truck loading rack (east of TCLR)
- ✓ Tank Truck Loading Rack (south of Tank 678)
- ✓ Ship loading/unloading facility (Docks A, B, C and D)
- ✓ ARU Loading Rack (west side)

2.6.1 Loading and Unloading Operations

Spill control procedures for loading and unloading operations are discussed in more detail in Section 3 of this Plan.

Docks

All spillage on the docks is contained and handled through wet and dry sloop systems. In the event of a spill on water, spill booms are deployed and vacuum trucks are used for cleanup. Cleanups are handled by HRO personnel and contractors for quick and effective treatment. Standard Operating Procedures for loading and unloading barges and ships are maintained electronically at in LiveLink.

Tank Car/Truck

Prior to loading or unloading, tank cars and trucks are first spotted in the appropriate location and are secured by either setting the brake or wheel chocks on each side of the wheel or both. Drivers are not allowed in their vehicle during loading or unloading. The car or truck is not allowed to leave the spotted location until all disconnections have been made, and all safety chains have been removed and outlets have been checked for leakage. Loading rack containment is adequate to contain the largest compartment of any truck or tank car using the truck rack or rail rack, respectively. In addition, the loading rack is equipped with an automatic shutdown system and warning signs are posted at the rack.

2.6.2 Transfer Operations

Pipelines, which can contain oil, are capped at all unused terminal locations and are either tagged With "Line in Service" signs or blinded. Pipeline terminal connections are blank-flanged when:

- ✓ It is necessary to isolate leaks,
- ✓ Maintenance requirements dictate opening some in-line equipment, or

- ✓ It is necessary to isolate and clear a vessel to which the pipeline is connected.

Operations personnel in the course of their normal duties routinely check all above ground valves and piping.

2.7 SITE SECURITY

(b) (7)(F), (b) (3)

2.8 COMMUNICATIONS

Communication is essential to an efficient emergency response program. During a spill, communications control center will be established at the Emergency Operations Center in the eastern portion of the second floor of the Administration Building. The procedures in the EAP are then activated.

Communications are a critical element of the Emergency Response Team's (ERT) effort. The IC must have immediate communication with the Field Coordinator, ERT Operations Chief, HSSE Environmental and Safety Coordinators and with supporting units and organizations. While communications personnel and the systems they operate are not a part of the ERT, they are essential in supporting the Emergency Response efforts. A discussion of the responsibilities of the communications control center and resources of the communications control center is detailed in the [EAP](#).

2.9 INSPECTION AND RECORDS

Appropriate records are maintained covering key points of this program. Spill events are documented and the records are kept in the HRO Environmental Library. Records of tank integrity tests and inspections are maintained with the inspection procedures in the Inspection Department. Inspection records and are maintained for a period of 5 years.

2.10 ENVIRONMENTAL PERMITS

The environmental permits and authorizations for air, water, solid/hazardous waste and spill response for the HRO are summarized in [Table 2-8](#).

Table 2-8 Environmental Permits and Authorizations

Permit Type	Permit No.	Agency	Purpose	Effective Date
NSR	2167	TCEQ	State operating permit	08/19/10
Site ID	TXD08268897	EPA	Offsite disposal of hazardous waste	NA
Site ID	30092	TCEQ	Solid waste registration number for offsite disposal or solid and/or hazardous waste	NA
Title V	O-01372	TCEQ	Federal operating permit	03/12/12
TPDES	W0000392000	TCEQ	Wastewater discharge to Houston Ship Channel	01/13/10
RCRA Part B	HW-50106	TCEQ	Operating permit for closure of land treatment units	05/02/11
SRPP	20320	Texas GLO	OSPR Discharge Prevention and Response Certificate	07/29/13
SRPP	FRP-06-TX-00040	EPA	Statutory approval of SRPP	02/08/08
SRPP	Control No 93043	USCG	Approval of SRPP	10/07/13
Affluent	401/601	GCA	Wastewater Effluent Permit	10/27/11

Note: There are no pre-approved uses of chemical agents for inland or near shore environments. Authorization of in-situ burning is subject to State and Regional Response Team approval.

3.0 SPILL RESPONSE PROCEDURES

This section of the Plan describes how HRO will respond to spills that occur at the facility. These spills can be land-based within the refinery resulting from a variety of operations including, but not limited to, tank or pipeline liquid releases or from liquid spills to the water at HRO's Marine Terminal. As stated earlier, the EAP contains all of the pertinent information for reporting and responding to an emergency condition, which includes spills. This section discusses spill response in more detail.

3.1 STANDARD OPERATING PROCEDURES FOR ONSHORE SPILLS

The [EAP](#) contains procedures for the notification and response to spills. The EAP specifies the Security Operations Center (SOC) must be notified of any incident or emergency, regardless of the nature. Based on severity of the incident or emergency, the SOC may activate the Emergency Notification System which includes a plantwide tone-out system, public address system, and ERT call-out via a pager system. The internal notification and level of training for ERT personnel is provided in [Table 3-1](#).

The SOC will activate the EAP if there is the possibility of explosion or fire, or if hazardous materials spills have been released. Hazardous Material (HAZMAT) spills are responded to by the ERT and directed by a HAZMAT officer for all Alert levels. The Emergency Notification and Response Procedure is presented in [HSE-EAP-002](#). The overall ERT Command Structure and Operations Structure are illustrated in [Figure 3-1](#) and [Figure 3-2](#), respectively.

Table 3-1 Internal Notification References

INTERNAL NOTIFICATIONS - GENERAL FACILITY

3.2 EMERGENCY ACTION PLAN

The [EAP](#) is a separate document that communicates the procedures that represent a safe and effective approach to emergency response for this facility. The EAP provides for:

- ✓ An organization capable of managing the response effort and marshaling the necessary resources to deal with the emergency,
- ✓ An efficient means of notifying the appropriate ERT members of the emergency, thereby enabling them to respond quickly with proper equipment;
- ✓ Systematic emergency response training;
- ✓ Comprehensive procedures to be followed by Emergency Operations Center (EOC), ERT, Operations, and non-essential personnel in the event of an emergency; and
- ✓ Provision for efficiently utilizing outside assistance when necessary.

The EAP identifies the personnel that are on-call by job title. The SOC has an up-to-date call-out list with home phone numbers and pager numbers to contact to initiate an emergency action at any time of the day.

3.3 SPECIAL CASE: MARINE SPILLS

HRO has three docks on the Houston Ship Channel that can load or unload petroleum feedstock, intermediates or finished products. HRO has specially trained Spill Team that provides immediate response to a spill to water. The objective of the Spill Team is to contain the spill at the dock area. Outside contractors will provide clean-up and additional equipment as needed.

3.3.1 Spill Response Team

The Spill Team consists of a QI, and the duties of the Spill Team are described below. These duties are specific to Marine spill situations after an Alert 1 has been initiated, per the EAP. Other duties are given in the EAP for other command and support personnel.

- ✓ Assess the spill and decide on the response actions required.
- ✓ Operate the spill boat.
- ✓ Deploy boom and contain the spill.
- ✓ Clean-up and/or dispose of contaminated equipment or material, as necessary.
- ✓ Call out one or more spill response service contractors to contain and clean-up the spill.

3.3.2 Outside Contractors

HRO personnel provide the initial spill containment response and some degree of clean-up for marine spills. However, HRO relies on outside contractors to provide material and manpower for complete spill containment, removal of floating spillage, and clean-up of affected areas. HRO is a member of the Clean Channel Association (CCA) which provides worst-case spill response capability, specialized equipment, as well as HAZWOPER and ICS training for its members. In addition, HRO has a service contract with Garner Environmental Services to assist and respond to marine spills.

Both CCA and Garner Environmental are certified Oil Spill Response Organization (OSRO) as indicated by the OSRO certifications provided in [Figure 3-3](#) and [Figure 3-4](#), respectively. The Field Coordinator may request assistance from these outside contractors when a spill is beyond the capability of ERT personnel. In non-emergency situations, HRO's Solid Waste Coordinator makes the determination and directs the clean-up.

In accordance with the USCG Final Rule (FR Vol. 74, No. 167) dated August 31, 2009, certain facilities must identify in their response plan and ensure the availability of through contract or other approved means, dispersant application resources and aerial oil tracking capability. The requirement for dispersants is limited to facilities that operate in preauthorized areas. For this COTP zone, preauthorized area is defined as at least 3 nautical miles offshore and in at least 33 feet of water. Therefore, this Facility is currently operating outside the designated preauthorized area and is not required to amend the plan to address the dispersant requirements.

Additionally, the Rule states that facilities operating exclusively on "inland rivers" are not required to comply with the new aerial observation requirements. Coast Guard Headquarters has determined that "inland rivers," as used in the CAPS Final Rule, is equivalent to the term "inland area," which is defined in 33 CFR 154.1020 as "the area shoreward of the boundary lines defined in 46 CFR Part 7..." Therefore, the Facility is currently operating within an "inland river" and is not required to amend the plan to address aerial oil tracking requirements. However, if aerial oil tracking is required during a response, either through CCA or Garner Environmental Services access to aerial surveillance will be provided.

3.3.3 Other Governmental Agencies

In the event of a catastrophic spill resulting in potential impacts to the community, LEPCs and other governmental agencies may be called to assist the HRO with managing emergency responses. Because LEPCs understand the chemical hazards throughout the community, they have developed emergency plans in case of accidental releases which are

designed to help communities prepare for and respond to emergencies involving hazardous substances. A listing of local governmental agencies is provided in [Table 3-2](#).

3.3.4 Logistics

As illustrated in Figure 3-2, the Finance Section of HRO's Emergency Operations Command Structure falls under the Supply Unit in the Logistics Section. The primary responsibility of the Logistics Section Chief is to assemble on-site or corporate purchasing and procurement staff as necessary to support emergency responses. The Logistics Section Chief is also responsible for managing all financial aspects of an incident, tracking and documenting all costs and resources, verification and payment of contractor services, and providing financial input to demobilization planning.

3.4 NOTIFICATION REQUIREMENTS

In addition to local governmental agencies, the National Response Center, Texas Commission on Environmental Quality, Texas General Land Office, US Fish and Wildlife Service, and/or other Federal and State agencies may need to be notified. The contact information for Federal, State, and local regulatory agencies and emergency services is also presented in [Table 3-2](#). Either the Emergency Operations Coordinator or a designated EOC Staff person will coordinate response efforts with the designated Federal, state and/or local On-Scene Coordinator.

Depending the level and severity of emergency, additional HRO support may need to be called in. These support groups include Human Resources, Public Information personnel, Insurance Adjustment (Risk Management) coordinator, and other refinery support teams. These efforts will be consistent with the ACPs Unified Command System.

3.5 RESPONSE PERSONNEL

3.5.1 Qualified Individual

The QI and alternate QIs are listed in [Table 3.1](#). The QI is referred to as the Emergency Operations Coordinator, and all QIs and Alternate QIs must be:

- ✓ Able to speak fluent English;
- ✓ Available on a 24-hour basis by either pager, telephone or cellular phone and can arrive at the HRO facility in a reasonable time;
- ✓ Familiar with the implementation of the SRPP; and
- ✓ Trained in the responsibilities of the QI under the SRPP.

The QI and alternate QI s identified in the Plan have the full authority to:

- ✓ Activate internal alarms and hazard communication systems to notify all facility personnel (see [EAP](#));
- ✓ Notify all response personnel, as needed;
- ✓ Identify the character, exact source, amount and extent of the release, as well as the other items needed for notification;
- ✓ Notify and provide necessary information to the appropriate Federal, State and local authorities with designated response roles. Act as liaison with the pre-designated Federal On-Scene Coordinator;
- ✓ Assess the interaction of the spilled substance with water and/or other substances stored at the facility and notify response personnel at the scene of that assessment;
- ✓ Assess the possible hazards to human health and the environment due to the release. This assessment must consider both the direct and indirect effects of the release;
- ✓ Assess and implement prompt removal actions to contain and remove the substance released;
- ✓ Coordinate rescue and response actions as previously arranged with all response personnel;
- ✓ Obligate HRO funds required to carry out response activities; and
- ✓ Direct cleanup activities until properly relieved of this responsibility.

The QI and Alternate QI(s) may draw upon the input and knowledge of other facility and response personnel to help them respond to a spill in a timely manner.

3.5.2 Emergency Response Personnel

HRO developed the [EAP](#) based on the Incident Command System model. The ERT is an organized group of HRO refinery personnel who are equipped to handle all types of emergencies. During an emergency, the EOC is staffed with a team of specialists and managers to assist the Emergency Operations Coordinator (the QI).

The Emergency Operations Coordinator directs the ERT and EOC during an incident. Trained ERT personnel assume specific roles in either of these two areas. The ERT personnel respond to the incident in the notification functions from a Central Command Center. [Figure 3-1](#) and [Figure 3-2](#) illustrate the ERT Command Structure and Operational Structure. The Emergency Operations Organization roles and responsibilities are outlined in [HSE-EAP-005](#).

3.5.3 Contractor Response Personnel

Spill response activities performed by contract response personnel are managed and coordinated by the Emergency Operations Coordinator or his designee. A copy of the CCA Resource Manual is presented in [Figure 3-5](#), and the Garner Environmental Response Rate Schedule is provided in [Figure 3-6](#).

3.6 RESPONSE EQUIPMENT

3.6.1 On-site Equipment

The facility-owned response equipment is inspected per regulations using the appropriate company response equipment inspection checklist(s). Inspection records are maintained on file for a minimum of five (5) years. Spill response equipment owned and operated by HRO is listed in [Table 3-4](#).

3.6.2 Contractor Equipment

As indicated in [Section 3.3.2](#), CCA and Garner Environmental are OSRO-certified spill contractors available to HRO to assist with clean-up of spills. Spill response equipment owned and operated by CCA is listed in [Figure 3-7](#), and Garner Environmental Services spill response equipment is listed in [Figure 3-8](#).

In addition to spill response equipment owned and operated by HRO, CCA, and Garner Environmental Service, the Texas GLO has staged equipment located throughout the state for spill response. The locations of Texas GLO staged equipment in close proximity to HRO is illustrated in [Figure 3-9](#).

Table 3-4 HRO Emergency Spill Response Equipment

Equipment	Description	Operational Check	Location / accessibility
Oil Boom	1500' 18" conventional oil containment boom	Once per quarter	1250' - Spill Response Facility
Oil Boom		Once per quarter	250' - Boom Box between B and C Dock
Oil Boom		Once per quarter	250' - Boom Box between C and D Dock
Spill Boats	1-16' flat bottomed boat and 1-21' flat bottomed spill boat.	Once per quarter	16' boat located in Spill Response Facility (NE corner of refinery) and 21' boat located in No. 5 Barn
Vacuum Truck - 1989 Freightliner / Cusco, truck No. 6135	70 - barrel capacity	Trucks are used daily for various purposes.	Leased from Veolia
Vacuum Truck - 1990 International/Cusco, truck No. 3335	70 - barrel capacity	Trucks are used daily for various purposes	Leased from Veolia
Vacuum Truck - 1991 International/Cusco, truck no. 6008	70 - barrel capacity	Trucks are used daily for various purposes	Leased from Veolia
Vacuum Truck - 2002 International, truck no. 6189	Liquid Ring Ace	Trucks are used daily for various purposes	Leased from Veolia
Absorbents - Spill Textiles.	Assorted Sorbent Booms & Pads	Once per quarter	East Staging Building, Waste Crew Truck, 7 Hazmat Trailer
Absorbents	Sorbent Granules	Once per quarter	East Staging Building, Waste Crew Truck, 7 Hazmat Trailer
Power Generator	PTO-Driven	Once per quarter	Rescue Truck R-1, Cascade Truck C-1
900 MHz Motorola Radios, MTS2000 Smartnet Trunked Portable Radio, Model HOIQX/207H,	5 - Plant Frequency	Radios are used daily and replaced as needed.	HSE Communications Equipment Cabinet
Lighting	Light Towers	Once per quarter	Rescue Truck R-1, Cascade Truck C-1
Respirators - Scott SCBA Masks	50 - Small, medium, large	Once per quarter	Cascade Truck
Respirators - 4.5 Scott Ready to Use	36	Once per quarter	Cascade Truck
Ready to Use Scott Bottles	36	Once per quarter	Cascade Truck

3.7 DETERMINING SPILL FLOW DIRECTION IN HOUSTON SHIP CHANNEL

The following information can be used for determining probable spill direction in the Houston Ship Channel. The Emergency Management Coordinator shall be responsible for providing up-to-date accurate weather information to the Severe Weather Management Team. Also, employee emergency and severe weather information is available by calling phone number (713) 321-5775.

Wind Direction and Speed:

Real-time wind direction and velocity is obtained from the HRO Weather Station read-out located in the SOC. Based on the measured wind direction and velocity, the speed at which an oil slick moves on the surface of water is estimated at about 3.4% of the wind velocity.

Ship Channel Current and Tide Direction:

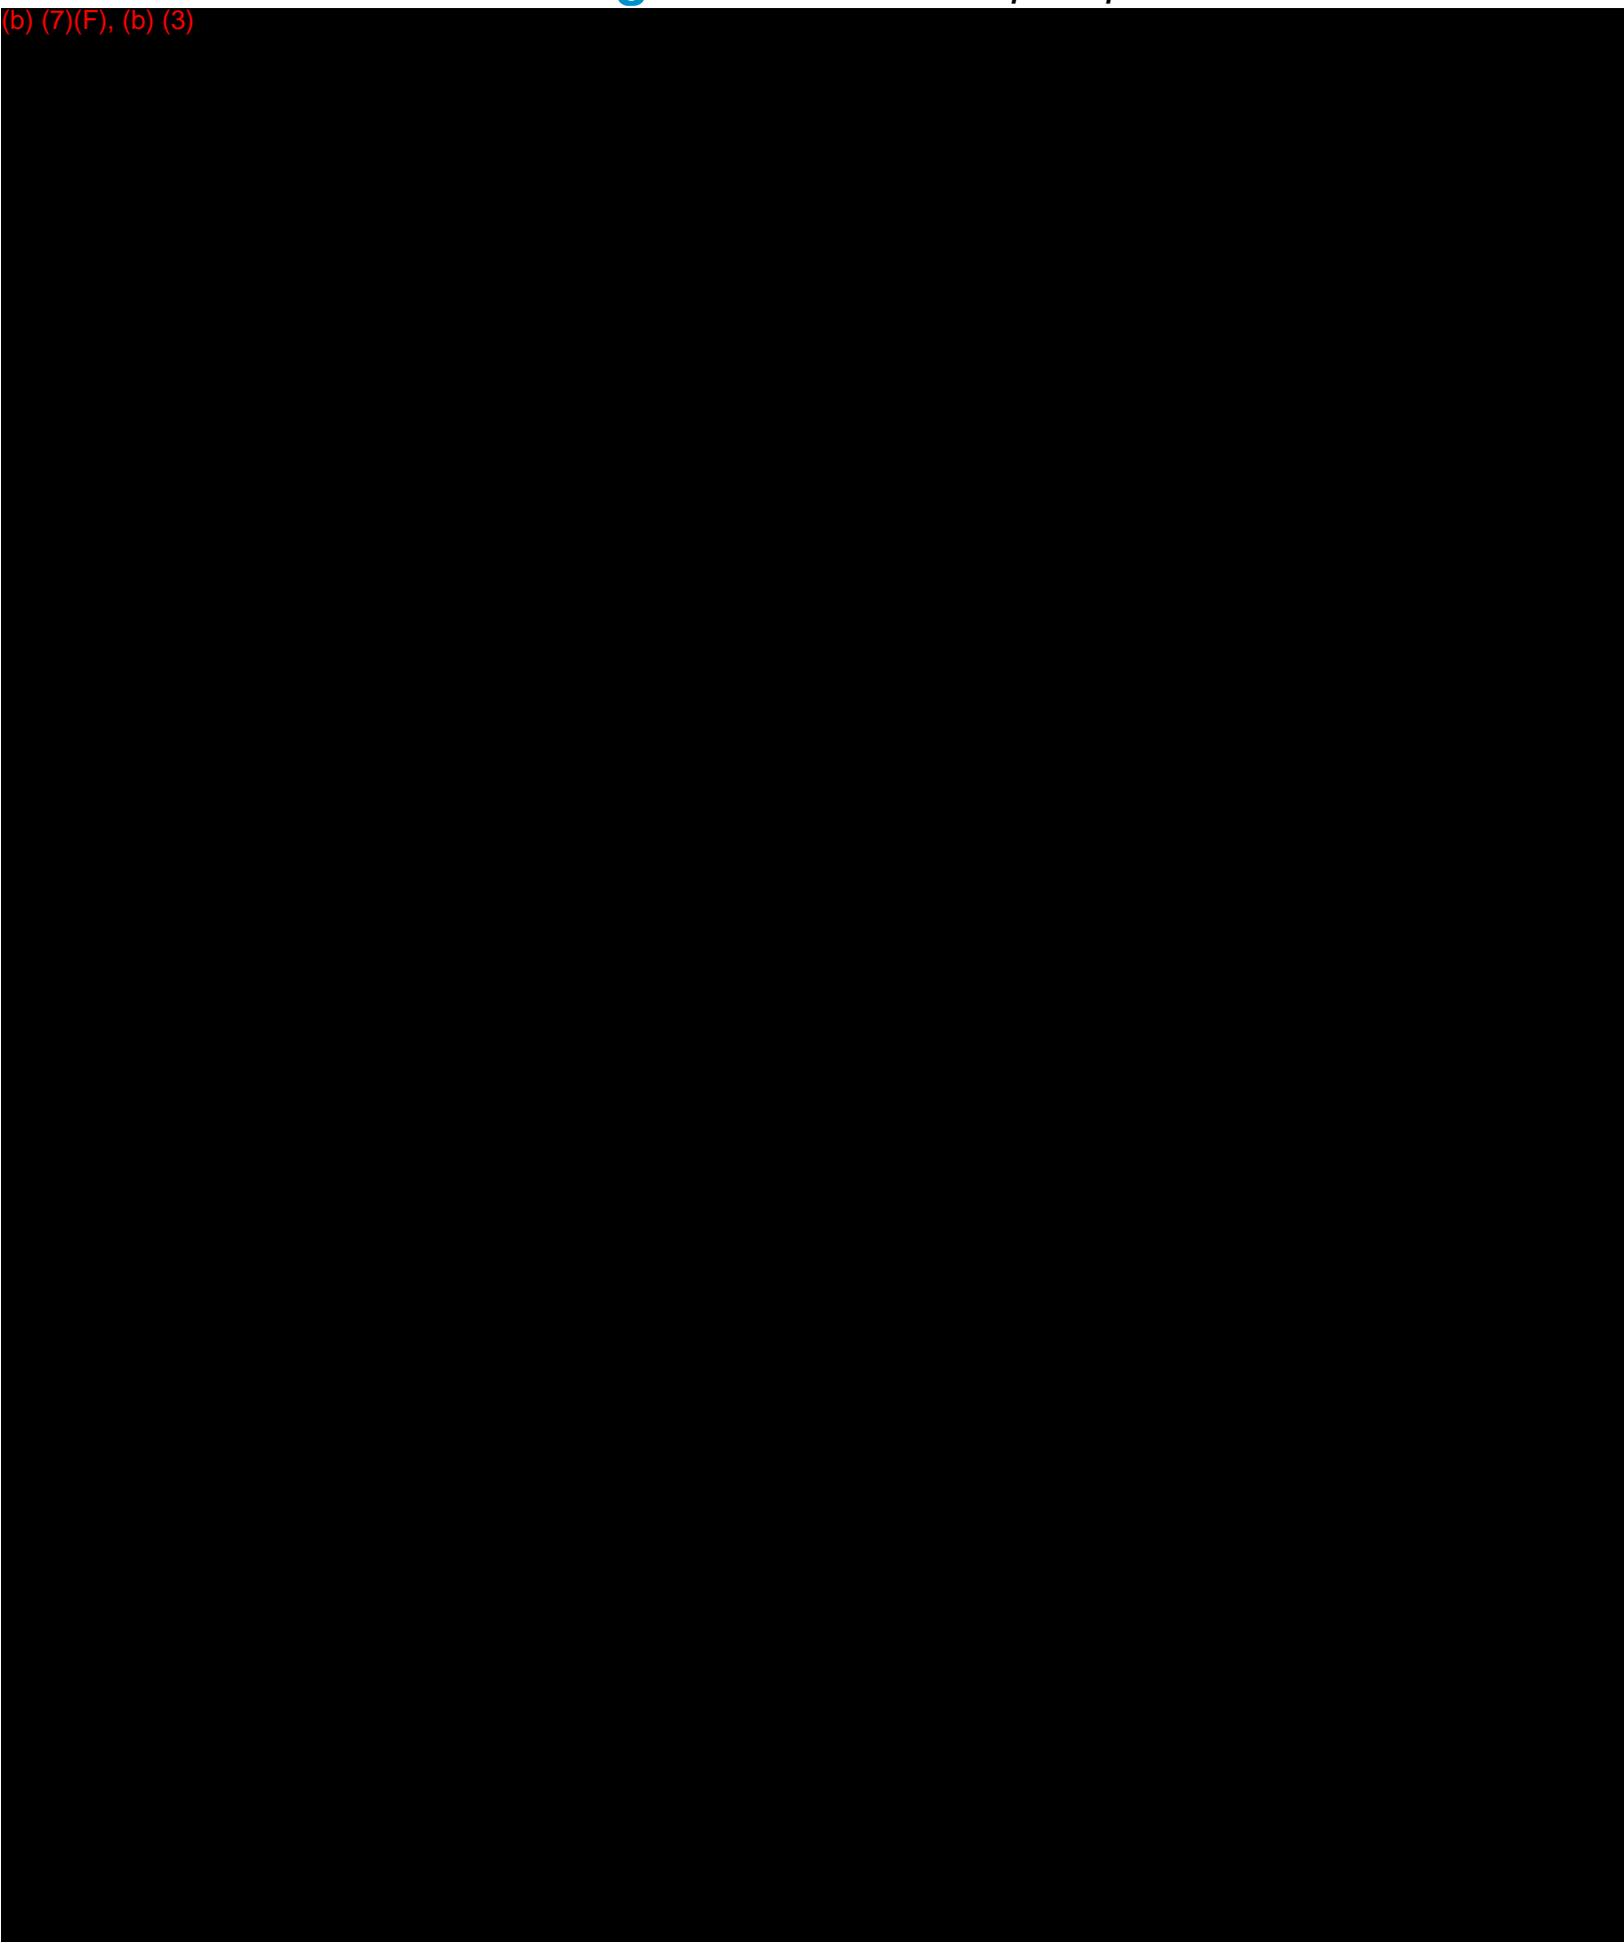

The local USCG Station's Vessel Traffic Service, (713) 674-8488, can provide current and tide information on a 24-hour basis. During daylight hours, surface velocity can be determined by timing drifting material for a measured length of dock or shoreline.

Spill Flow Direction:

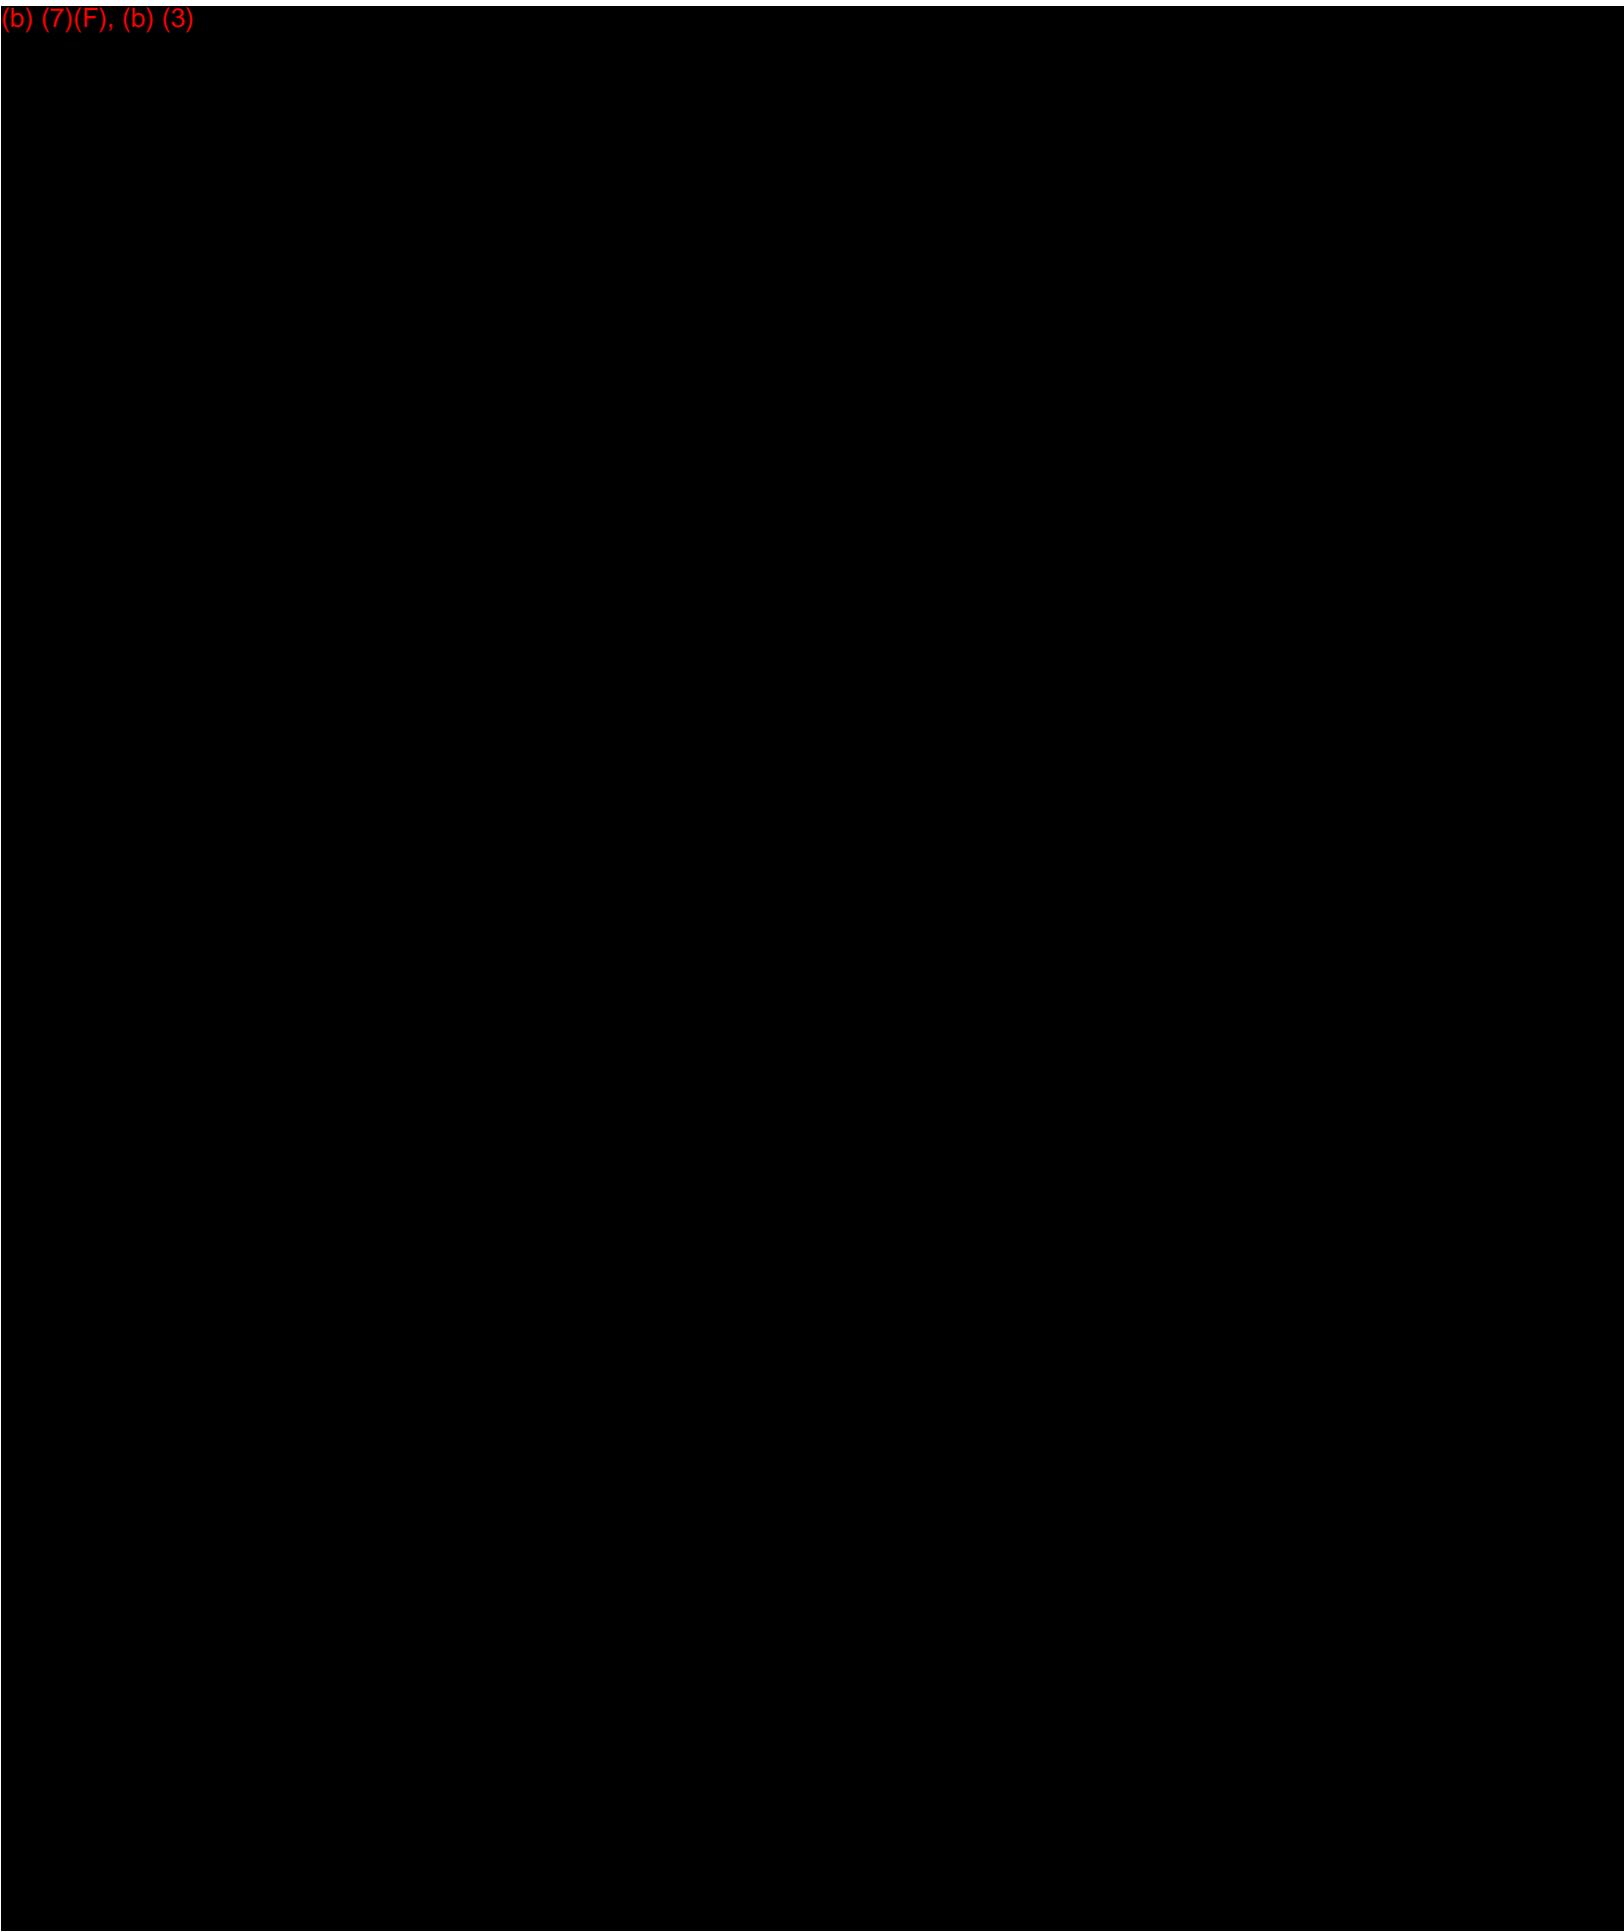

- ✓ No wind - oil will tend to move at the same velocity as the water surface.
- ✓ Wind and current in same direction - oil movement is the sum of the two velocities. (Note, an oil slick moves at about 3.4% of the wind velocity.)
- ✓ Wind and current in opposite directions - wind can reduce or reverse the water velocity at the surface. Oil could move upstream.
- ✓ High tide - acts to retard oil movement downstream.
- ✓ Low tide - acts in the downstream direction.

Note - tidal difference in the Houston Ship Channel is approximately 1 foot from high to low tide; therefore, it plays a minor role in determining spill direction. Actual on-scene observation of spill movement will take priority over the estimates done above.

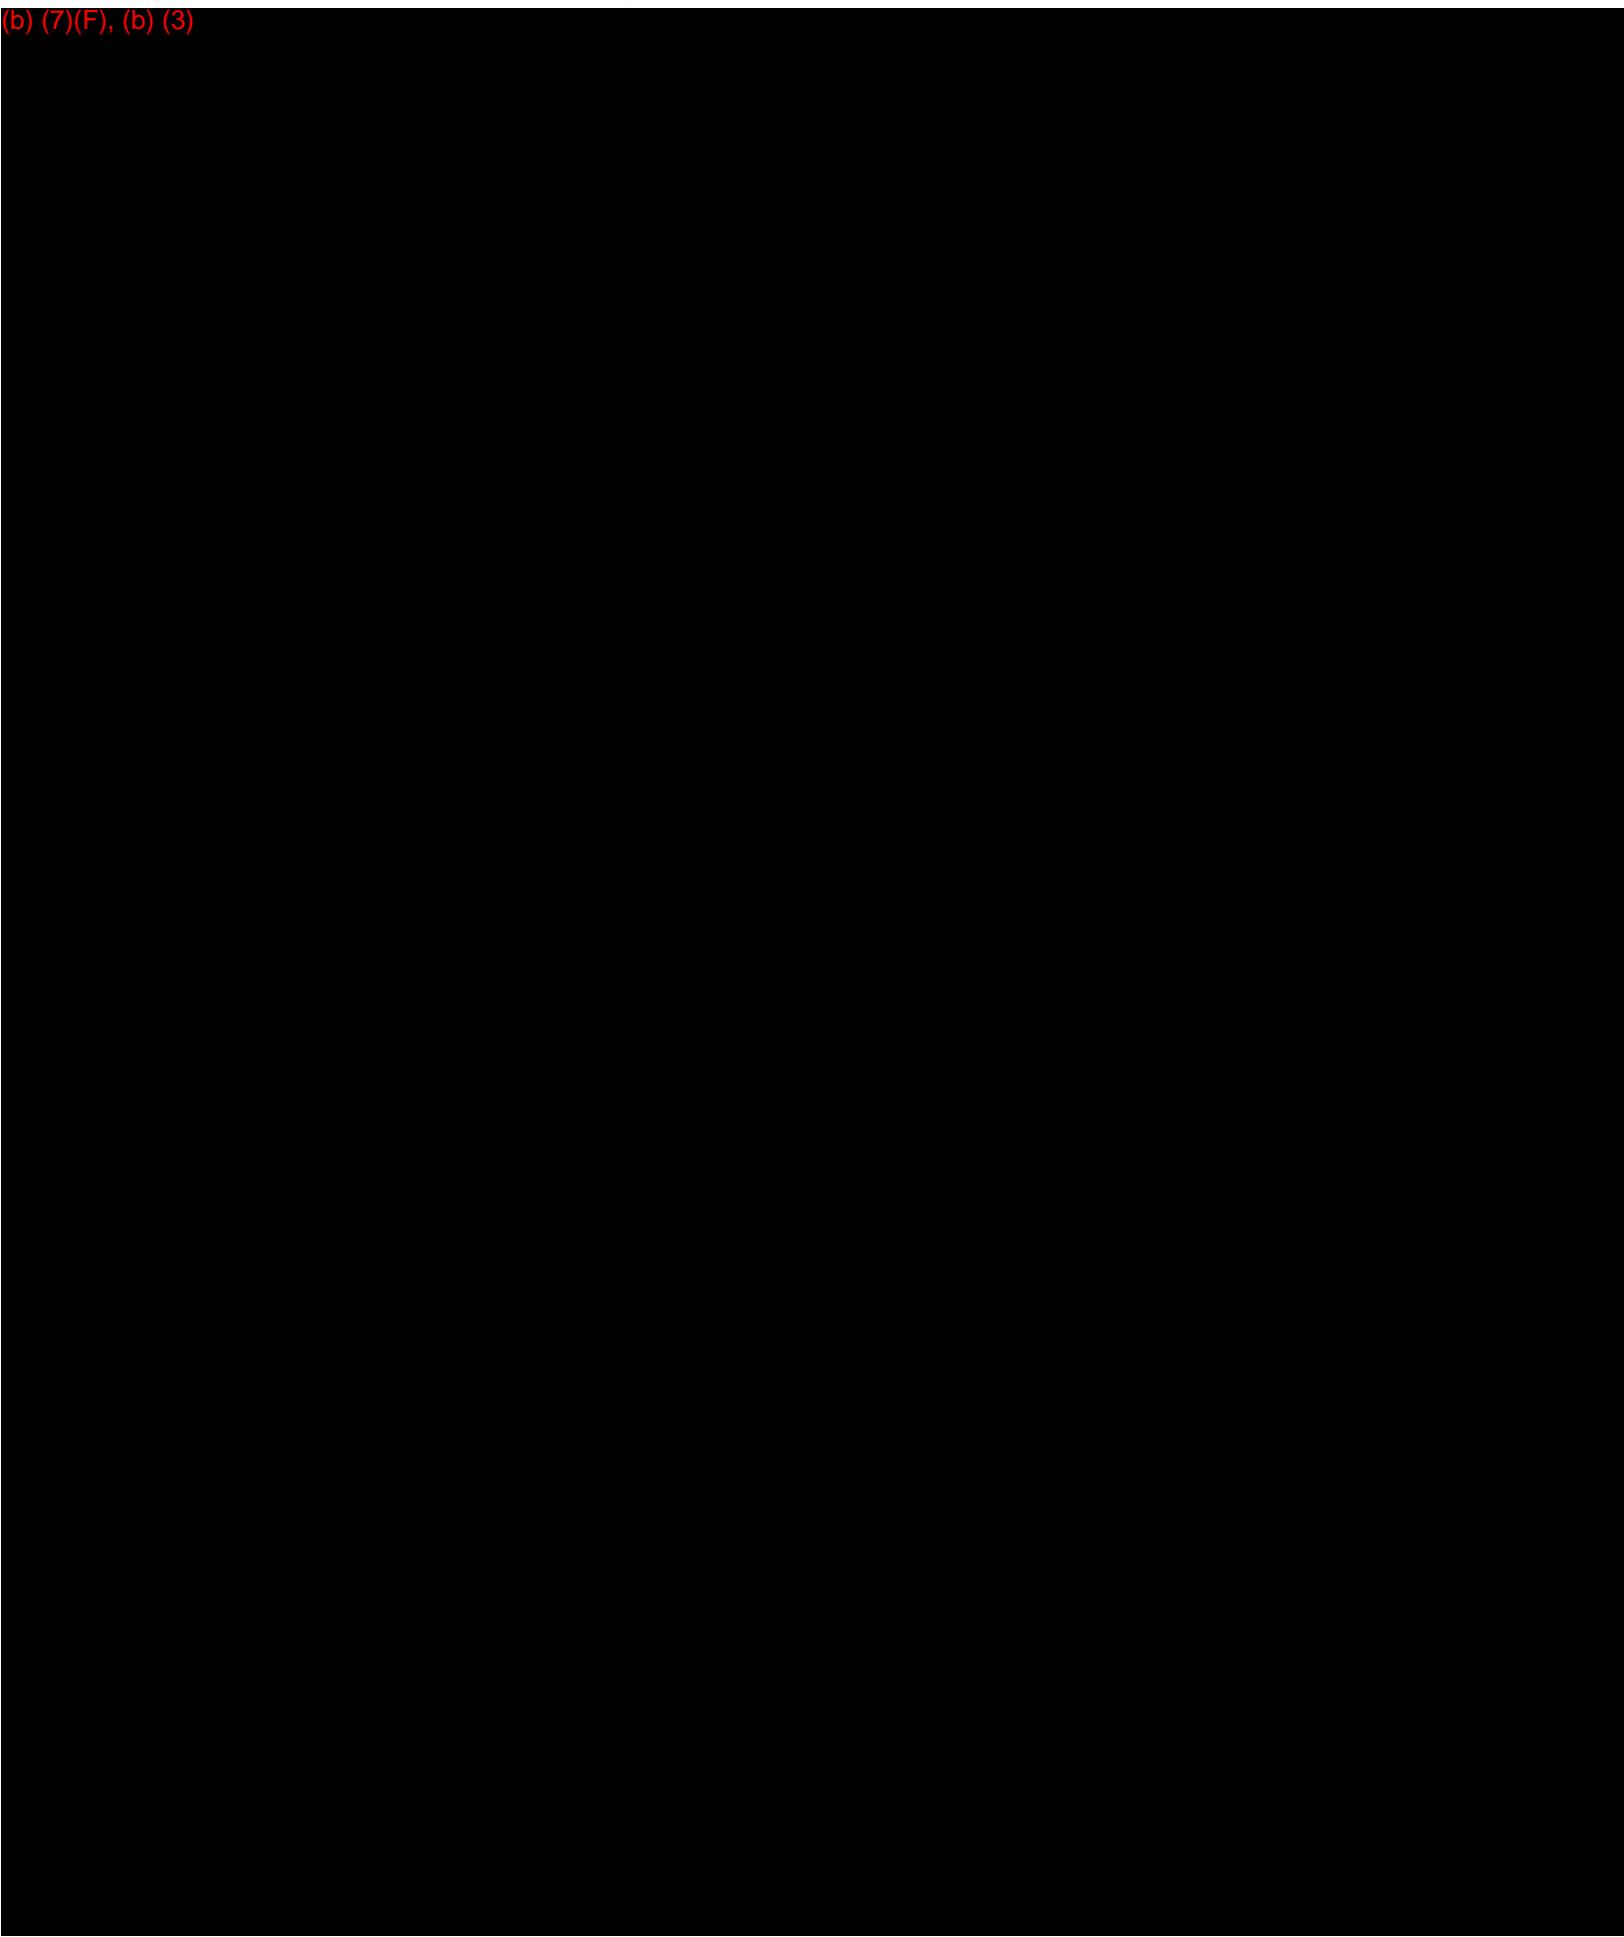

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

(b) (7)(F), (b) (3)

4.0 ANALYSIS OF POTENTIAL SPILLS

4.1 WORST CASE DISCHARGE

The worst-case scenario discharge for HRO is calculated using the criteria specified in the USCG, EPA, and DOT regulations §33 CFR 154, §40 CFR 112, and §49 CFR 194, respectively. The largest calculated spill will be used for planning purposes.

Since the scenarios vary by agency, each scenario is discussed separately and summarized below. HRO used the EPA calculated volume for persistent and non-persistent oils in Group 1 to Group 4 as listed below in [Table 4-1](#). The age of each tank along with its roof design and maximum fill capacity is provided in [Table 2-1](#).

Table 4-1 EPA Calculated Volume for Persistent and Non-Persistent Oils

Oil Group	Tank No.	Max Fill Capacity (bbls)*
1	134TK0850	(b) (7)(F), (b) (3)
	135TK0808	
	135TK0564	
	133TK0882	
	135TK0565	
	134TK0011	
	134TK0613	
	134TK0619	
Group 1 Total:		
2	133TK0876	
	135TK0578	
	133TK0879	
Group 2 Total:		
3	135TK0579	
	135TK0578	
	134TK0609	
	134TK0867	
Group 3 Total:		
4	136TK0558	
	138TK0006	
	136TK0559	
Group 4 Total:		

The EPA worst-case discharge for the Group 3 oil (heavy aromatics) is based on the largest Group 3 oil storage tank within secondary containment, and all the tanks use operational controls to meet secondary containment criteria specified in [Section 2.2.3](#). During the facility evaluation, HRO determined Tank 579 is the largest Group 3 tank, so it was selected for calculating the EPA worst-case discharge (catastrophic tank failure). The EPA scenario involves a catastrophic tank rupture onto concrete or earthen material resulting in the entire contents entering the Sims Bayou and eventually the Houston Ship Channel via a breach of the containment dike wall.

(b) (7)(F), (b) (3)

Prevention measure	Standard	Credit (%)
Secondary containment > 100%	NFPA 30	50
Built/repaired to API standards	API STD 620/650/653	10
Overfill protection standards	API RP 2350	5
Testing/cathodic protection	API STD 650/651/653	5
Tertiary containment/drainage/treatment	NFPA 30	5
Maximum allowable credit		75

DOT Breakout Tank Worst-Case Discharge = (b) (7)(F), (b) (3)

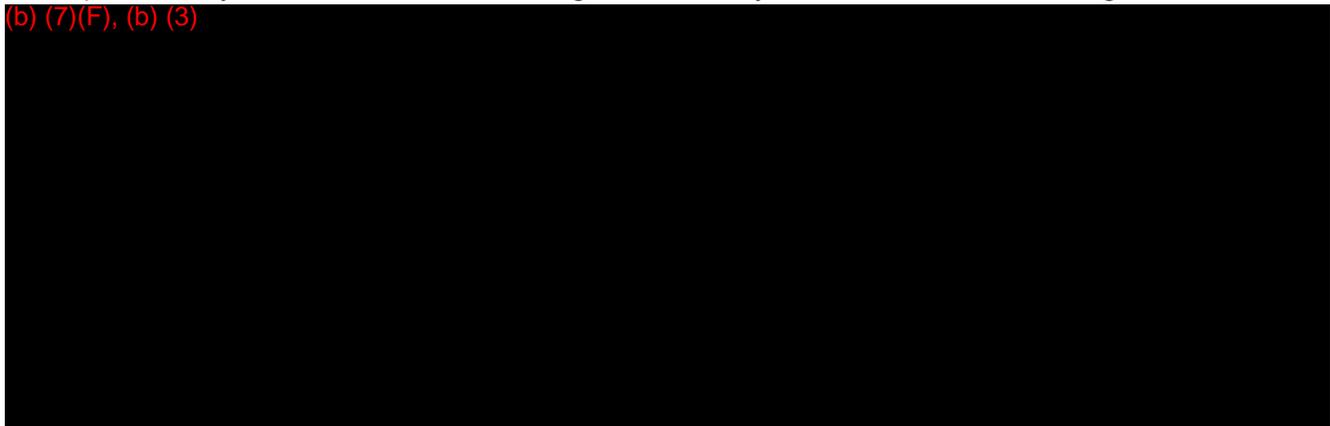

(b) (7)(F), (b) (3)

Since there is no historic discharge data for this scenario, the estimate is based on best engineering judgment. Under worst-case conditions of darkness and severe weather, it is estimated that the time to detect and shutdown the flow would be ≤ 1 -hour. The total spill volume is calculated to be (b) (7)(F), (b) (3)

The weather at the time of the worst-case discharge is assumed to be rainy, and the distance to the Sims Bayou as well as fish and wildlife and sensitive environments is less than one-half mile. Due to development on the adjacent property, surface topography will decrease the likelihood that a discharge will reach the Sims Bayou. Remediation equipment will be provided by the OSROs. The following is a summary of the worst-case discharge:

(b) (7)(F), (b) (3)

Therefore the worst-case spill for estimating response time is the loss of the contents from the four Group 3 tanks used for the EPA worst-case scenario is illustrated in [Figure 4-1](#).

4.2 MEDIUM DISCHARGE

The "maximum most probable discharge" (medium discharge) is defined by USCG regulations (§33 CFR 154) as a discharge of 1,200 barrels or 10 percent of the worst-case discharge, whichever is less. This is larger than the EPA planning volume or 36,000 gallons (857 barrels) (§40 CFR 112). The planning volume is 1,200 barrels. A medium discharge scenario is discussed in [Section 5.2.3](#).

4.3 SMALL DISCHARGE

The "average most probable discharge" (small discharge) is defined by USCG and EPA regulations (§33 CFR 154 and §40 CFR 112) as a discharge of 50 barrels. A small discharge scenario is discussed in [Section 5.2.4](#).

4.4 HISTORICAL OIL DISCHARGES

A list of historical tank failures from 1996 to 2013 resulting in the release of oil is presented in [Table 4-3](#).

4.5 DISCHARGE CHARACTERISTICS FROM EQUIPMENT FAILURE

This section describes the characteristics of discharges due to failure of the various types of major equipment used at the Facility.

4.5.1 Storage Tank Leak or Failure

- ✓ Direction of Flow: Outside containment or wastewater sewer system, drainage is towards the Houston Ship Channel.
- ✓ Rate of flow: Variable—depends on the size and location of the tank failure.
- ✓ Total quantity of oil: Should not exceed the working capacity of the tank, which is the maximum normal fill level of the tank (safe working capacity).

4.5.2 Tank Overfill

The maximum quantity of oil potentially discharged is based on a tank overfill resulting from failure of overfill protection equipment while a tank is being filled.

- ✓ Direction of Flow: For loss of secondary containment in the 225 Tank Farm, South Tank Farm, Allendale Tank Farm, and West Tank Farm, drainage would be toward the Houston Ship Channel via Sims Bayou located on the west side of the facility. For loss of secondary containment in the East Tank Farm and Heavy Oils Tank Farm, drainage would be toward the Houston Ship Channel via Vince Bayou and Light Company Road drainage located on the east side of the facility. For loss of secondary containment in the Central Tank Farm, drainage flows into the in-plant drainage system.
- ✓ Rate of Flow: Not greater than (b) (7)(F), (b) per hour based on the Enterprise pipeline delivery rate into tankage. Storage tanks are filled by the refinery operated equipment, which has a maximum pumping rate of 15,000 barrels per hour.
- ✓ Total Quantity of Oil: Variable – the amount of oil released is dependent upon the amount of time that elapses before the failure is detected, how long it takes block-in the line or connected secondary containment area, and how quickly a controlled shutdown can be completed to stop the release from the tank.

4.5.3 Tankcar/Tank Truck Overfill, Hose Failure in Loading Rack Area

- ✓ Direction of Flow: The tankcar/tank truck loading rack is equipped with an in ground hydrocarbon collection system, so oil resulting from overfills and hose failure will drain into the in-plant drainage system.
- ✓ Rate of Flow: Not greater than 275 gallons per minute based on the delivery rate for both railcars and tank trucks.
- ✓ Total Quantity of Oil: Variable – the quantity of oil spilled is dependent upon the amount of time that elapses before the failure is detected, how long it takes block-in the line, and how quickly a controlled shutdown can be completed to stop the loading/unloading operation.

4.5.4 Pipeline Manifold Areas, Equipment Failure

The maximum quantity of oil potentially discharged is based on a failure of the piping system due to corrosion. Another failure mode could be from contact by vehicles or other equipment.

- ✓ Direction of Flow: For piping system failures outside secondary containment areas in the 225 Tank Farm, South Tank Farm, Allendale Tank Farm, and West Tank Farm, drainage would be toward the Houston Ship Channel via Sims Bayou located on the west side of the facility. For piping system failures outside secondary containment areas in the East Tank Farm and Heavy Oils Tank Farm, drainage would be toward the Houston Ship Channel via Vince Bayou and Light Company Road drainage located on the east side of the facility. For piping system failures outside secondary containment areas in the Central Tank Farm, drainage flows into the in-plant drainage system.
- ✓ Rate of Flow: Not greater than (b) (7)(F), (b) (3) per hour, based on the Enterprise pipeline delivery rate to tankage.
- ✓ Total Quantity of Oil: The amount of oil released is dependent upon the time that elapses before the failure is detected, how long it takes block-in the line, and how quickly a controlled shutdown can be completed to stop flow through the pipeline to the Facility.

5.0 SPILL MITIGATION PROCEDURES

5.1 MITIGATION PROCEDURES FOR OPERATIONAL ACTIVITIES

5.1.1 Procedures for Equipment Leaks and Spills

Secondary Spill Containment

It is the policy of HRO to provide either permanent or temporary spill containment, where practical, to ensure no oil or other chemicals are unintentionally released to navigable waterways, to the soil, and/or to the plant sewer systems.

The guidance provided below pertains to storing liquid materials in drums, totes, and other containers; use of unmanned powered equipment (e.g., light carts, pumps, compressors, generators, welders, and power washers); and use of frac tanks and vacuum boxes.

- ✓ Inside Curbed Concrete Areas – storage of liquid materials and use of unmanned powered equipment inside curbed concrete areas is exempt from secondary spill containment as long as leaks/spills are mitigated and every effort is made to prevent hydrocarbons from entering the storm water collection sewer or contaminating soil, rock, or gravel. Use of kiddie pools is recommended when equipment is found leaking.
- ✓ Outside Curbed Concrete Areas – secondary spill containment shall be provided when storing liquid materials or using unmanned powered equipment located outside curbed concrete areas or in remote locations.
- ✓ Temporary secondary spill containment shall be provided during filling operations for all frac tanks and vacuum boxes containing hydrocarbons and/or waste liquids.

Spills on Land

EPA identifies the immediate actions as following:

- ✓ Stop the product flow. Act quickly to secure pumps, close valves, etc.
- ✓ Warn personnel. Enforce safety and security measures.
- ✓ Shut-off ignition sources (e.g., motors, electrical circuits, open flames, etc.).
- ✓ Initiate containment around the tank and/or in the water with oil boom.
- ✓ Notify National Response Center at: (800) 424–8802.
- ✓ Notify State or Federal On-Scene Coordinator.
- ✓ Notify other agencies, as appropriate.

As specified in the facility [EAP](#), all spills must be reported immediately in accordance with [HSE-EAP-002 Emergency Notification and Response](#) procedure. Depending on the type, amount, location, and duration of the spill, the EOC may be activated. The EOC is activated immediately if a fire or potential fire exists as a result of the spill, or if the source of the spill has to be stopped by HAZMAT members of the ERT. The ERT organization has adopted the Channel Industries Mutual Aid (CIMA) [Emergency Response Safety Plan Procedure](#) and uses both the [Level 1 Site Safety Plan Template](#) and the [Level 2 Site Safety Plan Template](#) to cover response location safety and health plan requirements specified in §154.1035(e)(5).

The area must be cleaned to pre-spill conditions. This determination can be made by sampling and testing the soil, or a visual determination by the On-Call Environmental Engineer and/or the Solid Waste Coordinator. The type of verification analysis will depend on the type of material spilled.

A sample of the spilled material may be needed for analysis for determining the proper method and location of disposal. The Solid Waste Coordinator will assist with the sample collection.

Spills at the Docks

As with spills to land, all dock spills and spills on the Houston Ship Channel are reported immediately in accordance with [HSE-EAP-002 Emergency Notification and Response](#). Specific emergency operating procedures have been developed to provide the immediate actions to be taken in the event of a spill or emergency shutdown of the Marine Terminal Dock Operations as specified in 139 Terminal Docks Emergency Operating Procedures.

Depending on the type, amount, location, and duration of the spill, the EOC may be activated. The EOC is activated immediately if a fire or potential fire exists as a result of the spill, or if the source of the spill has to be stopped by HAZMAT members of the ERT.

As discussed in Section 3, the Dock Spill Response Team will deploy the initial containment boom in order to confine a dock spill. The PSS (Field Coordinator) or the Oil Movement Shift Foreman (Dock Spill Team Leader) will activate the Dock Spill Response Team.

At the same time, an outside spill remediation contractor will be contacted to provide additional booms and deploy them as needed. They will also provide clean up assistance to remove spilled material from the water and shore. The contractor will be supervised by the Field Coordinator.

The Solid Waste Coordinator will provide assistance with proper disposal of residual clean up materials, (sorber pads, rags, PPE and other oily materials).

5.1.2 Procedures for Fires and Explosions

In the event of an explosion and/or fire, the procedures listed below from the [EAP](#) must be followed:

- ✓ Dial Extension 4444 or contact the SOC on radio (b) (7)(F), (b) (3) and report the emergency condition.
- ✓ Give exact location and nature of the emergency and provide as much information as possible. The more information provided the more effective the response will be.
- ✓ Give your name and job title.
- ✓ Tell what product is involved.
- ✓ Tell what, if any, injuries there are (number, type, severity, etc.).
- ✓ Make sure all information is understood. Stay on the line until dismissed by the dispatcher to ensure that all necessary information has been communicated.
- ✓ Pay attention to the Dispatcher for any emergency action instructions.

The EAP is the document that contains all the pertinent information for emergency response procedures.

5.1.3 Spill Mitigation and Shutdown Sequence

The following scenarios would be the most likely sources for discharges into the HSC.

Failure of Manifold: Immediately shut down pumping equipment and close all line and ship manifold discharge valves. Every attempt will be made to prevent the spill from entering the water by either pumping from the sump or deck drainage system into drums or other appropriate containment device, directing the flow into a containment or collection area away from the water, or placing containment boom or sorbent material in area. If the spill enters the water, immediately deploy facility owned equipment and contact the USCG approved OSRO as needed to assist with spill containment.

Failure of Transfer Equipment (Loading Arm or Hoses): Immediately shut down pumping equipment and close upstream and downstream block valves. Clean-up will be initiated immediately using the same mitigation measures as a manifold failure.

Piping Rupture: In areas without containment, contain spill with soil dikes or sand bags and or oil sorbent socks, and remove retained oil with vacuum truck for reuse. Some oil may reach the refinery sewer system, which will carry the oil to the wastewater collection. The API Separator will remove small quantities of oil entering the OWS system, and oil entering the Storm Water and QQQ collection systems should be recovered by oil skimmers on (b) (7)(F), (b) (3).

Piping Leak: Oil leaks outside the tank dike area will flow down the refinery sewer system to the wastewater treating system. The API Separator will remove oil entering the OWS system and the oil skimmers on Tanks 835 and 838 will remove any oil entering the storm water collection system, which will be subsequently reprocessed. Mitigation procedures for pressurized and non-pressurized piping leaks will be the same with the exception of shutting off pumps as would be the case for a pressurized piping leak.

Tank Overfill: Oil from a tank overfill will be contained within the dike area. Any spilled oil will be removed from the dike area with vacuum trucks, separated, and reprocessed.

Tank Failure: Same as Tank Overfill.

Explosion/Fire: After stopping the flow of the leak, any resulting oil spill will be removed from the affected area with vacuum trucks, separated, and reprocessed.

Equipment Failure: Same as Piping Leak.

Maintenance Operations: Any maintenance operation that could result in oil spillage must be given special consideration to prevent oil from reaching navigable waters. Before any maintenance operation is initiated, equipment is drained to the proper containment system.

5.2 OIL DISCHARGE MITIGATION PROCEDURES

5.2.1 Worst Case Discharge – Land and Water

In the event of a worst-case oil spill event, as described in Section 4, the following steps will be taken in addition to the procedures specified in the [EAP](#):

- ✓ Plant Shift Superintendent (PSS) is notified of a spill by Unit Operator or Shift Supervisor.
- ✓ PSS activates the Spill Response Team and notifies Garner Environmental.
- ✓ PSS goes to scene and accesses the situation.
- ✓ PSS activates the IC per EAP requirements.
- ✓ Garner Environmental will deploy additional booms across the Houston Ship Channel up and down stream of the spill once the USCG stops ship traffic on the Channel. Garner Environmental response equipment is listed in [Figure 3-8](#).
- ✓ IC ensures agency notifications are made, notifies the QI, and requests assistance as needed from CCA as needed.

- ✓ CCA responders will be asked to boom off environmentally sensitive areas as shown in [Figure 5-1](#). CCA is well equipped to respond to a worst-case spill as indicated by the equipment listed in [Figure 3-7](#).
- ✓ Emphasis will be to contain and recover the spill from the water as quickly as possible using shallow water and barge oil skimmers.
- ✓ Shore line clean-up will follow as soon as water clean-up is completed. **Dispersants will NOT be used** unless authorized by Federal or State authorities.

HRO has the manpower resources to maintain the IC on a 24-hour schedule for the duration of the worst-case spill.

5.2.2 Worst Case Discharge – Pipeline

Pipeline spills can be detected by various refinery personnel who are on-site 24-hours per day, 7-days per week. Oil Movement personnel frequently inspect active pipelines and are in contact with the control room via two-way radios. As discussed in Section 3, the first person to detect a spill or pipeline rupture will immediately notify his/her supervisor. The supervisor will notify the PSS, who will determine if the plant EAP needs to be activated. This will depend on the type of material spilled, amount and location.

Mitigation Procedures: In the case of a worst-case pipeline spill, our HAZMAT Team and the HRO spill response contractors identified in [Section 3.3.2](#) will respond within one-hour. HRO also has standard earth moving equipment that can be used to assist in spill control and containment. The worst-case pipeline spill would affect State Highway 225 and the EOC would be activated.

The following procedures will be followed in the event of an emergency response to a pipeline leak:

- ✓ Once a leak is detected, Oil Movements will shutdown the affected pipeline as soon as possible.
- ✓ The Oil Movements Manager, Pumper Foreman, and PSS will determine the appropriate course of action, which may include activating the EOC. Spill response contractors will be notified if additional assistance is required.
- ✓ Isolate the leak site from the source by closing the block valves on each side of the leak until conditions are brought under control.
- ✓ Eliminate all nearby ignition sources, especially those downwind from the source.
- ✓ Check the [MSDS](#) to determine the toxic and flammable characteristics of the material involved in the incident.

- ✓ Establish site control and secure the area depending on the alert level status. Adjust area if the weather conditions change.
- ✓ The affected area shall be cleaned up and repaired.
- ✓ A post incident review shall be conducted to prevent future incidents.

5.2.3 Maximum Most Probably Discharge

The planning volume for a maximum most probable discharge is 1,200 barrels. The procedures for responding will be the same as for the worst-case discharge to the Houston Ship Channel with the following exceptions:

- ✓ In most cases, Garner Environmental will be able to contain and collect the spilled material.
- ✓ If the discharge is greater than 250 barrels, CCA may partially mobilize equipment (barge skimmer) to provide sufficient clean up equipment to assist Garner Environmental and to protect environmentally sensitive areas.

Description of Discharge: This size discharge would most likely occur due to a major equipment failure or during product transfer. Examples may include, but not limited to:

- ✓ Line or flange rupture
- ✓ Valve rupture
- ✓ Misc. Tank failure
- ✓ Tank or truck overfill
- ✓ Pipeline manifold rupture

Because of diked and other containment located throughout the refinery and adjacent tank farms, it is very unlikely that the discharge would leave the facility property or reach a navigable waterway before spill containment could begin. However, HRO is located directly adjacent to the Houston Ship Channel. The distance to Sims Bayou or the Houston Ship Channel, fish and wildlife and sensitive environments is less than one-half mile from the perimeter of the Facility. If the discharge occurs in the vicinity of the dock, surface topography increases the likelihood that a discharge will reach the waterway. If required, remediation equipment will be provided by the OSROs.

The threat of damaging fish, wildlife, and sensitive areas is high due to heavy industrial activity along the Ship Channel. Therefore, impact to these areas should be avoided and/or minimized if at all possible.

In the event of a medium size discharge, Garner Environmental Services would be notified. While waiting for assistance from Garner, qualified facility personnel would attempt to contain the discharge with the facility-owned equipment listed in [Table 3-3](#). Diked area containment of large spills can be handled with the use of contractor vacuum trucks.

This type of spill would not impact shore side wells or drinking water intakes. Inclement weather conditions such as hurricanes, tropical storms, and heavy rains could affect response efforts if the spill entered Sims Bayou. Finally, this type of spill is not one that would result in a chain reaction of failures of other equipment.

Response Requirement: The facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium/Maximum Most Probable Discharge. The response resources shall, as appropriate, include:

- ✓ Oil recovery devices with an effective daily recovery capacity equal to 50% of the Medium/Maximum Most Probable Discharge volume must be capable of arriving on scene within 12-hours.
- ✓ Sufficient quantity of containment boom must arrive within 6-hours for oil collection and containment and for protection of fish and wildlife and sensitive environments, as appropriate.
- ✓ Temporary storage capacity equal to twice the daily recovery capacity must be available.

Facility Response Resources and Capability: The facility will initially respond to a Medium/Maximum Most Probable Discharge with a similar response to the Small Discharge. Additional response OSRO resources will be requested as needed which will arrive within 12-hours.

- ✓ Oil recovery devices with an effective daily recovery capacity of 50% of the Medium/Maximum Most Probable Discharge volume secured from the OSRO contractor(s) will be on scene within 12-hours.
- ✓ (b) (7)(F), (b) (3) capacity for recovered oily material will be secured from the OSRO contractor(s) and/or made available within HRO's storage facilities.
- ✓ Containment boom for oil collection and containment and for protection of fish and wildlife and sensitive areas will be secured from the OSRO contractor(s) in the event that the spill escapes the boundaries of the facility and impacts Sims Bayou, the Houston Ship Channel and/or the wastewater treatment system.

5.2.4 Average Most Probably Discharge

Based on the volume stated in Section 4, the average most probable discharge would be 50 barrels. This size discharge would most likely occur due to minor equipment failures or human error. Examples may include, but not limited to, pump seal leaks, dock hose ruptures, valve leaks, container ruptures, and pipe ruptures.

The types of material that could be discharged include any of the products that are handled at the facility. Examples include, but are not limited to, gasoline, fuel oil, crude oil, diesel fuel, naphtha, kerosene, methanol, toluene, xylenes, spent caustic, additives, and lube oil.

This size discharge would likely be noticed quickly and appropriate clean up measures taken since product transfers are monitored by facility persons in charge (PICs) and/or by vessel or barge tanker men. These types of small spills are typically contained on the dock platform, barge or vessel deck.

While the OSRO or spill contractor would be notified and the best method for containment determined, such discharges that are contained at the dock or barge or vessel deck could be diverted to product tanks. Response contract vacuum truck, absorbent pad and boom, or other equipment can handle such spills that go into the water. Response efforts for a spill of this size would more than likely not be affected by adverse weather conditions.

This type of spill would not impact shore side wells or drinking water intakes. Finally, this spill type is not one that would result in a chain reaction of failures of other equipment.

Response Requirement: The facility must identify sufficient resources, by contract or other approved means, to respond to a small discharge. The response resources must include at a minimum:

- ✓ 1,000-foot of containment boom or twice the length of the largest vessel that regularly conducts oil transfers to or from the facility, whichever is greater, and the means of deploying and anchoring the boom at the facility within 1-hour of the detection of a spill.
- ✓ Oil recovery devices with an effective daily recovery capacity equal to the amount of oil discharged in a Small/Average Most Probable Discharge or greater which is available at the facility within 2-hours of the detection of an oil discharge.
- ✓ Oil storage capacity for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources and Capability: The facility will respond to a Small Discharge/Average Most Probable Discharge with manpower and equipment identified in

[Table 3-3](#) as well as OSRO contract and Texas GLO manpower and equipment identified in [Figure 3-7](#), [Figure 3-8](#), and [Figure 3-9](#), respectively..

- ✓ A 50 barrel discharge typically will not escape the containment of the facility.
- ✓ In the unlikely event that a spill did escape the containment of the facility, it would be expected to impact Sims Bayou, the Houston Ship Channel or the facility wastewater treatment system, response operations would be implemented immediately upon discovery.
- ✓ Oil containment and recovery devices can be secured from contract resources (with a minimum effective daily recovery capacity of 50 barrels) and can be implemented at the facility, as the situation demands.
- ✓ A minimum of 100 barrels of oil storage capacity for recovered oily material can be secured from contractor resources or made available within HRO's storage facilities as the situation demands.
- ✓ Additional recovery and storage equipment may be secured from Channel Industries Mutual Aid (CIMA), and other contract resources, as the situation demands.

In case of an average most probable discharge, HRO has appropriate containment or diversionary facilities to prevent land discharged oil from reaching the Houston Ship Channel. Dikes around storage tanks provide the first line of containment. Undiked areas are protected by an underground wastewater collection system. The sewer system carries oil to the wastewater treatment facility where oil is removed in the API Separator.

Spills that occur at the docks and go directly into the Houston Ship Channel have to be contained quickly to minimize any impact to Environmentally Sensitive Areas as illustrated in [Figure 5-1](#). Depending on the material spilled, weather, tides, and the time of day, dock spills can usually be contained at the docks because there is a ship or barge being loaded or unloaded, and boat operators will help deploy containment booms if it can be one in a SAFE manner. The distance to Sims Bayou or the Houston Ship Channel, fish and wildlife and sensitive environments is less than one-half mile from the perimeter of the Facility. If the discharge occurs in the vicinity of the dock, surface topography increases the likelihood that a discharge will reach the waterway. Remediation equipment, if required, will be provided by the OSROs.

When a leak is discovered, the responsible unit should attempt to stop the flow after reporting the spill. Unit personnel need to stop the flow at a control point that is SAFE to approach. For a spill, the ERT will perform the following response activities under the direction of the command structure:

- ✓ Mitigate a spill or release through the use of vapor suppression, sorbent application, vacuuming, tarping, and/or skimming
- ✓ Isolate a spill area through the use of diversions, ditches, pits, sumps, dikes, dams, berms, and/or containment booms.
- ✓ Stop a leak through the use of over packing, patching, plugging, packers, and/or equipment shutdown.

A contractor under the direction of the command structure specified by the [EAP](#) may perform some of these activities.

5.3 SPILL RECOVERY STRATEGIES

5.3.1 Mechanical Recovery

Offshore: Available on-site emergency response equipment is limited to initial containment equipment. Spill response contractors will supply petroleum product recovery equipment. Recovery equipment includes additional booms, skimmers, and vacuum trucks. The response time for the contractors is approximately 30-minutes to 6-hours.

Contaminated Surfaces: Plant property (docks, roads, boats, vessels, etc.) and visually affected equipment or facilities will be physically cleaned by wiping gross contamination with oil sorbent material, followed by hydro blasting. The water accumulated from hydro blasting will be collected and placed in the refinery's wastewater treatment system. Used oil sorbent material will be placed in containers for off-site disposal.

Contaminated Soil: Spills to soil will be cleaned up quickly, normally within 24-hours, to minimize penetration of spilled material into the soil profile. Vacuum trucks will be used to remove spilled liquid material. Appropriate equipment (shovels, front end loader or backhoe) will be used to remove the affected soil and place it in a container (drum, bin or roll off box).

The affected soil will be properly disposed or recycled in accordance with TCEQ regulations, depending on the representative sample analytical results. Soil removal is discontinued when visually uncontaminated soil is reached. In some cases, analytical results (e.g., oil and grease, BETX, etc.) are needed to determine when uncontaminated soil is reached. Clean fill is brought in to fill in these excavations as needed.

Shorelines: In general, shoreline clean-up will be conducted manually to prevent detrimental effects to the environment by heavy machinery. Access to the shoreline will be by water, unless convenient roadways are available. Specific guidelines for shoreline clean-

up are presented below and the response resource operating criteria of oil recovery devices is presented in [Figure 5-2](#).

Shore Clean-up Advisory Team: The shoreline along the Houston Ship Channel can be characterized as man-made shore with dredge spoil banks. The HSSE Environmental Department will escort all responding regulatory agencies and will serve as Liaison Officer.

Recommended actions and actions to avoid when dealing with substances with properties similar to oil are presented in [Table 5-1](#). In all cases, the use of boom and skimmers is the preferred method of protecting the shoreline. Except for manual removal on the Houston Ship Channel bank, no preferred option exists for removal and disposal. Mixing exposes contaminated sand to evaporation and is practical only for open sand beaches.

Natural cleaning (leaving the substance to degrade naturally) is preferred because it would have a lesser environmental impact. Low pressure flushing is preferred in the tidal flats; the work area should be boomed and the spilled substance collected or absorbed to prevent recontamination. [Table 5-2](#) discusses these oil spill response options in detail.

5.3.2 Recovered Oil Storage

HRO has storage available for recovered crude and product oil that exceeds twice the effective daily recovery capacity required or 80,000 barrels per day (Group 3 Oil). The volume of storage available is summarized below:

- ✓ CCA: (b) (7)(F), (b) (3) (refer to [Figure 3-7](#))
- ✓ HRO's Tank 810 & 811: (b) (7)(F), (b) (3)
- ✓ Barges: vary in size (used to temporarily store recovered material from the CCA skimmer barges prior to recovery through the API Separator or Process Solutions)

Decanted water from recovery operations will be discharged to the front of the API Separator at the Vacuum Truck Dump Station. The remaining oil will be recovered and reprocessed.

Transfer of oil from skimmers to tankage will be made via vacuum trucks or the ballast water line from the Dock Area. Skimmers will dock at one of the barge docks for transfer of oil to the vacuum trucks. If the skimmers are too far away, the recovered material will be transferred to barges so the skimmers do not have to move from their recovery location. The barges can be unloaded at a later date. Booms will be placed around the vacuum trucks and in the water around the skimmer to contain any losses that occur during transfer operations. Off-loading of skimmers will take approximately 1-hour per skimmer. Access to the barge docks is limited to essential personnel only.

5.3.3 Separation of Oil, Water, and Debris

Oil/Water Separation: Oil will be separated in the API Separator. Water is discharged to a publicly owned treatment works, and oil is recovered and reprocessed.

Oil/Water Emulsions: All emulsions will be treated in the slop oil system where the water is discharged to a publicly owned treatment works, and oil is recovered and reprocessed.

Recovered Materials: Recovered oil will be placed in the refinery's slop oil system. Oil in the slop oil system is reprocessed. This method limits the high costs of disposal and minimizes harm to the environment.

Debris Contamination: Debris contamination will be prevented by containing the oil as quickly as possible with booms and adsorbents. Immediate containment will not only limit the amount of contaminated debris generated and the associated disposal cost, but will also minimize damage to the environment.

Supplies of booms and adsorbents are maintained throughout the dock areas so the response may be initiated immediately in the event of an oil spill. In the event that the spill cannot be contained, booms will be placed between the advancing oil front and shorelines, or other environmentally sensitive areas.

5.3.4 Waste Minimization

The best method of waste minimization is to contain the spill as quickly and efficiently as possible. Additional waste minimization methods include:

- ✓ Clean and re-use booms as often as possible.
- ✓ Recycle recovered oil in the refinery oil recycling system.
- ✓ Placement of protective booms around facilities that will require decontamination, such as docks, vessels, and mooring structures.
- ✓ Biological treatment of affected soil in a land treatment unit rather than landfill disposal, if the affected soil meets land ban criteria in §40 CFR 268.

5.4 WASTE DISPOSAL

Recovered liquid materials are recovered and reprocessed in the Coker Unit. Disposal of recovered sorbents are the responsibility of the clean-up contractor. Oil-affected soils are analyzed and disposed of according to applicable regulations.

5.4.1 Waste Material Identification

Waste materials generated from an oil or chemical spill clean-up operation are:

- ✓ Slop oil and oil sludge consisting of oil and other organic material such as soil and vegetation,
- ✓ Contaminated sorbent material,
- ✓ Contaminated soil and water from oil or chemical spills is recovered by vacuum truck and transferred to one of the slop oil tanks at the refinery.

5.4.2 Disposal Procedure

Waste materials must be disposed of to comply with federal and state hazardous waste and solid waste management regulations to avoid harm to the environment or spread of further contamination as specified in [HSE-ENV-610](#). The Solid Waste Coordinator and Environmental Affairs work together to ensure these procedures are followed. For spills with waste materials on site (during working hours), the Solid Waste Coordinator will ensure:

- ✓ Employees to handle the waste,
- ✓ Safety precautions are taken,
- ✓ Materials are placed in the proper drum or container,
- ✓ Drums are properly sealed and labeled, and
- ✓ Drums and containers are transported to the drum storage area for temporary (<90 day) storage.

HRO only transports solid waste to those facilities that have been audited and are pre-approved by the HSSE Environmental Department. After working hours, the PSS will instruct the SOC to call the Solid Waste Coordinator.

For off-site spills with waste materials, the clean-up contractor is responsible for placing waste in the proper containers with the proper labels, seal the containers, and transport the waste to the Container Storage Area where the waste will be temporarily stored until off-site disposal.

5.4.3 Transportation of Waste

All hazardous waste generated as a result of spill response will be taken to either of the two Container Storage Areas (CSAs). HSSE Environmental Department is responsible for disposal of all hazardous and non-hazardous waste generated from refinery operations. The group is well versed and experienced with securing transportation of waste bound for off-site disposal. No wastes will be taken off-site without the authorization of HSSE Environmental Department. Approved waste transporters and external waste disposal facilities are listed in [Table 5-3](#).

5.5 ENVIRONMENTALLY SENSITIVE AREAS

Environmentally sensitive areas along and in the Houston Ship Channel have been identified in the EPA Region VI Inland Area ACP and the Galveston Bay ACP. As the planning distance, HRO uses 15-mile downstream (Baytown Tunnel) and 4-miles upstream (Turning Basin). [Figure 5-1](#) illustrates the location of environmentally sensitive areas with this reach of the Houston Ship Channel. [Table 5-4](#) describes where these areas are located and the amount of boom required.

The most effective way to protect these sensitive areas is to deploy containment boom across the entrances to bayous, inlets, and bays. This would be done prior to an oil spill reaching those reaches the adjacent waterways.

In the event of a worst-case spill, CCA will be able to provide rapid response for deploying boom in these sensitive areas. The criteria used for boom deployment in sensitive areas are listed in [Table 5-4](#):

A Priority: Marshes, Tidal Flats, and Bay Margins up channel to the Turning Basin and down channel to the Lynchburg Ferry Crossing, including the Battleship Texas and surrounding San Jacinto National Monument land and water structures.

- ✓ Boom length = $(15,525 + 15,525 + 4,500) = 35,550$ feet
- ✓ Time to deploy 6 hours
- ✓ Equipment and personnel 100 people, 40 johnboats and supply trailers.

B Priority: Marshes, Tidal Flats, and Bay Margins from the Lynchburg Ferry Crossing to the Fred Hartman Bridge, dredge spoil banks (Alexander and Goat Islands) and the rest of San Jacinto National Monument.

- ✓ Boom length = $(48,150 + 27,000 + 15,525) = 90,675$ feet
- ✓ Time to deploy 12 hours (18 hours into spill)
- ✓ Equipment and personnel 200 people, 80 boats and supply trailers

C Priority: Riverbanks and man-made shore

- ✓ Boom length = $(3,150 + 127,000) = 130,150$ feet
- ✓ Time to deploy 36 hours (54 hours into spill)
- ✓ Equipment and personnel 200 people, 80 boats and supply trailers

The above allocation of resources is done to maximize the deployment of booms ahead of the spill to protect the most sensitive areas in front of the spill. These estimates are based

on the CCA Resource Manual provided in [Figure 3-5](#) and personal communication with Garner Environmental Services. [Figure 5-1](#) indicates the environmental sensitive areas in close proximity to the refinery. These estimates may differ during an actual spill event depending on the rate of spill movement, wind, and tidal conditions.

Most of the CCA members are located on the Houston Ship Channel. In addition, HRO's response will be to deploy three booms up and downstream of the spill as close as possible to where the oil enters the Houston Ship Channel. The booms will be deployed across the entire width of the Houston Ship Channel. Recovery of spilled material will follow as soon as booms are in place to trap the material.

5.6 WILDLIFE PROTECTION AND REHABILITATION

There are seven species on the Federal Endangered Species list that may be found in the Harris County area, predominately bird species that pass through during migration. These species are listed in [Table 5-5](#) and consist of one reptile, one wild flower, and five birds. Protection of these species during an oil discharge will be a high priority, especially if these species are found in the area of a discharge. They will be given high priority for protection and rehabilitation, if the need arises.

Oil discharges, particularly in estuaries and near shore areas, often cause severe stress to resident and migratory birds. Oil contaminated birds are unable to fly, lose their natural waterproofing that allows them to float, and lose the insulating property of their feathers. The birds may often become ill from ingesting oil-contaminated water.

Cleaning oil contaminated birds requires specialized training and experience. HRO will not attempt to clean contaminated birds without proper direction from the appropriate authorities.

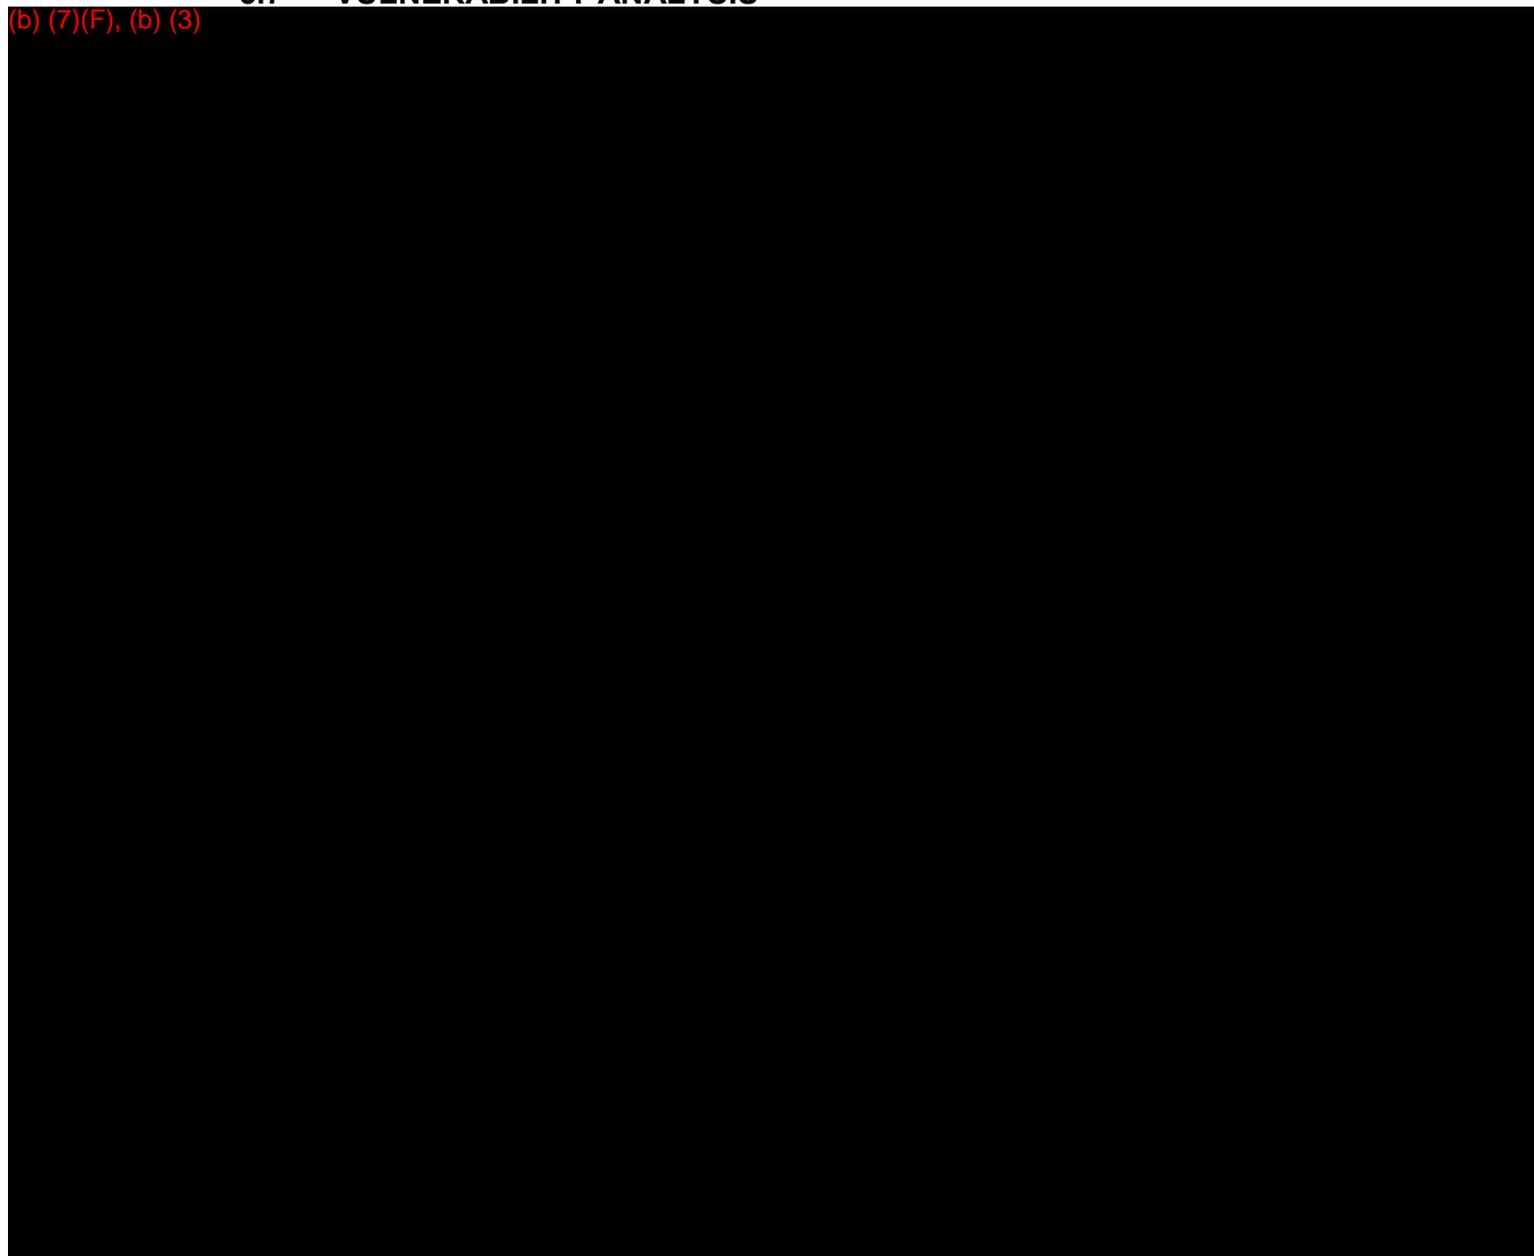

HRO will contact the following agencies and/or personnel for assistance in arranging and coordinating the collection, cleaning, and recovery of any oil-contaminated birds or other wildlife:

- ✓ Texas General Land Office: 800-832-8224 (24-hour Oil Spill Notification)
- ✓ Texas Parks & Wildlife: 281-842-8100 (24-hour Hotline); 281-534-0138; 281 534-0130 (office)
- ✓ U.S. Fish & Wildlife: Ron Brinkley at 281 286 8282 (office); 281-505-4754 (pager); or (b) (6) (cell).

- ✓ Wildlife Center of Texas: Sharon Schmalz or Margaret Pickell, Certified Oiled Wildlife and Response Team Members, at (b) (6) (cell); (b) (6) (cell); 713 279-1417 (pager); 281-418-8100 (pager); (b) (6) (home).
- ✓ Wildlife Response Services, LLC: Rhonda Murgatroyd, Certified Oiled Wildlife and Response Team Member, at 713-705-5897 (office); 281-266-0054 (pager).

5.7 VULNERABILITY ANALYSIS

(b) (7)(F), (b) (3)

Residential Areas

Residential populations begin within one mile of the Facility and continue outward. The coverage area of these areas is not continuous; rather it is broken up by commercial areas. Any evacuation efforts for these areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Businesses

The immediate area surrounding the Facility is for the most part commercialized. The listing of businesses in the area of the Facility is extensive and is detailed in the applicable ACP. Any evacuation efforts for these areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.).

Fish and Wildlife, Wetlands, and other Sensitive Environments

The immediate area surrounding the Facility is commercialized and supports only minor amounts of wildlife. The overall impact on fish and wildlife, wetlands, and other sensitive environments will happen upon impact of the local waterways and associated non-commercialized areas.

The local ecosystem is host to a variety of species including migratory as well as year round inhabitants. The general species found in the area of the Facility are detailed in the applicable ACP. State and Federal agencies as well as contract resources will provide guidance on response and protection strategies during an actual response situation.

Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

Wetland habitats (as applicable) within the potential impact area of a spill originating from the Facility are identified on the Texas GLO and NOAA, Texas Oil Spill Planning and Response Atlas.

Lakes and Streams

The lakes, streams, and rivers that may be potentially impacted by a discharge originating at the Facility are identified on the Texas GLO and NOAA, Texas Oil Spill Planning and Response Atlas.

Endangered Flora and Fauna

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Texas GLO and NOAA Texas Oil Spill Planning and Response Atlas.

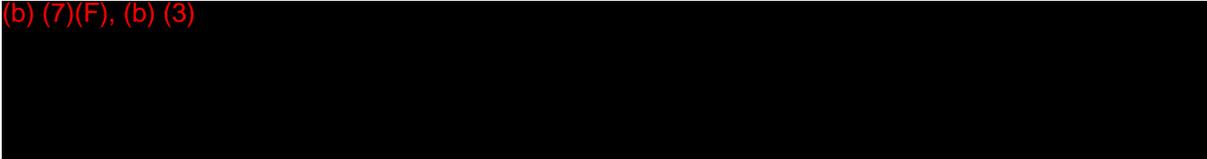

Transportation Routes (air, land, and water)

Land and water transportation routes could both potentially be affected by a discharge originating from the Facility. These transportation routes are identified on the Texas GLO and NOAA Texas Oil Spill Planning and Response Atlas.

The local emergency assistance agencies (police department, fire department, etc.) and the U.S. Coast Guard (as applicable) would be contacted for traffic control in the area of the discharge.

Utilities

(b) (7)(F), (b) (3)

**Other Areas of Economic Importance**

The local waterways are bordered by various dock facilities, other commercial facilities, and recreational/public use areas. Any evacuation efforts necessary for these areas will be coordinated with the local emergency assistance agencies (police department, fire department, etc.), State Police, U.S. Coast Guard, and other agencies as the situation demands.

6.0 HAZARDOUS MATERIAL IDENTIFICATION

Varieties of hazardous materials are present at the HRO. Most of the tanks at the refinery contain petroleum or petroleum products; a few contain clarified water, wastewater water, and pure chemical products. As specified in [Section 2.1.3](#), a complete set of [MSDSs](#) for all product streams, intermediates, and purchased chemicals used at the refinery is maintained electronically and available online through the HSSE webpage.

Production units no longer maintain hardcopy Hazard Communication Manuals at the unit since all PI&Ds, Process Flow Diagrams, and MSDSs for each refinery stream are maintained electronically and available online. A listing of the specific refinery streams (MSDS numbers) used in each production area can be found in LiveLink.

The site-specific list of CERCLA hazardous and SARA extremely hazardous substances (taken from §40 CFR 302 and §40 CFR 355) are listed in [Table 6-1](#). The table contains the reportable quantity amounts. In addition, HRO has provided a site-specific list of RCRA hazardous waste and respective spill reportable quantities in this section. These materials can be expected to be present at the refinery in threshold amounts. A list of hazardous and extremely hazardous substances can be found in §40 CFR 302 and §40 CFR 355 (as published in the Federal Register), and the hazardous waste classification is provided in [Table 6-2](#).

7.0 EQUIPMENT INSPECTION AND TESTING

7.1 Process Equipment and Piping

HRO is a fully integrated petroleum refinery. The facility is staffed by Operations and Maintenance personnel 24 hours per day, 365 days per year. Valves, flanges, aboveground pipelines, and other exposed equipment are routinely inspected during daily rounds. Plant operators conduct visual surveillance of the tanks and secondary containment basins during their normal course of their daily duties.

Underground pipelines are inspected anytime there is an excavation in the vicinity of the pipelines. Any leaks or spills are reported immediately. Aboveground storage tanks within secondary containment are subjected to integrity testing during routine scheduled inspections (per API 653 Standard for External Tank Inspections), when material repairs or alterations are performed, when there is a change in tank design, or when there is a change in tank service, as appropriate at the time of integrity test. The following are the techniques or combination of such techniques that may be used:

- ✓ Hydrostatic testing,
- ✓ Radiographic testing,
- ✓ Visual inspections
- ✓ Ultrasonic testing, (internal and external)
- ✓ Acoustic emissions testing, or
- ✓ Other system of nondestructive shell testing

These tests are used to check for the potential for brittle fracture failure to occur. Appropriate action will be taken to repair the tank, or to take the tank out of service. Records of periodic tank maintenance and inspections are filed and maintained with the Inspection department for a period of not less than 5 years. The Tank Inspection Checklist is provided below in [Figure 7-1](#).

Operating personnel make daily visual inspections of their facilities, record observations in the electronic Shift Notes, and write work orders as needed equipment repairs. The Maintenance department schedules work based on the priority assigned to the work order notification.

Figure 7-1 Tank Inspection Checklist

At a minimum, tanks are inspected against the following checklist:

Check tanks for leaks, specifically looking for:

- ✓ Drip marks
- ✓ Discoloration of tanks
- ✓ Puddles containing spilled or leaked material
- ✓ Corrosion Cracks
- ✓ Localized dead vegetation

Check foundation for:

- ✓ Cracks
- ✓ Discoloration
- ✓ Puddles containing spilled or leaked material
- ✓ Settling
- ✓ Gaps between tank and foundations
- ✓ Damage caused by vegetation roots

Check piping for:

- ✓ Droplets of stored material
- ✓ Discoloration
- ✓ Corrosion
- ✓ Bowing of pipe between supports
- ✓ Evidence of stored material seepage from valves or seals
- ✓ Localized dead vegetation

Maintenance maintains detailed records of the repairs and inspection conducted on each piece of equipment. These records include the manufacturer's specifications plus a listing of repair dates and type of repairs made. The inspector makes scheduled inspections of all stationary equipment in the refinery. Metal thickness is measured, corrosion rates are calculated, and predictions are made regarding the time remaining before retirement thickness is reached. The inspector maintains permanent detailed records of their observations and findings. All leaks are noted as are the depths of pits and general comments regarding corrosion observations. Periodic inspection is conducted of dock sumps and drip pans for signs of corrosion.

Oil transfer hoses are inspected at the docks for damage prior to pressure testing to ensure that the pressure testing area does not drain to the Houston Ship Channel. Marine Dock loading arms are hydrostatically tested annually back to the first block valve. (b) (7)(F), (b) (3)

and material drained to this sump is pumped to the API Separator for recovery and reprocessing.

7.2 Marine Spill Response Equipment

The HRO Spill Response Team conducts monthly inspections of major spill response equipment including oil spill response boats and containment booms. During each inspection, boat motors are operated and any problems are immediately reported to the Maintenance so repairs can be made. Containment booms are visually inspected to ensure they are ready for deployment and have no signs of significant deterioration.

The Senior Spill Response Team Captain is responsible for ensuring that the oil spill response equipment is well maintained, documenting the monthly inspections, and transmitting the inspection forms to the HSE Library where the records are maintained for at least 3 years. A copy of the monthly marine spill response inspection form is presented in [Figure 7-2](#).

7.3 Onshore Spill Response Equipment

Equipment designated for use during a spill response on includes a backhoe and/or a front-end loader, vacuum trucks, and sorbent material. This equipment is readily available, and preventative maintenance is routinely performed by the equipment user (either HRO or OSRO contractor). Since the equipment is used for many routine refinery operational activities, no formal maintenance record file is kept at the HSE Library.

Figure 7-2 Marine Response Inspection Form

RESPONDERS

Name	SS#	Emergency Contact Phone #

PRE-OPERATION SAFETY CHECK

- Boat registration and license are on board and current (required by Coast Guard)
- Use buddy system--nobody goes alone!
- Life jackets for all on board
- Plugs in bottom of boat are screwed in tight
- Gas tank & spare are full
- Oil reservoir full
- Battery is charged - unplug from battery charger
- Paddle & anchor
- Lights work (night time)
- Kill switch attached to driver's life jacket

Description of Vessel

Type: <u>flat-bottomed work boat</u>	Engines: Number <u>2</u>	Color: <u>Red</u>
Registration No.:	Horsepower: <u>50 HP & 6 HP</u>	Color of Trim: <u>Blue & Gold</u>
Make: <u>Boat Right (Custom)</u>	Fuel Capacity: <u>2 @ 6 Gal, 1 @ 2 Gal</u>	Sails: <u>N/A</u>
Length: <u>16 feet</u>	Type: <u>Outboard</u>	Canvas Top?: <u>N/A</u>

Survival Equipment: (Mark as appropriate)

Purpose: _____	

Figure 7-2 Marine Response Inspection Form, continued
Next Run Preparation

This list shows that all basic items needed for the next run are present or accounted for (that is, the order has been made to have any needed items fixed or replaced) after the run, and any comments on equipment's performance and suggestions for improved operations.

- Boat registration and license are on board and current (required by Coast Guard)
- Number of Life Jackets (Total)_____ 1) Put away_____ 2) To be cleaned_____ 3) To be replaced_____
- Plugs in bottom of boat are present; any water in boat has been allowed to drain.
- Gas line to 50 HP motor has been bled down.
- Gas tank #1 full_____ Gas tank #2 full_____ Spare tank full with **1/2 Qt. oil : 3 Gallons gas mix**_____
- Oil reservoir full.
- Batteries are plugged into battery charger.
- Paddle & anchor
- Line for anchor (ft.)_____, line for mooring_____, line extra _____
- Lights work: Q-Beam _____ Tail light works _____ Tail light stowed in compartment_____
- Spill boom disposition _____
- Ft. in Spill Barn _____ Ft. in boom box _____

COMMENTS: Fix or replace items? Does anything need to be ordered? Performance of equipment? Suggested changes to equipment or procedures?

Sign and return to the Battalion Chief after each run. Battalion chief forward a copy to HSE Library.

8.0 PERSONNEL TRAINING AND DRILLS

8.1 TRAINING PROCEDURES

8.1.1 SRPP Training

All HRO Operations and Maintenance personnel are required to review and become familiar with pertinent sections of the SRPP as necessary to perform their job requirements. At a minimum, this review shall include emergency notification procedures, spill reporting, and spill prevention guidelines specified in the [EAP](#). Training on the contents of this Plan is required for all new employees and on an annual basis for current employees as a part of HRO's Annual Regulatory Training (ART) program. Emphasis is placed on the above-mentioned procedures and on insuring a quick response to spills.

The Facility conducts prevention briefings for oil-handling personnel annually during ART to assure adequate understanding of the SPCC elements of the SRPP. These briefings include discussion of potential discharges or component failures and precautionary measures. Briefing records are maintained in the Plateau Training System as long as personnel are assigned duties under the SRPP.

8.1.2 HAZWOPER Training

All ERT personnel are given Hazardous Waste Operations and Emergency Response (HAZWOPER) Tech Level training as defined in §29 CFR 1910.120. This training program provides a general knowledge of hazardous materials, the processes an employee may encounter, and provides detailed information on how to deal with emergency conditions. The HAZWOPER Tech Level training incorporates 48 hours of training and qualifies the individual as a Fire Fighter/HAZMAT Technician. In addition, all HRO field personnel receive an annual refresher course to maintain the HAZWOPER First Responder Awareness training. Operations field personnel, to include Dock Operations receive HAZWOPER First Responder Operations Level Training. This training is sufficient to enable them to recognize hazardous situations and make an appropriate initial response to protect others in vicinity, company property, and the environment. All HRO personnel are also trained on Occupational Safety and Health (OSHA) Hazardous Communication and Emergency Planning and Community Right-to-Know (EPCRA) topics.

The ERT members are trained to respond to spills at the refinery according to the Emergency Response Team training manual, and team members are qualified as Fire Fighter/HAZMAT Technician. The course topics covered in the ERT quarterly training program includes the following:

- ✓ Introduction to Emergency Response
- ✓ Fire Science
- ✓ Portable Fire Extinguishers
- ✓ Water Supply Systems and Appliances – General
- ✓ Portable Monitors
- ✓ Structural Firefighting Turnout Gear
- ✓ Hose handling and Fire Streams Practice
- ✓ Pump Operation – General
- ✓ Foam Engine #1 – Operation/Specification
- ✓ Foam Aerial/Telesquirt #2 Operation/Specification
- ✓ Foam Engine #3 – Operation/Specification
- ✓ Engine #5 – Operation/Specification
- ✓ Supply Line and Attack Line Setup
- ✓ Relay pumping
- ✓ Respiratory Protective Equipment – Self-Contained Breathing Apparatus
- ✓ Air Supplied Respirators
- ✓ Search and Rescue
- ✓ Rescue and Confined Spaces
- ✓ High Temperature Protective Clothing
- ✓ Chemical Protective Clothing
- ✓ Hazardous Materials Response Planning to minimize the potential for fire, explosion of environmental damage
- ✓ Recognizing and Identifying Hazardous Materials which includes the characteristics and hazards of oil
- ✓ Risk/Hazard Assessment
- ✓ Site and Scene Management which includes conditions that are likely to worsen emergencies
- ✓ EAP Procedures
- ✓ Toxicology
- ✓ Decontamination
- ✓ Monitoring and Survey Equipment
- ✓ Basic Methods for Control and Containment
- ✓ Plugging and Patching Devices and Spill Containment for Pipeline Leaks
- ✓ Fire Fighting Foam

- ✓ Flammable Liquid Spill – Fire Fighting and Vapor Suppression Control
- ✓ Tank Fire Fighting
- ✓ Refinery Fire Fighting Protection Systems
- ✓ Gases
- ✓ Hazards of Gases
- ✓ Gas Emergency Controls
- ✓ Safety
- ✓ Fire Fighting and Electricity

ERT annual training requirements call for a minimum of 32 hours of mandatory training as specified in [HSE-EAP-011 Training and Exercise Plan](#). In addition, outside training may be offered at accredited schools. All specified ERT Officers and PSS are trained to HAZWOPER Level V On-Scene Incident Command (IC). In addition, outside advanced emergency management training at such institutions as Texas A&M University and Lamar University may be offered to Spill Response Team Members, Operations Chiefs, ICs, and Field Coordinators.

Personnel who support ERT team efforts in responding to spills may also receive HAZWOPER training. The level of HAZWOPER training an individual receives depends upon their respective job responsibilities during a spill. The required levels for spill response personnel are presented in the EAP. In addition, all contract personnel that assist HRO in spill response activities will be trained to at least the HAZWOPER Level III (HAZMAT technician). Volunteers or casual laborers will not be employed by HRO during spill response. Therefore, no training program has been established for these types of laborers.

HAZWOPER training records for all personnel referenced in the SRPP is collected by the Fire Chief and maintained in the HSE Library. The training records for HRO personnel and trainers consist of the following information:

- ✓ Employee name and position title or location
- ✓ Identification number
- ✓ Training topic
- ✓ Training date
- ✓ Trainer
- ✓ Training hours

These records are maintained in the HSE Library file as long as personnel are assigned duties under the SRPP. The contractors maintain training records for contractors' personnel.

8.1.3 Levels of Qualification

ERT training at HRO recognizes five levels of qualification and skill that progressively qualifies an individual for increasing responsibility in the Emergency Response Organization. HRO trains personnel to First Responder Awareness, Fire Fighter/HAZMAT Technician, and Incident Command Levels. . These three levels of qualifications are described as follows:

First Responder Awareness Level (All Personnel)

All individuals in the plant are trained to First Responder Awareness. These individuals are defined as those who are likely to discover or witness an emergency condition or release of a hazardous substance. These individuals are trained to:

- ✓ Initiate an emergency response sequence using proper notification protocols.
- ✓ Take no action, but to follow appropriate instructions.

First Responder Awareness Level (Operations)

Operations First Responders who discover or witness an emergency condition or release of a hazardous substance are responsible for additional first responder duties. All operations personnel are trained to:

- ✓ Initiate an emergency response sequence using proper notification protocols.
- ✓ Evaluate the hazard/risk and ensure proper PPE and equipment is used.
- ✓ Manage and control access to the scene and attempt to identify the problem
- ✓ Initiate ICS until relieved by responder with higher level of training.
- ✓ Attempt to identify the hazardous substance and estimate the quantity released,
- ✓ Monitor the area for airborne hazards and barricade entrance to the scene

Fire Fighter/HAZMAT Technician Level

Individuals who respond to releases and potential releases for the purpose of stopping the release are trained to this level. These individuals are trained to:

- ✓ Assume an aggressive or offensive role.
- ✓ Patch, plug, or stop a leaking hazardous material.

All ERT personnel are trained to the Fire Fighter/HAZMAT Technician level. This level of training includes:

- ✓ Knowledge of how to implement the Emergency Response Plan.
- ✓ Knowledge of the classification, identification, and verification of known and unknown materials by using monitoring survey equipment.
- ✓ Qualification to function within an assigned role in the Incident Command System (ICS).
- ✓ Knowledge of how to select and use proper specialized personnel protective equipment.
- ✓ Understanding of hazard and risk assessment techniques.
- ✓ The ability to perform advanced control, containment, and/or confinement operations within the capabilities of the resources and personnel protective available.
- ✓ Understanding of how to implement the contamination procedures and how to terminate containment procedures.
- ✓ Understand basic chemical and toxicology terminology behavior.

On-Scene Incident Commander Level

Personnel trained to Incident Commander Level are qualified to assume control of the incident scene and implement the ICS. Under the Emergency Response Plan, the first qualified Incident Commander trained person on the emergency scene implements the ICS and assumes the role of IC. That person continues to exercise the IC responsibility until relieved by a more senior individual. Personnel trained to this level include:

- ✓ EOC Staff
- ✓ All PSSs
- ✓ All HSE Representatives
- ✓ Designed Operations Shift Supervisors.

8.1.4 Marine Spill Team Training

The Spill Response Team is a division of the ERT. In addition to the HAZWOPER training referenced above, the Spill Response Team also receives separate marine spill training that is conducted according to Marine Spill Operations in conjunction with the spill drill exercises addressed in [Section 8.2](#). The Spill Response Team training and drills are conducted semi-annually. The spill training addresses the following topics:

- ✓ Oil spills in the environment
- ✓ Movement of oil on water

- ✓ Containment of oil on surface water
- ✓ Recovery of oil on surface water
- ✓ Response team equipment
- ✓ Oil spill clean-up contractors and cooperatives

The training records for the Spill Response Team are collected and routed through the Senior Spill Team Captain to the HSE Library file where the records are maintained as long as personnel are assigned duties under the SRPP. The Spill Response Team training records include a summary of topics covered in the training session along with a brief description of any drills conducted with the training.

8.1.5 Qualified Individual Training

Upon learning of a spill or potential spill of oil or hazardous substance, the QI and Alternate QIs have to be able to communicate with the appropriate Federal, state and local officials and with the persons providing personnel and equipment for the spill response. Federal regulations require Emergency Response Plan holders to identify the type of training the QI receives. The goal is to ensure that the QI is fully capable to perform the required duties. The QI is not expected to be the expert in all areas of the Spill Plan, but to have sufficient knowledge of all aspects so that the Plan can be implemented in a timely manner.

The following QI training elements that apply to HRO are from the National Preparedness for Response Exercise Program (PREP) document on “Training Reference for Oil Spill Response” to demonstrate knowledge of:

- ✓ Notification procedures and the communication system used to make the notifications,
- ✓ Procedures used to mitigate or prevent discharge,
- ✓ Operational abilities of the OSROs that would respond to a spill at our facility for the different size discharges,
- ✓ Roles and responsibilities for the QI during and after a spill incident,
- ✓ Roles and responsibilities of the federal and state agencies during a spill incident,
- ✓ The contents of the EAP, which include worker safety, public affairs, crisis management. The EAP is based on the ICS,
- ✓ Procedures for obtaining approval for dispersant use,
- ✓ Protection of and damage assessment of sensitive biological areas, and
- ✓ The contents of the ACP and the NCP.

8.2 DRILLS

8.2.1 Qualified Individual Drill Notification

HRO conducts weekly emergency alert notification drills that test the entire emergency response system. One part of this test is a pager notification of all emergency and spill response personnel that includes the QI and the designated alternant. The system test is to ensure individual pagers are working properly. The SOC maintains records of the system tests, and the records are maintained in the HSE Library.

8.2.2 Emergency Response Team Drills

HSE conducts ERT drills to ensure an effective emergency response using the established ICS. Drills are conducted during quarterly emergency response training and are designated to cover the topics addressed in Section 8.1.2.

HSE Safety Representatives are responsible for monitoring drills. An ERT Drill Checklist illustrated in [Figure 8-1](#) is used to record observations regarding response effectiveness and deficiencies noted, and ERT personnel participating in the training are record in the ERT Training Documentation Form presented in [Figure 8-2](#).

Observations noted will be discussed at a post emergency response drill meeting to improve future response. Personnel attending the meeting will include responders involved directly in the drill.

8.2.3 Pipeline Spill Drills

As part of the ERT training discussed in Section 8.2.2, response to pipeline leaks and spills are also part of the overall training program. Drills are conducted during quarterly ERT training and are designated to cover the topics addressed in Section 8.1.2 that relate the pipelines. The monitoring and documentation procedures are given in Section 8.2.2.

8.2.4 Marine Spill Team Drills

The Spill Response Team conducts major equipment deployment drills semi-annually. The equipment deployed focuses on the use of boats and containment boom. This training serves to keep all members familiar with boat operations, boating safety, equipment handling and deployment, and improve team response.

An annual unannounced spill drill is conducted utilizing the Spill Response Team and the ICS addressed in the EAP. A specific spill scenario is developed for each unannounced drill. The Dock Spill Team will deploy major response equipment located at the Refinery and a spill response contractor included in the SRPP is activated during each annual

unannounced drill. The ICS is conducted concurrent with the field activities of the Dock Spill Team. An unannounced spill drill required by a Federal or State agency or the COTP may be substituted for the facility unannounced drill, if appropriate.

Key spill response personnel prepare a critique of each unannounced spill drill. This critique addresses the field activities of the Marine Spill Team and the tabletop exercise. The critique is distributed to all spill response personnel to evaluate and improve spill response where it is needed.

Records documenting all emergency response team notification system drills are maintained in accordance with the EAP. All records for the quarterly training and associated drills conducted by the Marine Spill Team are collected and routed through the Oil Movements Shift Supervisor to the HSE Library where the records are maintained as long as personnel are assigned duties under the SRPP. Quarterly Marine Spill Team drill records include a summary of the drill exercise along with the topics covered in the training session.

Records of each unannounced drill are routed by the Marine Operations Supervisor to the HSE Library where the records are maintained for a minimum period of 3 years. These records will include a description of the spill scenario, a list of all emergency response team personnel involved with the drill along with their respective job responsibilities, a complete record of the emergency response activities obtained from the documentation officer, and the drill critique.

8.2.5 Area Exercises

HRO participates actively in the CCA quarterly spill drills that exercise the response of member companies to respond to large oil spills. HRO's oil spill response contractor (Garner Environmental) is also a member and actively participates in these drills.

8.2.6 Triennial Exercise of the Entire Response Plan

Every 3 years all components of the entire response plan will be exercised. The PREP Guidelines allows the plan holder to exercise the individual components of the response plan over a 3 year period rather than hold a large drill once every 3 years.

The following are the basic types of plan components from the HRO Plan that will be exercised at least once every 3 years:

Organizational Design

- ✓ Notifications
- ✓ Staff Mobilization
- ✓ Ability to operate within the response management system described in the Plan

Operational Response

- ✓ Discharge Control
- ✓ Assessment of discharge
- ✓ Containment of discharge
- ✓ Recovery of spilled material
- ✓ Protection of sensitive areas
- ✓ Disposal of recovered material and contaminated debris

Response Support

- ✓ Communications
- ✓ Transportation
- ✓ Personnel Support
- ✓ Equipment maintenance and Support
- ✓ Procurement
- ✓ Documentation

The Plan will be exercised in segments over a period of 3 years, with each component of the Plan exercised at least once within the 3 year period. Response to an actual spill can be taken as credit for the items exercised, as long as they are evaluated. Proper records will be kept of each exercise and the documentation maintained in the HSE Library.

8.2.7 Summary

In the 3 year cycle, the following internal exercises will be conducted:

- ✓ 12 QI notification exercises;
- ✓ 3 spill management team tabletop exercises – one must involve the worst-case scenario;
- ✓ 3 unannounced exercises;
- ✓ Equipment deployment exercises as described below:
 - ✓ 6 facility owned and operated equipment deployment exercises (docks);
 - ✓ 3 OSRO equipment deployment exercises (docks);
 - ✓ 3 pipeline equipment deployment exercises;
- ✓ Triennial exercise of entire response plan.

The external Area exercises will be done in coordination with the CCA quarterly and annual drills. All drills will be documented and retained on file in HSE Library.

HOUSTON Refining LP	DOCUMENT NUMBER:	HSE-EAP-001	Page: 1 OF 3	Approval Date:	06/30/2011
Document Title:	HOW TO REPORT AN INCIDENT OR EMERGENCY				
Approver: CHRIS MATTHEWS	<i>Electronic Signature On File</i>		Effective Date:	07/01/2011	
Document Owner: Jeff Windham	<i>Electronic Signature On File</i>		Review Date:	02/24/2011	

Any plant situation involving fire, injury or serious medical emergency, or any incident where the health or well-being of personnel or the environment may be impacted must be reported. When emergency situations occur, it is important that a response be made by trained personnel. Prompt and accurate reporting helps ensure that the proper response and follow-up are carried out.

INCIDENTS

An **incident** is limited in quantity, exposure potential, or toxicity. An incident poses no emergency or significant threat to the safety or health of employees in the immediate vicinity, even during clean up. A response to an incident can come from the immediate area utilizing equipment available in the area. Standard operating procedures will be followed for responding. Incidental spills that do not have the potential to develop into an emergency are covered under HAZCOM. Material Safety Data Sheets (MSDS) and HAZCOM manuals serve as a source for chemical-specific information. The environmental manual serves as a procedure and reference source.

An example of an incident would be a one pint spill of toluene under a lab hood in the laboratory. The quantity is low, the employee has knowledge of the chemical hazards, and a ventilation hood keeps employee exposure to a minimum.

EMERGENCIES

An **emergency** may include a fire, explosion, gas release, chemical spill or medical/rescue. An emergency response is required regardless of the surrounding circumstances and conditions. An emergency response includes, but is not limited to, the following situations:

- Resources are required from outside the immediate release area.
- Conditions require evacuation of employees in the area.
- Releases pose, or have the potential to pose, conditions that are immediately dangerous to life or health (IDLH).
- Releases require immediate attention because of imminent danger.
- There is uncertainty that the employees or equipment in the work area can handle the hazard.
- The situation is unclear or data is lacking on important factors.

INCIDENT AND EMERGENCY NOTIFICATION

"This is an electronically "Controlled" document. If printed this document is valid for 2 days from 04/11/13."

DOCUMENT NO:	HSE-EAP-001	PAGE:	2 of 3
DOCUMENT NAME: HOW TO REPORT AND INCIDENT OR EMERGENCY			

All Incidents must be reported through area supervision utilizing the cFlow FFR reporting process. See the *HSE Field Manual, Incident Reporting & Investigation* for further details.

All emergencies, regardless of their nature (safety, environmental, health or operational) must be reported to the Main Gate Dispatch. The preferred means for reporting emergencies is via telephone by calling **ext. 4444**. As an alternate, reporting by radio on the **(b) (7)(F), (b) (3)** is acceptable.

What to Report in an Incident or Emergency

- Your name and job title
- Phone number you are calling from
- Exact location and nature of the emergency or incident
- What product is involved
- What, if any, injuries there are (do not give names of injured)

In addition, the Main Gate Dispatch may ask additional questions in order to determine the appropriate response action.

Your Responsibility When Reporting

When reporting an incident or emergency, you should:

- ensure that all information is understood;
- stay on the line until dismissed by the dispatcher;
- provide as much information as possible;
- stay calm; and
- **pay attention to the dispatcher for any emergency action instructions.**

Upon receiving an incident or emergency report, the Main Gate Dispatch will initiate the appropriate response action.

EMERGENCY NOTIFICATION SYSTEM

The refinery Emergency Notification System (ENS) is used to advise personnel of emergency response and evacuation orders (See the [HSE-EAP-003 Evacuation and Personnel Accounting Procedure](#)).

The ENS is an integrated multi-media system designed for the purpose of communicating emergency messages to plant occupants. The system consists of tone, voice, and text messaging to a combination of sub-systems throughout the facility.

Upon notification of an emergency, the Main Gate Dispatcher activates the ENS. The ENS will provide information on the Alert level, type of emergency, location, and evacuation requirements. Additionally, the system is used to advise of any further special information. An All Clear is issued over the ENS to terminate the emergency.

The ENS may also be used to inform / notify personnel of refinery situations that they should be aware of, but do not meet the definition of an emergency (i.e., unit start ups and shut downs, adverse weather situations, etc.)

EMERGENCY CLASSIFICATION

Emergencies are classified by the level of response that is required and the type of emergency.

Responses are tiered into four alert levels. The level of a particular event is dependent on its magnitude from minor to serious. Each alert level activates emergency response groups according to predetermined response orders.

The type of emergencies may be either:

- Medical
- Rescue
- Fire
- Gas release
- Spill
- General emergency (i.e., weather event, power failure, process upset, etc.)

The Main Gate Dispatcher disseminates information provided and dispatches the appropriate level of Alert. After the initial Alert, the level may subsequently be escalated by the Plant Coordinator, the Incident Commander or the Field Coordinator.

DOCUMENT NO:	HSE-EAP-002	PAGE:	2 OF 5
DOCUMENT NAME: EMERGENCY NOTIFICATION & RESPONSE			

The tiered alert levels are defined below. General emergency management group response orders for each alert level are listed in [Appendix 1 - Response Classifications: Alert Levels](#).

ALERT 1: Medical, Rescue, Fire, Gas Release, or Spill

Minor emergency requiring only a limited emergency response. The impact of the event is contained to one source or within its area of origin. There is no potential for the incident to effect areas outside of the facility.

Examples of an Alert 1 emergency include, but may not be limited to, the following:

- Fires contained to one source or unit
- Minor spill or release which is confined within the area of origin
- Medical emergency with less than three (3) injuries or illnesses
- Malfunction or damage of radiography equipment unshielding source

ALERT 2: Medical, Rescue, Fire, Gas Release, or Spill

Emergency requiring activation of the Emergency Operations Center due to

- Actual or potential for off-site impact
- News media coverage
- The need for additional emergency management, technical or logistical support
- Significant regulatory agency involvement

Examples of an Alert 2 emergencies include, but may not be limited to, the following:

- Explosion and fire impacting more than an isolated area
- Major spill or release that is or may impact areas outside of facility
- Medical emergency with more than three (3) serious injuries or illnesses
- Incident involving a fatality
- Incident involving multiple units or buildings

ALERT 3: Medical, Rescue, Fire, Gas Release, or Spill

Emergency requiring activation of off-site emergency response team members and all emergency management support and resources.

Examples of an Alert 3 emergency include, but may not be limited to, the following:

- Major fire or explosion affecting a large area
- Fully involved fire in a large storage tank
- Major spill or release impacting areas outside of facility
- Mass casualty medical emergency
- Emergency of a long duration or other circumstances that make additional responders necessary

DOCUMENT NO:	HSE-EAP-002	PAGE:	3 OF 5
DOCUMENT NAME: EMERGENCY NOTIFICATION & RESPONSE			

ALERT 4: Medical, Rescue, Fire, Gas Release, or Spill

Emergency requiring outside mutual aid assistance and support.

An Alert 4 activates resources from Channel Industries Mutual Aid (CIMA). The Main Gate Dispatcher or Incident Commander activates the CIMA predetermined list as indicated below:

- CIMA first, second or third alarm
- CIMA Mass Casualty Incident: MCI-10, MCI-20 or MCI-30

Note that a CIMA "Special Call" does not in and of itself constitute an Alert 4 Response.

ALL CLEAR

When the emergency is over and it is safe for personnel to return to normal work activity, Main Gate Dispatch will activate the "All-Clear" via the ENS.

SRU THERMAL OXIDIZER / FLARE RELEASES

The Plant Shift Superintendent is responsible for ensuring that appropriate responses are made to SRU incinerator or flare releases.

Incinerator or flare releases, which may affect or are affecting the refinery or areas outside the plant boundaries, shall be alerted according to the alert levels described above. Those events that impact or are visible to areas outside of the refinery, should result in consideration of community notification via the CAER Line.

Effect or impact from SRU releases may be determined using known facts and observable information as follows:

- SRU Operating conditions
- H₂S and SO₂ Emissions Analyzer data
- Visual observations
- Atmospheric conditions

DOCUMENT NAME: EMERGENCY OPERATIONS ORGANIZATION			

SUMMARY

The **Emergency Operations** group provides support to emergency field efforts and to refinery operations from the EOC and other associated facilities. Support efforts include high level strategic planning, coordination of resources, recovery planning and business actions produced by an emergency event. Their planning and support efforts provide the strategic direction and support necessary to effectively mitigate the adverse consequences of events posing a threat to the well being of the company, employees or the community.

The refinery Emergency Management Organization is divided into four areas. The areas are:

- Emergency Operations (EOC)
- Emergency Operations - Manufacturing
- Emergency Response – Field Command
- Emergency Response – Operations

The **Emergency Operations - Manufacturing** group provides direct process operations control of the emergency scene and other refinery operations. The group manages emergency response strategic efforts relating to affected unit operations, emergency shutdowns and emergency response.

Emergency Response – Field Command provides overall on-site direction of emergency response efforts. Command efforts include defining objectives, establishing priorities and allocating resources. Incident Command, working in conjunction with manufacturing, sets strategic priorities for managing the incident.

The **Emergency Response - Operations** group provides the tactical direction for the Emergency Response Team. The Emergency Response Team (ERT) provides emergency fire, hazard control, medical and rescue services to the facility.

The respective support areas are organized in the following groups:

- Operations Planning and Support
- HSSE Support
- Human Resources Support
- Logistics Support

DOCUMENT NO:	HSE-EAP-005	PAGE:	3 OF 60
DOCUMENT NAME: EMERGENCY OPERATIONS ORGANIZATION			

SCOPE AND REFERENCES

This procedure applies to all emergency situations that may occur throughout the Refinery. This program is established to ensure compliance with OSHA requirements:

29 CFR 1910.38 Employee Emergency Plans and Fire Prevention Plans

29 CFR 1910.119(n) Process Safety Management of Highly Hazardous Chemicals (Emergency planning and response)

29 CFR 1910.120(q) Hazardous Waste Operations and Emergency Response (Emergency response to hazardous substance releases)

29 CFR 1910.156 Fire Brigades

Emergency Alerts

Emergency Operations and their functional teams are activated during an Alert 2 or greater event.

Other Emergency Operations Activations

For refinery events or incidents that may not demand an Alert activation, include, but may not be limited too, security events, bomb threats, or serious operational upsets. Emergency Operations may be activated by the Plant Shift Superintendent, a Superintendent or a Manager.

Reporting Locations

The Director and Coordinators of Emergency Operations and other designated positions report to the EOC. Some Emergency Operations positions report to other locations as designated in this plan.

Check In

On arrival to their reporting location, responders shall check in as per their reporting assignment. Check in includes establishing communications per job duties and responsibilities.

DOCUMENT NO:	HSE-EAP-005	PAGE:	4 OF 60
DOCUMENT NAME: EMERGENCY OPERATIONS ORGANIZATION			

DEFINITIONS

Affected Unit or Area - A process manufacturing unit, tank farm, or loading facility that is experiencing an emergency event (fire, spill, and gas release).

Emergency Operations Center (EOC) – The physical location at which the coordination of information and resources to support incident management (on-scene and offsite) and planning activities takes place.

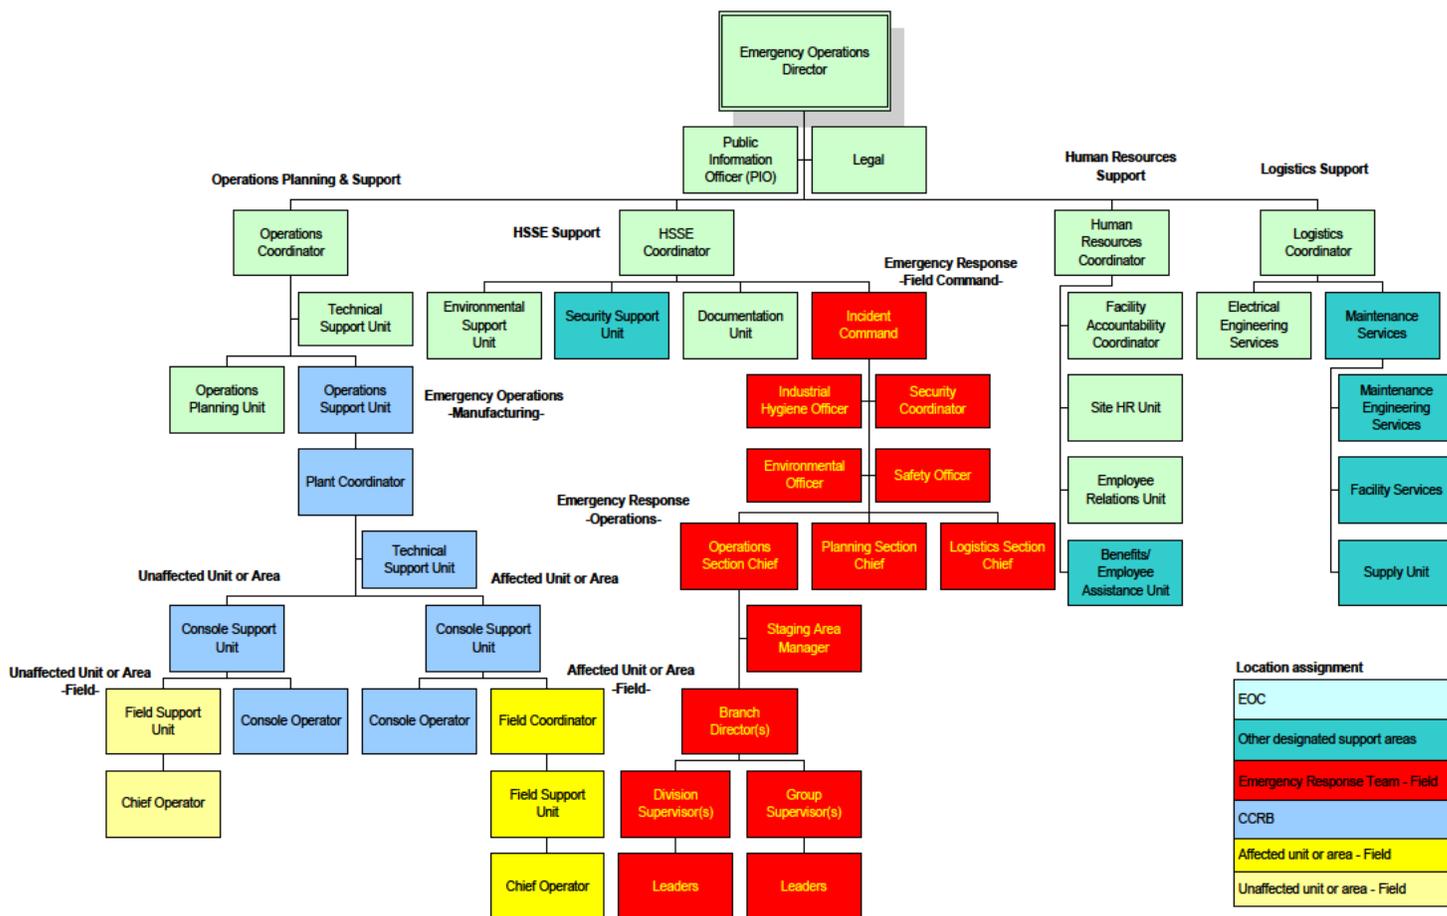

Field Command Post (FCP) or Incident Command Post – The field location where the primary functions of incident management are performed. The FCP may be located in a command support or mobile command van.

Unaffected Unit or Area – A process manufacturing unit, tank farm or loading facility that is not directly affected by an emergency in the facility but may be required to perform operational adjustments and changes.

DOCUMENT NAME: EMERGENCY OPERATIONS ORGANIZATION			

EMERGENCY OPERATIONS CENTER (EOC)

An EOC is activated: To support the on-scene response and manage offsite concerns during an escalating incident by relieving the burden of external coordination and security from field emergency resources.

An EOC is:

- A physical location.
- Staffed with personnel trained for and authorized to represent their discipline.
- Equipped with mechanisms for communicating with the incident site and obtaining resources and potential resources.
- Managed through objectives and defined duties/responsibilities.

An EOC consists of: Personnel and equipment appropriate to the level of the incident.

An EOC is used: To provide coordination, direction and support during emergencies.

An EOC may: Facilitate functions and support Incident Command when resource needs exceed scene capabilities.

An EOC does not: Command the on-scene level of the incident.

Primary EOC Location

The **primary EOC** is located in the **Main Office Building, East Wing, Second Floor, HSE Emergency Services.**

Alternate Location

If the primary EOC is rendered unusable due to damage, an alternate location will be used.

The alternate EOC is the **HRO Training Center, located on Allen Genoa St.**

GENERAL

During the activation of an Alert 2 or greater event, the first team member to arrive at EOC will assume the Emergency Operations Director position and establish control of the center's activities.

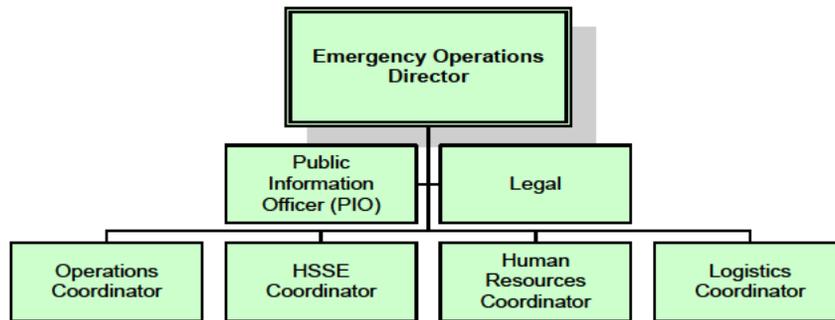

Coordinators assume their assigned duties, establish communications, and activate their functional plans with their Teams.

Other Team members, reporting to EOC, will staff their positions and assume their duties and responsibilities.

DOCUMENT NO:	HSE-EAP-005	PAGE:	7 OF 60

EMERGENCY OPERATIONS ORGANIZATION			

EMERGENCY OPERATIONS

EMERGENCY OPERATIONS DIRECTOR

The Emergency Operations Director provides management leadership to the group and the refinery. The primary responsibility of the Emergency Operations Director is to lead coordinated efforts in addressing facility planning and support issues.

The Emergency Operations Director is responsible for communications to corporate and the requesting of corporate support resources.

The Emergency Operations Director leads and directs management support and planning efforts. For the Emergency Operations group, the Director establishes objectives, develops strategies, issues assignments and ensures joint planning/integration of tactical operations. The Emergency Operations Director evaluates the current situation and ensures that current planning is adequate.

The Director communicates directly with their Staff and the Coordinators in EOC. Additionally, the Director communicates with the Divisional Vice President.

The Director is responsible for alerting Company Officials of a Crisis and may request Company resources to assist in response efforts.

DOCUMENT NO:	HSE-EAP-005	PAGE:	8 OF 60
DOCUMENT NAME: EMERGENCY OPERATIONS ORGANIZATION			

CRISIS IDENTIFICATION AND INITIAL RESPONSE

A "crisis situation" is any unplanned event that has a major impact on the company, its employees, or the public. A "crisis" significantly interrupts the operations or conduct of business; requires immediate coordinated management response; and requires immediate decision-making from an executive level. This includes events which may be external to the company and its facilities, but which have the potential to quickly focus extensive news media and public attention on the company.

Indication that there is the potential for any of the following to occur should initiate an evaluation to determine whether a potential for a "crisis situation" exists.

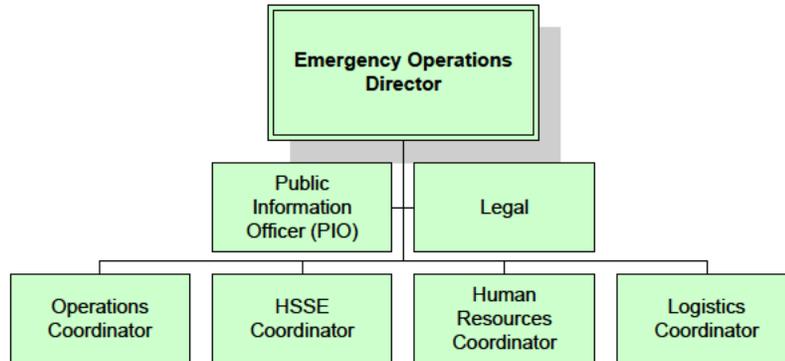

- Fatalities or serious injuries.
- Fire or explosion resulting in substantial property damage.
- Potential for significant environmental damage.
- The release of or exposure to a material which could pose a threat to the health and safety of employees or residents of the community or result in adverse environmental impact.
- Significant transportation incident or marine spill involving raw materials purchased for, or finished products produced by the Company.
- Significant interruption or loss of operations at a manufacturing facility.
- Labor dispute that has the potential to result in an interruption of operations.
- Terrorist threat or security-related risk.
- Major media coverage.
- Loss of critical information processing systems.
- Employee/workplace violence.

"Crisis situations" must be reported immediately to the "Crisis Notification Line", See [Duties and Responsibilities: Emergency Operations Director](#).

EMERGENCY OPERATIONS ORGANIZATION			

Duties and Responsibilities: Emergency Operations Director

- Leads and directs management support and planning efforts. Facilitates Emergency Operations groups in planning and support efforts. Approves high-level facility strategic direction plans.
- Ensures refinery or community evacuations are adequate.
- Ensures overall personnel accountability.
- Manages by objectives. Determines overall strategy for support and planning.
- Ensures security of facility.
- Establishes a planning cycle. Sets planning meeting times with Coordinators and Staff.
- May request periodic predictions on incident potential.
- Keep current on situation. Establishes information requirements and reporting schedules. Compiles emergency status summary information. Ensures agency information collection and reporting requirements are being met.
- Ensures expedition of resources requested by Emergency Response – Field Command and Manufacturing.
- Assembles information on alternative refinery operations strategies.
- Ensures that data is gathered for analysis and subsequent planning efforts.
- Ensure proper staffing of EOC and other support functions.
- Ensures investigation is initiated on event.

DOCUMENT NO:	HSE-EAP-005	PAGE:	11 OF 60
DOCUMENT NAME:			
EMERGENCY OPERATIONS ORGANIZATION			

Duties and Responsibilities: Emergency Operations Director

- Requests Legal support.
- Approves all media and employee communications releases.
- Requests activation of corporate emergency resources as necessary (Corporate Emergency Response Team CERT).
- Ensures coordination of marketing, supply and logistics as related to:
 - Customer /supplies
 - LBI affected facilities
 - Pipelines
 - Exchange partners
 - Off-site terminals
 - Railroads and truck transporters
 - Marine transporters
- Ensures recovery planning efforts are initiated as required.
- Determines and approves the demobilization of Emergency Operations resources.
- Communicates with high-level community and governmental officials as necessary.
- Communicates directly with the Divisional Vice President as required.
- Alerts Company Officials by contacting the Crisis Notification Line:

**CRISIS NOTIFICATION
281-452-8880**

Procedure for Reporting a Potential Crisis

During all hours (days and nights) call the listed number. Call immediately upon becoming aware of the reportable incident. The Channelview Complex Security Officer will answer you call.

