Toluene is of slight acute toxicity, although inhalation exposure may cause dizziness and CNS depression, while ingestion may be fatal if aspiration into the lung occurs. Toluene may increase the sensitivity of the heart leading to potentially fatal cardiac sensitization. It is moderately irritating to skin and eye.

- *Xylene* 1330-20-7

May be irritating to the eyes, skin, and respiratory system. Aspiration hazard. Ingestion of this material, followed by vomiting and aspiration of the more volatile components of this material into the lungs, may lead to chemical pneumonia and even death.

- *Ethyl Benzene* 100-41-4

Inhalation hazard. Ingestion hazard. Skin and eye irritant.

- *Cumene* 98-82-8

Slight eye irritant. Slight skin irritant. Aspiration hazard. CNS depressant.

- *Trimethyl benzene* 25551-13-7

CNS depressant. Aspiration hazard.

- *Ethyl Toluene* 25550-14-5

May be irritating to the skin.

- *Indene* 95-13-6

May cause drowsiness and dizziness. Aspiration into the lungs may cause chemical pneumonia.

- *Naphthalene* 91-20-3

May be irritating to the eyes, skin and respiratory tract. Direct contact with the eye may cause corneal damage. May be toxic by all routes of exposure. Target organs for toxic effects include the blood, liver, kidneys, eyes, and central nervous system (CNS). Symptoms of overexposure may include headache, restlessness, lethargy, vomiting, anorexia, anemia, diminished vision, and acute kidney failure. Individuals who have an inherited G6PD deficiency in their red blood cells may be particularly sensitive to the toxic effects of Naphthalene. Naphthalene can cross the placenta and harm the fetus.

- *Butanes*

May produce symptoms of central nervous system depression including headache, dizziness, nausea, euphoria, loss of equilibrium, drowsiness, visual disturbances, fatigue, unconsciousness and respiratory arrest. Contact with liquid may cause frostbite.

Skin

May be absorbed through the skin and produce toxic effects such as CNS depression. May cause dermatitis by defatting the skin from prolonged or repeated contact.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE169
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

OP 400

Inhalation

High concentrations can displace oxygen and cause drowsiness, dizziness, unconsciousness and/or suffocation by asphyxiation.

Ingestion

Readily absorbed upon ingestion and may produce toxic effects similar to those resulting from inhalation exposure. Ingestion followed by vomiting could result in aspiration into the lungs of the more volatile components of this material which in turn could lead to life-threatening chemical pneumonia.

- *Cyclopentane 287-92-3*

Repeated or prolonged exposure of the skin to this material may cause defatting and drying of the skin.

- *Cyclohexane 110-82-7*

No adverse chronic human health effects have been reported for this material.

- *Benzene 71-43-2*

Benzene is considered to be a cancer-causing agent. Repeated exposure is linked to bone marrow toxicity, reduced red- and white blood cell counts and decreased immunological function irrespective of the route of contact.

- *Methyl Cyclohexane 108-87-2*

Repeated or prolonged contact with skin may cause defatting and drying of the skin which may result in dermatitis.

- *n-Hexane 110-54-3*

Damage to nerves in hands or feet may occur from prolonged inhalation of n-hexane concentrations of 60 to 240 ppm. Repeated exposure to air concentrations of 500 ppm n-hexane can produce progressively worsening damage to the peripheral nerves. Prolonged and repeated exposure to vapors may cause damage to the CNS, lungs and kidneys. Suspect reproductive hazard.

- *Toluene 108-88-3*

Repeated exposure to high concentrations has been shown to cause neurological changes and hearing loss in animals, and in humans in abuse situations. May cause developmental toxicity.

- *Xylene 1330-20-7*

May cause dermatitis by defatting the skin from prolonged or repeated contact. May contribute to the development of diseases of the nervous system, liver and kidney. May be a reproductive hazard.

- *Ethyl Benzene 100-41-4*

May effect hearing. Repeated or prolonged exposure may damage liver and kidneys. Possible cancer hazard. Repeated contact with skin may cause cracking and/or fissuring.

- *Cumene 98-82-8*

This material has been classified by IARC as a group 2B substance (possibly carcinogenic to humans). Prolonged and/or repeated contact may cause mild to moderate skin defatting, redness, blistering, lesions, and/or scaly dermatitis. May cause kidney and/or lung damage.

- *Trimethyl benzene 25551-13-7*

No adverse chronic human health effects have been reported for this material.

- *Ethyl Toluene 25550-14-5*

Specific data not available.

- *Indene 95-13-6*

No known chronic health effects.

- *Naphthalene 91-20-3*

Target organs for toxic effects of chronic exposure include the blood, the skin, the eyes, and the central nervous system. Symptoms of chronic overexposure may include dermatitis, anemia, sores on the eye or cloudiness of the eyeball, diseases involving the nerves or nervous system, and allergic skin reactions. Potential Cancer Hazard, see section 11.

- *Butanes*

No known chronic health effects.

Typical composition

4. FIRST AID MEASURES

Skin

Remove contaminated clothing and shoes. Immediately flush the contact area with plenty of low pressure water to cool the skin. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.

Inhalation

Move to fresh air. If not breathing, give artificial respiration. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, give oxygen. Get immediate medical advice/ attention.

Eyes

Remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart and flush eyes with plenty of water for at least 15 minutes. Get medical attention. Do not use eye ointment unless directed to by a physician.

Ingestion

MATERIAL SAFETY DATA SHEET

MSDS No.: BE169
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

OP 400

Ingestion

Do NOT induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. If victim is drowsy or unconscious, place on the left side with head down. Do not leave victim unattended. Obtain medical attention.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

OSHA/NFPA Class IA flammable liquid.

Flash point

-48 - -37 °C (-54.4 - -34.6 °F)

Autoignition temperature

229 - 275 °C (444.2 - 527 °F)

Lower explosion limit

0.9 vol% (% vol in air).

Upper explosion limit

8.5 vol% (% vol in air).

Extinguishing Media

Suitable extinguishing media

Extinguishing media - small fires Dry chemical Carbon dioxide (CO₂) Foam Water fog. Inert gas. Extinguishing media - large fires LARGE FIRE: Use water spray, water fog or foam. DO NOT use straight streams

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies.

Precautions for fire-fighting

Fire Hazard Releases flammable vapors below normal ambient temperatures. When mixed with air and exposed to ignition source, vapors can burn in open or explode if confined. Flammable vapors may be heavier than air and travel long distances along the ground before igniting and flashing back to vapor source. If container is not properly cooled, it can rupture in the heat of a fire.

Hazardous combustion products

Hazardous decomposition products formed under fire conditions. Carbon monoxide, carbon dioxide and unburned hydrocarbons (smoke).

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Contain spillage, soak up with non-combustible absorbent material, (e.g. sand, earth, diatomaceous earth, vermiculite) and transfer to a container for disposal according to local / national regulations (see section 13). Use clean non-sparking tools to collect absorbed material.

7. HANDLING AND STORAGE

MATERIAL SAFETY DATA SHEET

MSDS No.: BE169
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

OP 400

Handling

Do not handle near heat, sparks, or flame. Avoid contact with incompatible agents. Use only with adequate ventilation/personal protection. Avoid contact with eyes, skin and clothing. Do not enter storage area unless adequately ventilated. Metal containers involved in the transfer of this material should be grounded and bonded. Never siphon by mouth. Do not breathe vapor. Prevent contact with food, chewing, or smoking materials. Do not take internally. When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Use only with adequate ventilation/personal protection. Avoid contact with eyes, skin and clothing. Wash thoroughly after handling. Prevent contact with food, chewing, or smoking materials. All sampling should be conducted in a manner which avoids skin contact and inhalation of vapors. Clean up any spilled material. Parts and equipment using or containing this material should be steam-cleaned if possible prior to all maintenance procedures. Empty containers retain some liquid and vapor residue and can be dangerous, so all hazard precautions must be observed when handling empties. Do not pressurize, cut, weld, braze, solder, drill, grind, or expose containers to heat, flame, sparks, static electricity, or other sources of ignition. Empty drums should be completely drained, properly bunged and promptly disposed of or reconditioned. Special slow load procedures for 'switch loading' must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point hydrocarbon products. Electrostatic charges may be generated as a result of flow or agitation.

Storage

Handle empty containers with care - residue may be combustible. Vapors may form explosive mixtures with air. Vapor space above stored liquid may be flammable/explosive unless blanketed with inert gas. Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved. Refer to NFPA 77 for relevant consensus guidance. This liquid may accumulate static electricity even when transferred into properly grounded containers. Static electricity accumulation may be significantly increased by the presence of small quantities of water. Store and transport in accordance with all applicable laws. Store containers in a cool, dry, ventilated, fire resistant area away from sources of ignition and incompatible materials. Refrigeration preferred. Refer to NFPA 77 and API RP-2003 for relevant consensus guidance.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of mists and/or vapors below the recommended exposure limits. Ensure that eyewash stations and safety showers are close to the workstation location.

Personal protective equipment

Inhalation

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Organic vapor or supplied air respirator may be appropriate. Respirator selection and use should comply with OSHA 29 CFR 1910.134 or ANSI Z88.2.

Skin

Wear long-sleeved fire-retardant garments (e.g., Nomex (R)) while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, boots, and additional facial protection.

Eyes

Safety glasses with side-shields. Use splash goggles when eye contact due to splashing or spraying liquid is possible.

Occupational Exposure Limits

Consult local authorities for acceptable exposure limits.

 Validation Date: 05/20/2011

OP 400

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance: liquid colorless, to, light yellow

Odor: Faint, mild hydrocarbon odor. Sweet aromatic.

Odor Threshold: 1 - 7 ppm

pH: not applicable

Boiling point/boiling range: 0 - 274 °C (32 - 525.2 °F)

Melting/freezing point: -75 °C (-103 °F)

Flash point: -48 -- -37 °C (-54.4 -- -34.6 °F)

Autoignition temperature: 229 - 275 °C (444.2 - 527 °F)

Flammability: OSHA/NFPA Class IA flammable liquid.

Lower explosion limit: 0.9 vol% (% vol in air).

Upper explosion limit: 8.5 vol% (% vol in air).

Explosive properties: no data available

Oxidizing properties: no data available

Vapor pressure: ~ 11 - 62 kPa @ 37.8 °C (100.04 °F)

Evaporation rate: 8 - 10 (butyl acetate = 1)

Relative density: 0.67 - 0.73(Water = 1)

Viscosity: 0.5 - 1.5 mm²/s

Water solubility: Slightly soluble in cold water.

Partition coefficient: n-octanol/water: Specific data not available.

Other physico-chemical properties: no data available

10. STABILITY AND REACTIVITY

Chemical stability

Stable

Conditions to avoid

Keep away from heat and sources of ignition.

Materials to avoid

Oxidizers. Nitric acid

Hazardous decomposition products

Carbon monoxide, carbon dioxide and unburned hydrocarbons (smoke).

OP 400

MATERIAL SAFETY DATA SHEET

MSDS No.: BE169
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

OP 400

Sensitive individuals may exhibit skin rash, wheezing, tightness of the chest, and difficulty breathing that may progress to a life-threatening inability to breathe.

Reproductive effects

No effects on reproductive organs were observed in a 90-day inhalation study with rats exposed to ~10,200 ppm (29.8 mg/L).

Genetic Toxicity

Cyclopentane was negative in the Ames Test and mouse lymphoma assay and in an in vivo micronucleus test, but induced chromosome aberrations in an in vitro mammalian cell assay.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

Other information

No data available.

- *Cyclohexane* 110-82-7

Acute toxicity

<u>LC50 (Inhl)</u>	rat	13.9 MG/L	4 HOURS
<u>LD50 (Oral)</u>	rat	> 5000 MG/KG	
<u>LD50 (Skin)</u>	rabbit	> 2000 MG/KG	

Target Organs

Central nervous system effects.

Repeated dose toxicity

No known chronic health effects.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *Benzene* 71-43-2

Acute toxicity

	rat	13,700 PPM	4 HOURS
	rabbit	> 8260 MG/KG BWT	

Acute effects

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations.

Ingestion

May cause CNS depression, gastric discomfort, and vomiting. This material is an aspiration hazard.

Skin contact

No systemic toxicity is expected from acute dermal exposure.

Target Organs

Damages bone marrow. Eye. Skin.

Repeated dose toxicity

The hematopoietic system is the primary target for benzene, irrespective of the route of exposure. Broadly similar effects are seen in rodents and humans, including bone marrow toxicity and reduced red- and white blood cell counts.

Reproductive effects

Results from animal studies are inconsistent, with adverse effects on the ovary and testis reported in mice following repeated inhalation exposure but no effects on the gonads or on fertility observed in rats exposed under similar conditions.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE169
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

OP 400

No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Developmental Toxicity

Results from animal studies clearly demonstrate that benzene is not a teratogen, however mild fetotoxicity (including lowered body weight, delayed ossification and sub-clinical hematological changes) have been observed in rodents exposed during pregnancy, generally in association with maternal toxicity. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Genetic Toxicity

Benzene is genotoxic in vivo, and induces chromosomal aberrations and micronuclei in rats and mice following oral or inhalation exposure. Comparable changes would be anticipated in humans. The incidence of micronuclei in fetal rat liver is increased following administration of large doses by intraperitoneal injection to pregnant mice, while high-level oral exposure induced chromosomal aberrations in germ cells from male mice. The relevance to humans of these latter findings is not known.

Carcinogenicity

Benzene is a multi-site animal carcinogen, producing tumors in hematopoietic- and epithelial tissues after long term inhalation or oral exposure. Epidemiological studies confirm it is a human carcinogen, causing primarily acute non-lymphocytic leukemia.

- *Methyl Cyclohexane* 108-87-2

Acute toxicity

LD50 (Oral) rat > 3,200 MG/KG

Irritation

Skin

May be irritating to the skin. Repeated or prolonged contact with skin may cause dermatitis.

Eyes

May cause eye irritation.

Target Organs

Skin. Eye. Respiratory system. Central nervous system effects.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *n-Hexane* 110-54-3

Acute toxicity

LC50 (Inhl) rat 48,000 PPM 4 HOURS

LD50 (Oral) rat 28,710 MG/KG

LD50 (Skin) rabbit 3000 MG/KG

Irritation

Eyes

Eye irritant.

Target Organs

Skin. Eye. Respiratory system. Central nervous system effects. Peripheral nervous system Testes.

Repeated dose toxicity

Rabbits exposed by inhalation to 3,000 ppm 8 hours/day for 8 days showed changes in the lungs, emphysema, necrosis of the bronchial epithelium, and atelectasis. Rats continuously exposed to 400 ppm developed anoxapathy, although intermittent exposure to 10,000 ppm 6 hours/day, 5 days/week for 13 weeks caused only mild paranodal axonal swelling. The offspring of rats and mice exposed orally or by inhalation to n-hexane during gestation showed depressed weight gain after birth. This agent also affects male and female reproductive capacity.

Reproductive effects

MATERIAL SAFETY DATA SHEET

MSDS No.: BE169
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

OP 400

Exposure to n-hexane may damage the developing fetus.

Developmental Toxicity

Causes productive and embryotoxic effects and is cytotoxic in mammalian and human test systems.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

Other information

Exposure of humans to 5,000 ppm n-hexane for 10 minutes causes marked vertigo; exposure to 1,500 ppm results in headache and slight nausea. In industrial settings, exposure to levels exceeding 1,000 ppm have been reported to cause mild symptoms of narcosis. Eye and upper respiratory tract irritation has been reported to occur in humans exposed to 880 ppm n-hexane for 15 minutes. Dermal contact with n-hexane results in immediate irritation characterized by erythema and hyperemia; exposed subjects developed blisters 5 hours following dermal exposure to n-hexane. The neuropathic toxicity of n-hexane in humans is well documented; cases of polyneuropathy have typically occurred in humans chronically exposed to levels of n-hexane ranging from 400 to 600 ppm, with occasional exposures up to 2,500 ppm. Distal symmetrical motor weakness is common in most cases; however, in severely affected individuals, motor weakness may extend to the pelvic and high musculature. Nerve biopsies in affected individuals show swelling of the nerve and thinning of the myelin sheath. Functional neurological disturbances usually progress for a few months after termination of exposure. Although recovery is expected to occur within a year, clinical polyneuropathy has been reported in some cases to remain after 2 years. Blurred vision, restricted visual field, and optic nerve atrophy has been reported to occur in association with n-hexane-induced polyneuropathy.

- *Toluene 108-88-3*

Acute toxicity

<u>LC50 (vapor)</u>	rat	7500 PPM	4 HOURS
	rat	5,580 MG/KG BWT	
	Rabbit.	> 5000 MG/KG BWT	

Acute effects

Inhalation

Vapors or aerosol may cause irritation of the eyes, nose and throat as well as CNS depression (fatigue, dizziness, loss of concentration, with collapse, coma and death possible in cases of severe overexposure).

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract and CNS depression (fatigue, dizziness, collapse, coma and death). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

Moderate skin irritant.

Eyes

Moderate eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Skin. Eye. Hearing. Nasal cavity. central nervous system (CNS) Heart

Repeated dose toxicity

No evidence of systemic toxicity was reported in rats exposed to 1.15 mg/l (300 ppm) toluene vapor for two years, while higher exposures were associated with inflammation and degeneration of nasal epithelial tissue. Rats exposed repeatedly to very high concentrations of toluene exhibited neurological changes and permanent hearing loss. Clinical case reports indicate the occurrence of serious and persistent changes (including tremor, ataxia, memory impairment and possible

MATERIAL SAFETY DATA SHEET

MSDS No.: BE169
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

OP 400

hearing loss) in humans following deliberate over-exposure to toluene in abuse situations. The relevance of these findings to low level occupational exposure to toluene is not known.

Reproductive effects

Studies in animals demonstrate no histopathological lesions in testes or ovaries of rats and mice exposed to 9.4 mg/l (2500 ppm) toluene vapor for 14-15 weeks, and no loss of fertility in male rats after exposure to 7.5 mg/l (2000 ppm) for a similar period of time. Epididymal weights and sperm counts were decreased in one study, but the absence of any adverse effect on reproduction makes the functional relevance of these observations unclear. No reliable human data are available.

Developmental Toxicity

Studies in pregnant rats demonstrate that toluene is not a teratogen, however mild fetotoxicity (lower body weight, delayed ossification, delayed physical development) may occur in the absence of maternal toxicity at exposures in the range 1.9-2.8 mg/l (500-750 ppm). Other studies describe adverse effects on learning and cognitive functions in rat pups exposed to 4.5-6.7 mg/l (1200-1800 ppm) in utero, although it is unclear if end-points evaluated in these tests are directly relevant to humans.

Genetic Toxicity

In vitro and in vivo mutagenicity tests were negative.

Carcinogenicity

Inhalation studies in rats and mice demonstrate that toluene is not a carcinogen. It has been used extensively as a solvent in rodent skin painting studies with occasional slight, increases in tumor incidence reported: an epigenetic mechanism (based on irritation rather than genotoxicity) may underpin these findings. Toluene is considered a Group 3 substance by IARC, not classifiable as to its carcinogenicity to humans.

• Xylene 1330-20-7

Acute toxicity

<u>LC50 (Inhl)</u>	rat	5000 PPM	4 HOURS
	mouse	3907 MG/KG	6 HOURS
	rat	4550 PPM	4 HOURS
<u>LD50 (Oral)</u>	rat	4300 MG/KG	
<u>LD50 (Skin)</u>	rabbit	>1700 MG/KG	

Irritation

Skin

Moderate skin irritant. May cause dermatitis by defatting the skin from prolonged or repeated contact.

Eyes

This material is expected to be a mild eye irritant. Xylenes are irritating to the eyes with the potential to cause conjunctivitis and corneal opacity.

Target Organs

Skin. Eye. central nervous system (CNS)

Repeated dose toxicity

Repeated inhalation exposures of rats to xylenes cause liver effects at 920 ppm (4.0 mg/L) and ototoxicity at \geq 800 ppm (3.48 mg/L). Repeated oral exposures to xylenes produce reductions in body weight in male rats at 500 mg/kg bwt/day, liver effects and hyaline droplet formation in male rats at \geq 150 mg/kg bwt/day, kidney effects in male and female rats at \geq 750 mg/kg bwt/day, and a reduction in bodyweight gain in male mice at \geq 250 mg/kg bwt/day. Repeated inhalation exposures of gerbils to \geq 160 ppm (0.70 mg/L) xylenes cause apparently irreversible CNS effects.

Reproductive effects

A reproductive toxicity study, two dominant lethal studies, and evaluation of reproductive organs in repeated dose studies indicate that xylenes do not affect reproductive performance or induce structural damage to reproductive organs of laboratory animals at non-anesthetic doses. However, xylenes have been shown to produce damage to reproductive organs in rats repeatedly exposed to extremely high, anesthetic doses.

Developmental Toxicity

Results from animal studies demonstrate that xylenes may cause reduced fetal weight and delayed ossification, but not malformations, at inhalation dose levels causing no or only slight maternal toxicity (\geq 115 ppm or 0.5 mg/L). Slight neurobehavioral effects were noted in offspring of rats exposed to 500 ppm (2.2 mg/L) in the absence of maternal toxicity.

Carcinogenicity

MATERIAL SAFETY DATA SHEET

MSDS No.: BE169
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

OP 400

Not listed by IARC, NTP, OSHA or EPA.

- *Ethyl Benzene 100-41-4*

Acute toxicity

<u>LC50 (vapor)</u>	rat	4000 PPM
<u>LD50 (Oral)</u>	rat	3500 - 4700 MG/KG BWT
<u>LD50 (Skin)</u>	rabbit	> 15,000 MG/KG BWT

Acute effects

Inhalation

Vapors may cause irritation of the eyes, nose and throat as well as CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure) May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract. High doses may cause CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization. Aspiration may cause pulmonary edema and pneumonitis.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring. While skin absorption is a potential route of exposure, no adverse health effects are anticipated following accidental or incidental contact.

Irritation

Skin

This product is expected to be an skin irritant.

Eyes

Moderate to severe eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Central nervous system. Lung. Liver. Kidneys. Thyroid. Blood. Hearing. heart

Repeated dose toxicity

No adverse effects were present in rats or mice exposed to 1000 ppm (4.3 mg/l) ethylbenzene vapor for up to 13 weeks. Longer-term exposure resulted in an increased incidence of chronic progressive nephropathy (CPN) in kidneys from rats inhaling 750 ppm (3.3 mg/l) for up to two years. Since CPN is a spontaneous age-related condition specific to rodents, these findings are of doubtful relevance to humans. Mice exposed chronically under similar conditions responded with changes in the lung, liver and thyroid. Additional effects in rats observed with repeated oral exposure of ≥ 250 mg bwt/day ethyl benzene for 90 days include changes in hematology (indicative of a mild regenerative anemia) and clinical chemistry parameters (indicative of hepatic microsomal enzyme induction), decreases in prothrombin time, mild alimentary effects and liver pathology. A standard neurotoxicity protocol study conducted in young adult rats did not find neurotoxic effects following repeated daily oral exposure to doses up to 500 mg/kg bwt/day.

Specialist investigations provide evidence of hearing loss in rats following repeated exposure (13 weeks) to concentrations of 200 ppm (0.85 mg/l) and above. Ethyl benzene at up to 500 ppm vapor concentration did not adversely affect the functional ability of the humoral component of the immune system of rats as measured by splenic IgM antibody forming cell response to the T-dependent antigen, sheep erythrocytes.

Reproductive effects

No parental, neonatal, or reproductive toxicity was observed following inhalation exposure of rats to up to 500 ppm or 500 ppm/342 mg/kg bwt/day ethylbenzene. Histopathological examination of reproductive tissue from rats, mice and rabbits has generally revealed no adverse changes following sub-chronic- or chronic inhalation exposure to high vapor concentrations. An increased incidence of testicular tumors in F344 male rats exposed to 750 ppm (3.3 mg/l) ethylbenzene vapor for 2 years is considered of doubtful relevance to reproductive toxicity.

Developmental Toxicity

MATERIAL SAFETY DATA SHEET

MSDS No.: BE169
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

OP 400

Decreased fetal body weight and an increased occurrence of skeletal and other variations were reported in the presence of concurrent maternal toxicity (CNS effects, decreased body weight, liver enlargement) when female rats were exposed to ethylbenzene concentrations of 1000 ppm (4.3 mg/l) or above throughout pregnancy. No adverse effects to neurodevelopment were observed in rats exposed to 500 ppm/342 mg/kg bwt/day ethylbenzene.

Genetic Toxicity

No increase in micronuclei or hepatic UDS was observed in mice after treatment with ethylbenzene in vivo. It was not genotoxic in microbial systems, nor did it induce chromosomal aberrations or sister chromatid exchanges in mammalian cells in vitro. Variable results were obtained for mutation at the TK+/- locus in L5178Y cells, although the most reliable study that utilized the current standard study protocol and doses that were not significantly cytotoxic gave a negative mutagenic response. The overall weight of evidence indicates that ethylbenzene is not genotoxic.

Carcinogenicity

The carcinogenic potential of ethylbenzene after inhalation exposure has been investigated in two recent regulatory guideline studies performed by NTP. Male rats exposed to 750 ppm (3.3 mg/l) over 2 years showed an increased incidence of testicular interstitial cell adenoma, a common tumor present also in a large majority of the untreated males included in the study. High level exposure was also linked with an increased incidence of kidney tumors in both sexes; the appearance of these lesions was strongly associated with the development of Chronic Progressive Nephropathy, a spontaneous age-related disease of rats with no equivalent counterpart in humans. Male mice exposed to 750 ppm ethylbenzene for 2 years responded with an increased incidence of lung tumors, while the incidence of liver tumors was increased in females. Mechanistic studies suggest that these lesions in the mouse developed secondary to enhanced cell proliferation in these tissues, while the weight of evidence from mutagenicity testing also indicates that a non-genotoxic mechanism was involved. Listed by IARC as possibly carcinogenic in humans (Group 2B).

- *Cumene* 98-82-8

Acute toxicity

<u>LC50 (Inhl)</u>	rat	39000 MG/M3	4 HOURS
<u>LD50 (Oral)</u>	rat	1400 MG/KG	
<u>LD50 (Skin)</u>	rabbit	> 3160 MG/KG	

Irritation

Skin

Slight skin irritant. May cause dermatitis by defatting the skin from prolonged or repeated contact.

Eyes

Slight eye irritant.

Sensitization

Not expected to be a sensitizer.

Target Organs

Central nervous system. Skin. Eye. Respiratory system. Nasal cavity. Kidney Liver Lungs

Reproductive effects

This substance is not expected to be a reproductive toxicant.

Genetic Toxicity

Negative for genotoxicity using both in vitro and in vivo tests.

Carcinogenicity

The NTP has found that Cumene causes increased incidences of combined benign and malign kidney tumors in male rats, and malignant lung tumors in mice of both sexes. This material has been classified by IARC as a group 2B substance (possibly carcinogenic to humans).

- *Trimethyl benzene* 25551-13-7

Acute toxicity

<u>LD50 (Oral)</u>	rat	8970 MG/KG
--------------------	-----	------------

Irritation

MATERIAL SAFETY DATA SHEET

Skin

Skin irritant.

- *Ethyl Toluene* 25550-14-5

Acute toxicity

<u>LC50 (Inhl)</u>		50	2 HOURS
	mouse	54	4 HOURS

Irritation

Skin

Skin irritant.

Repeated dose toxicity

Repeated exposure may cause liver and kidney damage.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *Indene* 95-13-6

Acute toxicity

<u>LC50 (Inhl)</u>	rat	14 GM/M3
--------------------	-----	----------

Carcinogenicity

Specific data not available.

- *Naphthalene* 91-20-3

Acute toxicity

<u>LC50 (Inhl)</u>	rat	>340 MG/M3	4 HOUR
--------------------	-----	------------	--------

LD50 (Oral)

rat	490 MG/KG
mouse	533 MG/KG
guinea pig	1200 MG/KG

Irritation

Skin

Maybe irritating to the skin.

Eyes

May cause eye irritation.

Repeated dose toxicity

Repeated inhalation or ingestion of naphthalene causes methemoglobine*

Developmental Toxicity

Results from repeated dose oral gavage tests with naphthalene showed fetotoxicity in rats (increase in resorptions at 450 mg/kg bwt/day) and in mice (decrease in number of live pups/litter at 300 mg/kg bwt/day) in the presence of maternal toxicity (reduction in body weight gains in rats; decrease in survival and reduction in body weight in mice).

Genetic Toxicity

Naphthalene produced chromosome damage in in vitro assays, but not in in vivo assays in which mice were administered 500 mg/kg bwt orally or 250 mg/kg bwt by intraperitoneal injection.

Carcinogenicity

The National Toxicology Program (NTP) has evaluated this substance and placed it in Group R: Reasonably Anticipated To Be A Human Carcinogen. The International Agency for Research on Cancer (IARC) has evaluated this substance and placed it in Group 2B (possibly carcinogenic to humans).

Acute toxicity to aquatic invertebrates

LC50 / 96 HOURS Chaetogammarus marinus 2.6 mg/l

Environmental fate and pathways

- Cyclopentane 287-92-3

Ecotoxicity

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS Daphnia magna. 10.5 mg/l

Environmental fate and pathways

Hydrolysis is not expected to be an important factor in the environmental fate process for this material. It is not expected to adsorb onto soils or sediments. Limited biodegradation. Expected to have high mobility in soils. This material is expected to exist solely as a vapor in the ambient atmosphere. The vapor-phase of this material is degraded in the atmosphere by reaction with photochemically-produced hydroxyl radicals and ozone.

- Cyclohexane 110-82-7

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOUR Pimephales promelas 4.53 mg/l (flow-through)

LC50 / 96 HOURS Lepomis macrochirus 34.72 mg/l

LC50 / 96 HOURS Poecilia reticulata 48.0 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS waterflea. 400 mg/l

Toxicity to aquatic plants

EC50 / 72 HOURS Scenedesmus subspicatus > 500 mg/l

Toxicity to microorganisms

EC50 / 5 min Photobacterium phosphoreum 85.5 mg/l

EC50 / 10 min Photobacterium phosphoreum 93 mg/l

Environmental fate and pathways

This material is expected to exist solely as a vapor in the ambient atmosphere. The vapor-phase of this material is degraded in the atmosphere by reaction with photochemically-produced hydroxyl radicals and ozone. It is expected to be poorly adsorbed onto soils or sediments. Volatilization from water surfaces is expected to be an important environmental fate process.

Persistence and degradability

Stability in water: In aquatic systems, this material may partition from the water column to organic matter contained in sediments and suspended materials.

Stability in soil: The potential for volatilization from dry soil surfaces may exist. Volatilization from moist soil surfaces is expected to be an important fate process of this material.

Biodegradation: This material is expected to be resistant to biodegradation.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE169
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

OP 400

Bioaccumulation: This material may bioaccumulate.

- *Benzene* 71-43-2

Ecotoxicity

Acute Fish toxicity

/96 HOURS Oncorhynchus mykiss (rainbow trout) 5.3 mg/l

Acute toxicity to aquatic invertebrates

/48 HOURS Daphnia magna. 10 mg/l

Toxicity to aquatic plants

/72 HOURS Pseudokirchneriella subcapitata (green algae) 32 mg/l

Toxicity to microorganisms

/24 HOURS Nitrosomonas sp. 13 mg/l

Chronic toxicity to fish

/32 DAY Pimephales promelas 1.6 mg/l

Chronic toxicity to aquatic invertebrates

/7 DAY Ceriodaphnia dubia 3 mg/l

Environmental fate and pathways

Mobility

Behavior in environmental compartments: When released to water, volatilization will result in substantial losses to the atmosphere with a calculated half-life in the troposphere of approximately 13.4 days. A calculated Koc value of 134.1 l/kg does not indicate a significant potential for geoaccumulation.

Persistence and degradability

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: Bioconcentration factor (BCF) ~ 10 (fish.) BCF in fish ~ 10.

- *Methyl Cyclohexane* 108-87-2

Ecotoxicity

This material may be harmful to aquatic species.

Acute Fish toxicity

LC50 /96 HOUR Golden shiner (notemigonus crysoleucas) 72 mg/l

Environmental fate and pathways

No Data Available.

- *n-Hexane* 110-54-3

Ecotoxicity

This material may be very toxic to aquatic species.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE169
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

OP 400

Acute Fish toxicity

LC50 / 96 HOUR Oncorhynchus mykiss 4.14 mg/l

LC50 / 96 HOUR Pimephales promelas 2.5 mg/l

LC50 / 96 HOURS Lepomis macrochirus 4.12 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS waterflea. 3.87 mg/l

Environmental fate and pathways

Photolysis, hydrolysis or bioconcentration of n-hexane are not expected to be an important environmental fate processes. Biodegradation of n-hexane may occur in soil and water; however, volatilization and adsorption are expected to be far more important fate processes. A Koc range of 1250 to 4100 indicates a low to slight mobility class in soil for n-hexane. In aquatic systems n-hexane may partition from the water column to organic matter contained in sediments and suspended materials. Rapid volatilization from environmental waters is expected.

Persistence and degradability

Stability in water: In aquatic systems, this material may partition from the water column to organic matter contained in sediments and suspended materials.

Biodegradation: Biodegradation may occur in soil and water, however, volatilization and adsorption are expected to be far more important fate processes.

Bioaccumulation: This material is not expected to bioaccumulate.

13. DISPOSAL CONSIDERATIONS

Maximize material recovery for reuse or recycling. Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) characteristics. Contaminated product, soil, water, container residues and spill cleanup materials may be hazardous wastes under applicable local, state or international regulations due to toxicity. Dispose of as hazardous waste in compliance with local and national regulations.

2. HAZARDS IDENTIFICATION

Emergency Overview

This material is HAZARDOUS as defined by the OSHA Hazard Communication Standard, 29CFR, 1910.1200.

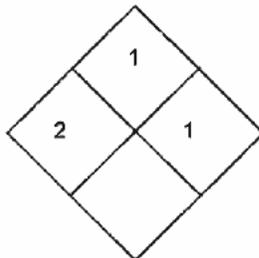

Signal Word

WARNING.

Hazards

May cause irritation of the skin. Contact with hot liquid may cause burns. Heavier than air, vapors may travel long distances along the ground before igniting and flash back to vapor source. Hydrogen sulfide (H₂S) and other hazardous vapors may evolve and collect in the headspace of storage tanks and other enclosed vessels. H₂S is an extremely flammable and a highly toxic gas. Contain 4-to-6-membered condensed-ring (polynuclear) aromatic hydrocarbons (PNAs), and possibly carbazoles. May affect the unborn. Potential cancer hazard.

<u>Component</u>	<u>CAS-No.</u>	<u>EC-No.</u>	<u>Weight %</u>
Distillates (petroleum), heavy thermal cracked	64741-81-7	265-082-4	100.0

Typical composition

4. FIRST AID MEASURES

General advice

May cause cancer. This substance may be genotoxic. May cause harm to the unborn child. Harmful by inhalation. Harmful: danger of serious damage to health by prolonged exposure in contact with skin. Inhalation of heated vapors or mists may cause central nervous system (CNS) effects including headache, drowsiness, dizziness, and blurred vision and possible cardiac sensitization.

Ingestion may cause CNS effects, discomfort and irritation of the gastrointestinal tract, nausea, vomiting, and diarrhea. May be irritating to the eyes. May be irritating to the skin. Repeated exposure may cause skin dryness or cracking. Very toxic by inhalation. H₂S vapors may cause moderate to severe eye irritation and photophobia (sensitivity to light). Always observe self-protection methods. Move out of dangerous area. Do not leave the victim unattended. Remove contaminated shoes and clothing. Get medical attention immediately. Show this material safety data sheet to the doctor in attendance.

COKER GAS OIL

Skin

All contaminated clothing should be removed, and contaminated skin areas washed with lipophilic soap, or green soap, and water. DO NOT use gasoline, kerosene, solvents, or harsh abrasive skin cleaners. Do not wash with machine dishwashing or laundry detergents. Seek medical attention if tissue appears damaged or if pain or irritation persists. In the event of a high pressure injection injury, worker should obtain immediate medical assistance. Discard contaminated leather goods.

Inhalation

Remove victim to fresh air and keep at rest in a position comfortable for breathing. Keep patient warm and at rest. If breathing is difficult, give oxygen. If unconscious place in recovery position and seek medical advice. In the event of unconsciousness, apnea or cardiac arrest (no pulse) apply cardiopulmonary resuscitation.

Eyes

In case of eye contact, remove contact lens and rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Do not use eye ointment unless directed to by a physician. If irritation, blurred vision or swelling occurs and persists, obtain medical advice from a specialist.

Ingestion

DO NOT induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. Get medical attention immediately. Do not give milk or alcoholic beverages. Never give anything by mouth to an unconscious person.

Notes to physician

Treat symptomatically. Treatment of overexposure should be directed at the control of symptoms and the clinical condition of the patient. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to this material. Gastrointestinal decontamination in accidental petroleum distillate ingestions is not recommended, because of the severe aspiration hazard.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

OSHA/NFPA Class IIIB combustible liquid.

Flash point

> 180 °C (> 356 °F)

Autoignition temperature

No Data Available.

Lower explosion limit

not determined

Upper explosion limit

not determined

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Use water spray, dry chemical, foam, or carbon dioxide. Sand LARGE FIRES: Water spray Foam Water fog. Sand Carbon dioxide (CO₂) Dry chemical Apply water carefully to avoid frothing/steam explosion.

Unsuitable extinguishing media

Do not use a solid water stream as it may scatter and spread fire. Simultaneous use of foam and water on the same surface is to be avoided as water destroys the foam.

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear positive pressure self-contained breathing apparatus (SCBA). Structural firefighters protective clothing will only

MATERIAL SAFETY DATA SHEET

MSDS No.: BE93
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/05/2011

COKER GAS OIL

provide limited protection.

Precautions for fire-fighting

This material will release vapors when heated above the flash point temperature that can ignite when exposed to a source of ignition. Vapors may travel long distances along the ground before reaching a source of ignition and flashing back. Move containers from fire area if you can do it without risk. Fight from a maximum distance or use unmanned hose holders or monitor nozzles. Containers can build up pressure if exposed to heat; cool with flooding quantities of water until well after the fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of vessel. Always stay away from the ends of tanks. Contents under pressure and can explode when exposed to heat or flames. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. When mixed with air and exposed to ignition source, vapors can burn in open or explode if confined. Burning liquid may float on water. Apply aqueous extinguishing media carefully to any molten/liquid material to prevent frothing/steam explosion. Prevent fire extinguishing water from contaminating surface water or the ground water system. Notify authorities immediately if liquid enters sewer/public waters. Fire residues and contaminated fire extinguishing water must be disposed of in accordance with local regulations.

Hazardous combustion products

Carbon monoxide, carbon dioxide and unburned hydrocarbons (smoke). May also include hydrogen sulfide, sulfur oxides or sulfuric acid.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Contain/collect rapidly to minimize dispersion. Release causes immediate fire/explosion hazard. Evacuate/limit access. Eliminate all sources of ignition. If liquid is hot, let cool naturally. Notify fire and environmental authorities. Note: recommended measures are based on the most likely spillage scenarios for this material; however, local conditions (wind, air temperature, wave/current direction and speed) may significantly influence the choice of appropriate actions. For this reason, local experts should be consulted when necessary. Local regulations may also prescribe or limit actions to be taken. Use clean non-sparking tools to collect absorbed material. All equipment used when handling this product must be grounded. Do not touch or walk through spilled material. Stop leak if you can do it without risk. A vapor suppressing foam may be used to reduce vapors. Absorb or cover with dry earth, sand or other non-combustible material and transfer to containers. For large spills: Contain spill with dike to prevent entry into sewers or waterways. Water spray may reduce vapor; but may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. DO NOT use water jet. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place contaminated materials into appropriate containers for disposal. On water, contain/minimize dispersion/collect. Remove from surface water (e.g. by skimming or siphoning). The use of dispersants should be advised by an expert, and, if required, approved by local authorities.

If the product contaminates rivers and lakes or drains inform respective authorities.

7. HANDLING AND STORAGE

Handling

Use only with adequate ventilation and in closed systems. Ensure all equipment is electrically grounded before beginning transfer operations. Eliminate all sources of ignition. Liquid material is slippery-remove small leaks/spills from walking surface with solid absorbent. Odor is not an adequate warning of potentially hazardous ambient air concentrations. Do not pressurize, cut, weld, braze solder, drill, or grind on containers. Check atmosphere for explosiveness and oxygen deficiencies. (Subject to applicability): Concentration of hydrogen sulfide (H₂S) in tank headspaces may reach hazardous values, especially in case of prolonged storage. This situation is especially relevant for those operations which involve direct exposure to the vapors in the tank.

If sulfur compounds are suspected to be present in the product, check the atmosphere for hydrogen sulfide (H₂S) content. Do not handle near heat, sparks, or open flame. Use good housekeeping practices during use, storage, transfer, and handling. Electrostatic charges may be generated as a result of flow or agitation. Do not use compressed air for filling, discharging or handling. Special slow load procedures for 'switch loading' must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point hydrocarbon products. This liquid may accumulate static electricity even when transferred into properly grounded

MATERIAL SAFETY DATA SHEET

MSDS No.: BE93
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 07/05/2011

COKER GAS OIL

Handling

containers. Always keep nozzle in contact with the container throughout the loading process. Static electricity accumulation may be significantly increased by the presence of small quantities of water. Use only non-sparking tools. Avoid contact with incompatible agents. Handle empty containers with care; vapor/residue may be flammable. Ensure that all relevant regulations regarding explosive atmospheres, and handling and storage facilities of flammable products are followed.

Storage

Vapor space above stored liquid may be flammable/explosive unless blanketed with inert gas. Electrical installations / working materials must comply with the technological safety standards. Hydrogen sulfide (H₂S) and other hazardous vapors may evolve and collect in the headspace of storage tanks and other enclosed vessels. H₂S is an extremely flammable and a highly toxic gas. Store in original container. Store closed drums with bung in up position. Keep away from all ignition sources; segregate from incompatible materials. Keep containers tightly closed in a dry, cool, well-ventilated place, plainly labeled, and out of closed vehicles. Ground all containers, transfer vessels, and equipment containing this material. Containers should be able to withstand pressures expected from warming or cooling during storage. Flammable materials should be stored in separate safety storage cabinet or room. Bonding and grounding measures may not be enough if nonconductive flammables are involved. Recommended materials: For containers, or container linings use mild steel, stainless steel. Unsuitable materials: Some synthetic materials may be unsuitable for container or container linings depending on the material specification and intended use. Compatibility should be checked with the manufacturer.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Engineering controls, preferably enclosed systems, should be used whenever feasible to maintain exposures below acceptable criteria. When such controls are not feasible, or sufficient to achieve full conformance, other engineering controls such as local exhaust ventilation should be used. Where engineering controls are not feasible use adequate local exhaust ventilation wherever mist, spray or vapor may be generated. Provide local exhaust or general room ventilation to minimize exposure to vapors. Emergency shower and eyewash facility should be in close proximity (ANSI Z358.1)

Personal protective equipment

Inhalation

Use an approved respirator, either air-supplied or air purifying (consult your company safety professional for guidance). The type of respiratory protection will depend upon whether the maximum exposure concentration is known. Consider the maximum period for wear. If exposure exceeds the standard limits, respiratory protection equipment which meets 29 U.S. Code of Federal Regulations (CFR) 1910.134 and is U.S. National Institute for Occupational Safety and Health (NIOSH) approved must be worn. Organic vapor or supplied air respirator may be appropriate. Respirator selection and use should comply with OSHA 29 CFR 1910.134 or ANSI Z88.2.

Skin

Impervious gloves Wear chemical resistant gloves such as: Neoprene, Nitrile, Vinyl Butyl Rubber Gloves, or PVC Avoid contact with skin. Skin should be washed after contact. Flame retardant protective clothing Choose body protection in relation to its type, to the concentration and amount of dangerous substances, and to the specific work-place. Avoid contact with skin. Immediately remove all contaminated clothing. Use PPE that is chemical resistant to the product and prevents skin contact.

Eyes

Wear safety glasses. Where the opportunity for a splash or spray caused by high pressure or agitation of the material is possible, use a face shield and chemical goggles.

Remarks

Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use.

COKER GAS OIL

10. STABILITY AND REACTIVITY

Chemical stability

Stable under recommended storage conditions.

Conditions to avoid

Heat, flames and sparks. Avoid static discharge or other sources of ignition. Electrostatic charges may be generated as a result of flow or agitation.

Materials to avoid

Strong acids and oxidizing agents

11. TOXICOLOGICAL INFORMATION

Product information

Acute toxicity

<u>LC50 (aerosol)</u>	rat	4.1 MG/L
<u>LD50 (Oral)</u>	rat	4,320 MG/KG
<u>LD50 (Skin)</u>	rabbit	> 2000 MK/KG

Acute effects

Inhalation

Predicted exposure concentration Stream expected to have a low order of acute inhalation toxicity based on toxicity information for streams having components in common with this stream.

Skin contact

Predicted exposure concentration Stream expected to have a low order of acute dermal toxicity based on toxicity information for streams having components in common with this stream.

Irritation

Skin

Stream expected to be no more than slightly irritating to the skin based on toxicity information for streams having components in common with this stream. These effects are not considered to warrant classification as a skin irritant

Eyes

Stream expected to be no more than transient, fully reversible irritating to the eye based on toxicity information for streams having components in common with this stream. These effects are not considered to warrant classification as an eye irritant.

Sensitization

Stream expected not to be a sensitizer based on toxicity information for streams having components in common with this stream.

Target Organs

Damages developing fetus.

Repeated dose toxicity

May cause damage to organs through prolonged or repeated exposure. Stream expected to be toxic to target organs with

MATERIAL SAFETY DATA SHEET

MSDS No.: BE93
 Variant: U.S.A.-BN
 Revision: 1.0
 Validation Date: 07/05/2011

COKER GAS OIL

repeated exposure based on toxicity information for streams having components in common with this stream. Results of repeated exposure toxicity testing indicate alterations in serum cholesterol and blood urea nitrogen at high dermal doses accompanied by red blood cell, platelet, liver, and thymus effects at lower exposure levels.

Reproductive effects

Stream expected not to be toxic to reproduction based on toxicity information for streams having components in common with this stream.

Developmental Toxicity

Suspected of damaging the unborn child. Stream expected to be toxic to development based on toxicity information for streams having components in common with this stream. Results of developmental toxicity testing indicate alterations in fetal and pup development, which sometimes occurred in the presence of maternal toxicity.

Genetic Toxicity

Not mutagenic. Stream expected to be not mutagenic based on toxicity information for streams having components in common with this stream.

Carcinogenicity

Stream expected to be carcinogenic based on toxicity information for streams having components in common with this stream. Results obtained from the modified Ames test, from mouse skin painting tests and initiation/promotion assay along with chemical (PAH) analysis indicate that Heavy Fuel Oil streams are carcinogenic.

COMPONENT INFORMATION

- *Distillates (petroleum), heavy thermal cracked 64741-81-7*

12. ECOLOGICAL INFORMATION

Product information

Ecotoxicity

Acute Fish toxicity

LL50 / 96 HOURS *Oncorhynchus mykiss* (rainbow trout) 79 mg/l

Acute toxicity to aquatic invertebrates

static test / 48 HOURS *Daphnia magna* (Water flea) 2 mg/l

Toxicity to aquatic plants

EL50 / 72 HOURS 0.75 mg/l

Toxicity to microorganisms

LL50 / 0.72 HOURS *Tetrahymena pyriformis* (ciliated protozoa) > 1,000 mg/l

Summary: Based on Quantitative structure-activity relationship (QSAR) estimation.

Chronic toxicity to fish

NOEC / 0.1 mg/l

Summary: Based on Quantitative structure-activity relationship (QSAR) estimation.

13. DISPOSAL CONSIDERATIONS

Dispose of as hazardous waste in compliance with local and national regulations. The product should not be allowed to enter drains, water courses or the soil. Proper grounding procedures to avoid static electricity should be followed. Can be incinerated, when in compliance with local regulations. Contaminated product, soil or water should be considered dangerous due to potential evolution of flammable vapor.

14. TRANSPORT INFORMATION

2. HAZARDS IDENTIFICATION

Emergency Overview

This material is HAZARDOUS as defined by the OSHA Hazard Communication Standard, 29CFR, 1910.1200.

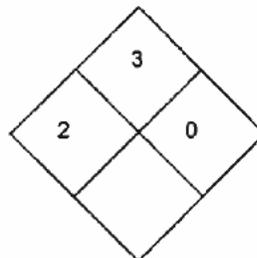

Signal Word

DANGER.

Hazards

Extremely flammable liquid. Harmful if inhaled or absorbed through the skin. Harmful or fatal if swallowed. CNS depressant. Aspiration hazard Contains material which can cause cancer. Mutagenic Substance. Vapors may form explosive mixtures with air. Vapors can travel to a source of ignition and flash back. Vapors explosion hazard indoors, outdoors or in sewers. Slipping hazard if spilled on hard smooth walking surface.

REFORMER FEED UNFINISHED

Odor

Aromatic or gasoline-like odor.

Odor Threshold

No value available.

Potential health effects

Routes of exposure

Inhalation Skin Absorption Eyes

- *Methylcyclopentane* 96-37-7

This product may cause eye, skin, and respiratory tract irritation. High concentrations may cause central nervous system (CNS) depression. Ingestion would likely cause gastrointestinal tract irritation.

- *n-Hexane* 110-54-3

May cause irritation to the eyes, nausea, vertigo, bronchial and central nervous system effects. This material presents an acute aspiration hazard. May be irritating to the skin. High or repeated exposures can damage the peripheral nervous system, causing numbness, tingling, and/or muscle weakness in the hands or feet. The onset of health effects associated with n-hexane may be influenced by exposure to additional chemicals such as methyl isobutyl ketone and methyl ethyl ketone.

- *Benzene* 71-43-2

Slight acute toxicity. Inhalation exposure to high concentrations may cause dizziness and CNS depression. Ingestion of relatively small amounts may be fatal if aspiration into the lungs takes place.

- *Methyl Cyclohexane* 108-87-2

Liquid, mist, or vapors can cause eye, skin and respiratory tract irritation. CNS depressant. Exposure to excess vapor may cause headache, fatigue, drowsiness and dizziness.

- *Toluene* 108-88-3

Toluene is of slight acute toxicity, although inhalation exposure may cause dizziness and CNS depression, while ingestion may be fatal if aspiration into the lung occurs. Toluene may increase the sensitivity of the heart leading to potentially fatal cardiac sensitization. It is moderately irritating to skin and eye.

- *Xylene* 1330-20-7

May be irritating to the eyes, skin, and respiratory system. Aspiration hazard. Ingestion of this material, followed by vomiting and aspiration of the more volatile components of this material into the lungs, may lead to chemical pneumonia and even death.

- *Ethyl Benzene* 100-41-4

Inhalation hazard. Ingestion hazard. Skin and eye irritant.

- *Cumene* 98-82-8

Slight eye irritant. Slight skin irritant. Aspiration hazard. CNS depressant.

- *Trimethyl benzene* 25551-13-7

CNS depressant. Aspiration hazard.

- *Ethyl Toluene* 25550-14-5

May be irritating to the skin.

- *Naphthalene* 91-20-3

May be irritating to the eyes, skin and respiratory tract. Direct contact with the eye may cause corneal damage. May be toxic by all routes of exposure. Target organs for toxic effects include the blood, liver, kidneys, eyes, and central nervous system (CNS). Symptoms of overexposure may include headache, restlessness, lethargy, vomiting, anorexia, anemia, diminished vision, and acute kidney failure. Individuals who have an inherited G6PD deficiency in their red blood cells may be particularly sensitive to the toxic effects of Naphthalene. Naphthalene can cross the placenta and harm the fetus.

Skin

May be absorbed through the skin and produce toxic effects such as CNS depression. May cause dermatitis by defatting the skin from prolonged or repeated contact.

Inhalation

High concentrations can displace oxygen and cause drowsiness, dizziness, unconsciousness and/or suffocation by asphyxiation.

Ingestion

MATERIAL SAFETY DATA SHEET

MSDS No.: BE174
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

REFORMER FEED UNFINISHED

Ingestion

Readily absorbed upon ingestion and may produce toxic effects similar to those resulting from inhalation exposure. Ingestion followed by vomiting could result in aspiration into the lungs of the more volatile components of this material which in turn could lead to life-threatening chemical pneumonia.

- *Methylcyclopentane 96-37-7*

Repeated exposure can cause peripheral nerve damage and defatting of the skin.

- *n-Hexane 110-54-3*

Damage to nerves in hands or feet may occur from prolonged inhalation of n-hexane concentrations of 60 to 240 ppm. Repeated exposure to air concentrations of 500 ppm n-hexane can produce progressively worsening damage to the peripheral nerves. Prolonged and repeated exposure to vapors may cause damage to the CNS, lungs and kidneys. Suspect reproductive hazard.

- *Benzene 71-43-2*

Benzene is considered to be a cancer-causing agent. Repeated exposure is linked to bone marrow toxicity, reduced red- and white blood cell counts and decreased immunological function irrespective of the route of contact.

- *Methyl Cyclohexane 108-87-2*

Repeated or prolonged contact with skin may cause defatting and drying of the skin which may result in dermatitis.

- *Toluene 108-88-3*

Repeated exposure to high concentrations has been shown to cause neurological changes and hearing loss in animals, and in humans in abuse situations. May cause developmental toxicity.

- *Xylene 1330-20-7*

May cause dermatitis by defatting the skin from prolonged or repeated contact. May contribute to the development of diseases of the nervous system, liver and kidney. May be a reproductive hazard.

- *Ethyl Benzene 100-41-4*

May effect hearing. Repeated or prolonged exposure may damage liver and kidneys. Possible cancer hazard. Repeated contact with skin may cause cracking and/or fissuring.

- *Cumene 98-82-8*

This material has been classified by IARC as a group 2B substance (possibly carcinogenic to humans). Prolonged and/or repeated contact may cause mild to moderate skin defatting, redness, blistering, lesions, and/or scaly dermatitis. May cause kidney and/or lung damage.

- *Trimethyl benzene 25551-13-7*

No adverse chronic human health effects have been reported for this material.

- *Ethyl Toluene 25550-14-5*

Specific data not available.

- *Naphthalene 91-20-3*

Target organs for toxic effects of chronic exposure include the blood, the skin, the eyes, and the central nervous system. Symptoms of chronic overexposure may include dermatitis, anemia, sores on the eye or cloudiness of the eyeball, diseases involving the nerves or nervous system, and allergic skin reactions. Potential Cancer Hazard, see section 11.

Typical composition

4. FIRST AID MEASURES

Skin

Remove contaminated clothing and shoes. Immediately flush the contact area with plenty of low pressure water to cool the skin. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.

Inhalation

Move to fresh air. If not breathing, give artificial respiration. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, give oxygen. Get immediate medical advice/ attention.

Eyes

Remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart and flush eyes with plenty of water for at least 15 minutes. Get medical attention. Do not use eye ointment unless directed to by a physician.

Ingestion

Do NOT induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. If victim is drowsy or unconscious, place on the left side with head down. Do not leave victim unattended. Obtain medical attention.

Notes to physician

Treat symptomatically.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

OSHA/NFPA Class IB Flammable Liquid.

Flash point

-9 - -6 °C (15.8 - 21.2 °F) closed cup

 ~ 0.9 vol%

Upper explosion limit
 ~ 7.0 vol%

Extinguishing Media

Suitable extinguishing media

Extinguishing media - small fires Drychemical Carbon dioxide (CO₂) Foam Water fog. Inert gas. Extinguishing media - large fires **LARGE FIRE:** Use water spray, water fog or foam. **DO NOT** use straight streams

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies.

Precautions for fire-fighting

Fire Hazard Releases flammable vapors below normal ambient temperatures. When mixed with air and exposed to ignition source, vapors can burn in open or explode if confined. Flammable vapors may be heavier than air and travel long distances along the ground before igniting and flashing back to vapor source. If container is not properly cooled, it can rupture in the heat of a fire.

Hazardous combustion products

Hazardous decomposition products formed under fire conditions. Carbon monoxide, carbon dioxide and unburned hydrocarbons (smoke).

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Contain spillage, soak up with non-combustible absorbent material, (e.g. sand, earth, diatomaceous earth, vermiculite) and transfer to a container for disposal according to local / national regulations (see section 13). Use clean non-sparking tools to collect absorbed material.

7. HANDLING AND STORAGE

Handling

Do not handle near heat, sparks, or flame. Avoid contact with incompatible agents. Use only with adequate ventilation/personal protection. Avoid contact with eyes, skin and clothing. Do not enter storage area unless adequately ventilated. Metal containers involved in the transfer of this material should be grounded and bonded. Never siphon by mouth. Do not breathe vapor. Prevent contact with food, chewing, or smoking materials. **Do not take internally.** When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Use only with adequate ventilation/personal protection. Avoid contact with eyes, skin and clothing. Wash thoroughly after handling. Prevent contact with food, chewing, or smoking materials. All sampling should be conducted in a manner which avoids skin contact and inhalation of vapors. Clean up any spilled material. Parts and equipment using or containing this material should be steam-cleaned if possible prior to all maintenance procedures. Empty containers retain some liquid and vapor residue and can be dangerous, so all hazard precautions must be observed when handling empties. Do not pressurize, cut, weld, braze, solder, drill, grind, or expose containers to heat, flame, sparks, static electricity, or other sources of ignition. Empty drums should be completely drained, properly bunged and promptly disposed of or reconditioned. Special slow load procedures for 'switch loading' must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point hydrocarbon products. Electrostatic charges may be generated as a result of flow or agitation.

Storage

Handle empty containers with care - residue may be combustible. Vapors may form explosive mixtures with air. Vapor

MATERIAL SAFETY DATA SHEET

MSDS No.: BE174
 Variant: U.S.A.-BN
 Revision: 1.2
 Validation Date: 05/20/2011

REFORMER FEED UNFINISHED

Storage

space above stored liquid may be flammable/explosive unless blanketed with inert gas. Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved. Refer to NFPA 77 for relevant consensus guidance. This liquid may accumulate static electricity even when transferred into properly grounded containers. Static electricity accumulation may be significantly increased by the presence of small quantities of water. Store and transport in accordance with all applicable laws. Store containers in a cool, dry, ventilated, fire resistant area away from sources of ignition and incompatible materials. Refrigeration preferred. Refer to NFPA77 and API RP-2003 for relevant consensus guidance.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of mists and/or vapors below the recommended exposure limits. Ensure that eyewash stations and safety showers are close to the workstation location.

Personal protective equipment

Inhalation

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Organic vapor or supplied air respirator may be appropriate. Respirator selection and use should comply with OSHA 29 CFR 1910.134 or ANSI Z88.2.

Skin

Wear long-sleeved fire-retardant garments (e.g., Nomex (R)) while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, boots, and additional facial protection.

Eyes

Safety glasses with side-shields. Use splash goggles when eye contact due to splashing or spraying liquid is possible.

Occupational Exposure Limits

Consult local authorities for acceptable exposure limits.

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance: liquid colorless, to, light yellow

Odor: Aromatic or gasoline-like odor.

Odor Threshold: No value available.

pH: Not applicable.

Boiling point/boiling range: 80 - 235 °C (176 - 455 °F)

Melting/freezing point: < -46 °C (< -50.8 °F)

Flash point: -9 - -6 °C (15.8 - 21.2 °F) closed cup

11. TOXICOLOGICAL INFORMATION

Product Information

Product Summary

No toxicology information is available.

COMPONENT INFORMATION

MATERIAL SAFETY DATA SHEET

MSDS No.: BE174
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

REFORMER FEED UNFINISHED

- *Gasoline, Straight Run* 68606-11-1

Other information

No data available.

- *Methylcyclopentane* 96-37-7

Target Organs

Skin. Eye. Respiratory system. Nervous system.

Repeated dose toxicity

Repeated exposure can cause peripheral nerve damage and defatting of the skin.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *n-Hexane* 110-54-3

Acute toxicity

<u>LC50 (Inhl)</u>	rat	48,000 PPM	4 HOURS
<u>LD50 (Oral)</u>	rat	28,710 MG/KG	
<u>LD50 (Skin)</u>	rabbit	3000 MG/KG	

Irritation

Eyes

Eye irritant.

Target Organs

Skin. Eye. Respiratory system. Central nervous system effects. Peripheral nervous system Testes.

Repeated dose toxicity

Rabbits exposed by inhalation to 3,000 ppm 8 hours/day for 8 days showed changes in the lungs, emphysema, necrosis of the bronchial epithelium, and atelectasis. Rats continuously exposed to 400 ppm developed anoxapathy, although intermittent exposure to 10,000 ppm 6 hours/day, 5 days/week for 13 weeks caused only mild paranodal axonal swelling. The offspring of rats and mice exposed orally or by inhalation to n-hexane during gestation showed depressed weight gain after birth. This agent also affects male and female reproductive capacity.

Reproductive effects

Exposure to n-hexane may damage the developing fetus.

Developmental Toxicity

Causes productive and embryotoxic effects and is cytotoxic in mammalian and human test systems.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

Other information

Exposure of humans to 5,000 ppm n-hexane for 10 minutes causes marked vertigo; exposure to 1,500 ppm results in headache and slight nausea. In industrial settings, exposure to levels exceeding 1,000 ppm have been reported to cause mild symptoms of narcosis. Eye and upper respiratory tract irritation has been reported to occur in humans exposed to 880 ppm n-hexane for 15 minutes. Dermal contact with n-hexane results in immediate irritation characterized by erythema and hyperemia; exposed subjects developed blisters 5 hours following dermal exposure to n-hexane. The neuropathic toxicity of n-n-hexane in humans is well documented; cases of polyneuropathy have typically occurred in humans chronically exposed to levels of n-hexane ranging from 400 to 600 ppm, with occasional exposures up to 2,500 ppm. Distal symmetrical motor weakness is common in most cases; however, in severely affected individuals, motor weakness may extend to the pelvic and high musculature. Nerve biopsies in affected individuals show swelling of the nerve and thinning of the myelin sheath. Functional neurological disturbances usually progress for a few months after termination of exposure. Although recovery is expected to occur within a year, clinical polyneuropathy has been reported in some cases to remain after 2 years. Blurred vision, restricted visual field, and optic nerve atrophy has been reported to occur in association with n-hexane-induced polyneuropathy.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE174
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

REFORMER FEED UNFINISHED

- *Benzene* 71-43-2

Acute toxicity

rat	13,700 PPM	4 HOURS
rabbit	> 8260 MG/KG BWT	

Acute effects

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations.

Ingestion

May cause CNS depression, gastric discomfort, and vomiting. This material is an aspiration hazard.

Skin contact

No systemic toxicity is expected from acute dermal exposure.

Target Organs

Damages bone marrow. Eye. Skin.

Repeated dose toxicity

The hematopoietic system is the primary target for benzene, irrespective of the route of exposure. Broadly similar effects are seen in rodents and humans, including bone marrow toxicity and reduced red- and white blood cell counts.

Reproductive effects

Results from animal studies are inconsistent, with adverse effects on the ovary and testis reported in mice following repeated inhalation exposure but no effects on the gonads or on fertility observed in rats exposed under similar conditions. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Developmental Toxicity

Results from animal studies clearly demonstrate that benzene is not a teratogen, however mild fetotoxicity (including lowered bodyweight, delayed ossification and sub-clinical hematological changes) have been observed in rodents exposed during pregnancy, generally in association with maternal toxicity. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Genetic Toxicity

Benzene is genotoxic in vivo, and induces chromosomal aberrations and micronuclei in rats and mice following oral or inhalation exposure. Comparable changes would be anticipated in humans. The incidence of micronuclei in fetal rat liver is increased following administration of large doses by intraperitoneal injection to pregnant mice, while high-level oral exposure induced chromosomal aberrations in germ cells from male mice. The relevance to humans of these latter findings is not known.

Carcinogenicity

Benzene is a multi-site animal carcinogen, producing tumors in hematopoietic- and epithelial tissues after long term inhalation or oral exposure. Epidemiology studies confirm it is a human carcinogen, causing primarily acute non-lymphocytic leukemia.

- *Methyl Cyclohexane* 108-87-2

Acute toxicity

<u>LD50 (Oral)</u>	rat	> 3,200 MG/KG
--------------------	-----	---------------

Irritation

Skin

May be irritating to the skin. Repeated or prolonged contact with skin may cause dermatitis.

Eyes

May cause eye irritation.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE174
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

REFORMER FEED UNFINISHED

Skin. Eye. Respiratory system. Central nervous system effects.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA

- *Toluene* 108-88-3

Acute toxicity

<u>LC50 (vapor)</u>	rat	7500 PPM	4 HOURS
	rat	5,580 MG/KG BWT	
	Rabbit.	> 5000 MG/KG BWT	

Acute effects

Inhalation

Vapors or aerosol may cause irritation of the eyes, nose and throat as well as CNS depression (fatigue, dizziness, loss of concentration, with collapse, coma and death possible in cases of severe overexposure).

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract and CNS depression (fatigue, dizziness, collapse, coma and death). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

Moderate skin irritant.

Eyes

Moderate eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Skin. Eye. Hearing. Nasal cavity. central nervous system (CNS) Heart

Repeated dose toxicity

No evidence of systemic toxicity was reported in rats exposed to 1.15 mg/l (300 ppm) toluene vapor for two years, while higher exposures were associated with inflammation and degeneration of nasal epithelial tissue. Rats exposed repeatedly to very high concentrations of toluene exhibited neurological changes and permanent hearing loss. Clinical case reports indicate the occurrence of serious and persistent changes (including tremor, ataxia, memory impairment and possible hearing loss) in humans following deliberate over-exposure to toluene in abuse situations. The relevance of these findings to low level occupational exposure to toluene is not known.

Reproductive effects

Studies in animals demonstrate no histopathological lesions in testes or ovaries of rats and mice exposed to 9.4 mg/l (2500 ppm) toluene vapor for 14-15 weeks, and no loss of fertility in male rats after exposure to 7.5 mg/l (2000 ppm) for a similar period of time. Epididymal weights and sperm counts were decreased in one study, but the absence of any adverse effect on reproduction makes the functional relevance of these observations unclear. No reliable human data are available.

Developmental Toxicity

Studies in pregnant rats demonstrate that toluene is not a teratogen, however mild fetotoxicity (lower body weight, delayed ossification, delayed physical development) may occur in the absence of maternal toxicity at exposures in the range 1.9-2.8 mg/l (500-750 ppm). Other studies describe adverse effects on learning and cognitive functions in rat pups exposed to 4.5-6.7 mg/l (1200-1800 ppm) in utero, although it is unclear if end-points evaluated in these tests are directly relevant to humans.

Genetic Toxicity

In vitro and in vivo mutagenicity tests were negative.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE174
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

REFORMER FEED UNFINISHED

Carcinogenicity

Inhalation studies in rats and mice demonstrate that toluene is not a carcinogen. It has been used extensively as a solvent in rodent skin painting studies with occasional slight increases in tumor incidence reported: an epigenetic mechanism (based on irritation rather than genotoxicity) may underpin these findings. Toluene is considered a Group 3 substance by IARC, not classifiable as to its carcinogenicity to humans.

- *Xylene* 1330-20-7

Acute toxicity

<u>LC50 (Inhl)</u>	rat	5000 PPM	4 HOURS
	mouse	3907 MG/KG	6 HOURS
	rat	4550 PPM	4 HOURS

LD50 (Oral) rat 4300 MG/KG

LD50 (Skin) rabbit >1700 MG/KG

Irritation

Skin

Moderate skin irritant. May cause dermatitis by defatting the skin from prolonged or repeated contact.

Eyes

This material is expected to be a mild eye irritant. Xylenes are irritating to the eyes with the potential to cause conjunctivitis and corneal opacity.

Target Organs

Skin. Eye. central nervous system (CNS)

Repeated dose toxicity

Repeated inhalation exposures of rats to xylenes cause liver effects at 920 ppm (4.0 mg/L) and ototoxicity at \geq 800 ppm (3.48 mg/L). Repeated oral exposures to xylenes produce reductions in body weight in male rats at 500 mg/kg bwt/day; liver effects and hyaline droplet formation in male rats at \geq 150 mg/kg bwt/day; kidney effects in male and female rats at \geq 750 mg/kg bwt/day; and a reduction in bodyweight gain in male mice at \geq 250 mg/kg bwt/day. Repeated inhalation exposures of gerbils to \geq 160 ppm (0.70 mg/L) xylenes cause apparently irreversible CNS effects.

Reproductive effects

A reproductive toxicity study, two dominant lethal studies, and evaluation of reproductive organs in repeated dose studies indicate that xylenes do not affect reproductive performance or induce structural damage to reproductive organs of laboratory animals at non-anesthetic doses. However, xylenes have been shown to produce damage to reproductive organs in rats repeatedly exposed to extremely high, anesthetic doses.

Developmental Toxicity

Results from animal studies demonstrate that xylenes may cause reduced fetal weight and delayed ossification, but not malformations, at inhalation dose levels causing no or only slight maternal toxicity (\geq 115 ppm or 0.5 mg/L). Slight neurobehavioral effects were noted in offspring of rats exposed to 500 ppm (2.2 mg/L) in the absence of maternal toxicity.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *Ethyl Benzene* 100-41-4

Acute toxicity

 Validation Date: 05/20/2011

REFORMER FEED UNFINISHED

concentration, with collapse, coma and death in cases of severe over-exposure) May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract. High doses may cause CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization. Aspiration may cause pulmonary edema and pneumonitis.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring. While skin absorption is a potential route of exposure, no adverse health effects are anticipated following accidental or incidental contact.

Irritation

Skin

This product is expected to be an skin irritant.

Eyes

Moderate to severe eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Central nervous system. Lung. Liver. Kidneys. Thyroid. Blood. Hearing. heart

Repeated dose toxicity

No adverse effects were present in rats or mice exposed to 1000 ppm (4.3 mg/l) ethylbenzene vapor for up to 13 weeks. Longer-term exposure resulted in an increased incidence of chronic progressive nephropathy (CPN) in kidneys from rats inhaling 750 ppm (3.3 mg/l) for up to two years. Since CPN is a spontaneous age-related condition specific to rodents, these findings are of doubtful relevance to humans. Mice exposed chronically under similar conditions responded with changes in the lung, liver and thyroid. Additional effects in rats observed with repeated oral exposure of \geq 250 mg bwt/day ethyl benzene for 90 days include changes in hematology (indicative of a mild regenerative anemia) and clinical chemistry parameters (indicative of hepatic microsomal enzyme induction), decreases in prothrombin time, mild alimentary effects and liver pathology. A standard neurotoxicity protocol study conducted in young adult rats did not find neurotoxic effects following repeated daily oral exposure to doses up to 500 mg/kg bwt/day. Specialist investigations provide evidence of hearing loss in rats following repeated exposure (13 weeks) to concentrations of 200 ppm (0.85 mg/l) and above. Ethyl benzene at up to 500 ppm vapor concentration did not adversely affect the functional ability of the humoral component of the immune system of rats as measured by splenic IgM antibody forming cell response to the T-dependent antigen, sheep erythrocytes.

Reproductive effects

No parental, neonatal, or reproductive toxicity was observed following inhalation exposure of rats to up to 500 ppm or 500 ppm/342 mg/kg bwt/day ethylbenzene. Histopathological examination of reproductive tissue from rats, mice and rabbits has generally revealed no adverse changes following sub-chronic- or chronic inhalation exposure to high vapor concentrations. An increased incidence of testicular tumors in F344 male rats exposed to 750 ppm (3.3 mg/l) ethylbenzene vapor for 2 years is considered of doubtful relevance to reproductive toxicity.

Developmental Toxicity

Decreased fetal body weight and an increased occurrence of skeletal and other variations were reported in the presence of concurrent maternal toxicity (CNS effects, decreased body weight, liver enlargement) when female rats were exposed to ethylbenzene concentrations of 1000 ppm (4.3 mg/l) or above throughout pregnancy. No adverse effects to neurodevelopment were observed in rats exposed to 500 ppm/342 mg/kg bwt/day ethylbenzene.

Genetic Toxicity

No increase in micronuclei or hepatic UDS was observed in mice after treatment with ethylbenzene in vivo. It was not genotoxic in microbial systems, nor did it induce chromosomal aberrations or sister chromatid exchanges in mammalian cells in vitro. Variable results were obtained for mutation at the TK⁺/- locus in L5178Y cells, although the most reliable study that utilized the current standard study protocol and doses that were not significantly cytotoxic gave a negative mutagenic response. The overall weight of evidence indicates that ethylbenzene is not genotoxic.

Carcinogenicity

The carcinogenic potential of ethylbenzene after inhalation exposure has been investigated in two recent regulatory guideline studies performed by NTP. Male rats exposed to 750 ppm (3.3 mg/l) over 2 years showed an increased incidence of testicular interstitial cell adenoma, a common tumor present also in a large majority of the untreated males included in the

MATERIAL SAFETY DATA SHEET

MSDS No.: BE174
 Variant: U.S.A.-EN
 Revision: 1.2
 Validation Date: 05/20/2011

REFORMER FEED UNFINISHED

study. High level exposure was also linked with an increased incidence of kidney tumors in both sexes; the appearance of these lesions was strongly associated with the development of Chronic Progressive Nephropathy, a spontaneous age-related disease of rats with no equivalent counterpart in humans. Male mice exposed to 750 ppm ethylbenzene for 2 years responded with an increased incidence of lung tumors, while the incidence of liver tumors was increased in females. Mechanistic studies suggest that these lesions in the mouse developed secondary to enhanced cell proliferation in these tissues, while the weight of evidence from mutagenicity testing also indicates that a non-genotoxic mechanism was involved. Listed by IARC as possibly carcinogenic in humans (Group 2B).

- *Cumene* 98-82-8

Acute toxicity

<u>LC50 (Inhl)</u>	rat	39000 MG/M3	4 HOURS
<u>LD50 (Oral)</u>	rat	1400 MG/KG	
<u>LD50 (Skin)</u>	rabbit	> 3160 MG/KG	

Irritation

Skin

Slight skin irritant. May cause dermatitis by defatting the skin from prolonged or repeated contact.

Eyes

Slight eye irritant.

Sensitization

Not expected to be a sensitizer.

Target Organs

Central nervous system. Skin. Eye. Respiratory system. Nasal cavity. Kidney Liver Lungs

Reproductive effects

This substance is not expected to be a reproductive toxicant.

Genetic Toxicity

Negative for genotoxicity using both in vitro and in vivo tests.

Carcinogenicity

The NTP has found that Cumene causes increased incidences of combined benign and malign kidney tumors in male rats, and malignant lung tumors in mice of both sexes. This material has been classified by IARC as a group 2B substance (possibly carcinogenic to humans).

Repeated exposure may cause liver and kidney damage.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *Naphthalene* 91-20-3

Acute toxicity

LC50 (Inhl) rat >340 MG/M3 4 HOUR

LD50 (Oral) rat 490 MG/KG
 mouse 533 MG/KG
 guinea pig 1200 MG/KG

Irritation

Skin

May be irritating to the skin.

Eyes

May cause eye irritation.

Repeated dose toxicity

Repeated inhalation or ingestion of naphthalene causes methemoglobinemia*

Developmental Toxicity

Results from repeated dose oral gavage tests with naphthalene showed fetotoxicity in rats (increase in resorptions at 450 mg/kg bwt/day) and in mice (decrease in number of live pups/litter at 300 mg/kg bwt/day) in the presence of maternal toxicity (reduction in body weight gains in rats; decrease in survival and reduction in body weight in mice).

Genetic Toxicity

Naphthalene produced chromosome damage in in vitro assays, but not in in vivo assays in which mice were administered 500 mg/kg bwt orally or 250 mg/kg bwt by intraperitoneal injection.

Carcinogenicity

The National Toxicology Program (NTP) has evaluated this substance and placed it in Group R: Reasonably Anticipated To Be A Human Carcinogen. The International Agency for Research on Cancer (IARC) has evaluated this substance and placed it in Group 2B (possibly carcinogenic to humans).

Ecotoxicity

No Data Available.

Environmental fate and pathways

This material is expected to exist solely as a vapor in the ambient atmosphere. The vapor-phase of this material is degraded in the atmosphere by reaction with photochemically-produced hydroxyl radicals and ozone. Volatilization from dry soil surfaces is expected. Volatilization from moist soil surfaces is expected. The estimated BCF value suggests that this material will bioconcentrate in aquatic organisms.

Persistence and degradability

Stability in soil: This material is expected to have slight mobility in soil.

Biodegradation: No relevant studies identified.

Bioaccumulation: Bioconcentration factor (BCF) ~ 2.5 (estimated) Estimated BCF = 2.5

- *n-Hexane* 110-54-3

Ecotoxicity

This material may be very toxic to aquatic species.

Acute Fish toxicity

LC50 / 96 HOUR *Pimephales promelas* 2.5 mg/l

LC50 / 96 HOURS *Lepomis macrochirus* 4.12 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS *waterflea*. 3.87 mg/l

Environmental fate and pathways

Photolysis, hydrolysis or bioconcentration of n-hexane are not expected to be an important environmental fate processes. Biodegradation of n-hexane may occur in soil and water; however, volatilization and adsorption are expected to be far more important fate processes. A Koc range of 1250 to 4100 indicates a low to slight mobility class in soil for n-hexane. In aquatic systems n-hexane may partition from the water column to organic matter contained in sediments and suspended materials. Rapid volatilization from environmental waters is expected.

Persistence and degradability

Mobility

Behavior in environmental compartments: The atmosphere is the main environmental compartment for the release of toluene. In water, volatilization will result in substantial losses to the atmosphere with a half-life of 1-2 days. A calculated Koc value of 37-160 indicates no significant potential for geoaccumulation.

Persistence and degradability

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: Log Kow (Fish) <3

- *Xylene* 1330-20-7

Ecotoxicity

This material is classified as harmful to fish.

Acute Fish toxicity

LC50 / 96 HOUR rainbow trout. 13.5 mg/l

LC50 / 24 HOUR goldfish 13 mg/l

Environmental fate and pathways

This material is expected to exist solely as a vapor in the ambient atmosphere. The vapor-phase of this material is degraded in the atmosphere by reaction with photochemically-produced hydroxyl radicals and ozone. Expected to have moderate mobility in soils. Volatilization from moist soil surfaces is expected. Volatilization from dry soil surfaces is expected.

Persistence and degradability

MATERIAL SAFETY DATA SHEET

MSDS No.: BE174
 Variant: U.S.A.-BN
 Revision: 1.2
 Validation Date: 05/20/2011

REFORMER FEED UNFINISHED

Biodegradation: Biodegradable under aerobic and anaerobic conditions.

Bioaccumulation: This material is not expected to bioaccumulate.

- *Ethyl Benzene* 100-41-4

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOUR *Oncorhynchus mykiss* 4.2 mg/l

LC50 / 96 HOUR *Menidia menidia* 5.1 mg/l

LC50 / 96 HOUR *Poecilia reticulata* 9.6 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOUR *Daphnia magna*. 1.8 - 2.9 mg/l

EC50 / 48 HOUR *Artemia salina* 9.2 mg/l

Toxicity to aquatic plants

EC50 / 72 HOUR *Selenastrum capricornutum* 4.6 mg/l

EC50 / 96 HOUR *Selenastrum capricornutum* 3.6 mg/l

EC50 / 96 HOUR *Skeletonema costatum* 7.7 mg/l

Toxicity to microorganisms

IC50 / 48 HOUR Sewage sludge 130 mg/l

Chronic toxicity to fish

Summary: No Data Available.

Chronic toxicity to aquatic invertebrates

IC50 (reproduction) / 7 DAY *Ceriodaphnia dubia* 3.3 mg/l

NOEL (reproduction) / 7 DAY *Ceriodaphnia dubia* 1.0 mg/l

Summary: May exhibit chronic toxicity in specific invertebrates.

Environmental fate and pathways

Mobility

Behavior in environmental compartments: The atmosphere is the main environmental compartment for releases of ethylbenzene (half-life approx. 1 day). In water, volatilization to air and biodegradation will result in substantial losses, with an estimated half-life of approx 0.1 - 13 days.

Persistence and degradability

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: This material is not expected to bioaccumulate.

MATERIAL SAFETY DATA SHEET

 Validation Date: 05/20/2011

REFORMER FEED UNFINISHED

- *Cumene* 98-82-8

Ecotoxicity

This material is toxic to fish. It may cause long term adverse effects in the aquatic environment.

Acute Fish toxicity

LC50 / 96 HOURS *Pimephales promelas* (fathead minnow) 6.04 - 6.61 mg/l

Summary: flow-through test

LC50 / 96 HOURS *Oncorhynchus mykiss* (rainbow trout) 4.8 mg/l

Summary: flow-through test

LC50 / 96 HOURS *Oncorhynchus mykiss* (rainbow trout) 2.7 mg/l

Summary: semi-static test

LC50 / 96 HOURS *Poecilia reticulata* (guppy) 5.1 mg/l

Summary: semi-static test

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS *Daphnia magna* (Water flea) 0.6 mg/l

EC50 / 48 HOURS *Daphnia magna* (Water flea) 7.9 - 14.1 mg/l

Toxicity to aquatic plants

EC50 / 72 HOURS *Pseudokirchneriella subcapitata* 2.6 mg/l

Environmental fate and pathways

This material is expected to exist solely as a vapor in the ambient atmosphere. Vapor-phase is degraded in the atmosphere by reaction with photochemically produced hydroxyl radicals. It may adsorb onto soils or sediments. Volatilization from water surfaces is expected to be an important environmental fate process. Volatilization from moist soil surfaces is expected.

Persistence and degradability

Stability in water: In aquatic systems, this material may partition from the water column to organic matter contained in sediments and suspended materials.

Biodegradation: This material is expected to be readily biodegradable.

Bioaccumulation: Bioconcentration factor (BCF) ~ 35 BCF ~ 35.0

- *Trimethyl benzene* 25551-13-7

Ecotoxicity

No data available.

Environmental fate and pathways

No data available.

- *Naphthalene 91-20-3*

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOURS rainbow trout. 26 mg/l

Summary: Very toxic to aquatic organisms.

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS Daphnia magna. 21.9 mg/l

Environmental fate and pathways

Persistence and degradability

Biodegradation: Biodegradable under aerobic conditions.

Bioaccumulation: Naphthalene has a moderate tendency to bioaccumulate although fish and microorganisms readily metabolize it.

13. DISPOSAL CONSIDERATIONS

Maximize material recovery for reuse or recycling. Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) characteristics. Contaminated product, soil, water, container residues and spill cleanup materials may be hazardous wastes under applicable local, state or international regulations due to toxicity. Dispose of as hazardous waste in compliance with local and national regulations.

 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

Odor

Gasoline/ hydrocarbon like odor.

Odor Threshold

AIHA reports the odor threshold at 1.6 ppm for toluene.

Potential health effects

Routes of exposure

Eye. Inhalation. Skin. Ingestion.

Acute effects

See component summary.

- *Toluene 108-88-3*

Toluene is of slight acute toxicity, although inhalation exposure may cause dizziness and CNS depression, while ingestion may be fatal if aspiration into the lung occurs. Toluene may increase the sensitivity of the heart leading to potentially fatal cardiac sensitization. It is moderately irritating to skin and eye.

- *Xylene 1330-20-7*

May be irritating to the eyes, skin, and respiratory system. Aspiration hazard. Ingestion of this material, followed by vomiting and aspiration of the more volatile components of this material into the lungs, may lead to chemical pneumonia and even death.

- *Ethyl Benzene 100-41-4*

Inhalation hazard. Ingestion hazard. Skin and eye irritant.

- *Isopentane 78-78-4*

This product may cause eye, skin, and respiratory tract irritation. High concentrations may cause central nervous system (CNS) depression. Ingestion would likely cause gastrointestinal tract irritation.

- *n-Pentane 109-66-0*

Aspiration hazard. May cause central nervous system depression.

- *Cyclopentane 287-92-3*

Aspiration hazard. May cause central nervous system depression.

- *Naphthalene 91-20-3*

May be irritating to the eyes, skin and respiratory tract. Direct contact with the eye may cause corneal damage. May be toxic by all routes of exposure. Target organs for toxic effects include the blood, liver, kidneys, eyes, and central nervous system (CNS). Symptoms of overexposure may include headache, restlessness, lethargy, vomiting, anorexia, anemia, diminished vision, and acute kidney failure. Individuals who have an inherited G6PD deficiency in their red blood cells may be particularly sensitive to the toxic effects of Naphthalene. Naphthalene can cross the placenta and harm the fetus.

- *Isoprene 78-79-5*

Harmful if swallowed. May be irritating to the eyes, skin, and respiratory tract. May produce symptoms of CNS depression including headache, dizziness, nausea, loss of sense of balance, drowsiness, and visual disturbances. May lead to potentially fatal cardiac sensitization.

- *Ethyl Toluene 25550-14-5*

May be irritating to the skin.

- *Indene 95-13-6*

May cause drowsiness and dizziness. Aspiration into the lungs may cause chemical pneumonia.

- *n-Heptane 142-82-5*

CNS depressant. Aspiration hazard.

- *Benzene 71-43-2*

Slight acute toxicity. Inhalation exposure to high concentrations may cause dizziness and CNS depression. Ingestion of relatively small amounts may be fatal if aspiration into the lungs takes place.

- *Styrene 100-42-5*

Moderate eye irritant. Moderate skin irritant. It may cause irritation to the respiratory tract and to other mucous membranes. CNS depressant. High concentrations of this substance may cause cardiac arrhythmias that may be fatal. Ingestion hazard. Aspiration hazard

- *Propyl Benzene 103-65-1*

May cause irritation to eyes and skin. May cause drowsiness and dizziness. Aspiration into the lungs may cause chemical pneumonia.

- *Cumene 98-82-8*

Slight eye irritant. Slight skin irritant. Aspiration hazard. CNS depressant.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

- *Trimethyl benzene 25551-13-7*

CNS depressant. Aspiration hazard.

- *Dicyclopentadiene 77-73-6*

Headache, sneezing, and cough may occur. Dicyclopentadiene is an eye skin, and respiratory tract irritant. Exposure to high concentrations may cause nausea, central nervous system (CNS) depression with symptoms such as dizziness, weakness, headache, loss of coordination, loss of consciousness, coma, death and possibly cardiac sensitization. Ingestion of dicyclopentadiene would likely cause gastrointestinal tract irritation. Aspiration into the lung may cause fatal chemical pneumonitis. Can be fatal if large amounts are inhaled or ingested.

- *Allylbenzene 300-57-2*

May cause irritation to skin, eyes, and respiratory tract.

- *N-Octane 111-65-9*

CNS depressant. Aspiration hazard.

- *Vinyl toluene 25013-15-4*

May cause irritation to skin, eyes, and respiratory tract.

- *1,2,4-Trimethylbenzene 95-63-6*

May cause eye and skin irritation. Respiratory tract irritant. CNS depressant. Aspiration hazard.

Skin

May cause irritation to the skin. This irritation can result in redness and swelling of the skin. Repeated contact with the skin may cause it to become dry and cracked.

Inhalation

May cause irritation to the nose, throat and respiratory tract. Depending upon concentration and duration, exposure may also cause dizziness, drowsiness, loss of coordination, coma or suffocation.

Eyes

Can cause eye irritation.

Ingestion

Ingestion would likely cause gastrointestinal tract irritation.

Chronic effects

See component summary.

- *Toluene 108-88-3*

Repeated exposure to high concentrations has been shown to cause neurological changes and hearing loss in animals, and in humans in abuse situations. May cause developmental toxicity.

- *Xylene 1330-20-7*

May cause dermatitis by defatting the skin from prolonged or repeated contact. May contribute to the development of diseases of the nervous system, liver and kidney. May be a reproductive hazard.

- *Ethyl Benzene 100-41-4*

May effect hearing. Repeated or prolonged exposure may damage liver and kidneys. Possible cancer hazard. Repeated contact with skin may cause cracking and/or fissuring.

- *Isopentane 78-78-4*

Repeated or prolonged exposure of the skin to this material may cause defatting and drying of the skin. This substance is a developmental toxicant.

- *n-Pentane 109-66-0*

Repeated or prolonged exposure of the skin to this material may cause defatting and drying of the skin.

- *Cyclopentane 287-92-3*

Repeated or prolonged exposure of the skin to this material may cause defatting and drying of the skin.

- *Naphthalene 91-20-3*

Target organs for toxic effects of chronic exposure include the blood, the skin, the eyes, and the central nervous system. Symptoms of chronic overexposure may include dermatitis, anemia, sores on the eye or cloudiness of the eyeball, diseases involving the nerves or nervous system, and allergic skin reactions. Potential Cancer Hazard, see section 11.

- *Isoprene 78-79-5*

Repeated or prolonged exposure of the skin to this material may cause defatting and drying of the skin. Has been shown to damage the liver, kidneys and lungs based on animal studies. This substance may have effects on the haematopoietic system, resulting in blood disorders. Isoprene has been classified as a possible human carcinogen.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

- *Ethyl Toluene 25550-14-5*

Specific data not available.

- *Indene 95-13-6*

No known chronic health effects.

- *n-Heptane 142-82-5*

No adverse chronic human health effects have been reported for this material.

- *Benzene 71-43-2*

Benzene is considered to be a cancer-causing agent. Repeated exposure is linked to bone marrow toxicity, reduced red- and white blood cell counts and decreased immunological function irrespective of the route of contact.

- *Styrene 100-42-5*

This material has been classified by IARC as a group 2B substance (possibly carcinogenic to humans). Chronic exposure may result in sensory effects including mild hearing loss, and minor impairment of color vision discrimination. May cause dermatitis by defatting the skin from prolonged or repeated contact.

- *Propyl Benzene 103-65-1*

No known chronic health effects.

- *Cumene 98-82-8*

This material has been classified by IARC as a group 2B substance (possibly carcinogenic to humans). Prolonged and/or repeated contact may cause mild to moderate skin defatting, redness, blistering, lesions, and/or scaly dermatitis. May cause kidney and/or lung damage.

- *Trimethyl benzene 25551-13-7*

No adverse chronic human health effects have been reported for this material.

- *Dicyclopentadiene 77-73-6*

Prolonged and repeated exposure to vapors may cause damage to the Central Nervous System, kidneys, liver, and adrenal glands.

- *Allylbenzene 300-57-2*

No known chronic health effects.

- *N-Octane 111-65-9*

No adverse chronic human health effects have been reported for this material.

- *Vinyl toluene 25013-15-4*

May cause dermatitis by defatting the skin from prolonged or repeated contact. Repeated or prolonged exposure may result in liver damage.

- *1,2,4-Trimethylbenzene 95-63-6*

Repeated or prolonged skin contact may defat the skin and produce dermatitis.

Aggravated Medical Condition

Any pre-existing disorders or diseases of the: liver kidney skin blood central nervous system (CNS) eyes lungs and/or pregnancy

Typical composition

4. FIRST AID MEASURES

General advice

Take proper precautions to ensure your own health and safety before attempting rescue and providing first aid. For specific information refer to the Emergency Overview in Section 2 of this MSDS.

Skin

Immediately remove excess chemical and contaminated clothing; thoroughly wash contaminated skin with mild soap and water. If irritation persists after washing, seek medical attention. Thoroughly clean contaminated clothing before reuse; discard contaminated leather goods (gloves, shoes, belts, wallets, etc.).

Inhalation

Move the exposed person to fresh air at once. If breathing has stopped, perform artificial respiration. When breathing is difficult, properly trained personnel may assist the affected person by administering oxygen. Keep the affected person warm and at rest. Get medical attention immediately.

Eyes

Thoroughly flush the eyes with large amounts of clean low-pressure water for at least 15 minutes, occasionally lifting the upper and lower eyelids. If irritation persists, seek medical attention.

Ingestion

DO NOT induce vomiting. If vomiting does occur, have victim lean forward to reduce risk of aspiration. Get medical attention immediately.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

Notes to physician

Do not induce vomiting. However, if vomiting occurs spontaneously, maintain open airway. A chest x-ray should be taken immediately after stabilization of breathing and circulation to document aspiration and detect the presence of pneumothorax. Gastrointestinal decontamination in accidental petroleum distillate ingestions is not recommended, because of the severe aspiration hazard. Gastric lavage is indicated in those patients who require decontamination. Be sure that an endotracheal tube is in place prior to lavage; use cuffed tubes in patients over 7 years of age.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

OSHA/NFPA Class IB Flammable Liquid.

Flash point

< -40.0 °C (-40 °F) closed cup

Autoignition temperature

498 °C (928.4 °F)

Lower explosion limit

1.2 vol%

Upper explosion limit

7 vol%

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Use dry chemicals, CO₂, or foam. LARGE FIRE: Use water spray, water fog or foam. DO NOT use straight streams

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear positive pressure self-contained breathing apparatus (SCBA). Structural firefighters protective clothing will only provide limited protection.

Precautions for fire-fighting

Vapors may travel long distances along the ground before reaching a source of ignition and flashing back. When mixed with air and exposed to ignition source, vapors can burn in open or explode if confined. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Cool containers with flooding quantities of water until well after fire is out. Move containers from fire area if you can do it without risk. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn.

Hazardous combustion products

Carbon oxides (CO, CO₂)

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Flammable liquid. Eliminate all sources of ignition. Release can cause fire/explosion/health/environmental hazards. Evacuate/limit access. All equipment used when handling this product must be grounded. Do not touch or walk through spilled material. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. A vapor suppressing foam may be used to reduce vapors. Absorb or cover with dry earth, sand or other non-combustible material and transfer to containers. Use clean non-sparking tools to collect absorbed material.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

7. HANDLING AND STORAGE

Handling

Do not handle near heat, sparks, or flame. Avoid contact with incompatible agents. Use only with adequate ventilation/personal protection. Avoid contact with eyes, skin and clothing. Do not enter storage area unless adequately ventilated. Metal containers involved in the transfer of this material should be grounded and bonded. Special slow load procedures for 'switch loading' must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point hydrocarbon products. Electrostatic charges may be generated as a result of flow or agitation.

Storage

Keep containers tightly closed when not in use and store in a well-ventilated area. Isolate incompatible materials such as oxidizers. Containers should be clearly labeled. Metal containers used to store this material should be grounded. Vapor space above stored liquid may be flammable/explosive unless blanketed with inert gas. Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved. Refer to NFPA 77 for relevant consensus guidance. This liquid may accumulate static electricity even when transferred into properly grounded containers. Static electricity accumulation may be significantly increased by the presence of small quantities of water.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits.

Personal protective equipment

Inhalation

When workers are facing concentrations above the exposure limit they must use appropriate certified respirators.

Skin

Wear chemical resistant gloves such as: Viton(TM). When skin contact is possible, protective clothing including gloves, apron, sleeves, boots, head and face protection should be worn. The equipment must be cleaned thoroughly after each use.

Eyes

Eye protection such as chemical splash goggles and/or face shield must be worn when possibility exists for eye contact due to splashing or spraying liquid, airborne particles, or vapor.

Remarks

Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use. Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure. Clothing that has become saturated with the product must be removed immediately because the product is absorbed through the skin. Use good personal hygiene practices. Wash hands before eating, drinking, smoking, or using toilet facilities. Wash clothing frequently.

Occupational Exposure Limits

Consult local authorities for acceptable exposure limits.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance: liquid colorless, to, light yellow

Odor: Gasoline/ hydrocarbon like odor.

Odor Threshold: AIHA reports the odor threshold at 1.6 ppm for toluene.

pH: Not applicable.

Boiling point/boiling range: 30 - 229 °C (86 - 444.2 °F)

Melting/freezing point: -46 °C (-50.8 °F)

Flash point: < -40.0 °C (-40 °F) closed cup

Autoignition temperature: 498 °C (928.4 °F)

Flammability: OSHA/NFPA Class IB Flammable Liquid.

Lower explosion limit: 1.2 vol%

Upper explosion limit: 7 vol%

Explosive properties: No Data Available.

Oxidizing properties: No Data Available.

Vapor pressure: RVP = 11 psia max

Evaporation rate: no data available

Relative density: 0.8 - 0.9(Water = 1)

Relative vapor density: no data available

Viscosity: No Data Available.

Water solubility: Slightly soluble

Partition coefficient: n-octanol/water: No Data Available.

Other physico-chemical properties: No additional information available.

10. STABILITY AND REACTIVITY

Chemical stability
 The product is stable.

Conditions to avoid
 Avoid contact with strong oxidizers, excessive heat, sparks or open flame.

Materials to avoid
 Does not react with common materials.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

Hazardous decomposition products

No degradation data available.

Hazardous polymerization

Will not occur.

Reactions with Air and Water

Does not react with air or water.

11. TOXICOLOGICAL INFORMATION

Product information

Product Summary

See components summary.

COMPONENT INFORMATION

- *Toluene* 108-88-3

Acute toxicity

<u>LC50 (vapor)</u>	rat	7500 PPM	4 HOURS
	rat	5,580 MG/KG BWT	
	Rabbit.	> 5000 MG/KG BWT	

Acute effects

Inhalation

Vapors or aerosol may cause irritation of the eyes, nose and throat as well as CNS depression (fatigue, dizziness, loss of concentration, with collapse, coma and death possible in cases of severe overexposure).

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract and CNS depression (fatigue, dizziness, collapse, coma and death). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

Moderate skin irritant.

Eyes

Moderate eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Skin. Eye. Hearing. Nasal cavity. central nervous system (CNS) Heart

Repeated dose toxicity

No evidence of systemic toxicity was reported in rats exposed to 1.15 mg/l (300 ppm) toluene vapor for two years, while

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

higher exposures were associated with inflammation and degeneration of nasal epithelial tissue. Rats exposed repeatedly to very high concentrations of toluene exhibited neurological changes and permanent hearing loss. Clinical case reports indicate the occurrence of serious and persistent changes (including tremor, ataxia, memory impairment and possible hearing loss) in humans following deliberate over-exposure to toluene in abuse situations. The relevance of these findings to low level occupational exposure to toluene is not known.

Reproductive effects

Studies in animals demonstrate no histopathological lesions in testes or ovaries of rats and mice exposed to 9.4 mg/l (2500 ppm) toluene vapor for 14-15 weeks, and no loss of fertility in male rats after exposure to 7.5 mg/l (2000 ppm) for a similar period of time. Epididymal weights and sperm counts were decreased in one study, but the absence of any adverse effect on reproduction makes the functional relevance of these observations unclear. No reliable human data are available.

Developmental Toxicity

Studies in pregnant rats demonstrate that toluene is not a teratogen, however mild fetotoxicity (lower body weight, delayed ossification, delayed physical development) may occur in the absence of maternal toxicity at exposures in the range 1.9-2.8 mg/l (500-750 ppm). Other studies describe adverse effects on learning and cognitive functions in rat pups exposed to 4.5-6.7 mg/l (1200-1800 ppm) in utero, although it is unclear if end-points evaluated in these tests are directly relevant to humans.

Genetic Toxicity

In vitro and in vivo mutagenicity tests were negative.

Carcinogenicity

Inhalation studies in rats and mice demonstrate that toluene is not a carcinogen. It has been used extensively as a solvent in rodent skin painting studies with occasional slight increases in tumor incidence reported: an epigenetic mechanism (based on irritation rather than genotoxicity) may underpin these findings. Toluene is considered a Group 3 substance by IARC, not classifiable as to its carcinogenicity to humans.