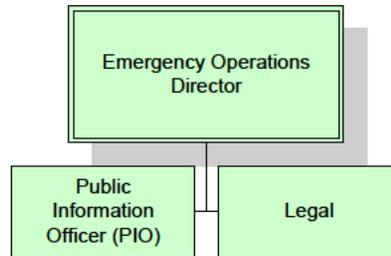

Provide:

- Your name and title
- The telephone number that you can be reached at within the next 30-minutes
- A brief description of the incident

You will be called back (normally within 15-minutes) to record all pertinent details of the incident.

DOCUMENT NO:	HSE-EAP-005	PAGE:	12 OF 60
DOCUMENT NAME:			
EMERGENCY OPERATIONS ORGANIZATION			

EMERGENCY OPERATIONS STAFF

The following are staff functions of the Emergency Operations Director.

Public Information Officer (PIO)

Public Information Officer (PIO) is responsible for interfacing with the public, media and employees. The Public Information Officer assembles accurate, accessible, and complete information on the incident. The Emergency Operations Director is responsible for approving releases of information. Corporate Public Relations may be activated as necessary to assist in accordance with the magnitude of the event.

See [Duties and Responsibilities: Public Information Officer \(PIO\)](#)

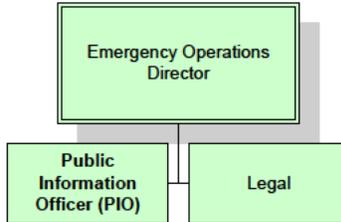

Legal

Legal provides representation and consulting support to the Emergency Operations Director. Dependent on the event, legal teams may be directed to perform legal investigations and address agency inquiries. Additionally, Legal supports Public Information, Security and Environmental Support Units.

EMERGENCY OPERATIONS ORGANIZATION			

OPERATIONS PLANNING AND SUPPORT

Operations Planning and Support functions range from direct support of emergency response efforts to planning for mitigation and process changes.

Refinery operations are highly integrated. An emergency event may dictate process adjustments or shutdowns on upstream or downstream process units. The Operations Planning and Support group gathers data and information from the Emergency Operations – Manufacturing group in order to provide direct support, plan long term manufacturing strategies and analyze business implications.

Operations Coordinator

The Operations Coordinator provides leadership for the team's planning and support efforts in the EOC. The Coordinator will establish contact and attain information with Operations Support Unit in the Central Control Room (CCR). The Operations Coordinator will communicate this information to Operations Planning personnel located in the EOC. Circumstances at the affected unit will normally dictate the extent of support and planning actions required for the facility. Using information gathered from the event, the team develops adequate plans for future support, mitigation efforts, process changes and recovery. These plans are presented to the Emergency Operations Director.

See [Duties and Responsibilities: Operations Coordinator](#)

Technical Support Unit

Technical Support is a staff function of the Operations Coordinator. Technical Support provides technical and analytical assistance to the Operations Planning and Support group. This Technical Support position may also communicate with the Emergency Operations – Manufacturing group Technical Support personnel located in the CCRB. Accurate technical data is especially beneficial for business and mitigation planning.

See [Duties and Responsibilities: Technical Support Unit](#)

DOCUMENT NO:	HSE-EAP-005	PAGE:	17 OF 60
DOCUMENT NAME: EMERGENCY OPERATIONS ORGANIZATION			

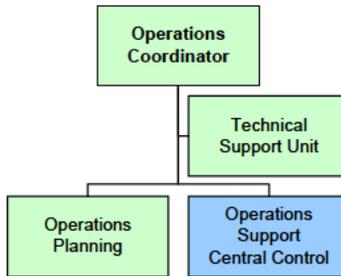

Operations Planning

Operations Planning members form a team that directly supports the emergency and develops longer term plans for support, mitigation, recovery and process changes. Developed plans are formulated considering information and data from economic/business conditions.

DOCUMENT NAME:			
EMERGENCY OPERATIONS ORGANIZATION			

HEALTH, SAFETY, SECURITY & ENVIRONMENTAL SUPPORT

Health, Safety and Environmental (HSSE) functions range from supporting emergency response services to planning efforts relating to mitigation and recovery. HSSE support directly performs off site monitoring, agency liaison and site perimeter security.

HSSE Coordinator

The HSSE Coordinator manages and coordinates Health, Safety, Security and Environmental support functions. From the EOC, the Coordinator attains field response information from the Incident Commander. The HSSE Coordinator manages off site monitoring, ensures the security of the site perimeter and consults with supporting staff on various issues. With this information, and assessments from the field, the HSE Coordinator develops plans for adequate HSSE response and mitigation/recovery support. See [Duties and Responsibilities: HSSE Coordinator](#)

Environmental Support Unit

Environmental Support coordinates overall environmental related matters. The position monitors conditions related to the emergency that have environmental implications. Environmental Support is directly responsible for ensuring environmental reporting and off site monitoring is performed. This position is the primary liaison for environmental agencies and the U.S. Coast Guard. Environmental Support gathers information from the Environmental Officer in the Field Command Post. With this information, and assessment from the field, an environmental action plan is established. Planning may include revised agency notifications, mitigation planning, and performance of offsite monitoring.

Environmental Engineers and Specialists report to Safety Supply for agency liaison or monitoring team assignments. See [Duties and Responsibilities: Environmental Support Unit](#)

Security Support Unit

Security Support coordinates overall security related matters. The position monitors conditions related to the emergency that have facility security implications. Security Support is directly responsible for ensuring emergency resources are escorted or directed from Staging to their assignment. Security Support gathers information from the Security Coordinator in the field (emergency scene). This position also addresses outside security issues that affect the plant. Security action plans are established using the information and

DOCUMENT NO:	HSE-EAP-005	PAGE:	25 OF 60
DOCUMENT NAME: EMERGENCY OPERATIONS ORGANIZATION			

assessments from the field. Planning may include security resource allocation for in-plant escorts, setting up representatives for outside and in-plant roadblocks and working with law enforcement agencies to safely secure the refinery.

See [Duties and Responsibilities: Security Support Unit](#)

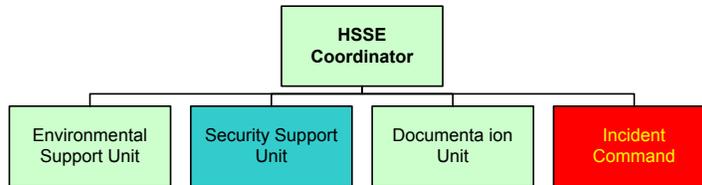

Documentation Unit

The Documentation Unit is responsible for documenting and recording all significant events related to the emergency. The Unit records field and EOC events and actions. The Documentation Unit ensures regulatory agency contacts are documented properly.

Depending on the event, supporting staff may be implemented. See [Duties and Responsibilities: Documentation Unit](#)

HUMAN RESOURCES SUPPORT

Human Resources Support (HR) functions range from immediate employee support to planning and provision efforts relating to follow-up employee and dependent services. Functions also include community service support, risk management support and employee communications.

Roles and responsibilities of Human Resources Support may include, but not be limited to, the following areas:

- Preliminary actions
- Initial actions
- Follow-up Actions

Preliminary actions refer to planning and preparation accomplished in advance of a crisis. Preliminary actions may include preparations of lists, contact numbers, procedures, preplans and communication plans prepared in advance.

Immediate Actions are those that are necessary within the first 24-hours following an event. Follow-up actions are performed thereafter.

Human Resources members are assigned to one of the Human Resource Units. Each unit will be coordinated and supervised by a Unit Leader. Unit Leaders are responsible for ensuring all functional responsibilities of the team are met.

DOCUMENT NO:	HSE-EAP-005	PAGE:	35 OF 60
DOCUMENT NAME: EMERGENCY OPERATIONS ORGANIZATION			

Human Resources Coordinator

The Human Resources Coordinator manages and coordinates all Human Resource matters. The Facility Accountability Coordinator (FAC) and Human Resource Units are coordinated by the Human Resources Coordinator from the Emergency Operations Center (EOC).

The Coordinator ensures that personnel accountability and other employee information is available in the EOC. In addition, the Human Resource Coordinator works with HSSE Support on risk management activities that affect the community, employees and contractors. Coordination activities include assessing conditions of personnel affected by the event and initiating steps towards support actions. See [Duties and Responsibilities: Human Resources Coordinator](#)

Facility Accountability Coordinator

The Facility Accountability Coordinator (FAC) compiles and provides personnel accounting information on all personnel in the facility. Accountability information is gathered from Access Control System and provided to Human Resources and the Emergency Operations Director. The FAC may also assist in locating unaccounted for personnel and gathering employee information. See [Duties and Responsibilities: Facility Accountability Coordinator](#)

Site HR Unit

The Site HR Unit coordinates and conducts unplanned HR activities and provides administrative support to all Units. Additionally, the Unit may organize and coordinate condolence visits, funeral arrangements and contractor status communications. The unit also conducts other routine HR activities as requested. See [Duties and Responsibilities: Site HR Unit](#)

Employee Relations Unit

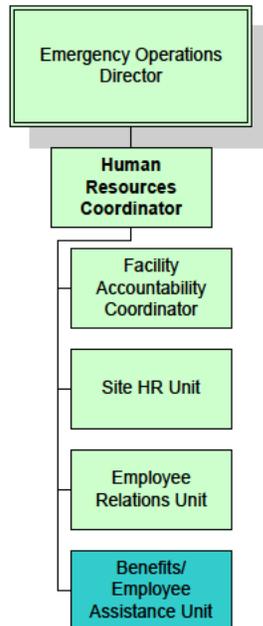

The Employee Relations Unit coordinates communications with both employees and families of injured employees. Unit members may be assigned to area hospitals in order to maintain a current status of injured employees in order to communicate this information to families. Additionally, the Unit ensures employees are informed on the status of the crisis and their role(s). See [Duties and Responsibilities: Employee Relations Unit](#)

Benefits/Employee Assistance Unit

The Benefits Unit has primary responsibility for developing and communicating benefit plan information to the HR Coordinator, other support Units, employees and family members. Additionally, the unit maintains responsibility for providing employee data. Coordinates efforts related to the Employee Assistance Program (EAP) including services for employees and families. See [Duties and Responsibilities: Benefits/Employee Assistance Unit](#)

EMERGENCY OPERATIONS ORGANIZATION			

FOLLOW-UP ACTIONS

- Establish and assemble Benefit/Employee Data teams to provide 24-hr or extended coverage as necessary.
- Contact and assemble vendor and account representative to expedite claims processing.
- Discuss with Legal Department, benefit and worker's compensation issues in advance of meetings with employee family members or beneficiaries.
- Establish and maintain a "Benefits Hot-line" to provide employee information and to afford a means to make inquiries.
- Determine and recommend to the Human Resources Coordinator "special" benefit needs for employees and families.
- Work with other members of the Human Resources unit to assist employee family members with travel arrangements as necessary.
- Designate time and place for family members to meet for discussion of benefits.
- Advise Human Resources Coordinator on compensation/benefit issues.
- Determine if visits to families are necessary relating to benefits.
- Monitors EAP activities and follow up as necessary.

EMERGENCY OPERATIONS ORGANIZATION			

LOGISTICS SUPPORT

Logistics Support provides the facility supplies and maintenance support during emergency conditions. Logistics Support provides immediate services to refinery operations and Emergency Response Teams. The team also plans mitigation support for cleanup and repair activities.

Logistics Coordinator

The Logistics Coordinator manages and coordinates all supply and maintenance support activities during emergency situations. Field service and supply requests will be routed to the Logistics Coordinator in EOC. From EOC, the Logistics Coordinator will expedite supplies and services through Logistics Support teams. As Operations Coordinators plan for mitigation and repairs, the Logistics Coordinator will dispatch the appropriate resources to support the strategy. See [Duties and Responsibilities: Logistics Coordinator](#)

Electrical Engineering Services

Electrical Engineering Services provides communications, instrumentation and electrical support for the facility. The service team provides engineering resources and directs maintenance to communications, instrument and electrical equipment. Electrical Engineering Services is responsible for ensuring facility radio communications equipment is operating properly. See [Duties and Responsibilities: Electrical Engineering Services](#)

DOCUMENT NO:	HSE-EAP-005	PAGE:	49 OF 60
DOCUMENT NAME: EMERGENCY OPERATIONS ORGANIZATION			

Maintenance Services

Maintenance Services supervises and directs personnel and equipment as required to support maintenance activities for response and mitigation.

Maintenance Services receives requests from the Logistics Coordinator in EOC, and dispatches assignments tasks to service and engineering groups. See [Duties and Responsibilities: Maintenance Services](#)

Maintenance Engineering Services

Maintenance Engineering provides engineering and inspection support for the facility. The team may be requested to perform field evaluations of damaged equipment to determine integrity. See [Duties and Responsibilities: Maintenance Engineering Services](#)

Facility Services

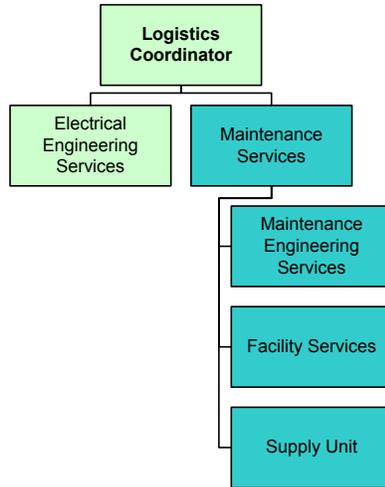

Facility Services provides facility service resources and equipment during emergencies and sets up support services ranging from food provisions to housing. See [Duties and Responsibilities: Facility Services](#)

Supply Unit

The Supply Unit provides procurement services for the facility during an emergency. The Unit Leader procures any equipment and supplies necessary for response and mitigation efforts. See [Duties and Responsibilities: Supply Unit](#)

DOCUMENT NO:	HSE-EAP-006	PAGE:	2 of 26
DOCUMENT NAME: EMERGENCY OPERATIONS - MANUFACTURING			

SUMMARY

The Emergency Operations - Manufacturing group provides direct process operations control of the involved process units, areas and other refinery operations. The group manages strategic efforts relating to affected unit operations, emergency shutdowns and emergency response.

Emergency Operations – Manufacturing is composed of Operations management/supervision and operations personnel in Central Control and in the field.

SCOPE AND REFERENCES

ACTIVATION

Portions of the Emergency Operations – Manufacturing group are activated during all Alerts affecting process units or areas. The entire group is activated during an Alert 2 or greater event.

Other Emergency Operations Activations

For refinery events or incidents that may not demand an Alert activation, to include, but may not be limited too, security events, bomb threats, or serious operational upsets, Emergency Operations, may be activated by the Plant Shift Superintendent, a Plant Manager, or Manager/Superintendent.

Reporting Locations

The Emergency Operations – Manufacturing group reports to the Central Control Room or directly to the affected and unaffected process units or areas.

Check In

On arrival to their reporting location, responders shall check in as per their reporting assignment. Check in includes establishing communications per job duties and responsibilities.

DEFINITIONS

Affected Unit or Area - A process manufacturing unit, terminal, or loading facility that is experiencing an emergency event (fire, spill, and gas release).

Central Control or Central Control Room (CCR) – The physical location in which process operations consoles are located for controlling and monitoring of manufacturing operations activities. The refinery operates processes from a central control location.

Chief Operator – For the purpose of this EAP section, the “Chief Operator” is defined as the process unit assigned Chief, Oil Movements Pumper and lead or #1 marine terminal Dockman.

DOCUMENT NO:	HSE-EAP-006	PAGE:	3 of 26
DOCUMENT NAME: EMERGENCY OPERATIONS - MANUFACTURING			

Emergency Operations Center (EOC) – The physical location at which the coordination of information and resources to support incident management (on-scene) and planning activities takes place.

Field Command Post (FCP) or Incident Command Post – The field location where the primary functions of incident management are performed. The FCP may be located in a command support vehicle or mobile command van.

Process Unit or Area - For the purpose of the EAP, a “process unit or area” is defined as any operations functional area to include manufacturing, terminals, loading facilities, and utility units.

Unaffected Unit or Area – A process manufacturing unit, terminal or loading facility that is not directly affected by an emergency in the facility but may be required to perform operational adjustments and changes.

ROLES AND RESPONSIBILITIES

Operations Support Unit

The Operations Support Unit directly supports manufacturing emergency response efforts. When activated, the Unit Leader assists the Plant Coordinator with short-term and long term process adjustments, diagnostics and shut down options. This Operations Support function communicates situation reports directly to the Operations Coordinator in the Emergency Operations Center (EOC). See [Duties and Responsibilities: Operations Support Unit](#)

Plant Coordinator

From the Central Control Room, the Plant Shift Superintendent assumes the position of Plant Coordinator. The Plant Coordinator provides direction and management relating to refinery manufacturing emergency operations and response. The Plant Coordinator directs implementation of operational strategies into tactical actions aimed at minimizing impact to the refinery.

The Plant Coordinator exercises supervisory control over the operating consoles. The Plant Coordinator communicates directly with the Field Coordinator, at the Field Command Post (FCP), during Alert 1 events, and with Console Support Units (in the CCR) during Alert 2 or greater events. See [Duties and Responsibilities: Plant Coordinator](#)

DOCUMENT NO:	HSE-EAP-006	PAGE:	4 of 26
DOCUMENT NAME: EMERGENCY OPERATIONS - MANUFACTURING			

The Plant Coordinator interacts with Console Operators to facilitate and ensure that:

- Appropriate emergency systems are activated in the affected unit or area.
- Unit personnel are accounted for.
- Appropriate shutdown measures are taken.
- Process adjustments are made to minimize the effects of the emergency in both affected and non-affected areas.
- Actions are coordinated and communicated through the Field Coordinator and Incident Command.

Spill Response

The Plant Coordinator is considered the primary Spill Response “Qualified Individual (QI).” See *Spill Response and Prevention Plan, SRPP*.

Technical Support Unit

Technical Support is a staff function of the Plant Coordinator. Technical Support provides process technical and analytical assistance directly to manufacturing groups in the Central Control Room. This Technical Support position may also be communicating with the Technical Support Unit personnel located in the EOC. See [Duties and Responsibilities: Technical Support Unit](#)

Console Support Unit

When activated, the Console Support Unit assists the Console Operator in their efforts to adjust processes and shut down equipment in accordance with emergency operating procedures. The Unit Leader assists the Console with communications to other operations personnel or outside/external groups, i.e. fuel, hydrogen, oxygen, power, water treatment and pipeline operations. The Support Unit also interacts and gathers operations situation reports from Console Operators, Field Support Units and the Field Coordinator. These reports are provided to assist the Plant Coordinator in future planning efforts. See [Duties and Responsibilities: Console Support Unit](#)

Console Operator

The Console Operators of both affected and non-affected process units evaluate the impact of the emergency on their respective process units/areas. Following this evaluation, the Console Operator may begin shutting down equipment or making process adjustments in accordance with emergency or other operating procedures. Console Operators maintain contact with the Chief Operator on strategic and tactical issues. The Console Operators communicate directly with the Plant Coordinator or when activated with their respective Console Support Unit Leader. See [Duties and Responsibilities: Console Operator](#)

The Console Operator must:

- Gather personnel accountability reports from the Chief Operator and pass them on to the Plant Coordinator or Console Support Unit when activated.
- Coordinate with Chief Operators, the Plant Coordinator and Console Support Unit respectively to make appropriate process adjustments.

DOCUMENT NO:	HSE-EAP-006	PAGE:	5 of 26
DOCUMENT NAME: EMERGENCY OPERATIONS - MANUFACTURING			

Field Coordinator

The assigned Operations Field Support Unit assumes the position of Field Coordinator. The Field Coordinator is the primary liaison between process unit operations and the Emergency Response Group. Communication between these groups is critical to ensure a safe and effective response.

The Field Coordinator is unified with Incident Command in the Field Command Post (FCP).

The Field Coordinator establishes and maintains contact with the Field Support Unit Leader of the affected process unit or area. This contact will enable strategic plans to be established for overall emergency and hazard control.

The Field Coordinator will also establish and maintain contact with the Plant Coordinator in the Central Control Room. Additionally, the Field Coordinator may be requested to provide direct updates to the Operations Coordinator in EOC. This contact may be established to keep EOC apprised of field conditions, strategies, and actions being taken to control the emergency. The Operations Coordinator uses this information to plan field support efforts, refinery wide operations, mitigation plans, and business strategies. [See *Duties and Responsibilities: Field Coordinator*](#)

Field Support Unit

Field Support Units report to the field (unit or process area) and supervise plant-operating functions in their respective areas. A Field Support Unit is comprised of a Leader and other assigned support personnel.

The Field Support Unit Leader ensures personnel accountability and provides information to the Field Coordinator or Console Support Units as expediently as possible.

Field Support Units interact with Chief Operators as required to gather appropriate information to facilitate the initiation of emergency actions and associated process changes. Field Support Unit Leaders communicate with their respective Console Support Units, or if their unit is affected, with the Field Coordinator to provide necessary information for support and response planning efforts.

The Field Support Unit will remain on assignment assisting the Chief Operator in coordination of tactical efforts. Communication will be established and maintained with the Field Coordinator on the Ops-1 radio channel or with the Console Support Unit on the assigned operations radio channel.

The Field Support Unit Leader may also serve as liaison with Emergency Response - Operations personnel in setting up tactical teams of operators and emergency response personnel. See [Duties and Responsibilities: Field Support Unit](#)

DOCUMENT NO:	HSE-EAP-006	PAGE:	6 of 26
DOCUMENT NAME: EMERGENCY OPERATIONS - MANUFACTURING			

Chief Operator

For the purposes of the EAP, the “Chief Operator” is defined as the operator of any manufacturing, terminal, loading, or utility facility functioning at the highest position in a line of authority or progression.

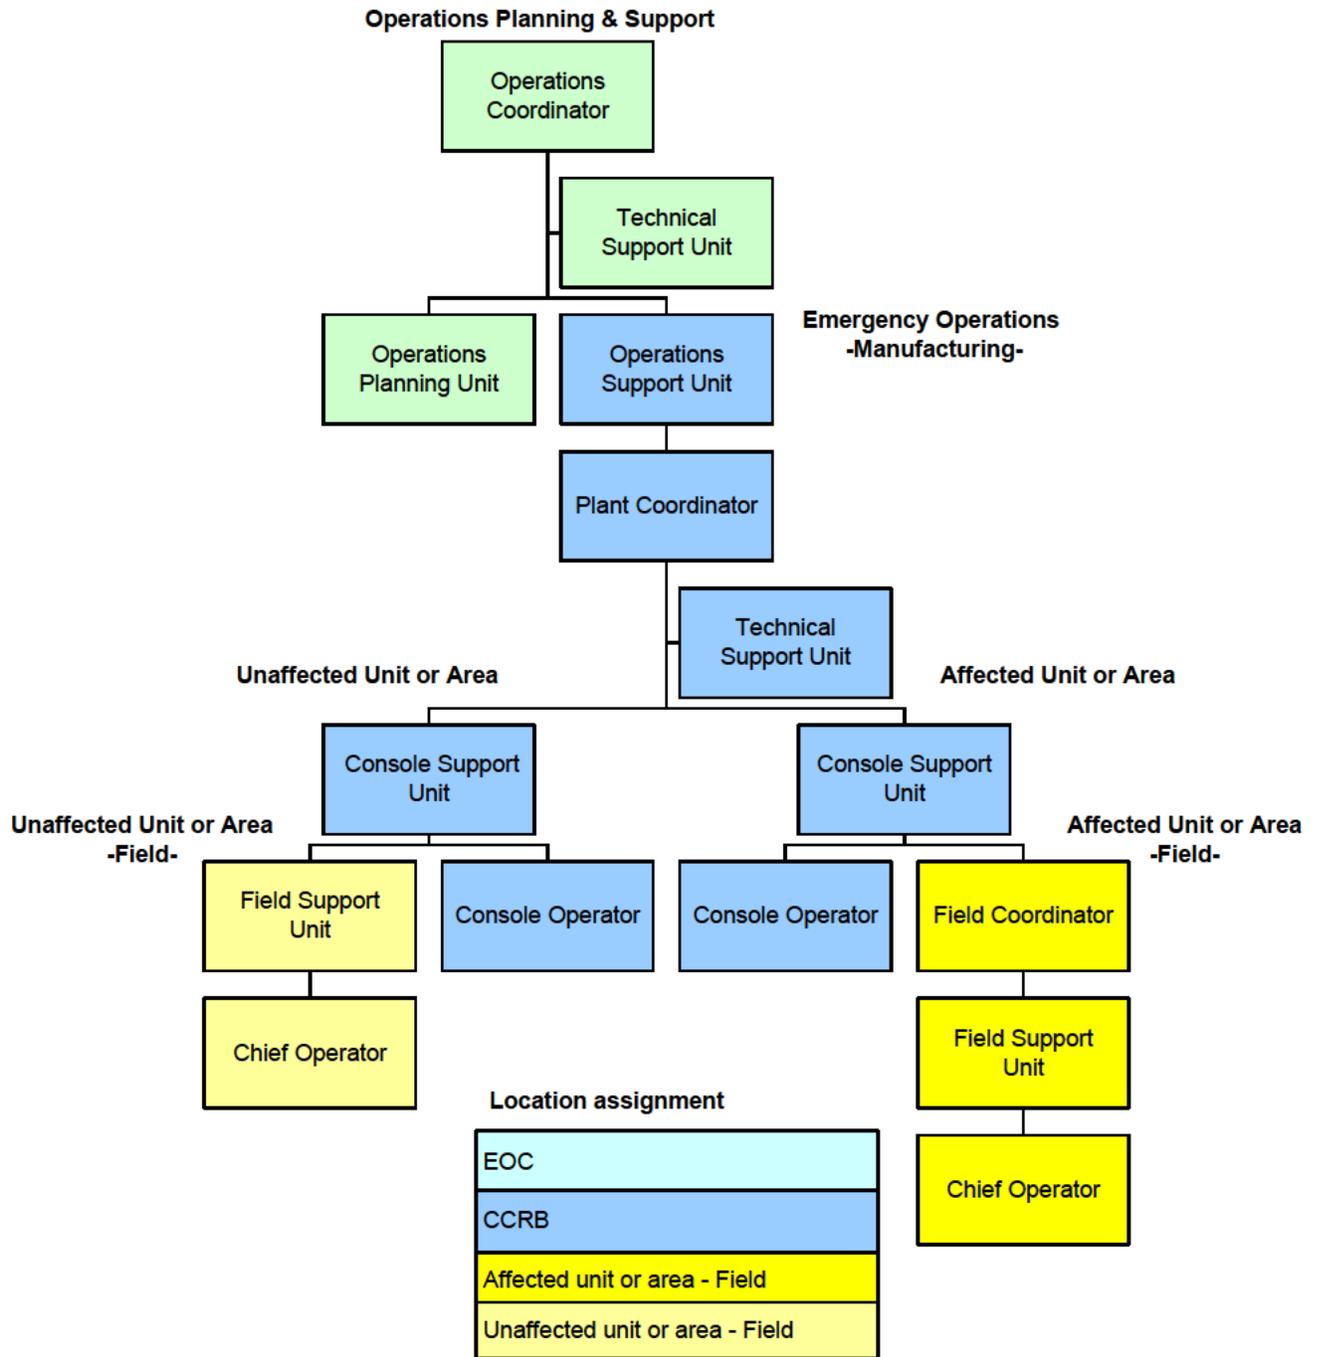

The Chief Operator, of the affected process unit, will direct and implement operations response efforts and emergency shutdowns. The Chief Operator maintains communications with the Console Operator. The Chief Operator will maintain contact with the Field Support Unit on strategic matters. See [Duties and Responsibilities: Chief Operator](#)

The affected unit Chief Operator gathers and maintains accountability of all unit operators. This information is reported to the Console Operator and Incident Command. The Chief Operator must:

- Ensure that the Main Gate Dispatcher is notified of the emergency.
- Ensure that fixed manual or automatic fire protection systems and other safety systems are activated.
- Gather reports on personnel accountability and pass them on to the Console Operator and directly to Incident Command or the Field Coordinator if their unit is affected.
- Work with the Console Operator to direct unit personnel conducting operations response and shutdown efforts.

- Reports information as required to the Plant Coordinator. Maintains communications and reports information as necessary to the Field Coordinator.
- Assists the Console with communications to other operations personnel or outside/external groups, i.e. fuel, hydrogen, oxygen, power, water treatment and pipeline operations.
- Interacts and gathers operations situation reports from Console Operators, Field Support Units and the Field Coordinator. These reports are provided to assist the Plant Coordinator in future planning efforts.
- Provides input into operational strategic direction for manufacturing emergency response efforts.
- Evaluates manufacturing response actions. Maintains awareness of affected unit or area operating status. Maintains awareness of all plant operating status.
- Remains in the Central Control Room while the response is in progress unless otherwise assigned.
- Coordinates and ensures adequate communications between console operators.
- Orders Operations logistical support, to include maintenance, through the Plant Coordinator.
- Plans and ensures adequate staffing of operational personnel and console operators.
- Exercises responsibility for protecting product and equipment in assigned area.
- May request respective operations or analytical support staff necessary to assist effort.
- Gathers data for analysis and subsequent planning efforts.
- Ensures control of refinery tank farm and associated pipelines in respective area or responsibility.

Duties and Responsibilities: Console Operator

- Gathers personnel accountability reports from the Chief Operator and pass them on to the Plant Coordinator or Console Support Unit when activated.
- Console Operators of both affected and non-affected process units will evaluate the impact of the emergency on their respective process units/areas. Following this evaluation, the Console Operator may begin shutting down equipment or making process adjustments in accordance with emergency or other operating procedures. Follows standard and emergency operating procedures appropriate for the incident.
- Maintains contact with the unit Chief Operator on strategic and tactical issues. The Console Operators communicate directly with the Plant Coordinator or when activated with Console Support Units. Works with Chief Operator regarding unit shutdown actions or other process adjustments.
- Advises Chief Operator of unit conditions and changes.
- Interacts with other Console Operators to ensure that the impact to other units/areas is considered and adjusted.
- Maintains a status awareness of unit operations.
- Coordinates with Chief Operators, Plant Coordinator and Console Support Unit respectively to make appropriate process adjustments.
- Assigns and directs unit operator actions and activities in accordance with standard operating procedures and emergency operating procedures.

Duties and Responsibilities: Field Coordinator

- Ensures accountability and life safety of all operations and non-essential personnel in affected area. Works with Incident Command to issues prompt evacuation orders for affected facility areas as necessary.
- Primary liaison between process unit operations and the Emergency Response Group through the Incident Commander. The Field Coordinator is unified with Incident Command in the Field Command Post (FCP).
- Works, in a unified manner, with Incident Command to plan and implement response goals and objectives.
- Establishes and maintains contact with the affected process unit or area Field Support Unit. Interacts with field operations personnel to ensure that unit related problems and significant process concerns are taken into account when conducting response actions.
- Works with the affected unit or areas operations group and Emergency Response to establish and implement strategic and tactical response plans to be established for overall emergency and hazard control. Provides input into operational strategic direction for manufacturing emergency response efforts.
- Reports information as necessary to the Plant Coordinator or Console Support Unit. Attains approvals from the Plant Coordinator for local strategic and tactical plans as necessary.
- May gather process information for future operational strategic plan development.
- Evaluates manufacturing response actions. Maintains awareness of affected unit or area operating status.
- Remains at the scene of the emergency while the response is in progress.
- If requested, may order Operations logistical support, to include maintenance, through the Plant Coordinator or the Console Support Unit.
- Ensures and may assist with planning to adequately staff of operations personnel at emergency site.
- Oversees overall safety of affected unit operations personnel.

DOCUMENT NO:	HSE-EAP-007	PAGE:	2 OF 30
DOCUMENT NAME: INCIDENT COMMAND SYSTEM & ORGANIZATION			

INCIDENT COMMAND SYSTEM (ICS)

The Incident Command System (ICS) is the national standard process for managing responses to emergency incidents. The ICS consists of personnel, facilities, equipment, communications, and procedures, all operating within a common organizational structure to gain control of and mitigate an incident. The ICS can develop into a complex organization with the major functions being Command, Operations, Planning, Logistics, Liaison, and Safety.

The ICS is designed to allow for multi-agency adoption within industrial, federal, state, and local emergency agencies. Therefore, terminology used in the ICS is designed to be acceptable and understandable to across different emergency management organizations.

Houston Refining, LP has adopted the CIMA Incident Command System for use during all emergencies that occur at the facility.

Organization of the Incident Command System begins to develop from the time that initial resources arrive at an incident. The organization starts with management of major functions initially being the responsibility of one or just a few persons. As the incident develops in size and / or complexity, activities management is assigned to additional individuals in order to maintain a reasonable span of control. Necessary aspects of the organization are maintained through all active phases of the incident. Command is terminated at the point that active operations or incident hazards no longer present a need for operational control.

The basic organizational structure is also applicable to small incidents and incidents not directly involving releases, such as hurricanes, floods, rescues, or medical incidents. The system's organizational structure is able to adapt to any emergency incident or planned event that might occur on the facility.

DOCUMENT NO:	HSE-EAP-007	PAGE:	3 OF 30
DOCUMENT NAME:			
INCIDENT COMMAND SYSTEM & ORGANIZATION			

INCIDENT COMMAND / INCIDENT MANAGEMENT FACILITIES

Field Command Post: The Command Post is the location from which the Incident Commander, Field Coordinator and necessary support staff operate to direct and coordinate incident control activities. The Command Post will normally be in the Command Vehicle near the scene of the incident. In some cases however, the Command Post may be located away from the incident scene.

Emergency Operations Center (EOC)

The Emergency Operations Center is the location from which the Emergency Operations organization operates. The primary EOC is in the Administration Building – HSSE Wing. The EOC is provided with resources and equipment necessary for the EOC staff to perform their responsibilities including access to emergency plans, radios, telephones systems, a fax machine, checklists, plot plans, and networked computer systems.

Alternate EOC

The Alternate EOC is located at the Houston Refinery Training Center at 317 Allen Genoa Road in the Computer Training Room. Limited radio capability is available at the Alternate EOC via portable base radio stations and handheld radios. Additional handheld radios should be obtained prior to moving to the Alternate EOC. Electronic resource material such as emergency plans, plot plans, checklists, and telephone numbers / call lists are accessible from Alternate EOC networked computer systems. Hard copy material must be moved when the Alternate EOC is established.

Central Control Room Building (CCRB)

The CCRB is utilized by the Emergency Operations – Manufacturing Organization to provide tactical level operational support to the EOC.

Logistics Support Center

The Logistics Support Center is the locations to which logistics support personnel not directly assigned to EOC report to await orders from the Logistics Coordinator. The logistics Support Center is located in the Administration Building HSSE Wing – Old EOC Conference Room.

Media Information Center

The Media Information Center is the location from which the Public Information Officer or designee will provide information and briefings to members of the media. The Media Information Center will normally be established in Training Room D in the HRO Training Center when necessary. If that area is inadequate, the Employee Recreation Center or the Admin Building Main Office Conference Room can be utilized.

Agency Information Center

The Agency Information Center is the location from which information is shared with representatives of regulatory agencies. The Agency Information Center will normally be established in the Administration Building – West Wing Conference Room C. In the event Conference Room C is unavailable or inadequate, the Administration Building Main Office Conference Room should be utilized.

DOCUMENT NO:	HSE-EAP-007	PAGE:	4 OF 30
DOCUMENT NAME:			
INCIDENT COMMAND SYSTEM & ORGANIZATION			

Staging Area

The Staging Area is a location near the incident, designated by Command to which unassigned emergency response resources will respond, check-in for accountability and wait for an assignment.

CIMA Staging Area

A CIMA Staging Area is established for temporary location of mutual aid resources. The staging areas are instituted by Command to control non-refinery resources that are not immediately assigned. Incoming mutual aid resources report to CIMA staging where they are checked in until requested by Command or the Operations Section Chief. The CIMA Staging Area Manager manages all aspects of the area. Primary CIMA Staging is located in the far east side of the Maintenance Parking Lot. Alternative CIMA Staging is located at the Credit Union Parking Lot or in the Lawndale Road corridor.

Medical Department: The HRO Medical Department may be utilized for various incident medical functions including but not limited to triage, treatment, or rehabilitation support.

Landing Zone (LZ): (b) (7)(F), (b) (3)

COMMAND STAFF

Incident Command

“Command” is the radio identifier used to distinguish the individual in charge of emergency response team efforts. The first arriving ERT officer establishes Command. If the Field Coordinator is on scene first, initial Command responsibilities become theirs. Command will then be transitioned to an appropriate ERT officer upon their arrival. See [Duties and Responsibilities: Incident Commander](#)

Safety Officer

A Safety Officer is established by Emergency Response – Command at every emergency involving a release of hazardous materials for the purpose of evaluating and monitoring safety hazards and related conditions. A Safety Officer may be established on non-release emergencies as well. Evaluation of all field operations and development of the Site Safety Plan is performed by or under the direction of the Safety Officer. Additional resources will be assigned as necessary to assist in safety observations during large incidents. When other safety assistants are established, they will be coordinated through the Safety Officer. See [Duties and Responsibilities: Safety Officer](#)

Industrial Hygiene Officer

The on-call Health & Safety Representative reports to the Command Post and becomes the Industrial Hygiene Officer during emergencies involving or having a potential to involve a release. With Command, the IH Officer will identify the materials involved, develop a

DOCUMENT NO:	HSE-EAP-007	PAGE:	5 OF 30
DOCUMENT NAME: INCIDENT COMMAND SYSTEM & ORGANIZATION			

monitoring strategy, and coordinate tactical implementation of the monitoring plan. The Industrial Hygiene Officer, will also support the Safety Officer in developing the Site Safety Plan. During minor events, the IH Officer personally implements monitoring actions or contacts additional Health and Safety resources as necessary. For large events, the IH Officer coordinates and supervises all industrial hygiene activities from the Command Van. See [Duties and Responsibilities: Industrial Hygiene Officer](#)

Environmental Officer

The on-call Environmental Representative reports to the Command Post and becomes the Environmental Officer during emergencies involving or having a potential to involve a release. With Command, the Environmental Officer will ensure proper notifications are made and that environmentally focused mitigation efforts are appropriate. The Environmental Officer is also responsible for coordinating agency interface during Alert 1 events. The Environmental Officer will attain additional resources and coordinate on-scene environmental support activities, as necessary. See [Duties and Responsibilities: Environmental Officer](#)

Security Coordinator

Security Patrol Unit 49 responds directly to the scene and checks in with Command. The Security Coordinator will immediately begin securing the area. The Security Coordinator will ensure communications with Command and will supervise all other personnel involved with scene security. See [Duties and Responsibilities: Security Coordinator](#)

Staging Area Manager

The Staging Area Manager position is established by Command to manage unassigned resources. During Mutual Aid events, a Channel Industries Mutual Aid (CIMA) Emergency Response Specialist may be asked to work with the Houston Refinery Staging Area Manager to manage outside resources. The Staging Area Manager establishes the Staging Area. The Staging Area Manager will track ERT resources as assigned or unassigned. The Staging Area Manager will dispatch resources to assignments as requested by Command or the Operations Section Chief. See [Duties and Responsibilities: Staging Area Manager](#)

Operations / Tactical Supervision

Operations Section Chief

As an incident organization grows or incident complexity becomes apparent, Command may establish an Operations Section Chief to direct deployment of resources, and oversee control and coordination of Branch Directors and Division / Group Supervisors. See [Duties and Responsibilities: Operations Section Chief](#)

Branch Director(s)

Branch Directors may be established as an intermediate supervisory layer of the incident command organization to maintain an effective span of control. When established, Branch directors will report to the Operations Section Chief and supervise Division / group Supervisors. See [Duties and Responsibilities: Branch Directors](#)

DOCUMENT NO:	HSE-EAP-007	PAGE:	6 OF 30
DOCUMENT NAME:			
INCIDENT COMMAND SYSTEM & ORGANIZATION			

Tactical Divisions and Groups

Divisions and Groups are tactical level supervisors assembled to direct tactical action plans. Division / Group supervisors oversee task level resources assigned to them.

Division Supervisor(s)

Division Supervisors oversee operations within a defined geographical area and are responsible for supervision and accountability of assigned task level resources (i.e. North, South, or 1st. Floor Division). Division Supervisors will use their Division designation as a radio identifier (North Division). See [Duties and Responsibilities: Division Supervisor\(s\)](#)

Group Supervisor(s)

Group Supervisors oversee operations of a functional discipline (i.e., Hazmat, Rescue, or Medical Group) without regard for geographic division and are responsible for supervision and accountability of assigned task level resources. Group Supervisors will use their Group designation as a radio identifier (Hazmat Group). See [Duties and Responsibilities: Group Supervisor\(s\)](#)

Spill Group (Oil Spill Water)

The Spill Group Supervisor directs emergency response efforts relating to the control of spills on waterways. When established, the Spill Group will coordinate and direct the deployment of boats and boom to control a spill.

The Spill Group Supervisor will report to the affected dock or area and coordinate the operations from the shore position. From the dock, the Spill Group Supervisor will communicate tactical directions to spill team members deployed on shore and in boats.

The Spill Group may also be required to communicate or direct outside / contract spill personnel working in the affected area.

Hazmat Group

The Hazmat Group Supervisor directs emergency response efforts relating to the control of hazardous material releases. When established, the Hazmat Group Supervisor directly coordinates advanced tactical hazmat operations and supervises task level hazmat team leaders.

For further procedures see [Hazardous Materials Response Plan HSE-EAP-009](#)

Medical Group

When established, the Medical Group Supervisor directs response efforts in relating to Emergency Medical Services (EMS). The Medical Group may also be given the responsibility to set up a rehab area for evaluating Emergency Response Team (ERT) members.

The Medical Group will coordinate efforts with the Houston Fire Department (HFD) EMS Division and other medical service entities. The Operations Section Chief, Branch Director, or the Medical Group will normally have the HFD EMS Supervisor assigned with them to better manage the incident.

DOCUMENT NO:	HSE-EAP-007	PAGE:	7 OF 30
DOCUMENT NAME: INCIDENT COMMAND SYSTEM & ORGANIZATION			

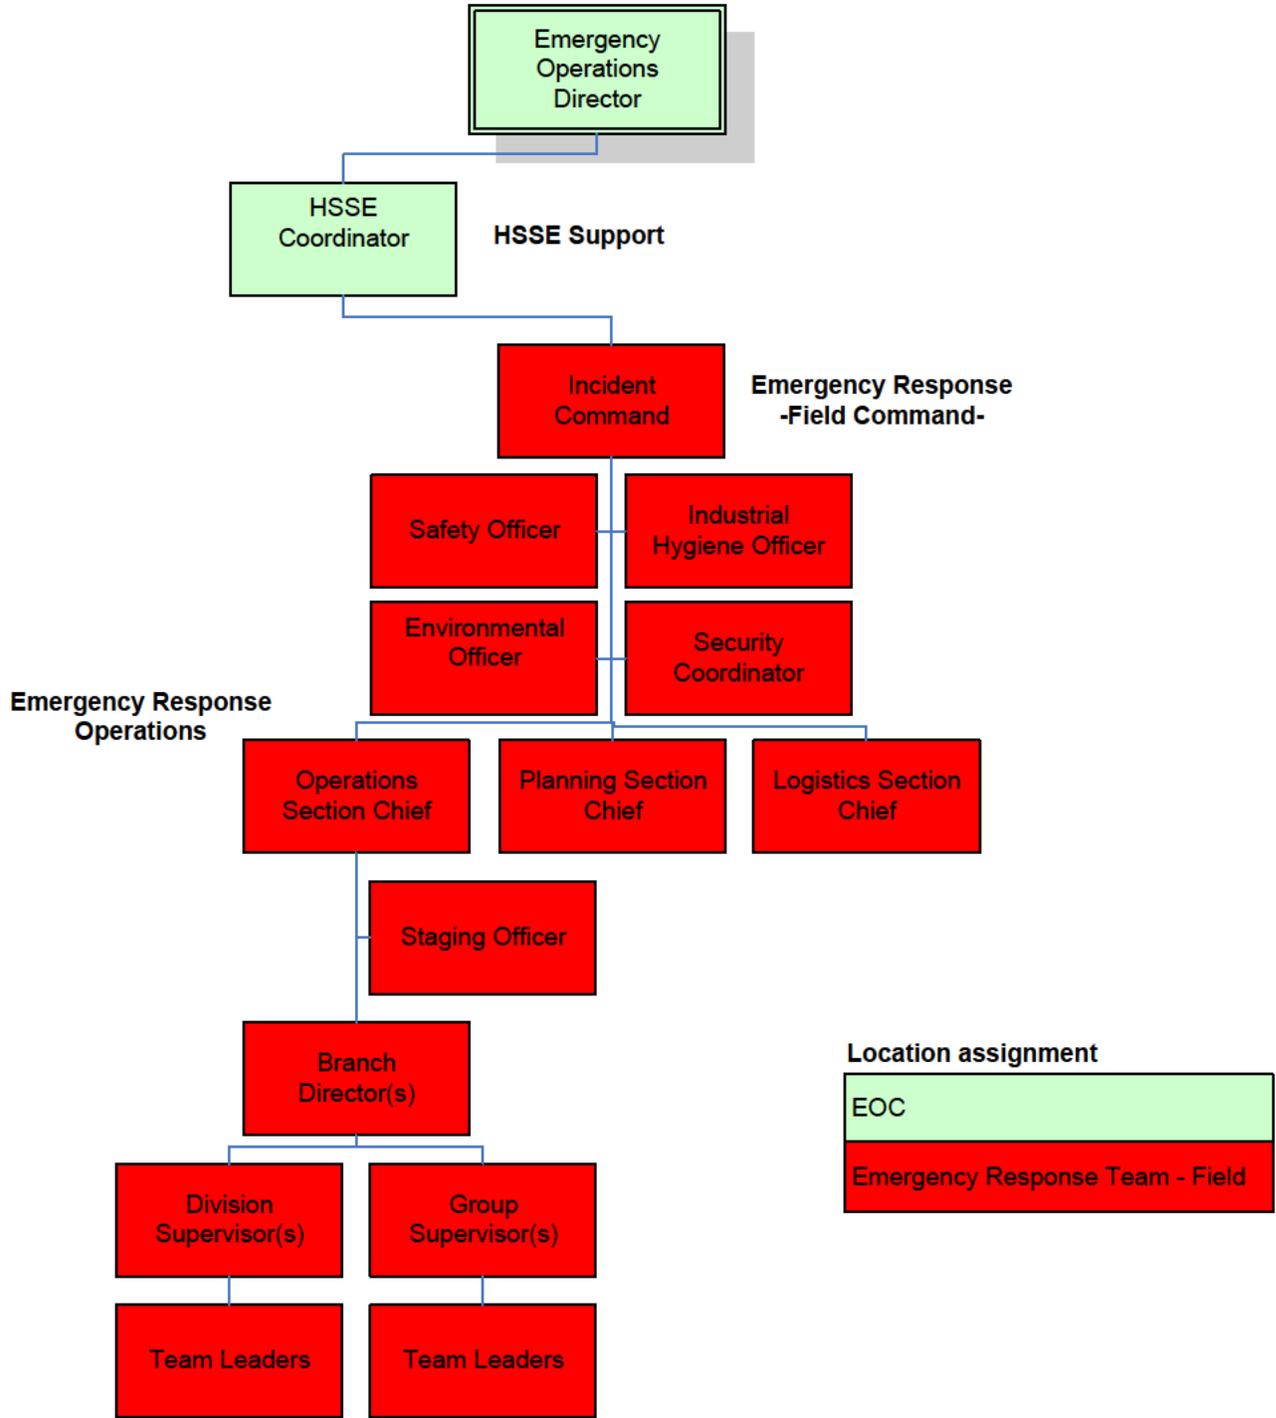

For further information see [Emergency Medical Services Plan HSE-EAP-010](#) and the [Rescue Response Plan HSE-EAP-011](#).

Rescue Group

When established, the Rescue Group Supervisor directs response efforts focused toward accomplishing safe and effective confined space and high angle rescue operations. The Rescue Group Supervisor position is established to supervise Rescue Team Leaders / rescue team personnel and coordinate activities with other functional areas in order to establish and maintain proper patient care.

REVISION SUMMARY

NOTE: If the changes proposed in this change log are typos or minor grammatical corrections that do NOT affect the intent of the policy only approval from the "Document Owner" is required.
All policy intent changes must be approved by the HSSE Manager.

Date	Proposed By	Description of Change	Approved By/Date
05/09/2011	Jeff Windham	Reformat, reorganize and regulatory review of procedure	

Houston Refining LP	DOCUMENT NUMBER:	HSE-EAP-008	Page: 1 of 13	Approval Date:	06/30/2011
Document Title:	COMMUNICATIONS				
Approver: CHRIS MATTHEWS	<i>Electronic Signature On File</i>		Effective Date:	07/01/2011	
Document Owner: Jeff Windham	<i>Electronic Signature On File</i>		Review Date:	05/10/2011	

Communications are a critical element of the emergency response and management effort. During emergencies communications must be immediate and accurate.

This Communications Plan provides information on the communications systems available to communicate to internal and external stakeholders during various emergency events.

EMERGENCY COMMUNICATIONS AND NOTIFICATION

Main Gate Dispatch is equipped with two-way radios, telephones, paging systems and a refinery Emergency Notifications System (ENS). The Dispatch Center is staffed 24 hours a day by a security representative trained for routine and emergency situations. Dispatchers also maintain a current telephone call-out list and the telephone numbers for all support agencies whose assistance might be needed during any type of emergency or incident. The ENS provides emergency and evacuation instructions to personnel throughout the facility. Consequently, the Main Gate is the focal point for emergency communications both inside and outside the refinery.

A secondary point for emergency communications is the Central Control Room (CCRB). The primary focus of the CCRB is communications with the process operating units during routine and emergency operations. The CCRB is equipped with radios, telephones, and a redundant Emergency Notification System (ENS) control console. These systems make the control room a fully functional secondary dispatch center.

Refinery Radio System

The refinery operates a trunked type radio system, which provides radio communication between personnel, vehicles, and key locations. A hub console, located at the Main Gate, can control all radio traffic for the entire system.

See [Appendix 5](#) for a list of radio system talkgroups

Radio Announcement System

The Radio Announcement System broadcasts a simultaneous message to every talkgroup channel on the radio system. The Announce System can be utilized for emergency and general plant announcements.

The Radio Announce System can be activated from the Main Gate Dispatch Console, and several specially programmed radios in the facility. Additionally, for emergencies, the Radio Announce System is integrated with the refinery Emergency Notification System (ENS).

NOTE: The Radio Announce System (activated from the Dispatch Radio Console) is the backup in the case of complete ENS failure.

DOCUMENT NO:	HSE-EAP-008	PAGE:	2 OF 15
DOCUMENT NAME:			
COMMUNICATIONS			

Radio Repeater Backup Systems

In the event of repeater failure the trunked radio system has two (2) backup modes available:

❑ Failsaft

During a partial system failure, radio talkgroups will be automatically pooled, or routed, onto three (3) repeaters by the system controller. This allows for limited radio communication. All users should limit communication to short messages that are absolutely necessary.

Users can recognize a failsaft condition by an audible soft tone heard on all radios every ten (10) seconds. Radios will indicate the condition by displaying the text "FAILSOFT" on the LCD screen every ten (10) seconds.

❑ Total Failure

A total radio system failure will be indicated by an audible soft tone heard on all radios every ten (10) seconds accompanied by the text "OUT OF RANGE" on the LCD screen every ten (10) seconds.

In the case of total system failure (repeater failure), Talkaround or Simplex Channels have been established for emergency communications. Talkaround channels do not utilize the trunked repeater system, thus allowing a fail-safe design that enables users to communicate "radio to radio" with limited range.

Talkaround channels are available and during a total system failure shall be allocated as indicated below:

Ops T/A 1	FCCU, Oil Movements
Ops T/A 2	Crudes, HDS, Light HDS
Ops T/A 3	Cokers
Ops T/A 4	SRU. Lubes
Maint T/A 1	South Maintenance
Maint T/A 2	North maintenance
ERT Tac 1	Primary HSSE and Emergency
ERT Tac 2	Secondary HSSE and Emergency
ERT Tac 3	Secondary HSSE and Emergency
ERT Tac 4	Secondary HSSE and Emergency
ERT Tac 5	Secondary HSSE and Emergency

DOCUMENT NO:	HSE-EAP-008	PAGE:	3 OF 15
DOCUMENT NAME: COMMUNICATIONS			

Backup Radio System

In addition to the talkaround channel plan, a backup radio system is available and may be placed in service. The backup radio system is a self-contained mobile radio system, which provides five (5) fully functional repeaters; four (4) of which are available for voice communication. With the backup system in service, normal radio system talkgroups can be used. This system cannot be used in conjunction with Talkaround channels. In the event this system is forced into service, users will be directed to return to their normally assigned talkgroups. Keeping communication to a minimum is imperative while using the backup system due to its limited number of repeaters and concurrent use by process units.

CIMA Emergency Scene Communications

(b) (7)(F), (b) (3)

Emergency Notification System ENS

The refinery Emergency Notification System (ENS) is used to advise personnel of emergency response and evacuation orders (See the [HSE-EAP-002 Emergency Notification and Response](#), and [HSE-EAP-003 Evacuation and Personnel Accounting Procedure](#)).

The ENS is an integrated multi-media system designed for the purpose of communicating emergency messages to plant occupants. The system consists of tone, voice, and text messaging to a combination of sub-systems throughout the facility.

The ENS may also be used to inform personnel of situations such as non-emergency incidents, severe weather conditions, or abnormal operational issues.

NOTE: the Main Gate Dispatcher conducts a full ENS test every Thursday at noon.

DOCUMENT NO:	HSE-EAP-008	PAGE:	4 OF 15
DOCUMENT NAME:			
COMMUNICATIONS			

ENS Components

ENS components can be described as follows:

ENS Media System Components	Type of Message and Location
Plant Radio Announce Talkgroup	Signal tone and voice message on all refinery radio system Talkgroups (Channels).
Building Public Address (PA) Systems	Signal tone and voice message on public address systems in buildings (Indoor public address sites).
Siren/Speaker Sites and Distributed Audio Systems	Signal tone, voice message, and signal strobe light from Plant/Siren Sites and Distributed Audio Speakers in operating area and units (Outdoor sites).
Message Signs	Text message signs located at refinery main entry points and gates.
Emergency Management Pager System	Text message sent to emergency management group pagers. Appendix 4 : lists the various emergency management pager groups.
Workstation PC Messaging	Pop-up text message sent to all LAN PC workstations.

The ENS components can be initiated by a single activation for Emergency Alerts, or may be set off individually for specific or special emergency notification or message requirements.

See [Appendix 1](#) for an illustration of the ENS architecture.

See [Appendix 2](#) for a description of the ENS component activation logic.

ENS Activation

Upon notification of an emergency, the Main Gate Dispatcher activates the ENS from the primary console. Emergency activation of the ENS will communicate emergency information by tone, voice and text message. Information provided will include Alert Level, Type of Emergency, Location, Wind Direction and Evacuation Type. Additionally, the system is used to advise of any further special information.

An All Clear is issued over the ENS to indicate that the emergency has been terminated.

DOCUMENT NO:	HSE-EAP-008	PAGE:	5 OF 15
DOCUMENT NAME:			
COMMUNICATIONS			

Backup ENS Capability

In the event of primary ENS console failure, three (3) fully capable backup consoles may activate the ENS from the following locations.

- ❑ Central Control Room (CCRB)

The CCRB console may also be used by Operations as a secondary means of communications to Operating Units or Areas.

- ❑ Command Van
- ❑ Maintenance Radio Shop at Site D

NOTE: The Radio Announce System (activated from the Dispatch Radio Console) is the backup in the case of complete ENS failure.

ENS Signal Tones

There are three signal tones generated by the ENS:

High Low Signal	Alert for fire, spill, gas release or other emergency / event requiring action by plant personnel
Steady Tone Signal	All Clear
Pulse Signal	All personnel plant-wide report to Evacuation Points

Unit Distributive Audio

Distributive Audio Systems provide unit specific communications with the placement of speakers throughout an area. The ENS System is directly linked to unit distributive audio where available. Distributive systems may also be directly linked to hazard detection systems in order to expediently warn personnel and evacuate a process unit. Process areas with Distributive Audio Systems are listed as follows:

- ❑ SRU 434
 - Includes units 433/434/435/437
 - System directly linked to H₂S detection systems.
- ❑ SRU 439
 - Includes units 439/440/441/442
 - System directly linked to H₂S detection systems.
- ❑ 636 Hydrotreater
- ❑ 736 Coker
- ❑ 737 Coker
- ❑ 537 Crude Still

DOCUMENT NO:	HSE-EAP-008	PAGE:	6 OF 15
DOCUMENT NAME:			
COMMUNICATIONS			

Emergency Management Pager System

Primary emergency notification to off-site emergency management / response personnel is conducted through the emergency management pager system. The pager system is a module of the Emergency Notification System. ENS Alert activation results in automatic activation of the pre-determined pager group(s). Manual activation of pager groups and individual pagers is accomplished by the Main Gate Dispatcher.

Emergency management pagers are established into three different cap code pager groups:

Alert 1 Pager Group Cap Code: 0399998	ERT Officers HSSE Personnel Security Personnel Refinery Leadership Team
Alert 2 + Pager Group: Cap Code: 0300103	ERT Members (non-officers) Other identified emergency management support personnel
ERT Pager Group Cap Code: 0399999	All ERT Members

See [Appendix 3](#) for a description of the pager group activation logic and examples of additional programmed pager groups.

Emergency Pager Backup Systems

Two (2) pager backup systems are available:

- Quickpage System

The Quickpage system is a portable system capable of initiating alphanumeric pages to Emergency Management groups.

- AutoDial System

An AutoDial telephone system is programmed to send numeric coded messages to Emergency Management groups. The numeric coding system consists of three groups of numbers. In sequence, the groups represent response classification, incident type and zone of incident. For details and examples see Appendix 2.

A numeric code message may also be sent from any phone.

See [Appendix 4](#) for a description of the numeric paging codes for emergency situations.

DOCUMENT NO:	HSE-EAP-008	PAGE:	7 OF 15
DOCUMENT NAME: COMMUNICATIONS			

TELEPHONE SYSTEMS

The facility telephone and cellular phone systems provide a key means of communication with both internal and external stakeholders. Utilization of telephone and cellular lines during an emergency assists in keeping radio frequencies open for emergency radio traffic.

In the event of power failure, the plant telephone system is provided with emergency power. The system will shift back to normal power upon system restoration.

Various Telephone Lists to include the refinery phone system, fax machines, EOC phones, CCRB phones, Command Van cell phones numbers, outside line phone numbers and the Emergency network System phone numbers are accessible from the [EOC Website](#).

Outside Telephone Lines

In the event of a total telephone system failure, EOC is provided with six (6) outside telephone lines that are independent of the plant telephone system. These phones are labeled as "Outside Line".

Emergency Network System

As an additional backup and in the event local telephone service is overloaded, telephones attached to the Deer Park Emergency Network System may be used. These phones are located in EOC and are labeled as "Emergency Network System". The emergency Network System phone numbers and locations are available on the [EOC Website](#).

Emergency Notification Manual

The Emergency Management Database contains a telephone number listing of entities that may need to be contacted to provide assistance, or otherwise be notified in the event of an emergency.

In case of information system failure, hardcopy *Emergency Notification Manuals* are provided in the following locations:

- MainGate Dispatch
- Emergency Operations Center (EOC)
- Field Command Post
- Plant Shift Superintendents Office.

DOCUMENT NO:	HSE-EAP-008	PAGE:	8 OF 15
DOCUMENT NAME: COMMUNICATIONS			

EMPLOYEE COMMUNICATIONS

Refinery Emergency Information Line

Additionally, the Refinery Emergency Information Line provides employees and their families an opportunity to call and receive updated information during emergencies or abnormal situations such as weather events. To hear messages on the Emergency Information Line, call:

(713) 321-5775

LyondellBasell Information Line

In the event local phone service is not available, employees and their families may call the LyondellBasell Information Line to obtain emergency or abnormal situation updates. To access the LyondellBasell Information Line, call :

1 (888) 457-6118

- Press 2 and then 6 to access HRO, then
- Press 1 to hear an update on plant status
- Press 2 to leave your contact information / location
- Press 3 to leave a message or ask a question and receive a return call

www.hrohome.com

The Internet website www.hrohome.com has been established as a mechanism for two-way, interactive communication between refinery management and employees. Although primarily established for hurricane evacuation situations, hrohome.com may be activated for other types of abnormal situations. To access the website:

- go to www.hrohome.com from any Internet capable device
- Login with your normal Network Logon ID
- Utilize the last four digits of the SSN as the Password

General information including site status and return to work requirements are provided in the Site Status tab at the top of the page.

Employees can provide information on their status, location and contact information via the Adverse Condition Reporting tab at the top of the page.

hrocheckin@lyondellbasell.com

As a last resort in the event employees are unable to contact their supervisor or another refinery contact person, employees may send an email or text message with their personal status and location, or a location a question or concern to hrocheckin@lyondellbasell.com.

OUTSIDE RESOURCES AND MUTUAL AID			

SUMMARY

The following describes procedures for the request and management of outside or mutual aid resources for emergencies. Additionally, the plan provides procedures for refinery responses to mutual aid requests (requests for refinery emergency resources).

CIMA Mutual aid resources are activated during Alert 4 Emergencies. However, limited requests for outside support may be made without the issuance of an Alert 4.

The Houston Refinery is located in the City of Houston. However, it is bordered on the east side by the City of Pasadena. Therefore, a multi-city response is possible dependent on the location and significance of the incident.

Due to the refinery being located in the City of Houston, the Houston Fire Department may be notified and requested to respond during an Alert 2 or greater event. This notice does not constitute an Alert 4 condition.

For a complete list of contact numbers see the Emergency Notification Manual.

CHANNEL INDUSTRIES MUTUAL AID (CIMA)

The Channel Industries Mutual Aid (CIMA) organization is an emergency response mutual aid group. The organization represents the joining together of over one hundred Houston Ship Channel area industries, government agencies and municipalities for the purpose of providing firefighting, rescue and emergency medical assistance for emergency situations -- either natural or man-made.

CIMA Zones

CIMA is divided into four (4) geographic zones:

- Zone 1 - All areas north of the Houston Ship Channel and the northern shore of Galveston Bay.
- Zone 2 - Area south of the Houston Ship Channel, west to downtown Houston, east to Beltway 8 and all areas south of the above mentioned boundaries.
- Zone 3 - Area south of the Houston Ship Channel and east of Beltway 8, south to Spencer Highway and east to the City of La Porte west city limits.
- Zone 4 - Area south of Spencer Highway, west to Beltway 8, east to the Galveston Bay Shores of the cities of Morgan's Point, La Porte, Shoreacres, Pasadena and Seabrook, and south to Interstate 45.

THE HOUSTON REFINERY IS LOCATED IN ZONE 2

DOCUMENT NO:	HSE-EAP-014	PAGE:	3 OF 24
DOCUMENT NAME: OUTSIDE RESOURCES AND MUTUAL AID			

Classifications of CIMA Emergencies

Fires or emergencies of different magnitudes are roughly classified below under the call designation which will be used on the CIMA Radio System. Members must understand the classifications of emergencies and the operations of the Zone system, and have planned for emergencies so the proper calls can be made in each instance.

Special Call

This call is issued in the form of a request for specific pieces of equipment, or manpower crews not to exceed a total of 2 pieces of equipment / crews. A Special Call also results in the response of one CIMA Officer, but DOES NOT automatically activate the CIMA Specialists and Command Van response.

Standby

A CIMA Standby is for an emergency event that is currently being managed with in-plant manpower and equipment, but which has the potential to develop into a larger emergency requiring outside assistance. This call activates the CIMA Specialists, Officer's and Command Van response.

Alarm List Activation

Alarm list activation is used for a fire or emergency which is beyond the control of in-plant manpower and materials to the extent that specific assistance is needed from members in the form of materials, equipment and/or manpower. The stricken company/agency activates a predetermined Alarm List. This call also activates the CIMA Specialists and Command Van response.

- 1st. Alarm Assignment
- 2nd. Alarm Assignment
- 3rd. Alarm Assignment
- MCI 10
- MCI 20
- MCI 30

DOCUMENT NO:	HSE-EAP-014	PAGE:	4 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

All Clear

The “all clear” will be given by the member who issued one of the above calls when the particular emergency condition which promoted the original call no longer exists.

CAER Alert

CIMA members, for expediency in making CAER notifications to neighboring CIMA facilities, may choose to use the CIMA radio system. However, it must be noted that the issuance of a CAER Alert over the CIMA radio system (regardless of the level), is for awareness only and does not constitute a CIMA Alert of any type. No response of the CIMA organization, including CIMA Specialist, is appropriate for a CAER Alert.

Road Block

Several CIMA members have made arrangements with adjacent facilities that upon notification, roads can be quickly blocked by personnel from those facilities until law enforcement can respond. This request can also be made on the CIMA radio system and DOES NOT, in and of itself, constitute a CIMA call of any type.

CIMA Alarm List

CIMA Alarm Lists provide a predetermined response catalogue for CIMA assistance to process events, tank fires, large volume water supply and EMS Mass Casualty (MCI) incidents.

Events that do not cleanly fit into one of the categories above will typically result in assignment of a process fire alarm list response.

The various CIMA Alarm Lists for Houston Refining can be accessed via the CIMA Database on the CIMA Website.

CIMA Radio System

CIMA owns and manages a radio system used by its members for dispatching and communicating. The refinery uses the CIMA radio system for requesting assistance and managing mutual aid responses in the facility. For further information on the CIMA Radio System, see [HSE-EAP-0008 Communications](#).

CIMA Dispatch

CIMA maintains two (2) dispatch centers operated 24-hrs a day in order to provide coverage for CIMA members during emergencies. CIMA dispatch is designated to dispatch Standbys, First Alarm Assistance, and Mass Casualty (MCI) calls.

The primary dispatch center for the Houston Refinery is CIMA Dispatch Baytown. CIMA Dispatch Baytown should be contacted to request a CIMA response to refinery events.

DOCUMENT NO:	HSE-EAP-014	PAGE:	5 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

CIMA DISPATCH CENTERS	
Location:	Contact number:
CIMA Dispatch Baytown	(713) 837-9191 or CIMA Radio System Channel C1 - Main Dispatch
CIMA Dispatch Pasadena	(713) 473-9191 or CIMA Radio System Channel C1 - Main Dispatch

*** Primary Dispatch Center for Houston Refinery***

Refinery CIMA Representative

A CIMA Representative must be designated for each member facility. The CIMA Representative for a member company is the official contact and voting member representing the organization.

The CIMA Representative and alternates for the refinery are as follows:

- Primary: Fire Chief
- First Alternate: Emergency Management Coordinator
- Second Alternate: Assistant Fire Chief, or designated ERT Officer

CIMA Emergency Response Specialist

CIMA Emergency Response Specialists are designated emergency responders in the organization who immediately report to any Standby or Assistance call for the purpose of supporting the stricken company with managing CIMA resources.

CIMA Assistance Procedures (Request for Assistance)

The Houston Refinery may require CIMA assistance for major emergencies requiring additional manpower and equipment support (Refinery Alert 4 response classification). Limited request for assistance (e.g., Houston Fire Department Emergency Medical Ambulance support), or a CIMA Special Call (request for not more than two (2) CIMA apparatus), may not constitute the issuance of a refinery Alert 4.

The following procedures outline the process for requesting and managing CIMA resources in the refinery.

DOCUMENT NO:	HSE-EAP-014	PAGE:	6 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

Authorization for the Request of CIMA Assistance

Any standby or assistance request to CIMA may be authorized by the following personnel:

- Emergency Operations Director
- EOC HSE Coordinator
- Incident Command
- Field Coordinator

Special Call or Alarm List Activation

The Main Gate Dispatcher may be requested to make the initial call. However, most assistance calls will be issued directly from the field command post. All subsequent communications with CIMA will be made by Incident Command.

Procedures for activation are as follows:

- Request for Standby or Assistance call shall be made via phone or over the CIMA Radio System to **CIMA Dispatch Baytown**. The preferable method is by the CIMA Radio System.
- Requests may include, but not be limited to the following:
 - ⇒ Request for Special Call (equipment or manpower)
 - ⇒ Request for Standby
 - ⇒ Request for Alarm List Activation
 - ⇒ Request for CIMA Mass Casualty Incident Response

Managing CIMA Resources

The following steps are to be used for managing CIMA resources entering the facility:

Note: Security will follow applicable Security Procedures when checking CIMA resources into the physical boundaries of the refinery to ensure compliance with TWIC requirements

- Incident Command shall designate which staging area will be used and assign a Staging Area Manager from Houston Refining.
- On arrival and assignment of CIMA resources into operational positions, Incident Command **shall give direction to move all emergency response radio traffic to the appropriate CIMA tactical channel talk group.**
- The Staging Area Manager will work with the EOC Security Coordinator to formulate plans for attaining plant resources required to escort CIMA resources from Staging to the respective assignment. The Staging Area Manager will document all incoming CIMA resources and shall track their assignment on the Staging Log.

DOCUMENT NO:	HSE-EAP-014	PAGE:	7 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

- The first CIMA Specialist arriving at the facility will be escorted to Incident Command at the Field Command Post.
 - The second arriving CIMA Specialist will typically be assigned to Staging.
 - Incident Command may request that additional CIMA resources be dispatched by a CIMA Specialist designated as CIMA Dispatch.
 - All other CIMA Specialists will report to the Staging Area for assignment. CIMA Specialists will typically be assigned as follows:
 - ⇒ Field Command Post – CIMA Incident Command Liaison
 - ⇒ Staging Area Manager
 - ⇒ Operations Section Chief
 - ⇒ Planning Section Chief
 - ⇒ Division / Group Supervisor(s)
- CIMA Specialists will often be assigned to Houston Refining Emergency Response Officers to assist and liaison with CIMA resources.
- An All Clear for the CIMA request shall be given by Incident Command after all CIMA resources have been decommissioned and returned to service.

CIMA Assistance Procedures -- Rendering Mutual Aid

The Houston Refinery is listed on many CIMA member company and municipal agency alarm lists. The following procedure shall be followed to allow for a prompt assistance call response.

CIMA Standbys and Alerts will be received primarily over the CIMA Radio System. Main Gate Dispatch is responsible for monitoring the CIMA radio on a 24-hr basis and notifying the appropriate personnel as stated in this procedure. Main Gate Dispatch will maintain a current catalogue of member company alarm lists which include Houston Refinery resources.

Personnel Authorized To Release Resources for CIMA

The listed personnel are authorized to release refinery resources for CIMA Assistance Calls.

- Plant Shift Superintendent
- Refinery RLT Member
- Fire Chief
- Assistant Fire Chief
- Emergency Management Coordinator

DOCUMENT NO:	HSE-EAP-014	PAGE:	8 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

CIMA Standby

- On receipt of a CIMA Standby for any zone, the Main Gate Dispatcher shall notify:
 - ⇒ the ERT Officers
 - ⇒ ERT Members on-site
 - ⇒ the Plant Shift Superintendent

These notifications should be made via:

- ⇒ the Emergency Management Pager System, and
- ⇒ the Announce Frequency of the Radio Notification System
- ⇒ Telephone

These notifications shall include as much of the following information as is available:

- ⇒ Stricken facilities name
 - ⇒ Address
 - ⇒ Zone number
 - ⇒ Type of incident (if available)
 - ⇒ Other applicable information (i.e., Houston Refining is on the 1st Alarm)
- Refinery CIMA Specialist(s) shall respond directly to the stricken facility according to CIMA response procedures.
 - The Shift Commander on duty will assemble a standby crew when:
 - ⇒ The Standby is issued for Zone 2.
 - ⇒ A Standby is issued for a member company which lists refinery resources on their first or second alarms.
 - ⇒ A significant event exists that will most surely involve a refinery response.
 - The standby crew should pick up the requested equipment and assemble at the facility Main Gate

*The Officer in charge of the crew should be the ranking Officer from the respective discipline or equipment requested. *Example: Foam Engine 3, Sr. Captain - Fire Suppression; Hazmat Unit, Sr. Captain - Hazmat.* Ranking Officers may assign or take charge of respective crews.
 - The Standby Crew shall remain at the facility Main Gate until called to respond, released, or an All Clear is issued.

DOCUMENT NO:	HSE-EAP-014	PAGE:	9 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

CIMA Special Call or Alarm List Activation

The following procedures shall be followed when a request for refinery resources is received:

- On receipt of a CIMA request for assistance, the Main Gate Dispatcher shall notify:
 - ⇒ The ERT Officer's
 - ⇒ ERT Members on-site
 - ⇒ The Plant Shift Superintendent

These notifications should be made via

- ⇒ The Emergency Management Pager System
- ⇒ The Announce Frequency of the Radio Notification System
- ⇒ Telephone

These notifications shall include as much of the following information as is available:

- ⇒ Stricken facility's name
 - ⇒ Address
 - ⇒ Zone number
 - ⇒ Type of incident (if available)
 - ⇒ Refinery resources being requested
 - ⇒ Other applicable information (i.e., Shell has issued a 1st Alarm, and Houston Refining is one the 2nd Alarm)
- Refinery CIMA Specialist(s) shall respond directly to the stricken facility according to CIMA response procedures.
 - The Shift Commander on duty will assemble a response or standby crew as appropriate when:
 - ⇒ Refinery resources are requested to respond.
 - ⇒ Refinery resources are listed on the next Alarm level
 - ⇒ A significant emergency exists that will most surely involve a refinery response.

*The Officer in charge of the crew should be the ranking Officer from the respective discipline or equipment requested. *Example: Foam Engine 3, Sr. Captain - Fire Suppression; Hazmat Unit, Sr. Captain - Hazmat.* Ranking Officers may assign or take charge of respective crews.

Response Procedures

The following procedures shall be followed when responding to a CIMA Assistance Call:

- The CIMA Crew Officer will be responsible for:

DOCUMENT NO:	HSE-EAP-014	PAGE:	10 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

- ⇒ Providing crew leadership and supervision.
 - ⇒ All equipment and resources used at the scene.
 - ⇒ Crew safety and health.
 - ⇒ All radio communications with CIMA units and the Main Gate Dispatcher.
 - ⇒ On scene communications with CIMA tactical officers.
- If multiple apparatus are requested to respond in the *Off Hours*:
 - ⇒ The most necessary apparatus will be responded first by ERT Members on-site.
 - ⇒ Additional apparatus or equipment will be staffed by off-site ERT members.
 - The Plant Shift Superintendent **must** be notified when equipment leaves the facility.
 - In accordance with CIMA standard operating procedures:
 - ⇒ All response personnel must have full turnout gear and SCBA. The exception is personnel responding to an EMS assistance call on Medic 1.
 - ⇒ A minimum crew of four (4) personnel is required on an apparatus. A minimum crew of two (2) personnel is required on Medic 1.
 - ⇒ Responding personnel must have CIMA radio communications. The CIMA patch may be utilized as necessary. (See **Communications.**)
 - ⇒ Responding resources shall announce their response over CIMA Channel C1 (i.e., "Lyondell Houston Aerial 1 Responding")
 - For some responses, it may be necessary to respond with a support vehicle with appropriate state required emergency warning devices.
 - All response procedures as stated in CIMA standard operating procedures will be followed.

Other Considerations

- The refinery status must always be considered when responding to outside emergencies. **The refinery must be adequately protected.**

In certain instances, it may be prudent to advise another CIMA member facility to place a crew on standby to assist in plant protection while refinery special equipment and personnel are committed.
- If a refinery Alert is issued while refinery resources are committed to a CIMA Assistance Call, the Team Leader and Refinery CIMA Response Specialists shall evaluate the Alert and request a release from the outside scene as deemed necessary.

DOCUMENT NO:	HSE-EAP-014	PAGE:	11 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

- Most requests for refinery resources will be for a single apparatus and crew only. However, a significant disaster may require a second team and further apparatus to respond. The Houston Refinery is on several member companies' alarm lists with a request for multiple apparatuses.
- Consideration must always be given to properly relieving crews for long duration events. The Shift commander on duty will coordinate assignment of relief crews.

CIMA Member Companies and Agencies

Names, telephone numbers, alarm lists, and equipment lists for CIMA members are listed in the **CIMA DATABASE on the CIMA WEBSITE**.

For further details concerning CIMA procedures and resource lists see the CIMA WEBSITE.

FIRE PROTECTION: LOCAL FIRE DEPARTMENTS

Although they are members of CIMA, two municipal fire fighting organizations and the Houston Port Authority are available to assist with facility fire protection.

For CIMA fire protection capabilities see **Channel Industries Mutual Aid**.

Houston Fire Department

The Houston Fire Department (HFD) has primary fire suppression jurisdiction for the Houston Refinery.

At Incident Command's discretion, HFD may be notified and requested to respond during the activation of an Alert 2 incident. HFD will automatically be called for an Alert 3 or greater – Fire, Spill, or Gas Release.

The Houston Fire Department will also be contacted for emergency medical services (EMS). See **Emergency Medical Services Plan**.

Houston Fire Department Procedures

- The first arriving or HFD Command Officer and his respective unit (District Chief, Captain, or apparatus officer) shall be escorted directly to Incident Command at the Command Post.
- All other apparatus shall be instructed to stage on Lawndale (Initial Staging Area) until instructed to move up to an in-plant Staging Area (CIMA Staging Area). ER - Command may assign a Houston Refining Staging Area Manager to organize the staging effort (see Staging Officer).
- Per HFD Command's request, a liaison through the Houston Fire Department's Hazardous Materials Response Team (HM-22) may be organized.

DOCUMENT NO:	HSE-EAP-014	PAGE:	12 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

- HFD resources shall be utilized by Command as deemed necessary. Additional resources may be requested.
- A unified command structure may be organized as necessary.
- An HFD Officer will be requested to stay at the Command Post until the event is under control.

Pasadena Fire Department

With the exception of the (b) (7)(F), (b) (3) [REDACTED], the refinery is not in the immediate jurisdiction of the Pasadena Fire Department (PFD). However, refinery emergencies may affect the City of Pasadena or PFD may be responding due to a citizen report.

Pasadena Fire Department Procedures

- The first arriving or PFD Command Officer and his respective unit (District Chief, Captain, or apparatus officer) shall be escorted directly to Incident Command at the Command Post.
- All other apparatus shall be instructed to stage on Lawndale (Initial Staging Area) until instructed to move up to an in-plant Staging Area (CIMA Staging Area). Command may assign a Houston Refining Staging Area Manager to organize the staging effort (see Staging Officer).
- The PFD Command Officer will be informed concerning the emergency. If the event impacts the City of Pasadena, the officer will be requested to stay at the Command Post until the event is under control. PFD resources may be requested by Command as deemed necessary. Additional resources may be requested.
- A unified command structure may be organized as necessary.

Houston Port Authority Fire Department

The Houston Port Authority Fire Department operates three (3) Fire Boats on the Houston Ship Channel. The Port Authority has jurisdiction on the Houston Ship Channel shoreline with boundaries from the turning basin to the Bayport Channel. These Fire Boats are available for waterfront and ship / barge firefighting support. The fire boats also have the capabilities of supplying water to the refinery fire water system.

Fire Boat assistance may be requested through the:

- **Port Authority Dispatch (713) 670-2647(primary number)**
- CIMA Dispatch, CIMA Channel C1 - Dispatch
- Houston Fire Department Dispatch.

DOCUMENT NO:	HSE-EAP-014	PAGE:	13 OF 24
DOCUMENT NAME: OUTSIDE RESOURCES AND MUTUAL AID			

Fire Boat Procedures for Ship or Dock Fire

- Responding Fire Boats will monitor CIMA Channel C1 - Dispatch.
- In route, the Fire Boats shall be advised at which dock the emergency is located and all hazards involved.
- When the Fire Boat arrives, a Houston Refinery ERT Officer shall be placed on the vessel as soon as practical. This will allow enhanced radio communications with Incident Command.
- If possible, a senior Officer with the Port Authority shall be requested to stay at the Command Post until the event is under control.
- A unified command structure may be organized as necessary.

NOTE: Fire protection for ship and barge fires is not the direct responsibility of Houston Refinery. The Houston Refinery may support vessel fire efforts and will initiate action necessary to protect the Houston Refinery dock and shoreline facilities.

Fire Boat Procedures for Water Supply

- Responding Fire Boats will monitor CIMA Channel C1 - Dispatch.
- In route, the Fire Boats shall be advised at which dock to report.
- When the Fire Boat arrives, a Houston Refinery ERT Officer shall meet the vessel at the docks and assist in supply line connection and for communication with Incident Command.
- 5" Storz supply lines shall be used if possible. 2.5" NST supply lines may be used, but are not preferred. Enough supply lines shall be set up to provide for full pumping capacity of the Fire Boat. An in-line bleeder should be used to evacuate supply lines when removing them from service.
- Water flow should be opened and closed slowly to prevent piping damage to boats and associated refinery equipment.
- If Fire Boat master streams are utilized, adjacent electrical equipment shall be isolated.
- Rehabilitation for Fire Boat Crews should be considered.

DOCUMENT NO:	HSE-EAP-014	PAGE:	14 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

EMERGENCY MEDICAL AND RESCUE SERVICES

Emergency Medical Services (EMS) are available from the Houston Fire Department and Memorial-Hermann Hospital Lifelight (Medivac). CIMA resources are available for mass casualty events.

For CIMA Mass Casualty Incident Plan management and available Rescue Resources, see the **CIMA WEBSITE**.

Houston Fire Department Emergency Medical and Rescue Services

The Houston Fire Department (HFD) has secondary EMS and Rescue duty responsibilities for the Houston Refinery.

The Houston Fire Department will be contacted for emergency medical services (EMS) requiring transportation by outside ambulance to area hospitals.

The HFD EMS Division responds (dispatches units) on a tiered system dependent on the type of emergency. Therefore, the type of assistance received is directly related to patient information provided to the HFD Dispatcher.

HFD EMS and Rescue responses may include but not be limited to the following:

- Ambulance -- Basic Life Support (BLS) Unit
- Medic Unit -- Advanced Life Support (ALS) Unit
- Engine Company -- Engine Company dispatched as first responder or to assist Medic Unit on life-threatening incidents, i.e., CPR in progress.
- Ladder Company -- Ladder trucks provide first responder and light rescue capabilities, and may respond to assist in EMS / rescue operations.
- Heavy Rescue Unit -- Rescue unit staffed and equipped for high angle, confined space, and trench rescue.

Houston Fire Department EMS and Rescue Procedures

- Incident Command must ensure that adequate patient information is provided to Main Gate Dispatch for HFD EMS requests.
- If an Engine or Ladder Company arrives first, they will be escorted to the scene upon direction from Command.
- Ambulances, medic units, EMS Supervisors, or rescue units shall be escorted to the scene as directed by Command.
- Other HFD resources shall be utilized by Command as deemed necessary. Additional resources may be requested if necessary. Additional HFD resources will be directed to stage on Lawndale or in the CIMA Staging Area.

DOCUMENT NO:	HSE-EAP-014	PAGE:	15 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

- A unified command structure may be organized as necessary for mass casualty incidents.
- Adequate patient information shall be provided to the HFD EMS Officer in charge. This information should be in writing (see EMS Form in EAP volume titled **ADMINISTRATIVE PLANS**) and reviewed directly with the Officer. During this transition process, communications are critical.
- For mass casualty incidents, an HFD Command Officer will be requested to stay with Command at the Field Command Post. Additional HFD EMS Officers may be assigned to or assist the Triage, Treatment and Transport Unit Leader(s).

Lifelight - Memorial-Hermann Hospital

Primary medivac operations are conducted by Memorial-Hermann Hospital Lifelight. Lifelight helicopters deliver EMS personnel to the scene and provide expedient transportation to the trauma center at Memorial-Hermann Hospital.

The requesting of Lifelight may be, but is not limited to, the following types of emergency medical incidents:

- Multi-system Trauma
- Large percent burns
- Burns to specific body regions
- Severe head/neck injuries

Helicopter Landing Zones

Helicopter Landing Zones have been designated for the refinery. These Landing Zones may be used to support medivac (Lifelight) and other emergency helicopter operations. Helicopter Landing Zones are designated as one of the following:

- Heliports
- Designated Landing Zones (LZ)

LANDING ZONE	LOCATION
Heliport	East side of Gate 3 (Main Gate)
Heliport	Northeast side of the facility between the Ship Channel and the East Guard Basin
Designated Landing Zone	Designated location on Lawndale Street

ER - Command may alter and set up additional Landing Zones as circumstances require.

DOCUMENT NO:	HSE-EAP-014	PAGE:	16 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

Heliport Procedures

A heliport is an area of land used for helicopter landing and takeoff operations. For the purpose of this document, this area is permanently marked and designed for the intended use.

The following procedures should be followed when using heliports:

- Mark the LZ:

During night operations, if the area does not have designation lighting, the area shall be marked by flares or portable strobe lights.
- Incident Command shall ensure that the heliport is secured from unauthorized personnel.
- Establish ground contact with landing aircraft. Incident Command shall be ground contact unless this duty is assigned to another officer.
- *For heliports a fire/rescue standby is not required.*

Designated Landing Zone Procedures

Designated Landing Zones are temporary areas established for helicopter landing and takeoff operations.

The following procedures should be followed to set up a safe landing zone for helicopter operations:

- Determine the location of the LZ:

If possible all LZ locations should be on a hard paved surface. All refinery pre-determined locations are on a paved surface.

The LZ must be: **60' square (Day)**
 100' square (Night)

For LZ diagram see [Attachment 3: Landing Zone Operations](#).

If a dust hazard exists, the area may be lightly wetted down.
- Mark the LZ:

The LZ shall be marked by flares or portable strobe lights. Fluorescent orange cones may be used during the day.
- Establish ground contact with landing aircraft. Incident Command shall be ground contact unless this duty is assigned to another officer.

DOCUMENT NO:	HSE-EAP-014	PAGE:	17 OF 24
DOCUMENT NAME: OUTSIDE RESOURCES AND MUTUAL AID			

Ground to Air Contact

PRIMARY

FIRE MUTUAL AID (154.280)

SECONDARY

CIMA (b) (7)(F), (b) (3)

Medivac Helicopter units may not land without a confirmed ground contact.

- Communicate LZ location and hazard information.

Advise the pilot of the following conditions:

- ⇒ Terrain hazards (e.g., level or slope, rocks or brush, paved or dusty roads)
- ⇒ Obstacles (e.g., street signs, vehicles, trees, antennas or utility lines)
- ⇒ Wind direction (e.g., wind direction, flare, portable strobes or marking cones on each corner of LZ with a fifth marking on the upwind side.)

To facilitate LZ safety, a fire and rescue standby should be placed at landing zones as follows:

- A foam pumper staged and readied for immediate fire attack.
- A standby crew of at least two (2) personnel in full turnout gear and SCBA placed for immediate rescue operations.
- All personnel will stage behind the foam engine during landing and take-off.
- At night, turn off all strobe lights on vehicles near the LZ to prevent vision problems for the pilot.
- Do not illuminate the LZ with flood lights to prevent possible blinding of the pilot. Illumination used in the area should be directed towards the ground onto the scene and away from the LZ.
- Approach the helicopter from the front and ONLY when signaled to do so by the pilot or a crew member.

DOCUMENT NO:	HSE-EAP-014	PAGE:	18 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

Medivac (Lifelight) Procedures

Requests for Lifelight, or any other medivac service, should be made to the helicopter dispatcher by phone (landline).

By landline provide the following information:

- Patient information
- Landing location
- Ground contact radio channel and frequency

Proper radio procedures are to await the incoming flight's call for landing instructions and patient information. Previous to this, the pilot will not be monitoring for a ground contact.

- Incident Command must ensure that adequate patient information is provided to Main Gate Dispatch for Lifelight requests.
- Proper Landing Zone (LZ) must be provided and ground contact established.
- On arrival, the Lifelight EMS Officer shall be escorted directly to the scene or to a safe location to await delivery of patient.
- Adequate patient information shall be provided to the Lifelight Officer in charge. This information should be in writing and reviewed directly with the Officer. During this transition process, communication is critical.
- For mass casualty incidents, the refinery incident command system may request to have a Lifelight Medical Officer working with the Triage Unit Leader.

HAZARDOUS MATERIALS RESPONSE - HAZMAT TEAMS

The Houston Fire Department is available to assist with facility hazardous materials spills or releases.

For CIMA Hazmat capabilities see **Channel Industries Mutual Aid**.

Houston Fire Department

The Houston Fire Department (HFD) may provide hazardous materials support with their Hazardous Materials Response Team (HM-22).

HFD will may be notified and requested to respond during the activation of an Alert 2 or greater emergency - Fire, Spill, or Gas Release.

Procedures for Hazardous Materials Response

DOCUMENT NO:	HSE-EAP-014	PAGE:	19 OF 24
DOCUMENT NAME: OUTSIDE RESOURCES AND MUTUAL AID			

Due to the nature of the refinery emergencies, procedures to be followed for a HFD Hazmat Response are typically similar to that of a fire suppression response. The Houston Fire Department HAZMAT Team automatically responds with all HFD alarm assignments for fires, spills or releases.

OIL SPILL WATER - OIL SPILL RESPONSE TEAMS

Beyond initial spill containment response and some degree of minor cleanup for marine spills, Houston Refining relies on outside contractors and a spill association to provide material and manpower for complete spill containment, removal of floating spillage, and clean-up of affected areas.

The following contractor and spill association are under contract with Houston Refining.

- Garner Environmental
- Clean Channel Association

A companion document to be used in conjunction with the Emergency Action Plan is the Houston Refining *SPILL RESPONSE AND PREVENTION PLAN*. The Spill Response and Prevention Plan describes how Houston Refining will respond to spills that occur in the facility. These spills can be land-based within the refinery resulting from a variety of operations including, but not limited to, tank or pipeline liquid releases or from liquid spills to water at Houston Refining's Marine Terminal.

For detailed information on outside resources for spill response, see the SPILL RESPONSE AND PREVENTION PLAN (SRPP)

LAW ENFORCEMENT: LOCAL LAW ENFORCEMENT AGENCIES

Several local, state and federal law enforcement agencies provide assistance and govern laws within the facility and surrounding community.

The majority of the refinery is located in the City of Houston. However, the Houston Refining Recreation Facility is in the city of Pasadena.

Law enforcement agencies may be called or may respond to the facility for reasons such as the following:

DOCUMENT NO:	HSE-EAP-014	PAGE:	20 OF 24
DOCUMENT NAME: OUTSIDE RESOURCES AND MUTUAL AID			

- Criminal investigations
- Fire investigations
- Searches
- Serving of warrants
- Crime in progress
- Pursuit of suspect through the facility
- Trespassing violations
- Public safety
- Securing of public roads adjacent to the facility.

Law Enforcement Procedures

Entry into the Facility

- On arrival of any law enforcement official, the **Plant Shift Superintendent, the Manager – Emergency Services & Security, and the Security Supervisor shall be notified**. Depending on the sense of urgency concerning the response, having one of these personnel meet with the law enforcement officials may be beneficial.
- The law enforcement official **should be escorted through the facility** as they request.
- If the law enforcement agency enters the refinery rapidly, e.g., in pursuit of a suspect or to make a felony arrest, Houston Refining Security personnel shall **safely** ensue and observe the actions in order to promote the safety of refinery personnel. Security personnel shall follow all orders of law enforcement personnel under such circumstances.
- Houston Refining Safety and Security personnel shall assist law enforcement personnel for investigations and other requests.
- Responsible attempts should be made to inform officials of refinery safety regulations and hazards.
- For minor investigations, an HSE Security Representative may be the company liaison. For substantial investigations, a liaison or liaison group may be appointed by management. This liaison group may include a representative from legal.

DOCUMENT NO:	HSE-EAP-014	PAGE:	21 OF 24
DOCUMENT NAME: OUTSIDE RESOURCES AND MUTUAL AID			

Response To Refinery Emergency Alerts

- The first arriving or Law Enforcement Command Officer shall meet with Security Support or with the Security Coordinator if the Security Supervisor is not on site. Depending on the immediate need for support, the officer may be escorted directly to Incident Command at the Command Post.

The Security Support Unit serves as the primary liaison with law enforcement agencies.

- Law enforcement resources may be utilized by incident Command or Emergency Operations as deemed necessary.
- A unified command structure may be organized as necessary.
- A law enforcement official may be requested to stay at the Command Post or in EOC to assist in managing law enforcement resources.

For securing adjacent off-site roadways, see the [HSE-EAP-004 Emergency Site Security and Control](#).

REFINERY STAGING AREAS

A staging area is established for temporary location of available mutual aid resources on three-minute notice. The staging areas are established by Incident Command to control resources not immediately assigned. The Staging Area Manager manages all aspects of the area. A staging area may include temporary sanitation services and fueling areas. All incoming resources report to staging where they are checked in until requested.

Staging areas for the refinery have been pre-designated to position incoming outside emergency equipment and resources. Incident Command will provide orders on which area to use or may opt to substitute another area as event circumstances require.

(b) (7) (F), (b) (3)

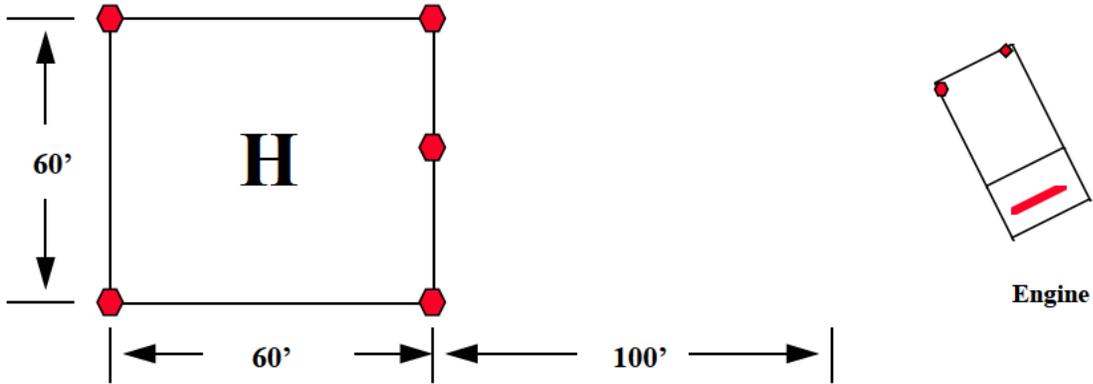

DOCUMENT NO:	HSE-EAP-014	PAGE:	22 OF 24
DOCUMENT NAME: OUTSIDE RESOURCES AND MUTUAL AID			

Pre-designated Refinery Staging Areas are used for emergency equipment staging only. These areas may not be used for any other purpose without the expressed written consent of the Manager, HSE.

REVISION SUMMARY

NOTE: If the changes proposed in this change log are typos or minor grammatical corrections that do NOT affect the intent of the policy only approval from the "Document Owner" is required. All policy intent changes must be approved by the HSSE Manager.

Date	Proposed By	Description of Change	Approved By/Date
2/24/2011	J. Windham	Reformat, reorganize and regulatory review of procedure	

HOUSTON Refining LP	DOCUMENT NUMBER:	HSE-EAP-011	Page: 1 OF 66	Approval Date:	06/30/2011
Document Title:	TRAINING AND EXERCISE PLAN				
Approver: CHRIS MATTHEWS	<i>Electronic Signature On File</i>		Effective Date:	07/01/2011	
Document Owner: Jeff Windham	<i>Electronic Signature On File</i>		Review Date:	06/15/2011	

Training and exercising provides a means for refinery organizations to prepare and validate emergency action capabilities. The benefits of these activities are numerous. While they add value by meeting the organization's loss control and personnel safety requirements, they also meet external and regulatory agency requirements.

Benefits of training and exercising include:

- enhancing capabilities;
- improving coordination and proficiency;
- finding improvement opportunities;
- identifying and preplanning resources;
- validating existing systems, processes, plans and procedures;
- meeting regulatory compliance requirements;
- responding to community needs ; and
- demonstrating a commitment to preparedness.

TRAINING AND EXERCISE PROGRAM

All business management involves strategic planning. Emergency management programs involve the same essential planning to maximize effectiveness.

Training and exercise planning enables organizational goals and objectives to be identified, developed, and implemented. Planning also allows for the integration of goals between two or more groups to allow for a combination of exercise activities.

The following types of activity are encompassed by and considered integral parts of the overall emergency management training and exercise program.

Training Activity

Training activities describe training and educating emergency management or other groups on strategies and tactics in relation to their area of responsibility. Sessions should include classroom and practical training using emergency response equipment.

Preplan Activity

Preplan Activities are meetings of an emergency management group or groups in order to discuss, plan, and document strategies and tactics for managing their area of responsibility. Preplan activities are useful in building relationships between participants and allowing for open discussion concerning how group or functional plans interact. Preplan activities are another useful way to train personnel on how to work and solve problems as a team.

DOCUMENT NO:	HSE-EAP-YYY	PAGE:	2 of 66
DOCUMENT NAME: Training and Exercise Plan			

Exercise Activity

Exercise activities are an umbrella term describing an activity that provides participants an opportunity to train and practice emergency and crisis management skills. Exercising should always provide positive learning opportunities and enable players to demonstrate skills and knowledge. A successful exercise or simulation links learning opportunities with lessons learned in a continuous cycle of improvement. The exercise cycle includes phases of planning, program design, development and evaluation. Evaluation allows for continuous improvement and revising of emergency plans. As each exercise is designed, developed, conducted and evaluated, lessons learned are incorporated into emergency action plans and the cycle begins again.

Several specific types of exercises are defined as follows:

Tabletop Exercise

An exercise activity conducted in a conference room setting, involving formal discussions on a scenario by an emergency management group. A tabletop exercise can be referred to as a “desktop exercise”.

Tabletop exercises may include outside support and response groups including, but not limited to, corporate personnel, law enforcement, local fire departments and regulatory agencies.

Drill

An exercise activity requiring a focused performance of only designated response activities by individuals and teams, to include mobilization of personnel and resources. Drills may be limited or full in scale. A limited drill involves a very specific group or function. A full drill evaluates capabilities in a broad range of functions.

Exercise

An exercise activity requiring performance, integration and coordination of response activities by several individuals and teams, as well as mobilization of personnel and resources. An exercise should be designed to mirror a real-life emergency as realistically as possible.

Full-Scale Exercise

An exercise, which validates the major aspects of an organization’s emergency and crisis management program and involves all levels of the organization.

DOCUMENT NO:	HSE-EAP-YYY	PAGE:	3 of 66
DOCUMENT NAME: Training and Exercise Plan			

Appendix 1: Emergency Management Training and Exercise Planning Summary exhibits emergency management training and exercise activities with the associated frequency requirements. The remainder of the Appendixs provide an explanation of the refinery groups involved, objectives of the sessions and groups responsible for development and implementation of the programs. This information composes the organization's training and exercise program. The Appendixs represent planned minimum facility requirements. Training and exercise requirements may be revised according to management decision in relation to organizational identified needs.

As allowed by some compliance standards, actual events may be substituted for certain exercise requirements. In these cases, a critique of the event must be performed and documented.

Training and Exercise Planning

The Emergency Management Coordinator will guide the organization in attaining its goals and objectives for training and exercises.

The Emergency Management Coordinator develops, for management approval, the planning schedule for emergency management training and exercises.

The ERT Training Coordinator develops the schedule and manages training for the Emergency Response Team.

The planning schedule is attached as follows:

REVISION SUMMARY

NOTE: If the changes proposed in this change log are typos or minor grammatical corrections that do NOT affect the intent of the policy only approval from the "Document Owner" is required.
All policy intent changes must be approved by the HSSE Manager.

Date	Proposed By	Description of Change	Approved By/Date
06/15/2011	Jeff Windham	Reformat	CM

HOUSTON Refining LP	DOCUMENT NUMBER:	HSE-EAP-012	Page: 1 OF 8	Approval Date:	06/30/2011
Document Title:	CRITIQUE & EVALUATION				
Approver: CHRIS MATTHEWS	<i>Electronic Signature On File</i>		Effective Date:	07/01/2011	
Document Owner: Jeff Windham	<i>Electronic Signature On File</i>		Review Date:	02/24/2011	

The critique and the follow-up process is the evaluation phase of emergency response activities. This evaluation phase compares performance to expected actions and objectives. Evaluation offers a means to:

- collect data, analyze and document how participants understand and perform their designated response roles;
- compare performance to expected responses, objectives and performance criteria;
- assess the consolidated capabilities of teams and organizations; and
- ensure the continual improvement of emergency and crisis response capabilities by documenting strengths and areas for improvements.

The purpose of continuous improvement is to ensure that the lessons learned, corrective actions and areas of identified improvement are:

- integrated into the prevention, planning, training, quality assurance and future exercise considerations of the organization; and
- properly shared to maximize value throughout the organization.

This section provides the process and procedures for formal critiques.

CRITIQUE PROCESS

Informal critiques are routinely conducted by the Emergency Response and Operations personnel after training exercises and drills. Formal critiques shall be performed subsequent to the following:

- Actual emergencies classified as Alert 2 or greater responses.
- Emergency Response Exercises and Drills of a plant-wide nature.

Training and Exercise Guidelines located in the section titled *Emergency Management Training and Exercise Plan* provide direction on when to perform exercise and drill formal critiques.

- Actual emergencies, by the request of the HSSE Manager.

DOCUMENT NO:	HSE-XXX-YYY	PAGE:	2 of 8
DOCUMENT NAME: Critique & Evaluation			

Effective evaluation of emergencies and exercises is based on four (4) basic concepts:

- Observation
- Data collection
- Analysis
- Documentation and presentation of findings.

Observation

Observations are performed in order to collect data from an event.

Observations are collected by selected participants during emergencies. For exercises and drills, observations are collected by selected participants and evaluators.

Participants provide their perspective of an event during the course of actions. Evaluators are provided for exercises and drills to document response activities. Evaluators must have a working knowledge of response structures, plans and procedures.

Data Collection

Data is collected through various formats as described:

Logs and Documentation

Actual logs and documentation of the event should be collected for analysis. Logs and documentation provide valuable data on actions, tasks performed and their effectiveness. Documentation should include recorded times of performed actions.

Critique and Evaluation Form

A Critique and Evaluation Form has been established to collect information from selected participants and evaluators. Critique and Evaluation Forms must be completed following and no later than 24 hours after an event. The preferred method is to have a Debriefing Session immediately following the event. During the session, participants can discuss issues and collectively complete their forms. The Debriefing Sessions should be grouped to include, but may not be limited to, the following personnel:

- Emergency Operations (EOC)
- Emergency Operations - Manufacturing
- Emergency Operations - Field
- Emergency Response
- Evaluators (for exercises and drills only)

DOCUMENT NO:	HSE-XXX-YYY	PAGE:	3 of 8
DOCUMENT NAME: Critique & Evaluation			

The Debriefing Session should be lead by the Emergency Operations Director for the Emergency Operations Group, and Emergency Response Command for the field groups

The Critique and Evaluation forms should be filled out by, but may not be limited to, the following emergency management personnel:

- All Coordinators and Staff personnel in EOC.
- The Field Coordinator and the Supervisor, Superintendent or Lead Operator of the affected unit.
- Emergency Response Command and the command staff personnel.
- Emergency Operations Chief, Division and other assigned officers.
- Evaluators (for exercises and drills only)

Consolidated forms from the various groups is acceptable.

All Documentation and Critique Forms shall be forwarded to the Emergency Management Coordinator.

See Attachment 1: Critique and Evaluation Form.

Data Analysis

The Emergency Management Coordinator will compile the collected data for analysis. The data will be analyzed in comparison with identified objectives and effectiveness of the response. The analysis should include sufficient detail to support whether internal standards as well as expectations of the groups are met.

For Exercises and Drills, the evaluators, as a committee, shall meet together for analysis of the information.

Documentation and Presentation of Findings

A Performance Report shall be prepared by the Emergency Management Coordinator. The report will present findings from critiques, evaluator assessments and other supporting documents. Issues reported should represent achievements and opportunities for improvement. Issues will be presented in general broad based terms.

The report is intended to provide feedback to management, the union and participants. A variation of the report may be provided facility-wide to promote lessons learned and areas of improvement.

These terms are intended to provide information to managers and all facility personnel in order to facilitate improvement activities. Prior to addressing these broad-based issues, no further item specific follow-up will be presented. Item closure will be represented with the issuance of this report to the facility.

DOCUMENT NO:	HSE-XXX-YYY	PAGE:	4 of 8
DOCUMENT NAME: Critique & Evaluation			

Future exercises and drills will provide on-going progress appraisals. As programs progress, prospective plans may include specific item recommendations and supporting follow-up actions as necessary.

Recommendation Tracking and Closure

Formal recommendations will be initiated when critique findings present significant improvement opportunities, or for which documentation of closure is required.

The Emergency Management Coordinator is responsible for entering recommendations into the company approved recommendation tracking system under the title "**Emergency Management**".

REVISION SUMMARY

NOTE: If the changes proposed in this change log are typos or minor grammatical corrections that do NOT affect the intent of the policy only approval from the "Document Owner" is required.
All policy intent changes must be approved by the HSSE Manager.

Date	Proposed By	Description of Change	Approved By/Date
02/24/2011	Jeff Windham	Reformat	CM

HOUSTON Refining LP	DOCUMENT NUMBER:	HSE-EAP-013	Page: 1 OF 7	Approval Date:	06/30/2011
Document Title:	FIRE RESPONSE PLAN				
Approver: CHRIS MATTHEWS	<i>Electronic Signature On File</i>		Effective Date:	07/01/2011	
Document Owner: Jeff Windham	<i>Electronic Signature On File</i>		Review Date:	05/15/2011	

The flammable and combustible nature of crude oil and its refined products pose a significant fire hazard to petroleum refining operations. In addition to process fire hazards, there are many structures, vehicles and pieces of machinery / equipment may become involved in a fire emergency.

This section provides procedures and guidelines specific to handling fires that occur within the boundaries of the Houston Refinery.

Some refinery streams, products and process chemicals may also pose a toxic hazard on contact with the skin or when inhaled. For emergencies requiring the use of specialized hazardous material PPE, techniques or equipment, see the EAP Hazardous Materials Response Plan.

MANAGEMENT OF FIRE EMERGENCIES

An emergency incident involving a fire requires the same reporting procedures as any other emergency within the refinery. The response level shall be commensurate with defined response classifications (Alert Levels) dependent on the significance of the event. Response of the Emergency Response Team is dictated by documented ERT Response Procedures. The Incident Command System (ICS) will be used for management of all fire scene emergencies.

If a major structure (e.g., office building, laboratory, storehouse or shop) is involved in a fire, an elevated alert level may be issued and Houston Fire Department may be requested for their structural firefighting expertise.

Refinery personnel trained on responses to fire emergencies shall report the fire immediately, and if possible may take safe actions to control or extinguish the fire using portable extinguishers, fire hose reels, steam lances and fixed fire protection systems.

As the Emergency Alert is issued and response personnel arrive, the scene will transition into the ICS management system for a fire scene.

Identification of Material Involved in the Fire

A fire in the refinery will often involve a hazardous material. As with any other hazardous materials emergency, identification of the materials involved is of primary concern in order to properly:

- provide strategic planning,
- assess the risks so that effective tactical actions can be taken,
- protect responders,
- protect the community.

DOCUMENT NO:	HSE-XXX-YYY	PAGE:	2 of 7
DOCUMENT NAME: FIRE RESPONSE PLAN			

The materials on fire must be identified in order to properly and safely provide rescue of personnel, treat exposed personnel, extinguish the fire and mitigate the fire scene of any residual material.

Several sources available to assist in materials identification are listed in the HSE-EAP-XXXX Hazardous Material Response Plan.

Strategy and Tactics

Basic strategies for fighting fires in the refinery involve both defensive and offensive approaches.

The defensive mode involves exposure protection and fire containment conducted from outside of the hazardous area. Exposure protection is undertaken to protect equipment not directly involved in the fire whereas containment efforts seek to prevent the fire from spreading to other areas.

An offensive attack involves extinguishing the fire or isolating the fuel source from within the hazard zone. For fires involving flammable and combustible liquids and gases, extinguishing is best performed by fuel removal. Extinguishing fires with fuel sources leaking may prove hazardous. Limiting the number and proximity of response personnel to the fire should be considered. When at all possible, fuel source isolations should be performed from a safe location, outside of the hazard zone. Aggressive attempts to stop leaks may be necessary when other efforts are not feasible.

Control of flammable liquid spills is best accomplished via a fast offensive foam application. This control method will limit exposures until consideration can be given to isolation of the fuel source.

Tactical considerations must always include life safety first. Proper evacuation, isolation, and control of the area are required. Emergency control and property conservation must be undertaken while taking into account life safety concerns.

Mitigation of Fire Scenes

After the emergency scene is secured, Command will consult with the Environmental Officer to determine what mitigation action will be taken. The owner or responsible Operations Area will assume the responsibilities for control/containment and mitigation actions in accordance with the Houston Refining SPILL RESPONSE AND PREVENTION PLAN (SRPP) with assistance from the Environmental Officer.

Procedures Involving Damaged Insulation

Much of the refinery piping and vessel insulation contains asbestos (Asbestos Containing Material, ACM). In the event of a fire or explosion, damage to insulation may create a potential for asbestos exposure.

DOCUMENT NO:	HSE-XXX-YYY	PAGE:	3 of 7
DOCUMENT NAME: FIRE RESPONSE PLAN			

The ICS Industrial Hygiene Officer should be consulted with regard to PPE and work practices required within areas where damage to ACM has occurred.

Outside Resources and Mutual Aid For Fire Response

Some fire incidents may require assistance from Houston Fire Department or Channel industries Mutual Aid. For procedures addressing outside resources and mutual aid for fire emergencies, see HSE-EAP-0014 Outside Resources and Mutual Aid.

Scene Control and Security

Tactical Divisions and Group Supervisors will coordinate with the Operations Section Chief or Command in establishing and monitoring incident scene control zones. Command will direct the incident Security Coordinator in establishing and monitoring a security zone around the perimeter of an incident. Control and Security Zones are necessary to:

- Keep non-essential personnel out of the Control Zones.
- Ensure that personnel entering the Control Zones have proper PPE.
- Ensure that proper decontamination is performed on personnel leaving the Hot Zone.

The concept of a Control Zone is illustrated in HSE-EAP-010 Hazardous Materials Response Plan, Appendix 2: Control Zones.

Information concerning incident scene security can be found in HSE-EAP-004 Emergency Incident Security and Control.

Marine Firefighting

Houston Refining has no official jurisdiction over any marine vessel. By State jurisdiction, the Port of Houston Authority has authority and uses the Houston Fire Department by contract for marine vessel firefighting. In the event of a fire on a marine vessel docked at the Refinery, Houston Refining will assist only at the request of the Ships Master, Owner, Port of Houston Authority, Houston Fire Department or Coast Guard.

Houston Refining does not maintain shipboard trained firefighters. Upon an appropriate request for assistance, Houston Refining ERT Members will only be committee to on deck operations and / or shore based assistance. The ship's Master, Captain or agent owner is in command of all operations of the vessel. Houston Refining will participate in a unified command with vessel agents and local authorities as required.

Houston Refining will take action to protect company owned docks and shore facilities in the event of a ship fire.

DOCUMENT NO:	HSE-XXX-YYY	PAGE:	4 of 7
DOCUMENT NAME: FIRE RESPONSE PLAN			

FIRE FIGHTING PERSONAL PROTECTIVE EQUIPMENT

All Houston Refining ERT members are provided with appropriate NFPA approved firefighting protective clothing to include:

- Turnout coat
- Turnout pants with boots
- Fire fighter's helmet
- Firefighter's protective hood, and
- Fire fighter's protective gloves

ERT Members receive training in the capabilities, donning procedures, and proper use of the bunker gear ensemble to include, as a minimum, the following:

- That turnout gear is designed to protect against temperature (steam, hot water, hot particles) and ordinary fire fighting hazards.
- The hazards and limitations of the equipment.
- That turnout gear may be used when:
 - ⇒ Contact with splashes of extremely hazardous material is unlikely.
 - ⇒ High levels of chemicals toxic to the skin are not present in the atmosphere of the incident vicinity.
 - ⇒ There are no adverse effects from chemical exposure to small-unprotected areas of skin.

Personal Protective Equipment (PPE) Requirements

Emergency Response personnel performing offensive firefighting activity or otherwise entering any fire area subject to changing conditions, which could be hazardous, shall be equipped with and use a minimum of full turnout gear and SCBA during the initial response phase of all fires and spills of volatile flammable, combustible or toxic products. Examples of such areas include but are not limited to:

- The battery limits of a processing unit experiencing working fire conditions
- The diked area of a tank or manifold fire / leak
- Any flammable / combustible liquid spill / fire area
- Any structure which has had a positive report of fire

These minimum PPE requirements will be required until industrial hygiene monitoring of the incident area identifies the necessary boundaries of a regulated / hot zone and the appropriate PPE levels for the hazards found. Those boundaries and PPE levels will then be communicated to all affected personnel.

DOCUMENT NO:	HSE-XXX-YYY	PAGE:	5 of 7
DOCUMENT NAME: FIRE RESPONSE PLAN			

In addition to full turnout gear and SCBA, Command may require other specialized protective equipment for specific hazards or for personnel involved in specific activities in defined areas.

Decontamination

Firefighter's protective ensembles shall be decontaminated upon product exposures.

Gross decontamination will be performed at the incident scene via fixed or temporary decontamination stations. Wash water shall be contained within fixed effluent systems or appropriate portable containers. See HSE-EAP-011 Hazardous Materials Response Plan, Decontamination of Personal Protective Equipment for additional information regarding on-site decontamination

After on-site decontamination efforts are complete, it may be necessary to send the equipment to a specialized vendor for more thorough decontamination. If this step is determined to be required, each individual set of gear shall be placed in an impervious bag at the scene. The gear shall not be re-used until returned from the vendor.

DOCUMENT NO:	HSE-XXX-YYY	PAGE:	6 OF 7
DOCUMENT NAME:			

REVISION SUMMARY

NOTE: If the changes proposed in this change log are typos or minor grammatical corrections that do NOT affect the intent of the policy only approval from the "Document Owner" is required. All policy intent changes must be approved by the HSSE Manager.

DOCUMENT NO:	HSE-XXX-YYY	PAGE:	7 OF 7
DOCUMENT NAME:			

--	--	--	--

HOUSTON Refining LP	DOCUMENT NUMBER:	HSE-EAP-014	Page: 1 of 16	Approval Date:	06/30/2011
Document Title:	HAZMAT RESPONSE PLAN				
Approver: CHRIS MATTHEWS	<i>Electronic Signature On File</i>		Effective Date:	07/01/2011	
Document Owner: Jeff Windham	<i>Electronic Signature On File</i>		Review Date:	02/24/2011	

Many emergencies in the Refinery involve hazardous materials which are flammable or combustible by nature and may be on fire. However, a spill or release of a hazardous material which may be toxic on contact with the skin or when inhaled is also a serious condition which emergency response groups must manage. This section provides procedures and guidelines specific to handling hazardous materials which require specialized equipment and techniques due to their toxic or corrosive nature.

The Emergency Response Team (ERT) under the leadership of the Hazmat Group shall provide specialized hazardous materials techniques and equipment. Specialized hazardous materials equipment shall only be used by personnel who have received proper training in their use.

Detailed requirements on prevention and response to spill events can be found in the site Spill Response and Prevention Plan

MANAGEMENT AND HANDLING OF SMALL SPILLS (INCIDENT)

An **incident** is limited in quantity, exposure potential, or toxicity.

Note: All incidents must be reported to main gate dispatch.
--

An incident poses no emergency or significant threat to the safety and health of employees in the immediate vicinity, even during clean up. A response to an incident can come from the immediate area utilizing equipment available in the area. Standard operating procedures can be followed for responding. Incidental spills that do not have the potential to develop into an emergency are covered under HAZCOM. MSDSs and HAZCOM manuals serve as a source for chemical-specific information. The environmental manual serves as a procedure and reference source.

Small spills can be handled by operations or maintenance personnel at the incident scene. This may include, but is not limited to, stopping and containing the leak or spill and picking up the material. These actions may only be taken if they can be accomplished with equipment readily available by individuals properly trained to perform the task.

When the personnel on the scene determine that control and mitigation require specialized equipment, techniques and training, an Emergency Alert shall be requested and activated. The Alert will summon the proper Emergency Response personnel to assist in managing the emergency.

DOCUMENT NO:	HSE-EAP-010	PAGE:	2 OF 16
DOCUMENT NAME: HAZMAT RESPONSE PLAN			

MANAGEMENT OF HAZARDOUS MATERIALS EMERGENCIES

An emergency incident involving a hazardous material spill or release requires the same reporting and will receive the same response as any other emergency. The Incident Command System (ICS) will be used for management of all hazardous materials emergencies. Responses shall be according to the Response Classifications (Alert Levels) for the respective type of emergency.

Identification of Hazardous Materials

At the scene of any hazardous materials emergency, the identification of the materials involved is of primary concern in order to properly:

- Provide strategic planning
- Assess the risks so that effective tactical actions can be taken
- Protect responders
- Protect the community

The product or material must be identified in order to properly and safely provide:

- Rescue of personnel
- Decontamination of personnel
- Treatment of exposed personnel
- Termination of the release or leak
- Proper mitigation of spilled material

Several sources available to assist in material identifications are listed in Appendix 1: **Identification of Hazardous Materials.**

Strategy and Tactics

Basic strategies for handling hazardous materials emergencies involve both defensive and offensive approaches.

The defensive mode involves containing the hazard to a respective area. This containing prevents further area contamination and limits exposures.

An offensive mode involves stopping the leak. Attempts should be made to stop leaks from as safe a location and distance as possible. Limiting the proximity of response personnel to the material should be considered. Aggressive attempts to stop leaks may be necessary when other efforts are not feasible. Aggressive offensives may also be necessary when other methods will not stop the leak in a timely enough manner to prevent further substantial hazards from occurring.

DOCUMENT NO:	HSE-EAP-010	PAGE:	3 OF 16
DOCUMENT NAME:			
HAZMAT RESPONSE PLAN			

Tactical considerations must always include life safety first. Proper evacuation, isolation and control of the area are required. Emergency control and property conservation must be undertaken while taking into account life safety concerns.

Mitigation of Hazardous Materials

After the emergency scene is secured, the Incident Commander will consult with the Environmental Officer to determine what mitigation action will be taken. The owner or responsible Operations Superintendent or Supervisor will assume the responsibilities for control/containment and mitigation actions in accordance with the Houston Refinery Spill Response and Prevention Plan (SRPP) with assistance from the Environmental Officer.

Fire Involving Hazardous Materials

Due to the presence of hazardous materials in the Refinery, it is possible that a fire or explosion may involve the release of significant volumes of hazardous materials. Hazardous material containers may also be exposed to fires, which could cause damage to the vessel and subsequent release of a hazardous chemical. Therefore, Command must determine whether or not a hazardous materials threat does in fact exist so that firefighters and others required to be on the incident scene can be equipped with the appropriate personal protective equipment.

See HSE-EAP-010 Fire Response Plan for more information on fire responses.

Procedures Involving Damaged Insulation

Much of the refinery piping and vessel insulation contains asbestos (Asbestos Containing Material, ACM). In the event of a fire or explosion, damage to insulation may create a potential for ACM exposure.

For procedures on handling damaged insulation, see the **HSE FIELD MANUAL, Procedure 15, Asbestos Abatement** and the **HSE COMPLIANCE PROGRAM AND PROCEDURE MANUAL, Asbestos Control Plan**

HAZMAT Group

See [Incident Command System & Organization HSE-EAP-007](#)

- Hazmat Group
- Entry
- Decontamination
- Site Access Control

Site Entry

The Hazmat Group or other tactical Divisions will coordinate with Command, the Operations Section Chief, Branch Directors and the Security Coordinator as necessary to establish and monitor Control Zones. Control Zones are necessary to:

DOCUMENT NO:	HSE-EAP-010	PAGE:	4 OF 16
DOCUMENT NAME: HAZMAT RESPONSE PLAN			

- Keep non-essential personnel out of hazardous areas and Control Zones.
- Ensure that personnel entering the Control Zones have proper PPE.
- Ensure that proper decontamination is performed on personnel leaving the Hot Zone.

The concept of a Control Zone is illustrated in [Appendix 2](#) and [Appendix 3](#)

For information concerning in plant and outside roadblocks, see HSE-EAP-004 Emergency Scene Security and Control

PERSONAL PROTECTIVE EQUIPMENT FOR HAZARDOUS CHEMICAL EXPOSURE

When exposure to hazardous materials is a possibility, response personnel shall wear appropriate personal protective equipment. Since hazardous chemicals vary widely in their characteristics, it is important to identify the chemical materials present and specify personal protective equipment suitable for the exposures possible. However, since this may not be immediately possible, the following shall be used as a guide to specify when emergency response personnel shall be required to wear chemical protective equipment.

For definitions which apply to all chemical personal protective equipment discussions, standards and other documentation as well as to this Emergency Action Plan see [Appendix 4](#)

Personal Protective Equipment Selection (PPE)

Chemical protective clothing (CPC) shall be selected based on the level of protection needed. If specialized levels of personal protective equipment are required, the Hazmat Group will coordinate with the Safety and Industrial Hygiene (IH) Officers to determine the best options.

Compatibility of the involved chemical with the material of the chemical suit (and gloves) shall be determined and considered in selecting of chemical protective clothing, preferably using the compatibility chart of the manufacturer of the clothing.

When working with flammable gases or flammable liquids, flash protection shall be provided by either a flash protective over-garment or by employing other protective measures.

Cooling vests will be worn at the discretion of the wearer of encapsulated protective clothing or the Hazmat Group Supervisor in charge.

See [Incident Command System & Organization HSE-EAP-007](#)

- Industrial Hygiene Officer
- Safety Officer

DOCUMENT NO:	HSE-EAP-010	PAGE:	5 OF 16
DOCUMENT NAME: HAZMAT RESPONSE PLAN			

Levels of Protection

The four levels of protection which may be required and the requirements governing the selection of equipment to meet each level are as follows:

- Level A Protection - Selected when the highest level of protection to skin, eyes and respiratory system is needed. Level A protection consists of SCBA and encapsulated protective clothing.
- Level B Protection - Selected when the highest level of respiratory protection is needed, but a lesser level of skin protection is needed. Level B protection consists of SCBA and encapsulated or non-encapsulated protective clothing.
- Level C Protection - Selected when the criteria for using air-purifying respirators are met. Level C protection consists of air purifying respirator and non-encapsulated protective clothing. Level C protection shall not be selected except where the atmosphere is monitored and levels of airborne substances meet the criteria for air purifying respirators.
- Level D Protection - Used only when the site has no respiratory or skin hazards. Level D protection consists of work Nomex uniform with head and eye protection.

Additional detail information on PPE may be found in the **EMERGENCY RESPONSE TRAINING MANUAL**.

PPE Donning and Doffing

Encapsulated Protective Clothing

The following rules shall be observed during donning and doffing of encapsulated protective clothing. Refer to the **EMERGENCY RESPONSE TRAINING MANUAL** for detailed information on the donning and doffing procedure.

- Encapsulated protective clothing shall be given a visual inspection prior to use.
- Donning and doffing encapsulated clothing shall be in accordance with industry and manufacturer's standards.
- A helper shall be employed to assist in the donning and doffing of encapsulated protective clothing.

Non-encapsulated Protective Clothing

The following rules shall be observed during donning and doffing of non-encapsulated protective clothing.

DOCUMENT NO:	HSE-EAP-010	PAGE:	6 OF 16
DOCUMENT NAME:			
HAZMAT RESPONSE PLAN			

- Non-encapsulated protective clothing shall be given a visual inspection prior to use.
- The type of non-encapsulated protective clothing shall determine the method of donning and doffing.
- Openings in non-encapsulated protective clothing shall be taped when liquid or vapor contact with the skin is possible.

Self Contained Breathing Apparatus (SCBA)

Donning and doffing SCBA shall be in accordance with the Refinery's SCBA Training Course, and shall follow the manufacturer's specifications and recommendations.

The level of respiratory protection may be downgraded to air purifying respirators after air monitoring results confirm that all criteria for this type of respirator are met.

Personal Protective Equipment Use

Personal protective equipment must be used and operated under certain accepted safe procedures. Command, the Operations Section Chief, Branch Director, and the Hazmat Group Supervisor are responsible for ensuring safe operating procedures are followed.

The following procedures shall be followed when chemical protective clothing is in use:

- Personnel wearing chemical protective clothing and operating in the hot zone shall work in pairs.
- At least one team shall back up each operating team working in chemical protective clothing in the hot zone. The level of protection for back up personnel shall be equal to that of the operating team.
- Back-up personnel should keep the operating team in view and shall remain alert to a call for assistance.
- Each operating team shall have radio communication when working in encapsulated protective clothing.
- Chemical protective clothing which has a poor degradation rating or rapid breakthrough time for the chemical being handled shall be decontaminated and removed immediately after receiving a severe liquid splash or vapor exposure.
- All personnel in chemical protective clothing shall leave the hot zone via the decontamination corridor.
- Eye protection is mandatory when operating in the hot zone, either by SCBA, splash goggles or safety glasses.

Work Mission Duration

Continuous time of work by personnel wearing encapsulated protective clothing shall be limited to the duration of a one-hour air cylinder, minus the time needed to exit the hot zone

DOCUMENT NO:	HSE-EAP-010	PAGE:	7 OF 16
DOCUMENT NAME:			
HAZMAT RESPONSE PLAN			

and complete the decontamination procedure. The actual permitted work duration shall be established by Command. A shorter duration may be specified. Personnel shall leave a hazard zone at the first symptom of any distress. Types and symptoms of distress are listed in [Appendix 5](#)

Personnel Monitoring for Encapsulated Chemical Protective Clothing (CPC)

Personnel encapsulated in protective clothing are subject to various physical and physiological constraints; hence they shall be monitored continuously. Monitoring procedures to be followed when personnel are utilizing fully encapsulated CPC are as follows:

- Personnel in encapsulated protective clothing shall be monitored by back-up personnel and by radio communication.
- The **time shall be recorded** when personnel are enclosed in encapsulated protective clothing, and the personnel encapsulated shall be notified after an elapsed time of 30 minutes, and at five minute intervals thereafter.
- When ambient temperature exceeds 70 degrees, the wearer of encapsulated protective clothing without cooling vests shall be notified after an elapsed time of 20 minutes, and at five minute intervals thereafter.
- Heart rate and body temperature of personnel wearing encapsulated protective clothing shall be measured and recorded upon leaving the hot zone and again before re-entering the hot zone in encapsulated protective clothing.
- Personnel shall not be permitted to return to the hot zone in encapsulated protective clothing when:
 - ⇒ The heart rate exceeds 110 beats per minute (measured by the radial pulse for 30 seconds) or exceeds the maximum heart rate established for the individual.
 - ⇒ The body temperature exceeds 99 degrees Fahrenheit.

Decontamination

Decontamination shall be established as necessary where chemical protective clothing is worn. The specific decontamination procedure used shall be specified by Command with the concurrence of the IH Officer. As required, a Decontamination Unit Leader will be assigned by the Hazmat Group to direct the decontamination process.

The following rules shall be followed in the decontamination of personal protective equipment after hazardous chemical exposure.

- The decontamination area must be located upwind and uphill of the hot zone.
- All personnel leaving the hot zone shall exit via the decontamination corridor and shall be thoroughly decontaminated before removing chemical protective clothing.

DOCUMENT NO:	HSE-EAP-010	PAGE:	8 OF 16
DOCUMENT NAME: HAZMAT RESPONSE PLAN			

- Disposable or limited use CPC shall be decontaminated and properly prepared for disposal at the incident site.
- SCBA which came in contact with liquid or vapor at a hazardous materials incident shall be decontaminated and returned to the Safety Supply for a thorough inspection.
- Personal protective equipment that cannot be decontaminated to an acceptable level shall be disposed of in accordance with hazardous waste handling policies and procedures, and with state and federal laws.
- All contaminated water from the decontamination procedure shall be collected, tested and disposed of using established procedures.

[Attachment 6: Nine Step Decon Procedure](#) shows the steps in the decon procedure and describes the actions taken in each step. The attachment also shows a typical decontamination area setup.

Further detailed training information is listed in the **EMERGENCY RESPONSE TEAM TRAINING MANUAL, Decontamination**.

For procedures on decontamination and transportation of injured or exposed personnel, see [EMERGENCY MEDICAL SERVICES PLAN HSE-EAP-011, Decontamination of Exposed Personnel](#) in this volume.

PPE TRAINING AND RESPIRATOR FIT TESTING

PPE training is included in the normal training provided all ERT personnel. Refer to the **EMERGENCY RESPONSE TEAM TRAINING MANUAL** for additional detail.

Respiratory fit testing will be performed annually on Emergency Response, ERT and other essential (e.g., Operations and other support) personnel by the HSE Department. See **HSE FIELD MANUAL** for further detail.

APPENDIX 1 IDENTIFICATION OF HAZARDOUS MATERIALS

- **OCCUPANCY AND LOCATION**
 - ⇒ Unit or process area?
 - ⇒ Building, warehouse or shipping area?
 - ⇒ Manufacturing area?
- **HAZCOM INFORMATION**
 - ⇒ Process Flow diagrams
 - ⇒ Material Safety Data Sheets
 - ⇒ Unit Inventories
- **PROCESS INFORMATION**
 - ⇒ Information from Operations personnel
 - ⇒ Process and Instrumentation Diagrams (P&ID)
 - ⇒ Operations procedures
- **CONTAINER TYPE AND SHAPE**
 - ⇒ Type of process vessel; e.g., drum, pressure vessel, tower, accumulator, etc.
 - ⇒ Type and shape of tank car or truck.
 - ⇒ Type of storage tank; e.g., sphere, bullet tank, floating roof tank, etc.
 - ⇒ Type of storage container; e.g., cylinder, carboy, bulk package.
- **MARKINGS, LABELS, COLORS AND PLACARDS**
 - ⇒ Design of labels on package showing dangers.
 - ⇒ Proper name (label)
 - ⇒ Design, color and symbol designating hazard and hazard class (labels and placards)
 - ⇒ Worded or number placards
 - ⇒ Color or marking on container
 - ⇒ NFPA 704 System
- **SHIPPING PAPERS**
 - ⇒ Invoices
 - ⇒ Way bills
 - ⇒ Bill of lading
 - ⇒ Manifests
 - ⇒ Air Bills
- **RESOURCES**
 - ⇒ Reference manuals
 - ⇒ DOT Emergency Response Guidebook
 - ⇒ CHEMTREC
 - ⇒ Emergency contact for manufacturer or generator of the material
- **SENSE PERCEPTION**

This means to look and always be alert.

DO NOT TOUCH OR SMELL PRODUCT TO ATTEMPT TO IDENTIFY THEM

 - ⇒ Visual observations
 - ⇒ Olfactory sensing

APPENDIX 2 CONTROL ZONES

- **HOT ZONE** (also known as the Exclusion or Restricted Zone)
 - ⇒ Spill or contaminated area.
 - ⇒ Access limited to personnel necessary to control the incident.
 - ⇒ Boundary lines should be delineated by hazard tape or signs.
 - ⇒ Depending on task there may be different levels of protection in the Hot Zone.

- **WARM ZONE** (also known as the Decontamination or Contamination Reduction Area)
 - ⇒ Personnel and equipment decontamination.
 - ⇒ Reduces spread of contamination.
 - ⇒ Severity of contamination should decrease as one moves through the area.

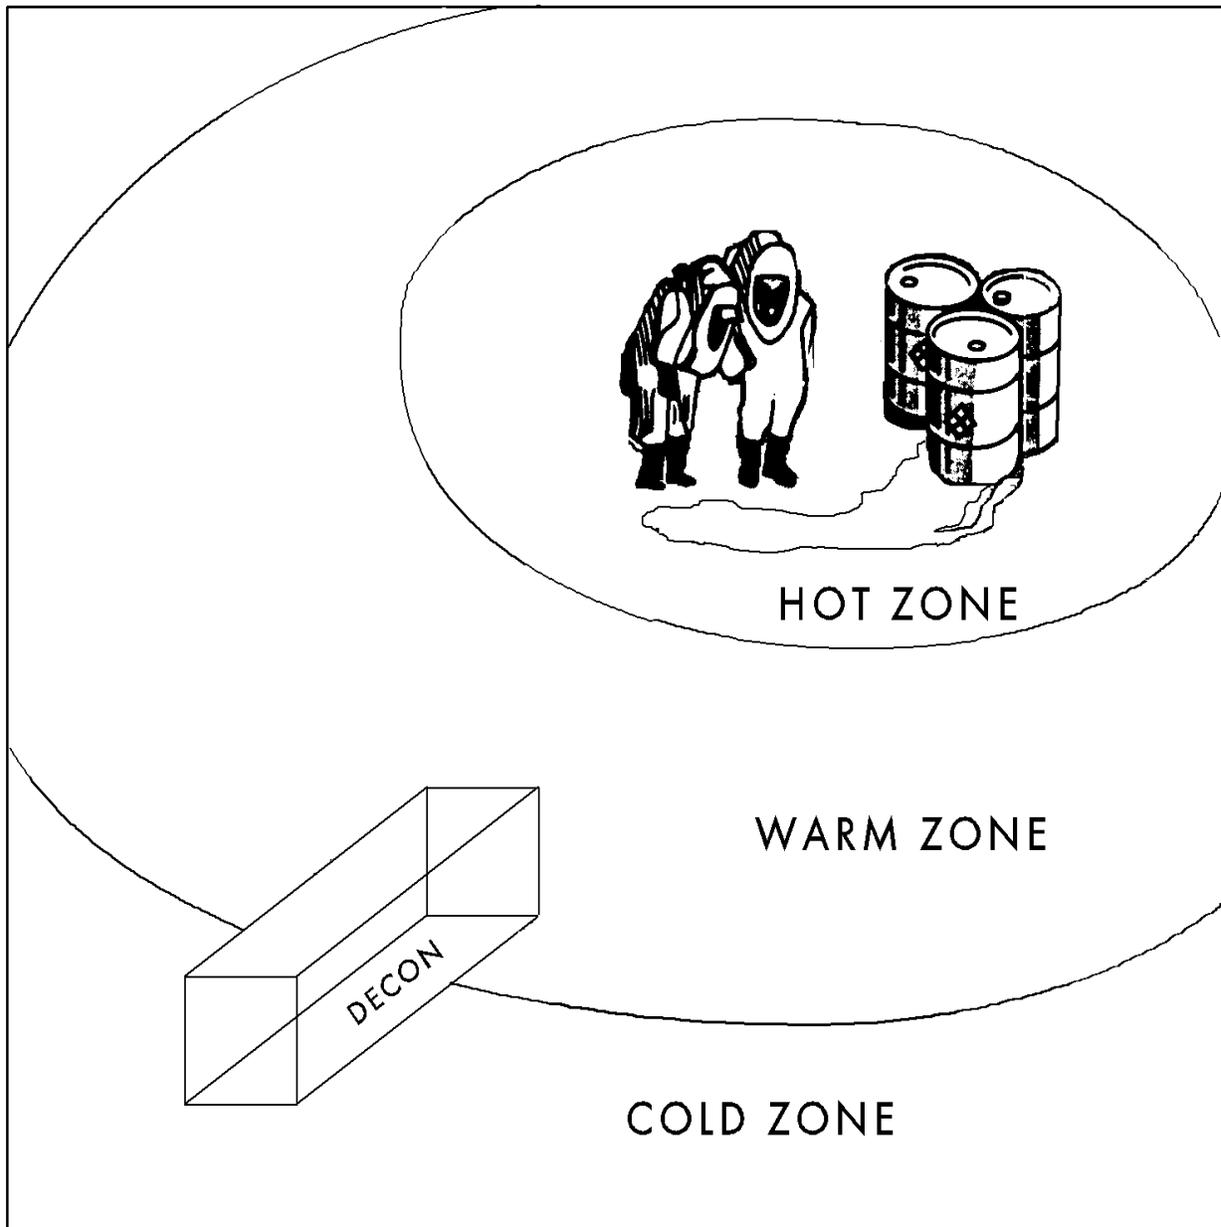

- **COLD ZONE** (also known as the Clean or Support Zone)
 - ⇒ Field Command Post location.
 - ⇒ No specialized PPE required.

DOCUMENT NO:	HSE-EAP-010	PAGE:	12 OF 16
DOCUMENT NAME:			
HAZMAT RESPONSE PLAN			

APPENDIX 3

CONTROL ZONES SURROUNDING A SPILL

- Decontamination in the WARM ZONE
- The Decon Area must be located upwind and uphill from the HOT ZONE

APPENDIX 4

DEFINITIONS FOR PERSONAL PROTECTIVE EQUIPMENT FOR HAZARDOUS CHEMICAL EXPOSURE

- **Chemical Protective Clothing (CPC)** -- Special clothing made of materials which resist chemical degradation and chemical permeation; includes encapsulated protective clothing, non-encapsulated protective clothing, gloves and boots.
- **Decontamination Corridor** -- An area in which decontamination is established; the corridor abuts the Hot Zone.
- **Encapsulated Protective Clothing** -- Chemical resistant clothing which, when used with SCBA, offers full body protection against chemical vapors, gases, liquids and particulates.
- **Flash Protective Overgarment** -- Garments made of fire-resistive materials which are worn with chemical protective clothing to protect the wearer against a flash fire.
- **Non-encapsulated Protective Clothing** -- Chemical protective clothing that offers protection against liquid splashes of skin-affecting chemicals; includes common splash suits and disposable chemical protective clothing.
- **Over-gloving** -- The use of two pairs of chemical resistant gloves, one pair worn over the other, for double protection against chemical contact.
- **PPE** -- Personal Protective Equipment.
- **SCBA** -- Self Contained Breathing Apparatus.