- *Xylene* 1330-20-7

Acute toxicity

<u>LC50 (Inh)</u>	rat	5000 PPM	4 HOURS
	mouse	3907 MG/KG	6 HOURS
	rat	4550 PPM	4 HOURS

LD50 (Oral) rat 4300 MG/KG

LD50 (Skin) rabbit >1700 MG/KG

Irritation

Skin

Moderate skin irritant. May cause dermatitis by defatting the skin from prolonged or repeated contact.

Eyes

This material is expected to be a mild eye irritant. Xylenes are irritating to the eyes with the potential to cause conjunctivitis and corneal opacity.

Target Organs

Skin. Eye. central nervous system (CNS)

Repeated dose toxicity

Repeated inhalation exposures of rats to xylenes cause liver effects at 920 ppm (4.0 mg/L) and ototoxicity at \geq 800 ppm (3.48 mg/L). Repeated oral exposures to xylenes produce reductions in bodyweight in male rats at 500 mg/kg bwt/day, liver effects and hyaline droplet formation in male rats at \geq 150 mg/kg bwt/day, kidney effects in male and female rats at \geq 750 mg/kg bwt/day, and a reduction in bodyweight gain in male mice at \geq 250 mg/kg bwt/day. Repeated inhalation exposures of gerbils to \geq 160 ppm (0.70 mg/L) xylenes cause apparently irreversible CNS effects.

Reproductive effects

A reproductive toxicity study, two dominant lethal studies, and evaluation of reproductive organs in repeated dose studies indicate that xylenes do not affect reproductive performance or induce structural damage to reproductive organs of laboratory animals at non-anesthetic doses. However, xylenes have been shown to produce damage to reproductive organs in rats repeatedly exposed to extremely high, anesthetic doses.

Developmental Toxicity

Results from animal studies demonstrate that xylenes may cause reduced fetal weight and delayed ossification, but not

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

malformations, at inhalation dose levels causing no or only slight maternal toxicity (≥ 115 ppm or 0.5 mg/L). Slight neurobehavioral effects were noted in offspring of rats exposed to 500 ppm (2.2 mg/L) in the absence of maternal toxicity.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *Ethyl Benzene* 100-41-4

Acute toxicity

<u>LC50 (vapor)</u>	rat	4000 PPM
<u>LD50 (Oral)</u>	rat	3500 - 4700 MG/KG BWT
<u>LD50 (Skin)</u>	rabbit	> 15,000 MG/KG BWT

Acute effects

Inhalation

Vapors may cause irritation of the eyes, nose and throat as well as CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure) May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract. High doses may cause CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization. Aspiration may cause pulmonary edema and pneumonitis.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring. While skin absorption is a potential route of exposure, no adverse health effects are anticipated following accidental or incidental contact.

Irritation

Skin

This product is expected to be an skin irritant.

Eyes

Moderate to severe eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Eye. Skin. Central nervous system. Lung. Liver. Kidneys. Thyroid. Blood. Hearing. heart

Repeated dose toxicity

No adverse effects were present in rats or mice exposed to 1000 ppm (4.3 mg/l) ethylbenzene vapor for up to 13 weeks. Longer-term exposure resulted in an increased incidence of chronic progressive nephropathy (CPN) in kidneys from rats inhaling 750 ppm (3.3 mg/l) for up to two years. Since CPN is a spontaneous age-related condition specific to rodents, these findings are of doubtful relevance to humans. Mice exposed chronically under similar conditions responded with changes in the lung, liver and thyroid. Additional effects in rats observed with repeated oral exposure of ≥ 250 mg bwt/day ethyl benzene for 90 days include changes in hematology (indicative of a mild regenerative anemia) and clinical chemistry parameters (indicative of hepatic microsomal enzyme induction), decreases in prothrombin time, mild alimentary effects and liver pathology. A standard neurotoxicity protocol study conducted in young adult rats did not find neurotoxic effects following repeated daily oral exposure to doses up to 500 mg/kg bwt/day.

Specialist investigations provide evidence of hearing loss in rats following repeated exposure (13 weeks) to concentrations of 200 ppm (0.85 mg/l) and above. Ethyl benzene at up to 500 ppm vapor concentration did not adversely affect the functional ability of the humoral component of the immune system of rats as measured by splenic IgM antibody forming cell response to the T-dependent antigen, sheep erythrocytes.

Reproductive effects

No parental, neonatal, or reproductive toxicity was observed following inhalation exposure of rats to up to 500 ppm or 500 ppm/342 mg/kg bwt/day ethylbenzene. Histopathological examination of reproductive tissue from rats, mice and rabbits has generally revealed no adverse changes following sub-chronic- or chronic inhalation exposure to high vapor concentrations.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

An increased incidence of testicular tumors in F344 male rats exposed to 750 ppm (3.3 mg/l) ethylbenzene vapor for 2 years is considered of doubtful relevance to reproductive toxicity.

Developmental Toxicity

Decreased fetal body weight and an increased occurrence of skeletal and other variations were reported in the presence of concurrent maternal toxicity (CNS effects, decreased body weight, liver enlargement) when female rats were exposed to ethylbenzene concentrations of 1000 ppm (4.3 mg/l) or above throughout pregnancy. No adverse effects to neurodevelopment were observed in rats exposed to 500 ppm/342 mg/kg bwt/day ethylbenzene.

Genetic Toxicity

No increase in micronuclei or hepatic UDS was observed in mice after treatment with ethylbenzene in vivo. It was not genotoxic in microbial systems, nor did it induce chromosomal aberrations or sister chromatid exchanges in mammalian cells in vitro. Variable results were obtained for mutation at the TK+/- locus in L5178Y cells, although the most reliable study that utilized the current standard study protocol and doses that were not significantly cytotoxic gave a negative mutagenic response. The overall weight of evidence indicates that ethylbenzene is not genotoxic.

Carcinogenicity

The carcinogenic potential of ethylbenzene after inhalation exposure has been investigated in two recent regulatory guideline studies performed by NTP. Male rats exposed to 750 ppm (3.3 mg/l) over 2 years showed an increased incidence of testicular interstitial cell adenoma, a common tumor present also in a large majority of the untreated males included in the study. High level exposure was also linked with an increased incidence of kidney tumors in both sexes; the appearance of these lesions was strongly associated with the development of Chronic Progressive Nephropathy, a spontaneous age-related disease of rats with no equivalent counterpart in humans. Male mice exposed to 750 ppm ethylbenzene for 2 years responded with an increased incidence of lung tumors, while the incidence of liver tumors was increased in females. Mechanistic studies suggest that these lesions in the mouse developed secondary to enhanced cell proliferation in these tissues, while the weight of evidence from mutagenicity testing also indicates that a non-genotoxic mechanism was involved. Listed by IARC as possibly carcinogenic in humans (Group 2B).

- *Isopentane* 78-78-4

Acute toxicity

<u>LC50 (Inhl)</u>	mouse	413 MG/L	2 HOURS
	rat	1281.9 MG/L	4 HOURS

Irritation

Skin

Defatting of the skin with irritation, dryness and cracking.

Eyes

Slight eye irritant.

Target Organs

Skin. Eye.

Repeated dose toxicity

Repeated oral gavage exposures of rats to 500 mg/kg bwt/day isopentane produced lethality and decreases in bodyweight gain.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *n-Pentane* 109-66-0

Acute toxicity

<u>LC50 (Inhl)</u>	rat	> 18.02 MG/L	4 HOURS
<u>LD50 (Oral)</u>	rat	> 2000 MG/KG BWT	
<u>LD50 (Skin)</u>	rabbit	3000 MG/KG	

Target Organs

Respiratory system. Kidneys.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

Repeated dose toxicity

No treatment-related effects were observed in a 90-day inhalation study in rats exposed to n-pentane at up to 6778 ppm (20 mg/L). Inhalation neurotoxicity evaluations in rats exposed to n-pentane at 3000 ppm (8.9 mg/L) for up to 30 weeks found no evidence of neurotoxicity. Repeated oral gavage exposures of rats to 500 mg/kg bwt/day n-pentane produced lethality, decreases in bodyweight gain and slightly lower kidney weights.

Reproductive effects

No effects on reproductive organs were observed in a 90-day inhalation study in rats exposed to n-pentane at ~7000 ppm (20 mg/L). n-Pentane was negative in a dominant lethal test in mice when males were given a single intraperitoneal injection of 48-666 mg/kg bwt.

Developmental Toxicity

No developmental toxicity was observed when pregnant rats were exposed to n-pentane by oral administration of 1000mg/kg bwt/day or by inhalation of 10000 ppm (29.5 mg/L).

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *Cyclopentane* 287-92-3

Acute toxicity

<u>LC50 (Inh)</u>	rat	106 GM/M3
<u>LD50 (Oral)</u>	rat	11,400 MG/KG

Acute effects

Inhalation

Specific data not available.

Ingestion

Specific data not available.

Skin contact

Specific data not available.

Irritation

Skin

Specific data not available.

Eyes

Specific data not available.

Target Organs

Skin. Central nervous system. Lung.

Repeated dose toxicity

Sensitive individuals may exhibit skin rash, wheezing, tightness of the chest, and difficulty breathing that may progress to a life-threatening inability to breathe.

Reproductive effects

No effects on reproductive organs were observed in a 90-day inhalation study with rats exposed to ~10,200 ppm (29.8 mg/L).

Genetic Toxicity

Cyclopentane was negative in the Ames Test and mouse lymphoma assay and in an in vivo micronucleus test, but induced chromosome aberrations in an in vitro mammalian cell assay.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

Other information

No data available.

MATERIAL SAFETY DATA SHEET

 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

- *Naphthalene* 91-20-3

Acute toxicity

<u>LC50 (Inhl)</u>	rat	>340 MG/M3	4 HOUR
<u>LD50 (Oral)</u>	rat	490 MG/KG	
	mouse	533 MG/KG	
	guinea pig	1200 MG/KG	

Irritation

Skin

May be irritating to the skin.

Eyes

May cause eye irritation.

Repeated dose toxicity

Repeated inhalation or ingestion of naphthalene causes methemoglobine*

Developmental Toxicity

Results from repeated dose oral gavage tests with naphthalene showed fetotoxicity in rats (increase in resorptions at 450 mg/kg bwt/day) and in mice (decrease in number of live pups/litter at 300 mg/kg bwt/day) in the presence of maternal toxicity (reduction in body weight gains in rats; decrease in survival and reduction in body weight in mice).

Genetic Toxicity

Naphthalene produced chromosome damage in in vitro assays, but not in in vivo assays in which mice were administered 500 mg/kg bwt orally or 250 mg/kg bwt by intraperitoneal injection.

Carcinogenicity

The National Toxicology Program (NTP) has evaluated this substance and placed it in Group R: Reasonably Anticipated To Be A Human Carcinogen. The International Agency for Research on Cancer (IARC) has evaluated this substance and placed it in Group 2B (possibly carcinogenic to humans).

- *Isoprene* 78-79-5

Acute toxicity

<u>LC50 (Inhl)</u>	rat	180 MG/L	4.0 HOURS
	mouse	157 MG/L	2.0 HOURS
<u>LD50 (Oral)</u>	rat	2043 - 2210 MG/KG BWT	

Acute effects

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations.

Ingestion

Harmful if swallowed.

Skin contact

No Data Available.

Irritation

Skin

Liquid slightly irritating to skin. Repeated contact with neat product may dry the skin causing cracking and/or fissuring.

Eyes

No data on eye irritation found.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Liver, Lung, Kidneys, Testes.

Repeated dose toxicity

Isoprene produces adverse effects in a range of tissues (including Harderian gland, forestomach, liver, lung, spleen, hematopoietic system, mesenteric lymph node, testis and nose/nasal cavity) in mice after repeated inhalation exposure (greater than or equal to 70 ppm), whereas, in rats at higher exposures (greater than or equal to 700 ppm), lesions are limited to testes, kidney and spleen.

Reproductive effects

Following repeated inhalation of isoprene vapor, the only exposure-related effects reported in rats were slight increases in testicular hyperplasia at 7000 ppm. In mice, the following effects were noted: testicular atrophy (greater than or equal to 280 ppm); reductions in epididymal weights, spermatid head counts/concentrations, and sperm motility (greater than or equal to 700 ppm); and increased estrous cycle lengths (7000 ppm).

Developmental Toxicity

Results from studies with rats and mice demonstrate that isoprene is not a teratogen. Reduced fetal bodyweight has been observed in mice exposed to greater than or equal to 280 ppm isoprene vapor during pregnancy.

Genetic Toxicity

Isoprene is genotoxic in the mouse, inducing micronuclei in bone marrow after inhalation exposure at greater than or equal to 438 ppm, the lowest dose tested.

Carcinogenicity

Animal data demonstrate marked species difference in carcinogenic response to isoprene. In the mouse, long term inhalation exposure is associated with an increased incidence of benign and malignant cancers in a wide range of tissues, whereas, in the rat, only benign tumors in testes, kidney and mammary gland have been seen. The lowest exposure concentrations that were carcinogenic to rats and mice were 220 ppm and 70 ppm, respectively. Listed by IARC as possibly carcinogenic to humans (Group 2B). This listing is based on sufficient evidence of carcinogenicity in experimental animals. Listed by NTP as reasonably anticipated to be a human carcinogen in their Report on Carcinogens 10th Edition. This listing was based on sufficient evidence of tumor formation at multiple organ sites in multiple species of experimental animals.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

LD50 (Oral) mouse 5000 MG/KG

LD50 (Skin) rabbit 3000 MG/KG

Target Organs

Central nervous system. Lung.

- *Benzene* 71-43-2

Acute toxicity

rat 13,700 PPM 4 HOURS

rabbit > 8260 MG/KG BWT

Acute effects

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations.

Ingestion

May cause CNS depression, gastric discomfort, and vomiting. This material is an aspiration hazard.

Skin contact

No systemic toxicity is expected from acute dermal exposure.

Target Organs

Damages bone marrow. Eye. Skin.

Repeated dose toxicity

The hematopoietic system is the primary target for benzene, irrespective of the route of exposure. Broadly similar effects are seen in rodents and humans, including bone marrow toxicity and reduced red- and white blood cell counts.

Reproductive effects

Results from animal studies are inconsistent, with adverse effects on the ovary and testis reported in mice following repeated inhalation exposure but no effects on the gonads or on fertility observed in rats exposed under similar conditions. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Developmental Toxicity

Results from animal studies clearly demonstrate that benzene is not a teratogen, however mild fetotoxicity (including lowered bodyweight, delayed ossification and sub-clinical hematological changes) have been observed in rodents exposed during pregnancy, generally in association with maternal toxicity. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Genetic Toxicity

Benzene is genotoxic in vivo, and induces chromosomal aberrations and micronuclei in rats and mice following oral or inhalation exposure. Comparable changes would be anticipated in humans. The incidence of micronuclei in fetal rat liver is increased following administration of large doses by intraperitoneal injection to pregnant mice, while high-level oral exposure induced chromosomal aberrations in germ cells from male mice. The relevance to humans of these latter findings is not known.

Carcinogenicity

Benzene is a multi-site animal carcinogen, producing tumors in hematopoietic- and epithelial tissues after long term inhalation or oral exposure. Epidemiologist studies confirm it is a human carcinogen, causing primarily acute non-lymphocytic leukemia.

- *Styrene* 100-42-5

Acute toxicity

rat ~ 5000 MG/KG

Acute effects

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN

 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

Inhalation

Vapors are toxic when inhaled. Vapors may cause irritation of the eyes, nose and throat as well as CNS depression (primarily fatigue, dizziness and loss of concentration, with collapse, coma and death in cases of severe over-exposure) May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Ingestion

This substance is of low acute toxicity when administered orally. Ingestion may cause discomfort and irritation of the gastrointestinal tract, effects on lungs and kidneys, and CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe overexposure) Aspiration into the lung may cause fatal chemical pneumonitis. May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Target Organs

Cardiac sensitization. Nervous system Nasal cavity. Lungs Eyes Skin

- *Propyl Benzene* 103-65-1

Acute toxicity

Irritation

Skin

Slight skin irritant. May cause dermatitis by defatting the skin from prolonged or repeated contact.

Eyes

Slight eye irritant.

Sensitization

Not expected to be a sensitizer.

Target Organs

Central nervous system. Skin. Eye. Respiratory system. Nasal cavity. Kidney Liver Lungs

Reproductive effects

This substance is not expected to be a reproductive toxicant.

Genetic Toxicity

Negative for genotoxicity using both in vitro and in vivo tests.

Carcinogenicity

The NTP has found that Cumene causes increased incidences of combined benign and malign kidney tumors in male rats, and malignant lung tumors in mice of both sexes. This material has been classified by IARC as a group 2B substance (possibly carcinogenic to humans).

- *Trimethyl benzene* 25551-13-7

	mouse	190-250 MG/KG

<u>LD50 (Skin)</u>	rabbit	>2000 MG/KG
--------------------	--------	-------------

Acute effects

Inhalation

High doses may cause CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure).

Ingestion

Ingestion of high doses may cause discomfort and irritation of the gastrointestinal tract and CNS depression (fatigue, dizziness and possibly loss of concentration, with collapse, coma and death in cases of severe over-exposure). Ingestion of this material, followed by vomiting and aspiration of the more volatile components of this material into the lungs, may lead to chemical pneumonia and even death.

Skin contact

No adverse systemic effects are anticipated following accidental or incidental skin contact; however, severe overexposure to the skin may cause CNS depression and death.

Irritation

Skin

Liquid is irritating to skin. Repeated contact with neat product may dry the skin causing cracking and/or fissuring.

Eyes

Slight eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Skin. Eye. Respiratory system. Central nervous system effects. Gastrointestinal tract. Kidneys. Liver. Adrenal glands.

Repeated dose toxicity

Repeated inhalation exposures to dicyclopentadiene produced lethality in mice at ≥ 51 ppm and in rats at ≥ 250 ppm. At non-lethal concentrations, inhalation exposure of mice, rats and dogs produced CNS effects in mice at ≥ 5 ppm and in dogs at ≥ 47 ppm, decreased bodyweight gain in rats at 100 ppm, liver effects in male rats at ≥ 19.7 ppm, and kidney effects in male rats at ≥ 1 ppm. Repeated oral gavage exposures to rats produced lethality and liver effects at 100 mg/kg bwt/day and, at lower concentrations, effects on the adrenal gland (≥ 20 mg/kg bwt) and, in males, kidney (≥ 4 mg/kg bwt). The kidney lesions appear to be hyaline droplet nephropathy, a male rat specific disease not considered relevant to humans.

Reproductive effects

In repeated dose oral gavage studies in rats, effects on reproductive parameters (failure to nurse resulting in litter loss, increased days to litter, pup mortality, lower pup weights) were observed only in the presence of maternal toxicity (lethality, decreased bodyweight, and increased liver weight) at 100 mg/kg bwt/day.

Developmental Toxicity

Results from repeated dose oral gavage tests showed signs of fetotoxicity (decreased viability, lower birth and body

Skin. Eye. Respiratory system. Central nervous system effects.

Repeated dose toxicity

Repeated or prolonged contact with skin may cause defatting and drying of the skin which may result in dermatitis.

Carcinogenicity

Not listed by IARC, NTP, OSHA or EPA.

- *Vinyl toluene* 25013-15-4

Acute toxicity

LD50 (Oral) rat 2255 MG/KG

Irritation

Skin

Neat liquid is moderately irritating to skin.

Repeated dose toxicity

Repeated inhalation exposures of rats to vinyl toluene cause reductions in body weight and toxicity to the nasal tract at ≥ 100 ppm (0.48 mg/L); nephropathy in males at ≥ 160 ppm (0.77 mg/L); liver effects at ≥ 1000 ppm (4.83 mg/L); and lung effects at 1300 ppm (6.28 mg/L). Repeated inhalation exposures of mice to vinyl toluene cause reductions in body weight and toxicity to the nasal tract at ≥ 10 ppm (0.048 mg/L); lung effects at 160 ppm (0.77 mg/L); and liver effects and death at 200 ppm (0.97 mg/L). In rats repeatedly exposed by inhalation to vinyl toluene, there was some evidence for neurotoxicity (decreased motor conduction velocity) at ≥ 100 ppm (0.48 mg/L).

Reproductive effects

Specific data not available.

Developmental Toxicity

Specific data not available.

Genetic Toxicity

Vinyl toluene produced positive results for gene mutation in mouse lymphoma cells and chromosome damage in human lymphocytes, and was positive in a mouse micronucleus test after intraperitoneal dosing at 200 mg/kg bwt.

Carcinogenicity

Toluene is listed by OSHA and NTP as "Not classifiable as a Human Carcinogen".

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

- *1,2,4-Trimethylbenzene* 95-63-6

Acute toxicity

LC50 (Inhl) rat 18 G/M3 4 HOURS

Target Organs

Eye. Skin. Respiratory system. Central nervous system. Blood.

Repeated dose toxicity

Repeated inhalation exposures to 1,2,4-trimethyl-benzene causes changes in hematological parameters in male rats at 250 ppm (1.23 mg/L); and pulmonary lesions in male and female rats at ≥ 100 ppm (1.23 mg/L).

Developmental Toxicity

Results from a repeated dose inhalation test with trimethylbenzene showed fetotoxicity in rats (decreased pup bodyweight) at ≥ 600 ppm (2.95 mg/L) in the presence of maternal toxicity (reduced body weight gain).

Genetic Toxicity

Trimethylbenzene was positive in a bacterial gene mutation assay and produced sister chromatid exchanges in mouse bone marrow (at ≥ 730 mg/kg bwt), but did not induce micronuclei in the same cells.

12. ECOLOGICAL INFORMATION

Product information

Ecotoxicity

See component summary.

Environmental fate and pathways

When released into the environment, this material will volatilize rapidly. This material will biodegrade relatively rapidly in both soil and water, and will not persist in the environment. Due care should be taken to avoid accidental releases to aquatic or terrestrial systems.

Persistence and degradability

Bioaccumulation: See component summary.

COMPONENT INFORMATION

- *Toluene* 108-88-3

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOUR *Oncorhynchus mykiss* 55 mg/l

LC50 / 96 HOUR *Carassius auratus* 22.8 mg/l

LC50 / 96 HOUR *Pimephales promelas* 31.7 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOUR *Daphnia magna*. 11.5 - 14.9 mg/l

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

Toxicity to aquatic plants

Summary: No Data Available.

Toxicity to microorganisms

Summary: No Data Available.

Chronic toxicity to fish

NOEC / 40 DAY Oncorhynchus sp. 1.4 mg/l
 Summary: Actual exposure time: 27 - 40 day.

Chronic toxicity to aquatic invertebrates

NOEC / 21 DAY Daphnia magna. 1.0 mg/l

NOEC / 7 DAY Ceriodaphnia dubia 0.74 mg/l

Environmental fate and pathways

Mobility

Behavior in environmental compartments: The atmosphere is the main environmental compartment for the release of toluene. In water, volatilization will result in substantial losses to the atmosphere with a half-life of 1-2 days. A calculated Koc value of 37-160 indicates no significant potential for geoaccumulation.

Persistence and degradability

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: Log Kow (Fish) <3

- *Xylene* 1330-20-7

Ecotoxicity

This material is classified as harmful to fish.

Acute Fish toxicity

LC50 / 96 HOUR rainbow trout. 13.5 mg/l

LC50 / 24 HOUR goldfish 13 mg/l

Environmental fate and pathways

This material is expected to exist solely as a vapor in the ambient atmosphere. The vapor-phase of this material is degraded in the atmosphere by reaction with photochemically-produced hydroxyl radicals and ozone. Expected to have moderate mobility in soils. Volatilization from moist soil surfaces is expected. Volatilization from dry soil surfaces is expected.

Persistence and degradability

Biodegradation: Biodegradable under aerobic and anaerobic conditions.

Bioaccumulation: This material is not expected to bioaccumulate.

- *Ethyl Benzene* 100-41-4

Ecotoxicity

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN

HEAVY PYROLYSIS GASOLINE

Acute Fish toxicity

LC50 / 96 HOUR *Oncorhynchus mykiss* 4.2 mg/l

LC50 / 96 HOUR *Menidia menidia* 5.1 mg/l

LC50 / 96 HOUR *Poecilia reticulata* 9.6 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOUR *Daphnia magna*. 1.8 - 2.9 mg/l

EC50 / 48 HOUR *Artemia salina* 9.2 mg/l

Toxicity to aquatic plants

EC50 / 72 HOUR *Selenastrum capricornutum* 4.6 mg/l

EC50 / 96 HOUR *Selenastrum capricornutum* 3.6 mg/l

EC50 / 96 HOUR *Skeletonema costatum* 7.7 mg/l

Toxicity to microorganisms

IC50 / 48 HOUR Sewage sludge 130 mg/l

Chronic toxicity to fish

Summary: No Data Available.

Chronic toxicity to aquatic invertebrates

IC50 (reproduction) / 7 DAY *Ceriodaphnia dubia* 3.3 mg/l

NOEL (reproduction) / 7 DAY *Ceriodaphnia dubia* 1.0 mg/l

Summary: May exhibit chronic toxicity in specific invertebrates.

Environmental fate and pathways

Mobility

Behavior in environmental compartments: The atmosphere is the main environmental compartment for releases of ethylbenzene (half-life approx. 1 day). In water, volatilization to air and biodegradation will result in substantial losses, with an estimated half-life of approx. 0.1 - 13 days.

Persistence and degradability

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: This material is not expected to bioaccumulate.

- *Isopentane* 78-78-4

Ecotoxicity

This material is toxic to aquatic organisms.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS Daphnia magna. 2.3 mg/l

Environmental fate and pathways

This material is likely to evaporate from soil and water.

Persistence and degradability

Stability in water: Volatilization from water surfaces is expected to be an important environmental fate process.

Stability in soil: Volatilization from moist soil surfaces is expected to be an important fate process of this material.

Biodegradation: This material is expected to be biodegradable.

Bioaccumulation: This material is not expected to bioaccumulate.

- *n-Pentane* 109-66-0

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOURS Oncorhynchus mykiss 4.3 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS waterflea. 9.7 mg/l

Environmental fate and pathways

This material is expected to exist solely as a vapor in the ambient atmosphere. The vapor-phase of this material is degraded in the atmosphere by reaction with photochemically-produced hydroxyl radicals and ozone.

Persistence and degradability

Stability in soil: Volatilization from moist soil surfaces is expected to be an important fate process of this material.

Bioaccumulation: This material is not expected to bioaccumulate.

- *Cyclopentane* 287-92-3

Ecotoxicity

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS Daphnia magna. 10.5 mg/l

Environmental fate and pathways

Hydrolysis is not expected to be an important factor in the environmental fate process for this material. It is not expected to adsorb onto soils or sediments. Limited biodegradation. Expected to have high mobility in soils. This material is expected to exist solely as a vapor in the ambient atmosphere. The vapor-phase of this material is degraded in the atmosphere by reaction with photochemically-produced hydroxyl radicals and ozone.

- *Naphthalene* 91-20-3

Ecotoxicity

 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

Acute Fish toxicity

LC50 / 96 HOURS rainbow trout. 26 mg/l

Summary: Very toxic to aquatic organisms.

Acute toxicity to aquatic invertebrates

EC50 / 48 HOURS Daphnia magna. 21.9 mg/l

Environmental fate and pathways

Persistence and degradability

Biodegradation: Biodegradable under aerobic conditions.

Bioaccumulation: Naphthalene has a moderate tendency to bioaccumulate although fish and microorganisms readily metabolize it.

- *Isoprene* 78-79-5

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOURS Oncorhynchus mykiss 7.43 mg/l

Acute toxicity to aquatic invertebrates

LC50 / 48 HOURS Daphnia magna. 5.77 mg/l

Summary: This material is toxic to aquatic invertebrates (acute exposure). Substantive aquatic exposure is not likely based on the volatile nature of this chemical.

Toxicity to aquatic plants

NOEC / 72 HOURS algae 15.5 mg/l

Summary: Biomass Production

EC50 / 72 HOURS algae > 35.2 mg/l

Summary: growth rate reduction Substantive aquatic exposure is not likely based on the volatile nature of this chemical. This material is harmful to algae or higher aquatic plants.

NOEC / green algae. 1.7 mg/l

Summary: Biomass Production

NOEC / green algae. 6.0 mg/l

Summary: growth rate reduction

Toxicity to microorganisms

Summary: No Data Available.

Chronic toxicity to fish

2.81 mg/l

Summary: Calculated Fish 30-day Chronic Toxicity Value (Predicted, Isoprene): 2.81 mg/L

Chronic toxicity to aquatic invertebrates

EC50 / 16 d daphnids. 1.38 mg/l

Summary: Calculated

LC50 / 14 d Earthworm

Summary: Calculated 311 mg/kg

MATERIAL SAFETY DATA SHEET

MSDS No.: BE172
 Variant: U.S.A.-EN
 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

Environmental fate and pathways

Persistence and degradability

Stability in water: In the aquatic environment, isoprene is expected to adsorb to suspended solids and sediments. Volatilization from water surfaces expected based on isoprene's vapor pressure and water solubility. Based on specific gravity, isoprene is expected to float on water (in case of a spill) and rapidly evaporate.

Stability in soil: Expected to have moderate mobility in soil, with volatilization from moist soil surfaces expected to be an important fate process based on isoprene's vapor pressure of 493 mm Hg at 20°C and water solubility of 300 mg/L at 20°C.

Biodegradation: Not readily biodegradable. In the atmosphere, isoprene degrades in reactions with photochemically-produced hydroxyl radicals, ozone molecules, and nitrate radicals with a half-life of 1.2 hours. Does not undergo hydrolysis.

Bioaccumulation: Bioconcentration factor (BCF) 15 (estimated) Low potential for bioconcentrating/bioaccumulating in aquatic organisms based on a log Kow of 2.42 and an estimated BCF of 15. Half-life in soil estimated to range from 7 to 28 days.

- *Ethyl Toluene* 25550-14-5

 Revision: 1.0
 Validation Date: 05/20/2011

HEAVY PYROLYSIS GASOLINE

Chronic toxicity to aquatic invertebrates

EC50 / 21 d Daphnia magna. 4.0 mg/l

Summary: Reproduction rate. Not expected to exhibit chronic toxicity to aquatic invertebrates.

Summary: Limited data are available which indicate this stream may be toxic to aquatic invertebrates during chronic exposure.

Environmental fate and pathways

Not readily biodegradable, although some microbial decomposition may take place. In water, the volatilization half-life of DCPD from model waterways (lake, pond, river) is estimated to be between 1.3 and 9.9 days. The half-life of DCPD through indirect phototransformation in natural water is estimated to be 76 days. In air, the estimated photodegradation half-life of DCPD is 0.1 days. Bioaccumulation is expected to occur at low levels based on an estimated fish BCF ranging from 11 to 53.

Persistence and degradability

Stability in soil: Low mobility in soil. Expected to volatilize from dry or moist soil surfaces, although some adsorption to soil may occur. Volatilizes from water. May adsorb to sediment and organic matter.

Biodegradation: May biodegrade under aerobic conditions with acclimated microbes. In the atmosphere, the stream chemicals will react readily with hydroxyl radicals (calculated half-life range 1.1-31.8 hours). Direct photodegradation and hydrolysis are not likely to be important fate processes.

Disclaimer

The information on this MSDS was obtained from sources which we believe are reliable. However, the information is provided without any warranty, expressed or implied, regarding its correctness. Some information presented and conclusions drawn herein are from sources other than direct test data on the substance itself. The conditions or methods of handling, storage, use and disposal of the product are beyond our control and may be beyond our knowledge. For this and other reasons, we do not assume responsibility and expressly disclaim liability for loss, damage, or expense arising out of or in any way connected with handling, storage, use, or disposal of this product. If the product is used as a component in another product, this MSDS information may not be applicable. Information is correct to the best of our knowledge at the date of the MSDS publication.

Numerical Data Presentation

The presentation of numerical data, such as that used for physical and chemical properties and toxicological values, is expressed using a comma (,) to separate digits into groups of three and a period (.) as the decimal marker. For example, 1,234.56 mg/kg = 1 234,56 mg/kg.

1. PRODUCT AND COMPANY IDENTIFICATION

Product name: BENZENE

Number: 00000000000016113

Chemical characterization: C6 Aromatic Hydrocarbon

CAS-No.: 71-43-2

Chemical Name: Benzene

Synonyms: Benzene, Benzol, Cyclohexatriene, BZ;Benzol;Benzolene;Pyrobenzol:phene;Phenylhydride;Annulene; Cyclohexatriene; Coal Naphtha; Mineral Naphtha; C6 Alkylbenzene; C6 Aromatic Hydrocarbon Solvent; Reagent-grade Benzene (meets ASTM D835" Refined Benzene-485" or "Nitration Grade" Specifications).

Use category: Chemical intermediaries.

Company Address

Houston Refining
 One Houston Center, Suite 700
 1221 McKinney St.
 P.O. Box 2583
 Houston Texas 77252-2583

2. HAZARDS IDENTIFICATION

Emergency Overview

This material is HAZARDOUS by OSHA Hazard Communication definition.

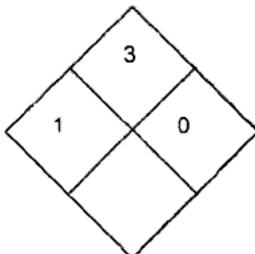

Signal Word

Danger

Hazards

Flammable. Vapors may form explosive mixtures with air. Vapors can travel to a source of ignition and flash back. Vapors explosion hazard indoors, outdoors or in sewers. Severe eye irritant. May cause corneal injury and possible necrosis. Skin irritant - defatting action. Respiratory tract irritant. Inhalation hazard. High ingestion hazard-chemical pneumonia. Aspiration hazard. CNS depressant. Cancer Hazard.

NFPA®

HMIS®

Health	*	2
Flammability		3
Physical Hazard		0

Physical state

Color

MATERIAL SAFETY DATA SHEET

MSDS No.: BE210
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

BENZENE

Color

Clear, colorless.

Odor

Distinctive odor. Aromatic odor.

Odor Threshold

1.5 - 5.0 ppm / ODOR IS NOT AN ADEQUATE WARNING TO PREVENT EXPOSURE.

Potential health effects

Routes of exposure

Eye. Inhalation. Skin.

Acute effects

See component summary.

- *Benzene 71-43-2*

Slight acute toxicity. Inhalation exposure to high concentrations may cause dizziness and CNS depression. Ingestion of relatively small amounts may be fatal if aspiration into the lungs takes place.

- *Toluene 108-88-3*

Toluene is of slight acute toxicity, although inhalation exposure may cause dizziness and CNS depression, while ingestion may be fatal if aspiration into the lung occurs. Toluene may increase the sensitivity of the heart leading to potentially fatal cardiac sensitization. It is moderately irritating to skin and eye.

Skin

Irritating to the skin, not a sensitizer. Causes irritation seen as local redness and possible swelling. Not expected to be a skin absorption hazard.

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations.

Eyes

Severe eye irritant.

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract and CNS depression (fatigue, dizziness, collapse, coma and death).

Chronic effects

See component summary.

- *Benzene 71-43-2*

Benzene is considered to be a cancer-causing agent. Repeated exposure is linked to bone marrow toxicity, reduced red- and white blood cell counts and decreased immunological function irrespective of the route of contact.

- *Toluene 108-88-3*

Repeated exposure to high concentrations has been shown to cause neurological changes and hearing loss in animals, and in humans in abuse situations. May cause developmental toxicity.

Aggravated Medical Condition

Individuals with pre-existing skin disorders, kidney, liver, central nervous system, blood and hemopoietic-organ disorders should avoid exposure to this material. Pre-existing disorders of the respiratory system. Any pre-existing disorders or diseases of the eye.

3. COMPOSITION/INFORMATION ON INGREDIENTS

<u>Component</u>	<u>CAS-No.</u>	<u>EC-No.</u>	<u>Weight %</u>
Benzene	71-43-2	200-753-7	>= 99.7
Toluene	108-88-3	203-625-9	<= 0.1

Typical composition

4. FIRST AID MEASURES

General advice

Benzene is an OSHA regulated substance, depending on the level of exposure, additional medical follow-up may be required. See 29 CFR 1910.1028 (j)(4) for medical requirements due to an emergency situation. Take proper precautions to ensure your own health and safety before attempting rescue and providing first aid. For specific information refer to the Emergency Overview in Section 2 of this MSDS.

Skin

Take off contaminated clothing and wash before reuse. Clothing that has become saturated with the product must be removed immediately because the product is absorbed through the skin. Seek medical attention if ill effect or irritation develops. After contact with skin, wash immediately with plenty of soap and water.

Inhalation

If overcome by exposure, remove victim to fresh air immediately. Give oxygen or artificial respiration as needed. Obtain emergency medical attention.

Eyes

In case of eye contact, immediately rinse with clean water for 20-30 minutes. Obtain emergency medical attention.

Ingestion

Do not induce vomiting. Risk of damage to lungs exceeds poisoning risk. Seek medical attention if discomfort persists.

5. FIRE-FIGHTING MEASURES

Flammable properties

Classification

OSHA/NFPA Class IB Flammable Liquid.

Flash point

-11 °C (12.2 °F) (TCC)

Autoignition temperature

498 °C (928.4 °F) (ASTM E659).

Lower explosion limit

~ 1.3 vol%

Upper explosion limit

~ 8 vol%

MATERIAL SAFETY DATA SHEET

MSDS No.: BE210
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

BENZENE

Extinguishing Media

Suitable extinguishing media

SMALL FIRE: Use dry chemical, CO₂, water spray or regular foam. LARGE FIRE: Use water spray, water fog or regular foam. Do not use straight streams.

Protective equipment and precautions for firefighters

Protective equipment and precautions for firefighters

Wear positive pressure self-contained breathing apparatus (SCBA). Structural firefighters protective clothing will only provide limited protection.

Precautions for fire-fighting

Extremely flammable vapors may be generated by material (flash point < freezing point) below normal ambient temperatures. Fine sprays/mists may be combustible at temperatures below normal flash point. Vapors may travel long distances along the ground before reaching a source of ignition and flashing back. A concentration of 2000 ppm in air is immediately dangerous to life/health. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Apply water spray/fog for cooling. Do not use solid water stream/may spread fire. Move containers from fire area if you can do it without risk. Blanket with firefighting foam. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Heat may build enough pressure to rupture closed containers/spreading fire/increasing risk of burns/injuries. Always stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. This material releases flammable vapors at well below ambient temperatures and may form flammable mixtures with air. When mixed with air in certain proportions and exposed to an ignition source, these vapors can burn in the open or be explosive in confined spaces. Being heavier than air, these vapors may travel long distances along the ground before reaching a point of ignition and flashing back.

Hazardous combustion products

Incomplete combustion will form carbon monoxide and other toxic vapors.

6. ACCIDENTAL RELEASE MEASURES

Spills and leaks

Extremely flammable liquid. Release can cause fire/explosion/health/environmental hazards. Eliminate all sources of ignition. All equipment used when handling this product must be grounded. Do not touch or walk through spilled material. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. A vapor suppressing foam may be used to reduce vapors. Use clean non-sparking tools to collect absorbed material. Water spray may reduce vapor; but may not prevent ignition in closed spaces. Contain spillage, and then collect with non-combustible absorbent material, (e.g. sand, earth, diatomaceous earth, vermiculite) and place in container for disposal according to local / national regulations (see section 13). For larger spillages on water contain with booms or barriers, use surface acting agents to thicken spilled materials. Remove trapped material with suction hoses.

Both local exhaust and good general room ventilation must be provided not only to control exposure but also to prevent formation of flammable mixtures. Special attention should be given to low areas/pits where flammable vapors can accumulate.

7. HANDLING AND STORAGE

Handling

For industrial use only. Use only non-sparking tools. Carefully vent any internal pressure before removing closure. Do not overfill containers which may burst on freezing. Thaw frozen containers only at room temperature. Containers must be properly grounded before beginning transfer. All equipment must conform to applicable electrical code. Handle used containers with care - residue is flammable/poisonous. Isolate, vent, drain, wash and purge systems or equipment before maintenance or repair. Extinguish all ignition sources. Check atmosphere for explosiveness and oxygen deficiencies. If any residual product may be present, total encapsulating impervious protective suits, gloves, and boots should be worn. Observe precautions pertaining to confined space entry. Provide grounding/equipment conforming to electrical codes. Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved. Refer to NFPA 77 for relevant consensus guidance.

MATERIAL SAFETY DATA SHEET

MSDS No.: BE210
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

BENZENE

Storage

Store in tightly closed/properly vented containers away from heat/sparks/open flame and strong oxidizing agents. Store closed drums with bung in up position. Avoid breathing vapors in top of shipping container; may contain a known human carcinogen. Bonding and grounding measures may not be enough if nonconductive flammable liquids are involved. Refer to NFPA 77 for relevant consensus guidance.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls

Both local exhaust and good general room ventilation must be provided not only to control exposure but also to prevent formation of flammable mixtures. Special attention should be given to low areas/pits where flammable vapors can accumulate.

Personal protective equipment

Inhalation

When workers are facing concentrations above the exposure limit they must use appropriate certified respirators.

Skin

Use chemical resistant gloves appropriate to conditions of use. Protective clothing including gloves, apron, sleeves, boots, and full head/face protection should be worn. The equipment must be cleaned thoroughly after each use.

Eyes

Eye protection such as chemical splash goggles and/or face shield must be worn when possibility exists for eye contact due to splashing or spraying liquid, airborne particles, or vapor.

Remarks

Selection of appropriate personal protective equipment should be based on an evaluation of the performance characteristics of the protective equipment relative to the task(s) to be performed, conditions present, duration of use, and the hazards and/or potential hazards that may be encountered during use. Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure. The U.S.Code of Federal Regulations (CFR), 29 CFR 1910.1028, gives detailed information on Benzene health hazards and symptoms of over-exposure. It also addresses the requirements and responsibilities for providing, wearing, and maintaining protective equipment as well as procedures for medical monitoring of Benzene exposures. Use good personal hygiene practices. Wash hands before eating, drinking, smoking, or using toilet facilities. Take off contaminated clothing and wash before reuse. Shower after work using plenty of soap and water.

Occupational Exposure Limits

 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

BENZENE

Other physico-chemical properties: Refractive index N20/D = 1.5011.

10. STABILITY AND REACTIVITY

Chemical stability

The product is stable.

Conditions to avoid

Heat, sparks, open flame, other ignition sources, oxidizing conditions, and freezing temperatures.

Materials to avoid

Nitric acid. Halogens (bromine, chlorine, fluorine). Strong oxidizing agents.

Hazardous decomposition products

Excessive heating and/or incomplete combustion may produce carbon monoxide, carbon dioxide and other harmful substances.

Hazardous polymerization

Not expected to occur.

Reactions with Air and Water

Not expected to occur.

11. TOXICOLOGICAL INFORMATION

Product information

Product Summary

Benzene is of slight acute toxicity, although inhalation exposure to high concentrations may cause dizziness and CNS depression, while ingestion of relatively small amounts may be fatal if aspiration into the lung takes place. Liquid benzene is irritating to skin and severely irritating to the eye. Repeated exposure is linked to bone marrow toxicity, reduced red- and white blood cell counts, and decreased immunological function irrespective of the route of contact. It is a multi-site carcinogen in animals, while human epidemiology studies demonstrate a causal association between long term occupation exposure and acute non-lymphocytic leukemia. It is genotoxic in vivo, and induces chromosomal aberrations and micronuclei in rodents following oral or inhalation exposure. Results from reproductive studies are inconsistent, with adverse effects on the ovary and testis reported in mice following repeated inhalation exposure but no effects on the gonads or on fertility observed in rats exposed under similar conditions. Mild fetotoxicity (lowered fetal body weight, delayed ossification and sub-clinical hematological changes, generally in association with maternal toxicity) has been observed in rats and mice exposed during pregnancy. The relevance of these changes to human reproductive health is not known.

COMPONENT INFORMATION

- Benzene 71-43-2

Acute toxicity

<u>LC50 (vapor)</u>	rat	13,700 PPM	4 HOURS
	mouse	9980	8 HOURS
	rat	10000	7 HOURS

<u>LD50 (Skin)</u>	rabbit	> 8260 MG/KG BWT
--------------------	--------	------------------

MATERIAL SAFETY DATA SHEET

MSDS No.: BE210
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

BENZENE

Acute effects

Inhalation

Signs of eye, throat, and respiratory tract irritation (cough and difficulty breathing), CNS depression (fatigue, dizziness, headache, collapse, coma and death) and possible cardiac sensitization may occur after exposure to high vapor concentrations.

Ingestion

May cause CNS depression, gastric discomfort, and vomiting. This material is an aspiration hazard.

Skin contact

No systemic toxicity is expected from acute dermal exposure.

Irritation

Skin

Skin irritant.

Eyes

Severe eye irritant.

Sensitization

No evidence of skin or respiratory sensitization.

Target Organs

Damages bone marrow. Eye. Skin.

Repeated dose toxicity

The hematopoietic system is the primary target for benzene, irrespective of the route of exposure. Broadly similar effects are seen in rodents and humans, including bone marrow toxicity and reduced red- and white blood cell counts.

Reproductive effects

Results from animal studies are inconsistent, with adverse effects on the ovary and testis reported in mice following repeated inhalation exposure but no effects on the gonads or on fertility observed in rats exposed under similar conditions. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Developmental Toxicity

Results from animal studies clearly demonstrate that benzene is not a teratogen, however mild fetotoxicity (including lowered body weight, delayed ossification and sub-clinical hematological changes) have been observed in rodents exposed during pregnancy, generally in association with maternal toxicity. No reliable human data are available, hence the relevance of these findings to human reproductive health is not known.

Genetic Toxicity

Benzene is genotoxic in vivo, and induces chromosomal aberrations and micronuclei in rats and mice following oral or inhalation exposure. Comparable changes would be anticipated in humans. The incidence of micronuclei in fetal rat liver is increased following administration of large doses by intraperitoneal injection to pregnant mice, while high-level oral exposure induced chromosomal aberrations in germ cells from male mice. The relevance to humans of these latter findings is not known.

Carcinogenicity

Benzene is a multi-site animal carcinogen, producing tumors in hematopoietic- and epithelial tissues after long term inhalation or oral exposure. Epidemiology studies confirm it is a human carcinogen, causing primarily acute non-lymphocytic leukemia.

- *Toluene 108-88-3*

Acute toxicity

<u>LC50 (vapor)</u>	rat	7500 PPM	4 HOURS
	rat	5,580 MG/KG BWT	
	Rabbit.	> 5000 MG/KG BWT	

Acute effects

Inhalation

MATERIAL SAFETY DATA SHEET

MSDS No.: BE210
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

BENZENE

Vapors or aerosol may cause irritation of the eyes, nose and throat as well as CNS depression (fatigue, dizziness, loss of concentration, with collapse, coma and death possible in cases of severe overexposure).

Ingestion

Ingestion may cause discomfort and irritation of the gastrointestinal tract and CNS depression (fatigue, dizziness, collapse, coma and death). May increase the sensitivity of the heart to endogenous catecholamines leading to potentially fatal cardiac sensitization.

Skin contact

Repeated contact with skin may cause cracking and/or fissuring.

Irritation

Skin

Moderate skin irritant.

Eyes

Moderate eye irritant.

Sensitization

Not expected to cause sensitization by skin contact.

Target Organs

Skin. Eye. Hearing. Nasal cavity. central nervous system (CNS) Heart

Repeated dose toxicity

No evidence of systemic toxicity was reported in rats exposed to 1.15 mg/l (300 ppm) toluene vapor for two years, while higher exposures were associated with inflammation and degeneration of nasal epithelial tissue. Rats exposed repeatedly to very high concentrations of toluene exhibited neurological changes and permanent hearing loss. Clinical case reports indicate the occurrence of serious and persistent changes (including tremor, ataxia, memory impairment and possible hearing loss) in humans following deliberate over-exposure to toluene in abuse situations. The relevance of these findings to low level occupational exposure to toluene is not known.

Reproductive effects

Studies in animals demonstrate no histopathological lesions in testes or ovaries of rats and mice exposed to 9.4 mg/l (2500 ppm) toluene vapor for 14-15 weeks, and no loss of fertility in male rats after exposure to 7.5 mg/l (2000 ppm) for a similar period of time. Epididymal weights and sperm counts were decreased in one study, but the absence of any adverse effect on reproduction makes the functional relevance of these observations unclear. No reliable human data are available.

Developmental Toxicity

Studies in pregnant rats demonstrate that toluene is not a teratogen, however mild fetotoxicity (lower body weight, delayed ossification, delayed physical development) may occur in the absence of maternal toxicity at exposures in the range 1.9-2.8 mg/l (500-750 ppm). Other studies describe adverse effects on learning and cognitive functions in rat pups exposed to 4.5-6.7 mg/l (1200-1800 ppm) in utero, although it is unclear if end-points evaluated in these tests are directly relevant to humans.

Genetic Toxicity

In vitro and in vivo mutagenicity tests were negative.

Carcinogenicity

Inhalation studies in rats and mice demonstrate that toluene is not a carcinogen. It has been used extensively as a solvent in rodent skin painting studies with occasional slight, increases in tumor incidence reported: an epigenetic mechanism (based on irritation rather than genotoxicity) may underpin these findings. Toluene is considered a Group 3 substance by IARC, not classifiable as to its carcinogenicity to humans.

12. ECOLOGICAL INFORMATION

Product information

Ecotoxicity

Environmental fate and pathways

See component summary.

COMPONENT INFORMATION

- *Benzene* 71-43-2

Ecotoxicity

Acute Fish toxicity

LC50 / 96 HOUR *Oncorhynchus mykiss* 5.3 - 21.6 mg/l

LC50 / 96 HOUR *Pimephales promelas* 14.0 - 15.6 mg/l

LC50 / 96 HOUR *Poecilia reticulata* 28.6 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 24 HOURS *Daphnia magna*. 10 mg/l

EC50 / 48 HOUR *Ceriodaphnia dubia* 17.2 mg/l

Toxicity to aquatic plants

EC50 / 72 HOUR *Selenastrum capricornutum* 28 - 100 mg/l

Toxicity to microorganisms

IC50 / 24 HOURS *Nitrosomonas* sp. 13 mg/l

Chronic toxicity to fish

LOEC / 32 DAY *Pimephales promelas* 1.6 mg/l

Chronic toxicity to aquatic invertebrates

EC50 / 7 DAY *Ceriodaphnia dubia* 11.6 mg/l

Environmental fate and pathways

Mobility

Behavior in environmental compartments: When released to water, volatilization will result in substantial losses to the atmosphere with a calculated half-life in the troposphere of approximately 13.4 days. A calculated Koc value of 134.1 l/kg does not indicate a significant potential for bioaccumulation.

Persistence and degradability

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: Bioconcentration factor (BCF) ~ 10 (fish.) BCF in fish ~ 10.

- *Toluene* 108-88-3

Ecotoxicity

LC50 / 96 HOUR Oncorhynchus mykiss 55 mg/l

LC50 / 96 HOUR Carassius auratus 22.8 mg/l

LC50 / 96 HOUR Pimephales promelas 31.7 mg/l

Acute toxicity to aquatic invertebrates

EC50 / 48 HOUR Daphnia magna. 11.5 - 14.9 mg/l

Toxicity to aquatic plants

Summary: No Data Available.

Toxicity to microorganisms

Summary: No Data Available.

Chronic toxicity to fish

NOEC / 40 DAY Oncorhynchus sp. 1.4 mg/l

Summary: Actual exposure time: 27 - 40 day.

Chronic toxicity to aquatic invertebrates

NOEC / 21 DAY Daphnia magna. 1.0 mg/l

NOEC / 7 DAY Ceriodaphnia dubia 0.74 mg/l

Environmental fate and pathways

Mobility

Behavior in environmental compartments: The atmosphere is the main environmental compartment for the release of toluene. In water, volatilization will result in substantial losses to the atmosphere with a half-life of 1-2 days. A calculated Koc value of 37-160 indicates no significant potential for geoaccumulation.

Persistence and degradability

Biodegradation: Readily biodegradable in aerobic conditions.

Bioaccumulation: Log Kow (Fish) <3

13. DISPOSAL CONSIDERATIONS

Assure effluent complies with applicable regulations. Landfill solids at permitted sites. Use registered transporters. Burn concentrated liquids. Avoid flame-outs. Assure emissions comply with applicable regulations. Familiarize personnel with proper use of respiratory protection equipment. Avoid waste contact/breathing harmful vapors. Dilute aqueous waste, free of floating oil, may biodegrade. Avoid overloading/poisoning plant biomass. (See 40 U.S. Code of Federal Regulations (CFR) 261 and 29 CFR 1910). Contaminated product/soil/water may be U.S. Resource Conservation and Recovery Act (RCRA)/U.S. Occupational Safety and Health Administration (OSHA) hazardous waste due to potential fire/poisoning.

14. TRANSPORT INFORMATION

Special Provisions

If you reformulate or further process this material, you should consider re-evaluation of the regulatory status of the components listed in the composition section of this sheet, based on final composition of your product.

 Validation Date: 11/05/2010

BENZENE

ID No. UN1114
 Hazard class 3
 Packing group II

15. REGULATORY INFORMATION

Notification status

All ingredients are on the following inventories or are exempted from listing

Country	Notification
Australia	AICS
Canada	DSL
China	IECS
European Union	EINECS
Japan	ENCS/SHL
Korea	ECL
Philippines	PICCS
United States of America	TSCA
New Zealand	NZIoC

Contact product.safety@lyondellbasell.com for additional global inventory information.

If identified components of this product are listed under the TSCA 12(b) Export Notification rule, they will be listed below.

SARA 302/304

<u>Component</u>	<u>TPQ</u>	<u>RQ</u>
Benzene		10 lbs
Toluene		1000 lbs

SARA 311/312

Based upon available information, this material is classified as the following health and/or physical hazards according to Section 311 & 312:

Immediate (Acute) Health Hazard.
 Delayed (Chronic) Health Hazard.
 Fire Hazard.
 Sudden Release of Pressure.

SARA 313

This product contains the following chemicals subject to the reporting requirements of SARA Title III, Section 313 and 40 CFR 372:

<u>Component</u>	<u>Reporting Threshold</u>
Benzene	0.1%
Toluene	1.0%

State Reporting

Known to the State of California to cause cancer.

71-43-2 Benzene (December 11, 2009)

Known to the State of California to cause birth defects.

71-43-2 Benzene (December 11, 2009)

108-88-3 Toluene

MATERIAL SAFETY DATA SHEET

MSDS No.: BE210
 Variant: U.S.A.-EN
 Revision: 1.1
 Validation Date: 11/05/2010

BENZENE

Known to the State of California to cause reproductive toxicity in males.

71-43-2 Benzene (December 11, 2009)

Known to the State of California to cause reproductive toxicity in females.

108-88-3 Toluene (December 11, 2009)

This product contains the following chemicals regulated by New Jersey's Worker and Community Right to Know Act:

71-43-2 Benzene

108-88-3 Toluene

This product contains the following chemicals regulated by Massachusetts' Right to Know Law:

71-43-2 Benzene

108-88-3 Toluene

This product contains the following chemicals regulated by Pennsylvania's Right to Know Act:

71-43-2 Benzene

108-88-3 Toluene

Disclaimer

The information on this MSDS was obtained from sources which we believe are reliable. However, the information is provided without any warranty, expressed or implied, regarding its correctness. Some information presented and conclusions drawn herein are from sources other than direct test data on the substance itself. The conditions or methods of handling, storage, use and disposal of the product are beyond our control and may be beyond our knowledge. For this and other reasons, we do not assume responsibility and expressly disclaim liability for loss, damage, or expense arising out of or in any way connected with handling, storage, use, or disposal of this product. If the product is used as a component in another product, this MSDS information may not be applicable. Information is correct to the best of our knowledge at the date of the MSDS publication.

Numerical Data Presentation

The presentation of numerical data, such as that used for physical and chemical properties and toxicological values, is expressed using a comma (,) to separate digits into groups of three and a period (.) as the decimal marker. For example, 1,234.56 mg/kg = 1 234,56 mg/kg.

Language Translations

This document may be available in languages other than English.

End of Material Safety Data Sheet

Hydrogen-rich, Sweet Refinery Gases (C1-C4 Hydrocarbons)

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0003
Revision Date 10/11/2002

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Compressed Gas/Liquid.
Color Colorless liquid; invisible vapor. **Odor** Odorless to faint, unpleasant.

DANGER! Extremely flammable compressed gas/liquid; vapor may cause flash fire or explosion.
High pressure and rapid diffusion hazard.
High concentrations of vapor reduce oxygen available for breathing and may cause central nervous system (CNS) depression or suffocation.
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats).
Liquid or compressed gas contact may cause frostbite or freeze burns.

Hazard Rankings

	HMIS	NFPA
Health Hazard	2	1

Reactivity	1	1

* = Chronic Health Hazard

Protective Equipment

Minimum Recommended
See Section 8 for Details

SECTION 1: IDENTIFICATION

Trade Name	Hydrogen-rich, Sweet Refinery Gases (C1-C4 Hydrocarbons)	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	068814675*	Medical Emergency	(800) 313-7645 or (918) 495-4700
CAS Number	68814-67-5 or 68476-01-3	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Hydrogen and C1-C5 Alkane/Alkene Hydrocarbons Mixture		
Synonyms	Demoisturized C1-C4 Hydrocarbons with Hydrogen; Reformer Hydrogen; Reformer Recycle Gas; Reformer Makeup, Hydrogen-rich, Gases (Petroleum); DHDS, NHDS, and 2nd Stage Recycle Gases; 460 Header Hydrogen.		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Distillation Tail Gas, Hydrogen Sulfide-Free (Petroleum)	68308-02-1	100
2) Hydrogen	1333-74-0	50-85
3) Methane	74-82-8	5-20
4) Ethane	74-84-0	5-15
5) Ethylene	74-85-1	1-5
6) Propane	74-98-6	1-10
7) Propylene	115-07-1	1-3
8) Iso-Butane	75-28-5	1-3
9) Butenes or Butylenes	25167-67-3	1-3
10) n-Butane	106-97-8	0-2

Hydrogen-rich, Sweet Refinery Gases (C1-C4 Hydrocarbons)

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Skin contact. Eye contact.

Signs and Symptoms of Acute Exposure

Inhalation	One or more components of this gas mixture are "simple asphyxiants" (see Section 8). Their vapors can displace the amount of oxygen in air available to breathe below that necessary to sustain life, especially if working in confined spaces. Breathing vapors may also irritate the respiratory tract and cause central nervous system (CNS) depression. Symptoms may include headache, dizziness, slurred speech, excitation or giddiness, nausea, blurred vision, memory loss, drowsiness, fatigue, rapid or difficult breathing, confusion, vertigo, loss of consciousness, convulsions, coma, and even death, depending upon the concentration and duration of exposure.
Eye Contact	This gas is non-irritating; however, direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn."
Skin Contact	Direct contact with a liquefied/pressurized gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. This material is not expected to be absorbed through the skin.
Ingestion	Due to its volatile nature, ingestion is not normally an applicable route of exposure for this liquefied gas mixture. However, if swallowed, this material may "freeze burn" the mucous membranes of the mouth, throat, and esophagus.
Chronic Health Effects Summary	Chronic inhalation exposure or high concentrations of some components of this gas (propane, propylene, isobutane, butenes, and n-butane) of this material may increase the sensitivity of the heart to epinephrine (adrenalin) and catecholamine-like drugs . Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians").
Conditions Aggravated by Exposure	Personnel with pre-existing chronic respiratory diseases, central nervous system (CNS) disease, high blood pressure, or cardiovascular conditions should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of "simple asphyxiants". They should take additional precautions to minimize or avoid exposure.
Target Organs	The substance is toxic to eyes, skin, mucous membranes, lungs, central nervous system, brain, and heart.
Carcinogenic Potential	This material does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC, or NTP.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
-------------------	--

Hydrogen-rich, Sweet Refinery Gases (C1-C4 Hydrocarbons)

Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Seek medical attention if tissue appears damaged or if pain persists.
Ingestion	Due to the volatile nature of this material, ingestion is a highly unlikely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	<p>If cough or difficulty in breathing develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. Monitor arterial blood gases and chest x-ray in cases with significant exposure. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.</p> <p>Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse).</p> <p>If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas.		
Flash Point Method	CLOSED CUP: AP -185°C (-301°F) [Estimated]		
Lower Flammable Limit	AP 2.0%	Upper Flammable Limit	AP 74.2%
Autoignition Temperature	AP 288°C (550°F)		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, unburned hydrocarbon vapors, and possibly trace oxides of sulfur.		
Special Properties	This liquefied gas is extremely flammable at well below ambient temperatures and readily forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. Exposed to an ignition source, it will burn in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources! Being heavier than air, its flammable vapors can travel long distances close to the ground to an ignition source, and then flash back.		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.		
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Hydrogen-rich, Sweet Refinery Gases (C1-C4 Hydrocarbons)

Extremely Flammable Liquefied Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This liquefied gas or waste mixtures containing this material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling

This gas mixture contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring for oxygen deficiency and flammability.

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of mixed gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Drain and purge equipment as necessary to remove material residues. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Do not allow vaporizing material to contact eyes, skin or other tissues. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated.

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

Hydrogen-rich, Sweet Refinery Gases (C1-C4 Hydrocarbons)

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling liquefied gases. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with cold liquid, solid, or vapors.

Body Protection Prevent potential skin contact with cold liquid, solid, or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower.

Respiratory Protection Odor is not an adequate warning for potentially hazardous air concentrations! For unknown vapor concentrations, use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator, if adequate protection is provided. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).

General Comments For an explanation about some of the occupational exposure limits shown below, refer to the definition of "Simple Asphyxiant" presented in the American Conference of Governmental Industrial Hygienists (ACGIH) most current **Threshold Limit Values (TLVs) for Chemical Substances and Physical Agents** handbook. Releases of this liquefied gas mixture may create flammable, explosive, and/or oxygen-deficient atmospheres (< 19.5 Vol.% in air). DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions. Air purifying respirators offer no protection against oxygen deficiency.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen	Simple asphyxiant.
2) Methane	Simple asphyxiant.
3) Ethane	Simple asphyxiant.
4) Ethylene	Simple asphyxiant.
5) Propylene	Simple asphyxiant.
6) Propane	TWA: 2500 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL)
7) Butane	TWA: 800 (ppm) from ACGIH (TLV) TWA: 800 (ppm) from OSHA (PEL)
8) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL)

Hydrogen-rich, Sweet Refinery Gases (C1-C4 Hydrocarbons)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Compressed Gas/Liquid.	Color	Colorless liquid; invisible vapor.	Odor	Odorless to faint, unpleasant.
Specific Gravity	0.45 to 0.58 (Water = 1)	pH	Not applicable.	Vapor Density	0.75 to 2.0 (Air = 1)
Boiling Point/Range	-254° to -0.5°C (-425° to 31°F) at 14.7 psia [ASTM D-2887]			Melting/Freezing Point	-240° to -138°C (-400° to -217°F) at 14.7 psia
Vapor Pressure	100 to 250 psia at 40°C (104°F)			Viscosity (cSt @ 40°C)	Not applicable.
Solubility in Water	Slightly soluble in cold water.			Volatile Characteristics	This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.

Additional Properties This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard.
 Average Density at 60°F = < 4.25 lbs./gallon [ASTM D-2500];
 Gross Heat of Combustion at 60°F = 21,500 to 24,000 Btu/lb. or 1,000 to 2,500 Btu/cu.ft.;
 Dry Point Temperature = 31°F (-0.5°C) [ASTM D-86].

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions. Polymerization can occur under conditions of extremely high temperature and pressure.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the **Emergency Overview on Page 1** and the **Hazards Identification in Section 3** of this MSDS.

Toxicity Data	<p>Propylene: GAS (LC₅₀): Chronic: 1,250 ppm for 6 hours/day for 14 weeks [Mouse]. GAS (TC_{Lo}): Chronic: 5,000 ppm for 6 hours/day for 2 years [Rat] - Reduced olfactory sensory response.</p> <p>Iso-Butane: GAS (TC_{Lo}): Acute: 1,040 gm/m³ for 2 hours [Mouse] - Excitement. GAS (LC₅₀): Acute: 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress.</p> <p>Iso-Butene (Isobutylene or 2-Methylpropene): GAS (LC₅₀): Acute: 415 gm/m³ for 2 hours [Mouse]. GAS (LC₅₀): Acute: 620 gm/m³ for 4 hours [Rat].</p> <p>n-Butane:</p>
----------------------	--

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline).

In humans, at concentrations of 6.4% in air or higher, **propylene** causes mild intoxication, dermal sensations, and an inability to concentrate on tasks within two minutes. Gross inhalation of propylene

Hydrogen-rich, Sweet Refinery Gases (C1-C4 Hydrocarbons)

concentrations of 40% or higher for a couple minutes cause redding of the eyelids and face, tearing, coughing, and sometimes flexing of the legs, reduced blood pressure, and/or disordered heart rhythm. A concentration of 50% causes anesthesia in two minutes, followed by complete recovery without any physiological indications.

Chronic low-level exposures to **propylene** may entail a possible hazard from the formation of a reactive metabolite, **propylene oxide**, which is a "suspect human carcinogen". However, propylene have not been shown to be carcinogenic in rat studies. For example, propylene was tested by the National Cancer Institute (NCI) in a two-year, 6 hours/day, 5 days/week inhalation study using rats and mice with exposure concentrations at 5,000 and 10,000 ppm. The resulting data suggested that propylene induces signs of nasal cavity toxicity (epithelial hyperplasia/metaplasia) including increased incidence of neo-plastic lesions in rats, but not in mice. **Propylene** is NOT considered carcinogenic to either rats or mice even though it may be partially metabolized to **propylene oxide** which has been shown to be mutagenic and produces site of contact tumors in rodents following long-term administration. Propylene has also been found to be a cardiac sensitizer in dogs.

Human volunteers had no apparent effects from exposures of 250 ppm, 500 ppm, and 1,000 ppm concentrations in air of **isobutane** and **n-butane** for periods of 8 hours daily for 10 days to 14 days, respectively. Chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage.

An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane** and **butylene** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material; however, releases are expected to cause only localized non-persistent environmental damage.

At ambient temperatures and pressure, the **ethylene, propylene, and butenes** components of this material will readily vaporize and may contribute to generation of atmospheric smog. The atmospheric half-lives of **ethane, ethylene, propane, propylene, and the butenes** under photochemical smog conditions are estimated to be between 5 to 8 hours. Experimental data shows that significant photooxidation of **ethylene and propylene** occurs rapidly within 7 to 21 hours. The atmospheric half-lives of the **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days. Photooxidation of **ethane, propane, isobutane, and n-butane** in air (< 8%) are not considered to be environmentally significant.

Environmental Fate

Refined liquefied petroleum hydrocarbon gases are essentially insoluble in water (< 0.1%); and therefore, this material will not cause harm to aquatic life.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

This material may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be in accordance with applicable Federal, State, and local regulations. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

Hydrogen-rich, Sweet Refinery Gases (C1-C4 Hydrocarbons)

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Compressed gases, flammable, n.o.s. (Hydrogen, Methane)		
Hazard Class	DOT Class: 2.1 (Flammable gas).	Packing Group(s)	Not applicable.
		UN/NA ID	UN1954
Reportable Quantity	There are no Reportable Quantity (RQ) substance components present in this material which might require DOT HAZMAT bill-of-lading display.		
Placards		Emergency Response Guide No.	115
		HAZMAT STCC No.	49 057 29
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. Chemical substances present in this material which are subject to this statute: None were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, Acute (Immediate) and Chronic (Delayed) Health Hazards.
SARA 313	This material contains the following components in concentrations above de minimis levels that are listed as "Toxic Chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313: Ethylene or Ethene [CAS No. 74-85-1] concentration = 1 to 5% Propylene or Propene [CAS No. 115-07-1] concentration = 1 to 3%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "Hazardous Substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. This material does not contain any chemical substances subject to this statute. However, it is recommended that you contact state and local authorities to determine if there are any other reporting requirements in the event of a spill.
CWA	This material might be classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material does not contain any chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling, refer to the components listed in Section 2.

Hydrogen-rich, Sweet Refinery Gases (C1-C4 Hydrocarbons)**Additional Regulatory Remarks**

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in this material as "Volatile Organic Compounds (VOC)" which contribute significantly to air pollution which endangers public health and welfare": **Ethylene (Ethene), Propylene (Propene), 1-Butene, and Isobutylene.**

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this material which are subject to this statute are: **Hydrogen, Methane, Ethane, Ethylene (Ethene), Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), Butane, and various Butenes.**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Material Safety Data Sheet

LYONDELL-CITGO Refining LP 12000
Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0004
Revision Date 09/10/2001

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Gas/Liquefied Gas		
Color	Colorless liquid, invisible vapor	Odor	Odorless to a strong, foul smelling, rotten egg odor which is unreliable as a warning of possible exposure

DANGER! Extremely flammable and potentially poisonous gas/liquid; vapor may cause flash fire or explosion!
High pressure and rapid diffusion hazard!
Contains low levels of hydrogen sulfide (H₂S)!
May be harmful or fatal if inhaled!
High concentrations of vapor reduce oxygen available for breathing and may cause central nervous system (CNS) depression or suffocation!
Mist or vapor may cause eye, skin, mucous membrane, and respiratory tract irritation and inflammation!
Liquid or compressed gas contact may cause frostbite or freeze burns!
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
May be corrosive to some metals!

SECTION 1: IDENTIFICATION

Trade Name	Refinery Fuel Gas	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	068308270*	Medical Emergency	(918) 495-4700
CAS Number	68308-27-0	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Fuel Gas		
Synonyms	Refinery Gas Mixture, Treated Low-pressure (Low-Line) Gas, Desulfurized Fuel Gas, C1-C5 Hydrocarbons and Hydrogen with residual Hydrogen Sulfide, Hydrogen and Alkane/Alkene Hydrocarbons		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Fuel Gases, Refinery	68308-27-0	100
2) Nitrogen	7727-37-9	3-6
3) Hydrogen	1333-74-0	1-10
4) Methane	74-82-8	35-55
5) Ethane	74-84-0	10-20
6) Ethylene	74-85-1	2-4
7) Propane	74-98-6	5-15
8) Propylene	115-07-1	1-3

Refinery Fuel Gas

9) Iso-Butane	75-28-5	2-5
10) Butenes or Butylenes	25167-67-3	1-2
11) n-Butane	106-97-8	2-6
12) Iso-Pentane	78-78-4	1-3
13) n-Pentane	109-66-0	0 5-3
14) Hydrogen sulfide	7783-06-4	0 0001-0 1

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Eye contact. Skin contact Skin absorption

Signs and Symptoms of Acute Exposure

Inhalation	<p>May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure Symptoms are characterized by coughing, choking, or shortness of breath. The National Institute for Occupational Safety and Health has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health At concentrations above 500 ppm, H₂S causes unconsciousness and respiratory paralysis leading to coma and/or death (See Section 11)</p> <p><i>Additionally, at least one component of this gas/liquid mixture is a "simple asphyxiant". High concentrations of this mixture can displace the amount of oxygen available to breathe below that level necessary to sustain life (hypoxia) Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, shortness of breath, nausea, vomiting, confusion, muscular weakness, loss of coordination, convulsions, unconsciousness, coma, and death, depending upon the concentration level and duration of exposure. Oxygen deprivation is possible if working in confined spaces</i></p>
Eye Contact	<p>Vapors may cause moderate to severe eye irritation and photophobia (light sensitivity) upon short-term exposure. Severity depends upon the concentrations of hydrogen sulfide and duration of exposure. Direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn "</p>
Skin Contact	<p>Direct contact with an expanding gas may produce severe and possibly permanent skin damage from frostbite or freeze burns Hydrogen sulfide can be absorbed through the skin to produce toxic effects</p>
Ingestion	<p>Ingestion is not an applicable route of exposure for gases</p>
Chronic Health Effects Summary	<p>Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities Whether or not there is a chronic toxicity of H₂S distinct from its acute and subchronic effects is debatable However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures (See Section 11)</p> <p>Chronic inhalation to components of this gas (propane, n-butane, and n-pentane) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline)-like drugs.</p>
Conditions Aggravated by Exposure	<p>Personnel with eye, skin, cardiac, pulmonary, or neurological disorders, high blood pressure, and those with a compromised ability to use oxygen (asthmatics, anemics, etc) should take additional precautions to minimize or avoid exposure</p> <p>Exposure to high concentrations of this material may increase the sensitivity of the heart to epinephrine (adrenalin) and catecholamine-like drugs. Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians")</p>
Target Organs	<p>The substance is toxic to eyes, skin, mucous membranes, lungs, central and sympathetic nervous systems, brain, heart, and possibly, the endocrine and reproductive systems</p>
Carcinogenic Potential	<p>This material does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC, or NTP</p>

Corrosive	<input checked="" type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. If pain, redness, swelling, tearing, or light sensitivity persists, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Seek medical attention if tissue appears damaged or if pain persists.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry.
Notes to Physician	Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients. This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines such as epinephrine (adrenaline) and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Flammable Gas/Liquefied Gas Extremely flammable ¹		
Flash Point Method	CLOSED CUP AP -107° to -73°C (-160° to -100°F) (Estimated)		
Lower Flammable Limit	AP 1.6 %	Upper Flammable Limit	AP 45 %
Autoignition Temperature	AP 260°C (500°F)		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons, and oxides of sulfur		
Special Properties	This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources ¹ . Hydrogen burns with a blue flame which may not be visible in daylight.		

Refinery Fuel Gas

Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Compressed Gas/Liquefied Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area to an area far upwind. Establish a "regulated zone" with site control and security. Eliminate all ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safely stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This gas or waste mixtures containing this gas should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling **Danger! Poisonous and Flammable Gas!** Do NOT breathe vapor, it contains **hydrogen sulfide (H₂S)**. This gas mixture also contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S concentrations, and flammability.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed petroleum gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue.

Refinery Fuel Gas

Storage

Do not store this material near heat or any other potential ignition sources. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Do not store this product in unlabeled containers. Keep containers tightly closed. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N F P A 's National Electrical Code (NEC). H₂S is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.)

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location. Where H₂S is routinely stored or handled, install monitoring equipment or system with alarms.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection

Avoid skin contact and use gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). When handling this material which can produce frostbite or cold burns, use leather gloves over these chemically-resistant gloves. Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Prevent potential skin contact with cold liquid, solid, or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection.

Respiratory Protection

A full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g. ANSI Z88.2).

General Comments

Releases of this gas may create flammable, explosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Odor is an inadequate warning for hazardous air concentrations. Air purifying respirators offer no protection against oxygen deficiency, hydrogen sulfide, and simple asphyxiants.

Refinery Fuel Gas

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA 10 STEL 15 (ppm) from ACGIH (TLV) TWA 5 (ppm) from ACGIH (TLV) [Proposed] TWA 10 STEL 15 CEIL 20 (ppm) from OSHA (PEL)
2) Hydrogen	Simple asphyxiant
3) Methane	Simple asphyxiant
4) Ethane	Simple asphyxiant
5) Ethylene	Simple asphyxiant
6) Propylene	Simple asphyxiant
7) Liquefied Petroleum Gases	TWA 1000 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL)
8) Propane	TWA: 2500 (ppm) from ACGIH (TLV) TWA 1000 (ppm) from OSHA (PEL)
9) Butanes	TWA 800 (ppm) from ACGIH (TLV) TWA 800 (ppm) from OSHA (PEL)
10) Pentane, all isomers	TWA 600 (ppm) from ACGIH (TLV) TWA 1000 (ppm) from OSHA (PEL)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Gas/Liquefied Gas	Color	Colorless liquid, invisible vapor.	Odor	Odorless to a strong, foul smelling, rotten egg odor which is unreliable as a warning of possible exposure
Specific Gravity	AP 0.37 to 0.58 (Water = 1)	pH	In the presence of moisture, H ₂ S can convert to acidic H ₂ SO ₄	Vapor Density	1.0 to 2.0 (Air = 1)
Boiling Point/Range	-253° to 35°C (-423° to 96°F) (by ASTM D-2887)	Melting/Freezing Point	AP -260° to -82°C (-435° to -117°F) at 14.7 psia	Viscosity (cSt @ 40°C)	Not applicable
Vapor Pressure	50 to 250 psia at 100°F	Volatile Characteristics	This material is usually stored as a liquefied gas mixture. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.		
Solubility in Water	Moderately soluble in cold water (GT 0.5%)				
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Alkane, Isoparaffin, Alkene, and Cycloalkane Hydrocarbons Content = GT 99.9 Wt % (ASTM D-1319), Hydrogen Sulfide Content = 0.0001 to 0.1 Wt %, Average Density at 60°F = LT 4.50 lbs/gal (ASTM D-2161); Gross Heat of Combustion at 60°F = AP 21,000 Btu/lb or 900 to 2,500 Btu/cu ft				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions. Polymerization can occur under conditions of extremely high temperature and pressure.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

Refinery Fuel Gas

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Hydrogen sulfide:

- GAS (TCLo) Acute 10 ppm for 15 minutes (Human) - Eye irritation
- GAS (TCLo) Acute 50 to 100 ppm for 15 minutes (Human) - Respiratory irritation
- GAS (LC100) Acute 600 to 750 ppm for 30 minutes (Human) - Respiratory paralysis and death
- GAS (LCLo) Acute 5,700 ug/kg for 8 hours (Human) - Chronic pulmonary edema, coma, and death

Propylene:

- GAS (LC50) Chronic 1,250 ppm for 6 hours/day for 14 weeks [Mouse]
- GAS (TCLo) Chronic 5,000 ppm for 6 hours/day for 2 years [Rat] - Reduced olfactory sensory response

Iso-Butane:

- GAS (TCLo) Acute 1,040 gm/m³ for 2 hours [Mouse] - Excitement
- GAS (LC50) Acute 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress.

n-Butane:

- GAS (LC50) Acute 660 gm/m³ for 4 hour(s) [Rat]
- GAS (LC50) Acute 680 gm/m³ for 2 hours [Mouse]

2,2-Dimethylpropane (Neopentane):

- INTRAPERITONEAL (LD50) Acute 100 mg/kg [Mouse]

n-Pentane:

- GAS (LC50) Acute 364 gm/m³ for 4 hour(s) [Rat] - Excitement
- INTRAVENOUS (LD50) Acute 446 mg/kg [Mouse]

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (LT 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (GT 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol % in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred, however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline). An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. And, **n-pentane** caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure.

Human volunteers had no apparent effects from exposure concentrations of 250 ppm, 500 ppm, and 1,000 ppm of **isobutane and n-butane** in air for periods of 8 hours daily for 10 days to 14 days, respectively. However, chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane and butylenes** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone.

Inhalation of 500 ppm of **isopentane or n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects, however, higher exposure concentrations of 90,000 to 120,000 ppm (9-12 Wt % in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. Rat 28-day feeding studies done on both **isopentane and n-pentane** using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

Refinery Fuel Gas

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this material. Releases are expected to cause only localized non-persistent environmental damage, however, at ambient temperatures and pressure, the ethylene, propylene, butenes, and hydrogen sulfide components of this material may contribute to generation of atmospheric smog. The atmospheric half-lives of ethane, propane, and butanes under photochemical smog conditions are estimated to be between 5 to 8 hours, and, experimental data shows that significant photooxidation of ethylene and propylene occurs rapidly within 14 to 21 hours. The atmospheric half-lives of butanes under photochemical smog conditions are estimated to be between 5 and 7 days. Photooxidation of hydrogen, methane, ethane, propane, isobutane, and n-butane in air (LT 8%) are not considered environmentally significant. The n-pentane and pentane isomers all have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. Hydrogen sulfide residence times in the atmosphere range from about one day to more than 40 days, depending upon the season, latitude, and presence of other air pollutants. Reduced temperatures increase the residence time.
Environmental Fate	Refined liquefied petroleum hydrocarbon gases are essentially insoluble in water (LT 0.1%), and therefore, this material will not cause harm to aquatic life. For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

This material may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be in accordance with applicable Federal, State, and local regulations. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U.S. Department of Transportation (DOT) regulated material		
Proper Shipping Name	Compressed gases, toxic, flammable, n.o.s. (Hydrogen sulfide, Methane) Inhalation Hazard Zone B		
Hazard Class	2.3 (Poison gas) and 2.1 (Flammable gas)	Packing Group(s)	Not applicable.
		UN/NA ID	UN1953
Reportable Quantity	A Reportable Quantity (RQ) has been established for the Hydrogen sulfide component of this material. (See Section 15.)		
Placards			Emergency Response Guide No. 119
		HAZMAT STCC No.	49 057 66
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

Refinery Fuel Gas

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. A chemical substance present in this material which is subject to this statute is: Hydrogen sulfide [CAS No. 7783-06-4] concentration: 0.0001 to 0.1 Wt. %.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Reactive Hazard, Sudden Release of Pressure Hazard, and the Acute (Immediate) and Chronic (Delayed) Health Hazards.
SARA 313	This material contains the following components in concentrations above de minimis levels and they are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 Ethylene or Ethene [CAS No. 74-85-1] concentration: 2 to 4 Wt. % Propylene or Propene [CAS No. 115-07-1] concentration: 1 to 3 Wt. %.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. A chemical substance present in this material subject to this statute is Hydrogen sulfide (RQ = 100 lbs. [45.36 kg]) concentration = 0.0001 to 0.1 Wt. %.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material does not contain any chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in this material as "Volatile Organic Compounds (VOC)" which contribute significantly to air pollution and endanger public health and welfare" Ethylene (Ethene) [CAS No. 74-85-1], Propylene (Propene) [CAS No. 115-07-1], 1-Butene [CAS No. 106-98-9], Isobutylene [CAS No. 115-11-7], Isopentane [CAS No. 78-78-4], and n-Pentane [CAS No. 109-66-0]. In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this material which are subject to this statute are: Hydrogen, Methane, Ethane, Ethylene (Ethene), Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), Butenes, Butane, Isopentane (Butane, 2-methyl), Pentane, and Hydrogen Sulfide.

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0005
Revision Date 06/12/2000

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquefied Gas
Color Colorless liquid; invisible gas and vapor, white frost at release point. **Odor** Faint, unpleasant.

DANGER! High pressure and rapid diffusion hazard!
Extremely flammable gas/liquid; vapor may cause flash fire or explosion!
High concentrations of vapor reduce oxygen available for breathing!
May cause central nervous system (CNS) depression or suffocation!
Liquid or compressed gas contact may cause frostbite or freeze burns!
Vapor or mist may irritate mucous membranes and respiratory tract!
Liquid contact may cause mild to moderate eye and/or skin irritation!
May be harmful or fatal if inhaled or absorbed through the skin!
Overexposures may cause target organ effects such as lung, brain, liver, and/or kidney damage!
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!

SECTION 1: IDENTIFICATION

Trade Name	Methane/Hydrogen-rich, Sweet Refinery Gases (C1-C5 Hydrocarbons)	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	068308270*	Medical Emergency	(918) 495-4700
CAS Number	68308-27-0	CHEMTREC Emergency	(800) 424-9300
Product Family	C1-C5 Alkane and Alkene Hydrocarbons with Hydrogen		
Synonyms	Sweet Refinery Gas; Light Ends Fractionation Gases, DEA Contactor Tail Gases, Stabilizer Off Gases; Light Reformate Stabilizer Tower Overhead Gas Stream; Distillation Tail Gases, Hydrogen Sulfide-free (Petroleum), C1-C5 Hydrocarbons and Hydrogen Mixture.		

**Methane/Hydrogen-rich,
Sweet Refinery Gases
(C1-C5 Hydrocarbons)**

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Distillation Tail Gas, Hydrogen Sulfide-Free (Petroleum)	68308-02-1	100
2) Methane	74-82-8	25-40
3) Hydrogen	1333-74-0	15-30
4) Ethane	74-84-0	10-20
5) Ethylene	74-85-1	1-5
6) Propane	74-98-6	5-15
7) Propylene	115-07-1	1-5
8) Iso-Butane	75-28-5	1-5
9) Butenes or Butylenes	25167-67-3	1-3
10) n-Butane	106-97-8	1-5
11) Iso-Pentane	78-78-4	1-3
12) n-Pentane	109-66-0	0.5-1.5

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Skin contact Eye contact

Signs and Symptoms of Acute Exposure

Inhalation	Several components of this gas/liquid mixture are "simple asphyxiants" (see Section 8) High concentrations of this mixture can displace the amount of oxygen in air available to breathe below that necessary to sustain life (<i>hypoxia</i>), especially if working in confined spaces Breathing vapors may also cause central nervous system (CNS) depression. Symptoms may include headache, dizziness, slurred speech, excitation or giddiness, nausea, vomiting, visual disturbances, memory loss, confusion, vertigo, drowsiness, fatigue, rapid or difficult breathing, muscular weakness, loss of consciousness, convulsions, coma, and even death, depending upon the concentration and duration of exposure
Eye Contact	Direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn." Prolonged or repeated vapor exposure may cause irritation. This is based upon animal test results for this product's heavier components.
Skin Contact	Direct contact with a liquefied/pressurized gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. The liquid form may cause mild to moderate skin irritation and inflammation
Ingestion	Due to its volatile nature, ingestion is not normally an applicable route of exposure for this liquefied gas mixture. However, if swallowed, this material may "freeze burn" the mucous membranes of the mouth, throat, and esophagus or be aspirated into the lungs Aspiration can result in severe lung damage or death. Cardiovascular effects include shallow rapid pulse and pallor followed by flushing Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may result in death
Chronic Health Effects Summary	Chronic inhalation to components of this liquefied gas (propane, n-butane, and n-pentane) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline) -like drugs.
Conditions Aggravated by Exposure	Personnel with pre-existing chronic respiratory diseases, central nervous system (CNS) disease, high blood pressure, cardiovascular conditions, or skin disorders should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this liquefied gas mixture. They should take additional precautions to minimize or avoid exposure.
Target Organs	This substance is toxic to eyes, skin, mucous membranes, lungs, central nervous system, brain, heart, and possibly, the liver and/or kidneys
Carcinogenic Potential	This material does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC, or NTP.

Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	If cough or difficulty in breathing develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. Monitor arterial blood gases and chest x-ray in cases with significant exposure. If contact with pressurized or liquefied gas causes frostbite of the eyes, early ophthalmologic consultation is recommended. This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines and other sympathomimetic drugs such as epinephrine (adrenaline) should be reserved for emergency situations and then used only with special precaution.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas.		
Flash Point Method	CLOSED CUP LT -60°C (-76°F) (Estimated)		
Lower Flammable Limit	AP 1.4%	Upper Flammable Limit	AP 12.5%
Autoignition Temperature	AP 288°C (550°F)		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, unburned hydrocarbons, and oxides of sulfur.		
Special Properties	This liquefied gas is extremely flammable at well below ambient temperatures and readily forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. Some components are lighter than air and rise rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, this material will burn in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources!		

**Methane/Hydrogen-rich,
Sweet Refinery Gases
(C1-C5 Hydrocarbons)**

Extinguishing Media

DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials

Fire Fighting Protective Clothing

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquefied Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This liquefied gas or waste mixtures containing this material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802)

SECTION 7: HANDLING AND STORAGE**Handling**

This liquefied gas mixture contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring for oxygen deficiency and flammability.

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of mixed gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Drain and purge equipment as necessary to remove material residues. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Do not allow vaporizing material to contact eyes, skin or other tissues. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated.

**Methane/Hydrogen-rich,
Sweet Refinery Gases
(C1-C5 Hydrocarbons)**

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier Do not puncture or incinerate cylinders

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection Ensure that an emergency eye wash station and safety shower are near the work-station location

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment For certain operations, additional PPE may be required.

**Eye Protection**

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gases If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with cold liquid or vapors.

Body Protection

Prevent potential skin contact with cold liquid or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

Odor is not an adequate warning for potentially hazardous air concentrations! Use a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors Air purifying respirators offer no protection against oxygen deficient atmospheres. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).

General Comments

For an explanation about some of the occupational exposure limits shown below, refer to the definition of "Simple Asphyxiant" presented in the American Conference of Governmental Industrial Hygienists (ACGIH) most current **Threshold Limit Values (TLVs) for Chemical Substances and Physical Agents** handbook Releases of this liquefied gas mixture may create flammable, explosive, and/or oxygen-deficient atmospheres (LT 19.5 Vol.% in air). DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability Warning! Odor is an inadequate warning for hazardous conditions

**Methane/Hydrogen-rich,
Sweet Refinery Gases
(C1-C5 Hydrocarbons)**

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen	Simple asphyxiant
2) Methane	Simple asphyxiant.
3) Ethane	Simple asphyxiant
4) Ethylene	Simple asphyxiant.
5) Propylene	Simple asphyxiant.
6) Propane	TWA: 2500 (ppm) from ACGIH (TLV) [1999] TWA: 1000 (ppm) from OSHA (PEL) [1989]
7) Butanes	TWA: 800 (ppm) from ACGIH (TLV) [1999] TWA: 800 (ppm) from OSHA (PEL) [1989]
8) Pentane, all isomers	TWA: 600 (ppm) from ACGIH (TLV) [1999] TWA: 1000 (ppm) from OSHA (PEL) [1976]
9) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) [1999] TWA: 1000 (ppm) from OSHA (PEL) [1989]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquefied Gas	Color	Colorless liquid; invisible gas and vapor, white frost at release point	Odor	Faint, unpleasant.
Specific Gravity	0.40 to 0.53 (Water = 1)	pH	Not applicable.	Vapor Density	0.5 to 1.0 (Air = 1)
Boiling Point/Range	-253° to 36°C (-423° to 97°F) at 14.7 psia (ASTM D-2887)	Melting/Freezing Point			-260° to -129°C (-435° to -200°F) at 14.7 psia
Vapor Pressure	100 to 205 psia at 40°C (104°F)	Viscosity (cSt @ 40°C)			Not applicable.
Solubility in Water	Slightly soluble in cold water.	Volatile Characteristics			This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Gross Heat of Combustion at 60°F = AP 22,000 to 25,000 Btu/lb or 1,000 to 2,000 Btu/cu.ft ; Dry Point Temperature = AP 82°F (28°C) (ASTM D-86), Average Density at 60°F = LT 5.0 lbs./gal (ASTM D-2161).				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur, but possible.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

**Methane/Hydrogen-rich,
Sweet Refinery Gases
(C1-C5 Hydrocarbons)**

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Propylene:

GAS (LC50): Chronic. 1,250 ppm for 6 hours/day for 14 weeks [Mouse]

GAS (TCLo): Chronic: 5,000 ppm for 6 hours/day for 2 years [Rat] - Reduced olfactory sensory response

Iso-Butane:

GAS (TCLo) Acute: 1,040 gm/m³ for 2 hours [Mouse] - Excitement

GAS (LC50): Acute: 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress.

Iso-Butene (Isobutylene or 2-Methylpropene)

GAS (LC50): Acute: 415 gm/m³ for 2 hours [Mouse].

GAS (LC50): Acute: 620 gm/m³ for 4 hours [Rat] **n-Butane**

GAS (LC50): Acute: 658,000 mg/m³ for 4 hours [Rat].

GAS (LC50) Acute. 680,000 mg/m³ for 2 hours [Mouse].

n-Butane

GAS (LC50). Acute 658,000 mg/m³ for 4 hours [Rat].

GAS (LC50): Acute: 680,000 mg/m³ for 2 hours [Mouse].

n-Pentane

GAS (LC50): Acute. 364,000 mg/m³ for 4 hours [Rat] - Excitement

INTRAVENOUS (LD50): Acute: 446 mg/kg [Mouse].

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline).

In humans, at concentrations of 6.4% in air or higher, **propylene** causes mild intoxication, dermal sensations, and an inability to concentrate on tasks within two minutes. Gross inhalation of propylene concentrations of 40% or higher for a couple minutes cause reddening of the eyelids and face, tearing, coughing, and sometimes flexing of the legs, reduced blood pressure, and/or disordered heart rhythm. A concentration of 50% causes anesthesia in two minutes, followed by complete recovery without any physiological indications.

Chronic low-level exposures to **propylene** may entail a possible hazard from the formation of a reactive metabolite, **propylene oxide**, which is a "suspect human carcinogen". However, propylene have not been shown to be carcinogenic in rat studies. For example, propylene was tested by the National Cancer Institute (NCI) in a two-year, 6 hours/day, 5 days/week inhalation study using rats and mice with exposure concentrations at 5,000 and 10,000 ppm. The resulting data suggested that propylene induces signs of nasal cavity toxicity (epithelial hyperplasia/metaplasia) including increased incidence of neo-plastic lesions in rats, but not in mice. **Propylene** is NOT considered carcinogenic to either rats or mice even though it may be partially metabolized to **propylene oxide** which has been shown to be mutagenic and produces site of contact tumors in rodents following long-term administration. Propylene has also been found to be a cardiac sensitizer in dogs.

Human volunteers had no apparent effects from exposures of 250 ppm, 500 ppm, and 1,000 ppm concentrations in air of **isobutane** and **n-butane** for periods of 8 hours daily for 10 days to 14 days, respectively. An **n-Butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane** and **butenes** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone. Chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage.

Inhalation of 500 ppm of **isopentane** or **n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects; however, higher exposure concentrations of 90,000 to 120,000 ppm (9 to 12 Wt.% in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be be fatal. n-Pentane caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure. Rat 28-day feeding studies on both isopentane and n-pentane using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, the ethylene, propylene, and butenes components of this material will readily vaporize and may contribute to generation of atmospheric smog.
Environmental Fate	<p>The atmospheric half-lives of ethane, ethylene, propane, propylene, and butenes under photochemical smog conditions are estimated to be between 5 to 8 hours. Experimental data shows that significant photooxidation of ethylene, propylene and butenes occurs rapidly within 7 to 21 hours. The atmospheric half-lives of the butanes under photochemical smog conditions are estimated to be between 5 and 7 days. The pentanes have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. Photooxidation of propane, isobutane, and n-butane in air (LT 8%) are not considered to be environmentally significant.</p> <p>Refined liquefied petroleum hydrocarbon gases are essentially insoluble in water (LT 0.1%); and therefore, this material will not cause harm to aquatic life.</p> <p>For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)</p>

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

This material may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). In addition, conditions of use may cause this material to become a hazardous waste for additional reasons, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this liquefied gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT)		
Proper Shipping Name	Compressed gases, flammable, n.o.s. (Hydrogen, Methane)		
Hazard Class	CLASS 2.1 Flammable gas.	Packing Group(s)	Not applicable.
		UN/NA ID	UN1954
Reportable Quantity	There are no Reportable Quantity (RQ) substance components present in this material which might require DOT HAZMAT bill-of-lading display.		
Placards		Emergency Response Guide No.	115
		HAZMAT STCC No.	49 057 29
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

**Methane/Hydrogen-rich,
Sweet Refinery Gases
(C1-C5 Hydrocarbons)**

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	These streams and/or their components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. There are no chemical substances present in this material subject to this statute.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, and Acute (Immediate) & Chronic (Delayed) Health Hazards.
SARA 313	This material contains the following components in concentrations which are at or above de minimis levels and are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313: Ethylene or Ethene [CAS No. 74-85-1] concentration: 1 to 5% Propylene or Propene [CAS No. 115-07-1] concentration: 1 to 5%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "Hazardous Substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. This material does not contain any chemical substances subject to this statute. However, it is recommended that you contact state and local authorities to determine if there are any other reporting requirements in the event of a spill.
CWA	This material might be classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material does not contain any chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it may be not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling, refer to components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in this material as a "Volatile Organic Compounds (VOC)" which contribute significantly to air pollution which endangers public health and welfare" Ethylene (Ethene), Propylene (Propene), 1-Butene, Isobutylene, and n-Pentane. In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this product which are subject to this statute are: Hydrogen, Methane, Ethane, Ethylene (Ethene), Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), Butane, various Butenes, Isopentane (Butane, 2-methyl), n-Pentane, and 2,2-Dimethylpropane (Neopentane).

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Sulfur Plant Feed from the Sour Water Stripper

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0011
Revision Date 11/28/2001

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Compressed Gas.		
Color	Colorless to water white.	Odor	Faint to a strong, foul smelling, rotten egg or ammoniacal odor which is unreliable as a warning of possible exposure.

DANGER! Vapor may cause flash fire or explosion!
High pressure and rapid diffusion hazard!
Contains toxic Hydrogen Sulfide and Ammonia!
Extremely flammable and toxic compressed gas!
May be harmful or fatal if inhaled or absorbed!
High concentrations of vapor reduce oxygen available for breathing and may cause central nervous system (CNS) depression or suffocation!
Compressed gas vapor, mist, or liquid contact may cause thermal burns and/or frostbite or freeze burns!
May react violently with acids, acidic solutions, or halogenated materials!
Reactions may generate extremely flammable Hydrogen!
May be corrosive to some metals!

SECTION 1: IDENTIFICATION

Trade Name	Sulfur Plant Feed from the Sour Water Stripper	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	068783051*	Medical Emergency	(800) 313-7645 or (918) 495-4700
CAS Number	68783-05-1	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Hydrogen Sulfide, Ammonia, Carbon Dioxide, and Water.		
Synonyms	Acid Gas; Sour Gas; Ammonia-Hydrogen Sulfide Gas; Sulfur Plant Feed from the Sour Water Stripper Overhead; Claus Unit Feed.		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Ammonia-Hydrogen Sulfide Gases	68783-05-1	100
2) Hydrogen sulfide	7783-06-4	35-84
3) Ammonia	7664-41-7	10-40
4) Water (Steam)	7732-18-5	5-20
5) Carbon dioxide	124-38-9	1-5

Sulfur Plant Feed from the Sour Water Stripper

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye contact. Inhalation. Skin Absorption. Ingestion.