DOCUMENT NO:	HSE-EAP-010	PAGE:	14 OF 16

APPENDIX 5

SIGNS OF DISTRESS ASSOCIATED WITH USE OF CHEMICAL PROTECTIVE CLOTHING

Types of distress and their respective symptoms include:

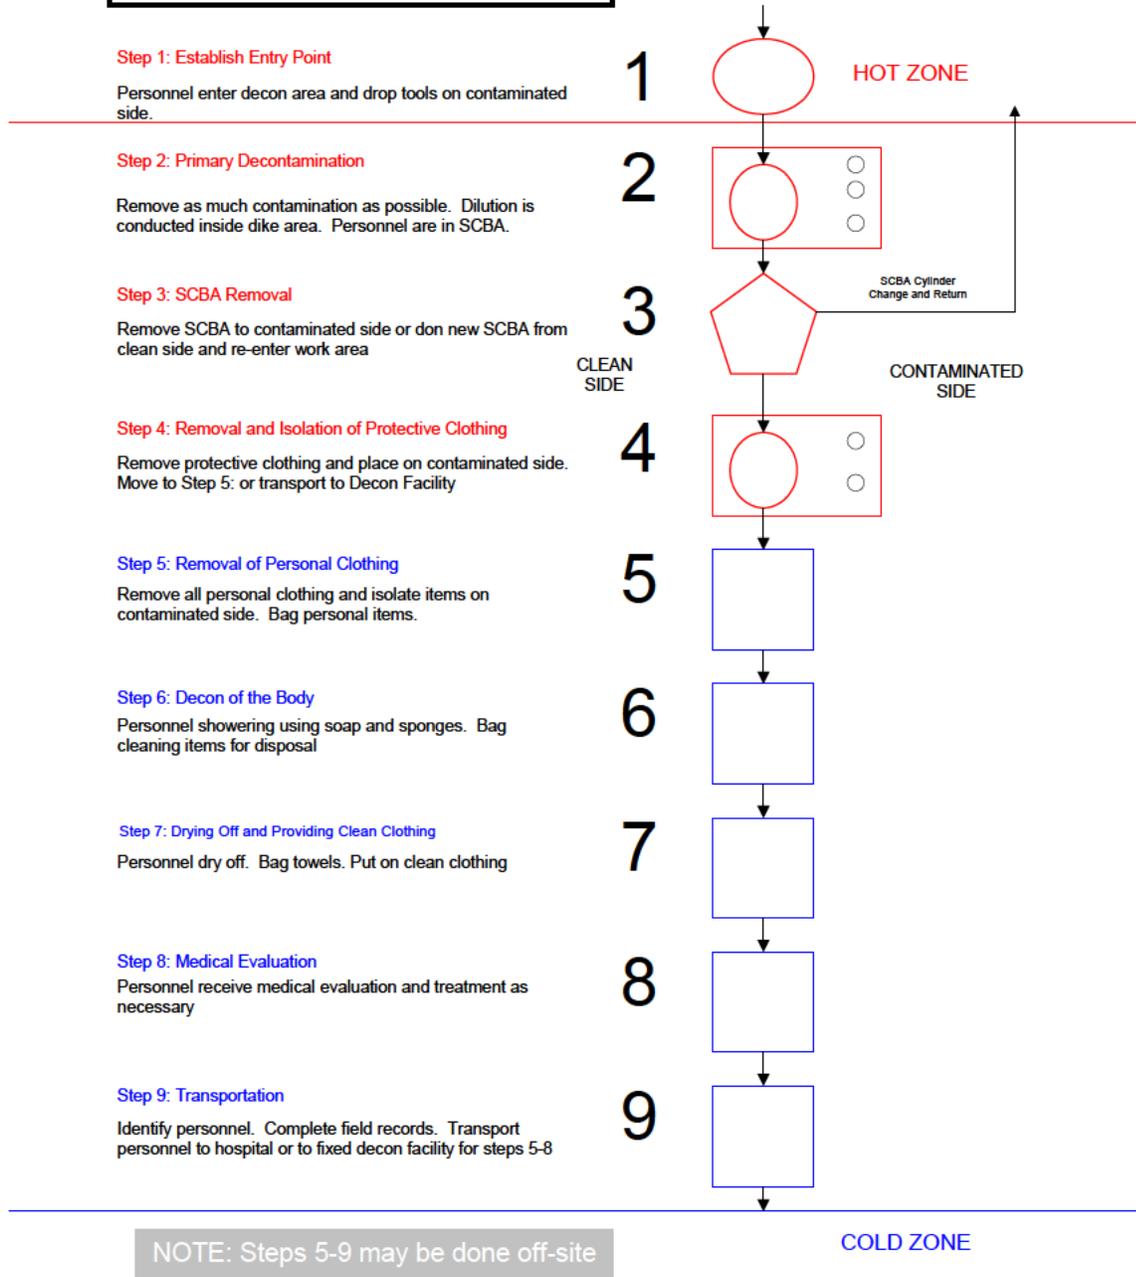

- **Chemical Distress:**
 - ⇒ Headache
 - ⇒ Dizziness
 - ⇒ Blurred vision
 - ⇒ Cramping
 - ⇒ Irritation of eyes, skin and respiratory tract

- **Heat Distress:**
 - ⇒ Muscle spasm
 - ⇒ Pain in extremities or abdomen
 - ⇒ Dizziness
 - ⇒ Lethargic/listless
 - ⇒ Nausea

A rest period will be required for wearers of encapsulated protective clothing after each mission.

REVISION SUMMARY

NOTE: If the changes proposed in this change log are typos or minor grammatical corrections that do NOT affect the intent of the policy only approval from the "Document Owner" is required. All policy intent changes must be approved by the HSSE Manager.

Date	Proposed By	Description of Change	Approved By/Date
2/24/2011	S. Kuhfeldt	Reformat, reorganize and regulatory review of procedure	

HOUSTON Refining LP	DOCUMENT NUMBER:	HSE-EAP-015	Page: 1 OF 7	Approval Date:	06/30/2011
Document Title:	EMERGENCY MEDICAL SERVICES PLAN				
Approver: CHRIS MATTHEWS	<i>Electronic Signature On File</i>		Effective Date:	07/01/2011	
Document Owner: Jeff Windham	<i>Electronic Signature On File</i>		Review Date:	02/24/2011	

Many times, emergencies within the refinery involve injuries or illnesses. These situations warrant the Emergency Medical Services (EMS) training of the Rescue Team. The purpose of EMS is to provide early access, initial care, and to arrange for transportation of a patient to an appropriate medical facility. The Rescue Team portion of the Emergency Response Team (ERT) will carry out these actions.

MANAGEMENT OF MEDICAL EMERGENCIES

When a Medical Emergency occurs, the equipment and personnel respond according to the Response Classification (Alert Level). The Incident Command System (ICS) is implemented, as in other types of emergencies, and a Medical Group Supervisor may be assigned. The Medical Group may delegate the following team leader positions according to the size and severity of the scene: Triage, Medical Treatment, Transportation, Air Operations, and Rescue.

Treatment

Each member of EMS has been properly trained in Emergency Medicine and is following physicians' orders. The procedures can be found in the Houston Refinery **EMS BASIC AND ADVANCED EMERGENCY MEDICAL CARE, PROCEDURES, PROTOCOLS AND ORDERS**. Protocols are indirect orders signed by the Plant Medical Director to help establish a uniform standard of care within the refinery.

Transportation

Patients requiring outside medical assistance will be transported off site to an appropriate medical facility. Patients will be transported by one of three options. When appropriate, the Houston Refinery ambulance, Medic 1, will be utilized to transport to the appropriate facility. When necessary, both the Houston Fire Department and Hermann Life Flight may be utilized. Criteria for use of all of these resources are available in the Houston Refinery EMS Response Procedures.

DOCUMENT NO:	HSE-EAP-011	PAGE:	2 OF 7
DOCUMENT NAME:			
EMERGENCY MEDICAL SERVICES PLAN			

MASS CASUALTY INCIDENT

Major emergencies in the refinery may involve injuries to large numbers of people. It is important to handle each patient in a rapid and effective manner. The picking and choosing of patients according to the severity of injuries and illness of the patient is called Triage. The method accepted by the EMS is termed Simple Triage and Rapid Treatment (START). Using triage tags with a color-coded system allows patients to be evaluated and placed in one of four categories for treatment and transportation purposes. See the following:

[Attachment 1: START Triage.](#)

[Attachment 2: Triage Tag.](#)

[Attachment 3: Medical Transportation Plan.](#)

- Transportation, job function
- Air Operations, job function
- Rescue, job function

DECONTAMINATION OF EXPOSED PERSONNEL

Patients involved in hazardous material incidents must be properly decontaminated before being transferred to outside personnel or facilities. Patient decon should be done at the incident scene whenever possible. If the patient is unable to be properly decontaminated at the scene, he/she should be taken to the Houston Refinery Medical Facility for further decontamination. A Decon Leader may be present for large Hazmat incidents. In these cases, patients should go through the decontamination process as established in [HSE-EAP-010 Attachment 6: Nine Step Decon Procedure](#) located in the **Hazardous Materials Response Plan**.

It is important to remember that some patients cannot be totally decontaminated before leaving the facility to receive further treatment. Special steps should then be taken to protect the equipment, ambulance, and personnel coming in contact with these patients. EMS personnel should wear necessary personal protective equipment to ensure the lowest possible exposure. The exposed patient shall be accompanied with the proper MSDSs to be given to the transporting EMS service or Receiving Facility. Although patient decon is one of the responsibilities of both the HAZMAT and EMS, it is ultimately the responsibility of Command to ensure that all patients and responding personnel are decontaminated.

DOCUMENT NO:	HSE-EAP-011	PAGE:	3 OF 7
DOCUMENT NAME: EMERGENCY MEDICAL SERVICES PLAN			

Following contact with a contaminated patient, the incident scene, ambulance, and all exposed equipment should be properly decontaminated

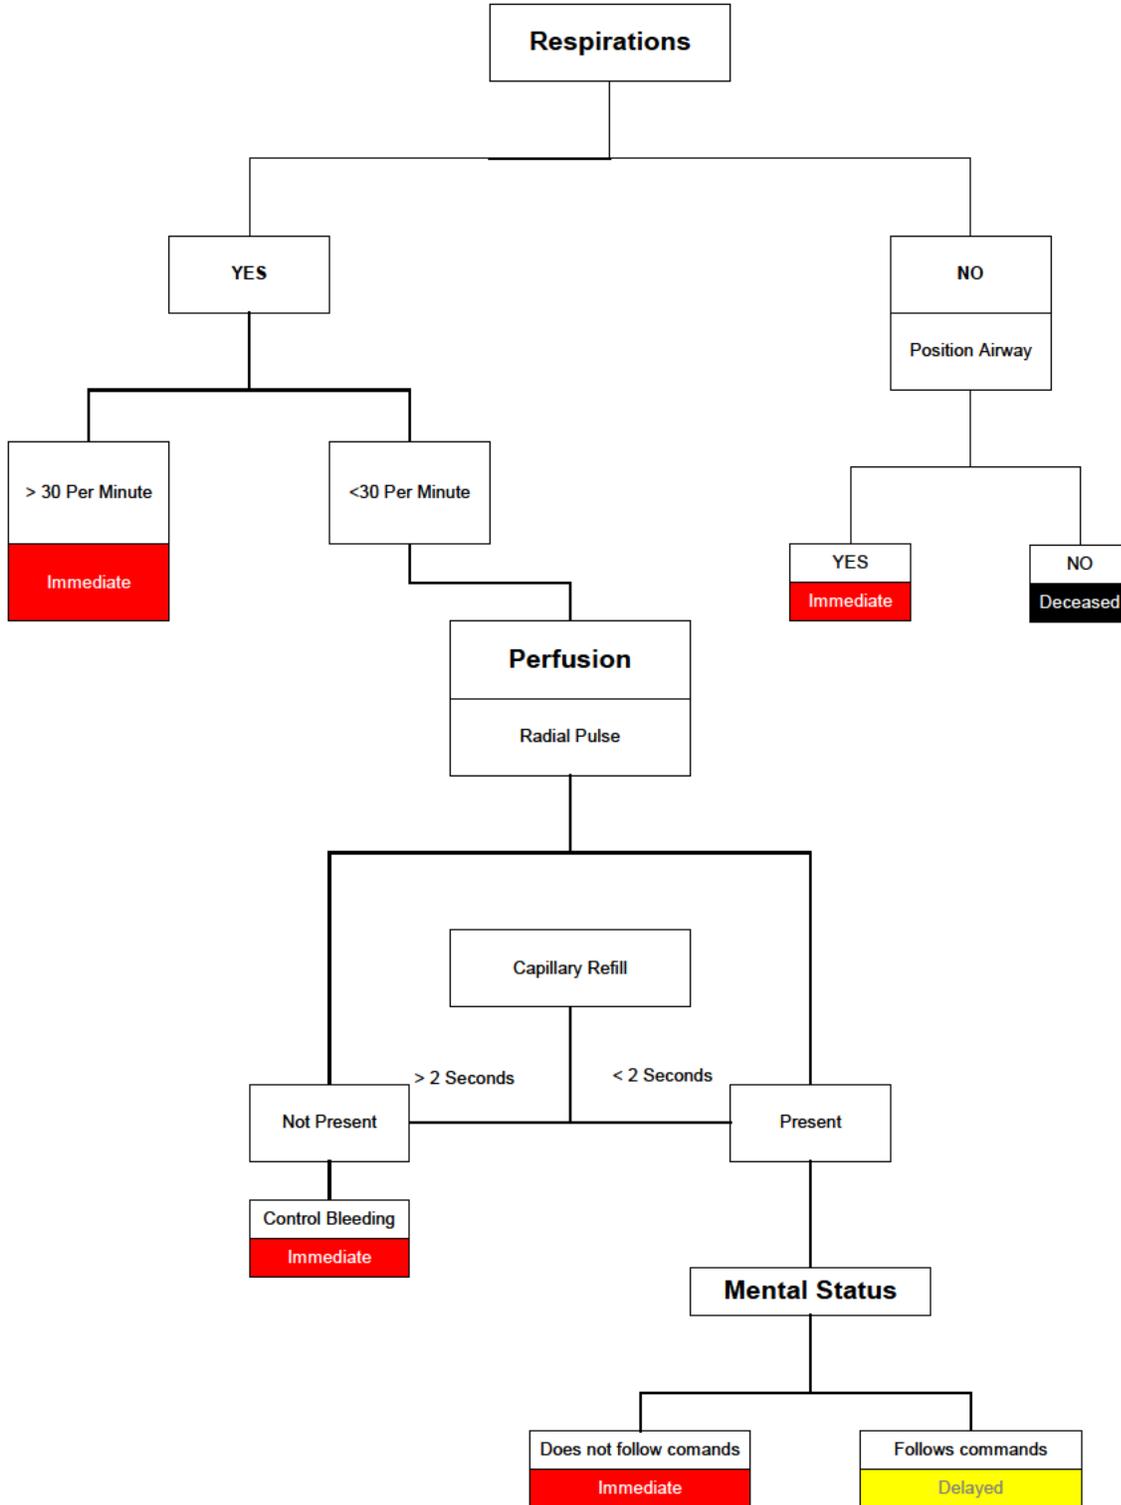

Members of the Emergency Response Team (ERT) shall assume at all times that any patient's blood or body fluids are infectious of HIV, HBV, or other pathogens. This assumption helps ensure that established work practices are followed, personal protective equipment is worn, and biological waste is handled appropriately. Employees exposed to another person's blood or body fluids while conducting their job duties shall report the exposure to the Medical Department. Exposure can be by needle sticks, cuts, abrasions or human bites, among others. All proper work practices and housekeeping practices shall be utilized at all times.

If it is deemed appropriate, responders and patients should also utilize precautions against airborne pathogens such as Tuberculosis.

For the Bloodborne Pathogen Program and associated universal precautions, See [Bloodborne Pathogen Program located in H&S Manual.](#)

REVISION SUMMARY

NOTE: If the changes proposed in this change log are typos or minor grammatical corrections that do NOT affect the intent of the policy only approval from the "Document Owner" is required. All policy intent changes must be approved by the HSSE Manager.

Date	Proposed By	Description of Change	Approved By/Date
2/24/2011	S. Kuhfeldt	Reformat, reorganize and regulatory review of procedure	

HOUSTON Refining LP	DOCUMENT NUMBER:	HSE-EAP-016	Page: 1 OF 4	Approval Date:	06/30/2011
Document Title:	RESCUE RESPONSE PLAN				
Approver: CHRIS MATTHEWS	<i>Electronic Signature On File</i>		Effective Date:	07/01/2011	
Document Owner: Jeff Windham	<i>Electronic Signature On File</i>		Review Date:	02/24/2011	

In some cases, emergencies within the refinery may involve Confined Space, High Angle, or other heavy rescue efforts. These situations warrant the specialized training, tactics, and equipment of a Rescue Team. The Rescue Team's purpose is to extricate patients who are entrapped or unable to remove themselves from a dangerous situation.

NOTIFICATION

When a Rescue situation occurs within the refinery, the equipment and personnel respond according to the Response Classification (Alert Level).

RESCUE

See [Emergency Response - Operations](#): Rescue: Roles and Responsibilities
Medical: Roles and Responsibilities

MANAGEMENT OF RESCUE OPERATIONS

The Incident Command System (ICS) is implemented and a Rescue Group Supervisor or Rescue Team Leader may be assigned.

Rescue Operations - General Procedures

- Emergency Response - Command (Command) may conduct a brief team meeting for the purposes of developing a strategic plan for the emergency or implementing a pre-plan where appropriate.
- Command may establish a **Safety Officer** position when personnel are available to stop and correct any unsafe acts, but may not modify the strategic plan.
- Command shall designate a **Hole Watch** for all confined space emergencies.
- No Rescue equipment shall be used in a manner inconsistent with the recommendations of the manufacturer.
- Consistent with the current requirements of NFPA 1983, all "**Main Lines**" shall be rigged with "new" (unused) rope.
- Cranes, hoists, and cherry pickers shall not be used to transport rescue personnel or patients unless all requirements of the applicable OSHA standards are met. Their use as "**elevated anchor points**" shall be permitted where other means are not available.

DOCUMENT NO:	HSE-EAP-012	PAGE:	2 OF 4
DOCUMENT NAME: RESCUE RESPONSE PLAN			

- All Rescue personnel shall wear a minimum of a Class III harness, helmet, gloves, and safety glasses during rescue activities; operating within confined spaces or outside guardrails.
- All Primary and Secondary Rescuers shall employ safety lines at all times except where they pose a greater risk to the safety of the rescuer. All safety lines shall be equipped with “shock absorbing” devices.
- Access and egress systems shall provide for the immediate retrieval of all rescuers.
- All rescue systems shall be “rigged” for two person loading.
- Preliminary atmospheric testing shall be conducted prior to entering any confined space.
- Where permitted, entries into atmospheres containing less than 19.5% oxygen shall require the use of self-contained breathing apparatus used in accordance with the manufacturer’s recommendations.
- Where permitted, entries into atmospheres containing 10% or less of the Lower Explosive Level (LEL) shall only be made where the source of flammability can be identified and controlled. Where atmospheres contain greater than 10% of the LEL, engineering controls shall be employed to lower the percentage to less than 10% prior to entry.
- Where permitted, entries into atmospheres containing toxic levels of hazardous materials shall only be made when a Material Safety Data Sheet (MSDS) identifies the material and recommended personal protective equipment is available to protect all personnel.
- In cases where engineering controls are used to eliminate or control hazards, their effectiveness and continued operation shall be monitored frequently.
- Where the atmosphere within a confined space cannot be thoroughly tested from the point of access, positive pressure breathing apparatus shall be worn and the atmosphere within the space shall be checked by the use of a personal monitor affixed to the primary rescuer. If the results of the monitoring indicate an acceptable atmosphere, rescuers may remove their face piece.
- Whenever rescuers wear respiratory protective devices, additional apparatus shall be provided for the patient(s).
- When respiratory protection is worn, the “On Air” time shall be recorded.
- When used, SCBAs must be capable of passing through openings when worn in their “design” position.

DOCUMENT NO:	HSE-EAP-012	PAGE:	3 OF 4
DOCUMENT NAME: RESCUE RESPONSE PLAN			

- Where combination Supplied Air SCBAs are used, it shall be in a manner consistent with their NIOSH Approval.
- Engineering controls, such as ventilation, shall be employed whenever practical to control ambient conditions.
- All potential exposure information shall be documented and appropriate personal protective equipment shall be worn.
- An effective form of communication with the rescuers shall be established prior to entering any confined space. In all cases where rescuers are required to work without "line of sight" contact, a primary and secondary means of communication shall be established.
- All patients shall be handled and packaged in a manner consistent with their medical needs, except where continued exposure to environmental conditions may cause further injury or death. All patients shall be treated according to **Approved Medical Protocols**
- Where hazardous materials may contaminate patients, they shall be handled in a manner consistent with their medical condition. Patient contamination information shall be given to the Medical Treatment and Transportation Personnel.

Date	Proposed By	Description of Change	Approved By/Date
2/24/2011	S. Kuhfeldt	Reformat, reorganize and regulatory review of procedure	

HOUSTON Refining LP	DOCUMENT NUMBER:	HSE-EAP-017	Page: 1 OF 6	Approval Date:	06/30/2011
Document Title:	RADIATION RESPONSE PLAN				
Approver: CHRIS MATTHEWS	<i>Electronic Signature On File</i>		Effective Date:	07/01/2011	
Document Owner: Jeff Windham	<i>Electronic Signature On File</i>		Review Date:	01/18/2011	

Radiation sources are located in several permanent and fixed areas of the refinery. Permanent sources are located on various process vessels and equipment for level (gauging) and flow indication. Other portable sources are brought into the refinery to perform radiography inspections to piping and equipment (non-destructive testing / X-ray).

Radiation sources are maintained in shielded enclosures which direct and control radiation release for useful purposes. Under normal circumstances, sources located in their shielded housings present no hazard. However, if the shielding is breached, the potential for radiation exposure exists. Shielded enclosures for radiation sources are substantial and under any circumstances their failure is remote. This section provides procedures and guidelines to use if source controls have been breached.

For a list of permanent sources in the refinery, see [Appendix 1: Locations of Radiation Sources in the Refinery](#).

MANAGEMENT OF RADIATION EMERGENCIES

An emergency where a source is exposed requires the same reporting and will receive the same response as any other emergency. The Incident Command System (ICS) will be used for management of all radiation scene emergencies. Responses shall be according to the response classifications (Alert Levels) for the respective type of emergency. However, due to the nature and strength of permanent or portable sources, Response Classifications beyond an Alert 2 are not necessary.

Types of Radiation Emergencies

A radiation hazard will exist if the radiation from a source is not controlled by shielding. Events which could breach the shielding and propagate a radiation emergency may include, but not be limited to the following types of events:

- Fires and explosions involving radioactive sources (e.g., fires or explosions which expose source instrumentation to excessive heat or mechanical damage from an explosion).
- Radiography equipment malfunction (e.g., disconnected sources from radiography cameras).
- Mechanical damage to source housing (e.g., damage to source instrument housings by other mechanical equipment or other failures).
- Vehicular accidents involving the movement of sources (e.g., radiography or other transport trucks).

DOCUMENT NO:	HSE-EAP-012	PAGE:	2 OF 7
DOCUMENT NAME: RADIATION RESPONSE PLAN			

Identification of Materials Involved

As with all hazardous materials emergencies, the identification of the materials involved is of primary concern in order to properly:

- Provide strategic planning.
- Assess the risks so that effective tactical actions can be taken.
- Protect responders.
- Protect the community.

The Incident Commander and Tactical Officers must quickly determine if radioactive sources are involved in any emergency to provide the proper planning and protection.

Fires and Explosions Involving Radioactive Sources

Exposure risk must be considered on any lines or vessels that are involved in fires or explosions upon which radioactive sources are used for gauging and flow indication.

An explosion may cause a source to be misplaced from its protective housing. Although refinery sources are classified as “low level”, they must be considered hazardous and treated accordingly.

Damage to source-containing instrumentation by fire exposure is considered remote due to the substantial protective housings. However, if the instruments have been exposed to fire, ER - Command must consider that damage may have occurred and take appropriate steps to protect Emergency Response members providing fire control support. Proper verification must be made that radiation leakage is not occurring.

Radiography Equipment Malfunction

Radiography is a process of testing materials using penetrating radiation such as X-rays or gamma rays. This allows examination of the interior of objects or assemblies that are impenetrable to light. Sources used for radiography are considered “high level” and pose a potential risk to personnel.

The malfunction of radiography equipment can leave a source unprotected and exposed. Two basic types of malfunctions may occur:

- The camera device malfunctions leaving the source extended (exposed) with the inability to retrieve (secure) it properly.
- A camera malfunctions allowing the source to be extended and disconnected from the device leaving no means of retrieval.

Either event will leave the source exposed and unshielded providing potentially high exposures to personnel.

DOCUMENT NO:	HSE-EAP-012	PAGE:	3 OF 7
DOCUMENT NAME: RADIATION RESPONSE PLAN			

Mechanical Damage to Source Housing

The housing for all radioactive sources is substantial. A powerful mechanism would have to be employed to mechanically damage gauging instrumentation or radiography equipment shielding. However, if a mechanical stress has been employed on the housing, careful consideration and steps must be taken until it can be verified that the shielding is intact and no leakage is occurring.

Vehicle Accidents Involving the Movement of Sources

Radioactive sources are commonly moved in the refinery by truck. Stringent packaging and securing must be performed before a source can be transported. Radiography sources are the most common source moved by vehicle.

In transit, vehicles carrying sources may be involved in traffic accidents or fires. Potential damage to the source housings are similar to those previously described for fires, explosions and mechanical damage.

If properly packaged and secured, it is unlikely that a breach of the housing could occur. However any vehicle accident must be treated as if the housing has been damaged until verification can be made that no leakage is occurring.

Procedures for Handling Radiation Emergencies

For radiation emergencies, the Plant Emergency Notification system will be activated, and standard procedures and response orders will be followed. A minimum of a Non essential Personnel Evacuation of the area will be issued.

Generally, three items must be considered for protection from radiation:

- Distance
- Shielding
- Time (time exposed).

The following are specific procedures for handling radiation emergencies in the facility:

- For all unknown source exposures, the area within a radius (in all directions) of 150 feet must be immediately evacuated and secured (isolated).
- The Refinery Radiation Safety Officer (RSO) must be immediately notified.
- The Industrial Hygienist On-Call shall become the Industrial Hygiene Officer until relieved by the RSO.
- The secured area shall be monitored to ensure the hot zone is established properly. The area shall be barricaded at the 2 mr/hr mark. (Areas outside the hot zone shall be at 2 mr/hr or less.)

DOCUMENT NO:	HSE-EAP-012	PAGE:	4 OF 7
DOCUMENT NAME: RADIATION RESPONSE PLAN			

Tactical Divisions will coordinate with the Incident Commander, the Operations Section Chief and the Security Coordinator to establish and monitor site control zones.

The concept of a Control Zone is illustrated in the [Hazardous Materials Response Plan, Appendix 2: Control Zones](#).

For information concerning in plant and outside roadblocks, see [HSE-EAP-004 Emergency Site Security and Control](#)

- The RSO will notify directly or ensure notification of the following:
 - ⇒ Texas Department of Health Bureau of Radiation Control
 - ⇒ A Contractor licensed by the Bureau of Radiation Control
- Only a licensed radiation contractor is qualified and trained to perform emergency recovery and securing of exposed sources. **No Houston Refinery Emergency Response personnel will perform recovery and securing operations.**

Naturally Occurring Radioactive Material, NORM

Naturally Occurring Radioactive Materials (NORM) are located in rock and soil formations throughout the earth's crust. NORM is found in many oil and gas streams and may move with these streams as they are extracted and transported. NORM may be found on vessel walls, piping, pump casings and other process equipment.

Emergencies and incidents involving NORM may include accidents involving NORM-contaminated equipment or waste. NORM-contaminated equipment and waste is considered to be a "low level" hazard and normally poses only minimal health risks by skin exposure or inhalation. Handling of these types of events will be in accordance with the **HSE FIELD MANUAL, Procedure 14: Naturally Occurring Radioactive Material (NORM)**.

SEVERE WEATHER MANAGEMENT PLAN			

SUMMARY

SEVERE WEATHER MANAGEMENT PLAN

This plan provides a coordinated, teamwork-based program intended to reduce the potential for injury to personnel, damage to facilities or curtailment of production due to severe weather.

For purposes of this plan, "severe weather" shall be defined as hurricanes, sub-freezing temperatures, severe thunderstorms or flooding (from other than hurricane related rainfall or tides).

ROLES & RESPONSIBILITIES

SEVERE WEATHER MANAGEMENT TEAM

The Severe Weather Management Team is composed of senior management team leader and various functional teams, which guide implementation of the severe weather management plan.

Emergency Management personnel have responsibility for monitoring weather forecasts and informing management of weather conditions that have a possibility of adversely impacting the refinery. Main Gate Security has front-line responsibility for monitoring weather conditions that could imminently affect refinery operations and notifying the Plant Shift Superintendent (PSS) when a weather threat is identified. The PSS has responsibility for coordinating preparedness activities when there is an imminent threat of severe weather. In the event of a severe weather impact, the PSS will advise the Executive On Call regarding refinery status.

In the event of severe weather, the Severe Weather Management Team Leader may activate the plan. The Team Leader shall be responsible for implementing the applicable parts of this plan as needed to deal with threatening severe weather conditions.

The team shall serve as the refinery's advisory and resource group for all phases of the severe weather management plan. As conditions dictate, the team will make recommendations for securing plant equipment and protecting personnel following prescribed checklists and schedules.

Headquarters of the Severe Weather Management Team will be in the Emergency Operations Center (EOC).

The Severe Weather Management Team Organization and Roles & Responsibilities can be referenced in

[Appendix 1: Severe Weather Management Team Roles & Responsibilities](#)

DOCUMENT NO:	HSE-EAP-015	PAGE:	3 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

METEOROLOGY SERVICES and WEATHER INFORMATION

Refinery site specific meteorological services are provided by ImpactWeather, Inc. All information is available by logging on to the ImpactWeather member Internet site. Services provided include:

- ❑ Daily Planning Forecast – issued early each morning, provides expected weather conditions throughout the following week. Daily Planning Forecasts are also faxed to the Plant Shift Superintendent, Main Gate Security, HSE, and the Main Lobby.
- ❑ Severe Weather Threat Assessments – updated several times a day, provides indication of severe weather that may affect the refinery during the current and next day. Severe Weather Threat Assessments are available on the ImpactWeather member Internet site. Notification of the potential for severe weather events such as tornado outbreaks or ice storms is also emailed to select personnel.
- ❑ Severe Weather Alerts – phased alerting system that provides notification that severe weather may, or will affect the refinery within the next several hours. The color-coded condition alert system is:
 - Green – All Clear. No severe weather currently predicted.
 - Yellow – Severe weather is possible within the next several hours. A Condition Yellow Alert is issued when the threat is judged to be both severe, and likely to occur
 - Orange – Issued when significant weather is likely to occur within the next hour. Condition Orange Alerts will typically be issued for thunderstorm type of activity and indicate the strong possibility of conditions including but not limited to wind gusts over 45 mph, the possibility of tornadoes, very frequent lightning, and hail
 - Red – Extremely severe weather is imminent within the hour. Condition Red Alerts are reserved only for the most hazardous weather events. Conditions that may call for a Condition Red include but are not limited to verified tornado activity hail over 2 inches in diameter and wind gusts over 60 mph.

The refinery receives Severe Weather Alerts via Fax at the PSS Office, Main Gate Security, HSE, and the Main Lobby as well as specific personnel email and pager notifications. Red Severe Weather Alerts also result in a phone call to Main Gate Security.

- ❑ Tropical Weather Service – provides information on tropical weather development throughout hurricane season, and outlooks on specific tropical events that have a possibility of affecting the refinery. The tropical weather service includes site specific conditions that can reasonably be expected over the forecast time period.

DOCUMENT NO:	HSE-EAP-015	PAGE:	4 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

- Meteorologist Consultation – ImpactWeather’s duty meteorologist is also available 24 hours a day for live consultation or clarification of information by calling the toll free ImpactWeather line.

The refinery has two local on-site weather stations. These stations are located on top of the Administration Building and the C&P Building, and are used to provide real time wind speed, wind direction, and temperature information. Data from the stations is available at Main Gate Security, and in the HSE Workroom.

Additionally, local weather information in close proximity to the refinery is available at the following Internet sites

- TxDOT Roadway Weather Sensors: <http://pri.hcoem.org/txdot/> (closest sensor is 610 Bridge over the Houston Ship Channel)
- Houston Hobby Airport:
<http://weather.noaa.gov/weather/current/KHOU.html>

EMPLOYEE COMMUNICATIONS

When severe weather threatens, or has affected the refinery, Houston Refining employees may obtain information on the refinery’s status and return-to-work requirements by:

- Accessing www.hrohme.com on the Internet
- Calling the **Lyondellbasell Info Line** toll-free, **1-888-457-6118** (select 2 - East Region, then 6 - Houston Refinery)
- Calling the **HRO Employee Emergency and Severe Weather Information Line at 713-321-5775**

If necessary, the refinery will utilize print, television, and radio media to disseminate information to employees as well:

- **NewsRadio 740 KTRH**, located on the AM frequency is the primary outlet

DOCUMENT NO:	HSE-EAP-015	PAGE:	5 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

PROCEDURE

HURRICANE PREPAREDNESS PLAN

Hurricanes are the most threatening of all severe weather conditions, and therefore are the principal focus of this plan. The advance warning available for hurricanes typically provides sufficient time for preparation and protection of facilities, equipment, and personnel.

This Hurricane Preparedness Plan features procedures and guidelines for use prior to, during, and immediately after a storm to help ensure that plant equipment is properly secured, personnel are not exposed to preventable hazards, and disruption of operations is minimized. Commonly used Tropical Weather terminology associated with this plan is provided in [Appendix 2: Storm Terminology](#)

Included in this plan are checklists, schedules and timelines for use as guides to coordinate an orderly preparation and shutdown of the facility in the event the Severe Weather Management Team Leader calls for such action. Stated preparation and shutdown guidelines may be adjusted with the approval of the team leader based on existing and expected weather conditions and probability data.

Activation of this plan shall be considered if the Houston area is within the 75% landfall probability cone, or it is reasonably possible that the Houston area could be impacted by a tropical storm / hurricane.

Unless specifically noted otherwise, the estimated time of arrival of sustained 40 mph winds is the "reference" point for all decisions and activity timing in this hurricane preparedness plan.

Severe Weather Checklists

The Hurricane Preparedness Plan provides for preventive / asset protection activities in three phases.

Each refinery department that is responsible for specific storm preparation activity should develop and maintain department specific storm phase checklists.

Phase 1: Preseason Checklist

Phase 1 is defined as the period from the start of hurricane season until an actual storm is close enough to be a threat. Phase 1 activities are to be completed prior to the start of hurricane season.

The Phase 1 Checklist is located in [Appendix 3: Hurricane Preparedness Phase 1 Pre-Season Checklist](#). The Phase 1 Checklist includes sandbagging charts for flood prevention of critical equipment.

DOCUMENT NO:	HSE-EAP-015	PAGE:	6 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

Phase 2: Checklist

In anticipation of a hurricane, Phase 2 activities shall begin at the direction of the Severe Weather Management Team Leader.

The decision to implement Phase 2 will be a judgment decision based on the best available weather information at the time. Initiation of Phase 2 preparations should be considered prior to 96 hours in advance of the arrival of sustained 40 mph winds.

Some of the items in this checklist are duplications of Phase 1. However, all of these items must be checked again immediately before the arrival of severe weather and any necessary corrective action taken without delay.

The Phase 2 Checklist is located in [Appendix 4: Hurricane Preparedness Phase 2 Checklist](#).

Phase 3: Checklist

In anticipation of a hurricane, Phase 3 final preparations, including appropriate operations curtailments shall begin at the direction of the Severe Weather Management Team Leader at approximately 72 hours in advance of sustained tropical storm force winds (40 mph).

The beginning of Phase 3 activity is based on the best available weather information.

Non-essential personnel may be released at the discretion of management.

When Phase 3 is initiated, all of the Phase 3 checklist items shall be expedited.

The Phase 3 Checklist is located in [Appendix 5: Hurricane Preparedness Phase 3 Checklist](#).

Hurricane Teams and Associated Staffing

As part of the Phase 1 activity, each manager / superintendent is responsible for obtaining an adequate number of appropriately skilled personnel to serve on the Shutdown / Startup Team and Rideout Team. Personnel who could fill positions in the recovery organization should be identified and their emergency / 3rd party contact information should be obtained during Phase 1. Where specialty contractor personnel are required, the departmental contact is responsible for working with Purchasing to ensure that an appropriate number of skilled contractors will be available.

For information on the various storm teams' staffing needs, see [Appendix 6: Hurricane Planning, Personnel Staffing Plans](#).

DOCUMENT NO:	HSE-EAP-015	PAGE:	7 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

Upon initiation of the Phase 2 activity, four hurricane teams will be established. The teams are:

- Shutdown / Startup Team (SST) – The SST will assume operations responsibility from the normal operations staff and has responsibility to operate the refinery at reduced or circulation rates, and/or shutdown the plant per direction of the Severe Weather Management Team. Should storm conditions be less than expected, the SST may begin startup preparation activity to a point allowed by the number of personnel available. If the refinery is shut down, and based on the expectation for certain storm conditions, the SST may be moved as a group to a safe location away from the refinery. The SST is primarily composed of operations personnel, with appropriate support staff.
- Rideout Team (RT) – The RT is defined as the group of personnel that will attend to and manage the refinery in the event of a total shutdown and evacuation of the SST. The RT's primary responsibility in this case is fire watch, security of the plant, and initiating preliminary hazard / damage assessments after a storm has passed. The RT mainly consists of personnel who rollover from the SST and is composed of Operations, Reliability, IS, HSE, and ERT personnel.
- Assessment Team (AT) – The AT is formed from Rideout Team members and is responsible for performing plant-wide and unit perimeter assessments for acute hazards and significant damage with intent to identify those hazards, mitigate them where practical, and clear the operating units for entry of Recovery Team personnel to perform detailed assessments and repairs. AT personnel may be moved to a safe location with the SST in the event conditions dictate that action. The AT will be coordinated into an appropriate number of individual teams that will typically consist of HSE, Reliability, and Operations personnel.
- Recovery Team – The Recovery Team is responsible for managing repair activity that is necessary to put the refinery in a condition to allow safe startup. The Recovery Team will relieve the Rideout and Assessment Teams. Transition to the Recovery Team effort will typically take place at some point after the Assessment Teams have completed and documented the initial assessments and cleared the units for detailed assessments entry. The Recovery Team will be activated by and report to the refinery at a time determined appropriate by the Severe Weather Management Team. For more information on the recovery effort, see the HRO Hurricane Recovery Plan (need to know where this will be kept).

Note: Some personnel, with cross-functional skills and knowledge may be assigned to serve on multiple teams with primary responsibility dependant on the team that is primarily active at a certain time.

DOCUMENT NO:	HSE-EAP-015	PAGE:	8 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

Each manager / superintendent will validate / update their storm teams' personnel lists during Phase 2. The Emergency Management Coordinator or designee shall be notified of any changes that are necessary. Managers / Superintendents will retain the list of storm team personnel from their area, and fax a copy to EOC at 713-609-6245.

Hurricane Preparedness Timeline

The Hurricane Preparedness Timeline is designed to facilitate planning for facility preparation, release and reporting of personnel and operations curtailment activities. Although the various activities in the timeline are defined, actual activity and initiation points may vary with specific storm data.

The general and an interactive preparedness timeline are located in [Appendix 7: Hurricane Preparedness Timeline](#).

Release and Reporting of Personnel

Proper timing in the release and reporting of various personnel groups is essential to help ensure employee safety and adequate facility preparation. The following times should be used as a guide to release and reporting. Times indicated are in advance of the predicted arrival of 40 mph sustained winds.

96 Hours:	<ul style="list-style-type: none"> Release Shutdown / Startup Team for home and family preparation
72 Hours:	<ul style="list-style-type: none"> Begin the staggered release of non-essential personnel Release Rideout Team and Assessment Team for home and family preparation
60 Hours:	<ul style="list-style-type: none"> Shutdown / Startup Team report for storm duty
48 Hours:	<ul style="list-style-type: none"> Release of non-essential personnel outside of Operations complete Begin release of operations personnel who are not on SST / RT as unit operational status allows
36 Hours:	<ul style="list-style-type: none"> Rideout Team and Assessment Team report for storm duty Release of operations personnel who are not on SST / RT complete
12 Hours:	<ul style="list-style-type: none"> Release of Shutdown Team complete
0 – 12 Hours	<ul style="list-style-type: none"> Final preparations

Note: Release and reporting of personnel assigned to both the Shutdown / Startup Team and the Rideout Team should align with that of the Shutdown / Startup Team.

Operations Curtailments / Decision Points

Various levels of operations curtailment will be considered if the refinery is within the 75% probability window of receiving sustained tropical storm force winds (40 mph) for extended periods.

DOCUMENT NO:	HSE-EAP-015	PAGE:	9 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

Operational decisions will be based on predicted conditions at the refinery and length of exposure. The following guidelines will be used to outline the operational decision-making process:

- ❑ Sustained winds up to 40 mph: Normal Operating Conditions
- ❑ Sustained winds over 40 mph for up to 4 hours: Rate Reductions
- ❑ Sustained winds over 40 mph for more than 4 hours: Refinery on Circulation
- ❑ Sustained winds over 75 mph for more than 2 hours: Plant Shut Down

Depending on the intensity and track of the storm, and other applicable issues, the following timing points are critical in considering possible operations curtailments:

- ❑ Initiation to 72 Hours: Begin discussions and decision making process
- ❑ 60 Hours: Critical decision point for going to minimum refinery rates
- ❑ 48 Hours: Critical decision point for taking the refinery to total circulation
- ❑ 36 Hours: Critical decision point for continuing with circulation or initiating shutdown

All units should be at operating conditions determined to be appropriate for the expected weather conditions 12 hours prior to the arrival of 40 mph sustained winds. Guidelines for circulation and shutdown timing of all units can be found in [Appendix 8: Operations Circulation / Shutdown Timing](#).

[The Total Refinery Circulation / Shutdown Guideline is shown in Appendix 9.](#)

Incident Management

EOC shall be established at a minimum level 36 hours prior to the arrival of sustained 40 mph winds to facilitate situation development tracking and accountability of storm team personnel.

Command shall be established approximately four hours prior to the arrival of sustained 40 mph winds.

Calpine Operability and Relocation

Calpine Cogeneration plans to maintain utilities production at a level commensurate with the refinery's demand needs throughout the storm event or as long as possible. However, wind speed conditions may limit Calpine's ability to safely occupy its control building. Calpine management will determine the conditions upon which an evacuation of their facility will be necessary. Generally, Calpine personnel will shelter within the Calpine facility during storms with wind expectations up to 95 mph sustained winds. If conditions dictate evacuation of the Calpine facility, Calpine personnel will be relocated to the HRO CCRB. From there, Calpine personnel will be able to operate their processes. Relocation will be facilitated by HRO Emergency Services.

DOCUMENT NO:	HSE-EAP-015	PAGE:	10 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

To facilitate the evacuation decision making process, a detailed condition expectations forecast will be provided to Calpine when sustained wind speeds greater than 40 mph are predicted.

Communication with Calpine will be the responsibility of the PSS and the Utilities Board Operator. Communication links will be via telephone or Utilities Channel 1.

If an evacuation determination is made, the following process will be followed:

- ❑ Two hours prior to the expectation for 40 mph sustained winds, Command will designate personnel to proceed to the Calpine Control Building to transport the initial personnel group to the CCRB.
- ❑ The initial group of Calpine employees will ensure that the interface from the CCRB is operating and will then take over control of the Calpine processes.
- ❑ The remaining personnel will then be picked up and delivered to the CCRB.

Personnel Safety, Tracking & Accountability

Personnel On-Site

As conditions deteriorate limitations on outside activity and accountability of all personnel within the refinery becomes paramount.

This Accountability Plan is applicable to all HRO, Contract, and Calpine personnel working at the refinery site during tropical storm and/or hurricane weather events. This plan can be utilized to account for personnel during other adverse events as well.

On-Site Accountability processes shall be initiated by Command prior to the arrival of 40 mph winds. Accountability will be documented and maintained in effect until the Severe Weather Management Team Leader, Command, and the Plant Shift Superintendent determine it is no longer necessary. It is particularly critical that accountability of damage assessment teams be conducted throughout the assessment process.

Upon initiation of this Accountability Process:

- ❑ A Facility Accountability Coordinator (FAC) shall be appointed to track the location and working status of each person at the refinery. The FAC will work from EOC.
- ❑ Each department / area will fax a personnel list to EOC (ext. 6245) indicating those people who are currently on-site and assigned to that area. Any changes as a result of people arriving, departing, or moving to a different area shall be communicated to EOC.

DOCUMENT NO:	HSE-EAP-015	PAGE:	11 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

- ❑ EOC will validate the on-site personnel list against a report generated by the Security Access Control System to verify that all personnel on-site are accounted for.
- ❑ Outside activity shall be minimized to the extent possible at sustained wind speeds of 25 mph or greater.
- ❑ At sustained wind speeds of 40 mph or greater, outside activity must be approved by Command (in EOC @ ext. 4844) and by the Plant Shift Superintendent. EOC will be notified of personnel who will be working outside, and then notified when outside activity is complete and personnel have returned to their assigned area.
- ❑ As the storm passes and winds begin to subside, restrictions on outside activity as indicated above will be maintained until discontinued by the Severe Weather Management Team Leader and Command.

Personnel Off-Site

All employees will update their contact information in iManage prior to Hurricane Season and immediately prior to specific storm events.

Prior to each storm that is expected to impact the greater Houston area; supervisors / managers are responsible for obtaining storm contact / evacuation information from their direct reports and critical contract personnel.

[Appendix 10: Houston Refining Employee Emergency Tracking Forms](#) will be utilized for this purpose. Hard copies are to be retained by the supervisor/manager and by a designee/backup throughout the adverse condition, with a copy emailed to HRO EOC, or faxed to EOC at 713-609-6245.

After storm events have impacted the area:

- ❑ Employees will be responsible for keeping track of refinery conditions and return-to-work requirements via the methods mentioned in the **Employee Communications** section above.
- ❑ Employees are required to check in within 24 hours of the storm event via the www.hrohome.com website, or the **Lyondell Basell Info Line (1-888-457-6118)** as listed in the **Employee Communications** section above and provide info on their location, how they can be reached, their availability to return to work and any significant personal losses or need for assistance.

DOCUMENT NO:	HSE-EAP-015	PAGE:	12 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

- As an alternate means to check in, employees may email or send a text message to hrocheckin@lyondellbasell.com with the above information.

NOTE: Contact numbers for the Plant Shift Superintendent and Shift Clerks SHOULD NOT be used for employee check-in or general information about plant conditions. These lines should be restricted to official ongoing, real-time plant operations.

Post-Storm Assessment Process

If a severe weather system has affected the refinery, post-storm impact assessments will be conducted prior to personnel entering areas to perform work. The intent is to identify, assess, and mitigate hazards that may have been created by storm conditions.

This section will be utilized as a guide to perform post-storm assessments in order to ensure the highest level of personnel safety. Assessments will be conducted under the Incident Command System. This section also provides guidance on possible action to be taken to mitigate those hazards in order to create a safe work environment.

Potential Hazards

The following represent some, but not all hazards that present the potential for unquantified exposures in the timeframe immediately after a severe weather event:

- Electrical Hazards
- Flooding
- Currents (receding water)
- Loose hydrocarbons
- Chemical exposures
- Asbestos
- Undermining of soil
- Structural failure
- Obscuration of walking surfaces via flood water
- Missing grates and hole coverings
- Slip, Trip, Fall Hazards
- Unexpected energization of equipment
- Sharp edges
- Wildlife (snakes)

Note: If flooding has occurred, assessments in flooded areas may begin after flood water has receded to a point that the area perimeter can be safely traversed by vehicle or by foot as appropriate. Personnel should avoid walking into areas that are flooded. However, if it becomes imperative to access flooded areas, the task should be discussed with supervision and personnel must take extra precautions to avoid trips and falls. These precautions may include, but are not limited to developing pre-task safety plan, assessing the electrical hazards within the flooded area, appropriate PPE, an observer that stays in a safe location, the use of a pole to probe the area before taking steps, and if possible, a retrieval line.

Additionally, decontamination stations shall be established if personnel must enter flooded / contaminated areas.

DOCUMENT NO:	HSE-EAP-015	PAGE:	13 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

Assessment Teams

In order to assess these hazards, teams of appropriately knowledgeable personnel will perform staged surveys to identify, and if possible, manage identified hazards. Survey teams will consist of:

- HSE
- Electrical
- Engineering (Structural, Civil, Mechanical, Process)
- Process Control
- Operations
- Others as identified

Hazard Abatement and Identification

If the refinery experiences a TOTAL power loss during a period of severe weather, the first step in providing a safe work environment is to isolate the refinery power distribution system by opening the two main 69kV breakers and the two main 15kV breakers located at the 138kV Substation. Once power is restored by either the Cogeneration Facility or the Utility, the refinery Power Distribution Group will bring units back on-line in an orderly fashion, but only after a thorough inspection of each unit has occurred to eliminate the potential for damaged circuits to become energized when power is restored.

Otherwise, the system is designed to react to faults which may occur as a result of severe weather damage. The refinery power grid will remain on during the event, and specific breakers / switches will be opened to isolate damaged circuits only once the storm has passed.

Process computers shall be put into a state that prevents them from trying to control the process until such times as all process equipment has been assessed and declared useable.

Identified damage and hazards shall be documented on the provided plot plans with the plot plans being returned to EOC after the assessment is complete. Damage shall also be documented via camera. Unmitigated hazards shall be identified by visual means (paint, barricade tape, etc.).

Assessment Process

Each Assessment Team will be provided gridded plot plans which shall be utilized to identify the boundaries of each team's responsibility, the areas where various assessments have been completed, and to indicate hazards found within those areas. A Site Safety Plan shall be established by the Safety Officer and reviewed with all Assessment Teams. Assessment Teams shall be deployed and operated under the established Incident Command System. A Division Supervisor or Team Leader respectively, shall report the team's position, progress, and accountability as required.

DOCUMENT NO:	HSE-EAP-015	PAGE:	14 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

Initial perimeter / boundary assessments of process and tank farm areas are intended to determine to the extent possible, if chemical, asbestos, fire, structural, and electrical exposure hazards are present. These surveys should be conducted visually and with four gas detection meters (LEL, O2, H2S, and HC). Personnel performing these assessments may utilize vehicles and shall have bunker gear and SCBA available. These assessments will be performed by HSE / ERT, Operations, and Reliability personnel. Initial surveys will assist in the determination of appropriate personal protective equipment for detailed assessments.

After perimeter surveys are complete, similar but more detailed assessments (visual and with four gas meters) will occur within process and tank farm areas to further identify the potential for chemical, asbestos, fire, and electrical exposure hazards. These assessments will be performed by HSE / ERT, Operations, and Reliability personnel.

After areas have been declared clear of chemical exposure, fire, and electrical hazards, or after identified hazards have been mitigated, structural integrity surveys shall be completed to identify possible structural failure hazards. The structural surveys are intended to identify as much as possible, structures and structural members that have already failed, or have been stressed to the point that they may fail as recovery operations continue. Since cooling towers are very susceptible to wind damage, particular attention should be placed on examination of cooling tower stairs and load bearing members. Special attention should also be given to the potential of structural / support compromise caused by receding water undermining foundation soil. Personnel performing these assessments will typically consist of Reliability Engineering, Operations, Maintenance, and HSE personnel.

After areas have been declared clear of structural failure hazards, or after identified hazards have been visually identified and barricaded, and/or mitigated, operations equipment assessments shall be conducted. These assessments are intended to examine all process pumps, valves, check valves, motors, compressors, heaters, process control equipment, etc to identify damage or process integrity issues that may have occurred. Personnel performing these assessments will typically consist of Operations, Ref Tech, Reliability, and Maintenance personnel.

After the operations equipment surveys have been completed and process equipment integrity problems have been appropriately mitigated, those areas will be declared free of storm hazards and the areas will be turned over to the owning areas for an appropriate level of pre-startup safety review.

DOCUMENT NO:	HSE-EAP-015	PAGE:	15 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

HIGH WINDS, SEVERE THUNDERSTORMS, LIGHTNING AND TORNAOES

This category of severe weather usually occurs on short notice such that organized preparation is not usually possible. However, to the extent that preparation is possible, the applicable checklist items in [Appendix 3: Hurricane Preparedness Phase 1 Pre-Season Checklist](#) ensure an annual review of items related to high winds and severe thunderstorms.

If sustained high winds are predicted, then as a minimum, a general cleanup of the facility should be ordered with special attention given to removing or securing loose items, trash, construction materials and small equipment which could be damaged or become airborne. Winds above 40 mph will make dangerous missiles out of otherwise harmless materials, such as boards, buckets, cans, bottles and even small stones. Loose sheet metal in a high wind is especially dangerous to personnel and to electrical equipment. Flying sheet metal coming in contact with power lines or substation equipment can easily cause a power outage with serious consequences to plant operations.

FLOODING

Flooding from non-hurricane related causes usually happens with little advance warning. In the event such flooding is predicted, the applicable parts of the [Appendix 3: Hurricane Preparedness Phase 1 Pre-season Checklist](#) should be used as a guide in flood preparation actions. Since advance warning may be limited to only a few hours, each individual with severe weather responsibilities should quickly prioritize the actions to be taken (assuming ample time to be available) and ensure that the most critical of those actions are carried out first.

If a plant curtailment or shutdown is ordered and sufficient time is available before arrival of the flood, the "Schedule for Unit Shutdown" shall be followed. If sufficient time is not available for a planned shutdown, then each supervisor shall follow instructions from management, and secure the equipment for which he is responsible in the best manner possible under the circumstances.

DOCUMENT NO:	HSE-EAP-015	PAGE:	16 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

FREEZE PREPAREDNESS PLAN

A hard freeze is defined as the condition existing when temperatures remain below freezing for a period of 6 hours or more. If the possibility of a hard freeze is predicted, preventive measures must be taken to prevent damage to piping and equipment.

All lines subject to freezing must be protected. The cost of repair of even small water lines due to freeze damage can be a major expense both in terms of direct maintenance costs and production lost. Freeze damage, especially to smaller water lines, is virtually always preventable.

The preferred freeze protection method is to drain any line which is subject to freezing. **Allowing a water line to drip as a freeze preventive measure is permissible only as a last resort because dripping results in two serious problems. First, a safety hazard results from the ice formed on the ground or floor, and second, an additional load is placed on the water treatment facility since the dripped water must be collected and treated.**

When freezing conditions threaten, the area around any dripping water line (whether the drip is intentional or not) must be properly barricaded and marked as a hazardous area.

Additional precautions must be taken to protect other utility and process stream lines in the following types of service:

- Instrument air supply lines.
- Process stream and product lines containing product with freeze points, which may be affected by low ambient temperatures.
- Process stream and product lines containing high viscosity hydrocarbons or elemental sulfur.

Each department shall develop its own Freeze Protection Checklist so that operations personnel will be able to take effective preventive action when a hard freeze threatens.

ACTION: By October 31 of each year, each department manager with freeze protection responsibilities shall send the Emergency Management Coordinator written confirmation that the annual review of the department's Freeze Protection Checklist has been accomplished. This written confirmation shall include updated checklists, procedures and other information as appropriate.

DOCUMENT NO:	HSE-EAP-015	PAGE:	17 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

LIGHTNING THREATS

ROLES & RESPONSIBILITIES

Emergency Management Coordinator:

- Owner of this guideline and responsible for providing guidance toward its implementation.
- Initiates notification and training to affected personnel upon modifications to this guideline.

Main Gate Dispatcher:

- Monitors and gathers data from the ImpactWeather Guardian Lightning System.
- Notifies the Plant Shift Superintendent and provides storm / lightning strike specific data when lightning is within 15 and 7 miles of the refinery.
- Provides general announcements when lightning is within 7 miles of the refinery. At the discretion of the plant shift Superintendent, may provide general announcement when lightning has struck within 15 miles of the refinery.
- Provides "Return to normal activity" general announcements when lightning has not struck within 7 miles for 20 minutes.

Plant Shift Superintendent:

- Will acknowledge the lightning threat based on information provided by the Main Gate Dispatcher.
- Will have access to the ImpactWeather Guardian Lightning System to gain first hand knowledge of storm / strike specific data as required.
- Determines if a lightning hazard announcement should be initiated by the Main Gate Dispatcher when notified that lightning is within 15 miles of the refinery.

Supervision (Operations, Maintenance, Contractor):

- Responsible for the safety of their employees working in the refinery.
- Ensures their employees understand the appropriate response to the "7 mile" and "Return to normal activity" general announcements.

Houston Refining Employees and Contractors:

- Responsible for their personal safety while working in the refinery.
- Responsible for understanding the appropriate response for the "7 mile" and "Return to normal activity" general announcements.

PROCEDURAL GUIDELINES

Data Gathering

ImpactWeather will provide lightning threat information and lightning strike data to the refinery via the Main Gate Dispatcher. At various threat levels, ImpactWeather sends appropriate information to identified refinery personnel via email. The Main Gate

DOCUMENT NO:	HSE-EAP-015	PAGE:	18 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

Dispatcher is the focal point for gathering lightning threat data and ensuring notifications are made to appropriate personnel when lightning is identified as a threat to the refinery.

ImpactWeather's Lightning Threat Predictor provides an indication that atmospheric conditions are such, or a known storm is moving so that lightning may occur within the identified threat area. The Lightning Threat Predictor serves as a prompt to initiate a higher level of awareness that lightning is possible within the threat area. ImpactWeather will issue a Lightning Alert via email when the Houston Refinery site is within the threat area. Upon receiving a Lightning Alert, the Main Gate Dispatcher will actively monitor the situation.

Action Points

The first "Action Point" for the Main Gate Dispatcher is a lightning strike within 15 miles of the refinery. Upon receiving notification that lightning has struck within 15 miles, the Main Gate Dispatcher will utilize the ImpactWeather Guardian Lightning System to determine the strike distance from the refinery, the relative location of the strike(s) in relation to the refinery, the direction that the storm which is producing lightning is moving, and the general density of lightning strikes that are being produced. The Main Gate Dispatcher then notifies the Plant Shift Superintendent and provides the information indicated above. Based on the information provided by the Main Gate Dispatcher, the Plant Shift Superintendent will acknowledge the potential lighting threat and recommend continued monitoring of the situation or proceeding to the second "Action Point" at this time.

The second "Action Point" for the Main Gate Dispatcher is a lightning strike within 7 miles of the refinery. Upon receiving notification from ImpactWeather, the Main Gate Dispatcher shall notify the Plant Shift Superintendent of the current situation and that they are going to make a 7 mile general announcement. Unless directed otherwise, the Main Gate Dispatcher will issue the following general announcement:

"This is a general announcement; there is lightning within 7 miles of the refinery.
This is a general announcement."

The third "Action Point" for the Main Gate Dispatcher is a 20 minute lapse without lightning within 7 miles. Upon receiving such notification from ImpactWeather, the Main Gate Dispatcher shall notify the Plant Shift Superintendent of the current situation and that they are going to make a general announcement to return to normal work activity. The Main Gate Dispatcher will then issue the following general announcement:

"This is a general announcement, there is no longer lightning within 7 miles of the refinery. Normal work activity may resume. This is a general announcement."

DOCUMENT NO:	HSE-EAP-015	PAGE:	19 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

Work Curtailment Guidelines When Lighting is within 7 Miles of the Refinery

When a 7 or 15 mile general announcement is made, Operation's personal will continue with their normal duties while being cognizant of the hazards of open areas as listed below. Operation's First Line Supervision shall make the final decision to continue work based on the actual conditions at the work site.

When a 7 or 15 mile general announcement is made, all maintenance employees working in open / exposed areas should notify their supervisor that they are "Safing" up their current work. They should then seek shelter. Examples of open / exposed areas are, but not limited to:

- Confined spaces
- Crane work
- Tank Farms with no overhead equipment
- Docks with no overhead equipment
- Towers with no overhead equipment
- Top decks of structures with no overhead equipment

When a 7 or 15 mile general announcement is made, maintenance employees working in areas with overhead protection / equipment should continue working. Examples of overhead equipment / protection are, but not limited to:

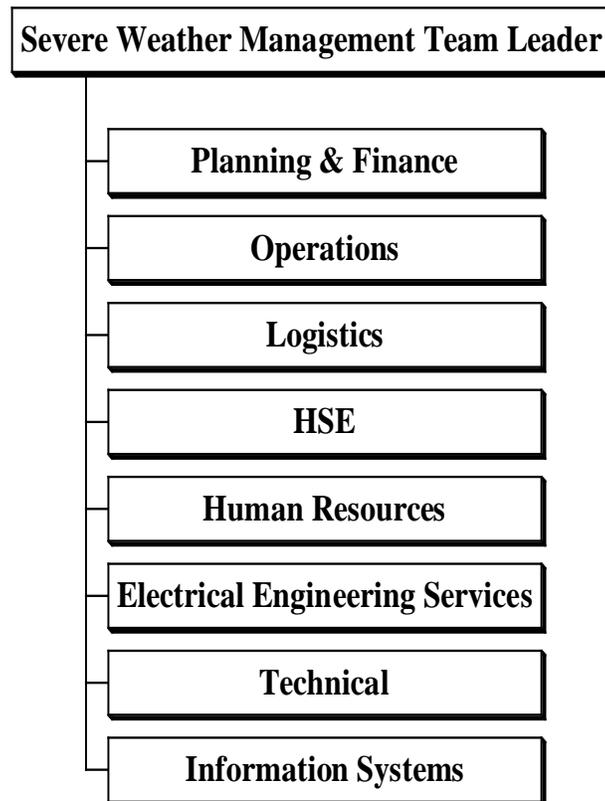

- Areas inside of operating units with structures above and around the area
- Compressor decks with roof structures
- Areas under overhead pipe racks or with overhead equipment
- Crane work with structures above and around the area
- Additional floors of structures
- Fan decks
- Temporary Fabrication shops

Maintenance supervision shall make the final decision to continue work based on the actual conditions at the work site.

APPENDIX 2: STORM TERMINOLOGY

SAFFIR-SIMPSON HURRICANE SCALE					
STORM CATEGORY	WIND VELOCITY	SURGE (FEET)		DAMAGE	EFFECTS
		COAST	BAYS		
One	74-95 MPH Winds	4-5	4-7	Minimal	Minimal damage to building structures. Damage primarily to unanchored mobile homes, shrubbery, and trees. Also some coastal road flooding and minor pier damage.
Two	96-100 MPH Winds	6-8	8-12	Moderate	Some roofing material, door, and window damage to buildings. Considerable damage to vegetation mobile homes, and piers. Small craft in unprotected anchorages break moorings.
Three	111-130 MPH Winds	9-12	13-18	Extensive	Structural damage to small residences and utility buildings with a minor amount of curtain wall failures. Mobile homes are destroyed. Flooding near the coast destroys smaller structures with larger structures damaged by floating debris.
Four	131-155 MPH Winds	13-18	19-24	Extreme	More extensive curtain wall failures with some complete roof structure failure on small residences. Major erosion of beach areas. Major damage to lower floors of structures near the shore.
Five	>155 MPH Winds	18+	24+	Catastrophic	Complete roof failure on many residences and industrial buildings. Some complete building failures with small utility buildings blown over or awry. Major damage to lower floors of all structures located less than fifteen (15) feet above sea level.

SEVERE WEATHER MANAGEMENT PLAN			

HURRICANE TERMS	
TERM	DEFINITION
Tropical Wave	A trough of cyclonic curvature maximum in the trade-winds easterlies. The wave may reach maximum amplitude in the lower troposphere. Showers and thunderstorms occur on the east side of the wave-axis as the wave moves to the west.
Tropical Disturbance	A discrete system of apparently organized showers and thunderstorms that originates in the tropics or subtropics and maintains its identity for twenty four (24) hours or more. It may or may not be associated with a detectable perturbation of the wind field (tropical wave)
Tropical Depression	An organized system of clouds and thunderstorms with a defined counterclockwise circulation (in the Northern Hemisphere) and maximum sustained wind speeds of 38 MPH (33 knots) or less.
Tropical Storm	An organized system of strong thunderstorms with a defined circulation and maximum sustained wind speeds of 39 to 73 MPH (34 to 63 knots). The storm is now given a name.
Hurricane	An intense tropical weather with a well-defined circulation and maximum sustained winds speeds of 74 MPH (64 knots) or higher. The term "hurricane" is used for Northern Hemisphere cyclones from east of the International Dateline to the Greenwich Meridian.
Hurricane Watch	Conditions pose a possible threat to the watch area within 24 hours <i>IMPORTANT NOTE: From the area of highest landfall prediction, hurricane watches have a probability of error of 150 nautical miles. .</i>
Hurricane Warning	Sustained winds of 74 MPH or higher are expected in the warning area within 24 hours or less. <i>IMPORTANT NOTE: From the area of landfall prediction, hurricane warnings have a probability of error of 90 nautical miles.</i>

APPENDIX 5

HURRICANE PREPAREDNESS PHASE 3 CHECKLIST

Phase 3 activities must be completed and documentation sent to Emergency Management Coordinator.

ACTIVITY PHASE 3	RESPONSIBILITY
General	
<input type="checkbox"/> All booms, cranes, dock booms, etc., should be lowered and secured. All gantries should be secured.	➤ Equipment Owner
<input type="checkbox"/> Ensure that all firewall drains are closed.	➤ Tank Owner
<input type="checkbox"/> Check all floating roof tank drains. If any roof drain is not working, it must be repaired immediately. (If a roof drain is blocked off, a heavy rain will sink the roof.)	➤ Tank Owner
<input type="checkbox"/> Protect all non-reinforced glass by taping, boarding up, etc.	➤ Maintenance Manager
<input type="checkbox"/> Plug drain holes and partially fill trash dumpsters with water.	➤ Maintenance Manager
<input type="checkbox"/> Establish 6 Work Orders for recovery efforts. 5 for Asset Teams, and 1 for Plant General	➤ Accounting
<input type="checkbox"/> Fill all in-plant fuel station storage tanks and fuel trucks that are on site	➤ Maintenance Manager
<input type="checkbox"/> Obtain recovery rental equipment that is not already on site	➤ Maintenance Manager
<input type="checkbox"/> Establish Recovery Work Orders. 1 for each Asset Team and 1 for plant General	➤ Maintenance Manager
Information Services	
<input type="checkbox"/> Back up data systems and prepare to shutdown as necessary	➤ Manager Computing Operations, Alternate – Manager Information Services
Electrical and Standby Equipment	
<input type="checkbox"/> Place portable generators in place per operations orders. Install all necessary electrical connections.	➤ Maintenance Manager
<input type="checkbox"/> Fill all trucks and other equipment with fuel. (Gasoline cannot be pumped during a power failure.) Fill 55-gallon drums and have hand pumps available.	➤ Equipment Owner
Emergency Response	
<input type="checkbox"/> Provide safe storage for oil spill boat.	➤ HSE Manager
<input type="checkbox"/> Move oil spill boom and other oil spill pickup equipment to safe location.	➤ HSE Manager
<input type="checkbox"/> Move all emergency response apparatus (fire apparatus, etc.) to safe and logistically proper locations.	➤ HSE Manager
Operations	
<input type="checkbox"/> Remove all exposed and non-supported pressure gauges. Pressure gauges are especially vulnerable to being blown off, which can result in breakage of the associated small piping.	➤ Equipment Owner
<input type="checkbox"/> Ensure that all Cooling Tower Fans are locked out and that Anti-Rotation devices are installed on all fans.	➤ Ops & Maintenance

DOCUMENT NO:	HSE-EAP-015	PAGE:	46 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

Plant Elevators	
<input type="checkbox"/> Cover ventilation louvers on all elevator penthouses to keep storm rain out. Remove the covers as soon as possible after the storm to re-establish adequate ventilation.	➤ Equipment Owner
<input type="checkbox"/> Stop all elevators in position at second floor landings. Do not operate elevators during storm.	➤ Equipment Owner
Standby Personnel	
<input type="checkbox"/> At the completion of Phase 3, release all non-standby and non-essential personnel. Put standby personnel in place.	➤ All Managers

APPENDIX 9

Refinery total Circulation / shutdown Guideline

Last saved: 4/11/2013 1:42 PM

Timing for evacuation

Proper timing in the release and reporting of various personnel groups is essential to help ensure employee safety and adequate facility preparation. The following times are used as a guide for release and reporting. Times indicated are in advance of the predicted arrival of 40 mph sustained winds.

- NOTE: Suppliers plan:
 - N2 –
 - Air Products (top off N2 storage tanks)
 - PraxAir – will maintain N2 supply
 - Hydrogen –
 - PraxAir – will be shutdown 36 hours before landfall
 - Air Products – will maintain H2 supply (300 mile pipeline)
 - **Channelview**
 - Natural Gas –
 - Houston Pipeline – Will maintain NG supply
 - Midcon – will maintain NG supply
 - Coastal Water Authority (CWA) – Raw Water (Will not S/D, may be forced down)
 - Electricity/Steam/Boiler Feed Water/Clarified Water – Calpine S/D plan will match our plan – will continue to monitor process from CCRB
- ❖ 108 Hours – (4.5 days)
 - Operations – Transition operations (all shifts) to 7 – 12's
 - If Shutdown/Startup (SU/SD) Teams are not filled with volunteers, operations to draft employees as needed to meet refinery SU/SD needs
- ❖ 96 Hours – (4 days)
 - Release SU/SD Team and Ride-out Team for home and family preparation
- ❖ 72 Hours – (3 days)
 - Begin the staggered release of non-essential personnel (non ops)
 - Release Assessment Team for home and family preparation
- ❖ 60 Hours – (2.5 Days) **Critical decision on going to min refinery rates and initiating Shutdown of specific listed**
 - Operations – Take refinery to minimum rates with operating personnel not on SU/SD Team
 - Crude rate @180MBD
 - 736/737 Cokers on 4 drum minimum operation based on resid
 - Shutdown 534 Depent, 632 HDS begins processing full range Coker Naphtha
 - Shutdown 630 HDS and begin hot hydrogen sweep. All 536 WWD and 537 Kero to 631 HDS
 - FCCU to min rate – 65MBD

DOCUMENT NO:	HSE-EAP-015	PAGE:	49 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

- ❖ **48 Hours – (2 Days) Critical decision for taking refinery to total circulation**
 - SU/SD Team and Ride out Team report for storm duty
 - Operations – Take all units to total circulation, besides the FCC.
 - The FCC needs to start the shut down process at 48 hours.
 - Release of operations personnel who are not on SU/SD Team / Ride-out Team as unit operational status allows.
- ❖ **36 Hours – (1.5 Days) Critical decision for continued circulation or shutdown**
 - Operations - Take all refinery units to cold state.
 - Release of remaining operations personnel who are not on Ride-out Team as shutdowns are completed
- ❖ **0 – 12 Hours**
 - Final preparations
 - Ride out team in place – no personnel in the field

3rd party vendors of anticipated changes:

- 3rd Party H₂ suppliers
 - Praxair: (800) 926-9620 and hit “1” for the control room
 - Air Products: (281) 478-7562
 - Channelview: (281) 452-8421
- 3rd Party NG suppliers
 - Houston Pipeline: (800) 392-1956
 - Midcon (Kinder Morgan): (713) 769-9200
- Contact CWA for projected water usage to let them know we will be reducing our consumption: (281) 424-2312
- PP delivery – Enterprise: (281) 385-4239 or (713) 667-9431
- BB delivery to Channelview: (281) 452-8399 (tank farm)
- LPG Pipeline: (281) 452-8420 (CHO) and (918) 660-4458 (BP Pipeline)
- Calpine – Communicate consumption/production changes in steam, water, electrical, and the loss of high and low pressure gas. Ensure that Calpine has enough 35% HCL and membrane grade caustic to last for a few days. (713) 456-1338 or (713) 456-1345
- The COC will remain operating until fuel gas is no longer available.
- FCCU O₂ supply and Nitrogen delivery for the Plant – Praxair (listed above)
 - Fill both nitrogen bullets at the MAG and the SRC

Other administrative actions required prior to refinery circulation:

- Notify the Environmental on-call representative for any HSE concerns during shutdown.

DOCUMENT NO:	HSE-EAP-015	PAGE:	50 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

Critical Issues:

- Make sure that product streams are diverted to slop or off-test tank(s) prior to going off-test. Verify all stream line-ups to ensure no tanks are contaminated. Document all changes in C-Notes. **Protect product tank qualities.**
- Monitor all release stream temperatures. **Protect tank temperatures within the established normal ranges.**
- Monitor releases to tanks for vapor flows. Ensure all slop and pump-out systems have good liquid seals.
- Block in amine circulation to/from units as they shutdown. Notify the SRC console operator prior to blocking in circulation.
- The PSS will coordinate all shut down activities and communicate all issues and status updates as needed. Additional help may be required at the CCRB for the PSS.
- This guideline does not replace SOPs and EOPs but should be used as a checklist for plant wide issues and logistics.

Cutter for shut down:

- During the shut down process as we lose cutter supply (LCO, Crude Unit diesel or kerosene will not be available) from the process units. We will have to line up 882-TK (LCO) to the FCCU plot edge where it will be routed to the treated and untreated cutter systems. The following link will open a diagram illustrating the mentioned line-up.

[LCO from 882 to Cutter System](#) **NEED TO FIND LINK**

- A minimum inventory of 30MB of LCO should be maintained in 882 tk during hurricane season. If LCO from 882-TK is unavailable an alternate supply of cutter can be lined up from 609-TK to the low and high-pressure cutter systems once the FCCU is shutdown.
- When 736 shuts down (when 737 is down) the HP cutter pumps will need to be operated to supply cutter to 736 via the 737 cutter system. The HP cutter system can only be routed directly to 737.

Shut down sequence: This is not an all-inclusive list of activities. Unit specific shut-down procedures should be utilized. Shutdown sequence starts with crude rates at min of 180 MBD and Coker running at 4-drum minimum rates. Crude and Coker operations need to coordinate/alternate usage of 550 and 125 steam systems during the shutdown process.

1. Start raising reactor temperatures on 439 Claus units per unit shutdown SOP's to allow for improved heat soak during shutdown process. Repeat this step on all other Claus units
2. 537 Crude Unit and 737 Coker will begin shutting down first. 737 Coker will need to flush their system with 736 CLGO during shut down activities. Remember to divert product streams to slop as they go off-test.

DOCUMENT NO:	HSE-EAP-015	PAGE:	51 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

3. 537 Crude Unit will begin reducing rate and heater firing in order to segregate the Crude and Vacuum Towers prior to circulating both sides. The crude tower will release long resid to the Cokers and resid tankage prior to going on total circulation. Follow the regular unit shut-down SOP.
 - CTOH, diesel and kerosene products will be routed to slop as they go off-test. Evaluate the tank levels and control flow rates in order to manage tank capacities.
 - Vacuum gas oils (LVGO, MVGO, and HVGO) will dump down the tower as vacuum is broke. Continue releasing VGO streams to 594-TK until draw trays are at minimum levels and release resid to 813/814-TK until the vacuum tower is on total circulation.
4. 737 Coker will reduce rate and trip one heater. Stay on long resid as long as necessary
 - Route coker naphtha to hot mix spheres. This requires taking both 736 and 737 Naphtha streams to the spheres (534 Depent should already be down).
 - Bring 632 HDS to circulation as feed becomes low in 585 and 815 tks.
 - Route CLGO/CHGO to 891-TK upon bypassing the 2nd heater.
 - Start flushing cutter (at 537 Crude unit) down the hot feed line once the second 737 heater is bypassed. Route the 537 hot feed line to 801/813/814-TK through the HIC line and 736 hot feed blending area.
5. As the crude and coker units shutdown, the HDS units will begin losing feed and will need to go on partial/total circulation per unit SOP's.
6. The FCCU will be reducing rate during this time and will get down to all cold feed prior to bypass. As the FCCU reduces rates their console operator will need to notify the HDS console operator that they will be stopping hot feed. At this point the HDS console operator should maximize their cold product release to ensure 594-TK does not get too hot. Both consoles will work together to manage 594-TK temperatures.
7. 533 Lubes complex will be reducing rates and going on total circulation. Remember to protect product tanks and follow unit shut down SOP's. Transfer oil as necessary into empty tanks to prevent them from floating if storm presents flooding issues.
8. Approximately 4 hours into the shut down process, begin reducing 536 feed rates and heater firing in order to segregate the Crude and Vacuum Towers prior to circulating both sides. The Crude Tower will be releasing long resid to the Cokers and resid tankage prior to going on total circulation. Follow the regular unit shut down SOP.
 - CTOH, diesel and WWD products will be routed to slop (584 tk) as they go off-test. Evaluate the tank levels and control flow rates in order to manage tank capacities.
 - Vacuum gas oils (LVGO and HVGO) will dump down the tower as vacuum is broke. Continue releasing VGO streams to 594-TK until draw trays are at minimum levels and release resid to 813/814-TK until the vacuum tower is on total circulation.
 - NOTE: Ensure HP Cutter is lined up to Hot/Cold Resid Release lines to Coker/Resid Tks

DOCUMENT NO:	HSE-EAP-015	PAGE:	52 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

9. 736 Coker will reduce feed rates and clear the first heater (6 hours) through a coking drum per SOP. As soon as stable switch to a clean drum with open vents and steam to atmosphere. Following this move, bypass the other heater. Route products to slop as they go off-test and follow the regular unit shut down SOP. **CAUTION: Start the shut-down and bypass procedure on the heater with at least 4 hours of coking since the last switch to prevent having a drum containing un-coked material.**
 - Naptha should already be going to hot mix tanks
 - Route CLGO/CHGO to 891 TK
 - Start flushing (at 536 Crude unit) down the coker hot feed line once the second 736 heater is bypassed. Route the 536 feed line to 813/814-TK through the 736 hot feed blending area.
10. The HDS units will have lost all feed at this time and will be on circulation or hot hydrogen sweep. Remember, all HDS units will have their product lines diverted to off-test tanks by Oil Movements.
 - 630 already sweeping, product release to 609-TK
 - 631 HDS on circulation, product release to 609-TK
 - 632 HDS (OP-400 line) to 618-TK
 - 633 and 635 HDS to 609-TK
 - 634 and 636 HDS should continue maximizing their cold release to the FCCU to protect 594-TK temperatures.
 - 637 HDS to 674-TK
 - **CAUTION: Monitor release temperatures and tower levels closely to protect tanks.**
11. The FCCU will be at minimum rate processing all cold feed and will bypass the reactor. Continue catalyst circulation and start torch oil into the regen to maintain temperature. Float the gas plant on the firing line and low line per SOP.
12. The FCCU blower will remain in operation until the combustor needs to be shutdown. At this point catalyst off-loading will begin on the Regen side and the blower will be shut down.
13. As the FCCU shuts down 637 HDS will lose feed and will need to go on partial/total circulation per SOP.
14. 733 LEF and 735 Unifiner will have been reducing rate and pulling feed from tank as they lose feed from the crude units. Divert Unifiner product to 11/850 tanks. Once feed is lost from the crude units, both towers will be shut down. Adequate H₂ should be available from 3rd party suppliers to sweep and circulate on the Unifiner system.
15. Shut down the BTU Depent as feed is lost. Divert btms product stream to OP-400.
16. 230 Gas Plant will pace the Refinery as much as possible. There will be excess low line gas as units depressure, but will eventually decrease as units go on total circulation and/or shutdown.
17. The BRU towers will be placed on total reflux as feed is lost.
18. The SRU will begin shutting down amine circulation.

DOCUMENT NO:	HSE-EAP-015	PAGE:	53 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

19. The SRU will continually reduce rates as Refinery DEA gas make decreases.
- The Claus units will go on natural gas assist firing and eventually total natural gas firing as rates decrease further.
 - Shut down 439 Claus Unit before 433 and 434 as these units are smaller and will be able to handle lower amounts of DEA Regenerator gas.
 - The TGU's will go on circulation with 440 TGU on recycle blower operation.
 - 435 TGU will remain on line as long as possible with 433 or 434 processing DEA gas.
 - When process gets too low to operate 435, swing all gas to 440, which has a recycle blower.
 - As gas loads allow, shut down 433 and 434 units according to normal unit shut down SOP's.
20. 230 and 236 Gas Plants will be the last Units to shutdown.
- NOTE: Amine circulation will determine timing of 230 and 236 shutdowns

Operations Shutdown Time Line (begins approx 48 hours prior to 40 mph winds)

- From 0-4 hours:
 - 537 Crude Unit goes on circulation. Cutter flows established in hot and cold lines. 635 and 631 HDS units on circulation.
 - 737 Coker; one heater on circulation and one cleared
- From 4-8 hours:
 - 536 Crude Unit on circulation. Cutter flows established in hot and cold lines.
 - 736 Coker; one heater on circulation and one cleared
 - FCCU at minimum rate on all cold feed and preparing to bypass the reactor
 - HDS units on hot H₂ sweep
 - Unifiner shuts down
 - BT Depent down (if running), BRU on reflux/circulation
 - SRU 439 Claus and TGU down, 433 and 434 on natural gas assist
 - Lube Complex will be down.
- After 12-16 hours:
 - All units lined out on total circulation.

DOCUMENT NO:	HSE-EAP-015	PAGE:	54 OF 56
DOCUMENT NAME:			
SEVERE WEATHER MANAGEMENT PLAN			

Plan for Total Refinery Shutdown

- All heaters, pumps, fin-fans, and cooling towers will be shutdown.
- All compressors should be shutdown except on 230 Gas Plant. Shutdown lube oil circulation pumps per procedure.
- Leave coker Fractionator bottoms circulation pumps running
- For heaters: Double block and bleed all fuel and pilot gas. Trip SIS systems as available and field verify.
- Leave flare purges in place
- Leave flare pilots in service
- De-inventory FCCU Catalyst
- Shutdown 236 Gas Plant
- Close Coke drum bottom heads. **Fill coke drums ~50% with water and leave vents open.** Lower the Ideco's all the way into the drum and secure Ideco's and top heads.
- Fill storage tanks with water per procedure
- Shutdown 230 compressors as gas loads allow
- Alarm Management - As units are brought down, unit alarms must be managed in one of the following two ways.
 - Note: Unit alarms cannot be shutdown across the board as they were last year.

PANDEMIC PREPAREDNESS AND RESPONSE GUIDELINE			

SUMMARY

The purpose of the plan is to provide guidelines to preparedness and response measures that should be considered during a pandemic episode that may impact business and operation at the Houston Refinery site. The goal is to reduce the possibility for disease transmission and maintain an effective level of business continuity.

SCOPE & REFERENCES

This procedure applies to all employees, contract personnel and visitors at the Houston Refinery.

- The following documents relate to this procedure
- Corporate Management System Guideline – Pandemic Preparedness & Response
- United States Centers for Disease Control
- United States Department of Homeland Security
- Occupational Safety and Health Administration

DEFINITIONS

Pandemic – Multiple epidemic outbreaks of an infectious disease that is spreading through the worldwide human population.

Pandemic Flu – A virulent flu that causes a global outbreak of the illness. Because there is little natural immunity, nor a vaccine or limited amounts of vaccine, the disease can spread easily from person to person.

Seasonal (or common) Flu – A respiratory illness that can be transmitted from person to person. Most people have some type of immunity, and a vaccine is available.

Non-essential Personnel – Personnel who can work remotely or who can miss two weeks of work without creating significant disruptions to plant operations in the short-term.

World Health Organization (WHO) – The World Health Organization is the United Nations specialized agency for health whose objective is the attainment by all peoples of the highest possible level of health.

DOCUMENT NO:	HSE-EAP-018	PAGE:	3 OF 24
DOCUMENT NAME:			
PANDEMIC PREPAREDNESS AND RESPONSE GUIDELINE			

WHO Pandemic Alert System – The alert system utilized by the WHO to inform the world of the level of pandemic threat. LBI utilizes the WHO as a reference for implementation of the LBI Pandemic Preparedness and Response Plan. A change in the WHO’s alert level to Level 4 will initiate the LBI plan. While the WHO’s system will reflect the global status, the company understands that all parts of the world may not be impacted at the same time. Therefore, implementation of actions at the Houston Refinery will be based on local episodic conditions that could directly impact the refinery.

WHO Alert Level	Description	Trigger
1	Inter-pandemic phase. New virus in animals, no human cases	Low risk of human cases
2		Higher risk of human cases
3	Pandemic alert. New virus causes human cases	No or very limited human-to-human transmission
4		Evidence of increased human-to-human transmission
5		Evidence of significant human-to-human transmission
6	Pandemic	Efficient and sustained human-to-human transmission

DOCUMENT NO:	HSE-EAP-018	PAGE:	4 OF 24
DOCUMENT NAME:			
PANDEMIC PREPAREDNESS AND RESPONSE GUIDELINE			

Lyondellbasell Pandemic Stage Level – The LBI specific plan that specifies the preparedness / response actions to be considered based on local episodic conditions that are currently are have a potential to impact the refinery.

LBI Level	Stage	Description/Trigger
0		WHO moves to the global pandemic phase level 4
1		Confirmed community transmission in your region (Americas, AP/ME, EU)
2		Spread throughout your region or multiple cases in your country
3		Widespread outbreaks in your country or multiple locations in your locale
4		Current confirmed case involving your facility
5		Absenteeism at / beyond critical levels

Facility Pandemic Focal Point – The individual responsible for coordinating the development and assisting with implementation of this preparedness and response plan.

Facility Pandemic Response Team – A cross-functional team consisting of:

Manager(s) – Plant
 Manager – HSSE
 Manager – Health & Safety
 Manager – Emergency Services & Security
 Manager – Human Resources
 Facility Medical Director
 Facility Pandemic Focal Point
 Others as deemed appropriate

ROLES AND RESPONSIBILITIES

HSSE Manager

- Ensuring the information in this procedure is communicated to employees and contractors.
- Overseeing the response and implementation of action plans when alert levels are raised.
- Reviewing local conditions and discussing with corporate HSE as needed.

Managers, Superintendents and Supervisors

DOCUMENT NO:	HSE-EAP-018	PAGE:	5 OF 24
DOCUMENT NAME:			
PANDEMIC PREPAREDNESS AND RESPONSE GUIDELINE			

- Ensuring delivery of official communications and implementation of actions as directed within their area of responsibility when the alert level is raised.
- Reporting information on employees with known pandemic illness like symptoms to the Facility Pandemic Focal Point or Medical

Employees

- Follow the requirements that are implemented as a result of this plan in response to a potential pandemic situation.
- Reporting pandemic illness like symptoms to the Facility Pandemic Focal Point or Medical.

Facility Pandemic Focal Point

- Coordinates the development of the refinery pandemic preparedness and response plan and assist the HSSE Manager in implementation of the plan.
- Communicate with Regional Pandemic Focal Point on behalf of the refinery.

Facility Pandemic Response Team

- Implements the refinery specific pandemic preparedness and response plan.

PROCEDURE

ALERT / STAGE LEVEL GUIDELINES

The recommendations of this plan are provided as guidance toward activity to consider at various stages of pandemic threat. This plan does not require progression from one alert / stage level to the next. The measures referenced in Attachment 1 may be accelerated, delayed or implemented in multiple steps based on local episodic conditions of the illness.

[Attachment 1](#) – Pandemic Preparedness Checklist contains specific items / actions that should to be considered at each of the Pandemic Stage Levels.

WHO Alert Level 3

- Declaration of WHO Alert Level 3 initiates the LBI Pandemic Preparedness measures.
- Local actions at this phase consist primarily of validation of plans and minimum staffing levels, preparation of employee communications, acquisition of infection control supplies and planning for expanded telecommuting.
- Corporate HSE will monitor recognized health organizations to determine the extent of threat to various LBI business regions.
- Refinery HSSE will establish a pandemic specific communication link with corporate via the Regional Pandemic Focal Point.

DOCUMENT NO:	HSE-EAP-018	PAGE:	6 OF 24
DOCUMENT NAME:			
PANDEMIC PREPAREDNESS AND RESPONSE GUIDELINE			

WHO Alert Level 4 / LBI Stage Level 0

Declaration of WHO alert Level 4 initiates the LBI Pandemic Response Plan at LBI Stage Level 0. Local action at this phase consists of a final check of plans and implementation of initial employee communications. Typical communication mechanisms at this level will be via Pipeline and email distribution.

- Convene initial meeting of the Facility Pandemic Response Team to review plans and initiate action as dictated by the situation.
- Monitor the situation via regional/local governmental health agencies to assess the necessary response level and make adjustments as determined necessary.
- Establish communication links with key outside entities such as, suppliers, customers, contractors, etc. The intent of these discussions is to become aware of key entity plans that may adversely impact refinery operations. Adjustments to the refinery plan may become necessary based on the information received.
- Validate plans to include minimum staffing levels (Attachment 2) and essential business functions.

LBI Stage Levels 1, 2 and 3

LBI Stage Levels 1 & 2 are initiated as there is an increase in spread of the target pandemic illness throughout the Americas Region. Level 3 is initiated as widespread outbreaks of the illness occur in the United States, or significant case spread is confirmed locally. Highlights of activity to be considered at Stage Levels 1 & 2 include:

- Continue to assess the local situation to determine if local escalation of the Stage Level is appropriate.
- Continue employee communications. Intensify as dictated by escalation of the illness.
- Educate personnel on the signs and symptoms associated with the target pandemic illness.
- Implement measures to minimize potential spread of the illness within the refinery environment.
- Encourage personnel to stay at home if they begin to show signs & symptoms of the illness, or have a fever. Employees who suspect they have had the illness should not return to work until 24 hours after they are free of a fever without the use of fever reducing medications.

LBI Stage Level 4

LBI stage Level 4 is initiated when a refinery employee or resident contractor is confirmed to have contracted a case of the target pandemic illness. Action at Stage Level 4 is focused toward minimizing the potential for spread of the illness among refinery personnel as highlighted below:

- Minimizing opportunities for transmission of the illness among refinery personnel.

DOCUMENT NO:	HSE-EAP-018	PAGE:	7 OF 24
DOCUMENT NAME:			
PANDEMIC PREPAREDNESS AND RESPONSE GUIDELINE			

- Personnel are to actively monitor employee communications mechanisms (www.hrohome.com, the refinery Info Line 713-321-5775), which will be updated daily.
- Employees who have had the pandemic illness should not return to work for 24 hours after they have been free of a fever without the use of fever reducing medications. Return to work approval will be made by the Medical Department in consultation with the RLT and Health & Safety Management.

LBI Stage Level 5

LBI Stage Level 5 is initiated as absences at the refinery approach or exceeds critical levels. Level 5 is considered a crisis. Activity at Level 5 is focused on maintaining maximum refinery production with the personnel that are available, communicating with appropriate corporate executives, and if necessary, safely shutting down the refinery.

Inter-Pandemic and Post-Pandemic Phases

Pandemic situations are often characterized by waves of periods with significant illness impact followed by periods with less impact. Appropriate preparedness and response activities should continue through the lull periods. The expectation of an oncoming wave should be maintained until it is known that local impact of the illness has passed.

The Inter-Pandemic phase should be utilized to re-evaluate plans and make adjustments if necessary. Re-assessment of defined minimum staffing levels, essential personnel and critical roles necessary to maintain refinery operations, as well as illness prevention measures and supplies should occur during this time period.

The Post-Pandemic Phase begins when it is clear that the pandemic threat has passed. Re-stocking of consumable material shall be undertaken as quickly as resources allow. As with other crisis situations, a formal evaluation of the plan's adequacy and the organization's performance against the plan should be conducted.

EMPLOYEE COMMUNICATIONS

By their very nature, pandemic situations are largely unpredictable. As a result, they can cause significant apprehension among human populations. Proactive and forthright employee communications serve a vital purpose in creating an environment in which personnel feel informed and therefore will support the aspects of this plan. The following suggestions pertain to communicating pandemic related information to employees:

Types of Information to Communicate

Depending on the specific illness, severity, and transmission rate, the following types of information should be considered for communicating to refinery personnel:

- General update information on the developing situation

DOCUMENT NO:	HSE-EAP-018	PAGE:	8 OF 24
DOCUMENT NAME:			
PANDEMIC PREPAREDNESS AND RESPONSE GUIDELINE			

- General information on the specific pandemic illness to include a description of the signs & symptoms
- Basic personal hygiene, protection and infection control measures to include information on effective hand washing and social distancing measures
- Seasonal flu vaccination promotions
- Measures being taken to reduce the potential for spread of the illness
- Communicate to ERT on management of potentially infected personnel
- What to do if you begin to feel ill
- Stay at home if experiencing symptoms of the illness. Do not return until 24 hours after being fever-free
- Self care & family care information
- Expectations for checking in / monitoring refinery communication mechanisms should an employee become ill or need to miss work
- Return to work requirements if an employee misses work due to the illness

Communication Mechanisms

In the initial and developing stages of the pandemic situation, training information and employee communication will typically be via email and the intranet. Face to face employee meetings can also be utilized and are useful for providing employees the opportunity to voice concerns and ask questions.

As a pandemic situation begins to impact the refinery, the communication mechanisms listed above will be supplemented by existing crisis communications systems.

The Refinery INFO Line (713) 321-5775 will be utilized to provide outgoing information to personnel in regard to the current situation and direction for returning to work if they have been impacted by the pandemic illness.

www.hrohome.com will be implemented as absence levels increase and the situation begins to become critical. hrohome.com is a two way system that in addition to outgoing information, allows employees to leave information regarding their status and availability.

TRAINING

Corporate health will develop a pandemic awareness training package. All members of the Facility Pandemic Response Team, key departmental representatives and others critical to managing the pandemic situation are required to participate in this training.

As the situation develops and local conditions require, the Facility Pandemic Response Team will develop and coordinate delivery of employee training and communications to include information on the particular illness and individual responsibilities for managing the situation at the refinery.

Appendix 1: Pandemic Preparedness Checklist

Pandemic Preparedness Checklist				
This checklist provides guidelines for the measures that may be implemented during the threat of a pandemic illness. The measures referenced below for various stages of pandemic development may be accelerated or delayed based on local episodic conditions of the illness.				
ALERT / STAGE LEVEL	ITEMS TO CONSIDER	Dept / Responsibility	Required Action	Priority
Up to WHO 3	LBI Pandemic Preparedness Phase			
	Designate Facility Pandemic Focal Point	HSSE manager		
	Establish Link with Corporate HSE / Regional Pandemic Focal Point	Facility Pandemic Focal Point		
	Monitor sources of information for the potential of emerging health threats (Local & Federal Health Agencies, Media)	HSSE		
	Review and validate Pandemic Preparedness and Response Plan	Departmental Representatives		
	Validate minimum staffing levels necessary to run refinery	Departmental Representatives		
	Prepare employee communications	HR		
	Pandemic Information Intranet Page	HR		
	Information on signs & symptoms of specific illness	HR Medical		
	General information on infectious control measures	HR Medical		
	Self / family care information	HR Medical		
	Communicate to employees as the situation requires	HR		
	Engage IS for increased telecommuting possibility	Facility Pandemic Focal Point

Pandemic Preparedness Checklist				
This checklist provides guidelines for the measures that may be implemented during the threat of a pandemic illness. The measures referenced below for various stages of pandemic development may be accelerated or delayed based on local episodic conditions of the illness.				
ALERT / STAGE LEVEL	ITEMS TO CONSIDER	Dept / Responsibility	Required Action	Priority
	Ensure adequate stockpiles of soap, paper towels, surface disinfectants and hand disinfectants are adequate	Health & Safety Purchasing		
	Ensure stock of disposable filtering facepiece respirators (N95/FFP) are adequate. Consider 2 per shift per # employees utilizing for 4 weeks.	Health & Safety Purchasing		
	Plan for illness specific absence monitoring	HR		
LBI Stage Level 0	WHO move to Global Pandemic Phase 4			
	Convene initial meeting of the Facility Pandemic Response Team	Facility Pandemic Focal Point		
	Monitor sources of information to determine extent of threat	Facility Pandemic Focal Point		
	Activate internal communications as necessitated by the situation	Facility Pandemic Response Team HR		
	Establish communications link with key outside entities such as suppliers, customers, contractors, etc.	Facility Pandemic Response Team Departmental Representatives		
	Determine Refinery Access Points and Gates that will be closed should the situation continue to develop and begin to impact the immediate area	Facility Pandemic Response Team Security

Appendix 2: Pandemic Minimum Staffing Guidelines

Management / Leadership

- 2 RLT members on site required (days)

Operations (PSM Based):

Supervision:

- Plant Shift Superintendent - 1 days / 1 Nights (7 X 12 schedule no days off)
- Shift Supervisors – 2 days / 2 Nights (7 X 12 schedule no days off)

Crude

- Crude Console – 2 days / 2 Nights (7 X 12 schedule no days off)
- Crude LOP – 5 days / 5 Nights (7 X 12 schedule no days off)

HDS (Current as of Sept 1. Collapse in progress)

- HDS Console (Currently pre collapse)
 - LT HDS Console - 1 days / 1 Nights (7 X 12 schedule no days off)
 - HVY HDS Console - 1 days / 1 Nights (7 X 12 schedule no days off)
 - Reform Console - 1 days / 1 Nights (7 X 12 schedule no days off)
- LT HDS LOP - 4 days / 4 Nights (7 X 12 schedule no days off)
- HVY HDS LOP - 4 days / 4 Nights (7 X 12 schedule no days off)
- Reform LOP – 2 days / 2 Nights (7 X 12 schedule no days off)

FCCU

- FCCU Console – 2 days / 2 Nights (7 X 12 schedule no days off)
- FCCU LOP – 5 days / 5 Nights (7 X 12 schedule no days off)

Coker

- Coker Console – 2 days / 2 Nights (7 X 12 schedule no days off)
- 736 Coker LOP – 5 days / 5 Nights (7 X 12 schedule no days off)
 - Kinder Morgan support required
- 737 Coker LOP - 4 days / 4 Nights (7 X 12 schedule no days off)

Lubes / Utilities / Loading Rack

- Lubes/Utilities Console - 1 days / 1 Nights (7 X 12 schedule no days off)
- Lubes LOP – 2 days / 2 Nights (7 X 12 schedule no days off)
 - Stand alone process could be shutdown – large number of support folks at loading racks, Pumping and blending, and Lab that could be taken off of required list if we made this decision.
- 533 Pumping and Blending LOP – 2 days and 1 nights (2 day employees needed 5 days a week and 1 day employees on weekends – 1 night person 7X12 schedule)
 - If Lubes is shutdown – required employees could be 1 day and 1 night for fire watch only.
- Utilities LOP - 4 days / 4 Nights (7 X 12 schedule no days off)
- Loading Rack – 4 days to support Lubes business – could go to 2 if Lubes is down (with Lubes down will still need to load and unload caustic)

DOCUMENT NO:	HSE-EAP-018	PAGE:	18 OF 24
DOCUMENT NAME:			
PANDEMIC PREPAREDNESS AND RESPONSE GUIDELINE			

SRC

- SRC Console – 2 days / 2 Nights (7 X 12 schedule no days off)
- SRC LOP – 5 days / 5 Nights (7 X 12 schedule no days off)

OM/Docks

- OM/Docks – 5 days / 5 Nights (7 X 12 schedule no days off)
 - At least 2 of the 5 would need to be qualified on the docks.

Lab

- “C” Lab – 2 days / 2 Nights (7 X 12 schedule no days off)
- “C” Lab Days – 2 days if Lubes continues to run
- “A” Lab – 2 days / 2 Nights (7 X 12 schedule no days off)
- 1 Staff member – manage supplies, CofA, ISO approvals

Maintenance

- Electrical/Power distribution Techs – 4
- Analyzer Techs – 2
- DCI Techs – 2
- Instrument Techs – 2
- Machinists – 4
- Ref Mechs – 4
- Special Equipment Operators – 1
- Radio Techs – 1
- Facilities – 2
- Warehouse - 1
- Maintenance Supervisors – 3

Reliability**Fixed Equipment**

- 2 Engineers
- 2 Inspectors

Machinery / Rotating Equipment

- 5 personnel (1 per asset team)

IEA

- 2 Instrument Engineers (one staff level and one asset team)
- 2 Instrument Specialists
- 1 Electrical Specialist
- 1 Electrical Engineer
- 1 Analyzer Specialist
- 1 Analyzer Engineer

DOCUMENT NO:	HSE-EAP-018	PAGE:	19 OF 24

PANDEMIC PREPAREDNESS AND RESPONSE GUIDELINE			

Appendix 3

Appendix D to Sec. 1910.134 (Mandatory) Information for Employees Using Respirators When Not Required Under the Standard

Respirators are an effective method of protection against designated hazards when properly selected and worn. Respirator use is encouraged, even when exposures are below the exposure limit, to provide an additional level of comfort and protection for workers. However, if a respirator is used improperly or not kept clean, the respirator itself can become a hazard to the worker. Sometimes, workers may wear respirators to avoid exposures to hazards, even if the amount of hazardous substance does not exceed the limits set by OSHA standards. If your employer provides respirators for your voluntary use, or if you provide your own respirator, you need to take certain precautions to be sure that the respirator itself does not present a hazard.

You should do the following:

1. Read and heed all instructions provided by the manufacturer on use, maintenance, cleaning and care, and warnings regarding the respirators limitations.
2. Choose respirators certified for use to protect against the contaminant of concern. NIOSH, the National Institute for Occupational Safety and Health of the U.S. Department of Health and Human Services, certifies respirators. A label or statement of certification should appear on the respirator or respirator packaging. It will tell you what the respirator is designed for and how much it will protect you.
3. Do not wear your respirator into atmospheres containing contaminants for which your respirator is not designed to protect against. For example, a respirator designed to filter dust particles will not protect you against gases, vapors, or very small solid particles of fumes or smoke.
4. Keep track of your respirator so that you do not mistakenly use someone else's respirator.

[63 FR 1152, Jan. 8, 1998; 63 FR 20098, April 23, 1998]

Respiratory Protection Awareness Training
Voluntary Use of Disposable Dust Masks

Who is this information for?

This handout must be reviewed by anyone who uses a single-use filtering facepiece (i.e. disposable dust mask) on a voluntary basis.

Misuse can be hazardous

If a respirator is used improperly or not kept clean and disinfected, the mask itself can become a hazard to you.

DOCUMENT NO:	HSE-EAP-018	PAGE:	22 OF 24
DOCUMENT NAME:			
PANDEMIC PREPAREDNESS AND RESPONSE GUIDELINE			

If Houston Refinery provides masks for your voluntary use, or if you utilize your own mask/respirator, you must take the following precautions to be sure that the mask itself does not present a hazard.

Precautions you must take before use

The following must be assured:

Disposable dust masks may only be worn at the request of employees if the facility determines that the masks will not by themselves create a hazard.

The mask selected is certified for use against the contaminant. A label or statement of certification should appear on the respirator packaging.

Particulate dust masks may not be worn in areas where contaminant concentrations may exceed recommended or government mandated exposure limits or in oxygen deficient atmospheres.

For example, a respirator designed to filter dust particles will not protect you against gases, vapors or very small solids particles of fumes or smoke.

Individuals who choose to wear dust masks are NOT cleared to use half face or full face air-purifying respirators (APR) or perform any job requiring the use of these respirators without being included in the facility's respiratory protection program.

No medical clearance is required for disposable dust mask users.

No fit testing is required for disposable dust mask users.

Precautions you must take during use:

Follow all instructions provided by the Respiratory Program Coordinator.

Follow the manufacturer's instructions provided with the mask (usually in the packaging) regarding use, maintenance, care, cleaning/disposal, storage and limitations.

Fitting Instructions: These must be followed each time the mask is worn.

Cup the mask in your hand, with the nosepiece at your fingertips, allowing the headbands to hang freely below your hand.

Position the mask under your chin with the nosepiece up. Pull the top strap over your head resting it high at the top back of your head. Pull the bottom strap over your head and position it around the neck below the ears.

Place your fingertips from both hands at the top of the metal nosepiece. Using two hands mold the nose area to the shape of your nose by pushing inward while moving your fingertips down both sides of the nosepiece.

Pinching the nosepiece using one hand may result in improper fit and less effective mask performance. Use two hands.

REVISION SUMMARY

NOTE: If the changes proposed in this change log are typos or minor grammatical corrections that do NOT affect the intent of the policy only approval from the "Document Owner" is required. All policy intent changes must be approved by the HSSE Manager.

Date	Proposed By	Description of Change	Approved By/Date
2/24/2011	S. Kuhfeldt	Reformat, reorganize and regulatory review of procedure	

Houston Refining LP	DOCUMENT: HSE-ENV-610 Page: 1 of 4		
MANUAL: Environmental Department SOP Manual	REVISION NUMBER: 4	REVISION DATE: 06-10-13	
DOCUMENT TITLE: On-Site Waste Activities	EFFECTIVE DATE: September 12, 2002	EXPIRATION DATE: None	
WRITTEN/REVISED BY: Mike Godfrey, Principal Engineer	REVIEW FREQUENCY: 5-Years		
APPROVER NAME/TITLE: Roel Munoz, Environmental/DOT Supt.	SIGNATURE:	DATE:	

1.0 SUMMARY

The purpose of this procedure is to provide guidelines for waste handling and on-site disposition of waste generated at Houston Refining LP (HRO).

The procedure will define the roles of the Environmental Department, the Solid Waste Coordinator, Operations, Maintenance, and other affected groups.

2.0 SCOPE

This procedure applies to all Operations, Maintenance, Laboratory, and construction areas generating waste materials, including any hydrocarbon spills.

3.0 SUMMARY OF ROLES AND RESPONSIBILITIES and DEFINITIONS

3.1 Operations, Maintenance, Laboratory, and Construction personnel are responsible for notifying the Solid Waste Coordinator (SWC) at least ten (10) days prior to waste generation from activities such as unit or tank cleanouts, construction work, building renovations, and/or maintenance and turnaround activities.

3.2 The Solid Waste Coordinator is responsible for assisting Operations, Maintenance, and Construction personnel in properly containerizing and storing of waste material, including spilled hydrocarbons or spills of hazardous material. The SWC is responsible for ordering the proper containers and having them placed at the appropriate site for the job. The SWC will collect samples of the waste material for analytical testing, submit them to an approved laboratory, following the proper chain of custody, for waste characterization, and will evaluate the results and assign waste code numbers. The SWC will schedule the movement of solid wastes to storage and to final disposition, and the SWC will determine the land treatment plot that will be used for on-site waste disposition (non-hazardous waste only).

3.3 The Environmental Department is responsible for remaining current on all federal and state regulatory requirements, and for providing regulatory and technical guidance to the plant personnel, including the SWC.

3.4 DEFINITIONS

Unit Staging Area: A unit staging area is a designated place for temporary storage of waste on the unit. The unit staging areas should be clearly marked and a sign placed there to identify it as such. A unit may contact the SWC to establish a unit staging area.

DOCUMENT NO.	HSE-ENV-610	REVISION NO.	4
REVISION DATE:	06/10/13	PAGE:	2 OF 4

Plant Trash: Plant Trash consists of pallets, cardboard, office waste, empty bags, wire/metal bands, and food waste.

Oily Wastes: Oily Trash may consist of anything that is contaminated with hydrocarbons. Examples of oily trash are all process filters, oily personal protective equipment (slickers, gloves), oily rags, and floor dry that has been used to clean up a spill.

Land-farms: Facility units for the treatment and/or disposal of industrial solid waste subject to permit limitations defined by the Texas Commission on Environmental Quality (TCEQ). Land farms are fixed biological treatment areas that break down organics into carbon dioxide and water. In the past, HRO has been authorized to operate both hazardous and non-hazardous land treatment units (land-farms) to manage only wastes generated on-site. However, HRO no longer operates "active" hazardous waste land-farms; hazardous waste can no longer be placed on these sites.

4.0 PROCEDURES

4.1 Operations and Maintenance shall:

- 4.1.1 Notify the SWC at least ten (10) days prior to the onset of any scheduled activity that will generate a waste. This will ensure appropriate time to secure containers, obtain samples of the waste stream, and determine strategy for storage of the waste material, as necessary. For spills of hydrocarbons or hazardous materials, the SWC shall be contacted immediately, either by radio, telephone, or by pager so that he/she can respond quickly with appropriate equipment to clean up the spill, sample, and dispose of the spilled material according to all regulatory requirements.
- 4.1.2 Identify any empty drums or drums containing waste material and place these in the staging area on the unit. Plant trash should not be placed in the unit staging area. Empty drums are picked up from each unit twice weekly (Tuesday and Thursday). In order to be placed on the schedule for drum pick-up, units must contact the SWC and request drum pickup. All pickups for waste material (except plant trash or oily trash) must be arranged with the SWC.
- 4.1.3 Unit personnel are responsible for segregating plant trash from oily trash. Each unit has been provided with small HRO dumpsters designated for plant trash. Plant trash roll-off boxes are located at the plant trash ramp adjacent to Marine Vapor Combustor Unit. Transportation is responsible for emptying each unit's plant trash dumpster into the trash boxes at the plant trash ramp.

DOCUMENT NO.	HSE-ENV-610	REVISION NO.	4
REVISION DATE:	06/10/13	PAGE:	3 OF 4

- 4.1.4** Each unit should have a designated receptacle for oily trash. Transportation can provide separate dumpsters for each unit or maintenance area. If smaller receptacles for oily trash are needed, the SWC can provide these. These should be clearly labeled for oily trash. Oily trash should not be placed into the plant trash dumpster. The oily trash and process filters are taken to a separate roll-off box at the plant trash ramp (30 yd. container designated by signs) by the HRO transportation department. Drums or small receptacles for oily trash are emptied by the Waste Operations Crew and returned weekly.
- 4.1.5** Any waste that is placed into the pickup area or called in must be properly labeled or identified on the container. Examples: "Waste Lube Oil", "Charcoal from HVAC System", "Paint Waste". Hazardous wastes will be given priority.

5.2 The Solid Waste Coordinator shall:

- 5.2.1** Assist each unit in establishing a temporary unit staging area.
- 5.2.2** Schedule each unit for pick-up of empty drums/containers and waste material from the designated unit staging area.
- 5.2.3** Assist Operations personnel with clean-up of hydrocarbon spills by providing equipment and personnel to clean up, package, sample, and dispose of the spilled material in compliance with all applicable regulations. The SWC shall utilize qualified contractor personnel as necessary to achieve removal and disposal of the spilled material as quickly as possible. If possible, recovered hydrocarbons shall be recycled through the refinery's slop oil system.
- 5.2.4** Drums and containers shall be inspected and their integrity assured prior to being moved.
- 5.2.5** Prior to storage of waste at East or West Staging, all containers are labeled with a completed hazardous or non-hazardous label (with accumulation dates). Unlabeled containers or containers whose contents are unknown are to be labeled as hazardous until the contents are positively identified and labeled. Drums or roll-off bins containing hazardous and non-hazardous waste will be transported and stored at East or West Staging by the Waste Operations crew.
- 5.2.6** Maintain a waste tracking database containing current inventories of East and West Staging areas. Ensure that hazardous waste is not stored at HRO for more than 90 days.
- 5.2.7** Direct the Waste Operations crew in obtaining and preserving samples for waste stream characterization and proper disposal or recycling.

DOCUMENT NO.	HSE-ENV-610	REVISION NO.	4
REVISION DATE:	06/10/13	PAGE:	4 OF 4

- 5.2.8 Following review of the analytical data, schedule the pickup of the waste stream from the East or West Staging.
- 5.2.9 Coordinate all waste movements (on-site and off-site via manifests) with Data Management Department personnel to ensure an accurate account of the waste stream, number and type of drums, and quantity of material being shipped.
- 5.2.10 Manage staging areas so that these meet safety and regulatory requirements.

5.3 The Environmental Department shall:

- 5.3.1 Assist the SWC as needed in submitting samples to an approved laboratory for waste analysis for characterization and loading.
- 5.3.2 Assist the SWC in reviewing analytical results, verifying the validity of results, and in assigning the appropriate waste code number.
- 5.3.3 Data Management personnel shall maintain a waste database, and prepare internal and external waste manifests as needed.

6.0 CHEMICALS INVOLVED, MSDS NUMBERS, REPORTABLE QUANTITY

Waste material encompasses a variety of compounds and chemicals. Material Safety Data Sheets are referenced to determine specific chemicals that may be in the waste material. Analytical evaluation along with process knowledge of the material and of the process generating the waste material is gathered to characterize each waste stream.

7.0 PERSONAL PROTECTIVE EQUIPMENT

The Supervisor of personnel involved in the waste handling operation will determine the proper personal protection required using information from the MSDS, analytical results, and area monitoring. For specific chemical guidance, see attached chart "Chemical Agent Identification and PPE Determination". Call Industrial Hygiene if you have any questions about proper personal protective equipment to be used for a job.

8.0 WASTE MINIMIZATION ACTIONS

Each unit/area should ensure that activities and practices are in place to prevent or reduce the generation of waste materials. Activities such as source reduction and reuse/recycling of waste through operating procedure changes can greatly reduce the quantity of waste generated at HRO. Avoid mixing contaminated material with clean or uncontaminated material or soil. Do not mix hazardous waste with non-hazardous waste because this severely limits disposal options and increases disposal costs.

Subj: Your Request for Alternative Compliance with Title 33 CFR 156.170(c)(4)

Re: Your letter dated December 12, 1991

Dear Sir:

I have reviewed your request for an alternative compliance from Title 33 Code of Federal Regulations (CFR) Section 156.170(c)(4), regarding the annual pressure test of transfer pipe systems.

During my tour of your facility I noted the primary containment and the topography of the secondary facility containment which would drain any oil spills upland of the dock area into a catchment system. I find your overall facility containment system provides an equivalent level of safety and protection from pollution by oil or hazardous materials. Consequently, I am granting your request to require that your pipe systems only be tested back to the first valve on shore. A copy of this letter will be maintained in your facility file for future reference.

This practice is considered an acceptable alternative in accordance with Title 33 CFR 154.107. Should this procedure change you must notify me. If you have any questions, please feel free to contact Lieutenant Junior Grade Clapper of my staff at the above number.

Sincerely,

R. J. Prosser

Mr. Edward K. Roe
Clean Channel Assoc.
P.O. Box 2489
Houston, TX 77252-2489

Dear Mr. Roe:

I have completed a review of your organization's resources and records for the purpose of determining your classification level as an Oil Spill Removal Organization. This review included a visit to your response resource sites and was conducted as outlined in Coast Guard Navigation and Vessel Inspection Circular 12-92 (NVIC 12-92) and NSFCC Instruction 16480.1 dated June 1993. The review has resulted in the following determination:

FINAL CLASSIFICATION for the following environments:

CLASS E - River & Canal Environment
CLASS E - Inland & Nearshore Environment

You have been assigned OSRO Classification Number 011. Enclosure (1) to this letter provides a summary of the response resources available at each of your sites. You must provide this letter and list to any client wishing to name you as their OSRO for the purposes of vessel and facility response plans. This list will help them determine if you can provide sufficient resources to the required location(s) within the response times necessary for their response plans. This list will also be provided to all Coast Guard response plan reviewers, who will check it against the response plans that have been submitted to them for approval.

If you have questions regarding your final classification or information in the attached sheets, please contact CDR Dave Giraitis of my staff at (919) 331-6005.

Sincerely,

D. S. JENSEN
Captain, U.S. Coast Guard
Commanding Officer

Mr. Edward K. Roe
Clean Channel Association
111 East Loop North
Houston, TX 77029

Dear Mr. Roe:

Your application for classification as an Oil Spill Removal Organization (OSRO) has been reviewed and processed as outlined in the Coast Guard OSRO Classification Guidelines dated 28 December 1995.

Enclosures (1) and (2) to this letter provide a summary of your interim classifications by environment and COTP zone, and a summary of the resource totals for Temporary Storage Capacity (TSC), Effective Daily Recovery Capacity (EDRC) and boom used to determine these classifications. A copy of this letter with enclosures (1) and (2) should be provided to your current and potential clients. A complete listing of all of your resources can be downloaded from the RRI Bulletin Board System at (919) 331-6039/6042 or, if you prefer, we can mail a printout to you upon request.

You will be contacted in the near future to schedule a resource verification visit. Final classification will be issued following completion of resource verification. If you have any questions regarding your classification, please contact LTJG George Ganoung of my staff at (919) 331-6000, ext 3041.

Sincerely,

Re: Issuance of Discharge Cleanup Organization Certificate,
DCO-504

Dear Mr. Roe:

Congratulations! You have been certified by the Texas General Land Office as a Discharge Cleanup Organization. This certification allows you to be listed as a clean up contractor by facilities in their facility response plan. Additionally, this allows the General Land Office to utilize your services in a state funded spill response.

During the review process we noted items in your application that need clarification. These items and a specific explanation statement will follow under separate cover.

As stated in the regulations, the maintenance of this certificate will require an annual review of each DCO. During this inspection, spill response documentation from the preceeding months will be reviewed along with new items that can improve spill response and coordination. Your organization is encouraged to maintain the highest response standards possible and to view your response duties as an opportunity to minimize environmental impact, as well as operate a profitable business.

The certification process is not a static situation. As in all emergency response operations, continued refinement of operations will be necessary through increased training and in some cases equipment purchase. The implementation of federal oil pollution standards is progressing forward and these standards could well change the nature of spill response and preparedness. Please stay tuned to the processes.

Thank you for your information submitted with the application packet. Additionally, I would like to thank you for the cordial atmosphere you created for my inspection staff.

Sincerely,

Timothy G. McKinna
Timothy G. McKinna, Deputy Commissioner

RE: Discharge Cleanup Organization (DCO) Certification

Dear Mr. Glen:

Enclosed is your updated DCO certificate. It is valid for three years from the date shown as long as your company continues to meet minimum certification requirements. Those requirements include, among other things, notifying the General Land Office of any change of ownership or of any major change in equipment or personnel.

We thank you for your participation in this important program and look forward to working with you in the future.

Sincerely,

Robert L. Rivera
DCO Program Administrator

Letter of Promulgation

This page promulgates the Clean Channel Association Resource Manual. The purpose of the manual is to provide operating personnel with the information they will need to initiate a Clean Channel Association (CCA) response to a spill. The manual is condensed from the previous Response Plan. It is predicated on the fact that the spiller is responsible for directing all activities associated with the spill. If the spiller is unknown or takes inadequate action, the government, through the U. S. Coast Guard or Texas General Land Office, assumes that role. CCA does not manage a spill but provides resources (and technical advice) to the spiller. CCA provides on-water containment and removal equipment. CCA will generally limit deployment activities to medium or major spills, i.e. 10,000 gallons or more. However, if the spiller needs technical support for any size spill or potential spill, always call CCA.

S. P. Glenn

1. CALL OUT PROCEDURES

- A. The activation of a CCA response is accomplished by contacting the administrative director or any CCA employees. Contact can be accomplished by telephoning as follows:

Administrative Director: Phil Glenn

CCA Office: 713-534-6195
 Fax: 713-534-6197
 Home: (b) (6)
 Cellular phone: (b) (6)
 Email: phil@cleanchannel.org

Equipment and Maintenance Supervisor: Steven Bigby

Home: (b) (6)
 Cellular phone: (b) (6)
 Email: steven@cleanchannel.org

Administrative Assistant: Karen Storm

Cellular phone: (b) (6)
 Email: karen@cleanchannel.org

Training Specialist: William (Bill) T. Hand

Cellular phone: (b) (6)
 Email: bhand47@yahoo.com

- B. If unable to contact CCA staff, T&T Marine Salvage (CCA's equipment managers/operators) can be contacted directly to activate CCA resources. T&T's 24 hr. number is 281-488-5757.

T&T Marine Salvage: Ronnie Rouse
 Cellular phone: (b) (6)
 Email: ronnier@tandtmarine.com

- C. **In extraordinary emergency situations (such as hurricane evacuation) if the above numbers are not working, please call 281-513-7172. This phone will not be available during normal operations.**

- B. When contact is made, the following information should be provided to CCA:
- Name and contact number of person calling, date, time, telephone number of responsible party's contact person
 - Spiller
 - Source of spill (vessel name, pipeline, etc.)
 - Material spilled, including any hazards involved (provide copy of MSDS)
 - Quantity spilled
 - Location of spill
 - Confirmation that USCG and GLO have been notified
 - Assistance requested of CCA to be activated immediately
 - If immediate assistance is not requested what resources are desired to be alerted and put on standby
 - Locations that assistance is required (potential staging areas are listed in Appendix 2)
 - Name of spiller's representative at each location
- C. Upon receipt of the above information, CCA will ensure that CCA can safely respond. The assistance requested will then be compared with CCA's resource listing to identify the resources most nearly meeting the spiller's request. Once identified, the contractor or member able to provide the resources will be contacted by CCA, provided the above information, and requested to respond. Once a commitment to respond has been obtained, the spiller will be notified of specific resources, including personnel, responding, and the location(s) they are responding to. Upon activation of CCA's Response Network and after initial responders have been requested all other members will be notified. Members will be requested to prepare their equipment for deployment and standby for further guidance.
- D. Efforts should be made to place the responding resource in contact with the spiller's representative as soon as possible. The earlier they are in contact, the more coordinated the effort will be.

4. RESOURCES

The resources available to CCA for response activities are listed on the following pages. CCA maintains the highest OSRO classification: MM/W1-W3, River/Canal/Inland, for Facilities and Vessels in both Houston and Port Arthur COTP zones. CCA is also certified as a Discharge Cleanup Organization by the Texas General Land Office.

RESOURCE SUMMARY CLEAN CHANNEL/MEMBERS/CLEAN CHANNEL CONTRACTOR

	6 HRS	REQUIRED
Containment Boom	69,050'	30,000'
Derated Recovery Capacity	55,813 bpd	50,000 bpd
Storage Capacity	(b) (7)(F), (b) (3)	

Note -Storage Capacity -Effective storage is 24,000 BBLs per day greater than actual storage capacity due to Houston Fuel Oil's ability to decant 1,000 BBLs per hour of recovered oil into a process system at one of Houston's refineries.

11200 Westheimer, Suite 850
Houston, TX 77042
Office: 713-977-9951 or 1-800-899-4672 for emergencies

4.2.2 FIREFIGHTING

There are several sources of assistance in fighting fires in the Houston/Galveston area in addition to local, municipal fire departments. Some of these resources are limited in their knowledge of shipboard fires, a fact that must be continuously considered during a shipboard fire. **REMEMBER TO GET THE SHIP'S FIREFIGHTING PLAN FROM THE RED TUBE AT THE TOP OF THE GANGWAY.**

A. CIMA (CHANNEL INDUSTRIES MUTUAL AID)

Houston Area (24)713-473-9191

CIMA is an industry mutual aid organization. Member companies respond with landside resources, both personnel and equipment, to assist the member experiencing an emergency. The member experiencing the emergency directs response operations.

B. PORT OF HOUSTON FIREBOATS

All Boats.....713-670-3620

The Port of Houston maintains fireboats at Barbours Cut, Greens Bayou, and Woodhouse Terminal in Galena Park. They are continuously manned by a Captain and an engineer, and draw firefighters from the local fire station.

The Bracewell and Tellepsen are 68' in length, each equipped with two 2000 gpm pumps and three monitors; and carry 1000 gallons of foam. The Captain Farnsworth is 80' in length and has two 3000 gpm pumps and three monitors, and carries 2000 gal. of foam.

C. WILLIAMS FIRE & HAZARD CONTROL, INC.

1675 Texla Road

Vidor, TX 77662

Office: 409-727-2347; 1-800-231-4613

Emergency: 281-999-0276 Houston, TX

D. WILD WELL CONTROL INC.

22730 Gosling Road, Spring, Texas 77389

Office: 281-353-5481

E. SEABROOK FIREBOAT

Office: 281-474-2101

The Seabrook Volunteer Fire Department has a fireboat located at Seabrook.

4.2.3 LIGHTERING

In many spill events it is necessary to lighter cargo. In addition to CCA's lightering capability the following firms offer pumping services for lightering operations.

A. MARIFLEX

Pasadena Texas 77503

Office: 713-534-7100

VAC TRUCK COMPANIES**B. UVAC**

3120 Pasadena Freeway

Pasadena, TX 77503

Office: 713-473-5588

24-hr. 1-888-696-8822

www.uvac.com**C. SWS ENVIRONMENTAL SERVICES**

1700 North E St

La Porte, TX 77571, United States

(281) 867-9131

www.swsenvironmental.com**4.2.4 SALVAGE**

Vessels and waterfront facilities involved on casualties may need assistance in stabilizing the situation and eliminating further threat. This is typically through effecting temporary hull repairs and removing a grounded/sunken vessel. Resources in the Houston/Galveston area offering those services are listed below.

A. T & T MARINE SALVAGE, INC.

9723 Teichman Road
Galveston, Texas
Office: 281-488-5757

4.2.5 DISPOSAL SITES

The preferred method of disposal for oil recovered from the water's surface is to reclaim the oil by reprocessing it at a local refinery. The facility to which the oil was destined will be the facility of choice. The following are firms which can handle disposal of recovered oil/debris which cannot be reclaimed.

A. CLEAN HARBORS

Deer Park, Texas
Office: 281-930-2300

Should a temporary site be necessary to store debris, the site selected must be covered with a liner to prevent further ground contamination. If possible a shallow excavation should be made to prevent run-off. If not possible a "ditch", also lined, should be dug around the temporary storage site to contain the run-off, which may be caused by rain or the oil itself heating and becoming fluid. A source of lining material is:

POLY-FLEX POLYETHYLENE GEOMEMBRANES

2000 West Marshall Drive
Grand Prairie, Texas 75051
Office: 972-647-4374 Ext. 7269 Emergency: 1-800-527-3322
Fax: 972-337-7233

4.2.6 AVIATION RESOURCES

During a medium or major spill, it is necessary to use aircraft to track the oil, direct response efforts, and document through photography.

A. PHI

24-hour phone: 337-235-2452

B. PARADIGM HELICOPTERS

Corporate	Response Rate Schedule Domestic	Schedule
Operations		Rev. June 2011

Automotive Equipment

Automotive Equipment Hourly Rates charges are portal to portal. A four (4) hour minimum time will be charged on all call-outs. Equipment / auto / truck charges do not include fuel, which will be invoiced separately. A mileage charge of \$0.50 per mile after the first 50 miles will be added for all Motorized Equipment, including automobiles and pick-up trucks, in addition to the applicable fuel surcharge(s). Unless GESI applies a flat fuel surcharge as referenced herein, fuel surcharges will be applied based on the Hourly/Daily Equipment/Vehicle rate on all Motorized Equipment pursuant to index on cost per gallon as reported by the Department of Energy EIA Retail On-Highway Gasoline and Diesel Prices. Fuel surcharge(s) will be invoiced as a separate line item. The fuel surcharge percentage is adjusted every Monday of each week based upon the weekly U.S. National Average. See page 3 for example [shown up to \$4.00] of how surcharges are calculated based on fuel price range, i.e., increase in fuel price range by .05% results in corresponding incremental increase in surcharge.

Equipment Decontamination / Washout

Time and Material charges are portal to portal and will continue through decontamination and/or washout of any and all equipment used on the job.

Haz-Mat Rates

Haz-Mat rates will be charged when the material being dealt with has a hazard rating of two or greater on the NFPA 704 labeling system or hazardous material identifying system, or if a job requires the use of respiratory protection.

Insurance

The rates in this RATE SCHEDULE include insurance coverage for Worker's Compensation, General Liability, Pollution and Automobile Liability. A Certificate of Insurance will be forwarded upon request.

Personnel

Experienced consulting, supervisory, technical instructor and equipment operating personnel are available for complete emergency spill response and spill cleanup operations and vacuum service, 24 hours a day, 7 days a week. Straight time rates will be billed from 0800 (8:00 a.m.) through 1600 (4:00 p.m.) daily, Monday through Friday. All other non holiday hours worked, including Saturday and Sunday will be billed at the Overtime rate. **DOUBLE TIME RATES** will be charged for all Garner recognized Holidays which include Christmas Day, New Years Day, Memorial Day, Fourth of July, Labor Day, and Thanksgiving Day. When these holidays fall on a weekend, the nearer weekday will be charged at the Overtime rate.

All labor charges will be in accordance with Garner Environmental Services, Inc. service receipts. Charges for personnel are portal-to-portal. Garner Environmental Services, Inc. will invoice for personnel and the time required to mobilize, service, repair, and restock all vehicles and equipment used in the performance of the services for customer. There will be a **4-Hour Minimum Service Charge On All Labor Call-Outs**.

In the event Garner Environmental Services, Inc. responds to a request from a governmental agency and/or third party and/or Customer and/or on behalf of Customer for record gathering and/or litigation support services, including but not limited to testifying at any proceeding, deposition, hearing or trial, and whether during the performance of services or any time after, Customer hereby agrees to and will pay to GESI, in accordance with the payment terms herein, the charges for the personnel provided and/or requested and/or required in the amount corresponding to the personnel designation in this rate sheet and will further reimburse GESI for reasonable expenses incurred as a result, including for transportation, parking and/or lodging, if necessary.

Garner Environmental Services, Inc. reserves the right to charge Customer for all items and adjustments made by third party negotiators, customer quality assurance personnel, third party management or auditors and the like.

At no time will post emergency response negotiated rates be allowed to become retroactive.

Replacement of Damaged or Contaminated Equipment

If, during performance of a service and/or services for a customer, equipment and/or material sustain damage which renders the equipment and/or material beyond repair or renders decontamination impossible, said equipment and/or material will be subject to a replacement charge at Garner Environmental Services, Inc.'s cost plus 15% unless said damage was sustained as a result of misuse by Garner Environmental Services, Inc. personnel.

Roll-Off Boxes

Roll-Off Box delivery and pickup charges vary according to the distance from the site location. The cost for roll-off box liners is \$50.00 each. Box Liners are not mandatory, but if the Roll-Off Box requires cleaning at the end of the rental period, the customer will incur the cleaning charges.

All rates listed in this schedule are subject to change without notice.

Corporate	Response Rate Schedule Domestic	Schedule
Operations		Rev. June 2011

Stand-By Rates

Stand-By Rates will be equal to the daily rates in this schedule unless otherwise agreed to in writing on a case-by-case basis. Full rates will apply for personnel and per diem.

Subcontract Services / Third-Party Services

When Garner Environmental Services, Inc.'s equipment is available, Garner Environmental Services, Inc. will use and bill Customer for said equipment at rates published in the rate schedule. For any item that is identified on Garner Environmental Services, Inc.'s rate sheet and which Garner acquires through or from a third party vendor or supplier, Customer will pay to Garner Environmental Services, Inc. the higher of Garner Environmental Services, Inc.'s rate or Garner Environmental Services, Inc.'s cost plus a 20% handling charge.

A 20% handling charge will apply and be invoiced for all shipping and transportation of equipment, materials and goods regardless of whether such equipment, materials and goods appear on Garner Environmental Services, Inc.'s rate schedule. In addition, for all items not listed on Garner Environmental Services, Inc.'s rate schedule, including but not limited to personnel, equipment, materials and goods, laboratory services, testing services, damage waivers and/or other services, said items will be billed at Garner Environmental Services, Inc.'s cost plus a 20% handling charge.

Cost, as used herein, is defined as the amount invoiced to Garner Environmental Services, Inc. by a third-party supplier of material and/or goods and/or material and/or labor and/or equipment and/or services.

Taxes

All domestic federal, state and municipal taxes, except income taxes and ad-valorem taxes, now and hereinafter imposed with respect to services rendered, to rental equipment, to the processing, manufacture, repair, and to the delivery and transportation of equipment and supplies will be added to and become part of the total price payable by the Customer. If a Customer claims an exemption from payment of Sales and Use Tax, the Customer will be required to render an Exemption Certificate or a Resale Certificate to Garner Environmental Services, Inc. for said exemption to apply to the services rendered. If for any reason the services rendered result in the assessment of foreign income taxes, excise taxes, or other fees alleged as owing to a foreign state or government, the Customer will pay directly the amount of any assessment or fee. In the event Company pays any such foreign tax or fee directly, Customer will promptly reimburse Company for same.

Terms

The term of payment for all invoices is *Net Payment Due Immediately Upon Receipt of Invoice in United States Dollars (US \$)*. The balance of any invoice not timely paid will accrue a finance charge computed at the periodic rate of one and one-half percent (1.5%) per month (18% per annum) beginning on the thirty-first (31st) day from the date of invoice. Customer is obligated to make payment to Garner Environmental Services, Inc. at its principal office at 1717 West 13th Street, Deer Park, TX 77536 in Harris County, Texas. It remains the Customer's obligation to pay all invoices regardless of insurance or third party claims.

Place of Performance

The procurement of Garner Environmental Services, Inc.'s services may not be in the same county as the work site area. Customer is obligated to make payment to Garner Environmental Services, Inc. in Harris County, Texas for services provided. Because this agreement has been procured in Harris County, Texas and is being managed and administered from Garner Environmental Services, Inc.'s central office in Harris County, Texas, this agreement is being performed in Harris County, Texas. The validity, interpretation and performance of the services and payment and the contents herein are to be interpreted and enforced pursuant to the laws of the State of Texas and any suit in connection herewith will be filed in Harris County, Texas.

Travel, Lodging and Per Diem

For all employees who perform work at a location over 50 miles from the employee's normally assigned Garner Environmental Services, Inc. branch office, Garner Environmental Services, Inc. charges for employee travel to and from the work site on the basis of Garner Environmental Services, Inc.'s incurred costs plus 20% for all commercial transportation. A minimum Per Diem charge of **\$150.00** per day for each such employee will be charged and due for each day that such employee is present in the locale of the work site. When working in high cost areas as defined by U.S. Government Travel Regulations, travel, lodging and per diem rates may increase.

All rates listed in this schedule are subject to change without notice.

CERTIFICATE OF LIABILITY INSURANCE

DATE (MM/DD/YYYY)

5/3/2012

THIS CERTIFICATE IS ISSUED AS A MATTER OF INFORMATION ONLY AND CONFERS NO RIGHTS UPON THE CERTIFICATE HOLDER. THIS CERTIFICATE DOES NOT AFFIRMATIVELY OR NEGATIVELY AMEND, EXTEND OR ALTER THE COVERAGE AFFORDED BY THE POLICIES BELOW. THIS CERTIFICATE OF INSURANCE DOES NOT CONSTITUTE A CONTRACT BETWEEN THE ISSUING INSURER(S), AUTHORIZED REPRESENTATIVE OR PRODUCER, AND THE CERTIFICATE HOLDER.

IMPORTANT: If the certificate holder is an ADDITIONAL INSURED, the policy(ies) must be endorsed. If SUBROGATION IS WAIVED, subject to the terms and conditions of the policy, certain policies may require an endorsement. A statement on this certificate does not confer rights to the certificate holder in lieu of such endorsement(s).

As Respects General Liability Policy

Per Form Asper 1211

Clause II. WHO IS AN INSURED

6. Any person or organization with whom you agree to include as an a insured in a written contract, written agreement or permit, but only with respect to bodily injury, property damage, environmental damage or personal and advertising injury arising out of your operations, your work, equipment or premises leased or rented by you, or your products which are distributed or sold in the regular course of a vendor's business, however:

a. A vendor is not an insured as respects bodily injury, property damage, clean-up cost, emergency response cost, crisis cost or personal and advertising injury:

(1) For which the vendor is obligated to pay damages by reason of the assumption of liability in a contract or agreement except that which the vendor would have in the absence of the contract or agreement;

(2) Arising out of any express warranty unauthorized by you;

(3) Arising out of any physical or chemical change in the product made intentionally by the vendor;

(4) Arising out of repackaging, except when unpacked solely for the purpose of inspection, demonstration, testing, or the substitution of parts under instructions from you, and then repackaged in the original container;

(5) Arising out of any failure to make inspections, adjustments, tests or servicing as the vendor has agreed to make or normally undertakes to make in the usual course of business, in connection with the distribution or sale of the products;

(6) Arising out of demonstration, installation, servicing or repair operations, except such operations performed at the vendor's location in connection with the sale of the product;

or
 (7) Arising out of products which, after distribution or sale by you, have been labeled or relabeled or used as a container, part or ingredient of any other thing or substance by or for the vendor.

b. A manager or lessor of premises, a lessor of leased equipment, or a mortgagee, assignee, or receiver is not an insured as respects bodily injury, property damage, clean-up cost, emergency response cost, crisis cost, or personal and advertising injury:

(1) Arising out of any occurrence that takes place after the equipment lease expires or you cease to be a tenant; or

(2) Arising out of structural alterations, new construction or demolition operations performed by or on behalf of the manager or lessor of premises, or mortgagee, assignee, or receiver.

As Respects General Liability Policy:

Per Form Asper 1211

CLAUSE X. CONDITIONS

Transfer of Rights of Recovery Against Others To Us

If the insured has rights to recover all or part of any payment we have made under this Policy, those rights are transferred to us. At our request, the insured will bring suit or transfer those rights to us and help us enforce them. However, if the insured has waived rights of recovery against any person or organization in a written contract or agreement prior to a loss, we waive any right of recovery we may have under this Policy against such person or organization.

As Respects Excess Policy

ADDITIONAL REMARKS

THIS ADDITIONAL REMARKS FORM IS A SCHEDULE TO ACORD FORM,

FORM NUMBER: 25 **FORM TITLE:** Certificate of Liability (05/10)

CERTIFICATE HOLDER: ***Master ** \$1 mil XS

ADDRESS: _____

CLAUSE I. INSURING AGREEMENT

The insurer will pay on the insured's behalf ultimate net loss (resulting from bodily injury, property damage, personal injury, advertising injury, environmental damage, emergency response costs, clean-up costs or loss) in excess of, and not in contribution with, the underlying policies. Except as otherwise provided in this Policy, this Policy shall follow all provisions, exclusions, limitations, and all other terms and conditions of the followed policy. In the event of a conflict between this Policy and the followed policy, this Policy shall govern and control. Notwithstanding any other provision of this Policy, in no event shall this Policy grant broader coverage than that provided to the insured under any of the underlying policies.

As Respects Automobile Liability Policy

Per Form CA 00 01 03 06, Section IV - Business Auto Conditions, B. General Conditions

5. Other Insurance

a. For any covered "auto" you own, this Coverage Form provides primary insurance. For any covered "auto" you dont own, the insurance provided by this Coverage Form is excess over any other collectible insurance. However, while a covered "auto" which is a "trailer" is connected to another vehicle, the Liability Coverage this Coverage Form provides for the "trailer" is:

- (1) Excess while it is connected to a motor vehicle you do not own.
- (2) Primary while it is connected to a covered "auto" you own.

b. For Hired Auto Physical Damage Coverage, any covered "auto" you lease, hire, rent or borrow is deemed to be a covered "auto" you own. However, any "auto" that is leased, hired, rented or borrowed with a driver is not a covered "auto".

c. Regardless of the provisions of Paragraph a. above, this Coverage Form's Liability Coverage is primary for any liability assumed under an "insured contract".

As Respects General Liability Policy

Per Form Asper 1211

CLAUSE VII. OTHER INSURANCE

A. Primary Insurance

Except as provided in Paragraph B. of this Clause, this insurance is primary. The insurer's obligations as primary insurer are not affected unless any of the other insurance is also primary, the insurer will share with all other primary insurance as follows:

- (1) If all of the other insurance permits contribution by equal shares, the insurer will follow such method also whereby each insurer contributes equal amounts until it has paid its limit of liability or none of the loss remains, whichever comes first; or
- (2) If any of the other insurance does not permit contribution by equal shares, the insurer will contribute by limits whereby each insurer's share is based on the ratio of its limit of liability to the total limits of insurance of all insurers. However, regardless of whether B. below applies, in the event that a written contract or agreement or permit requires this insurance to be primary for any person or organization with whom you agreed to insure and such person or organization is an insured under this policy, we will not seek contributions from any such other insurance issued to such person or organization.

B. Excess Insurance

This insurance is excess over:

(1) Any other insurance, whether primary, excess, contingent or on any other basis that is: (i) Fire, Extended Coverage, Builder's Risk, Installation Risk or similar coverage for your work; (ii) Fire insurance for premises rented to you or temporarily occupied by you with permission of the owner; (iii) insurance purchased by you to cover your liability as a tenant for property damage to premises rented to you or temporarily occupied by you with permission of the owner; or (iv) insurance applicable to loss arising out of the maintenance or use of aircraft, autos or watercraft.