Signs and Symptoms of Acute Exposure

Inhalation	<p>May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. The National Institute for Occupational Safety and Health (NIOSH) has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are "immediately dangerous to life and health". At concentrations above 500 ppm, H₂S causes unconsciousness and respiratory paralysis leading to coma and/or death.</p> <p>Ammonia (NH₃) vapors may cause severe lung effects which might be delayed in onset. Symptoms are characterized by coughing, choking, or shortness of breath. Also, NIOSH has determined that atmospheres containing 300 ppm or more of NH₃ are "immediately dangerous to life and health". (See Section 11.)</p>
Eye Contact	<p>Hot vapor contact will cause severe thermal burns. Direct contact with cooled vapor may cause moderate irritation and photophobia (light sensitivity) upon short-term exposure; and, if not promptly removed, it can produce severe, and possibly permanent, tissue damage commonly referred to as a "freeze burn". The severity of the effects depend on the concentrations of hydrogen sulfide and ammonia, the duration of exposure, and how soon after exposure the eyes are washed.</p>
Skin Contact	<p>Hot vapor contact will cause severe thermal burns. Direct contact with an expanding gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. Ammonia may be moderately irritating or corrosive to the skin. Irritation may follow an initial delay between the time that the exposure occurs and the sense of irritation begins. This latency period can vary as much as several hours for a dilute solution (0.04 wt.% ammonia) to minutes with more concentrated solutions. Prolonged or repeated contact, even to dilute concentrations of ammonia solutions, may cause some degree of permanent tissue destruction. Hydrogen sulfide can be absorbed through the skin to produce toxic effects. If the skin is damaged, absorption increases.</p>
Ingestion	<p>Ingestion is not an applicable route of exposure for gases. However, if the condensate portion of this mixture is swallowed, this material may cause gastrointestinal tract irritation, nausea, and vomiting, in addition to a burning sensation in the mouth, throat, and digestive tract. Depending upon the ammonia concentration, ulceration of the gastrointestinal tract may also occur.</p>
Chronic Health Effects Summary	<p>Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H₂S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures.</p> <p>Chronic dyspnea, obstructive lung disease, and bronchial hyper-reactivity were adverse effects experienced by several workers two years after their occupational overexposures to mists or aerosols of ammonia. Also, when ingested by rats, aqueous ammonia solutions have been shown to cause gastrointestinal tract tumors.</p> <p>Long-term exposure to airborne carbon dioxide concentrations as low as 0.5 to 1% can alter the body's acid-base and calcium-phosphorus balance, resulting in metabolic acidosis and increased calcium deposits in soft tissues. Chronic exposure to levels of 1 to 2% CO₂ in air can stress the adrenal cortex because of constant respiratory stimulation; this level of exposure may be considered dangerous after several hours. CO₂ might also be a threat to the well-being of the unborn if a pregnant woman is exposed enough to cause metabolic acidosis. (See Section 11.)</p>
Conditions Aggravated by Exposure	<p>Personnel with pre-existing eye, skin, or gastrointestinal disorders, nervous system diseases, impaired kidney function, or chronic respiratory diseases neurological disorders, high blood pressure, and those with a compromised ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this material's components. They should take additional precautions to minimize or avoid exposure.</p>
Target Organs	<p>The material is potentially toxic to eyes, skin, mucous membranes, lungs, central and sympathetic nervous systems, brain, and possibly the blood, heart, and/or the endocrine and reproductive systems.</p>
Carcinogenic Potential	<p>This material does not contain any components at concentrations above 0.1% which are considered to be carcinogenic by OSHA, IARC, or NTP.</p>

Sulfur Plant Feed from the Sour Water Stripper

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input checked="" type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Do not attempt to remove contact lenses. Immediately irrigate eyes with copious amounts of cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	Flush thoroughly with water under a cool or cold shower for at least 15 minutes while removing contaminated shoes and clothing. Gently and thoroughly wash contaminated skin with running water and non-abrasive soap. Be particularly careful to clean folds, crevices, creases, and groin area. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Thoroughly clean contaminated clothing before reuse.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	<p>If after exposed skin has been washed gently with running water and non-abrasive soap, one may neutralize severely irritated or burned tissue with a dilute solution of boric acid or acetic acid.</p> <p>Inhalation overexposure can produce other toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.</p> <p>Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Water (steam)-saturated compressed gas is non-flammable under normal conditions of use; however, if improperly handled, released H ₂ S or H ₂ vapors are Extremely Flammable!		
Flash Point Method	Not applicable or AP -76°C (-100°F) for H ₂ S. [ASTM D-56]		
Lower Flammable Limit	Not applicable or 4.0% for H ₂ S.	Upper Flammable Limit	Not applicable or 45% for H ₂ S.
Autoignition Temperature	Not applicable or AP 260°C (500°F) for H ₂ S.		

Sulfur Plant Feed from the Sour Water Stripper

Hazardous Combustion Products

Contact with some metals can generate extremely flammable **hydrogen (H₂)** gas. This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!

Special Properties

A volatile component of this gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. High heat, hot surface contact, or mixing with acids may spring steam, extremely flammable H₂S, and/or toxic NH₃ vapors out of an aqueous solution. H₂S is heavier than air and may travel long distances along the ground to an ignition source and flash back. It may also create a vapor/air explosion hazard in confined spaces such as in sewers. Adding this mixture directly to unbuffered water may cause a slightly exothermic reaction.

Extinguishing Media

DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use extinguishing media suitable for the surrounding fire. In an advanced or massive fire, evacuate area and fight fire from a safe distance or a protected location. Approach fire from upwind. Use unmanned monitors and hoseholders to keep cooling streams of water on fire-exposed cylinders or tanks until well after the fire is out. If possible, isolate materials not yet involved in the fire and protect personnel. Move containers away from fire area if it can be done without risk.

Protection of Fire Fighters

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This gas or waste mixtures containing this gas should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

Sulfur Plant Feed from the Sour Water Stripper

SECTION 7: HANDLING AND STORAGE

Handling

Danger! Poisonous and Flammable Gas! Do NOT breathe vapor; it contains **hydrogen sulfide (H₂S) and ammonia**. Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S concentrations, and flammability.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue. Do not allow vaporizing material to contact eyes, skin or other tissues. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated.

Storage

Do not store this material near heat or any other potential ignition sources. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Do not store this product in unlabeled containers. Keep containers tightly closed. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC). H₂S is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.)

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location. Where H₂S is routinely stored or handled, fixed or personal monitors can be used for detection and as an exposure monitoring system.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Sulfur Plant Feed from the Sour Water Stripper

Eye Protection	Thermal protection should be provided if the solution has a temperature above 120 degrees F. Suitable eye wash water should be readily available. Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.
Hand Protection	Avoid skin contact. Use of chemical-resistant gloves (e.g., PVC, neoprene, rubber, or vinyl) is required. Thermal protection should be used whenever the solution has a temperature above 120 degrees F. Wash hands and other exposed skin with mild soap and water before eating, drinking, smoking, or using the toilet facilities.
Body Protection	Avoid all skin contact. If splashing or spraying is expected, chemical-resistant protective clothing (e.g., vinyl, Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. Thermal protection should be provided when the solution has a temperature above 120 degrees F. If general contact occurs, IMMEDIATELY remove soaked clothing and shower thoroughly. Contaminated leather goods should be removed immediately and discarded.
Respiratory Protection	Misting or vapor generation is not expected under normal conditions of use; so respiratory protection is not anticipated under normal use conditions and with adequate ventilation. However, when anticipated or if generated hydrogen sulfide or ammonia are present at concentrations above applicable workplace exposure levels, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g. ANSI Z88.2).
General Comments	Releases may create flammable, explosive, toxic, and/or oxygen-deficient atmospheres (< 19.5 Vol.% in air). DO NOT ENTER such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions. Air purifying respirators offer no protection against oxygen deficiency and hydrogen sulfide. Use good personal hygiene practices. Wash hands and other exposed skin areas with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities, or leaving work. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners. Exposure standards/control limits for some of the components apply to airborne concentrations of dust, and are not truly applicable to liquid solutions. Use of personal protective equipment and good personal hygiene are essential to controlling exposures to this aqueous solution.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) TWA: 5 (ppm) from ACGIH (TLV) [Proposed]
2) Ammonia	TWA: 10 STEL: 15 CEIL: 20 (ppm) from OSHA (PEL) TWA: 25 STEL: 35 (ppm) from ACGIH (TLV) TWA: 50 STEL: 35 (ppm) from OSHA (PEL) STEL: 35 (ppm) from OSHA (PEL) [Proposed]
3) Carbon dioxide	TWA: 5000 STEL: 30000 (ppm) from ACGIH (TLV) TWA: 5000 STEL: 30000 (ppm) from OSHA (PEL)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Compressed Gas.	Color	Colorless to water white.	Odor	Faint to a strong, foul smelling, rotten egg or ammoniacal odor which is unreliable as a warning of possible exposure.
Specific Gravity	0.62 to 0.82 (Water = 1)	pH	6.0 to 12.0 In the presence of moisture, H ₂ S can convert to acid H ₂ SO ₄ .	Vapor Density	1.00 to 1.50 (Air = 1)
Boiling Point/Range	-79° to 100°C (-110° to 212°F) at 14.7 psia.	Melting/Freezing Point		Viscosity (cSt @ 40°C)	-129° to 0°C (-200° to 32°F) at 14.7 psia. Not applicable.
Vapor Pressure	212 to 394 psia at 100°F (based upon H ₂ S and NH ₃)	Volatile Characteristics		Characteristics	Negligible volatility in proper storage. 100% upon release.
Solubility in Water	Completely soluble in cold water; but may cause an exothermic reaction.				

Sulfur Plant Feed from the Sour Water Stripper

Additional Properties A 1% solution of ammonia has a greater than 9.0 pH. Ammonia has a vapor density lighter than air and will disperse rapidly; however, hydrogen sulfide has a vapor density heavier than air and will tend to accumulate in low places or travel along the ground creating a flashback fire hazard.

This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard.
Average Density at 60°F = 3.0 to 4.50 lbs./gal. (ASTM D-2161);
Gross Heat of Combustion at 60°F = 350 to 550 Btu/cu.ft.

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from strong acids, heat and hot surfaces, strong oxidizing conditions, and severe agitation. Contact with some metals can generate extremely flammable hydrogen (H ₂) gas.		
Materials Incompatibility	Strong acids, halogenated compounds, and some heavy metals. Ammonia solutions are corrosive to chromium and silver and alloys containing these metals and will react violently with their powdered forms.		
Hazardous Decomposition Products	Sulfur dioxide. Free aromatic amines may be released in a reducing environment.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Hydrogen sulfide:

- GAS (TC_{Lo}): Acute: 10 ppm for 15 minutes [Human] - Eye irritation.
- GAS (TC_{Lo}): Acute: 50 to 100 ppm for 15 minutes [Human] - Respiratory irritation.
- GAS (LC₁₀₀): Acute: 600 to 750 ppm for 30 minutes [Human] - Respiratory paralysis and death.
- GAS (LC_{Lo}): Acute: 5,700 ug/kg for 8 hours [Human] - Chronic pulmonary edema, coma, and death.

Ammonia:

- ORAL (LD_{Lo}): Acute: 132 mg/kg [Human].
- ORAL (TD_{Lo}): Acute: 15 uL/kg [Human] - Structural changes in the esophagus.
- GAS (TC_{Lo}): Acute: 20 ppm for 1hour [Human] - Eye irritation, ulcerated nasal septum, and structural changes in the trachea or bronchi.
- GAS (LC_{Lo}): Acute: 5,000 ppm for 5 minutes [Human].
- GAS (LC_{Lo}): Acute: 5,000 ppm for 5 minutes [Guinea Pig].
- GAS (LC₅₀): Acute: 2,000 ppm for 4 hours [Rat].
- GAS (LC₅₀): Acute: 7,000 mg/m³ for 1 hour [Cat and Rabbit] - Excitement and flaccid paralysis without anesthesia.
- GAS (LC₅₀): Acute: 4,230 ppm for 1 hour [Mouse] - Ataxia, tremors, and convulsions.

Carbon dioxide:

- GAS (LC_{Lo}): Acute: 90,000 ppm for 5 minutes [Human and Dog].
- GAS (TC_{Lo}): Chronic: 10,000 ppm for 24 hours for 30 days [Rat] - Blood compositional changes.
- GAS (TC_{Lo}): Chronic: 27,000 ppm for 24 hours for 30 days [Rabbit] - Somnolence.

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (< 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (> 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Sulfur Plant Feed from the Sour Water Stripper

Ammonia is a strong base and forms **ammonium hydroxide** upon contact with water. This material is corrosive to many organic compounds. If ingested, ammonia can cause severe pain, bloody diarrhea, cardiovascular collapse, and death. Concentrated ammonia is a strong corrosive which can cause burns of the following types: cryogenic from contact with refrigerated liquid, thermal from exothermic reaction with water, and chemical from its alkalinity. It gelatinizes the tissue, forming deep and painful lesions. At low concentrations, aqueous ammonia is a moderate to strong irritant to the eyes, skin, mucous membranes, and respiratory and digestive tracts. Its effects on the lungs can be severe and delayed in onset; respiratory support may be required following acute inhalation. However, there seems to be a wide variability in the human sensitivity to ammonia.

Chronic dyspnea, restrictive lung dysfunction, obstructive lung disease, and bronchial hyper-reactivity were adverse effects experienced by several employees two years after their occupational overexposures to mists and aerosols of **ammonia**. An **aqueous ammonia solution** caused gastrointestinal cicatricial tumors in rats following a 24-week feeding assay. NH_3 produced a positive mutagenic response in the Ames Assay and caused chromosomal aberrations during a 16-week cytogenic study using rats. However, in general, pH alterations produce false positive results in short-term genetic assays.

Many people have died from overexposure to **carbon dioxide (CO_2) gas**. CO_2 exerts direct toxicity on the heart, resulting in diminished contractile force. It is also a vasodilator, and is the most potent cerebrovascular dilator known. At an airborne concentration of 5,500 ppm for 6 hours, CO_2 has no ill effects, while at 3% (30,000 ppm) it is mildly narcotic and causes reduced hearing, increased blood pressure, and rapid pulse. Its IDLH has been determined to be 40,000 ppm (4%) in air. Concentrations of 50,000 to 80,000 ppm (5 to 8%) produce normal symptoms of hypoxia (see Section 3) within 10 minutes. And, at 8 to 10% in air, CO_2 causes tremors, hypertension, difficulty in breathing, and loss of consciousness within 5 to 10 minutes. Extended exposure to concentrations between 10 and 15% can be lethal. Breathing 20% CO_2 in air for 1 minute causes convulsions, unconsciousness, and usually death.

Long-term exposure to airborne **carbon dioxide** concentrations as low as 0.5 to 1%, while being generally well tolerated, can alter the body's acid-base and calcium-phosphorus balance, resulting in metabolic acidosis and increased calcium deposits in soft tissues. Chronic exposure to levels of 1 to 2% CO_2 in air can stress the adrenal cortex because of constant respiratory stimulation; if not given a period of gradual adaption, this level of exposure is considered dangerous after several hours. CO_2 might also be a threat to the well-being of the unborn if a pregnant woman is exposed enough to cause metabolic acidosis. This decreases the blood supply to the uterus which increases fetal breathing movements and reduces fetal development. Also, laboratory rat studies suggest that CO_2 exposures may adversely affect male reproduction by altering the testes causing premature release of sperm and reduced fertility.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. Vapor releases from this material are expected to cause significant immediate impact but only localized non-persistent environmental damage. Due caution should be exercised to prevent an accidental release into the environment. This material and any contaminated soil or other water may be hazardous to human, animal, and aquatic life. Volatile components may contribute to smog formation.

Hydrogen sulfide residence times in the atmosphere range from about one day to more than 40 days, depending upon the season, latitude, and presence of other air pollutants. Reduced temperatures increase the residence time.

Environmental Fate

This material is soluble in water and is expected to readily disperse in marine environments. Caustic solutions have produced slight to moderate toxicity in laboratory tests with aquatic organisms. It is expected to be moderately alkaline. If released to surface water, it may cause a pH rise depending upon the buffering capacity of the waterbody. Aquatic organisms become increasingly stressed as pH concentration exceeds 9.0, with many species being intolerant of pH of 10.0 or higher. Substances in this mixture do not bioaccumulate.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

Sulfur Plant Feed from the Sour Water Stripper

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a hazardous waste at the time of disposal. This material may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. Maximize component recovery prior for reuse or recycling. This material may disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this gas to the atmosphere should be avoided. Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Compressed gas, toxic, flammable, n.o.s. Inhalation Hazard Zone B (Hydrogen sulfide and Ammonia)		
Hazard Class	2.3 (Poisonous gas)	Packing Group(s)	Not applicable.
		UN/NA ID	UN1953

Reportable Quantity Reportable Quantity (RQ) substance components present in this material which require DOT HAZMAT bill-of-lading display is **Hydrogen sulfide and Ammonia**. (See Section 15.)

Placards

Emergency Response Guide No. 119

HAZMAT STCC No. 49 203 78

MARPOL III Status Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.

SARA 302/304 The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. This material contains the following chemical substances which are subject to this statute:

Hydroxide sulfide [CAS No. 7783-06-4] concentration: 35 to 84%

Ammonia [CAS No. 7664-41-7] concentration: 10 to 40%.

SARA 311/312 The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories:

Acute (Immediate) & Chronic (Delayed) Health, Sudden Release of Pressure, Fire, and Reactivity Hazards

SARA 313 This material contains the following components in concentrations which are at or above de minimis levels and are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313:

Hydroxide sulfide [CAS No. 7783-06-4] concentration: 35 to 84%

Ammonia [CAS No. 7664-41-7] concentration: 10 to 40%.

Sulfur Plant Feed from the Sour Water Stripper

CERCLA

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this material subject to this statute are:

Hydroxide sulfide [CAS No. 7783-06-4] concentration: 35 to 84%
Ammonia [CAS No. 7664-41-7] concentration: 10 to 40%.

CWA

This material is NOT classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA).

**California
Proposition 65**

This material does not contain any ingredients for which the State of California has found to cause cancer, birth defects, or other reproductive harm; and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.

**New Jersey
Right-to-Know Label**

For New Jersey labeling refer to components listed in Section 2.

**Additional Regulatory
Remarks**

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Chemical substances present in this material subject to this statute are:

Hydroxide sulfide [CAS No. 7783-06-4] concentration: 35 to 84%
Ammonia [CAS No. 7664-41-7] concentration: 10 to 40%.

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 2.0
Revision Date 11/28/2001
Print Date Printed on 11/28/2001.

Acid Scrubber Off Gas

HMIS	IMPORTANT: Read this MSDS before handling and disposing of this product and pass this information on to employees, customers, and users of this product. This product is covered by the OSHA Hazard Communication Standard and this document has been prepared in accord with the MSDS requirements of the rule.	Protective Equipment
Health Hazard *4		
Fire Hazard 4		
Reactivity 0		
* = Chronic Health Hazard		

SECTION 1: IDENTIFICATION

Trade Name	Acid Scrubber Off Gas	MSDS No.	RS0015
Product Number	068527139*	Revision Date	6/24/97
CAS Number	68527-13-9		
Synonyms	Recycled hydrogen sulfide, Sour off gas		
Generic Name	Gases, petroleum, acid, ethanolamine scrubber		
Chemical Family	Hydrogen sulfide and carbon dioxide		
Manufacturer	LYONDELL-CITGO Refining Company Ltd. 12000 Lawndale Avenue P O Box 2451 Houston, Texas 77252-2451	Telephone Numbers	800/424-9300 CHEMTREC 800/313-7645 Company Hot Line 713/321-4215 MSDS Requests

SECTION 2: COMPOSITION

Component Name	CAS Number	Carcinogenic Listings	Concentration Wt%
HYDROGEN SULFIDE (H ₂ S)	7783-06-4	Not applicable	AP 47 to 54
CARBON DIOXIDE (CO ₂)	124-38-9	Not applicable	AP 46 to 53

SECTION 3: HAZARDS IDENTIFICATION

EMERGENCY OVERVIEW

Signal Word	DANGER!	Color	Colorless.
Physical State	Gas	Odor	Strong, rotten egg-like odor from 0.1 ppm to 100 ppm Sense of smell may be deadened above 100 ppm.
Physical and Health Hazards	Extremely flammable, poisonous gas; may be harmful or fatal if inhaled! Eye and respiratory system irritant. Compressed gases have a potential hazard of sudden release of pressure. Contact with liquefied or compressed gas may cause frostbite or freeze burns. Corrosive to some metals.		
Environmental Hazards	Ecological effects testing has not been conducted on this product. If released, it could have detrimental effects until dissipated.		

POTENTIAL HEALTH EFFECTS

Routes of Exposure Inhalation, skin and eye contact, and skin absorption.

Signs and Symptoms of Acute Exposure

• <i>Inhalation</i>	Poison; may be fatal if inhaled! Concentrations of hydrogen sulfide at or below 250 ppm may cause respiratory tract irritation and pulmonary edema. H ₂ S concentrations between 250 ppm and 500 ppm may result in headache, nausea, disorientation, irregular heartbeat, low blood pressure, and/or coma. Greater than 500 ppm H ₂ S may cause sudden collapse, respiratory paralysis, convulsions, and death. Inhalation of high concentrations of CO ₂ may adversely affect vision.
• <i>Eye Contact</i>	Vapors may cause moderate to severe eye irritation and sensitivity to light. Direct contact with liquefied/pressurized gas may produce severe and possibly permanent damage from freeze burns.
• <i>Skin Contact</i>	Hydrogen sulfide is non-irritating to the skin, but can be absorbed to produce toxic effects (see <i>Inhalation</i> above). Direct contact with liquefied/pressurized gas may produce severe and possibly permanent damage from freeze burns.
• <i>Ingestion</i>	Ingestion is not an applicable route of exposure for gases.
Chronic Health Effects Summary	Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H ₂ S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures.
Conditions Aggravated by Exposure	Personnel with pre-existing eye, respiratory, cardiac, or neurological conditions should take additional precautions to minimize or avoid exposure.
Target Organs	This substance may be toxic to the eyes, central nervous system, upper respiratory system, lungs, heart, and possibly the reproductive systems.
Carcinogenic Potential	Please refer to Sections 2 and/or 11 for the identification of components, if any, which have been identified as having carcinogenic potential in animals and/or humans.

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to the Emergency Overview in Section 3 and Exposure Controls in Section 8 of this MSDS.

Inhalation	Move the exposed person to fresh air at once. If breathing has stopped, initiate artificial respiration; if the heart has stopped, initiate CPR. When breathing is difficult, properly trained personnel may administer 100% oxygen. Keep the affected person warm and at rest. Get medical attention as soon as possible.
Eye Contact	If eye tissue is frozen, seek medical attention immediately. If tissue is not frozen, immediately and thoroughly flush the eyes with large amounts of clean low-pressure water for at least 15 minutes, occasionally lifting the upper and lower eyelids. If irritation, pain, swelling, tearing or light sensitivity persists, obtain medical attention as soon as possible.
Skin Contact	If frostbite has occurred, seek medical attention immediately. Do not rub the affected areas or flush them with water. In order to prevent further damage, do not attempt to remove frozen clothing from frostbitten areas. If frostbite has not occurred, immediately and thoroughly wash contaminated skin with mild soap and water.
Ingestion	Ingestion is not a route of exposure.
Notes to Physician	Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal.

SECTION 5: FIRE FIGHTING MEASURES**FLAMMABLE PROPERTIES**

Flammability	Extremely flammable gas!
Classification	
Flash Point/Method	LT -105°F (-77°C)/ ASTM D-56
Flammable Limits %	LEL: AP 4.0 UEL: AP 44 (based on NFPA hydrogen sulfide)
Auto-Ignition Temperature	AP 500°F (260°C, based on NFPA hydrogen sulfide).
Hazardous Combustion Products	Burning or excessive heating may produce oxides of carbon and/or sulfur.
Special Properties	Extremely flammable gas; exposed to an ignition source it will burn in the open or explode in a confined space. Being heavier than air, its flammable vapors may travel long distances along the ground before reaching a source of ignition and flashing back. Vapors may collect in low or confined areas. Containers may explode when heated.

EXTINGUISHING MEDIA

DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS LEAK CAN BE STOPPED!
Cool tanks and containers with water fog or spray in order to prevent pressure build-up, autoignition or explosion. Use water, dry chemical, carbon dioxide, or inert gas to extinguish adjacent burning materials.

FIRE FIGHTING

Protective Equipment/Clothing: Wear a NIOSH-approved positive pressure self-contained breathing apparatus and firefighter's turnout gear.

Instructions: STOP GAS FLOW! Evacuate area and fight from a maximum distance or use unmanned hose holders or monitor nozzles. Use water spray to reduce vapors or divert vapor cloud drift. Containers can build up pressure if exposed to heat; cool with flooding quantities of water until well after the fire is out. Do not direct water at source of leak or pressure relief devices, icing may occur. Withdraw immediately in case of rising sound from venting safety devices or discoloration of vessel. ALWAYS stay away from the ends of "bullet" tanks.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview in Section 3 and Exposure Controls in Section 8 of this MSDS.

Eliminate all ignition sources. Wear vapor protective, fully encapsulating clothing for spills and leaks with no fire. Keep upwind; do not enter release. Stop leak if you can do so without risk; use non-sparking tools.

Use water spray to disperse vapors or divert vapor cloud drift. Do not direct water at source of leak. Prevent vapors from entering sewers, ventilation systems and confined areas. Isolate area until gas has dispersed.

SECTION 7: HANDLING and STORAGE**Handling**

Do not breathe this gas. Hydrogen sulfide's rotten egg-like odor is not reliable as a warning of possible exposure! Do not enter storage areas unless adequately ventilated. Keep containers tightly closed. Use only in a closed system constructed from resistant materials. Emergency self-contained breathing apparatus should be readily available. A continuous monitoring system with alarms is recommended for work areas where H₂S is routinely present.

Keep away from heat, sparks, flame and other sources of ignition. Use spark-proof tools and explosion proof equipment. Avoid contact with eyes, skin, and clothing. Wash thoroughly after handling. Emergency eye wash stations should be nearby. Train workers about this material's hazards and how to handle accidental release situations.

Hydrogen sulfide is very corrosive to all electro-chemical series metals. It can cause pipes and valves to corrode and become blistered, pitted and brittle. Lines and fittings likely to contain H₂S should be inspected frequently and receive special attention, monitoring and maintenance to prevent leaks. Metal components used in H₂S service should be resistant to sulfide stress cracking.

Storage

Keep away from heat, sparks and other sources of ignition; segregate from incompatible materials. Store original container tightly closed in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Ground all containers and transfer vessels.

Cylinders must be stored upright and firmly secured; avoid placing them in high-traffic areas. Valve caps should remain on all cylinders not in use. Storage and handling facilities should meet the applicable requirements of the National Electrical Code and National Fire Protection Association standards.

SECTION 8: EXPOSURE CONTROLS and PERSONAL PROTECTION**ENGINEERING CONTROLS**

Engineering controls are normally required when handling this material. Use closed system or other controls to maintain airborne levels below recommended exposure limits. Engineering controls should meet applicable requirements of the National Electrical Code. Storage or handling facilities should be equipped with an emergency eyewash station and safety shower.

PERSONAL PROTECTIVE EQUIPMENT• *Protective Equipment*• *Eye Protection*

A full-face supplied air respirator with escape bottle or a positive-pressure pressure-demand self-contained breathing apparatus (SCBA) is required.

• *Skin Protection*- *Hands*

Use Neoprene or PVC/Nitrile gloves. When handling hot materials or those that can produce frostbite or cold burns, use leather gloves over chemically resistant gloves.

- *Body*

Avoid skin contact; wear chemical resistant protective clothing. This might include apron, slicker suit, boots, and additional facial protection.

• *Respiratory Protection*

A full-face supplied air respirator with escape bottle or a positive-pressure pressure-demand self-contained breathing apparatus (SCBA) is required.

• *General Comments*

A cartridge respirator offers NO PROTECTION against hydrogen sulfide (H₂S).

EXPOSURE GUIDELINES

Substance	Source	Date	Type	Value	Time
HYDROGEN SULFIDE	OSHA	1989	PEL	10 ppm	8 hours
HYDROGEN SULFIDE	OSHA	1989	STEL	15 ppm	15 minutes
HYDROGEN SULFIDE	OSHA	1989	CEILING	20 ppm	NA
HYDROGEN SULFIDE	ACGIH	1996	TLV	10 ppm	8 hours
HYDROGEN SULFIDE	ACGIH	1996	STEL	15 ppm	15 minutes
CARBON DIOXIDE	OSHA	1989	PEL	10,000 ppm	8 hours
CARBON DIOXIDE	OSHA	1989	STEL	30,000 ppm	15 minutes
CARBON DIOXIDE	ACGIH	1996	TLV	5,000 ppm	8 hours
CARBON DIOXIDE	ACGIH	1996	STEL	30,000 ppm	15 minutes

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Gas		
Color	Colorless.		
Odor	Strong, rotten egg-like odor from 0.1 ppm to 100 ppm. Sense of smell may be deadened above 100 ppm.		
pH	Not applicable.		
Vapor Pressure	AP 19 psia at 68 °F	Viscosity	Not applicable.
Vapor Specific Gravity	AP 1.2 to 1.5 (air = 1.0 at 60°F)	Melting/Freezing Pt.	AP -117°F (-83°C)
Volatile Characteristics	Complete (100 %)	Solubility in Water	Appreciable (> 10%)
Boiling Point/Range	AP -109° to -76°F (-78° to -60°C)	Specific Gravity	Less than 1.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard.		

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.
Conditions to Avoid	Heat, flame, or strong oxidizing materials.
Incompatibility with Other Materials	Dangerously reactive with strong oxidizing materials (nitric acid, chlorine, fluorine, etc.), some metals, metal oxides, and metal powders. Corrosive to some metals and alloys, especially those containing copper and/or tungsten
Hazardous Decomposition Products	No degradation data available.
Hazardous Polymerization	Not expected to occur.

SECTION 11: TOXICOLOGICAL INFORMATION**HYDROGEN SULFIDE (H₂S)**Acute

TE _{Lo} Human:	AP 1 ppm - Odor response threshold
TC _{Lo} Human:	AP 10 ppm for 15 minutes - Eye irritation
TC _{Lo} Human:	50 to 100 ppm for 15 minutes - Respiratory irritation
IDLH Value:	100 ppm
LC _{Lo} Human:	600 ppm for 30 minutes
LC ₅₀ Mouse:	673 ppm for 1 hour
LC ₅₀ Rat:	444 ppm for 4 hours

Subchronic

5 weeks Rats: 100 ppm for 8 hours/day - pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase.

Reproductive Effects

One unconfirmed study mentions H₂S as causing damage to the testes and/or male reproduction. Recent studies do not confirm this association.

CARBON DIOXIDE (CO₂):Acute

LC_{Lo} Human: 90,000 ppm for 5 minutes

LC_{Lo} Guinea Pig: 90,000 ppm for 5 minutes

Subchronic

30-Day Rat. 10,000 ppm for 24 hours/day - Blood changes.

30-Day Rabbit: 27,000 ppm for 24 hours/day - Somnolence.

42-Day Human males: 15,000 ppm for 24 hours/day - Headaches, deepened respiration, breathing difficulty upon exertion, metabolic acidosis, and increased calcium deposits in soft tissues.

Reproductive Effects

No human reproductive data concerning CO₂ is available, however, carbon dioxide has been reported to have a variety of reproductive effects in experimental animals including changes in sperm production and reduced fertility. The well-being of the unborn may be at risk if the mother is exposed to a concentration sufficient to render her unconscious.

SECTION 12: ECOLOGICAL INFORMATION

Hydrogen sulfide is toxic to both plants and animals and is harmful to aquatic life in very low concentrations. If it is spilled onto the soil, it will be rapidly released to the atmosphere.

However, it is soluble in water and the presence of precipitation or ground water at the time of the spill will influence its environmental fate. Residence times in the atmosphere range from one day to more than 40 days, depending upon season, and atmospheric conditions.

SECTION 13: DISPOSAL CONSIDERATIONS

Dispose of by burning in a properly designed and permitted flare or incinerator. Venting of this gas to the atmosphere should be avoided.

SECTION 14: TRANSPORT INFORMATION

DOT Status A U.S. Department of Transportation regulated material.
Proper Shipping Name Compressed gases, toxic, flammable, n.o.s. (hydrogen sulfide)
Inhalation Hazard Zone B
Hazard Class 2.3
UN/NA ID UN1953
Reportable Quantity RQ (HYDROGEN SULFIDE)

Packing Group(s) NA

Placards

Emergency Response Guide Number 119

HAZMAT STCC Number 49 203 78

MARPOL III Status Not a "Marine Pollutant".

SECTION 15: REGULATORY INFORMATION

TSCA	All components of this product are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires emergency planning and notification based on Threshold Planning Quantities (TPQ's) and Reportable Quantities (RQ's) listed in 40 CFR 302.4 and 40 CFR 355. Chemical substances present in this product subject to this statute are: HYDROGEN SULFIDE
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Immediate Health Hazard, Delayed Health Hazard, Fire Hazard, and Sudden Release of Pressure
SARA 313	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires submission of an annual Toxic Chemical Release Inventory Report (Form R) by facilities which receive, import, make, process, or otherwise use "Toxic Chemicals" above specified threshold quantities. These facilities must also notify their customers if a product contains "Toxic Chemicals" regulated under 40 CFR 372.65. This information must also be included in all MSDS's that are copied and distributed for the product. Chemical substances present in this product subject to this statute are: HYDROGEN SULFIDE
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of hazardous substances equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. Chemical substances present in this product subject to this statute are: HYDROGEN SULFIDE RQ: 100 Pound(s) (45.4 Kg)
California Proposition 65	The California Safe Drinking Water and Toxic Enforcement Act of 1986 (Proposition 65) requires warning be given for ingredients known to the State of California to cause cancer, birth defects, or other reproductive toxicity. This product contains no known chemical substances subject to this statute.
Additional Regulatory Remarks	The Clean Air Act Section 112(r) of 1993 requires development, implementation, and submission of risk management plans for facilities that manufacture, process, use, store or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this stream which are subject to this statute are: CARBON DIOXIDE and HYDROGEN SULFIDE.

Sour Refinery Gases (C1-C4 Hydrocarbons)

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0018
Revision Date 10/15/2002

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Gas/Liquefied Gas.		
Color	Colorless liquid; invisible gas and vapor; white frost at release point.	Odor	Strong, foul smelling; rotten egg odor is unreliable as a warning of possible exposure.

DANGER! Extremely flammable and poisonous gas/liquid;
vapor may cause flash fire or explosion.
High pressure and rapid diffusion hazard.
High vapor concentrations reduce oxygen available for breathing.
Contains Hydrogen Sulfide (H₂S).
May be harmful or fatal if inhaled or absorbed through the skin.
May cause central nervous system (CNS) depression
or suffocation.
Compressed gas/liquid contact may cause frostbite/freeze burns.
Mist or vapor may cause mild to severe eye, skin, mucous
membrane, and respiratory tract irritation and inflammation.
Aspiration into the lungs will cause pulmonary edema and
chemical pneumonia.
Overexposures may cause central nervous system (CNS)
depression and other target organ effects.
Prolonged and/or repeated inhalation may increase the heart's
susceptibility to arrhythmias (irregular beats).
Corrosive to some metals.

SECTION 1: IDENTIFICATION

Trade Name	Sour Refinery Gases (C1-C4 Hydrocarbons)	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	068477929*	Medical Emergency	(918) 495-4700
CAS Number	68477-92-9	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Sour Hydrocarbon Gas Mixture		
Synonyms	Sour Light Refinery Gas; Sour Light Gases; Sour C1-C4 Mix with Hydrogen; Gas Blend containing Hydrogen and Hydrogen Sulfide; C1-C4 Hydrocarbons, H ₂ , and H ₂ S.		

Sour Refinery Gases (C1-C4 Hydrocarbons)

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Sour C1-C4 Hydrocarbons	68477-92-9	100
2) Hydrogen sulfide	7783-06-4	0.05-5
3) Ammonia	7664-41-7	0-0.9
4) Hydrogen	1333-74-0	1-10
5) Methane	74-82-8	1-15
6) Ethane	74-84-0	5-15
7) Ethylene	74-85-1	1-5
8) Propane	74-98-6	15-30
9) Propylene	115-07-1	1-10
10) Isobutane	75-28-5	15-25
11) Butenes or Butylenes	25167-67-3	1-10
12) n-Butane	106-97-8	10-20

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Eye contact. Skin contact. Skin absorption.

Signs and Symptoms of Acute Exposure

Inhalation

May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. **Ammonia** vapors may cause severe lung effects which might be delayed in onset. Symptoms are characterized by coughing, choking, or shortness of breath. NIOSH has determined that atmospheres containing 100 ppm or more of **hydrogen sulfide (H₂S)** are immediately dangerous to life and health. At concentrations above 500 ppm, **H₂S** cause unconsciousness and respiratory paralysis leading to coma and/or death. Also, NIOSH has determined that atmospheres containing 300 ppm or more of **ammonia (NH₃)** are immediately dangerous to life and health. (See Section 11.)

Additionally, at least one component of this gas/liquid mixture is a "simple asphyxiant". High concentrations of this mixture can displace the amount of oxygen available to breathe below that level necessary to sustain life (hypoxia). Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, shortness of breath, nausea, vomiting, confusion, muscular weakness, loss of coordination, convulsions, unconsciousness, coma, and death, depending upon the concentration level and duration of exposure. Oxygen deprivation is possible if working in confined spaces.

Breathing high concentrations of the liquid-phase vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon the exposure duration. Approximately 20,000 ppm (or 2 vol.%) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes.

Eye Contact

Vapors may cause mild to severe eye irritation and photophobia (light sensitivity) upon short-term exposure. Severity depends upon the concentration of **hydrogen sulfide and ammonia** and duration of exposure. Direct contact with pressurized/liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn." Direct liquid contact can cause clouding of the cornea with small areas of superficial corneal necrosis.

Direct liquid contact may cause eye irritation and clouding of the cornea with small areas of superficial corneal necrosis upon short-term exposure and can produce severe, and possibly permanent, tissue damage if not promptly removed. The severity of the effects depend on the concentration of the **ammonia** component and how soon after exposure the eyes are washed.

Sour Refinery Gases (C1-C4 Hydrocarbons)

Skin Contact	<p>May be moderately irritating or corrosive to the skin. Irritation may follow an initial delay between the time that the exposure occurs and the sense of irritation begins. This latency period can vary as much as several hours for a dilute solution (0.04 wt.% ammonia) to minutes with more concentrated solutions. Prolonged or repeated contact, even to dilute concentrations of ammonia solutions, may cause some degree of permanent tissue destruction.</p> <p>Direct contact with a liquefied/pressurized gas portion of this material may produce severe and possibly permanent skin damage from frostbite or freeze burns. Tests on this material's components suggest that moderate to severe skin irritation, inflammation, and blistering is expected to occur upon short-term liquid contact. Hydrogen sulfide may be absorbed through the skin, and produce toxic effects such as CNS depression (see "Inhalation" above). If the skin is damaged, absorption increases.</p>
Ingestion	<p>Ingestion of this material is highly unlikely due to its volatile nature. However, if swallowed, this material may cause gastrointestinal tract irritation, nausea, and vomiting, in addition to a burning sensation in the mouth, throat, and digestive tract. Depending upon the ammonia concentration, ulceration of the gastrointestinal tract may also occur. Additional central nervous system (CNS) effects may occur prior to the onset of convulsions, coma, and death.</p> <p>Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Cardiovascular effects include shallow rapid pulse and pallor followed by flushing. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may result in death.</p>
Chronic Health Effects Summary	<p>Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H₂S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures.</p> <p>Chronic dyspnea, obstructive lung disease, and bronchial hyper-reactivity were adverse effects experienced by several workers two years after their occupational overexposures to mists or aerosols of ammonia. Also, when ingested by rats, aqueous ammonia solutions have been shown to cause gastrointestinal tract tumors.</p> <p>Chronic inhalation to components of this material (propane, propylene, isobutane, and n-butane) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline)-like drugs. (See Section 11.)</p>
Conditions Aggravated by Exposure	<p>Personnel with pre-existing eye, skin, cardiac, pulmonary, liver, kidney, or neurological disorders, high blood pressure, and those with a compromised ability to use oxygen, such as asthmatics, anemics, and those with reduced pulmonary function, may be more sensitive to excess concentrations of this material's components. They should take additional precautions to minimize or avoid exposure.</p>
Target Organs	<p>This material is toxic to eyes, skin, mucous membranes, lungs, central and sympathetic nervous systems, brain, heart, blood, and possibly, the endocrine and reproductive systems.</p>
Carcinogenic Potential	<p>This material does not contain any components at concentrations above 0.1% which are considered to be carcinogenic by OSHA, IARC, or NTP.</p>

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>

Sour Refinery Gases (C1-C4 Hydrocarbons)

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Be particularly careful to clean folds, crevices, creases, and groin area. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if irritation or pain persists. Thoroughly clean contaminated clothing before reuse.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	<p>Nitrite as an antidote for acute hydrogen sulfide intoxicification may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients.</p> <p>Inhalation overexposure can produce other toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.</p> <p>If after exposed skin has been washed gently with running water and non-abrasive soap, one may neutralize severely irritated or burned tissue with a dilute solution of boric acid or acetic acid.</p> <p>This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines such as epinephrine (adrenaline) and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas and Liquefied Gas.		
Flash Point Method	CLOSED CUP: AP -107° to -73°C (-160° to -100°F). (Estimated)		
Lower Flammable Limit	1.6 to 4.0%	Upper Flammable Limit	AP 45%
Autoignition Temperature	260° to 288°C (500° to 550°F)		
Hazardous Combustion Products	Carbon dioxide and monoxide, smoke, fumes, oxides of sulfur, and possibly, unburned hydrocarbons or mercaptans.		

Sour Refinery Gases (C1-C4 Hydrocarbons)

Special Properties	This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Compressed Gas/Liquid Mixture! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area to an area far upwind. Establish a "regulated zone" with site control and security. Eliminate all ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. Cover spill with a vapor-suppressing foam as soon as possible. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off.

SECTION 7: HANDLING AND STORAGE

Sour Refinery Gases (C1-C4 Hydrocarbons)

Handling

Danger! Corrosive or Irritating Liquid and/or Poisonous and Flammable Gas! Do NOT breathe mist or vapor; it may contain **hydrogen sulfide (H₂S)**, **ammonia (NH₃)**, and/or **simple asphyxiants**. Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S concentrations, and flammability.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed petroleum gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue.

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC). The H₂S component of this material is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.)

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location. Where **hydrogen sulfide and/or ammonia** are routinely stored or handled, install monitoring equipment or system with alarms and special ventilation will be required.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Sour Refinery Gases (C1-C4 Hydrocarbons)

Hand Protection	Avoid skin contact and use gloves (e.g. disposable neoprene, nitrile, vinyl, or PVC/NBR). When handling this material which can produce frostbite or cold burns, use leather gloves over these chemically-resistant gloves. Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.
Body Protection	Prevent potential skin contact with cold liquid, solid, or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.
Respiratory Protection	A full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g. ANSI Z88.2).
General Comments	Releases of this gas/liquid mixture may create flammable, explosive, corrosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Air purifying respirators offer no protection against hydrogen sulfide, ammonia, and simple asphyxiants.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) TWA: 5 (ppm) from ACGIH (TLV) [Proposed]
2) Ammonia	TWA: 10 STEL: 15 CEIL: 20 (ppm) from OSHA (PEL) TWA: 25 STEL: 35 (ppm) from ACGIH (TLV) TWA: 50 STEL: 35 (ppm) from OSHA (PEL) STEL: 35 (ppm) from OSHA (PEL) [Proposed]
3) Hydrogen	Simple asphyxiant.
4) Methane	Simple asphyxiant.
5) Ethane	Simple asphyxiant.
6) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL) [Proposed]
7) Propane	TWA: 2500 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL) [Proposed]
8) Butanes	TWA: 800 (ppm) from ACGIH (TLV) TWA: 800 (ppm) from OSHA (PEL) [Proposed]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Gas/Liquefied Gas.	Color Colorless liquid; invisible gas and vapor; white frost at release point.	Odor	Strong, foul smelling; rotten egg odor is unreliable as a warning of possible exposure.
Specific Gravity	0.30 to 0.59 (Water = 1)	pH In the presence of moisture, H ₂ S can convert to H ₂ SO ₄ .	Vapor Density	0.55 to 2.0 (Air = 1)
Boiling Point/Range	-253°C to -1°C (-423° to 31°F) [ASTM D-2887]		Melting/Freezing Point	-259° to -139°C (-435° to -217°F) at 14.7 psia.
Vapor Pressure	200 to 400 psia at 100°F.		Viscosity (cSt @ 40°C)	Not applicable.
Solubility in Water	Moderately soluble in cold water.		Volatile Characteristics	This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Hydrogen Sulfide and Ammonia Content = 0.1 to 13 Wt.%; Alkane, Isoparaffin, Alkene, and Cycloalkane Hydrocarbons Content = 87 to 99.9 Wt.% [ASTM D-1319]; Average Density at 60°F = AP 4.50 lbs./gallon [ASTM D-2161].			

Sour Refinery Gases (C1-C4 Hydrocarbons)

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, calcium hypochlorite, chlorates, permanganates, nitrates, hydrogen peroxide, mercury oxide, and oxygen. Oxidizer mixtures and alkane hydrocarbons and chlorine gas mixtures have produced explosions. Under some conditions, mercaptans may react with water or steam to produce additional toxic and flammable vapors.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the **Emergency Overview on Page 1** and the **Hazards Identification in Section 3** of this MSDS.

Toxicity Data

Hydrogen sulfide:

GAS (TC_{Lo}): Acute: 10 ppm for 15 minutes (Human) - Eye irritation.

GAS (TC_{Lo}): Acute: 50 to 100 ppm for 15 minutes (Human) - Respiratory irritation.

GAS (LC₁₀₀): Acute: 600 to 750 ppm for 30 minutes (Human) - Respiratory paralysis and death.

GAS (LC_{Lo}): Acute: 5,700 ug/kg for 8 hours (Human) - Chronic pulmonary edema, coma, and death.

Ammonia:

ORAL (LD_{Lo}): Acute: 132 mg/kg [Human].

ORAL (TD_{Lo}): Acute: 15 uL/kg [Human] - Structural changes in the esophagus.

GAS (TC_{Lo}): Acute: 20 ppm for 1hour [Human] - Eye irritation, ulcerated nasal septum, and structural changes in the trachea or bronchi.

GAS (LC_{Lo}): Acute: 5,000 ppm for 5 minutes [Human].

GAS (LC_{Lo}): Acute: 5,000 ppm for 5 minutes [Guinea Pig].

GAS (LC₅₀): Acute: 2,000 ppm for 4 hours [Rat].

GAS (LC₅₀): Acute: 7,000 mg/m³ for 1 hour [Cat and Rabbit] - Excitement and flaccid paralysis without anesthesia.

GAS (LC₅₀): Acute: 4,230 ppm for 1 hour [Mouse] - Ataxia, tremors, and convulsions.

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (< 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (> 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Ammonia is a strong base and forms **ammonium hydroxide** upon contact with water. This material is corrosive to many organic compounds. If ingested, ammonia can cause severe pain, bloody diarrhea, cardiovascular collapse, and death. Concentrated ammonia is a strong corrosive which can cause burns of the following types: cryogenic from contact with refrigerated liquid, thermal from exothermic reaction with water, and chemical from its alkalinity. It gelatinizes the tissue, forming deep and painful lesions. At low concentrations, aqueous ammonia is a moderate to strong irritant to the eyes, skin, mucous membranes, and respiratory and digestive tracts. Its effects on the lungs can be severe and delayed in onset; respiratory support may be required following acute inhalation. However, there seems to be a wide variability in the human sensitivity to ammonia.

Chronic dyspnea, restrictive lung dysfunction, obstructive lung disease, and bronchial hyper-reactivity were adverse effects experienced by several employees two years after their occupational overexposures to mists and aerosols of ammonia.

Sour Refinery Gases (C1-C4 Hydrocarbons)

An **aqueous ammonia solution** caused gastrointestinal cicatrized tumors in rats following a 24-week feeding assay. NH_3 produced a positive mutagenic response in the Ames Assay and caused chromosomal aberrations during a 16-week cytogenic study using rats. However, in general, pH alterations produce false positive results in short-term genetic assays.

Propylene:

GAS (LC_{50}): Chronic: 1,250 ppm for 6 hours/day for 14 weeks [Mouse].

GAS (TC_{Lo}): Chronic: 5,000 ppm for 6 hours/day for 2 years [Rat] - Reduced olfactory sensory response.

Iso-Butane:

GAS (TC_{Lo}): Acute: 1,040,000 mg/m^3 for 2 hours [Mouse] - Excitement.

GAS (LC_{50}): Acute: 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress.

Iso-Butene (Isobutylene or 2-Methylpropene):

GAS (LC_{50}): Acute: 415,000 mg/m^3 for 2 hours [Mouse].

GAS (LC_{50}): Acute: 620,000 mg/m^3 for 4 hours [Rat].

n-Butane:

GAS (LC_{50}): Acute: 660,000 mg/m^3 for 4 hours [Rat].

GAS (LC_{50}): Acute: 680,000 mg/m^3 for 2 hours [Mouse].

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline). An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. And, **n-pentane** caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure.

In humans, at concentrations of 6.4% in air or higher, **propylene** causes mild intoxication, dermal sensations, and an inability to concentrate on tasks within two minutes. Gross inhalation of propylene concentrations of 40% or higher for a couple minutes cause reddening of the eyelids and face, tearing, coughing, and sometimes flexing of the legs, reduced blood pressure, and/or disordered heart rhythm. A concentration of 50% causes anesthesia in two minutes, followed by complete recovery without any physiological indications.

Chronic low-level exposures to **propylene** may entail a possible hazard from the formation of a reactive metabolite, **propylene oxide**, which is a "suspect human carcinogen". However, propylene have not been shown to be carcinogenic in rat studies. For example, propylene was tested by the National Cancer Institute (NCI) in a two-year, 6 hours/day, 5 days/week inhalation study using rats and mice with exposure concentrations at 5,000 and 10,000 ppm. The resulting data suggested that propylene induces signs of nasal cavity toxicity (epithelial hyperplasia/metaplasia) including increased incidence of neo-plastic lesions in rats, but not in mice. **Propylene** is NOT considered carcinogenic to either rats or mice even though it may be partially metabolized to **propylene oxide** which has been shown to be mutagenic and produces site of contact tumors in rodents following long-term administration. Propylene has also been found to be a cardiac sensitizer in dogs.

Human volunteers had no apparent effects from exposures of 250 ppm, 500 ppm, and 1,000 ppm concentrations in air of **isobutane and n-butane** for periods of 8 hours daily for 10 days to 14 days, respectively. Chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage.

An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane and butylene** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone.