(2) Any other indemnity or primary insurance available to you covering liability for damages arising out of premises, operations, or the products and completed operations hazard, for which you have been added as an additional insured.

(3) Any project specific primary insurance available to you covering liability for damages arising out of your work, for which you are an insured.

When this insurance is excess, we will have no duty to defend the insured against any suit if any other insurer has a duty to defend the insured against that suit. If no other insurer has a duty to defend, we will undertake to do so, but we will be entitled to the insured's rights against all those other insurers.

When this insurance is excess over other insurance, we will pay only our share of the amount of the loss, if any, that exceeds the sum of the: (a) total amount that all such other insurance would pay for the loss in the absence of this insurance; and (b) total of all deductible, retained and self-insured amounts under all that other insurance. Then, we will share the remaining loss, if any, with any other insurance that is not described in this Clause VI.B. and was not bought specifically to apply in excess of the applicable Limits of Liability of this Policy.

As Respects General Liability Policy

Per Form Asper 1211

CLAUSE X. CONDITIONS

Separation of Insureds

Except as provided in Clause VIII. of this Policy, or as respects any Limit of Liability or any rights or duties specifically assigned in this Policy to the First Named Insured, this Policy applies as if each insured were the only insured and applies separately to each insured against whom a claim is made. Accordingly, any "wrongful act" (meaning any misrepresentation, concealment, breach of a term or condition, or violation of any duty under this Policy) by one insured shall not prejudice the interest of, or coverage for, another insured, except any "wrongful act" of any insured who is a parent, subsidiary or affiliate of the First Named Insured shall be imputed to the First Named Insured. Nonetheless, the insurer shall have the right to limit, cancel or exclude coverage for any particular insured arising from such insured's own "wrongful act."

TO CERTIFICATE HOLDER

Our agency has issued the enclosed certificate of insurance on behalf of our client. We want to share with you some important information regarding certificates of insurance.

The Texas Legislature passed and Governor Perry signed Senate Bill 425 to become effective January 1, 2012. After this date it will be illegal for an agent or insurance company to issue evidence of insurance on a certificate form that has not been approved by the Texas Department of Insurance (TDI). It is also illegal for anyone to require an agent or insurance company to use a certificate form that has not been approved by the State.

The law provides some guidance on the content and limitations of certificates, as follows:

- A certificate is not an insurance policy and does not amend, extend, or alter the coverage afforded by the referenced insurance policy.
- A certificate shall not confer to a certificate holder new or additional rights beyond what the policy and endorsements provide.
- A certificate may not contain a reference to a legal or insurance requirement contained in a contract other than the underlying contract of insurance or endorsement to the insurance policy.
- A person may have a legal right to notice of cancellation, nonrenewal or material change or any similar notice only if (1) the person is named within the policy or an endorsement to the policy, and (2) the policy or endorsement, or a state or rule, requires notice to be provided.
- The law confirms that “a certificate of insurance that is executed, issued, or required and that is in violation with this chapter is void and has no effect.”

Additional information concerning the new law may be obtained by contacting the TDI (800) 252-3439 or visiting the web site <http://www.tdi.texas.gov/rules/informal1216.html>.

For this reason, we may not be able to provide some of the specific certificate holder requested information which is outside the scope of the approved document. We are willing to explain each of these items and provide policy endorsements or other information subject to our client's approval.

We hope you will understand our position and ask that you give us a call if you have any questions or comments.

ITEM THREE - Supplement
 (Business Auto, Truckers & Motor Carrier Coverage Form)

POLICY NO. AS2-641-443542-022

ITEM SEVEN - Supplement
 (Garage Coverage Form - Non Dealers)

**SCHEDULE OF PHYSICAL DAMAGE INSURANCE DEDUCTIBLES FOR
 NEWLY ACQUIRED COVERED AUTOS**

In addition to autos you now own your selection of symbol or in the covered autos column of ITEM TWO provides coverage for those autos you acquire ownership of after the policy begins as shown below:

SCHEDULE OF PHYSICAL DAMAGE INSURANCE DEDUCTIBLES

Physical Damage Insurance is provided for those coverages where a premium entry is shown in ITEM TWO and for those covered autos as shown by the entry of a symbol in the COVERED AUTOS column of ITEM TWO. Deductibles for these autos apply as shown below:

TYPES OF COVERED AUTOS	COVERAGES/DEDUCTIBLES	
	Comprehensive	Collision
All covered autos of the private passenger, light and medium truck types,	\$ 1,000	\$ 1,000
All other covered autos.	\$ 5,000	\$ 5,000
	\$	\$
	\$	\$
	\$	\$
	\$	\$
	\$	\$
	<input type="checkbox"/> Collision Coverage applies only to such covered autos having an Actual Cash Value exceeding \$

COVERED AUTO DESIGNATION SYMBOL

This endorsement modifies insurance provided under the following:

BUSINESS AUTO COVERAGE FORM
 GARAGE COVERAGE FORM
 MOTOR CARRIER COVERAGE FORM
 TRUCKERS COVERAGE FORM
 BUSINESS AUTO PHYSICAL DAMAGE COVERAGE FORM

With respect to coverage provided by this endorsement, the provisions of the Coverage Form apply unless modified by the endorsement.

Section I – Covered Autos is amended by adding the following:

Item Two of the Declarations shows the "autos" that are covered "autos" for each of your coverages. The following numerical symbols may be used (in addition to the numerical symbols described in the Coverage Form) to describe the "autos" that may be covered "autos". The entry of one of these symbols next to a coverage on the Declarations will designate the only "autos" that are covered "autos".

Symbol		Description Of Covered Auto Designation Symbols
		For use with the Business Auto Coverage Form
10	=	Owned Private Passenger types, Light and Medium power units with Manufacturer's model year 2005 or newer, all other owned power units.

For use with the Garage Coverage Forms

THIS ENDORSEMENT CHANGES THE POLICY. PLEASE READ IT CAREFULLY.

INSURED CONTRACT DEFINITION AMENDATORY ENDORSEMENT

In consideration of the premium charged, the Definition of **insured contract** is deleted in its entirety and replaced with the following:

Insured contract means: (i) A contract for a lease of premises; provided that portion of the contract for a lease of premises in excess of 30 consecutive days that indemnifies any person or organization for damage by fire, lightning or explosion to premises while rented to you or temporarily occupied by you with permission of the owner is not an **insured contract**; (ii) A side-track agreement; (iii) Any easement or license agreement; (iv) An obligation, as required by ordinance, to indemnify a municipality, except in connection with work for a municipality; (v) An elevator maintenance agreement; (vi) that part of any other contract or agreement pertaining to your business (including an indemnification of a municipality in connection with work performed for a municipality) under which you assume the tort liability of another party to pay for **bodily injury, property damage or environmental damage** to a third person or organization. Tort liability means a liability that would be imposed by law in the absence of any contract or agreement. Provided (vi) does not include that part of any contract or agreement that indemnifies an architect, engineer or surveyor for injury or damage arising out of: (a) Preparing, approving or failing to prepare or approve maps, drawings, opinions, reports, surveys, change orders, designs or specifications; or (b) Giving directions or instructions, or failing to give them, if that is the primary cause of the injury or damage.

All other terms and conditions of this Policy remain unchanged.

THIS ENDORSEMENT CHANGES THE POLICY. PLEASE READ IT CAREFULLY.

DESIGNATED INSURED

This endorsement modifies insurance provided under the following:

BUSINESS AUTO COVERAGE FORM
GARAGE COVERAGE FORM
MOTOR CARRIER COVERAGE FORM
TRUCKERS COVERAGE FORM

With respect to coverage provided by this endorsement, the provisions of the Coverage Form apply unless modified by this endorsement.

This endorsement identifies person(s) or organization(s) who are "insureds" under the Who Is An Insured Provision of the Coverage Form. This endorsement does not alter coverage provided in the Coverage Form.

SCHEDULE

Name of Person(s) or Organization(s):

Any person or organization whom you have agreed in writing to add as an additional insured, but only to coverage and minimum limits of insurance required by the written agreement, and in no event to exceed either the scope of coverage or the limits of insurance provided in this policy.

(If no entry appears above, information required to complete this endorsement will be shown in the Declarations as applicable to the endorsement.)

Each person or organization shown in the Schedule is an "insured" for Liability Coverage, but only to the extent that person or organization qualifies as an "insured" under the Who Is An Insured Provision contained in Section II of the Coverage Form.

Policy No: AS2641443542022
Effective Date: 04/21/12
Expiration Date: 04/21/13

**WAIVER OF TRANSFER OF RIGHTS OF RECOVERY
AGAINST OTHERS TO US**

This endorsement modifies insurance provided under the following:

Business Auto Coverage Form
Garage Coverage Form
Truckers Coverage Form
Motor Carrier Coverage Form

SCHEDULE

Premium:

Name of Person or Organization:

Any person or organization for whom you perform work under a written contract if the contract requires you to obtain this agreement from us, but only if the contract is executed prior to the injury or damage occurring.

The TRANSFER OF RIGHTS OF RECOVERY AGAINST OTHERS TO US condition is amended by the addition of the following:

We waive any right of recovery we may have against the person or organization shown in the Schedule above because of payments we make for injury or damage arising out of your operations of a covered auto done under contract with that person or organization. This waiver applies only to the person or organization shown in the Schedule above.

Policy No: AS2641443542022
Effective Date: 04/21/12
Expiration Date: 04/21/13
Sales Office: 0001

WAIVER OF OUR RIGHT TO RECOVER FROM OTHERS ENDORSEMENT

We have the right to recover our payments from anyone liable for an injury covered by this policy. We will not enforce our right against the person or organization named in the Schedule. (This agreement applies only to the extent that you perform work under a written contract that requires you to obtain this agreement from us.)

This agreement shall not operate directly or indirectly to benefit anyone not named in the Schedule.

Schedule

All persons or organizations that are parties to a written contract that requires you to obtain this agreement, provided you executed the contract before the loss.

LESSOR - ADDITIONAL INSURED AND LOSS PAYEE

This endorsement modifies insurance provided under the following:

BUSINESS AUTO COVERAGE FORM
 BUSINESS AUTO PHYSICAL DAMAGE COVERAGE FORM
 GARAGE COVERAGE FORM
 MOTOR CARRIER COVERAGE FORM
 TRUCKERS COVERAGE FORM

With respect to coverage provided by this endorsement, the provisions of the Coverage Form apply unless modified by the endorsement.

SCHEDULE

Insurance Company:	
Policy Number: AS2-641-443542-022	Effective Date:
Expiration Date:	
Named Insured:	
Address:	
Additional Insured (Lessor):	Any lessor who has a written contract or agreement requiring you to provide primary coverage for the vehicle(s) specified in the lease.
Address:	
Designation Or Description Of "Leased Autos":	Any leased auto as defined in Paragraph E below.

Coverages	Limit Of Insurance
Liability	\$ Each "Accident"
Comprehensive	Actual Cash Value Or Cost Of Repair Whichever Is Less, Minus \$ Deductible For Each Covered "Leased Auto"
Collision	Actual Cash Value Or Cost Of Repair Whichever Is Less, Minus \$ Deductible For Each Covered "Leased Auto"
Specified Causes Of Loss	Actual Cash Value Or Cost Of Repair Whichever Is Less, Minus \$ Deductible For Each Covered "Leased Auto"
Information required to complete this Schedule, if not shown above, will be shown in the Declarations.	

A. Coverage

1. Any "leased auto" designated or described in the Schedule will be considered a covered "auto" you own and not a covered "auto" you hire or borrow.
2. For a "leased auto" designated or described in the Schedule, **Who Is An Insured** is changed to include as an "insured" the lessor named in the Schedule. However, the lessor is an "insured" only for "bodily injury" or "property damage" resulting from the acts or omissions by:
 - a. You;
 - b. Any of your "employees" or agents; or
 - c. Any person, except the lessor or any "employee" or agent of the lessor, operating a "leased auto" with the permission of any of the above.
3. The coverages provided under this endorsement apply to any "leased auto" described in the Schedule until the expiration date shown in the Schedule, or when the lessor or his or her agent takes possession of the "leased auto", whichever occurs first.

B. Loss Payable Clause

1. We will pay, as interest may appear, you and the lessor named in this endorsement for "loss" to a "leased auto".
2. The insurance covers the interest of the lessor unless the "loss" results from fraudulent acts or omissions on your part.
3. If we make any payment to the lessor, we will obtain his or her rights against any other party.

C. Cancellation

1. If we cancel the policy, we will mail notice to the lessor in accordance with the Cancellation Common Policy Condition.
 2. If you cancel the policy, we will mail notice to the lessor.
 3. Cancellation ends this agreement.
- D. The lessor is not liable for payment of your premiums.

E. Additional Definition

As used in this endorsement:

"Leased auto" means an "auto" leased or rented to you, including any substitute, replacement or extra "auto" needed to meet seasonal or other needs, under a leasing or rental agreement that requires you to provide direct primary insurance for the lessor.

Policy No: AS2-641-443542-022

POLLUTION LIABILITY – BROADENED COVERAGE FOR COVERED AUTOS – BUSINESS AUTO, MOTOR CARRIER AND TRUCKERS COVERAGE FORMS

This endorsement modifies insurance provided under the following:

BUSINESS AUTO COVERAGE FORM
MOTOR CARRIER COVERAGE FORM
TRUCKERS COVERAGE FORM

With respect to coverage provided by this endorsement, the provisions of the Coverage Form apply unless modified by the endorsement.

A. Liability Coverage is changed as follows:

1. Paragraph a. of the **Pollution** Exclusion applies only to liability assumed under a contract or agreement.
2. With respect to the coverage afforded by Paragraph A.1. above, Exclusion **B.6. Care, Custody Or Control** does not apply.

B. Changes In Definitions

For the purposes of this endorsement, Paragraph **D.** of the **Definitions** Section is replaced by the following:

- D.** "Covered pollution cost or expense" means any cost or expense arising out of:
1. Any request, demand, order or statutory or regulatory requirement that any "insured" or others test for, monitor, clean up, remove, contain, treat, detoxify or neutralize, or in any way respond to, or assess the effects of "pollutants"; or
 2. Any claim or "suit" by or on behalf of a governmental authority for damages because of testing for, monitoring, cleaning up, removing, containing, treating, detoxifying or neutralizing, or in any way responding to or assessing the effects of "pollutants".

"Covered pollution cost or expense" does not include any cost or expense arising out of the actual, alleged or threatened discharge, dispersal, seepage, migration, release or escape of "pollutants":

- a. Before the "pollutants" or any property in which the "pollutants" are contained are moved from the place where they are accepted by the "insured" for movement into or onto the covered "auto"; or
- b. After the "pollutants" or any property in which the "pollutants" are contained are moved from the covered "auto" to the place where they are finally delivered, disposed of or abandoned by the "insured".

Paragraphs a. and b. above do not apply to "accidents" that occur away from premises owned by or rented to an "insured" with respect to "pollutants" not in or upon a covered "auto" if:

- (1) The "pollutants" or any property in which the "pollutants" are contained are upset, overturned or damaged as a result of the maintenance or use of a covered "auto"; and
- (2) The discharge, dispersal, seepage, migration, release or escape of the "pollutants" is caused directly by such upset, overturn or damage.

MARITIME COVERAGE ENDORSEMENT

This endorsement changes how insurance provided by Part Two (Employers Liability Insurance) applies to bodily injury to a master or member of the crew of any vessel.

A. How This Insurance Applies is replaced by the following:

A. How This Insurance Applies

This insurance applies to bodily injury by accident or bodily injury by disease. Bodily injury includes resulting death.

1. The bodily injury must arise out of and in the course of the injured employee's employment by you.
2. The employment must be necessary or incidental to work described in Item 1 of the Schedule of the Maritime Coverage Endorsement.
3. The bodily injury must occur in the territorial limits of, or in the operation of a vessel sailing directly between the ports of, the continental United States of America, Alaska, Hawaii or Canada.
4. Bodily injury by accident must occur during the policy period.
5. Bodily injury by disease must be caused or aggravated by the conditions of your employment. The employee's last day of last exposure to the conditions causing or aggravating such bodily injury by disease must occur during the policy period.
6. If you are sued, the original suit and any related legal actions for damages for bodily injury by accident or by disease must be brought in the United States of America, its territories or possessions, or Canada.

C. Exclusions is changed by removing exclusion 10 and by adding exclusions 13 and 14.

This insurance does not cover:

13. Bodily injury covered by a Protection and Indemnity Policy or similar policy issued to you or for your benefit. This exclusion applies even if the other policy does not apply because of another insurance clause, deductible or limitation of liability clause, or any similar clause.
14. Your duty to provide transportation, wages, maintenance and cure. This exclusion does not apply if a premium entry is shown in Item 2 of the Schedule.

D. We Will Defend is changed by adding the following statement:

We will treat a suit or other action in rem against a vessel owned or chartered by you as a suit against you.

G. Limits of Liability

Our liability to pay for damages is limited. Our limits of liability are shown in the Schedule. They apply as explained below.

WC 00 02 01 A

Page 1 of 2

ED 4/1992

MARITIME COVERAGE ENDORSEMENT

1. Bodily Injury by Accident. The limit shown for "bodily injury by accident-each accident" is the most we will pay for all damages covered by this insurance because of bodily injury to one or more employees in any one accident.
A disease is not bodily injury by accident unless it results directly from bodily injury by accident.
2. Bodily Injury by Disease. The limit shown for "bodily injury by disease-aggregate" is the most we will pay for all damages covered by this insurance because of bodily injury by disease to one or more employees. The limit applies separately to bodily injury by disease arising out of work in each state shown in Item 3.A. of the Information Page. Bodily injury by disease will be deemed to occur in the state of the vessel's home port.
Bodily injury by disease does not include disease that results directly from a bodily injury by accident.
3. We will not pay any claims for damages after we have paid the applicable limit of our liability under this insurance.

Schedule

OUTER CONTINENTAL SHELF LANDS ACT COVERAGE ENDORSEMENT

This endorsement applies only to the work described in Item 4 of the Information Page or in the Schedule as subject to the Outer Continental Shelf Lands Act. The policy will apply to that work as though the location shown in the Schedule were a state named in Item 3.A. of the Information Page.

General Section C. **Workers' Compensation Law** is replaced by the following:

C. **Workers' Compensation Law**

Workers' Compensation Law means the workers or workmen's compensation law and occupational disease law of each state or territory named in Item 3.A. of the Information Page and the Outer Continental Shelf Lands Act (43 USC Sections 1331-1356). It includes any amendments to those laws that are in effect during the policy period. It does not include any other federal workers or workmen's compensation law, other federal occupational disease law or the provisions of any law that provide nonoccupational disability benefits.

Part Two (Employers Liability Insurance), C. Exclusions., exclusion 8, does not apply to work subject to the Outer Continental Shelf Lands Act.

LONGSHORE AND HARBOR WORKERS' COMPENSATION ACT COVERAGE ENDORSEMENT

This endorsement applies only to work subject to the Longshore and Harbor Workers' Compensation Act in a state shown in the Schedule. The policy applies to that work as though that state were listed in Item 3.A. of the Information Page.

General Section C. **Workers' Compensation Law** is replaced by the following:

C. Workers' Compensation Law

Workers' Compensation Law means the workers or workmen's compensation law and occupational disease law of each state or territory named in Item 3.A. of the Information Page and the Longshore and Harbor Workers' Compensation Act (33 USC Sections 901-950). It includes any amendments to those laws that are in effect during the policy period. It does not include any other federal workers or workmen's compensation law, other federal occupational disease law or the provisions of any law that provide nonoccupational disability benefits.

Part Two (Employers Liability Insurance), C. Exclusions., exclusion 8, does not apply to work subject to the Longshore and Harbor Workers' Compensation Act.

This endorsement does not apply to work subject to the Defense Base Act, the Outer Continental Shelf Lands Act, or the Nonappropriated Fund Instrumentalities Act.

<u>State</u>	Schedule	<u>Longshore and Harbor Workers' Compensation Act Coverage Percentage</u>
REFER TO SCHEDULE GPO 2926 FOR STATES AND PERCENTAGES		
Each state named in Item 3.A of the Information Page and the states of ND, OH, WA & WY.		

The rates for classifications with code numbers not followed by the letter "F" are rates for work not ordinarily subject to the Longshore and Harbor Workers' Compensation Act. If this policy covers work under such classifications, and if the work is subject to the Longshore and Harbor Workers' Compensation Act, those non-F classification rates will be increased by the Longshore and Harbor Workers' Compensation Act Coverage Percentage shown in the Schedule.

VOLUNTARY COMPENSATION MARITIME COVERAGE ENDORSEMENT

This endorsement adds Voluntary Compensation Maritime Insurance to the policy.

A. How This Insurance Applies

This insurance applies to bodily injury by accident or bodily injury by disease. Bodily injury includes resulting death.

1. The bodily injury must be sustained by an employee who is a master or member of the crew of a vessel described in the Schedule.
2. The bodily injury must occur in employment that is necessary or incidental to work described in Item 2 of the Schedule.
3. The bodily injury must occur in the territorial limits of, or in the operation of a vessel sailing directly between the ports of, the continental United States of America, Alaska, Hawaii or Canada.
4. Bodily injury by accident must occur during the policy period.
5. Bodily injury by disease must be caused or aggravated by the conditions of your employment. The employee's last day of last exposure to the conditions causing or aggravating such bodily injury by disease must occur during the policy period.

B. We Will Pay

We will pay an amount equal to the benefits that would be required of you if you and your employees described in Item 1 of the Schedule were subject to the workers compensation law shown in Item 1 of the Schedule. We will pay those amounts to the persons who would be entitled to them under that law.

C. Exclusions

This insurance does not cover:

1. any obligation imposed by a workers compensation or occupational disease law, or any similar law.
2. bodily injury intentionally caused or aggravated by you.

D. Before We Pay

Before we pay benefits to the persons entitled to them, they must:

1. release you and us, in writing, of all responsibility for the injury or death.
2. transfer to us their right to recover from others who may be responsible for the injury or death.
3. cooperate with us and do everything necessary to enable us to enforce the right to recover from others.

If the persons entitled to the benefits of this insurance fail to do those things, our duty to pay ends at once. If they claim damages from you or from us for the injury or death, our duty to pay ends at once.

E. Recovery From Others

If we make a recovery from others, we will keep an amount equal to our expenses of recovery and the benefits we paid. We will pay the balance to the persons entitled to it. If the persons entitled to the benefits of this insurance make a recovery from others, they must reimburse us for the benefits we paid them.

ALTERNATE EMPLOYER ENDORSEMENT

This endorsement applies only with respect to bodily injury to your employees while in the course of special or temporary employment by the alternate employer in the state named in Item 2 of the Schedule. Part One (Workers Compensation Insurance) and Part Two (Employers Liability Insurance) will apply as though the alternate employer is insured. If an entry is shown in Item 3 of the Schedule the insurance afforded by this endorsement applies only to work you perform under the contract or at the project named in the Schedule.

Under Part One (Workers Compensation Insurance) we will reimburse the alternate employer for the benefits required by the workers compensation law if we are not permitted to pay the benefits directly to the persons entitled to them.

The insurance afforded by this endorsement is not intended to satisfy the alternate employer's duty to secure its obligations under the workers compensation law. We will not file evidence of this insurance on behalf of the alternate employer with any government agency.

We will not ask any other insurer of the alternate employer to share with us a loss covered by this endorsement.

Premium will be charged for your employees while in the course of special or temporary employment by the alternate employer.

The policy may be canceled according to its terms without sending notice to the alternate employer.

Part Four (Your Duties If Injury Occurs) applies to you and the alternate employer. The alternate employer will recognize our right to defend under Parts One and Two and our right to inspect under Part Six.

DCO # 509

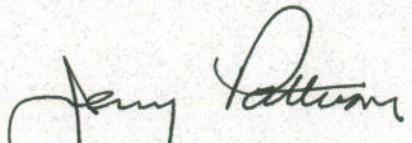

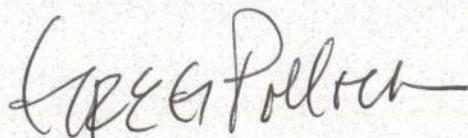

Discharge Cleanup Organization Certificate

Garner Environmental Services

Deer Park, Texas

This certificate carries with it the need to maintain a high level of response preparedness, to respond in a timely, professional manner, and to notify the Texas General Land Office of any change in the Holder's ability to accomplish this mission. Certification is for three years from the above date.

Commissioner
Texas General Land Office

Deputy Commissioner
Oil Spill Prevention and Response

CLEAN CHANNEL ASSOCIATION OWNED EQUIPMENT

- A. Equipment located at CCA/Pasadena office/warehouse
1. Trailer containing 1700 feet of 18" oil spill containment boom with related equipment including, without limitation, tow bridals and anchors;
 2. Trailer containing 1000 feet of 24" oil spill containment boom
 3. Two (2) 18' outboard powered workboats
 4. Three (3) each three-inch diesel driven portable pumps with portable hoses
 5. Two (2) each two-inch diesel driven portable pumps with hoses
 6. One (1) Pharos Marine GT-185 skimming system with hydraulic power pack
 7. One (1) Gastech LEL/OXY/H₂S meter
 8. 2,000 feet of 8" oil spill containment boom
 9. Two (2) portable weir skimmers (Douglas 18000)
 10. One (1) Sludgemaster Pump for heavy oils (300 gpm)
 11. One (1) 40' shipping container
 12. One (1) 18' Boston Whaler with 150 hp engine
 13. One (1) LORI skimming system mounted on a 26' vessel with 20 bbls storage.
 14. One (1) JBF DIP 402 Skimmer Vessel
 15. One (1) 24' decontamination trailer, supplies for 100 showers, and cleaning materials
- B. One 40' shipping container located at Dow Chemical Co., Freeport, Texas equipped with the following:
1. 1,000 feet of 36" oil spill containment boom with related equipment including, without limitation, tow bridals and anchors
 2. One each three-inch diesel driven portable pump with portable hoses
 3. One portable weir skimmer (Douglas 18000)
 4. One 2,100 gal. Fastank portable storage container
- C. The following equipment is owned by Clean Channel Association and normally stored on board vessels *Clean Channel 2* and *Clean Channel 3*:
1. 1,000 feet of 18" oil spill containment boom (each skimmer barge)
 2. One (1) portable weir skimmer (Douglas 18000) with hoses (each skimmer barge)
- D. One (1) 20' trailer located at T&T Marine Salvage, Galveston, Texas, containing 1,000 feet of 18" oil spill containment boom.
- E. One (1) LORI skimming system mounted on a 24' vessel with 50 bbls storage located in Freeport, Texas.
- F. One (1) JBF DIP 402 Skimmer Vessel located at Shell Oil Deer Park Refinery.
1. 2,000 feet of 24" oil spill containment boom
- G. 1,000 feet of 24" oil spill containment boom located at Westway Terminal, Galena Park, TX

CLEAN CHANNEL ASSOCIATION LEASED EQUIPMENT

Clean Channel 2 and Clean Channel 3 - Two (2) recovery barges 30' x 120' with 1,500 bbl capacity with oil recovery system and related equipment including:

1. Built-in weir skimming system
2. One (1) Cargo pump 4", electric driven
3. Three (3) Trash pump 3", electric driven
4. One (1) 100kw diesel powered generator
5. Three (3) 2" double diaphragm air pumps
6. Two (2) Elastec Model 136 2-drum drum skimmers

NOTE: *Equipment list provided by CCA on 08-27-12 (Karen Storm)*

(G3)

¹ A facility that handles, stores, or transports multiple groups of oil must do separate calculations for each oil group on site except for those oil groups that constitute 10 percent or less by volume of the total oil storage capacity at the facility. For purposes of this calculation, the volumes of all products in an oil group must be summed to determine the percentage of the facility's total oil storage capacity.

Group 4 1.4

Group 5 1.0

Response Resource Operating Criteria of Oil Recovery Devices

<u>Operating Area</u>	<u>Tier 1</u>	<u>Tier 2</u>	<u>Tier 3</u>
River & Canals	.30	.40	.60
Inland / Near shore /Great Lakes	.15	.25	.40
Offshore	.10	.165	.21

Note: These mobilization factors are for total resources mobilized, not incremental resources.

Response Capability Caps By Geographic Area (Thousand Barrels/Day)

<u>February 18, 1993</u>	<u>Tier 1</u>	<u>Tier 2</u>	<u>Tier 3</u>
All except rivers, canals, Great Lakes	10K	20K	40K
Great Lakes	5K	10K	20K
Rivers & Canals	1.5K	3K	6K
<u>February 18, 1998</u>			
All except rivers, canals, & Great Lakes	12.5K	25K	50K
Great Lakes	6.35K	12.3K	25K
Rivers & Canals	1.875K	3.75K	7.5K
<u>February 18, 2003</u>	TBD	TBD	TBD

Note: The caps show cumulative overall effective daily recovery rate, not incremental increases. This table updated to conform to EPA Final Rule 40 CFR 112, September 26, 1994.

Removal Capacity Planning Table

Spill Location	Near shore / Inland			Rivers and Canals		
Sustainable On-Water Recovery	4 days			3 days		
Oil Group	% Natural Dissipation	% Recovered Floating Oil	% Oil Onshore	% Natural Dissipation	% Recovered Floating Oil	% Oil Onshore
1. Non-persistent Oils	80	20	10	80	10	10
2. Light Crudes and Fuels	50	50	30	40	15	45
3. Medium Crudes and Fuels	30	50	50	20	15	65
4. Heavy Crudes and Fuels*	10	50	70	5	20	75

* For planning purposes, non-petroleum oil must be considered a Group 4 persistent oil.

Response Resource Operating Criteria of Oil Recovery Devices

Revised USCG OSRO Classifications (as of 31 October 1996)

The USCG has classified OSROs according to their response capabilities, within each Captain of the Port (COTP) zone, for vessels and for facilities in four types of environments. Response capabilities are rated A, B, C, D, or E as described below.

Minimum Equipment Requirements for OSRO Classifications

Classification	Resource Quantity Guidelines	Maximum Facility Response Times	Maximum Vessel Response Time
Rivers/Canals			
A	Boom: 2,000 EDRC: 50 bb TSC: 100 bb	Boom Deployment: 1 hour EDRC/TSC: 2 hours	Boom Deployment: 1 hour EDRC/TSC: 2 hours
B	Containment Boom 4,000 Protective Boom 4,000 EDRC: 1,250 bb TSC: 2,500 bb	High Volume Port: 6 hours Other Ports: 12 hours	High Volume Port: 12 hours Other Ports: 24 hours
C ⁴	Containment Boom 4,000 Protective Boom 10,000 EDRC: 1,500 bb TSC: 3,000 bb	High Volume Port: 6 hours Other Ports: 12 hours	High Volume Port: 12 hours Other Ports: 24 hours
D ⁴	Containment Boom 4,000 Protective Boom 16,000 EDRC: 3,000 bb TSC: 6,000 bb	High Volume Port: 30 hours Other Ports: 36 hours	High Volume Port: 36 hours Other Ports: 48 hours

1. PRODUCT AND COMPANY IDENTIFICATION

Product name: GASOLINE

Number: 00000000000014944

Internal ID: AP0011, AP1250, PS2438, PS0148

Chemical characterization: Mixture

CAS-No.: 86290-81-5

Chemical Name: Hydrocarbons and additives

Synonyms: Petrol, Low boiling point naphtha, Low-octane motor gasoline, Gasoline all types, Gasoline with Ethanol (all grades), Conventional gasoline, RBOB

Use category: Motor Fuel (gasoline)

Company Address

Houston Refining
 One Houston Center, Suite 700
 1221 McKinney St.

2. HAZARDS IDENTIFICATION

Emergency Overview

This material is HAZARDOUS by OSHA Hazard Communication definition.

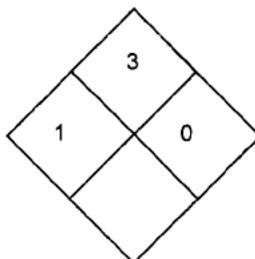

Signal Word

DANGER.

Hazards

Extremely flammable liquid. Vapors may form explosive mixtures with air. Vapors can travel to a source of ignition and flash back. Vapors explosion hazard indoors, outdoors or in sewers. May cause eye and skin irritation. Respiratory tract irritant. Aspiration may cause lung damage. Exposure to vapor may cause central nervous system depression (fatigue, dizziness, headache, collapse, coma and death) and, possibly, cardiac sensitization. May affect hearing. Possible reproductive toxin. May cause developmental toxicity. Contains material which can cause cancer.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE173
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

GASOLINE

Color

colorless to light yellow

Odor

Gasoline or naphtha odor.

Odor Threshold

No value available.

Potential health effects

Routes of exposure

Skin. Inhalation. Eye.

Acute effects

Skin

May produce skin irritation. Repeated or prolonged contact with skin may cause defatting and drying of the skin which may result in dermatitis.

Inhalation

Can cause pulmonary edema if aspirated into lungs.

Eyes

May cause moderate irritation, including burning sensation, tearing, redness or swelling. Effects of eye irritation are reversible.

Ingestion

Aspiration may cause lung damage.

Chronic effects

Repeated or prolonged exposure of the skin to this material may cause defatting and drying of the skin. Prolonged or repeated exposure to vapors may cause lung damage. May effect hearing. Suspect reproductive hazard. May cause developmental toxicity. Contains material which may cause cancer based on animal data.

3. COMPOSITION/INFORMATION ON INGREDIENTS

<u>Component</u>	<u>CAS-No.</u>	<u>EC-No.</u>	<u>Vol-%</u>
Gasoline	86290-81-5	289-220-8	85.0 <= 100.0

Typical composition

4. FIRST AID MEASURES

General advice

Causes skin irritation. May cause minor eye irritation. Aspiration into the lungs during swallowing or vomiting can cause lung damage, possibly leading to chronic lung dysfunction or death. Inhalation of vapors may cause signs of respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death), possible cardiac sensitization, and irritation of the eyes, nose and throat. Harmful: danger of serious damage to health by prolonged exposure through inhalation. May cause cancer. This substance may be genotoxic. Always observe self-protection methods. Move out of dangerous area. Do not leave the victim unattended. Remove contaminated shoes and clothing. Get medical attention immediately. Show this material safety data sheet to the doctor in attendance.

Skin

All contaminated clothing should be removed, and contaminated skin areas washed with lipophilic soap, or green soap, and water. Never use low boiling point naphthas for washing contaminated skin. Do not wash with machine dishwashing or laundry detergents. Seek medical attention if tissue appears damaged or if pain or irritation persists. Discard contaminated leather goods.

Inhalation

Remove victim to fresh air and keep at rest in a position comfortable for breathing. Keep patient warm and at rest. If breathing is difficult, give oxygen. If unconscious place in recovery position and seek medical advice. In the event of unconsciousness, apnea or cardiac arrest (no pulse) apply cardiopulmonary resuscitation.

Eyes

In case of eye contact, remove contact lens and rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Do not use eye ointment unless directed to by a physician. If irritation, blurred vision or swelling occurs and persists, obtain medical advice from a specialist.

Ingestion

DO NOT induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. Get medical attention immediately. Do not give milk or alcoholic beverages. Never give anything by mouth to an unconscious person.

Notes to physician

Treat symptomatically. Inhalation may cause CNS depression. Overexposure may produce anesthetic or narcotic effects. Do not induce vomiting. Risk of damage to lungs exceeds poisoning risk. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to this material. Treatment of overexposure should be directed at the control of symptoms and the clinical condition of the patient. Gastrointestinal decontamination in accidental petroleum distillate ingestions is not recommended, because of the severe aspiration hazard.

5. FIRE-FIGHTING MEASURES

MATERIAL SAFETY DATA SHEET

MSDS No.: BE173
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

GASOLINE

Flammable properties

Classification

Extremely flammable liquid.

Flash point

< -40 °C (< -40 °F) Tag closed cup

Autoignition temperature

> 250 °C (> 482 °F)

Lower explosion limit

1.4 vol% (% vol in air).

Upper explosion limit

7.6 vol% (% vol in air).

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Dry chemical. CO₂. Water spray. Foam. Sand. LARGE FIRES: Water spray. Water fog. Foam. Dry chemical. CO₂. Sand.

Unsuitable extinguishing media

Do not use solid water stream/may spread fire. Simultaneous use of foam and water on the same surface is to be avoided as water destroys the foam.

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear positive pressure self-contained breathing apparatus (SCBA). Structural firefighters protective clothing will only provide limited protection.

Precautions for fire-fighting

When exposed to ignition source in air, vapors can burn in open or explode if confined. Flammable vapors may be heavier than air and travel long distances along the ground before igniting and flashing back to vapor source. Releases flammable vapors below normal ambient temperatures. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Move containers from fire area if you can do it without risk. Sustained fire attack on vessels may result in a Boiling Liquid Expanding Vapour Explosion (BLEVE). Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Prevent fire extinguishing water from contaminating surface water or the ground water system. When fighting a fire, notify environmental authorities if liquid enters sewers or public waters. Fire residues and contaminated fire extinguishing water must be disposed of in accordance with local regulations. Thermal decomposition may produce carbon monoxide and other toxic vapors.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Extinguish all ignition sources. Stop leak if you can do it without risk. Evacuate/limit access. Restrict water use for cleanup. Notify fire and environmental authorities. Note: recommended measures are based on the most likely spillage scenarios for this material; however, local conditions (wind, air temperature, wave/current direction and speed) may significantly influence the choice of appropriate actions. For this reason, local experts should be consulted when necessary. Local regulations may also prescribe or limit actions to be taken. A vapor suppressing foam may be used to reduce vapors. DO NOT use water jet. Use clean non-sparking tools to collect absorbed material. On water, material is insoluble and floats. On water, contain/minimize dispersion/collect. Remove from surface water (e.g. by skimming or siphoning). The use of dispersants should be advised by an expert, and, if required, approved by local authorities.

Liquids/vapors may ignite. Contain/collect rapidly to minimize dispersion. Prevent spreading of vapors through sewers, ventilation systems and confined areas. Do not touch or walk through spilled material. Water spray may reduce vapor; but

MATERIAL SAFETY DATA SHEET

MSDS No.: BE173
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

GASOLINE

Spills and leaks

may not prevent ignition in closed spaces. Absorb or cover with dry earth, sand or other non-combustible material and transfer to containers.

7. HANDLING AND STORAGE

Handling

Electrostatic charge may build up during handling. Equipment should be grounded and bonded. During transfer of product, ground container and insure that all conveying equipment is properly grounded. Always keep nozzle in contact with the container throughout the loading process. Special slow load procedures for 'switch loading' must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point hydrocarbon products. Electrostatic charges may be generated as a result of flow or agitation. Use only non-sparking tools. Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved. Refer to NFPA 77 for relevant consensus guidance. Keep container closed and drum bungs in place. Store away from heat, sparks, open flames, strong oxidizing agents and direct sunlight. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of U.S. national electrical code, U.S. National Fire Protection Agency (NFPA). Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Never siphon by mouth. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Ensure adequate ventilation, especially in confined areas. Eliminate all sources of ignition. Spilled material can make walking hazardous, potentially causing falls and serious injury. Do not breathe vapor. Avoid contact with skin. Do not smoke. Do not pressurize, cut, weld, braze solder, drill, or grind on containers. Use good housekeeping practices during use, storage, transfer, and handling.

Storage

Store only in tightly closed, properly vented containers away from heat, sparks, open flame and strong oxidizing agents. Store closed drums with bung in up position. Vapor space above stored liquid may be flammable/explosive unless blanketed with inert gas. Electrical installations / working materials must comply with the technological safety standards. Keep container tightly closed and properly labeled. Cleaning, inspection and maintenance of the internal structure of storage tanks must be done only by properly equipped and qualified personnel as defined by national, local or company regulations. Recommended materials: For containers, or container linings use mild steel, stainless steel. Unsuitable materials: Some synthetic materials may be unsuitable for container or container linings depending on the material specification and intended use. Compatibility should be checked with the manufacturer.

Storage area layout, tank design, equipment and operating procedures must comply with the relevant European, national or local legislation. Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved. Refer to NFPA 77 for relevant consensus guidance. This liquid may accumulate static electricity even when transferred into properly grounded containers. Static electricity accumulation may be significantly increased by the presence of small quantities of water. Store and transport in accordance with all applicable laws.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. Use adequate ventilation to keep vapor concentrations below applicable exposure limit(s).

Personal protective equipment

Inhalation

Appropriate respiratory protection where atmosphere exceeds recommended limits. If exposure may exceed the exposure limit(s), use respiratory equipment recommended or approved by appropriate local, state or international agency.

10. STABILITY AND REACTIVITY

Chemical stability

This product is normally stable.

Conditions to avoid

Heat, sparks, open flames and strong oxidizing conditions.

Materials to avoid

Strong oxidizing agents

Hazardous decomposition products

Incomplete combustion can result in the production of carbon monoxide, carbon dioxide and other toxic gases.

Hazardous polymerization

Not expected to occur.

11. TOXICOLOGICAL INFORMATION

Product information

Product Summary

Inhalation of high vapor concentrations can cause CNS-depression and narcosis. Inhalation of vapors in high concentration may cause shortness of breath (lung edema). Solvents may degrease the skin. This product contains benzene. Benzene is considered to be a cancer-causing agent. Repeated exposure is linked to bone marrow toxicity, reduced red- and white blood cell counts and decreased immunological function irrespective of the route of contact. Benzene can destroy blood-forming cells in the bone marrow and is associated with leukemia and possibly other cancers. This material also contains components that may cause hearing loss and may be a developmental toxin. Toluene has known developmental toxicity. Suspect reproductive hazard - contains material which may injure unborn child. Suspect reproductive hazard. Damage to nerves in hands or feet may occur from prolonged inhalation of n-hexane concentrations of 60 to 240 ppm.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE173
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

GASOLINE

Product Summary

Repeated exposure to air concentrations of 500 ppm n-hexane can produce progressively worsening damage to the peripheral nerves. This product may contain ETBE. Kidney effects specific to male rats (hyaline droplet nephropathy) and liver enlargement with no evidence of structural damage in mice were reported following repeated exposure to ETBE vapor.

Acute toxicity

LC50 (Inhl) rat >5.61 4 HOURS

LD50 (Skin) rabbit >2000 MG/KG

Acute effects

Inhalation

Predicted exposure concentration Stream expected to have a low order of acute inhalation toxicity based on toxicity information for streams having components in common with this stream.

Inhalation may cause CNS depression. Can cause pulmonary edema if aspirated into lungs.

Ingestion

Predicted exposure concentration Stream expected to have a low order of acute oral toxicity based on toxicity information for streams having components in common with this stream.

Irritation

Skin

Stream expected to be irritating to the skin based on toxicity information for streams having components in common with this stream.

Skin

Irritating to skin.

Eyes

Stream expected to be no more than transient, fully reversible irritating to the eye based on toxicity information for streams having components in common with this stream. These effects are not considered to warrant classification as an eye irritant.

Sensitization

Stream expected not to be a sensitizer based on toxicity information for streams having components in common with this stream.

Target Organs

Skin. Central nervous system. Blood. central nervous system (CNS) Liver. Kidneys.

Repeated dose toxicity

Repeated or prolonged contact with skin may cause defatting and drying of the skin which may result in dermatitis.

Genetic Toxicity

Mutagenic Substance. May cause genetic defects. Stream expected to be mutagenic based on toxicity information for components present in this stream.

Carcinogenicity

May cause cancer. Stream expected to be carcinogenic based on toxicity information for streams having components in common with this stream.

Other information

This product contains benzene. Benzene is considered to be a cancer-causing agent. Repeated exposure is linked to bone marrow toxicity, reduced red- and white blood cell counts and decreased immunological function irrespective of the route of contact. Contains xylene(all isomers). May cause dermatitis by defatting the skin from prolonged or repeated contact. May contribute to the development of diseases of the nervous system, liver and kidney. May be a reproductive hazard. Ethyl alcohol May cause eye and upper respiratory tract irritation. Short-term overexposure above 1,000 ppm by the inhalation route may cause central nervous system (CNS) effects such as headache and irritation of eyes, nose and throat. If continued for more than an hour additional CNS effects may occur such as: dizziness, drowsiness, loss of a ppetite, and an

MATERIAL SAFETY DATA SHEET

 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

GASOLINE

Other information

inability to concentrate. Gastrointestinal (stomach) effects may occur with symptoms such as nausea and vomiting. Long-term exposure can also cause loss of appetite, weight loss, nervousness, memory loss, mental retardation and liver damage. May cause dermatitis by defatting the skin from prolonged or repeated contact. Alcoholic beverages are carcinogenic to humans. Ethanol is a developmental toxin and various effects have been associated with ethanol intake. Examples of chronic ethanol abuse effects include physical dependence, malnutrition, amnesia, dementia, somnolence, cardiac myopathy, hepatotoxicity, GI bleeding and pancreatitis. Combined exposure to ethanol and certain other chemicals may result in increased toxic effects. Toluene is of slight acute toxicity, although inhalation exposure may cause dizziness and CNS depression, while ingestion may be fatal if aspiration into the lung occurs. Toluene may increase the sensitivity of the heart leading to potentially fatal cardiac sensitization. It is moderately irritating to skin and eye. Repeated exposure to high concentrations has been shown to cause neurological changes and hearing loss in animals, and in humans in abuse situations. May cause developmental toxicity. n-hexane May cause irritation to the eyes, nausea, vertigo, bronchial and central nervous system effects. This material presents an acute aspiration hazard. Damage to nerves in hands or feet may occur from prolonged inhalation of n-hexane concentrations of 60 to 240 ppm. Repeated exposure to air concentrations of 500 ppm n-hexane can produce progressively worsening damage to the peripheral nerves. Suspect reproductive hazard. naphthalene. Maybe irritating to the eyes, skin and respiratory tract. Direct contact with the eye may cause corneal damage. May be toxic by all routes of exposure. Target organs for toxic effects include the blood, liver, kidneys, eyes, and central nervous system (CNS). Symptoms of overexposure may include headache, restlessness, lethargy, vomiting, anorexia, anemia, diminished vision, and acute kidney failure. Individuals who have an inherited G6PD deficiency in their red blood cells may be particularly sensitive to the toxic effects of Naphthalene. Naphthalene can cross the placenta and harm the fetus. cumene Prolonged and/or repeated contact may cause mild to moderate skin defatting, redness, blistering, lesions, and/or scaly dermatitis. May cause kidney and/or lung damage. May cause cancer. Ethyl benzene May effect hearing. Repeated or prolonged exposure may cause severe irritation of the nose, throat and lungs, as well as liver and kidney damage. Possible cancer hazard. Repeated contact with skin may cause cracking and/or fissuring.

12. ECOLOGICAL INFORMATION

Product information

Ecotoxicity

Toxic to aquatic life with long lasting effects.

Acute Fish toxicity

LL50 / 96 HOURS Oncorhynchus mykiss (rainbow trout) 10 mg/l

LL50 / 96 HOURS Pimephales promelas (fathead minnow) 8.2 mg/l

Acute toxicity to aquatic invertebrates

Chronic toxicity to fish

NOELR / 14 d fish. 2.6 mg/l

Summary: QSAR (Quantitative structure-activity relationship) based calculation predicts low chronic toxicity.

Chronic toxicity to aquatic invertebrates

NOELR / 21 d Daphnia magna (Water flea) 2.6 mg/l

MATERIAL SAFETY DATA SHEET

MSDS No.: BE173
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

GASOLINE

Environmental fate and pathways

Mobility

Behavior in environmental compartments: Partitioning mainly to air. Environmental releases partition mainly to water.
 Predicted distribution to environmental compartments: The product is insoluble and floats on water.

Persistence and degradability

Stability in water: The product is insoluble and floats on water.

Biodegradation: Not expected to be hydrolytically unstable. Not readily, but considered likely to be inherently biodegradable.

Bioaccumulation: This material may bioaccumulate.

13. DISPOSAL CONSIDERATIONS

Contaminated product, soil, water, and empty containers may be hazardous wastes due to possible presence of flammable gases. Assure emissions comply with applicable regulations. Preferred disposal for this volatile, flammable product is through combustion. Proper grounding procedures to avoid static electricity should be followed. The product should not be allowed to enter drains, water courses or the soil.

14. TRANSPORT INFORMATION

Special Provisions

If you reformulate or further process this material, you should consider re-evaluation of the regulatory status of the components listed in the composition section of this sheet, based on final composition of your product.

Proper shipping name Gasoline

Reportable quantity Benzene

ID No. UN1203

Hazard class 3

Packing group II

15. REGULATORY INFORMATION

Notification status

All ingredients are on the following inventories or are exempted from listing

2. HAZARDS IDENTIFICATION
Emergency Overview

This material is HAZARDOUS as defined by the OSHA Hazard Communication Standard, 29CFR, 1910.1200.

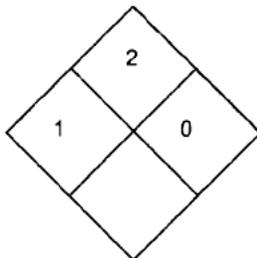

Signal Word

WARNING.

Hazards

Combustible liquid. Vapors may form explosive mixtures with air. Vapors can travel to a source of ignition and flash back. Vapors explosion hazard indoors, outdoors or in sewers. May cause central nervous system effects. Causes headache, drowsiness or other effects to the central nervous system. Can cause mild eye and skin irritation. MAY BE HARMFUL IF SWALLOWED. Ingestion of this material, followed by vomiting and aspiration of the more volatile components of this material into the lungs, may lead to chemical pneumonia and even death. Marine diesel fuel is possibly carcinogenic to humans (Group 2B) Listed by IARC as a group 2B - Possible Human Carcinogen. Distillate (light) fuels are not classifiable as to their carcinogenicity to humans (Group 3).

 Revision: 1.1
 Validation Date: 08/27/2010

ULTRA LOW SULFUR DIESEL

Color

Clear, colorless to light amber.

Odor

characteristic

Odor Threshold

No Data Available.

Potential health effects

Routes of exposure

Skin. Inhalation. Ingestion.

Acute effects

Skin

May produce skin irritation. Repeated or prolonged contact with skin may cause defatting and drying of the skin which may result in dermatitis.

Inhalation

Can cause pulmonary edema if aspirated into lungs.

Eyes

May cause moderate irritation, including burning sensation, tearing, redness or swelling. Effects of eye irritation are reversible.

Ingestion

Aspiration may cause lung damage.

Chronic effects

Repeated or prolonged exposure of the skin to this material may cause defatting and drying of the skin. Prolonged or repeated exposure to vapors may cause lung damage.

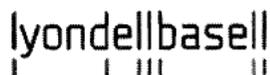

Aggravated Medical Condition

Persons with pre-existing chronic respiratory disease or skin disorders should minimize their exposure to this material.

3. COMPOSITION/INFORMATION ON INGREDIENTS

<u>Component</u>	<u>CAS-No.</u>	<u>EC-No.</u>	<u>Weight %</u>
1,1'-Biphenyl	92-52-4	202-163-5	0.5 <= 1.5
Naphthalene	91-20-3	202-049-5	0.0 <= 3.0
Diesel Fuel Oil	68334-30-5	269-822-7	0.0 <= 100.0
Trimethyl benzene	25551-13-7	247-099-9	0.5 <= 1.5

ULTRA LOW SULFUR DIESEL

4. FIRST AID MEASURES

General advice

Take proper precautions to ensure your own health and safety before attempting rescue and providing first aid. For specific information refer to the Emergency Overview in Section 2 of this MSDS.

Skin

Remove contaminated clothing and wash skin with plenty of soap and water. Wash clothing before wearing again.

Inhalation

Move the exposed person to fresh air at once. If breathing has stopped, perform artificial respiration. When breathing is difficult, properly trained personnel may assist the affected person by administering oxygen. Keep the affected person warm and at rest. Get medical attention immediately.

Eyes

Check for and remove contact lenses. Immediately flush the eyes with large amounts of clean low-pressure water for at least 15 minutes, occasionally lifting the upper and lower lids. If pain or irritation persists, promptly obtain medical attention.

Ingestion

DO NOT induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. Get medical attention immediately.

Notes to physician

Treat symptomatically.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

OSHA/NFPA Class IIIA Combustible Liquid.

Flash point

>= 60 °C (>= 140 °F)

Autoignition temperature

> 200 °C (> 392 °F)

Lower explosion limit

~ 0.6 vol%

Upper explosion limit

~ 7.5 vol%

Extinguishing Media

Suitable extinguishing media

LARGE FIRE: Use water spray, water fog or foam. DO NOT use straight streams. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. SMALL FIRE: Carbon Dioxide. Sand. Foam. Dry powder

Unsuitable extinguishing media

Do not use solid water stream/may spread fire.

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE164
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 08/27/2010

ULTRA LOW SULFUR DIESEL

Precautions for fire-fighting

Fight from a maximum distance or use unmanned hose holders or monitor nozzles. Containers can build up pressure if exposed to heat; cool with flooding quantities of water until well after the fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of vessel. Always stay away from the ends of tanks. Assure good ventilation to prevent flammable vapor formation. This material releases flammable vapors at well below ambient temperatures and may form flammable mixtures with air. When mixed with air in certain proportions and exposed to an ignition source, these vapors can burn in the open or be explosive in confined spaces. Being heavier than air, these vapors may travel long distances along the ground before reaching a point of ignition and flashing back. Burning liquid may float on water. Notify authorities immediately if liquid enters sewer/public waters.

Hazardous combustion products

Carbon dioxide, carbon monoxide, smoke, fumes and unburned hydrocarbons.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Combustible liquid. Release causes immediate fire/explosion hazard. Evacuate/limit access. Eliminate all sources of ignition. All equipment used when handling this product must be grounded. Do not touch or walk through spilled material. Stop leak if you can do so without risk. Prevent entry into waterways, sewers, basements, or confined areas. A vapor-suppressing foam may be used to reduce vapors. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, nonsparking tools to collect absorbed material. For large spills, secure the area and control access. Dike far ahead of liquid spill to ensure complete collection. Water spray may be used to reduce vapor, but it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. In an urban area, clean up spill as soon as possible; in natural environments, clean up on advice from an ecologist. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible materials. Place into appropriate waste containers for later disposal. The spilled material and any soil or water which it has contacted will be hazardous to animals and/or aquatic life. Comply with all laws and regulations.

7. HANDLING AND STORAGE

Handling

Electrostatic charge may build up during handling. Equipment should be grounded and bonded. During transfer of product, ground container and insure that all conveying equipment is properly grounded. Always keep nozzle in contact with the container throughout the loading process. Special slow load procedures for 'switch loading' must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point hydrocarbon products. Electrostatic charges may be generated as a result of flow or agitation. Use only non-sparking tools. Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved. Refer to NFPA 77 for relevant consensus guidance. Keep container closed and drum bungs in place. Store away from heat, sparks, open flames, strong oxidizing agents and direct sunlight. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of U.S. national electrical code, U.S. National Fire Protection Agency (NFPA). Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Never siphon by mouth. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Wash thoroughly after handling with soap and water.

Storage

Keep away from all ignition sources; segregate from incompatible materials. Keep containers tightly closed in a dry, cool, well-ventilated place, plainly labeled, and out of closed vehicles. Ground all containers, transfer vessels, and equipment containing this material. Containers should be able to withstand pressures expected from warming or cooling during storage. Flammable materials should be stored in separate safety storage cabinet or room. Keep containers tightly closed when not in use and store in a well-ventilated area. Isolate incompatible materials such as oxidizers. Containers should be clearly labeled. Metal containers used to store this material should be grounded. Do not store near strong oxidizers. Electrical installations / working materials must comply with the technological safety standards. Vapors may form explosive mixtures with air. Vapor space above stored liquid may be flammable/explosive unless blanketed with inert gas. Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved. Refer to NFPA 77 for relevant consensus guidance. This liquid may accumulate static electricity even when transferred into properly grounded containers.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE164
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 08/27/2010

ULTRA LOW SULFUR DIESEL

Storage

Static electricity accumulation may be significantly increased by the presence of small quantities of water. Store and transport in accordance with all applicable laws.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Use adequate ventilation to keep vapor concentrations below applicable exposure limit(s). Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. If mechanical ventilation is used, electrical systems should conform to U.S. National Electric Code. Emergency shower and eyewash facility should be in close proximity (ANSI Z358.1)

Personal protective equipment

Inhalation

A respiratory protection program which complies with U.S. Occupational Safety and Health Administration (OSHA) general industry standard 1910.134(e) should be implemented. Where exposure through inhalation may occur from use, approved respiratory protection equipment is recommended. Where excessive vapor, mist, or dust may result from use, use approved respiratory protection equipment. NIOSH approved organic vapor respirator equipped with a dust/mist prefilter should be used. For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA).

Skin

Avoid contact with skin. Skin should be washed after contact. DO NOT use gasoline, kerosene, solvents or harsh abrasives as skin cleaners. Recommended preventive skin protection Avoid contact with skin. Choose body protection in relation to its type, to the concentration and amount of dangerous substances, and to the specific work-place.

Eyes

Safety glasses are the minimum requirements. Use splash goggles when eye contact due to splashing or spraying liquid is possible.

Remarks

Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use. Odor is an inadequate warning for hazardous conditions. Warning! Use of this material in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and/or inadequate oxygen levels for breathing.

Occupational Exposure Limits

Component	Source	Type:	Value	Note
1,1'-Biphenyl	US (ACGIH)	TWA	0.2 ppm	None.
	US (OSHA)	TWA	0.2 ppm 1 mg/m ³	None.
Naphthalene	US (ACGIH)	STEL	15 ppm	None.
	US (ACGIH)	TWA	10 ppm	None.
	US (OSHA)	TWA	10 ppm 50 mg/m ³	None.
Diesel Fuel Oil	ACGIH	TWA	100 mg/m ³	None.
	US (ACGIH)	TWA	100 mg/m ³ inhalable fraction and vapor, as Total hydrocarbon	None.
Trimethyl benzene	US (OSHA)	TWA	25 ppm	None.
	US (ACGIH)	TWA	25 ppm	None.

ULTRA LOW SULFUR DIESEL

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance: liquid Clear, colorless to light amber.

Odor: characteristic

Odor Threshold: No Data Available.

pH: Not applicable.

Boiling point/boiling range: 160 - 400 °C (320 - 752 °F)

Melting/freezing point: No Data Available.

Flash point: ≥ 60 °C (≥ 140 °F)

Autoignition temperature: > 200 °C (> 392 °F)

Flammability: OSHA/NFPA Class IIIA Combustible Liquid.

Lower explosion limit: ~ 0.6 vol%

Upper explosion limit: ~ 7.5 vol%

Explosive properties: No Data Available.

Oxidizing properties: No Data Available.

Vapor pressure: 0.4 kPa @ 40 °C (104 °F) (Estimated)

Evaporation rate: No Data Available.

Relative density: 0.81 - 0.90 @ 15 °C (59 °F)

Relative vapor density: not determined

Viscosity: 2.0 - 7.4 mm²/s @ 40 °C (104 °F)

Water solubility: < 1 mg/l

Solubility (l): No Data Available.

Partition coefficient: n-octanol/water: no data available

Other physico-chemical properties: No additional information available.

10. STABILITY AND REACTIVITY

Chemical stability

The product is stable.

Conditions to avoid

Heat, sparks and open flame.

Materials to avoid

MATERIAL SAFETY DATA SHEET

MSDS No.: BE164
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 08/27/2010

ULTRA LOW SULFUR DIESEL

Materials to avoid

Strong acids, bases, and oxidizing agents, such as liquid chlorine and oxygen. May react with peroxides.

Hazardous polymerization

Not expected to occur.

11. TOXICOLOGICAL INFORMATION

Product information

Product Summary

May produce skin irritation. Slight eye irritant. Inhalation of vapors may cause respiratory distress and CNS effects. Aspiration may cause lung damage. Marine diesel fuel is possibly carcinogenic to humans (Group 2B) Distillate (light) fuels are not classifiable as to their carcinogenicity to humans (Group 3).

Acute toxicity

<u>LC50 (Inhl)</u>	rat	4.6 MG/L	4 HOURS
<u>LD50 (Oral)</u>	rat	>5000 MG/KG	
<u>LD50 (Skin)</u>	rabbit	>2000 MG/KG	

Acute effects

Inhalation

Inhalation may cause CNS depression. Respiration of solvent vapor may cause dizziness. Can cause pulmonary edema if aspirated into lungs.

Ingestion

Aspiration may cause pulmonary edema and pneumonitis.

Skin contact

Skin irritant. Repeated exposure may cause cracking and drying due to the extraction of oils.

Irritation

Skin

Irritating to skin.

Eyes

slight irritation

Sensitization

Not expected to be a sensitizer.

Target Organs

Skin. Central nervous system. Lungs

Repeated dose toxicity

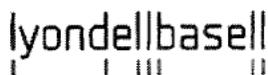

Prolonged contact with the skin may cause mechanical irritation and subsequent dermatitis.

Genetic Toxicity

This substance is a low concern for genetic toxicity. Mutagenicity in vivo studies have shown negative results in animals. Mutagenicity in vitro studies have shown predominantly negative results in animals.

Carcinogenicity

Marine diesel fuel is possibly carcinogenic to humans (Group 2B) Distillate (light) fuels are not classifiable as to their carcinogenicity to humans (Group 3).

MATERIAL SAFETY DATA SHEET

MSDS No.: BE164
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 08/27/2010

ULTRA LOW SULFUR DIESEL

Other information

Contains naphthalene. May be irritating to the eyes, skin and respiratory tract. Direct contact with the eye may cause corneal damage. May be toxic by all routes of exposure. Target organs for toxic effects include the blood, liver, kidneys, eyes, and central nervous system (CNS). Symptoms of overexposure may include headache, restlessness, lethargy, vomiting, anorexia, anemia, diminished vision, and acute kidney failure. Individuals who have an inherited G6PD deficiency in their red blood cells may be particularly sensitive to the toxic effects of Naphthalene. Naphthalene can cross the placenta and harm the fetus. Target organs for toxic effects of chronic exposure include the blood, the skin, the eyes, and the central nervous system. Symptoms of chronic overexposure may include dermatitis, anemia, sores on the eye or cloudiness of the eyeball, diseases involving the nerves or nervous system, and allergic skin reactions. Results from repeated dose oral gavage tests with naphthalene showed fetotoxicity in rats (increase in resorptions at 450 mg/kg bwt/day) and in mice (decrease in number of live pups/litter at 300 mg/kg bwt/day) in the presence of maternal toxicity (reduction in body weight gains in rats; decrease in survival and reduction in body weight in mice). Naphthalene produced chromosome damage in in vitro assays, but not in in vivo assays in which mice were administered 500 mg/kg bwt orally or 250 mg/kg bwt by intraperitoneal injection. The National Toxicology Program (NTP) has evaluated this substance and placed it in Group R: Reasonably Anticipated To Be A Human Carcinogen. The International Agency for Research on Cancer (IARC) has evaluated this substance and placed it in Group 2B (possibly carcinogenic to humans).

12. ECOLOGICAL INFORMATION

Product information

Ecotoxicity

Toxic to aquatic organisms. May cause long-term adverse effects in the aquatic environment.

Acute Fish toxicity

LC50 / 96 HOURS *Pimephales promelas* (fathead minnow) 35 mg/l (flow-through)

Environmental fate and pathways

Mobility

Behavior in environmental compartments: Environmental releases partition mainly to water.

Predicted distribution to environmental compartments: The product is insoluble and floats on water.

Persistence and degradability

Stability in water: The product is insoluble and floats on water.

Biodegradation: Not readily biodegradable.

Bioaccumulation: This material may bioaccumulate.

13. DISPOSAL CONSIDERATIONS

It is the responsibility for the waste generator to characterize waste streams relative to the pertinent regulatory provisions to ensure that applicable requirements are reviewed and met. Dispose of all waste and contaminated equipment in accordance with all applicable federal, state and local health and environmental regulations. Recovery and reuse, rather than disposal, should be the ultimate goal of handling efforts. The materials resulting from clean-up operations may be hazardous wastes and therefore, subject to specific regulations. Contact the RCRA Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulation (see 40 CFR Parts 260 through 271). State and/or local regulations may be more restrictive.

2. HAZARDS IDENTIFICATION

Emergency Overview

This material is HAZARDOUS by OSHA Hazard Communication definition.

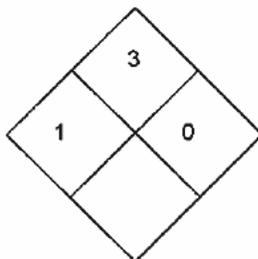

Signal Word

DANGER.

Hazards

Extremely flammable. Vapor may cause flash fire or explosion. May be harmful if inhaled, swallowed or absorbed through the skin. May be irritating to the eyes, skin, and respiratory system. Overexposures may cause central nervous system (CNS) depression and/or other target organ effects.

NFPA®

 Revision: 1.2
 Validation Date: 05/20/2011

ALKYLATE

Odor Threshold
 No Data Available.

Potential health effects

Routes of exposure
 Eye. Inhalation. Skin. Ingestion.

Acute effects

High concentrations of vapor reduce oxygen available for breathing. May cause eye, skin, and/or respiratory tract irritation and inflammation. May be harmful or fatal if inhaled, ingested, or absorbed through the skin. See component summary.

- *Octane Isomers*

May be irritating to the skin. Aspiration hazard. CNS depressant.

- *Heptane (and isomers)*

CNS depressant. Aspiration hazard.

- *Hexane Isomers*

May be irritating to the eyes, skin, and respiratory system. Inhalation of vapors may cause dizziness, narcosis, nausea or asphyxiation. Ingestion of this material, followed by vomiting and aspiration of the more volatile components of this material into the lungs, may lead to chemical pneumonia and even death.

- *Isopentane 78-78-4*

This product may cause eye, skin, and respiratory tract irritation. High concentrations may cause central nervous system (CNS) depression. Ingestion would likely cause gastrointestinal tract irritation.

- *n-Butane 106-97-8*

Simple asphyxiant. Inhalation of vapors may cause dizziness, narcosis, nausea or asphyxiation. CNS depressant.

Skin

Irritating to the skin, not a sensitizer. May be absorbed through the skin and produce toxic effects such as CNS depression.

Inhalation

Breathing high concentrations of vapor or mist may cause respiratory tract irritation, nausea, vomiting, central nervous system (CNS) depression and asphyxiation. Symptoms may include headache, dizziness, blurred vision, slurred speech, memory loss, confusion, fatigue, loss of consciousness, convulsions, paralysis, or coma.

Eyes

Based upon animal test data on a similar product, no irritation to only minimal eye irritation is expected upon short-term exposure.

Ingestion

Irritates mucous membranes of the mouth, throat, and esophagus and is readily absorbed by the stomach and intestinal tract. CNS symptoms include nausea, vomiting, pallor, dizziness, staggering gait, drowsiness, shallow rapid pulse, loss of consciousness, and delirium prior to the onset of convulsions, coma, and death. Ingestion and/or vomiting of this material may result in aspiration into the lungs. Even a small amount of this liquid entering the lungs can produce potentially fatal effects (pulmonary edema and pneumonitis).

Chronic effects

Prolonged and/or repeated contact may cause mild to moderate skin defatting, redness, blistering, lesions, and/or scaly dermatitis. Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung tumor) formation and chronic lung dysfunction. Altered mental states, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called "petrol sniffers encephalopathy"), delirium, seizures, and sudden death have been common symptoms among gasoline and naphtha abusers.

- *Octane Isomers*

Lungs may be affected by repeated or prolonged exposure.

- *Heptane (and isomers)*

Repeated or prolonged exposure to styrene may cause nausea, loss of Appetite, CNS depression, and general weakness.

- *Hexane isomers*

Eye irritation, skin irritation leading to dermatitis, chemical pneumonia, and central nervous system depression may occur

MATERIAL SAFETY DATA SHEET

MSDS No.: BE207
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

ALKYLATE

from repeated or prolonged exposure.

- *Isopentane 78-78-4*

Repeated or prolonged exposure of the skin to this material may cause defatting and drying of the skin. This substance is a developmental toxicant.

- *n-Butane 106-97-8*

Repeated or prolonged exposure to low levels of this material produces no known adverse chronic health hazards.

Aggravated Medical Condition

Persons with pre-existing skin disorders, peripheral or central nervous system (CNS) disease, psychological conditions, cardiac conditions, impaired pulmonary, cardiovascular, or liver/kidney function, or chronic respiratory diseases should avoid exposure

3. COMPOSITION/INFORMATION ON INGREDIENTS

<u>Component</u>	<u>CAS-No.</u>	<u>EC-No.</u>	<u>Weight %</u>
Octane Isomers	Mixture	Isomeric Mixture	58.0 <= 65.0
Heptane (and isomers)	Mixture	Isomeric mixture	7.0 <= 8.0
Hexane isomers	Mixture	Mixture	5.0 <= 7.0
Isopentane	78-78-4	201-142-8	5.0 <= 7.0
n-Butane	106-97-8	203-448-7	0.5 <= 2.0

Typical composition

4. FIRST AID MEASURES

General advice

Take proper precautions to ensure your own health and safety before attempting rescue and providing first aid. For specific information refer to the Emergency Overview in Section 2 of this MSDS.

Skin

Immediately remove excess chemical and contaminated clothing; thoroughly wash contaminated skin with mild soap and water. If irritation persists after washing, seek medical attention. Thoroughly clean contaminated clothing before reuse; discard contaminated leather goods (gloves, shoes, belts, wallets, etc.).

Inhalation

Move the exposed person to fresh air at once. If breathing has stopped, perform artificial respiration. When breathing is difficult, properly trained personnel may assist the affected person by administering oxygen. Keep the affected person warm and at rest. Get medical attention immediately.

Eyes

Immediately flush the eyes with large amounts of clean low-pressure water for at least 15 minutes, occasionally lifting the upper and lower lids. If pain or irritation persists, promptly obtain medical attention.

Ingestion

DO NOT induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. Get medical

Ingestion
 attention immediately.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

OSHA/NFPA Class IB Flammable Liquid.

Flash point

-43 - -23 °C (-45.4 - -9.4 °F) Tag closed cup (Estimated) ASTM D 56

Autoignition temperature

280 °C (536 °F)

Lower explosion limit

0.9 vol%

Upper explosion limit

7.6 vol%

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Use dry chemicals, CO₂, or foam. LARGE FIRE: Use water spray, water fog or foam. DO NOT use straight streams

Unsuitable extinguishing media

DO NOT use water jet.

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear an approved positive pressure self-contained breathing apparatus and firefighter turnout gear.

Precautions for fire-fighting

This material releases flammable vapors at well below ambient temperatures and may form flammable mixtures with air. When mixed with air in certain proportions and exposed to an ignition source, these vapors can burn in the open or be explosive in confined spaces. Being heavier than air, these vapors may travel long distances along the ground before reaching a point of ignition and flashing back. Evacuate area and fight from a maximum distance or use unmanned hose holders or monitor nozzles. Heat may generate flammable or explosive vapors; disperse with water spray or cover pooling liquid with foam. Containers can build up pressure if exposed to heat; cool with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of vessel. Always stay away from the ends of tanks. Be aware that burning liquid will float on water. Notify authorities immediately if liquid enters sewer/public waters.

Hazardous combustion products

Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Eliminate all sources of ignition. All equipment used when handling this product must be grounded. Do not touch or walk through spilled material. Stop leak if you can do so without risk. Prevent entry into waterways, sewers, basements, or confined areas. A vapor-suppressing foam may be used to reduce vapors. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, nonsparking tools to collect absorbed

MATERIAL SAFETY DATA SHEET

 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

ALKYLATE

Spills and leaks

material. For large spills, secure the area and control access. Dike far ahead of liquid spill to ensure complete collection. Water spray may be used to reduce vapor, but it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. In an urban area, cleanup spill as soon as possible; in natural environments, clean up on advice from an ecologist. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible materials. Place into appropriate waste containers for later disposal. The spilled material and any soil or water which it has contacted will be hazardous to animals and/or aquatic life. Comply with all laws and regulations.

7. HANDLING AND STORAGE

Handling

Use only with adequate ventilation/personal protection. Avoid contact with eyes, skin and clothing. Wash thoroughly after handling. Prevent contact with food, chewing, or smoking materials. All sampling should be conducted in a manner which avoids skin contact and inhalation of vapors. Clean up any spilled material. Parts and equipment using or containing this material should be steam-cleaned if possible prior to all maintenance procedures. Empty containers retain some liquid and vapor residue and can be dangerous, so all hazard precautions must be observed when handling empties. Do not pressurize, cut, weld, braze, solder, drill, grind, or expose containers to heat, flame, sparks, static electricity, or other sources of ignition. Empty drums should be completely drained, properly bunged and promptly disposed of or reconditioned.

Storage

Keep away from all ignition sources; segregate from incompatible materials. Keep containers tightly closed in a dry, cool, well-ventilated place, plainly labeled, and out of closed vehicles. Ground all containers, transfer vessels, and equipment containing this material. Containers should be able to withstand pressures expected from warming or cooling during storage. Flammable materials should be stored in separate safety storage cabinet or room.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

If good general ventilation is insufficient to keep airborne levels below recommended exposure limits, use process enclosures, local exhaust ventilation, or other engineering means to control the concentration of regulated substances.

Personal protective equipment

Inhalation

When workers are facing concentrations above the exposure limit they must use appropriate certified respirators.

Skin

Wear insulated gloves if contact with liquid is possible. Use chemical resistant gloves appropriate to conditions of use. Use PPE that is chemical resistant to the product and prevents skin contact.

Eyes

Wear safety glasses as minimum eye protection. Conditions may warrant the use of chemical goggles and possibly a face shield. Consult your standard operating procedure or safety professional for advice. Use protective eye and face devices that comply with ANSI Z87.1-1987.

Occupational Exposure Limits

Consult local authorities for acceptable exposure limits.

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance: liquid Clear, colorless.

Odor: Gasoline/ hydrocarbon like odor.

Odor Threshold: No Data Available.

pH: Not applicable.

Boiling point/boiling range: ~ 31 - 50 °C (87.8 - 122 °F)

Melting/freezing point: -59 °C (-74.2 °F)

Flash point: -43 - -23 °C (-45.4 - -9.4 °F) Tag closed cup (Estimated) ASTM D 56

Autoignition temperature: 280 °C (536 °F)

Flammability: OSHA/NFPA Class IB Flammable Liquid.

Lower explosion limit: 0.9 vol%

Upper explosion limit: 7.6 vol%

Explosive properties: No Data Available.

Oxidizing properties: No Data Available.

Vapor pressure: Vapor pressure 4.1 to 5.1 psia (@100 deg F)

Evaporation rate: No Data Available.

Relative density: 0.69 - 0.71 (Water = 1)

Relative vapor density: 3.0 @ 21.1 °C (69.98 °F)

Viscosity: Not applicable.

Water solubility: Slightly soluble

Partition coefficient: n-octanol/water: Specific data not available.

Other physico-chemical properties: No additional information available.

10. STABILITY AND REACTIVITY

Chemical stability

The product is stable.

Conditions to avoid

All sources of ignition.

Materials to avoid

Strong acids, alkalis, and oxidizers such as liquid chlorine and oxygen. If uninhibited, naphtha will cause rusting of copper

Hazardous polymerization

Will not occur.

Reactions with Air and Water

Does not react with air, water or other common materials.

11. TOXICOLOGICAL INFORMATION

Product information

Product Summary

See componentsummary. See componentsummary.

Acute toxicity

LC50 (Inhl) rat > 5.04 MG/L 4 HOURS

LD50 (Oral) rat > 7000 MG/KG

LD50 (Skin) rabbit > 2000 MG/KG

COMPONENT INFORMATION

- *Octane Isomers*

Acute effects

Ingestion

Harmful if swallowed.

Irritation

Skin

May be irritating to the skin.

- *Heptane (and isomers)*

Target Organs

Central nervous system. Lung.

Repeated dose toxicity

Repeated exposure can cause peripheral nerve damage and defatting of the skin.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *Hexane isomers*

Acute effects

Inhalation

ALKYLATE

Overexposure may cause irritation to the respiratory tract and to other mucous membranes. May produce symptoms of central nervous system depression including headache, dizziness, nausea, loss of sense of balance, drowsiness, visual disturbances, unconsciousness and sense of balance, drowsiness, visual disturbances, unconsciousness and death.

Irritation

Skin

Maybe irritating to the skin.

Eyes

May cause eye irritation.

Target Organs

Skin. Eye. Respiratory system. CNS depressant.

Repeated dose toxicity

No known chronic health effects.

Reproductive effects

Not expected to occur.

Developmental Toxicity

Not expected to occur.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *Isopentane* 78-78-4

Acute toxicity

<u>LC50 (Inhl)</u>	mouse	413 MG/L	2 HOURS
	rat	1281.9 MG/L	4 HOURS

Irritation

Skin

Defatting of the skin with irritation, dryness and cracking.

Eyes

Slight eye irritant.

Target Organs

Skin. Eye.

Repeated dose toxicity

Repeated oral gavage exposures of rats to 500 mg/kg bwt/day isopentane produced lethality and decreases in bodyweight gain.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *n-Butane* 106-97-8

Acute toxicity

<u>LC50 (Inhl)</u>	rat	658 MG/L	4 HOURS
	mouse	680 MG/L	2 HOURS

Acute effects

Ingestion

Stream is a gas with a low boiling point; hence, oral exposure and resulting acute toxicity are unlikely.

Skin contact

Stream is a gas with a low boiling point; hence, dermal uptake and resulting acute toxicity are unlikely.

Irritation

MATERIAL SAFETY DATA SHEET

MSDS No.: BE207
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

ALKYLATE

Skin

None expected. Evaporating liquid may cause frost bite.

Eyes

None expected. Evaporating liquid may cause frost bite.

Target Organs

CNS depressant.

Repeated dose toxicity

No biologically significant treatment-related systemic effects were seen when rats were exposed by inhalation for 4-6 weeks to 9000 ppm (21.4 mg/L) n-butane.

Reproductive effects

No signs of reproductive toxicity were observed in an inhalation screening test of rats exposed to up to 9000 ppm (21.39 mg/L) n-butane.

Developmental Toxicity

No signs of developmental toxicity were observed in an inhalation screening test of rats exposed to up to 9000 ppm (21.39 mg/L) n-butane.

12. ECOLOGICAL INFORMATION

Product information

Ecotoxicity

Volatile hydrocarbon compounds in this product may be released to the atmosphere and react with photochemically-produced hydroxyl radicals to create smog. If spilled, this product, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. This material is potentially toxic to freshwater and saltwater ecosystems. It will normally float on the water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways a naphtha layer can cover a large surface area and limit or eliminate the natural atmospheric oxygen transport into the water. Over time, this could be harmful or fatal. The coating action of this material may also be harmful or fatal to water birds and aquatic life.

Environmental fate and pathways

No information found in our selected references.

Persistence and degradability

Bioaccumulation: Not expected to occur.

COMPONENT INFORMATION

- *Octane Isomers*

Ecotoxicity

No data available.

Environmental fate and pathways

No data available.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE207
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

ALKYLATE

- *Heptane (and isomers)*

Ecotoxicity

No Data Available.

Environmental fate and pathways

This material is expected to exist solely as a vapor in the ambient atmosphere. The vapor-phase of this material is degraded in the atmosphere by reaction with photochemically-produced hydroxyl radicals and ozone. This material is not expected to persist in the environment.

Persistence and degradability

Stability in water: In aquatic systems, this material may partition from the water column to organic matter contained in sediments and suspended materials.

Stability in soil: This material is expected to have slight mobility in soil.

Bioaccumulation: This material may bioaccumulate.

- *Hexane isomers*

Ecotoxicity

No Data Available.

Environmental fate and pathways

Persistence and degradability

Bioaccumulation: Not expected to occur.

- *Isopentane 78-78-4*

Ecotoxicity

This material is toxic to aquatic organisms.

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS *Daphnia magna*. 2.3 mg/l

Environmental fate and pathways

This material is likely to evaporate from soil and water.

Persistence and degradability

Stability in water: Volatilization from water surfaces is expected to be an important environmental fate process.

Stability in soil: Volatilization from moist soil surfaces is expected to be an important fate process of this material.

Biodegradation: This material is expected to be biodegradable.

Bioaccumulation: This material is not expected to bioaccumulate.

- *n-Butane 106-97-8*

Ecotoxicity

MATERIAL SAFETY DATA SHEET

MSDS No.: BE207
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

ALKYLATE

This material is expected to be non-hazardous to aquatic species.

Environmental fate and pathways

This material is likely to evaporate from soil and water.

Persistence and degradability

Stability in water: Not likely to adsorb to suspended solids and sediment in water.

Stability in soil: Expected to have very high to moderate mobility in soils. Volatilization from surface soil may be quite rapid, although this process may be slowed by dicyclopentadiene's adsorption to the soil. This compound is expected to display low mobility. Biodegradation and hydrolysis are not expected to be significant factors.

Biodegradation: Biodegradation may occur in soil and water, however, volatilization and adsorption are expected to be far more important fate processes.

Bioaccumulation: This material is not expected to bioaccumulate.

13. DISPOSAL CONSIDERATIONS

Recycle if possible. This material is classified as a Hazardous Material by RCRA. Use only permitted transporters and disposal facilities and conform to all laws. If this material is introduced into a wastewater treatment system, chemical and biological oxygen demand will increase. This material will biodegrade if gradually exposed to microorganisms, preferably in an aerobic environment. In concentration of 0.2 volume percent or less, this material will have little or no effect on sewage-seeded wastewater bio-oxidation and/or digestion. A concentration of 1.0 volume per cent will double the required digestion period. Higher concentrations interfere with floc formation and settling and may also plug filters or exchange beds. Vapor emissions from a bio-oxidation process might prove to be a potential health hazard.

14. TRANSPORT INFORMATION

Special Provisions

If you reformulate or further process this material, you should consider re-evaluation of the regulatory status of the components listed in the composition section of this sheet, based on final composition of your product. If you reformulate or further process this material, you should consider re-evaluation of the regulatory status of the components listed in the composition section of this sheet, based on final composition of your product.

Proper shipping name Petroleum distillates, n.o.s. (Octane Isomers, Heptane Isomers)

ID No. UN1268
Hazard class 3
Packing group I

SECTION 3: HAZARDS IDENTIFICATION

EMERGENCY OVERVIEW

 Signal Word **DANGER!** Color **Colorless liquid/invisible vapor.**

 Physical State **Gas** Odor **Faint, unpleasant**

 Physical and Health Hazards **Extremely Flammable Compressed Gas! High concentrations of vapor reduce Oxygen available for breathing and may cause central nervous system (CNS) depression or suffocation. Liquid or compressed gas contact may cause frostbite or freeze burns. Inhalation may sensitize the heart to sympathomimetic drugs.**

 Environmental Hazards **Ecological effects testing has not been conducted on this product. Releases are expected to cause only localized non-persistent environmental damage.**

POTENTIAL HEALTH EFFECTS

 Routes of Exposure **Inhalation; Skin and Eye Contact.**

Signs and Symptoms of Acute Exposure

- **Inhalation** High concentrations of this gas will exclude Oxygen and may lead to central nervous system (CNS) depression or asphyxiation. Symptoms include headache, dizziness, visual disturbances, intoxication, loss of coordination, drowsiness, muscular fatigue, rapid breathing, narcosis, tremors, convulsions, unconsciousness, coma, and/or death, depending upon the concentration level and duration of exposure.
- **Eye Contact** This gas is non-irritating, but, direct contact with liquefied/pressurized gas or frost particles may produce severe, and possibly permanent, eye damage from freeze burns.
- **Skin Contact** Non-irritating, but, solid and liquid forms of this material and pressurized gas can cause freeze burns.
- **Ingestion** Ingestion is not an applicable route of exposure for gases.

Chronic Health Effects Summary

Propane and n-Butane may cause a weak cardiac sensitization to Epinephrine (Adrenaline)-like drugs.

Conditions Aggravated by Exposure

Personnel with pre-existing chronic respiratory diseases, CNS disease, or cardiac conditions should avoid exposure. Persons who are compromised in their ability to use Oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of "Simple Asphyxiants".

Target Organs

Skin, eyes, central nervous system, and heart.

Carcinogenic Potential

Please refer to Section 2 for the identification of components, if any, which have been identified as having carcinogenic potential.

SECTION 4: FIRST AID MEASURES

- Inhalation** Evacuate the victim to a safe, fresh air area as soon as possible. Loosen tight clothing such as a collar, tie, belt, or waistband. If breathing is difficult, administer air or oxygen. If the victim is not breathing, administer cardiopulmonary resuscitation (CPR), as necessary. **WARNING.** Persons providing mouth-to-mouth resuscitation may be placing themselves at risk, either from exposure to toxic materials or communicable disease.
- Eye Contact** Vapors are not expected to cause an eye irritation hazard. If contacted by liquid or solid, immediately flush the eye(s) gently with warm water (105° to 115°F) for at least 15 minutes. Seek medical attention if pain or redness persists.
- Skin Contact** Frozen tissues should be flooded or soaked with warm water (105° to 115°F). **DO NOT USE HOT WATER!** Cryogenic burns which result in blistering or deeper tissue freezing should be promptly seen by a physician.
- Ingestion** Ingestion is highly unlikely. However, if ingested, and only if the patient is conscious, induce vomiting with a quart or more of warm water. Immediately obtain medical attention.
- Notes to Physician** Patient(s) should be kept quiet and warm until medical care is obtained.

This material may make the heart more susceptible to arrhythmias (irregular beats). Catecholamines such as Epinephrine (Adrenaline), and other similar sympathomimetic drugs, should be reserved for emergencies and then used only with special precaution.

SECTION 5: FIRE FIGHTING MEASURES

FLAMMABLE PROPERTIES

- Flammability Classification** Extremely Flammable! OSHA/NFPA Class-IA Flammable Gas/Liquid.
- Flash Point/Method** LT -120° to -115°F by ASTM D-56.
- Flammable Limits %** LEL: AP 1.8% UEL: AP 8.4%
(Based upon NFPA "ISOBUTANE".)

Auto-Ignition Temperature	AP 550°F (288°C) by ASTM E-659 (Based upon NFPA "BUTANE".)
Hazardous Combustion Products	Burning or excessive heating may produce smoke, Carbon Monoxide, Carbon Dioxide, and possibly other harmful gases/vapors.
Special Properties	Vapor may cause flash fire or explosion! Keep away from all ignition sources! This gas releases flammable vapors at well below ambient temperatures and readily forms flammable mixtures with air. Exposed to an ignition source, it will burn in the open or explode in confined spaces. Being heavier than air, its flammable vapors may travel long distances along the ground before reaching a point of ignition, and then flash back.

EXTINGUISHING MEDIA

SHUT OFF GAS FLOW! If source cannot be shut off, withdraw from area and let the fire burn. Water fog and spray can be used to cool containers and structures adjacent to the fire. Once the gas supply is eliminated, dry chemical, Carbon Dioxide (CO₂), and/or inert gas (Nitrogen, Halon, etc.) may be used to extinguish adjacent burning materials.

FIRE FIGHTING INSTRUCTIONS

Gas fires should not be extinguished until the gas flow can be stopped. Shut off the gas source and allow the fire to burn itself out. If the source cannot be shut off immediately, all equipment and surfaces exposed to the fire should be cooled with water to prevent overheating, flash-backs, or explosions. Control the fire until the gas supply can be shut off.

Do not enter any enclosed or confined fire space without proper protective clothing and equipment. This may include a self-contained breathing apparatus to protect against the hazardous effects of combustion products and/or Oxygen deficiencies. If firefighters cannot work upwind to the fire, respiratory protective equipment must be worn. Cool tanks and containers exposed to fire with water. Withdraw immediately in case of rising sound from venting safety device or discoloration of the vessel, tank, or pipeline. Immediately notify the appropriate authorities if cryogenic liquid(s) enter sewers or waterways.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Small Spills

Extremely Flammable Liquefied Compressed Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area upwind. Remove all potential ignition sources. Safety stop the source gas flow using non-sparking tools. Ventilate enclosed areas to prevent formation of flammable or Oxygen-deficient atmospheres. Closed gas systems form white-colored frost at the point of a leak. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Water spray may be used to reduce vapors. Avoid entering a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing.

Large Spills

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This gas or waste mixtures containing this gas should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING and STORAGE

Handling

Use only with adequate ventilation/personal protection. Do NOT breathe vapor. Avoid contact with eyes, skin, and clothing. Wash thoroughly after handling. Prevent contact with food, chewing, or smoking materials.

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of Petroleum gases. If upon initial receipt inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Large pressure build-up can cause explosive decomposition at the cylinder head or release valve. The cylinder or other container will rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when handling gas/liquids.

Storage

Flammable gas/liquids should be stored in a separate safety storage cabinet or room. Keep away from heat and all other ignition sources! Keep containers tightly closed, plainly labeled, out of closed vehicles, and in a cool, well-ventilated place. A well ventilated, refrigerated room is preferable for materials with flash points lower than 70°F (AP 21°C). Containers should be able to withstand pressures expected from warming or cooling in storage. Do not puncture or incinerate containers. Do NOT contact with oxidizable materials. All electrical equipment in storage and/or handling areas should be installed in accordance with applicable requirements of the National Electrical Code and National Fire Protection Association standards.

Always chain cylinders securely and avoid placing them in high-traffic areas and away from falling objects. To prevent container damage, avoid dragging, rolling, sliding, or knocking cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and unneeded partially-filled containers should be returned to the supplier as soon as possible.

SECTION 8: EXPOSURE CONTROLS and PERSONAL PROTECTION

ENGINEERING CONTROLS

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. Ensure that an emergency eyewash station and safety shower are proximal to the work-station location.

PERSONAL PROTECTIVE EQUIPMENT

• Protective Equipment

• Eye Protection

Use chemical-type goggles and face shield when handling liquefied gases. Safety glasses with side shields and/or face shield are recommended when vapor is being discharged or whenever handling high-pressure cylinders and piping systems.

• Skin Protection

- Hands

Use insulated, impervious, chemical-resistant gloves to protect hands from potential contact with cold liquid, solid, or vapors.

- Body

Prevent potential skin contact with cold liquid, solid, or vapors. Use insulated, impervious, chemical-resistant clothing and equipment (apron, slicker suit, Tyvek, boots, etc.) to protect other potential skin contact areas.

• Respiratory Protection

Odor is not an adequate warning for potentially hazardous air concentrations! For unknown vapor concentrations use a self contained breathing apparatus (SCBA). For known vapor concentrations, above the 1,000 ppm exposure guideline shown below in this Section, use a NIOSH/MSHA-approved organic vapor respirator, if adequate protection is provided. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent.

• General Comments

For explanation of the occupational exposure limits shown below, refer to the definition of "Simple Asphyxiant" presented in the American Conference of Governmental Industrial Hygienists (ACGIH) most current **Threshold Limit Values (TLVs) for Chemical Substances and Physical Agents** handbook. Releases of these gases may cause atmospheres, some Oxygen-deficient (LT 21 Vol.% in air), which can have flammable/explosive potential. DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for Oxygen deficiency and flammability.

EXPOSURE GUIDELINES

Substance	Source	Date	Type	Value	Time
PROPANE	ACGIH	1995	"Simple Asphyxiant"		
PROPANE	OSHA	1989	PEL	1000 ppm	8 Hrs
BUTANE	OSHA	1989	PEL	800 ppm	8 Hrs
BUTANE	ACGIH	1995	TLV	800 ppm	8 Hrs
L.P.G. (LIQUEFIED PETROLEUM GAS)	OSHA	1989	PEL	1000 ppm	8 Hrs
L.P.G. (LIQUEFIED PETROLEUM GAS)	ACGIH	1995	TLV	1000 ppm	8 Hrs

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Gas		
Color	Colorless liquid/invisible vapor		
Odor	Faint, unpleasant.		
pH	Not applicable.		
Vapor Pressure	AP 50 to 75 psia at 100°F.	Viscosity	Not applicable.
Vapor Specific Gravity	AP 2.0 when Air = 1.0 at 70°F.	Melting/Freezing Pt.	AP -255° to -215°F at 14.7 psia.
Volatile Characteristics	Complete (100 Wt.%)	Solubility in Water	Moderate (1 to 5 Wt.%)
Boiling Point/Range	AP -45° to 35°F (-43° to 1°C) at 14.7 psia (by ASTM D-2887)	Specific Gravity	AP 0.55 to 0.57 at 60°F.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Gross Heat of Combustion at 60°F = AP 21,250 Btu/lb. or 3,350 Btu/cu. ft.		

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.
Conditions to Avoid	Heat, sparks, open flames, and strong oxidizing conditons.
Incompatibility with Other Materials	Strong acids, alkalis, and oxidizers such as Oxygen (gas or liquid), Chlorine, Flourne and Flouride compounds, Bromine, and metal catalysts.
Hazardous Decomposition Products	Burning or excessive heating may produce smoke, Carbon Monoxide, Carbon Dioxide, and possibly other harmful gases/vapors.
Hazardous Polymerization	Not expected to occur.

SECTION 11: TOXICOLOGICAL INFORMATION

Exposure to 1,000 ppm of PROPANE for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS, including cardiac, pulmonary, or neurologic functions in humans.

No other specific information is available in our data base regarding the chronic toxic effects of this material for humans.

ISOBUTANE (2-METHYLPROPANE):

GAS (TCLo): Acute: 1,040 gm/M3 (Mouse) (2 hours) - Excitement.
GAS (LC50): Acute: 57,000 ppm (Rat) (15 minutes) - Tremors, convulsions,
& respiratory depression.

BUTANE (n-BUTANE):

GAS (LC50): Acute: 680 gm/M3 (Mouse) (2 hours).
GAS (LC50): Acute: 660 gm/M3 (Rat) (4 hours).

LIQUEFIED PETROLEUM GAS (LPG or LP-GAS):

GAS (TCLo): Acute: GT 10,000 ppm (Rabbit screen level) (4 hours) -
Cardiac sensitization.

SECTION 12: ECOLOGICAL INFORMATION

Ecological effects testing has not been conducted on this product. If it were spilled, no significant detrimental effects would be expected to occur.

Liquefied petroleum gases are essentially insoluble in water; and therefore, this product will not cause harm to aquatic life. It will normally evaporate rapidly if spilled. At ambient temperatures and pressures, Ethylene and Propylene will evaporate and may potentially contribute to generation of atmospheric smog

SECTION 13: DISPOSAL CONSIDERATIONS

When it becomes necessary to dispose of this gas, it is preferable to do so as a vapor. It may be used as an auxiliary fuel or disposed of by burning in a properly designed flare or incinerator. Venting of this gas to the atmosphere should be avoided.

SECTION 14: TRANSPORT INFORMATION

DOT Status A U.S. Department of Transportation regulated material.
Proper Shipping Name Isobutane or Petroleum gases, liquefied
Hazard Class 2.1
UN/NA ID UN1969 or UN1075
Reportable Quantity Not applicable.

Packing Group(s) Not applicable.

Placards

Emergency Response Guide Number 22

HAZMAT STCC Number 49 057 50

MARPOL III Status This product is NOT a "Marine Pollutant".

SECTION 15: REGULATORY INFORMATION

TSCA All components of this product are listed on the Toxic Substance Control Act (TSCA) inventory
SARA 304 The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires emergency planning based on **Threshold Planning Quantities (TPQs)** and release reporting based on **Reportable Quantities (RQs)** in 40 CFR 355 (used for SARA 302, 304, 311 and 312). No chemical components present in this product exceed the de minimus reporting level established under this statute.

HoustonRefining

A Lyondell Company

ISOBUTANE - HIGH PURITY

MSDS No. AP0106

SARA 311/312

The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This product would be classified under the following hazard categories.

Immediate (Acute) Health Hazard; Fire Hazard; and Sudden Release of Pressure Hazard.

SARA 313

The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires submission of annual release of "Toxic Chemicals" that appear in 40 CFR 372.65 (used for SARA 313) This information must be included in all MSDSs that are copied and distributed for this material. No chemical components present in this product are subject to the reporting requirements under this statute.

CERCLA

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "Hazardous Substances" equal to or greater than the "Reportable Quantities (RQs)" listed in 40 CFR 302.4. No chemical components present in this product are subject to the reporting requirements under this statute.

California Proposition 65

Per the California Safe Drinking Water and Toxics Enforcement Act of 1986, this product DOES NOT contain any of the ingredients for which the State of California has found to cause cancer, birth defects, or other reproductive harm, which requires a warning under the statute.

Additional Regulatory Remarks

Food and Drug Administration (FDA): The PROPANE component of this product is currently on the "Generally Regarded As Safe (GRAS)" list.

SECTION 16: OTHER INFORMATION**HMIS (U.S.A.)**

Component Name	CAS Number	Carcinogenic Listings	Concentration Wt%
ISO-PENTANE	78-78-4	Not applicable	AP 90 to 97
N-PENTANE	109-66-0	Not applicable	AP 3 to 10

SECTION 3: HAZARDS IDENTIFICATION

EMERGENCY OVERVIEW

Signal Word DANGER! **Color** Colorless liquid/invisible vapor. Odor may be inadequate to warn of potential overexposure

Physical State Gas/Liquid **Odor** Faint, unpleasant

Physical and Health Hazards **Extremely Flammable Compressed Gas/Liquid! High concentrations of vapor reduce Oxygen available for breathing and may cause central nervous system (CNS) depression or suffocation. Liquid or compressed gas contact may cause frostbite or freeze burns. Vapor, mist, or liquid contact may cause eye, skin, and mucous membrane irritation! May be harmful or fatal if swallowed! Contains Petroleum Distillates! If swallowed, DO NOT INDUCE VOMITING since aspiration into the lungs will cause pulmonary edema and chemical pneumonia. Inhalation may sensitize the heart to sympathomimetic drugs.**

Environmental Hazards Ecological effects testing has not been conducted on this product Releases are expected to cause only localized non-persistent environmental damage.

POTENTIAL HEALTH EFFECTS

Routes of Exposure Inhalation, Skin and Eye Contact

Signs and Symptoms of Acute Exposure

- **Inhalation** High concentrations of this gas will exclude Oxygen and may lead to central nervous system (CNS) depression or asphyxiation. Symptoms include headache, dizziness, visual disturbances, intoxication, loss of coordination, drowsiness, muscular fatigue, rapid breathing, narcosis, tremors, convulsions, unconsciousness, coma, and/or death, depending upon the concentration level and duration of exposure.
- **Eye Contact** The gas is non-irritating, but, direct contact with liquefied/pressurized gas or frost particles may produce severe, and possibly permanent, eye damage from freeze burns.
- **Skin Contact** Pressurized gas, liquid, and solid forms of this material can cause freeze burns or skin irritation and/or inflammation.
- **Ingestion** Ingestion is highly unlikely. However, if swallowed, liquid and solid forms of this material can cause freeze burns and/or irritation and inflammation of mucous membranes. Symptoms include a burning sensation of the mouth and esophagus, nausea, dizziness, and vomiting.

Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting, which will result in pulmonary edema (fluid in the alveoli) and chemical pneumonitis. Cardiovascular effects include swallow rapid pulse and pallor followed by flushing. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may result in death.

Chronic Health Effects Summary

n-Pentane may cause a weak cardiac sensitization to Epinephrine (Adrenaline)-like drugs.

Conditions Aggravated by Exposure

Personnel with pre-existing chronic respiratory diseases, CNS disease, or cardiac conditions should avoid exposure. Persons who are compromised in their ability to use Oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excessive concentrations.

Target Organs

Skin, eyes, mucous membranes, lungs, central nervous system, heart, and bladder.

Carcinogenic Potential

Please refer to Section 2 for the identification of components, if any, which have been identified as having carcinogenic potential in animals and/or humans.

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to the Emergency Overview in Section 3 and Exposure Controls in Section 8 of this MSDS.

- Inhalation** Evacuate the victim to a safe, fresh air area as soon as possible. Loosen tight clothing such as a collar, tie, belt, or waistband. If breathing is difficult, administer air or oxygen. If the victim is not breathing, administer cardiopulmonary resuscitation (CPR), as necessary. **WARNING** Persons providing mouth-to-mouth resuscitation may be placing themselves at risk, either from exposure to toxic materials or communicable disease.
- Eye Contact** Vapors are not expected to cause an eye irritation hazard. If contacted by liquid or solid, immediately flush the eye(s) gently with warm water (105° to 115°F) for at least 15 minutes. Seek medical attention if pain or redness persists.
- Skin Contact** Frozen tissues should be flooded or soaked with warm water (105° to 115°F). **DO NOT USE HOT WATER!** Cryogenic burns which result in blistering or deeper tissue freezing should be promptly seen by a physician.
- Ingestion** Ingestion is highly unlikely. However, if ingested, and only if the patient is conscious, induce vomiting with a quart or more of warm water. Immediately obtain medical attention.

Notes to Physician

Patient(s) should be kept quiet and warm until medical care is obtained

This material may make the heart more susceptible to arrhythmias (irregular beats) Catecholamines such as Epinepherine (Adrenline), and other similar sympathomimetic drugs, should be reserved for emergencies and then used only with special precaution.

SECTION 5: FIRE FIGHTING MEASURES**FLAMMABLE PROPERTIES**

Flammability Classification	Extremely Flammable! OSHA/NFPA Class-IA Flammable Gas/Liquid
Flash Point/Method	AP -70°F (-57°C) by ASTM D-56
Flammable Limits %	LEL: AP 1.4% in air UEL: AP 7.6% in air (Based upon NFPA "ISOPENTANE")
Auto-Ignition Temperature	AP 788°F (420°C) by ASTM E-659 (Based upon NFPA "ISOPENTANE")
Hazardous Combustion Products	Burning or excessive heating may produce smoke, Carbon Monoxide, Carbon Dioxide, and possibly other harmful gases/vapors
Special Properties	Vapor may cause flash fire or explosion! Keep away from all ignition sources! This gas releases flammable vapors at well below ambient temperatures and readily forms flammable mixtures with air Exposed to an ignition source, it will burn in the open or explode in confined spaces Being heavier than air, its flammable vapors may travel long distances along the ground before reaching a point of ignition, and then flash back

EXTINGUISHING MEDIA

SHUT OFF GAS FLOW! If source cannot be shut off, withdraw from area and let the fire burn Water fog and spray can be used to cool containers and structures adjacent to the fire. Once the gas supply is eliminated, dry chemical, Carbon Dioxide (CO2), and/or inert gas (Nitrogen, Halon, etc) may be used to extinguish adjacent burning materials

FIRE FIGHTING

Gas fires should not be extinguished until the gas flow can be stopped Shut off the gas source and allow the fire to burn itself out If the source cannot be shut off immediately, all equipment and surfaces exposed to the fire should be cooled with water to prevent over-heating, flash-backs, or explosions Control the fire until the gas supply can be shut off

Do not enter any enclosed or confined fire space without proper protective clothing and equipment. This may include a self-contained breathing apparatus to protect against the hazardous effects of combustion products and/or Oxygen deficiencies. If firefighters cannot work upwind to the fire, respiratory protective equipment must be worn. Cool tanks and containers exposed to fire with water Withdraw immediately in case of rising sound from venting safety device or discoloration of the vessel, tank, or pipeline Immediately notify the appropriate authorities if cryogenic liquid(s) enter sewers or waterways.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview in Section 3 and Exposure Controls in Section 8 of this MSDS

Small Spills

Extremely Flammable Liquefied Compressed Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area upwind. Remove all potential ignition sources. Safety stop the source gas flow using non-sparking tools. Ventilate enclosed areas to prevent formation of flammable or Oxygen-deficient atmospheres. Closed gas systems form white-colored frost at the point of a leak. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Water spray may be used to reduce vapors. Avoid entering a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing.

Large Spills

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This gas/liquid or waste mixtures containing this gas/liquid should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING and STORAGE**Handling**

Use only with adequate ventilation/personal protection. Do NOT breathe vapor. Avoid contact with eyes, skin, and clothing. Wash thoroughly after handling. Prevent contact with food, chewing, or smoking materials.

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of Petroleum gases. If upon initial receipt inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Large pressure build-up can cause explosive decomposition at the cylinder head or release valve. The cylinder or other container will rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when handling gas/liquids.

Storage

Flammable gas/liquids should be stored in a separate safety storage cabinet or room. Keep away from heat and all other ignition sources! Keep containers tightly closed, plainly labeled, out of closed vehicles, and in a cool, well-ventilated place. A well ventilated, refrigerated room is preferable for materials with flash points lower than 70°F (AP 21°C). Containers should be able to withstand pressures expected from warming or cooling in storage. Do not puncture or incinerate containers. Do NOT contact with oxidizable materials. All electrical equipment in storage and/or handling areas should be installed in accordance with applicable requirements of the National Electrical Code and National Fire Protection Association standards.

Always chain cylinders securely and avoid placing them in high-traffic areas and away from falling objects. To prevent container damage, avoid dragging, rolling, sliding, or knocking cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and unneeded partially-filled containers should be returned to the supplier as soon as possible.

SECTION 8: EXPOSURE CONTROLS and PERSONAL PROTECTION**ENGINEERING CONTROLS**

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. Ensure that an emergency eyewash station and safety shower are proximal to the work-station location.

PERSONAL PROTECTIVE EQUIPMENT

- *Protective Equipment*

- *Eye Protection* Use chemical-type goggles and face shield when handling liquefied gases. Safety glasses with side shields and/or face shield are recommended when vapor is being discharged or whenever handling high-pressure cylinders and piping systems.
- *Skin Protection*
 - *Hands* Use insulated, impervious, chemical-resistant gloves to protect hands from potential contact with cold liquid, solid, or vapors.
 - *Body* Prevent potential skin contact with cold liquid, solid, or vapors. Use insulated, impervious, chemical-resistant clothing and equipment (apron, slicker suit, Tyvek, boots, etc.) to protect other potential skin contact areas.
- *Respiratory Protection* Odor is not an adequate warning for potentially hazardous air concentrations! For unknown vapor concentrations use a self-contained breathing apparatus (SCBA). For known vapor concentrations, above the 1,000 ppm exposure guideline shown below in this Section, use a NIOSH/MSHA-approved organic vapor respirator, if adequate protection is provided. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent.
- *General Comments* **Warning!** Use of Hydrocarbon fuel in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and inadequate Oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

EXPOSURE GUIDELINES

Substance	Source	Date	Type	Value	Time
PENTANE	OSHA	1989	PEL	600 ppm	8 Hrs
PENTANE	OSHA	1989	STEL	750 ppm	15 Mins
PENTANE (ALL ISOMERS)	ACGIH	1976	TLV	600 ppm	8 Hrs
PENTANE (ALL ISOMERS)	ACGIH	1976	STEL	750 ppm	15 Mins

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Gas/Liquid		
Color	Colorless liquid/invisible vapor. Odor may be inadequate to warn of potential overexposure.		
Odor	Faint, unpleasant.		
pH	Not applicable		
Vapor Pressure	AP 15 to 21 psi., absolute at 100°F (38°C)	Viscosity	Not applicable
Vapor Specific Gravity	AP 2.49 when Air = 1.0 at 70°F	Melting/Freezing Pt.	AP -255° to -201°F at 14.7 psia
Volatile Characteristics	Complete (100 Wt.%)	Solubility in Water	Slight (0.1 to 1 Wt.%)
Boiling Point/Range	AP 82° to 97°F (28° to 36°C) at 14.7 psia. (ASTM D-2887.)	Specific Gravity	AP 0.62 to 0.63 at 60°F.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Gross Heat of Combustion at 60°F = AP 20,900 Btu/lb or 4,000 Btu/cu ft.		

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable
Conditions to Avoid	Keep away from heat, sparks, open flame, and strong oxidizing conditons
Incompatibility with Other Materials	Strong acids, alkalies, and oxidizers such as Oxygen (gas or liquid), Chlorine, Flourine and Flouride compounds, Bromine, and metal catalysts.
Hazardous Decomposition Products	Burning or excessive heating may produce smoke, Carbon Monoxide, Carbon Dioxide, and possibly other harmful gases/vapors
Hazardous Polymerization	Not expected to occur

SECTION 11: TOXICOLOGICAL INFORMATION

Inhalation of 500 ppm **Isopentane** or **n-Pentane** have been reported NOT to produce any ill effects in humans. Also, inhalation of 5,000 ppm **n-Pentane** for 10 minutes has been reported NOT to produce any ill effects, but, higher concentrations of 90,000 to 120,000 ppm (9 to 12 Wt.% in air) have caused CNS depression and narcosis. Approximately 130,000 ppm can be fatal.

ISOPENTANE (2-METHYLBUTANE)

GAS (LCLo)	Acute 420,000 mg/M3 (Mouse) (2 hours) - Excitement
28-DAY ORAL (TDL0)	Subchronic 10,000 mg/kg (Rat) - Weight loss or decreased weight gain and some deaths.

PENTANE (n-PENTANE)

GAS (LCLo)	Acute: 325,000 mg/M3 (Mouse) (2 hours)
GAS (LC50)	Acute: 365,000 mg/M3 (Rat) (4 hours)
GAS (TCLo)	Acute: 100,000 ppm (Rabbit screen level) (4 hours) - Cardiac sensitization.
INTRAVENOUS (LC50)	Acute 445 mg/kg (Mouse)
28-DAY ORAL (TCLo)	Subchronic. 10,000 mg/kg (Rat) - Weight loss or decreased weight gain, especially in the bladder

SECTION 12: ECOLOGICAL INFORMATION

Ecological effects testing has not been conducted on this product. If it were spilled, no significant detrimental effects would be expected to occur.

Pentanes are only slightly soluble in water, and therefore, this product will not likely cause harm to aquatic life. It will normally evaporate rapidly if spilled.

SECTION 13: DISPOSAL CONSIDERATIONS

When it becomes necessary to dispose of this gas, it is preferable to do so as a vapor. It may be used as an auxillary fuel or disposed of by burning in a properly designed flare or incinerator. Venting of this gas to the atmosphere should be avoided.

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U S Department of Transportation regulated material		
Proper Shipping Name	Pentanes		
Hazard Class	3		
UN/NA ID	UN1265	Packing Group(s)	PG I
Reportable Quantity	Not applicable		
Placards		Emergency Response Guide Number	128
		HAZMAT STCC Number	49 081 92
		MARPOL III Status	This product is NOT a "Marine Pollutant"

SECTION 15: REGULATORY INFORMATION

TSCA	All components of this product are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires emergency planning based on Threshold Planning Quantities (TPQs) and release reporting based on Reportable Quantities (RQs) in 40 CFR 355 (used for SARA 302, 304, 311 and 312). No chemical components present in this product exceed the de minimus reporting level established under this statute
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This product would be classified under the following hazard categories: Immediate (Acute) and Delayed (Chronic) Health Hazards; Fire Hazard; and Sudden Release of Pressure Hazard.
SARA 313	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires submission of annual release of " Toxic Chemicals " that appear in 40 CFR 372.65 (used for SARA 313). This information must be included in all MSDSs that are copied and distributed for this material. No chemical components present in this product are subject to the reporting requirements under this statute
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of " Hazardous Substances " equal to or greater than the " Reportable Quantities (RQs) " listed in 40 CFR 302.4. No chemical components present in this product are subject to the reporting requirements under this statute
California Proposition 65	Per the California Safe Drinking Water and Toxics Enforcement Act of 1986 , this product DOES NOT contain any of the ingredients for which the State of California has found to cause cancer, birth defects, or other reproductive harm, which requires a warning under the statute
Additional Regulatory Remarks	The Federal Hazardous Substances Act , related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13). This product contains " Petroleum Distillates " which require special labeling if distributed in a manner intended, or packaged in a form suitable, for use in the household or by children. Precautionary label dialogue must display the following: Contains Petroleum Distillates! May be harmful or fatal if swallowed! KEEP OUT OF REACH OF CHILDREN! DO NOT SIPHON BY MOUTH!

Clean Air Act - Section 111 (40 CFR 60.489): The EPA classifies the following Gasoline components as "**Volatile Organic Compounds**" which "contribute significantly to air pollution that endangers public health and welfare" ISOPENTANE and N-PENTANE

 HFR# 2,3,0

1. PRODUCT AND COMPANY IDENTIFICATION

Product name: TOLUENE BLEND STOCK

Number: 000000000000016083

Chemical characterization: C7-C8 Aromatic Hydrocarbons

CAS-No.: 64742-95-6

Chemical Name: Solvent naphtha (petroleum), light aromatic.

Synonyms: Toluene/Ethylbenzene/Xylenes-Rich Naphtha, Gasoline Blending Component, Mixed Xylenes, Xylene Isomers, Ethylbenzene, and Toluene, Light Aromatic Solvent Naphtha (Petroleum), C7-C8 Alkylbenzenes, Dimethylbenzenes, Ethylbenzene, and Toluene, C7-C8 Aromatic Hydrocarbon Solvent

Company Address

 Houston Refining
 One Houston Center, Suite 700
 1221 McKinney St.
 P.O. Box 2583
 Houston Texas 77252-2583

Company Telephone

 Product Safety 800 700-0946
 product.safety@lyondellbasell.com

Emergency telephone

 CHEMTREC USA 800-424-9300
 LYONDELL 800-245-4532

2. HAZARDS IDENTIFICATION

Emergency Overview

This material is HAZARDOUS by OSHA Hazard Communication definition.

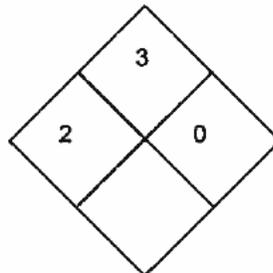

Signal Word

DANGER.

Hazards

Highly flammable. Heavier than air, vapors may travel long distances along the ground before igniting and flash back to vapor source. Vapors may form explosive mixtures with air. Vapors can travel to a source of ignition and flash back. Vapors explosion hazard indoors, outdoors or in sewers. May cause eye and skin irritation. Exposure to vapor may cause central nervous system depression (fatigue, dizziness, headache, collapse, coma and death) and, possibly, cardiac sensitization. Affects central nervous system. May effect hearing. Possible cardiac sensitizer. May cause developmental toxicity. May cause cancer.

NFPA®

TOLUENE BLEND STOCK

Color

Colorless.

Odor

Characteristic. Sweet aromatic.

Odor Threshold

Specific data not available.

Potential health effects
Routes of exposure

Skin. Inhalation. Eye.

Acute effects

See component summary.

- *Toluene 108-88-3*

Toluene is of slight acute toxicity, although inhalation exposure may cause dizziness and CNS depression, while ingestion may be fatal if aspiration into the lung occurs. Toluene may increase the sensitivity of the heart leading to potentially fatal cardiac sensitization. It is moderately irritating to skin and eye.

- *Ethyl Benzene 100-41-4*

Inhalation hazard. Ingestion hazard. Skin and eye irritant.

- *m-Xylene 108-38-3*

Harmful by inhalation and if swallowed. Inhalation of vapors may cause respiratory distress and CNS effects. This material may be absorbed through the skin.

- *o-Xylene 95-47-6*

Harmful by inhalation and if swallowed. Inhalation of vapors may cause respiratory distress and CNS effects. This material may be absorbed through the skin.

- *p-Xylene 106-42-3*

Harmful by inhalation and if swallowed. Inhalation of vapors may cause respiratory distress and CNS effects. This material may be absorbed through the skin.

Chronic effects

See component summary.

- *Toluene 108-88-3*

Repeated exposure to high concentrations has been shown to cause neurological changes and hearing loss in animals, and in humans in abuse situations. May cause developmental toxicity.

- *Ethyl Benzene 100-41-4*

May effect hearing. Repeated or prolonged exposure may damage liver and kidneys. Possible cancer hazard. Repeated contact with skin may cause cracking and/or fissuring.

- *m-Xylene 108-38-3*

Prolonged or repeated breathing of high concentrations may cause symptoms of central nervous system depression. Repeated or prolonged exposure may result in liver damage. May effect hearing.

- *o-Xylene 95-47-6*

Prolonged or repeated breathing of high concentrations may cause symptoms of central nervous system depression. Repeated or prolonged exposure may result in liver damage. May effect hearing.

- *p-Xylene 106-42-3*

Prolonged or repeated breathing of high concentrations may cause symptoms of central nervous system depression. Repeated or prolonged exposure may result in liver damage. May effect hearing.

Typical composition

4. FIRST AID MEASURES

General advice

Take proper precautions to ensure your own health and safety before attempting rescue and providing first aid. For specific information refer to the Emergency Overview in Section 2 of this MSDS.

Skin

All contaminated clothing should be removed, and contaminated skin areas washed with lipophilic soap, or green soap, and water. Never use low boiling point naphthas for washing contaminated skin. Do not wash with machine dishwashing or laundry detergents. Seek medical attention if tissue appears damaged or if pain or irritation persists. In the event of a high pressure injection injury, worker should obtain immediate medical assistance. Discard contaminated leather goods.

Inhalation

Remove victim to fresh air and keep at rest in a position comfortable for breathing. Keep patient warm and at rest. If breathing is difficult, give oxygen. If unconscious place in recovery position and seek medical advice. In the event of unconsciousness, apnea or cardiac arrest (no pulse) apply cardiopulmonary resuscitation.

Eyes

In case of eye contact, remove contact lens and rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Do not use eye ointment unless directed to by a physician. If irritation, blurred vision or swelling occurs and persists, obtain medical advice from a specialist.

Ingestion

DO NOT induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. Get medical attention immediately. Do not give milk or alcoholic beverages. Never give anything by mouth to an unconscious person.

Notes to physician

Treat symptomatically. Treatment of overexposure should be directed at the control of symptoms and the clinical condition of the patient. Gastrointestinal decontamination in accidental petroleum distillate ingestions is not recommended, because of the severe aspiration hazard. Inhalation may cause CNS depression. Overexposure may produce anesthetic or narcotic effects. Do not induce vomiting. Risk of damage to lungs exceeds poisoning risk. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to this material.

5. FIRE-FIGHTING MEASURES

MATERIAL SAFETY DATA SHEET

MSDS No.: BE85
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 11/30/2011

TOLUENE BLEND STOCK

Flammable properties

Classification

OSHA/NFPA Class IB Flammable Liquid.

Flash point

5 - 15 °C (41 - 59 °F) Tag closed cup ASTM D 56

Autoignition temperature

432 - 455 °C (809.6 - 851 °F)

Lower explosion limit

1.4 vol%

Upper explosion limit

7.6 vol%

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Dry chemical. CO₂. Water spray. Foam. Sand. LARGE FIRES: Water spray. Water fog. Foam. Dry chemical. CO₂. Sand.

Unsuitable extinguishing media

Do not use solid water stream/may spread fire. Simultaneous use of foam and water on the same surface is to be avoided as water destroys the foam.

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear positive pressure self-contained breathing apparatus (SCBA). Structural firefighters protective clothing will only provide limited protection.

Precautions for fire-fighting

When mixed with air and exposed to ignition source, vapors can burn in open or explode if confined. Flammable vapors may be heavier than air and travel long distances along the ground before igniting and flashing back to vapor source. Releases flammable vapors below normal ambient temperatures. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Move containers from fire area if you can do it without risk. Sustained fire attack on vessels may result in a Boiling Liquid Expanding Vapour Explosion (BLEVE). Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Prevent fire extinguishing water from contaminating surface water or the ground water system. When fighting a fire, notify environmental authorities if liquid enters sewers or public waters. Fire residues and contaminated fire extinguishing water must be disposed of in accordance with local regulations. Thermal decomposition may produce carbon monoxide and other toxic vapors.

Hazardous combustion products

Thermal decomposition may generate carbon monoxide, carbon dioxide, and perhaps other toxic vapors.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Extinguish all ignition sources. Stop leak if you can do it without risk. Evacuate/limit access. Restrict water use for cleanup. Notify fire and environmental authorities. Note: recommended measures are based on the most likely spillage scenarios for this material; however, local conditions (wind, air temperature, wave/current direction and speed) may significantly influence the choice of appropriate actions. For this reason, local experts should be consulted when necessary. Local regulations may also prescribe or limit actions to be taken. A vapor suppressing foam may be used to reduce vapors. DO NOT use water jet. Use clean non-sparking tools to collect absorbed material. On water, material is insoluble and floats. On water, contain/minimize dispersion/collect. Remove from surface water (e.g. by skimming or siphoning). The use of dispersants should be advised by an expert, and, if required, approved by local authorities.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE85
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 11/30/2011

TOLUENE BLEND STOCK

Spills and leaks

Liquids/vapors may ignite. Contain/collect rapidly to minimize dispersion. Prevent spreading of vapors through sewers, ventilation systems and confined areas. Do not touch or walk through spilled material. Water spray may reduce vapor; but may not prevent ignition in closed spaces. Absorb or cover with dry earth, sand or other non-combustible material and transfer to containers.

Prevent entry into waterways, sewers, basements or confined areas. If the product contaminates rivers and lakes or drains inform respective authorities. On water, material is insoluble and floats.

7. HANDLING AND STORAGE

Handling

Take necessary action to avoid static electricity discharge (which might cause ignition of organic vapors). Extinguish all ignition sources. Containers must be properly grounded before beginning transfer. Use only non-sparking tools. Check atmosphere for explosiveness and oxygen deficiencies. Carefully vent any internal pressure before removing closure. Observe precautions pertaining to confined space entry. Do not use compressed air for filling, discharging or handling. Handle empty containers with care; vapor residue may be flammable/explosive. Decontaminate containers thoroughly before reuse/disposal. Isolate, vent, drain, wash and purge systems or equipment before maintenance or repair. All equipment must conform to applicable electrical code. Do not pressurize, cut, weld, braze solder, drill, or grind on containers. Special slow load procedures for 'switch loading' must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point hydrocarbon products. Electrostatic charges may be generated as a result of flow or agitation.

Storage

Store only in tightly closed, properly vented containers away from heat, sparks, open flame and strong oxidizing agents. Store closed drums with bung in up position. Vapor space above stored liquid may be flammable/explosive unless blanketed with inert gas. Electrical installations / working materials must comply with the technological safety standards. Keep container tightly closed and properly labeled. Cleaning, inspection and maintenance of the internal structure of storage tanks must be done only by properly equipped and qualified personnel as defined by national, local or company regulations. Recommended materials: For containers, or container linings use mild steel, stainless steel. Unsuitable materials: Some synthetic materials may be unsuitable for container or container linings depending on the material specification and intended use. Compatibility should be checked with the manufacturer.

Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved. Refer to NFPA 77 for relevant consensus guidance. This liquid may accumulate static electricity even when transferred into properly grounded containers. Static electricity accumulation may be significantly increased by the presence of small quantities of water.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits.

Personal protective equipment

Inhalation

When workers are facing concentrations above the exposure limit they must use appropriate certified respirators. The type of respiratory protection will depend upon whether the maximum exposure concentration is known.

Consider the maximum period for wear. Where engineering controls are not feasible or sufficient to achieve full conformance with exposure limits (Section 8), use NIOSH approved respiratory protection equipment. Respirators should be selected based on the form and concentration of contaminant in air and in accordance with OSHA (29 CFR 1910.134).

Skin

Wear insulated gloves if contact with liquid is possible. Wear chemical resistant gloves such as: Glove material fluoroelastomer; material thickness 0.4 mm; break through time \geq 480 min. Gloves must be replaced after 8 hours of wear. The suitability for a specific workplace should be discussed with the producers of the protective gloves. Gloves should be discarded and replaced if there is any indication of degradation or chemical breakthrough. When skin contact is possible, protective clothing including gloves, apron, sleeves, boots, head and face protection should be worn. Choose body

TOLUENE BLEND STOCK

Skin

protection according to the amount and concentration of the dangerous substance at the work place. Use PPE that is chemical resistant to the product and prevents skin contact. Fire retardant clothing is appropriate for routine occupational use.

Eyes

Safety glasses with side-shields Eye protection such as chemical splash goggles and/or face shield must be worn when possibility exists for eye contact due to splashing or spraying liquid.

Remarks

Wash hands before eating, drinking, smoking, or using toilet facilities. Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure. Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use. Use good personal hygiene practices.

Partition coefficient: n-octanol/water: Specific data not available.

Other physico-chemical properties: No additional information available.

10. STABILITY AND REACTIVITY

Chemical stability

The product is stable.

Conditions to avoid

Heat, sparks, open flames and strong oxidizing conditions.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE85
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 11/30/2011

TOLUENE BLEND STOCK

Materials to avoid

Strong oxidizing agents

Hazardous decomposition products

Incomplete combustion can result in the production of carbon monoxide, carbon dioxide and other toxic gases.

Hazardous polymerization

Not expected to occur.

11. TOXICOLOGICAL INFORMATION

Product information

Product Summary

See component summary.

COMPONENT INFORMATION

- *Toluene* 108-88-3

Acute toxicity

<u>LC50 (vapor)</u>	rat	7500 PPM	4 HOURS
<u>LD50 (Oral)</u>	rat	5,580 MG/KG BWT	
<u>LD50 (Skin)</u>	Rabbit.	> 5000 MG/KG BWT	

Acute effects

Inhalation

Vapors or aerosol may cause irritation of the eyes, nose and throat as well as CNS depression (fatigue, dizziness, loss of concentration, with collapse, coma and death possible in cases of severe overexposure).

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract and CNS depression (fatigue, dizziness, collapse, coma and death). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

Moderate skin irritant.

Eyes

Moderate eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Skin. Eye. Hearing. Nasal cavity. central nervous system (CNS) Heart

MATERIAL SAFETY DATA SHEET

MSDS No.: BE85
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 11/30/2011

TOLUENE BLEND STOCK

Repeated dose toxicity

No evidence of systemic toxicity was reported in rats exposed to 1.15 mg/l (300 ppm) toluene vapor for two years, while higher exposures were associated with inflammation and degeneration of nasal epithelial tissue. Rats exposed repeatedly to very high concentrations of toluene exhibited neurological changes and permanent hearing loss. Clinical case reports indicate the occurrence of serious and persistent changes (including tremor, ataxia, memory impairment and possible hearing loss) in humans following deliberate over-exposure to toluene in abuse situations. The relevance of these findings to low level occupational exposure to toluene is not known.

Reproductive effects

Studies in animals demonstrate no histopathological lesions in testes or ovaries of rats and mice exposed to 9.4 mg/l (2500 ppm) toluene vapor for 14-15 weeks, and no loss of fertility in male rats after exposure to 7.5 mg/l (2000 ppm) for a similar period of time. Epididymal weights and sperm counts were decreased in one study, but the absence of any adverse effect on reproduction makes the functional relevance of these observations unclear. No reliable human data are available.

Developmental Toxicity

Studies in pregnant rats demonstrate that toluene is not a teratogen, however mild fetotoxicity (lower body weight, delayed ossification, delayed physical development) may occur in the absence of maternal toxicity at exposures in the range 1.9-2.8 mg/l (500-750 ppm). Other studies describe adverse effects on learning and cognitive functions in rat pups exposed to 4.5-6.7 mg/l (1200-1800 ppm) in utero, although it is unclear if end-points evaluated in these tests are directly relevant to humans.

Genetic Toxicity

In vitro and in vivo mutagenicity tests were negative.

Carcinogenicity

Inhalation studies in rats and mice demonstrate that toluene is not a carcinogen. It has been used extensively as a solvent in rodent skin painting studies with occasional slight, increases in tumor incidence reported: an epigenetic mechanism (based on irritation rather than genotoxicity) may underpin these findings. Toluene is considered a Group 3 substance by IARC, not classifiable as to its carcinogenicity to humans.

- *Ethyl Benzene 100-41-4*

Acute toxicity

<u>LC50 (vapor)</u>	rat	4000 PPM
<u>LD50 (Oral)</u>	rat	3500 - 4700 MG/KG BWT
<u>LD50 (Skin)</u>	rabbit	> 15,000 MG/KG BWT

Acute effects

Inhalation

Vapors may cause irritation of the eyes, nose and throat as well as CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure) May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract. High doses may cause CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization. Aspiration may cause pulmonary edema and pneumonitis.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring. While skin absorption is a potential route of exposure, no adverse health effects are anticipated following accidental or incidental contact.

Irritation

Skin

This product is expected to be an skin irritant.

Eyes

Moderate to severe eye irritant.

Sensitization

MATERIAL SAFETY DATA SHEET

MSDS No.: BE85
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 11/30/2011

TOLUENE BLEND STOCK

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Central nervous system. Lung. Liver. Kidneys. Thyroid. Blood. Hearing. heart

Repeated dose toxicity

No adverse effects were present in rats or mice exposed to 1000 ppm (4.3 mg/l) ethylbenzene vapor for up to 13 weeks. Longer-term exposure resulted in an increased incidence of chronic progressive nephropathy (CPN) in kidneys from rats inhaling 750 ppm (3.3 mg/l) for up to two years. Since CPN is a spontaneous age-related condition specific to rodents, these findings are of doubtful relevance to humans. Mice exposed chronically under similar conditions responded with changes in the lung, liver and thyroid. Additional effects in rats observed with repeated oral exposure of ≥ 250 mg bwt/day ethyl benzene for 90 days include changes in hematology (indicative of a mild regenerative anemia) and clinical chemistry parameters (indicative of hepatic microsomal enzyme induction), decreases in prothrombin time, mild alimentary effects and liver pathology. A standard neurotoxicity protocol study conducted in young adult rats did not find neurotoxic effects following repeated daily oral exposure to doses up to 500 mg/kg bwt/day.

Specialist investigations provide evidence of hearing loss in rats following repeated exposure (13 weeks) to concentrations of 200 ppm (0.85 mg/l) and above. Ethyl benzene at up to 500 ppm vapor concentration did not adversely affect the functional ability of the humoral component of the immune system of rats as measured by splenic IgM antibody forming cell response to the T-dependent antigen, sheep erythrocytes.

Reproductive effects

No parental, neonatal, or reproductive toxicity was observed following inhalation exposure of rats to up to 500 ppm or 500 ppm/342 mg/kg bwt/day ethylbenzene. Histopathological examination of reproductive tissue from rats, mice and rabbits has generally revealed no adverse changes following sub-chronic- or chronic inhalation exposure to high vapor concentrations. An increased incidence of testicular tumors in F344 male rats exposed to 750 ppm (3.3 mg/l) ethylbenzene vapor for 2 years is considered of doubtful relevance to reproductive toxicity.

Developmental Toxicity

Decreased fetal body weight and an increased occurrence of skeletal and other variations were reported in the presence of concurrent maternal toxicity (CNS effects, decreased body weight, liver enlargement) when female rats were exposed to ethylbenzene concentrations of 1000 ppm (4.3 mg/l) or above throughout pregnancy. No adverse effects to neurodevelopment were observed in rats exposed to 500 ppm/342 mg/kg bwt/day ethylbenzene.

Genetic Toxicity

No increase in micronuclei or hepatic UDS was observed in mice after treatment with ethylbenzene in vivo. It was not genotoxic in microbial systems, nor did it induce chromosomal aberrations or sister chromatid exchanges in mammalian cells in vitro. Variable results were obtained for mutation at the TK \pm locus in L5178Y cells, although the most reliable study that utilized the current standard study protocol and doses that were not significantly cytotoxic gave a negative mutagenic response. The overall weight of evidence indicates that ethylbenzene is not genotoxic.

Carcinogenicity

The carcinogenic potential of ethylbenzene after inhalation exposure has been investigated in two recent regulatory guideline studies performed by NTP. Male rats exposed to 750 ppm (3.3 mg/l) over 2 years showed an increased incidence of testicular interstitial cell adenoma, a common tumor present also in a large majority of the untreated males included in the study. High level exposure was also linked with an increased incidence of kidney tumors in both sexes; the appearance of these lesions was strongly associated with the development of Chronic Progressive Nephropathy, a spontaneous age-related disease of rats with no equivalent counterpart in humans. Male mice exposed to 750 ppm ethylbenzene for 2 years responded with an increased incidence of lung tumors, while the incidence of liver tumors was increased in females. Mechanistic studies suggest that these lesions in the mouse developed secondary to enhanced cell proliferation in these tissues, while the weight of evidence from mutagenicity testing also indicates that a non-genotoxic mechanism was involved. Listed by IARC as possibly carcinogenic in humans (Group 2B).

- *m-Xylene* 108-38-3

Acute toxicity

<u>LC50 (Inhl)</u>	rat	5984 PPM	6 HOURS
	mouse	5267 PPM	6 HOURS

<u>LD50 (Oral)</u>	rat	6661 MG/KG BW
--------------------	-----	---------------

Acute effects

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor

MATERIAL SAFETY DATA SHEET

MSDS No.: BE85
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 11/30/2011

TOLUENE BLEND STOCK

concentrations. Exposure to high vapor concentrations may cause effects on hearing.

Ingestion

May be harmful if swallowed. Ingestion may cause effects on liver, spleen and kidneys. High doses may cause CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure). Possible cardiac sensitization. Aspiration may cause pulmonary edema and pneumonitis.

Skin contact

Skin absorption hazard. Considered to be of low toxicity by the dermal route of exposure. However, dermal exposure to high concentrations may cause discomfort and irritation of the gastrointestinal tract; effects on lungs, liver and kidneys; and CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure). Expected to have a low order of acute dermal toxicity based on component toxicity information. Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

May be irritating to the skin. Repeated and/or prolonged contact with skin may cause inflammation, hyperkeratosis, acanthosis and ulceration.

Eyes

May cause moderate to severe eye irritation.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Hearing. Central nervous system. Liver. Kidneys. Cardiac sensitization.

Repeated dose toxicity

Repeated inhalation exposure of rats to m-xylene caused slight changes in liver histopathology and CNS (behavioral) effects at \Rightarrow 100 ppm (0.43 mg/L) but no ototoxicity at 1800 ppm (7.82 mg/L). Oral exposure of rats to m-xylene for 13 weeks produced decreased body weight gains in males at \Rightarrow 200 mg/kg bwt/day and in females at \Rightarrow 800 mg/kg bwt/day; and exposure to 2000 mg/kg bwt/day for 10 days produced increases in liver weights. No ototoxicity was observed in rats exposed orally to m-xylene at 1798 mg/kg bwt/day. The observed liver effects may be adaptive rather than adverse effects.

Reproductive effects

No effect on testicular weight was found in rats exposed by inhalation to 100 ppm (0.43 mg/L) m-xylene for 13 weeks. No damage to reproductive organs was noted in rats exposed by oral gavage to m-xylene at 800 mg/kg bwt/day for 13 weeks.

Developmental Toxicity

May be toxic to the developing embryo and fetus. Inhalation exposure of pregnant rats to m-xylene was reported to produce decreases in fetal weight and a slight decrease in implantations at 700 ppm (3.0 mg/L) in the presence of maternal toxicity (decreased body weight gain and feed consumption, increased relative liver weight). After oral gavage exposure, increased resorptions and cleft palate formation were reported in fetuses of mice exposed to 2580 mg/kg bwt/day, in the presence of maternal toxicity (unspecified). As mice under stress have been shown to be predisposed to produce offspring with cleft palate, the significance of this finding is uncertain.

Genetic Toxicity

m-Xylene produced negative results in assays for gene mutation in bacteria, recessive lethal mutations in the fruit fly, and induction of micronuclei in mouse bone marrow after intraperitoneal injection.

Carcinogenicity

Available data for mixed xylenes indicate that m-xylene is not likely to be carcinogenic to humans. Cancer data for mixed xylenes are used as surrogate data for this product. Oral exposure to mixed xylenes for 2 years did not produce tumors in rats or mice at doses up to 500 or 1000 mg/kg bwt/day, respectively. IARC concluded that xylenes are not classifiable as to their carcinogenicity to humans (Group 3).

- *o*-Xylene 95-47-6

Acute toxicity

rat	4,330 PPM (PREDICTED)	6 HOURS
mouse	3,907 PPM (PREDICTED)	6.0 HOURS

MATERIAL SAFETY DATA SHEET

MSDS No.: BE85
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 11/30/2011

TOLUENE BLEND STOCK

LD50 (Oral) rat 3,523 MG/KG (PREDICTED)
 mouse >= 5,251 MG/KG (PREDICTED)

LD50 (Skin) rabbit >4.350 MG/KG (PREDICTED)

Acute effects

Inhalation

This substance has a low order of acute toxicity by the inhalation route. Inhalation of vapors may cause signs of respiratory tract irritation (cough and difficulty breathing), CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure), possible cardiac sensitization, and irritation of the eyes and throat. Exposure to high vapor concentrations may cause effects on hearing.

Ingestion

This substance is of low acute toxicity when administered orally. May be harmful if swallowed. Ingestion may cause effects on liver, spleen and kidneys; CNS depression (primarily fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe overexposure), and possible cardiac sensitization. Aspiration into the lung may cause fatal chemical pneumonitis.

Skin contact

Skin absorption hazard. Repeated contact with skin may cause cracking and/or fissuring. Considered to be of low toxicity by the dermal route of exposure. However, dermal exposure to high concentrations may cause discomfort and irritation of the gastrointestinal tract; effects on lungs, liver and kidneys; and CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure).

Irritation

Skin

May be irritating to the skin. Repeated contact with skin may cause cracking and/or fissuring.

Eyes

Mild to moderate irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Hearing. Central nervous system. Liver. Kidneys. Cardiac sensitization.

Repeated dose toxicity

May be toxic following repeated exposure to high doses. Repeated inhalation exposure of rats to o-xylene caused a reduction in body weight and liver effects (increase in weight, enzyme changes, cell proliferation, and histopathology) at ≥ 1090 ppm (4.73 mg/L), but no ototoxicity at 1800 ppm (7.82 mg/L). Oral exposure of rats for 10 days to o-xylene produced increases in liver weights and decreases in body weights at 2000 mg/kg bwt/day. The observed liver effects may be adaptive rather than adverse effects.

Reproductive effects

Not expected to cause reproductive toxicity. Available information from studies conducted in laboratory animals with similar substances (mixed xylenes, m- and p-xylene) shows no evidence of an effect on reproductive performance or reproductive organs at high inhalation or oral doses. Mixed xylenes have been shown to produce damage to reproductive organs in rats repeatedly exposed to extremely high, anesthetic doses. None.

Developmental Toxicity

May be toxic to the developing embryo and fetus. Inhalation exposure of pregnant rats to o-xylene was reported to produce decreases in fetal weight at ≥ 350 ppm (1.5 mg/L) and increases in skeletal variations, but not malformations, at 2000 ppm (8.7 mg/L), in the presence of maternal toxicity (decreased body weight gain and feed consumption, increased relative liver weight). After oral gavage exposure, increased resorptions and cleft palate formation were reported in fetuses of mice exposed to 1935 mg/kg bwt/day, in the presence of maternal toxicity (unspecified). As mice under stress have been shown to be predisposed to produce offspring with cleft palate, the significance of this finding is uncertain.

Genetic Toxicity

o-Xylene produced negative results in assays for gene mutation in bacteria, recessive lethal mutations in the fruit fly, and induction of micronuclei in mouse bone marrow or changes in sperm morphology in rats after intraperitoneal injection.

Carcinogenicity

Available data for mixed xylenes indicate that o-xylene is not likely to be carcinogenic to humans. Cancer data for mixed xylenes are used as surrogate data for this product. Oral exposure to mixed xylenes for 2 years did not produce tumors in

MATERIAL SAFETY DATA SHEET

 Revision: 1.0
 Validation Date: 11/30/2011

TOLUENE BLEND STOCK

rats or mice at doses up to 500 or 1000 mg/kg bwt/day, respectively. IARC concluded that xylenes are not classifiable as to their carcinogenicity to humans (Group 3).

- *p*-Xylene 106-42-3

Acute toxicity

<u>LC50 (vapor)</u>	rat	4740 PPM	4 HOURS
<u>LC50 (Inhl)</u>	mouse	3907 PPM	6 HOURS
<u>LD50 (Oral)</u>	rat	4,029 MG/KG	
<u>LD50 (Skin)</u>	rabbit	(predicted) > 4,350 MG/KG	

Acute effects

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations. Exposure to high vapor concentrations may cause effects on hearing.

Ingestion

May be harmful if swallowed. Ingestion may cause effects on liver, spleen and kidneys. High doses may cause CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure). Possible cardiac sensitization. Aspiration may cause pulmonary edema and pneumonitis.

Skin contact

Skin absorption hazard. Considered to be of low toxicity by the dermal route of exposure. However, dermal exposure to high concentrations may cause discomfort and irritation of the gastrointestinal tract; effects on lungs, liver and kidneys; and CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure). Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

May be irritating to the skin. Repeated contact with skin may cause cracking and/or fissuring.

Eyes

May cause eye irritation.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Hearing. Central nervous system. Liver. Kidneys. Cardiac sensitization.

Repeated dose toxicity

May be toxic following repeated exposure to high doses. No standard repeated inhalation exposure study is available. However, in limited scope studies, repeated inhalation exposure of rats to *p*-xylene caused ototoxicity at ≥ 900 ppm (3.91 mg/L) but not at 450 ppm (1.95 mg/L). Repeated inhalation exposures of laboratory animals to other xylene isomers and/or mixed xylenes caused reduced body weight/weight gain at ≥ 1000 ppm (4.35 mg/L), liver and CNS (behavioral) effects at ≥ 100 ppm (0.43 mg/L), and, in rats, ototoxicity at ≥ 250 ppm (1.09 mg/L). No treatment-related effects were seen in rats after oral exposure to *p*-xylene at 800 mg/kg bwt/day for 13 weeks. Short-term (10-14 days) repeated oral exposure of rats to *p*-xylene produced increases in liver weights and decreases in body weights and relative thymus weights at 2000 mg/kg bwt/day, and ototoxicity at 899 mg/kg bwt/day (the only concentration tested for ototoxicity). No ototoxicity was observed in guinea pigs exposed to *p*-xylene at this dose level. Oral exposure of rats to mixed xylenes at 500 mg/kg bwt/day for 103 weeks produced only slightly decreased body weight. Repeated oral exposure of mice to mixed xylenes produced a reduction in body weight in females at 2000 mg/kg bwt/day for 13 weeks, but no treatment-related effects were seen after exposure to 1000 mg/kg bwt/day for 103 weeks. The observed liver effects may be adaptive rather than adverse effects.

Reproductive effects

This substance is not expected to be a reproductive toxicant. No damage to reproductive organs was noted in rats exposed by oral gavage to *p*-xylene at 800 mg/kg bwt/day for 13 weeks. Results for mixed xylenes in a one-generation reproductive toxicity study (rats, inhalation at 500 ppm/2.17 mg/L) and two dominant lethal studies (rats, i.p.; mice, s.c.; 864 mg/kg bwt), and from evaluation of reproductive organs in repeated dose studies (male rats, inhalation, 1000 ppm [4.35 mg/L]; rats

MATERIAL SAFETY DATA SHEET

MSDS No.: BE85

 Validation Date: 11/30/2011

TOLUENE BLEND STOCK

[1000 mg/kg bwt/day] and mice [2000 mg/kg bwt/day, oral] indicate that mixed xylenes do not affect reproductive performance or induce structural damage to reproductive organs of laboratory animals at high inhalation or oral doses. However, xylenes have been shown to produce damage to reproductive organs in rats repeatedly exposed to extremely high, anesthetic doses.

Developmental Toxicity

May be toxic to the developing embryo and fetus. Inhalation exposure of pregnant rats to p-xylene was reported to produce decreases in fetal weight and increases in post implantation loss at ≥ 700 ppm (3.0 mg/L), and increases in skeletal variations, but not malformations, at 2000 ppm (8.7 mg/L) in the presence of maternal toxicity (decreased body weight gain and feed consumption, and increased relative liver weight). No effect on neurobehavior was noted in offspring of rat dams exposed to 800 and 1600 ppm (3.5 or 7.0 mg/L) prenatally. After oral gavage exposure, increased resorptions and cleft palate formation were reported in fetuses of mice exposed to p-xylene at ≥ 1935 mg/kg bwt/day, in the presence of maternal toxicity (unspecified). As mice under stress have been shown to be predisposed to produce offspring with cleft palate, the significance of this finding is uncertain.

Genetic Toxicity

Not expected to be genotoxic. p-Xylene produced negative results in assays for gene mutation in bacteria and induction of micronuclei in mouse bone marrow after intraperitoneal injection. Two positive responses have been reported for mixed xylenes, but the overall weight of evidence from a variety of in vitro and in vivo genotoxicity studies with xylenes indicates that these substances are not genotoxic.

Carcinogenicity

Available data for mixed xylenes indicate that p-xylene is not likely to be carcinogenic to humans. Cancer data for mixed xylenes are used as surrogate data for this product. Oral exposure to mixed xylenes for 2 years did not produce tumors in rats or mice at doses up to 500 or 1000 mg/kg bwt/day, respectively. IARC concluded that xylenes are not classifiable as to their carcinogenicity to humans (Group 3).

Persistence and degradability

Biodegradation: This material is expected to be readily biodegradable. Expected to be hydrolytically stable, but rapidly degraded following atmospheric release.

Bioaccumulation: Significant bioaccumulation is not expected. Fish BCF (Anguilla japonica) 23.6 after 10 days (mixed xylenes); BCF (Carassius auratus) 14.8 (xylene isomer).

13. DISPOSAL CONSIDERATIONS

Contaminated product, soil, water, and empty containers may be hazardous wastes due to possible presence of flammable gases. Assure emissions comply with applicable regulations. Preferred disposal for this volatile, flammable product is through combustion. Use flare if pressure warrants. Proper grounding procedures to avoid static electricity should be followed. The product should not be allowed to enter drains, water courses or the soil.

14. TRANSPORT INFORMATION

Special Provisions

If you reformulate or further process this material, you should consider re-evaluation of the regulatory status of the components listed in the composition section of this sheet, based on final composition of your product.

Proper shipping name Petroleum distillates, n.o.s. (TOLUENE, XYLENES)

Reportable quantity ETHYLBENZENE

ID No. UN1268

Hazard class 3

Packing group II

2. HAZARDS IDENTIFICATION

Emergency Overview

This material is HAZARDOUS by OSHA Hazard Communication definition.

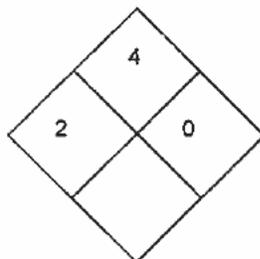

Signal Word

DANGER.

Hazards

Extremely flammable liquid. Heavier than air, vapors may travel long distances along the ground before igniting and flash back to vapor source. Vapors may form explosive mixtures with air. Vapors can travel to a source of ignition and flash back. Vapors explosion hazard indoors, outdoors or in sewers. May cause eye and skin irritation. Irritating to the respiratory system. May cause drowsiness and dizziness. Exposure to vapor may cause central nervous system depression (fatigue, dizziness, headache, collapse, coma and death) and, possibly, cardiac sensitization. Possible reproductive toxin. May cause cancer.

Gasoline or naphtha odor. characteristic

Odor Threshold

No Data Available.

Potential health effects

Routes of exposure

Skin. Inhalation. Eye.

Acute effects

See component summary.

- *Octane Isomers*

May be irritating to the skin. Aspiration hazard. CNS depressant.

- *Heptane isomers*

CNS depressant. Aspiration hazard.

- *n-Hexane 110-54-3*

May cause irritation to the eyes, nausea, vertigo, bronchial and central nervous system effects. This material presents an acute aspiration hazard. May be irritating to the skin. High or repeated exposures can damage the peripheral nervous system, causing numbness, tingling, and/or muscle weakness in the hands or feet. The onset of health effects associated with n-hexane may be influenced by exposure to additional chemicals such as methyl isobutyl ketone and methyl ethyl ketone.

- *Methylcyclopentane 96-37-7*

This product may cause eye, skin, and respiratory tract irritation. High concentrations may cause central nervous system (CNS) depression. Ingestion would likely cause gastrointestinal tract irritation.

- *Cyclohexane 110-82-7*

CNS depressant. Simple asphyxiant. May be irritating to the eyes, skin, and respiratory system.

- *n-Pentane 109-66-0*

Aspiration hazard. May cause central nervous system depression.

- *Cyclopentane 287-92-3*

Aspiration hazard. May cause central nervous system depression.

- *Toluene 108-88-3*

Toluene is of slight acute toxicity, although inhalation exposure may cause dizziness and CNS depression, while ingestion may be fatal if aspiration into the lung occurs. Toluene may increase the sensitivity of the heart leading to potentially fatal cardiac sensitization. It is moderately irritating to skin and eye.

- *Methyl Cyclohexane 108-87-2*

Liquid, mist, or vapors can cause eye, skin and respiratory tract irritation. CNS depressant. Exposure to excess vapor may cause headache, fatigue, drowsiness and dizziness.

- *Ethyl Benzene 100-41-4*

Inhalation hazard. Ingestion hazard. Skin and eye irritant.

- *o-Xylene 95-47-6*

Harmful by inhalation and if swallowed. Inhalation of vapors may cause respiratory distress and CNS effects. This material may be absorbed through the skin.

- *m-Xylene 108-38-3*

Harmful by inhalation and if swallowed. Inhalation of vapors may cause respiratory distress and CNS effects. This material may be absorbed through the skin.

- *n-Heptane 142-82-5*

CNS depressant. Aspiration hazard.

- *p-Xylene 106-42-3*

Harmful by inhalation and if swallowed. Inhalation of vapors may cause respiratory distress and CNS effects. This material may be absorbed through the skin.

- *Benzene 71-43-2*

Slight acute toxicity. Inhalation exposure to high concentrations may cause dizziness and CNS depression. Ingestion of relatively small amounts may be fatal if aspiration into the lungs takes place.

BT RAFFINATE

- *n-Butane 106-97-8*

Simple asphyxiant. Inhalation of vapors may cause dizziness, narcosis, nausea or asphyxiation. CNS depressant.

Chronic effects

See component summary.

- *Octane Isomers*

Lungs may be affected by repeated or prolonged exposure.

- *Heptane isomers*

Repeated or prolonged exposure to styrene may cause nausea, loss of Appetite, CNS depression, and general weakness.

- *n-Hexane 110-54-3*

Damage to nerves in hands or feet may occur from prolonged inhalation of *n*-hexane concentrations of 60 to 240 ppm. Repeated exposure to air concentrations of 500 ppm *n*-hexane can produce progressively worsening damage to the peripheral nerves. Prolonged and repeated exposure to vapors may cause damage to the CNS, lungs and kidneys. Suspect reproductive hazard.

- *Methylcyclopentane 96-37-7*

Repeated exposure can cause peripheral nerve damage and defatting of the skin.

- *Cyclohexane 110-82-7*

No adverse chronic human health effects have been reported for this material.

- *n-Pentane 109-66-0*

Repeated or prolonged exposure of the skin to this material may cause defatting and drying of the skin.

- *Cyclopentane 287-92-3*

Repeated or prolonged exposure of the skin to this material may cause defatting and drying of the skin.

- *Toluene 108-88-3*

Repeated exposure to high concentrations has been shown to cause neurological changes and hearing loss in animals, and in humans in abuse situations. May cause developmental toxicity.

- *Methyl Cyclohexane 108-87-2*

Repeated or prolonged contact with skin may cause defatting and drying of the skin which may result in dermatitis.

- *Ethyl Benzene 100-41-4*

May effect hearing. Repeated or prolonged exposure may damage liver and kidneys. Possible cancer hazard. Repeated contact with skin may cause cracking and/or fissuring.

- *o-Xylene 95-47-6*

Prolonged or repeated breathing of high concentrations may cause symptoms of central nervous system depression. Repeated or prolonged exposure may result in liver damage. May effect hearing.

- *m-Xylene 108-38-3*

Prolonged or repeated breathing of high concentrations may cause symptoms of central nervous system depression. Repeated or prolonged exposure may result in liver damage. May effect hearing.

- *n-Heptane 142-82-5*

No adverse chronic human health effects have been reported for this material.

- *p-Xylene 106-42-3*

Prolonged or repeated breathing of high concentrations may cause symptoms of central nervous system depression. Repeated or prolonged exposure may result in liver damage. May effect hearing.

- *Benzene 71-43-2*

Benzene is considered to be a cancer-causing agent. Repeated exposure is linked to bone marrow toxicity, reduced red- and white blood cell counts and decreased immunological function irrespective of the route of contact.

- *n-Butane 106-97-8*

Repeated or prolonged exposure to low levels of this material produces no known adverse chronic health hazards.

n-Butane	106-97-8	203-448-7	0.0 <= 5.0

Typical composition

See section 16 for full text of risk phrases.

4. FIRST AID MEASURES

General advice

Take proper precautions to ensure your own health and safety before attempting rescue and providing first aid. For specific information refer to the Emergency Overview in Section 2 of this MSDS.

Skin

All contaminated clothing should be removed, and contaminated skin areas washed with lipophilic soap, or green soap, and water. Never use low boiling point naphthas for washing contaminated skin. Do not wash with machine dishwashing or laundry detergents. Seek medical attention if tissue appears damaged or if pain or irritation persists. In the event of a high pressure injection injury, worker should obtain immediate medical assistance. Discard contaminated leather goods.

Inhalation

MATERIAL SAFETY DATA SHEET

MSDS No.: BE89
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 12/12/2011

BT RAFFINATE

Inhalation

Remove victim to fresh air and keep at rest in a position comfortable for breathing. Keep patient warm and at rest. If breathing is difficult, give oxygen. If unconscious place in recovery position and seek medical advice. In the event of unconsciousness, apnea or cardiac arrest (no pulse) apply cardiopulmonary resuscitation.

Eyes

In case of eye contact, remove contact lens and rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Do not use eye ointment unless directed to by a physician. If irritation, blurred vision or swelling occurs and persists, obtain medical advice from a specialist.

Ingestion

DO NOT induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. Get medical attention immediately. Do not give milk or alcoholic beverages. Never give anything by mouth to an unconscious person.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

OSHA/NFPA Class IA flammable liquid.

Flash point

< 23 °C (< 73.4 °F)

Autoignition temperature

232 °C (449.6 °F)

Lower explosion limit

1 vol%

Upper explosion limit

7.6 vol%

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Dry chemical. CO₂. Water spray. Foam. Sand. LARGE FIRES: Water spray. Water fog. Foam. Dry chemical. CO₂. Sand.

Unsuitable extinguishing media

Do not use solid water stream/may spread fire. Simultaneous use of foam and water on the same surface is to be avoided as water destroys the foam.

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear positive pressure self-contained breathing apparatus (SCBA). Structural firefighters protective clothing will only provide limited protection.

Precautions for fire-fighting

When exposed to ignition source in air, vapors can burn in open or explode if confined. Flammable vapors may be heavier than air and travel long distances along the ground before igniting and flashing back to vapor source. Releases flammable vapors below normal ambient temperatures. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Move containers from fire area if you can do it without risk. Sustained fire attack on vessels may result in a Boiling Liquid Expanding Vapour Explosion (BLEVE). Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Prevent fire extinguishing water from contaminating surface water or the ground water system. When fighting a fire, notify environmental authorities if liquid enters sewers or public waters. Fire residues and contaminated fire

MATERIAL SAFETY DATA SHEET

MSDS No.: BE89
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 12/12/2011

BT RAFFINATE

Precautions for fire-fighting

Extinguishing water must be disposed of in accordance with local regulations. Thermal decomposition may produce carbon monoxide and other toxic vapors.

Hazardous combustion products

Thermal decomposition may generate carbon monoxide, carbon dioxide, and perhaps other toxic vapors. May also include hydrogen sulfide, sulfur oxides or sulfuric acid.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Extinguish all ignition sources. Stop leak if you can do it without risk. Evacuate/limit access. Restrict water use for cleanup. Notify fire and environmental authorities. Note: recommended measures are based on the most likely spillage scenarios for this material; however, local conditions (wind, air temperature, wave/current direction and speed) may significantly influence the choice of appropriate actions. For this reason, local experts should be consulted when necessary. Local regulations may also prescribe or limit actions to be taken. A vapor suppressing foam may be used to reduce vapors. DO NOT use water jet. Use clean non-sparking tools to collect absorbed material. On water, material is insoluble and floats. On water, contain/minimize dispersion/collect. Remove from surface water (e.g. by skimming or siphoning). The use of dispersants should be advised by an expert, and, if required, approved by local authorities.

Liquids/vapors may ignite. Contain/collect rapidly to minimize dispersion. Prevent spreading of vapors through sewers, ventilation systems and confined areas. Do not touch or walk through spilled material. Water spray may reduce vapor, but may not prevent ignition in closed spaces. Absorb or cover with dry earth, sand or other non-combustible material and transfer to containers.

Prevent entry into waterways, sewers, basements or confined areas. If the product contaminates rivers and lakes or drains inform respective authorities. On water, material is insoluble and floats.

7. HANDLING AND STORAGE

Handling

Take necessary action to avoid static electricity discharge (which might cause ignition of organic vapors). Extinguish all ignition sources. Containers must be properly grounded before beginning transfer. Use only non-sparking tools. Check atmosphere for explosiveness and oxygen deficiencies. Carefully vent any internal pressure before removing closure. Observe precautions pertaining to confined space entry. Do not use compressed air for filling, discharging or handling. Handle empty containers with care; vapor residue may be flammable/explosive. Decontaminate containers thoroughly before reuse/disposal. Isolate, vent, drain, wash and purge systems or equipment before maintenance or repair. All equipment must conform to applicable electrical code. Do not pressurize, cut, weld, braze solder, drill, or grind on containers. Use only bottom loading of tankers, in compliance with European regulations. Electrostatic charges may be generated as a result of flow or agitation. Special slow load procedures for 'switch loading' must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point hydrocarbon products.

Storage

Store only in tightly closed, properly vented containers away from heat, sparks, open flame and strong oxidizing agents. Store closed drums with bung in up position. Vapor space above stored liquid may be flammable/explosive unless blanketed with inert gas. Electrical installations / working materials must comply with the technological safety standards. Keep container tightly closed and properly labeled. Cleaning, inspection and maintenance of the internal structure of storage tanks must be done only by properly equipped and qualified personnel as defined by national, local or company regulations. Recommended materials: For containers, or container linings use mild steel, stainless steel. Unsuitable materials: Some synthetic materials may be unsuitable for container or container linings depending on the material specification and intended use. Compatibility should be checked with the manufacturer.

Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved. Refer to NFPA 77 for relevant consensus guidance. This liquid may accumulate static electricity even when transferred into properly grounded containers. Static electricity accumulation may be significantly increased by the presence of small quantities of water.

BT RAFFINATE

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits.

Personal protective equipment

Inhalation

When workers are facing concentrations above the exposure limit they must use appropriate certified respirators. The type of respiratory protection will depend upon whether the maximum exposure concentration is known.

Consider the maximum period for wear.

Skin

Wear chemical resistant gloves such as: Glove material fluoroelastomer; material thickness 0.4 mm; break through time \geq 480 min. Gloves must be replaced after 8 hours of wear. The suitability for a specific workplace should be discussed with the producers of the protective gloves. Gloves should be discarded and replaced if there is any indication of degradation or chemical breakthrough. When skin contact is possible, protective clothing including gloves, apron, sleeves, boots, head and face protection should be worn. Choose body protection according to the amount and concentration of the dangerous substance at the work place. Use PPE that is chemical resistant to the product and prevents skin contact. Fire retardant clothing is appropriate for routine occupational use.

Eyes

Safety glasses with side-shields Eye protection such as chemical splash goggles and/or face shield must be worn when possibility exists for eye contact due to splashing or spraying liquid.

Remarks

Wash hands before eating, drinking, smoking, or using toilet facilities. Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure. Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use. Use good personal hygiene practices.

Occupational Exposure Limits

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance: liquid transparent, colorless

Odor: Gasoline or naphtha odor. characteristic

Odor Threshold: No Data Available.

pH: not applicable

Boiling point/boiling range: 36 - 143 °C (96.8 - 289.4 °F)

Melting point/freezing point: -129 - -57 °C (-200.2 - -70.6 °F)

Flash point: < 23 °C (< 73.4 °F)

Autoignition temperature: 232 °C (449.6 °F)

Flammability: OSHA/NFPA Class IA flammable liquid.

Lower explosion limit: 1 vol%

Upper explosion limit: 7.6 vol%

Explosive properties: Not explosive

Oxidizing properties: Not considered an oxidizing agent.

Vapor pressure: 13.8 - 75.8 kPa @ 37.8 °C (100.04 °F)

Evaporation rate: 6 (butyl acetate = 1)

Relative density: 0.68 - 0.72 @ 15 °C (59 °F)

Relative vapor density: 3.5 @ 15.5 - 32.2 °C (59.9 - 89.96 °F)

Viscosity: < 2 mm²/s @ 37.8 °C (100.04 °F)

Water solubility: Negligible (Less Than .1 Percent).

Partition coefficient: n-octanol/water: Specific data not available.

Other physico-chemical properties: No additional information available.

10. STABILITY AND REACTIVITY

Conditions to avoid

Heat, sparks, open flame, other ignition sources, and oxidizing conditions.

Materials to avoid

Strong oxidizing agents

Hazardous decomposition products

Incomplete combustion can result in the production of carbon monoxide, carbon dioxide and other toxic gases.

Hazardous polymerization

 Not expected to occur.

11. TOXICOLOGICAL INFORMATION

Product information

Product Summary
 See component summary.

COMPONENT INFORMATION

- *Naphtha, petroleum, solvent-refined light 64741-84-0*

Acute effects

Inhalation

Predicted exposure concentration Stream expected to have a low order of acute inhalation toxicity based on toxicity information for streams having components in common with this stream.

Ingestion

Predicted exposure concentration Stream expected to have a low order of acute oral toxicity based on toxicity information for streams having components in common with this stream.

Skin contact

Predicted exposure concentration Stream expected to have a low order of acute dermal toxicity based on toxicity information for streams having components in common with this stream.

Irritation

Skin

Stream expected to be irritating to the skin based on toxicity information for streams having components in common with this stream.

Eyes

Stream expected to be no more than transient, fully reversible irritating to the eye based on toxicity information for streams having components in common with this stream. These effects are not considered to warrant classification as an eye irritant.

This substance produced irritant effects of corneal opacity, iris congestion, and moderate to severe conjunctival irritation.

Sensitization

Stream expected not to be a sensitizer based on toxicity information for streams having components in common with this stream.

Target Organs

Skin, central nervous system (CNS)

- *Hexane Isomers*

Other information

No data available.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE89
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 12/12/2011

BT RAFFINATE

- *Octane Isomers*

Acute effects

Ingestion

Harmful if swallowed.

Irritation

Skin

May be irritating to the skin.

- *Heptane isomers*

Target Organs

Central nervous system. Lung.

Repeated dose toxicity

Repeated exposure can cause peripheral nerve damage and defatting of the skin.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *n-Hexane 110-54-3*

Acute toxicity

LC50 (Inhl) rat 48,000 PPM 4 HOURS

LD50 (Oral) rat 28,710 MG/KG

LD50 (Skin) rabbit 3000 MG/KG

Irritation

Eyes

Eye irritant.

Target Organs

Skin. Eye. Respiratory system. Central nervous system effects. Peripheral nervous system Testes.

Repeated dose toxicity

Rabbits exposed by inhalation to 3,000 ppm 8 hours/day for 8 days showed changes in the lungs, emphysema, necrosis of the bronchial epithelium, and atelectasis. Rats continuously exposed to 400 ppm developed anoxapathy, although intermittent exposure to 10,000 ppm 6 hours/day, 5 days/week for 13 weeks caused only mild paranodal axonal swelling. The offspring of rats and mice exposed orally or by inhalation to n-hexane during gestation showed depressed weight gain after birth. This agent also affects male and female reproductive capacity.

Reproductive effects

Exposure to n-hexane may damage the developing fetus.

Developmental Toxicity

Causes productive and embryotoxic effects and is cytotoxic in mammalian and human test systems.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

Other information

Exposure of humans to 5,000 ppm n-hexane for 10 minutes causes marked vertigo; exposure to 1,500 ppm results in headache and slight nausea. In industrial settings, exposure to levels exceeding 1,000 ppm have been reported to cause mild symptoms of narcosis. Eye and upper respiratory tract irritation has been reported to occur in humans exposed to 880 ppm n-hexane for 15 minutes. Dermal contact with n-hexane results in immediate irritation characterized by erythema and hyperemia; exposed subjects developed blisters 5 hours following dermal exposure to n-hexane. The neuropathic toxicity of n-hexane in humans is well documented; cases of polyneuropathy have typically occurred in humans chronically exposed to levels of n-hexane ranging from 400 to 600 ppm, with occasional exposures up to 2,500 ppm. Distal symmetrical motor weakness is common in most cases; however, in severely affected individuals, motor weakness may

MATERIAL SAFETY DATA SHEET

 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 12/12/2011

BT RAFFINATE

Other information

extend to the pelvic and high musculature. Nerve biopsies in affected individuals show swelling of the nerve and thinning of the myelin sheath. Functional neurological disturbances usually progress for a few months after termination of exposure. Although recovery is expected to occur within a year, clinical polyneuropathy has been reported in some cases to remain after 2 years. Blurred vision, restricted visual field, and optic nerve atrophy has been reported to occur in association with n-hexane-induced polyneuropathy.

- *Methylcyclopentane* 96-37-7

Target Organs

Skin. Eye. Respiratory system. Nervous system.

Repeated dose toxicity

Repeated exposure can cause peripheral nerve damage and defatting of the skin.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *Cyclohexane* 110-82-7

Acute toxicity

<u>LC50 (Inhl)</u>	rat	13.9 MG/L	4 HOURS
<u>LD50 (Oral)</u>	rat	> 5000 MG/KG	
<u>LD50 (Skin)</u>	rabbit	> 2000 MG/KG	

Target Organs

Central nervous system effects.

Repeated dose toxicity

No known chronic health effects.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *n-Pentane* 109-66-0

Acute toxicity

<u>LC50 (Inhl)</u>	rat	> 18.02 MG/L	4 HOURS
<u>LD50 (Oral)</u>	rat	> 2000 MG/KG BWT	
<u>LD50 (Skin)</u>	rabbit	3000 MG/KG	

Target Organs

Respiratory system. Kidneys.

Repeated dose toxicity

No treatment-related effects were observed in a 90-day inhalation study in rats exposed to n-pentane at up to 6778 ppm (20 mg/L). Inhalation neurotoxicity evaluations in rats exposed to n-pentane at 3000 ppm (8.9 mg/L) for up to 30 weeks found no evidence of neurotoxicity. Repeated oral gavage exposures of rats to 500 mg/kg bwt/day n-pentane produced lethality, decreases in bodyweight gain and slightly lower kidney weights.

Reproductive effects

No effects on reproductive organs were observed in a 90-day inhalation study in rats exposed to n-pentane at ~7000 ppm (20 mg/L). n-Pentane was negative in a dominant lethal test in mice when males were given a single intraperitoneal injection of 48-666 mg/kg bwt.

Developmental Toxicity

No developmental toxicity was observed when pregnant rats were exposed to n-pentane by oral administration of 1000mg/kg bwt/day or by inhalation of 10000 ppm (29.5 mg/L).

Carcinogenicity

MATERIAL SAFETY DATA SHEET

MSDS No.: BE89
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 12/12/2011

BT RAFFINATE

Target Organs

Not listed by IARC, NTP, OSHA or EPA.

- *Cyclopentane* 287-92-3

Acute toxicity

LC50 (Inhl) rat 106 GM/M3

LD50 (Oral) rat 11,400 MG/KG

Acute effects

Inhalation

Specific data not available.

Ingestion

Specific data not available.

Skin contact

Specific data not available.

Irritation

Skin

Specific data not available.

Eyes

Specific data not available.

Target Organs

Skin. Central nervous system. Lung.

Repeated dose toxicity

Sensitive individuals may exhibit skin rash, wheezing, tightness of the chest, and difficulty breathing that may progress to a life-threatening inability to breathe.

Reproductive effects

No effects on reproductive organs were observed in a 90-day inhalation study with rats exposed to ~10,200 ppm (29.8 mg/L).

Genetic Toxicity

Cyclopentane was negative in the Ames Test and mouse lymphoma assay and in an in vivo micronucleus test, but induced chromosome aberrations in an in vitro mammalian cell assay.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

Other information

No data available.

- *Toluene* 108-88-3

Acute toxicity

LC50 (vapor) rat 7500 PPM 4 HOURS

LD50 (Oral) rat 5,580 MG/KG BWT

LD50 (Skin) Rabbit > 5000 MG/KG BWT

Acute effects

Inhalation

Vapors or aerosol may cause irritation of the eyes, nose and throat as well as CNS depression (fatigue, dizziness, loss of concentration, with collapse, coma and death possible in cases of severe overexposure).

BT RAFFINATE

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract and CNS depression (fatigue, dizziness, collapse, coma and death). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

Moderate skin irritant.

Eyes

Moderate eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Skin. Eye. Hearing. Nasal cavity. central nervous system (CNS) Heart

Repeated dose toxicity

No evidence of systemic toxicity was reported in rats exposed to 1.15 mg/l (300 ppm) toluene vapor for two years, while higher exposures were associated with inflammation and degeneration of nasal epithelial tissue. Rats exposed repeatedly to very high concentrations of toluene exhibited neurological changes and permanent hearing loss. Clinical case reports indicate the occurrence of serious and persistent changes (including tremor, ataxia, memory impairment and possible hearing loss) in humans following deliberate over-exposure to toluene in abuse situations. The relevance of these findings to low level occupational exposure to toluene is not known.

Reproductive effects

Studies in animals demonstrate no histopathological lesions in testes or ovaries of rats and mice exposed to 9.4 mg/l (2500 ppm) toluene vapor for 14-15 weeks, and no loss of fertility in male rats after exposure to 7.5 mg/l (2000 ppm) for a similar period of time. Epididymal weights and sperm counts were decreased in one study, but the absence of any adverse effect on reproduction makes the functional relevance of these observations unclear. No reliable human data are available.

Developmental Toxicity

Studies in pregnant rats demonstrate that toluene is not a teratogen, however mild fetotoxicity (lower body weight, delayed ossification, delayed physical development) may occur in the absence of maternal toxicity at exposures in the range 1.9-2.8 mg/l (500-750 ppm). Other studies describe adverse effects on learning and cognitive functions in rat pups exposed to 4.5-6.7 mg/l (1200-1800 ppm) in utero, although it is unclear if end-points evaluated in these tests are directly relevant to humans.

Genetic Toxicity

In vitro and in vivo mutagenicity tests were negative.

Carcinogenicity

Inhalation studies in rats and mice demonstrate that toluene is not a carcinogen. It has been used extensively as a solvent in rodent skin painting studies with occasional slight increases in tumor incidence reported: an epigenetic mechanism (based on irritation rather than genotoxicity) may underpin these findings. Toluene is considered a Group 3 substance by IARC, not classifiable as to its carcinogenicity to humans.

- *Methyl Cyclohexane* 108-87-2

Acute toxicity

LD50 (Oral) rat > 3,200 MG/KG

Irritation

Skin

May be irritating to the skin. Repeated or prolonged contact with skin may cause dermatitis.

Eyes

May cause eye irritation.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE89
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 12/12/2011

BT RAFFINATE

Target Organs

Skin. Eye. Respiratory system. Central nervous system effects.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *Ethyl Benzene* 100-41-4

Acute toxicity

<u>LC50 (vapor)</u>	rat	4000 PPM
<u>LD50 (Oral)</u>	rat	3500 - 4700 MG/KG BWT
<u>LD50 (Skin)</u>	rabbit	> 15,000 MG/KG BWT

Acute effects

Inhalation

Vapors may cause irritation of the eyes, nose and throat as well as CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure) May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract. High doses may cause CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization. Aspiration may cause pulmonary edema and pneumonitis.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring. While skin absorption is a potential route of exposure, no adverse health effects are anticipated following accidental or incidental contact.

Irritation

Skin

This product is expected to be an skin irritant.

Eyes

Moderate to severe eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Central nervous system. Lung. Liver. Kidneys. Thyroid. Blood. Hearing. heart

Repeated dose toxicity

No adverse effects were present in rats or mice exposed to 1000 ppm (4.3 mg/l) ethylbenzene vapor for up to 13 weeks. Longer-term exposure resulted in an increased incidence of chronic progressive nephropathy (CPN) in kidneys from rats inhaling 750 ppm (3.3 mg/l) for up to two years. Since CPN is a spontaneous age-related condition specific to rodents, these findings are of doubtful relevance to humans. Mice exposed chronically under similar conditions responded with changes in the lung, liver and thyroid. Additional effects in rats observed with repeated oral exposure of \geq 250 mg bwt/day ethyl benzene for 90 days include changes in hematology (indicative of a mild regenerative anemia) and clinical chemistry parameters (indicative of hepatic microsomal enzyme induction), decreases in prothrombin time, mild alimentary effects and liver pathology. A standard neurotoxicity protocol study conducted in young adult rats did not find neurotoxic effects following repeated daily oral exposure to doses up to 500 mg/kg bwt/day.

Specialist investigations provide evidence of hearing loss in rats following repeated exposure (13 weeks) to concentrations of 200 ppm (0.85 mg/l) and above. Ethyl benzene at up to 500 ppm vapor concentration did not adversely affect the functional ability of the humoral component of the immune system of rats as measured by splenic IgM antibody forming cell response to the T-dependent antigen, sheep erythrocytes.

Reproductive effects

No parental, neonatal, or reproductive toxicity was observed following inhalation exposure of rats to up to 500 ppm or 500 ppm/342 mg/kg bwt/day ethylbenzene. Histopathological examination of reproductive tissue from rats, mice and rabbits has generally revealed no adverse changes following sub-chronic- or chronic inhalation exposure to high vapor concentrations.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE89
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 12/12/2011

BT RAFFINATE

An increased incidence of testicular tumors in F344 male rats exposed to 750 ppm (3.3 mg/l) ethylbenzene vapor for 2 years is considered of doubtful relevance to reproductive toxicity.

Developmental Toxicity

Decreased fetal body weight and an increased occurrence of skeletal and other variations were reported in the presence of concurrent maternal toxicity (CNS effects, decreased body weight, liver enlargement) when female rats were exposed to ethylbenzene concentrations of 1000 ppm (4.3 mg/l) or above throughout pregnancy. No adverse effects to neurodevelopment were observed in rats exposed to 500 ppm/342 mg/kg bwt/day ethylbenzene.

Genetic Toxicity

No increase in micronuclei or hepatic UDS was observed in mice after treatment with ethylbenzene in vivo. It was not genotoxic in microbial systems, nor did it induce chromosomal aberrations or sister chromatid exchanges in mammalian cells in vitro. Variable results were obtained for mutation at the TK+/- locus in L5178Y cells, although the most reliable study that utilized the current standard study protocol and doses that were not significantly cytotoxic gave a negative mutagenic response. The overall weight of evidence indicates that ethylbenzene is not genotoxic.

Carcinogenicity

The carcinogenic potential of ethylbenzene after inhalation exposure has been investigated in two recent regulatory guideline studies performed by NTP. Male rats exposed to 750 ppm (3.3 mg/l) over 2 years showed an increased incidence of testicular interstitial cell adenoma, a common tumor present also in a large majority of the untreated males included in the study. High level exposure was also linked with an increased incidence of kidney tumors in both sexes; the appearance of these lesions was strongly associated with the development of Chronic Progressive Nephropathy, a spontaneous age-related disease of rats with no equivalent counterpart in humans. Male mice exposed to 750 ppm ethylbenzene for 2 years responded with an increased incidence of lung tumors, while the incidence of liver tumors was increased in females. Mechanistic studies suggest that these lesions in the mouse developed secondary to enhanced cell proliferation in these tissues, while the weight of evidence from mutagenicity testing also indicates that a non-genotoxic mechanism was involved. Listed by IARC as possibly carcinogenic in humans (Group 2B).

- *o*-Xylene 95-47-6

Acute toxicity

rat	4,330 PPM (PREDICTED)	6 HOURS
mouse	3,907 PPM (PREDICTED)	6.0 HOURS

<u>LD50 (Oral)</u>	rat	3,523 MG/KG (PREDICTED)
	mouse	>= 5,251 MG/KG (PREDICTED)

<u>LD50 (Skin)</u>	rabbit	>4.350 MG/KG (PREDICTED)
--------------------	--------	--------------------------

Acute effects

Inhalation

This substance has a low order of acute toxicity by the inhalation route. Inhalation of vapors may cause signs of respiratory tract irritation (cough and difficulty breathing), CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure), possible cardiac sensitization, and irritation of the eyes and throat. Exposure to high vapor concentrations may cause effects on hearing.

Ingestion

This substance is of low acute toxicity when administered orally. May be harmful if swallowed. Ingestion may cause effects on liver, spleen and kidneys; CNS depression (primarily fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe overexposure), and possible cardiac sensitization. Aspiration into the lung may cause fatal chemical pneumonitis.

Skin contact

Skin absorption hazard. Repeated contact with skin may cause cracking and/or fissuring. Considered to be of low toxicity by the dermal route of exposure. However, dermal exposure to high concentrations may cause discomfort and irritation of the gastrointestinal tract; effects on lungs, liver and kidneys; and CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure).

Irritation

Skin

MATERIAL SAFETY DATA SHEET

MSDS No.: BE89
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 12/12/2011

BT RAFFINATE

May be irritating to the skin. Repeated contact with skin may cause cracking and/or fissuring.

Eyes

Mild to moderate irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Hearing. Central nervous system. Liver. Kidneys. Cardiac sensitization.

Repeated dose toxicity

May be toxic following repeated exposure to high doses. Repeated inhalation exposure of rats to o-xylene caused a reduction in body weight and liver effects (increase in weight, enzyme changes, cell proliferation, and histopathology) at ≥ 1090 ppm (4.73 mg/L), but no ototoxicity at 1800 ppm (7.82 mg/L). Oral exposure of rats for 10 days to o-xylene produced increases in liver weights and decreases in body weights at 2000 mg/kg bwt/day. The observed liver effects may be adaptive rather than adverse effects.

Reproductive effects

Not expected to cause reproductive toxicity. Available information from studies conducted in laboratory animals with similar substances (mixed xylenes, m- and p-xylene) shows no evidence of an effect on reproductive performance or reproductive organs at high inhalation or oral doses. Mixed xylenes have been shown to produce damage to reproductive organs in rats repeatedly exposed to extremely high, anesthetic doses. None.

Developmental Toxicity

May be toxic to the developing embryo and fetus. Inhalation exposure of pregnant rats to o-xylene was reported to produce decreases in fetal weight at ≥ 350 ppm (1.5 mg/L) and increases in skeletal variations, but not malformations, at 2000 ppm (8.7 mg/L), in the presence of maternal toxicity (decreased body weight gain and feed consumption, increased relative liver weight). After oral gavage exposure, increased resorptions and cleft palate formation were reported in fetuses of mice exposed to 1935 mg/kg bwt/day, in the presence of maternal toxicity (unspecified). As mice under stress have been shown to be predisposed to produce offspring with cleft palate, the significance of this finding is uncertain.

Genetic Toxicity

o-Xylene produced negative results in assays for gene mutation in bacteria, recessive lethal mutations in the fruit fly, and induction of micronuclei in mouse bone marrow or changes in sperm morphology in rats after intraperitoneal injection.

Carcinogenicity

Available data for mixed xylenes indicate that o-xylene is not likely to be carcinogenic to humans. Cancer data for mixed xylenes are used as surrogate data for this product. Oral exposure to mixed xylenes for 2 years did not produce tumors in rats or mice at doses up to 500 or 1000 mg/kg bwt/day, respectively. IARC concluded that xylenes are not classifiable as to their carcinogenicity to humans (Group 3).

- *m-Xylene* 108-38-3

Acute toxicity

<u>LC50 (Inhl)</u>	rat	5984 PPM	6 HOURS

May be harmful if swallowed. Ingestion may cause effects on liver, spleen and kidneys. High doses may cause CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure). Possible cardiac sensitization. Aspiration may cause pulmonary edema and pneumonitis.

Skin contact

Skin absorption hazard. Considered to be of low toxicity by the dermal route of exposure. However, dermal exposure to high concentrations may cause discomfort and irritation of the gastrointestinal tract; effects on lungs, liver and kidneys; and

MATERIAL SAFETY DATA SHEET

MSDS No.: BE89
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 12/12/2011

BT RAFFINATE

CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure). Expected to have a low order of acute dermal toxicity based on component toxicity information. Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

May be irritating to the skin. Repeated and/or prolonged contact with skin may cause inflammation, hyperkeratosis, acanthosis and ulceration.

Eyes

May cause moderate to severe eye irritation.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Hearing. Central nervous system. Liver. Kidneys. Cardiac sensitization.

Repeated dose toxicity

Repeated inhalation exposure of rats to m-xylene caused slight changes in liver histopathology and CNS (behavioral) effects at \Rightarrow 100 ppm (0.43 mg/L) but no ototoxicity at 1800 ppm (7.82 mg/L). Oral exposure of rats to m-xylene for 13 weeks produced decreased body weight gains in males at \Rightarrow 200 mg/kg bwt/day and in females at \Rightarrow 800 mg/kg bwt/day; and exposure to 2000 mg/kg bwt/day for 10 days produced increases in liver weights. No ototoxicity was observed in rats exposed orally to m-xylene at 1798 mg/kg bwt/day. The observed liver effects may be adaptive rather than adverse effects.

Reproductive effects

No effect on testicular weight was found in rats exposed by inhalation to 100 ppm (0.43 mg/L) m-xylene for 13 weeks. No damage to reproductive organs was noted in rats exposed by oral gavage to m-xylene at 800 mg/kg bwt/day for 13 weeks.

Developmental Toxicity

May be toxic to the developing embryo and fetus. Inhalation exposure of pregnant rats to m-xylene was reported to produce decreases in fetal weight and a slight decrease in implantations at 700 ppm (3.0 mg/L) in the presence of maternal toxicity (decreased body weight gain and feed consumption, increased relative liver weight). After oral gavage exposure, increased resorptions and cleft palate formation were reported in fetuses of mice exposed to 2580 mg/kg bwt/day, in the presence of maternal toxicity (unspecified). As mice under stress have been shown to be predisposed to produce offspring with cleft palate, the significance of this finding is uncertain.

Genetic Toxicity

m-Xylene produced negative results in assays for gene mutation in bacteria, recessive lethal mutations in the fruit fly, and induction of micronuclei in mouse bone marrow after intraperitoneal injection.

Carcinogenicity

Available data for mixed xylenes indicate that m-xylene is not likely to be carcinogenic to humans. Cancer data for mixed xylenes are used as surrogate data for this product. Oral exposure to mixed xylenes for 2 years did not produce tumors in rats or mice at doses up to 500 or 1000 mg/kg bwt/day, respectively. IARC concluded that xylenes are not classifiable as to their carcinogenicity to humans (Group 3).

BT RAFFINATE

<u>LD50 (Oral)</u>	rat	4,029 MG/KG
<u>LD50 (Skin)</u>	rabbit	(predicted) > 4,350 MG/KG

Acute effects

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations. Exposure to high vapor concentrations may cause effects on hearing.

Ingestion

May be harmful if swallowed. Ingestion may cause effects on liver, spleen and kidneys. High doses may cause CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure). Possible cardiac sensitization. Aspiration may cause pulmonary edema and pneumonitis.

Skin contact

Skin absorption hazard. Considered to be of low toxicity by the dermal route of exposure. However, dermal exposure to high concentrations may cause discomfort and irritation of the gastrointestinal tract; effects on lungs, liver and kidneys; and CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure). Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

May be irritating to the skin. Repeated contact with skin may cause cracking and/or fissuring.

Eyes

May cause eye irritation.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Hearing. Central nervous system. Liver. Kidneys. Cardiac sensitization.

Repeated dose toxicity

May be toxic following repeated exposure to high doses. No standard repeated inhalation exposure study is available. However, in limited scope studies, repeated inhalation exposure of rats to p-xylene caused ototoxicity at ≥ 900 ppm (3.91 mg/L) but not at 450 ppm (1.95 mg/L). Repeated inhalation exposures of laboratory animals to other xylene isomers and/or mixed xylenes caused reduced body weight/weight gain at ≥ 1000 ppm (4.35 mg/L), liver and CNS (behavioral) effects at ≥ 100 ppm (0.43 mg/L), and, in rats, ototoxicity at ≥ 250 ppm (1.09 mg/L). No treatment-related effects were seen in rats after oral exposure to p-xylene at 800 mg/kg bwt/day for 13 weeks. Short-term (10-14 days) repeated oral exposure of rats to p-xylene produced increases in liver weights and decreases in body weights and relative thymus weights at 2000 mg/kg bwt/day, and ototoxicity at 899 mg/kg bwt/day (the only concentration tested for ototoxicity). No ototoxicity was observed in guinea pigs exposed to p-xylene at this dose level. Oral exposure of rats to mixed xylenes at 500 mg/kg bwt/day for 103 weeks produced only slightly decreased body weight. Repeated oral exposure of mice to mixed xylenes produced a reduction in body weight in females at 2000 mg/kg bwt/day for 13 weeks, but no treatment-related effects were seen after exposure to 1000 mg/kg bwt/day for 103 weeks. The observed liver effects may be adaptive rather than adverse effects.

Reproductive effects

This substance is not expected to be a reproductive toxicant. No damage to reproductive organs was noted in rats exposed by oral gavage to p-xylene at 800 mg/kg bwt/day for 13 weeks. Results for mixed xylenes in a one-generation reproductive toxicity study (rats, inhalation at 500 ppm/2.17 mg/L) and two dominant lethal studies (rats, i.p.; mice, s.c; 864 mg/kg bwt), and from evaluation of reproductive organs in repeated dose studies (male rats, inhalation, 1000 ppm [4.35 mg/L]; rats [1000 mg/kg bwt/day] and mice [2000 mg/kg bwt/day], oral) indicate that mixed xylenes do not affect reproductive performance or induce structural damage to reproductive organs of laboratory animals at high inhalation or oral doses. However, xylenes have been shown to produce damage to reproductive organs in rats repeatedly exposed to extremely high, anesthetic doses.

Developmental Toxicity

May be toxic to the developing embryo and fetus. Inhalation exposure of pregnant rats to p-xylene was reported to produce decreases in fetal weight and increases in post implantation loss at ≥ 700 ppm 3.0 mg/L), and increases in skeletal variations, but not malformations, at 2000 ppm (8.7 mg/L) in the presence of maternal toxicity (decreased body weight gain

MATERIAL SAFETY DATA SHEET

MSDS No.: BE89
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 12/12/2011

BT RAFFINATE

and feed consumption, and increased relative liver weight). No effect on neurobehavior was noted in offspring of rat dams exposed to 800 and 1600 ppm (3.5 or 7.0 mg/L) prenatally. After oral gavage exposure, increased resorptions and cleft palate formation were reported in fetuses of mice exposed to p-xylene at ≥ 1935 mg/kg bwt/day, in the presence of maternal toxicity (unspecified). As mice under stress have been shown to be predisposed to produce offspring with cleft palate, the significance of this finding is uncertain.

Genetic Toxicity

Not expected to be genotoxic. p-Xylene produced negative results in assays for gene mutation in bacteria and induction of micronuclei in mouse bone marrow after intraperitoneal injection. Two positive responses have been reported for mixed xylenes, but the overall weight of evidence from a variety of in vitro and in vivo genotoxicity studies with xylenes indicates that these substances are not genotoxic.

Carcinogenicity

Available data for mixed xylenes indicate that p-xylene is not likely to be carcinogenic to humans. Cancer data for mixed xylenes are used as surrogate data for this product. Oral exposure to mixed xylenes for 2 years did not produce tumors in rats or mice at doses up to 500 or 1000 mg/kg bwt/day, respectively. IARC concluded that xylenes are not classifiable as to their carcinogenicity to humans (Group 3).

- Benzene 71-43-2

Acute toxicity

<u>LC50 (vapor)</u>	rat	13,700 PPM	4 HOURS
<u>LD50 (Skin)</u>	rabbit	> 8260 MG/KG BWT	

Acute effects

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations.

Ingestion

May cause CNS depression, gastric discomfort, and vomiting. This material is an aspiration hazard.

Skin contact

No systemic toxicity is expected from acute dermal exposure.

Target Organs

Damages bone marrow. Eye. Skin.

Repeated dose toxicity

The hematopoietic system is the primary target for benzene, irrespective of the route of exposure. Broadly similar effects are seen in rodents and humans, including bone marrow toxicity and reduced red- and white blood cell counts.

Reproductive effects

Results from animal studies are inconsistent, with adverse effects on the ovary and testis reported in mice following repeated inhalation exposure but no effects on the gonads or on fertility observed in rats exposed under similar conditions. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Developmental Toxicity

Results from animal studies clearly demonstrate that benzene is not a teratogen, however mild fetotoxicity (including lowered body weight, delayed ossification and sub-clinical hematological changes) have been observed in rodents exposed during pregnancy, generally in association with maternal toxicity. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Genetic Toxicity

Benzene is genotoxic in vivo, and induces chromosomal aberrations and micronuclei in rats and mice following oral or inhalation exposure. Comparable changes would be anticipated in humans. The incidence of micronuclei in fetal rat liver is increased following administration of large doses by intraperitoneal injection to pregnant mice, while high-level oral exposure induced chromosomal aberrations in germ cells from male mice. The relevance to humans of these latter findings is not known.

Carcinogenicity

Benzene is a multi-site animal carcinogen, producing tumors in hematopoietic- and epithelial tissues after long term

inhalation or oral exposure. Epidemiology studies confirm it is a human carcinogen, causing primarily acute non-lymphocytic leukemia.

- *n-Butane* 106-97-8

Acute toxicity

<u>LC50 (Inhl)</u>	rat	658 MG/L	4 HOURS
	mouse	680 MG/L	2 HOURS

Acute effects

Ingestion

Stream is a gas with a low boiling point; hence, oral exposure and resulting acute toxicity are unlikely.

Skin contact

Stream is a gas with a low boiling point; hence, dermal uptake and resulting acute toxicity are unlikely.

Irritation

Skin

None expected. Evaporating liquid may cause frost bite.

Eyes

None expected. Evaporating liquid may cause frost bite.

Target Organs

CNS depressant.

Repeated dose toxicity

No biologically significant treatment-related systemic effects were seen when rats were exposed by inhalation for 4-6 weeks to 9000 ppm (21.4 mg/L) nbutane.

Reproductive effects

No signs of reproductive toxicity were observed in an inhalation screening test of rats exposed to up to 9000 ppm (21.39 mg/L) n-butane.

Developmental Toxicity

No signs of developmental toxicity were observed in an inhalation screening test of rats exposed to up to 9000 ppm (21.39 mg/L) n-butane.

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS *waterflea*. 3.87 mg/l

Environmental fate and pathways

Photolysis, hydrolysis or bioconcentration of n-hexane are not expected to be an important environmental fate processes. Biodegradation of n-hexane may occur in soil and water; however, volatilization and adsorption are expected to be far more important fate processes. A Koc range of 1250 to 4100 indicates a low to slight mobility class in soil for n-hexane. In aquatic systems n-hexane may partition from the water column to organic matter contained in sediments and suspended materials. Rapid volatilization from environmental waters is expected.

Persistence and degradability

Stability in water: In aquatic systems, this material may partition from the water column to organic matter contained in sediments and suspended materials.

Biodegradation: Biodegradation may occur in soil and water, however, volatilization and adsorption are expected to be far more important fate processes.

Bioaccumulation: This material is not expected to bioaccumulate.

Environmental fate and pathways

Mobility

Behavior in environmental compartments: The atmosphere is the main environmental compartment for releases of ethylbenzene (half-life approx. 1 day). In water, volatilization to air and biodegradation will result in substantial losses, with an estimated half-life of approx. 0.1 - 13 days.

Persistence and degradability

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: This material is not expected to bioaccumulate.

- *o*-Xylene 95-47-6

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOURS Oncorhynchus mykiss (rainbow trout) 7.6 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 24 HOURS Daphnia magna (Water flea) 1 mg/l

Toxicity to aquatic plants

EC50 / 72 HOURS Selenastrum capricornutum (green algae) 4.7 mg/l

Toxicity to microorganisms

EC50 / 0.5 HOURS Activated sludge 70 mg/l

Chronic toxicity to fish

NOEC / 56 d Oncorhynchus mykiss (rainbow trout) 1.3 mg/l

Summary: (predicted; mixed xylenes)

Chronic toxicity to aquatic invertebrates

NOEC / 7 d Ceriodaphnia (water flea) 1.17 mg/l

Environmental fate and pathways

Mobility

Behavior in environmental compartments: Some volatilization from water or soil surfaces is expected, with *o*-xylene initially partitioned mainly to soil and water. Expected to exist solely as a vapor in the ambient atmosphere.

Persistence and degradability

Biodegradation: Inherently biodegradable. Expected to be hydrolytically stable, but rapidly degraded following atmospheric release.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE89
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 12/12/2011

BT RAFFINATE

Bioaccumulation: Significant bioaccumulation is not expected.

- *m-Xylene* 108-38-3

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOURS *Oncorhynchus mykiss* (rainbow trout) 8.4 mg/l

Acute toxicity to aquatic invertebrates

LC50 / 48 HOURS *Daphnia magna* (Water flea) 4.7 mg/l

Toxicity to aquatic plants

EC50 / 72 HOURS *Selenastrum capricornutum* (green algae) 4.9 mg/l

Chronic toxicity to fish

NOEC / 56 d *Oncorhynchus mykiss* (rainbow trout) 1.3 mg/l

Summary: (predicted; mixed xylenes)

Chronic toxicity to aquatic invertebrates

NOEC / 7 d *Ceriodaphnia* (water flea) 1.17 mg/l

Environmental fate and pathways

Persistence and degradability

Biodegradation: Readily biodegradable. Expected to be hydrolytically stable, but rapidly degraded following atmospheric release.

Bioaccumulation: Significant bioaccumulation is not expected.

- *n-Heptane* 142-82-5

Ecotoxicity

This material may be very toxic to aquatic species.

Acute Fish toxicity

LC50 / 24 HOUR goldfish 4 mg/l

LC50 / 96 HOURS Cichlid fish 375 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 24 HOURS *Daphnia magna*. > 10 mg/l

Environmental fate and pathways

This material is expected to exist solely as a vapor in the ambient atmosphere. The vapor-phase of this material is degraded in the atmosphere by reaction with photochemically-produced hydroxyl radicals and ozone.

Persistence and degradability

Stability in water: In aquatic systems, this material may partition from the water column to organic matter contained in sediments and suspended materials.

Stability in soil: This material is expected to have slight mobility in soil.

Biodegradation: No data available.

Bioaccumulation: This material may bioaccumulate.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE89
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 12/12/2011

BT RAFFINATE

Environmental fate and pathways

Mobility

Behavior in environmental compartments: When released to water, volatilization will result in substantial losses to the atmosphere with a calculated half-life in the troposphere of approximately 13.4 days. A calculated Koc value of 134.1 l/kg does not indicate a significant potential for geoaccumulation.

Persistence and degradability

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: Bioconcentration factor (BCF) ~ 10 (fish.) BCF in fish ~ 10.

- *n-Butane* 106-97-8

Ecotoxicity

This material is expected to be non-hazardous to aquatic species.

Environmental fate and pathways

This material is likely to evaporate from soil and water.

Persistence and degradability

Stability in water: Not likely to adsorb to suspended solids and sediment in water.

Stability in soil: Expected to have very high to moderate mobility in soils. Volatilization from surface soil may be quite rapid, although this process may be slowed by dicyclopentadiene's adsorption to the soil. This compound is expected to display low mobility. Biodegradation and hydrolysis are not expected to be significant factors.

Biodegradation: Biodegradation may occur in soil and water, however, volatilization and adsorption are expected to be far more important fate processes.

Bioaccumulation: This material is not expected to bioaccumulate.

13. DISPOSAL CONSIDERATIONS

Contaminated product, soil, water, and empty containers may be hazardous wastes due to possible presence of flammable gases. Assure emissions comply with applicable regulations. Preferred disposal for this volatile, flammable product is through combustion. Use flare if pressure warrants. Proper grounding procedures to avoid static electricity should be followed. The product should not be allowed to enter drains, water courses or the soil.

14. TRANSPORT INFORMATION

Special Provisions

If you reformulate or further process this material, you should consider re-evaluation of the regulatory status of the components listed in the composition section of this sheet, based on final composition of your product.

2. HAZARDS IDENTIFICATION

Emergency Overview

This material is HAZARDOUS as defined by the OSHA Hazard Communication Standard, 29CFR, 1910.1200.

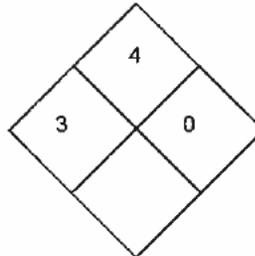

Signal Word

DANGER.

Hazards

Extremely flammable. Vapors may form explosive mixtures with air. Vapors can travel to a source of ignition and flash back. Vapors explosion hazard indoors, outdoors or in sewers. Vapor may cause flash fire or explosion. Poison. Harmful or fatal if swallowed. May cause central nervous system effects. Contains hydrogen sulfide gas, maybe fatal if inhaled. May cause lung damage. Possible cancer hazard. Harmful to aquatic organisms.

NFPA®

HMIS®

Health	*	3
Flammability		4
Physical Hazard		0

Physical state

liquid

Color

Clear pale yellow to amber.

Odor

Hydrogen sulfide; rotten eggs.

MATERIAL SAFETY DATA SHEET

 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

Odor Threshold
 No Data Available.

Potential health effects

Routes of exposure
 Skin. Inhalation. Ingestion.

Acute effects
 Inhalation hazard. May cause drowsiness and dizziness. See component summary.

- *Hexane isomers*

May be irritating to the eyes, skin, and respiratory system. Inhalation of vapors may cause dizziness, narcosis, nausea or asphyxiation. Ingestion of this material, followed by vomiting and aspiration of the more volatile components of this material into the lungs, may lead to chemical pneumonia and even death.

- *n-Hexane 110-54-3*

May cause irritation to the eyes, nausea, vertigo, bronchial and central nervous system effects. This material presents an acute aspiration hazard. May be irritating to the skin. High or repeated exposures can damage the peripheral nervous system, causing numbness, tingling, and/or muscle weakness in the hands or feet. The onset of health effects associated with n-hexane may be influenced by exposure to additional chemicals such as methyl isobutyl ketone and methyl ethyl ketone.

- *Xylene 1330-20-7*

May be irritating to the eyes, skin, and respiratory system. Aspiration hazard. Ingestion of this material, followed by vomiting and aspiration of the more volatile components of this material into the lungs, may lead to chemical pneumonia and even death.

- *Butenes 25167-67-3*

CNS depressant. Simple asphyxiant. Contact with liquid may cause frostbite.

- *Benzene 71-43-2*

Slight acute toxicity. Inhalation exposure to high concentrations may cause dizziness and CNS depression. Ingestion of relatively small amounts may be fatal if aspiration into the lungs takes place.

- *Cyclohexane 110-82-7*

CNS depressant. Simple asphyxiant. May be irritating to the eyes, skin, and respiratory system.

- *Toluene 108-88-3*

Toluene is of slight acute toxicity, although inhalation exposure may cause dizziness and CNS depression, while ingestion may be fatal if aspiration into the lung occurs. Toluene may increase the sensitivity of the heart leading to potentially fatal cardiac sensitization. It is moderately irritating to skin and eye.

- *Trimethylbenzene 25551-13-7*

CNS depressant. Aspiration hazard.

- *Ethyl Toluene 25550-14-5*

May be irritating to the skin.

- *1,3-Butadiene 106-99-0*

May be irritating to the eyes, skin, and respiratory system. CNS depressant.

- *Ethyl Benzene 100-41-4*

Inhalation hazard. Ingestion hazard. Skin and eye irritant.

- *Hydrogen sulfide 7783-06-4*

Hydrogen sulfide is a highly toxic gas that can be fatal in certain concentrations. Skin absorption hazard. Respiratory tract irritant. Inhalation may cause asthma-like symptoms, including coughing, wheezing, tightness of chest, shortness of breath, and headache. Higher exposures can cause a build-up of fluid in the lungs (pulmonary edema), with severe shortness of breath. CNS depressant.

Skin

May produce skin irritation. Repeated or prolonged contact with skin may cause defatting and drying of the skin which may result in dermatitis. May cause irritation to the skin. This irritation can result in redness and swelling of the skin. Repeated contact with the skin may cause it to become dry and cracked. May be absorbed through the skin and produce toxic effects such as CNS depression.

Inhalation

Can cause pulmonary edema if aspirated into lungs. May produce symptoms of central nervous system depression including headache, dizziness, nausea, euphoria, loss of equilibrium, drowsiness, visual disturbances, fatigue,

MATERIAL SAFETY DATA SHEET

MSDS No.: BE159
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

Inhalation

unconsciousness and respiratory arrest. High concentrations of this substance may cause cardiac arrhythmias that may be fatal. Hydrogen sulfide is a highly toxic gas that can be fatal in certain concentrations. Inhalation of the vapor or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath and may cause transient central nervous system (CNS) depression.

Eyes

May cause moderate irritation, including burning sensation, tearing, redness or swelling. Effects of eye irritation are reversible. May cause moderate irritation, including burning sensation, tearing, redness or swelling. May cause blurred vision. Effects may become more severe with repeated or prolonged contact.

Ingestion

Aspiration may cause lung damage. Harmful if swallowed. May cause abdominal discomfort, nausea and diarrhea. Aspiration into the lungs during swallowing or vomiting can cause lung damage, possibly leading to chronic lung dysfunction or death. Swallowing this material may cause effects similar to those described in the inhalation section.

Chronic effects

Prolonged contact with the skin may cause mechanical irritation and subsequent dermatitis. Prolonged or repeated exposure to vapors may cause lung damage. Contains material which may cause cancer based on animal data. Contains material that may cause adverse reproductive effects. Prolonged and/or repeated contact may cause mild to moderate skin defatting, redness, blistering, lesions, and/or scaly dermatitis. Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung tumor) formation and chronic lung dysfunction. Altered mental states, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called "petrol sniffers encephalopathy"), delirium, seizures, and sudden death have been common symptoms among gasoline and naphtha abusers. Damage to nerves in hands or feet may occur from prolonged inhalation of n-hexane concentrations of 60 to 240 ppm. Repeated exposure to air concentrations of 500 ppm n-hexane can produce progressively worsening damage to the peripheral nerves. Animal carcinogen. These findings are not likely relevant to humans. See chapter 11. Toxicological information

- *Hexane isomers*

Eye irritation, skin irritation leading to dermatitis, chemical pneumonia, and central nervous system depression may occur from repeated or prolonged exposure.

- *n-Hexane 110-54-3*

Damage to nerves in hands or feet may occur from prolonged inhalation of n-hexane concentrations of 60 to 240 ppm. Repeated exposure to air concentrations of 500 ppm n-hexane can produce progressively worsening damage to the peripheral nerves. Prolonged and repeated exposure to vapors may cause damage to the CNS, lungs and kidneys. Suspect reproductive hazard.

- *Xylene 1330-20-7*

May cause dermatitis by defatting the skin from prolonged or repeated contact. May contribute to the development of diseases of the nervous system, liver and kidney. May be a reproductive hazard.

- *Butenes 25167-67-3*

Hazard identification for this product is based on information available on its components.

- *Benzene 71-43-2*

Benzene is considered to be a cancer-causing agent. Repeated exposure is linked to bone marrow toxicity, reduced red- and white blood cell counts and decreased immunological function irrespective of the route of contact.

- *Cyclohexane 110-82-7*

No adverse chronic human health effects have been reported for this material.

- *Toluene 108-88-3*

Repeated exposure to high concentrations has been shown to cause neurological changes and hearing loss in animals, and in humans in abuse situations. May cause developmental toxicity.

- *Trimethyl benzene 25551-13-7*

No adverse chronic human health effects have been reported for this material.

- *Ethyl Toluene 25550-14-5*

Specific data not available.

- *1,3-Butadiene 106-99-0*

Known human carcinogen. Reproductive and developmental effects were present in test animals.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE159
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

- *Ethyl Benzene 100-41-4*

May effect hearing. Repeated or prolonged exposure may damage liver and kidneys. Possible cancer hazard. Repeated contact with skin may cause cracking and/or fissuring.

- *Hydrogen sulfide 7783-06-4*

Prolonged or repeated breathing of high concentrations may cause symptoms of central nervous system depression. Repeated exposure may cause eye damage with possible loss of vision.

Aggravated Medical Condition

Any pre-existing disorders or diseases of the: central nervous system (CNS) peripheral nervous system or heart Any pre-existing disorders or diseases of the: central nervous system (CNS) peripheral nervous system or heart

3. COMPOSITION/INFORMATION ON INGREDIENTS

<u>Component</u>	<u>CAS-No.</u>	<u>EC-No.</u>	<u>Weight %</u>
Hexane isomers	Mixture	Mixture	5.0 <= 15.0
n-Hexane	110-54-3	203-777-6	1.0 <= 10.0

Hydrogen sulfide	7783-06-4	231-977-3	< 0.2

Typical composition

4. FIRST AID MEASURES

General advice

Take proper precautions to ensure your own health and safety before attempting rescue and providing first aid. For specific information refer to the Emergency Overview in Section 2 of this MSDS.

Skin

Remove contaminated clothing as needed. Flush skin with water. Do not use ointments. If skin surface is damaged, apply a clean dressing and seek medical attention. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.

Inhalation

MATERIAL SAFETY DATA SHEET

MSDS No.: BE159
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

Inhalation

Immediately remove victim to fresh air. If victim has stopped breathing, give artificial respiration, preferably mouth-to-mouth. GET MEDICAL ATTENTION IMMEDIATELY. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, give oxygen.

Eyes

Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold the eyes apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician.

Ingestion

DO NOT induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. Get medical attention immediately. Never give anything by mouth to an unconscious person.

Notes to physician

Treat symptomatically.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

OSHA/NFPA Class IB Flammable Liquid.

Flash point

< -45 °C (-49 °F) closed cup

Autoignition temperature

No Data Available.

Lower explosion limit

~ 1 vol%

Upper explosion limit

~ 7 vol%

Extinguishing Media

Suitable extinguishing media

LARGE FIRE: Use water spray, water fog or foam. DO NOT use straight streams. SMALL FIRE: Use drychemicals, CO₂, or foam. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment.

Unsuitable extinguishing media

Do not use solid water stream/may spread fire.

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear an approved positive pressure self-contained breathing apparatus and firefighter turnout gear.

Precautions for fire-fighting

Fight from a maximum distance or use unmanned hose holders or monitor nozzles. Containers can build up pressure if exposed to heat; cool with flooding quantities of water until well after the fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of vessel. Always stay away from the ends of tanks. Notify authorities immediately if liquid enters sewer/public waters. Assure good ventilation to prevent flammable vapor formation. This material releases flammable vapors at well below ambient temperatures and may form flammable mixtures with air. When mixed with air in certain proportions and exposed to an ignition source, these vapors can burn in the open or be explosive in

MATERIAL SAFETY DATA SHEET

MSDS No.: BE159
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

Precautions for fire-fighting

confined spaces. Being heavier than air, these vapors may travel long distances along the ground before reaching a point of ignition and flashing back. Heat may build enough pressure to rupture dosed containers/spreading fire/increasing risk of burns/injuries.

Hazardous combustion products

Carbon Monoxide. Carbon dioxide. Oxides of nitrogen. Oxides of sulfur.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Flammable liquid. Release causes immediate fire/explosion hazard. A vapor suppressing foam may be used to reduce vapors. Eliminate all sources of ignition. All equipment used when handling this product must be grounded. Stop leak if you can do it without risk. Do not touch or walk through spilled material. Absorb or cover with dry earth, sand or other non-combustible material and transfer to containers. Use clean non-sparking tools to collect absorbed material. Water spray may reduce vapor; but may not prevent ignition in closed spaces. Contain spill with dike to prevent entry into sewers or waterways. Depending on the size and nature of the release, all responders may need to be HAZWOPER trained and local, state and federal authorities may need to be notified. Use suitable disposal containers. Contain spill and evacuate all non-essential personnel. In urban areas, cleanup spill as soon as possible; in natural environments, seek cleanup advice from environmental specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. This material will float on water and its run-off may create an explosion or fire hazard. Comply with all laws and regulations.

7. HANDLING AND STORAGE

Handling

Store in tightly closed containers. Eliminate every possible source of ignition. Equipment containing this material should be isolated and thoroughly drained, washed and purged prior to maintenance/repair operations. Electrostatic charges may be generated as a result of flow or agitation. Handle empty containers with care - residue may be combustible and burn if exposed to heat/sparks/open flame. A spill or leak can cause an immediate fire/explosion hazard. Do not pressurize, cut, weld, braze solder, drill, or grind on containers. A static spark or discharge can ignite accumulated vapors, particularly during dry weather conditions. Product container is not designed for elevated pressure. Bond and ground all equipment before transferring this material from one container to another. Never siphon by mouth. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material. After handling, always wash hands thoroughly with soap and water. Always keep nozzle in contact with the container throughout the loading process. Do not pressurize or expose empty containers to open flame, sparks, or heat. Do not fill any portable container in or on a vehicle without proper bonding. Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved. Refer to NFPA 77 for relevant consensus guidance.

Storage

Keep away from all ignition sources; segregate from incompatible materials. Keep containers tightly closed in a dry, cool, well-ventilated place, plainly labeled, and out of closed vehicles. Ground all containers, transfer vessels, and equipment containing this material. Containers should be able to withstand pressures expected from warming or cooling during storage. Flammable materials should be stored in separate safety storage cabinet or room. All equipment must conform to applicable electrical code. Store and transport in accordance with all applicable laws.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. If mechanical ventilation is used, electrical systems should conform to U.S. National Electric Code. Emergency shower and eyewash facility should be in close proximity (ANSI Z358.1) Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. If mechanical ventilation is used, electrical systems should conform to U.S. National Electric Code. Emergency shower and

MATERIAL SAFETY DATA SHEET

 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

Engineering Controls

eyewash facility should be in close proximity (ANSI Z358.1)

Personal protective equipment

Inhalation

A respiratory protection program which complies with U.S. Occupational Safety and Health Administration (OSHA) general industry standard 1910.134(e) should be implemented. A full-faced supplied air pressure-demand respirator with escape bottle or a pressure-demand self-contained, breathing apparatus (SCBA) is required. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).

Skin

Avoid contact with skin. Skin should be washed after contact. DO NOT use gasoline, kerosene, solvents or harsh abrasives as skin cleaners. Use heavy duty gloves constructed of chemical resistant materials such as Viton® or heavy nitrile rubber. Avoid contact with skin. When skin contact is possible, protective clothing including gloves, apron, sleeves, boots, head and face protection should be worn. Promptly remove and discard contaminated leather goods (gloves, belts, shoes, wallets, etc). Upon clothing contamination, immediately remove soaked clothing and shower. Wear long-sleeved fire-retardant garments (e.g., Nomex (R)) while working with flammable and combustible liquids.

Eyes

Wear safety glasses. Where the opportunity for a splash or spray caused by high pressure or agitation of the material is possible, use a face shield and chemical goggles. Suitable eye wash water should be readily available.

Remarks

Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use. Odor is an inadequate warning for hazardous conditions. Warning! Use of this material in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and/or inadequate oxygen levels for breathing.

Occupational Exposure Limits

Consult local authorities for acceptable exposure limits.

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance: liquid Clear pale yellow to amber.

Odor: Hydrogen sulfide; rotten eggs.

Odor Threshold: No Data Available.

pH: Not applicable.

Boiling point/boiling range: ≥ 69 °C (156.2 °F)

Melting/freezing point: No Data Available.

Flash point: < -45 °C (-49 °F) closed cup

Autoignition temperature: No Data Available.

Flammability: OSHA/NFPA Class IB Flammable Liquid.

Lower explosion limit: ~ 1 vol%

MATERIAL SAFETY DATA SHEET

 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

Upper explosion limit: ~ 7 vol%

Explosive properties: No Data Available.

Oxidizing properties: No Data Available.

Vapor pressure: <= 16.5 kPa @ 20 °C (68 °F)

Evaporation rate: No Data Available.

Relative density: 0.8661(Water = 1)

Relative vapor density: > 1 (Air = 1.0)

Viscosity: No Data Available.

Water solubility: Very slightly soluble in cold water.

Partition coefficient: n-octanol/water: Specific data not available.

Other physico-chemical properties: No additional information available.

10. STABILITY AND REACTIVITY

Chemical stability

The product is stable.

Conditions to avoid

Heat, sparks and open flame.

Materials to avoid

Strong acids. Strong bases. Strong oxidizer.

Hazardous polymerization

Not expected to occur.

11. TOXICOLOGICAL INFORMATION

Product information

Product Summary

Inhalation of high vapor concentrations can cause CNS-depression and narcosis. Inhalation of vapors in high concentration may cause shortness of breath (lung edema). Solvents may degrease the skin. Prolonged exposure may produce anesthetic and narcotic effects. (See Component Toxicity Information).

Acute toxicity

<u>LC50 (Inh)</u>	rat	>5.61	4 HOURS

 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

Predicted exposure concentration Stream expected to have a low order of acute inhalation toxicity based on toxicity information for streams having components in common with this stream.

Inhalation may cause CNS depression. Can cause pulmonary edema if aspirated into lungs.

Ingestion

Predicted exposure concentration Stream expected to have a low order of acute oral toxicity based on toxicity information for streams having components in common with this stream.

Skin contact

Predicted exposure concentration Stream expected to have a low order of acute dermal toxicity based on toxicity information for streams having components in common with this stream.

Irritation

Skin

Skin irritant. Stream expected to be irritating to the skin based on toxicity information for streams having components in common with this stream.

Eyes

Non-irritating to the eyes. Stream expected to be no more than transient, fully reversible irritating to the eye based on toxicity information for streams having components in common with this stream. These effects are not considered to warrant classification as an eye irritant.

Sensitization

Stream expected not to be a sensitizer based on toxicity information for streams having components in common with this stream.

Target Organs

Blood. Liver. Kidneys. Lung. Central nervous system.

Reproductive effects

Stream expected not to be toxic to reproduction based on toxicity information for streams having components in common with this stream.

Developmental Toxicity

Suspected of damaging the unborn child. Stream expected to be toxic to development based on toxicity information for components present in this stream.

Genetic Toxicity

Mutagenic Substance. May cause genetic defects. Stream expected to be mutagenic based on toxicity information for components present in this stream.

Carcinogenicity

May cause cancer. Stream expected to be carcinogenic based on toxicity information for streams having components in common with this stream.

COMPONENT INFORMATION

- *Hexane isomers*

Acute effects

Inhalation

Overexposure may cause irritation to the respiratory tract and to other mucous membranes. May produce symptoms of central nervous system depression including headache, dizziness, nausea, loss of sense of balance, drowsiness, visual

MATERIAL SAFETY DATA SHEET

FLUID GASOLINE LIGHT

disturbances, unconsciousness and sense of balance, drowsiness, visual disturbances, unconsciousness and death.

Irritation

Skin

May be irritating to the skin.

Eyes

May cause eye irritation.

Target Organs

Skin. Eye. Respiratory system. CNS depressant.

Repeated dose toxicity

No known chronic health effects.

Reproductive effects

Not expected to occur.

Developmental Toxicity

Not expected to occur.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *n-Hexane* 110-54-3

Acute toxicity

LC50 (Inhl) rat 48,000 PPM 4 HOURS

LD50 (Oral) rat 28,710 MG/KG

LD50 (Skin) rabbit 3000 MG/KG

Irritation

Eyes

Eye irritant.

Target Organs

Skin. Eye. Respiratory system. Central nervous system effects. Peripheral nervous system Testes.

Repeated dose toxicity

Rabbits exposed by inhalation to 3,000 ppm 8 hours/day for 8 days showed changes in the lungs, emphysema, necrosis of the bronchial epithelium, and atelectasis. Rats continuously exposed to 400 ppm developed anoxapathy, although intermittent exposure to 10,000 ppm 6 hours/day, 5 days/week for 13 weeks caused only mild paranodal axonal swelling. The offspring of rats and mice exposed orally or by inhalation to n-hexane during gestation showed depressed weight gain after birth. This agent also affects male and female reproductive capacity.

Reproductive effects

Exposure to n-hexane may damage the developing fetus.

Developmental Toxicity

Causes productive and embryotoxic effects and is cytotoxic in mammalian and human test systems.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

Other information

Exposure of humans to 5,000 ppm n-hexane for 10 minutes causes marked vertigo; exposure to 1,500 ppm results in headache and slight nausea. In industrial settings, exposure to levels exceeding 1,000 ppm have been reported to cause mild symptoms of narcosis. Eye and upper respiratory tract irritation has been reported to occur in humans exposed to 880 ppm n-hexane for 15 minutes. Dermal contact with n-hexane results in immediate irritation characterized by erythema and hyperemia; exposed subjects developed blisters 5 hours following dermal exposure to n-hexane. The neuropathic toxicity of n-hexane in humans is well documented; cases of polyneuropathy have typically occurred in humans chronically exposed to levels of n-hexane ranging from 400 to 600 ppm, with occasional exposures up to 2,500 ppm. Distal symmetrical motor weakness is common in most cases; however, in severely affected individuals, motor weakness may

MATERIAL SAFETY DATA SHEET

FLUID GASOLINE LIGHT

Other information

extend to the pelvic and high musculature. Nerve biopsies in affected individuals show swelling of the nerve and thinning of the myelin sheath. Functional neurological disturbances usually progress for a few months after termination of exposure. Although recovery is expected to occur within a year, clinical polyneuropathy has been reported in some cases to remain after 2 years. Blurred vision, restricted visual field, and optic nerve atrophy has been reported to occur in association with n-hexane-induced polyneuropathy.

- *Xylene* 1330-20-7

Acute toxicity

<u>LC50 (Inhl)</u>	rat	5000 PPM	4 HOURS
	mouse	3907 MG/KG	6 HOURS
	rat	4550 PPM	4 HOURS

LD50 (Oral) rat 4300 MG/KG

LD50 (Skin) rabbit >1700 MG/KG

Irritation

Skin

Moderate skin irritant. May cause dermatitis by defatting the skin from prolonged or repeated contact.

Eyes

This material is expected to be a mild eye irritant. Xylenes are irritating to the eyes with the potential to cause conjunctivitis and corneal opacity.

Target Organs

Skin. Eye. central nervous system (CNS)

Repeated dose toxicity

Repeated inhalation exposures of rats to xylenes cause liver effects at 920 ppm (4.0 mg/L) and ototoxicity at \geq 800 ppm (3.48 mg/L). Repeated oral exposures to xylenes produce reductions in body weight in male rats at 500 mg/kg bwt/day; liver effects and hyaline droplet formation in male rats at \geq 150 mg/kg bwt/day; kidney effects in male and female rats at \geq 750 mg/kg bwt/day, and a reduction in bodyweight gain in male mice at \geq 250 mg/kg bwt/day. Repeated inhalation exposures of gerbils to \geq 160 ppm (0.70 mg/L) xylenes cause apparently irreversible CNS effects.

Reproductive effects

A reproductive toxicity study, two dominant lethal studies, and evaluation of reproductive organs in repeated dose studies indicate that xylenes do not affect reproductive performance or induce structural damage to reproductive organs of laboratory animals at non-anesthetic doses. However, xylenes have been shown to produce damage to reproductive organs in rats repeatedly exposed to extremely high, anesthetic doses.

Developmental Toxicity

Results from animal studies demonstrate that xylenes may cause reduced fetal weight and delayed ossification, but not malformations, at inhalation dose levels causing no or only slight maternal toxicity (\geq 115 ppm or 0.5 mg/L). Slight neurobehavioral effects were noted in offspring of rats exposed to 500 ppm (2.2 mg/L) in the absence of maternal toxicity.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *Butenes* 25167-67-3

Acute toxicity

<u>LC50 (Inhl)</u>	rat	> 23 MG/L	4.0 HOURS
--------------------	-----	-----------	-----------

Acute effects

Ingestion

Stream is a gas with a low boiling point; hence, oral exposure and resulting acute toxicity are unlikely.

Skin contact

Stream is a gas with a low boiling point; hence, dermal uptake and resulting acute toxicity are unlikely.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE159
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

Irritation

Skin

No data on skin irritation found. Dermal contact with rapidly evaporating liquid could result in freezing of the tissues or frostbite.

Eyes

There is no evidence to suggest this material may cause eye irritation.

Sensitization

No evidence of skin or respiratory sensitization.

Target Organs

Nasal cavity.

Repeated dose toxicity

Based on available animal data for components and for a stream having components in common with this stream minimal toxic effects from repeated exposures are expected. A Crude Butadiene C4 olefin stream administered by inhalation to rats at 20 mg/L for 4 wks produced no biologically significant treatment-related systemic effects. The stream components tested for repeated exposure toxicity include isobutylene, 2-butene, and 1-butene and their reported toxicological effects include: decreased body weight and nasal lesions. (See component information for details). No known chronic health effects.

Developmental Toxicity

Based on available animal data for components and a stream having components in common with this stream, this stream is not expected to cause developmental toxicity or teratogenicity. No developmental toxicity or teratogenicity was observed in screening studies conducted in rats exposed to a Crude Butadiene C4 olefin stream containing mostly butenes at 20 mg/L or to high concentrations of the components, isobutylene, 1-butene, or 2-butene. (See component information for details).

Carcinogenicity

This stream contains carcinogenic components. Cancer data for butadiene are used as surrogate data for this stream, which contain up to 0.5% butadiene. The stream component, isobutylene, produced tumors in long term animal studies. (See component information for details).

- Benzene 71-43-2

Acute toxicity

rat	13,700 PPM	4 HOURS
rabbit	> 8260 MG/KG BWT	

Acute effects

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations.

Ingestion

May cause CNS depression, gastric discomfort, and vomiting. This material is an aspiration hazard.

Skin contact

No systemic toxicity is expected from acute dermal exposure.

Target Organs

Damages bone marrow. Eye. Skin.

Repeated dose toxicity

The hematopoietic system is the primary target for benzene, irrespective of the route of exposure. Broadly similar effects are seen in rodents and humans, including bone marrow toxicity and reduced red- and white blood cell counts.

Reproductive effects

Results from animal studies are inconsistent, with adverse effects on the ovary and testis reported in mice following repeated inhalation exposure but no effects on the gonads or on fertility observed in rats exposed under similar conditions. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Developmental Toxicity

MATERIAL SAFETY DATA SHEET

MSDS No.: BE159
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

Results from animal studies clearly demonstrate that benzene is not a teratogen, however mild fetotoxicity (including lowered bodyweight, delayed ossification and sub-clinical hematological changes) have been observed in rodents exposed during pregnancy, generally in association with maternal toxicity. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Genetic Toxicity

Benzene is genotoxic in vivo, and induces chromosomal aberrations and micronuclei in rats and mice following oral or inhalation exposure. Comparable changes would be anticipated in humans. The incidence of micronuclei in fetal rat liver is increased following administration of large doses by intraperitoneal injection to pregnant mice, while high-level oral exposure induced chromosomal aberrations in germ cells from male mice. The relevance to humans of these latter findings is not known.

Carcinogenicity

Benzene is a multi-site animal carcinogen, producing tumors in hematopoietic- and epithelial tissues after long term inhalation or oral exposure. Epidemiology studies confirm it is a human carcinogen, causing primarily acute non-lymphocytic leukemia.

- *Cyclohexane 110-82-7*

Acute toxicity

<u>LC50 (Inhl)</u>	rat	13.9 MG/L	4 HOURS
<u>LD50 (Oral)</u>	rat	> 5000 MG/KG	
<u>LD50 (Skin)</u>	rabbit	> 2000 MG/KG	

Target Organs

Central nervous system effects.

Repeated dose toxicity

No known chronic health effects.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *Toluene 108-88-3*

Acute toxicity

<u>LC50 (vapor)</u>	rat	7500 PPM	4 HOURS
	rat	5,580 MG/KG BWT	
	Rabbit.	> 5000 MG/KG BWT	

Acute effects

Inhalation

Vapors or aerosol may cause irritation of the eyes, nose and throat as well as CNS depression (fatigue, dizziness, loss of concentration, with collapse, coma and death possible in cases of severe overexposure).

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract and CNS depression (fatigue, dizziness, collapse, coma and death). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

Moderate skin irritant.

Eyes

MATERIAL SAFETY DATA SHEET

MSDS No.: BE159
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

Moderate eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Skin. Eye. Hearing. Nasal cavity. central nervous system (CNS) Heart

Repeated dose toxicity

No evidence of systemic toxicity was reported in rats exposed to 1.15 mg/l (300 ppm) toluene vapor for two years, while higher exposures were associated with inflammation and degeneration of nasal epithelial tissue. Rats exposed repeatedly to very high concentrations of toluene exhibited neurological changes and permanent hearing loss. Clinical case reports indicate the occurrence of serious and persistent changes (including tremor, ataxia, memory impairment and possible hearing loss) in humans following deliberate over-exposure to toluene in abuse situations. The relevance of these findings to low level occupational exposure to toluene is not known.

Reproductive effects

Studies in animals demonstrate no histopathological lesions in testes or ovaries of rats and mice exposed to 9.4 mg/l (2500 ppm) toluene vapor for 14-15 weeks, and no loss of fertility in male rats after exposure to 7.5 mg/l (2000 ppm) for a similar period of time. Epididymal weights and sperm counts were decreased in one study, but the absence of any adverse effect on reproduction makes the functional relevance of these observations unclear. No reliable human data are available.

Developmental Toxicity

Studies in pregnant rats demonstrate that toluene is not a teratogen, however mild fetotoxicity (lower body weight, delayed ossification, delayed physical development) may occur in the absence of maternal toxicity at exposures in the range 1.9-2.8 mg/l (500-750 ppm). Other studies describe adverse effects on learning and cognitive functions in rat pups exposed to 4.5-6.7 mg/l (1200-1800 ppm) in utero, although it is unclear if end-points evaluated in these tests are directly relevant to humans.

Genetic Toxicity

In vitro and in vivo mutagenicity tests were negative.

Carcinogenicity

Inhalation studies in rats and mice demonstrate that toluene is not a carcinogen. It has been used extensively as a solvent in rodent skin painting studies with occasional slight increases in tumor incidence reported: an epigenetic mechanism (based on irritation rather than genotoxicity) may underpin these findings. Toluene is considered a Group 3 substance by IARC, not classifiable as to its carcinogenicity to humans.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE159
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

- 1,3-Butadiene 106-99-0

Acute toxicity

<u>LC50 (Inhl)</u>	rat	285 MG/L	4 HOURS
	mouse	267 MG/L	4 HOURS

Acute effects

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations.

Ingestion

There are no known reliable studies regarding toxicity in humans or animals after oral exposures.

Skin contact

There are no known reliable studies regarding systemic toxicity in humans or animals after dermal exposures. There are no known reliable studies regarding sensitization in test animals. However, human experience suggests that it is unlikely to cause allergic skin conditions.

Irritation

Skin

Dermal contact with rapidly evaporating liquid could result in freezing of the tissues or frostbite. There are no known reliable studies regarding systemic toxicity in humans or animals after dermal exposures. There are no known reliable studies regarding sensitization in test animals. However, human experience suggests that it is unlikely to cause allergic skin conditions.

Eyes

Vapor may be irritating to the eye, especially at high concentrations.

Target Organs

Respiratory system. Lymphohematopoietic system. Gonads. Liver. Damages the heart. Central nervous system.

Repeated dose toxicity

Butadiene is highly toxic in the mouse, producing lesions in a range of tissues (including ovary, testis, lung, liver, bone marrow, thymus, forestomach and heart) after repeated inhalation exposure. No comparable changes occurred in rats or other laboratory animal species, hence the relevance of these findings to humans is that it is a known carcinogen.

Reproductive effects

Testicular- and ovarian atrophy, and changes in sperm head morphology, have been reported in mice following repeated exposure to butadiene vapor, however no adverse effects on fertility or reproduction have been reported.

Developmental Toxicity

Results from animal studies demonstrate that butadiene is not a teratogen, however mild fetotoxicity (primarily retarded development) has been observed in rodents exposed to high levels of butadiene vapor during pregnancy. These effects generally occur at exposures that also produce maternal toxicity.

Genetic Toxicity

Butadiene is genotoxic in the mouse, and induces micronuclei, chromosomal aberrations and gene mutations after inhalation exposure. Most studies with rats are negative; however, butadiene produced hprt mutations in rats, but at a concentration much higher than that required for mice. Studies to assess genetic damage in exposed worker populations have returned inconsistent or equivocal results.

Carcinogenicity

Animal data demonstrate marked species difference in carcinogenic response to butadiene. In the mouse, long term inhalation exposure is associated with an increased incidence of benign and malignant cancers in a wide range of tissues, whereas a more limited tumor profile is seen in the rat. Epidemiology studies suggest butadiene may be carcinogenic in humans with a concern for cancers of the lymphohematopoietic system. Listed by IARC as "carcinogenic to humans" (Group 1), on the basis of "sufficient evidence" in humans of an increased risk for leukemias. Listed by NTP as known to be a human carcinogen in their Report on Carcinogens, current edition. This listing was based on sufficient evidence of carcinogenicity in humans, including epidemiologic and mechanistic information, to indicate a causal relationship between occupational exposure to 1,3-butadiene and excess mortality from lymphatic and hematopoietic cancers.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE159
 Variant: U.S.A.-EN

FLUID GASOLINE LIGHT

- Ethyl Benzene 100-41-4

Acute toxicity

<u>LC50 (vapor)</u>	rat	4000 PPM
<u>LD50 (Oral)</u>	rat	3500 - 4700 MG/KG BWT
<u>LD50 (Skin)</u>	rabbit	> 15,000 MG/KG BWT

Acute effects

Inhalation

Vapors may cause irritation of the eyes, nose and throat as well as CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure) May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract. High doses may cause CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization. Aspiration may cause pulmonary edema and pneumonitis.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring. While skin absorption is a potential route of exposure, no adverse health effects are anticipated following accidental or incidental contact.

Irritation

Skin

This product is expected to be an skin irritant.

Eyes

Moderate to severe eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Central nervous system. Lung. Liver. Kidneys. Thyroid. Blood. Hearing. heart

Repeated dose toxicity

No adverse effects were present in rats or mice exposed to 1000 ppm (4.3 mg/l) ethylbenzene vapor for up to 13 weeks. Longer-term exposure resulted in an increased incidence of chronic progressive nephropathy (CPN) in kidneys from rats inhaling 750 ppm (3.3 mg/l) for up to two years. Since CPN is a spontaneous age-related condition specific to rodents, these findings are of doubtful relevance to humans. Mice exposed chronically under similar conditions responded with changes in the lung, liver and thyroid. Additional effects in rats observed with repeated oral exposure of ≥ 250 mg bwt/day ethyl benzene for 90 days include changes in hematology (indicative of a mild regenerative anemia) and clinical chemistry parameters (indicative of hepatic microsomal enzyme induction), decreases in prothrombin time, mild alimentary effects and liver pathology. A standard neurotoxicity protocol study conducted in young adult rats did not find neurotoxic effects following repeated daily oral exposure to doses up to 500 mg/kg bwt/day.

Specialist investigations provide evidence of hearing loss in rats following repeated exposure (13 weeks) to concentrations of 200 ppm (0.85 mg/l) and above. Ethyl benzene at up to 500 ppm vapor concentration did not adversely affect the functional ability of the humoral component of the immune system of rats as measured by splenic IgM antibody forming cell response to the T-dependent antigen, sheep erythrocytes.

Reproductive effects

No parental, neonatal, or reproductive toxicity was observed following inhalation exposure of rats to up to 500 ppm or 500 ppm/342 mg/kg bwt/day ethylbenzene. Histopathological examination of reproductive tissue from rats, mice and rabbits has generally revealed no adverse changes following sub-chronic- or chronic inhalation exposure to high vapor concentrations. An increased incidence of testicular tumors in F344 male rats exposed to 750 ppm (3.3 mg/l) ethylbenzene vapor for 2 years is considered of doubtful relevance to reproductive toxicity.

Developmental Toxicity

Decreased fetal body weight and an increased occurrence of skeletal and other variations were reported in the presence of

MATERIAL SAFETY DATA SHEET

MSDS No.: BE159
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

concurrent maternal toxicity (CNS effects, decreased body weight, liver enlargement) when female rats were exposed to ethylbenzene concentrations of 1000 ppm (4.3 mg/l) or above throughout pregnancy. No adverse effects to neurodevelopment were observed in rats exposed to 500 ppm/342 mg/kg bw/day ethylbenzene.

Genetic Toxicity

No increase in micronuclei or hepatic UDS was observed in mice after treatment with ethylbenzene in vivo. It was not genotoxic in microbial systems, nor did it induce chromosomal aberrations or sister chromatid exchanges in mammalian cells in vitro. Variable results were obtained for mutation at the TK+/- locus in L5178Y cells, although the most reliable study that utilized the current standard study protocol and doses that were not significantly cytotoxic gave a negative mutagenic response. The overall weight of evidence indicates that ethylbenzene is not genotoxic.

Carcinogenicity

The carcinogenic potential of ethylbenzene after inhalation exposure has been investigated in two recent regulatory guideline studies performed by NTP. Male rats exposed to 750 ppm (3.3 mg/l) over 2 years showed an increased incidence of testicular interstitial cell adenoma, a common tumor present also in a large majority of the untreated males included in the study. High level exposure was also linked with an increased incidence of kidney tumors in both sexes; the appearance of these lesions was strongly associated with the development of Chronic Progressive Nephropathy, a spontaneous age-related disease of rats with no equivalent counterpart in humans. Male mice exposed to 750 ppm ethylbenzene for 2 years responded with an increased incidence of lung tumors, while the incidence of liver tumors was increased in females. Mechanistic studies suggest that these lesions in the mouse developed secondary to enhanced cell proliferation in these tissues, while the weight of evidence from mutagenicity testing also indicates that a non-genotoxic mechanism was involved. Listed by IARC as possibly carcinogenic in humans (Group 2B).

- *Hydrogen sulfide* 7783-06-4

Acute toxicity

LC50 (Inhl) rat 0.701 MG/L 4 HOURS

Acute effects

Inhalation

Inhalation may cause CNS depression. Damages the respiratory system.

Ingestion

Stream is a gas with a low boiling point; hence, oral exposure and resulting acute toxicity are unlikely.

Irritation

Eyes

Eye irritant.

Target Organs

Eye. Lung. Central nervous system effects. Nasal cavity. Respiratory system. Heart

Repeated dose toxicity

Repeated inhalation exposure of rats and mice to hydrogen sulfide for 90 days produced decreases in body weight gain and feed consumption at 80 ppm (0.11 mg/L), lesions in the nasal tract and (in rats) lung at >_ 30 ppm (0.04mg/L). Nasal lesions were also observed when rats were exposed to >_ 30 ppm for 10 weeks or >_ 80 ppm for 5 days. Decreased performance in neurological tests has been observed in rats exposed by inhalation to >_ 80 ppm hydrogen sulfide for 5 days; however, no neuropathologic findings were noted when rats and mice were exposed to 80 ppm for 90 days. Rabbits exposed half an hour per day for 5 days to 72 ppm (0.10 mg/L) experienced cardiac arrhythmia.

Reproductive effects

No significant alterations in reproductive performance were observed in rats exposed to 80 ppm (0.111 mg/L) hydrogen sulfide in an inhalation screening study. No treatment-related histopathological changes were found in reproductive organs of rats or mice exposed to up to 80 ppm for 90 days. No adverse effect on spermatogenesis was found when male rats were exposed to 220 ppm (0.306 mg/L) for 7 days, then mated with unexposed virgin females.

Developmental Toxicity

No signs of developmental toxicity, including effects on neurobehavioral performance, were seen in a well-conducted rat inhalation reproduction/developmental toxicity screening study at up to 80 ppm (0.111 mg/L); and no evidence of developmental toxicity was seen in three other studies in which rats were exposed to hydrogen sulfide during gestation at concentrations up to 220 ppm (0.306 mg/L). However, neuro-developmental toxicity studies with offspring of rats exposed to hydrogen sulfide during the gestation and lactation periods have found some alterations that are suggestive of neurotoxicity

MATERIAL SAFETY DATA SHEET

 Variant: U.S.A.-BN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

(e.g., alterations in cerebellar Purkinje cell growth and developmental neurochemical effects) after exposure to 20 ppm (0.028 mg/L). The toxicological significance of these findings in the absence of alterations in neurobehavioral performance is not known.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

12. ECOLOGICAL INFORMATION

Product information

Ecotoxicity

Toxic to aquatic life with long lasting effects. See component summary.

Acute Fish toxicity

LL50 / 96 HOURS *Oncorhynchus mykiss* (rainbow trout) 10 mg/l

LL50 / 96 HOURS *Pimephales promelas* (fathead minnow) 8.2 mg/l

Acute toxicity to aquatic invertebrates

EL50 / 48 HOURS *Daphnia magna* (Water flea) 4.5 mg/l

Toxicity to aquatic plants

EL50 / 72 HOURS *Pseudokirchneriella subcapitata* (green algae) 3.1 mg/l

NOELR / 72 HOURS *Pseudokirchneriella subcapitata* (green algae) 0.5 mg/l

Toxicity to microorganisms

EC50 / 40 HOURS *Tetrahymena pyriformis* (ciliated protozoa) 15.41 mg/l

Summary: Based on Quantitative structure-activity relationship (QSAR) estimation.

Chronic toxicity to fish

NOELR / 14 d fish 2.6 mg/l

Summary: QSAR (Quantitative structure-activity relationship) based calculation predicts low chronic toxicity.

Chronic toxicity to aquatic invertebrates

NOELR / 21 d *Daphnia magna* (Water flea) 2.6 mg/l

Environmental fate and pathways

If released to water it will float. This material is likely to evaporate from soil and water.

COMPONENT INFORMATION

- *Hexane isomers*

Ecotoxicity

No Data Available.

Environmental fate and pathways

MATERIAL SAFETY DATA SHEET

MSDS No.: BE159
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

Persistence and degradability

Bioaccumulation: Not expected to occur.

- *n-Hexane* 110-54-3

Ecotoxicity

This material may be very toxic to aquatic species.

Acute Fish toxicity

LC50 / 96 HOUR *Oncorhynchus mykiss* 4.14 mg/l

LC50 / 96 HOUR *Pimephales promelas* 2.5 mg/l

LC50 / 96 HOURS *Lepomis macrochirus* 4.12 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS waterflea. 3.87 mg/l

Environmental fate and pathways

Photolysis, hydrolysis or bioconcentration of n-hexane are not expected to be an important environmental fate processes. Biodegradation of n-hexane may occur in soil and water; however, volatilization and adsorption are expected to be far more important fate processes. A K_{oc} range of 1250 to 4100 indicates a low to slight mobility class in soil for n-hexane. In aquatic systems n-hexane may partition from the water column to organic matter contained in sediments and suspended materials. Rapid volatilization from environmental waters is expected.

Persistence and degradability

Stability in water: In aquatic systems, this material may partition from the water column to organic matter contained in sediments and suspended materials.

Biodegradation: Biodegradation may occur in soil and water, however, volatilization and adsorption are expected to be far more important fate processes.

Bioaccumulation: This material is not expected to bioaccumulate.

- *Xylene* 1330-20-7

Ecotoxicity

This material is classified as harmful to fish.

Acute Fish toxicity

LC50 / 96 HOUR rainbow trout. 13.5 mg/l

LC50 / 24 HOUR goldfish 13 mg/l

Environmental fate and pathways

This material is expected to exist solely as a vapor in the ambient atmosphere. The vapor-phase of this material is degraded in the atmosphere by reaction with photochemically-produced hydroxyl radicals and ozone. Expected to have moderate mobility in soils. Volatilization from moist soil surfaces is expected. Volatilization from dry soil surfaces is expected.

Persistence and degradability

Biodegradation: Biodegradable under aerobic and anaerobic conditions.

Bioaccumulation: This material is not expected to bioaccumulate.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE159
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

- *Butenes* 25167-67-3

Ecotoxicity

When released into the environment, this material will volatilize rapidly.

Acute Fish toxicity

LC50 / 96 HOURS fathead minnow

Summary: 6.28 – 40.98 mg/l calculated range. This material is harmful to fish. Substantive aquatic exposure is not likely based on the volatile nature of this chemical.

Acute toxicity to aquatic invertebrates

LC50 / 48 HOURS Daphnia magna.

Summary: 7.15 – 43.88 mg/l calculated range. This material is harmful to aquatic invertebrates. Substantive aquatic exposure is not likely based on the volatile nature of this chemical.

Toxicity to aquatic plants

EC50 / 72 HOURS algae

Summary: 4.71 – 27.42 mg/l calculated range. This material is harmful to algae or higher aquatic plants. Substantive aquatic exposure is not likely based on the volatile nature of this chemical.

Toxicity to microorganisms

Summary: No Data Available.

Chronic toxicity to fish

Summary: No Data Available.

Chronic toxicity to aquatic invertebrates

Summary: No Data Available.

Environmental fate and pathways

The atmosphere is the main environmental compartment for released stream chemicals where they will react rapidly with hydroxyl radicals (half-life 2 - 53 hrs). In water, volatilization will result in substantial losses to the atmosphere.
 No Data Available.

Persistence and degradability

Biodegradation: Biodegradable under aerobic conditions.

Bioaccumulation: This material is not expected to bioaccumulate.

- *Benzene* 71-43-2

Ecotoxicity

Acute Fish toxicity

/96 HOURS Oncorhynchus mykiss (rainbow trout) 5.3 mg/l

Acute toxicity to aquatic invertebrates

/48 HOURS Daphnia magna. 10 mg/l

Toxicity to aquatic plants

/72 HOURS Pseudokirchneriella subcapitata (green algae) 32 mg/l

Toxicity to microorganisms

/24 HOURS Nitrosomonas sp. 13 mg/l

MATERIAL SAFETY DATA SHEET

MSDS No.: BE159
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

Chronic toxicity to fish

/ 32 DAY Pimephales promelas 1.6 mg/l

Chronic toxicity to aquatic invertebrates

/ 7 DAY Ceriodaphnia dubia 3 mg/l

Environmental fate and pathways

Mobility

Behavior in environmental compartments: When released to water, volatilization will result in substantial losses to the atmosphere with a calculated half-life in the troposphere of approximately 13.4 days. A calculated Koc value of 134.1 l/kg does not indicate a significant potential for bioaccumulation.

Persistence and degradability

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: Bioconcentration factor (BCF) ~ 10 (fish.) BCF in fish ~ 10.

- *Cyclohexane* 110-82-7

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOUR Pimephales promelas 4.53 mg/l (flow-through)

LC50 / 96 HOURS Lepomis macrochirus 34.72 mg/l

LC50 / 96 HOURS Poecilia reticulata 48.0 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS waterflea. 400 mg/l

Toxicity to aquatic plants

EC50 / 72 HOURS Scenedesmus subspicatus > 500 mg/l

Toxicity to microorganisms

EC50 / 5 min Photobacterium phosphoreum 85.5 mg/l

EC50 / 10 min Photobacterium phosphoreum 93 mg/l

Environmental fate and pathways

This material is expected to exist solely as a vapor in the ambient atmosphere. The vapor-phase of this material is degraded in the atmosphere by reaction with photochemically-produced hydroxyl radicals and ozone. It is expected to be poorly adsorbed onto soils or sediments. Volatilization from water surfaces is expected to be an important environmental fate process.

Persistence and degradability

Stability in water: In aquatic systems, this material may partition from the water column to organic matter contained in sediments and suspended materials.

Stability in soil: The potential for volatilization from dry soil surfaces may exist. Volatilization from moist soil surfaces is expected to be an important fate process of this material.

Biodegradation: This material is expected to be resistant to biodegradation.

Bioaccumulation: This material may bioaccumulate.

- *Toluene* 108-88-3

FLUID GASOLINE LIGHT

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOUR *Oncorhynchus mykiss* 55 mg/l

LC50 / 96 HOUR *Carassius auratus* 22.8 mg/l

LC50 / 96 HOUR *Pimephales promelas* 31.7 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOUR *Daphnia magna* 11.5 - 14.9 mg/l

Toxicity to aquatic plants

Summary: No Data Available.

Toxicity to microorganisms

Summary: No Data Available.

Chronic toxicity to fish

NOEC / 40 DAY *Oncorhynchus* sp. 1.4 mg/l

Summary: Actual exposure time: 27 - 40 day.

Chronic toxicity to aquatic invertebrates

NOEC / 21 DAY *Daphnia magna* 1.0 mg/l

NOEC / 7 DAY *Ceriodaphnia dubia* 0.74 mg/l

Environmental fate and pathways

Mobility

Behavior in environmental compartments: The atmosphere is the main environmental compartment for the release of toluene. In water, volatilization will result in substantial losses to the atmosphere with a half-life of 1-2 days. A calculated Koc value of 37-160 indicates no significant potential for geoaccumulation.

Persistence and degradability

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: Log Kow (Fish) <3

- *Trimethyl benzene* 25551-13-7

Ecotoxicity

No data available.

Environmental fate and pathways

No data available.

- *Ethyl Toluene* 25550-14-5

Ecotoxicity

No data available.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE159
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE LIGHT

Environmental fate and pathways

No data available.

- *1,3-Butadiene* 106-99-0

Ecotoxicity

Due to the physio-chemical characteristics of this material, no reliable test data are available.

Environmental fate and pathways

The atmosphere is the main environmental compartment for released butadiene where it will react rapidly with hydroxyl radicals (half-life 1 - 10 hr) and ozone (half-life 8 - 48 hr). In water, volatilization will result in substantial losses to the atmosphere with a half-life of about 4 hr.

Persistence and degradability

Biodegradation: Not readily biodegradable (but would be lost from open waters by evaporation).

Bioaccumulation: Bioconcentration factor (BCF) 10 - 13 (estimated) Bioaccumulation is unlikely.

- *Ethyl Benzene* 100-41-4

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOUR *Oncorhynchus mykiss* 4.2 mg/l

LC50 / 96 HOUR *Menidia menidia* 5.1 mg/l

LC50 / 96 HOUR *Poecilia reticulata* 9.6 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOUR *Daphnia magna*. 1.8 - 2.9 mg/l

EC50 / 48 HOUR *Artemia salina* 9.2 mg/l

Toxicity to aquatic plants

EC50 / 72 HOUR *Selenastrum capricornutum* 4.6 mg/l

EC50 / 96 HOUR *Selenastrum capricornutum* 3.6 mg/l

EC50 / 96 HOUR *Skeletonema costatum* 7.7 mg/l

Toxicity to microorganisms

IC50 / 48 HOUR Sewage sludge 130 mg/l

Chronic toxicity to fish

Summary: No Data Available.

MATERIAL SAFETY DATA SHEET

FLUID GASOLINE LIGHT

Chronic toxicity to aquatic invertebrates

IC50 (reproduction) / 7 DAY Ceriodaphnia dubia 3.3 mg/l

NOEL (reproduction) / 7 DAY Ceriodaphnia dubia 1.0 mg/l

Summary: May exhibit chronic toxicity in specific invertebrates.

Environmental fate and pathways

Mobility

Behavior in environmental compartments: The atmosphere is the main environmental compartment for releases of ethylbenzene (half-life approx. 1 day). In water, volatilization to air and biodegradation will result in substantial losses, with an estimated half-life of approx 0.1 - 13 days.

Persistence and degradability

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: This material is not expected to bioaccumulate.

- *Hydrogen sulfide* 7783-06-4

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOURS Lepomis macrochirus 0.0448 mg/l (flow-through)

LC50 / 96 HOURS Pimephales promelas 0.016 mg/l (flow-through)

Acute toxicity to aquatic invertebrates

EC50 / 96 HOURS Gammarus pseudolimnaeus 0.022 mg/l

Other adverse effects

No Data Available.

Environmental fate and pathways

When released into the environment, this material will volatilize rapidly. This material is not expected to persist in the environment.

Persistence and degradability

Biodegradation: This material is expected to be biodegradable.

Bioaccumulation: This material is not expected to bioaccumulate.

13. DISPOSAL CONSIDERATIONS

It is the responsibility for the waste generator to characterize waste streams relative to the pertinent regulatory provisions to ensure that applicable requirements are reviewed and met. Dispose of all waste and contaminated equipment in accordance with all applicable federal, state and local health and environmental regulations. Recovery and reuse, rather than disposal, should be the ultimate goal of handling efforts. The materials resulting from clean-up operations may be hazardous wastes and therefore, subject to specific regulations. Contact the RCRA/ Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulation (see 40 CFR Parts 260 through 271). State and/or local regulations may be more restrictive.

2. HAZARDS IDENTIFICATION

Emergency Overview

This material is HAZARDOUS as defined by the OSHA Hazard Communication Standard, 29CFR, 1910.1200.

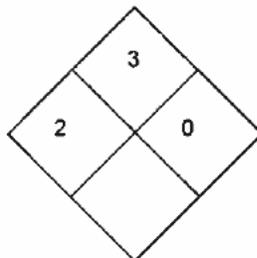

Signal Word

DANGER.

Hazards

Extremely flammable liquid. Heavier than air, vapors may travel long distances along the ground before igniting and flash back to vapor source. Vapors may form explosive mixtures with air. Vapors can travel to a source of ignition and flash back. Vapors explosion hazard indoors, outdoors or in sewers. May cause eye and skin irritation. Irritating to the respiratory system. May cause drowsiness and dizziness. Exposure to vapor may cause central nervous system depression (fatigue, dizziness, headache, collapse, coma and death) and, possibly, cardiac sensitization. Contains material which can cause cancer. Mutagenic Substance. This material also contains components that may cause hearing loss and may be a developmental toxin. Harmful to aquatic organisms.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE156
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE HVY

Color

colorless to light yellow

Odor

Gasoline or naphtha odor. characteristic

Odor Threshold

No Data Available.

Potential health effects

Routes of exposure

Skin. Inhalation. Eye.

Acute effects

Inhalation hazard. May cause drowsiness and dizziness.

- *Xylene 1330-20-7*

May be irritating to the eyes, skin, and respiratory system. Aspiration hazard. Ingestion of this material, followed by vomiting and aspiration of the more volatile components of this material into the lungs, may lead to chemical pneumonia and even death.

- *Trimethyl benzene 25551-13-7*

CNS depressant. Aspiration hazard.

- *Methyl Cyclohexane 108-87-2*

Liquid, mist, or vapors can cause eye, skin and respiratory tract irritation. CNS depressant. Exposure to excess vapor may cause headache, fatigue, drowsiness and dizziness.

- *Toluene 108-88-3*

Toluene is of slight acute toxicity, although inhalation exposure may cause dizziness and CNS depression, while ingestion may be fatal if aspiration into the lung occurs. Toluene may increase the sensitivity of the heart leading to potentially fatal cardiac sensitization. It is moderately irritating to skin and eye.

- *1,2,4-Trimethylbenzene 95-63-6*

May cause eye and skin irritation. Respiratory tract irritant. CNS depressant. Aspiration hazard.

- *Ethyl Benzene 100-41-4*

Inhalation hazard. Ingestion hazard. Skin and eye irritant.

- *Indene 95-13-6*

May cause drowsiness and dizziness. Aspiration into the lungs may cause chemical pneumonia.

- *Naphthalene 91-20-3*

May be irritating to the eyes, skin and respiratory tract. Direct contact with the eye may cause corneal damage. May be toxic by all routes of exposure. Target organs for toxic effects include the blood, liver, kidneys, eyes, and central nervous system (CNS). Symptoms of overexposure may include headache, restlessness, lethargy, vomiting, anorexia, anemia, diminished vision, and acute kidney failure. Individuals who have an inherited G6PD deficiency in their red blood cells may be particularly sensitive to the toxic effects of Naphthalene. Naphthalene can cross the placenta and harm the fetus.

- *Benzene 71-43-2*

Slight acute toxicity. Inhalation exposure to high concentrations may cause dizziness and CNS depression. Ingestion of relatively small amounts may be fatal if aspiration into the lungs takes place.

- *Cumene 98-82-8*

Slight eye irritant. Slight skin irritant. Aspiration hazard. CNS depressant.

Skin

May produce skin irritation. Repeated or prolonged contact with skin may cause defatting and drying of the skin which may result in dermatitis.

Inhalation

Can cause pulmonary edema if aspirated into lungs.

Eyes

May cause moderate irritation, including burning sensation, tearing, redness or swelling. Effects of eye irritation are reversible.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE156
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE HVY

Ingestion

Aspiration may cause lung damage.

Chronic effects

Prolonged contact with the skin may cause mechanical irritation and subsequent dermatitis. Prolonged or repeated exposure to vapors may cause lung damage. Contains material which may cause cancer based on animal data. Contains material that may cause adverse reproductive effects.

- *Xylene 1330-20-7*

May cause dermatitis by defatting the skin from prolonged or repeated contact. May contribute to the development of diseases of the nervous system, liver and kidney. May be a reproductive hazard.

- *Trimethyl benzene 25551-13-7*

No adverse chronic human health effects have been reported for this material.

- *Methyl Cyclohexane 108-87-2*

Repeated or prolonged contact with skin may cause defatting and drying of the skin which may result in dermatitis.

- *Toluene 108-88-3*

Repeated exposure to high concentrations has been shown to cause neurological changes and hearing loss in animals, and in humans in abuse situations. May cause developmental toxicity.

- *1,2,4-Trimethylbenzene 95-63-6*

Repeated or prolonged skin contact may defat the skin and produce dermatitis.

- *Ethyl Benzene 100-41-4*

May effect hearing. Repeated or prolonged exposure may damage liver and kidneys. Possible cancer hazard. Repeated contact with skin may cause cracking and/or fissuring.

- *Indene 95-13-6*

No known chronic health effects.

- *Naphthalene 91-20-3*

Target organs for toxic effects of chronic exposure include the blood, the skin, the eyes, and the central nervous system. Symptoms of chronic overexposure may include dermatitis, anemia, sores on the eye or cloudiness of the eyeball, diseases involving the nerves or nervous system, and allergic skin reactions. Potential Cancer Hazard, see section 11.

- *Benzene 71-43-2*

Benzene is considered to be a cancer-causing agent. Repeated exposure is linked to bone marrow toxicity, reduced red- and white blood cell counts and decreased immunological function irrespective of the route of contact.

- *Cumene 98-82-8*

This material has been classified by IARC as a group 2B substance (possibly carcinogenic to humans). Prolonged and/or repeated contact may cause mild to moderate skin defatting, redness, blistering, lesions, and/or scaly dermatitis. May cause kidney and/or lung damage.

Aggravated Medical Condition

Any pre-existing disorders or diseases of the: central nervous system (CNS) peripheral nervous system or heart

4. FIRST AID MEASURES

General advice

Causes skin irritation. May cause minor eye irritation. Aspiration into the lungs during swallowing or vomiting can cause lung damage, possibly leading to chronic lung dysfunction or death. Inhalation of vapors may cause signs of respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death), possible cardiac sensitization, and irritation of the eyes, nose and throat. Harmful: danger of serious damage to health by prolonged exposure through inhalation. May cause cancer. This substance may be genotoxic. Always observe self-protection methods. Move out of dangerous area. Do not leave the victim unattended. Remove contaminated shoes and clothing. Get medical attention immediately. Show this material safety data sheet to the doctor in attendance.

Skin

All contaminated clothing should be removed, and contaminated skin areas washed with lipophilic soap, or green soap, and water. Never use low boiling point naphthas for washing contaminated skin. Do not wash with machine dishwashing or laundry detergents. Seek medical attention if tissue appears damaged or if pain or irritation persists. In the event of a high pressure injection injury, worker should obtain immediate medical assistance. Discard contaminated leather goods.

Inhalation

Remove victim to fresh air and keep at rest in a position comfortable for breathing. Keep patient warm and at rest. If breathing is difficult, give oxygen. If unconscious place in recovery position and seek medical advice. In the event of unconsciousness, apnea or cardiac arrest (no pulse) apply cardiopulmonary resuscitation.

Eyes

In case of eye contact, remove contact lens and rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Do not use eye ointment unless directed to by a physician. If irritation, blurred vision or swelling occurs and persists, obtain medical advice from a specialist.

Ingestion

DO NOT induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. Get medical attention immediately. Do not give milk or alcoholic beverages. Never give anything by mouth to an unconscious person.

Notes to physician

Inhalation may cause CNS depression. Overexposure may produce anesthetic or narcotic effects. Do not induce vomiting. Risk of damage to lungs exceeds poisoning risk. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to this material. Treat symptomatically. Treatment of overexposure should be directed at the control of symptoms and the clinical condition of the patient. Gastrointestinal decontamination in accidental petroleum distillate ingestions is not recommended, because of the severe aspiration hazard.

5. FIRE-FIGHTING MEASURES

MATERIAL SAFETY DATA SHEET

MSDS No.: BE156
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE HVY

Flammable properties

Classification

OSHA/NFPA Class IB Flammable Liquid.

Flash point

< 23 °C (< 73.4 °F) ASTMD 56

Autoignition temperature

> 200 °C (> 392 °F)

Lower explosion limit

1.4 vol%

Upper explosion limit

7.6 vol%

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Dry chemical. CO₂. Water spray. Foam. Sand. LARGE FIRES: Water spray. Water fog. Foam. Dry chemical. CO₂. Sand.

Unsuitable extinguishing media

Do not use solid water stream/may spread fire. Simultaneous use of foam and water on the same surface is to be avoided as water destroys the foam.

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear positive pressure self-contained breathing apparatus (SCBA). Structural firefighters protective clothing will only provide limited protection.

Precautions for fire-fighting

When exposed to ignition source in air, vapors can burn in open or explode if confined. Flammable vapors may be heavier than air and travel long distances along the ground before igniting and flashing back to vapor source. Releases flammable vapors below normal ambient temperatures. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Move containers from fire area if you can do it without risk. Sustained fire attack on vessels may result in a Boiling Liquid Expanding Vapour Explosion (BLEVE). Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Prevent fire extinguishing water from contaminating surface water or the ground water system. When fighting a fire, notify environmental authorities if liquid enters sewers or public waters. Fire residues and contaminated fire extinguishing water must be disposed of in accordance with local regulations. Thermal decomposition may produce carbon monoxide and other toxic vapors.

Hazardous combustion products

Thermal decomposition may generate carbon monoxide, carbon dioxide, and perhaps other toxic vapors.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Extinguish all ignition sources. Stop leak if you can do it without risk. Evacuate/limit access. Restrict water use for cleanup. Notify fire and environmental authorities. Note: recommended measures are based on the most likely spillage scenarios for this material; however, local conditions (wind, air temperature, wave/current direction and speed) may significantly influence the choice of appropriate actions. For this reason, local experts should be consulted when necessary. Local regulations may also prescribe or limit actions to be taken. A vapor suppressing foam may be used to reduce vapors. DO NOT use water jet. Use clean non-sparking tools to collect absorbed material. On water, material is insoluble and floats. On water, contain/minimize dispersion/collect. Remove from surface water (e.g. by skimming or siphoning). The use of dispersants should be advised by an expert, and, if required, approved by local authorities.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE156
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE HVY

Spills and leaks

Liquids/vapors may ignite. Contain/collect rapidly to minimize dispersion. Prevent spreading of vapors through sewers, ventilation systems and confined areas. Do not touch or walk through spilled material. Water spray may reduce vapor; but may not prevent ignition in closed spaces. Absorb or cover with dry earth, sand or other non-combustible material and transfer to containers.

Prevent entry into waterways, sewers, basements or confined areas. If the product contaminates rivers and lakes or drains inform respective authorities. On water, material is insoluble and floats.

7. HANDLING AND STORAGE

Handling

Ensure all equipment is electrically grounded before beginning transfer operations. Eliminate every possible source of ignition. Spilled material can make walking hazardous, potentially causing falls and serious injury. Do not breathe vapor. Avoid contact with skin. Do not smoke. Do not pressurize, cut, weld, braze solder, drill, or grind on containers. Use good housekeeping practices during use, storage, transfer, and handling.

Storage

Store only in tightly closed, properly vented containers away from heat, sparks, open flame and strong oxidizing agents. Store closed drums with bung in up position. Vapor space above stored liquid may be flammable/explosive unless blanketed with inert gas. Electrical installations / working materials must comply with the technological safety standards. Keep container tightly closed and properly labeled. Cleaning, inspection and maintenance of the internal structure of storage tanks must be done only by properly equipped and qualified personnel as defined by national, local or company regulations. Recommended materials: For containers, or container linings use mild steel, stainless steel. Unsuitable materials: Some synthetic materials may be unsuitable for container or container linings depending on the material specification and intended use. Compatibility should be checked with the manufacturer.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. If mechanical ventilation is used, electrical systems should conform to U.S. National Electric Code. Emergency shower and eyewash facility should be in close proximity (ANSI Z358.1)

Personal protective equipment

Inhalation

When workers are facing concentrations above the exposure limit they must use appropriate certified respirators. The type of respiratory protection will depend upon whether the maximum exposure concentration is known.

Consider the maximum period for wear. Organic vapor or supplied air respirator may be appropriate. Respirator selection and use should comply with OSHA 29 CFR 1910.134 or ANSI Z88.2.

Skin

Wear insulated gloves if contact with liquid is possible. Wear chemical resistant gloves such as: Glove material fluoroelastomer; material thickness 0.4 mm; break through time \geq 480 min. Gloves must be replaced after 8 hours of wear. The suitability for a specific workplace should be discussed with the producers of the protective gloves. Gloves should be discarded and replaced if there is any indication of degradation or chemical breakthrough. When skin contact is possible, protective clothing including gloves, apron, sleeves, boots, head and face protection should be worn. Choose body protection according to the amount and concentration of the dangerous substance at the work place. Use PPE that is chemical resistant to the product and prevents skin contact. Fire retardant clothing is appropriate for routine occupational use.

Eyes

Safety glasses with side-shields Eye protection such as chemical splash goggles and/or face shield must be worn when possibility exists for eye contact due to splashing or spraying liquid.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE156
 Variant: U.S.A.-BN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE HVY

Remarks

Wash hands before eating, drinking, smoking, or using toilet facilities. Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure. Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use. Use good personal hygiene practices.

11. TOXICOLOGICAL INFORMATION

Product Information

Product Summary

Inhalation of high vapor concentrations can cause CNS-depression and narcosis. Inhalation of vapors in high concentration may cause shortness of breath (lung edema). Solvents may degrease the skin. Prolonged exposure may produce anesthetic and narcotic effects. (See Component Toxicity Information).

Acute toxicity

LC50 (Inh) rat >5.61 4 HOURS

LD50 (Oral) rat >5,000 MG/KG

LD50 (Skin) rabbit >2000 MG/KG

Acute effects

Inhalation

Predicted exposure concentration Stream expected to have a low order of acute inhalation toxicity based on toxicity information for streams having components in common with this stream.

Inhalation may cause CNS depression. Can cause pulmonary edema if aspirated into lungs.

Ingestion

Predicted exposure concentration Stream expected to have a low order of acute oral toxicity based on toxicity information for streams having components in common with this stream.

Skin contact

Predicted exposure concentration Stream expected to have a low order of acute dermal toxicity based on toxicity information for streams having components in common with this stream.

Irritation

Skin

Skin irritant. Stream expected to be irritating to the skin based on toxicity information for streams having components in common with this stream.

Eyes

Non-irritating to the eyes. Stream expected to be no more than transient, fully reversible irritating to the eye based on toxicity information for streams having components in common with this stream. These effects are not considered to warrant classification as an eye irritant.

Sensitization

Stream expected not to be a sensitizer based on toxicity information for streams having components in common with this stream.

Target Organs

Skin. Central nervous system. Blood. Liver. Kidneys.

Reproductive effects

Stream expected not to be toxic to reproduction based on toxicity information for streams having components in common with this stream.

Developmental Toxicity

Suspected of damaging the unborn child. Stream expected to be toxic to development based on toxicity information for components present in this stream.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE156
 Variant: U.S.A.-BN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE HVY

Genetic Toxicity

Mutagenic Substance. May cause genetic defects. Stream expected to be mutagenic based on toxicity information for components present in this stream.

Carcinogenicity

May cause cancer. Stream expected to be carcinogenic based on toxicity information for streams having components in common with this stream.

COMPONENT INFORMATION

- *Heavy Catalytic Cracked Distillate (Petroleum)* 64741-54-4
- *Xylene* 1330-20-7

Acute toxicity

<u>LC50 (Inhl)</u>	rat	5000 PPM	4 HOURS
	mouse	3907 MG/KG	6 HOURS
	rat	4550 PPM	4 HOURS

LD50 (Oral) rat 4300 MG/KG

LD50 (Skin) rabbit >1700 MG/KG

Irritation

Skin

Moderate skin irritant. May cause dermatitis by defatting the skin from prolonged or repeated contact.

Eyes

This material is expected to be a mild eye irritant. Xylenes are irritating to the eyes with the potential to cause conjunctivitis and corneal opacity.

Target Organs

Skin. Eye. central nervous system (CNS)

Repeated dose toxicity

Repeated inhalation exposures of rats to xylenes cause liver effects at 920 ppm (4.0 mg/L) and ototoxicity at \geq 800 ppm (3.48 mg/L). Repeated oral exposures to xylenes produce reductions in body weight in male rats at 500 mg/kg bwt/day; liver effects and hyaline droplet formation in male rats at \geq 150 mg/kg bwt/day; kidney effects in male and female rats at \geq 750 mg/kg bwt/day; and a reduction in bodyweight gain in male mice at \geq 250 mg/kg bwt/day. Repeated inhalation exposures of gerbils to \geq 160 ppm (0.70 mg/L) xylenes cause apparently irreversible CNS effects.

Reproductive effects

A reproductive toxicity study, two dominant lethal studies, and evaluation of reproductive organs in repeated dose studies indicate that xylenes do not affect reproductive performance or induce structural damage to reproductive organs of laboratory animals at non-anesthetic doses. However, xylenes have been shown to produce damage to reproductive organs in rats repeatedly exposed to extremely high, anesthetic doses.

Developmental Toxicity

Results from animal studies demonstrate that xylenes may cause reduced fetal weight and delayed ossification, but not malformations, at inhalation dose levels causing no or only slight maternal toxicity (\geq 115 ppm or 0.5 mg/L). Slight neurobehavioral effects were noted in offspring of rats exposed to 500 ppm (2.2 mg/L) in the absence of maternal toxicity.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE156
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE HVY

- *Trimethyl benzene* 25551-13-7

Acute toxicity

LD50 (Oral) rat 8970 MG/KG

Irritation

Skin

Skin irritant.

- *Methyl Cyclohexane* 108-87-2

Acute toxicity

LD50 (Oral) rat > 3,200 MG/KG

Irritation

Skin

May be irritating to the skin. Repeated or prolonged contact with skin may cause dermatitis.

Eyes

May cause eye irritation.

Target Organs

Skin. Eye. Respiratory system. Central nervous system effects.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *Toluene* 108-88-3

Acute toxicity

LC50 (vapor) rat 7500 PPM 4 HOURS

rat 5,580 MG/KG BWT

Rabbit. > 5000 MG/KG BWT

Acute effects

Inhalation

Vapors or aerosol may cause irritation of the eyes, nose and throat as well as CNS depression (fatigue, dizziness, loss of concentration, with collapse, coma and death possible in cases of severe overexposure).

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract and CNS depression (fatigue, dizziness, collapse, coma and death). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

Moderate skin irritant.

Eyes

Moderate eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE156
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE HVY

Target Organs

Skin. Eye. Hearing. Nasal cavity. central nervous system (CNS) Heart

Repeated dose toxicity

No evidence of systemic toxicity was reported in rats exposed to 1.15 mg/l (300 ppm) toluene vapor for two years, while higher exposures were associated with inflammation and degeneration of nasal epithelial tissue. Rats exposed repeatedly to very high concentrations of toluene exhibited neurological changes and permanent hearing loss. Clinical case reports indicate the occurrence of serious and persistent changes (including tremor, ataxia, memory impairment and possible hearing loss) in humans following deliberate over-exposure to toluene in abuse situations. The relevance of these findings to low level occupational exposure to toluene is not known.

Reproductive effects

Studies in animals demonstrate no histopathological lesions in testes or ovaries of rats and mice exposed to 9.4 mg/l (2500 ppm) toluene vapor for 14-15 weeks, and no loss of fertility in male rats after exposure to 7.5 mg/l (2000 ppm) for a similar period of time. Epididymal weights and sperm counts were decreased in one study, but the absence of any adverse effect on reproduction makes the functional relevance of these observations unclear. No reliable human data are available.

Developmental Toxicity

Studies in pregnant rats demonstrate that toluene is not a teratogen, however mild fetotoxicity (lower body weight, delayed ossification, delayed physical development) may occur in the absence of maternal toxicity at exposures in the range 1.9-2.8 mg/l (500-750 ppm). Other studies describe adverse effects on learning and cognitive functions in rat pups exposed to 4.5-6.7 mg/l (1200-1800 ppm) in utero, although it is unclear if end-points evaluated in these tests are directly relevant to humans.

Genetic Toxicity

In vitro and in vivo mutagenicity tests were negative.

Carcinogenicity

Inhalation studies in rats and mice demonstrate that toluene is not a carcinogen. It has been used extensively as a solvent in rodent skin painting studies with occasional slight increases in tumor incidence reported: an epigenetic mechanism (based on irritation rather than genotoxicity) may underpin these findings. Toluene is considered a Group 3 substance by IARC, not classifiable as to its carcinogenicity to humans.

- *1,2,4-Trimethylbenzene* 95-63-6

Acute toxicity

<u>LC50 (Inhl)</u>	rat	18 G/M3	4 HOURS
--------------------	-----	---------	---------

Target Organs

Eye. Skin. Respiratory system. Central nervous system. Blood.

Repeated dose toxicity

Repeated inhalation exposures to 1,2,4-trimethyl-benzene causes changes in hematological parameters in male rats at 250 ppm (1.23 mg/L); and pulmonary lesions in male and female rats at \geq 100 ppm (1.23 mg/L).

Developmental Toxicity

Results from a repeated dose inhalation test with trimethylbenzene showed fetotoxicity in rats (decreased pup bodyweight) at \geq 600 ppm (2.95 mg/L) in the presence of maternal toxicity (reduced body weight gain).

Genetic Toxicity

Trimethylbenzene was positive in a bacterial gene mutation assay and produced sister chromatid exchanges in mouse bone marrow (at \geq 730 mg/kg bwt), but did not induce micronuclei in the same cells.

- *Ethyl Benzene* 100-41-4

Acute toxicity

<u>LC50 (vapor)</u>	rat	4000 PPM
<u>LD50 (Oral)</u>	rat	3500 - 4700 MG/KG BWT
<u>LD50 (Skin)</u>	rabbit	> 15,000 MG/KG BWT

Acute effects

Inhalation

MATERIAL SAFETY DATA SHEET

MSDS No.: BE156
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE HVY

Vapors may cause irritation of the eyes, nose and throat as well as CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure) May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract. High doses may cause CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization. Aspiration may cause pulmonary edema and pneumonitis.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring. While skin absorption is a potential route of exposure, no adverse health effects are anticipated following accidental or incidental contact.

Irritation

Skin

This product is expected to be an skin irritant.

Eyes

Moderate to severe eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Central nervous system. Lung. Liver. Kidneys. Thyroid. Blood. Hearing. heart

Repeated dose toxicity

No adverse effects were present in rats or mice exposed to 1000 ppm (4.3 mg/l) ethylbenzene vapor for up to 13 weeks. Longer-term exposure resulted in an increased incidence of chronic progressive nephropathy (CPN) in kidneys from rats inhaling 750 ppm (3.3 mg/l) for up to two years. Since CPN is a spontaneous age-related condition specific to rodents, these findings are of doubtful relevance to humans. Mice exposed chronically under similar conditions responded with changes in the lung, liver and thyroid. Additional effects in rats observed with repeated oral exposure of ≥ 250 mg bwt/day ethyl benzene for 90 days include changes in hematology (indicative of a mild regenerative anemia) and clinical chemistry parameters (indicative of hepatic microsomal enzyme induction), decreases in prothrombin time, mild alimentary effects and liver pathology. A standard neurotoxicity protocol study conducted in young adult rats did not find neurotoxic effects following repeated daily oral exposure to doses up to 500 mg/kg bwt/day.

Specialist investigations provide evidence of hearing loss in rats following repeated exposure (13 weeks) to concentrations of 200 ppm (0.85 mg/l) and above. Ethyl benzene at up to 500 ppm vapor concentration did not adversely affect the functional ability of the humoral component of the immune system of rats as measured by splenic IgM antibody forming cell response to the T-dependent antigen, sheep erythrocytes.

Reproductive effects

No parental, neonatal, or reproductive toxicity was observed following inhalation exposure of rats to up to 500 ppm or 500 ppm/342 mg/kg bwt/day ethylbenzene. Histopathological examination of reproductive tissue from rats, mice and rabbits has generally revealed no adverse changes following sub-chronic- or chronic inhalation exposure to high vapor concentrations. An increased incidence of testicular tumors in F344 male rats exposed to 750 ppm (3.3 mg/l) ethylbenzene vapor for 2 years is considered of doubtful relevance to reproductive toxicity.

Developmental Toxicity

Decreased fetal body weight and an increased occurrence of skeletal and other variations were reported in the presence of concurrent maternal toxicity (CNS effects, decreased body weight, liver enlargement) when female rats were exposed to ethylbenzene concentrations of 1000 ppm (4.3 mg/l) or above throughout pregnancy. No adverse effects to neurodevelopment were observed in rats exposed to 500 ppm/342 mg/kg bwt/day ethylbenzene.

Genetic Toxicity

No increase in micronuclei or hepatic UDS was observed in mice after treatment with ethylbenzene in vivo. It was not genotoxic in microbial systems, nor did it induce chromosomal aberrations or sister chromatid exchanges in mammalian cells in vitro. Variable results were obtained for mutation at the TK⁺ locus in L5178Y cells, although the most reliable study that utilized the current standard study protocol and doses that were not significantly cytotoxic gave a negative mutagenic response. The overall weight of evidence indicates that ethylbenzene is not genotoxic.

Carcinogenicity

The carcinogenic potential of ethylbenzene after inhalation exposure has been investigated in two recent regulatory guideline studies performed by NTP. Male rats exposed to 750 ppm (3.3 mg/l) over 2 years showed an increased incidence

MATERIAL SAFETY DATA SHEET

MSDS No.: BE156
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE HVY

of testicular interstitial cell adenoma, a common tumor present also in a large majority of the untreated males included in the study. High level exposure was also linked with an increased incidence of kidney tumors in both sexes; the appearance of these lesions was strongly associated with the development of Chronic Progressive Nephropathy, a spontaneous age-related disease of rats with no equivalent counterpart in humans. Male mice exposed to 750 ppm ethylbenzene for 2 years responded with an increased incidence of lung tumors, while the incidence of liver tumors was increased in females. Mechanistic studies suggest that these lesions in the mouse developed secondary to enhanced cell proliferation in these tissues, while the weight of evidence from mutagenicity testing also indicates that a non-genotoxic mechanism was involved. Listed by IARC as possibly carcinogenic in humans (Group 2B).

- *Indene 95-13-6*

Acute toxicity

LC50 (Inhl) rat 14 GM/M3

Carcinogenicity

Specific data not available.

- *Naphthalene 91-20-3*

Acute toxicity

LC50 (Inhl) rat >340 MG/M3 4 HOUR

LD50 (Oral)

rat	490 MG/KG
mouse	533 MG/KG
guinea pig	1200 MG/KG

Irritation

Skin

Maybe irritating to the skin.

Eyes

May cause eye irritation.

Repeated dose toxicity

Repeated inhalation or ingestion of naphthalene causes methemoglobin*

Developmental Toxicity

Results from repeated dose oral gavage tests with naphthalene showed fetotoxicity in rats (increase in resorptions at 450 mg/kg bwt/day) and in mice (decrease in number of live pups/litter at 300 mg/kg bwt/day) in the presence of maternal toxicity (reduction in body weight gains in rats; decrease in survival and reduction in body weight in mice).

Genetic Toxicity

Naphthalene produced chromosome damage in in vitro assays, but not in in vivo assays in which mice were administered 500 mg/kg bwt orally or 250 mg/kg bwt by intraperitoneal injection.

Carcinogenicity

The National Toxicology Program (NTP) has evaluated this substance and placed it in Group R: Reasonably Anticipated To Be A Human Carcinogen. The International Agency for Research on Cancer (IARC) has evaluated this substance and placed it in Group 2B (possibly carcinogenic to humans).

- *Benzene 71-43-2*

 Validation Date: 05/20/2011

FLUID GASOLINE HVY

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations.

Ingestion

May cause CNS depression, gastric discomfort, and vomiting. This material is an aspiration hazard.

Skin contact

No systemic toxicity is expected from acute dermal exposure.

Target Organs

Damages bone marrow. Eye. Skin.

Repeated dose toxicity

The hematopoietic system is the primary target for benzene, irrespective of the route of exposure. Broadly similar effects are seen in rodents and humans, including bone marrow toxicity and reduced red- and white blood cell counts.

Reproductive effects

Results from animal studies are inconsistent, with adverse effects on the ovary and testis reported in mice following repeated inhalation exposure but no effects on the gonads or on fertility observed in rats exposed under similar conditions. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Developmental Toxicity

Results from animal studies clearly demonstrate that benzene is not a teratogen, however mild fetotoxicity (including lowered body weight, delayed ossification and sub-clinical hematological changes) have been observed in rodents exposed during pregnancy, generally in association with maternal toxicity. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Genetic Toxicity

Benzene is genotoxic *in vivo*, and induces chromosomal aberrations and micronuclei in rats and mice following oral or inhalation exposure. Comparable changes would be anticipated in humans. The incidence of micronuclei in fetal rat liver is increased following administration of large doses by intraperitoneal injection to pregnant mice, while high-level oral exposure induced chromosomal aberrations in germ cells from male mice. The relevance to humans of these latter findings is not known.

Carcinogenicity

Benzene is a multi-site animal carcinogen, producing tumors in hematopoietic- and epithelial tissues after long term inhalation or oral exposure. Epidemiology studies confirm it is a human carcinogen, causing primarily acute non-lymphocytic leukemia.

- *Cumene* 98-82-8

Acute toxicity

<u>LC50 (Inh)</u>	rat	39000 MG/M3	4 HOURS
<u>LD50 (Oral)</u>	rat	1400 MG/KG	
<u>LD50 (Skin)</u>	rabbit	> 3160 MG/KG	

Irritation

Skin

Slight skin irritant. May cause dermatitis by defatting the skin from prolonged or repeated contact.

Eyes

Slight eye irritant.

Sensitization

Not expected to be a sensitizer.