Sour Refinery Gases (C1-C4 Hydrocarbons)

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity	<p>Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, the hydrogen sulfide and ammonia components of this material may contribute to generation of atmospheric smog. The atmospheric half-life of propane under photochemical smog conditions are estimated to be between 5 to 8 hours. The atmospheric half-lives of butanes under photochemical smog conditions are estimated to be between 5 and 7 days. Photooxidation of propane, isobutane, and n-butane in air (< 8%) are not considered environmentally significant.</p> <p>Hydrogen sulfide residence times in the atmosphere range from about one day to more than 40 days, depending upon the season, latitude, and presence of other air pollutants. Reduced temperatures increase the residence time.</p>
Environmental Fate	<p>Refined liquefied petroleum hydrocarbon gases are essentially insoluble in water (< 0.1%); however, hydrogen sulfide is moderately soluble in water so this material and any contaminated soil or water may be hazardous to human, animal, and aquatic life.</p> <p>For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)</p>

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this gas/liquid to the atmosphere should be avoided. Maximize material recovery for reuse or recycling.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitability (D001) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U.S. Department of Transportation (DOT) regulated material.		
Proper Shipping Name	Compressed gases, flammable, toxic, n.o.s. Inhalation Hazard Zone B (Hydrogen sulfide, Hydrogen)		
Hazard Class	DOT Class: 2.3 (Poisonous gas) and 2.1 (Flammable gas).	Packing Group(s) UN/NA ID	Not applicable. UN1953
Reportable Quantity	The Reportable Quantity (RQ) substance components present in this material which might require DOT HAZMAT bill-of-lading display are Hydrogen sulfide and Ammonia .		

Sour Refinery Gases (C1-C4 Hydrocarbons)

Placards

Emergency Response Guide No. 119

HAZMAT STCC No. 49 057 66

MARPOL III Status Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. Chemical substances present in this material and possibly subject to this statute are: Hydrogen sulfide [CAS No. = 7783-06-4] concentration: 0.05 to 5% Ammonia [CAS No. = 7664-41-7] concentration: 0 to 0.9%.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, Reactive, & Acute (Immediate) & Chronic (Delayed) Health Hazards.
SARA 313	This material contains the following components in concentrations which might be at or above de minimis levels and are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313: Hydrogen sulfide [CAS No. = 7783-06-4] concentration: 0.05 to 5% Ethylene or Ethene [CAS No. 74-85-1] concentration: 1 to 5% Propylene or Propene [CAS No. 115-07-1] concentration: 1 to 10%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances which might be present in this material and are subject to this statute are: Hydrogen sulfide [CAS No. = 7783-06-4] (RQ = 100 lbs. [45.36 kg]) concentration: 0.05 to 5% Ammonia [CAS No. = 7664-41-7] (RQ = 100 lbs. [45.36 kg]) concentration: 0 to 0.9%.
CWA	This material might be classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material does not may contain any chemical substance which is known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling, refer to the components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in this material as "Volatile Organic Compounds (VOC)" which contribute significantly to air pollution which endangers public health and welfare": Ethylene (Ethene), Propylene (Propene), 1-Butene, and Isobutylene. In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances which may be present in this material which are subject to this statute include: Hydrogen sulfide, Ammonia, Hydrogen, Methane, Ethane, Ethylene (Ethene), Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), various Butenes, and n-Butane.

Sour Refinery Gases (C1-C4 Hydrocarbons)**SECTION 16: OTHER INFORMATION**

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Hydrogen-Rich, Sour Refinery Gases (C1-C4 Hydrocarbons)

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0019
Revision Date 10/11/2002

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Gas/Liquefied Gas.		
Color	Colorless liquid; invisible gas and vapor; white frost at release point.	Odor	Strong, foul smelling; rotten egg odor is unreliable as a warning of possible exposure.

DANGER! Extremely flammable and poisonous gas/liquid;
vapor may cause flash fire or explosion.
High pressure and rapid diffusion hazard.
High vapor concentrations reduce oxygen available for breathing.
Contains Hydrogen Sulfide (H₂S) and Ammonia.
May be harmful or fatal if inhaled or absorbed through the skin.
May cause central nervous system (CNS) depression
or suffocation.
Compressed gas/liquid contact may cause frostbite/freeze burns.
Mist or vapor may cause mild to severe eye, skin, mucous
membrane, and respiratory tract irritation and inflammation.
Aspiration into the lungs will cause pulmonary edema and
chemical pneumonia.
Overexposures may cause central nervous system (CNS)
depression and other target organ effects.
Prolonged and/or repeated inhalation may increase the heart's
susceptibility to arrhythmias (irregular beats).
Corrosive to some metals.

Hazard Rankings

SECTION 1: IDENTIFICATION

Trade Name	Hydrogen-Rich, Sour Refinery Gases (C1-C4 Hydrocarbons)	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	1111110019	Medical Emergency	(918) 495-4700
CAS Number	68783-07-3	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Sour Hydrocarbon Gas Mixture		
Synonyms	Sour Refinery Gas; Mixture of Light Ends Fractionator (LEF) Gases; Refinery Blend Gases (Petroleum); Gas Blend containing Hydrogen, Hydrogen Sulfide and Mercaptans; C1-C4 Hydrocarbons, H ₂ , H ₂ S, and R-SHs.		

Hydrogen-Rich, Sour Refinery Gases (C1-C4 Hydrocarbons)

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Refinery Blend Gases (Petroleum)	68783-07-3	100
2) Hydrogen sulfide	7783-06-4	0.001-10
3) Ammonia	7664-41-7	0.1-3
4) Hydrogen	1333-74-0	10-50
5) Methane	74-82-8	10-30
6) Ethane	74-84-0	10-20
7) Ethylene	74-85-1	1-5
8) Propane	74-98-6	10-30
9) Propylene	115-07-1	1-5
10) Isobutane	75-28-5	1-5
11) Butenes or Butylenes	25167-67-3	0.1-3
12) n-Butane	106-97-8	10-40

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Eye contact. Skin contact. Skin absorption.

Signs and Symptoms of Acute Exposure

Inhalation

May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. **Ammonia** vapors may cause severe lung effects which might be delayed in onset. Symptoms are characterized by coughing, choking, or shortness of breath. NIOSH has determined that atmospheres containing 100 ppm or more of **hydrogen sulfide (H₂S)** are immediately dangerous to life and health. At concentrations above 500 ppm, **H₂S** cause unconsciousness and respiratory paralysis leading to coma and/or death. Also, NIOSH has determined that atmospheres containing 300 ppm or more of **ammonia (NH₃)** are immediately dangerous to life and health. (See Section 11.)

Additionally, at least one component of this gas/liquid mixture is a "simple asphyxiant". High concentrations of this mixture can displace the amount of oxygen available to breathe below that level necessary to sustain life (hypoxia). Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, shortness of breath, nausea, vomiting, confusion, muscular weakness, loss of coordination, convulsions, unconsciousness, coma, and death, depending upon the concentration level and duration of exposure. Oxygen deprivation is possible if working in confined spaces.

Breathing high concentrations of the liquid-phase vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon the exposure duration. Approximately 20,000 ppm (or 2 vol.%) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes.

Eye Contact

Vapors may cause mild to severe eye irritation and photophobia (light sensitivity) upon short-term exposure. Severity depends upon the concentration of **hydrogen sulfide and ammonia** and duration of exposure. Direct contact with pressurized/liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn." Direct liquid contact can cause clouding of the cornea with small areas of superficial corneal necrosis.

Direct liquid contact may cause eye irritation and clouding of the cornea with small areas of superficial corneal necrosis upon short-term exposure and can produce severe, and possibly permanent, tissue damage if not promptly removed. The severity of the effects depend on the concentration of the **ammonia** component and how soon after exposure the eyes are washed.

Hydrogen-Rich, Sour Refinery Gases (C1-C4 Hydrocarbons)

Skin Contact

May be moderately irritating or corrosive to the skin. Irritation may follow an initial delay between the time that the exposure occurs and the sense of irritation begins. This latency period can vary as much as several hours for a dilute solution (0.04 wt.% ammonia) to minutes with more concentrated solutions. Prolonged or repeated contact, even to **dilute concentrations of ammonia solutions**, may cause some degree of permanent tissue destruction.

Direct contact with a liquefied/pressurized gas portion of this material may produce severe and possibly permanent skin damage from frostbite or freeze burns. Tests on this material's components suggest that moderate to severe skin irritation, inflammation, and blistering is expected to occur upon short-term liquid contact. **Hydrogen sulfide** may be absorbed through the skin, and produce toxic effects such as CNS depression (see "Inhalation" above). If the skin is damaged, absorption increases.

Ingestion

Ingestion of this material is highly unlikely due to its volatile nature. However, if swallowed, this material may cause gastrointestinal tract irritation, nausea, and vomiting, in addition to a burning sensation in the mouth, throat, and digestive tract. Depending upon the **ammonia** concentration, ulceration of the gastrointestinal tract may also occur. Additional central nervous system (CNS) effects may occur prior to the onset of convulsions, coma, and death.

Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Cardiovascular effects include shallow rapid pulse and pallor followed by flushing. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may result in death.

Chronic Health Effects Summary

Subchronic exposure to low levels of **hydrogen sulfide** can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H₂S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures.

Chronic dyspnea, obstructive lung disease, and bronchial hyper-reactivity were adverse effects experienced by several workers two years after their occupational overexposures to mists or aerosols of **ammonia**. Also, when ingested by rats, **aqueous ammonia solutions** have been shown to cause gastrointestinal tract tumors.

Chronic inhalation to components of this material (**propane, propylene, isobutane, and n-butane**) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of **epinephrine (adrenaline)-like drugs**. (See Section 11.)

Conditions Aggravated by Exposure

Personnel with pre-existing eye, skin, cardiac, pulmonary, liver, kidney, or neurological disorders, high blood pressure, and those with a compromised ability to use oxygen, such as asthmatics, anemics, and those with reduced pulmonary function, may be more sensitive to excess concentrations of this material's components. They should take additional precautions to minimize or avoid exposure.

Target Organs

This material is toxic to eyes, skin, mucous membranes, lungs, central and sympathetic nervous systems, brain, heart, blood, and possibly, the endocrine and reproductive systems.

Carcinogenic Potential

This material does not contain any components at concentrations above 0.1% which are considered to be carcinogenic by OSHA, IARC, or NTP.

OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input checked="" type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

Hydrogen-Rich, Sour Refinery Gases (C1-C4 Hydrocarbons)

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Be particularly careful to clean folds, crevices, creases, and groin area. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if irritation or pain persists. Thoroughly clean contaminated clothing before reuse.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	<p>Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients.</p> <p>Inhalation overexposure can produce other toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.</p> <p>If after exposed skin has been washed gently with running water and non-abrasive soap, one may neutralize severely irritated or burned tissue with a dilute solution of boric acid or acetic acid.</p> <p>This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines such as epinephrine (adrenline) and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas and Liquefied Gas.		
Flash Point Method	CLOSED CUP: AP -107° to -73°C (-160° to -100°F). (Estimated)		
Lower Flammable Limit	1.6 to 4.0%	Upper Flammable Limit	AP 45%
Autoignition Temperature	260° to 288°C (500° to 550°F)		
Hazardous Combustion Products	Carbon dioxide and monoxide, smoke, fumes, oxides of sulfur, and possibly, unburned hydrocarbons or mercaptans.		

Hydrogen-Rich, Sour Refinery Gases (C1-C4 Hydrocarbons)

Special Properties	This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Compressed Gas/Liquid Mixture! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area to an area far upwind. Establish a "regulated zone" with site control and security. Eliminate all ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. Cover spill with a vapor-suppressing foam as soon as possible. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off.

SECTION 7: HANDLING AND STORAGE

Hydrogen-Rich, Sour Refinery Gases (C1-C4 Hydrocarbons)

Handling

Danger! Corrosive or Irritating Liquid and/or Poisonous and Flammable Gas! Do NOT breathe mist or vapor; it may contain hydrogen sulfide (H₂S), ammonia (NH₃), and/or simple asphyxiants. Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S concentrations, and flammability.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed petroleum gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue.

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC). The H₂S component of this material is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.)

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location. Where hydrogen sulfide and/or ammonia are routinely stored or handled, install monitoring equipment or system with alarms and special ventilation will be required.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hydrogen-Rich, Sour Refinery Gases (C1-C4 Hydrocarbons)

Hand Protection	Avoid skin contact and use gloves (e.g. disposable neoprene, nitrile, vinyl, or PVC/NBR). When handling this material which can produce frostbite or cold burns, use leather gloves over these chemically-resistant gloves. Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.
Body Protection	Prevent potential skin contact with cold liquid, solid, or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.
Respiratory Protection	A full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g. ANSI Z88.2).
General Comments	Releases of this gas/liquid mixture may create flammable, explosive, corrosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions, especially since the odor threshold of benzene is several ppm above the occupational exposure guideline levels. Air purifying respirators offer no protection against hydrogen sulfide, ammonia, and simple asphyxiants.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) TWA: 5 (ppm) from ACGIH (TLV) [Proposed]
2) Ammonia	TWA: 10 STEL: 20 (ppm) from OSHA (PEL) TWA: 25 STEL: 35 (ppm) from ACGIH (TLV) TWA: 50 STEL: 35 (ppm) from OSHA (PEL) STEL: 35 (ppm) from OSHA (PEL) [Proposed]
3) Hydrogen	Simple asphyxiant.
4) Methane	Simple asphyxiant.
5) Ethane	Simple asphyxiant.
6) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL) [Proposed]
7) Propane	TWA: 2500 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL) [Proposed]
8) Butanes	TWA: 800 (ppm) from ACGIH (TLV) TWA: 800 (ppm) from OSHA (PEL) [Proposed]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Gas/Liquefied Gas.	Color Colorless liquid; invisible gas and vapor; white frost at release point.	Odor	Strong, foul smelling; rotten egg odor is unreliable as a warning of possible exposure.
Specific Gravity	0.30 to 0.59 (Water = 1)	pH In the presence of moisture, H ₂ S can convert to H ₂ SO ₄ .	Vapor Density	0.55 to 2.0 (Air = 1)
Boiling Point/Range	-253°C to -1°C (-423° to 31°F) [ASTM D-2887]		Melting/Freezing Point	-259° to -139°C (-435° to -217°F) at 14.7 psia.
Vapor Pressure	200 to 400 psia at 100°F.		Viscosity (cSt @ 40°C)	Not applicable.
Solubility in Water	Moderately soluble in cold water.		Volatile Characteristics	This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Hydrogen Sulfide and Ammonia Content = 0.1 to 13 Wt.%; Alkane, Isoparaffin, Alkene, and Cycloalkane Hydrocarbons Content = 87 to 99.9 Wt.% [ASTM D-1319]; Average Density at 60°F = AP 4.50 lbs./gallon [ASTM D-2161].			

Hydrogen-Rich, Sour Refinery Gases (C1-C4 Hydrocarbons)

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, calcium hypochlorite, chlorates, permanganates, nitrates, hydrogen peroxide, mercury oxide, and oxygen. Oxidizer mixtures and alkane hydrocarbons and chlorine gas mixtures have produced explosions. Under some conditions, mercaptans may react with water or steam to produce additional toxic and flammable vapors.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the **Emergency Overview on Page 1** and the **Hazards Identification in Section 3** of this MSDS.

Toxicity Data	<p>Hydrogen sulfide:</p> <p>GAS (TC_{Lo}): Acute: 10 ppm for 15 minutes (Human) - Eye irritation.</p> <p>GAS (TC_{Lo}): Acute: 50 to 100 ppm for 15 minutes (Human) - Respiratory irritation.</p> <p>GAS (LC₁₀₀): Acute: 600 to 750 ppm for 30 minutes (Human) - Respiratory paralysis and death.</p> <p>GAS (LC_{Lo}): Acute: 5,700 ug/kg for 8 hours (Human) - Chronic pulmonary edema, coma, and death.</p> <p>Ammonia:</p> <p>ORAL (LD_{Lo}): Acute: 132 mg/kg [Human].</p> <p>ORAL (TD_{Lo}): Acute: 15 uL/kg [Human] - Structural changes in the esophagus.</p> <p>GAS (TC_{Lo}): Acute: 20 ppm for 1hour [Human] - Eye irritation, ulcerated nasal septum, and structural changes in the trachea or bronchi.</p> <p>GAS (LC_{Lo}): Acute: 5,000 ppm for 5 minutes [Human].</p> <p>GAS (LC_{Lo}): Acute: 5,000 ppm for 5 minutes [Guinea Pig].</p> <p>GAS (LC₅₀): Acute: 2,000 ppm for 4 hours [Rat].</p> <p>GAS (LC₅₀): Acute: 7,000 mg/m³ for 1 hour [Cat and Rabbit] - Excitement and flaccid paralysis without anesthesia.</p> <p>GAS (LC₅₀): Acute: 4,230 ppm for 1 hour [Mouse] - Ataxia, tremors, and convulsions.</p>
----------------------	--

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (< 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (> 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Ammonia is a strong base and forms **ammonium hydroxide** upon contact with water. This material is corrosive to many organic compounds. If ingested, ammonia can cause severe pain, bloody diarrhea, cardiovascular collapse, and death. Concentrated ammonia is a strong corrosive which can cause burns of the following types: cryogenic from contact with refrigerated liquid, thermal from exothermic reaction with water, and chemical from its alkalinity. It gelatinizes the tissue, forming deep and painful lesions. At low concentrations, aqueous ammonia is a moderate to strong irritant to the eyes, skin, mucous membranes, and respiratory and digestive tracts. Its effects on the lungs can be severe and delayed in onset; respiratory support may be required following acute inhalation. However, there seems to be a wide variability in the human sensitivity to ammonia.

Chronic dyspnea, restrictive lung dysfunction, obstructive lung disease, and bronchial hyper-reactivity were adverse effects experienced by several employees two years after their occupational overexposures to mists and aerosols of ammonia. An aqueous ammonia solution caused

Hydrogen-Rich, Sour Refinery Gases (C1-C4 Hydrocarbons)

gastrointestinal cicatrical tumors in rats following a 24-week feeding assay. NH₃ produced a positive mutagenic response in the Ames Assay and caused chromosomal aberrations during a 16-week cytogenic study using rats. However, in general, pH alterations produce false positive results in short-term genetic assays.

Propylene:

GAS (LC₅₀): Chronic: 1,250 ppm for 6 hours/day for 14 weeks [Mouse].

GAS (TC_{Lo}): Chronic: 5,000 ppm for 6 hours/day for 2 years [Rat] - Reduced olfactory sensory response.

Iso-Butane:

GAS (TC_{Lo}): Acute: 1,040,000 mg/m³ for 2 hours [Mouse] - Excitment.

GAS (LC₅₀): Acute: 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress.

Iso-Butene (Isobutylene or 2-Methylpropene):

GAS (LC₅₀): Acute: 415,000 mg/m³ for 2 hours [Mouse].

GAS (LC₅₀): Acute: 620,000 mg/m³ for 4 hours [Rat].

n-Butane:

GAS (LC₅₀): Acute: 660,000 mg/m³ for 4 hours [Rat].

GAS (LC₅₀): Acute: 680,000 mg/m³ for 2 hours [Mouse].

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol. % in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline). An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. And, **n-pentane** caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure.

In humans, at concentrations of 6.4% in air or higher, **propylene** causes mild intoxication, dermal sensations, and an inability to concentrate on tasks within two minutes. Gross inhalation of propylene concentrations of 40% or higher for a couple minutes cause redding of the eyelids and face, tearing, coughing, and sometimes flexing of the legs, reduced blood pressure, and/or disordered heart rhythm. A concentration of 50% causes anesthesia in two minutes, followed by complete recovery without any physiological indications.

Chronic low-level exposures to **propylene** may entail a possible hazard from the formation of a reactive metabolite, **propylene oxide**, which is a "suspect human carcinogen". However, propylene have not been shown to be carcinogenic in rat studies. For example, propylene was tested by the National Cancer Institute (NCI) in a two-year, 6 hours/day, 5 days/week inhalation study using rats and mice with exposure concentrations at 5,000 and 10,000 ppm. The resulting data suggested that propylene induces signs of nasal cavity toxicity (epithelial hyperplasia/metaplasia) including increased incidence of neo-plastic lesions in rats, but not in mice. **Propylene** is NOT considered carcinogenic to either rats or mice even though it may be partially metabolized to **propylene oxide** which has been shown to be mutagenic and produces site of contact tumors in rodents following long-term administration. Propylene has also been found to be a cardiac sensitizer in dogs.

Human volunteers had no apparent effects from exposures of 250 ppm, 500 ppm, and 1,000 ppm concentrations in air of **isobutane and n-butane** for periods of 8 hours daily for 10 days to 14 days, respectively. Chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage.

An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane and butylene** (additive effect), than the degree of narcosis

Hydrogen-Rich, Sour Refinery Gases (C1-C4 Hydrocarbons)

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, the **hydrogen sulfide and ammonia** components of this material may contribute to generation of atmospheric smog. The atmospheric half-life of **propane** under photochemical smog conditions are estimated to be between 5 to 8 hours. The atmospheric half-lives of **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days. Photooxidation of **propane, isobutane, and n-butane** in air (< 8%) are not considered environmentally significant.

Hydrogen sulfide residence times in the atmosphere range from about one day to more than 40 days, depending upon the season, latitude, and presence of other air pollutants. Reduced temperatures increase the residence time.

Environmental Fate **Refined liquefied petroleum hydrocarbon gases** are essentially insoluble in water (< 0.1%); however, **hydrogen sulfide** is moderately soluble in water so this material and any contaminated soil or water may be hazardous to human, animal, and aquatic life.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this gas/liquid to the atmosphere should be avoided. Maximize material recovery for reuse or recycling.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitability (D001) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U.S. Department of Transportation (DOT) regulated material.		
Proper Shipping Name	Compressed gases, flammable, toxic, n.o.s. Inhalation Hazard Zone B (Hydrogen sulfide, Hydrogen)		
Hazard Class	DOT Class: 2.3 (Poisonous gas) and 2.1 (Flammable gas).	Packing Group(s) UN/NA ID	Not applicable. UN1953
Reportable Quantity	The Reportable Quantity (RQ) substance components present in this material which might require DOT HAZMAT bill-of-lading display are Hydrogen sulfide and Ammonia .		

Hydrogen-Rich, Sour Refinery Gases (C1-C4 Hydrocarbons)

Placards

Emergency Response Guide No.	119
HAZMAT STCC No.	49 057 66
MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. Chemical substances which are present in this material and subject to this statute are: Hydrogen sulfide [CAS No. = 7783-06-4] concentration: 0.01 to 8% Ammonia [CAS No. = 7664-41-7] concentration: 0.1 to 2%.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, Reactive, & Acute (Immediate) & Chronic (Delayed) Health Hazards.
SARA 313	This material contains the following components in concentrations which might be at or above de minimis levels and are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313: Hydrogen sulfide [CAS No. = 7783-06-4] concentration: 0.01 to 8% Ammonia [CAS No. = 7664-41-7] concentration: 0.1 to 2% Ethylene or Ethene [CAS No. 74-85-1] concentration: 1 to 5% Propylene or Propene [CAS No. 115-07-1] concentration: 1 to 5%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances which might be present in this material that are subject to this statute are: Hydrogen sulfide [CAS No. = 7783-06-4] (RQ = 100 lbs. [45.36 kg]) concentration: 0.01 to 8% Ammonia [CAS No. = 7664-41-7] (RQ = 100 lbs. [45.36 kg]) conc.: 0.1 to 2%.
CWA	This material might be classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material does not may contain any chemical substance which is known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling, refer to the components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in this material as "Volatile Organic Compounds (VOC)" which contribute significantly to air pollution which endangers public health and welfare": Ethylene (Ethene), Propylene (Propene), 1-Butene, and Isobutylene. In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances which may be present in this material which are subject to this statute include: Hydrogen sulfide, Ammonia, Hydrogen, Methane, Ethane, Ethylene (Ethene), Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), various Butenes, and n-Butane.

Hydrogen-Rich, Sour Refinery Gases (C1-C4 Hydrocarbons)**SECTION 16: OTHER INFORMATION**

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Gas.
Color Colorless to light yellow.
Odor Hydrocarbon. Rotten eggs. (Strong.)

DANGER!

Extremely Flammable and Poisonous Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Remove all potential ignition sources. Safely stop the source gas flow using non-sparking tools. Allow any entrained liquid spills to evaporate. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. Do not enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during response operations. This gas may travel great distances and be ignited by a remote ignition source.

**Contains Hydrogen Sulfide Gas!
Harmful to aquatic organisms.**

Protective Equipment

**Minimum Recommended
See Section 8 for Details**

Minimum PPE reflects the requirements for this material at this facility:

LYONDELL-CITGO Refining
LP Manufacturing Complex

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	Vent Waste Sour Gas (C1-C6 Hydrocarbons)	Technical Contact	(800) 525-4692
Product Number	Not available.	Medical Emergency	(800) 313-7645
CAS Number	68814-47-1	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Sour Gas		
Synonyms	Refinery Vent Waste Gas Mixture, Refinery Gas Mixture, Untreated Low-Pressure (Low-Line) Gas, Low-Line Gathering System Gas, Untreated Fuel Gas, C1-C6 Hydrocarbons with Hydrogen Sulfide.		

Vent Waste Sour Gas (C1-C6 Hydrocarbons)

SECTION 2. COMPOSITION (TYPICAL)

Component Name(s)	CAS Registry No.	Concentration (%)
Propane	74-98-6	15 - 20
Ethane	74-84-0	15 - 20
n-Butane	106-97-8	15 - 20
n-Pentane	109-66-0	10 - 15
Ethylene	74-85-1	2 - 5
Methane	74-82-8	1 - 5
Iso-Butane	75-28-5	1 - 5
Hexane, other isomers	Mixture	1 - 5
n-Hexane	110-54-3	1 - 3
Pentanes, all isomers	Mixture	1 - 3
Propylene	115-07-1	1 - 2
Butenes or Butylenes	25167-67-3	0.5 - 1.5
Hydrogen sulfide	7783-06-4	0.4 - 1

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation

May be harmful or fatal if inhaled. Contains hydrogen sulfide. The National Institute for Occupational Safety and Health has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health. At concentrations above 500 to 1000 ppm, H₂S causes unconsciousness and respiratory paralysis leading to coma and/or death.

Inhalation of gas or vapor may cause respiratory paralysis, severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath.

Additionally, one or more components of this gas mixture is a "simple asphyxiant". High concentrations of this gas can displace the amount of oxygen available to breathe below that level necessary to sustain life. Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, weakness, nausea, vomiting, loss of coordination, unconsciousness, and coma, depending upon the concentration level and duration of exposure.

Eye Contact

Vapors may cause eye irritation and light sensitivity. Severity depends upon the concentration and duration of exposure.

Skin Contact

Direct contact with an expanding gas may produce skin damage from frostbite or freeze burns. Skin absorption of hydrogen sulfide appears to be minimal in humans.

Ingestion

Ingestion is not an applicable route of exposure for gases.

Chronic Health Effects Summary

Subacute exposure to low levels of hydrogen sulfide can produce eye irritation, watering, light sensitivity and corneal opacity. Reported effects from subacute exposure also include bronchitis, pulmonary edema, nausea, abdominal cramps and diarrhea.

Conditions Aggravated by Exposure

Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Respiratory System, Central Nervous System (CNS), Heart (Cardiac)

Target Organs

Contains material which may cause damage to the following organs: mucous membranes, heart, skin, central nervous system (CNS), eye, lens or cornea.

Carcinogenic Potential

This product is not known to contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC or NTP.

Vent Waste Sour Gas (C1-C6 Hydrocarbons)

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).			
OSHA Health Hazard Classification		OSHA Physical Hazard Classification	
Irritant <input checked="" type="checkbox"/>	Sensitizer <input type="checkbox"/>	Combustible <input type="checkbox"/>	Explosive <input checked="" type="checkbox"/>
Toxic <input type="checkbox"/>	Highly Toxic <input type="checkbox"/>	Flammable <input checked="" type="checkbox"/>	Oxidizer <input type="checkbox"/>
Corrosive <input type="checkbox"/>	Carcinogenic <input type="checkbox"/>	Compressed Gas <input type="checkbox"/>	Organic Peroxide <input type="checkbox"/>
			Pyrophoric <input type="checkbox"/>
			Water-reactive <input type="checkbox"/>
			Unstable <input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If tissue is frozen, immediately seek medical attention. If tissue is not frozen, check for and remove contact lenses. Then, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure luke warm water for at least 15 minutes, occasionally lifting the upper and lower eyelids. If pain, redness, swelling, tearing, or light sensitivity persist, obtain medical attention as soon as possible. Do not use eye ointment unless directed by a physician.
Skin Contact	In the event of frostbite or freeze burn, the affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water. Rewarming should continue until natural skin tones return to the affected area. Seek medical attention if tissue appears damaged or if pain persists.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry.
Notes to Physician	<p>INHALATION: Inhalation overexposure can produce toxic effects. Treat intoxications as hydrogen sulfide exposures. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Administer supplemental oxygen with assisted ventilation, as required.</p> <p>This material (or a component) sensitizes the heart to the effects of sympathomimetic amines. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias in individuals exposed to this material. Administration of sympathomimetic drugs should be avoided.</p> <p>Treat symptomatically.</p>

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas.
Flash Point	Open cup: <-45°C (-49°F).
Lower Flammable Limit	AP 1 %
Upper Flammable Limit	AP 13 %
Autoignition Temperature	The lowest known value is 430°C (806°F) (Butane, all isomers).

Vent Waste Sour Gas (C1-C6 Hydrocarbons)

Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons, and oxides of sulfur and nitrogen.
Special Properties	This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable and Poisonous Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Remove all potential ignition sources. Safely stop the source gas flow using non-sparking tools. Allow any entrained liquid spills to evaporate. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. Do not enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during response operations. This gas may travel great distances and be ignited by a remote ignition source.

SECTION 7. HANDLING AND STORAGE

Handling DANGER: Poisonous and Flammable Gas. Do NOT breathe vapor; it contains hydrogen sulfide (H₂S). This gas mixture also contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow escaping material to contact eyes or skin. Wear appropriate respiratory protection, protective work clothing, eye and face protection when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S concentrations, and flammability.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. Empty containers may still contain flammable and poisonous residue.

Vent Waste Sour Gas (C1-C6 Hydrocarbons)

Storage

Do not store this material near heat or any other potential ignition sources. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Do not store this product in unlabeled containers. Keep containers tightly closed. H₂S is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.) Where H₂S is routinely stored, install monitoring equipment or system with alarms.

Store sample cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F (38° C). Protect from dampness, salt or corrosive chemicals.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may be required in work areas to prevent accumulation of mixtures of gas and air that may ignite with explosive force. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are located near the work-station. Where H₂S is routinely stored or handled, install monitoring equipment or system with alarms.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling sampling cylinders, pressurized containers and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection

Use neoprene or PCV/nitrile gloves. When handling materials that can produce frostbite or cold burns, use leather gloves over these chemically-resistant gloves.

Body Protection

Prevent potential skin contact with cold liquid or vapors. Use insulated and chemical-resistant clothing (apron, slicker suit, coveralls, boots, etc.). Fire-retardant garments (e.g. Nomex®) should be worn while working with flammable gases and gas/liquids.

Respiratory Protection

A full-face supplied air pressure-demand respirator with escape bottle or a pressure-demand self-contained, breathing apparatus (SCBA) is required. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).

General Comments

Releases of this gas may create flammable, explosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency, flammability and toxic gas levels. Odor is NOT adequate to warn of hazardous conditions. Air purifying respirators offer no protection against oxygen deficiency, hydrogen sulfide, and simple asphyxiants.

Occupational Exposure Guidelines

Substance

Applicable Workplace Exposure Levels

Vent Waste Sour Gas (C1-C6 Hydrocarbons)

Propane	ACGIH (United States). TWA: 2500 ppm 8 hour(s).
	OSHA (United States). TWA: 1000 ppm 8 hour(s).
	Simple asphyxiant.
Ethane	Simple asphyxiant.
n-Butane	ACGIH (United States). TWA: 800 ppm 8 hour(s).
n-Pentane	ACGIH (United States, 1998). TWA: 600 ppm
	OSHA (United States, 1976). TWA: 1000 ppm
Ethylene	Simple asphyxiant.
Methane	Simple asphyxiant.
Iso-Butane	ACGIH (United States). TWA: 800 ppm 8 hour(s).
Hexane, other isomers	ACGIH (United States). TWA: 500 ppm 8 hour(s).
	STEL: 1000 ppm 15 minute(s).
n-Hexane	ACGIH (United States). Skin TWA: 50 ppm 8 hour(s).
	OSHA (United States). TWA: 500 ppm 8 hour(s).
Pentanes, all isomers	ACGIH (United States). TWA: 600 ppm 8 hour(s).
	OSHA (United States). TWA: 1000 ppm 8 hour(s).
Propylene	Simple asphyxiant.
Butenes or Butylenes	Not available.
Hydrogen sulfide	ACGIH TLV (United States). TWA: 10 ppm 8 hour(s).
	STEL: 15 ppm 15 minute(s).
	OSHA (United States). CEIL: 20 ppm 8 hour(s).
	STEL: 50 ppm 15 minute(s). Form: *10 minute peak; once per 8 hour shift

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Gas.	Color	Colorless to light yellow.	Odor	Hydrocarbon. Rotten eggs. (Strong.)
Specific Gravity	0.65 (Water = 1)	pH	Not Applicable.	Vapor Density	>1 (Air = 1)
Boiling Range	-12°C (10.4°F)			Melting/Freezing Point	-160°C (-256°F)
Vapor Pressure	Not applicable.			Volatility	650 g/l VOC (w/v)
Solubility in Water	Partially soluble in cold water.			Viscosity (cSt @ 40°C)	not available
Flash Point	Open cup: <-45°C (-49°F).				
Additional Properties	No additional information.				

Vent Waste Sour Gas (C1-C6 Hydrocarbons)

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong oxidizers.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the **Emergency Overview on Page 1** and the **Hazards Identification in Section 3** of this MSDS.

Toxicity Data	<p>Propane Studies in laboratory animals indicate exposure to extremely high levels of propane (1 to 10 vol.% in air) may cause cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.</p> <p>n-Butane INHALATION (LC50): Acute: 660000 mg/m³ 4 hour(s) [Rat]. 680000 mg/m³ 2 hour(s) [Mouse]. An n-butane exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Also, butane may decrease the myocardial threshold to epinephrine-induced arrhythmias.</p> <p>n-Pentane n-Pentane was associated with cardiac sensitization in rabbits at a concentration of 100,000 ppm in air within four hours of exposure. Pentane can act as an anesthetic by inhalation. Mice exhibited signs of respiratory irritation and mild central nervous system effects at concentrations of 32,000 to 69,000 ppm for five minutes.</p> <p>n-Hexane This material contains n-hexane. Long-term or repeated exposure to n-hexane can cause permanent peripheral nerve damage. Initial symptoms are numbness of the fingers and toes. Also, motor weakness can occur in the digits, but may also involve muscles of the arms, thighs and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure. Co-exposure to methylethyl ketone or methyl isobutyl ketone increases the neurotoxic properties of n-hexane. In laboratory studies, prolonged exposure to elevated concentrations of n-hexane was associated with decreased sperm count and degenerative changes in the testicles of rats.</p> <p>Pentanes, all isomers Studies of pentane isomers in laboratory animals indicate exposure to extremely high levels (roughly 10 vol.%) may induce cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.</p> <p>Hydrogen sulfide INHALATION (LC50): Acute: 444 ppm 1 hour(s) [Rat]. 673 ppm 1 hour(s) [Mouse]. Hydrogen Sulfide (H₂S) has an unpleasant odor that diminishes with increased concentrations. Eye irritation can occur at concentrations above four ppm. Olfactory fatigue occurs rapidly at concentrations above 50. Accordingly, odor is not a reliable warning property. Symptoms increase with exposures above 50 ppm. Respiratory effects including irritation with possible pulmonary edema can occur with exposure above 50 ppm. At concentrations above 500 ppm, an immediate loss of consciousness, depressed respiration and death can occur. NIOSH has determined that H₂S concentrations above 100 ppm are immediately dangerous to life and health.</p>
----------------------	---

Vent Waste Sour Gas (C1-C6 Hydrocarbons)

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this material.
Environmental Fate	An environmental fate analysis has not been conducted on this specific product. Releases are expected to cause significant immediate impact but only localized non-persistent environmental damage.

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Material residues may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. If possible and permissible, this material may be disposed of as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator. Venting of this gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be in accordance with applicable Federal, State, and local regulations. Contact your regional US EPA office for guidance concerning case specific disposal issues. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304 Emergency Planning and Notification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: fire, Sudden Release of Pressure, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard
SARA 313 Toxic Chemical Notification and Release Reporting	This product contains the following components in concentrations above <i>de minimis</i> levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: n-Hexane [CAS No.: 110-54-3] Concentration: 2%

Vent Waste Sour Gas (C1-C6 Hydrocarbons)

CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are: n-Hexane [CAS No.: 110-54-3] RQ = 5000 lb. (2268 kg) Concentration: 2% Hydrogen sulfide [CAS No.: 7783-06-4] RQ = 100 lb. (45.36 kg) Concentration: 0.7%
Clean Water Act (CWA)	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This product is not known to contain any components for which the State of California has found to cause cancer, birth defects or other reproductive harm.
New Jersey Right-to-Know Label	For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.
Additional Regulatory Remarks	No additional regulatory remarks.

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Emergency Overview

Physical State Gas.

Color Colorless to light yellow. **Odor** Hydrocarbon. Rotten eggs. (Strong.)

Extremely Flammable and Poisonous Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Remove all potential ignition sources. Safely stop the source gas flow using non-sparking tools. Allow any entrained liquid spills to evaporate. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. Do not enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during response operations. This gas may travel great distances and be ignited by a remote ignition source. Contains Hydrogen Sulfide.

Hydrogen sulfide	7783-06-4	0.1 - 1

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation

May be harmful or fatal if inhaled. Contains hydrogen sulfide. The National Institute for Occupational Safety and Health has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health. At concentrations above 500 to 1000 ppm, H₂S causes unconsciousness and respiratory paralysis leading to coma and/or death.

Inhalation of gas or vapor may cause respiratory paralysis, severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath.

Additionally, one or more components of this gas mixture is a "simple asphyxiant". High concentrations of this gas can displace the amount of oxygen available to breathe below that level necessary to sustain life. Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, weakness, nausea, vomiting, loss of coordination, unconsciousness, and coma, depending upon the concentration level and duration of exposure.

Eye Contact

Vapors may cause eye irritation and light sensitivity. Severity depends upon the concentration and duration of exposure.

Skin Contact

Direct contact with an expanding gas may produce skin damage from frostbite or freeze burns. Skin absorption of hydrogen sulfide appears to be minimal in humans.

Ingestion

Ingestion is not an applicable route of exposure for gases.

Chronic Health Effects Summary

Subacute exposure to low levels of hydrogen sulfide can produce eye irritation, watering, light sensitivity and corneal opacity. Reported effects from subacute exposure also include bronchitis, pulmonary edema, nausea, abdominal cramps and diarrhea.

Conditions Aggravated by Exposure

Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Respiratory System, Central Nervous System (CNS), Heart (Cardiac)

Target Organs

Contains material which may cause damage to the following organs: mucous membranes, heart, skin, central nervous system (CNS), eye, lens or cornea.

Carcinogenic Potential

This product is not known to contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC or NTP.

Hydrogen Rich Sour Refinery Gas

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Toxic	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If tissue is frozen, immediately seek medical attention. If tissue is not frozen, check for and remove contact lenses. Then, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure luke warm water for at least 15 minutes, occasionally lifting the upper and lower eyelids. If pain, redness, swelling, tearing, or light sensitivity persist, obtain medical attention as soon as possible. Do not use eye ointment unless directed by a physician.
Skin Contact	In the event of frostbite or freeze burn, the affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water. Rewarming should continue until natural skin tones return to the affected area. Seek medical attention if tissue appears damaged or if pain persists.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry.
Notes to Physician	<p>INHALATION: Inhalation overexposure can produce toxic effects. Treat intoxications as hydrogen sulfide exposures. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Administer supplemental oxygen with assisted ventilation, as required.</p> <p>This material (or a component) sensitizes the heart to the effects of sympathomimetic amines. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias in individuals exposed to this material. Administration of sympathomimetic drugs should be avoided.</p> <p>Treat symptomatically.</p>

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas.
Flash Point	Open cup: <-45°C (-49°F).
Lower Flammable Limit	AP 1 %
Upper Flammable Limit	AP 13 %
Autoignition Temperature	The lowest known value is 430°C (806°F) (Butane, all isomers).

Hydrogen Rich Sour Refinery Gas

Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons, and oxides of sulfur and nitrogen.
Special Properties	This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable and Poisonous Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Remove all potential ignition sources. Safely stop the source gas flow using non-sparking tools. Allow any entrained liquid spills to evaporate. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. Do not enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during response operations. This gas may travel great distances and be ignited by a remote ignition source.

SECTION 7. HANDLING AND STORAGE

Handling DANGER: Poisonous and Flammable Gas. Do NOT breathe vapor; it contains hydrogen sulfide (H₂S). This gas mixture also contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow escaping material to contact eyes or skin. Wear appropriate respiratory protection, protective work clothing, eye and face protection when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S concentrations, and flammability.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. Empty containers may still contain flammable and poisonous residue.

Hydrogen Rich Sour Refinery Gas

Storage

Do not store this material near heat or any other potential ignition sources. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Do not store this product in unlabeled containers. Keep containers tightly closed. H₂S is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.) Where H₂S is routinely stored, install monitoring equipment or system with alarms.

Store sample cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F (38° C). Protect from dampness, salt or corrosive chemicals.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

- Engineering Controls** Local exhaust and general room ventilation may be required in work areas to prevent accumulation of mixtures of gas and air that may ignite with explosive force. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are located near the work-station. Where H₂S is routinely stored or handled, install monitoring equipment or system with alarms.
- Personal Protective Equipment** Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.
- Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

- Eye Protection** Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling sampling cylinders, pressurized containers and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.
- Hand Protection** Use neoprene or PCV/nitrile gloves. When handling materials that can produce frostbite or cold burns, use leather gloves over these chemically-resistant gloves.
- Body Protection** Prevent potential skin contact with cold liquid or vapors. Use insulated and chemical-resistant clothing (apron, slicker suit, coveralls, boots, etc.). Fire-retardant garments (e.g. Nomex®) should be worn while working with flammable gases and gas/liquids.
- Respiratory Protection** A full-face supplied air pressure-demand respirator with escape bottle or a pressure-demand self-contained, breathing apparatus (SCBA) is required. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).
- General Comments** Releases of this gas may create flammable, explosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency, flammability and toxic gas levels. Odor is NOT adequate to warn of hazardous conditions. Air purifying respirators offer no protection against oxygen deficiency, hydrogen sulfide, and simple asphyxiants.

Occupational Exposure Guidelines

Substance

Applicable Workplace Exposure Levels

Hydrogen Rich Sour Refinery Gas

Hydrogen	Simple asphyxiant.
Methane	Simple asphyxiant.
Ethane	Simple asphyxiant.
Propane	ACGIH (United States). TWA: 2500 ppm 8 hour(s).
	OSHA (United States). TWA: 1000 ppm 8 hour(s).
	Simple asphyxiant.
Butane, all isomers	ACGIH (United States). TWA: 800 ppm 8 hour(s).
Pentanes, all isomers	ACGIH (United States). TWA: 600 ppm 8 hour(s).
	OSHA (United States). TWA: 1000 ppm 8 hour(s).
n-Heptane	OSHA (United States). TWA: 500 ppm
	ACGIH (United States). TWA: 400 ppm STEL: 500 ppm
Hexane, other isomers	ACGIH (United States). TWA: 500 ppm 8 hour(s). STEL: 1000 ppm 15 minute(s).
Ammonia	Not available.
Hydrogen Sulfide	ACGIH TLV (United States). TWA: 10 ppm 8 hour(s). STEL: 15 ppm 15 minute(s).
	OSHA (United States). CEIL: 20 ppm 8 hour(s). STEL: 50 ppm 15 minute(s). Form: *10 minute peak; once per 8 hour shift
Sour Gases (family)	Not available.

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Gas.	Color	Colorless to light yellow.	Odor	Hydrocarbon. Rotten eggs. (Strong.)
Specific Gravity	0.65 (Water = 1)	pH	Not Applicable.	Vapor Density	>1 (Air = 1)
Boiling Range	-12°C (10.4°F)			Melting/Freezing Point	-160°C (-256°F)
Vapor Pressure	Not applicable.			Volatility	650 g/l VOC (w/v)
Solubility in Water	Partially soluble in cold water.			Viscosity (cSt @ 40°C)	not available
Flash Point	Open cup: <-45°C (-49°F).				
Additional Properties	No additional information.				

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong oxidizers.		

Hydrogen Rich Sour Refinery Gas

Hazardous Decomposition Products

No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Propane:

Studies in laboratory animals indicate exposure to extremely high levels of propane (1 to 10 vol.% in air) may cause cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.

n-Hexane:

This material contains n-hexane. Long-term or repeated exposure to n-hexane can cause permanent peripheral nerve damage. Initial symptoms are numbness of the fingers and toes. Also, motor weakness can occur in the digits, but may also involve muscles of the arms, thighs and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure. Co-exposure to methylethyl ketone or methyl isobutyl ketone increases the neurotoxic properties of n-hexane. In laboratory studies, prolonged exposure to elevated concentrations of n-hexane was associated with decreased sperm count and degenerative changes in the testicles of rats.

Butane, all isomers

Studies in laboratory animals indicate exposure to extremely high levels of butanes (1-10 or higher vol.% in air) may cause cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.

n-Heptane:

n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not considered to be carcinogenic.

Pentanes, all isomers

Studies of pentane isomers in laboratory animals indicate exposure to extremely high levels (roughly 10 vol.%) may induce cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.

Hydrogen Sulfide

INHALATION (LC50): Acute: 444 ppm 1 hour(s) [Rat]. 673 ppm 1 hour(s) [Mouse]. Hydrogen Sulfide (H₂S) has an unpleasant odor that diminishes with increased concentrations. Eye irritation can occur at concentrations above four ppm. Olfactory fatigue occurs rapidly at concentrations above 50. Accordingly, odor is not a reliable warning property. Symptoms increase with exposures above 50 ppm. Respiratory effects including irritation with possible pulmonary edema can occur with exposure above 50 ppm. At concentrations above 500 ppm, an immediate loss of consciousness, depressed respiration and death can occur. NIOSH has determined that H₂S concentrations at or above 100 ppm are immediately dangerous to life and health.

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material.

Environmental Fate

An environmental fate analysis has not been conducted on this specific product. Releases are expected to cause significant immediate impact but only localized non-persistent environmental damage.

Hydrogen Rich Sour Refinery Gas

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Material residues may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. If possible and permissible, this material may be disposed of as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator. Venting of this gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be in accordance with applicable Federal, State, and local regulations. Contact your regional US EPA office for guidance concerning case specific disposal issues. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

TSCA Inventory

This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.

SARA 302/304 Emergency Planning and Notification

The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.

SARA 311/312 Hazard Identification

The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories:

fire, Sudden Release of Pressure, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard

SARA 313 Toxic Chemical Notification and Release Reporting

This product contains the following components in concentrations above *de minimis* levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA:

n-Hexane [CAS No.: 110-54-3] Concentration: 20%

CERCLA

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are:

n-Hexane [CAS No.: 110-54-3] RQ = 5000 lbs. (2268 kg) Concentration: 20%

Hydrogen sulfide [CAS No.: 7783-06-4] RQ = 100 lbs. (45.36 kg) Concentration: 0.55%

Clean Water Act (CWA)

Hydrogen Rich Sour Refinery Gas

This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

**California
Proposition 65**

This product is not known to contain any components for which the State of California has found to cause cancer, birth defects or other reproductive harm.

**New Jersey
Right-to-Know Label**

For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.

**Additional Regulatory
Remarks**

No additional regulatory remarks.

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 5.0
Revision Date 9/6/2006
Print Date Printed on 9/6/2006.

Mixed Refinery Gases With Hydrogen (C1-C6 Hydrocarbons)

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0025
Revision Date 11/21/2002

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Gas/Liquefied Gas		
Color	Colorless liquid; invisible gas and vapor; white frost at release point.	Odor	Odorless to faint, unpleasant to strong, foul smelling; rotten egg odor is unreliable as a warning of possible exposure.

DANGER! Extremely flammable and potentially
poisonous gas/liquid; vapor may cause flash fire
or explosion.

High pressure and rapid diffusion hazard.

High concentrations of vapor reduce oxygen available
for breathing.

May contain Hydrogen Sulfide (H₂S).

May be corrosive to some metals.

May cause central nervous system (CNS) depression
or suffocation.

Liquid or compressed gas contact may cause frostbite
or freeze burns.

Vapor or mist may cause mild to severe eye, mucous membranes,
skin, and respiratory tract irritation and inflammation.

May be harmful or fatal if inhaled or absorbed through the skin.

Overexposures may cause target organ effects such as lung,
brain, liver, and/or kidney damage.

Prolonged and/or repeated inhalation may increase the
heart's susceptibility to arrhythmias (irregular beats).

11) Hexane Isomers	Mixture	0.1-5
12) Nitrogen	7727-37-9	0-1.5
13) Hydrogen sulfide	7783-06-4	0.0001-0.1

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Skin contact. Eye contact.