Target Organs

Central nervous system. Skin. Eye. Respiratory system. Nasal cavity. Kidney Liver Lungs

Reproductive effects

This substance is not expected to be a reproductive toxicant.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE156
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE HVY

Genetic Toxicity

Negative for genotoxicity using both in vitro and in vivo tests.

Carcinogenicity

The NTP has found that Cumene causes increased incidences of combined benign and malign kidney tumors in male rats, and malignant lung tumors in mice of both sexes. This material has been classified by IARC as a group 2B substance (possibly carcinogenic to humans).

12. ECOLOGICAL INFORMATION

Product information

Ecotoxicity

Toxic to aquatic life with long lasting effects.

Acute Fish toxicity

LL50 / 96 HOURS *Oncorhynchus mykiss* (rainbow trout) 10 mg/l

LL50 / 96 HOURS *Pimephales promelas* (fathead minnow) 8.2 mg/l

Acute toxicity to aquatic invertebrates

EL50 / 48 HOURS *Daphnia magna* (Water flea) 4.5 mg/l

Toxicity to aquatic plants

EL50 / 72 HOURS *Pseudokirchneriella subcapitata* (green algae) 3.1 mg/l

NOELR / 72 HOURS *Pseudokirchneriella subcapitata* (green algae) 0.5 mg/l

Toxicity to microorganisms

EC50 / 40 HOURS *Tetrahymena pyriformis* (ciliated protozoa) 15.41 mg/l

Summary: Based on Quantitative structure-activity relationship (QSAR) estimation.

Chronic toxicity to fish

NOELR / 14 d fish. 2.6 mg/l

Summary: QSAR (Quantitative structure-activity relationship) based calculation predicts low chronic toxicity.

Chronic toxicity to aquatic invertebrates

NOELR / 21 d *Daphnia magna* (Water flea) 2.6 mg/l

Environmental fate and pathways

If released to water it will float. This material is likely to evaporate from soil and water.

Mobility

Behavior in environmental compartments: Partitioning mainly to air.

Predicted distribution to environmental compartments: The product will be dispersed amongst the various environmental compartments (soil/ water/ air).

Persistence and degradability

Biodegradation: Not expected to be hydrolytically unstable. Not readily, but considered likely to be inherently biodegradable.

Bioaccumulation: This material may bioaccumulate.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE156
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE HVY

COMPONENT INFORMATION

- *Heavy Catalytic Cracked Distillate (Petroleum)* 64741-54-4

Ecotoxicity

Environmental fate and pathways

- *Xylene* 1330-20-7

Ecotoxicity

This material is classified as harmful to fish.

Acute Fish toxicity

LC50 / 96 HOUR rainbow trout 13.5 mg/l

LC50 / 24 HOUR goldfish 13 mg/l

Environmental fate and pathways

This material is expected to exist solely as a vapor in the ambient atmosphere. The vapor-phase of this material is degraded in the atmosphere by reaction with photochemically-produced hydroxyl radicals and ozone. Expected to have moderate mobility in soils. Volatilization from moist soil surfaces is expected. Volatilization from dry soil surfaces is expected.

Persistence and degradability

Biodegradation: Biodegradable under aerobic and anaerobic conditions.

Bioaccumulation: This material is not expected to bioaccumulate.

- *Trimethyl benzene* 25551-13-7

Ecotoxicity

No data available.

Environmental fate and pathways

No data available.

- *Methyl Cyclohexane* 108-87-2

Ecotoxicity

This material may be harmful to aquatic species.

Acute Fish toxicity

LC50 / 96 HOUR Golden shiner (*notemigonus crysoleucas*) 72 mg/l

Environmental fate and pathways

MATERIAL SAFETY DATA SHEET

MSDS No.: BE156
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE HVY

No Data Available.

- *Toluene* 108-88-3

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOUR *Oncorhynchus mykiss* 55 mg/l

LC50 / 96 HOUR *Carassius auratus* 22.8 mg/l

LC50 / 96 HOUR *Pimephales promelas* 31.7 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOUR *Daphnia magna*. 11.5 - 14.9 mg/l

Toxicity to aquatic plants

Summary: No Data Available.

Toxicity to microorganisms

Summary: No Data Available.

Chronic toxicity to fish

NOEC / 40 DAY *Oncorhynchus* sp. 1.4 mg/l

Summary: Actual exposure time: 27 - 40 day.

Chronic toxicity to aquatic invertebrates

NOEC / 21 DAY *Daphnia magna*. 1.0 mg/l

NOEC / 7 DAY *Ceriodaphnia dubia* 0.74 mg/l

Environmental fate and pathways

Mobility

Behavior in environmental compartments: The atmosphere is the main environmental compartment for the release of toluene. In water, volatilization will result in substantial losses to the atmosphere with a half-life of 1-2 days. A calculated Koc value of 37-160 indicates no significant potential for geoaccumulation.

Persistence and degradability

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: Log Kow (Fish) <3

- *1,2,4-Trimethylbenzene* 95-63-6

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOURS fathead minnow 7.72 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS *Daphnia magna*. 6.14 mg/l

Environmental fate and pathways

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOUR *Oncorhynchus mykiss* 4.2 mg/l

LC50 / 96 HOUR *Menidia menidia* 5.1 mg/l

LC50 / 96 HOUR *Poecilia reticulata* 9.6 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOUR *Daphnia magna* 1.8 - 2.9 mg/l

EC50 / 48 HOUR *Artemia salina* 9.2 mg/l

Toxicity to aquatic plants

EC50 / 72 HOUR *Selenastrum capricornutum* 4.6 mg/l

EC50 / 96 HOUR *Selenastrum capricornutum* 3.6 mg/l

EC50 / 96 HOUR *Skeletonema costatum* 7.7 mg/l

Toxicity to microorganisms

IC50 / 48 HOUR Sewage sludge 130 mg/l

Chronic toxicity to fish

Summary: No Data Available.

Chronic toxicity to aquatic invertebrates

IC50 (reproduction) / 7 DAY *Ceriodaphnia dubia* 3.3 mg/l

NOEL (reproduction) / 7 DAY *Ceriodaphnia dubia* 1.0 mg/l

Summary: May exhibit chronic toxicity in specific invertebrates.

Environmental fate and pathways

Mobility

Behavior in environmental compartments: The atmosphere is the main environmental compartment for releases of ethylbenzene (half-life approx. 1 day). In water, volatilization to air and biodegradation will result in substantial losses, with an estimated half-life of approx. 0.1 - 13 days.

Persistence and degradability

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: This material is not expected to bioaccumulate.

MATERIAL SAFETY DATA SHEET

MATERIAL SAFETY DATA SHEET

MSDS No.: BE156
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE HVY

Behavior in environmental compartments: When released to water, volatilization will result in substantial losses to the atmosphere with a calculated half-life in the troposphere of approximately 13.4 days. A calculated Koc value of 134.1 l/kg does not indicate a significant potential for bioaccumulation.

Persistence and degradability

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: Bioconcentration factor (BCF) ~ 10 (fish.) BCF in fish ~ 10.

- *Cumene* 98-82-8

Ecotoxicity

This material is toxic to fish. It may cause long term adverse effects in the aquatic environment.

Acute Fish toxicity

LC50 / 96 HOURS *Pimephales promelas* (fathead minnow) 6.04 - 6.61 mg/l

Summary: flow-through test

LC50 / 96 HOURS *Oncorhynchus mykiss* (rainbow trout) 4.8 mg/l

Summary: flow-through test

LC50 / 96 HOURS *Oncorhynchus mykiss* (rainbow trout) 2.7 mg/l

Summary: semi-static test

LC50 / 96 HOURS *Poecilia reticulata* (guppy) 5.1 mg/l

Summary: semi-static test

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS *Daphnia magna* (Water flea) 0.6 mg/l

EC50 / 48 HOURS *Daphnia magna* (Water flea) 7.9 - 14.1 mg/l

Toxicity to aquatic plants

EC50 / 72 HOURS *Pseudokirchneriella subcapitata* 2.6 mg/l

Environmental fate and pathways

This material is expected to exist solely as a vapor in the ambient atmosphere. Vapor-phase is degraded in the atmosphere by reaction with photochemically produced hydroxyl radicals. It may adsorb onto soils or sediments. Volatilization from water surfaces is expected to be an important environmental fate process. Volatilization from moist soil surfaces is expected.

Persistence and degradability

Stability in water: In aquatic systems, this material may partition from the water column to organic matter contained in sediments and suspended materials.

Biodegradation: This material is expected to be readily biodegradable.

Bioaccumulation: Bioconcentration factor (BCF) ~ 35 BCF ~ 35.0

13. DISPOSAL CONSIDERATIONS

MATERIAL SAFETY DATA SHEET

MSDS No.: BE156
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

FLUID GASOLINE HVY

Contaminated product, soil, water, and empty containers may be hazardous wastes due to possible presence of flammable gases. Assure emissions comply with applicable regulations. Proper grounding procedures to avoid static electricity should be followed. The product should not be allowed to enter drains, water courses or the soil. Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) characteristics. Contact the RCRA/ Superfund Hotline at (800)424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

14. TRANSPORT INFORMATION

Special Provisions

If you reformulate or further process this material, you should consider re-evaluation of the regulatory status of the components listed in the composition section of this sheet, based on final composition of your product. If you reformulate or further process this material, you should consider re-evaluation of the regulatory status of the components listed in the composition section of this sheet, based on final composition of your product. This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

Proper shipping name Petroleum distillates, n.o.s. (XYLENE, TRIMETHYLBENZENES)

Reportable quantity XYLENE
BENZENE

ID No. UN1268

Disclaimer

The information on this MSDS was obtained from sources which we believe are reliable. However, the information is provided without any warranty, expressed or implied, regarding its correctness. Some information presented and conclusions drawn herein are from sources other than direct test data on the substance itself. The conditions or methods of handling, storage, use and disposal of the product are beyond our control and may be beyond our knowledge. For this and other reasons, we do not assume responsibility and expressly disclaim liability for loss, damage, or expense arising out of or in any way connected with handling, storage, use, or disposal of this product. If the product is used as a component in another product, this MSDS information may not be applicable. Information is correct to the best of our knowledge at the date of the MSDS publication.

Numerical Data Presentation

The presentation of numerical data, such as that used for physical and chemical properties and toxicological values, is expressed using a comma (,) to separate digits into groups of three and a period (.) as the decimal marker. For example, 1,234.56 mg/kg = 1 234,56 mg/kg.

2. HAZARDS IDENTIFICATION

Emergency Overview

This material is HAZARDOUS as defined by the OSHA Hazard Communication Standard, 29CFR, 1910.1200.

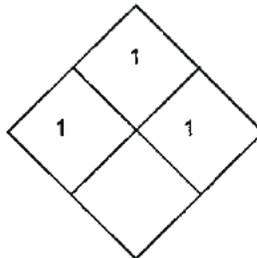

Signal Word

WARNING.

Hazards

May cause irritation of the skin. Contact with hot liquid may cause burns. Repeated exposure may cause cracking and drying due to the extraction of oils. Heavier than air, vapors may travel long distances along the ground before igniting and flash back to vapor source. Hydrogen sulfide (H₂S) and other hazardous vapors may evolve and collect in the headspace of storage tanks and other enclosed vessels. H₂S is an extremely flammable and a highly toxic gas. Inhalation hazard. Contain 4-to-6-membered condensed-ring (polynuclear) aromatic hydrocarbons (PNAs), and possibly carbazoles. May cause genetic defects. May affect the unborn. Potential cancer hazard.

 Validation Date: 02/15/2011

VGO

Odor

characteristic

Odor Threshold

No value available.

Potential health effects

Routes of exposure

Skin. Eye. Inhalation.

Acute effects

Skin

Prolonged or repeated contact may cause skin to become dry or cracked. This material may contain polynuclear aromatic hydrocarbons (PAH), some of which induced skin tumors on laboratory animals upon prolonged and repeated exposure. Prolonged or repeated contact may cause skin to become dry or cracked. This material may contain polynuclear aromatic hydrocarbons (PAH), some of which induced skin tumors on laboratory animals upon prolonged and repeated exposure. May cause irritation of the skin. Contact with hot liquid may cause burns. May be absorbed through the skin and produce toxic effects such as CNS depression. Short-term contact symptoms include redness, itching, and burning of the skin. If the skin is damaged, absorption increases.

Inhalation

May be irritating to respiratory system. May be irritating to respiratory system. Ingestion of large quantities can cause intestinal obstruction. Inhalation of the vapor or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath and may cause transient central nervous system (CNS) depression.

Eyes

Not expected to cause eye irritation. Not expected to cause eye irritation. May cause minimal irritation. Animal test results on similar unheated materials suggest that this product may cause minimal eye irritation upon short-term exposure. Symptoms include stinging, watering, and redness. H₂S vapors may cause moderate to severe eye irritation and photophobia (sensitivity to light).

Ingestion

Not a likely route of exposure. Ingestion would likely cause gastrointestinal tract irritation. Not a likely route of exposure. Ingestion would likely cause gastrointestinal tract irritation. Contact with hot material may cause thermal burns. If swallowed, no significant adverse health effects are anticipated; however, this material can cause a laxative effect. The National Institute for Occupational Safety and Health has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health. Concentrations of H₂S at or below 250 ppm and 500 ppm may result in headache, nausea, disorientation, irregular heartbeat, and/or low blood pressure. At greater than 500 ppm, H₂S causes sudden collapse, unconsciousness, and respiratory paralysis leading to convulsions, coma, and/or death. (See Section 11). May be harmful or fatal if inhaled.

Aggravated Medical Condition

Persons with pre-existing central nervous system (CNS) disease, skin disorders, impaired kidney function or chronic respiratory disease should avoid exposure. Any pre-existing disorders or diseases of the: lungs and/or Liver disease.

 Revision: 1.0
 Validation Date: 02/15/2011

VGO

Typical composition

4. FIRST AID MEASURES

General advice

May cause cancer. This substance may be genotoxic. May cause harm to the unborn child. Harmful by inhalation. Harmful: danger of serious damage to health by prolonged exposure in contact with skin. Inhalation of heated vapors or mists may cause central nervous system (CNS) effects including headache, drowsiness, dizziness, and blurred vision and possible cardiac sensitization.

Ingestion may cause CNS effects, discomfort and irritation of the gastrointestinal tract, nausea, vomiting, and diarrhea.

May be irritating to the eyes. May be irritating to the skin. Repeated exposure may cause skin dryness or cracking. Very toxic by inhalation. H₂S vapors may cause moderate to severe eye irritation and photophobia (sensitivity to light). Always observe self-protection methods. Move out of dangerous area. Do not leave the victim unattended. Remove contaminated shoes and clothing. Get medical attention immediately. Show this material safety data sheet to the doctor in attendance.

Skin

All contaminated clothingshould be removed, and contaminated skin areas washed with lipophilic soap, or green soap, and water. DO NOT use gasoline, kerosene, solvents, or harsh abrasive skin cleaners. Do not wash with machine dishwashing or laundry detergents. Seek medical attention if tissue appears damaged or if pain or irritation persists. In the event of a high pressure injection injury, worker should obtain immediate medical assistance. Discard contaminated leather goods.

Inhalation

Remove victim to fresh air and keep at rest in a position comfortable for breathing. Keep patient warm and at rest. If breathing is difficult, give oxygen. If unconscious place in recovery position and seek medical advice. In the event of unconsciousness, apnea or cardiac arrest (no pulse) apply cardiopulmonary resuscitation.

Eyes

In case of eye contact, remove contact lens and rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Do not use eye ointment unless directed to by a physician. If irritation, blurred vision or swelling occurs and persists, obtain medical advice from a specialist.

Ingestion

DO NOT induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. Get medical attention immediately. Do not give milk or alcoholic beverages. Never give anything by mouth to an unconscious person.

Notes to physician

Treat symptomatically. Treatment of overexposure should be directed at the control of symptoms and the clinical condition of the patient. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to this material. Gastrointestinal decontamination in accidental petroleum distillate ingestions is not recommended, because of the severe aspiration hazard.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

OSHA/NFPA Class III B combustible liquid.

Flash point

> 180 °C (> 356 °F)

Autoignition temperature

No Data Available.

 Validation Date: 02/15/2011

VGO

Lower explosion limit
not determined

Upper explosion limit
not determined

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Use water spray, dry chemical, foam, or carbon dioxide. Sand LARGE FIRES: Water spray Foam Water fog. Sand Carbon dioxide (CO₂) Dry chemical Apply water carefully to avoid frothing/steam explosion.

Unsuitable extinguishing media

Do not use a solid water stream as it may scatter and spread fire. Simultaneous use of foam and water on the same surface is to be avoided as water destroys the foam.

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear positive pressure self-contained breathing apparatus (SCBA). Structural firefighters protective clothing will only provide limited protection.

Precautions for fire-fighting

This material will release vapors when heated above the flash point temperature that can ignite when exposed to a source of ignition. Vapors may travel long distances along the ground before reaching a source of ignition and flashing back. Move containers from fire area if you can do it without risk. Fight from a maximum distance or use unmanned hose holders or monitor nozzles. Containers can build up pressure if exposed to heat; cool with flooding quantities of water until well after the fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of vessel. Always stay away from the ends of tanks. Contents under pressure and can explode when exposed to heat or flames. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. When mixed with air and exposed to ignition source, vapors can burn in open or explode if confined. Burning liquid may float on water. Apply aqueous extinguishing media carefully to any molten/liquid material to prevent frothing/steam explosion. Prevent fire extinguishing water from contaminating surface water or the ground water system. Notify authorities immediately if liquid enters sewer/public waters. Fire residues and contaminated fire extinguishing water must be disposed of in accordance with local regulations.

Hazardous combustion products

Carbon monoxide, carbon dioxide and unburned hydrocarbons (smoke). May also include hydrogen sulfide, sulfur oxides or sulfuric acid.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Contain/collect rapidly to minimize dispersion. Release causes immediate fire/explosion hazard. Evacuate/limit access. Eliminate all sources of ignition. If liquid is hot, let cool naturally. Notify fire and environmental authorities. Note: recommended measures are based on the most likely spillage scenarios for this material; however, local conditions (wind, air temperature, wave/current direction and speed) may significantly influence the choice of appropriate actions. For this reason, local experts should be consulted when necessary. Local regulations may also prescribe or limit actions to be taken. Use clean non-sparking tools to collect absorbed material. All equipment used when handling this product must be grounded. Do not touch or walk through spilled material. Stop leak if you can do it without risk. A vapor suppressing foam may be used to reduce vapors. Absorb or cover with dry earth, sand or other non-combustible material and transfer to containers. For large spills: Contain spill with dike to prevent entry into sewers or waterways. Water spray may reduce vapor; but may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. DO NOT use water jet. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place contaminated materials into appropriate containers for disposal. On water, contain/minimize dispersion/collect. Remove from surface water (e.g. by skimming or siphoning). The use of dispersants should be advised by an expert, and, if required, approved by local authorities.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE194
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 02/15/2011

VGO

Prevent entry into waterways, sewers, basements or confined areas. If the product contaminates rivers and lakes or drains inform respective authorities.

7. HANDLING AND STORAGE

Handling

Use only with adequate ventilation and in closed systems. Ensure all equipment is electrically grounded before beginning transfer operations. Eliminate all sources of ignition. Liquid material is slippery-remove small leaks/spills from walking surface with solid absorbent. Odor is not an adequate warning of potentially hazardous ambient air concentrations. Do not pressurize, cut, weld, braze solder, drill, or grind on containers. Check atmosphere for explosiveness and oxygen deficiencies. (Subject to applicability): Concentration of hydrogen sulfide (H₂S) in tank headspaces may reach hazardous values, especially in case of prolonged storage. This situation is especially relevant for those operations which involve direct exposure to the vapors in the tank.

If sulfur compounds are suspected to be present in the product, check the atmosphere for hydrogen sulfide (H₂S) content. Do not handle near heat, sparks, or open flame. Use good housekeeping practices during use, storage, transfer, and handling. Electrostatic charges may be generated as a result of flow or agitation. Do not use compressed air for filling, discharging or handling. Special slow load procedures for 'switch loading' must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point hydrocarbon products. This liquid may accumulate static electricity even when transferred into properly grounded containers. Always keep nozzle in contact with the container throughout the loading process. Static electricity accumulation may be significantly increased by the presence of small quantities of water. Use only non-sparking tools. Avoid contact with incompatible agents. Handle empty containers with care; vapor/residue may be flammable. Ensure that all relevant regulations regarding explosive atmospheres, and handling and storage facilities of flammable products are followed.

Storage

Vapor space above stored liquid may be flammable/explosive unless blanketed with inert gas. Electrical installations / working materials must comply with the technological safety standards. Hydrogen sulfide (H₂S) and other hazardous vapors may evolve and collect in the headspace of storage tanks and other enclosed vessels. H₂S is an extremely flammable and a highly toxic gas. Store in original container. Store closed drums with bung in up position. Keep away from all ignition sources; segregate from incompatible materials. Keep containers tightly closed in a dry, cool, well-ventilated place, plainly labeled, and out of closed vehicles. Ground all containers, transfer vessels, and equipment containing this material. Containers should be able to withstand pressures expected from warming or cooling during storage. Flammable materials should be stored in separate safety storage cabinet or room. Bonding and grounding measures may not be enough if nonconductive flammables are involved. Recommended materials: For containers, or container linings use mild steel, stainless steel. Unsuitable materials: Some synthetic materials may be unsuitable for container or container linings depending on the material specification and intended use. Compatibility should be checked with the manufacturer.

Storage area layout, tank design, equipment and operating procedures must comply with the relevant European, national or local legislation. Cleaning, inspection and maintenance of the internal structure of storage tanks must be done only by properly equipped and qualified personnel as defined by national, local or company regulations.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Engineering controls, preferably enclosed systems, should be used whenever feasible to maintain exposures below acceptable criteria. When such controls are not feasible, or sufficient to achieve full conformance, other engineering controls such as local exhaust ventilation should be used. Where engineering controls are not feasible use adequate local exhaust ventilation wherever mist, spray or vapor may be generated. Provide local exhaust or general room ventilation to minimize exposure to vapors. Emergency shower and eyewash facility should be in close proximity (ANSI Z358.1)

Personal protective equipment

Inhalation

Use an approved respirator, either air-supplied or air purifying (consult your company safety professional, or Equistar Industrial Hygiene group for guidance). The type of respiratory protection will depend upon whether the maximum exposure concentration is known. Consider the maximum period for wear. If exposure exceeds the standard limits, respiratory protection equipment which meets 29 U.S. Code of Federal Regulations (CFR) 1910.134 and is U.S. National Institute for Occupational Safety and Health (NIOSH) approved must be worn. Organic vapor or supplied air respirator may be appropriate. Respirator selection and use should comply with OSHA 29 CFR 1910.134 or ANSI Z88.2.

Skin

MATERIAL SAFETY DATA SHEET

MSDS No.: BE194
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 02/15/2011

VGO

Impervious gloves Wear chemical resistant gloves such as: Neoprene, Nitrile, Vinyl Butyl Rubber Gloves, or PVC. Avoid contact with skin. Skin should be washed after contact. Flame retardant protective clothing. Choose body protection in relation to its type, to the concentration and amount of dangerous substances, and to the specific work-place. Avoid contact with skin. Immediately remove all contaminated clothing. Use PPE that is chemical resistant to the product and prevents skin contact.

Eyes

Wear safety glasses. Where the opportunity for a splash or spray caused by high pressure or agitation of the material is possible, use a face shield and chemical goggles.

Remarks

Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use.

Occupational Exposure Limits

Component	Source	Type:	Value	Note
Hydrogen sulfide	US (ACGIH)	STEL	15 ppm	None.
	US (ACGIH)	TWA	10 ppm	None.
	98/24/EC	Peak	50 ppm	None.
	US (OSHA)	CEILING	20 ppm	None.
	NIOSH	IDLH	100 ppm	None.

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance: liquid dark brown, black

Odor: characteristic

Odor Threshold: No value available.

pH: not applicable not applicable Not applicable.

Boiling point/boiling range: > 150 - 750 °C (302 - 1,382 °F)

Melting/freezing point: < 30 °C (< 86 °F)

Flash point: > 180 °C (> 356 °F)

Autoignition temperature: No Data Available.

Flammability: OSHA/NFPA Class IIIB combustible liquid.

Lower explosion limit: not determined

Upper explosion limit: not determined

Explosive properties: Not applicable. (No chemical groups associated with explosive properties.)

Oxidizing properties: No Data Available.

Vapor pressure: 0.02 - 0.791 kPa @ 120 °C (248 °F) (MW 330 to 500) 0.063 - 0.861 kPa @ 150 °C (302 °F) (MW 350 to 420)

Evaporation rate: Not applicable.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE194
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 02/15/2011

VGO

Relative density: 0.8 - 1.2

Relative vapor density: 10 @ 21.1 °C (69.98 °F)(Air = 1.0)

Viscosity: > 20.5 mm²/s @ 40 °C (104 °F)

Water solubility: no data available

Partition coefficient: n-octanol/water: no data available

Other physico-chemical properties: No additional information available.

10. STABILITY AND REACTIVITY

Chemical stability

Stable under recommended storage conditions.

Conditions to avoid

Heat, flames and sparks. Avoid static discharge or other sources of ignition. Electrostatic charges may be generated as a result of flow or agitation.

Materials to avoid

Strong acids and oxidizing agents

11. TOXICOLOGICAL INFORMATION

Product information

Product Summary

No known chronic health effects.

Acute toxicity

<u>LC50 (aerosol)</u>	rat	4.1 MG/L
<u>LD50 (Oral)</u>	rat	4,320 MG/KG
<u>LD50 (Skin)</u>	rabbit	> 2000 MK/KG

Acute effects

Inhalation

Predicted exposure concentration Stream expected to have a low order of acute inhalation toxicity based on toxicity information for streams having components in common with this stream.

Skin contact

Predicted exposure concentration Stream expected to have a low order of acute dermal toxicity based on toxicity information for streams having components in common with this stream.

Irritation

Skin

Stream expected to be no more than slightly irritating to the skin based on toxicity information for streams having components in common with this stream. These effects are not considered to warrant classification as a skin irritant

MATERIAL SAFETY DATA SHEET

MSDS No.: BE194
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 02/15/2011

VGO

Eyes

Stream expected to be no more than transient, fully reversible irritating to the eye based on toxicity information for streams having components in common with this stream. These effects are not considered to warrant classification as an eye irritant.

Sensitization

Stream expected not to be a sensitizer based on toxicity information for streams having components in common with this stream.

Target Organs

Damages developing fetus.

Repeated dose toxicity

May cause damage to organs through prolonged or repeated exposure. Stream expected to be toxic to target organs with repeated exposure based on toxicity information for streams having components in common with this stream. Results of repeated exposure toxicity testing indicate alterations in serum cholesterol and blood urea nitrogen at high dermal doses accompanied by red blood cell, platelet, liver, and thymus effects at lower exposure levels.

Reproductive effects

Stream expected not to be toxic to reproduction based on toxicity information for streams having components in common with this stream.

Developmental Toxicity

Suspected of damaging the unborn child. Stream expected to be toxic to development based on toxicity information for streams having components in common with this stream. Results of developmental toxicity testing indicate alterations in fetal and pup development, which sometimes occurred in the presence of maternal toxicity.

Genetic Toxicity

Not mutagenic. Stream expected to be not mutagenic based on toxicity information for streams having components in common with this stream.

Carcinogenicity

Stream expected to be carcinogenic based on toxicity information for streams having components in common with this stream. Results obtained from the modified Ames test, from mouse skin painting tests and initiation/promotion assay along with chemical (PAH) analysis indicate that Heavy Fuel Oil streams are carcinogenic.

12. ECOLOGICAL INFORMATION

Product Information

Ecotoxicity

No additional information available.

Acute Fish toxicity

LL50 / 96 HOURS Oncorhynchus mykiss (rainbow trout) 79 mg/l

Acute toxicity to aquatic invertebrates

static test / 48 HOURS Daphnia magna (Water flea) 2 mg/l

Toxicity to aquatic plants

EL50 / 72 HOURS 0.75 mg/l

MATERIAL SAFETY DATA SHEET

MSDS No.: BE194
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 02/15/2011

VGO

Toxicity to microorganisms

LL50 / 0.72 HOURS Tetrahymena pyriformis (ciliated protozoa) > 1,000 mg/l

Summary: Based on Quantitative structure-activity relationship (QSAR) estimation.

Chronic toxicity to fish

NOEC / 0.1 mg/l

Summary: Based on Quantitative structure-activity relationship (QSAR) estimation.

Chronic toxicity to aquatic invertebrates

NOEL / 0.27 mg/l

Summary: Based on Quantitative structure-activity relationship (QSAR) estimation.

Environmental fate and pathways

No additional information available.

Mobility

Predicted distribution to environmental compartments: Predicted distribution to environmental compartments Partitioning mainly to Soil

Persistence and degradability

Biodegradation: Not expected to be hydrolytically unstable. Not expected to be biodegradable.

Bioaccumulation: Consideration of representative hydrocarbon structures indicated none are likely to be highly bioaccumulative.

13. DISPOSAL CONSIDERATIONS

Dispose of as hazardous waste in compliance with local and national regulations. The product should not be allowed to enter drains, water courses or the soil. Proper grounding procedures to avoid static electricity should be followed. Can be incinerated, when in compliance with local regulations. Contaminated product, soil or water should be considered dangerous due to potential evolution of flammable vapor. Contaminated product, soil or water may be hazardous waste due to potentially low flash point.

14. TRANSPORT INFORMATION

Proper shipping name Oil, Residual, not regulated

15. REGULATORY INFORMATION

Notification status

All ingredients are on the following inventories or are exempted from listing

Disclaimer

The information on this MSDS was obtained from sources which we believe are reliable. However, the information is provided without any warranty, expressed or implied, regarding its correctness. Some information presented and conclusions drawn herein are from sources other than direct test data on the substance itself. The conditions or methods of handling, storage, use and disposal of the product are beyond our control and may be beyond our knowledge. For this and other reasons, we do not assume responsibility and expressly disclaim liability for loss, damage, or expense arising out of or in any way connected with handling, storage, use, or disposal of this product. If the product is used as a component in another product, this MSDS information may not be applicable. Information is correct to the best of our knowledge at the date of the MSDS publication.

Numerical Data Presentation

The presentation of numerical data, such as that used for physical and chemical properties and toxicological values, is expressed using a comma (,) to separate digits into groups of three and a period (.) as the decimal marker. For example, 1,234.56 mg/kg = 1 234,56 mg/kg.

2. HAZARDS IDENTIFICATION

Emergency Overview

This material is HAZARDOUS as defined by the OSHA Hazard Communication Standard, 29CFR, 1910.1200.

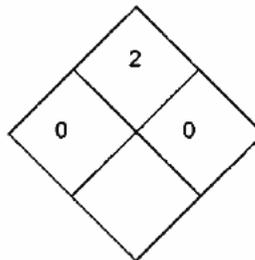

Signal Word

WARNING.

Hazards

Flammable. Vapors may form explosive mixtures with air. Vapors can travel to a source of ignition and flash back. Vapors explosion hazard indoors, outdoors or in sewers. Irritating to the skin, not a sensitizer. Harmful if swallowed. Ingestion of this material may result in aspiration into the lungs causing chemical pneumonia. Combustible liquid. MAY BE HARMFUL IF SWALLOWED. Ingestion of this material may result in aspiration into the lungs causing chemical pneumonia. Irritating to the skin, not a sensitizer. Can cause eye irritation. Possible CANCER hazard

NFPA®

HMIS®

Health	*	1
Flammability		2
Physical Hazard		0

Physical state

MATERIAL SAFETY DATA SHEET

MSDS No.: BE88
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 02/15/2011

KEROSENE/JET FUEL

Odor

Hydrocarbon.

Odor Threshold

Specific data not available.

Potential health effects

Routes of exposure

Skin. Inhalation. Ingestion.

Acute effects

Skin

Skin irritant.

Inhalation

Aspiration may cause lung damage.

Eyes

Not expected to cause eye irritation.

Ingestion

Swallowing this material may result in health hazard.

Chronic effects

Repeated or prolonged exposure may cause respiratory irritation. Prolonged exposure may produce anesthetic and narcotic effects.

Aggravated Medical Condition

Persons with pre-existing chronic respiratory disease or skin disorders should minimize their exposure to this material.

3. COMPOSITION/INFORMATION ON INGREDIENTS

<u>Component</u>	<u>CAS-No.</u>	<u>EC-No.</u>	<u>Weight %</u>
Kerosene, petroleum, hydrodesulfurized	64742-81-0	265-184-9	0.0 <= 100.0
Naphthalene	91-20-3	202-049-5	0.0 <= 3.0
Ethyl Benzene	100-41-4	202-849-4	0.0 <= 1.0

Typical composition

4. FIRST AID MEASURES

General advice

Causes skin irritation. May cause minor eye irritation. Aspiration into the lungs during swallowing or vomiting can cause lung damage, possibly leading to chronic lung dysfunction or death. Possible cardiac sensitization. May cause drowsiness or dizziness. Always observe self-protection methods. Move out of dangerous area. Do not leave the victim unattended.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE88
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 02/15/2011

KEROSENE/JET FUEL

General advice

Get medical attention immediately. Show this material safety data sheet to the doctor in attendance. Remove contaminated shoes and clothing.

Skin

All contaminated clothing should be removed, and contaminated skin areas washed with lipophilic soap, or green soap, and water. Never use low boiling point naphthas for washing contaminated skin. Do not wash with machine dishwashing or laundry detergents. Seek medical attention if tissue appears damaged or if pain or irritation persists. In the event of a high pressure injection injury, worker should obtain immediate medical assistance. Discard contaminated leather goods.

Inhalation

Remove victim to fresh air and keep at rest in a position comfortable for breathing. Keep patient warm and at rest. If breathing is difficult, give oxygen. If unconscious place in recovery position and seek medical advice. In the event of unconsciousness, apnea or cardiac arrest (no pulse) apply cardiopulmonary resuscitation.

Eyes

In case of eye contact, remove contact lens and rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Do not use eye ointment unless directed to by a physician. If irritation, blurred vision or swelling occurs and persists, obtain medical advice from a specialist.

Ingestion

DO NOT induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. Get medical attention immediately. Do not give milk or alcoholic beverages. Never give anything by mouth to an unconscious person.

Notes to physician

Treat symptomatically. Treatment of overexposure should be directed at the control of symptoms and the clinical condition of the patient. Gastrointestinal decontamination in accidental petroleum distillate ingestions is not recommended, because of the severe aspiration hazard. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to this material.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

OSHA/NFPA Class II combustible liquid.

Flash point

> 23 °C (> 73.4 °F)

Autoignition temperature

> 200 °C (> 392 °F)

Lower explosion limit

~ 0.7 vol%

Upper explosion limit

~ 5 vol%

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Carbon Dioxide. Sand. Foam. Dry powder. Inert gas. Water fog. LARGE FIRES: water spray water fog foam. Apply water carefully to avoid frothing/steam explosion.

Unsuitable extinguishing media

Do not use a solid water stream as it may scatter and spread fire. Simultaneous use of foam and water on the same surface is to be avoided as water destroys the foam.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE88
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 02/15/2011

KEROSENE/JET FUEL

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear positive pressure self-contained breathing apparatus (SCBA). Structural firefighters protective clothing will only provide limited protection.

Precautions for fire-fighting

Fight from a maximum distance or use unmanned hose holders or monitor nozzles. Containers can build up pressure if exposed to heat; cool with flooding quantities of water until well after the fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of vessel. Always stay away from the ends of tanks. Move containers from fire area if you can do it without risk. Sustained fire attack on vessels may result in a Boiling Liquid Expanding Vapour Explosion (BLEVE). This material releases flammable vapors at well below ambient temperatures and may form flammable mixtures with air. When mixed with air in certain proportions and exposed to an ignition source, these vapors can burn in the open or be explosive in confined spaces. Being heavier than air, these vapors may travel long distances along the ground before reaching a point of ignition and flashing back. The product will float and can be reignited on surface water. Burning liquid may float on water. Apply aqueous extinguishing media carefully to any molten/liquid material to prevent frothing/steam explosion. Prevent fire extinguishing water from contaminating surface water or the ground water system. Notify authorities immediately if liquid enters sewer/public waters. Fire residues and contaminated fire extinguishing water must be disposed of in accordance with local regulations. Thermal decomposition may produce carbon monoxide and other toxic vapors.

Hazardous combustion products

Incomplete combustion will form carbon monoxide and other toxic vapors.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Combustible liquid. Release causes immediate fire/explosion hazard. Evacuate/limit access. Notify fire and environmental authorities. Note: recommended measures are based on the most likely spillage scenarios for this material; however, local conditions (wind, air temperature, wave/current direction and speed) may significantly influence the choice of appropriate actions. For this reason, local experts should be consulted when necessary. Local regulations may also prescribe or limit actions to be taken. All equipment used when handling this product must be grounded. Do not touch or walk through spilled material. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. A vapor suppressing foam may be used to reduce vapors. Absorb or cover with dry earth, sand or other non-combustible material and transfer to containers. Use clean non-sparking tools to collect absorbed material. For large spills: Contain spill with dike to prevent entry into sewers or waterways. Water spray may reduce vapor; but may not prevent ignition in closed spaces. On water, contain/recover rapidly to minimize dispersion. Remove from surface water (e.g. by skimming or siphoning). The use of dispersants should be advised by an expert, and, if required, approved by local authorities.

Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. The spilled material and any soil or water which it has contacted will be hazardous to animals and/or aquatic life.

Prevent entry into waterways, sewers, basements or confined areas. If the product contaminates rivers and lakes or drains inform respective authorities.

7. HANDLING AND STORAGE

Handling

Eliminate every possible source of ignition. Check atmosphere for explosiveness and oxygen deficiencies. Special slow load procedures for 'switch loading' must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point hydrocarbon products. Static electricity accumulation may be significantly increased by the presence of small quantities of water. Electrostatic charge may build up during handling. Equipment should be grounded and bonded. During transfer of product, ground container and insure that all conveying equipment is properly grounded. A static ignition hazard can exist when low vapor pressure products such as diesel, heating oil, kerosene or jet fuels are loaded into a cargo tank containing flammable vapors from a previous load of a low flash point solvent. Always keep nozzle in contact with the container throughout the loading process. Use only non-sparking tools. Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE88
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 02/15/2011

KEROSENE/JET FUEL

Handling

Refer to NFPA 77 for relevant consensus guidance. Keep container closed and drum bungs in place. Store away from heat, sparks, open flames, strong oxidizing agents and direct sunlight. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Never siphon by mouth. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Wash thoroughly after handling with soap and water. Do not use compressed air for filling, discharging or handling. Liquid material is slippery-remove small leaks/spills from walking surface with solid absorbent. Do not pressurize or expose empty containers to open flame, sparks, or heat. Observe precautions pertaining to confined space entry.

Storage

Vapor space above stored liquid may be flammable/explosive unless blanketed with inert gas. Store away from heat, sparks, open flames, strong oxidizing agents and direct sunlight. Keep away from all ignition sources; segregate from incompatible materials. Keep containers tightly closed in a dry, cool, well-ventilated place, plainly labeled, and out of closed vehicles. Ground all containers, transfer vessels, and equipment containing this material. Containers should be able to withstand pressures expected from warming or cooling during storage. Flammable materials should be stored in separate safety storage cabinet or room. Keep in properly labeled containers. Bonding and grounding measures may not be enough if nonconductive flammables are involved. This liquid may accumulate static electricity even when transferred into properly grounded containers. Static electricity accumulation may be significantly increased by the presence of small quantities of water. Electrical installations / working materials must comply with the technological safety standards. Recommended materials: For containers, or container linings use mild steel, stainless steel. Unsuitable materials: Some synthetic materials may be unsuitable for container or container linings depending on the material specification and intended use. Compatibility should be checked with the manufacturer.

Store closed drums with bung in up position. Cleaning, inspection and maintenance of the internal structure of storage tanks must be done only by properly equipped and qualified personnel as defined by national, local or company regulations.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. If mechanical ventilation is used, electrical systems should conform to U.S. National Electric Code. Emergency shower and eyewash facility should be in close proximity (ANSI Z358.1)

Personal protective equipment

Inhalation

A respiratory protection program which complies with U.S. Occupational Safety and Health Administration (OSHA) general industry standard 1910.134(e) should be implemented. Where exposure through inhalation may occur from use, approved respiratory protection equipment is recommended. Not expected to present a respiratory hazard due to normally low vapor pressures. Where excessive vapor, mist, or dust may result from use, use approved respiratory protection equipment. NIOSH approved organic vapor respirator equipped with a dust/mist prefilter should be used. For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA).

Skin

Wear chemical resistant gloves such as: Glove material fluoroelastomer; material thickness 0.4 mm; break through time \geq 480 min. Gloves must be replaced after 8 hours of wear. Gloves should be discarded and replaced if there is any indication of degradation or chemical breakthrough. Choose body protection in relation to its type, to the concentration and amount of dangerous substances, and to the specific work-place. When skin contact is possible, protective clothing including gloves, apron, sleeves, boots, head and face protection should be worn. Use PPE that is chemical resistant to the product and prevents skin contact. Fire retardant clothing is appropriate for routine occupational use.

Eyes

Wear safety glasses. Where the opportunity for a splash or spray caused by high pressure or agitation of the material is possible, use a face shield and chemical goggles. Suitable eye wash water should be readily available.

Remarks

Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use. Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure. Wash hands before eating, drinking, smoking, or using toilet facilities. Use good personal hygiene practices. Remove and wash contaminated clothing before re-use.

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance: liquid Clear, colorless to light amber.

Odor: Hydrocarbon.

Odor Threshold: Specific data not available.

pH: Not applicable.

Boiling point/boiling range: 90 - 300 °C (194 - 572 °F)

MATERIAL SAFETY DATA SHEET

MSDS No.: BE88
 Variant: U.S.A.-BN
 Revision: 1.0
 Validation Date: 02/15/2011

KEROSENE/JET FUEL

Melting/freezing point: < -20 °C (< -4 °F)

Flash point: > 23 °C (> 73.4 °F)

Autoignition temperature: > 200 °C (> 392 °F)

Flammability: OSHA/NFPA Class II combustible liquid.

Lower explosion limit: ~ 0.7 vol%

Upper explosion limit: ~ 5 vol%

Explosive properties: Not applicable. (No chemical groups associated with explosive properties.)

Oxidizing properties: Not considered an oxidizing agent.

Vapor pressure: 1 - 21 kPa @ 37.8 °C (100.04 °F)

Evaporation rate: No Data Available.

Relative density: 0.775 - 0.840 @ 15 °C (59 °F)

Relative vapor density: < 1 (Air = 1.0)

Viscosity: 1 - 2.5 mm²/s @ 40 °C (104 °F)
 2.9 - 12 mm²/s @ 20 °C (68 °F)

Water solubility: 0.005 - 0.12 g/l

Partition coefficient: n-octanol/water: Log Kow >3.3

Other physico-chemical properties: No additional information available.

10. STABILITY AND REACTIVITY

Chemical stability

The product is stable.

Conditions to avoid

Heat, sparks and open flame.

Materials to avoid

Strong acids, bases, and oxidizing agents, such as liquid chlorine and oxygen. May react with peroxides.

Hazardous polymerization

Not expected to occur.

11. TOXICOLOGICAL INFORMATION

Product information

Product Summary

Aspiration may cause lung damage. Ingestion of this material, followed by vomiting and aspiration of the more volatile components of this material into the lungs, may lead to chemical pneumonia and even death. May produce skin irritation.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE88
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 02/15/2011

KEROSENE/JET FUEL

Product Summary

Inhalation of vapors in high concentration may cause irritation of respiratory system. Inhalation may cause CNS depression.

Acute toxicity

<u>LC50 (Inh)</u>	rat	5.28	4 HOURS
<u>LD50 (Oral)</u>	rat	>5000 MG/KG	
<u>LD50 (Skin)</u>	Rabbit	>2000 MG/KG	

Acute effects

Inhalation

Predicted exposure concentration Inhalation may cause CNS depression. Can cause pulmonary edema if aspirated into lungs. Stream expected to have a low order of acute inhalation toxicity based on toxicity information for streams having components in common with this stream.

Ingestion

Predicted exposure concentration Stream expected to have a low order of acute oral toxicity based on toxicity information for streams having components in common with this stream.

Skin contact

Predicted exposure concentration Stream expected to have a low order of acute dermal toxicity based on toxicity information for streams having components in common with this stream.

Irritation

Skin

Stream expected to be irritating to the skin based on toxicity information for streams having components in common with this stream.

Eyes

Stream expected to be no more than transient, fully reversible irritating to the eye based on toxicity information for streams having components in common with this stream. These effects are not considered to warrant classification as an eye irritant.

Sensitization

Stream expected not to be a sensitizer based on toxicity information for streams having components in common with this stream.

Target Organs

Skin. Lungs

Repeated dose toxicity

The repeated inhalation and oral studies of kerosene in rats produced no consistent toxicological effects other than changes in male rat kidneys (alpha-2u-globulin nephropathy). Dermal studies indicate a very low potential for systemic toxicity, however, repeated treatment at high levels can produce quite severe dermal effects at the application site.

12. ECOLOGICAL INFORMATION

Product information

Ecotoxicity

MATERIAL SAFETY DATA SHEET

MSDS No.: BE88
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 02/15/2011

KEROSENE/JET FUEL

Acute Fish toxicity

LL50 / 96 HOURS Oncorhynchus mykiss (rainbow trout) 2 - 5 mg/l

NOEL / 2 mg/l

LL50 / 96 HOURS Oncorhynchus mykiss (rainbow trout) 2 - 100 mg/l

NOEL / 6.8 - 10 mg/l

Acute toxicity to aquatic invertebrates

EL50 / 48 HOURS Daphnia magna (Water flea) 1.4 mg/l

NOEL / 0.3 mg/l

EL50 / 48 HOURS Daphnia magna (Water flea) 1.9 - 89 mg/l

NOEL / 0.3 - 40 mg/l

Environmental fate and pathways

Mobility

Predicted distribution to environmental compartments: Predicted distribution to environmental compartments After release, disperses into the air.

Persistence and degradability

Stability in water: Volatilization from water surfaces is expected to be an important environmental fate process.

Biodegradation: Not readily, but considered likely to be inherently biodegradable. Photodegradation following atmospheric release is not expected to be a significant route of degradation in the environment.

Bioaccumulation: The substance is a hydrocarbon UVCB. Consideration of representative hydrocarbon structures indicated none are likely to be highly bioaccumulative.

13. DISPOSAL CONSIDERATIONS

The product should not be allowed to enter drains, water courses or the soil. Proper grounding procedures to avoid static electricity should be followed. Contaminated product, soil or water may be hazardous waste due to potentially low flash point. Contaminated product, soil or water should be considered dangerous due to potential evolution of flammable vapor.

Disclaimer

The information on this MSDS was obtained from sources which we believe are reliable. However, the information is provided without any warranty, expressed or implied, regarding its correctness. Some information presented and conclusions drawn herein are from sources other than direct test data on the substance itself. The conditions or methods of handling, storage, use and disposal of the product are beyond our control and may be beyond our knowledge. For this and other reasons, we do not assume responsibility and expressly disclaim liability for loss, damage, or expense arising out of or in any way connected with handling, storage, use, or disposal of this product. If the product is used as a component in another product, this MSDS information may not be applicable. Information is correct to the best of our knowledge at the date of the MSDS publication.

Numerical Data Presentation

The presentation of numerical data, such as that used for physical and chemical properties and toxicological values, is expressed using a comma (,) to separate digits into groups of three and a period (.) as the decimal marker. For example, 1,234.56 mg/kg = 1 234,56 mg/kg.

Language Translations

This document may be available in languages other than English.

2. HAZARDS IDENTIFICATION

Emergency Overview

This material is HAZARDOUS as defined by the OSHA Hazard Communication Standard, 29CFR, 1910.1200.

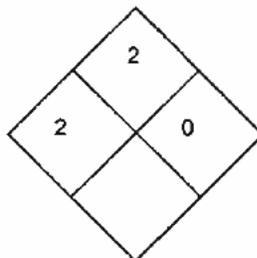

Signal Word

WARNING.

Hazards

Vapors and fumes may be hazardous or fatal. Avoid contact with hot product - may cause burns. If hot product contacts water, a violent eruption of steam and vapor may occur. May be irritating to the eyes, skin, and respiratory system. Contain 4-to-6-membered condensed-ring (polynuclear) aromatic hydrocarbons (PNAs), and possibly carbazoles. Contains material which can cause cancer. Contains material which can cause mutagenic effects. Stream Components have been shown to cause reproductive and developmental toxicity in laboratory animals following repeated inhalation exposure. This stream contains genotoxic and carcinogenic components.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE92
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 09/20/2011

COKER FEED

Color

dark brown to black Red Brown to Black.

Odor

Slightly burnt odor. Hydrocarbon. Asphaltic odor. Hydrogen sulfide; rotten eggs.

Odor Threshold

No value available.

Potential health effects

Routes of exposure

Skin. Eye. Inhalation.

Acute effects

See component summary.

- *Hydrogen sulfide 7783-06-4*

Hydrogen sulfide is a highly toxic gas that can be fatal in certain concentrations. Skin absorption hazard. Respiratory tract irritant. Inhalation may cause asthma-like symptoms, including coughing, wheezing, tightness of chest, shortness of breath, and headache. Higher exposures can cause a build-up of fluid in the lungs (pulmonary edema), with severe shortness of breath. CNS depressant.

Skin

Avoid contact with hot product - may cause burns. May cause moderate skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. May be absorbed through the skin and produce toxic effects such as CNS depression. If the skin is damaged, absorption increases.

Inhalation

Inhalation of the vapor or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath and may cause transient central nervous system (CNS) depression.

Eyes

Symptoms include stinging, watering, and redness. H₂S vapors may cause moderate to severe eye irritation and photophobia (sensitivity to light).

Chronic effects

Prolonged exposure may cause skin irritation.

- *Hydrogen sulfide 7783-06-4*

Prolonged or repeated breathing of high concentrations may cause symptoms of central nervous system depression. Repeated exposure may cause eye damage with possible loss of vision.

3. COMPOSITION/INFORMATION ON INGREDIENTS

Hydrogen sulfide	7783-06-4	231-977-3	0.0	<= 0.01

Typical composition

4. FIRST AID MEASURES

General advice

Take proper precautions to ensure your own health and safety before attempting rescue and providing first aid. For specific information refer to the Emergency Overview in Section 2 of this MSDS. At ambient temperatures, product may cause slight skin or eye irritation. Hydrogen sulfide (H₂S) and other hazardous vapors may evolve and collect in the headspace of storage tanks and other enclosed vessels. H₂S is an extremely flammable and a highly toxic gas. Always observe self-protection methods. Move out of dangerous area. Do not leave the victim unattended. Get medical attention immediately. Show this material safety data sheet to the doctor in attendance.

Skin

If burned by hot material, cool skin by quenching with large amounts of cool water. Do not put ice on the burn. Do not attempt to remove portions of clothing glued to burnt skin but cut around them. Remove non-sticking garments carefully. Wash thoroughly with soap and water. DO NOT use gasoline, kerosene, solvents or harsh abrasives as skin cleaners. Never use low boiling point naphthas for washing contaminated skin. Seek medical attention if ill effect or irritation develops.

Inhalation

If symptoms develop from exposure to bitumen fumes, mists or vapour, remove victim to fresh air and keep at rest in a position comfortable for breathing.

If overcome by exposure to H₂S, remove victim to fresh air immediately. If breathing is difficult, give oxygen. If unconscious place in recovery position and seek medical advice. In the event of unconsciousness, apnea or cardiac arrest (no pulse) apply cardiopulmonary resuscitation.

Eyes

Continuously flush eye(s) with cool running water for at least 5 minutes. Beyond flushing, DO NOT attempt to remove the material adherent to the eye(s).

Seek immediate medical attention, preferably an ophthalmologist.

Ingestion

DO NOT induce vomiting. Rinse mouth with water. If vomiting does occur, have victim lean forward to reduce risk of aspiration.

Notes to physician

Treat symptomatically. Treatment of overexposure should be directed at the control of symptoms and the clinical condition of the patient. Concentrations of H₂S at or below 250 ppm and 500 ppm may result in headache, nausea, disorientation, irregular heartbeat, and/or low blood pressure. Pulmonary edema is a common complication from exposure to high concentrations of hydrogen sulfide while respiratory tract irritation occurs at lower concentrations.

H₂S vapors may cause moderate to severe eye irritation and photophobia (sensitivity to light). Following exposure to hydrogen sulfide, supportive care and oxygen may be sufficient to treat the victim without the need to use nitrites.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

OSHA/NFPA Class IIIA Combustible Liquid.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE92
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 09/20/2011

COKER FEED

Flash point
 > 70 °C (> 158 °F)

Autoignition temperature
 400 °C (752 °F)

Lower explosion limit
 no data available

Upper explosion limit
 no data available

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Use dry chemical, CO₂, water spray or regular foam. Inert gas. Sand. LARGE FIRES: Water spray. Foam. Dry chemical. Carbon dioxide (CO₂). Inert gas. Sand. Apply aqueous extinguishing media carefully to any molten/liquid material to prevent frothing/steam explosion.

Unsuitable extinguishing media

Do not use a solid water stream as it may scatter and spread fire. Simultaneous use of foam and water on the same surface is to be avoided as water destroys the foam.

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear an approved positive pressure self-contained breathing apparatus and firefighter turnout gear. Structural firefighters protective clothing will only provide limited protection.

Precautions for fire-fighting

This material will release vapors when heated above the flash point temperature that can ignite when exposed to a source of ignition. Flammable vapors may be heavier than air and travel long distances along the ground before igniting and flashing back to vapor source. Evacuate area and fight from a maximum distance or use unmanned hose holders or monitor nozzles. Heat may generate flammable or explosive vapors; disperse with water spray or cover pooling liquid with foam. Containers can build up pressure if exposed to heat; cool with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of vessel. Always stay away from the ends of tanks. Move containers from fire area if you can do it without risk. Prevent fire extinguishing water from contaminating surface water or the ground water system. When fighting a fire, notify environmental authorities if liquid enters sewers or public waters. Fire residues and contaminated fire extinguishing water must be disposed of in accordance with local regulations. Thermal decomposition may produce carbon monoxide and other toxic vapors.

Hazardous combustion products

Carbon monoxide, carbon dioxide and unburned hydrocarbons (smoke). May also include hydrogen sulfide, sulfur oxides or sulfuric acid.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Do not touch or walk through spilled material. If liquid is hot, attempt to confine spill and let the liquid solidify. Do not direct water at spill or source of leak. Stop leak if you can do it without risk. Use only non-sparking tools. All equipment used when handling this product must be grounded. Take measures to prevent the build up of electrostatic charge. Use mechanical handling equipment. In those cases when the presence of dangerous amounts of H₂S in the leaked/spilled product is suspected or proved, additional or special actions may be warranted, including access restrictions, use of special protection equipment, procedures and personnel training. All recovered material should be packaged, labeled, transported and disposed of or reclaimed in conformance with applicable laws and regulations and in conformance with good engineering practices. Reclaim where possible.

 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 09/20/2011

COKER FEED

7. HANDLING AND STORAGE

Handling

If sulfur compounds are suspected to be present in the product, check the atmosphere for hydrogen sulfide (H₂S) content.

The bulk temperature during handling should be kept as low as possible consistent with efficient discharge, and at no time should it exceed the maximum temperature recommended by the supplier.

Use adequate ventilation and/or engineering controls in high temperature processing to prevent exposure to vapors.

Check atmosphere for explosiveness and oxygen deficiencies. (Subject to applicability): Concentration of hydrogen sulfide (H₂S) in tank headspaces may reach hazardous values, especially in case of prolonged storage. This situation is especially relevant for those operations which involve direct exposure to the vapors in the tank.

Keep away from heat/sparks/open flames/hot surfaces. - No smoking. Ensure all equipment is electrically grounded before beginning transfer operations. Smoking, eating and drinking should be prohibited in the application area. Observe precautions pertaining to confined space entry. Equipment containing this material should be isolated and thoroughly drained, washed and purged prior to maintenance/repair operations. Use good housekeeping practices during use, storage, transfer, and handling. Avoid contact with combustible material (paper, wool, oil). Do not pressurize or expose empty containers to open flame, sparks, or heat. Normal precautions should be maintained in handling hot liquids during the unloading of shipping and storage containers. Avoid contact with water. Use only with adequate ventilation/personal protection. Wash thoroughly after handling. Keep away from all sources of ignition. Wash thoroughly after handling with soap and water. Keep container tightly closed when not in use.

Storage

Electrical installations / working materials must comply with the technological safety standards. Avoid contact with incompatible agents. Keep container tightly closed and properly labeled. Metal containers used to store this material should be grounded. Selfheating leading to auto ignition at the surfaces of porous or fibrous materials impregnated with oils or bitumens, can occur at temperatures as low as 100°C. Oil and bitumen contamination of thermal insulation materials and the accumulation of oily rags or similar material near hot surfaces, should therefore be avoided, and lagging should be replaced where necessary by a nonabsorbent type of insulation.

Deposits (carbonaceous materials and iron sulphides) can develop on the internal walls and roofs of tanks in case of long term storage.

Recommended materials: For containers, or container linings use mild steel, stainless steel. All hazard precautions also apply to empty containers. Storage area layout, tank design, equipment and operating procedures must comply with the relevant European, national or local legislation. Cleaning, inspection and maintenance of the internal structure of storage tanks must be done only by properly equipped and qualified personnel as defined by national, local or company regulations. Do not pressurize, cut, weld, braze solder, drill, or grind on containers. Keep container tightly closed and properly labeled. Store away from heat, sparks, open flame and strong oxidizing agents.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Emergency shower and eyewash facility should be in close proximity (ANSI Z358.1)

Personal protective equipment

Inhalation

When workers are facing concentrations above the exposure limit they must use appropriate certified respirators. The type of respiratory protection will depend upon whether the maximum exposure concentration is known.

Skin

Wear chemical resistant gloves such as: PVC Neoprene. Nitrile. Vinyl or Butyl rubber. If handling hot material, wear thermal resistant gloves. Skin should be washed after contact. Fire retardant clothing is appropriate for routine occupational use. Use PPE that is chemical resistant to the product and prevents skin contact. When skin contact is possible, protective clothing including gloves, apron, sleeves, boots, head and face protection should be worn.

Eyes

Safety glasses with perforated sides. Eye protection such as chemical splash goggles and/or face shield must be worn when possibility exists for eye contact due to splashing or spraying liquid.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE92
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 09/20/2011

COKER FEED

Remarks

Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use. Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure. Use good personal hygiene practices. Wash hands before eating, drinking, smoking, or using toilet facilities.

10. STABILITY AND REACTIVITY

Chemical stability

The product is stable.

Conditions to avoid

High temperatures and severe oxidizing conditions. Contact with strong acids.

Materials to avoid

Strong acids, bases, and oxidizing agents, such as liquid chlorine and oxygen. Avoid contact with copper and copper containing alloys. Corrosive to some metals. Powdered metals. Metal oxides. Oxidizers.

Hazardous decomposition products

No degradation data available.

Hazardous polymerization

Not expected to occur.

11. TOXICOLOGICAL INFORMATION

Product information

Product Summary

See component summary.

COMPONENT INFORMATION

- *Residues (petroleum) vacuum 64741-56-6*

Acute toxicity

LC50 (Inhl) rat >0.0944 MG/L 4 HOURS

LD50 (Oral) rat > 5000 MG/KG

LD50 (Skin) rabbit > 2,000 MG/KG

Acute effects

Inhalation

Predicted exposure concentration Stream expected to have a low order of acute inhalation toxicity based on toxicity information for streams having components in common with this stream.

MATERIAL SAFETY DATA SHEET

COKER FEED

Ingestion

Stream expected to have a low order of acute oral toxicity based on toxicity information for streams having components in common with this stream.

Irritation

Skin

Stream expected to be no more than slightly irritating to the skin based on toxicity information for streams having components in common with this stream. These effects are not considered to warrant classification as a skin irritant.

Eyes

Stream expected to be no more than transient, fully reversible irritating to the eye based on toxicity information for streams having components in common with this stream. These effects are not considered to warrant classification as an eye irritant.

Sensitization

Stream expected not to be a sensitizer based on toxicity information for streams having components in common with this stream.

Repeated dose toxicity

This substance is a low concern to health following prolonged inhalation or dermal exposures.

Reproductive effects

Stream expected not to be toxic to reproduction based on toxicity information for streams having components in common with this stream.

Developmental Toxicity

Stream expected not to be toxic to development based on toxicity information for streams having components in common with this stream.

Genetic Toxicity

This substance is a low concern for genetic toxicity.

Carcinogenicity

Studies in laboratory animals indicate that this substance is not carcinogenic.

- *Heavy catalytic cracked naphtha 64741-54-4*

Acute toxicity

LC50 (Inhl) rat >5.25 MG/L 4 HOURS

LD50 (Oral) rat 5,000 MG/KG

LD50 (Skin) Rabbit. > 2,000 MG/KG

Acute effects

Inhalation

Predicted exposure concentration Stream expected to have a low order of acute inhalation toxicity based on toxicity information for streams having components in common with this stream.

Inhalation may cause CNS depression. Can cause pulmonary edema if aspirated into lungs.

Ingestion

Predicted exposure concentration Stream expected to have a low order of acute oral toxicity based on toxicity information for components and a stream having components in common with this stream; however, some components are toxic.

Skin contact

Predicted exposure concentration Stream expected to have a low order of acute dermal toxicity based on toxicity information for streams having components in common with this stream.

Irritation

Skin

Not a skin irritant. Stream expected to be no more than slightly irritating to the skin based on toxicity information for streams having components in common with this stream. These effects are not considered to warrant classification as a skin irritant

Eyes

MATERIAL SAFETY DATA SHEET

MSDS No.: BE92
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 09/20/2011

COKER FEED

Stream expected to be no more than transient, fully reversible irritating to the eye based on toxicity information for streams having components in common with this stream. These effects are not considered to warrant classification as an eye irritant.

Sensitization

Stream expected not to be a sensitizer based on toxicity information for streams having components in common with this stream.

Repeated dose toxicity

May cause damage to organs through prolonged or repeated exposure. Stream expected to be toxic to target organs with repeated exposure based on toxicity information for streams having components in common with this stream. Results of repeated exposure toxicity testing indicate alterations in serum cholesterol and blood urea nitrogen at high dermal doses accompanied by red blood cell, platelet, liver, and thymus effects at lower exposure levels.

Reproductive effects

Stream expected not to be toxic to reproduction based on toxicity information for streams having components in common with this stream.

Developmental Toxicity

Suspected of damaging the unborn child. Stream expected to be toxic to development based on toxicity information for streams having components in common with this stream. Results of developmental toxicity testing indicate alterations in fetal and pup development, which sometimes occurred in the presence of maternal toxicity.

Genetic Toxicity

Not mutagenic. Stream expected to be not mutagenic based on toxicity information for streams having components in common with this stream.

Carcinogenicity

May cause cancer. Stream expected to be carcinogenic based on toxicity information for streams having components in common with this stream. Results obtained from the modified Ames test, from mouse skin painting tests and initiation/promotion assay along with chemical (PAH) analysis indicate that Heavy Fuel Oil streams are carcinogenic.

- *Stop Oil, C20+ Hydrocarbons 68476-53-9*

Other information

No data available.

- *Hydrogen sulfide 7783-06-4*

Acute toxicity

LC50 (Inhl) rat 0.701 MG/L 4 HOURS

Acute effects

Inhalation

Inhalation may cause CNS depression. Damages the respiratory system.

Ingestion

Stream is a gas with a low boiling point; hence, oral exposure and resulting acute toxicity are unlikely.

Irritation

Eyes

Eye irritant.

Target Organs

Eye. Lung. Central nervous system effects. Nasal cavity. Respiratory system. Heart

Repeated dose toxicity

MATERIAL SAFETY DATA SHEET

MSDS No.: BE92
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 09/20/2011

COKER FEED

Repeated inhalation exposure of rats and mice to hydrogen sulfide for 90 days produced decreases in body weight gain and feed consumption at 80 ppm (0.11 mg/L), lesions in the nasal tract and (in rats) lung at \geq 30 ppm (0.04mg/L). Nasal lesions were also observed when rats were exposed to \geq 30 ppm for 10 weeks or \geq 80 ppm for 5 days. Decreased performance in neurological tests has been observed in rats exposed by inhalation to \geq 80 ppm hydrogen sulfide for 5 days; however, no neuropathologic findings were noted when rats and mice were exposed to 80 ppm for 90 days. Rabbits exposed half an hour per day for 5 days to 72 ppm (0.10 mg/L) experienced cardiac arrhythmia.

Reproductive effects

No significant alterations in reproductive performance were observed in rats exposed to 80 ppm (0.111 mg/L) hydrogen sulfide in an inhalation screening study. No treatment-related histopathological changes were found in reproductive organs of rats or mice exposed to up to 80 ppm for 90 days. No adverse effect on spermatogenesis was found when male rats were exposed to 220 ppm (0.306 mg/L) for 7 days, then mated with unexposed virgin females.

Developmental Toxicity

No signs of developmental toxicity, including effects on neurobehavioral performance, were seen in a well-conducted rat inhalation reproduction/developmental toxicity screening study at up to 80 ppm (0.111 mg/L); and no evidence of developmental toxicity was seen in three other studies in which rats were exposed to hydrogen sulfide during gestation at concentrations up to 220 ppm (0.306 mg/L). However, neuro-developmental toxicity studies with offspring of rats exposed to hydrogen sulfide during the gestation and lactation periods have found some alterations that are suggestive of neurotoxicity (e.g., alterations in cerebellar Purkinje cell growth and developmental neurochemical effects) after exposure to 20 ppm (0.028 mg/L). The toxicological significance of these findings in the absence of alterations in neurobehavioral performance is not known.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

12. ECOLOGICAL INFORMATION

Product information

Ecotoxicity

See component summary.

 1221 McKinney St.
 P.O. Box 2583
 Houston, Texas 77252-2583

MSDS No. AP0827**Revision Date** 11/01/06

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Gas/Liquid		
Color	Colorless liquid, invisible vapor.	Odor	Faint, unpleasant, hydrocarbon.

DANGER! Extremely flammable compressed gas/liquid;
 vapor may cause flash fire or explosion!
 High pressure and rapid diffusion hazard!
 High concentrations of vapor reduce oxygen available for
 breathing and may cause central nervous system
 (CNS) depression or suffocation!
 Prolonged and/or repeated inhalation may increase the
 heart's susceptibility to arrhythmias (irregular beats)!
 Liquid or compressed gas contact may cause frostbite
 or freeze burns!

Hazard Rankings

Component Name(s)	CAS Registry No.	Concentration (%)
1) C3-C4 Hydrocarbons	68476-40-4	100
2) Iso-Butane	75-28-5	75-95
3) N-Butane	106-97-8	4-15
4) Propane	74-98-6	1-10

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Skin contact. Eye contact.

Signs and Symptoms of Acute Exposure

Isobutane - Refinery Grade

Inhalation	This gas' vapors can displace the amount of oxygen in air available to breathe below that necessary to sustain life, especially if working in confined spaces. Breathing vapors may also irritate the respiratory tract and cause central nervous system (CNS) depression. Symptoms may include headache, dizziness, slurred speech, excitation or giddiness, nausea, blurred vision, memory loss, drowsiness, fatigue, rapid or difficult breathing, confusion, vertigo, loss of consciousness, convulsions, coma, and even death, depending upon the concentration and duration of exposure.
Eye Contact	This gas is non-irritating; however, direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn."
Skin Contact	Direct contact with a liquefied/pressurized gas may produce severe and possibly permanent skin damage from frostbite or freeze burns.
Ingestion	Ingestion is not an applicable route of exposure for gases.
Chronic Health Effects Summary	Chronic inhalation to components of this gas (propane and n-butane) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of Epinephrine (Adrenaline)-like drugs.
Conditions Aggravated by Exposure	Personnel with pre-existing chronic respiratory diseases, central nervous system (CNS) disease, or cardiovascular conditions should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this gas.
Target Organs	The substance is toxic to heart, skin, eyes, central nervous system (CNS).
Carcinogenic Potential	This product does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC or NTP.

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. Irrigate the eyes with copious amounts of clean, low-pressure, room-temperature water. Do not use hot water! Do not use eye ointment unless directed to by a physician. Seek medical attention if excessive tearing, irritation, or pain persists.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Seek medical attention if tissue appears damaged or if pain persists.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry.
Notes to Physician	If cough or difficulty in breathing develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. Monitor arterial blood gases and chest x-ray in cases with significant exposure. If contact with pressurized or liquefied gas causes frostbite of the eyes, early ophthalmologic consultation is recommended. This material may make the heart more susceptible to arrhythmias. Catecholamines and other sympathomimetic drugs should be reserved for emergency situations and then used only with special precaution.

Isobutane - Refinery Grade

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas		
Flash Point/Method	CLOSED CUP AP -83°C (-118°F) (Estimated)		
Lower Flammable Limit	AP 1.8 %	Upper Flammable Limit	AP 8.4 %
Auto-Ignition Temp.	AP 405°C (761°F)		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, unburned hydrocarbon vapors, and trace oxides of sulfur.		
Special Properties	This gas is flammable at well below ambient temperatures and readily forms flammable mixtures with air. Exposed to an ignition source, it will burn in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources! Being heavier than air, its flammable vapors can travel long distances close to the ground to an ignition source, and then flash back.		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.		
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Compressed Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area upwind. Remove all potential ignition sources. Safety stop the source gas flow using non-sparking tools. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Closed gas systems form white-colored frost at the point of a leak. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Water spray may be used to reduce vapors. Avoid entering a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This gas or waste mixtures containing this gas should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling This gas mixture contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring for oxygen deficiency and flammability.

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of mixed gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Drain and purge equipment as necessary to remove material residues. Ground all containers when transferring material.

Isobutane - Refinery Grade

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Do not allow vaporizing material to contact eyes, skin or other tissues. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated.

Storage

Do not store this material near heat or any other potential ignition sources. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Do not store this product in unlabeled containers. Keep containers tightly closed.

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling liquefied gases. Safety glasses equipped with side shields or face shield are recommended when vapor is being discharged or whenever handling high-pressure cylinders and piping systems.

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves to protect hands from potential contact with cold liquid, solid, or vapors.

Body Protection

Prevent potential skin contact with cold liquid, solid, or vapors. Use insulated and chemical-resistant clothing (apron, slicker suit, coveralls, boots, etc.). Fire-retardant garments (e.g. Nomex®) should be worn while working with flammable gases and gas/liquids.

Respiratory Protection

Odor is not an adequate warning for potentially hazardous air concentrations! For unknown vapor concentrations, use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator, if adequate protection is provided. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).

General Comments

Releases of this gas mixture may cause atmospheres, some oxygen-deficient (LT 21 Vol.% in air), which can have flammable/explosive potential. DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability.

Occupational Exposure Guidelines

Substance

Applicable Workplace Exposure Levels

- 1) Liquefied Petroleum Gases
- 2) Propane
- 3) Butanes

TWA: 1000 (ppm) from ACGIH (TLV) [1998]
 TWA: 1000 (ppm) from OSHA (PEL) [1989]
 TWA: 2500 (ppm) from ACGIH (TLV) [1998]
 TWA: 1000 (ppm) from OSHA (PEL) [1989]
 TWA: 800 (ppm) from ACGIH (TLV) [1998]
 TWA: 800 (ppm) from OSHA (PEL) [1989]

Isobutane - Refinery Grade

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Gas/Liquid	Color	Colorless liquid; invisible vapor	Odor	Faint, unpleasant, hydrocarbon
Specific Gravity	AP 0.57 (Water = 1)	pH	Not applicable.	Vapor Density	AP 2.0 (Air = 1)
Boiling Point/Range	AP -48° to -9°C (-55° to 15°F) at 14.7 psia (ASTM D-2887)			Melting/Freezing Point	AP -160° to -137°C (-255° to -215°F) at 14.7 psia
Vapor Pressure	AP 50 to 75 psia at 40°C (104°F)			Viscosity (cSt @ 40°C)	Not applicable.
Solubility in Water	Slightly soluble in cold water.			Volatile Characteristics	This material is usually stored as a liquid. If open to the atmosphere it will evaporate quickly to form a vapor cloud.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Gross Heat of Combustion at 60°F = AP 21,250 Btu/lb or 3,350 Btu/cu ft., Dry Point Temperature = AP 31°F (-1°C) (ASTM D-86).				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	Iso-Butane: GAS (TCLo): Acute 1,040 gm/m ³ for 2 hours [Mouse] - Excitement. GAS (LC50): Acute 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress
	n-Butane: GAS (LC50): Acute: 660 gm/m ³ for 4 hour(s) [Rat] GAS (LC50): Acute: 680 gm/m ³ for 2 hours [Mouse].

Liquefied Petroleum Gases: When a 4-hour rabbit inhalation screen test was run on a liquefied petroleum gas, no deaths occurred; however, the animal's heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline)

Butanes: Human volunteers had no apparent effects from exposures of 250 ppm, 500 ppm, and 1,000 ppm concentrations in air of isobutane and n-butane for periods of 8 hours daily for 10 days to 14 days, respectively. Chronic inhalation of high concentrations of isobutane may cause liver and/or kidney damage

An n-Butane exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. Laboratory animals have exhibited a higher degree of narcosis when exposed to both butane and butylene (additive effect), than the degree of narcosis exhibited following exposure to either gas alone

Propane: Exposure to 1,000 ppm of propane for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs.

Isobutane - Refinery Grade

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity Ecological effects testing has not been conducted on this material. Releases are expected to cause only localized non-persistent environmental damage.

Environmental Fate Refined liquefied petroleum hydrocarbon gases are essentially insoluble in water (LT 0.1%); and therefore, this material will not cause harm to aquatic life. These liquefied gas mixtures will normally evaporate rapidly if spilled. At ambient temperatures and pressure, the components of this gas may contribute to generation of atmospheric smog in a limited manner.

The atmospheric half-lives of propane and the butanes under photochemical smog conditions are estimated to be between 5 and 7 days. Photooxidation of propane, isobutane, and n-butane in air (LT 8%) are not considered environmentally significant.

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

This material may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be in accordance with applicable Federal, State, and local regulations. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U.S. Department of Transportation regulated material		
Proper Shipping Name	Petroleum gases, liquefied (or Isobutane)		
Hazard Class	CLASS 2.1. Flammable gas.	Packing Group(s)	Not applicable.
		UN/NA ID	UN1075 (or UN1969)
Reportable Quantity	A Reportable Quantity (RQ) has not been established for any components of this material		
Placards		Emergency Response Guide No.	115
		HAZMAT STCC No.	49 057 50
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.

SARA 302/304 The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.

SARA 311/312 The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories:
Fire, Sudden Release of Pressure, and Acute (Immediate) Health Hazards.

HoustonRefining

A Lyondell Company

Isobutane - Refinery Grade

SARA 313	This product contains the following components in concentrations above de minimis levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: No components were identified.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "Hazardous Substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. This product or refinery stream is not known to contain chemical substances subject to this statute. However, it is recommended that you contact state and local authorities to determine if there are any other reporting requirements in the event of a spill.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	The California Safe Drinking Water and Toxic Enforcement Act of 1986 (Proposition 65) requires warning be given for ingredients known to the State of California to cause cancer, birth defects, or other reproductive toxicity. This product does not contain any known chemical substances subject to this statute.
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this product which are subject to this statute are: Propane, Isobutane (Propane, 2-methyl), and Butane

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION	Logo and Manufacturer name change.
Version Number	12.1
Revision Date	11/01/06

2. HAZARDS IDENTIFICATION

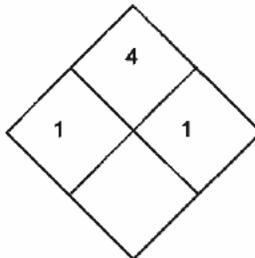

Emergency Overview

This material is HAZARDOUS by OSHA Hazard Communication definition.

Hazards

Extremely flammable gas. Vapor may cause flash fire or explosion. High Pressure and rapid diffusion hazard. May cause frostbite or freeze burns. CNS depressant. Simple asphyxiant. Possible cardiac Sensitizer. Stream Components have been shown to cause reproductive and developmental toxicity in laboratory animals following repeated inhalation exposure. This stream contains genotoxic and carcinogenic components.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE204
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

NORMAL BUTANE

Odor Threshold

No Data Available.

Potential health effects

Routes of exposure

Inhalation. Skin. Eye.

Acute effects

See components summary.

- *Propane 74-98-6*

Inhalation of very high concentrations may cause asphyxia, anesthesia, CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe overexposure), and possible cardiac sensitization.

- *Isobutane 75-28-5*

CNS depressant. Can cause cryogenic burns to eyes and skin. Simple asphyxiant.

- *n-Butane 106-97-8*

Simple asphyxiant. Inhalation of vapors may cause dizziness, narcosis, nausea or asphyxiation. CNS depressant.

- *1-Butene 106-98-9*

CNS depressant. Simple asphyxiant. Contact with liquid may cause frostbite.

- *Isobutylene 115-11-7*

Simple asphyxiant, high concentrations can displace oxygen and cause drowsiness and dizziness. Liquid contact may cause cryogenic burns (frostbite).

- *1,3-Butadiene 106-99-0*

May be irritating to the eyes, skin, and respiratory system. CNS depressant.

- *Isopentane 78-78-4*

This product may cause eye, skin, and respiratory tract irritation. High concentrations may cause central nervous system (CNS) depression. Ingestion would likely cause gastrointestinal tract irritation.

- *n-Pentane 109-66-0*

Aspiration hazard. May cause central nervous system depression.

- *Trans-butene-2 624-64-6*

Simple asphyxiant. Contact with liquid may cause frostbite.

- *2-Butene 107-01-7*

CNS depressant. Simple asphyxiant. Contact with liquid may cause frostbite.

- *Hydrogen sulfide 7783-06-4*

Hydrogen sulfide is a highly toxic gas that can be fatal in certain concentrations. Skin absorption hazard. Respiratory tract irritant. Inhalation may cause asthma-like symptoms, including coughing, wheezing, tightness of chest, shortness of breath, and headache. Higher exposures can cause a build-up of fluid in the lungs (pulmonary edema), with severe shortness of breath. CNS depressant.

- *Methyl Mercaptan 74-93-1*

CNS depressant. May be irritating to the eyes.

- *Ethyl Mercaptan 75-08-1*

Harmful if swallowed.

- *Dimethyl Disulfide 624-92-0*

Respiratory tract irritant. CNS depressant.

- *Carbon Disulfide 75-15-0*

Can be fatal if large amounts are inhaled or ingested.

Skin

Dermal contact with rapidly evaporating liquid could result in freezing of the tissues or frostbite.

Inhalation

Inhalation of vapors may cause respiratory distress and CNS effects. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending on upon level of exposure concentration and/or duration.

Eyes

This gas is non-irritating; but direct contact with liquified/pressurized gas or frost particles may produce severe and possibly permanent eye damage from freeze burns.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE204
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

NORMAL BUTANE

Ingestion

Not a route of exposure for a gas.

Chronic effects

Repeated exposure, reproductive and developmental, genotoxic, and cancer hazard. See chapter 11. Toxicological information

- *Propane 74-98-6*

No reports of human health hazards were found.

- *Isobutane 75-28-5*

Reproductive and developmental effects were present in test animals.

- *n-Butane 106-97-8*

Repeated or prolonged exposure to low levels of this material produces no known adverse chronic health hazards.

- *1-Butene 106-98-9*

No adverse chronic human health effects have been reported for this material.

- *Isobutylene 115-11-7*

Component(s) caused cancer and/or birth defects in lab animals.

- *1,3-Butadiene 106-99-0*

Known human carcinogen. Reproductive and developmental effects were present in test animals.

- *Isopentane 78-78-4*

Repeated or prolonged exposure of the skin to this material may cause defatting and drying of the skin. This substance is a developmental toxicant.

- *n-Pentane 109-66-0*

Repeated or prolonged exposure of the skin to this material may cause defatting and drying of the skin.

- *Trans-butene-2 624-64-6*

No known chronic health effects.

- *2-Butene 107-01-7*

Repeated exposures of rats for ~6 wk to 2500 and 5000 ppm (5.7 and 11.5 mg/L) 2-butene (cis and trans) caused reduced bodyweight parameters but no evidence of organ toxicity.

- *Hydrogen sulfide 7783-06-4*

Prolonged or repeated breathing of high concentrations may cause symptoms of central nervous system depression.

Repeated exposure may cause eye damage with possible loss of vision.

- *Methyl Mercaptan 74-93-1*

Component caused a decrease in body weight gain in lab animals.

- *Ethyl Mercaptan 75-08-1*

May cause nausea. Repeated or prolonged exposure may irritate the mucous membranes.

- *Dimethyl Disulfide 624-92-0*

Component caused a decrease in body weight gain in lab animals.

- *Carbon Disulfide 75-15-0*

Central nervous system effects.

Aggravated Medical Condition

Personnel with pre-existing chronic respiratory diseases should avoid exposure to this material. This material may aggravate existing cardiovascular disease or function. Persons with chronic respiratory disease may be at increased risk.

4. FIRST AID MEASURES

General advice

Take proper precautions to ensure your own health and safety before attempting rescue and providing first aid. For specific information refer to the Emergency Overview in Section 2 of this MSDS.

Skin

The affected frozen tissue area should be placed in a warm water bath, with temperatures at or below 40C. DO NOT use: Dry Heat or Hot water. Rewarming should continue until natural skin tones return to the affected area. Seek medical attention if discomfort persists.

Inhalation

Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. Move the exposed person to fresh air at once. If breathing has stopped, perform artificial respiration. When breathing is difficult, properly trained personnel may assist the affected person by administering oxygen. Keep the affected person warm and at rest. Get medical attention immediately.

Eyes

Check for and remove contact lenses. For contact with cold liquid or gas. Flush eyes with directed stream of lukewarm water for at least 15 minutes. GET MEDICAL ATTENTION IMMEDIATELY.

Ingestion

Ingestion unlikely.

MATERIAL SAFETY DATA SHEET

 Validation Date: 11/05/2010

NORMAL BUTANE

Notes to physician
 Treat symptomatically.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

Extremely flammable gas.

Flash point

~ -60 °C (-76 °F) closed cup (Based on Butane)

Autoignition temperature

~ 287 °C (548.6 °F) (Based on Butane)

Lower explosion limit

1.9 vol% (Based on Butane)

Upper explosion limit

8.5 vol% (Based on Butane)

Extinguishing Media

Suitable extinguishing media

LARGE FIRE: Use waterspray, water fog or foam. DO NOT use straight streams SMALL FIRE: Use dry chemicals, CO2

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies.

Precautions for fire-fighting

DO NOT extinguish a leaking gas fire unless leak can be stopped. Fires involving this material should not be extinguished unless the source flow can be stopped immediately. Shut off the source and allow the fire to burn itself out. If it can not be shut off immediately, all exposed equipment and surfaces must be cooled with water to prevent over-heating, flash backs, or explosions. Control fire until source can be shut off. Potential explosion hazard from reignition, if fire is put out without shutting off source. Releases flammable vapors below normal ambient temperatures. Flammable vapors may be heavier than air and travel long distances along the ground before igniting and flashing back to vapor source.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Extremely flammable gas. Release causes immediate fire/explosion hazard. Evacuate all non-essential personnel to an area upwind (at least 1/2 mile in all directions if tanks or tank cars are involved in fire or spill). Stop source of release with non-sparking tools before beginning clean-up or fire extinguishing. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Closed systems form white frost at the point of leak. Do not direct water at spill or source of leak. Eliminate all sources of ignition. Let evaporate. If possible, turn leaking container so that gas escapes rather than liquid. Do not direct water at spill or source. Use water spray curtain to divert vapor drift. Prevent entry into sewers, basements or confined areas. Caution: When in contact with refrigerated/cryogenic liquids, many materials become brittle and are likely to break without warning. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Liquid spills will vaporize forming cold dense vapor clouds that do not readily disperse. Avoid vapor cloud even with proper respiratory equipment. Contain spill with dike to prevent entry into sewers or waterways.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE204
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

NORMAL BUTANE

7. HANDLING AND STORAGE

Handling

Odor is not an adequate warning of potentially hazardous ambient air concentrations. Releases of these gases may cause atmospheres, some oxygen deficient, which can have flammable/explosive potential. Do not enter such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability. During transfer of product, ground container and insure that all conveying equipment is properly grounded. Consult the U.S. National Fire Protection Association standard for the storage and handling of liquified petroleum gases (NFPA No. 58) for additional recommendations.

Storage

Store in tightly closed/properly vented containers away from ignition sources, reducing agents, foreign metals, strong acids, or water. Keep containers tightly closed and in a well-ventilated place. Store away from oxidizers and other combustible material by a distance of at least 20 feet. Keep container tightly closed and properly labeled. Securely chain cylinders when in use and protect against physical damage. Store below 100°F (38°C). Protect from dampness, salt or corrosive materials. Store and transport in an upright container.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Personal protective equipment

Inhalation

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). When workers are facing concentrations above the exposure limit they must use appropriate certified respirators.

Skin

Use chemical resistant gloves appropriate to conditions of use. Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use.

Eyes

Wear safety glasses as minimum eye protection. Conditions may warrant the use of chemical goggles and possibly a face shield. Consult your standard operating procedure or safety professional for advice. Use protective eye and face devices that comply with ANSI Z87.1-1987.

Remarks

Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure.

Occupational Exposure Limits

NORMAL BUTANE

Other physico-chemical properties: Low boiling point intensifies pressure and rapid diffusion hazard.

10. STABILITY AND REACTIVITY

Chemical stability

This product is stable when properly stored and is not expected to polymerize.

Conditions to avoid

Heat, sparks, open flames and strong oxidizing conditions.

Materials to avoid

Strong acids, bases, and oxidizing agents, such as liquid chlorine and oxygen. Halogens (bromine, chlorine, fluorine). Peroxides. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.

Hazardous decomposition products

Carbon Monoxide and Carbon dioxide. When heated to decomposition it emits acrid smoke and fumes. Unburned hydrocarbons.

11. TOXICOLOGICAL INFORMATION

Product information

Product Summary

Data for components are used as surrogate data for the health characterization of this product. Inhalation of very high concentrations of the Product may cause asphyxia, anesthesia, CNS stimulation followed by CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure), and possible cardiac sensitization. If hydrogen sulfide is present, other neurological effects and respiratory tract irritation and/or damage may also be produced. Exposure to methyl or ethyl mercaptans, dimethyl sulfide, dimethyl disulfide or carbon disulfide, if present, may also cause irritation of mucous membranes. Dangerous levels of hydrogen sulfide and methyl or ethyl mercaptan may not be detected by odor. Exposure to acetonitrile, if present, may also cause difficult or painful breathing, lung damage, respiratory tract irritation and corneal opacity. Very little of this Product is likely to be absorbed through the skin. Skin or eye irritation is not likely, but evaporating liquid might cause frost injuries. Skin sensitization is not expected. Available animal data for components of the stream demonstrate repeated exposure toxicity by the inhalation route of exposure, with species differences in affected target organ toxicity. Stream Components have been shown to cause reproductive and developmental toxicity in laboratory animals following repeated inhalation exposure. This stream contains genotoxic and carcinogenic components.

Acute toxicity

<u>LC50 (Inhl).</u> <u>(predicted:</u> <u>mixture of cis-</u> <u>and trans-2-</u> <u>butene)</u>	rat	23 MG/L (10,000 PPM)	4 HOURS
<u>LC50 (vapor).</u> <u>Based on</u> <u>isopentane.</u> <u>(predicted)</u>	mouse	413 MG/L (140,000 PPM)	2 HOURS

Acute effects

Inhalation

Stream expected to have a low order of acute inhalation toxicity based on toxicity information for components present at > 1%; however, stream occasionally contains hydrogen sulfide, methyl mercaptan, ethyl mercaptan, carbon disulfide and/or acetonitrile at levels that may be dangerous to life and health (i.e., greater than 100 ppm, 150 ppm, 500 ppm, 500 ppm and 500 ppm respectively); and may contain dimethyl sulfide at levels causing 50% lethality in rats and mice (805 ppm and 500

MATERIAL SAFETY DATA SHEET

MSDS No.: BE204
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

NORMAL BUTANE

ppm, respectively).

Ingestion

Stream is a gas with a low boiling point; hence, oral exposure and resulting acute toxicity are unlikely.

Skin contact

Stream is a gas with a low boiling point; hence, dermal uptake and resulting acute toxicity are unlikely.

Irritation

Skin

None expected. Evaporating liquid may cause frost bite.

Eyes

None expected. Evaporating liquid may cause frost bite.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

See component summary.

Repeated dose toxicity

May be toxic following repeated inhalation exposure to very high concentrations. Repeated inhalation exposure of rats to a stream containing components in common with this product, at 10,000 ppm for 13 weeks produced no treatment-related general systemic effects; however, available animal data for components of the product demonstrate repeated exposure toxicity with species differences in affected target organs. The stream components demonstrating significant toxicity following repeated inhalation exposures are propane, isobutylene, 2-butene, hydrogen sulfide, methyl mercaptan, ethyl mercaptan, dimethyl sulfide, carbon disulfide and acetonitrile; and their reported toxicological effects include: decreased body weight/weight gain; effects on the nasal tract, forestomach, cardiovascular system, hematopoietic and nervous systems, lung, adrenal gland, thymus, liver, spleen and kidney; changes in clinical chemistry parameters; nausea; irritation of mucous membranes; ocular effects; and a rise in olfactory threshold.

Reproductive effects

May cause reproductive toxicity. In a 13-week inhalation toxicity study conducted in rats, a stream having components in common with this stream produced no effects on reproductive organ weight or pathology; estrus cycle; or sperm count, motility or morphology. Available information from studies conducted in laboratory animals with most components of this stream (n-butane, propane, propylene, 1-butene, isobutylene, 2-butene, n-pentane, ethane, cyclopentane, 2-methyl-2-butene) shows no evidence of an effect on reproductive performance or reproductive organs at high inhalation doses. The component hydrogen sulfide produced no evidence of reproductive toxicity at 80 ppm (0.111 mg/L). Other minor components (dimethyl sulfide, dimethyl disulfide, acetonitrile) produced no effects on reproductive organs in rats and/or mice after repeated oral or inhalation exposures. Three components (isobutane, 1,3-butadiene and carbon disulfide) have demonstrated possible reproductive toxicity. These effects included an increase in post-implantation loss, testicular and ovarian atrophy, and changes in sperm head morphology and in humans, possible changes in male reproductive function.

Developmental Toxicity

May be toxic to the developing embryo/fetus. No signs of developmental toxicity were seen in rats in an inhalation developmental toxicity study conducted with a stream having components in common with this stream. Available information from studies conducted in laboratory animals at high inhalation doses with most components of this stream (propane, propylene, n-butane, 1-butene, isobutylene, 2-butene, n-pentane, ethane, 2-methyl-2-butene) shows no evidence of developmental toxicity. Some components (isobutane, 1,3-butadiene, hydrogen sulfide, dimethyl disulfide and carbon disulfide) have demonstrated possible developmental toxicity. These effects included decreased fetal weight and pup viability and increased pre- and post-implantation loss, retarded development, alterations in cerebellar Purkinje cell growth, developmental neurochemical effects, and skeletal and visceral malformations.

Genetic Toxicity

May be genotoxic. A stream with components in common with this stream was negative in a micronucleus assay in rats exposed by inhalation. Most components of normal-Butane have produced negative results in a variety of in vitro and in vivo genotoxicity studies; however, two stream components (2-methyl-2-butene and 1,3-butadiene) have caused gene mutation and/or chromosome damage in rats and/or mice after inhalation exposure, and another component (cyclopentane) was positive in an in vitro chromosome aberrations assay but negative in an in vivo micronucleus assay. Studies to assess genetic damage in humans exposed to the stream component 1,3-butadiene have returned inconsistent or equivocal results. Acetonitrile (a component present at <= 1200 ppm) showed weak clastogenic activity in cultured mammalian cells

NORMAL BUTANE

Developmental Toxicity

and in a mouse bone marrow micronucleus test; however, negative results were obtained in two other micronucleus tests. Acetonitrile induced aneuploidy in yeast and oocytes of fruit flies.

Carcinogenicity

This product contains carcinogenic components. Cancer data for components are used as surrogate data for this product.

COMPONENT INFORMATION

- *Propane* 74-98-6

Acute toxicity

LC50 (vapor) rat >1443 MG/L 0.25 HOURS

Acute effects

Inhalation

Inhalation of very high concentrations may cause asphyxia, anesthesia, CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe overexposure), and possible cardiac sensitization.

Ingestion

Propane is a compressed gas; hence oral exposure and resulting acute toxicity are unlikely.

Skin contact

Evaporating liquid might cause frost injuries. Very little propane is likely to be absorbed through the skin.

Irritation

Skin

Propane is not likely to cause skin irritation, but evaporating liquid might cause frost injuries.

Eyes

There is no evidence to suggest this material may cause eye irritation. Liquid contact may cause cryogenic burns (frostbite).

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

CNS depressant. Cardiac sensitization. Eye. Skin.

Repeated dose toxicity

Repeated inhalation exposures of rats for 4-6 weeks to 12,000 ppm (21.64 mg/L) propane caused no general systemic or neurotoxic effects apart from a reduction of body weight/weight gain in males. No adverse effects were noted when human subjects were exposed to 1000 ppm (1.80 mg/L) propane for 2 weeks.

Reproductive effects

No signs of reproductive toxicity were observed in an inhalation screening test of rats exposed up to 12,000 ppm (21.64 mg/L) propane.

Developmental Toxicity

No signs of developmental toxicity were observed in an inhalation screening test of rats exposed to up to 12,000 ppm (21.64 mg/L) propane.

Genetic Toxicity

Propane was negative in an in vitro test for bacterial gene mutation.

Carcinogenicity

No Data Available.

- *Isobutane* 75-28-5

NORMAL BUTANE

Acute toxicity

<u>LC50 (Inhl)</u>	mouse	1237 MG/L	2 HOURS
	rat	31 MG/L	4 HOURS

Acute effects

Inhalation

Simple asphyxiant.

Irritation

Skin

Dermal contact with rapidly evaporating liquid could result in freezing of the tissues or frostbite.

Eyes

None expected. Evaporating liquid may cause frost bite.

Target Organs

CNS depressant.

Repeated dose toxicity

No biologically significant treatment-related systemic effects were seen when rats were exposed by inhalation for 4-6 weeks to 9000 ppm (21.4 mg/L) isobutane. No adverse effects were noted when human subjects were exposed to 500 ppm (1.19 mg/L) isobutane for 2 weeks.

Reproductive effects

An exposure-related increase in post-implantation loss, in the absence of parental toxicity, was observed in an inhalation screening test of rats exposed to 9000 ppm (21.39 mg/L) isobutane.

Developmental Toxicity

An exposure-related increase in post-implantation loss, in the absence of parental toxicity, was observed in an inhalation screening test of rats exposed to 9000 ppm (21.39 mg/L) isobutane.

Carcinogenicity

This substance is not classified for carcinogenicity by IARC, OSHA, NTP, or the EPA.

Developmental Toxicity

No signs of developmental toxicity were observed in an inhalation screening test of rats exposed to up to 9000 ppm (21.39 mg/L) n-butane.

- *1-Butene* 106-98-9

Acute effects

Inhalation

Simple asphyxiant.

Ingestion

Stream is a gas with a low boiling point; hence, oral exposure and resulting acute toxicity are unlikely.

Skin contact

Stream is a gas with a low boiling point; hence, dermal uptake and resulting acute toxicity are unlikely.

Target Organs

No significant hazards.

Repeated dose toxicity

No biologically significant treatment-related systemic effects were seen when rats were exposed for 4 wk to 8000 ppm (18.4 mg/L) 1-butene.

Reproductive effects

No treatment-related reproductive toxicity was observed in an inhalation screening test of rats exposed to up to 8000 ppm (18.4 mg/L) 1-butene.

Developmental Toxicity

No developmental toxicity or teratogenicity was observed in a screening test of rats exposed to 8000 ppm (18.4 mg/L) 1-butene.

Genetic Toxicity

1-Butene was not genotoxic in tests that evaluated mutations and chromosomal aberrations.

- *Isobutylene* 115-11-7

Acute effects

Ingestion

Isobutylene is a gas with a low boiling point; hence, oral exposure and resulting acute toxicity are unlikely.

Skin contact

Isobutylene is a gas with a low boiling point; hence, oral exposure and resulting acute toxicity are unlikely.

Irritation

Skin

Rapid evaporation of the liquid may cause frostbite.

Eyes

Rapid evaporation of the liquid may cause frostbite.

Target Organs

Eye. Skin. Respiratory system. central nervous system (CNS) Cardiac sensitization.

Reproductive effects

No biologically significant effects on male or female reproductive organs/parameters were observed in repeated dose inhalation studies in rats or mice at concentrations up to 8000 ppm (18.4 mg/L).

Developmental Toxicity

MATERIAL SAFETY DATA SHEET

MSDS No.: BE204
 Variant: U.S.A.-BN
 Revision: 1.1
 Validation Date: 11/05/2010

NORMAL BUTANE

Developmental Toxicity

No signs of developmental toxicity were observed in a screening inhalation test of rats exposed to up to 8000 ppm (18.4 mg/L) isobutylene.

Genetic Toxicity

Isobutylene was not genotoxic in tests conducted in vitro at concentrations up to 100% and in vivo at concentrations up to 10,000 ppm (22.9 mg/L). Isobutylene is metabolized to 2-methyl-1,2-epoxypropane, a substance shown to be genotoxic in some in vitro tests; however this conversion is of doubtful significance to isobutylene genotoxicity as all the tests of isobutylene are negative.

Carcinogenicity

Isobutylene produced an increase in follicular cell carcinomas of the thyroid in male rats following inhalation exposures to 8000 ppm (18.4 mg/L) for 2 years. Thyroid tumors did not occur in male rats exposed to lower doses, or to female rats or male or female mice.

- *1,3-Butadiene 106-99-0*

Acute toxicity

<u>LC50 (Inhl)</u>	rat	285 MG/L	4 HOURS
	mouse	267 MG/L	4 HOURS

Acute effects

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations.

Ingestion

There are no known reliable studies regarding toxicity in humans or animals after oral exposures.

Skin contact

There are no known reliable studies regarding systemic toxicity in humans or animals after dermal exposures. There are no known reliable studies regarding sensitization in test animals. However, human experience suggests that it is unlikely to cause allergic skin conditions.

Irritation

Skin

Dermal contact with rapidly evaporating liquid could result in freezing of the tissues or frostbite. There are no known reliable studies regarding systemic toxicity in humans or animals after dermal exposures. There are no known reliable studies regarding sensitization in test animals. However, human experience suggests that it is unlikely to cause allergic skin conditions.

Eyes

Vapor may be irritating to the eye, especially at high concentrations.

Target Organs

Respiratory system. Lymphohematopoietic system. Gonads. Liver. Damages the heart. Central nervous system.

Repeated dose toxicity

Butadiene is highly toxic in the mouse, producing lesions in a range of tissues (including ovary, testis, lung, liver, bone marrow, thymus, forestomach and heart) after repeated inhalation exposure. No comparable changes occurred in rats or other laboratory animal species, hence the relevance of these findings to humans is that it is a known carcinogen.

Reproductive effects

Testicular- and ovarian atrophy, and changes in sperm head morphology, have been reported in mice following repeated exposure to butadiene vapor, however no adverse effects on fertility or reproduction have been reported.

Developmental Toxicity

Results from animal studies demonstrate that butadiene is not a teratogen, however mild fetotoxicity (primarily retarded development) has been observed in rodents exposed to high levels of butadiene vapor during pregnancy. These effects generally occur at exposures that also produce maternal toxicity.

Genetic Toxicity

Butadiene is genotoxic in the mouse, and induces micronuclei, chromosomal aberrations and gene mutations after

MATERIAL SAFETY DATA SHEET

MSDS No.: BE204
 Variant: U.S.A.-BN
 Revision: 1.1
 Validation Date: 11/05/2010

NORMAL BUTANE

Developmental Toxicity

Inhalation exposure. Most studies with rats are negative; however, butadiene produced hprt mutations in rats, but at a concentration much higher than that required for mice. Studies to assess genetic damage in exposed worker populations have returned inconsistent or equivocal results.

Carcinogenicity

Animal data demonstrate marked species difference in carcinogenic response to butadiene. In the mouse, long term inhalation exposure is associated with an increased incidence of benign and malignant cancers in a wide range of tissues, whereas a more limited tumor profile is seen in the rat. Epidemiology studies suggest butadiene may be carcinogenic in humans with a concern for cancers of the lymphohematopoietic system. Listed by IARC as "carcinogenic to humans" (Group 1), on the basis of "sufficient evidence" in humans of an increased risk for leukemias. Listed by NTP as known to be a human carcinogen in their Report on Carcinogens, current edition. This listing was based on sufficient evidence of carcinogenicity in humans, including epidemiologic and mechanistic information, to indicate a causal relationship between occupational exposure to 1,3-butadiene and excess mortality from lymphatic and hematopoietic cancers.

- *Isopentane* 78-78-4

Acute toxicity

<u>LC50 (Inhl)</u>	mouse	413 MG/L	2 HOURS
	rat	1281.9 MG/L	4 HOURS

Irritation

Skin

Defatting of the skin with irritation, dryness and cracking.

Eyes

Slight eye irritant.

Target Organs

Skin. Eye.

Repeated dose toxicity

Repeated oral gavage exposures of rats to 500 mg/kg bwt/day isopentane produced lethality and decreases in bodyweight gain.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

Eye irritant.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE204
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

NORMAL BUTANE

Target Organs

Eye. Lung. Central nervous system effects. Nasal cavity. Respiratory system. Heart

Repeated dose toxicity

Repeated inhalation exposure of rats and mice to hydrogen sulfide for 90 days produced decreases in body weight gain and feed consumption at 80 ppm (0.11 mg/L), lesions in the nasal tract and (in rats) lung at $>_{=}$ 30 ppm (0.04mg/L). Nasal lesions were also observed when rats were exposed to $>_{=}$ 30 ppm for 10 weeks or $>_{=}$ 80 ppm for 5 days. Decreased performance in neurological tests has been observed in rats exposed by inhalation to $>_{=}$ 80 ppm hydrogen sulfide for 5 days; however, no neuropathologic findings were noted when rats and mice were exposed to 80 ppm for 90 days. Rabbits exposed half an hour per day for 5 days to 72 ppm (0.10 mg/L) experienced cardiac arrhythmia.

Reproductive effects

No significant alterations in reproductive performance were observed in rats exposed to 80 ppm (0.111 mg/L) hydrogen sulfide in an inhalation screening study. No treatment-related histopathological changes were found in reproductive organs of rats or mice exposed to up to 80 ppm for 90 days. No adverse effect on spermatogenesis was found when male rats were exposed to 220 ppm (0.306 mg/L) for 7 days, then mated with unexposed virgin females.

Developmental Toxicity

No signs of developmental toxicity, including effects on neurobehavioral performance, were seen in a well-conducted rat inhalation reproduction/developmental toxicity screening study at up to 80 ppm (0.111 mg/L); and no evidence of developmental toxicity was seen in three other studies in which rats were exposed to hydrogen sulfide during gestation at concentrations up to 220 ppm (0.306 mg/L). However, neuro-developmental toxicity studies with offspring of rats exposed to hydrogen sulfide during the gestation and lactation periods have found some alterations that are suggestive of neurotoxicity (e.g., alterations in cerebellar Purkinje cell growth and developmental neurochemical effects) after exposure to 20 ppm (0.028 mg/L). The toxicological significance of these findings in the absence of alterations in neurobehavioral performance is not known.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

Acute effects

Inhalation

No human information is available.

Ingestion

No human information is available.

Skin contact

There are no known reliable studies regarding systemic toxicity in humans or animals after dermal exposures.

Target Organs

Nasal cavity. Skin irritant.

Repeated dose toxicity

Rats exposed to dimethyl disulfide by inhalation for 6 hr/day, 5 days/week for 90 days showed decreased body weight gain, changes in clinical chemistry parameters and reversible microscopic changes in the nasal mucosa (> 10 ppm/0.039 mg/L); reduced food consumption (> 25 ppm/0.096 mg/L); decreased thymus weight and increased adrenal gland weight (125 ppm/0.482 mg/L); and marginal changes in hematology parameters (females at 250 ppm/0.96 mg/L); but no evidence of neurotoxicity. Domestic fowl administered dimethyl disulfide orally at total daily doses of 300 µg for 6 days and 600 µg for 6 days, showed signs of neurotoxicity and hemolytic anemia. Dermal exposure of rabbits to dimethyl disulfide on 5 days/week (10.63 and 106.3 mg/kg bwt/day for 4 weeks; and 1063 mg/kg bwt/day for 2 1/2 weeks) produced mortality in the high dose, lethargy in the mid and high doses, differences in some hematology and clinical chemistry parameters in high dose males, and severe, dose-related skin irritation in all dose groups.

Reproductive effects

No effects on reproductive organs were observed in rats following inhalation of dimethyl disulfide for 90 days at concentrations up to 250 ppm (0.96 mg/L).

Developmental Toxicity

In an inhalation developmental toxicity study in rats administered up to 50 ppm (0.193 mg/L) dimethyl disulfide on gestation days 6 to 15, a reduction in fetal weight and an increase in retarded ossification were seen at 50 ppm, in the presence of maternal toxicity (reduced body weight gain), but there was no evidence of teratogenicity.

Genetic Toxicity

Predominantly negative results were obtained with dimethyl disulfide when tested in vitro (negative in assays for bacterial and mammalian cell gene mutation and bacterial DNA damage and repair, ambiguous positive for chromosome aberrations

<u>LD50 (Oral)</u>	rat	11400 MG/KG BWT
	mouse	12800 MG/KG BWT

Acute effects

Inhalation

Acute effects may include vertigo, drowsiness, fatigue, blurred vision, headache and/or eye and throat irritation. High concentrations in air may be narcotic and depress the central nervous system (CNS) with symptoms including headache, breathing difficulty, dizziness, drowsiness, loss of coordination, weakness, nausea, and vomiting.

Ingestion

May be harmful if swallowed.

Skin contact

No human information is available.

Irritation

Skin

May produce blisters.

Eyes

Specific data not available.

Sensitization

no data available

Target Organs

Central nervous system effects. Skin.

Repeated dose toxicity

Neurotoxic effects on the central and peripheral nervous systems were consistently observed in rodents following inhalation exposure to carbon disulfide (CS₂) at > 250 ppm (0.8 mg/L). Other effects observed in laboratory animals repeatedly exposed to CS₂ include decreases in body weight gain and changes in hematology parameters at > 300 ppm, hepatotoxicity at > 400 ppm, cardiovascular effects at > 321 ppm (1.0 mg/L), ocular effects at > 256 ppm (0.8 mg/L), and kidney effects in male mice at 800 ppm (2.5 mg/L). Male rabbits exposed to CS₂ at concentrations that increased from 250 ppm (0.8 mg/L) to 750 ppm (2.3 mg/L) over 38 weeks also showed effects on the adrenal gland, spleen, and kidney. The central and peripheral nervous systems appear to be the critical targets for CS₂-induced toxicity in humans. Other effects for which there is considerable weight of evidence in humans exposed to CS₂ by inhalation include alterations in serum lipids and blood pressure that are associated with increased risk of cardiovascular disease, and ocular effects. Specialized oral toxicity studies with rats administered CS₂ showed reductions in body weight (253 mg/kg bwt/day for 4 weeks) and anemia (25 mg/kg bwt/day for 60 days).

Reproductive effects

Inhalation exposure of female rats to 250 ppm (0.78 mg/L) carbon disulfide produced no reproductive toxicity; but exposure to 500 ppm (1.6 mg/L) produced litter loss, increased pup mortality and decreased pup viability and live litter size, in the presence of maternal toxicity (decreased body weight gain). Exposure of male rats to 600 ppm (1.9 mg/L) for 10 weeks affected mating behavior but there were no clear effects on sperm counts, circulating levels of reproductive hormones or testicular histology; and sperm counts and reproductive organ weights were not affected by exposure to 900 ppm (2.8 mg/L) for 12 weeks. There are reports of reduced libido and/or impotence in male workers exposed to high concentrations.

Developmental Toxicity

MATERIAL SAFETY DATA SHEET

MSDS No.: BE204
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

NORMAL BUTANE

Developmental Toxicity

In developmental toxicity studies with rodents, inhalation of carbon disulfide produced decreased fetal weight and pup viability and increased pre- and post-implantation loss at >_400 ppm (1.2 mg/L) and teratogenic effects (unossified sternabrae in rats at 800 ppm [2.5 mg/L]; combined skeletal and visceral malformations in rabbits at 1200 ppm [3.7 mg/L]), generally in the presence of maternal toxicity (decreased bodyweight gain and, at 1200 ppm, CNS effects). Other studies of uncertain validity have reported teratogenic effects (club foot, hydrocephalus, microcephalus) and/or neurological effects, including behavioral alterations, in offspring of rats exposed to concentrations as low as 3.2 ppm (0.01 mg/L). There is no clear evidence of effects of carbon disulfide on human development.

Persistence and degradability

Biodegradation: Expected to be biodegradable

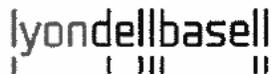

Bioaccumulation: This material is not expected to bioaccumulate.

- *n-Butane* 106-97-8

Ecotoxicity

This material is expected to be non-hazardous to aquatic species.

Environmental fate and pathways

MATERIAL SAFETY DATA SHEET

MSDS No.: BE204
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

NORMAL BUTANE

This material is likely to evaporate from soil and water.

Persistence and degradability

Stability in water: Not likely to adsorb to suspended solids and sediment in water.

Stability in soil: Expected to have very high to moderate mobility in soils. Volatilization from surface soil may be quite rapid, although this process may be slowed by dicyclopentadiene's adsorption to the soil. This compound is expected to display low mobility. Biodegradation and hydrolysis are not expected to be significant factors.

Biodegradation: Biodegradation may occur in soil and water, however, volatilization and adsorption are expected to be far more important fate processes.

Bioaccumulation: This material is not expected to bioaccumulate.

- *1-Butene* 106-98-9

Ecotoxicity

No Data Available.

Environmental fate and pathways

Persistence and degradability

Stability in water: Not likely to adsorb to suspended solids and sediment in water.

Stability in soil: Expected to have very high to moderate mobility in soils. Volatilization from moist soil surfaces is expected.

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: Not expected to bioaccumulate in aquatic organisms.

- *Isobutylene* 115-11-7

Ecotoxicity

No additional information available.

Acute Fish toxicity

/96.0 HOURS fish. 19 mg/l

Summary: (estimation)

Acute toxicity to aquatic invertebrates

/48 HOURS Daphnia 16 mg/l (estimation)

Summary: (estimation)

Toxicity to aquatic plants

/96 HOURS green algae. 6.9 mg/l

Summary: (estimation)

Toxicity to microorganisms

Summary: study scientifically unjustified

Chronic toxicity to fish

/30 d fish. 2 mg/l

Summary: (estimation)

Chronic toxicity to aquatic invertebrates

Daphnia 1.6 mg/l

Summary: (estimation)

MATERIAL SAFETY DATA SHEET

MSDS No.: BE204
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

NORMAL BUTANE

Environmental fate and pathways

Mobility

Behavior in environmental compartments: Expected to exist solely as a vapor in the ambient atmosphere. Partitioning mainly to air.

Predicted distribution to environmental compartments: After release, disperses into the air.

Persistence and degradability

Stability in soil: Expected to have high mobility in soils. Volatilization from moist soil surfaces is expected.

Biodegradation: Inherently biodegradable. Photodegradation following atmospheric release is expected to be the most significant route of degradation in the environment.

Bioaccumulation: Bioaccumulation is unlikely.

- *1,3-Butadiene* 106-99-0

Ecotoxicity

Due to the physio-chemical characteristics of this material, no reliable test data are available.

Environmental fate and pathways

The atmosphere is the main environmental compartment for released butadiene where it will react rapidly with hydroxyl radicals (half-life 1 - 10 hr) and ozone (half-life 8 - 48 hr). In water, volatilization will result in substantial losses to the atmosphere with a half-life of about 4 hr.

Persistence and degradability

Biodegradation: Not readily biodegradable (but would be lost from open waters by evaporation).

Bioaccumulation: Bioconcentration factor (BCF) 10 - 13 (estimated) Bioaccumulation is unlikely.

- *Isopentane* 78-78-4

Ecotoxicity

This material is toxic to aquatic organisms.

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS *Daphnia magna*. 2.3 mg/l

Environmental fate and pathways

This material is likely to evaporate from soil and water.

Persistence and degradability

Stability in water: Volatilization from water surfaces is expected to be an important environmental fate process.

Stability in soil: Volatilization from moist soil surfaces is expected to be an important fate process of this material.

Biodegradation: This material is expected to be biodegradable.

Bioaccumulation: This material is not expected to bioaccumulate.

- *n-Pentane* 109-66-0

Ecotoxicity

MATERIAL SAFETY DATA SHEET

MSDS No.: BE204

13. DISPOSAL CONSIDERATIONS

Dispose of all waste and contaminated equipment in accordance with all applicable federal, state and local health and environmental regulations. Recovery and reuse, rather than disposal, should be the ultimate goal of handling efforts. The materials resulting from clean-up operations may be hazardous wastes and therefore, subject to specific regulations.

14. TRANSPORT INFORMATION

 Validation Date: 11/05/2010

COKE

Odor Threshold

Specific data not available.

Potential health effects

Routes of exposure

Skin. Inhalation. Eye.

Acute effects

See componentsummary.

- *Coke (Petroleum) 64741-79-3*
 May be irritating to the eyes, skin, and respiratory system.

Skin

Avoid contact with hot product - may cause burns. Dust from this product may cause skin irritation.

Inhalation

Dust from this material may cause respiratory irritation if inhaled.

Eyes

Mechanical irritation is possible.

Ingestion

Ingestion not a likely route of exposure.

Chronic effects

See componentsummary.

- *Coke (Petroleum) 64741-79-3*
 Prolonged contact with the skin may cause mechanical irritation and subsequent dermatitis. Chronic inhalation may cause lung damage.

Aggravated Medical Condition

Personnel with preexisting skin disorders or chronic respiratory diseases should avoid exposure to this product.

3. COMPOSITION/INFORMATION ON INGREDIENTS

<u>Component</u>	<u>CAS-No.</u>	<u>EC-No.</u>	<u>Weight %</u>

4. FIRST AID MEASURES

General advice

Take proper precautions to ensure your own health and safety before attempting rescue and providing first aid. For specific information refer to the Emergency Overview in Section 2 of this MSDS.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE91
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

COKE

Skin

Immediately flush the contact area with plenty of low pressure water to cool the skin. Immediately seek medical attention. Remove contaminated clothing and wash skin with plenty of soap and water. Seek medical attention if discomfort persists. Seek medical attention if ill effect or irritation develops. Wash clothing before wearing again.

Inhalation

Move the exposed person to fresh air at once. If breathing has stopped, perform artificial respiration. When breathing is difficult, properly trained personnel may assist the affected person by administering oxygen. Keep the affected person warm and at rest. Get medical attention immediately.

Eyes

If hot dust or fines enter the eyes, immediately irrigate with large amounts of room-temperature water. Check for and remove contact lenses. Immediately flush the eyes with large amounts of clean low-pressure water for at least 15 minutes, occasionally lifting the upper and lower lids. If pain or irritation persists, promptly obtain medical attention.

Ingestion

Not expected to present a significant ingestion hazard under anticipated conditions of normal use. If product is ingested, do not induce vomiting and contact a physician or Poison Control Center.

Notes to physician

Treat symptomatically.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

Combustible solid.

Flash point

No Data Available.

Autoignition temperature

No Data Available.

Lower explosion limit

Not applicable.

Upper explosion limit

Not applicable.

Extinguishing Media

Suitable extinguishing media

Water mist Foam Dry chemical

Unsuitable extinguishing media

Do not use solid water stream/may spread fire.

Protective equipment and precautions for firefighters

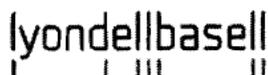

Protective equipment and precautions for firefighters

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies.

Precautions for fire-fighting

Dust may form explosive mixtures with air. Avoid contact with hot material/prevent serious burns. Cool nearby material. Use waterspray/waterfog for cooling. This material may reignite.

Hazardous combustion products

MATERIAL SAFETY DATA SHEET

MSDS No.: BE91
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

COKE

Hazardous combustion products

Incomplete combustion may produce carbon monoxide, sulfur oxides, and other toxic gases.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Contain spill and evacuate all non-essential personnel. Use good housekeeping practices since spilled material may be a slipping hazard. In urban areas, cleanup spill as soon as possible; in natural environments, seek cleanup advice from environmental specialists. Equip cleanup crew with proper protection. On land, vacuum/shovel into suitable disposal containers. Use approved industrial vacuum cleaner for removal. Comply with all laws and regulations.

7. HANDLING AND STORAGE

Handling

Do not handle hot material. All electrical equipment should be grounded and conform to applicable electric codes and regulatory requirements. Electrostatic charges may be generated as a result of flow or agitation. Bond and ground all equipment before transferring this material from one container to another. Dust and fine formation is possible as this material dries. Do not breath dust or fumes and avoid conditions which create dust. Ensure use of appropriate personal protective clothing/equipment, including insulated gloves, if material is hot. Equipment containing this material should be isolated and thoroughly drained, washed and purged prior to maintenance/repair operations. Wash thoroughly after handling.

Storage

Keep container tightly closed and properly labeled. Ground all equipment containing this material. Use good housekeeping practices during storage, transferring and handling. Process enclosures and adequate ventilation should be used to avoid excessive dust accumulation.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Use with adequate ventilation. Emergency shower and eyewash facility should be in close proximity (ANSI Z358.1) Local exhaust and general ventilation must be adequate to meet exposure limit(s). Special ventilation or high-efficiency vacuuming may be required to handle material at elevated temperatures or under mechanical agitation.

Personal protective equipment

Inhalation

When workers are facing concentrations above the exposure limit they must use appropriate certified respirators.

Skin

Use chemical resistant gloves appropriate to conditions of use. If handling hot material, wear thermal resistant gloves. Where use can result in skin contact, practice good personal hygiene. Wash thoroughly after handling. Use insulated gloves, impervious apron, long sleeves and other protective clothing when handling this material hot, wash clothing frequently. Avoid contact with hot product - may cause burns. Avoid prolonged or repeated contact with skin. When skin contact is possible, protective clothing including gloves, apron, sleeves, boots, head and face protection should be worn. Use a full-body heat-resistant or internally cooled suit when work conditions dictate.

Eyes

Eye protection such as chemical splash goggles and/or face shield must be worn when possibility exists for eye contact due to splashing or spraying liquid, airborne particles, or vapor. Suitable eye wash water should be readily available.

Remarks

MATERIAL SAFETY DATA SHEET

MSDS No.: BE91
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

COKE

Remarks

Use good personal hygiene practices. Wash hands before eating, drinking, smoking, or using toilet facilities. DO NOT use gasoline, kerosene, solvents, or harsh abrasive skin cleaners. Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use.

Occupational Exposure Limits

Consult local authorities for acceptable exposure limits.

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance: solid Black

Odor: Faint, mild hydrocarbon odor.

COMPONENT INFORMATION

- *Coke (Petroleum)* 64741-79-3

Ecotoxicity

This material is expected to have low toxicity to aquatic species. However, due caution should be exercised to prevent the accidental release of this material to the environment.

Environmental fate and pathways

Will either incorporate into sediment or float in the surface, depending on the particle size and density in relation to the water.

13. DISPOSAL CONSIDERATIONS

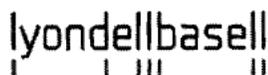

Conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a hazardous waste at the time of disposal. Contact the RCRA/ Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulation (see 40 CFR Parts 260 through 271).

See components summary.

- *Sulfur 7704-34-9*

May be irritating to the eyes, skin, and respiratory system.

- *Hydrogen sulfide 7783-06-4*

Hydrogen sulfide is a highly toxic gas that can be fatal in certain concentrations. Skin absorption hazard. Respiratory tract irritant. Inhalation may cause asthma-like symptoms, including coughing, wheezing, tightness of chest, shortness of breath, and headache. Higher exposures can cause a build-up of fluid in the lungs (pulmonary edema), with severe shortness of breath. CNS depressant.

- *Sulfur dioxide 7446-09-5*

May be harmful or fatal if inhaled. Irritation of the eyes and respiratory system. Can cause severe irritation and burns of the eyes with possible permanent damage. Skin contact can cause severe skin irritation and burns. Contact with liquid may cause frostbite.

Skin

Avoid contact with hot product - may cause burns. Burns may be severe and cause permanent damage. This material may be absorbed through the skin.

Inhalation

Inhalation of the vapor or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath and may cause transient central nervous system (CNS) depression. Hydrogen sulfide is a highly toxic gas that can be fatal in certain concentrations.

Eyes

H₂S vapors may cause moderate to severe eye irritation and photophobia (sensitivity to light).

Ingestion

Ingestion not a likely route of exposure. Harmful if swallowed. Burns may be severe and cause permanent damage.

Chronic effects

See component summary.

- *Sulfur 7704-34-9*

Repeated or prolonged contact with skin may cause allergic sensitization, allergic skin reaction or contact dermatitis.

- *Hydrogen sulfide 7783-06-4*

Prolonged or repeated breathing of high concentrations may cause symptoms of central nervous system depression. Repeated exposure may cause eye damage with possible loss of vision.

- *Sulfur dioxide 7446-09-5*

Lungs may be affected by repeated or prolonged exposure. May cause severe irritation or burns of respiratory system, pulmonary edema, lung inflammation, headache, coughing, difficult breathing, dizziness, chest pains, teeth damage and respiratory failure. Aspiration may cause pulmonary edema and pneumonitis.

Aggravated Medical Condition

Any pre-existing disorders or diseases of the: eyes neurological conditions Persons with pre-existing skin disorders, peripheral or central nervous system (CNS) disease, psychological conditions, cardiac conditions, impaired pulmonary, cardiovascular, or liver/kidney function, or chronic respiratory diseases should avoid exposure

MATERIAL SAFETY DATA SHEET

3. COMPOSITION/INFORMATION ON INGREDIENTS

<u>Component</u>	<u>CAS-No.</u>	<u>EC-No.</u>	<u>Weight %</u>
Sulfur	7704-34-9	231-722-6	99.98 <= 100.0
Hydrogen sulfide	7783-06-4	231-977-3	0.001 <= 0.015
Sulfur dioxide	7446-09-5	231-195-2	0.0 <= 0.01

Typical composition

4. FIRST AID MEASURES

General advice

Take proper precautions to ensure your own health and safety before attempting rescue and providing first aid. For specific information refer to the Emergency Overview in Section 2 of this MSDS.

Skin

If burned by hot material, cool skin by quenching with large amounts of cool water. Call a physician.

Inhalation

Move the exposed person to fresh air at once. If breathing has stopped, perform artificial respiration. When breathing is difficult, properly trained personnel may assist the affected person by administering oxygen. Keep the affected person warm and at rest. Get medical attention immediately.

Eyes

Immediately flush the eyes with large amounts of clean low-pressure water for at least 15 minutes, occasionally lifting the upper and lower lids. If pain or irritation persists, promptly obtain medical attention.

Ingestion

Ingestion unlikely. However, if ingested, obtain emergency medical attention.

Notes to physician

Treat symptomatically.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

OSHA/NFPA Class III B combustible liquid.

Flash point

207 °C (404.6 °F) (Cleveland Closed Cup)

Autoignition temperature

232 °C (449.6 °F) (ASTM E659).

Lower explosion limit

0.35 - 4.3 vol%

Upper explosion limit

14.0 - 45.5 vol%

MATERIAL SAFETY DATA SHEET

MSDS No.: BE166
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 11/05/2010

SULFUR

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: sand CO2 (carbon dioxide) water fog Inert gas - Halon/N2.

Unsuitable extinguishing media

Do not use solid water stream/may spread fire.

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear an approved positive pressure self-contained breathing apparatus and firefighter turnout gear. Structural firefighters' protective clothing is recommended for fire situations ONLY; it is not effective in spill situations.

Precautions for fire-fighting

Vapor is heavier than air, may travel long distance along the ground before igniting and flash back to vapor source. When mixed with air and exposed to ignition source, vapors can burn in open or explode if confined. Evacuate area and fight from a maximum distance or use unmanned hose holders or monitor nozzles. Heat may generate flammable or explosive vapors; disperse with water spray or cover pooling liquid with foam. Containers can build up pressure if exposed to heat; cool with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of vessel. Always stay away from the ends of tanks.

Hazardous combustion products

Oxides of sulfur.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Do not touch or walk through spilled material. If liquid is hot, attempt to confine spill and let the liquid solidify. Equip cleanup crew with proper protection.

7. HANDLING AND STORAGE

Handling

Use good housekeeping practices during use, storage, transfer, and handling. All material sampling should avoid skin contact. Wash thoroughly after handling. Isolate, vent, drain, wash and purge systems or equipment before maintenance or repair. Eliminate every possible source of ignition. Use grounded electrical/mechanical equipment. Containers must be properly grounded before beginning transfer. Check atmosphere for explosiveness and oxygen deficiencies. Observe precautions pertaining to confined space entry.

Storage

Keep container tightly closed and properly labeled. Ground all equipment containing this material. Electrical installations should be in accordance with Articles 500 and 501 of the National Electrical Code (Class 1 Group D hazard locations). NFPA 30, Flammable and Combustible Code, should be followed for all storage and handling.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Use adequate ventilation to keep vapor concentrations below applicable exposure limit(s). At elevated temperatures, special ventilation may be required even if the flash point has not been exceeded. Emergency shower and eyewash facility should be in close proximity (ANSI Z358.1)

Personal protective equipment

MATERIAL SAFETY DATA SHEET

MSDS No.: BE166
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 11/05/2010

SULFUR

Inhalation

When workers are facing concentrations above the exposure limit they must use appropriate certified respirators.

Skin

Wear heat protective gloves and clothing if there is a potential for contact with heated material. For repeated and prolonged contact use: Nitrile, Neoprene, or Butyl Rubber Gloves. Wear heat protective gloves and clothing if there is a potential for contact with heated material. Appropriate protective clothing should be worn to prevent skin contact. Depending on the conditions of use, protective gloves, apron, boots, head and face protection should be worn. Where use can result in skin contact, practice good personal hygiene.

Eyes

Wear chemical safety goggles plus full face shield to protect against splashing when appropriate (ANSI Z87.1).

Remarks

Use good personal hygiene practices. Wash thoroughly after handling with soap and water. Wash hands before eating, drinking, smoking, or using toilet facilities.

Occupational Exposure Limits

Component	Source	Type:	Value	Note
Hydrogen sulfide	US (ACGIH)	STEL	15 ppm	None.
	US (ACGIH)	TWA	10 ppm	None.
	98/24/EC	Peak	50 ppm	None.
	US (OSHA)	CEILING	20 ppm	None.
	NIOSH	IDLH	100 ppm	None.
Sulfur dioxide	US (ACGIH)	STEL	0.25 ppm	None.
	US (OSHA)	TWA	5 ppm 13 mg/m ³	None.
	NIOSH	IDLH	100 ppm	None.

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance: liquid Yellow.

Odor: Hydrogen sulfide; rotten eggs.

Odor Threshold: No value available.

pH: Not applicable.

Boiling point/boiling range: 444 °C (831.2 °F)

MATERIAL SAFETY DATA SHEET

MSDS No.: BE166
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 11/05/2010

SULFUR

Melting/freezing point: 113 - 115 °C (235.4 - 239 °F)

Flash point: 207 °C (404.6 °F) (Cleveland Closed Cup)

Autoignition temperature: 232 °C (449.6 °F) (ASTM E659).

Flammability: OSHA/NFPA Class IIIB combustible liquid.

Lower explosion limit: 0.35 - 4.3 vol%

Upper explosion limit: 14.0 - 45.5 vol%

Explosive properties: No Data Available.

Oxidizing properties: No Data Available.

Vapor pressure: ~ 0.1 mm Hg @ 140 °C (284 °F) 1.0 mm Hg @ 184 °C (363.2 °F)

Evaporation rate: negligible

Relative density: 1.96 - 2.06

Relative vapor density: > 10 @ 21.11 °C (70 °F)(Air = 1.0)

Viscosity: Not applicable.

Water solubility: Insoluble in cold water.

Partition coefficient: n-octanol/water: Specific data not available.

Other physico-chemical properties: No additional information available.

10. STABILITY AND REACTIVITY

Chemical stability

This product is normally stable. However, molten sulfur may react with oxygen in air and it can react exothermally with certain substances.

Conditions to avoid

Oxidizers. Reactive substances.

Materials to avoid

Avoid contact with copper and copper containing alloys. Nitrates. Strong oxidizing agents. Steel. Phosphorous compounds. Certain metals. Chlorates. Bromates. Carbides.

Hazardous decomposition products

Molten sulfur burns to form sulfur dioxide and can react with hydrocarbons and other organic substances to product toxic hydrogen sulfide and/or carbon disulfide.

Hazardous polymerization

Not expected to occur.

11. TOXICOLOGICAL INFORMATION

Product information

MATERIAL SAFETY DATA SHEET

MSDS No.: BE166
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 11/05/2010

SULFUR

Product Summary

See component summary.

COMPONENT INFORMATION

- *Sulfur 7704-34-9*

Acute toxicity

LC50 (Inhl) rat > 9.23 MG/L 4 HOURS

LD50 (Oral) rat > 3,000 MG/KG

LD50 (Skin) rabbit > 2000 MG/KG

Repeated dose toxicity

No known chronic health effects.

- *Hydrogen sulfide 7783-06-4*

Acute toxicity

LC50 (Inhl) rat 0.701 MG/L 4 HOURS

Acute effects

Inhalation

Inhalation may cause CNS depression. Damages the respiratory system.

Ingestion

Stream is a gas with a low boiling point; hence, oral exposure and resulting acute toxicity are unlikely.

Irritation

Eyes

Eye irritant.

Target Organs

Eye. Lung. Central nervous system effects. Nasal cavity. Respiratory system. Heart

Repeated dose toxicity

Repeated inhalation exposure of rats and mice to hydrogen sulfide for 90 days produced decreases in body weight gain and feed consumption at 80 ppm (0.11 mg/L), lesions in the nasal tract and (in rats) lung at >_ 30 ppm (0.04mg/L). Nasal lesions were also observed when rats were exposed to >_ 30 ppm for 10 weeks or >_ 80 ppm for 5 days. Decreased performance in neurological tests has been observed in rats exposed by inhalation to >_ 80 ppm hydrogen sulfide for 5 days; however, no neuropathologic findings were noted when rats and mice were exposed to 80 ppm for 90 days. Rabbits exposed half an hour per day for 5 days to 72 ppm (0.10 mg/L) experienced cardiac arrhythmia.

Reproductive effects

No significant alterations in reproductive performance were observed in rats exposed to 80 ppm (0.111 mg/L) hydrogen sulfide in an inhalation screening study. No treatment-related histopathological changes were found in reproductive organs of rats or mice exposed to up to 80 ppm for 90 days. No adverse effect on spermatogenesis was found when male rats were exposed to 220 ppm (0.306 mg/L) for 7 days, then mated with unexposed virgin females.

Developmental Toxicity

No signs of developmental toxicity, including effects on neurobehavioral performance, were seen in a well-conducted rat inhalation reproduction/developmental toxicity screening study at up to 80 ppm (0.111 mg/L); and no evidence of developmental toxicity was seen in three other studies in which rats were exposed to hydrogen sulfide during gestation at concentrations up to 220 ppm (0.306 mg/L). However, neuro-developmental toxicity studies with offspring of rats exposed to hydrogen sulfide during the gestation and lactation periods have found some alterations that are suggestive of neurotoxicity

MATERIAL SAFETY DATA SHEET

Environmental fate and pathways

When released into the environment, this material will volatilize rapidly. This material is not expected to persist in the environment.

Persistence and degradability

Biodegradation: This material is expected to be biodegradable.

Bioaccumulation: This material is not expected to bioaccumulate.

- *Sulfur dioxide* 7446-09-5

Ecotoxicity

No data available.

Environmental fate and pathways

No data available.

13. DISPOSAL CONSIDERATIONS

Dispose of all waste and contaminated equipment in accordance with all applicable federal, state and local health and environmental regulations. Recovery and reuse, rather than disposal, should be the ultimate goal of handling efforts. The materials resulting from clean-up operations may be hazardous wastes and therefore, subject to specific regulations.

14. TRANSPORT INFORMATION

Special Provisions

If you reformulate or further process this material, you should consider re-evaluation of the regulatory status of the components listed in the composition section of this sheet, based on final composition of your product.

Proper shipping name Sulfur, molten
Reportable quantity HYDROGEN SULFIDE
ID No. NA2448
Hazard class 9
Packing group III

Disclaimer

The information on this MSDS was obtained from sources which we believe are reliable. However, the information is provided without any warranty, expressed or implied, regarding its correctness. Some information presented and conclusions drawn herein are from sources other than direct test data on the substance itself. The conditions or methods of handling, storage, use and disposal of the product are beyond our control and may be beyond our knowledge. For this and other reasons, we do not assume responsibility and expressly disclaim liability for loss, damage, or expense arising out of or in any way connected with handling, storage, use, or disposal of this product. If the product is used as a component in another product, this MSDS information may not be applicable. Information is correct to the best of our knowledge at the date of the MSDS publication.

Numerical Data Presentation

The presentation of numerical data, such as that used for physical and chemical properties and toxicological values, is expressed using a comma (,) to separate digits into groups of three and a period (.) as the decimal marker. For example, 1,234.56 mg/kg = 1 234,56 mg/kg.

Language Translations

This document may be available in languages other than English.

2. HAZARDS IDENTIFICATION

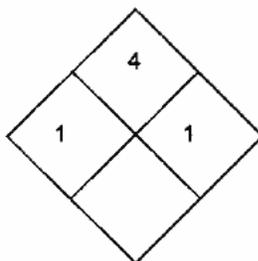

Emergency Overview

This material is HAZARDOUS by OSHA Hazard Communication definition.

Hazards

Extremely flammable gas. Vapor may cause flash fire or explosion. High Pressure and rapid diffusion hazard. May cause frostbite or freeze burns. CNS depressant. Simple asphyxiant. Possible cardiac sensitizer. Stream Components have been shown to cause reproductive and developmental toxicity in laboratory animals following repeated inhalation exposure. This stream contains genotoxic and carcinogenic components.

 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 01/24/2011

CAT BB

Potential health effects

Routes of exposure
 Inhalation. Skin. Eye.

Acute effects

Skin

Dermal contact with rapidly evaporating liquid could result in freezing of the tissues or frostbite.

Inhalation

Inhalation of vapors may cause respiratory distress and CNS effects. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending on upon level of exposure concentration and/or duration.

Eyes

This gas is non-irritating; but direct contact with liquified/pressurized gas or frost particles may produce severe and possibly permanent eye damage from freeze burns.

Ingestion

Not a route of exposure for a gas.

Chronic effects

Repeated exposure, reproductive and developmental, genotoxic, and cancer hazard. See chapter 11. Toxicological information

Aggravated Medical Condition

Personnel with pre-existing chronic respiratory diseases should avoid exposure to this material

3. COMPOSITION/INFORMATION ON INGREDIENTS

Typical composition

4. FIRST AID MEASURES

General advice

Take proper precautions to ensure your own health and safety before attempting rescue and providing first aid. For specific information refer to the Emergency Overview in Section 2 of this MSDS.

Skin

The affected frozen tissue area should be placed in a warm water bath, with temperatures at or below 40C. DO NOT use: Dry Heat or Hot water. Rewarming should continue until natural skin tones return to the affected area. Seek medical attention if discomfort persists.

Inhalation

Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. Move the exposed person to fresh air at once. If breathing has stopped, perform artificial respiration. When breathing is difficult, properly trained personnel may assist the affected person by administering oxygen. Keep the affected person warm and at rest. Get medical attention immediately.

Eyes

Check for and remove contact lenses. For contact with cold liquid or gas. Flush eyes with directed stream of lukewarm water for at least 15 minutes. GET MEDICAL ATTENTION IMMEDIATELY.

Ingestion

Ingestion unlikely.

Notes to physician

Treat symptomatically.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

Extremely flammable gas.

Flash point

< -56 °C (< -68.8 °F) closed cup

Autoignition temperature

288 - 460 °C (550.4 - 860 °F)

Lower explosion limit

1.8 vol%

Upper explosion limit

15 vol%

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Use dry chemicals, CO2 LARGE FIRE: Use water spray, water fog or foam. DO NOT use straight streams

MATERIAL SAFETY DATA SHEET

MSDS No.: BE206
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 01/24/2011

CAT BB

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Structural firefighters protective clothing will only provide limited protection. Always wear thermal protective clothing when handling refrigerated/cryogenic liquids.

Precautions for fire-fighting

DO NOT extinguish a leaking gas fire unless leak can be stopped. Fires involving this material should not be extinguished unless the source flow can be stopped immediately. Shut off the source and allow the fire to burn itself out. If it can not be shut off immediately, all exposed equipment and surfaces must be cooled with water to prevent overheating, flash backs, or explosions. Control fire until source can be shut off. Potential explosion hazard from reignition, if fire is put out without shutting off source. Releases flammable vapors below normal ambient temperatures. Flammable vapors may be heavier than air and travel long distances along the ground before igniting and flashing back to vapor source.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Extremely flammable gas. Release causes immediate fire/explosion hazard. Evacuate all non-essential personnel to an area upwind (at least 1/2 mile in all directions if tanks or tank cars are involved in fire or spill). Stop source of release with non-sparking tools before beginning clean-up or fire extinguishing. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Closed systems form white frost at the point of leak. Do not direct water at spill or source of leak. Eliminate all sources of ignition. Let evaporate. If possible, turn leaking container so that gas escapes rather than liquid. Do not direct water at spill or source. Use water spray curtain to divert vapor drift. Prevent entry into sewers, basements or confined areas. Caution: When in contact with refrigerated/cryogenic liquids, many materials become brittle and are likely to break without warning. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Liquid spills will vaporize forming cold dense vapor clouds that do not readily disperse. Avoid vapor cloud even with proper respiratory equipment. Contain spill with dike to prevent entry into sewers or waterways.

7. HANDLING AND STORAGE

Handling

Odor is not an adequate warning of potentially hazardous ambient air concentrations. Releases of these gases may cause atmospheres, some oxygen deficient, which can have flammable/explosive potential. Do not enter such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability. During transfer of product, ground container and insure that all conveying equipment is properly grounded. Consult the U.S. National Fire Protection Association standard for the storage and handling of liquified petroleum gases (NFPA No. 58) for additional recommendations.

Storage

Keep containers tightly closed and in a well-ventilated place. Store away from oxidizers and other combustible material by a distance of at least 20 feet. Keep container tightly closed and properly labeled. Securely chain cylinders when in use and protect against physical damage. Store below 100°F (38°C). Protect from dampness, salt or corrosive materials. Store and transport in an upright container. Do not store together with oxidizing and self-igniting products.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Personal protective equipment

Inhalation

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). When workers are facing concentrations above the exposure limit they must use appropriate certified respirators.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE206
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 01/24/2011

CAT BB

Skin

Use chemical resistant gloves appropriate to conditions of use. Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use.

Eyes

Wear safety glasses as minimum eye protection. Conditions may warrant the use of chemical goggles and possibly a face shield. Consult your standard operating procedure or safety professional for advice. Use protective eye and face devices that comply with ANSI Z87.1-1987.

Remarks

Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure.

Occupational Exposure Limits

Component	Source	Type:	Value	Note

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance: gaseous Colorless.

Odor: Unpleasant.

Odor Threshold: No Data Available.

pH: Not applicable.

Boiling point/boiling range: -48 - 36 °C (-54.4 - 96.8 °F)

Melting/freezing point: -187 - -129 °C (-304.6 - -200.2 °F)

Flash point: < -56 °C (< -68.8 °F) closed cup

Autoignition temperature: 288 - 460 °C (550.4 - 860 °F)

Flammability: Extremely flammable gas.

Lower explosion limit: 1.8 vol%

Upper explosion limit: 15 vol%

Explosive properties: No Data Available.

Oxidizing properties: No Data Available.

Vapor pressure: 60 - 3900 kPa @ 20 °C (68 °F)

Evaporation rate: Appreciable.

Relative density: 0.506 - 0.583 @ 15 °C (59 °F) g/cm³

Viscosity: Not applicable.

Water solubility: 0.024 - 0.061 g/l @ 20 °C (68 °F)

Partition coefficient: n-octanol/water: <= 2.8 log Pow

Other physico-chemical properties: Low boiling point intensifies pressure and rapid diffusion hazard.

10. STABILITY AND REACTIVITY

MATERIAL SAFETY DATA SHEET

MSDS No.: BE206
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 01/24/2011

CAT BB

Chemical stability

This product is stable when properly stored and is not expected to polymerize.

Conditions to avoid

Heat, sparks, open flames and strong oxidizing conditions.

Materials to avoid

Strong acids, bases, and oxidizing agents, such as liquid chlorine and oxygen. Halogens (bromine, chlorine, fluorine). Peroxides. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.

Hazardous decomposition products

Unburned hydrocarbons. Carbon monoxide, carbon dioxide and unburned hydrocarbons (smoke).

11. TOXICOLOGICAL INFORMATION

Product information

Product Summary

Data for components are used as surrogate data for the health characterization of this product. Inhalation of very high concentrations of the Product may cause asphyxia, anesthesia, CNS stimulation followed by CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure), and possible cardiac sensitization. Exposure to methyl or ethyl mercaptans or dimethyl disulfide, if present, may also cause irritation of mucous membranes. dangerous levels of methyl or ethyl mercaptan may not be detected by odor. Very little of this Product is likely to be absorbed through the skin. Skin or eye irritation is not likely, but evaporating liquid might cause frost injuries. Skin sensitization is not expected. Available animal data for components of the stream demonstrate repeated exposure toxicity by the inhalation route of exposure, with species differences in affected target organ toxicity. Stream Components have been shown to cause reproductive and developmental toxicity in laboratory animals following repeated inhalation exposure. This stream contains genotoxic and carcinogenic components.

Acute toxicity

<u>LC50 (Inh).</u> (predicted; mixture of cis- and trans-2- butene)	rat	>23 MG/L (10,000 PPM)	4 HOURS
<u>LC50 (vapor).</u> Based on isopentane	mouse	413 MG/L (140,000 PPM)	2 HOURS

Acute effects

Inhalation

Stream expected to have a low order of acute inhalation toxicity based on toxicity information for components present at > 1%; however, stream occasionally contains methyl mercaptan or ethyl mercaptan at levels that may be dangerous to life and health (i.e., greater than 150 ppm, and 500 ppm respectively); and may contain dimethyl sulfide at levels causing 50% lethality in rats and mice (805 ppm and 500 ppm, respectively).

Ingestion

Stream is a gas with a low boiling point; hence, oral exposure and resulting acute toxicity are unlikely.

Skin contact

Stream is a gas with a low boiling point; hence, dermal uptake and resulting acute toxicity are unlikely.

Irritation

Skin

None expected. Evaporating liquid may cause frost bite.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE206
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 01/24/2011

CAT BB

Eyes

None expected. Evaporating liquid may cause frost bite.

Sensitization

Not expected to be a sensitizer.

Target Organs

Central nervous system effects. Lymphohematopoietic system.

Repeated dose toxicity

May be toxic following repeated inhalation exposure to very high concentrations. Available animal data for components of the product demonstrate repeated exposure toxicity with species differences in affected target organs. The stream components demonstrating significant toxicity following repeated inhalation exposures are propane, propylene, isobutylene, 2-butene, 2-methyl-2-butene, methyl mercaptan, ethyl mercaptan and dimethyl sulfide; and their reported toxicological effects include: decreased body weight/weight gain; effects on the nasal tract, cardiovascular and hematopoietic systems, adrenal gland, thymus and kidney; changes in clinical chemistry parameters; nausea; irritation of mucous membranes; and a rise in olfactory threshold.

Reproductive effects

May cause reproductive toxicity. In a 13-week inhalation toxicity study conducted in rats, a stream having components in common with this stream produced no effects on reproductive organ weight or pathology; estrus cycle; or sperm count, motility or morphology. Available information from studies conducted in laboratory animals with most components of this stream (propane, propylene, n-butane, 1-butene, isobutylene, 2-butene, n-pentane, ethane, cyclopentane, 2-methyl-2-butene) shows no evidence of an effect on reproductive performance or reproductive organs at high inhalation doses. Dimethyl disulfide (present at <0.1%) produced no effects on reproductive organs in rats after initial toxicity at 250 ppm (0.96 mg/L) for 90 days. Two components (isobutane and 1,3-butadiene) have demonstrated possible reproductive toxicity. These effects included an increase in post-implantation loss, testicular and ovarian atrophy, and changes in sperm head morphology.

Developmental Toxicity

May be toxic to the developing embryo/fetus. No signs of developmental toxicity were seen in rats in an inhalation developmental toxicity study conducted with a stream having components in common with this stream. Available information from studies conducted in laboratory animals at high inhalation doses with most components of this stream (propane, propylene, n-butane, 1-butene, isobutylene, 2-butene, n-pentane, ethane, 2-methyl-2-butene) shows no evidence of developmental toxicity. Three components (isobutane, 1,3-butadiene and dimethyl disulfide) have demonstrated possible developmental toxicity. These effects included a reduction in fetal weight, an increase in post-implantation loss and retarded development.

Genetic Toxicity

May be genotoxic. A stream with components in common with this stream was negative in a micronucleus assay in rats exposed by inhalation. Most components of B-B Stock have produced negative results in a variety of in vitro and in vivo genotoxicity studies; however, two stream components (2-methyl-2-butene and 1,3-butadiene) have caused gene mutation and/or chromosome damage in rats and/or mice, after inhalation exposure, and another component (cyclopentane) was positive in an in vitro chromosome aberrations assay but negative in an in vivo micronucleus assay. Studies to assess genetic damage in humans exposed to 1,3-butadiene have returned inconsistent or equivocal results.

Carcinogenicity

This product contains carcinogenic components. Cancer data for components are used as surrogate data for this product. Animal data demonstrate marked species difference in carcinogenic response to butadiene. In the mouse, long term inhalation exposure is associated with an increased incidence of benign and malignant cancers in a wide range of tissues, whereas a more limited tumor profile is seen in the rat. Epidemiology studies suggest butadiene may be carcinogenic in humans with a concern for cancers of the lymphohematopoietic system.

12. ECOLOGICAL INFORMATION

Product information

Ecotoxicity

MATERIAL SAFETY DATA SHEET

MSDS No.: BE206
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 01/24/2011

CAT BB

Acute Fish toxicity

Summary: Predicted acute toxicity to fish is moderate (QSAR)

Acute toxicity to aquatic invertebrates

Summary: Predicted acute toxicity to aquatic invertebrates is moderate (QSAR).

Toxicity to aquatic plants

Summary: Predicted toxicity to aquatic algae is moderate (QSAR)

Toxicity to microorganisms

Summary: No Data Available.

Chronic toxicity to fish

Summary: Predicted low chronic toxicity to fish (QSAR)

Chronic toxicity to aquatic invertebrates

Summary: Predicted low chronic toxicity to aquatic invertebrates (QSAR)

Environmental fate and pathways

Persistence and degradability

Stability in Soil: Not expected to adsorb on soil.

Biodegradation: Readily biodegradable

Bioaccumulation: This material is not expected to bioaccumulate.

Other adverse effects

Photodegradation following atmospheric release is expected to be the most significant route of degradation in the environment.

13. DISPOSAL CONSIDERATIONS

Dispose of all waste and contaminated equipment in accordance with all applicable federal, state and local health and environmental regulations. Recovery and reuse, rather than disposal, should be the ultimate goal of handling efforts. The materials resulting from clean-up operations may be hazardous wastes and therefore, subject to specific regulations.

14. TRANSPORT INFORMATION

Proper shipping name	Petroleum gases, liquefied (Isobutane, Isobutylene)
Reportable quantity	BUTADIENE
ID No.	UN1075
Hazard class	2.1

MSDS No. AP0881

Revision Date 11/01/06

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Viscous liquid
Color Dark yellow to brown. **Odor** Slight burnt or cracked hydrocarbon

WARNING! Combustible liquid; vapor may cause flash fire.
Vapors and fumes may be hazardous or fatal!
Long-term heated storage (100° to 150°F) might evolve hydrogen sulfide, a flammable, toxic, sensitizing, and potentially deadly gas!
When heated, may cause thermal burns on contact! If hot product contacts water, a violent eruption of steam and vapor may occur!
Mist or vapor may severely irritate the eyes and respiratory tract!
Liquid contact may cause minimal eye and/or mild to moderate skin irritation and inflammation!
Contains 4- to 6-membered condensed-ring (polynuclear) aromatic hydrocarbons (PNAs), and possibly carbozoles!
May cause skin cancer following extended and/or repeated contact!
May be harmful to target organs and/or adversely affect reproduction if absorbed through the skin! Wash thoroughly after handling.
Spills may create a slipping hazard!

SECTION 1: IDENTIFICATION

Trade Name Heavy Cycle Oil (HCO)**Product Number** 1044310443**CAS Number** 64741-61-3**Product Family** Petroleum Hydrocarbon Gas Oil

Synonyms Heavy Cycle Oil from a Fluid Catalytic Cracker Unit; FCCU Heavy Cycle Oil; 732 Unit HCO; Heavy Catalytic Cracked Distillate (Petroleum), Catalytic Cracked Heavy Gas Oil; FCCU Heavy Distillate; Heat Medium Oil; Coker Unit Feed Component; Heavy Fuel Oil Blending Component; Unfinished No. 5 Fuel, No 5 Fuel Oil Blending Component; C15-C35 Petroleum Hydrocarbons.

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Heavy Catalytic Cracked Distillate (Petroleum)	64741-54-4	100
2) C15-C36 Saturated Hydrocarbons and Naphthenes	Mixture	75-95
3) Polynuclear Aromatic Hydrocarbons (4- to 6-member condensed-ring type)	68487-58-6	5-25
4) Chrysene (Benzo[a]phenanthrene)	218-01-9	0.08-0.15
5) 5-Methylchrysene	3697-24-3	0.08-0.15
6) Hydrogen sulfide	7783-06-4	0.0001-0.01

Heavy Cycle Oil (HCO)

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye Contact. Absorption. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	May be harmful or fatal if inhaled! Inhalation of the vapor or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath and may cause transient central nervous system (CNS) depression. The National Institute for Occupational Safety and Health has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H ₂ S) are immediately dangerous to life and health. Concentrations of H ₂ S at or below 250 ppm may cause respiratory tract irritation and pulmonary edema. H ₂ S concentrations between 250 ppm and 500 ppm may result in headache, nausea, disorientation, irregular heartbeat, and/or low blood pressure. At greater than 500 ppm, H ₂ S causes sudden collapse, unconsciousness, and respiratory paralysis leading to convulsions, coma, and/or death. (See Section 11.)
Eye Contact	Upon direct contact, hot material may cause severe thermal burns. Animal test results on similar unheated materials suggest that this product may cause minimal eye irritation upon short-term exposure. Symptoms include stinging, watering, and redness. H ₂ S vapors may cause moderate to severe eye irritation and photophobia (sensitivity to light).
Skin Contact	Skin contact with hot material may result in severe thermal burns. Animal test results on similar materials suggest that this material can cause moderate skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate dermatitis and/or more serious skin disorders. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and/or severe tissue damage. Based upon a similar product's animal test results, a mild allergic skin response may be expected on some sensitive individuals following repeated exposures.
Ingestion	Contact with hot material may cause thermal burns. If swallowed, no significant adverse health effects are anticipated, however, this material can cause a laxative effect. Ingestion of large quantities can cause intestinal obstruction.
Chronic Health Effects Summary	Heavy aromatic oils similar to this material have been shown to be mutagenic, induce skin tumors, and cause adverse effects in the liver, kidneys, thymus, adrenal glands, bone marrow, testes, and embryo/fetus of laboratory animals following prolonged and repeated application. It is considered to be potentially teratogenic. This heavy catalytic cracked distillate is also a heavy residual oil distillate similar to those shown to produce skin tumors and adverse effects in the liver and kidneys of laboratory animals following prolonged and repeated applications. All tumors appeared at the site of application. Toxic effects are unlikely to occur if good personal hygiene is practiced. Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H ₂ S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures. (See Section 11.)
Conditions Aggravated by Exposure	Personnel with pre-existing nervous system disease, cardiac or neurological conditions, skin disorders, chronic respiratory diseases, impaired lung, liver, kidney, thymus, or bone marrow function, anemia, red blood cell abnormalities, or immune system deficiencies should avoid exposure.
Target Organs	This substance is toxic to respiratory tract and lungs, central nervous system, heart, mucous membranes, skin, eyes, and possibly, the liver, kidneys, thymus, adrenal glands, blood, bone marrow, immune system, testes, and unborn embryo/fetus.
Carcinogenic Potential	This material contains numerous 4- to 6-membered condensed-ring (polynuclear) aromatic hydrocarbons (PNAH) at concentrations at or above 0.1%. Some of these compounds has been determined to be carcinogenic by OSHA, IARC, and NTP.

Heavy Cycle Oil (HCO)

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200)									
OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input checked="" type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If hot material is splashed into eyes, irrigate with large amounts of room-temperature water. Seek medical attention immediately. If ambient temperature material is splashed into eyes, check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	If burned by hot material, cool skin by quenching with large amounts of cool water. Do not remove material from the skin. Seek medical attention immediately. For contact at ambient temperatures, remove contaminated shoes and clothing. Wipe off excess material. Wash exposed skin with soap and water. If tissue appears damaged or if irritation or pain persist, apply a clean dressing and seek medical attention. Do not use ointments. Thoroughly clean contaminated clothing before reuse. Discard contaminated leather goods.
Ingestion	Do not induce vomiting or give anything by mouth. Rinse out mouth with water. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Do not leave victim unattended. Allow small quantities to pass through system. If large amounts are swallowed or irritation or discomfort occurs, seek medical attention immediately.
Notes to Physician	Inhalation overexposure can produce toxic effects. Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients. If only cough or difficulty in breathing develop, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis using pulmonary function tests and chest x-rays. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required. This material may affect the hematopoietic system or cause hepatotoxicity and/or nephrotoxicity. A complete blood count, liver function tests, renal function tests and urinalysis are suggested for significant exposures. In addition, monitoring arterial blood gases is suggested for significant exposures.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IIIA Liquid. Moderately combustible!		
Flash Point Method	CLOSED CUP: 75° to 80°C (167° to 178°F) (Setiflash Open Cup [ASTM D-92]).		
Lower Flammable Limit	1.0 to 4.0%	Upper Flammable Limit	7 to 44%
Autoignition Temperature	260° to 343°C (500° to 650°F)		

HoustonRefining

A Lyondell Company

Heavy Cycle Oil (HCO)

Hazardous Combustion Products	Burning or excessive heating may produce carbon monoxide, carbon dioxide, and possibly smoke, fumes, unburned hydrocarbons, and oxides of sulfur and nitrogen.
Special Properties	This "Combustible Liquid" releases vapors at or approaching its flash point temperature. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Mists or sprays may be flammable at temperatures below the flash point. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire. If stored under heat for extended periods or significantly agitated, this material might evolve or release hydrogen sulfide, a flammable gas, which can raise and widen this material's actual flammability limits and significantly lower its autoignition temperature. (See Section 7.)
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide (CO ₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Combustible Liquid. Evacuate non-essential personnel and remove all ignition sources. Carefully contain spill and stop source of spill if it can be done without risk. Do not touch or walk through spilled material. Cleanup crews must wear proper heat-resistant protective clothing. Remove spillage immediately from hard, smooth walking areas. Allow material to cool. Water mist or spray may be used to reduce heat or disperse vapors; but, it may not prevent ignition in closed spaces. This material will normally float on water. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid/semi-solid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

Handling	A spill or leak may cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally. When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.
-----------------	---

Heavy Cycle Oil (HCO)

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and properly labeled. Keep away from all ignition sources! Do not store with strong oxidizing agents. Hydrogen sulfide vapors may be evolved from long-term heated storage and/or agitated transport. H₂S is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.) Where H₂S is routinely stored, install monitoring equipment or system with alarms.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION**Engineering Controls**

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

This recommendation reflects minimum PPE when product is at elevated temperatures.

**Eye Protection**

Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Hand Protection

When handling hot materials or those that might produce thermal burns, use long-cuffed leather or heat-resistant gloves over chemically-resistant gloves. When product is at ambient temperatures, use disposable gloves (PVC, neoprene, nitrile, vinyl, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).

General Comments

WARNING! Do not use this material as a fuel without adequate ventilation. Inadequate ventilation can result in hazardous levels of combustion products and inadequate oxygen levels for breathing. Odor is not adequate to warn of hazardous conditions.

The standards for "coal tar pitch volatiles, as benzene solubles" are based upon coal coking, not upon petroleum-derived oils. However, in 29 CFR 1910.1200.1002, OSHA has defined "coal tar pitch volatiles" to include the fused polycyclic hydrocarbons which volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood and other organic matter. Accordingly, the coal tar pitch volatile standard may apply to the aerosol form of this material. The "hydrogen sulfide" standards apply only to vapors evolved from long-term heated storage and/or transport.

 TWA: 0.005 (mg/M³) from ACGIH (TLV) [Proposed]

"A3" Animal Carcinogen from ACGIH

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Viscous liquid	Color	Dark yellow to brown	Odor	Slight burnt or cracked hydrocarbon.
Specific Gravity	0.985 to 0.995 at 60°F (Water = 1)	pH	Not applicable	Vapor Density	> 10 (Ar = 1 at 70°F)
Boiling Point/Range	260° to 500°C (500° to 932°F) (ASTM D-86)			Melting/Freezing Point	< 24°C (< 75°F) (ASTM D-97)
Vapor Pressure	< 0.1 mm of Hg at 21°C (70°F).			Viscosity (cSt @ 40°C)	42.7 to 53.5 (ASTM D-445)
Solubility in Water	Negligible in cold water (LT 0.001%).			Volatile Characteristics	Negligible; no Volatile Organic Compounds (VOCs) present at 450°F.

Additional Properties: Average Calculated Density at 60°F = 8.247 lbs./gal. (ASTM D-2161);
 Saybolt Viscosity = 200 to 250 SUS at 100°F (38.7°C) (ASTM D-2161);
 90% Boiling Point Temperature = 850° to 905°F (455° to 485°C) (ASTM D-86);
 Sulfur Content = 0.5 to 1.5 Wt.% (ASTM D-2622);
 Evaporation Rate = < 0.005 when n-Butyl acetate = 1.0.

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine and oxygen. Hydrogen sulfide is dangerously reactive with strong oxidizers (nitric acid, chlorine, fluorine, etc.), some metals, metal oxides, and metal powders. H ₂ S is corrosive to some metals and alloys, especially those containing copper and/or tungsten.		
Hazardous Decomposition Products	Composition suggests that sulfur and nitrogen compounds might be generated; but, no degradation data is available.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Heavy Catalytic Cracked Distillate (Petroleum):

GAS (LC₅₀): Acute: >3.6 mg/L (Rat screen level).
ORAL (LD₅₀): Acute: 21.2 ml/kg (Rat).
DERMAL (LD₅₀): Acute: >2,000 mg/kg (Rabbit screen level).
DRAIZE EYE: Acute: Non-irritating to minimal eye irritant (Rabbit)
DRAIZE DERMAL: Acute: Moderate skin irritant (Rabbit).
BUEHLER DERMAL: Acute: Non-sensitizing (Guinea Pig).
IP DERMAL: Acute: Tumor initiator & possibly promoter activity (Mouse).
27-Week DERMAL: Chronic: 20 mg/kg 3x/week (Mouse) - Significant increase in contact-point skin tumors (on 81% of the animals) with 13-week mean latency and decreased survivability (30% mortality).

Heavy Cycle Oil (HCO)

A TSCA Section 8(e) notification from the American Petroleum Institute states that a long-term mouse skin painting study using **heavy catalytic cracked distillate** showed it to be severely irritating and tumorigenic. It also produced 59% mortality before sacrifice which occurred on day 193 due to poor health of the surviving animals.

The International Agency for Research on Cancer (IARC) has specifically evaluated **aromatic oils, including high-boiling fractions of catalytically cracked oils**, and determined them to be carcinogenic to experimental animals, and potentially humans. Also, the National Toxicology Program (NTP), U.S. Environmental Protection Agency (EPA), and American Conference of Governmental Industrial Hygienists (ACGIH) have independently classified various polynuclear aromatic hydrocarbon (PNA) compounds present in this product as "confirmed human (A1), suspected human (A2), or animal carcinogens (A3)".

This material contains **polycyclic aromatic hydrocarbons (PHAs or PNAs)**, some of which have been reported to cause skin cancer on humans under conditions of poor personal hygiene, prolonged/repeated contact, and exposure to sunlight. This material may also contain **alkylcarbazoles and alkylbenzocarbazoles** which if absorbed through the skin might be responsible, in whole or in part, for systemic toxicity to the liver, kidneys, spleen, and/or testes based upon limited laboratory animal studies.

Catalytic Cracked Clarified Oil [a similar material]:

28-Day DERMAL Sub-chronic 0% Mortality at 200, 10% at 400, 40% at 1,000, & 100% at 2,000 & 4,000 mg/kg/day (Rat & Rabbit) - Edema, skin ulceration, and depression. Minimal to moderate diffuse hepatocytomegaly in all animals at 400 mg/kg/day, slight skin hyperplasia and hyperkeratosis. Liver, thymus, and testes damage and increased liver-to-body weight ratios at 400 & 1,000 mg/kg/day. Studies at 2,000 and 4,000 mg/kg/day were terminated on day 11 due to early deaths.

12-Week DERMAL Sub-chronic: 5% Mortality at 40, 35% at 200, & 100% at 400 mg/kg/day (Rat) - Hepatocellular necrosis and generalized systemic toxicity.

52-Week DERMAL: Chronic: 5 uL/kg 2x/week (Mouse) - Significant increase in contact-point skin tumors with 22-week mean latency, increased liver and liver-to-body weight ratios, & decreased survivability (87% mortality).

104-Week DERMAL Chronic: 0.5 uL/kg 2x/week (Mouse) - 90% of the animals had contact-point skin tumors with 72-week mean latency.

MUTAGENICITY: Many different in-vivo and in-vitro mutagenic assays have shown "positive" responses with or without S9 metabolic activation. The only "negative" mutagenic responses were when using the Mouse Cell Transformation Assay without S9 activation, in-vitro Chinese Hamster Ovary Cell Assay, and in-vivo Mouse Bone Marrow Assay.

TERATOGENESIS:

in-vitro Ovarian Tumor Attachment Inhibition Assay Suspect teratogen (rating 3) (Mouse)

Embryonic Palatal HEPM Cell Growth Inhibition Assay Suspect teratogen (rating 3) with and without S9 metabolic activation (Human)

A TSCA Section 8(e) notification from Mobil Oil Company states that **catalytically cracked clarified oil** was not only carcinogenic, but also produced severe dose-dependent, organ-specific (liver, kidney, and testes) damage in rats during a 90-day sub-chronic dermal assay. Mortality occurred in 5% of the animals at 30 mg/kg/day, 55% at 125, 85% at 500, and 100% at 2,000. As a result of conducting additional dermal absorption studies, Mobil Oil believes that it is likely that alkyl- and alkylbenzocarbazoles present in this oil may have been responsible, in whole or in part, for the systemic toxicity. Epidemiology studies of Mobil refinery workers have not shown any effects corresponding to those observed in animals.

Hydrogen sulfide (H₂S):

GAS	(TE ₀₁)	Acute	AP 1 ppm (Human) - Odor response threshold
GAS	(TC ₀₁)	Acute	AP 10 ppm (Human) (15 minutes) - Eye irritation
GAS	(TC ₁₀)	Acute	50 to 100 ppm (Human) (15 minutes) - Respiratory irritation.
GAS	(LC ₁₀)	Acute	600 ppm (Human) (30 minutes) - Unconsciousness, respiratory paralysis, and death.
GAS	(LC ₁₀₀)	Acute	600 to 750 ppm (Human) (15 minutes) - Unconsciousness, respiratory paralysis, and death.
GAS	(LC ₁₀)	Acute	5,700 ug/kg (Human) - Chronic pulmonary edema, coma, and death.
GAS	(LC ₁₀)	Acute	800 ppm (Rat) (5 minutes)
GAS	(LC ₅₀)	Acute	635 ppm (Mouse) (1 hour)
GAS	(LC ₅₀)	Acute	445 ppm (Rat) (4 hours) - Hypermotility, diarrhea, and increased urine volume.
5-Day GAS	Sub-chronic	1,200 mg/M3 (Rat) (2 hours/day)	Decreased cholinesterase and degenerative brain changes.

HoustonRefining

A Lyondell Company

Heavy Cycle Oil (HCO)

35-Day GAS: Sub-chronic 100 ppm (Rat) (8 hours/day) - Decreased cytochrome oxidases and degenerative brain and pulmonary effects.

90-Day GAS: Sub-chronic: 80 ppm (Rat & Mouse) (6 hours/day) - Decreased brain weight and weight loss or decreased weight gain

TERATOGENESIS: Sub-chronic: 20 ppm for 24 hours on days 6 thru 22 of pregnancy (Rat) - Developmental physical effects.

OTHER REPRODUCTIVE EFFECTS: One unconfirmed study mentions H₂S as causing damage to the human testes and/or male reproduction. Recent studies do not confirm this association. Other studies mention increased risk of miscarriage, abortion, and difficulties during pregnancy and labor, but these studies involved mixed chemical exposures and/or physical confounders.

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (<20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (>50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their offspring slowed developmental physical effects.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this heavy distillate, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. This material is estimated to have a slow rate of biodegradation. Based upon spill investigation analysis, oils containing polynuclear aromatic hydrocarbon compounds similar to this material were shown to bioaccumulate in tissues of various aquatic organisms.

Environmental Fate

This heavy residual oil is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components gradually evaporating. In stagnant or slow-flowing waterways, this hydrocarbon oil layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase slowly. This material is slowly biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment with plenty of agitation. In sewage-seeded wastewater, at or below concentrations of 0.2 vol. % of this material, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol %, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds.

Conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

Heavy Cycle Oil (HCO)

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT) only when transported in bulk.		
Proper Shipping Name	Not regulated in non-bulk containers (Petroleum oil, N.O.I.B N), Combustible liquid for bulk container shipments.		
	This product has a flash point temperature of between 140° and 200°F (60° to 93°C), so for bulk shipments, it is classified as a DOT "Combustible liquid". However, according to 49 CFR 173.150(f)(2), certain transportation-related requirements, such as labeling, may not apply to this product when shipped in non-bulk "limited quantity" containers of less than 119 gallons capacity. However, pursuant to 49 CFR 173.150(b) and 173.150(f)(3), "limited-quantities" offered for or transported via aircraft or products which are defined as DOT "Marine Pollutants" may be subject to DOT regulation.		
Hazard Class	Not a DOT regulated material or "Combustible liquid"	Packing Group(s) UN/NA ID	Not applicable or PG III. Not applicable or NA1993
Reportable Quantity	The Reportable Quantity (RQ) substance components in this material which might require DOT HAZMAT bill-of-lading display are Chrysene (Benzo[a]phenanthrene) and Hydrogen sulfide.		
Placards	<div style="border: 1px solid black; padding: 5px; width: fit-content;"> <p>A Combustible placard may not be required for this material when transported in a non-bulk container with a maximum capacity LT 450 L (LT 119 Gal)</p> </div>	Emergency Response Guide No.	Not applicable or 128
		HAZMAT STCC No.	49 122 12
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8
			

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. A minor component substance of this material subject to the reporting requirements under this statute is Hydrogen sulfide [CAS No. 7783-06-4].
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Acute (Immediate) and Chronic (Delayed) Health Hazards, and the Fire Hazard.
SARA 313	This material contains the following components in concentrations which might be present at or above de minimis levels and they are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313: Chrysene (Benzo[a]phenanthrene) [CAS No. 218-01-9] concentration: 0.08 to 0.15% 6-Methylchrysene [CAS No. 3697-24-3] concentration: 0.08 to 0.16%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this material subject to this statute are: Chrysene (Benzo[a]phenanthrene) [CAS No. 218-01-9] (RQ = 100 lbs. [45.36 kg]) conc.: 0.08 to 0.15% Benzo[a]anthracene [CAS No. 86-86-3] (RQ = 10 lbs. [4.536 kg]) concentration: 0.04 to 0.05% Benzo[a]pyrene [CAS No. 50-32-8] (RQ = 1 lb. [0.4536 kg]) concentration: 0.007 to 0.011% Benzo[b]fluoranthene [CAS No. 205-99-2] (RQ = 1 lb. [0.4536 kg]) concentration: 0.005 to 0.015% Benzo[k]fluoranthene [CAS No. 207-08-9] (RQ = 5000 lbs. [2270 kg]) concentration: 0.002 to 0.004% Indeno[1,2,3-c,d]pyrene [CAS No. 193-39-5] (RQ = 100 lbs. [45.36 kg]) concentration: 0.001 to 0.003% Hydrogen sulfide [CAS No. 7783-06-4] (RQ = 100 lbs. [45.36 kg]) concentration: 0.0001 to 0.01%.

HoustonRefining

A Lyondell Company

Heavy Cycle Oil (HCO)

CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material contains detectable concentrations of the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it might be subject to requirements of California Health & Safety Code Section 25249.5: 8-Methylchrysene [CAS No. 3897-24-3] concentration: 0.08 to 0.15% Chrysene (Benzo[a]phenanthrene) [CAS No. 218-01-9] concentration: 0.08 to 0.15% Benzo[a]anthracene [CAS No. 56-55-3] concentration: 0.04 to 0.06% Benzo[a]pyrene [CAS No. 50-32-8] concentration: 0.007 to 0.011% Indeno[1,2,3-c,d]pyrene [CAS No. 193-39-5] concentration: 0.001 to 0.003% Benzo[b]fluoranthene [CAS No. 206-99-2] concentration: 0.005 to 0.015% Benzo[k]fluoranthene [CAS No. 206-82-3] concentration: 0.003 to 0.005% Benzo[k]fluoranthene [CAS No. 207-08-8] concentration: 0.002 to 0.004%.
New Jersey Right-to-Know Label	For New Jersey labeling, refer to components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. A chemical substance present in this material which is subject to this statute is Hydrogen Sulfide.

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid.
Color Transparent to opaque, slightly pale to yellow. **Odor** Characteristic, heating oil-like

WARNING! Mist or vapor may irritate the eyes, mucous membranes, and respiratory tract!
Liquid contact may cause minimal eye irritation and/or mild to severe skin irritation and inflammation!
Contains 4- to 6-membered condensed-ring (polynuclear) aromatic hydrocarbons (PNAs)! Based upon laboratory animal studies, may cause skin cancer following extended contact!
May be harmful if inhaled or absorbed through the skin!
Overexposures may cause central nervous system (CNS) depression and/or other target organ effects!
May be harmful or fatal if ingested! Aspiration into the lungs can cause pulmonary edema and lipid or chemical pneumonia!
Spills may create a slipping hazard!
If used as fuel, its engine exhaust may cause upper respiratory tract irritation and reversible pulmonary effects!
Long-term exposure to fuel exhaust particulates may cause cancer!

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact Eye Contact Absorption Inhalation

Signs and Symptoms of Acute Exposure

- Inhalation** Breathing mist or vapors may irritate the mucous membranes of the nose, throat, bronchi, and lungs, and may cause transient central nervous system (CNS) depression. CNS symptoms include headache, dizziness, nausea, intoxication, blurred vision, slurred speech, flushed face, confusion, weakness, fatigue, loss of consciousness, convulsions, coma, and death, depending on the concentration and/or duration of exposure.
- Eye Contact** Animal test results on this material and similar materials suggest that it causes none to minimal eye irritation upon short-term exposure. Symptoms include stinging, watering, and redness.
- Skin Contact** Animal test results on similar materials suggest that this product can cause mild to moderate skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate to severe dermatitis and/or more serious skin disorders. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and/or severe tissue damage.
- Ingestion** If swallowed, this material may irritate the mucous membranes of the mouth, throat, esophagus, and stomach. It can be readily absorbed by the stomach and intestinal tract. Ingestion can produce a burning sensation of the mouth and esophagus and central nervous system depression. Symptoms of CNS depression may include nausea, vomiting, dizziness, staggering gait, drowsiness, shallow rapid pulse, diarrhea, restlessness, sedation, inadequate respiratory function, and heart irregularities. Higher doses may cause loss of consciousness and delirium prior to the onset of convulsions, coma, and death (see "Inhalation" above). A lethal dose may be as low as one-half ounce for a child and one ounce for an adult human.

Due to its low viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration of a small amount of liquid can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.

Chronic Health Effects Summary Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction.

This **light vacuum gas oil** is a **middle distillate** similar to those shown to produce skin tumors on laboratory animals following repeated applications. All tumors appeared at the site of application during the latter portion of the typical 2-year lifespan of the animals. Toxic effects are unlikely to occur if good personal hygiene is practiced.

Biphenyl (Diphenyl) may cause liver and/or nerve damage. (See Section 11.)

Conditions Aggravated by Exposure Personnel with pre-existing central nervous system (CNS) disease, neurological conditions, skin disorders, impaired liver or kidney function, or chronic respiratory diseases should avoid exposure.

Target Organs This substance is toxic to lungs, nervous systems, brain, mucous membranes, skin, eyes, and possibly, the liver and kidneys.

Carcinogenic Potential This material is an **intermediate distillate** and contains certain **polynuclear aromatic hydrocarbons** at above 0.1%. It is considered carcinogenic by IARC and OSHA. (See Section 11.)

Light Gas Oil

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required. If ingested, this material presents a significant aspiration/lipoid or chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	NFPA Class-IIIB Combustible Material Slightly combustible!
Flash Point Method	CLOSED CUP 112° to 121°C (235° to 250°F) (Pensky-Martens Closed Cup [ASTM D-93])
Lower Flammable Limit	AP 0.6 % Upper Flammable Limit AP 5.8 %
Autoignition Temperature	AP 262°C (505°F)
Hazardous Combustion Products	Burning or excessive heating may produce carbon monoxide, carbon dioxide, and possibly smoke, fumes, unburned hydrocarbons, and oxides of sulfur.
Special Properties	This material releases vapors at or approaching the flash point temperature. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Mists or sprays may be flammable at temperatures below the flash point. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire. A static electrical charge can accumulate as a result of transfer flow or agitation. Discharge (static spark) can ignite vapors, especially in cold, dry weather conditions. Special slow load and monitoring procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point products. To reduce this hazard, receiving containers should always be grounded and the loading nozzle must be kept in contact with the container during the entire filling process. Do not fill any portable container in or on a vehicle without proper bonding.
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide (CO ₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.

HoustonRefining

A Lyondell Company

Light Gas Oil

Fire Fighting Protective Clothing

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat, cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material should be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors, but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible, in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak may cause a potential fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This combustible liquid should be stored in a separate safety cabinet or room. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N F P A.'s National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

- Engineering Controls** Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below) All electrical equipment should comply with the NFPA NEC Standards Ensure that an emergency eye wash station and safety shower are near the work-station location
- Personal Protective Equipment** Personal protective equipment should be selected based upon the conditions under which this material is used A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations The following pictograms represent the minimum requirements for personal protective equipment For certain operations, additional PPE may be required

- Eye Protection** Safety glasses with side shields are recommended as a minimum protection During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn Suitable eye wash water should be readily available
- Hand Protection** Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners
- Body Protection** Avoid skin contact It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn This might include long-sleeves, apron, slicker suit, boots, and additional facial protection If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower Contaminated leather goods should be removed promptly and discarded
- Respiratory Protection** For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided Protection factors vary depending upon the type of respirator used Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2)
- General Comments** WARNING! Do not use this material as a fuel without adequate ventilation Inadequate ventilation can result in hazardous levels of combustion products and inadequate oxygen levels for breathing Odor is not adequate to warn of hazardous conditions

The standards for "coal tar pitch volatiles, as benzene solubles" are based upon coal coking, not upon petroleum-derived oils However, in 29 CFR 1910.1200.1002, OSHA has defined "coal tar pitch volatiles" to include the fused polycyclic hydrocarbons which volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood and other organic matter Accordingly, the coal tar pitch volatile standard may apply to the aerosol form of this material

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Diesel fuel/Kerosene ("A3" Animal Carcinogen)	TWA 100 (mg/M ³) from ACGIH (TLV) [Proposed for 2001] - SKIN
2) Biphenyl (Diphenyl)	TWA 0.2 (ppm) from ACGIH (TLV) [2000] TWA 0.2 (ppm) from OSHA (PEL) [1989]
3) Oil mist, mineral	TWA 5 STEL 10 (mg/M ³) from ACGIH (TLV) [2000] TWA 5 (mg/M ³) from OSHA (PEL) [1976]
4) Coal tar pitch volatiles, as benzene solubles ("A1" Confirmed Human Carcinogen)	TWA 0.2 (mg/M ³) from ACGIH (TLV) [2000] TWA 0.2 (mg/M ³) from OSHA (PEL) [1989]
5) Oil mist, mineral, sum total of 15 PAHs listed as carcinogens by US NTP	TWA 0.005 (mg/M ³) from ACGIH (TLV) [Proposed for 2001]

Light Gas Oil

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid	Color	Transparent to opaque, slightly pale to yellow	Odor	Characteristic, heating oil-like
Specific Gravity	0.88 to 0.90 at 60°F (Water = 1)	pH	Not applicable	Vapor Density	5.5 to 10.0 (Air = 1 at 70°F)
Boiling Point/Range	230° to 413°C (446° to 775°F) (ASTM D-86)	Melting/Freezing Point			1° to 7°C (34° to 45°F) (ASTM D-97)
Vapor Pressure	0.1 to 0.4 Reid-psi at 38°C (100°F)	Viscosity (cSt @ 40°C)			7.35 to 11.75 (ASTM D-445)
Solubility in Water	Negligible to slightly soluble in cold water (0.001 to 0.02%)	Volatile Characteristics			Slight, no Volatile Organic Compounds (VOCs) present at 400°F (204°C)
Additional Properties	Alkane, Isoparaffin, Cycloalkane, and Naphthene Hydrocarbons Content = 58.5 to 80 Wt % (ASTM D-1319), C12-C30 Aromatic Hydrocarbon Content = 20 to 41.5 Wt % (ASTM D-1319), Average Density at 60°F = 7.411 lbs/gal (ASTM D-2161), Cetane Number = GT 40 (ASTM D-613 or D-976), Saybolt Viscosity = 50 to 65 SUS at 100°F (ASTM D-2161), Sulfur Content = LT 0.5 Wt % (by ASTM D-2622), 90% Boiling Point Temperature = 734° to 752°F (390° to 400°C) (ASTM D-86), Evaporation Rate = LT 0.01 when n-Butyl acetate = 1.0				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen		
Hazardous Decomposition Products	Composition suggests that sulfur compounds might be generated, but, no degradation data is available		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	Straight-run Middle Distillate and Light Paraffinic Distillate (Petroleum) [similar materials]
	GAS (LC50): Acute. 1.72 to 1.82 mg/L for 4 hours [Male Rat]
	ORAL (LD50) Acute GT 5,000 mg/kg [Rat screen] - Diarrhea, hypoactivity, and somnolence
	DERMAL (LD50). Acute. GT 2,000 mg/kg [Rabbit screen]
	BUEHLER DERMAL Acute Non-sensitizing [Guinea Pig].
	INTRAVENOUS (LD50) Acute: 180 mg/kg [Rabbit] - Respiratory stimulation, tremors, and coma
	28-Day DERMAL Subchronic: Minimal to moderate irritation at 200 to 2,000 mg/kg with no other treatment-related clinical effects observed
	Biphenyl (Diphenyl or 1,1'-Biphenyl)
	GAS (TCLo) Acute. 4,400 ug/m ³ for 4 hours [Human] - Flaccid paralysis of peripheral nerves without anesthesia and nausea or vomiting.
	ORAL (LD50): Acute: GT 2,600 mg/kg [Cat screen]
	ORAL (LD50) Acute 2,400 mg/kg [Rat and Rabbit]
	ORAL (LD50) Acute 1,900 mg/kg [Mouse] - Somnolence, hypermotility, and diarrhea
	DERMAL (LD50) Acute GT 5,010 mg/kg [Rabbit screen]
	INTRAVENOUS (LD50) Acute 56 mg/kg [Mouse]

Laboratory data associated some mixtures of petroleum hydrocarbons with boiling ranges between 300° and 700°F., commonly referred to as "middle distillates, including light vacuum gas oil" have caused increased incidence of skin tumors at the site of contact when applied repeatedly (twice per week) over the lifetime of the test animals (12 to 24 months). A few studies have shown that washing the animal's skin with soap and water between applications greatly reduces the carcinogenic effect of these middle distillates. Untreated and vacuum distillates including light vacuum gas oil have been identified as skin carcinogens by IARC. These similar materials have also been associated with liver and kidney damage in subchronic (90-day) inhalation studies with male rats.

Light Gas Oil

Untreated (straight-run and vacuum) middle distillates and light gas oils produced negative mutagenic responses in the Salmonella/microsome (Ames) assay, the in-vitro Chinese hamster ovary (CHO) sister chromatid exchange (SCE) assay, the in-vivo mouse SCE assay, and the in-vivo rat bone marrow cell chromosome aberrations assay; however, the in-vitro mouse lymphoma assay with and without S9 activation produced both mixed positive and negative responses. The significance of these animal study results to human health is unclear.

Studies with mice and rats have shown that some petroleum middle distillate fuels similar to this material have caused liver tumors and kidney damage and/or tumors. However, the kidney effects were sex hormone dependent and not seen in similar studies involving Guinea pigs, dogs, or monkeys. Also, the significance of the liver tumors in rodents is highly speculative relative to humans.

Studies with mice and rats have also shown that chronic exposures (8 hours/day, 7 days/week, for 24 months) to unfiltered diesel fuel exhaust produced lung tumors and lymphomas. On the basis of these studies, NIOSH recommended that complete diesel exhaust be regarded as a "potential carcinogen".

Numerous epidemiology studies have been carried out to test the hypothesis that lung and/or bladder cancers are associated with chronic exposure to diesel engine exhaust. The most comprehensive case-control and retrospective cohort studies on U.S. railroad workers showed an increased risk for lung cancer and this risk significantly increased with extended duration exposures. There are some indications that an elevated frequency of bladder cancer amongst bus and truck drivers may be due to diesel engine exhaust exposure.

Biphenyl (Diphenyl) inhalation overexposures have caused poisoning characterized by liver atrophy and central and/or peripheral nerve damage. Biphenyl vapors have also caused transient nausea, vomiting, flaccid paralysis, and/or bronchitis.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this intermediate distillate, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. If present, a volatile aromatic hydrocarbon component (biphenyl) may be released and possibly contribute to the creation of atmospheric smog.

Using Rainbow Trout (*Oncorhynchus mykiss*), Dungeness Crab (*Cancer magister*), and juvenile American Shad (*Squalius cephalus*), similar middle distillates and one of this material's components showed a 96-hour TL_{Ms} (Median Toxic Limit) of from 5 ppm to 20 ppm in ambient saltwater. Also, 96-hour LC₅₀ testing produced results from 20 ppm to 320 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Banded Killifish (*Fundulus diaphanus*), American Eel (*Anguilla rostrata*), White Perch (*Perca fluviatilis*), and Striped Mullet (*Mugil cephalus*). Based upon actual spill incident investigations, similar middle distillates and oils containing polynuclear aromatic hydrocarbon compounds similar to this material were shown to bioaccumulate in tissues of various fish and other aquatic organisms from less than 1 to 10 ppm levels.

Environmental Fate

This middle distillate is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, this hydrocarbon oil layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

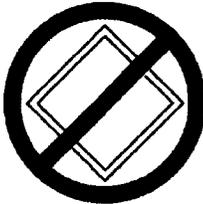

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Light Gas Oil

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol % of this material, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol %, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is not regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Petroleum oil, N O I B N		
Hazard Class	Not a DOT controlled material	Packing Group(s)	Not applicable
		UNNA ID	Not applicable
Reportable Quantity	Not applicable		
Picards		Emergency Response Guide No.	Not applicable
		HAZMAT STCC No.	Not applicable
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Acute (Immediate) Health Hazard and Chronic (Delayed) Health Hazard.
SARA 313	This material contains the following component in concentrations which might be at or above de minimis levels and are listed as a toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313: Biphenyl (Diphenyl) [CAS No. 92-52-4] concentration: 0 to 1.5%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. A chemical substance present in this material subject to this statute is: Chrysene (Benzo[a]phenanthrene) [CAS No. 218-01-9] (RQ = 100 lbs. [45.36 kg]) conc.: 0.001 to 0.003%
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

A Lyondell Company

Light Gas Oil

**California
Proposition 65**

This material, especially if it is used as a fuel, contains the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it might be subject to requirements of California Health & Safety Code Section 25249.5:
Chrysene (Benzo[a]phenanthrene) [CAS No. 218-01-9]
Diesel Engine Exhaust (following combustion)

**New Jersey
Right-to-Know Label**

For New Jersey labeling refer to components listed in Section 2

**Additional Regulatory
Remarks**

Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13): This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: **Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children!**

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following component of this material as a "Volatile Organic Compound (VOC)" which contributes significantly to air pollution which endangers public health and welfare" **Biphenyl (Diphenyl) [CAS No. 92-52-4]**.

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Physical State	Liquid.		
Color	Transparent, clear to slightly yellow.	Odor	Moderate, sweet and pleasant, aromatic hydrocarbon to gasoline-like.

WARNING! Flammable liquid; vapor may cause flash fire!
Mist or vapor may irritate the eyes, mucous membranes, and respiratory tract!
Liquid contact may cause mild to severe eye and/or moderate to severe skin irritation and inflammation!
May be harmful if inhaled or absorbed through the skin!
Overexposures may cause central nervous system (CNS) depression and/or other target organ effects such as hearing loss!
May be harmful or fatal if ingested!
Aspiration into the lungs can cause pulmonary edema and chemical pneumonia!
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
May adversely affect reproduction or reproductive development!
Spills may create a slipping hazard!

Heavy Straight-run Naphtha

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Heavy Straight-run Naphtha (Petroleum)	64741-41-9	100
2) Heptanes	Mixture	1-10
3) Methylcyclohexane	108-87-2	1-3
4) Toluene	108-88-3	1-5
5) C7-C12 alpha-Alkenes	68855-57-2	1-10
6) Octanes	Mixture	15-25
7) Xylenes, Mixed Isomers	1330-20-7	5-20
8) Ethylbenzene	100-41-4	1-5
9) Nonanes	Mixture	10-25
10) Cumene	98-82-8	1-5
11) n-Propylbenzene	103-65-1	0.5-1.5
12) Trimethylbenzene (mixed isomers)	25551-13-7	5-10
13) 1,2,4-Trimethylbenzene (Pseudocumene)	95-83-6	2-6
14) Ethylmethylbenzenes (Ethyltoluenes)	25550-14-5	1-10
15) Indene	95-13-6	0.5-1.5
16) Naphthalene	91-20-3	0.5-1.5
17) C10-C12 Alkylbenzenes	70693-06-0	5-10
18) C10-C12 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	5-10

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye Contact. Absorption. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon level of exposure concentration and/or duration. Vapors can reduce the oxygen content in air. Approximately 20,000 ppm (or 2 vol.%) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces.
Eye Contact	Animal test results on similar materials suggest that this product can cause mild to severe eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling.
Skin Contact	Animal test results on similar materials suggest that this product can cause moderate to severe skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate to severe dermatitis. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and severe tissue damage.
Ingestion	If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above). Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.
Chronic Health Effects Summary	Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Reports have associated repeated and prolonged occupational overexposure to solvents with irreversible brain and nervous system damage (sometimes referred to as "Solvent or Painter's Syndrome"). And, altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been common results for gasoline and naphtha abusers. Intentional misuse by deliberately concentrating and inhaling this product may be harmful or fatal.

Heavy Straight-run Naphtha

Notes to Physician

Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse). If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IB Flammable Liquid. Highly flammable!		
Flash Point Method	CLOSED CUP: -4° to 4°C (25° to 40°F). (Tagliabue [ASTM D-56])		
Lower Flammable Limit	AP 0.9 %	Upper Flammable Limit	AP 7.0 %
Autoignition Temperature	AP 232°C (450°F) (ASTM E-659)		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors including oxides of sulfur and nitrogen.		
Special Properties	Flammable Liquid! This material releases vapors at or well below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.		
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide (CO ₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.		
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

Heavy Straight-run Naphtha

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room, and preferably refrigerated. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Heavy Straight-run Naphtha

- Body Protection** Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.
- Respiratory Protection** For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).
- General Comments** Warning! Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Gasoline ("A3" Animal Carcinogen)	TWA: 300 STEL: 500 (ppm) from ACGIH (TLV) [1999] TWA: 300 STEL: 500 (ppm) from OSHA (PEL) [1989]
2) Petroleum Distillates (Naphtha)	TWA: 400 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
3) Heptane (n-Heptane)	TWA: 400 STEL: 500 (ppm) from ACGIH (TLV) [1999] TWA: 400 STEL: 500 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
4) Methylcyclohexane	TWA: 400 (ppm) from ACGIH (TLV) [1999] TWA: 400 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
5) Toluene ("A4" = Not Classifiable)	TWA: 50 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [1989] TWA: 200 CEIL: 300 (ppm) from OSHA (PEL) [1976]
6) Octane, all isomers	TWA: 300 (ppm) from ACGIH (TLV) [1999] TWA: 300 STEL: 375 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
7) Xylene, Mixed Isomers ("A4" = Not Classifiable)	TWA: 100 STEL: 150 (ppm) from ACGIH (TLV) [1999] TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [1989]
8) Ethylbenzene ("A4" = Not Classifiable)	TWA: 100 STEL: 125 (ppm) from ACGIH (TLV) [1999] TWA: 100 STEL: 125 (ppm) from OSHA (PEL) [1989]
9) Nonane, all isomers	TWA: 200 (ppm) from ACGIH (TLV) [1999] TWA: 200 (ppm) from OSHA (PEL) [1989]
10) Trimethylbenzene (mixed isomers)	TWA: 25 (ppm) from ACGIH (TLV) [1999] TWA: 25 (ppm) from OSHA (PEL) [1989]
11) Cumene	TWA: 50 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 50 (ppm) from OSHA (PEL) [1989] - SKIN
12) Indene	TWA: 10 (ppm) from ACGIH (TLV) [1999] TWA: 10 (ppm) from OSHA (PEL) [1989]
13) Naphthalene ("A4" = Not Classifiable)	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 10 STEL: 15 (ppm) from OSHA (PEL) [1989] TWA: 10 (ppm) from OSHA (PEL) [1976]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color	Transparent, clear to slightly yellow.	Odor	Moderate, sweet and pleasant, aromatic hydrocarbon to gasoline-like.
Specific Gravity	0.83 to 0.85 (Water = 1)	pH	Not applicable.	Vapor Density	3.5 to 3.9 (Air = 1)
Boiling Point/Range	82° to 235°C (180° to 455°F) (ASTM D-86)	Melting/Freezing Point			LT -46°C (-50°F)
Vapor Pressure	3.0 to 3.5 Reid-psia at 38°C (100°F).	Viscosity (cSt @ 40°C)			1 to 3
Solubility in Water	Soluble in methanol and diethyl ether. Slightly soluble in cold water (LT 0.1%).	Volatile Characteristics			Volatile Organic Compounds (VOCs) Content = 100%; 800 to 900 gm/L.

Heavy Straight-run Naphtha

Additional Properties Alkane, Isoparaffin, and Cycloalkane Hydrocarbons Content = 30 to 79 Wt.% (ASTM D-1319);
 C6-C12 Aromatic Hydrocarbons Content = 20 to 80 Wt.% (ASTM D-1319);
 Olefin Hydrocarbons Content = 1 to 10 Wt.% (ASTM D-1319);
 Average Density at 60°F = 6.995 lbs./gal. (ASTM D-2500);
 Evaporation Rate = 0.35 to 2.0 when n-Butyl acetate = 1.0;
 Sulfur Content = 0.1 to 0.25 Wt.% (ASTM D-2622, D-1266, or D-1552);
 90% Boiling Point Temperature = 415° to 435°F (213° to 224°C) (ASTM D-86);
 Dry Point Temperature = 450°F (232°C) (ASTM D-86);
 Net Heat of Combustion Value = 18,600 to 20,600 Btu/lb. (ASTM D-1405 or D-2382).

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen.		
Hazardous Decomposition Products	No substances are readily identified from composition; and, no degradation data is available.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Heavy Catalytic Cracked and Reformed Naphthas (Petroleum) (similar materials):

ORAL (LD50): Acute: 4,820 to 5,800 mg/kg [Rat] - Somnolence, diarrhea, and hypermotility.
 GAS (LC50): Acute: GT 5,040 mg/L for 4 hours [Rat screen level] - Somnolence.
 DERMAL (LD50): Acute: GT 2,000 mg/kg [Rabbit screen level].

n-Heptane:

GAS (LC50): Acute: 103,000 mg/m³ for 4 hours [Rat] - Convulsions.
 DERMAL (LD50): Acute: GT 2,000 mg/kg [Rabbit].
 INTRAVENOUS (LD50): Acute: 222 mg/kg [Mouse].

Toluene:

ORAL (LD50): Acute: 636 mg/kg [Rat].
 ORAL (LD50): Acute: 4,000 mg/kg [Cat].
 GAS (LC50): Acute: 49,000 mg/m³ for 4 hours [Rat].
 GAS (LC50): Acute: 5,320 ppm for 8 hours [Mouse].
 GAS (LC50): Acute: 400 ppm for 24 hours [Mouse].
 DERMAL (LD50): Acute: 14,100 uL/kg or 12,125 mg/kg [Rabbit].
 INTRAVENOUS (LD50): Acute: 1,960 mg/kg [Rat].
 INTRAVENOUS (LD50): Acute: 2,000 mg/kg [Mouse].
 SUBCUTANEOUS (LD50): Acute: 2,250 mg/kg [Mouse].
 INTRAPERITONEAL (LD50): Acute: 59 mg/kg [Mouse].
 INTRAPERITONEAL (LD50): Acute: 500 mg/kg [Guinea Pig].
 INTRAPERITONEAL (LD50): Acute: 1,332 mg/kg [Rat].

Methylcyclohexane:

ORAL (LD50): Acute: 2,250 mg/kg [Mouse].
 GAS (LC50): Acute: 41,500 mg/m³ for 2 hours [Mouse] - Hypermotility and diarrhea.
 GAS (LC50): Acute: 15,227 ppm for 1 hour [Rabbit] - General anesthetic, convulsions, and changes in the salivary glands.

n-Octane:

GAS (LC50): Acute: 118,000 mg/m³ for 4 hours [Rat].

Xylenes:

ORAL (LD50): Acute: 4,300 mg/kg [Rat].
 GAS (LC50): Acute: 4,550 ppm for 4 hours [Rat].
 DERMAL (LD50): Acute: 14,100 uL/kg [Rabbit].
 SUBCUTANEOUS (LD50): Acute: 1,700 mg/kg [Rat].
 INTRAPERITONEAL (LD50): Acute: 2,459 mg/kg [Rat].
 INTRAPERITONEAL (LD50): Acute: 1,548 mg/kg [Mouse].

Ethylbenzene:

ORAL (LD50): Acute: 3,500 mg/kg [Rat].
 DERMAL (LD50): Acute: 17,800 uL/kg [Rabbit].
 INTRAPERITONEAL (LD50): Acute: 2,624 mg/kg [Rat].

Heavy Straight-run Naphtha

n-Nonane:

GAS (LC50): Acute: 3,200 ppm for 4 hours [Rat].
 INTRAVENOUS (LD50): Acute: 218 mg/kg [Mouse].

n-Propylbenzene:

ORAL (LD50): Acute: 6,040 mg/kg [Rat].
 GAS (LC50): Acute: 65,000 ppm for 2 hours [Rat].

Trimethylbenzenes:

ORAL (LD50): Acute: 8,970 mg/kg [Rat].

1,2,4-Trimethylbenzene:

ORAL (LD50): Acute: 5,000 mg/kg [Rat].
 GAS (LC50): Acute: 18,000 mg/m³ for 4 hours [Rat].

Ethylmethylbenzenes (Ethyltoluenes):

GAS (LC50): Acute: 50,000 mg/m³ for 2 hours [Cat].
 GAS (LC50): Acute: 54,000 mg/m³ for 4 hours [Mouse].

Indene:

ORAL (LD50): Acute: 2,300 mg/kg [Rat].
 ORAL (LD50): Acute: 1,800 mg/kg [Mouse].
 GAS (LC50): Acute: 14,000 mg/m³ for 4 hours [Rat].

Naphthalene:

ORAL (LD50): Acute: 490 mg/kg [Rat].
 ORAL (LD50): Acute: 533 mg/kg [Mouse].
 ORAL (LD50): Acute: 1,200 mg/kg [Guinea Pig].
 SUBCUTANEOUS (LD50): Acute: 969 mg/kg [Mouse].
 INTRAVENOUS (LD50): Acute: 100 mg/kg [Mouse].
 INTRAPERITONEAL (LD50): Acute: 150 mg/kg [Mouse].

Subchronic (28-day) oral and dermal studies with heavy catalytic cracked and reformed naphthas similar to heavy straight-run naphtha (petroleum) using both rats and rabbits showed animal weight loss or reduced weight gain, renal tubule changes and acute tubular necrosis, plus slight to severe skin irritation without sensitization. These similar naphthas also produced equivocal mutagenic responses in the Salmonella/microsome (Ames) Assay and equivocal or positive responses in the in-vitro Mouse Lymphoma Assay with and without S9 activation. The significance of these animal mutagenicity study results to human health is unclear.

Long-term mouse skin painting studies sponsored by the American Petroleum Institute (API) showed heavy catalytic cracked naphtha caused a slight increased incidence of skin tumors at the site of contact when applied repeatedly (twice per week) over the lifetime of the test animals (12 to 24 months). Average latency period was 72 weeks. However, heavy catalytic reformed naphtha did not produce any skin tumors under the same regimen. A few studies have shown that washing the animal's skin with soap and water between applications greatly reduces the carcinogenic effect of similar and heavier petroleum distillates.

n-Heptane is a mucous membrane and respiratory tract irritant, but non-irritating to the eyes. It is readily absorbed by inhalation and dermal exposure and repeated direct skin application can produce defatting dermatitis. Exposures may cause decreased red blood cell counts, liver and heart damage, and central nervous system depression. n-Heptane is metabolized in the liver to form alcohols and ketones, including neurotoxic 2,5-heptanedione which is detectable in small amounts in the urine of exposed humans.

In a controlled study, human volunteers exposed to an airborne concentration of n-heptane of 1,000 ppm for 6 minutes or 2,000 ppm for 4 minutes experienced slight dizziness and incoordination. Higher-level exposures produced hilarity, dizziness, and semi-consciousness. Inhaling a concentration of 5,000 ppm for 15 minutes caused stupor and a gasoline-like taste. These higher exposures also decreased the myocardial threshold to the arrhythmogenic effects (irregular heart beats) of epinephrine, producing only a narrow margin of safety between exposures causing CNS effects, cardiac effects, and loss of consciousness.

One occupational exposure study involving a 95% purity n-heptane from 1 to 9 years duration concluded that it could produce minimal peripheral nerve damage with numbness and tingling of the extremities in the stocking-and-glove areas. In the same study, there was a decrease in motor nerve conduction velocities correlated with duration of exposure and adjusted for age effects; however, the average motor nerve conduction velocity in exposed workers was normal. Polyneuropathy associated with n-heptane exposure was reversible within a year following removal of exposure.

n-Heptane was not neurotoxic in rats exposed for up to 7 months. But based upon limited laboratory animal studies, n-heptane and its metabolites were found in low levels (LT 135 ppm) in the brain of rats exposed to airborne concentrations of 100, 500, or 1,500 ppm for 6 hours each day, five days per week, for 1 or 2 weeks. These substances disappeared within 2 weeks following removal of exposure. n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not expected to be carcinogenic.

Heavy Straight-run Naphtha

Rats inhaling **methylcyclohexane** at an airborne concentration of 15,250 ppm for 1 hour displayed tremors, loss of coordination, anesthesia, and convulsions. Inhalation of 10,050 ppm for 6 hours per day for 14 days showed rodent weight loss or decreased weight gain and changes in the structure of their salivary glands. Using rabbits, methylcyclohexane was shown to have an LD50 somewhere between 3,300 ppm and 7,300 ppm when exposed repeatedly for 6 hours per day, 5 days per week, for 3 weeks. Death was preceded by conjunctival congestion with mucoid secretion and lacrimation, salivation, coughing, sneezing, labored breathing, and diarrhea. Lethal oral dosing of rabbits caused lethargy, severe diarrhea, and circulatory collapse. Vascular and degenerative lesions were observed in the kidneys and liver.

2,2,4-Trimethylpentane (iso-octane) was highly irritating to mice at a 1,000 ppm in air exposure for 5 minutes and respiratory arrest occurred at exposures above 10,000 ppm for 5 minutes. CNS depression was observed at concentrations between 8,000 and 10,000 ppm in air. Kidney tubule necrosis, hyaline droplet formation, and acute renal failure were seen in male rats following oral administration of 10 gm/kg, 8 mL/kg, or 2,100 mg/kg of iso-octane for 2, 3, and 4 weeks, respectively.

Toluene (methylbenzene) has been a major solvent of intentional inhalation abuse. Deliberate long-term inhalation of high concentrations of toluene (glue sniffing, etc.) has been shown to cause liver, kidney, central nervous system, and permanent brain damage. Effects such as impaired speech, visual disturbances, and hearing loss, loss of balance and/or muscle control, and memory loss have been reported. Exposures of 100 to 200 ppm in air for 24 hours cause hallucinations, distorted perceptions, and changes in motor activity. Studies have indicated that children of women who sniffed massive exposures of toluene during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. Isolated case reports have suggested a spectrum of congenital defects similar to those seen in fetal alcohol (ethanol) syndrome. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate.

Animal studies suggest that **toluene** causes kidney, liver, and/or lung dysfunction and cardiac (heart muscle) sensitization to epinephrine or other adrenalin-like agents. This sensitization may cause fatal changes in heart beat rhythms. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency).

Long-term rodent inhalation studies with **toluene** produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness, and impaired reaction time. Also, rats exposed to 1,200 ppm and 1,400 ppm of toluene in air for 14 hours per day for 5 or 4 weeks (respectively) exhibited high-frequency hearing loss. Several animal studies using pregnant rodents have shown that toluene exposures may cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation studies, toluene has not been shown to be carcinogenic; nor is it mutagenic in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

An inhalation study with laboratory animals indicated an association of **xylene** with hearing loss in rats. Several animal studies using pregnant rodents have shown that **mixed xylene isomers (dimethylbenzenes)** may all cause embryo and/or fetotoxicity. Inhalation and feeding studies involving pregnant laboratory animals have produced limited evidence of fetal toxicity including increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes.

Chronic overexposure to **xylene** may produce irreversible damage to the central nervous system, including ototoxicity, that can be increased by the consumption of ethanol (alcoholic drinks). Drinking beverages which contain ethanol in conjunction with xylene exposure increases the alcoholic effects and impairs the clearance of xylenes from the body. Xylene isomers accumulate in the adipose (fat) tissues, from which they are slowly released. Complete clearance may take several days following exposure.

Two-year rat and mouse gavage studies by the National Toxicology Program (NTP) on **mixed xylene isomers including 17% ethylbenzene** showed "no evidence of carcinogenicity". Also, a two-year mixed xylenes skin-painting study on shaved rats and mice showed no incidence of non-neoplastic or neoplastic lesions. And, none of the components were mutagenic when tested in either the modified Ames, Chinese hamster ovary cell with and without metabolic activation, or sister-chromatid mutagenicity assays.

Heavy Straight-run Naphtha

The National Toxicology Program (NTP) recently completed a 2-year inhalation bioassay on **ethylbenzene** in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200, and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels. However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level; and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Hyperplasia was also observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear. NTP, IARC, and OSHA have not designated ethylbenzene as a carcinogen.

Rats inhaling **n-nonane** at an airborne concentration of 1,500 ppm for 7 days displayed mild tremors and loss of coordination. Inhalation of 1,600 ppm for 6 hours per day for 90 days showed animal weight loss or decreased weight gain and changes in the structure of their salivary glands. And, liver damage and an altered response to drugs were seen in rats given n-nonane for 2 to 7 days.

Prolonged and/or repeated overexposure to **cumene (isopropylbenzene)** via inhalation or skin absorption can cause liver and/or kidney damage.

Trimethylbenzenes are primary skin irritants and may cause asthmatic bronchitis and/or anemia. Based upon animal reproductive/developmental studies, trimethylbenzenes may also cause fetal toxicity.

Indene and the ethylmethylbenzenes are primary skin irritants and overexposures might cause liver and/or kidney damage or increase blood cholinesterase levels. Inhalation of these and other **C9 aromatic hydrocarbons** by pregnant mice and rats during gestational days 6 through 15 resulted in decreased fetal and newborn weights.

Naphthalene is a potential irritant to eyes, skin, and lungs. Following prolonged and/or repeated exposures, naphthalene has been shown to cause eye damage (cataracts and/or optical neuritis), premature destruction or red blood cells (hemolytic and aplastic anemia), and kidney damage (jaundice), and possibly neurotoxicity. Naphthalene-induced blood disorders in humans are characterized by variability in size, shape, and number of red blood cells, anemia, and decreased hemoglobin. Also, there have been reported anemia deaths amongst children exposed to moth ball (naphthalene) saturated blankets. Peripheral lens opacities occurred in 8 of 21 workers exposed to elevated levels of naphthalene vapors for 5 years. Repeated ingestion of a naphthalene-isopropanol mixture caused tremors, restlessness, hallucinations, and extreme apprehension. Also, naphthalene may cause fetal toxicity or damage. Laboratory studies produced limited evidence of fetal toxicity in pregnant female mice including decreased spleen weights.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this naphtha, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. Volatile aromatic hydrocarbon components (**toluene, xylenes, ethylbenzene, cumene, indene, trimethylbenzenes, and naphthalene**) may be released and possibly contribute to the creation of atmospheric smog.

Using Rainbow Trout (*Oncorhynchus mykiss*) and Dungeness Crab (*Cancer magister*), similar naphthas showed a 96-hour TLM (Median Toxic Limit) from 5 ppm to 20 ppm in ambient saltwater. Also, 24-hour and 96-hour TLMs produced results from 60 ppm to 200 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), Guppy (*Lebistes reticulatus*) and juvenile American Shad (*Squalius cephalus*) in fresh water. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

Environmental Fate

This naphtha mixture is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Petroleum distillates, n.o.s. (Octanes, Nonanes)		
Hazard Class	Class 3: Flammable liquid.	Packing Group(s)	PG II
		UN/NA ID	UN1268
Reportable Quantity	The Reportable Quantity (RQ) substance components in this material which might require DOT HAZMAT bill-of-lading display are Xylenes and Toluene and/or Ethylbenzene .		
Placards		Emergency Response Guide No.	128
		HAZMAT STCC No.	49 102 56
		MARPOL III Status	Component analysis might define this product as a DOT "Marine Pollutant" per 49 CFR 171.8 (Cumene, Trimethylbenzenes, Ethylmethylbenzenes, and Naphthalene).

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.

HoustonRefining

A Lyondell Company

Heavy Straight-run Naphtha

SARA 313

This material might contain the following components in concentrations at or above de minimis levels and they are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313:

Toluene [CAS No. 108-88-3] concentration: 1 to 5%
Xylenes [CAS No. 1330-20-7] concentration: 5 to 20%
Ethylbenzene [CAS No. 100-41-4] concentration: 1 to 5%
Cumene (Isopropylbenzene) [CAS No. 92-82-8] concentration: 1 to 5%
1,2,4-Trimethylbenzene (Pseudocumene) [CAS No. 95-63-6] concentration: 2 to 6%
Naphthalene [CAS No. 91-20-3] concentration: 0.5 to 1.5%

CERCLA

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this material subject to this statute are:

Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 0 to 0.001%
Toluene [CAS No. 108-88-3] (RQ = 1000 lbs. [453.6 kg]) concentration: 1 to 5%
2,2,4-Trimethylpentane (Iso-octane) [CAS No. 540-84-2] (RQ = 1000 lbs. [453.6 kg]) conc.: 0.15 to 2.5%
Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 5 to 20%
Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 1 to 5%
Cumene (Isopropylbenzene) [CAS No. 98-82-8] (RQ = 5000 lbs. [2268 kg]) concentration: 1 to 5%
Naphthalene [CAS No. 91-20-3] (RQ = 100 lbs. [45.36 kg]) concentration: 0.5 to 1.5%.

CWA

This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

California Proposition 65

This material might contain the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5:
Benzene [CAS No. 71-43-2] and Toluene [CAS No. 108-88-3].

New Jersey Right-to-Know Label

For New Jersey labeling refer to components listed in Section 2.

Additional Regulatory Remarks

Under Section 12(b) of TSCA: Because it contains detectable amounts of **Cumene (Isopropylbenzene) [CAS No. 98-82-8], n-Propylbenzene [CAS No. 103-65-1], and other C9 Aromatic Hydrocarbons**, this material might be subject to US EPA's one-time only per country export notification requirements.

Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13): This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a from suitable for use in the household or by children. Precautionary label dialogue should display the following:
Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children!

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare": **Benzene [CAS No. 71-43-2], Methylcyclohexane [CAS No. 108-87-2], Toluene [CAS No. 108-88-3], Xylenes [CAS No. 1330-20-7], Ethylbenzene [CAS No. 100-41-4], and Cumene [98-82-8].**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION	Logo and Manufacturer name change.
Version Number	7.1
Revision Date	11/01/06

2. HAZARDS IDENTIFICATION

Emergency Overview

This material is HAZARDOUS as defined by the OSHA Hazard Communication Standard, 29CFR, 1910.1200.

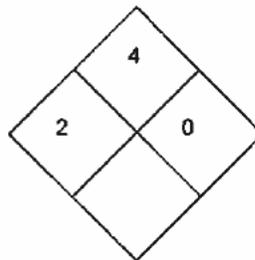

Signal Word

DANGER.

Hazards

Aspiration hazard. May be harmful if inhaled, swallowed or absorbed through the skin. This material also contains components that may cause hearing loss and may be a developmental toxin. Toxic to the nervous system. Possible cancer hazard.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE96
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 10/25/2011

COKER NAPHTHA

Color

colorless to light yellow

Odor

slight Hydrocarbon.

Odor Threshold

No value available.

Potential health effects

Routes of exposure

Eye. Skin. Inhalation.

Acute effects

Inhalation hazard. May cause drowsiness and dizziness.

- *Toluene 108-88-3*

Toluene is of slight acute toxicity, although inhalation exposure may cause dizziness and CNS depression, while ingestion may be fatal if aspiration into the lung occurs. Toluene may increase the sensitivity of the heart leading to potentially fatal cardiac sensitization. It is moderately irritating to skin and eye.

- *n-Pentane 109-66-0*

Aspiration hazard. May cause central nervous system depression.

- *Xylene 1330-20-7*

May be irritating to the eyes, skin, and respiratory system. Aspiration hazard. Ingestion of this material, followed by vomiting and aspiration of the more volatile components of this material into the lungs, may lead to chemical pneumonia and even death.

- *Ethyl alcohol 64-17-5*

May cause eye and upper respiratory tract irritation. Short-term overexposure above 1,000 ppm by the inhalation route may cause central nervous system (CNS) effects such as headache and irritation of eyes, nose and throat. If continued for more than an hour additional CNS effects may occur such as: dizziness, drowsiness, loss of appetite, and an inability to concentrate. Gastrointestinal (stomach) effects may occur with symptoms such as nausea and vomiting.

- *n-Hexane 110-54-3*

May cause irritation to the eyes, nausea, vertigo, bronchial and central nervous system effects. This material presents an acute aspiration hazard. May be irritating to the skin. High or repeated exposures can damage the peripheral nervous system, causing numbness, tingling, and/or muscle weakness in the hands or feet. The onset of health effects associated with n-hexane may be influenced by exposure to additional chemicals such as methyl isobutyl ketone and methyl ethyl ketone.

- *Methyl Cyclohexane 108-87-2*

Liquid, mist, or vapors can cause eye, skin and respiratory tract irritation. CNS depressant. Exposure to excess vapor may cause headache, fatigue, drowsiness and dizziness.

- *Trimethyl benzene 25551-13-7*

CNS depressant. Aspiration hazard.

- *Benzene 71-43-2*

Slight acute toxicity. Inhalation exposure to high concentrations may cause dizziness and CNS depression. Ingestion of relatively small amounts may be fatal if aspiration into the lungs takes place.

- *Cumene 98-82-8*

Slight eye irritant. Slight skin irritant. Aspiration hazard. CNS depressant.

- *Ethyl Benzene 100-41-4*

Inhalation hazard. Ingestion hazard. Skin and eye irritant.

- *Cyclohexane 110-82-7*

CNS depressant. Simple asphyxiant. May be irritating to the eyes, skin, and respiratory system.

- *Naphthalene 91-20-3*

May be irritating to the eyes, skin and respiratory tract. Direct contact with the eye may cause corneal damage. May be toxic by all routes of exposure. Target organs for toxic effects include the blood, liver, kidneys, eyes, and central nervous system (CNS). Symptoms of overexposure may include headache, restlessness, lethargy, vomiting, anorexia, anemia, diminished vision, and acute kidney failure. Individuals who have an inherited G6PD deficiency in their red blood cells may be particularly sensitive to the toxic effects of Naphthalene. Naphthalene can cross the placenta and harm the fetus.

- *Methylcyclopentane 96-37-7*

MATERIAL SAFETY DATA SHEET

MSDS No.: BE95
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 10/25/2011

COKER NAPHTHA

This product may cause eye, skin, and respiratory tract irritation. High concentrations may cause central nervous system (CNS) depression. Ingestion would likely cause gastrointestinal tract irritation.

- *Indene 95-13-6*

May cause drowsiness and dizziness. Aspiration into the lungs may cause chemical pneumonia.

Skin

May produce skin irritation. Repeated or prolonged contact with skin may cause defatting and drying of the skin which may result in dermatitis. May be absorbed through the skin and produce toxic effects such as CNS depression. Repeated or prolonged skin contact may result in allergic dermatitis. If the skin is damaged, absorption increases.

Inhalation

Can cause pulmonary edema if aspirated into lungs. High concentrations can displace oxygen and cause drowsiness, dizziness, unconsciousness and/or suffocation by asphyxiation. Exposure may cause symptoms of lack of oxygen, leading to collapse and death. Inhalation of vapors may cause respiratory distress and CNS effects.

Eyes

May cause moderate irritation, including burning sensation, tearing, redness or swelling. Effects of eye irritation are reversible.

Ingestion

Aspiration may cause lung damage. Irritates mucous membranes of the mouth, throat, and esophagus and is readily absorbed by the stomach and intestinal tract. CNS symptoms include nausea, vomiting, pallor, dizziness, staggering gait, drowsiness, shallow rapid pulse, loss of consciousness, and delirium prior to the onset of convulsions, coma, and death. Ingestion and/or vomiting of this material may result in aspiration into the lungs. Even a small amount of this liquid entering the lungs can produce potentially fatal effects (pulmonary edema and pneumonitis). Solid and liquid forms of this material and the pressurized gas can cause freeze burn.

Chronic effects

Repeated or prolonged exposure of the skin to this material may cause defatting and drying of the skin. Prolonged or repeated exposure to vapors may cause lung damage. May affect hearing. Suspect reproductive hazard. May cause developmental toxicity. Contains material which may cause cancer based on animal data.

- *Toluene 108-88-3*

Repeated exposure to high concentrations has been shown to cause neurological changes and hearing loss in animals, and in humans in abuse situations. May cause developmental toxicity.

- *n-Pentane 109-66-0*

Repeated or prolonged exposure of the skin to this material may cause defatting and drying of the skin.

- *Xylene 1330-20-7*

May cause dermatitis by defatting the skin from prolonged or repeated contact. May contribute to the development of diseases of the nervous system, liver and kidney. May be a reproductive hazard.

- *Ethyl alcohol 64-17-5*

Long-term exposure can also cause loss of appetite, weight loss, nervousness, memory loss, mental retardation and liver damage. May cause dermatitis by defatting the skin from prolonged or repeated contact. Alcoholic beverages are carcinogenic to humans. Ethanol is a developmental toxin and various effects have been associated with ethanol intake. Examples of chronic ethanol abuse effects include physical dependence, malnutrition, amnesia, dementia, somnolence, cardiac myopathy, hepatotoxicity, GI bleeding and pancreatitis. Combined exposure to ethanol and certain other chemicals may result in increased toxic effects.

- *n-Hexane 110-54-3*

Damage to nerves in hands or feet may occur from prolonged inhalation of n-hexane concentrations of 60 to 240 ppm. Repeated exposure to air concentrations of 500 ppm n-hexane can produce progressively worsening damage to the peripheral nerves. Prolonged and repeated exposure to vapors may cause damage to the CNS, lungs and kidneys. Suspect reproductive hazard.

- *Methyl Cyclohexane 108-87-2*

Repeated or prolonged contact with skin may cause defatting and drying of the skin which may result in dermatitis.

- *Trimethyl benzene 25551-13-7*

No adverse chronic human health effects have been reported for this material.

- *Benzene 71-43-2*

MATERIAL SAFETY DATA SHEET

MSDS No.: BE95
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 10/25/2011

COKER NAPHTHA

Benzene is considered to be a cancer-causing agent. Repeated exposure is linked to bone marrow toxicity, reduced red- and white blood cell counts and decreased immunological function irrespective of the route of contact.

- *Cumene 98-82-8*

This material has been classified by IARC as a group 2B substance (possibly carcinogenic to humans). Prolonged and/or repeated contact may cause mild to moderate skin defatting, redness, blistering, lesions, and/or scaly dermatitis. May cause kidney and/or lung damage.

- *Ethyl Benzene 100-41-4*

May effect hearing. Repeated or prolonged exposure may damage liver and kidneys. Possible cancer hazard. Repeated contact with skin may cause cracking and/or fissuring.

- *Cyclohexane 110-82-7*

No adverse chronic human health effects have been reported for this material.

- *Naphthalene 91-20-3*

Target organs for toxic effects of chronic exposure include the blood, the skin, the eyes, and the central nervous system. Symptoms of chronic overexposure may include dermatitis, anemia, sores on the eye or cloudiness of the eyeball, diseases involving the nerves or nervous system, and allergic skin reactions. Potential Cancer Hazard, see section 11.

- *Methylcyclopentane 96-37-7*

Repeated exposure can cause peripheral nerve damage and defatting of the skin.

- *Indene 95-13-6*

No known chronic health effects.

Aggravated Medical Condition

Pre-existing medical conditions including dermatitis, diseases of the lungs, kidneys, liver, heart, nervous system or the blood. Women of child bearing potential should avoid contact with this material. Any pre-existing disorders or diseases of the: liver blood

4. FIRST AID MEASURES

General advice

Take proper precautions to ensure your own health and safety before attempting rescue and providing first aid. For specific information refer to the Emergency Overview in Section 2 of this MSDS.

Skin

All contaminated clothing should be removed, and contaminated skin areas washed with lipophilic soap, or green soap, and water. Never use low boiling point naphthas for washing contaminated skin. Do not wash with machine dishwashing or laundry detergents. Seek medical attention if tissue appears damaged or if pain or irritation persists. Discard contaminated leather goods.

Inhalation

Remove victim to fresh air and keep at rest in a position comfortable for breathing. Keep patient warm and at rest. If breathing is difficult, give oxygen. If unconscious place in recovery position and seek medical advice. In the event of unconsciousness, apnea or cardiac arrest (no pulse) apply cardiopulmonary resuscitation. Move the exposed person to fresh air at once. If breathing has stopped, perform artificial respiration. When breathing is difficult, properly trained personnel may assist the affected person by administering oxygen. Keep the affected person warm and at rest. Get medical attention immediately.

Eyes

In case of eye contact, remove contact lens and rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Do not use eye ointment unless directed to by a physician. If irritation, blurred vision or swelling occurs and persists, obtain medical advice from a specialist. If eye tissue is frozen, seek medical attention immediately. If tissue is not frozen, thoroughly flush the eyes with large amounts of clean low-pressure water for at least 15 minutes, occasionally lifting the upper and lower eyelids. If irritation persists seek medical attention.

Ingestion

DO NOT induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. Never give anything by mouth to an unconscious person. Immediately seek medical attention.

Notes to physician

Treat symptomatically. Inhalation may cause CNS depression. Overexposure may produce anesthetic or narcotic effects. Do not induce vomiting. Risk of damage to lungs exceeds poisoning risk. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to this material. Treatment of overexposure should be directed at the control of symptoms and the clinical condition of the patient. Gastrointestinal decontamination in accidental petroleum distillate ingestions is not recommended, because of the severe aspiration hazard. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of pulmonary/upper airway edema. Provide 100% humidified supplemental oxygen with assisted ventilation if needed. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Gastric lavage may also be indicated. Airway protection may be necessary.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

Extremely flammable liquid. OSHA/NFPA Class IA flammable liquid.

Flash point

MATERIAL SAFETY DATA SHEET

MSDS No.: BE95
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 10/25/2011

COKER NAPHTHA

Flash point

-30 °C (-22 °F)

Autoignition temperature

~ 232 °C (449.6 °F)

Lower explosion limit

~ 1.1 vol%

Upper explosion limit

~ 7.6 vol% (% vol in air).

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Dry chemical. CO₂. Water spray. Foam. Sand. LARGE FIRES: Water spray. Water fog. Foam. Dry chemical. CO₂. Sand.

Unsuitable extinguishing media

Do not use solid water stream/may spread fire. Simultaneous use of foam and water on the same surface is to be avoided as water destroys the foam.

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear positive pressure self-contained breathing apparatus (SCBA). Structural firefighters protective clothing will only provide limited protection.

Precautions for fire-fighting

When exposed to ignition source in air, vapors can burn in open or explode if confined. Flammable vapors may be heavier than air and travel long distances along the ground before igniting and flashing back to vapor source. Releases flammable vapors below normal ambient temperatures. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Move containers from fire area if you can do it without risk. Sustained fire attack on vessels may result in a Boiling Liquid Expanding Vapour Explosion (BLEVE). Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Prevent fire extinguishing water from contaminating surface water or the ground water system. When fighting a fire, notify environmental authorities if liquid enters sewers or public waters. Fire residues and contaminated fire extinguishing water must be disposed of in accordance with local regulations. Thermal decomposition may produce carbon monoxide and other toxic vapors.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Release causes immediate fire/explosion hazard. Limit access to essential personnel. Eliminate all sources of ignition. Let evaporate. If possible, turn leaking container so that gas escapes rather than liquid. Do not direct water at spill or source. Use water spray curtain to divert vapor drift. Prevent entry into sewers, basements or confined areas. Do not direct water at spill or source of leak. Liquid spills will vaporize forming cold dense vapor clouds that do not readily disperse. Avoid vapor cloud even with proper respiratory equipment. A vapor suppressing foam may be used to reduce vapors. Caution: When in contact with refrigerated/cryogenic liquids, many materials become brittle and are likely to break without warning. Stop leak if you can do it without risk. Stop source of release with non-sparking tools before beginning clean-up or fire extinguishing. All equipment used when handling this product must be grounded. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Evacuate all non-essential personnel to an area upwind (at least 1/2 mile in all directions if tanks or tank cars are involved in in fire or spill). Evacuate/limit access.

If the product contaminates rivers and lakes or drains inform respective authorities.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE95
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 10/25/2011

COKER NAPHTHA

7. HANDLING AND STORAGE

Handling

Electrostatic charge may build up during handling. Equipment should be grounded and bonded. During transfer of product, ground container and insure that all conveying equipment is properly grounded. Always keep nozzle in contact with the container throughout the loading process. Special slow load procedures for 'switch loading' must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point hydrocarbon products. Electrostatic charges may be generated as a result of flow or agitation. Use only non-sparking tools. Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved. Refer to NFPA 77 for relevant consensus guidance. Keep container closed and drum bungs in place. Store away from heat, sparks, open flames, strong oxidizing agents and direct sunlight. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of U.S. national electrical code, U.S. National Fire Protection Agency (NFPA). Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Never siphon by mouth. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Ensure adequate ventilation, especially in confined areas. Eliminate all sources of ignition. Spilled material can make walking hazardous, potentially causing falls and serious injury. Do not breathe vapor. Avoid contact with skin. Do not smoke. Do not pressurize, cut, weld, braze solder, drill, or grind on containers. Use good housekeeping practices during use, storage, transfer, and handling.

Storage

Store only in tightly closed, properly vented containers away from heat, sparks, open flame and strong oxidizing agents. Store closed drums with bung in up position. Vapor space above stored liquid may be flammable/explosive unless blanketed with inert gas. Electrical installations / working materials must comply with the technological safety standards. Keep container tightly closed and properly labeled. Cleaning, inspection and maintenance of the internal structure of storage tanks must be done only by properly equipped and qualified personnel as defined by national, local or company regulations. Recommended materials: For containers, or container linings use mild steel, stainless steel. Unsuitable materials: Some synthetic materials may be unsuitable for container or container linings depending on the material specification and intended use. Compatibility should be checked with the manufacturer.

Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved. Refer to NFPA 77 for relevant consensus guidance. This liquid may accumulate static electricity even when transferred into properly grounded containers. Static electricity accumulation may be significantly increased by the presence of small quantities of water. Store and transport in accordance with all applicable laws.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. Use adequate ventilation to keep vapor concentrations below applicable exposure limit(s). Local exhaust in addition to general room ventilation may be required to meet exposure limit(s). If mechanical ventilation is used, electrical systems should conform to U.S. National Electric Code. Emergency shower and eyewash facility should be in close proximity (ANSI Z358.1)

Personal protective equipment

Inhalation

Appropriate respiratory protection where atmosphere exceeds recommended limits. If exposure may exceed the exposure limit(s), use respiratory equipment recommended or approved by appropriate local, state or international agency. Use appropriate respiratory protection where atmosphere exceeds recommended limits.

11. TOXICOLOGICAL INFORMATION

Product information

Product Summary

Inhalation of high vapor concentrations can cause CNS-depression and narcosis. Inhalation of vapors in high concentration may cause shortness of breath (lung edema). Solvents may degrease the skin. This product contains benzene. Benzene is considered to be a cancer-causing agent. Repeated exposure is linked to bone marrow toxicity, reduced red- and white blood cell counts and decreased immunological function irrespective of the route of contact. Benzene can destroy blood-forming cells in the bone marrow and is associated with leukemia and possibly other cancers. This material also contains components that may cause hearing loss and may be a developmental toxin. Toluene has known developmental toxicity. Suspect reproductive hazard - contains material which may injure unborn child. Suspect reproductive hazard. Damage to nerves in hands or feet may occur from prolonged inhalation of n-hexane concentrations of 60 to 240 ppm. Repeated exposure to air concentrations of 500 ppm n-hexane can produce progressively worsening damage to the peripheral nerves. The NTP has found that Cumene causes increased incidences of combined benign and malign kidney tumors in male rats, and malignant lung tumors in mice of both sexes.

Acute toxicity

<u>LC50 (Inhl)</u>	rat	>5.61	4 HOURS
<u>LD50 (Skin)</u>	rabbit	>2000 MG/KG	

Acute effects

Inhalation

Predicted exposure concentration Stream expected to have a low order of acute inhalation toxicity based on toxicity information for streams having components in common with this stream.

Inhalation may cause CNS depression. Can cause pulmonary edema if aspirated into lungs.

Ingestion

Predicted exposure concentration Stream expected to have a low order of acute oral toxicity based on toxicity information for streams having components in common with this stream.

Irritation

Skin

Stream expected to be irritating to the skin based on toxicity information for streams having components in common with this stream.

Skin

Irritating to skin.

Eyes

Stream expected to be no more than transient, fully reversible irritating to the eye based on toxicity information for streams having components in common with this stream. These effects are not considered to warrant classification as an eye irritant.

Sensitization

Stream expected not to be a sensitizer based on toxicity information for streams having components in common with this stream.

Target Organs

Skin. Central nervous system. Blood. central nervous system (CNS) Liver. Kidneys.

Repeated dose toxicity

Repeated or prolonged contact with skin may cause defatting and drying of the skin which may result in dermatitis.

Genetic Toxicity

Mutagenic Substance. May cause genetic defects. Stream expected to be mutagenic based on toxicity information for

MATERIAL SAFETY DATA SHEET

 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 10/25/2011

COKER NAPHTHA

components present in this stream.

Carcinogenicity

May cause cancer. Stream expected to be carcinogenic based on toxicity information for streams having components in common with this stream.

Other information

This product contains benzene. Benzene is considered to be a cancer-causing agent. Repeated exposure is linked to bone marrow toxicity, reduced red- and white blood cell counts and decreased immunological function irrespective of the route of contact. Contains xylene(all isomers). May cause dermatitis by defatting the skin from prolonged or repeated contact. May contribute to the development of diseases of the nervous system, liver and kidney. May be a reproductive hazard. Ethyl alcohol May cause eye and upper respiratory tract irritation. Short-term overexposure above 1,000 ppm by the inhalation route may cause central nervous system (CNS) effects such as headache and irritation of eyes, nose and throat. If continued for more than an hour additional CNS effects may occur such as: dizziness, drowsiness, loss of appetite, and an inability to concentrate. Gastrointestinal (stomach) effects may occur with symptoms such as nausea and vomiting. Long-term exposure can also cause loss of appetite, weight loss, nervousness, memory loss, mental retardation and liver damage. May cause dermatitis by defatting the skin from prolonged or repeated contact. Alcoholic beverages are carcinogenic to humans. Ethanol is a developmental toxin and various effects have been associated with ethanol intake. Examples of chronic ethanol abuse effects include physical dependence, malnutrition, amnesia, dementia, somnolence, cardiac myopathy, hepatotoxicity, GI bleeding and pancreatitis. Combined exposure to ethanol and certain other chemicals may result in increased toxic effects. Toluene is of slight acute toxicity, although inhalation exposure may cause dizziness and CNS depression, while ingestion may be fatal if aspiration into the lung occurs. Toluene may increase the sensitivity of the heart leading to potentially fatal cardiac sensitization. It is moderately irritating to skin and eye. Repeated exposure to high concentrations has been shown to cause neurological changes and hearing loss in animals, and in humans in abuse situations. May cause developmental toxicity. n-hexane May cause irritation to the eyes, nausea, vertigo, bronchial and central nervous system effects. This material presents an acute aspiration hazard. Damage to nerves in hands or feet may occur from prolonged inhalation of n-hexane concentrations of 60 to 240 ppm. Repeated exposure to air concentrations of 500 ppm n-hexane can produce progressively worsening damage to the peripheral nerves. Suspect reproductive hazard. naphthalene. May be irritating to the eyes, skin and respiratory tract. Direct contact with the eye may cause corneal damage. May be toxic by all routes of exposure. Target organs for toxic effects include the blood, liver, kidneys, eyes, and central nervous system (CNS). Symptoms of overexposure may include headache, restlessness, lethargy, vomiting, anorexia, anemia, diminished vision, and acute kidney failure. Individuals who have an inherited G6PD deficiency in their red blood cells may be particularly sensitive to the toxic effects of Naphthalene. Naphthalene can cross the placenta and harm the fetus. cumene Prolonged and/or repeated contact may cause mild to moderate skin defatting, redness, blistering, lesions, and/or scaly dermatitis. May cause kidney and/or lung damage. May cause cancer. Ethyl benzene May effect hearing. Repeated or prolonged exposure may cause severe irritation of the nose, throat and lungs, as well as liver and kidney damage. Possible cancer hazard. Repeated contact with skin may cause cracking and/or fissuring.

Acute effects

Inhalation

MATERIAL SAFETY DATA SHEET

MSDS No.: BE95
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 10/25/2011

COKER NAPHTHA

Vapors or aerosol may cause irritation of the eyes, nose and throat as well as CNS depression (fatigue, dizziness, loss of concentration, with collapse, coma and death possible in cases of severe overexposure).

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract and CNS depression (fatigue, dizziness, collapse, coma and death). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

Moderate skin irritant.

Eyes

Moderate eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Skin. Eye. Hearing. Nasal cavity. central nervous system (CNS) Heart

Repeated dose toxicity

No evidence of systemic toxicity was reported in rats exposed to 1.15 mg/l (300 ppm) toluene vapor for two years, while higher exposures were associated with inflammation and degeneration of nasal epithelial tissue. Rats exposed repeatedly to very high concentrations of toluene exhibited neurological changes and permanent hearing loss. Clinical case reports indicate the occurrence of serious and persistent changes (including tremor, ataxia, memory impairment and possible hearing loss) in humans following deliberate over-exposure to toluene in abuse situations. The relevance of these findings to low level occupational exposure to toluene is not known.

Reproductive effects

Studies in animals demonstrate no histopathological lesions in testes or ovaries of rats and mice exposed to 9.4 mg/l (2500 ppm) toluene vapor for 14-15 weeks, and no loss of fertility in male rats after exposure to 7.5 mg/l (2000 ppm) for a similar period of time. Epididymal weights and sperm counts were decreased in one study, but the absence of any adverse effect on reproduction makes the functional relevance of these observations unclear. No reliable human data are available.

Developmental Toxicity

Studies in pregnant rats demonstrate that toluene is not a teratogen, however mild fetotoxicity (lower body weight, delayed ossification, delayed physical development) may occur in the absence of maternal toxicity at exposures in the range 1.9-2.8 mg/l (500-750 ppm). Other studies describe adverse effects on learning and cognitive functions in rat pups exposed to 4.5-6.7 mg/l (1200-1800 ppm) in utero, although it is unclear if end-points evaluated in these tests are directly relevant to humans.

Genetic Toxicity

In vitro and in vivo mutagenicity tests were negative.

Carcinogenicity

Inhalation studies in rats and mice demonstrate that toluene is not a carcinogen. It has been used extensively as a solvent in rodent skin painting studies with occasional slight, increases in tumor incidence reported: an epigenetic mechanism (based on irritation rather than genotoxicity) may underpin these findings. Toluene is considered a Group 3 substance by IARC, not classifiable as to its carcinogenicity to humans.

- *n*-Pentane 109-66-0

Acute toxicity

<u>LC50 (Inh)</u>	rat	> 18.02 MG/L	4 HOURS
<u>LD50 (Oral)</u>	rat	> 2000 MG/KG BWT	
<u>LD50 (Skin)</u>	rabbit	3000 MG/KG	

Target Organs

MATERIAL SAFETY DATA SHEET

MSDS No.: BE95
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 10/25/2011

COKER NAPHTHA

Target Organs

Respiratory system. Kidneys.

Repeated dose toxicity

No treatment-related effects were observed in a 90-day inhalation study in rats exposed to n-pentane at up to 6778 ppm (20 mg/L). Inhalation neurotoxicity evaluations in rats exposed to n-pentane at 3000 ppm (8.9 mg/L) for up to 30 weeks found no evidence of neurotoxicity. Repeated oral gavage exposures of rats to 500 mg/kg bwt/day n-pentane produced lethality, decreases in bodyweight gain and slightly lower kidney weights.

Reproductive effects

No effects on reproductive organs were observed in a 90-day inhalation study in rats exposed to n-pentane at ~7000 ppm (20 mg/L). n-Pentane was negative in a dominant lethal test in mice when males were given a single intraperitoneal injection of 48-666 mg/kg bwt.

Developmental Toxicity

No developmental toxicity was observed when pregnant rats were exposed to n-pentane by oral administration of 1000mg/kg bwt/day or by inhalation of 10000 ppm (29.5 mg/L).

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *Xylene 1330-20-7*

Acute toxicity

<u>LC50 (Inh)</u>	rat	5000 PPM	4 HOURS
	mouse	3907 MG/KG	6 HOURS
	rat	4550 PPM	4 HOURS

LD50 (Oral) rat 4300 MG/KG

LD50 (Skin) rabbit >1700 MG/KG

Irritation

Skin

Moderate skin irritant. May cause dermatitis by defatting the skin from prolonged or repeated contact.

Eyes

This material is expected to be a mild eye irritant. Xylenes are irritating to the eyes with the potential to cause conjunctivitis and corneal opacity.

Target Organs

Skin. Eye. central nervous system (CNS)

Repeated dose toxicity

Repeated inhalation exposures of rats to xylenes cause liver effects at 920 ppm (4.0 mg/L) and ototoxicity at \geq 800 ppm (3.48 mg/L). Repeated oral exposures to xylenes produce reductions in body weight in male rats at 500 mg/kg bwt/day; liver effects and hyaline droplet formation in male rats at \geq 150 mg/kg bwt/day; kidney effects in male and female rats at \geq 750 mg/kg bwt/day; and a reduction in bodyweight gain in male mice at \geq 250 mg/kg bwt/day. Repeated inhalation exposures of gerbils to \geq 160 ppm (0.70 mg/L) xylenes cause apparently irreversible CNS effects.

Reproductive effects

A reproductive toxicity study, two dominant lethal studies, and evaluation of reproductive organs in repeated dose studies indicate that xylenes do not affect reproductive performance or induce structural damage to reproductive organs of laboratory animals at non-anesthetic doses. However, xylenes have been shown to produce damage to reproductive organs in rats repeatedly exposed to extremely high, anesthetic doses.

Developmental Toxicity

Results from animal studies demonstrate that xylenes may cause reduced fetal weight and delayed ossification, but not malformations, at inhalation dose levels causing no or only slight maternal toxicity (\geq 115 ppm or 0.5 mg/L). Slight neurobehavioral effects were noted in offspring of rats exposed to 500 ppm (2.2 mg/L) in the absence of maternal toxicity.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE95
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 10/25/2011

COKER NAPHTHA

- *Ethyl alcohol* 64-17-5

Acute toxicity

<u>LD50 (Oral)</u>	rat	10470 MG/KG BWT
<u>LDLo (Oral)</u>	Human	1400 MG/KG BWT

Irritation

Skin

Standard Draize skin test (rabbit) - Dose: 20 mg/24 hrs Reaction: Moderate Repeated exposure may cause skin dryness or cracking.

Eyes

Eye exposure to Ethanol generally causes transient pain, irritation, and reflex lid closure. A foreign-body sensation may persist for one to two days. Vapors produce transient stinging and tearing, but no apparent adverse effects. Transiently impaired preception of color may occur with acute ingestion or chronic alcoholism. Standard Draize eye test (rabbit) - Dose: 500 mg Reaction: Severe Dose: 500 mg/24 hrs Reaction: Mild

Repeated dose toxicity

Exposure to over 1000 ppm may cause headache, drowsiness and lassitude, loss of appetite, inability to concentrate and irritation of the throat.

Reproductive effects

Excessive consumption of alcoholic beverages during pregnancy can cause fetal alcohol syndrome. The development of physical and mental manifestation in the offspring; it may also cause defects in the central nervous system, heart, kidney and limbs. Moderate consumption can be associated with reduced birthweight and behavioral defects, but effects generally have not been observed with an intake of about one drink per day.

Carcinogenicity

The International Agency for Research on Cancer (IARC) has determined alcoholic beverages are carcinogenic to humans (Group 1) and the occurrence of malignant tumors of the oral cavity, pharynx, larynx, esophagus and liver is causally related to the consumption of alcoholic beverages in humans.

The American Conference of Governmental Industrial Hygienists (ACGIH) lists this substance as an A3 - Confirmed Animal Carcinogen with Unknown Relevance to Humans.

- *n-Hexane* 110-54-3

Acute toxicity

<u>LC50 (Inhl)</u>	rat	48,000 PPM	4 HOURS
<u>LD50 (Oral)</u>	rat	28,710 MG/KG	
<u>LD50 (Skin)</u>	rabbit	3000 MG/KG	

Irritation

Eyes

Eye irritant.

Target Organs

Skin. Eye. Respiratory system. Central nervous system effects. Peripheral nervous system Testes.

Repeated dose toxicity

Rabbits exposed by inhalation to 3,000 ppm 8 hours/day for 8 days showed changes in the lungs, emphysema, necrosis of the bronchial epithelium, and atelectasis. Rats continuously exposed to 400 ppm developed anoxapathy, although intermittent exposure to 10,000 ppm 6 hours/day, 5 days/week for 13 weeks caused only mild paranodol axonal swelling. The offspring of rats and mice exposed orally or by inhalation to n-hexane during gestation showed depressed weight gain after birth. This agent also affects male and female reproductive capacity.

Reproductive effects

Exposure to n-hexane may damage the developing fetus.

Developmental Toxicity

Causes productive and embryotoxic effects and is cytotoxic in mammalian and human test systems.

Carcinogenicity

MATERIAL SAFETY DATA SHEET

MSDS No.: BE95
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 10/25/2011

COKER NAPHTHA

Not listed by IARC, NTP, OSHA or EPA.

Other information

Exposure of humans to 5,000 ppm n-hexane for 10 minutes causes marked vertigo; exposure to 1,500 ppm results in headache and slight nausea. In industrial settings, exposure to levels exceeding 1,000 ppm have been reported to cause mild symptoms of narcosis. Eye and upper respiratory tract irritation has been reported to occur in humans exposed to 880 ppm n-hexane for 15 minutes. Dermal contact with n-hexane results in immediate irritation characterized by erythema and hyperemia; exposed subjects developed blisters 5 hours following dermal exposure to n-hexane. The neuropathic toxicity of n-hexane in humans is well documented; cases of polyneuropathy have typically occurred in humans chronically exposed to levels of n-hexane ranging from 400 to 600 ppm, with occasional exposures up to 2,500 ppm. Distal symmetrical motor weakness is common in most cases; however, in severely affected individuals, motor weakness may extend to the pelvic and high musculature. Nerve biopsies in affected individuals show swelling of the nerve and thinning of the myelin sheath. Functional neurological disturbances usually progress for a few months after termination of exposure. Although recovery is expected to occur within a year, clinical polyneuropathy has been reported in some cases to remain after 2 years. Blurred vision, restricted visual field, and optic nerve atrophy has been reported to occur in association with n-hexane-induced polyneuropathy.

 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 10/25/2011

COKER NAPHTHA

May cause CNS depression, gastric discomfort, and vomiting. This material is an aspiration hazard.

Skin contact

No systemic toxicity is expected from acute dermal exposure.

Target Organs

Damages bone marrow. Eye. Skin.

Repeated dose toxicity

The hematopoietic system is the primary target for benzene, irrespective of the route of exposure. Broadly similar effects are seen in rodents and humans, including bone marrow toxicity and reduced red- and white blood cell counts.

Reproductive effects

Results from animal studies are inconsistent, with adverse effects on the ovary and testis reported in mice following repeated inhalation exposure but no effects on the gonads or on fertility observed in rats exposed under similar conditions. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Developmental Toxicity

Results from animal studies clearly demonstrate that benzene is not a teratogen, however mild fetotoxicity (including lowered body weight, delayed ossification and sub-clinical hematological changes) have been observed in rodents exposed during pregnancy, generally in association with maternal toxicity. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Genetic Toxicity

Benzene is genotoxic in vivo, and induces chromosomal aberrations and micronuclei in rats and mice following oral or inhalation exposure. Comparable changes would be anticipated in humans. The incidence of micronuclei in fetal rat liver is increased following administration of large doses by intraperitoneal injection to pregnant mice, while high-level oral exposure induced chromosomal aberrations in germ cells from male mice. The relevance to humans of these latter findings is not known.

Carcinogenicity

Benzene is a multi-site animal carcinogen, producing tumors in hematopoietic- and epithelial tissues after long term inhalation or oral exposure. Epidemiology studies confirm it is a human carcinogen, causing primarily acute non-lymphocytic leukemia.

- *Cumene* 98-82-8

Acute toxicity

<u>LC50 (Inhl)</u>	rat	39000 MG/M3	4 HOURS
<u>LD50 (Oral)</u>	rat	1400 MG/KG	
<u>LD50 (Skin)</u>	rabbit	> 3160 MG/KG	

Irritation

Skin

Slight skin irritant. May cause dermatitis by defatting the skin from prolonged or repeated contact.

Eyes

Slight eye irritant.

Sensitization

Not expected to be a sensitizer.

Target Organs

Central nervous system. Skin. Eye. Respiratory system. Nasal cavity. Kidney Liver Lungs

Reproductive effects

This substance is not expected to be a reproductive toxicant.

Genetic Toxicity

Negative for genotoxicity using both in vitro and in vivo tests.

Carcinogenicity

The NTP has found that Cumene causes increased incidences of combined benign and malign kidney tumors in male rats,

MATERIAL SAFETY DATA SHEET

MSDS No.: BE95
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 10/25/2011

COKER NAPHTHA

and malignant lung tumors in mice of both sexes. This material has been classified by IARC as a group 2B substance (possibly carcinogenic to humans).

- *Ethyl Benzene* 100-41-4

Acute toxicity

<u>LC50 (vapor)</u>	rat	4000 PPM
<u>LD50 (Oral)</u>	rat	3500 - 4700 MG/KG BWT
<u>LD50 (Skin)</u>	rabbit	> 15,000 MG/KG BWT

Acute effects

Inhalation

Vapors may cause irritation of the eyes, nose and throat as well as CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure) May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract. High doses may cause CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization. Aspiration may cause pulmonary edema and pneumonitis.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring. While skin absorption is a potential route of exposure, no adverse health effects are anticipated following accidental or incidental contact.

Irritation

Skin

This product is expected to be an skin irritant.

Eyes

Moderate to severe eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Central nervous system. Lung. Liver. Kidneys. Thyroid. Blood. Hearing. heart

Repeated dose toxicity

No adverse effects were present in rats or mice exposed to 1000 ppm (4.3 mg/l) ethylbenzene vapor for up to 13 weeks. Longer-term exposure resulted in an increased incidence of chronic progressive nephropathy (CPN) in kidneys from rats inhaling 750 ppm (3.3 mg/l) for up to two years. Since CPN is a spontaneous age-related condition specific to rodents, these findings are of doubtful relevance to humans. Mice exposed chronically under similar conditions responded with changes in the lung, liver and thyroid. Additional effects in rats observed with repeated oral exposure of \geq 250 mg bwt/day ethyl benzene for 90 days include changes in hematology (indicative of a mild regenerative anemia) and clinical chemistry parameters (indicative of hepatic microsomal enzyme induction), decreases in prothrombin time, mild alimentary effects and liver pathology. A standard neurotoxicity protocol study conducted in young adult rats did not find neurotoxic effects following repeated daily oral exposure to doses up to 500 mg/kg bwt/day.

Specialist investigations provide evidence of hearing loss in rats following repeated exposure (13 weeks) to concentrations of 200 ppm (0.85 mg/l) and above. Ethyl benzene at up to 500 ppm vapor concentration did not adversely affect the functional ability of the humoral component of the immune system of rats as measured by splenic IgM antibody forming cell response to the T-dependent antigen, sheep erythrocytes.

Reproductive effects

No parental, neonatal, or reproductive toxicity was observed following inhalation exposure of rats to up to 500 ppm or 500 ppm/342 mg/kg bwt/day ethylbenzene. Histopathological examination of reproductive tissue from rats, mice and rabbits has generally revealed no adverse changes following sub-chronic- or chronic inhalation exposure to high vapor concentrations. An increased incidence of testicular tumors in F344 male rats exposed to 750 ppm (3.3 mg/l) ethylbenzene vapor for 2 years is considered of doubtful relevance to reproductive toxicity.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE95
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 10/25/2011

COKER NAPHTHA

Developmental Toxicity

Decreased fetal body weight and an increased occurrence of skeletal and other variations were reported in the presence of concurrent maternal toxicity (CNS effects, decreased body weight, liver enlargement) when female rats were exposed to ethylbenzene concentrations of 1000 ppm (4.3 mg/l) or above throughout pregnancy. No adverse effects to neurodevelopment were observed in rats exposed to 500 ppm/342 mg/kg bwt/day ethylbenzene.

Genetic Toxicity

No increase in micronuclei or hepatic UDS was observed in mice after treatment with ethylbenzene in vivo. It was not genotoxic in microbial systems, nor did it induce chromosomal aberrations or sister chromatid exchanges in mammalian cells in vitro. Variable results were obtained for mutation at the TK+/- locus in L5178Y cells, although the most reliable study that utilized the current standard study protocol and doses that were not significantly cytotoxic gave a negative mutagenic response. The overall weight of evidence indicates that ethylbenzene is not genotoxic.

Carcinogenicity

The carcinogenic potential of ethylbenzene after inhalation exposure has been investigated in two recent regulatory guideline studies performed by NTP. Male rats exposed to 750 ppm (3.3 mg/l) over 2 years showed an increased incidence of testicular interstitial cell adenoma, a common tumor present also in a large majority of the untreated males included in the study. High level exposure was also linked with an increased incidence of kidney tumors in both sexes; the appearance of these lesions was strongly associated with the development of Chronic Progressive Nephropathy, a spontaneous age-related disease of rats with no equivalent counterpart in humans. Male mice exposed to 750 ppm ethylbenzene for 2 years responded with an increased incidence of lung tumors, while the incidence of liver tumors was increased in females. Mechanistic studies suggest that these lesions in the mouse developed secondary to enhanced cell proliferation in these tissues, while the weight of evidence from mutagenicity testing also indicates that a non-genotoxic mechanism was involved. Listed by IARC as possibly carcinogenic in humans (Group 2B).

- *Cyclohexane* 110-82-7

Acute toxicity

<u>LC50 (Inhl)</u>	rat	13.9 MG/L	4 HOURS
<u>LD50 (Oral)</u>	rat	> 5000 MG/KG	
<u>LD50 (Skin)</u>	rabbit	> 2000 MG/KG

Irritation

Skin

May be irritating to the skin.

Eyes

May cause eye irritation.

Repeated dose toxicity

Repeated inhalation or ingestion of naphthalene causes methemoglobinemia*

MATERIAL SAFETY DATA SHEET

MSDS No.: BE95
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 10/25/2011

COKER NAPHTHA

Developmental Toxicity

Results from repeated dose oral gavage tests with naphthalene showed fetotoxicity in rats (increase in resorptions at 450 mg/kg bw/day) and in mice (decrease in number of live pups/litter at 300 mg/kg bw/day) in the presence of maternal toxicity (reduction in body weight gains in rats; decrease in survival and reduction in body weight in mice).

Genetic Toxicity

Naphthalene produced chromosome damage in in vitro assays, but not in in vivo assays in which mice were administered 500 mg/kg bw orally or 250 mg/kg bw by intraperitoneal injection.

Carcinogenicity

The National Toxicology Program (NTP) has evaluated this substance and placed it in Group R: Reasonably Anticipated To Be A Human Carcinogen. The International Agency for Research on Cancer (IARC) has evaluated this substance and placed it in Group 2B (possibly carcinogenic to humans).

- *Methylcyclopentane* 96-37-7

Target Organs

Skin. Eye. Respiratory system. Nervous system.

Repeated dose toxicity

Repeated exposure can cause peripheral nerve damage and defatting of the skin.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

MSDS No.: BE95
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 10/25/2011

COKER NAPHTHA

Photolysis, hydrolysis or bioconcentration of n-hexane are not expected to be an important environmental fate processes. Biodegradation of n-hexane may occur in soil and water; however, volatilization and adsorption are expected to be far more important fate processes. A Koc range of 1250 to 4100 indicates a low to slight mobility class in soil for n-hexane. In aquatic systems n-hexane may partition from the water column to organic matter contained in sediments and suspended materials. Rapid volatilization from environmental waters is expected.

Persistence and degradability

Stability in water: In aquatic systems, this material may partition from the water column to organic matter contained in sediments and suspended materials.

Biodegradation: Biodegradation may occur in soil and water, however, volatilization and adsorption are expected to be far more important fate processes.

13. DISPOSAL CONSIDERATIONS

Contaminated product, soil, water, and empty containers may be hazardous wastes due to possible presence of flammable gases. Assure emissions comply with applicable regulations. Preferred disposal for this volatile, flammable product is through combustion. Proper grounding procedures to avoid static electricity should be followed. The product should not be allowed to enter drains, water courses or the soil.

14. TRANSPORT INFORMATION

Special Provisions

If you reformulate or further process this material, you should consider re-evaluation of the regulatory status of the components listed in the composition section of this sheet, based on final composition of your product.

Disclaimer

The information on this MSDS was obtained from sources which we believe are reliable. However, the information is provided without any warranty, expressed or implied, regarding its correctness. Some information presented and conclusions drawn herein are from sources other than direct test data on the substance itself. The conditions or methods of handling, storage, use and disposal of the product are beyond our control and may be beyond our knowledge. For this and other reasons, we do not assume responsibility and expressly disclaim liability for loss, damage, or expense arising out of or in any way connected with handling, storage, use, or disposal of this product. If the product is used as a component in another product, this MSDS information may not be applicable.

Information is correct to the best of our knowledge at the date of the MSDS publication.

Numerical Data Presentation

The presentation of numerical data, such as that used for physical and chemical properties and toxicological values, is expressed using a comma (,) to separate digits into groups of three and a period (.) as the decimal marker. For example, 1,234.56 mg/kg = 1 234,56 mg/kg.

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid.
Color Transparent, colorless to slightly yellow. **Odor** Moderate, sweet and pleasant, aromatic hydrocarbon.

DANGER!

Highly flammable liquid; vapor may cause flash fire.

Mist or vapor may irritate the eyes, mucous membranes, and respiratory tract.

Liquid contact may cause mild to moderate eye and/or moderate to severe skin irritation and inflammation.

May be harmful if inhaled or absorbed through the skin.

Overexposures may cause central nervous system (CNS) depression and/or other target organ effects.

May be harmful or fatal if ingested.

Aspiration into the lungs can cause pulmonary edema and chemical pneumonia.

Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats).

Potential cancer hazard.

Contains Ethylbenzene and Naphthalene.

May cause blood disorders and kidney and/or liver damage.

Mutagenic hazard; may cause genetic damage.

May adversely affect reproduction or reproductive development.

Spills may create a slipping hazard.

SECTION 1: IDENTIFICATION

Trade Name Heavy Reformate

Product Number 1007210072

CAS Number 64741-68-0

Product Family C7-C12 Petroleum Hydrocarbons

Synonyms Heavy Reformate; Heavy Reformate Naphtha; Reformed Heavy Gasoline; Heavy Platformate; Topped Reformate;
Reformer Naphtha Splitter Tower Bottoms; 733 Rerun Tower Bottoms; ARU Feedstock;
High-Octane Gasoline Blending Component; R-478; ARCO® PX-2 Solvent (former name);
Upper Cylinder & Valve Lubricant; Heavy Catalytic Reformed Naphtha (Petroleum); HCRN.

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Heavy Catalytic Reformed Naphtha (Petroleum)	64741-68-0	100
2) Heptanes	Mixture	2-6
3) Methylcyclohexane	108-87-2	1-5
4) Toluene	108-88-3	5-15
5) Octanes	Mixture	6-20
6) Xylenes (Mixed Isomers)	1330-20-7	10-25
7) Ethylbenzene	100-41-4	2-7.5
8) Nonanes	Mixture	5-15
9) n-Propylbenzene	103-65-1	1-3
10) Trimethylbenzenes	25551-13-7	10-15
11) 1,2,4-Trimethylbenzene (Pseudocumene)	95-63-6	5-8
12) Ethylmethylbenzenes (Ethyltoluenes)	25550-14-5	5-10
13) C10-C12 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	1-10
14) Naphthalene	91-20-3	0.1-0.9
15) C10-C12 Alkylbenzenes	70693-06-0	1-10

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye Contact. Absorption. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon level of exposure concentration and/or duration. Vapors can reduce the oxygen content in air. Approximately 20,000 ppm (or 2 vol.%) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces.
Eye Contact	Animal test results on similar materials suggest that this material can cause minimal to moderate eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling.
Skin Contact	Animal test results on similar materials and components suggest that this material can cause moderate to severe skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate to severe dermatitis. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and severe tissue damage.
Ingestion	If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above). Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.
Chronic Health Effects Summary	Reports have associated repeated and prolonged occupational overexposure to solvents with irreversible brain and nervous system damage (sometimes referred to as "Solvent or Painter's Syndrome"). And, altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been common results for gasoline/naphtha abusers. Intentional misuse by deliberately concentrating and inhaling this product may be harmful or fatal.

Toluene may cause a weak cardiac sensitization to epinephrine (adrenalin)-like drugs. Available information indicates that **toluene** is NOT teratogenic, but it can be toxic to the embryo and fetus and may

Heavy Reformate

reduce fertility. In animal tests, high inhaled doses of toluene has caused reduced litter sizes, retarded development of the fetus, and increased incidence of non-lethal abnormalities.

Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Chronic occupational **toluene and xylene** exposures have caused auditory nerve degeneration.

At high exposure concentrations, **ethylbenzene** has been associated with multiple organ tumors in laboratory animals.

Based upon animal testing, the **C8 aromatic hydrocarbon components (xylene isomers and ethylbenzene)** might be assumed to cause embryo and fetal toxicity, spontaneous abortions, and/or decreased fetal and newborn weights if overexposures occur during a woman's early gestation period. And, the **C9 aromatic hydrocarbons (cumene, n-propylbenzene, trimethylbenzenes, indene, and ethylmethylbenzenes)** are presumed to cause fetal toxicity and/or decreased fetal and newborn weights if overexposure occurs during a woman's early gestation period.

Naphthalene is considered to be a toxic substance as defined by both human exposure and laboratory testing results. And, based upon animal testing, it might be considered carcinogenic. (See Section 11.)

Conditions Aggravated by Exposure Personnel with pre-existing central nervous system (CNS) disease, psychological conditions, skin disorders, impaired hearing, cardiovascular, liver, or kidney function, blood disorders, or chronic respiratory diseases should avoid exposure.

Target Organs The substance is toxic to lungs, central nervous system, especially the auditory nerves, brain, blood, kidneys, liver, heart, thymus, mucous membranes, skin, eyes, and possibly the reproductive system.

Carcinogenic Potential This material contains ethylbenzene and naphthalene at concentrations above 0.1%. **Ethylbenzene and naphthalene** are considered possibly carcinogenic to humans by IARC and "A3 Animal Carcinogens" by ACGIH. (See Section 11.)

OSHA Health Hazard Classification				OSHA Physical Hazard Classification

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

- Inhalation** Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
- Eye Contact** Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
- Skin Contact** Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
- Ingestion** Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.

HoustonRefining

A Lyondell Company

Heavy Reformate

Notes to Physician

Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IB Flammable Liquid. Highly flammable!		
Flash Point Method	CLOSED CUP: -6° to -4°C (21° to 25°F) (Tagliabue [ASTM D-56])		
Lower Flammable Limit	AP 0.9%	Upper Flammable Limit	AP 7.6%
Autoignition Temperature	AP 232°C (450°F) [ASTM E-659]		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors.		
Special Properties	<p>Flammable Liquid! This material releases vapors at or approaching its flash point temperature. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.</p> <p>A static electrical charge can accumulate as a result of transfer flow or agitation. Discharge (static spark) can ignite vapors, especially in cold, dry weather conditions. Special slow load and monitoring procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point products. To reduce this hazard's potential, receiving containers should always be grounded and the loading nozzle must be kept in contact with the container during the entire filling process. Do not fill any portable container in or on a vehicle without proper bonding. (See American Petroleum Institute Publication 2003).</p>		
Extinguishing Media	<p>SMALL FIRE: Use dry chemicals, carbon dioxide (CO₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.</p>		
Protection of Fire Fighters	<p>Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify authorities if liquid(s) enter sewers or waterways.</p>		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Heavy Reformate

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store other toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Heavy Reformate

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

- Eye Protection** Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.
- Hand Protection** Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, Silver Shield®, PVC/NBR, or fluoroelastomers such as Viton® or Teflon®). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.
- Body Protection** Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.
- Respiratory Protection** For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).
- General Comments** Warning! Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Petroleum Distillates (Naphtha)	TWA: 400 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
2) Heptane (n-Heptane)	TWA: 400 STEL: 500 (ppm) from ACGIH (TLV) TWA: 400 STEL: 500 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
3) Methylcyclohexane	TWA: 400 (ppm) from ACGIH (TLV) TWA: 400 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
4) Toluene	TWA: 50 (ppm) from ACGIH (TLV) - SKIN TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [Proposed] TWA: 200 CEIL: 300 (ppm) from OSHA (PEL) TWA: 300 (ppm) from ACGIH (TLV)
5) Octane, all isomers	TWA: 300 STEL: 375 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
6) Xylenes (Mixed Isomers)	TWA: 100 STEL: 150 (ppm) from ACGIH (TLV) TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [Proposed] TWA: 100 (ppm) from OSHA (PEL)
7) Ethylbenzene ("A3" Animal Carcinogen)	TWA: 100 STEL: 125 (ppm) from ACGIH (TLV) TWA: 100 STEL: 125 (ppm) from OSHA (PEL) [Proposed] TWA: 100 (ppm) from OSHA (PEL)
8) Nonane, all isomers	TWA: 200 (ppm) from ACGIH (TLV) TWA: 200 (ppm) from OSHA (PEL) [Proposed]
9) Trimethylbenzene (mixed isomers)	TWA: 25 (ppm) from ACGIH (TLV) TWA: 25 (ppm) from OSHA (PEL) [Proposed]
10) Naphthalene ("A3" Animal Carcinogen [Proposed])	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) - SKIN TWA: 10 STEL: 15 (ppm) from OSHA (PEL) [Proposed] TWA: 10 (ppm) from OSHA (PEL)

Heavy Reformate

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color	Transparent, colorless to slightly yellow.	Odor	Moderate, sweet and pleasant, aromatic hydrocarbon.
Specific Gravity	0.83 to 0.85 (Water = 1)	pH	Not applicable.	Vapor Density	3.5 to 4.0 (Air = 1)
Boiling Point/Range	85° to 235°C (185° to 455°F) [ASTM D-2887]			Melting/Freezing Point	< -70°C (< -95°F) [ASTM D-97]
Vapor Pressure	2 to 5 mm Hg at 20°C (68°F) or 1.0 to 2.0 Reid-psia at 100°F (37.8°C).			Viscosity (cSt @ 40°C)	1 to 3
Solubility in Water	Soluble in methanol and diethyl ether. Slightly soluble in cold water (< 0.05%).			Volatile Characteristics	Volatile Organic Compounds (VOCs) Content = 100%; 870 to 880 gm/L.

Additional Properties Alkane, Isoparaffin, and Cycloalkane Hydrocarbons Content = 12 to 56 Wt.% [ASTM D-1319];
C7-C12 Aromatic Hydrocarbon Content = 44 to 88 Wt.% [ASTM D-1319];
Average Density at 60°F = 6.994 lbs./gallon [ASTM D-2161];
Dry Point Temperature = AP 437°F (225°C) [ASTM D-86];
Octane Rating = AP 92 [ASTM D-2885];
Sulfur Content = AP 0.01 Wt.% [ASTM D-2622 or D-1266];
Evaporation Rate = 0.2 to 1.7 when n-Butyl acetate = 1.0;
Heat Value = 18,000 to 18,500 Btu.

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalies, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide, and oxygen.		
Hazardous Decomposition Products	No substances are readily identified from composition; and, no degradation data is available.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	Heavy Catalytic Reformate Naphtha (Petroleum): ORAL (LD50): Acute: 4,820 mg/kg [Rat males] - Somnolence, diarrhea, and hypermotility. ORAL (LD50): Acute: 5,040 mg/kg [Rat females] - Somnolence, diarrhea, and hypermotility. GAS (LC50): Acute: > 5,540 mg/L for 4 hours [Rat screen level] - No deaths; somnolence. DERMAL (LD50): Acute: > 2,000 mg/kg (Rabbit screen level). DRAIZE EYE: Acute: Mild to moderate eye irritant. [Rabbit]. DRAIZE DERMAL: Acute: Moderate to severe skin irritant. [Rabbit]. DERMAL (LD50): Acute: > 6,000 mg/kg [Rabbit screen level]. BUELER DERMAL: Acute: Non-sensitizing [Guinea Pig]. 28-Day DERMAL: Sub-Chronic: Moderate skin irritant at 200 mg/kg and severe skin irritant at 1,000 and 2,000 mg/kg [Rabbit]. MUTAGENICITY: Negative or equivocal responses for the modified Ames [Salmonella typhimurium], in vitro Lymphoma [Mouse] with and without S1 activation, and in vivo Bone Marrow Cytogenetics [Rat] assays. n-Heptane: GAS (LC50): Acute: 103,000 mg/m ³ for 4 hours [Rat] - Convulsions. DERMAL (LD50): Acute: > 2,000 mg/kg [Rabbit].
----------------------	---

Ethylbenzene:

ORAL (LD50): Acute: 3,500 mg/kg [Rat].
 DERMAL (LD50): Acute: 17,800 uL/kg [Rabbit].
 INTRAPERITONEAL (LD50): Acute: 2,624 mg/kg [Rat].

n-Nonane:

GAS (LC50): Acute: 3,200 ppm for 4 hours [Rat].
 INTRAVENOUS (LD50): Acute: 218 mg/kg [Mouse].
 INTRAPERITONEAL (LD₅₀): Acute: 150 mg/kg [Mouse].

n-Propylbenzene:

ORAL (LD50): Acute: 6,040 mg/kg [Rat].
 GAS (LC50): Acute: 65,000 ppm for 2 hours [Rat].

Trimethylbenzenes:

ORAL (LD50): Acute: 8,970 mg/kg [Rat].

1,2,4-Trimethylbenzene:

ORAL (LD50): Acute: 5,000 mg/kg [Rat].
 GAS (LC50): Acute: 18,000 mg/m³ for 4 hours [Rat].

Ethylmethylbenzenes (Ethyltoluenes):

GAS (LC50): Acute: 50,000 mg/m³ for 2 hours [Cat].
 GAS (LC50): Acute: 54,000 mg/m³ for 4 hours [Mouse].

n-Decane:

GAS (LC50): Acute: 72,300 mg/m³ for 2 hours [Mouse].

Naphthalene:

ORAL (LD50): Acute: 490 mg/kg [Rat].
 ORAL (LD50): Acute: 533 mg/kg [Mouse].
 ORAL (LD50): Acute: 1,200 mg/kg [Guinea Pig].

Subchronic (28-day) dermal studies with **heavy catalytic reformed naphtha (petroleum)** using rabbits showed animal weight loss or reduced weight gain, renal tubule changes and acute tubular necrosis, plus moderate to severe skin irritation without sensitization. Heavy catalytic reformed naphtha also produced negative or equivocal responses mutagenic responses in series of various assays. The significance of these animal mutagenicity study results to human health is unclear.

Long-term mouse skin painting studies sponsored by the American Petroleum Institute (API) showed **heavy catalytic reformed naphtha (petroleum)** did not produce any increased incidence of benign skin

Heavy Reformate

tumors at the site of contact when applied repeatedly (twice per week) over the lifetime of the test animals (12 to 24 months). Average latency period was 80 weeks. All animals survived throughout the study. A few studies have shown that washing the animal's skin with soap and water between applications greatly reduces the carcinogenic effect of similar and heavier **petroleum distillates**.

n-Heptane is a mucous membrane and respiratory tract irritant, but non-irritating to the eyes. It is readily absorbed by inhalation and dermal exposure and repeated direct skin application can produce defatting dermatitis. Exposures may cause decreased red blood cell counts, liver and heart damage, and central nervous system depression. n-Heptane is metabolized in the liver to form alcohols and ketones, including neurotoxic **2,5-heptanedione** which is detectable in small amounts in the urine of exposed humans.

In a controlled study, human volunteers exposed to an airborne concentration of **n-heptane** of 1,000 ppm for 6 minutes or 2,000 ppm for 4 minutes experienced slight dizziness and incoordination. Higher-level exposures produced hilarity, dizziness, and semi-consciousness. Inhaling a concentration of 5,000 ppm for 15 minutes caused stupor and a gasoline-like taste. These higher exposures also decreased the myocardial threshold to the arrhythmogenic effects (irregular heart beats) of epinephrine, producing only a narrow margin of safety between exposures causing CNS effects, cardiac effects, and loss of consciousness.

One occupational exposure study involving a **95% purity n-heptane** from 1 to 9 years duration concluded that it could produce minimal peripheral nerve damage with numbness and tingling of the extremities in the stocking-and-glove areas. In the same study, there was a decrease in motor nerve conduction velocities correlated with duration of exposure and adjusted for age effects; however, the average motor nerve conduction velocity in exposed workers was normal. Polyneuropathy associated with n-heptane exposure was reversible within a year following removal of exposure.

n-Heptane was not neurotoxic in rats exposed for up to 7 months. But based upon limited laboratory animal studies, **n-heptane and its metabolites** were found in low levels (< 135 ppm) in the brain of rats exposed to airborne concentrations of 100, 500, or 1,500 ppm for 6 hours each day, five days per week, for 1 or 2 weeks. These substances disappeared within 2 weeks following removal of exposure. n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not expected to be carcinogenic.

Rats inhaling **methylcyclohexane** at an airborne concentration of 15,250 ppm for one hour displayed tremors, loss of coordination, anesthesia, and convulsions. Inhalation of 10,050 ppm for six hours per day for 14 days showed rodent weight loss or decreased weight gain and changes in the structure of their salivary glands. Using rabbits, methylcyclohexane was shown to have an LD₅₀ somewhere between 3,300 ppm and 7,300 ppm when exposed repeatedly for six hours per day, five days per week, for three weeks. Death was preceded by conjunctival congestion with mucoid secretion and lacrimation, salivation, coughing, sneezing, labored breathing, and diarrhea. Lethal oral dosing of rabbits caused lethargy, severe diarrhea, and circulatory collapse. Vascular and degenerative lesions were observed in the kidneys and liver.

Toluene (methylbenzene) has been a major solvent of intentional inhalation abuse. Deliberate long-term inhalation of high concentrations of toluene (glue sniffing, etc.) has been shown to cause liver, kidney, central nervous system, and permanent brain damage. Effects such as impaired speech, visual disturbances, and hearing loss, loss of balance and/or muscle control, and memory loss have been reported. Exposures of 100 to 200 ppm in air for 24 hours cause hallucinations, distorted perceptions, and changes in motor activity. Studies have indicated that children of women who sniffed massive exposures of toluene during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. Isolated case reports have suggested a spectrum of congenital defects similar to those seen in fetal alcohol (ethanol) syndrome. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate.

Animal studies suggest that **toluene** causes kidney, liver, and/or lung dysfunction and cardiac (heart muscle) sensitization to epinephrine or other adrenalin-like agents. This sensitization may cause fatal changes in heart beat rhythms. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency).

Long-term rodent inhalation studies with **toluene** produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness, and impaired reaction time. Also, rats exposed to 1,200 ppm and 1,400 ppm of toluene in air for 14 hours per day for 5 or 4 weeks (respectively) exhibited high-frequency hearing loss. Several animal studies using pregnant rodents have shown that toluene exposures may cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation

Heavy Reformate

studies, toluene has not been shown to be carcinogenic; nor is it mutagenic in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

2,2,4-Trimethylpentane (iso-octane) was highly irritating to mice at a 1,000 ppm in air exposure for 5 minutes and respiratory arrest occurred at exposures above 10,000 ppm for 5 minutes. CNS depression was observed at concentrations between 8,000 and 10,000 ppm in air. Kidney tubule necrosis, hyaline droplet formation, and acute renal failure were seen in male rats following oral administration of 10 gm/kg, 8 mL/kg, or 2,100 mg/kg of iso-octane for 2, 3, and 4 weeks, respectively.

An inhalation study with laboratory animals indicated an association of **xylene** with hearing loss in rats. Several animal studies using pregnant rodents have shown that **mixed xylene isomers (dimethylbenzenes)** may all cause embryo and/or fetotoxicity. Inhalation and feeding studies involving pregnant laboratory animals have produced limited evidence of fetal toxicity including increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes.

Chronic overexposure to **xylene** may produce irreversible damage to the central nervous system, including ototoxicity, that can be increased by the consumption of ethanol (alcoholic drinks). Drinking beverages which contain ethanol in conjunction with xylene exposure increases the alcoholic effects and impairs the clearance of xylenes from the body. Xylene isomers accumulate in the adipose (fat) tissues, from which they are slowly released. Complete clearance may take several days following exposure.

Two-year rat and mouse gavage studies by the National Toxicology Program (NTP) on **mixed xylene isomers including 17% ethylbenzene** showed "no evidence of carcinogenicity". Also, a two-year mixed xylenes skin-painting study on shaved rats and mice showed no incidence of non-neoplastic or neoplastic lesions. And, none of the components were mutagenic when tested in either the modified Ames, Chinese hamster ovary cell with and without metabolic activation, or sister-chromatid mutagenicity assays.

NTP completed a 2-year inhalation bioassay of **ethylbenzene** in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200 and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels. However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level; and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Also, hyperplasia was observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear. However, based upon this data, the IARC has designated ethylbenzene as possibly carcinogenic to humans (Group 2B).

Rats inhaling **n-nonane** at an airborne concentration of 1,500 ppm for 7 days displayed mild tremors and loss of coordination. Inhalation of 1,600 ppm for 6 hours per day for 90 days showed animal weight loss or decreased weight gain and changes in the structure of their salivary glands. And, liver damage and an altered response to drugs were seen in rats given n-nonane for 2 to 7 days.

Prolonged and/or repeated overexposure to **cumene (isopropylbenzene)** via inhalation or skin absorption can cause liver and/or kidney damage.

Trimethylbenzenes are primary skin irritants and may cause asthmatic bronchitis and/or anemia. Levels of total hydrocarbon vapors present in the breathing atmosphere of these workers ranged from 10 to 60 ppm. Its TC_{L_0} for humans 10 ppm, with somnolence and respiratory tract irritation noted. In inhalation studies with rats, four of ten animals died after exposures of 2,400 ppm for 24 hours. An oral dose of 5 mL/kg resulted in death in one of ten rats. Minimum lethal intraperitoneal doses were 1.5 to 2.0 mL/kg in rats and 1.13 to 12 mL/kg in guinea pigs. **Mesitylene (1,3,5-Trimethylbenzene)** inhalation at concentrations of 1.5, 3.0, and 6.0 mg/L for six hours was associated with dose-related changes in white blood cell counts in rats. No significant effects on the complete blood count were noted with six hours per day exposure for five weeks, but elevations of alkaline phosphatase and SGOT were observed. Central nervous system depression and ataxia were noted in rats exposed to 5,100 to 9,180 ppm for two hours. Based upon animal reproductive/developmental studies, trimethylbenzenes may also cause fetal toxicity.

Ethylmethylbenzenes are primary skin irritants and overexposures might cause liver and/or kidney

Heavy Reformate

damage or increase blood cholinesterase levels. Inhalation of these and other **C9 aromatic hydrocarbons** by pregnant mice and rats during gestational days 6 through 15 resulted in decreased fetal and newborn weights.

Naphthalene is a potential irritant to eyes, skin, and lungs. Following prolonged and/or repeated exposures, naphthalene has been shown to cause eye damage (cataracts and/or optical neuritis), premature destruction of red blood cells (hemolytic and aplastic anemia), and kidney damage (jaundice), and possibly neurotoxicity. Naphthalene-induced blood disorders in humans are characterized by variability in size, shape, and number of red blood cells, anemia, and decreased hemoglobin. Also, there have been reported anemia deaths amongst children exposed to moth ball (naphthalene) saturated blankets. Peripheral lens opacities occurred in eight of 21 workers exposed to elevated levels of naphthalene vapors for five years. Repeated ingestion of a naphthalene-isopropanol mixture caused tremors, restlessness, hallucinations, and extreme apprehension. Based upon animal studies, naphthalene may cause fetal toxicity or damage and decreased spleen weights in pregnant female mice.

The National Toxicology Program (NTP) recently completed a 2-year inhalation bioassay of **naphthalene**. The study was conducted in male and female F344/N rats at exposure concentrations of 0, 10, 30, and 60 ppm. No significant effects were observed at the 10 ppm levels. However, compared to chamber controls, there was a dose-related increase in tumors generated at the 30 and 60 ppm levels in both males and females. Higher incidences of respiratory epithelial adenomas, olfactory epithelial neuroblastomas, and non-neoplastic lesions of the nose were observed when compared to chamber controls. Additionally, in cytogenic tests with Chinese hamster ovary cells, naphthalene induced significant increases in sister chromatid exchanges with and without metabolic activation (S9) and chromosomal aberrations with S9. The relevance of these findings to human health is unclear; however, based upon this data, the IARC has determined naphthalene to be possibly carcinogenic to humans (Class 2B).

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this naphtha, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. Volatile **aromatic hydrocarbon components (toluene, xylenes, ethylbenzene, cumene, indene, trimethylbenzenes, and naphthalene)** may be released and possibly contribute to the creation of atmospheric smog. **Toluene** has a half-life of from 3 hours to slightly over 1 day when hydroxyl radicals are present.

Using Rainbow Trout (*Oncorhynchus mykiss*) and Dungeness Crab (*Cancer magister*), similar naphthas showed a 96-hour TLm (Median Toxic Limit) from 5 ppm to 30 ppm in ambient saltwater. Also, 24-hour and 96-hour TLms produced results from 60 ppm to 200 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), Guppy (*Lebistes reticulatus*) and juvenile American Shad (*Squalius cephalus*) in fresh water. Also, 24-hour and 96-hour LC50s for **toluene** produced results from 25 ppm to 60 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), and Guppy (*Lebistes reticulatus*) in fresh water. Using Water Fleas (*Daphnia magna*), toluene showed 24-hour TLms of from 100 ppm to 200 ppm. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

Environmental Fate

This naphtha mixture is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

Heavy Reformate

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated with this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (U220) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Petroleum distillates, n.o.s. (Xylenes, Trimethylbenzenes)		
Hazard Class	DOT Class: 3 (Flammable liquid).	Packing Group(s)	PG II
		UN/NA ID	UN1268
Reportable Quantity	The Reportable Quantity (RQ) substance components in this material which may require DOT HAZMAT bill-of-lading display are Xylenes and Toluene .		
Placards		Emergency Response Guide No.	128
		HAZMAT STCC No.	49 102 56
		MARPOL III Status	All impacted components were delisted as DOT "Marine Pollutants" per 66 FR 120 (page 33413) dated 6/21/2001.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) Inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories:

HoustonRefining

A Lyondell Company

Heavy Reformate

Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.