Signs and Symptoms of Acute Exposure

Inhalation	<p>May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. The National Institute for Occupational Safety and Health has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health. At concentrations above 500 ppm, H₂S causes unconsciousness and respiratory paralysis leading to coma and/or death. (See Section 11.)</p> <p>Additionally, several components of this gas/liquid mixture are "simple asphyxiants" (see Section 8). High concentrations of this mixture can displace the amount of oxygen in air available to breathe below that necessary to sustain life (hypoxia), especially if working in confined spaces. Breathing vapors may also cause central nervous system (CNS) depression. Symptoms may include headache, dizziness, slurred speech, excitation or giddiness, nausea, vomiting, visual disturbances, memory loss, confusion, vertigo, drowsiness, fatigue, rapid or difficult breathing, muscular weakness, loss of consciousness, convulsions, coma, and even death, depending upon the concentration and duration of exposure.</p>
Eye Contact	<p>Vapors may cause mild to severe eye irritation and photophobia (light sensitivity) upon short-term exposure. Severity depends upon the concentrations of hydrogen sulfide and duration of exposure. Direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn." Direct liquid contact can cause clouding of the cornea with small areas of superficial corneal necrosis.</p>
Skin Contact	<p>Direct contact with a liquefied/pressurized gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. Hydrogen sulfide can be absorbed through the skin to produce toxic effects. Tests on this stream's components suggest that the liquid form may cause mild to moderate skin irritation and inflammation.</p>
Ingestion	<p>Due to its volatile nature, ingestion is not normally an applicable route of exposure for this liquefied gas mixture. However, if swallowed, this material may "freeze burn" the mucous membranes of the mouth, throat, and esophagus or be aspirated into the lungs. Aspiration can result in severe lung damage or death. Cardiovascular effects include shallow rapid pulse and pallor followed by flushing. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may result in death.</p>

Mixed Refinery Gases With Hydrogen (C1-C6 Hydrocarbons)

Chronic Health Effects Summary Subchronic exposure to low levels of **hydrogen sulfide** can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H₂S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures. (See Section 11.)

Chronic inhalation to components of this liquefied gas (**propane, n-butane, and n-pentane**) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of **epinephrine (adrenaline)**-like drugs.

Conditions Aggravated by Exposure Personnel with pre-existing chronic respiratory diseases, nervous system disease, psychological conditions, high blood pressure, cardiovascular conditions, and eye or skin disorders should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this liquefied gas mixture. They should take additional precautions to minimize or avoid exposure.

Target Organs These streams are toxic to eyes, skin, mucous membranes, lungs, central and sympathetic nervous systems, brain, heart, and possibly, the liver, kidneys, and reproductive systems.

Carcinogenic Potential This material does not contain any components at concentrations above 0.1% which are considered to be carcinogenic by OSHA, IARC, or NTP.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

- Inhalation** Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
- Eye Contact** If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
- Skin Contact** The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
- Ingestion** Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.

Mixed Refinery Gases With Hydrogen (C1-C6 Hydrocarbons)

Notes to Physician

Nitrite as an antidote for acute **hydrogen sulfide** intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients.

If cough or difficulty in breathing develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. Monitor arterial blood gases and chest x-ray in cases with significant exposure. If contact with pressurized or liquefied gas causes frostbite of the eyes, early ophthalmologic consultation is recommended. This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines and other sympathomimetic drugs such as epinephrine (adrenaline) should be reserved for emergency situations and then used only with special precaution.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas.		
Flash Point Method	CLOSED CUP: < -60°C (-76°F) [Estimated].		
Lower Flammable Limit	0.9 to 1.4%	Upper Flammable Limit	7 to 44%
Autoignition Temperature	260° to 460°C (500° to 860°F)		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, unburned hydrocarbons, and oxides of sulfur.		
Special Properties	This gas is extremely flammable at well below ambient temperatures and readily forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it will burn in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources!		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.		
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

Mixed Refinery Gases With Hydrogen (C1-C6 Hydrocarbons)

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This liquefied gas or waste mixtures containing this material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling

Danger! Poisonous and Flammable Gas! Do NOT breathe vapor; it may contain **hydrogen sulfide (H₂S)**. This gas mixture also contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S concentrations, and flammability.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed petroleum gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue.

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC). The H₂S component of this material is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.)

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location. Where H₂S is routinely stored or handled, install monitoring equipment or system with alarms.

Mixed Refinery Gases With Hydrogen (C1-C6 Hydrocarbons)

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

- Eye Protection** Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gases. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.
- Hand Protection** Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with cold liquid or vapors.
- Body Protection** Prevent potential skin contact with cold liquid or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.
- Respiratory Protection** Odor is not an adequate warning for potentially hazardous air concentrations! Use a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. Air purifying respirators offer no protection against **oxygen deficiency, hydrogen sulfide, and simple asphyxiants**. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).
- General Comments** Releases of this liquefied gas mixture may create flammable, explosive, and/or oxygen-deficient atmospheres (LT 19.5 Vol.% in air). DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency, hydrogen sulfide concentration, and flammability. Warning! Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen	Simple asphyxiant.
2) Nitrogen	Simple asphyxiant.
3) Methane	Simple asphyxiant.
4) Ethane	Simple asphyxiant.
5) Propane	TWA: 2500 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL) [Proposed]
6) Butanes	TWA: 800 (ppm) from ACGIH (TLV) TWA: 800 (ppm) from OSHA (PEL) [Proposed]
7) Pentane, all isomers	TWA: 600 (ppm) from ACGIH (TLV) TWA: 600 (ppm) from OSHA (PEL) [Proposed] TWA: 1000 (ppm) from OSHA (PEL)
8) Hexane, other isomers	TWA: 500 STEL: 1000 (ppm) from ACGIH (TLV) TWA: 500 STEL: 1000 (ppm) from OSHA (PEL) [Proposed]
9) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL) [Proposed]
10) Hydrogen sulfide	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) TWA: 5 (ppm) from ACGIH (TLV) [Proposed] TWA: 10 STEL: 15 CEIL: 20 (ppm) from OSHA (PEL)

Mixed Refinery Gases With Hydrogen (C1-C6 Hydrocarbons)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Gas/Liquefied Gas	Color	Colorless liquid; invisible gas and vapor; white frost at release point.	Odor	Odorless to faint, unpleasant to strong, foul smelling; rotten egg odor is unreliable as a warning of possible exposure.
Specific Gravity	AP 0.38 to 0.55 (Water = 1)	pH	Not applicable.	Vapor Density	AP 0.5 to 1.0 (Air = 1)
Boiling Point/Range	AP -253° to 63°C (-423° to 146°F) at 14.7 psia [ASTM D-2887]			Melting/Freezing Point	AP -260° to -83°C (-435° to -117°F) at 14.7 psia
Vapor Pressure	AP 50 to 250 psia at 40°C (104°F)			Viscosity (cSt @ 40°C)	Not applicable.
Solubility in Water	Slightly soluble in cold water.			Volatile Characteristics	This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Gross Heat of Combustion at 60°F = 21,500 to 22,000 Btu/lb or 1,000 to 2,500 Btu/cu.ft.; Dry Point Temperature = AP 140°F (60°C) [ASTM D-86]; Average Density at 60°F = < 5.0 lbs./gal. [ASTM D-2161].				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur, but possible.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	<p>Hydrogen sulfide: GAS (TCLo): Acute: 10 ppm for 15 minutes (Human) - Eye irritation. GAS (TCLo): Acute: 50 to 100 ppm for 15 minutes (Human) - Respiratory irritation. GAS (LC100): Acute: 600 to 750 ppm for 30 minutes (Human) - Respiratory paralysis and death. GAS (LCLo): Acute: 5,700 ug/kg for 8 hours (Human) - Chronic pulmonary edema, coma, and death.</p> <p>Iso-Butane: GAS (TCLo): Acute: 1,040 gm/m³ for 2 hours [Mouse] - Excitement. GAS (LC50): Acute: 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress.</p> <p>n-Butane: GAS (LC50): Acute: 658,000 mg/m³ for 4 hours [Rat]. GAS (LC50): Acute: 680,000 mg/m³ for 2 hours [Mouse].</p> <p>n-Pentane: GAS (LC50): Acute: 364,000 mg/m³ for 4 hours [Rat] - Excitement. INTRAVENOUS (LD50): Acute: 446 mg/kg [Mouse].</p>
----------------------	--

Mixed Refinery Gases With Hydrogen (C1-C6 Hydrocarbons)

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (< 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (> 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline).

In humans, at concentrations of 6.4% in air or higher, **propylene** causes mild intoxication, dermal sensations, and an inability to concentrate on tasks within two minutes. Gross inhalation of propylene concentrations of 40% or higher for a couple minutes cause reddening of the eyelids and face, tearing, coughing, and sometimes flexing of the legs, reduced blood pressure, and/or disordered heart rhythm. A concentration of 50% causes anesthesia in two minutes, followed by complete recovery without any physiological indications.

Chronic low-level exposures to **propylene** may entail a possible hazard from the formation of a reactive metabolite, **propylene oxide**, which is a "suspect human carcinogen". However, propylene have not been shown to be carcinogenic in rat studies. For example, propylene was tested by the National Cancer Institute (NCI) in a two-year, 6 hours/day, 5 days/week inhalation study using rats and mice with exposure concentrations at 5,000 and 10,000 ppm. The resulting data suggested that propylene induces signs of nasal cavity toxicity (epithelial hyperplasia/metaplasia) including increased incidence of neo-plastic lesions in rats, but not in mice. **Propylene** is NOT considered carcinogenic to either rats or mice even though it may be partially metabolized to **propylene oxide** which has been shown to be mutagenic and produces site of contact tumors in rodents following long-term administration. Propylene has also been found to be a cardiac sensitizer in dogs.

Human volunteers had no apparent effects from exposures of 250 ppm, 500 ppm, and 1,000 ppm concentrations in air of **isobutane and n-butane** for periods of 8 hours daily for 10 days to 14 days. Chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage.

An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane and butylene** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone.

Inhalation of 500 ppm of **isopentane or n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects; however, higher exposure concentrations of 90,000 to 120,000 ppm (9-12 Wt.% in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. Rat 28-day feeding studies done on both **isopentane and n-pentane** using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

Hexane isomers were not mutagenic in the Salmonella/microsome (Ames) assay and are NOT considered to be carcinogenic.

Mixed Refinery Gases With Hydrogen (C1-C6 Hydrocarbons)**SECTION 12: ECOLOGICAL INFORMATION**

Ecotoxicity Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, the **hydrogen sulfide** component of this material may contribute to generation of atmospheric smog. If released, the atmospheric half-life of **propane** under photochemical smog conditions is estimated to be between 5 to 8 hours. The atmospheric half-lives of **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days. Photooxidation of **propane, isobutane, and n-butane** in air (LT 8%) are not considered to be environmentally significant.

Hydrogen sulfide residence times in the atmosphere range from about one day to more than 40 days, depending upon the season, latitude, and presence of other air pollutants. Reduced temperatures increase the residence time. The **pentanes and hexane isomers** all have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present.

Environmental Fate If spilled, the **liquefied petroleum hydrocarbon gases** are only slightly soluble in water (LT 0.1%); but, the toxic **hydrogen sulfide** is moderately soluble in water. This liquefied stream, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

This material may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). In addition, conditions of use may cause this material to become a hazardous waste for additional reasons, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this gas/liquid to the atmosphere should be avoided. Maximize material recovery for reuse or recycling. Treatment, storage, transportation, and disposal must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U.S. Department of Transportation (DOT) regulated material.		
Proper Shipping Name	Compressed gases, flammable, n.o.s. (Methane, Ethane) or Compressed gases, flammable, toxic, n.o.s. Inhalation Hazard Zone B (Hydrogen sulfide, Methane and/or Ethane)		
Hazard Class	DOT Class: 2.1 (Flammable gas) or possibly 2.3 (Poisonous gas).	Packing Group(s) UN/NA ID	Not applicable. UN1954 or UN1953
Reportable Quantity	The Reportable Quantity (RQ) substance component that might be present in this material which requires DOT HAZMAT bill-of-lading display is Hydrogen sulfide .		

Mixed Refinery Gases With Hydrogen (C1-C6 Hydrocarbons)

Placards

Emergency Response Guide No.	115 or 119
HAZMAT STCC No.	49 057 29 or 49 057 66
MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	These streams and/or their components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. A chemical substance present in this material subject to this statute is: Hydrogen sulfide [CAS No. = 7783-06-4] concentration: 0.0001 to 0.1%.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, and Acute (Immediate) & Chronic (Delayed) Health Hazards.
SARA 313	This material contains the following components in concentrations which are at or above de minimis levels and listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313: Ethylene or Ethene [CAS No. 74-85-1] concentration: 1 to 10% Propylene or Propene [CAS No. 115-07-1] concentration: 1 to 5%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. A chemical substance that might be present in this material which is subject to this statute is: Hydrogen sulfide [CAS No. = 7783-06-4] (RQ = 100 lbs. [45.36 kg]) concentration: 0.0001 to 0.1%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material does not may contain any chemical substance which is known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling, refer to the components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following component in this material as a "Volatile Organic Compound (VOC)" which contributes significantly to air pollution which endangers public health and welfare": Ethylene (Ethene), Propylene (Propene), Isopentane, and n-Pentane. In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this product which are subject to this statute are: Hydrogen, Methane, Ethane, Ethylene (Ethene), Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), Butane, Isopentane (Butane, 2-methyl), n-Pentane, 2,2-Dimethylpropane (Neopentane), and Hydrogen Sulfide.

Mixed Refinery Gases With Hydrogen (C1-C6 Hydrocarbons)**SECTION 16: OTHER INFORMATION**

Revision Date 11/01/06**IMPORTANT:** Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.**Emergency Overview**

Physical State	Liquid.		
Color	Transparent to slightly opaque; slightly pale to yellow	Odor	Characteristic, kerosene-like

WARNING! Combustible liquid; vapor may cause flash fire. Mist or vapor may irritate the eyes, mucous membranes, and respiratory tract.

Liquid contact may cause minimal to mild eye and/or moderate to severe skin irritation and inflammation.

Based upon laboratory animal studies, may cause skin cancer following extended contact.

May be harmful if inhaled or absorbed through the skin. Overexposures may cause central nervous system (CNS) depression and/or other target organ effects.

May be harmful or fatal if ingested.

Aspiration into the lungs can cause pulmonary edema and lipid or chemical pneumonia.

Based upon animal testing, may adversely affect reproduction. Spills may create a slipping hazard.

If used as fuel, its engine exhaust may cause upper respiratory tract irritation and reversible pulmonary effects.

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Hydrodesulfurized Middle Distillate (Petroleum)	64742-80-9	25-100
2) Hydrodesulfurized Light Catalytic Cracked Distillate (Petroleum)	68333-25-5	0-75
3) Nonanes	Mixture	1-10
4) Trimethylbenzene (mixed isomers)	25551-13-7	0.5-1.5
5) Ethylmethylbenzenes (Ethyltoluenes)	25550-14-5	1-3
6) C10-C12 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	35-70
7) Naphthalene	91-20-3	1-3
8) C10-C11 Alkylbenzenes	70683-06-0	1-10
9) Biphenyl (Diphenyl)	82-52-4	0.5-1.5
10) C12-C23 Aromatic Hydrocarbons	Mixture	5-15
11) C13-C25 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	15-25

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact Eye Contact Absorption Inhalation

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon level of exposure concentration and/or duration. Vapors can reduce the oxygen content in air. Approximately 20,000 ppm (or 2 vol %) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces.
Eye Contact	Animal test results on similar materials suggest that this product can cause minimal to mild eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling.
Skin Contact	Animal test results on similar materials suggest that this product can cause moderate to severe skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause severe dermatitis and/or more serious skin disorders. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and/or severe tissue damage.
Ingestion	If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above). Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.
Chronic Health Effects Summary	Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. This hydrodesulfurized mixture is a middle distillate similar to those shown to produce skin tumors on laboratory animals following repeated applications. All tumors appeared at the site of application during the latter portion of the typical 2-year lifespan of the animals. Toxic effects are unlikely to occur if good personal hygiene is practiced. Based upon animal testing, the C9 aromatic hydrocarbon components (trimethylbenzenes and ethylmethylbenzenes) are presumed to cause fetal toxicity and/or decreased fetal and newborn weights if overexposure occurs during a woman's early gestation period. Naphthalene is considered to be a toxic substance as defined by both human exposure and laboratory testing results.

HoustonRefining

A Lyondell Company

Olefins Plant Feed - 730°EP (OP-730)

Biphenyl (Diphenyl) may cause liver and/or nerve damage (See Section 11.)

Conditions Aggravated by Exposure	Personnel with pre-existing central nervous system (CNS) disease, neurological conditions, skin disorders, impaired liver or kidney function, or chronic respiratory diseases, and women attempting to conceive should avoid exposure
Target Organs	This substance is toxic to lungs, nervous systems, brain, mucous membranes, skin, eyes, and possibly, the blood, liver, kidneys, and reproductive system
Carcinogenic Potential	This material contains middle distillates at or above a 0.1% concentration and it is considered to be carcinogenic by IARC and OSHA. (See Section 11.)

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

If ingested, this material presents a significant aspiration/lipoid or chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

HoustonRefining

A Lyondell Company

Olefins Plant Feed - 730°EP (OP-730)

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-II Combustible Liquid. Highly combustible!		
Flash Point Method	CLOSED CUP 51° to 60°C (125° to 140°F) [Pensky-Martens (ASTM D-93)]		
Lower Flammable Limit	AP 0.6 %	Upper Flammable Limit	AP 7.5 %
Autoignition Temperature	AP 257°C (494°F)		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors		
Special Properties	<p>Combustible Liquid! This material releases vapors at or approaching the flash point temperature. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Mists or sprays may be flammable at temperatures below the flash point. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.</p> <p>A static electrical charge can accumulate as a result of transfer flow or agitation. Discharge (static spark) can ignite vapors, especially in cold, dry weather conditions. Special slow load and monitoring procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point products. To reduce this hazard, receiving containers should always be grounded and the loading nozzle must be kept in contact with the container during the entire filling process. Do not fill any portable container in or on a vehicle without proper bonding.</p>		
Extinguishing Media	<p>SMALL FIRE: Use dry chemicals, carbon dioxide (CO₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.</p>		
Protection of Fire Fighters	<p>Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat, cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.</p>		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Combustible Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors, but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible, in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

HoustonRefining

A Lyondell Company

Olefins Plant Feed - 730°EP (OP-730)

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This combustible liquid should be stored in a separate safety cabinet or room. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

HoustonRefining

A Lyondell Company

Olefins Plant Feed - 730°EP (OP-730)

Respiratory Protection For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).

General Comments Warning! Use of this hydrocarbon fuel in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance

1) Diesel fuel/Kerosene ("A3" Animal Carcinogen)

2) Nonane, all isomers

3) Trimethylbenzene (mixed isomers)

4) Naphthalene

5) Biphenyl (Diphenyl)

TWA: 100 (mg/m³) from ACGIH (TLV) - SKIN [Proposed]

TWA: 200 (ppm) from ACGIH (TLV)

TWA: 200 (ppm) from OSHA (PEL) [Proposed]

TWA: 25 (ppm) from ACGIH (TLV)

TWA: 25 (ppm) from OSHA (PEL) [Proposed]

TWA: 10 STEL 15 (ppm) from ACGIH (TLV) - SKIN

TWA: 10 STEL 15 (ppm) from OSHA (PEL) [Proposed]

TWA: 10 (ppm) from OSHA (PEL)

TWA: 0.2 (ppm) from ACGIH (TLV)

TWA: 0.2 (ppm) from OSHA (PEL) [Proposed]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid	Color	Transparent to slightly opaque, slightly pale to yellow	Odor	Characteristic, kerosene-like
Specific Gravity	0.84 to 0.88 at 60°F (Water = 1)	pH	Not applicable	Vapor Density	5.0 to 5.2 (Air = 1 at 70°F)
Boiling Point/Range	155° to 388°C (310° to 730°F) (ASTM D-2887)	Melting/Freezing Point	< -25°C (-13°F) (ASTM D-2388)	Viscosity (cSt @ 40°C)	2.5 to 4 (ASTM D-445) and < 8 cSt at -20°C
Vapor Pressure	1.6 to 1.8 mm Hg at 20°C (68°F) or LT 0.1 psi(a) at 100°F (38°C)	Volatility Characteristics		Volatile Organic Compounds (VOCs) Content	= 100%, AP 825 gm/L
Solubility in Water	Negligible to slightly soluble in cold water (0.005 to 0.04%)	Additional Properties	Alkane, Isoparaffin, Cycloalkane, and Naphthene Hydrocarbons Content = 86 to 91 Wt % (ASTM D-1319), C9-C24 Aromatic Hydrocarbon Content = 9 to 34 Wt % (ASTM D-1319), Average Density at 60°F = 7.203 lbs/gal. (ASTM D-2161), Cetane Number = > 40 (ASTM D-613) or Cetane Index = GT 42 (ASTM D-976), Saybolt Viscosity = 32 to 38 SUS at 100°F (ASTM D-2161), Sulfur Content = < 0.2 Wt % (by ASTM D-2622) or LT 0.5 Wt % (by ASTM D-129), Ash Content = < 0.01 Wt % (ASTM D-482), Ramsbottom Carbon Residue = LT 0.35 Wt % (ASTM D-524), Evaporation Rate = LT 0.04 when n-Butyl acetate = 1.0.		

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide, and oxygen		
Hazardous Decomposition Products	No substances are readily identified from composition, and, no degradation data is available		

HoustonRefining

A Lyondell Company

Olefins Plant Feed - 730°EP (OP-730)

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Hydrodesulfurized Middle Distillate (Petroleum):

- GAS (LC50) Acute 4.60 to 7.64 mg/L for 4 hours [Rat] - Dyspnea, nasal discharge alopecia, and excess salivation
- ORAL (LD50) Acute >500,000 mg/kg [Rat screen] - Diarrhea, hyperactivity, ptosis, urine-stained stomach, and somnolence
- DERMAL (LD50) Acute >2,000 mg/kg [Rabbit screen]
- BUEHLER DERMAL Acute Non-sensitizing [Guinea Pig]
- INTRAVENOUS (LD50): Acute 180 mg/kg [Rabbit] - Respiratory stimulation, tremors, and coma
- 14-Day DERMAL Subchronic 0.05 ml/kg applied 3 times per week [Mouse, Human skin grafted to Athymic nude Mice] - Irritation and epidermal hyperplasia
- 62-Week DERMAL Chronic 0.05 ml/kg applied 3 times per week [Mouse] - Extreme skin irritation, moderate increase in contact-point skin tumors

n-Nonane:

- GAS (LC50) Acute 3,200 ppm for 4 hours [Rat].
- INTRAVENOUS (LD50) Acute 218 mg/kg [Mouse]

Trimethylbenzenes:

- ORAL (LD50): Acute 8,970 mg/kg [Rat]

Ethylmethylbenzenes (Ethyltoluenes):

- GAS (LC50) Acute 50,000 mg/m³ for 2 hours [Cat].
- GAS (LC50) Acute 54,000 mg/m³ for 4 hours [Mouse]

Naphthalene:

- ORAL (LD50) Acute 490 mg/kg [Rat]
- ORAL (LD50) Acute 533 mg/kg [Mouse]
- ORAL (LD50) Acute 1,200 mg/kg [Guinea Pig]
- SUBCUTANEOUS (LD50) Acute 969 mg/kg [Mouse]
- INTRAVENOUS (LD50) Acute 100 mg/kg [Mouse]
- INTRAPERITONEAL (LD50) Acute 150 mg/kg [Mouse]

Biphenyl (Diphenyl or 1,1'-Biphenyl):

- GAS (TCLo) Acute 4,400 ug/m³ for 4 hours [Human] - Flaccid paralysis of peripheral nerves without anesthesia and nausea or vomiting
- ORAL (LD50) Acute >2,600 mg/kg [Cat screen]
- ORAL (LD50) Acute 2,400 mg/kg [Rat and Rabbit]
- ORAL (LD50) Acute 1,900 mg/kg [Mouse] - Somnolence, hypermotility, and diarrhea
- DERMAL (LD50) Acute >5,010 mg/kg [Rabbit screen]
- INTRAVENOUS (LD50) Acute 58 mg/kg [Mouse]

Laboratory data associated some mixtures of petroleum hydrocarbons with boiling ranges between 300° and 700°F., commonly referred to as "middle distillates," including both hydrodesulfurized middle distillate and hydrodesulfurized light catalytic cracked distillate have caused increased incidence of skin tumors at the site of contact when applied repeatedly (twice per week) over the lifetime of the test animals (12 to 24 months). A few studies have shown that washing the animal's skin with soap and water between applications greatly reduces the carcinogenic effect of these middle distillates. Similar materials have also been associated with liver and kidney damage in subchronic (90-day) inhalation studies with male rats.

Hydrodesulfurized middle distillate produced negative mutagenic responses in the Salmonella/microsome (Ames) assay, the in-vitro Chinese hamster ovary (CHO) sister chromatid exchange (SCE) assay, the in-vivo mouse SCE assay, the in-vitro mouse lymphoma assay without S9 activation, and the in-vivo rat bone marrow cell chromosome aberrations assay, however, the in-vitro mouse lymphoma assay with S9 activation produced a positive response. The significance of these animal study results to human health is unclear.

Studies with mice and rats have shown that some petroleum middle distillate fuels similar to this material have caused liver tumors and kidney damage and/or tumors. However, the kidney effects were sex hormone dependent and not seen in similar studies involving Guinea pigs, dogs, or monkeys. Also, the significance of the liver tumors in rodents is highly speculative relative to humans.

Studies with mice and rats have also shown that chronic exposures (8 hours/day, 7 days/week, for 24 months) to unfiltered diesel fuel exhaust produced lung tumors and lymphomas. On the basis of these studies, NIOSH recommended that complete diesel exhaust be regarded as a "potential carcinogen."

HoustonRefining

A Lyondell Company

Olefins Plant Feed - 730^oEP (OP-730)

Numerous epidemiology studies have been carried out to test the hypothesis that lung and/or bladder cancers are associated with chronic exposure to diesel engine exhaust. The most comprehensive case-control and retrospective cohort studies on U S railroad workers showed an increased risk for lung cancer and this risk significantly increased with extended duration exposures. There are some indications that an elevated frequency of bladder cancer amongst bus and truck drivers may be due to diesel engine exhaust exposure.

Rats inhaling n-nonane at an airborne concentration of 1,500 ppm for 7 days displayed mild tremors and loss of coordination. Inhalation of 1,600 ppm for 6 hours per day for 90 days showed animal weight loss or decreased weight gain and changes in the structure of their salivary glands. And, liver damage and an altered response to drugs were seen in rats given n-nonane for 2 to 7 days.

Trimethylbenzenes are primary skin irritants and may cause asthmatic bronchitis and/or anemia. Based upon animal reproductive/developmental studies, trimethylbenzenes may also cause fetal toxicity.

Ethylmethylbenzenes are primary skin irritants and overexposures might cause liver and/or kidney damage or increase blood cholinesterase levels. Inhalation of these and other C9 aromatic hydrocarbons by pregnant mice and rats during gestational days 6 through 15 resulted in decreased fetal and newborn weights.

Naphthalene is a potential irritant to eyes, skin, and lungs. Following prolonged and/or repeated exposures, naphthalene has been shown to cause eye damage (cataracts and/or optical neuritis), premature destruction of red blood cells (hemolytic and aplastic anemia), and kidney damage (jaundice), and possibly neurotoxicity. Naphthalene-induced blood disorders in humans are characterized by variability in size, shape, and number of red blood cells, anemia, and decreased hemoglobin. Also, there have been reported anemia deaths amongst children exposed to moth ball (naphthalene) saturated blankets. Peripheral lens opacities occurred in 8 of 21 workers exposed to elevated levels of naphthalene vapors for 5 years. Repeated ingestion of a naphthalene-isopropanol mixture caused tremors, restlessness, hallucinations, and extreme apprehension. Also, naphthalene may cause fetal toxicity or damage. Laboratory studies produced limited evidence of fetal toxicity in pregnant female mice including decreased spleen weights.

Biphenyl (Diphenyl) inhalation overexposures have caused poisoning characterized by liver atrophy and central and/or peripheral nerve damage. Biphenyl vapors have also caused transient nausea, vomiting, flaccid paralysis, and/or bronchitis.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this material, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. If present, volatile aromatic hydrocarbon components (trimethylbenzenes, ethylmethylbenzenes, naphthalene, and biphenyl) may be released and possibly contribute to the creation of atmospheric smog.

Using Rainbow Trout (*Oncorhynchus mykiss*), Dungeness Crab (*Cancer magister*), and juvenile American Shad (*Squalus cephalus*), similar middle distillates and some of this material's components showed a 96-hour TLms (Median Toxic Limit) of from 5 ppm to 20 ppm in ambient saltwater. Also, 24-hour and 96-hour TLms produced results from 10 ppm to 200 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), and Guppy (*Lebistes reticulatus*) in fresh water. Based upon actual spill incident investigations, similar mixtures have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

Environmental Fate

This material is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, this hydrocarbon oil layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

HoustonRefining

A Lyondell Company

Olefins Plant Feed - 730*EP (OP-730)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residue at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol % of this material, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol %, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitability (D001) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal.

Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Petroleum distillates, n.o.s. (Nonanes, Ethylmethylbenzenes and/or Naphthalene); or Combustible liquid, n.o.s. (Petroleum distillates) or (Nonanes, Ethylmethylbenzenes, Naphthalene) in bulk.		
	This material has a flash point temperature of between 100° and 141°F (38° to 60°C). For bulk shipments, it is classified as a DOT "Flammable Liquid". However, according to 49 CFR 173.120(b)(2) and 173.150(f)(1), this material may be reclassified as a "Combustible Liquid" and exempted from certain transportation-related requirements, such as labeling, when shipped in non-bulk "limited-quantity" containers of less than 119 gallons capacity. According to 49 CFR 173.150(f)(2) and (3), this provision does not apply to "limited-quantities" offered for or transported via vessel or aircraft or products which are defined as DOT "Marine Pollutants". It is recommended that "Flammable Liquid" products which are reclassified be so identified on the bill-of-lading as "Combustible liquid, n.o.s. (Petroleum distillates) or (Nonanes, Ethylmethylbenzenes)" with identification number "NA1993".		
Hazard Class	DOT Class 3 (Flammable liquid)	Packing Group(s) UNNA ID	PG III UN1268 or NA1993.
Reportable Quantity	The Reportable Quantity (RQ) substance components in this material which require DOT HAZMAT bill-of-lading display are Naphthalene and Cumene.		
Picards		Emergency Response Guide No. 128	
		HAZMAT STCC No.	49 122 17
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

A Lyondal Company

Olefins Plant Feed - 730°EP (OP-730)

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.
SARA 313	This material contains the following components in concentrations which might be at or above de minimis levels and are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313: Naphthalene [CAS No. 91-20-3] concentration: 1 to 3% Biphenyl (Diphenyl) [CAS No. 92-52-4] concentration: 0.5 to 1.5%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this material subject to this statute are: Cumene [CAS No. 98-82-8] (RQ = 6000 lbs. [2270 kg]) concentration: 0 to 0.5% Naphthalene [CAS No. 91-20-3] (RQ = 100 lbs. [45.36 kg]) concentration: 1 to 3%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material does not contain any chemical substances which is known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling, refer to components listed in Section 2.
Additional Regulatory Remarks	Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13), this product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children! Under Section 12(b) of the Toxic Substances Control Act. Because it contains detectable amounts of 1,3,5-Trimethylbenzene (Mesitylene) [CAS No. 106-87-8] , this material might be subject to US EPA's one-time only per country export notification requirements. In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare": Cumene [CAS No. 98-82-8] and Biphenyl (Diphenyl) [CAS No. 92-52-4].

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid
Color Transparent to slightly opaque, slightly pale to yellow
Odor Characteristic, kerosene-like

WARNING! Combustible liquid; vapor may cause flash fire. Mist or vapor may irritate the eyes, mucous membranes, and respiratory tract.
Liquid contact may cause minimal to mild eye and/or moderate to severe skin irritation and inflammation.
Based upon laboratory animal studies, may cause skin cancer following extended contact.
May be harmful if inhaled or absorbed through the skin.
Overexposures may cause central nervous system (CNS) depression and/or other target organ effects.
May be harmful or fatal if ingested.
Aspiration into the lungs can cause pulmonary edema and lipid or chemical pneumonia.
Based upon animal testing, may adversely affect reproduction.
Spills may create a slipping hazard.
If used as fuel, its engine exhaust may cause upper respiratory tract irritation and reversible pulmonary effects.

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Hydrodesulfurized Middle Distillate (Petroleum)	64742-80-9	50-100
2) Hydrodesulfurized Light Catalytic Cracked Distillate (Petroleum)	68333-25-5	0-50
3) Nonanes	Mixture	1-10
4) Trimethylbenzene (mixed isomers)	25551-13-7	0.5-1.5
5) Ethylmethylbenzenes (Ethyltoluenes)	25550-14-5	1-3
6) C10-C12 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	60-70
7) Naphthalene	91-20-3	1-3
8) C10-C11 Alkylbenzenes	70693-06-0	1-10
9) Biphenyl (Diphenyl)	92-52-4	0.5-1.5
10) C12-C23 Aromatic Hydrocarbons	Mixture	5-15
11) C13-C25 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	10-20

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact Eye Contact Absorption Inhalation

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon level of exposure concentration and/or duration. Vapors can reduce the oxygen content in air. Approximately 20,000 ppm (or 2 vol %) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces.
Eye Contact	Animal test results on similar materials suggest that this product can cause minimal to mild eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling.
Skin Contact	Animal test results on similar materials suggest that this product can cause moderate to severe skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause severe dermatitis and/or more serious skin disorders. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and/or severe tissue damage.
Ingestion	If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above). Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.
Chronic Health Effects Summary	Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. This hydrodesulfurized mixture is a middle distillate similar to those shown to produce skin tumors on laboratory animals following repeated applications. All tumors appeared at the site of application during the latter portion of the typical 2-year lifespan of the animals. Toxic effects are unlikely to occur if good personal hygiene is practiced. Based upon animal testing, the C9 aromatic hydrocarbon components (trimethylbenzenes and ethylmethylbenzenes) are presumed to cause fetal toxicity and/or decreased fetal and newborn weights if overexposure occurs during a woman's early gestation period. Naphthalene is considered to be a toxic substance as defined by both human exposure and laboratory testing results.

HoustonRefining

A Lyondal Company

Olefins Plant Feed - 700°EP (OP-700)

Biphenyl (Diphenyl) may cause liver and/or nerve damage (See Section 11)

Conditions Aggravated by Exposure	Personnel with pre-existing central nervous system (CNS) disease, neurological conditions, skin disorders, impaired liver or kidney function, or chronic respiratory diseases, and women attempting to conceive should avoid exposure
Target Organs	This substance is toxic to lungs, nervous systems, brain, mucous membranes, skin, eyes, and possibly, the blood, liver, kidneys, and reproductive system
Carcinogenic Potential	This material contains middle distillates at or above a 0.1% concentration and it is considered to be carcinogenic by IARC and OSHA. (See Section 11)

OSHA Health Hazard Classification				OSHA Physical Hazard Classification			
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input checked="" type="checkbox"/>	Explosive	<input type="checkbox"/>

Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>
						Pyrophoric	<input type="checkbox"/>
						Water-reactive	<input type="checkbox"/>
						Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required. If ingested, this material presents a significant aspiration/lipoid or chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

HoustonRefining

A Lyondell Company

Olefins Plant Feed - 700°EP (OP-700)

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-II Combustible Liquid Highly combustible ¹		
Flash Point Method	CLOSED CUP 51° to 60°C (125° to 140°F) (Pensky-Martens (ASTM D-93))		
Lower Flammable Limit	AP 0.6 %	Upper Flammable Limit	AP 7.5 %
Autoignition Temperature	AP 257°C (494°F)		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors.		
Special Properties	<p>Combustible Liquid¹ This material releases vapors at or approaching the flash point temperature. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Mists or sprays may be flammable at temperatures below the flash point. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.</p> <p>A static electrical charge can accumulate as a result of transfer flow or agitation. Discharge (static spark) can ignite vapors, especially in cold, dry weather conditions. Special slow load and monitoring procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point products. To reduce this hazard, receiving containers should always be grounded and the loading nozzle must be kept in contact with the container during the entire filling process. Do not fill any portable container in or on a vehicle without proper bonding.</p>		
Extinguishing Media	<p>SMALL FIRE Use dry chemicals, carbon dioxide (CO₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.</p>		
Protection of Fire Fighters	<p>Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat, cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.</p>		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Combustible Liquid¹ Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors, but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible, in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

HoustonRefining

A Lyondell Company

Olefins Plant Feed - 700°EP (OP-700)

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources. Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This combustible liquid should be stored in a separate safety cabinet or room. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N F P A's National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

HoustonRefining

A Lyondell Company

Olefins Plant Feed - 700°EP (OP-700)

Respiratory Protection For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).

General Comments Warning! Use of this hydrocarbon fuel in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Diesel fuel/Kerosene ("A3" Animal Carcinogen)	TWA: 100 (mg/m ³) from ACGIH (TLV) - SKIN [Proposed]
2) Nonane, all isomers	TWA: 200 (ppm) from ACGIH (TLV)
	TWA: 200 (ppm) from OSHA (PEL) [Proposed]
3) Trimethylbenzene (mixed isomers)	TWA: 25 (ppm) from ACGIH (TLV)
	TWA: 25 (ppm) from OSHA (PEL) [Proposed]
4) Naphthalene	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) - SKIN
	TWA: 10 STEL: 15 (ppm) from OSHA (PEL) [Proposed]
	TWA: 10 (ppm) from OSHA (PEL)
5) Biphenyl (Diphenyl)	TWA: 0.2 (ppm) from ACGIH (TLV)
	TWA: 0.2 (ppm) from OSHA (PEL) [Proposed]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid	Color	Transparent to slightly opaque, slightly pale to yellow	Odor	Characteristic, kerosene-like
Specific Gravity	0.84 to 0.88 at 60°F (Water = 1)	pH	Not applicable	Vapor Density	5.0 to 5.2 (Air = 1 at 70°F)
Boiling Point/Range	155° to 371°C (310° to 700°F) (ASTM D-2887)			Melting/Freezing Point	< -25°C (-13° F) (ASTM D-2396)
Vapor Pressure	1.6 to 1.8 mm Hg at 20°C (68°F) or LT 0.1 psi(a) at 100°F (38°C)			Viscosity (cSt @ 40°C)	2.5 to 4 (ASTM D-445) and < 8 cSt at -20°C
Solubility in Water	Negligible to slightly soluble in cold water (0.005 to 0.04%)			Volatile Characteristics	Volatile Organic Compounds (VOCs) Content = 100%, AP 825 gm/L
Additional Properties	Alkane, isoparaffin, Cycloalkane, and Naphthene Hydrocarbons Content = 66 to 91 Wt % (ASTM D-1319), C9-C24 Aromatic Hydrocarbon Content = 9 to 34 Wt % (ASTM D-1319), Average Density at 60°F = 7.203 lbs./gal. (ASTM D-2161), Cetane Number = > 40 (ASTM D-613) or Cetane Index = GT 42 (ASTM D-876), Saybolt Viscosity = 32 to 37 SUS at 100°F (ASTM D-2161), Sulfur Content = < 0.2 Wt % (by ASTM D-2622) or LT 0.5 Wt % (by ASTM D-129), Ash Content = < 0.01 Wt % (ASTM D-482), Ramsbottom Carbon Residue = LT 0.35 Wt % (ASTM D-524), Evaporation Rate = LT 0.04 when n-Butyl acetate = 1.0				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide, and oxygen		
Hazardous Decomposition Products	No substances are readily identified from composition, and, no degradation data is available		

HoustonRefining

A Lyondell Company

Olefins Plant Feed - 700°EP (OP-700)

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Hydrosulfurized Middle Distillate (Petroleum):

GAS (LC50) Acute 4.60 to 7.64 mg/L for 4 hours [Rat] - Dyspnea, nasal discharge, alopecia, and excess salivation

ORAL (LD50) Acute >500,000 mg/kg [Rat screen] - Diarrhea, hyperactivity, ptosis, urine-stained stomach, and somnolence

DERMAL (LD50) Acute >2,000 mg/kg [Rabbit screen]

BUEHLER DERMAL Acute Non-sensitizing [Guinea Pig]

INTRAVENOUS (LD50) Acute 180 mg/kg [Rabbit] - Respiratory stimulation, tremors, and coma.

14-Day DERMAL Subchronic 0.05 ml/kg applied 3 times per week [Mouse, Human skin grafted to Athymic nude Mice] - Irritation and epidermal hyperplasia

62-Week DERMAL Chronic 0.05 ml/kg applied 3 times per week [Mouse] - Extreme skin irritation, moderate increase in contact-point skin tumors

n-Nonane:

GAS (LC50) Acute: 3,200 ppm for 4 hours [Rat]

INTRAVENOUS (LD50) Acute: 218 mg/kg [Mouse]

Trimethylbenzenes:

ORAL (LD50) Acute: 8,970 mg/kg [Rat]

Ethylmethylbenzenes (Ethyltoluenes):

GAS (LC50) Acute: 50,000 mg/m³ for 2 hours [Cat]

GAS (LC50) Acute: 54,000 mg/m³ for 4 hours [Mouse]

Naphthalene:

ORAL (LD50) Acute: 490 mg/kg [Rat]

ORAL (LD50) Acute: 533 mg/kg [Mouse]

ORAL (LD50) Acute: 1,200 mg/kg [Guinea Pig]

SUBCUTANEOUS (LD50) Acute: 969 mg/kg [Mouse]

INTRAVENOUS (LD50) Acute: 100 mg/kg [Mouse]

INTRAPERITONEAL (LD50) Acute: 150 mg/kg [Mouse]

Biphenyl (Diphenyl or 1,1'-Biphenyl):

GAS (TCLo) Acute: 4,400 ug/m³ for 4 hours [Human] - Flaccid paralysis of peripheral nerves without anesthesia and nausea or vomiting

ORAL (LD50) Acute: >2,800 mg/kg [Cat screen]

ORAL (LD50) Acute: 2,400 mg/kg [Rat and Rabbit]

ORAL (LD50) Acute: 1,900 mg/kg [Mouse] - Somnolence, hypermotility, and diarrhea

DERMAL (LD50) Acute: >5,010 mg/kg [Rabbit screen]

INTRAVENOUS (LD50) Acute: 56 mg/kg [Mouse]

Laboratory data associated some mixtures of petroleum hydrocarbons with boiling ranges between 300° and 700°F., commonly referred to as "middle distillates, including both hydrosulfurized middle distillate and hydrosulfurized light catalytic cracked distillate" have caused increased incidence of skin tumors at the site of contact when applied repeatedly (twice per week) over the lifetime of the test animals (12 to 24 months). A few studies have shown that washing the animal's skin with soap and water between applications greatly reduces the carcinogenic effect of these middle distillates. Similar materials have also been associated with liver and kidney damage in subchronic (90-day) inhalation studies with male rats.

Hydrosulfurized middle distillate produced negative mutagenic responses in the Salmonella/microsome (Ames) assay, the in-vitro Chinese hamster ovary (CHO) sister chromatid exchange (SCE) assay, the in-vivo mouse SCE assay, the in-vitro mouse lymphoma assay without S9 activation, and the in-vivo rat bone marrow cell chromosome aberrations assay, however, the in-vitro mouse lymphoma assay with S9 activation produced a positive response. The significance of these animal study results to human health is unclear.

Studies with mice and rats have shown that some petroleum middle distillate fuels similar to this material have caused liver tumors and kidney damage and/or tumors. However, the kidney effects were sex hormone dependent and not seen in similar studies involving Guinea pigs, dogs, or monkeys. Also, the significance of the liver tumors in rodents is highly speculative relative to humans.

Studies with mice and rats have also shown that chronic exposures (8 hours/day, 7 days/week, for 24 months) to unfiltered diesel fuel exhaust produced lung tumors and lymphomas. On the basis of these studies, NIOSH recommended that complete diesel exhaust be regarded as a "potential carcinogen".

HoustonRefining

A Lyondell Company

Olefins Plant Feed - 700°EP (OP-700)

Numerous epidemiology studies have been carried out to test the hypothesis that lung and/or bladder cancers are associated with chronic exposure to diesel engine exhaust. The most comprehensive case-control and retrospective cohort studies on U.S. railroad workers showed an increased risk for lung cancer and this risk significantly increased with extended duration exposures. There are some indications that an elevated frequency of bladder cancer amongst bus and truck drivers may be due to diesel engine exhaust exposure.

Rats inhaling n-nonane at an airborne concentration of 1,500 ppm for 7 days displayed mild tremors and loss of coordination. Inhalation of 1,600 ppm for 6 hours per day for 90 days showed animal weight loss or decreased weight gain and changes in the structure of their salivary glands. And, liver damage and an altered response to drugs were seen in rats given n-nonane for 2 to 7 days.

Trimethylbenzenes are primary skin irritants and may cause asthmatic bronchitis and/or anemia. Based upon animal reproductive/developmental studies, trimethylbenzenes may also cause fetal toxicity.

Ethylmethylbenzenes are primary skin irritants and overexposures might cause liver and/or kidney damage or increase blood cholinesterase levels. Inhalation of these and other C9 aromatic hydrocarbons by pregnant mice and rats during gestational days 6 through 15 resulted in decreased fetal and newborn weights.

Naphthalene is a potential irritant to eyes, skin, and lungs. Following prolonged and/or repeated exposures, naphthalene has been shown to cause eye damage (cataracts and/or optical neuritis), premature destruction or red blood cells (hemolytic and aplastic anemia), and kidney damage (jaundice), and possibly neurotoxicity. Naphthalene-induced blood disorders in humans are characterized by variability in size, shape, and number of red blood cells, anemia, and decreased hemoglobin. Also, there have been reported anemia deaths amongst children exposed to moth ball (naphthalene) saturated blankets. Peripheral lens opacities occurred in 8 of 21 workers exposed to elevated levels of naphthalene vapors for 5 years. Repeated ingestion of a naphthalene-isopropanol mixture caused tremors, restlessness, hallucinations, and extreme apprehension. Also, naphthalene may cause fetal toxicity or damage. Laboratory studies produced limited evidence of fetal toxicity in pregnant female mice including decreased spleen weights.

Biphenyl (Diphenyl) inhalation overexposures have caused poisoning characterized by liver atrophy and central and/or peripheral nerve damage. Biphenyl vapors have also caused transient nausea, vomiting, flaccid paralysis, and/or bronchitis.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this material, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. If present, volatile aromatic hydrocarbon components (trimethylbenzenes, ethylmethylbenzenes, naphthalene, and biphenyl) may be released and possibly contribute to the creation of atmospheric smog.

Using Rainbow Trout (*Oncorhynchus mykiss*), Dungeness Crab (*Cancer magister*), and juvenile American Shad (*Squalus cephalus*), similar middle distillates and some of this material's components showed a 96-hour TLms (Median Toxic Limit) of from 5 ppm to 20 ppm in ambient saltwater. Also, 24-hour and 96-hour TLms produced results from 10 ppm to 200 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), and Guppy (*Lebistes reticulatus*) in fresh water. Based upon actual spill incident investigations, similar mixtures have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

Environmental Fate

This material is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, this hydrocarbon oil layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

Olefins Plant Feed - 700°EP (OP-700)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol % of this material, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol %, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal.

Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT)		
Proper Shipping Name	Petroleum distillates, n.o.s. (Nonanes, Ethylmethylbenzenes and/or Naphthalene); or Combustible liquid, n.o.s. (Petroleum distillates) or (Nonanes, Ethylmethylbenzenes, Naphthalene) in bulk.		
	This material has a flash point temperature of between 100° and 141°F (38° to 60°C). For bulk shipments, it is classified as a DOT "Flammable Liquid". However, according to 49 CFR 173.120(b)(2) and 173.150(f)(1), this material may be reclassified as a "Combustible Liquid" and exempted from certain transportation-related requirements, such as labeling, when shipped in non-bulk "limited-quantity" containers of less than 119 gallons capacity. According to 49 CFR 173.150(f)(2) and (3), this provision does not apply to "limited-quantities" offered for or transported via vessel or aircraft or products which are defined as DOT "Marine Pollutants". It is recommended that "Flammable Liquid" products which are reclassified be so identified on the bill-of-lading as "Combustible liquid, n.o.s. (Petroleum distillates) or (Nonanes, Ethylmethylbenzenes)" with identification number "NA1993".		
Hazard Class	DOT Class 3 (Flammable liquid)	Packing Group(s) UN/NA ID	PG III UN1268 or NA1993
Reportable Quantity	The Reportable Quantity (RQ) substance components in this material which require DOT HAZMAT bill-of-lading display are Naphthalene and Cumene.		
Placards		Emergency Response Guide No.	128
		HAZMAT STCC No.	49 122 17
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

HoustonRefining

A Lyondell Company

Olefins Plant Feed - 700°EP (OP-700)

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.
SARA 313	This material contains the following components in concentrations which might be at or above de minimis levels and are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313: Naphthalene [CAS No. 91-20-3] concentration: 1 to 3% Biphenyl (Diphenyl) [CAS No. 92-52-4] concentration: 0.5 to 1.5%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this material subject to this statute are: Cumene [CAS No. 98-82-8] (RQ = 5000 lbs. [2270 kg]) concentration: 0 to 0.5% Naphthalene [CAS No. 91-20-3] (RQ = 100 lbs. [45.36 kg]) concentration: 1 to 3%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material does not contain any chemical substances which is known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5
New Jersey Right-to-Know Label	For New Jersey labeling, refer to components listed in Section 2.
Additional Regulatory Remarks	Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13). This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children! Under Section 12(b) of the Toxic Substances Control Act. Because it contains detectable amounts of 1,3,5-Trimethylbenzene (Mesitylene) [CAS No. 108-67-8] , this material might be subject to US EPA's one-time only per country export notification requirements. In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare": Cumene [CAS No. 98-82-8] and Biphenyl (Diphenyl) [CAS No. 92-62-4].

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0031
Revision Date 3/2/2005

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Gas. (Compressed gas/liquid.)
Color Colorless to light yellow. **Odor** Odorless or possible slight hydrocarbon. Possible rotten egg smell.