SARA 313

This material contains the following components in concentrations which might be at or above de minimis levels and are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313:

Toluene [CAS No. 108-88-3] concentration: 5 to 15%

Xylenes [CAS No. 1330-20-7] concentration: 10 to 25%

Ethylbenzene [CAS No. 100-41-4] concentration: 2 to 7.5%

Cumene (Isopropylbenzene) [CAS No. 92-82-8] concentration: 0.1 to 0.9%

1,2,4-Trimethylbenzene (Pseudocumene) [CAS No. 95-63-6] concentration: 5 to 8%

Naphthalene [CAS No. 91-20-3] concentration: 0.1 to 0.9%.

CERCLA

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this material subject to this statute are:

Toluene [CAS No. 108-88-3] (RQ = 1000 lbs. [453.6 kg]) concentration: 5 to 15%

2,2,4-Trimethylpentane (Iso-octane) [CAS No. 540-84-2] (RQ = 1000 lbs. [453.6 kg]) conc.: 0.5 to 5%

Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 10 to 25%

Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 2 to 7.5%

Cumene [CAS No. 92-82-8] (RQ = 5000 lbs. [2268 kg]) concentration: 0.1 to 0.9%

Naphthalene [CAS No. 91-20-3] (RQ = 100 lbs. [45.36 kg]) concentration: 0.1 to 0.9%.

CWA

This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

California Proposition 65

This material contains the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5: **Toluene [CAS No. 108-88-3] and Naphthalene [CAS No. 91-20-3].**

New Jersey Right-to-Know Label

For New Jersey labeling, refer to the components listed in Section 2.

Additional Regulatory Remarks

Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13): This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: **Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children!**

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following minor components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare": **Toluene (CAS No. 108-88-3), Xylenes (mixed) (CAS No. 1330-20-7), Ethylbenzene (CAS No. 100-41-4), and Cumene (Isopropylbenzene) (CAS No. 98-82-8).**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

2. HAZARDS IDENTIFICATION
Emergency Overview

This material is HAZARDOUS as defined by the OSHA Hazard Communication Standard, 29CFR, 1910.1200.

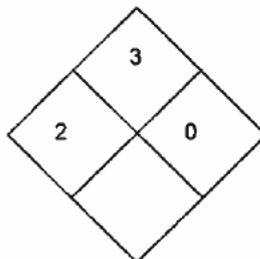

Signal Word

WARNING.

Hazards

Extremely flammable. Vapors may form explosive mixtures with air. Vapors can travel to a source of ignition and flash back. Vapors explosion hazard indoors, outdoors or in sewers. Vapor may cause flash fire or explosion. May be irritating to the skin. May cause central nervous system effects. Aspiration hazard. May cause lung damage. Possible cancer hazard. Mutagenic Substance. May affect the unborn. May effect hearing. Dangerous for the environment.

 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/05/2011

DEPENTANIZED COKER NAPHTHA

Color

colorless to light yellow

Odor

Aromatic or gasoline-like odor.

Odor Threshold

No value available.

Potential health effects

Routes of exposure

Eye. Inhalation. Skin.

Acute effects

Inhalation hazard. May cause drowsiness and dizziness. See component summary.

- *Xylene 1330-20-7*

May be irritating to the eyes, skin, and respiratory system. Aspiration hazard. Ingestion of this material, followed by vomiting and aspiration of the more volatile components of this material into the lungs, may lead to chemical pneumonia and even death.

- *Trimethyl benzene 25551-13-7*

CNS depressant. Aspiration hazard.

- *1,2,4-Trimethylbenzene 95-63-6*

May cause eye and skin irritation. Respiratory tract irritant. CNS depressant. Aspiration hazard.

- *n-Hexane 110-54-3*

May cause irritation to the eyes, nausea, vertigo, bronchial and central nervous system effects. This material presents an acute aspiration hazard. May be irritating to the skin. High or repeated exposures can damage the peripheral nervous system, causing numbness, tingling, and/or muscle weakness in the hands or feet. The onset of health effects associated with n-hexane may be influenced by exposure to additional chemicals such as methyl isobutyl ketone and methyl ethyl ketone.

- *Toluene 108-88-3*

Toluene is of slight acute toxicity, although inhalation exposure may cause dizziness and CNS depression, while ingestion may be fatal if aspiration into the lung occurs. Toluene may increase the sensitivity of the heart leading to potentially fatal cardiac sensitization. It is moderately irritating to skin and eye.

- *Ethyl Benzene 100-41-4*

Inhalation hazard. Ingestion hazard. Skin and eye irritant.

- *Indene 95-13-6*

May cause drowsiness and dizziness. Aspiration into the lungs may cause chemical pneumonia.

- *Naphthalene 91-20-3*

May be irritating to the eyes, skin and respiratory tract. Direct contact with the eye may cause corneal damage. May be toxic by all routes of exposure. Target organs for toxic effects include the blood, liver, kidneys, eyes, and central nervous system (CNS). Symptoms of overexposure may include headache, restlessness, lethargy, vomiting, anorexia, anemia, diminished vision, and acute kidney failure. Individuals who have an inherited G6PD deficiency in their red blood cells may be particularly sensitive to the toxic effects of Naphthalene. Naphthalene can cross the placenta and harm the fetus.

- *Benzene 71-43-2*

Slight acute toxicity. Inhalation exposure to high concentrations may cause dizziness and CNS depression. Ingestion of relatively small amounts may be fatal if aspiration into the lungs takes place.

Skin

May produce skin irritation. Repeated or prolonged contact with skin may cause defatting and drying of the skin which may result in dermatitis. May cause irritation to the skin. This irritation can result in redness and swelling of the skin. Repeated contact with the skin may cause it to become dry and cracked. May be absorbed through the skin and produce toxic effects such as CNS depression. May be absorbed through the skin and produce toxic effects such as CNS depression. May cause dermatitis by defatting the skin from prolonged or repeated contact. Short-term contact symptoms include redness, itching, and burning of the skin. May be absorbed through the skin and produce toxic effects such as CNS depression. If the skin is damaged, absorption increases.

Inhalation

Can cause pulmonary edema if aspirated into lungs. May produce symptoms of central nervous system depression

Inhalation

including headache, dizziness, nausea, euphoria, loss of equilibrium, drowsiness, visual disturbances, fatigue, unconsciousness and respiratory arrest. High concentrations of this substance may cause cardiac arrhythmias that may be fatal. Hydrogen sulfide is a highly toxic gas that can be fatal in certain concentrations. Inhalation of the vapor or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath and may cause transient central nervous system (CNS) depression. High concentrations can displace oxygen and cause drowsiness, dizziness, unconsciousness and/or suffocation by asphyxiation.

Eyes

May cause moderate irritation, including burning sensation, tearing, redness or swelling. Effects of eye irritation are reversible. May cause moderate irritation, including burning sensation, tearing, redness or swelling. May cause blurred vision. Effects may become more severe with repeated or prolonged contact.

Ingestion

Aspiration may cause lung damage. Harmful if swallowed. May cause abdominal discomfort, nausea and diarrhea. Aspiration into the lungs during swallowing or vomiting can cause lung damage, possibly leading to chronic lung dysfunction or death. Swallowing this material may cause effects similar to those described in the inhalation section. Readily absorbed upon ingestion and may produce toxic effects similar to those resulting from inhalation exposure. Ingestion followed by vomiting could result in aspiration into the lungs of the more volatile components of this material which in turn could lead to life-threatening chemical pneumonia. Ingestion of this material, followed by vomiting and aspiration of the more volatile components of this material into the lungs, may lead to chemical pneumonia and even death.

Chronic effects

Prolonged and/or repeated contact may cause mild to moderate skin defatting, redness, blistering, lesions, and/or scaly dermatitis. Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung tumor) formation and chronic lung dysfunction. Altered mental states, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called "petrol sniffers encephalopathy"), delirium, seizures, and sudden death have been common symptoms among gasoline and naphtha abusers. Repeated or prolonged contact with the skin may cause defatting dermatitis. Toluene has a cumulative effect on the nervous system. Irritation of mucous membranes, headaches, dizziness, nausea, loss of appetite, intolerance to alcohol, and auditory nerve degeneration have been reported with chronic toluene exposure. Possible cancer hazard (contains a material which may cause cancer based on animal data). May cause developmental toxicity. May affect the unborn.

- *Xylene 1330-20-7*

May cause dermatitis by defatting the skin from prolonged or repeated contact. May contribute to the development of diseases of the nervous system, liver and kidney. May be a reproductive hazard.

- *Trimethylbenzene 25551-13-7*

No adverse chronic human health effects have been reported for this material.

- *1,2,4-Trimethylbenzene 95-63-6*

Repeated or prolonged skin contact may defat the skin and produce dermatitis.

- *n-Hexane 110-54-3*

Damage to nerves in hands or feet may occur from prolonged inhalation of n-hexane concentrations of 60 to 240 ppm. Repeated exposure to air concentrations of 500 ppm n-hexane can produce progressively worsening damage to the peripheral nerves. Prolonged and repeated exposure to vapors may cause damage to the CNS, lungs and kidneys. Suspect reproductive hazard.

- *Toluene 108-88-3*

Repeated exposure to high concentrations has been shown to cause neurological changes and hearing loss in animals, and in humans in abuse situations. May cause developmental toxicity.

- *Ethyl Benzene 100-41-4*

May affect hearing. Repeated or prolonged exposure may damage liver and kidneys. Possible cancer hazard. Repeated contact with skin may cause cracking and/or fissuring.

- *Indene 95-13-6*

No known chronic health effects.

- *Naphthalene 91-20-3*

Target organs for toxic effects of chronic exposure include the blood, the skin, the eyes, and the central nervous system. Symptoms of chronic overexposure may include dermatitis, anemia, sores on the eye or cloudiness of the eyeball, diseases involving the nerves or nervous system, and allergic skin reactions. Potential Cancer Hazard, see section 11.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE99
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/05/2011

DEPENTANIZED COKER NAPHTHA

- *Benzene 71-43-2*

Benzene is considered to be a cancer-causing agent. Repeated exposure is linked to bone marrow toxicity, reduced red- and white blood cell counts and decreased immunological function irrespective of the route of contact.

Aggravated Medical Condition

Any pre-existing disorders or diseases of the: central nervous system (CNS) skin respiratory system liver kidney

3. COMPOSITION/INFORMATION ON INGREDIENTS

Typical composition

4. FIRST AID MEASURES

General advice

Take proper precautions to ensure your own health and safety before attempting rescue and providing first aid. For specific information refer to the Emergency Overview in Section 2 of this MSDS.

Skin

All contaminated clothing should be removed, and contaminated skin areas washed with lipophilic soap, or green soap, and water. Never use low boiling point naphthas for washing contaminated skin. Do not wash with machine dishwashing or laundry detergents. Seek medical attention if tissue appears damaged or if pain or irritation persists. In the event of a high pressure injection injury, worker should obtain immediate medical assistance. Discard contaminated leather goods.

Inhalation

Remove victim to fresh air and keep at rest in a position comfortable for breathing. Keep patient warm and at rest. If breathing is difficult, give oxygen. If unconscious place in recovery position and seek medical advice. In the event of unconsciousness, apnea or cardiac arrest (no pulse) apply cardiopulmonary resuscitation.

Eyes

MATERIAL SAFETY DATA SHEET

MSDS No.: BE99
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/05/2011

DEPENTANIZED COKER NAPHTHA

Eyes

In case of eye contact, remove contact lens and rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Do not use eye ointment unless directed to by a physician. If irritation, blurred vision or swelling occurs and persists, obtain medical advice from a specialist.

Ingestion

DO NOT induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. Get medical attention immediately. Do not give milk or alcoholic beverages. Never give anything by mouth to an unconscious person.

Notes to physician

Treat symptomatically. Inhalation may cause CNS depression. Overexposure may produce anesthetic or narcotic effects. Do not induce vomiting. Risk of damage to lungs exceeds poisoning risk. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to this material. Treatment of overexposure should be directed at the control of symptoms and the clinical condition of the patient. Gastrointestinal decontamination in accidental petroleum distillate ingestions is not recommended, because of the severe aspiration hazard.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

OSHA/NFPA Class IA flammable liquid.

Flash point

< 0 °C (32 °F) closed cup

Autoignition temperature

280 - 470 °C (536 - 878 °F)

Lower explosion limit

~ 1.4 vol%

Upper explosion limit

~ 7.6 vol%

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Use dry chemical, CO₂, water spray or regular foam. LARGE FIRES: Use water spray, dry chemical, foam, or carbon dioxide. Do not use solid water stream/may spread fire.

Unsuitable extinguishing media

Do not use solid water stream/may spread fire.

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear an approved positive pressure self-contained breathing apparatus and firefighter turnout gear.

Precautions for fire-fighting

When exposed to ignition source in air, vapors can burn in open or explode if confined. Flammable vapors may be heavier than air and travel long distances along the ground before igniting and flashing back to vapor source. Releases flammable vapors below normal ambient temperatures. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Move containers from fire area if you can do it without risk. Sustained fire attack on vessels may result in a Boiling Liquid Expanding Vapour Explosion (BLEVE). Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Prevent fire extinguishing water from contaminating surface water or the ground water system. When fighting a fire, notify environmental authorities if liquid enters sewers or public waters. Fire residues and contaminated fire extinguishing water must be disposed of in accordance with local regulations. Thermal decomposition may produce carbon

 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/05/2011

DEPENTANIZED COKER NAPHTHA

Precautions for fire-fighting
 monoxide and other toxic vapors.

Hazardous combustion products
 Carbon Monoxide. Carbon dioxide. Oxides of nitrogen.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Release causes immediate fire/explosion hazard. Evacuate all non-essential personnel to an area upwind (at least 1/2 mile in all directions if tanks or tank cars are involved in fire or spill). A vapor suppressing foam may be used to reduce vapors. Eliminate all sources of ignition. All equipment used when handling this product must be grounded. Stop leak if you can do it without risk. Do not touch or walk through spilled material. Prevent entry into waterways, sewers, basements or confined areas. Absorb or cover with dry earth, sand or other non-combustible material and transfer to containers. Use clean non-sparking tools to collect absorbed material. Contain spill with dike to prevent entry into sewers or waterways. Water spray may reduce vapor; but may not prevent ignition in closed spaces. Use suitable disposal containers.

7. HANDLING AND STORAGE

Handling

Ensure all equipment is electrically grounded before beginning transfer operations. Eliminate every possible source of ignition. Spilled material can make walking hazardous, potentially causing falls and serious injury. Do not breathe vapor. Avoid contact with skin. Do not smoke. Do not pressurize, cut, weld, braze solder, drill, or grind on containers. Use good housekeeping practices during use, storage, transfer, and handling. Electrostatic charges may be generated as a result of flow or agitation. A static spark or discharge can ignite accumulated vapors, particularly during dry weather conditions. Bond and ground all equipment before transferring this material from one container to another. Do not fill any portable container in or on a vehicle without proper bonding. Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved. Refer to NFPA 77 for relevant consensus guidance.

Storage

Keep away from all ignition sources; segregate from incompatible materials. Keep containers tightly closed in a dry, cool, well-ventilated place, plainly labeled, and out of closed vehicles. Ground all containers, transfer vessels, and equipment containing this material. Containers should be able to withstand pressures expected from warming or cooling during storage. Flammable materials should be stored in separate safety storage cabinet or room. All equipment must conform to applicable electrical code. Store and transport in accordance with all applicable laws.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits.

Personal protective equipment

Inhalation

When workers are facing concentrations above the exposure limit they must use appropriate certified respirators. The type of respiratory protection will depend upon whether the maximum exposure concentration is known.

Consider the maximum period for wear. If exposure can potentially exceed the exposure limit(s), respiratory protection recommended or approved by appropriate local, state or international agency must be used.

Skin

Wear insulated gloves if contact with liquid is possible. Wear chemical resistant gloves such as: Glove material fluoroelastomer; material thickness 0.4 mm; break through time \geq 480 min. Gloves must be replaced after 8 hours of wear. The suitability for a specific workplace should be discussed with the producers of the protective gloves. Gloves should be discarded and replaced if there is any indication of degradation or chemical breakthrough. When skin contact is possible,

MATERIAL SAFETY DATA SHEET

MSDS No.: BE99
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/05/2011

DEPENTANIZED COKER NAPHTHA

Skin

protective clothing including gloves, apron, sleeves, boots, head and face protection should be worn. Promptly remove and discard contaminated leather goods (gloves, belts, shoes, wallets, etc). Upon clothing contamination, immediately remove soaked clothing and shower. Choose body protection according to the amount and concentration of the dangerous substance at the work place. Fire retardant clothing is appropriate for routine occupational use.

Eyes

Safety glasses Eye protection such as chemical splash goggles and/or face shield must be worn when possibility exists for eye contact due to splashing or spraying liquid.

Remarks

Wash hands before eating, drinking, smoking, or using toilet facilities. Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure. Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use. Use good personal hygiene practices.

Relative density: 0.62 - 0.88 @ 15 °C (59 °F) (Water = 1)

Relative vapor density: No Data Available.

Viscosity: ~ < 1 mm²/s @ ~ 37.8 °C (100.04 °F)

Water solubility: Slightly soluble in cold water.

Partition coefficient: n-octanol/water: Specific data not available.

Other physico-chemical properties: No additional information available.

10. STABILITY AND REACTIVITY

Chemical stability

The product is stable.

Conditions to avoid

Heat, sparks, open flames and strong oxidizing conditions. Contact with strong acids.

Hazardous decomposition products

No degradation data available.

Hazardous polymerization

Not expected to occur.

11. TOXICOLOGICAL INFORMATION

Product information

Product Summary

Inhalation of high vapor concentrations can cause CNS-depression and narcosis. Inhalation of vapors in high concentration may cause shortness of breath (lung edema). Solvents may degrease the skin. Prolonged exposure may produce anesthetic and narcotic effects. (See Component Toxicity Information).

Acute toxicity

<u>LC50 (Inh)</u>	rat	>5.61 MG/L	4 HOURS
<u>LD50 (Oral)</u>	rat	>5,000 MG/KG	
<u>LD50 (Skin)</u>	rabbit	>2000 MG/KG	

Acute effects

Inhalation

Predicted exposure concentration. Stream expected to have a low order of acute inhalation toxicity based on toxicity information for streams having components in common with this stream.

Inhalation may cause CNS depression. Can cause pulmonary edema if aspirated into lungs.

Ingestion

MATERIAL SAFETY DATA SHEET

MSDS No.: BE99
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/05/2011

DEPENTANIZED COKER NAPHTHA

Predicted exposure concentration Stream expected to have a low order of acute oral toxicity based on toxicity information for streams having components in common with this stream.

Skin contact

Predicted exposure concentration Stream expected to have a low order of acute dermal toxicity based on toxicity information for streams having components in common with this stream.

Irritation

Skin

Skin irritant. Stream expected to be irritating to the skin based on toxicity information for streams having components in common with this stream.

Eyes

Non-irritating to the eyes. Stream expected to be no more than transient, fully reversible irritating to the eye based on toxicity information for streams having components in common with this stream. These effects are not considered to warrant classification as an eye irritant.

Sensitization

Stream expected not to be a sensitizer based on toxicity information for streams having components in common with this stream.

Target Organs

Blood. Liver. Kidneys. Lung. Central nervous system.

Reproductive effects

Stream expected not to be toxic to reproduction based on toxicity information for streams having components in common with this stream.

Developmental Toxicity

Suspected of damaging the unborn child. Stream expected to be toxic to development based on toxicity information for components present in this stream.

Genetic Toxicity

Mutagenic Substance. May cause genetic defects. Stream expected to be mutagenic based on toxicity information for components present in this stream.

Carcinogenicity

May cause cancer. Stream expected to be carcinogenic based on toxicity information for streams having components in common with this stream.

COMPONENT INFORMATION

- *Naphtha (petroleum) heavy thermal cracked* 64741-83-9

Other information

See Product Summary

- *Xylene* 1330-20-7

Acute toxicity

<u>LC50 (Inhl)</u>	rat	5000 PPM	4 HOURS
	mouse	3907 MG/KG	6 HOURS
	rat	4550 PPM	4 HOURS

MATERIAL SAFETY DATA SHEET

MSDS No.: BE99
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/05/2011

DEPENTANIZED COKER NAPHTHA

LD50 (Oral) rat 4300 MG/KG
LD50 (Skin) rabbit >1700 MG/KG

Irritation

Skin

Moderate skin irritant. May cause dermatitis by defatting the skin from prolonged or repeated contact.

Eyes

This material is expected to be a mild eye irritant. Xylenes are irritating to the eyes with the potential to cause conjunctivitis and corneal opacity.

Target Organs

Skin. Eye. central nervous system (CNS)

Repeated dose toxicity

Repeated inhalation exposures of rats to xylenes cause liver effects at 920 ppm (4.0 mg/L) and ototoxicity at \geq 800 ppm (3.48 mg/L). Repeated oral exposures to xylenes produce reductions in body weight in male rats at 500 mg/kg bwt/day; liver effects and hyaline droplet formation in male rats at \geq 150 mg/kg bwt/day; kidney effects in male and female rats at \geq 750 mg/kg bwt/day; and a reduction in bodyweight gain in male mice at \geq 250 mg/kg bwt/day. Repeated inhalation exposures of gerbils to \geq 160 ppm (0.70 mg/L) xylenes cause apparently irreversible CNS effects.

Reproductive effects

A reproductive toxicity study, two dominant lethal studies, and evaluation of reproductive organs in repeated dose studies indicate that xylenes do not affect reproductive performance or induce structural damage to reproductive organs of laboratory animals at non-anesthetic doses. However, xylenes have been shown to produce damage to reproductive organs in rats repeatedly exposed to extremely high, anesthetic doses.

Developmental Toxicity

Results from animal studies demonstrate that xylenes may cause reduced fetal weight and delayed ossification, but not malformations, at inhalation dose levels causing no or only slight maternal toxicity (\geq 115 ppm or 0.5 mg/L). Slight neurobehavioral effects were noted in offspring of rats exposed to 500 ppm (2.2 mg/L) in the absence of maternal toxicity.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *Trimethyl benzene* 25551-13-7

Acute toxicity

LD50 (Oral) rat 8970 MG/KG

Irritation

Skin

Skin irritant.

- *1,2,4-Trimethylbenzene* 95-63-6

Acute toxicity

LC50 (Inhi) rat 18 G/M3 4 HOURS

Target Organs

Eye. Skin. Respiratory system. Central nervous system. Blood.

Repeated dose toxicity

Repeated inhalation exposures to 1,2,4-trimethyl-benzene causes changes in hematological parameters in male rats at 250 ppm (1.23 mg/L); and pulmonary lesions in male and female rats at \geq 100 ppm (1.23 mg/L).

Developmental Toxicity

Results from a repeated dose inhalation test with trimethylbenzene showed fetotoxicity in rats (decreased pup bodyweight) at \geq 600 ppm (2.95 mg/L) in the presence of maternal toxicity (reduced body weight gain).

Genetic Toxicity

MATERIAL SAFETY DATA SHEET

MSDS No.: BE99
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/05/2011

DEPENTANIZED COKER NAPHTHA

Target Organs

Trimethylbenzene was positive in a bacterial gene mutation assay and produced sister chromatid exchanges in mouse bone marrow (at ≥ 730 mg/kg bwt), but did not induce micronuclei in the same cells.

- *n*-Hexane 110-54-3

Acute toxicity

<u>LC50 (Inh)</u>	rat	48,000 PPM	4 HOURS
<u>LD50 (Oral)</u>	rat	28,710 MG/KG	
<u>LD50 (Skin)</u>	rabbit	3000 MG/KG	

Irritation

Eyes

Eye irritant.

Target Organs

Skin. Eye. Respiratory system. Central nervous system effects. Peripheral nervous system Testes.

Repeated dose toxicity

Rabbits exposed by inhalation to 3,000 ppm 8 hours/day for 8 days showed changes in the lungs, emphysema, necrosis of the bronchial epithelium, and atelectasis. Rats continuously exposed to 400 ppm developed axonopathy, although intermittent exposure to 10,000 ppm 6 hours/day, 5 days/week for 13 weeks caused only mild paranodal axonal swelling. The offspring of rats and mice exposed orally or by inhalation to *n*-hexane during gestation showed depressed weight gain after birth. This agent also affects male and female reproductive capacity.

Reproductive effects

Exposure to *n*-hexane may damage the developing fetus.

Developmental Toxicity

Causes productive and embryotoxic effects and is cytotoxic in mammalian and human test systems.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

Other information

Exposure of humans to 5,000 ppm *n*-hexane for 10 minutes causes marked vertigo; exposure to 1,500 ppm results in headache and slight nausea. In industrial settings, exposure to levels exceeding 1,000 ppm have been reported to cause mild symptoms of narcosis. Eye and upper respiratory tract irritation has been reported to occur in humans exposed to 880 ppm *n*-hexane for 15 minutes. Dermal contact with *n*-hexane results in immediate irritation characterized by erythema and hyperemia; exposed subjects developed blisters 5 hours following dermal exposure to *n*-hexane. The neuropathic toxicity of *n*-hexane in humans is well documented; cases of polyneuropathy have typically occurred in humans chronically exposed to levels of *n*-hexane ranging from 400 to 600 ppm, with occasional exposures up to 2,500 ppm. Distal symmetrical motor weakness is common in most cases; however, in severely affected individuals, motor weakness may extend to the pelvic and high musculature. Nerve biopsies in affected individuals show swelling of the nerve and thinning of the myelin sheath. Functional neurological disturbances usually progress for a few months after termination of exposure. Although recovery is expected to occur within a year, clinical polyneuropathy has been reported in some cases to remain after 2 years. Blurred vision, restricted visual field, and optic nerve atrophy has been reported to occur in association with *n*-hexane-induced polyneuropathy.

	Rabbit.	> 5000 MG/KG BWT	

Acute effects

Inhalation

MATERIAL SAFETY DATA SHEET

MSDS No.: BE99
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/05/2011

DEPENTANIZED COKER NAPHTHA

Vapors or aerosol may cause irritation of the eyes, nose and throat as well as CNS depression (fatigue, dizziness, loss of concentration, with collapse, coma and death possible in cases of severe overexposure).

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract and CNS depression (fatigue, dizziness, collapse, coma and death). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

Moderate skin irritant.

Eyes

Moderate eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Skin. Eye. Hearing. Nasal cavity. central nervous system (CNS) Heart

Repeated dose toxicity

No evidence of systemic toxicity was reported in rats exposed to 1.15 mg/l (300 ppm) toluene vapor for two years, while higher exposures were associated with inflammation and degeneration of nasal epithelial tissue. Rats exposed repeatedly to very high concentrations of toluene exhibited neurological changes and permanent hearing loss. Clinical case reports indicate the occurrence of serious and persistent changes (including tremor, ataxia, memory impairment and possible hearing loss) in humans following deliberate over-exposure to toluene in abuse situations. The relevance of these findings to low level occupational exposure to toluene is not known.

Reproductive effects

Studies in animals demonstrate no histopathological lesions in testes or ovaries of rats and mice exposed to 9.4 mg/l (2500 ppm) toluene vapor for 14-15 weeks, and no loss of fertility in male rats after exposure to 7.5 mg/l (2000 ppm) for a similar period of time. Epididymal weights and sperm counts were decreased in one study, but the absence of any adverse effect on reproduction makes the functional relevance of these observations unclear. No reliable human data are available.

Developmental Toxicity

Studies in pregnant rats demonstrate that toluene is not a teratogen, however mild fetotoxicity (lower body weight, delayed ossification, delayed physical development) may occur in the absence of maternal toxicity at exposures in the range 1.9-2.8 mg/l (500-750 ppm). Other studies describe adverse effects on learning and cognitive functions in rat pups exposed to 4.5-6.7 mg/l (1200-1800 ppm) in utero, although it is unclear if end-points evaluated in these tests are directly relevant to humans.

Genetic Toxicity

In vitro and in vivo mutagenicity tests were negative.

Carcinogenicity

Inhalation studies in rats and mice demonstrate that toluene is not a carcinogen. It has been used extensively as a solvent in rodent skin painting studies with occasional slight increases in tumor incidence reported: an epigenetic mechanism (based on irritation rather than genotoxicity) may underpin these findings. Toluene is considered a Group 3 substance by IARC, not classifiable as to its carcinogenicity to humans.

- *Hexane Isomers*

Other information

No data available.

- *Ethyl Benzene 100-41-4*

Acute toxicity

LC50 (vapor) rat 4000 PPM

MATERIAL SAFETY DATA SHEET

MSDS No.: BE99
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/05/2011

DEPENTANIZED COKER NAPHTHA

LD50 (Oral) rat 3500 - 4700 MG/KG BWT

LD50 (Skin) rabbit > 15,000 MG/KG BWT

Acute effects

Inhalation

Vapors may cause irritation of the eyes, nose and throat as well as CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure) May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract. High doses may cause CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization. Aspiration may cause pulmonary edema and pneumonitis.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring. While skin absorption is a potential route of exposure, no adverse health effects are anticipated following accidental or incidental contact.

Irritation

Skin

This product is expected to be an skin irritant.

Eyes

Moderate to severe eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Central nervous system. Lung. Liver. Kidneys. Thyroid. Blood. Hearing. heart

Repeated dose toxicity

No adverse effects were present in rats or mice exposed to 1000 ppm (4.3 mg/l) ethylbenzene vapor for up to 13 weeks. Longer-term exposure resulted in an increased incidence of chronic progressive nephropathy (CPN) in kidneys from rats inhaling 750 ppm (3.3 mg/l) for up to two years. Since CPN is a spontaneous age-related condition specific to rodents, these findings are of doubtful relevance to humans. Mice exposed chronically under similar conditions responded with changes in the lung, liver and thyroid. Additional effects in rats observed with repeated oral exposure of ≥ 250 mg bwt/day ethyl benzene for 90 days include changes in hematology (indicative of a mild regenerative anemia) and clinical chemistry parameters (indicative of hepatic microsomal enzyme induction), decreases in prothrombin time, mild alimentary effects and liver pathology. A standard neurotoxicity protocol study conducted in young adult rats did not find neurotoxic effects following repeated daily oral exposure to doses up to 500 mg/kg bwt/day.

Specialist investigations provide evidence of hearing loss in rats following repeated exposure (13 weeks) to concentrations of 200 ppm (0.85 mg/l) and above. Ethyl benzene at up to 500 ppm vapor concentration did not adversely affect the functional ability of the humoral component of the immune system of rats as measured by splenic IgM antibody forming cell response to the T-dependent antigen, sheep erythrocytes.

Reproductive effects

No parental, neonatal, or reproductive toxicity was observed following inhalation exposure of rats to up to 500 ppm or 500 ppm/342 mg/kg bwt/day ethylbenzene. Histopathological examination of reproductive tissue from rats, mice and rabbits has generally revealed no adverse changes following sub-chronic- or chronic inhalation exposure to high vapor concentrations. An increased incidence of testicular tumors in F344 male rats exposed to 750 ppm (3.3 mg/l) ethylbenzene vapor for 2 years is considered of doubtful relevance to reproductive toxicity.

Developmental Toxicity

Decreased fetal body weight and an increased occurrence of skeletal and other variations were reported in the presence of concurrent maternal toxicity (CNS effects, decreased body weight, liver enlargement) when female rats were exposed to ethylbenzene concentrations of 1000 ppm (4.3 mg/l) or above throughout pregnancy. No adverse effects to neurodevelopment were observed in rats exposed to 500 ppm/342 mg/kg bwt/day ethylbenzene.

Genetic Toxicity

No increase in micronuclei or hepatic UDS was observed in mice after treatment with ethylbenzene in vivo. It was not genotoxic in microbial systems, nor did it induce chromosomal aberrations or sister chromatid exchanges in mammalian

 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/05/2011

DEPENTANIZED COKER NAPHTHA

cells in vitro. Variable results were obtained for mutation at the TK+/- locus in L5178Y cells, although the most reliable study that utilized the current standard study protocol and doses that were not significantly cytotoxic gave a negative mutagenic response. The overall weight of evidence indicates that ethylbenzene is not genotoxic.

Carcinogenicity

The carcinogenic potential of ethylbenzene after inhalation exposure has been investigated in two recent regulatory guideline studies performed by NTP. Male rats exposed to 750 ppm (3.3 mg/l) over 2 years showed an increased incidence of testicular interstitial cell adenoma, a common tumor present also in a large majority of the untreated males included in the study. High level exposure was also linked with an increased incidence of kidney tumors in both sexes; the appearance of these lesions was strongly associated with the development of Chronic Progressive Nephropathy, a spontaneous age-related disease of rats with no equivalent counterpart in humans. Male mice exposed to 750 ppm ethylbenzene for 2 years responded with an increased incidence of lung tumors, while the incidence of liver tumors was increased in females. Mechanistic studies suggest that these lesions in the mouse developed secondary to enhanced cell proliferation in these tissues, while the weight of evidence from mutagenicity testing also indicates that a non-genotoxic mechanism was involved. Listed by IARC as possibly carcinogenic in humans (Group 2B).

- *Indene 95-13-6*

Acute toxicity

LC50 (Inhl) rat 14 GM/M3

Carcinogenicity

Specific data not available.

- *Naphthalene 91-20-3*

Acute toxicity

LC50 (Inhl) rat >340 MG/M3 4 HOUR

LD50 (Oral) rat 490 MG/KG
 mouse 533 MG/KG
 guinea pig 1200 MG/KG

Irritation

Skin

May be irritating to the skin.

Eyes

May cause eye irritation.

Repeated dose toxicity

Repeated inhalation or ingestion of naphthalene causes methemoglobinemia*

Developmental Toxicity

Results from repeated dose oral gavage tests with naphthalene showed fetotoxicity in rats (increase in resorptions at 450 mg/kg bwt/day) and in mice (decrease in number of live pups/litter at 300 mg/kg bwt/day) in the presence of maternal toxicity (reduction in body weight gains in rats; decrease in survival and reduction in body weight in mice).

Genetic Toxicity

Naphthalene produced chromosome damage in in vitro assays, but not in in vivo assays in which mice were administered 500 mg/kg bwt orally or 250 mg/kg bwt by intraperitoneal injection.

Carcinogenicity

The National Toxicology Program (NTP) has evaluated this substance and placed it in Group R: Reasonably Anticipated To Be A Human Carcinogen. The International Agency for Research on Cancer (IARC) has evaluated this substance and placed it in Group 2B (possibly carcinogenic to humans).

- *Benzene 71-43-2*

Acute toxicity

rat 13,700 PPM 4 HOURS

MATERIAL SAFETY DATA SHEET

MSDS No.: BE99
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/05/2011

DEPENTANIZED COKER NAPHTHA

rabbit > 8260 MG/KG BWT

Acute effects

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations.

Ingestion

May cause CNS depression, gastric discomfort, and vomiting. This material is an aspiration hazard.

Skin contact

No systemic toxicity is expected from acute dermal exposure.

Target Organs

Damages bone marrow. Eye. Skin.

Repeated dose toxicity

The hematopoietic system is the primary target for benzene, irrespective of the route of exposure. Broadly similar effects are seen in rodents and humans, including bone marrow toxicity and reduced red- and white blood cell counts.

Reproductive effects

Results from animal studies are inconsistent, with adverse effects on the ovary and testis reported in mice following repeated inhalation exposure but no effects on the gonads or on fertility observed in rats exposed under similar conditions. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Developmental Toxicity

Results from animal studies clearly demonstrate that benzene is not a teratogen, however mild fetotoxicity (including lowered bodyweight, delayed ossification and sub-clinical hematological changes) have been observed in rodents exposed during pregnancy, generally in association with maternal toxicity. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Genetic Toxicity

Benzene is genotoxic in vivo, and induces chromosomal aberrations and micronuclei in rats and mice following oral or inhalation exposure. Comparable changes would be anticipated in humans. The incidence of micronuclei in fetal rat liver is increased following administration of large doses by intraperitoneal injection to pregnant mice, while high-level oral exposure induced chromosomal aberrations in germ cells from male mice. The relevance to humans of these latter findings is not known.

Carcinogenicity

Benzene is a multi-site animal carcinogen, producing tumors in hematopoietic- and epithelial tissues after long term inhalation or oral exposure. Epidemiology studies confirm it is a human carcinogen, causing primarily acute non-lymphocytic leukemia.

12. ECOLOGICAL INFORMATION

Product information

Ecotoxicity

Toxic to aquatic life with long lasting effects.

Acute Fish toxicity

LL50 / 96 HOURS Oncorhynchus mykiss (rainbow trout) 10 mg/l

LL50 / 96 HOURS Pimephales promelas (fathead minnow) 8.2 mg/l

Acute toxicity to aquatic invertebrates

EL50 / 48 HOURS Daphnia magna (Water flea) 4.5 mg/l

MATERIAL SAFETY DATA SHEET

MSDS No.: BE99
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/05/2011

DEPENTANIZED COKER NAPHTHA

Toxicity to aquatic plants

EL50 / 72 HOURS *Pseudokirchneriella subcapitata* (green algae) 3.1 mg/l

NOELR / 72 HOURS *Pseudokirchneriella subcapitata* (green algae) 0.5 mg/l

Toxicity to microorganisms

EC50 / 40 HOURS *Tetrahymena pyriformis* (ciliated protozoa) 15.41 mg/l

Summary: Based on Quantitative structure-activity relationship (QSAR) estimation.

Chronic toxicity to fish

NOELR / 14 d fish. 2.6 mg/l

Summary: QSAR (Quantitative structure-activity relationship) based calculation predicts low chronic toxicity.

Chronic toxicity to aquatic invertebrates

NOELR / 21 d *Daphnia magna* (Water flea) 2.6 mg/l

Environmental fate and pathways

If released to water it will float. This material is likely to evaporate from soil and water.

COMPONENT INFORMATION

- *Naphtha (petroleum) heavy thermal cracked* 64741-83-9

Ecotoxicity

Other adverse effects

See Product Summary

Environmental fate and pathways

- *Xylene* 1330-20-7

Ecotoxicity

This material is classified as harmful to fish.

Acute Fish toxicity

LC50 / 96 HOUR rainbow trout. 13.5 mg/l

LC50 / 24 HOUR goldfish 13 mg/l

Environmental fate and pathways

This material is expected to exist solely as a vapor in the ambient atmosphere. The vapor-phase of this material is degraded in the atmosphere by reaction with photochemically-produced hydroxyl radicals and ozone. Expected to have moderate mobility in soils. Volatilization from moist soil surfaces is expected. Volatilization from dry soil surfaces is expected.

Persistence and degradability

Biodegradation: Biodegradable under aerobic and anaerobic conditions.

Bioaccumulation: This material is not expected to bioaccumulate.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE99
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/05/2011

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS Daphnia magna. 6.14 mg/l

Environmental fate and pathways

No Data Available.

- *n-Hexane* 110-54-3

Ecotoxicity

This material may be very toxic to aquatic species.

Acute Fish toxicity

LC50 / 96 HOUR Oncorhynchus mykiss 4.14 mg/l

LC50 / 96 HOUR Pimephales promelas 2.5 mg/l

LC50 / 96 HOURS Lepomis macrochirus 4.12 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS waterflea. 3.87 mg/l

Environmental fate and pathways

Photolysis, hydrolysis or bioconcentration of n-hexane are not expected to be an important environmental fate processes. Biodegradation of n-hexane may occur in soil and water; however, volatilization and adsorption are expected to be far more important fate processes. A Koc range of 1250 to 4100 indicates a low to slight mobility class in soil for n-hexane. In aquatic systems n-hexane may partition from the water column to organic matter contained in sediments and suspended materials. Rapid volatilization from environmental waters is expected.

Persistence and degradability

Stability in water: In aquatic systems, this material may partition from the water column to organic matter contained in sediments and suspended materials.

Biodegradation: Biodegradation may occur in soil and water, however, volatilization and adsorption are expected to be far more important fate processes.

Bioaccumulation: This material is not expected to bioaccumulate.

13. DISPOSAL CONSIDERATIONS

It is the responsibility for the waste generator to characterize waste streams relative to the pertinent regulatory provisions to ensure that applicable requirements are reviewed and met. Dispose of all waste and contaminated equipment in accordance with all applicable federal, state and local health and environmental regulations. Recovery and reuse, rather than disposal, should be the ultimate goal of handling efforts. The materials resulting from clean-up operations may be hazardous wastes and therefore, subject to specific regulations. Contaminated product, soil, water, and empty containers may be hazardous wastes due to possible presence of flammable gases. Assure emissions comply with applicable regulations. Proper grounding procedures to avoid static electricity should be followed.

2. HAZARDS IDENTIFICATION

Emergency Overview

This material is HAZARDOUS as defined by the OSHA Hazard Communication Standard, 29CFR, 1910.1200.

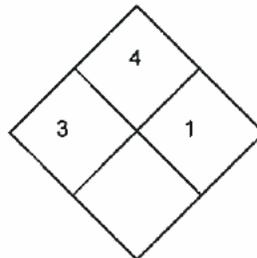

Signal Word

DANGER.

Hazards

Extremely flammable liquid. High concentrations can displace oxygen and cause drowsiness, dizziness, unconsciousness and/or suffocation by asphyxiation. Possible reproductive toxin. Possible cancer hazard. This material also contains components that may cause hearing loss and may be a developmental toxin.

 Pungent.

Odor Threshold
 No value available.

Potential health effects

Routes of exposure
 Inhalation. Ingestion. Skin.

- *Dimethyl Disulfide* 624-92-0
 Respiratory tract irritant. CNS depressant.

- *Benzene* 71-43-2

Slight acute toxicity. Inhalation exposure to high concentrations may cause dizziness and CNS depression. Ingestion of relatively small amounts may be fatal if aspiration into the lungs takes place.

- *Toluene* 108-88-3

Toluene is of slight acute toxicity, although inhalation exposure may cause dizziness and CNS depression, while ingestion may be fatal if aspiration into the lung occurs. Toluene may increase the sensitivity of the heart leading to potentially fatal cardiac sensitization. It is moderately irritating to skin and eye.

- *n-Hexane* 110-54-3

May cause irritation to the eyes, nausea, vertigo, bronchial and central nervous system effects. This material presents an acute aspiration hazard. May be irritating to the skin. High or repeated exposures can damage the peripheral nervous system, causing numbness, tingling, and/or muscle weakness in the hands or feet. The onset of health effects associated with n-hexane may be influenced by exposure to additional chemicals such as methyl isobutyl ketone and methyl ethyl ketone.

- *Methyl Mercaptan* 74-93-1

CNS depressant. May be irritating to the eyes.

- *Ethyl Mercaptan* 75-08-1

Harmful if swallowed.

Skin

May be mildly irritating to the skin. May be absorbed through the skin and produce toxic effects such as CNS depression. Repeated or prolonged contact may cause skin irritation.

Inhalation

Vapors or mists from this material can irritate the nose, throat and lungs, and cause signs and symptoms of central nervous system (CNS) depression, depending on the concentration and duration of exposure.

Ingestion

Irritates mucous membranes of the mouth, throat, and esophagus and is readily absorbed by the stomach and intestinal tract. CNS symptoms include nausea, vomiting, pallor, dizziness, staggering gait, drowsiness, shallow rapid pulse, loss of consciousness, and delirium prior to the onset of convulsions, coma, and death. Ingestion and/or vomiting of this material may result in aspiration into the lungs. Even a small amount of this liquid entering the lungs can produce potentially fatal effects (pulmonary edema and pneumonitis). Ingestion will result in burning of the mouth, throat and any part of the gastrointestinal system with which the material comes in contact. Nausea and vomiting may occur.

- *Dimethyl Disulfide* 624-92-0

Component caused a decrease in body weight gain in lab animals.

- *Benzene* 71-43-2

Benzene is considered to be a cancer-causing agent. Repeated exposure is linked to bone marrow toxicity, reduced red- and white blood cell counts and decreased immunological function irrespective of the route of contact.

- *Toluene* 108-88-3

Repeated exposure to high concentrations has been shown to cause neurological changes and hearing loss in animals, and in humans in abuse situations. May cause developmental toxicity.

- *n-Hexane* 110-54-3

DSO

Damage to nerves in hands or feet may occur from prolonged inhalation of n-hexane concentrations of 60 to 240 ppm. Repeated exposure to air concentrations of 500 ppm n-hexane can produce progressively worsening damage to the peripheral nerves. Prolonged and repeated exposure to vapors may cause damage to the CNS, lungs and kidneys. Suspect reproductive hazard.

- *Methyl Mercaptan 74-93-1*

Component caused a decrease in body weight gain in lab animals.

- *Ethyl Mercaptan 75-08-1*

May cause nausea. Repeated or prolonged exposure may irritate the mucous membranes.

Aggravated Medical Condition

Persons with pre-existing skin disorders, peripheral or central nervous system (CNS) disease, psychological conditions, cardiac conditions, impaired pulmonary, cardiovascular, or liver/kidney function, or chronic respiratory diseases should avoid exposure. Any pre-existing disorders or diseases of the: skin and/or blood

4. FIRST AID MEASURES

General advice

Take proper precautions to ensure your own health and safety before attempting rescue and providing first aid. For specific information refer to the Emergency Overview in Section 2 of this MSDS.

Skin

Immediately remove excess chemical and contaminated clothing; thoroughly wash contaminated skin with mild soap and water. If irritation persists after washing, seek medical attention. Thoroughly clean contaminated clothing before reuse; discard contaminated leather goods (gloves, shoes, belts, wallets, etc.).

Inhalation

Move the exposed person to fresh air at once. If breathing has stopped, perform artificial respiration. When breathing is difficult, properly trained personnel may assist the affected person by administering oxygen. Keep the affected person warm and at rest. Get medical attention immediately.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE100
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

DSO

Eyes

Immediately flush the eyes with large amounts of clean low-pressure water for at least 15 minutes, occasionally lifting the upper and lower lids. If pain or irritation persists, promptly obtain medical attention.

Ingestion

Rinse mouth with lukewarm water. DO NOT induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. Obtain medical attention.

Notes to physician

Do not induce vomiting. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Gastric lavage may also be indicated. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of pulmonary/upper airway edema. Provide 100% humidified supplemental oxygen with assisted ventilation if needed.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

Extremely flammable.

Flash point

~ 17.78 °C (64 °F)

Autoignition temperature

~ 219.44 °C (426.99 °F) (ASTME659).

Lower explosion limit

~ 1 vol% (% vol in air).

Upper explosion limit

~ 7.6 vol%

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Dry chemical, CO₂ (carbon dioxide) foam water fog Inert gas - Halon/N₂. LARGE FIRE: Use water spray, water fog or foam. DO NOT use straight streams

Unsuitable extinguishing media

Do not use solid water stream/may spread fire.

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear a NIOSH approved positive pressure self-contained breathing apparatus (SCBA). Fight fire from a safe distance/protected location. Use water spray/fog to disperse vapors below flammable limit.

Precautions for fire-fighting

Vapor is heavier than air, may travel long distance along the ground before igniting and flash back to vapor source. Evacuate area and fight from a maximum distance or use unmanned hose holders or monitor nozzles. Heat may generate flammable or explosive vapors; disperse with water spray or cover pooling liquid with foam. Containers can build up pressure if exposed to heat; cool with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of vessel. Always stay away from the ends of tanks.

6. ACCIDENTAL RELEASE MEASURES

MATERIAL SAFETY DATA SHEET

MSDS No.: BE100
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

DSO

Spills and leaks

Eliminate all sources of ignition. All equipment used when handling this product must be grounded. Do not touch or walk through spilled material. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. A vapor suppressing foam may be used to reduce vapors. Absorb or cover with dry earth, sand or other non-combustible material and transfer to containers. Use clean non-sparking tools to collect absorbed material. Evacuate/limit access. Evacuate all non-essential personnel to an area upwind (at least 1/2 mile in all directions if tanks or tank cars are involved in fire or spill). Water spray may reduce vapor, but may not prevent ignition in closed spaces.

7. HANDLING AND STORAGE

Handling

Store in tightly closed containers. Keep away from all sources of ignition. Leaks onto ground may cause slippery walking surface, increasing risk of falls/injury. Liquid material is slippery-remove small leaks/spills from walking surface with solid absorbent. Use only with adequate ventilation/personal protection. Avoid breathing vapors, mist or gas. Avoid contact with eyes, skin and clothing. Wash thoroughly after handling. All electrical equipment should be grounded and conform to applicable electric codes and regulatory requirements. Handle empty containers with care - residue may be flammable/poisonous.

Storage

Keep away from all ignition sources; segregate from incompatible materials. Keep containers tightly closed in a dry, cool, well-ventilated place, plainly labeled, and out of closed vehicles. Ground all containers, transfer vessels, and equipment containing this material. Containers should be able to withstand pressures expected from warming or cooling during storage. Flammable materials should be stored in separate safety storage cabinet or room.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. Electrical equipment should be grounded and conform to applicable electrical code. Emergency shower and eyewash facility should be in close proximity (ANSI Z358.1)

Personal protective equipment

Inhalation

If exposure exceeds the standard limits, respiratory protection equipment which meets 29 U.S. Code of Federal Regulations (CFR) 1910.134 and is U.S. National Institute for Occupational Safety and Health (NIOSH) approved must be worn.

Skin

Wear chemical resistant gloves such as: PVC Nitrile, Neoprene, or Butyl rubber. Avoid contact with skin. When skin contact is possible, protective clothing including gloves, apron, sleeves, boots, head and face protection should be worn. Use PPE that is chemical resistant to the product and prevents skin contact.

Eyes

Safety glasses with perforated sides. Use splash goggles when eye contact due to splashing or spraying liquid is possible. Contact lenses must not be worn.

Remarks

Use good personal hygiene practices. Wash hands before eating, drinking, smoking, or using toilet facilities. Wash thoroughly after handling with soap and water.

Partition coefficient: n-octanol/water: Specific data not available.

Other physico-chemical properties: No additional information available.

10. STABILITY AND REACTIVITY

Chemical stability

The product is stable.

Conditions to avoid

Heat, sparks and open flame.

Hazardous polymerization

Not expected to occur.

11. TOXICOLOGICAL INFORMATION

Product information

MATERIAL SAFETY DATA SHEET

MSDS No.: BE100
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

DSO

Product Summary
 See componentsummary.

COMPONENT INFORMATION

- *Disulfides, dialkyl and di-Ph, naphtha sweetening* 68955-96-4

Other information
 No data available.

- *Dimethyl Disulfide* 624-92-0

Acute toxicity

<u>LC50 (Inhl)</u>	rat	3.1 MG/L (805 PPM)	4 HOURS
	rat	1.9 MG/L (500 PPM)	4 HOURS

<u>LD50 (Oral)</u>	rat	190 MG/KG BWT
	rabbit	>2000 MG/KG BWT

Acute effects

Inhalation

No human information is available.

Ingestion

No human information is available.

Skin contact

There are no known reliable studies regarding systemic toxicity in humans or animals after dermal exposures.

Target Organs

Nasal cavity. Skin irritant.

Repeated dose toxicity

Rats exposed to dimethyl disulfide by inhalation for 6 hr/day, 5 days/week for 90 days showed decreased body weight gain, changes in clinical chemistry parameters and reversible microscopic changes in the nasal mucosa (> 10 ppm/0.039 mg/L); reduced food consumption (> 25 ppm/0.096 mg/L); decreased thymus weight and increased adrenal gland weight (125 ppm/0.482 mg/L); and marginal changes in hematology parameters (females at 250 ppm/0.96 mg/L); but no evidence of neurotoxicity. Domestic fowl administered dimethyl disulfide orally at total daily doses of 300 µg for 6 days and 600 µg for 6 days, showed signs of neurotoxicity and hemolytic anemia. Dermal exposure of rabbits to dimethyl disulfide on 5 days/week (10.63 and 106.3 mg/kg bwt/day for 4 weeks; and 1063 mg/kg bwt/day for 2 1/2 weeks) produced mortality in the high dose, lethargy in the mid and high doses, differences in some hematology and clinical chemistry parameters in high dose males, and severe, dose-related skin irritation in all dose groups.

Reproductive effects

No effects on reproductive organs were observed in rats following inhalation of dimethyl disulfide for 90 days at concentrations up to 250 ppm (0.96 mg/L).

Developmental Toxicity

In an inhalation developmental toxicity study in rats administered up to 50 ppm (0.193 mg/L) dimethyl disulfide on gestation days 6 to 15, a reduction in fetal weight and an increase in retarded ossification were seen at 50 ppm, in the presence of maternal toxicity (reduced body weight gain), but there was no evidence of teratogenicity.

Genetic Toxicity

Predominantly negative results were obtained with dimethyl disulfide when tested in vitro (negative in assays for bacterial and mammalian cell gene mutation and bacterial DNA damage and repair, ambiguous positive for chromosome aberrations in human lymphocytes). Negative results were obtained when dimethyl disulfide was evaluated in vivo (mouse

MATERIAL SAFETY DATA SHEET

MSDS No.: BE100
 Variant: U.S.A.-EN
 Revision: 1.1

DSO

Developmental Toxicity

micronucleus, unscheduled DNA synthesis).

- *Light sweetened naphtha (petroleum) 64741-87-3*

Other information

No data available.

- *Benzene 71-43-2*

Acute toxicity

<u>LC50 (vapor)</u>	rat	13,700 PPM	4 HOURS
	mouse	9980	8 HOURS
	rat	10000	7 HOURS

LD50 (Skin) rabbit > 8260 MG/KG BWT

Acute effects

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations.

Ingestion

May cause CNS depression, gastric discomfort, and vomiting. This material is an aspiration hazard.

Skin contact

No systemic toxicity is expected from acute dermal exposure.

Irritation

Skin

Skin irritant.

Eyes

Severe eye irritant.

Sensitization

No evidence of skin or respiratory sensitization.

Target Organs

Damages bone marrow. Eye. Skin.

Repeated dose toxicity

The hematopoietic system is the primary target for benzene, irrespective of the route of exposure. Broadly similar effects are seen in rodents and humans, including bone marrow toxicity and reduced red- and white blood cell counts.

Reproductive effects

Results from animal studies are inconsistent, with adverse effects on the ovary and testis reported in mice following repeated inhalation exposure but no effects on the gonads or on fertility observed in rats exposed under similar conditions. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Developmental Toxicity

Results from animal studies clearly demonstrate that benzene is not a teratogen, however mild fetotoxicity (including lowered body weight, delayed ossification and sub-clinical hematological changes) have been observed in rodents exposed during pregnancy, generally in association with maternal toxicity. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Genetic Toxicity

Benzene is genotoxic in vivo, and induces chromosomal aberrations and micronuclei in rats and mice following oral or inhalation exposure. Comparable changes would be anticipated in humans. The incidence of micronuclei in fetal rat liver is increased following administration of large doses by intraperitoneal injection to pregnant mice, while high-level oral exposure induced chromosomal aberrations in germ cells from male mice. The relevance to humans of these latter findings

MATERIAL SAFETY DATA SHEET

MSDS No.: BE100
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

DSO

Developmental Toxicity

is not known.

Carcinogenicity

Benzene is a multi-site animal carcinogen, producing tumors in hematopoietic- and epithelial tissues after long term inhalation or oral exposure. Epidemiology studies confirm it is a human carcinogen, causing primarily acute non-lymphocytic leukemia.

- *Toluene* 108-88-3

Acute toxicity

<u>LC50 (vapor)</u>	rat	7500 PPM	4 HOURS
	rat	5,580 MG/KG BWT	
	Rabbit	> 5000 MG/KG BWT	

Acute effects

Inhalation

Vapors or aerosol may cause irritation of the eyes, nose and throat as well as CNS depression (fatigue, dizziness, loss of concentration, with collapse, coma and death possible in cases of severe overexposure).

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract and CNS depression (fatigue, dizziness, collapse, coma and death). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

Moderate skin irritant.

Eyes

Moderate eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Skin. Eye. Hearing. Nasal cavity. central nervous system (CNS) Heart

Repeated dose toxicity

No evidence of systemic toxicity was reported in rats exposed to 1.15 mg/l (300 ppm) toluene vapor for two years, while higher exposures were associated with inflammation and degeneration of nasal epithelial tissue. Rats exposed repeatedly to very high concentrations of toluene exhibited neurological changes and permanent hearing loss. Clinical case reports indicate the occurrence of serious and persistent changes (including tremor, ataxia, memory impairment and possible hearing loss) in humans following deliberate over-exposure to toluene in abuse situations. The relevance of these findings to low level occupational exposure to toluene is not known.

Reproductive effects

Studies in animals demonstrate no histopathological lesions in testes or ovaries of rats and mice exposed to 9.4 mg/l (2500 ppm) toluene vapor for 14-15 weeks, and no loss of fertility in male rats after exposure to 7.5 mg/l (2000 ppm) for a similar period of time. Epididymal weights and sperm counts were decreased in one study, but the absence of any adverse effect on reproduction makes the functional relevance of these observations unclear. No reliable human data are available.

Developmental Toxicity

Studies in pregnant rats demonstrate that toluene is not a teratogen, however mild fetotoxicity (lower body weight, delayed ossification, delayed physical development) may occur in the absence of maternal toxicity at exposures in the range 1.9-2.8 mg/l (500-750 ppm). Other studies describe adverse effects on learning and cognitive functions in rat pups exposed to 4.5-6.7 mg/l (1200-1800 ppm) in utero, although it is unclear if end-points evaluated in these tests are directly relevant to humans.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE100
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

DSO

Genetic Toxicity

In vitro and in vivo mutagenicity tests were negative.

Carcinogenicity

Inhalation studies in rats and mice demonstrate that toluene is not a carcinogen. It has been used extensively as a solvent in rodent skin painting studies with occasional slight increases in tumor incidence reported; an epigenetic mechanism (based on irritation rather than genotoxicity) may underpin these findings. Toluene is considered a Group 3 substance by IARC, not classifiable as to its carcinogenicity to humans.

- *n-Hexane* 110-54-3

Acute toxicity

<u>LC50 (Inhl)</u>	rat	48,000 PPM	4 HOURS
<u>LD50 (Oral)</u>	rat	28,710 MG/KG	
<u>LD50 (Skin)</u>	rabbit	3000 MG/KG	

Irritation

Eyes

Eye irritant.

Target Organs

Skin. Eye. Respiratory system. Central nervous system effects. Peripheral nervous system Testes.

Repeated dose toxicity

Rabbits exposed by inhalation to 3,000 ppm 8 hours/day for 8 days showed changes in the lungs, emphysema, necrosis of the bronchial epithelium, and atelectasis. Rats continuously exposed to 400 ppm developed anoxopathy, although intermittent exposure to 10,000 ppm 6 hours/day, 5 days/week for 13 weeks caused only mild paranodal axonal swelling. The offspring of rats and mice exposed orally or by inhalation to n-hexane during gestation showed depressed weight gain after birth. This agent also affects male and female reproductive capacity.

Reproductive effects

Exposure to n-hexane may damage the developing fetus.

Developmental Toxicity

Causes productive and embryotoxic effects and is cytotoxic in mammalian and human test systems.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

Other information

Exposure of humans to 5,000 ppm n-hexane for 10 minutes causes marked vertigo; exposure to 1,500 ppm results in headache and slight nausea. In industrial settings, exposure to levels exceeding 1,000 ppm have been reported to cause mild symptoms of narcosis. Eye and upper respiratory tract irritation has been reported to occur in humans exposed to 880 ppm n-hexane for 15 minutes. Dermal contact with n-hexane results in immediate irritation characterized by erythema and hyperemia; exposed subjects developed blisters 5 hours following dermal exposure to n-hexane. The neuropathic toxicity of n-hexane in humans is well documented; cases of polyneuropathy have typically occurred in humans chronically exposed to levels of n-hexane ranging from 400 to 600 ppm, with occasional exposures up to 2,500 ppm. Distal symmetrical motor weakness is common in most cases; however, in severely affected individuals, motor weakness may extend to the pelvic and high musculature. Nerve biopsies in affected individuals show swelling of the nerve and thinning of the myelin sheath. Functional neurological disturbances usually progress for a few months after termination of exposure. Although recovery is expected to occur within a year, clinical polyneuropathy has been reported in some cases to remain after 2 years. Blurred vision, restricted visual field, and optic nerve atrophy has been reported to occur in association with n-hexane-induced polyneuropathy.

- *Methyl Mercaptan* 74-93-1

Acute toxicity

<u>LC50 (Inhl)</u>	rat	1.33 MG/L (675 PPM)	4 HOURS
--------------------	-----	---------------------	---------

Acute effects

MATERIAL SAFETY DATA SHEET

 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

DSO

Inhalation

May cause headaches. Inhalation may cause CNS depression. May cause irritation of the mucous membranes.

Ingestion

Stream is a gas with a low boiling point; hence, oral exposure and resulting acute toxicity are unlikely.

Skin contact

There are no known reliable studies regarding systemic toxicity in humans or animals after dermal exposures.

Irritation

Skin

There are no known reliable studies regarding systemic toxicity in humans or animals after dermal exposures.

Eyes

May cause eye irritation.

Target Organs

central nervous system (CNS) Mucous membrane irritant. Respiratory system. Eye irritant.

Repeated dose toxicity

Repeated inhalation exposure of rats for 90 days to 57 ppm (0.11 mg/L) methyl mercaptan produced a decrease in body weight gain.

- *Ethyl Mercaptan 75-08-1*

Acute toxicity

<u>LC50 (Inhl)</u>	rat	11.23 MG/L (4420 PPM)	4 HOURS
<u>LD50 (Oral)</u>	rat	682 MG/KG BWT

Toxicity to aquatic plants

Summary: No Data Available.

Toxicity to microorganisms

Summary: No Data Available.

Chronic toxicity to fish

NOEC / 40 DAY Oncorhynchus sp. 1.4 mg/l

Summary: Actual exposure time: 27 - 40 day.

Chronic toxicity to aquatic invertebrates

NOEC / 21 DAY Daphnia magna. 1.0 mg/l

NOEC / 7 DAY Ceriodaphnia dubia 0.74 mg/l

Environmental fate and pathways

Mobility

Behavior in environmental compartments: The atmosphere is the main environmental compartment for the release of toluene. In water, volatilization will result in substantial losses to the atmosphere with a half-life of 1-2 days. A calculated Koc value of 37-160 indicates no significant potential for geoaccumulation.

Persistence and degradability

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: Log Kow (Fish) <3

- *n*-Hexane 110-54-3

Ecotoxicity

This material may be very toxic to aquatic species.

Acute Fish toxicity

LC50 / 96 HOUR Oncorhynchus mykiss 4.14 mg/l

LC50 / 96 HOUR Pimephales promelas 2.5 mg/l

LC50 / 96 HOURS Lepomis macrochirus 4.12 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS waterflea. 3.87 mg/l

Environmental fate and pathways

Photolysis, hydrolysis or bioconcentration of *n*-hexane are not expected to be an important environmental fate processes. Biodegradation of *n*-hexane may occur in soil and water; however, volatilization and adsorption are expected to be far more important fate processes. A Koc range of 1250 to 4100 indicates a low to slight mobility class in soil for *n*-hexane. In aquatic systems *n*-hexane may partition from the water column to organic matter contained in sediments and suspended materials. Rapid volatilization from environmental waters is expected.

Persistence and degradability

Stability in water: In aquatic systems, this material may partition from the water column to organic matter contained in sediments and suspended materials.

Biodegradation: Biodegradation may occur in soil and water, however, volatilization and adsorption are expected to be far more important fate processes.

108-88-3 Toluene

Known to the State of California to cause reproductive toxicity in males.

71-43-2 Benzene (December 11, 2009)

Known to the State of California to cause reproductive toxicity in females.

108-88-3 Toluene (December 11, 2009)

This product contains the following chemicals regulated by New Jersey's Worker and Community Right to Know Act:

624-92-0 Dimethyl Disulfide
 71-43-2 Benzene
 108-88-3 Toluene
 110-54-3 n-Hexane
 74-93-1 Methyl Mercaptan
 75-08-1 Ethyl Mercaptan

This product contains the following chemicals regulated by Massachusetts' Right to Know Law:

624-92-0 Dimethyl Disulfide
 71-43-2 Benzene
 108-88-3 Toluene
 110-54-3 n-Hexane
 74-93-1 Methyl Mercaptan

MATERIAL SAFETY DATA SHEET

MSDS No.: BE100
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

DSO

75-08-1 Ethyl Mercaptan

This product contains the following chemicals regulated by Pennsylvania's Right to Know Act:

624-92-0 Dimethyl Disulfide
 71-43-2 Benzene
 108-88-3 Toluene
 110-54-3 n-Hexane
 74-93-1 Methyl Mercaptan
 75-08-1 Ethyl Mercaptan

Last revision: Logo change. November 3 2010

Disclaimer

The information on this MSDS was obtained from sources which we believe are reliable. However, the information is provided without any warranty, expressed or implied, regarding its correctness. Some information presented and conclusions drawn herein are from sources other than direct test data on the substance itself. The conditions or methods of handling, storage, use and disposal of the product are beyond our control and may be beyond our knowledge. For this and other reasons, we do not assume responsibility and expressly disclaim liability for loss, damage, or expense arising out of or in any way connected with handling, storage, use, or disposal of this product. If the product is used as a component in another product, this MSDS information may not be applicable. Information is correct to the best of our knowledge at the date of the MSDS publication.

Numerical Data Presentation

The presentation of numerical data, such as that used for physical and chemical properties and toxicological values, is expressed using a comma (,) to separate digits into groups of three and a period (.) as the decimal marker. For example, 1,234.56 mg/kg = 1 234,56 mg/kg.

Material Safety Data Sheet

MSDS No. AP1828
Revision Date 11/01/06

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid.
Color Transparent to slightly opaque, slightly yellow to slightly amber. **Odor** Characteristic, kerosene-like.

WARNING! Combustible liquid; vapor may cause flash fire. Mist or vapor may irritate the eyes, mucous membranes, and respiratory tract.
Liquid contact may cause minimal to mild eye irritation and/or mild to severe skin irritation and inflammation.
May be harmful if inhaled or absorbed through the skin.
Overexposures may cause central nervous system (CNS) depression and/or other target organ effects.
May be harmful or fatal if ingested. Aspiration into the lungs can cause pulmonary edema and lipid or chemical pneumonia.
Contains Naphthalene and Polynuclear Aromatic Hydrocarbons. Based upon laboratory animal studies, may cause skin cancer following extended contact or inhalation.
Mutagenic hazard; may cause genetic damage.
Based upon animal testing, may adversely affect reproduction.
Spills may create a slipping hazard.
If used as a fuel, its engine exhaust may cause upper respiratory tract irritation and reversible pulmonary effects.
Long-term exposure to fuel exhaust particulates may cause cancer.

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Light Thermal Cracked Distillate (Petroleum)	64741-82-6	100
2) Xylenes (Mixed Isomers)	1330-20-7	0-1.5
3) Trimethylbenzene (mixed isomers)	25551-13-7	0.5-1.5
4) Ethylmethylbenzenes (Ethyltoluenes)	25550-14-5	0.5-2
5) Naphthalene	91-20-3	1-3
6) C10-C11 Alkylbenzenes	70693-06-0	1-5
7) C11 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	15-25
8) C12 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	20-40
9) Biphenyl (Diphenyl)	92-52-4	1-5
10) C12-C21 Aromatic Hydrocarbons	Mixture	10-20
11) C13-C22 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	20-35
12) Polynuclear Aromatic Hydrocarbons (4- to 6-member condensed-ring type)	68487-58-6	0.1-1

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye Contact. Absorption. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing mist or vapors may irritate the mucous membranes of the nose, throat, bronchi, and lungs, and may cause transient central nervous system (CNS) depression. CNS symptoms include headache, dizziness, nausea, intoxication, blurred vision, slurred speech, flushed face, confusion, weakness, fatigue, loss of consciousness, convulsions, coma, and death, depending on the concentration and/or duration of exposure.
Eye Contact	Animal test results on similar materials suggest that this product can cause minimal to mild eye irritation upon short-term exposure. Symptoms include stinging, watering, and redness.
Skin Contact	Animal test results on similar materials suggest that this product can cause mild to moderate skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate to severe dermatitis and/or more serious skin disorders. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and/or severe tissue damage.
Ingestion	If swallowed, this material may irritate the mucous membranes of the mouth, throat, esophagus, and stomach. It can be readily absorbed by the stomach and intestinal tract. Ingestion can produce a burning sensation of the mouth and esophagus and central nervous system depression. Symptoms of CNS depression may include nausea, vomiting, dizziness, staggering gait, drowsiness, shallow rapid pulse, diarrhea, restlessness, sedation, inadequate respiratory function, and heart irregularities. Higher doses may cause loss of consciousness and delirium prior to the onset of convulsions, coma, and death (see "inhalation" above). A lethal dose may be as low as one-half ounce for a child and one ounce for an adult human.

Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration of a small amount of liquid can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.

Chronic Health Effects Summary This light thermal cracked distillate is a middle distillate similar to those shown to produce skin tumors on laboratory animals following repeated applications. All tumors appeared at the site of application during the latter part of the 2-year lifespan of the animals. Toxic effects are unlikely to occur if good personal hygiene is practiced.

Based upon animal testing, the C8 aromatic hydrocarbon components (xylene isomers) might be assumed to cause embryo and fetal toxicity, spontaneous abortions, and/or decreased fetal and newborn weights if overexposures occur during a woman's early gestation period. And, the C9 aromatic hydrocarbons (cumene, n-propylbenzene, trimethylbenzenes, indene, and ethylmethylbenzenes) are presumed to cause fetal toxicity and/or decreased fetal and newborn weights if overexposure occurs during a woman's early gestation period.

Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Chronic occupational xylene exposures have caused auditory nerve degeneration.

Coker Light Gas Oil (CLGO)

Naphthalene is considered to be a toxic substance as defined by both human exposure and laboratory testing results. And, based upon animal testing, it might be considered carcinogenic.

Biphenyl (Diphenyl) may cause liver and/or nerve damage. (See Section 11.)

- Conditions Aggravated by Exposure** Personnel with pre-existing central nervous system (CNS) disease, neurological conditions, skin disorders, impaired liver or kidney function, or chronic respiratory diseases, and women attempting to conceive should avoid exposure.
- Target Organs** This substance is toxic to lungs, nervous systems, brain, mucous membranes, skin, eyes, and possibly, the blood, liver, kidneys, and reproductive system.
- Carcinogenic Potential** This material contains naphthalene and small concentrations 4- to 6-membered condensed-ring (polynuclear) aromatic hydrocarbons (PNA's) at concentrations above 0.1%. Naphthalene is considered possibly carcinogenic to humans by IARC. Some PNA compounds has been determined to be carcinogenic by OSHA, IARC, and NTP. (See Section 11.)

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

- Inhalation** Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
- Eye Contact** Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
- Skin Contact** Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
- Ingestion** Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.

Notes to Physician Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

If ingested, this material presents a significant aspiration/lipoid or chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

Coker Light Gas Oil (CLGO)

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-II or IIIA Combustible Liquid. Highly or moderately combustible!		
Flash Point Method	CLOSED CUP: 52° to 82°C (125° to 180°F) (Pensky-Martens [ASTM D-93]).		
Lower Flammable Limit	AP 0.6%	Upper Flammable Limit	AP 7.5%
Autotemperature	AP 257°C (495°F)		
Hazardous Combustion Products	Burning or excessive heating may produce carbon monoxide, carbon dioxide, and possibly smoke, fumes, unburned hydrocarbons, and oxides of sulfur.		
Special Properties	<p>Combustible Liquid! This material releases vapors at or approaching the flash point temperature. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Mists or sprays may be flammable at temperatures below the flash point. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.</p> <p>A static electrical charge can accumulate as a result of transfer flow or agitation. Discharge (static spark) can ignite vapors, especially in cold, dry weather conditions. Special slow load and monitoring procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point products. To reduce this hazard, receiving containers should always be grounded and the loading nozzle must be kept in contact with the container during the entire filling process. Do not fill any portable container in or on a vehicle without proper bonding.</p>		
Extinguishing Media	<p>SMALL FIRE: Use dry chemicals, carbon dioxide (CO₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.</p>		
Protection of Fire Fighters	<p>Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.</p>		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Combustible Liquid! Release causes an potential fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

Coker Light Gas Oil (CLGO)

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause a potential fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This combustible liquid should be stored in a separate safety cabinet or room. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Coker Light Gas Oil (CLGO)

- Respiratory Protection** For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).
- General Comments** Warning! Use of this hydrocarbon fuel in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Diesel fuel/Kerosene ("A3" Animal Carcinogen)	TWA: 100 (mg/m ³) from ACGIH (TLV) [Proposed] - SKIN
2) Xylenes (mixed isomers)	TWA: 100 STEL: 150 (ppm) from ACGIH (TLV) TWA: 100 (ppm) from OSHA (PEL) [Proposed]
3) Trimethylbenzene (mixed isomers)	TWA: 25 (ppm) from ACGIH (TLV) TWA: 25 (ppm) from OSHA (PEL) [Proposed]
4) Naphthalene	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) - SKIN TWA: 10 STEL: 15 (ppm) from OSHA (PEL) [Proposed]
5) Biphenyl (Diphenyl)	TWA: 10 (ppm) from OSHA (PEL) TWA: 0.2 (ppm) from ACGIH (TLV) TWA: 0.2 (ppm) from OSHA (PEL) [Proposed]
6) Coal tar pitch volatiles, as benzene solubles	TWA: 0.2 (mg/m ³) from ACGIH (TLV) TWA: 0.2 (mg/m ³) from OSHA (PEL) [Proposed]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color	Transparent to slightly opaque, slightly yellow to slightly amber.	Odor	Characteristic, kerosene-like.
Specific Gravity	0.84 to 0.88 at 60°F (Water = 1)	pH	Not applicable.	Vapor Density	5.0 to 5.2 (Air = 1 at 70°F)
Boiling Point/Range	140° to 370°C (285° to 700°F) [ASTM D-2887]			Melting/Freezing Point	< -15°C (< 5°F) [ASTM D-97]
Vapor Pressure	< 0.1 psia at 38°C (100°F).			Viscosity (cSt @ 40°C)	3.85 to 7.35 [ASTM D-445]
Solubility in Water	Negligible to slightly soluble in cold water (0.005% to 0.04%).			Volatile Characteristics	Slight; some Volatile Organic Compounds (VOCs) present at 302°F (150°C).
Additional Properties	Alkane, isoparaffin, and Cycloalkane Hydrocarbons Content = 70 to 85 Wt.% [ASTM D-1319]; C8-C22 Aromatic Hydrocarbon Content = 15 to 30 Wt.% [ASTM D-1319]; Average Density at 60°F = 7.163 lbs./gal. [ASTM D-2161]; Cetane Number = 40 to 45 [ASTM D-613 or D-976]; Saybolt Viscosity = 38 to 50 SUS at 100°F [ASTM D-2161]; Sulfur Content = 1.3 to 1.9 Wt.% [ASTM D-2622]; Ash Content = < 0.05 Wt.% [ASTM D-482]; 90% Boiling Point Temperature = 600° to 625°F (315° to 330°C) [ASTM D-86]; Evaporation Rate = < 0.1 when n-Butyl acetate = 1.0.				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide, and oxygen.		
Hazardous Decomposition Products	No substances are readily identified from composition; and, no degradation data is available.		

Coker Light Gas Oil (CLGO)

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data**Straight-run Middle Distillate (Petroleum) [a similar material]:**

GAS (LC₅₀): Acute: 1.72 mg/L for 4 hours [Male Rat] - Pulmonary edema.
 GAS (LC₅₀): Acute: 1.82 mg/L for 4 hours [Female Rat] - Pulmonary edema.
 ORAL (LD₅₀): Acute: > 5,000 mg/kg [Rat screen] - Diarrhea, hypoactivity, and somnolence.
 DERMAL (LD₅₀): Acute: > 2,000 mg/kg [Rabbit screen].
 BUEHLER DERMAL: Acute. Non-sensitizing [Guinea Pig].
 INTRAVENOUS (LD₅₀): Acute: 180 mg/kg [Rabbit] - Respiratory stimulation, tremors, and coma.
 28-Day DERMAL: Subchronic: Moderate to severe irritation at 200 to 2,000 mg/kg with no other treatment-related clinical effects observed.

Xylenes:

ORAL (LD₅₀): Acute: 4,300 mg/kg [Rat].
 GAS (LC₅₀): Acute: 4,550 ppm for 4 hours [Rat].
 DERMAL (LD₅₀): Acute: 14,100 uL/kg [Rabbit].
 SUBCUTANEOUS (LD₅₀): Acute: 1,700 mg/kg [Rat].
 INTRAPERITONEAL (LD₅₀): Acute: 2,459 mg/kg [Rat].
 INTRAPERITONEAL (LD₅₀): Acute: 1,548 mg/kg [Mouse].

Trimethylbenzenes:

ORAL (LD₅₀): Acute: 8,970 mg/kg [Rat].

1,2,4-Trimethylbenzene:

ORAL (LD₅₀): Acute: 5,000 mg/kg [Rat].
 GAS (LC₅₀): Acute: 18,000 mg/m³ for 4 hours [Rat].

Ethylmethylbenzenes (Ethyltoluenes):

GAS (LC₅₀): Acute: 50,000 mg/m³ for 2 hours [Cat].
 GAS (LC₅₀): Acute: 54,000 mg/m³ for 4 hours [Mouse].

Naphthalene:

ORAL (LD₅₀): Acute: 490 mg/kg [Rat].
 ORAL (LD₅₀): Acute: 533 mg/kg [Mouse].
 ORAL (LD₅₀): Acute: 1,200 mg/kg [Guinea Pig].
 SUBCUTANEOUS (LD₅₀): Acute: 969 mg/kg [Mouse].
 INTRAVENOUS (LD₅₀): Acute: 100 mg/kg [Mouse].
 INTRAPERITONEAL (LD₅₀): Acute: 150 mg/kg [Mouse].

Biphenyl (Diphenyl or 1,1'-Biphenyl):

GAS (TC₅₀): Acute: 4,400 ug/m³ for 4 hours [Human] - Flaccid paralysis of peripheral nerves without anesthesia and nausea or vomiting.
 ORAL (LD₅₀): Acute: > 2,600 mg/kg [Cat screen].
 ORAL (LD₅₀): Acute: 2,400 mg/kg [Rat and Rabbit].
 ORAL (LD₅₀): Acute: 1,900 mg/kg [Mouse] - Somnolence, hypermotility, and diarrhea.
 DERMAL (LD₅₀): Acute: > 5,010 mg/kg [Rabbit screen].
 INTRAVENOUS (LD₅₀): Acute: 56 mg/kg [Mouse].

Laboratory data associated some mixtures of petroleum hydrocarbons with boiling ranges between 300° and 700°F., commonly referred to as "middle distillates, including straight-run middle distillate" have caused increased incidence of skin tumors at the site of contact when applied repeatedly (twice per week) over the lifetime of the test animals (12 to 24 months). A few studies have shown that washing the animal's skin with soap and water between applications greatly reduces the carcinogenic effect of these middle distillates. Untreated, cracked, and vacuum distillates including straight-run middle distillate have been identified as skin carcinogens by IARC. These similar materials have also been associated with liver and kidney damage in subchronic (90-day) inhalation studies with male rats.

Untreated (straight-run, cracked, and vacuum) middle distillates produced negative mutagenic responses in the Salmonella/microsome (Ames) assay, the in-vitro Chinese hamster ovary (CHO) sister chromatid exchange (SCE) assay, the in-vivo mouse SCE assay, and the in-vivo rat bone marrow cell chromosome aberrations assay; however, the in-vitro mouse lymphoma assay with and without S9 activation produced both mixed positive and negative responses. The significance of these study results to human health is unclear.

Studies with mice and rats have shown that some petroleum middle distillate fuels similar to this material have caused liver tumors and kidney damage and/or tumors. However, the kidney effects were sex hormone dependent and not seen in similar studies involving Guinea pigs, dogs, or monkeys. Also, the significance of the liver tumors in rodents is highly speculative relative to humans.

Coker Light Gas Oil (CLGO)

Studies with mice and rats have also shown that chronic exposures (8 hours/day, 7 days/week, for 24 months) to **unfiltered diesel fuel exhaust** produced lung tumors and lymphomas. On the basis of these studies, NIOSH recommended that **complete diesel exhaust** be regarded as a "potential carcinogen"

Numerous epidemiology studies have been carried out to test the hypothesis that lung and/or bladder cancers are associated with chronic exposure to **diesel engine exhaust**. The most comprehensive case-control and retrospective cohort studies on U.S. railroad workers showed an increased risk for lung cancer and this risk significantly increased with extended duration exposures. There are some indications that an elevated frequency of bladder cancer amongst bus and truck drivers may be due to diesel engine exhaust exposure

Overexposure to **xylene isomers** may cause upper respiratory tract irritation, headache, cyanosis, blood serum changes, CNS damage, and narcosis. Effects may be increased by the consumption of ethanol (alcoholic beverages) which impairs clearance from adipose (fat) tissues. Also, ototoxicity has been associated with chronic overexposure to xylene. An inhalation study with laboratory rats also indicated an association between elevated mixed xylene exposures and hearing loss. Lung inflammation and liver damage were identified as health effects in chronic studies using guinea pigs

Several animal studies using pregnant rodents have shown that **mixed xylene isomers and ethylbenzene (dimethylbenzenes)** may all cause embryo and/or fetotoxicity. Inhalation and feeding studies involving pregnant laboratory animals have produced limited evidence of fetal toxicity including increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes

Two-year rat and mouse gavage studies by the National Toxicology Program (NTP) on **mixed xylene isomers including 17% ethylbenzene (dimethylbenzenes)** showed "no evidence of carcinogenicity". Also, a two-year mixed xylenes skin-painting study on shaved rats and mice showed no incidence of non-neoplastic or neoplastic lesions. And, none of the components were mutagenic when tested in either the modified Ames, Chinese hamster ovary cell with and without metabolic activation, or sister-chromatid mutagenicity assays. Animal inhalation and feeding studies have also associated embryo and fetotoxicity with maternally toxic dose exposures of mixed xylene isomers and ethylbenzene. Fetal toxicity included increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes. The significance of these animal study results to humans is not known.

Trimethylbenzenes are primary skin irritants and may cause asthmatic bronchitis and/or anemia. Levels of total hydrocarbon vapors present in the breathing atmosphere of these workers ranged from 10 to 60 ppm. Its TC_{10} for humans 10 ppm, with somnolence and respiratory tract irritation noted. In inhalation studies with rats, four of ten animals died after exposures of 2,400 ppm for 24 hours. An oral dose of 5 mL/kg resulted in death in one of ten rats. Minimum lethal intraperitoneal doses were 1.5 to 2.0 mL/kg in rats and 1.13 to 12 mL/kg in guinea pigs. **Mesitylene (1,3,5-Trimethylbenzene)** inhalation at concentrations of 1.5, 30, and 60 mg/L for six hours was associated with dose-related changes in white blood cell counts in rats. No significant effects on the complete blood count were noted with six hours per day exposure for five weeks, but elevations of alkaline phosphatase and SGOT were observed. Central nervous system depression and ataxia were noted in rats exposed to 5,100 to 9,180 ppm for two hours. Based upon animal reproductive/developmental studies, trimethylbenzenes may also cause fetal toxicity

Ethylmethylbenzenes are primary skin irritants. Overexposure has been associated with kidney damage and increased blood cholinesterase levels. In inhalation developmental studies, indene and other C9 aromatic hydrocarbons have been associated with decreased fetal and newborn pup weights

Naphthalene is a potential irritant to eyes, skin, and lungs. Following prolonged and/or repeated exposures, naphthalene has been shown to cause eye damage (cataracts and/or optical neuritis), premature destruction of red blood cells (*hemolytic and aplastic anemia*), and kidney damage (*jaundice*), and possibly neurotoxicity. Naphthalene-induced blood disorders in humans are characterized by variability in size, shape, and number of red blood cells, anemia, and decreased hemoglobin. Also, there have been reported anemia deaths amongst children exposed to moth ball (naphthalene) saturated blankets. Peripheral lens opacities occurred in eight of 21 workers exposed to elevated levels of naphthalene vapors for five years. Repeated ingestion of a naphthalene-isopropanol mixture caused tremors, restlessness, hallucinations, and extreme apprehension. Based upon animal studies, naphthalene may cause fetal toxicity or damage and decreased spleen weights in pregnant female mice

The National Toxicology Program (NTP) recently completed a 2-year inhalation bioassay of naphthalene. The study was conducted in male and female F344/N rats at exposure concentrations of 0, 10, 30, and 60 ppm. No significant effects were observed at the 10 ppm levels. However, compared to chamber controls, there was a dose-related increase in tumors generated at the 30 and 60 ppm levels in both males and females. Higher incidences of respiratory epithelial adenomas, olfactory epithelial neuroblastomas, and non-neoplastic lesions of the nose were observed when compared to chamber controls. Additionally, in

Coker Light Gas Oil (CLGO)

cytogenic tests with Chinese hamster ovary cells, naphthalene induced significant increases in sister chromatid exchanges with and without metabolic activation (S9) and chromosomal aberrations with S9. The relevance of these findings to human health is unclear; however, based upon this data, IARC has determined naphthalene to be possibly carcinogen to humans (Class 2B).

Biphenyl (Diphenyl) inhalation overexposures have caused poisoning characterized by liver atrophy and central and/or peripheral nerve damage. Biphenyl vapors have also caused transient nausea, vomiting, flaccid paralysis, and/or bronchitis.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this kerosene, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. Volatile aromatic hydrocarbon components (trimethylbenzenes, ethylmethylbenzenes, naphthalene, and biphenyl) may be released and possibly contribute to the creation of atmospheric smog.

Using Rainbow Trout (*Oncorhynchus mykiss*), Dungeness Crab (*Cancer magister*), and juvenile American Shad (*Squalius cephalus*), similar middle distillates and some of this material's components showed a 96-hour TL_{Ms} (Median Toxic Limit) of from 10 ppm to 20 ppm in ambient saltwater. Also, 96-hour LC₅₀ testing produced results from 20 ppm to 320 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Banded Killifish (*Fundulus diaphanus*), American Eel (*Anguilla rostrata*), White Perch (*Perca fluviatilis*), and Striped Mullet (*Mugil cephalus*). Based upon actual spill incident investigations, similar middle distillates have been shown to bioaccumulate in tissues of various fish from less than 1 to 10 ppm levels.

Environmental Fate

This middle distillate is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, this hydrocarbon oil layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this material, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

Coker Light Gas Oil (CLGO)

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT) only when transported in bulk containers, via vessel, or via aircraft.		
Proper Shipping Name	Gas Oil or Petroleum distillates, n.o.s. (Naphthalene, Biphenyl) or Combustible liquid, n.o.s. (Naphthalene, Biphenyl) for bulk containers; it may or may not be regulated in non-bulk container shipments. If this product has a flash point temperature between 100° and 140°F (37.8° to 60.5°C), it is classified as a "Flammable liquid". And, if its flash point temperature is between 141° and 200°F (60.5° to 93°C), it is classified as a DOT "Combustible liquid" for bulk shipments. However, according to 49 CFR 173.150(f)(2), certain transportation-related requirements, such as labeling, may not apply to this product when shipped in non-bulk packaging of less than 119 gallons capacity. Also, pursuant to 49 CFR 173.150(b) and 173.150(f)(2) and (3), "limited-quantities" offered for or transported via aircraft may be subject to DOT regulation.		
Hazard Class	DOT Class: "3" (Flammable liquid) or "COMBUSTIBLE LIQUID" [with a flash point greater than 60.5° C (>141° F)] for bulk containers.	Packing Group(s) UN/NA ID	PG III or Not applicable. UN1202 or UN1268 or NA1993 or Not applicable.
Reportable Quantity	The Reportable Quantity (RQ) substance component in this material which might require DOT HAZMAT bill-of-lading display is Naphthalene and Xylenes.		
Placards	Emergency Response Guide No. 128 or Not applicable		
		HAZMAT STCC No.	4912218 or 4910256 or 4914112
		MARPOL III Status	All impacted components were delisted as DOT "Marine Pollutants" per 86 FR 120 (page 33413) dated 6/21/2001.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.
SARA 313	This material contains the following components in concentrations which might be at or above de minimis levels and are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313: 1,2,4-Trimethylbenzene (Pseudocumene) [CAS No. 96-63-6] concentration: 0.25 to 1.0% Naphthalene [CAS No. 91-20-3] concentration: 1 to 3% Biphenyl (Diphenyl) [CAS No. 92-62-4] concentration: 1 to 5%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this material subject to this statute are: Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 0 to 1.5% Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 0 to 0.1% Cumene [CAS No. 98-82-8] (RQ = 5000 lbs. [2268 kg]) concentration: 0.1 to 0.5% Naphthalene [CAS No. 91-20-3] (RQ = 100 lbs. [45.36 kg]) concentration: 1 to 3% Benzo[a]phenanthrene (Chrysene) [CAS No. 218-01-9] concentration: 0.0005 to 0.002%.

HoustonRefining

A Lyondell Company

Coker Light Gas Oil (CLGO)

CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material, especially if used as a fuel, might be considered to contain the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it might be subject to requirements of California Health & Safety Code Section 25249.5: Naphthalene [CAS No. 91-20-3] concentration: 1 to 3% Benzo[a]phenanthrene (Chrysene) [CAS No. 218-01-9] concentration: 0.0005 to 0.002% Diesel Engine Exhaust (following combustion).
New Jersey Right-to-Know Label	For New Jersey labeling, refer to the components listed in Section 2.
Additional Regulatory Remarks	Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13): This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children! In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following component of this material as a "Volatile Organic Compound (VOC)" which contributes significantly to air pollution which endangers public health and welfare": Xylenes (mixed) [CAS No. 1330-20-7], Ethylbenzene [100-41-4], Cumene [98-82-8], and Biphenyl (Diphenyl) [CAS No. 92-52-4].

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

2. HAZARDS IDENTIFICATION

Emergency Overview

This material is HAZARDOUS as defined by the OSHA Hazard Communication Standard, 29CFR, 1910.1200.

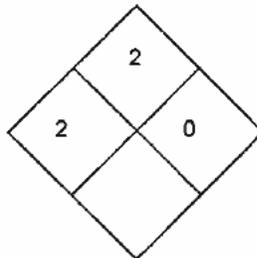

Signal Word

WARNING.

Hazards

Combustible liquid. Harmful if inhaled or absorbed through the skin. May cause irritation to skin, eyes, and respiratory tract. May cause central nervous system effects. Contains material which can cause cancer. May cause genetic defects. This material may contain polynuclear aromatic hydrocarbons (PAH), some of which induced skin tumors on laboratory animals upon prolonged and repeated exposure.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE105
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/22/2011

LT CYCLE OIL

Odor

Gasoline or naphtha odor.

Odor Threshold

No value available.

Potential health effects

Routes of exposure

Skin. Eye. Inhalation.

Acute effects

Inhalation hazard. May cause drowsiness and dizziness.

- *1,1'-Biphenyl 92-52-4*
No known acute health effects.
- *Trimethyl benzene 25551-13-7*
CNS depressant. Aspiration hazard.
- *Naphthalene 91-20-3*

May be irritating to the eyes, skin and respiratory tract. Direct contact with the eye may cause corneal damage. May be toxic by all routes of exposure. Target organs for toxic effects include the blood, liver, kidneys, eyes, and central nervous system (CNS). Symptoms of overexposure may include headache, restlessness, lethargy, vomiting, anorexia, anemia, diminished vision, and acute kidney failure. Individuals who have an inherited G6PD deficiency in their red blood cells may be particularly sensitive to the toxic effects of Naphthalene. Naphthalene can cross the placenta and harm the fetus.

Skin

May produce skin irritation. Repeated or prolonged contact with skin may cause defatting and drying of the skin which may result in dermatitis.

Inhalation

Can cause pulmonary edema if aspirated into lungs.

Eyes

May cause moderate irritation, including burning sensation, tearing, redness or swelling. May cause eye irritation. Effects of eye irritation are reversible.

Ingestion

Aspiration may cause lung damage.

Chronic effects

Repeated or prolonged exposure of the skin to this material may cause defatting and drying of the skin. Prolonged or repeated exposure to vapors may cause lung damage.

- *1,1'-Biphenyl 92-52-4*

Chronic exposure may result in central nervous system and gastrointestinal system disturbances. Prolonged and repeated exposure to vapors may cause damage to the Central Nervous System, kidneys, liver, and adrenal glands. May cause dermatitis by defatting the skin from prolonged or repeated contact.

- *Trimethyl benzene 25551-13-7*

No adverse chronic human health effects have been reported for this material.

- *Naphthalene 91-20-3*

Target organs for toxic effects of chronic exposure include the blood, the skin, the eyes, and the central nervous system. Symptoms of chronic overexposure may include dermatitis, anemia, sores on the eye or cloudiness of the eyeball, diseases involving the nerves or nervous system, and allergic skin reactions. Potential Cancer Hazard, see section 11.

Aggravated Medical Condition

Any pre-existing disorders or diseases of the: central nervous system (CNS) skin liver kidney respiratory system

3. COMPOSITION/INFORMATION ON INGREDIENTS

<u>Component</u>	<u>CAS-No.</u>	<u>EC-No.</u>	<u>Weight %</u>
Distillates (Petroleum), light catalytic cracked	64741-59-9	265-060-4	100.0
1,1'-Biphenyl	92-52-4	202-163-5	1.0 <= 5.0
Trimethyl benzene	25551-13-7	247-099-9	0.0 <= 1.5
Naphthalene	91-20-3	202-049-5	1.0 <= 3.0

Typical composition

4. FIRST AID MEASURES

General advice

May cause cancer. Harmful by inhalation. Harmful: danger of serious damage to health by prolonged exposure in contact with skin. Aspiration into the lungs during swallowing or vomiting can cause lung damage, possibly leading to chronic lung dysfunction or death. Causes skin irritation. Liquid, vapors or mist may be irritating to eyes, skin and respiratory tract.

Possible cardiac sensitization. Vapors may cause drowsiness and dizziness. Ingestion may cause CNS effects, discomfort and irritation of the gastrointestinal tract, nausea, vomiting, and diarrhea.

Repeated exposure may cause skin dryness or cracking. Always observe self-protection methods. Move out of dangerous area. Do not leave the victim unattended. Remove contaminated shoes and clothing. Get medical attention immediately. Show this material safety data sheet to the doctor in attendance.

Skin

All contaminated clothing should be removed, and contaminated skin areas washed with lipophilic soap, or green soap, and water. DO NOT use gasoline, kerosene, solvents, or harsh abrasive skin cleaners. Do not wash with machine dishwashing or laundry detergents. Seek medical attention if tissue appears damaged or if pain or irritation persists. In the event of a high pressure injection injury, worker should obtain immediate medical assistance. Discard contaminated leather goods.

Inhalation

Remove victim to fresh air and keep at rest in a position comfortable for breathing. Keep patient warm and at rest. If breathing is difficult, give oxygen. If unconscious place in recovery position and seek medical advice. In the event of unconsciousness, apnea or cardiac arrest (no pulse) apply cardiopulmonary resuscitation.

Eyes

In case of eye contact, remove contact lens and rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Do not use eye ointment unless directed to by a physician. If irritation, blurred vision or swelling occurs and persists, obtain medical advice from a specialist.

Ingestion

Do not induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. Never give anything by mouth to an unconscious person. Immediately seek medical attention.

Notes to physician

Do not induce vomiting. Risk of damage to lungs exceeds poisoning risk. Gastrointestinal decontamination in accidental petroleum distillate ingestions is not recommended, because of the severe aspiration hazard. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to this material. Treat symptomatically. Treatment of overexposure should be directed at the control of symptoms and the clinical condition of the patient.

 Validation Date: 07/22/2011

LT CYCLE OIL

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

OSHA/NFPA Class II combustible liquid.

Flash point

> 61 °C (> 141.8 °F)

Autoignition temperature

>= 225 °C (>= 437 °F)

Lower explosion limit

Specific data not available.

Upper explosion limit

Specific data not available.

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Use dry chemical, foam, or carbon dioxide or water fog Sand. LARGE FIRES: Water spray Water fog. Foam Dry chemical Carbon dioxide (CO₂) Sand Apply water carefully to avoid frothing/steam explosion.

Unsuitable extinguishing media

Do not use a solid water stream as it may scatter and spread fire. Simultaneous use of foam and water on the same surface is to be avoided as water destroys the foam.

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear positive pressure self-contained breathing apparatus (SCBA). Structural firefighters protective clothing will only provide limited protection.

Precautions for fire-fighting

Move containers from fire area if you can do it without risk. Fight from a maximum distance or use unmanned hose holders or monitor nozzles. Containers can build up pressure if exposed to heat; cool with flooding quantities of water until well after the fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of vessel. Always stay away from the ends of tanks. Contents under pressure and can explode when exposed to heat or flames. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. Releases flammable vapors below normal ambient temperatures. When mixed with air and exposed to ignition source, vapors can burn in open or explode if confined. Assure good ventilation to prevent flammable vapor formation. Vapors may travel long distances along the ground before reaching a source of ignition and flashing back. Sustained fire attack on vessels may result in a Boiling Liquid Expanding Vapour Explosion (BLEVE). The product will float and can be reignited on surface water. Apply aqueous extinguishing media carefully to any molten/liquid material to prevent frothing/steam explosion. Prevent fire extinguishing water from contaminating surface water or the ground water system. Notify authorities immediately if liquid enters sewer/public waters. Fire residues and contaminated fire extinguishing water must be disposed of in accordance with local regulations.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Combustible liquid. Release can cause fire or explosion. Evacuate/limit access. A vapor suppressing foam may be used to reduce vapors. Eliminate all sources of ignition. All equipment used when handling this product must be grounded. Stop leak if you can do it without risk. Do not touch or walk through spilled material. Can also be slippery on hard, smooth walking area. Prevent entry into waterways, sewers, basements or confined areas. Absorb or cover with dry earth, sand or other non-combustible material and transfer to containers. Use clean non-sparking tools to collect absorbed material. For

MATERIAL SAFETY DATA SHEET

MSDS No.: BE105
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/22/2011

LT CYCLE OIL

Spills and leaks

large spills: Limit access to essential personnel. Water spray may reduce vapor, but may not prevent ignition in closed spaces.

Prevent entry into waterways, sewers, basements or confined areas. If the product contaminates rivers and lakes or drains inform respective authorities.

7. HANDLING AND STORAGE

Handling

Ensure all equipment is electrically grounded before beginning transfer operations. Check atmosphere for explosiveness and oxygen deficiencies. If sulfur compounds are suspected to be present in the product, check the atmosphere for hydrogen sulfide (H₂S) content.

Eliminate every possible source of ignition. Spilled material can make walking hazardous, potentially causing falls and serious injury. Do not pressurize, cut, weld, braze solder, drill, or grind on containers. Do not use compressed air for filling, discharging or handling. Use good housekeeping practices during use, storage, transfer, and handling. Do not handle near heat, sparks, or flame. Avoid contact with incompatible agents. Use only with adequate ventilation/personal protection. Avoid contact with eyes, skin and clothing. Do not enter storage area unless adequately ventilated. Metal containers involved in the transfer of this material should be grounded and bonded. Electrostatic charges may be generated as a result of flow or agitation. Special slow load procedures for 'switch loading' must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point hydrocarbon products. Always keep nozzle in contact with the container throughout the loading process. Static electricity accumulation may be significantly increased by the presence of small quantities of water. Ensure that all relevant regulations regarding explosive atmospheres, and handling and storage facilities of flammable products are followed. Use only non-sparking tools. Handle empty containers with care; vapor/residue may be flammable. Do not pressurize or expose empty containers to open flame, sparks, or heat. Observe precautions pertaining to confined space entry.

Storage

Vapor space above stored liquid may be flammable/explosive unless blanketed with inert gas. Static electricity accumulation may be significantly increased by the presence of small quantities of water. Hydrogen sulfide (H₂S) and other hazardous vapors may evolve and collect in the headspace of storage tanks and other enclosed vessels. H₂S is an extremely flammable and a highly toxic gas. Store in original container. Store closed drums with bung in up position. Keep away from all ignition sources; segregate from incompatible materials. Keep containers tightly closed in a dry, cool, well-ventilated place, plainly labeled, and out of closed vehicles. Ground all containers, transfer vessels, and equipment containing this material. Containers should be able to withstand pressures expected from warming or cooling during storage. Flammable materials should be stored in separate safety storage cabinet or room. Bonding and grounding measures may not be enough if nonconductive flammables are involved. Recommended materials: For containers, or container linings use mild steel, stainless steel. Unsuitable materials: Some synthetic materials may be unsuitable for container or container linings depending on the material specification and intended use. Compatibility should be checked with the manufacturer.

Storage area layout, tank design, equipment and operating procedures must comply with the relevant European, national or local legislation. Cleaning, inspection and maintenance of the internal structure of storage tanks must be done only by properly equipped and qualified personnel as defined by national, local or company regulations.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Engineering controls, preferably enclosed systems, should be used whenever feasible to maintain exposures below acceptable criteria. When such controls are not feasible, or sufficient to achieve full conformance, other engineering controls such as local exhaust ventilation should be used. Provide local exhaust or general room ventilation to minimize exposure to vapors. Electrical equipment should be grounded and conform to applicable electrical code. Emergency shower and eyewash facility should be in close proximity (ANSI Z358.1)

Personal protective equipment

Skin

MATERIAL SAFETY DATA SHEET

MSDS No.: BE105
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/22/2011

LT CYCLE OIL

Skin

Avoid contact with skin. Wear insulated gloves if contact with liquid is possible. Skin should be washed after contact. Wear chemical resistant gloves such as: Nitrile. The suitability for a specific workplace should be discussed with the producers of the protective gloves. Gloves should be discarded and replaced if there is any indication of degradation or chemical breakthrough.

Eyes

Safety glasses with perforated sides. Wear chemical safety goggles plus full face shield to protect against splashing when appropriate (ANSI Z87.1).

Remarks

Wash hands before eating, drinking, smoking, or using toilet facilities. Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure. Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use. Use good personal hygiene practices.

Occupational Exposure Limits

Component	Source	Type:	Value	Note
1,1'-Biphenyl	US (ACGIH)	TWA	0.2 ppm	None.
	US (OSHA)	TWA	0.2 ppm 1 mg/m ³	None.
	NIOSH	IDLH	100 mg/m ³	None.
Trimethyl benzene	US (OSHA)	TWA	25 ppm	None.
	US (ACGIH)	TWA	25 ppm	None.
Naphthalene	US (ACGIH)	STEL	15 ppm	None.
	US (ACGIH)	TWA	10 ppm	None.
	US (OSHA)	TWA	10 ppm 50 mg/m ³	None.
	NIOSH	IDLH	250 ppm	None.

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance: liquid Transparent to light yellow., Yellow to amber.

Odor: Gasoline or naphtha odor.

Odor Threshold: No value available.

pH: Not applicable.

Boiling point/boiling range: 185 - 372 °C (365 - 701.6 °F)

MATERIAL SAFETY DATA SHEET

MSDS No.: BE105
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/22/2011

LT CYCLE OIL

Melting/freezing point: -40 - 6 °C (-40 - 42.8 °F)

Flash point: > 61 °C (> 141.8 °F)

Autoignition temperature: >= 225 °C (>= 437 °F)

Flammability: OSHA/NFPA Class II combustible liquid.

Lower explosion limit: Specific data not available.

Upper explosion limit: Specific data not available.

Explosive properties: Not explosive (No chemical groups associated with explosive properties.)

Oxidizing properties: Not considered an oxidizing agent.

Vapor pressure: 0.4 kPa @ 40 °C (104 °F) (Based on Vacuum Residues) < 0.1 mm Hg

Evaporation rate: Slight.

Relative density: 0.89 - 0.99 @ 15 °C (59 °F)

Relative vapor density: not determined

Viscosity: 3.65 - 7.35 mPa.s @ 40 °C (104 °F)
 >= 1.1 mm²/s @ 40 °C (104 °F)

Water solubility: 0.05 - 0.4 g/l Slightly soluble in cold water.

Partition coefficient: n-octanol/water: Not applicable.

Other physico-chemical properties: No information available.

10. STABILITY AND REACTIVITY

Chemical stability

The product is stable.

Conditions to avoid

Heat, sparks, open flames and strong oxidizing conditions. Contact with strong bases. Electrostatic charges may be generated as a result of flow or agitation.

Materials to avoid

Strong oxidizing agents

Hazardous decomposition products

Incomplete combustion can result in the production of carbon monoxide, carbon dioxide and other toxic gases. May also include hydrogen sulfide, sulfur oxides or sulfuric acid.

Hazardous polymerization

Not expected to occur.

11. TOXICOLOGICAL INFORMATION

MATERIAL SAFETY DATA SHEET

MSDS No.: BE105
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/22/2011

LT CYCLE OIL

Product information

Acute toxicity			
LC50 (aerosol)	rat	4.65 MG/L	4 HOURS
LD50 (Oral)	rat	3200 MG/KG	
LD50 (Skin)	rabbit	>2000 MG/KG	

Acute effects

Inhalation

Predicted exposure concentration Harmful by inhalation. Stream expected to be harmful by inhalation based on toxicity information for streams having components in common with this stream. Can cause pulmonary edema if aspirated into lungs.

Ingestion

Predicted exposure concentration Stream expected to have a low order of acute oral toxicity based on toxicity information for streams having components in common with this stream.

Skin contact

Predicted exposure concentration Stream expected to have a low order of acute dermal toxicity based on toxicity information for streams having components in common with this stream.

Irritation

Skin

Irritating to skin. Stream expected to be irritating to the skin based on toxicity information for streams having components in common with this stream.

Eyes

Stream expected to be no more than transient, fully reversible irritating to the eye based on toxicity information for streams having components in common with this stream. These effects are not considered to warrant classification as an eye irritant.

Sensitization

Stream expected not to be a sensitizer based on toxicity information for streams having components in common with this stream.

Target Organs

Skin. Central nervous system. Lungs

COMPONENT INFORMATION

- *Distillates (Petroleum), light catalytic cracked* 64741-59-9

Other information

See Product Summary

- *1,1'-Biphenyl* 92-52-4

Acute toxicity			
LCLo	Human	4400 UG/M ³	4 HOURS

MATERIAL SAFETY DATA SHEET

MSDS No.: BE105
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/22/2011

LT CYCLE OIL

<u>LD50 (Oral)</u>	rat	3280 MG/M3
	rabbit	2400 MG/M3
		> 2600 MG/KG
	mouse	1900 MG/KG

<u>LD50 (Skin)</u>	rabbit	> 5010 MG/KG
--------------------	--------	--------------

Target Organs
 Liver.

- *Trimethyl benzene* 25551-13-7

Acute toxicity

<u>LD50 (Oral)</u>	rat	8970 MG/KG
--------------------	-----	------------

Irritation

Skin

Skin irritant.

- *Naphthalene* 91-20-3

Acute toxicity

<u>LC50 (Inh)</u>	rat	>340 MG/M3	4 HOUR
-------------------	-----	------------	--------

<u>LD50 (Oral)</u>	rat	490 MG/KG
	mouse	533 MG/KG
	guinea pig	1200 MG/KG

Irritation

Skin

May be irritating to the skin.

Eyes

May cause eye irritation.

Repeated dose toxicity

Repeated inhalation or ingestion of naphthalene causes methemoglobinemia*

Developmental Toxicity

Results from repeated dose oral gavage tests with naphthalene showed fetotoxicity in rats (increase in resorptions at 450 mg/kg bwt/day) and in mice (decrease in number of live pups/litter at 300 mg/kg bwt/day) in the presence of maternal toxicity (reduction in body weight gains in rats; decrease in survival and reduction in body weight in mice).

Genetic Toxicity

Naphthalene produced chromosome damage in in vitro assays, but not in in vivo assays in which mice were administered 500 mg/kg bwt orally or 250 mg/kg bwt by intraperitoneal injection.

Carcinogenicity

The National Toxicology Program (NTP) has evaluated this substance and placed it in Group R: Reasonably Anticipated To Be A Human Carcinogen. The International Agency for Research on Cancer (IARC) has evaluated this substance and placed it in Group 2B (possibly carcinogenic to humans).

12. ECOLOGICAL INFORMATION

Product information

MATERIAL SAFETY DATA SHEET

MSDS No.: BE105
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/22/2011

LT CYCLE OIL

Ecotoxicity

Toxic to aquatic organisms. May cause long-term adverse effects in the aquatic environment.

Acute Fish toxicity

LL50 / 96 HOURS Fish 0.156 mg/l

Summary: Based on Quantitative structure-activity relationship (QSAR) estimation.

Acute toxicity to aquatic invertebrates

EL50 / 48 HOURS Daphnia magna (Water flea) 0.319 mg/l

Summary: Based on Quantitative structure-activity relationship (QSAR) estimation.

Toxicity to aquatic plants

EL50 / 72 HOURS Pseudokirchneriella subcapitata (green algae) 0.202 mg/l

Summary: Based on Quantitative structure-activity relationship (QSAR) estimation.

Toxicity to microorganisms

NOELR / 40 HOURS Tetrahymena pyriformis (ciliated protozoa) 0.241 mg/l

Summary: Based on Quantitative structure-activity relationship (QSAR) estimation.

Chronic toxicity to fish

NOEL / 14 d Oncorhynchus mykiss 0.029 mg/l

Summary: Based on Quantitative structure-activity relationship (QSAR) estimation.

Chronic toxicity to aquatic invertebrates

NOEL / 21 d Daphnia magna (Water flea) 0.053 mg/l

Summary: Based on Quantitative structure-activity relationship (QSAR) estimation.

Environmental fate and pathways

Mobility

Behavior in environmental compartments: Partitioning mainly to air.

Predicted distribution to environmental compartments: The product will be dispersed amongst the various environmental compartments (soil/ water/ air).

Persistence and degradability

Biodegradation: Not expected to be biodegradable. Not expected to be hydrolytically unstable. Will not undergo photolysis

Bioaccumulation: This material may bioaccumulate.

COMPONENT INFORMATION

- *Distillates (Petroleum), light catalytic cracked 64741-59-9*

Ecotoxicity

Acute Fish toxicity

LL50 / 79 mg/l

Acute toxicity to aquatic invertebrates

EL50 / Daphnia magna (Water flea) 2 mg/l

Toxicity to aquatic plants

ErL50 / algae 3.3 mg/l

NOEL / algae < 1 mg/l

MATERIAL SAFETY DATA SHEET

MSDS No.: BE105
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/22/2011

LT CYCLE OIL

Chronic toxicity to fish

Summary: No Data Available.

Chronic toxicity to aquatic invertebrates

Summary: No Data Available.

Environmental fate and pathways

- *1,1'-Biphenyl* 92-52-4

Ecotoxicity

No data available.

Environmental fate and pathways

No data available.

- *Trimethyl benzene* 25551-13-7

Ecotoxicity

No data available.

Environmental fate and pathways

No data available.

- *Naphthalene* 91-20-3

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOURS rainbow trout. 26 mg/l
 Summary: Very toxic to aquatic organisms.

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS Daphnia magna. 21.9 mg/l

Environmental fate and pathways

Persistence and degradability

Biodegradation: Biodegradable under aerobic conditions.

Bioaccumulation: Naphthalene has a moderate tendency to bioaccumulate although fish and microorganisms readily metabolize it.

13. DISPOSAL CONSIDERATIONS

MATERIAL SAFETY DATA SHEET

MSDS No.: BE105
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/22/2011

LT CYCLE OIL

The product should not be allowed to enter drains, water courses or the soil. Can be incinerated, when in compliance with local regulations. Proper grounding procedures to avoid static electricity should be followed. Contaminated product, soil or water should be considered dangerous due to potential evolution of flammable vapor.

14. TRANSPORT INFORMATION

Proper shipping name Petroleum distillates, n.o.s. (TRIMETHYLBENZENES)
Reportable quantity BIPHENYL
 NAPHTHALENE
ID No. UN1268
Hazard class 3
Packing group III

15. REGULATORY INFORMATION

Notification status

All ingredients are on the following inventories or are exempted from listing

Country	Notification
Australia	AKCS
Canada	DSL
China	IECS
European Union	EINECS
Korea	ECL
United States of America	TSCA

Contact product.safety@lyondellbasell.com for additional global inventory information.

Disclaimer

The information on this MSDS was obtained from sources which we believe are reliable. However, the information is provided without any warranty, expressed or implied, regarding its correctness. Some information presented and conclusions drawn herein are from sources other than direct test data on the substance itself. The conditions or methods of handling, storage, use and disposal of the product are beyond our control and may be beyond our knowledge. For this and other reasons, we do not assume responsibility and expressly disclaim liability for loss, damage, or expense arising out of or in any way connected with handling, storage, use, or disposal of this product. If the product is used as a component in another product, this MSDS information may not be applicable.

Information is correct to the best of our knowledge at the date of the MSDS publication.

Numerical Data Presentation

The presentation of numerical data, such as that used for physical and chemical properties and toxicological values, is expressed using a comma (,) to separate digits into groups of three and a period (.) as the decimal marker. For example, 1,234.56 mg/kg = 1 234,56 mg/kg.

Language Translations

2. HAZARDS IDENTIFICATION

Emergency Overview

This material is HAZARDOUS by OSHA Hazard Communication definition.

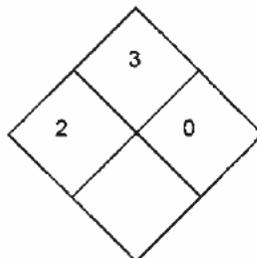

Signal Word

DANGER.

Hazards

Highly flammable. Vapors may form explosive mixtures with air. Vapors can travel to a source of ignition and flash back. Vapors explosion hazard indoors, outdoors or in sewers. Ingestion and inhalation hazard. Aspiration hazard. Moderate eye irritant. Moderate skin irritant. Cardiac sensitization. Developmental toxin. Toxic to the nervous system. May effect hearing. Contains carcinogenic components.

NFPA®

HMIS®

Health	2
Flammability	3
Physical Hazard	0

Physical state

liquid

Color

Colorless.

Odor

Sweet aromatic.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE167
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

TOLUENE - COMMERCIAL

Odor Threshold

AHA reports the odor threshold at 1.6 ppm for toluene. Patty's toxicology reports the odor threshold at 2.5 to 8.0 ppm, for toluene.

Potential health effects

Routes of exposure

Eye. Inhalation. Skin.

Acute effects

See component summary.

- *Toluene 108-88-3*

Toluene is of slight acute toxicity, although inhalation exposure may cause dizziness and CNS depression, while ingestion may be fatal if aspiration into the lung occurs. Toluene may increase the sensitivity of the heart leading to potentially fatal cardiac sensitization. It is moderately irritating to skin and eye.

- *Benzene 71-43-2*

Slight acute toxicity. Inhalation exposure to high concentrations may cause dizziness and CNS depression. Ingestion of relatively small amounts may be fatal if aspiration into the lungs takes place.

- *Ethyl Benzene 100-41-4*

Inhalation hazard. Ingestion hazard. Skin and eye irritant.

Skin

May cause moderate skin irritation. Not expected to be a sensitizer.

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations.

Eyes

Moderate eye irritant. Effects of eye irritation are reversible.

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract and CNS depression (fatigue, dizziness, collapse, coma and death). May lead to potentially fatal cardiac sensitization.

Chronic effects

See component summary.

- *Toluene 108-88-3*

Repeated exposure to high concentrations has been shown to cause neurological changes and hearing loss in animals, and in humans in abuse situations. May cause developmental toxicity.

- *Benzene 71-43-2*

Benzene is considered to be a cancer-causing agent. Repeated exposure is linked to bone marrow toxicity, reduced red- and white blood cell counts and decreased immunological function irrespective of the route of contact.

- *Ethyl Benzene 100-41-4*

May affect hearing. Repeated or prolonged exposure may damage liver and kidneys. Possible cancer hazard. Repeated contact with skin may cause cracking and/or fissuring.

3. COMPOSITION/INFORMATION ON INGREDIENTS

MATERIAL SAFETY DATA SHEET

Typical composition

4. FIRST AID MEASURES

General advice

Take proper precautions to ensure your own health and safety before attempting rescue and providing first aid. For specific information refer to the Emergency Overview in Section 2 of this MSDS.

Skin

Immediately remove excess chemical and contaminated clothing; thoroughly wash contaminated skin with mild soap and water. If irritation persists after washing, seek medical attention. Thoroughly clean contaminated clothing before reuse; discard contaminated leather goods (gloves, shoes, belts, wallets, etc.).

Inhalation

Move the exposed person to fresh air at once. If breathing has stopped, perform artificial respiration. When breathing is difficult, properly trained personnel may assist the affected person by administering oxygen. Keep the affected person warm and at rest. Get medical attention immediately.

Eyes

Thoroughly flush the eyes with large amounts of clean low-pressure water for at least 15 minutes, occasionally lifting the upper and lower eyelids. If irritation persists, seek medical attention.

Ingestion

DO NOT induce vomiting. Give large quantities of water. Obtain emergency medical attention.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

OSHA/NFPA Class IB Flammable Liquid.

Flash point

4.4 °C (39.92 °F) closed cup

Autoignition temperature

498 °C (928.4 °F)

Lower explosion limit

1.3 vol%

Upper explosion limit

MATERIAL SAFETY DATA SHEET

MSDS No.: BE167
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

TOLUENE - COMMERCIAL

Upper explosion limit
 8 vol%

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Use dry chemicals, CO₂, or foam. LARGE FIRE: Use water spray, water fog or foam. DO NOT use straight streams

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear an approved positive pressure self-contained breathing apparatus and firefighter turnout gear.

Precautions for fire-fighting

Vapors may travel long distances along the ground before reaching a source of ignition and flashing back. Fight from a maximum distance or use unmanned hose holders or monitor nozzles. Containers can build up pressure if exposed to heat; cool with flooding quantities of water until well after the fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of vessel. Always stay away from the ends of tanks. When mixed with air and exposed to ignition source, vapors can burn in open or explode if confined.

Hazardous combustion products

Carbon oxides (CO, CO₂)

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Eliminate all sources of ignition. Stop leak if you can do it without risk. Release can cause fire or explosion. Blanket with alcohol-resistant foam. Prevents spreading of vapors through sewers, ventilation systems and confined areas. Prevent entry into waterways, sewers, basements or confined areas. All equipment used when handling this product must be grounded. Do not touch or walk through spilled material. Water spray may reduce vapor; but may not prevent ignition in closed spaces. Use clean non-sparking tools to collect absorbed material. Dike large spills and place materials in salvage containers.

7. HANDLING AND STORAGE

Handling

Do not handle near heat, sparks, or flame. Avoid contact with incompatible agents. Use only with adequate ventilation/personal protection. Avoid contact with eyes, skin and clothing. Do not enter storage area unless adequately ventilated. Metal containers involved in the transfer of this material should be grounded and bonded. Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved. Refer to NFPA 77 for relevant consensus guidance.

Storage

Keep container tightly closed and properly labeled. Do not store near strong oxidizers. Keep away from all ignition sources; segregate from incompatible materials. Keep containers tightly closed in a dry, cool, well-ventilated place, plainly labeled, and out of closed vehicles. Ground all containers, transfer vessels, and equipment containing this material. Containers should be able to withstand pressures expected from warming or cooling during storage. Flammable materials should be stored in separate safety storage cabinet or room.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE167
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

TOLUENE - COMMERCIAL

Personal protective equipment

Inhalation

When workers are facing concentrations above the exposure limit they must use appropriate certified respirators.

Skin

Use chemical resistant gloves appropriate to conditions of use. When skin contact is possible, protective clothing including gloves, apron, sleeves, boots, head and face protection should be worn.

Eyes

Use splash goggles when eye contact due to splashing or spraying liquid is possible. Safety glasses are the minimum requirements.

Remarks

Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use. Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure. Use good personal hygiene practices. Wash hands before eating, drinking, smoking, or using toilet facilities. Take off contaminated clothing and wash before reuse. Shower after work using plenty of soap and water.

Viscosity: 0.560 mPa.s @ 25 °C (77 °F)

Water solubility: slightly soluble

Partition coefficient: n-octanol/water: Log Pow = 2.69

Other physico-chemical properties: No additional information available.

10. STABILITY AND REACTIVITY

Chemical stability

The product is stable.

Conditions to avoid

Avoid contact with strong oxidizers, excessive heat, sparks or open flame.

Materials to avoid

Does not react with water or common materials.

Hazardous decomposition products

Excessive heating and/or incomplete combustion may produce carbon monoxide, carbon dioxide and other harmful substances.

Hazardous polymerization

Will not occur.

Reactions with Air and Water

Does not react with air, water or other common materials.

11. TOXICOLOGICAL INFORMATION

Product information

Product Summary

See components summary.

COMPONENT INFORMATION

- *Toluene* 108-88-3

Acute toxicity

<u>LC50 (vapor)</u>	rat	7500 PPM	4 HOURS
	rat	5,580 MG/KG BWT	
	Rabbit.	> 5000 MG/KG BWT	

Acute effects

Inhalation

Vapors or aerosol may cause irritation of the eyes, nose and throat as well as CNS depression (fatigue, dizziness, loss of concentration, with collapse, coma and death possible in cases of severe overexposure).

MATERIAL SAFETY DATA SHEET

MSDS No.: BE167
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

TOLUENE - COMMERCIAL

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract and CNS depression (fatigue, dizziness, collapse, coma and death). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

Moderate skin irritant.

Eyes

Moderate eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Skin. Eye. Hearing. Nasal cavity. central nervous system (CNS) Heart

Repeated dose toxicity

No evidence of systemic toxicity was reported in rats exposed to 1.15 mg/l (300 ppm) toluene vapor for two years, while higher exposures were associated with inflammation and degeneration of nasal epithelial tissue. Rats exposed repeatedly to very high concentrations of toluene exhibited neurological changes and permanent hearing loss. Clinical case reports indicate the occurrence of serious and persistent changes (including tremor, ataxia, memory impairment and possible hearing loss) in humans following deliberate over-exposure to toluene in abuse situations. The relevance of these findings to low level occupational exposure to toluene is not known.

Reproductive effects

Studies in animals demonstrate no histopathological lesions in testes or ovaries of rats and mice exposed to 9.4 mg/l (2500 ppm) toluene vapor for 14-15 weeks, and no loss of fertility in male rats after exposure to 7.5 mg/l (2000 ppm) for a similar period of time. Epididymal weights and sperm counts were decreased in one study, but the absence of any adverse effect on reproduction makes the functional relevance of these observations unclear. No reliable human data are available.

Developmental Toxicity

Studies in pregnant rats demonstrate that toluene is not a teratogen, however mild fetotoxicity (lower body weight, delayed ossification, delayed physical development) may occur in the absence of maternal toxicity at exposures in the range 1.9-2.8 mg/l (500-750 ppm). Other studies describe adverse effects on learning and cognitive functions in rat pups exposed to 4.5-6.7 mg/l (1200-1800 ppm) in utero, although it is unclear if end-points evaluated in these tests are directly relevant to humans.

Genetic Toxicity

In vitro and in vivo mutagenicity tests were negative.

Carcinogenicity

Inhalation studies in rats and mice demonstrate that toluene is not a carcinogen. It has been used extensively as a solvent in rodent skin painting studies with occasional slight increases in tumor incidence reported; an epigenetic mechanism (based on irritation rather than genotoxicity) may underpin these findings. Toluene is considered a Group 3 substance by IARC, not classifiable as to its carcinogenicity to humans.

 Revision: 1.1
 Validation Date: 11/05/2010

TOLUENE - COMMERCIAL

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations.

Ingestion

May cause CNS depression, gastric discomfort, and vomiting. This material is an aspiration hazard.

Skin contact

No systemic toxicity is expected from acute dermal exposure.

Irritation

Skin

Skin irritant.

Eyes

Severe eye irritant.

Sensitization

No evidence of skin or respiratory sensitization.

Target Organs

Damages bone marrow. Eye. Skin.

Repeated dose toxicity

The hematopoietic system is the primary target for benzene, irrespective of the route of exposure. Broadly similar effects are seen in rodents and humans, including bone marrow toxicity and reduced red- and white blood cell counts.

Reproductive effects

Results from animal studies are inconsistent, with adverse effects on the ovary and testis reported in mice following repeated inhalation exposure but no effects on the gonads or on fertility observed in rats exposed under similar conditions. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Developmental Toxicity

Results from animal studies clearly demonstrate that benzene is not a teratogen, however mild fetotoxicity (including lowered bodyweight, delayed ossification and sub-clinical hematological changes) have been observed in rodents exposed during pregnancy, generally in association with maternal toxicity. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Genetic Toxicity

Benzene is genotoxic *in vivo*, and induces chromosomal aberrations and micronuclei in rats and mice following oral or inhalation exposure. Comparable changes would be anticipated in humans. The incidence of micronuclei in fetal rat liver is increased following administration of large doses by intraperitoneal injection to pregnant mice, while high-level oral exposure induced chromosomal aberrations in germ cells from male mice. The relevance to humans of these latter findings is not known.

Carcinogenicity

Benzene is a multi-site animal carcinogen, producing tumors in hematopoietic- and epithelial tissues after long term inhalation or oral exposure. Epidemiology studies confirm it is a human carcinogen, causing primarily acute non-lymphocytic leukemia.

MSDS No.: BE167
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

TOLUENE - COMMERCIAL

endogenous catecholamines leading to potentially fatal cardiac sensitization.

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract. High doses may cause CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization. Aspiration may cause pulmonary edema and pneumonitis.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring. While skin absorption is a potential route of exposure, no adverse health effects are anticipated following accidental or incidental contact.

Irritation

Skin

This product is expected to be an skin irritant.

Eyes

Moderate to severe eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Central nervous system. Lung. Liver. Kidneys. Thyroid. Blood. Hearing. heart

Repeated dose toxicity

No adverse effects were present in rats or mice exposed to 1000 ppm (4.3 mg/l) ethylbenzene vapor for up to 13 weeks. Longer-term exposure resulted in an increased incidence of chronic progressive nephropathy (CPN) in kidneys from rats inhaling 750 ppm (3.3 mg/l) for up to two years. Since CPN is a spontaneous age-related condition specific to rodents, these findings are of doubtful relevance to humans. Mice exposed chronically under similar conditions responded with changes in the lung, liver and thyroid. Additional effects in rats observed with repeated oral exposure of \geq 250 mg bwt/day ethyl benzene for 90 days include changes in hematology (indicative of a mild regenerative anemia) and clinical chemistry parameters (indicative of hepatic microsomal enzyme induction), decreases in prothrombin time, mild alimentary effects and liver pathology. A standard neurotoxicity protocol study conducted in young adult rats did not find neurotoxic effects following repeated daily oral exposure to doses up to 500 mg/kg bwt/day.

Specialist investigations provide evidence of hearing loss in rats following repeated exposure (13 weeks) to concentrations of 200 ppm (0.85 mg/l) and above. Ethyl benzene at up to 500 ppm vapor concentration did not adversely affect the functional ability of the humoral component of the immune system of rats as measured by splenic IgM antibody forming cell response to the T-dependent antigen, sheep erythrocytes.

Reproductive effects

No parental, neonatal, or reproductive toxicity was observed following inhalation exposure of rats to up to 500 ppm or 500 ppm/342 mg/kg bwt/day ethylbenzene. Histopathological examination of reproductive tissue from rats, mice and rabbits has generally revealed no adverse changes following sub-chronic- or chronic inhalation exposure to high vapor concentrations. An increased incidence of testicular tumors in F344 male rats exposed to 750 ppm (3.3 mg/l) ethylbenzene vapor for 2 years is considered of doubtful relevance to reproductive toxicity.

Developmental Toxicity

Decreased fetal body weight and an increased occurrence of skeletal and other variations were reported in the presence of concurrent maternal toxicity (CNS effects, decreased body weight, liver enlargement) when female rats were exposed to ethylbenzene concentrations of 1000 ppm (4.3 mg/l) or above throughout pregnancy. No adverse effects to neurodevelopment were observed in rats exposed to 500 ppm/342 mg/kg bwt/day ethylbenzene.

Genetic Toxicity

No increase in micronuclei or hepatic UDS was observed in mice after treatment with ethylbenzene in vivo. It was not genotoxic in microbial systems, nor did it induce chromosomal aberrations or sister chromatid exchanges in mammalian cells in vitro. Variable results were obtained for mutation at the TK+/- locus in L5178Y cells, although the most reliable study that utilized the current standard study protocol and doses that were not significantly cytotoxic gave a negative mutagenic response. The overall weight of evidence indicates that ethylbenzene is not genotoxic.

Carcinogenicity

The carcinogenic potential of ethylbenzene after inhalation exposure has been investigated in two recent regulatory guideline studies performed by NTP. Male rats exposed to 750 ppm (3.3 mg/l) over 2 years showed an increased incidence of testicular interstitial cell adenoma, a common tumor present also in a large majority of the untreated males included in the study. High level exposure was also linked with an increased incidence of kidney tumors in both sexes; the appearance of

MATERIAL SAFETY DATA SHEET

MSDS No.: BE167
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

TOLUENE - COMMERCIAL

Carcinogenicity

these lesions was strongly associated with the development of Chronic Progressive Nephropathy, a spontaneous age-related disease of rats with no equivalent counterpart in humans. Male mice exposed to 750 ppm ethylbenzene for 2 years responded with an increased incidence of lung tumors, while the incidence of liver tumors was increased in females. Mechanistic studies suggest that these lesions in the mouse developed secondary to enhanced cell proliferation in these tissues, while the weight of evidence from mutagenicity testing also indicates that a non-genotoxic mechanism was involved. Listed by IARC as possibly carcinogenic in humans (Group 2B).

- *p-Xylene* 106-42-3

Acute toxicity

<u>LC50 (vapor)</u>	rat	4740 PPM	4 HOURS
<u>LC50 (Inhl)</u>	mouse	3907	6 HOURS
<u>LD50 (Oral)</u>	rat	4,029 MG/KG	
<u>LD50 (Skin)</u>	rabbit	4,350 MG/KG	

Acute effects

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations. Exposure to high vapor concentrations may cause effects on hearing.

Ingestion

May be harmful if swallowed. Ingestion may cause effects on liver, spleen and kidneys. High doses may cause CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure). Possible cardiac sensitization. Aspiration may cause pulmonary edema and pneumonitis.

Skin contact

Skin absorption hazard. Considered to be of low toxicity by the dermal route of exposure. However, dermal exposure to high concentrations may cause discomfort and irritation of the gastrointestinal tract; effects on lungs, liver and kidneys; and CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure). Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

May be irritating to the skin. Repeated contact with skin may cause cracking and/or fissuring.

Eyes

May cause eye irritation.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Hearing. Central nervous system. Liver. Kidneys. Cardiac sensitization.

Repeated dose toxicity

May be toxic following repeated exposure to high doses. No standard repeated inhalation exposure study was available. However, in limited scope studies, repeated inhalation exposure of rats to p-xylene caused ototoxicity at ≥ 900 ppm (3.91 mg/L) but not at 450 ppm (1.95 mg/L). Repeated inhalation exposures of laboratory animals to other xylene isomers and/or mixed xylenes caused reduced body weight/weight gain at ≥ 1000 ppm (4.35 mg/L), liver and CNS (behavioral) effects at ≥ 100 ppm (0.43 mg/L), and, in rats, ototoxicity at ≥ 250 ppm (1.09 mg/L). No treatment-related effects were seen in rats after oral exposure to p-xylene at 800 mg/kg bwt/day for 13 weeks. Short-term (10-14 days) repeated oral exposure of rats to p-xylene produced increases in liver weights and decreases in body weights and relative thymus weights at 2000 mg/kg bwt/day, and ototoxicity at 899 mg/kg bwt/day (the only concentration tested for ototoxicity). No ototoxicity was observed in guinea pigs exposed to p-xylene at this dose level. Oral exposure of rats to mixed xylenes at 500 mg/kg bwt/day for 103 weeks produced only slightly decreased body weight. Repeated oral exposure of mice to mixed xylenes produced a reduction in body weight in females at 2000 mg/kg bwt/day for 13 weeks, but no treatment-related effects were seen after exposure to 1000 mg/kg bwt/day for 103 weeks. The observed liver effects may be adaptive rather than adverse effects.

MATERIAL SAFETY DATA SHEET

MSDS No: BF167
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

TOLUENE - COMMERCIAL

Reproductive effects

This substance is not expected to be a reproductive toxicant. No damage to reproductive organs was noted in rats exposed by oral gavage to p-xylene at 800 mg/kg bwt/day for 13 weeks. Results for mixed xylenes in a one-generation reproductive toxicity study (rats, inhalation at 500 ppm/2.17 mg/L) and two dominant lethal studies (rats, i.p.; mice, s.c; 864 mg/kg bwt), and from evaluation of reproductive organs in repeated dose studies (male rats, inhalation, 1000 ppm [4.35 mg/L]; rats [1000 mg/kg bwt/day] and mice [2000 mg/kg bwt/day], oral) indicate that mixed xylenes do not affect reproductive performance or induce structural damage to reproductive organs of laboratory animals at high inhalation or oral doses. However, xylenes have been shown to produce damage to reproductive organs in rats repeatedly exposed to extremely high, anesthetic doses.

Developmental Toxicity

May be toxic to the developing embryo and fetus. Inhalation exposure of pregnant rats to p-xylene was reported to produce decreases in fetal weight and increases in post implantation loss at ≥ 700 ppm 3.0 mg/L), and increases in skeletal variations, but not malformations, at 2000 ppm (8.7 mg/L) in the presence of maternal toxicity (decreased body weight gain and feed consumption, and increased relative liver weight). No effect on neurobehavior was noted in offspring of rat dams exposed to 800 and 1600 ppm (3.5 or 7.0 mg/L) prenatally. After oral gavage exposure, increased resorptions and cleft palate formation were reported in fetuses of mice exposed to p-xylene at ≥ 1935 mg/kg bwt/day, in the presence of maternal toxicity (unspecified). As mice under stress have been shown to be predisposed to produce offspring with cleft palate, the significance of this finding is uncertain.

Genetic Toxicity

Not expected to be genotoxic. p-Xylene produced negative results in assays for gene mutation in bacteria and induction of micronuclei in mouse bone marrow after intraperitoneal injection. Two positive responses have been reported for mixed xylenes, but the overall weight of evidence from a variety of in vitro and in vivo genotoxicity studies with xylenes indicates that they are not genotoxic.

Carcinogenicity

Available data for mixed xylenes indicate that the para-Xylene product is not likely to be carcinogenic to humans. Cancer data for mixed xylenes are used as surrogate data for this product. Oral exposure to mixed xylenes for 2 years did not produce tumors in rats or mice at doses up to 500 or 1000 mg/kg bwt/day, respectively. IARC concluded that xylenes are not classifiable as to their carcinogenicity to humans (Group 3).

- *m-Xylene* 108-38-3

Acute toxicity

LC50 (Inhl) rat 8000 PPM 4 HOURS

LD50 (Oral) rat 5000 MG/KG BW

Irritation

Skin

May be absorbed percutaneously, defatting and irritation of the skin may occur.

Eyes

Xylenes are irritating to the eyes with the potential to cause conjunctivitis and corneal opacity.

Carcinogenicity

This material is listed by IARC as; "Not classifiable as a human carcinogen (Group 3) human evidence is inadequate: animal evidence inadequate."

 Revision: 1.1
 Validation Date: 11/05/2010

TOLUENE - COMMERCIAL

Environmental fate and pathways

Mobility

Behavior in environmental compartments: Some volatilization from water or soil is expected, with p-xylene initially partitioned mainly to soil and water

Persistence and degradability

Biodegradation: This material is expected to be readily biodegradable. Expected to be hydrolytically stable, but rapidly degraded following atmospheric release.

Bioaccumulation: Significant bioaccumulation is not expected. Fish BCF (Anguilla japonica) 23.6 after 10 days; BCF (Carassius auratus) 14.8.

- *m-Xylene* 108-38-3

Ecotoxicity

Acute Fish toxicity

LC50 / 24 HOUR goldfish 58 mg/l

Environmental fate and pathways

Expected to exist solely as a vapor in the ambient atmosphere. The vapor-phase of this material is degraded in the atmosphere by reaction with photochemically-produced hydroxyl radicals and ozone. Volatilization from dry soil surfaces is expected. Volatilization from moist soil surfaces is expected. It may adsorb onto soils or sediments.

Persistence and degradability

Biodegradation: Biodegradable under aerobic and anaerobic conditions.

Bioaccumulation: This material is not expected to bioaccumulate.

13. DISPOSAL CONSIDERATIONS

Contaminated product/s oil/water may be U.S. Resource Conservation and Recovery Act (RCRA)/U.S. Occupational Safety and Health Administration (OSHA) hazardous waste due to potentially low flash point. Comply with federal, state, or local regulations for disposal. Use registered transporters.

14. TRANSPORT INFORMATION

Special Provisions

If you reformulate or further process this material, you should consider re-evaluation of the regulatory status of the components listed in the composition section of this sheet, based on final composition of your product.

Emergency Overview

This material is HAZARDOUS as defined by the OSHA Hazard Communication Standard, 29CFR, 1910.1200.

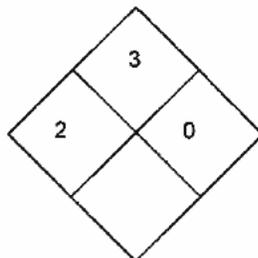

Signal Word

DANGER.

Hazards

Extremely flammable liquid. Harmful if inhaled or absorbed through the skin. Harmful or fatal if swallowed. CNS depressant. Aspiration hazard. Contains material which can cause cancer. Mutagenic Substance. Suspect reproductive hazard. Vapors may form explosive mixtures with air. Vapors can travel to a source of ignition and flash back. Vapors explosion hazard indoors, outdoors or in sewers. Slipping hazard if spilled on hard smooth walking surface.

Odor

Faint, mild hydrocarbon odor. Sweet aromatic.

Odor Threshold

1 - 7 ppm

Potential health effects

Routes of exposure

Eye. Inhalation. Skin.

- *Cyclopentane* 287-92-3

Aspiration hazard. May cause central nervous system depression.

- *Cyclohexane* 110-82-7

CNS depressant. Simple asphyxiant. May be irritating to the eyes, skin, and respiratory system.

- *Benzene* 71-43-2

Slight acute toxicity. Inhalation exposure to high concentrations may cause dizziness and CNS depression. Ingestion of relatively small amounts may be fatal if aspiration into the lungs takes place.

- *Methyl Cyclohexane* 108-87-2

Liquid, mist, or vapors can cause eye, skin and respiratory tract irritation. CNS depressant. Exposure to excess vapor may cause headache, fatigue, drowsiness and dizziness.

- *n-Hexane* 110-54-3

May cause irritation to the eyes, nausea, vertigo, bronchial and central nervous system effects. This material presents an acute aspiration hazard. May be irritating to the skin. High or repeated exposures can damage the peripheral nervous system, causing numbness, tingling, and/or muscle weakness in the hands or feet. The onset of health effects associated with n-hexane may be influenced by exposure to additional chemicals such as methyl isobutyl ketone and methyl ethyl ketone.

- *Toluene* 108-88-3