DANGER!

Extremely flammable compressed gas/liquid; Vapor may cause flash fire or explosion.

FLAMMABLE GAS. MAY CAUSE FLASH FIRE.

Repeated or excessive exposure to certain components of this mixture have been associated with central nervous system effects.

Breathing high concentrations can cause irregular heartbeats which may be fatal.

Liquid or compressed gas contact may cause frostbite or freeze burns.

EXPLOSIVE.

Hazard Rankings

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	Reformate Gas, Hydrogen-Rich (C1-C6 Hydrocarbons)	Technical Contact	(800) 525-4692
Product Number	Not available.	Medical Emergency	(800) 313-7645
CAS Number	68478-81-6	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Not applicable.		
Synonyms	Catalytic Reformer Recycle Gas, Catalytic Reformer Gases from C6-C8 Feedstock (Petroleum), Reformer Hydrogen, Plant Hydrogen Recycle, Naphtha unifier Stripper Gas, Magnaformer Absorber Tower Feed Gas, Magnaformer Reformate Separator Tower Overhead Steam, Hydrogen and C1-C6 alkane and Isoparaffin Hydrocarbons Mixture, 637 HDS Recycle Gas.		

Reformate Gas, Hydrogen-Rich (C1-C6 Hydrocarbons)

SECTION 2. COMPOSITION (TYPICAL)

Component Name(s)	CAS Registry No.	Concentration (%)
Hydrogen	1333-74-0	75 - 90
Methane	74-82-8	5 - 15
Ethane	74-84-0	1 - 10
Propane	74-98-6	1 - 5
Pentanes, all isomers	Mixture	<2
Iso-Butane	75-28-5	0.5 - 3
n-Butane	106-97-8	0.5 - 2
Nitrogen	7727-37-9	0.5 - 1.5
n-Hexane	110-54-3	<1
Hexane, other isomers	Mixture	<1
Hydrogen sulfide	7783-06-4	<0.01

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Eye contact. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation Breathing this gas keeps the body from getting enough oxygen. Symptoms include dizziness, confusion, headache, and nausea. Continued breathing of this gas may lead to unconsciousness and death from suffocation. Breathing high concentrations of this material, for example, in an enclosed space or by intentional abuse, can cause irregular heartbeats which can cause death.

Eye Contact This gas is non-irritating; however, direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn."

Skin Contact Direct contact with an pressurized/liquefied expanding gas may produce severe and possibly permanent skin damage from frostbite or freeze burns.

Ingestion Ingestion is not an applicable route of exposure for gases.

Chronic Health Effects Summary There is no evidence that long-term, low-level exposure to components of this gas mixture cause any chronic adverse health effects in animals or humans.

Conditions Aggravated by Exposure Personnel with pre-existing chronic respiratory diseases, central nervous system (CNS) disease, or cardiovascular conditions should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of "simple asphyxiants".

Exposure to high concentrations of **propane**, a minor component of this material, may increase the sensitivity of the heart to **epinephrine (adrenalin) and catecholamine-like drugs**. Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians").

Target Organs The substance is toxic to mucous membranes, skin, eyes, central nervous system (CNS), and possibly the heart.

Carcinogenic Potential This material does not contain any components at concentrations at or above 0.1% which are considered to be carcinogenic by OSHA, IARC, or NTP.

Reformate Gas, Hydrogen-Rich (C1-C6 Hydrocarbons)

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).									
OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Toxic	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. Irrigate the eyes with copious amounts of clean, low-pressure, room-temperature water. Do not use hot water! Do not use eye ointment unless directed to by a physician. Seek medical attention if excessive tearing, irritation, or pain persists.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Seek medical attention if tissue appears damaged or if pain persists.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry.
Notes to Physician	If cough or difficulty in breathing develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. Monitor arterial blood gases and chest x-ray in cases with significant exposure. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse). If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential.

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas.
Flash Point	-185°C (-301°F) (Estimated)
Lower Flammable Limit	AP 2.0%
Upper Flammable Limit	AP 75%
Autoignition Temperature	AP 400°C (752°F)
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes and unburned hydrocarbons.

Reformate Gas, Hydrogen-Rich (C1-C6 Hydrocarbons)

Special Properties	This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Compressed Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area upwind. Remove all potential ignition sources. Safety stop the source gas flow using non-sparking tools. Allow the substance to evaporate. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. Prevent this material's entry into waterways, sewers, basements, or confined areas. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This gas or waste mixtures containing this gas should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7. HANDLING AND STORAGE

Reformate Gas, Hydrogen-Rich (C1-C6 Hydrocarbons)

Handling

This gas mixture contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring for oxygen deficiency and flammability.

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of mixed gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Drain and purge equipment as necessary to remove material residues. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Do not allow vaporizing material to contact eyes, skin or other tissues. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated.

Storage

Do not store this material near heat or any other potential ignition sources. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Do not store this product in unlabeled containers. Keep containers tightly closed.

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling pressurized and/or liquefied gases. Safety glasses equipped with side shields or face shield are recommended when vapor is being discharged or whenever handling high-pressure cylinders and piping systems.

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves to protect hands from potential contact with cold liquid, solid, or vapors.

Reformate Gas, Hydrogen-Rich (C1-C6 Hydrocarbons)

Body Protection	Prevent potential skin contact with cold liquid, solid, or vapors. Use insulated and chemical-resistant clothing (apron, slicker suit, coveralls, boots, etc.). Fire-retardant garments (e.g. Nomex®) should be worn while working with flammable gases and gas/liquids.
Respiratory Protection	Odor is not an adequate warning for potentially hazardous air concentrations! For unknown vapor concentrations, use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator, if adequate protection is provided. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).
General Comments	For an explanation about some of the occupational exposure limits shown below, refer to the definition of " Simple Asphyxiant " presented in the American Conference of Governmental Industrial Hygienists (ACGIH) most current Threshold Limit Values (TLVs) for Chemical Substances and Physical Agents handbook. Releases of these gases may cause atmospheres, some oxygen-deficient (LT 21 Vol.% in air), which can have flammable/explosive potential. DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
Hydrogen	Simple asphyxiant.
Methane	Simple asphyxiant.
Ethane	Simple asphyxiant.
Propane	ACGIH (United States). TWA: 2500 ppm 8 hour(s).
	OSHA (United States). TWA: 1000 ppm 8 hour(s).
	Simple asphyxiant.
Pentanes, all isomers	ACGIH (United States). TWA: 600 ppm 8 hour(s).
	OSHA (United States). TWA: 1000 ppm 8 hour(s).
Iso-Butane	ACGIH (United States). TWA: 800 ppm 8 hour(s).
n-Butane	ACGIH (United States). TWA: 800 ppm 8 hour(s).
Nitrogen	Simple asphyxiant.
n-Hexane	ACGIH (United States). Skin TWA: 50 ppm 8 hour(s).
	OSHA (United States). TWA: 500 ppm 8 hour(s).
Hexane, other isomers	ACGIH TLV (United States). TWA: 500 ppm 8 hour(s).
	STEL: 1000 ppm 15 minute(s).
Hydrogen sulfide	ACGIH TLV (United States). TWA: 10 ppm 8 hour(s).
	STEL: 15 ppm 15 minute(s).
	OSHA (United States). CEIL: 20 ppm 8 hour(s).
	STEL: 50 ppm 15 minute(s). Form: *10 minute peak; once per 8 hour shift
Hexane, other isomers	ACGIH (United States). TWA: 500 ppm 8 hour(s).
	STEL: 1000 ppm 15 minute(s).

Reformate Gas, Hydrogen-Rich (C1-C6 Hydrocarbons)

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Gas. (Compressed gas/liquid.)	Color	Colorless to light yellow.	Odor	Odorless or possible slight hydrocarbon. Possible rotten egg smell.
Specific Gravity	0.07 to 0.38 (Water = 1)	pH	Not applicable.	Vapor Density	0.07 to 1.04 (Air = 1)
Boiling Range	-253° to -41°C (-423° to -43°F) at 14.7 psia			Melting/Freezing Point	-260° to -169°C (-435° to -272°F) at 14.7 psia
Vapor Pressure	205 to 250 psia at 40°C (104°F)			Volatility	This material is normally a gas. If released in liquid form, it will completely evaporate very quickly.
Solubility in Water	Negligible in cold water (LT 0.01 Wt.%).			Viscosity (cSt @ 40°C)	Not applicable.
Flash Point	-185°C (-301°F) (Estimated)				
Additional Properties	No additional information.				

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Butane, all isomers

Studies in laboratory animals indicate exposure to extremely high levels of butanes (1-10 or higher vol.% in air) may cause cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.

Propane

Studies in laboratory animals indicate exposure to extremely high levels of propane (1 to 10 vol.% in air) may cause cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.

Pentanes, all isomers

Studies of pentane isomers in laboratory animals indicate exposure to extremely high levels (roughly 10 vol.%) may induce cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.

Reformate Gas, Hydrogen-Rich (C1-C6 Hydrocarbons)

SECTION 12. ECOLOGICAL INFORMATION

- Ecotoxicity** Ecological effects testing has not been conducted on this material. Releases are expected to cause only localized non-persistent environmental damage.
- Environmental Fate** **Hydrogen and light alkane/alkene gases** are essentially insoluble in water (LT 0.1%); and therefore, this material will not cause harm to aquatic life. These pressurized gas mixtures will normally disperse rapidly in air if released.
- The atmospheric half-lives of **methane, ethane, and propane** under photochemical smog conditions are estimated to be between 5 to 8 hours. Photooxidation of **propane** in air (LT 8%) is not considered environmentally significant.
- For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

This material may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be in accordance with applicable Federal, State, and local regulations. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

- TSCA Inventory** This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
- SARA 302/304 Emergency Planning and Notification** The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.

Reformate Gas, Hydrogen-Rich (C1-C6 Hydrocarbons)

SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Sudden Release of Pressure Hazard, and Acute (Immediate) Health Hazard.
SARA 313 Toxic Chemical Notification and Release Reporting	This material does not contain any components in concentrations at or above de minimis levels and are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. This material is not known to contain chemical substances subject to this statute. However, it is recommended that you contact state and local authorities to determine if there are any other reporting requirements in the event of a release.
Clean Water Act (CWA)	This material is NOT classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA).
California Proposition 65	This material does not contain any chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling, refer to the components listed in Section 2.
Additional Regulatory Remarks	No additional regulatory remarks.

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 3.0
Revision Date 3/2/2005
Print Date Printed on 3/2/2005.

Sour LPG With Methyl Mercaptan

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0032
Revision Date 06/01/1999

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Liquefied Gas.		
Color	Colorless liquid, invisible gas and vapor, white frost at release point	Odor	Strong, foul smelling, distinctive rotten egg or cabbage odor is unreliable as a warning of possible danger

DANGER! Extremely flammable and poisonous liquefied gas; vapor may cause flash fire or explosion!
May form explosive peroxides on exposure to air!
High pressure and rapid diffusion hazard!
Contains Hydrogen Sulfide (H₂S)! Corrosive to some metals!
May be harmful or fatal if inhaled or ingested! High concentrations of vapor reduce oxygen available for breathing and may cause central nervous system (CNS) depression or suffocation!
Mist or vapor may cause eye, skin, mucous membrane, and respiratory tract irritation and inflammation!
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
Liquid or compressed gas contact may cause frostbite or freeze burns!
Overexposures may cause target organ effects such as lung, heart, central and sympathetic nervous systems, blood, liver, and/or kidney damage!

SECTION 1: IDENTIFICATION

Trade Name	Sour LPG With Methyl Mercaptan	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	1111110032	Medical Emergency	(918) 495-4700
CAS Number	68514-31-8	CHEMTREC Emergency	(800) 424-9300
Product Family	Sour Gas		
Synonyms	Sour Liquefied Petroleum Gas or Sour LP-Gas, BRU No. 2 Depropanizer Tower Overhead Stream; Magnaformer (735) Stabilizer Tower Overhead Stream, C3-C4 Hydrocarbons Mixture Containing H ₂ S and CH ₃ -SH.		

**Sour LPG
With Methyl Mercaptan**

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Sour C3-C4 Hydrocarbons	68514-31-8	100
2) Liquefied Petroleum Gases	68476-85-7	100
3) Propane	000074-98-6	25-75
4) Iso-Butane	75-28-5	20-40
5) Butenes or Butylenes	25167-67-3	1-15
6) n-Butane	106-97-8	1-15
7) Propylene	115-07-1	1-15
8) Hydrogen sulfide	7783-06-4	1-10
9) Methyl mercaptan	74-93-1	0.1-1
10) Ethane	74-84-0	0-2
11) Iso-Pentane	78-78-4	0-2

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Eye contact. Skin contact. Skin absorption.

Signs and Symptoms of Acute Exposure

Inhalation	<p>May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. The National Institute for Occupational Safety and Health has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health. At concentrations above 500 ppm, H₂S causes unconsciousness and respiratory paralysis leading to coma and/or death. (See Section 11.)</p> <p>Additionally, several components of this liquefied gas are "simple asphyxiants" High concentrations of this gas can displace the amount of oxygen available to breathe below that level necessary to sustain life. Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, weakness, nausea, vomiting, loss of coordination, unconsciousness, and coma, depending upon the concentration level and duration of exposure</p>
Eye Contact	<p>Vapors may cause moderate to severe eye irritation and photophobia (light sensitivity) upon short-term exposure. Severity depends upon the concentrations of hydrogen sulfide and methyl mercaptan and duration of exposure. Direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn."</p>
Skin Contact	<p>Direct contact with an expanding liquefied gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. Hydrogen sulfide and methyl mercaptan can be absorbed through the skin to produce toxic effects. If the skin is damaged, absorption increases</p>
Ingestion	<p>Due to its volatile nature, ingestion is not normally an applicable route of exposure for this liquefied gas mixture. However, if swallowed, this material may "freeze burn" the mucous membranes of the mouth, throat, and esophagus.</p>
Chronic Health Effects Summary	<p>Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H₂S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures. (See Section 11)</p> <p>Chronic inhalation to components of this gas (propane, propylene, and n-butane) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline)-like drugs.</p>
Conditions Aggravated by Exposure	<p>Personnel with eye, skin, cardiac, pulmonary, liver, kidney, or neurological disorders, high blood pressure, and those with a compromised ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this liquefied gas. They should take additional precautions to minimize or avoid exposure.</p>
Target Organs	<p>These streams are toxic to the eyes, skin, mucous membranes, lungs, central and sympathetic nervous systems, brain, heart, blood, and possibly, the bladder and the endocrine and reproductive systems</p>

**Sour LPG
With Methyl Mercaptan**

Carcinogenic Potential These streams do not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC, or NTP.

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input checked="" type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required. This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines such as epinephrine (adrenaline) and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas.		
Flash Point/Method	CLOSED CUP: AP -107° to -73°C (-160° to -100°F) (Estimated)		
Lower Flammable Limit	AP 1.6 %	Upper Flammable Limit	AP 45 %
Auto-Ignition Temp.	AP 260°C (500°F)		

**Sour LPG
With Methyl Mercaptan**

Hazardous Combustion Products	Carbon dioxide and monoxide, smoke, fumes, oxides of sulfur, and possibly, unburned hydrocarbons or mercaptans.
Special Properties	This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide, and/or inert gas (nitrogen) to extinguish adjacent burning materials.
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquefied Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safely stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This liquefied gas or waste mixtures containing this material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling **Danger! Poisonous and Flammable Gas!** Do NOT breathe vapor, it contains **hydrogen sulfide (H₂S), methyl mercaptan, and simple asphyxiants**. Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S concentrations, and flammability.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed petroleum gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

Sour LPG With Methyl Mercaptan

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue.

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC). H_2S is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.)

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location. Where H_2S is routinely stored or handled, install monitoring equipment or system with alarms.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with cold liquid or vapors.

Body Protection

Prevent potential skin contact with cold liquid or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable liquefied gases. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

A full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g. ANSI Z88.2).

General Comments

Releases of this liquefied gas mixture may create flammable, explosive, and/or oxygen-deficient atmospheres (LT 19.5 Vol.% in air). DO NOT ENTER such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions. Air purifying respirators offer no protection against oxygen deficiency, hydrogen sulfide, methyl mercaptan, and simple asphyxiants.

Sour LPG With Methyl Mercaptan

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) TWA: 10 STEL: 15 CEIL: 20 (ppm) from OSHA (PEL)
2) Methyl mercaptan	TWA: 5 (ppm) from ACGIH (TLV) [1997] TWA: 0.5 (ppm) from ACGIH (TLV) [proposed for 1998] TWA: 0.5 CEIL: 10 (ppm) from OSHA [1989]
3) Ethane	Simple asphyxiant.
4) Propylene	Simple asphyxiant
5) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1989]
6) Propane	TWA: 2500 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1989]
7) Butanes	TWA: 800 (ppm) from ACGIH (TLV) [1998] TWA: 800 (ppm) from OSHA (PEL) [1989]
8) Pentanes	TWA: 600 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1976]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquefied Gas.	Color	Colorless liquid; invisible gas and vapor; white frost at release point.	Odor	Strong, foul smelling; distinctive rotten egg or cabbage odor is unreliable as a warning of possible danger.
Specific Gravity	AP 0.55 to 0.60 (Water = 1)	pH	In the presence of moisture, H ₂ S can convert to acidic H ₂ SO ₄ .	Vapor Density	AP 1.5 to 1.9 (Air = 1)
Boiling Point/Range	AP -60° to 27°C (-75° to 82°F) at 14.7 psia (ASTM D-2887)	Melting/Freezing Point			AP -187° to -82°C (-305° to -117°F) at 14.7 psia
Vapor Pressure	50 to 190 psia at 100°F	Viscosity (cSt @ 40°C)			Not applicable
Solubility in Water	Moderately soluble in cold water.	Volatile Characteristics			This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Hydrogen Sulfide and Mercaptans Content = 1.1 to 11 Vol.%; C2-C5 Alkane, Isoparaffin, and Alkene Hydrocarbons Content = 89 to 98.9 Wt.% (ASTM D-1319), Gross Heat of Combustion at 60°F = AP 21,000 Btu/lb or 2,500 Btu/cu.ft., Average Density at 60°F = LT 5.00 lbs /gal. (ASTM D-2161).				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions. Polymerization can occur under conditions of extremely high temperature and pressure.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

**Sour LPG
With Methyl Mercaptan**

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the *Emergency Overview on Page 1* and the *Hazards Identification in Section 3* of this MSDS.

Toxicity Data

Hydrogen sulfide.

- GAS (TCLo): Acute: 10 ppm for 15 minutes (Human) - Eye irritation
- GAS (TCLo): Acute: 50 to 100 ppm for 15 minutes (Human) - Respiratory irritation
- GAS (LC100): Acute: 600 to 750 ppm for 30 minutes (Human) - Respiratory paralysis and death.
- GAS (LCLo): Acute: 5,700 ug/kg for 8 hours (Human) - Chronic pulmonary edema, coma, and death.

Methanethiol (Methyl mercaptan):

- GAS (LC50): Acute: 675 ppm for 4 hours [Rat] - Hypermotility, diarrhea, and reduced respiration.
- GAS (LC50): Acute: 6,530 ug/m³ for 2 hours [Mouse].

Propylene.

- GAS (LC50): Chronic: 1,250 ppm for 6 hours/day for 14 weeks [Mouse].
- GAS (TCLo): Chronic: 5,000 ppm for 6 hours/day for 2 years [Rat] - Reduced olfactory sensory response.

Iso-Butane.

- GAS (TCLo): Acute: 1,040,000 mg/m³ for 2 hours [Mouse] - Excitement.
- GAS (LC50): Acute: 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress

Iso-Butene (Isobutylene or 2-Methylpropene):

- GAS (LC50) Acute: 415,000 mg/m³ for 2 hours [Mouse]
- GAS (LC50): Acute: 620,000 mg/m³ for 4 hours [Rat].

n-Butane

- GAS (LC50): Acute: 660,000 mg/m³ for 4 hours [Rat].
- GAS (LC50): Acute: 680,000 mg/m³ for 2 hours [Mouse]

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (LT 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (GT 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Methyl mercaptan acts as respiratory poison by inhibiting the respiratory control center in the brain and cellular respiration, but only at concentrations exceeding 50 ppm in air. At lower chronic exposures, it can cause pulmonary edema, hemolytic anemia, methemoglobinemia, and kidney and/or liver damage. It is also an eye irritant and has been shown to produce positive responses in various mutagenic assays.

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on liquefied petroleum gas, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline). **Propylene** has also been found to be a cardiac sensitizer in dogs. An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias.

In humans, at concentrations of 6.4% in air or higher, **propylene** causes mild intoxication, dermal sensations, and an inability to concentrate on tasks within two minutes. Gross inhalation of propylene concentrations of 40% or higher for a couple minutes cause reddening of the eyelids and face, tearing, coughing, and sometimes flexing of the legs, reduced blood pressure, and/or disordered heart rhythm. A concentration of 50% causes anesthesia in two minutes, followed by complete recovery without any physiological indications.

Propylene was tested by the National Cancer Institute (NCI) in a two-year, 6 hours/day, 5 days/week inhalation study using rats and mice with exposure concentrations at 5,000 and 10,000 ppm. The resulting data suggested that propylene induces signs of nasal cavity toxicity (epithelial hyperplasia/metaplasia) including increased incidence of neo-plastic lesions in rats, but not in mice. Propylene is NOT considered carcinogenic to either rats or mice; however, it may be partially metabolized to **propylene oxide** which has been shown to be mutagenic and produces site of contact tumors in rodents following long-term exposure.

Sour LPG With Methyl Mercaptan

Human volunteers had no apparent effects from exposure concentrations of 250 ppm, 500 ppm, and 1,000 ppm of **isobutane and n-butane** in air for periods of 8 hours daily for 10 days to 14 days, respectively. However, chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage. Laboratory animals have exhibited a higher degree of narcosis when exposed to combinations of isobutane, n-butane, and butenes (additive effect), than the degree of narcosis exhibited following exposure to each gas alone.

Inhalation of 500 ppm of **isopentane** has been reported NOT to produce any ill effects in humans. Rat 28-day feeding studies done on **isopentane** using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, the **propane, propylene, butenes, hydrogen sulfide, and methyl mercaptan** components of these streams may contribute to generation of atmospheric smog. The atmospheric half-lives of **propane, propylene, and butenes** under photochemical smog conditions are estimated to be between 5 to 8 hours, and, experimental data shows that significant photooxidation of propylene occurs rapidly within 14 to 21 hours. The atmospheric half-lives of the **butenes** under photochemical smog conditions are estimated to be between 5 and 7 days. **Isopentane** has an estimated half-life of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. Photooxidation of **propane, isobutane, and n-butane** in air (LT 8%) are not considered to be environmentally significant. **Hydrogen sulfide** residence times in the atmosphere range from about one day to more than 40 days, depending upon the season, latitude, and presence of other air pollutants. Reduced temperatures increase the residence time.

Environmental Fate

Refined liquefied petroleum hydrocarbon gases are essentially insoluble in water (LT 0.1%); however, **hydrogen sulfide and methyl mercaptan** are moderately soluble in water so this material and any contaminated soil or water may be hazardous to human, animal, and aquatic life.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitability (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste for additional reasons, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this liquefied gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

**Sour LPG
With Methyl Mercaptan**

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U.S. Department of Transportation regulated material.		
Proper Shipping Name	Liquefied gas, flammable, toxic, n.o.s Inhalation Hazard Zone B (Hydrogen sulfide, Methyl mercaptan)		
Hazard Class	Class 2.3. Poisonous gas.	Packing Group(s)	Not applicable
		UN/NA ID	UN1953
Reportable Quantity	The Reportable Quantity (RQ) substance components present in this material which might require DOT HAZMAT bill-of-lading display are Hydrogen sulfide and Methyl mercaptan		
Placards			Emergency Response Guide No. 119
		HAZMAT STCC No.	49 203 78
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	These streams and/or their components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. Chemical substances which might be present in these streams and are subject to this statute are: Hydrogen sulfide [CAS No. 7783-06-4] and Methanethiol (Methyl mercaptan) [CAS No. 74-93-1] .
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, Reactivity, and Acute (Immediate) & Chronic (Delayed) Health Hazards.
SARA 313	These streams contain the following components in concentrations which are at or above de minimis levels and are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313: Propylene or Propene [CAS No. 115-07-1] concentration: 1 to 15% Hydrogen sulfide [CAS No. 7783-06-4] concentration: 1 to 10%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances that are present in these streams which are subject to this statute are: Hydrogen sulfide [CAS No. 7783-06-4] (RQ = 100 lbs. [45.36 kg]) concentration: 1 to 10% Methanethiol (Methyl mercaptan) [CAS No. 74-93-1] (RQ = 100 lbs. [45.36 kg]) conc.: 0.1 to 1%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	These streams do not contain any chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, they are not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in these streams as "Volatile Organic Compounds (VOC)" that contribute significantly to air pollution which endangers public health and welfare": Propylene (Propene), 1-Butene, Isobutylene, and Isopentane.

**Sour LPG
With Methyl Mercaptan**

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Chemical substances which may be present in these streams that are subject to this statute are Hydrogen sulfide, Methyl mercaptan (Methanethiol), Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), various Butenes, n-Butane, and Isopentane (Butane, 2-methyl)

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Gas/Liquefied Gas/ Liquid Mixture.		
Color	Colorless liquid, invisible gas and vapor, white frost at release point.	Odor	Strong, foul smelling, rotten egg or skunk odor is unreliable as a warning of possible exposure

DANGER! Extremely flammable and poisonous gas/liquid;
vapor may cause flash fire or explosion.

High pressure and rapid diffusion hazard.

High vapor concentrations reduce oxygen available for breathing.

Contains Hydrogen Sulfide (H₂S) and Mercaptans.

May be harmful or fatal if inhaled or absorbed through the skin.

May cause central nervous system (CNS) depression
or suffocation.

Compressed gas/liquid contact may cause frostbite/freeze burns.

Mist or vapor may cause mild to severe eye, skin, mucous
membrane, and respiratory tract irritation and inflammation.

Aspiration into the lungs will cause pulmonary edema and
chemical pneumonia.

Overexposures may cause central nervous system (CNS)
depression and other target organ effects.

Prolonged and/or repeated inhalation may increase the heart's
susceptibility to arrhythmias (irregular beats).

Potential cancer hazard. May contain low levels of Benzene.

May cause leukemia and/or other blood disorders.

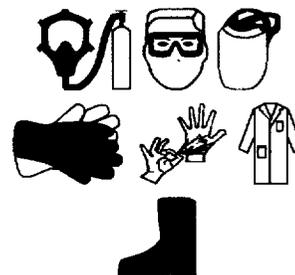

Mutagenic hazard; may cause genetic damage.

May adversely affect reproduction or reproductive development.

Spills may create a slipping hazard. Corrosive to some metals.

Protective Equipment

Minimum Recommended
See Section 8 for Details

SECTION 1: IDENTIFICATION

Trade Name	Refinery Gas (C1-C6), Sour with Mercaptans	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	1111110033	Medical Emergency	(918) 495-4700
CAS Number	Mixture (See Section 2.)	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Sour Hydrocarbon Gas Mixture		
Synonyms	Sour Refinery Gas, Mixture of Light Ends Fractionator (LEF) Gases; Gas Blend containing Hydrogen, Hydrogen Sulfide and Mercaptans, C1-C6 Hydrocarbons, H ₂ , H ₂ S, and R-SHs.		

Refinery Gas (C1-C6), Sour with Mercaptans

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Hydrogen sulfide	7783-06-4	0.1-10
2) Methyl mercaptan	74-93-1	0.01-0.1
3) Ethyl mercaptan	75-08-1	0-0.01
4) Hydrogen	1333-74-0	5-40
5) Methane	74-82-8	40-80
6) Ethane	74-84-0	10-50
7) Propane	74-98-6	1-40
8) Butanes	Mixture	1-50
9) Pentanes	Mixture	1-40
10) Cyclopentane	287-92-3	1-10
11) Hexane Isomers	Mixture	1-20
12) Methylcyclopentane	96-37-7	0-3
13) n-Hexane	110-54-3	0-15
14) Cyclohexane	110-82-7	0-3
15) Benzene	71-43-2	0-1

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation Eye contact Skin contact Skin absorption

Signs and Symptoms of Acute Exposure

Inhalation

May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. The National Institute for Occupational Safety and Health has determined that atmospheres containing 150 ppm or more of **methyl mercaptan** and 100 ppm or more of **hydrogen sulfide (H₂S)** are immediately dangerous to life and health (IDLH). For **ethyl mercaptan**, the NIOSH IDLH is 500 ppm. At concentrations above 500 ppm, H₂S causes unconsciousness and respiratory paralysis leading to coma and/or death. And, at concentrations above 700 ppm, **methyl mercaptan** may cause unconsciousness and respiratory paralysis leading to coma and/or death. (See Section 11)

Additionally, at least one component of this gas/liquid mixture is a "simple asphyxiant". High concentrations of this mixture can displace the amount of oxygen available to breathe below that level necessary to sustain life (hypoxia). Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, shortness of breath, nausea, vomiting, confusion, muscular weakness, loss of coordination, convulsions, unconsciousness, coma, and death, depending upon the concentration level and duration of exposure. Oxygen deprivation is possible if working in confined spaces.

Breathing high concentrations of the liquid-phase vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon the exposure duration. Approximately 20,000 ppm (or 2 vol %) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes.

Eye Contact

Vapors may cause mild to severe eye irritation and photophobia (light sensitivity) upon short-term exposure. Severity depends upon the concentration of **hydrogen sulfide and mercaptans** and duration of exposure. Direct contact with pressurized/liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn". Direct liquid contact can cause clouding of the cornea with small areas of superficial corneal necrosis.

Skin Contact

Direct contact with a liquefied/pressurized gas portion of this material may produce severe and possibly permanent skin damage from frostbite or freeze burns. Tests on this material's components suggest that moderate to severe skin irritation, inflammation, and blistering is expected to occur upon short-term liquid contact. Certain components of this material, including **hydrogen sulfide, methyl and ethyl mercaptans, n-hexane, cyclohexane, and benzene** may be absorbed through the skin, and produce toxic effects such as CNS depression (see "Inhalation" above). If the skin is damaged, absorption increases.

Refinery Gas (C1-C6), Sour with Mercaptans

Ingestion	<p>Ingestion of this material is highly unlikely due to its volatile nature. However, if swallowed this material may irritate the mucous membranes of the mouth, throat, and esophagus. The liquid-phase can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium. Additional central nervous system (CNS) effects may occur prior to the onset of convulsions, coma, and death.</p> <p>Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Cardiovascular effects include shallow rapid pulse and pallor followed by flushing. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may result in death.</p>
Chronic Health Effects Summary	<p>Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H₂S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures.</p> <p>Methyl and ethyl mercaptans, at low chronic exposures, may cause pulmonary edema, hemolytic anemia, methemoglobinemia, and kidney and/or liver damage. They have also been shown to produce positive responses in various mutagenic assays.</p> <p>Chronic inhalation to components of this material (propane, n-butane, and n-pentane) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline)-like drugs.</p> <p>Prolonged and/or repeated liquid or mist contact may cause moderate to severe skin irritation and inflammation. Symptoms include defatting, redness, dryness, blistering, lesions, and/or scaly dermatitis. Also, chronic inhalation of this material's vapors have been found to cause fatigue, nervousness, irritability, blurred vision, and labored breathing. Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been common results for gasoline and naphtha abusers.</p> <p>Even with acute exposures, n-hexane is toxic to the peripheral nerves, characterized by numbness, tingling, or pain in the extremities, progressively worsening of neuromuscular motor coordination (polyneuritis or polyneuropathy), and even partial paralysis. And, based upon animal studies, n-hexane's metabolite, 2,5-hexanedione, has been shown to cause degeneration of the testes.</p> <p>Benzene is considered to be a cancer causing agent. It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML). Benzene is also capable of causing changes in genetic material (chromosomes). Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy. Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents.</p> <p>Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. (See Section 11.)</p>
Conditions Aggravated by Exposure	<p>Personnel with eye, skin, cardiovascular, pulmonary, blood, liver, kidney, or neurological disorders, impaired hearing, high blood pressure, and chronic respiratory diseases or those with a compromised ability to use oxygen (asthmatics, anemics, etc.) should take additional precautions to minimize or avoid exposure.</p>
Target Organs	<p>These streams are toxic to eyes, skin, mucous membranes, lungs, central and sympathetic nervous systems, especially the auditory and peripheral nerves, brain, heart, liver, kidneys, thymus, and possibly, the endocrine and reproductive systems.</p>
Carcinogenic Potential	<p>This material contains benzene at concentrations above 0.1%. Benzene is considered to be a known human carcinogen by OSHA, IARC and NTP. (See Section 11.)</p>

Refinery Gas (C1-C6), Sour with Mercaptans

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910 1200).

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.

Eye Contact If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. If pain, redness, swelling, tearing, or light sensitivity persist, obtain medical attention as soon as possible.

Skin Contact The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.

Ingestion Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.

Notes to Physician Nitrite as an antidote for acute **hydrogen sulfide** intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients.

Inhalation overexposure can produce other toxic effects due to the **mercaptans**. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required. If seizures occur, administer a benzodiazepine intravenously (Diazepam or Lorazepam) at 4 to 10 mg for an adult or 0.1 to 0.5 mg for a child. Consider use of phenobarbital if seizures recur (30 mg for an adult or a child over 5 years old). For methemoglobinemia symptoms, administer 1 to 2 mg/kg methylene blue slowly intravenously. Additional doses may be required.

This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines such as epinephrine (adrenaline) and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.

If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

Refinery Gas (C1-C6), Sour with Mercaptans

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas, Liquefied Gas, and IA Liquid		
Flash Point Method	CLOSED CUP. AP -107° to -73°C (-160° to -100°F) (Estimated)		
Lower Flammable Limit	1.6 to 4.0%	Upper Flammable Limit	AP 45%
Autoignition Temperature	260° to 288°C (500° to 550°F)		
Hazardous Combustion Products	Carbon dioxide and monoxide, smoke, fumes, oxides of sulfur, and possibly, unburned hydrocarbons or mercaptans.		
Special Properties	This gas/liquid mixture is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.		
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Compressed Gas/Liquid Mixture! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area to an area far upwind. Establish a "regulated zone" with site control and security. Eliminate all ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. Cover spill with a vapor-suppressing foam as soon as possible. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible, in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

Refinery Gas (C1-C6), Sour with Mercaptans

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off.

SECTION 7: HANDLING AND STORAGE

Handling

Danger! Poisonous and Flammable Gas! Do NOT breathe vapor; it may contain **hydrogen sulfide (H₂S), mercaptans, and/or simple asphyxiants**. Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S concentrations, and flammability.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed petroleum gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue.

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC). The H₂S component of this material is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.)

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location. Where H₂S is routinely stored or handled, install monitoring equipment or system with alarms.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Refinery Gas (C1-C6), Sour with Mercaptans

Eye Protection	Use chemical-type goggles and face shield (ANSI Z87 1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.
Hand Protection	Avoid skin contact and use gloves (e.g. disposable neoprene, nitrile, vinyl, or PVC/NBR). When handling this material which can produce frostbite or cold burns, use leather gloves over these chemically-resistant gloves. Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.
Body Protection	Prevent potential skin contact with cold liquid, solid, or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.
Respiratory Protection	A full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g. ANSI Z88.2).
General Comments	Releases of this gas/liquid mixture may create flammable, explosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions, especially since the odor threshold of benzene is several ppm above the occupational exposure guideline levels. Air purifying respirators offer no protection against hydrogen sulfide, mercaptans, and simple asphyxiants .

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) TWA: 5 (ppm) from ACGIH (TLV) [Proposed]
2) Methyl mercaptan	TWA: 10 STEL: 15 CEIL: 20 (ppm) from OSHA (PEL) TWA: 0.5 (ppm) from ACGIH (TLV) TWA: 0.5 CEIL: 10 (ppm) from OSHA [Proposed] CEIL: 10 (ppm) from OSHA (PEL)
3) Ethyl mercaptan	TWA: 0.5 (ppm) from ACGIH (TLV) TWA: 0.5 CEIL: 10 (ppm) from OSHA (PEL) [Proposed]
4) Hydrogen	Simple asphyxiant
5) Methane	Simple asphyxiant
6) Ethane	Simple asphyxiant
7) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL) [Proposed]
8) Propane	TWA: 2500 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL) [Proposed]
9) Butanes	TWA: 800 (ppm) from ACGIH (TLV) TWA: 800 (ppm) from OSHA (PEL) [Proposed]
10) Pentane, all isomers	TWA: 600 (ppm) from ACGIH (TLV) TWA: 600 STEL: 750 (ppm) from OSHA (PEL) [Proposed] TWA: 1000 (ppm) from OSHA (PEL)
11) Cyclopentane	TWA: 600 (ppm) from ACGIH (TLV) TWA: 600 (ppm) from OSHA (PEL) [Proposed]
12) Hexane, other isomers	TWA: 500 STEL: 1000 (ppm) from ACGIH (TLV) TWA: 500 STEL: 1000 (ppm) from OSHA (PEL) [Proposed]
13) n-Hexane	TWA: 50 (ppm) from ACGIH (TLV) - SKIN TWA: 50 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
14) Cyclohexane	TWA: 100 (ppm) from ACGIH (TLV) TWA: 300 (ppm) from OSHA (PEL)
15) Benzene ("A1" and "Z-2" Carcinogen)	TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) - SKIN TWA: 1 STEL: 5 AL: 0.5 (ppm) from OSHA (PEL) - SKIN

Refinery Gas (C1-C6), Sour with Mercaptans

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Gas/Liquefied Gas/ Liquid Mixture.	Color	Colorless liquid; invisible gas and vapor, white frost at release point.	Odor	Strong, foul smelling; rotten egg or skunk odor is unreliable as a warning of possible exposure.
Specific Gravity	0.30 to 0.62 (Water = 1)	pH	In the presence of moisture, H ₂ S can convert to H ₂ SO ₄	Vapor Density	0.55 to 2.5 (Air = 1)
Boiling Point/Range	-253°C to 80°C (-423° to 176°F) [ASTM D-2887]			Melting/Freezing Point	-259° to -95°C (-435° to -140°F) at 14.7 psia.
Vapor Pressure	200 to 400 psia at 100°F			Viscosity (cSt @ 40°C)	Not applicable
Solubility in Water	Moderately soluble in cold water			Volatile Characteristics	This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard Hydrogen Sulfide and Mercaptans Content = 0.11 to 10.11 Wt %; Alkane, Isoparaffin, Alkene, and Cycloalkane Hydrocarbons Content = 99 to 100 Wt % [ASTM D-1319], C6 Aromatic Hydrocarbon Content = 0 to 1 Wt % [ASTM D-1319]; Average Density at 60°F = < 5.00 lbs /gallon [ASTM D-2161]				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, calcium hypochlorite, chlorates, permanganates, nitrates, hydrogen peroxide, mercury oxide, and oxygen. Mercaptans and oxidizer mixtures and alkane hydrocarbons and chlorine gas mixtures have produced explosions. Under some conditions, mercaptans may react with water or steam to produce additional toxic and flammable vapors. Methyl and ethyl mercaptans and n-heptane may attack some forms of plastics, coatings, and rubber.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	Methanethiol (Methyl mercaptan):
	GAS (LC ₁₀): Acute 4 ppm for 15 minutes [Human] - Nausea and headache.
	GAS (LC ₅₀): Acute 675 ppm for 4 hours [Rat] - Hypermotility, diarrhea, and reduced respiration
	GAS (LC ₅₀): Acute 6,530 ug/m ³ for 2 hours [Mouse]
	Ethanethiol (Ethyl mercaptan):
	GAS (LC ₅₀): Acute 2,770 ppm for 4 hours [Mouse] - Excitement, motor activity changes, and cyanosis.
	GAS (LC ₅₀): Acute 4,420 ppm for 4 hours [Rat] - Excitement, spastic paraparesis, and cyanosis.
	ORAL (LD ₅₀): Acute 682 mg/kg [Rat] - Muscle weakness, ataxia, and cyanosis.
	INTRAPERITONEAL (LD ₅₀): Acute 226 mg/kg [Rat] - Muscle weakness, ataxia, and cyanosis
	Hydrogen sulfide:
	GAS (TC ₁₀): Acute: 10 ppm for 15 minutes (Human) - Eye irritation
	GAS (TC ₁₀): Acute 50 to 100 ppm for 15 minutes (Human) - Respiratory irritation.
	GAS (LC ₁₀₀): Acute: 600 to 750 ppm for 30 minutes (Human) - Respiratory paralysis and death.
	GAS (LC ₁₀): Acute 5,700 ug/kg for 8 hours (Human) - Chronic pulmonary edema, coma, and death

Refinery Gas (C1-C6), Sour with Mercaptans

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (< 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (> 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Methyl and ethyl mercaptans act as respiratory poisons by inhibiting the respiratory control center in the brain and cellular respiration, but only at concentrations exceeding 50 ppm in air. At lower chronic exposures, they can cause pulmonary edema, hemolytic anemia, methemoglobinemia, and kidney and/or liver damage. They are also eye irritants and have been shown to produce positive responses in various mutagenic assays.

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol % in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred, however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline). An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. And, **n-pentane** caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure.

Human volunteers had no apparent effects from exposure concentrations of 250 ppm, 500 ppm, and 1,000 ppm of **isobutane and n-butane** in air for periods of 8 hours daily for 10 days to 14 days, respectively. However, chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane and butylenes** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone.

Inhalation of 500 ppm of **isopentane or n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects, however, higher exposure concentrations of 90,000 to 120,000 ppm (9-12 Wt % in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. Rat 28-day feeding studies done on both **isopentane and n-pentane** using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

Hexane isomers were not mutagenic in the Salmonella/microsome (Ames) assay and are NOT considered to be carcinogenic. **n-Hexane** is NOT a tumor promoter in mice and NOT considered to be carcinogenic, nor is it teratogenic in mice or rats. **n-Hexane**, or its metabolite **2,5-hexanedione**, has been shown to cause degeneration of the testes in rats, but, it did NOT produce spermatotoxicity in a multiple end-point test battery in rats given multiple doses for up to 5 days.

Cyclohexane can cause eye, skin and mucous membrane irritation, CNS depression, narcosis, and death at elevated concentrations. In experimental animals exposed to lethal concentrations by inhalation or oral routes, there was generalized vascular damage and severe degenerative changes in the heart, lungs, liver, kidneys and brain. Cyclohexane does not act as a promoter for tumors on mice when exposed to dimethylbenzanthracene. Further, it did not induce unscheduled DNA synthesis in cultured human lymphocytes. It is not mutagenic in the Salmonella/microsome (Ames) or the mouse lymphoma L5178Y assays, with or without metabolic activation, however, it did increase the number of chromosomal aberrations in bone marrow cells of rats exposed to between 100 and 300 ppm for 6 hours/day for 5 days. These chromosomal aberrations did not appear to be dose-related.

Refinery Gas (C1-C6), Sour with Mercaptans

Benzene has an IDLH (immediately dangerous to life or health) concentration of 500 ppm. Its estimated lethal dose for a normal human adult is one teaspoon to one ounce (AP 10 mL). Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes. Prolonged and repeated exposure to high concentrations of benzene is associated with injury to blood forming organs and anemia. Consumption of alcohol may increase the blood system changes related to benzene exposure. It is linked to the development of acute myelogenous leukemia (AML) in humans. NTP, IARC, and OSHA list benzene as carcinogenic to humans. Studies of workers exposed to high levels of benzene have identified humoral and cellular immunity impairment and a decrease in levels of circulating leukocytes. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice. Animal studies have shown testicular effects and alterations in reproductive cycles with some evidence of developmental effects. Studies with pregnant laboratory animals have demonstrated that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, the **hydrogen sulfide and the mercaptan** components of this material may contribute to generation of atmospheric smog. If released, the **volatile aromatic hydrocarbon component (benzene)** may also contribute to the creation of atmospheric smog. The atmospheric half-life of **propane** under photochemical smog conditions are estimated to be between 5 to 8 hours. The atmospheric half-lives of **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days. Photooxidation of **propane, isobutane, and n-butane** in air (< 8%) are not considered environmentally significant.

Hydrogen sulfide residence times in the atmosphere range from about one day to more than 40 days, depending upon the season, latitude, and presence of other air pollutants. Reduced temperatures increase the residence time. The **pentanes, n-hexane, and hexane isomers** all have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. Both **cyclopentane and cyclohexane** have a half-lives of from 6 hours to over 4 days when hydroxyl radicals are present.

Ecological effects testing has not been conducted on these streams. If spilled, the naphtha portion of these streams, their storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels. Also, toxic **hydrogen sulfide and the mercaptans** are moderately soluble in water.

Environmental Fate

The naphtha portion of this mixture is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHMTADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Refinery Gas (C1-C6), Sour with Mercaptans

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this gas/liquid to the atmosphere should be avoided. Maximize material recovery for reuse or recycling.

If spilled and the naphtha portion of this mixture is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase and vapor emissions from the process might prove to be a potential health hazard. The naphtha portion of this mixture is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U.S. Department of Transportation regulated material.		
Proper Shipping Name	Compressed gases, flammable, toxic, n.o.s. Inhalation Hazard Zone B (Hydrogen sulfide, Methane)		
Hazard Class	DOT Class: 2.3 (Poisonous gas) and 2.1 (Flammable gas).	Packing Group(s) UN/NA ID	Not applicable. UN1953
Reportable Quantity	The Reportable Quantity (RQ) substance components present in this material which might require DOT HAZMAT bill-of-lading display are Hydrogen sulfide and Methanethiol (Methyl mercaptan) and/or Benzene		
Placards			Emergency Response Guide No. 119 HAZMAT STCC No. 49 203 78 MARPOL III Status Not a DOT "Marine Pollutant" per 49 CFR 171.8

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. Chemical substances which are present in this material and subject to this statute are: Hydrogen sulfide [CAS No. = 7783-06-4] concentration: 0.1 to 10% Methanethiol (Methyl mercaptan) [CAS No. = 74-93-1] concentration: 0.01 to 0.1%.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, Reactive, & Acute (Immediate) & Chronic (Delayed) Health Hazards.

Refinery Gas (C1-C6), Sour with Mercaptans**SARA 313**

This material contains the following components in concentrations which might be at or above de minimis levels and are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313

Hydrogen sulfide [CAS No. = 7783-06-4] concentration: 0.1 to 10%
Methanethiol (Methyl mercaptan) [CAS No. = 74-93-1] concentration: 0.01 to 0.1%
n-Hexane [CAS No. 110-54-3] concentration: 0 to 15%
Cyclohexane [CAS No. 110-82-7] concentration: 0 to 3%
Benzene [CAS No. 71-43-2] concentration: 0 to 1%.

CERCLA

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances which might be present in this material that are subject to this statute are

Hydrogen sulfide [CAS No. = 7783-06-4] (RQ = 100 lbs. [45.36 kg]) concentration: 0.1 to 10%
Methanethiol (Methyl mercaptan) [CAS No. = 74-93-1] (RQ = 100 lbs. [45.36 kg]) conc.: 0.01 to 0.1%
n-Hexane [CAS No. 110-54-3] (RQ = 5,000 lbs. [2,270 kg]) concentration: 0 to 15%
Cyclohexane [CAS No. 110-82-7] (RQ = 1000 lbs. [453.6 kg]) concentration: 0 to 3%
Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 0 to 1%.

CWA

This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802

California Proposition 65

These streams contain the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5 **Benzene [CAS No. 71-43-2] and Toluene [CAS No. 108-88-3].**

New Jersey Right-to-Know Label

For New Jersey labeling, refer to the components listed in Section 2.

Additional Regulatory Remarks

Under Section 12(b) of the Toxic Substances Control Act. Because it might contain detectable amounts of **Cyclohexane (CAS No. 110-82-7)**, this material might be subject to US EPA's one-time only per country export notification requirements.

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in this material as a "Volatile Organic Compounds (VOC)" which contribute significantly to air pollution which endangers public health and welfare": **Isopentane [CAS No. 78-78-4], n-Pentane [CAS No. 109-66-0], Cyclohexane [CAS No. 110-82-7], and possibly Benzene [CAS No. 106-98-9].**

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances which may be present in this material which are subject to this statute include: **Hydrogen sulfide, Methyl mercaptan (Methanethiol), Ethyl mercaptan (Ethanethiol), Hydrogen, Methane, Ethane, Propane, Isobutane (Propane, 2-methyl), n-Butane, Isopentane (Butane, 2-methyl), 2,2-Dimethylpropane (Neopentane), and n-Pentane.**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Sulfur Plant Gas

HMIS	IMPORTANT: Read this MSDS before handling and disposing of this product and pass this information on to employees, customers, and users of this product. This product is covered by the OSHA Hazard Communication Standard and this document has been prepared in accord with the MSDS requirements of the rule.	Protective Equipment
Health Hazard *4		
Fire Hazard 4		
Reactivity 0		
* = Chronic Health Hazard		

SECTION 1: IDENTIFICATION

Trade Name	Sulfur Plant Gas	MSDS No.	RS0038
Product Number	1111111147	Revision Date	3/18/98
CAS Number	Mixture See section2		
Synonyms	Acid gas, sulfur plant incinerator gas, sulfur plant flare gas		
Generic Name	Sour refinery gases		
Chemical Family	Mixed inorganic gases and steam		
Manufacturer	LYONDELL-CITGO Refining Company Ltd. 12000 Lawndale Avenue P O Box 2451 Houston, Texas 77252-2451	Telephone Numbers	800/424-9300 CHEMTREC 800/313-7645 Company Hot Line 713/321-4215 MSDS Requests

SECTION 2: COMPOSITION

Component Name	CAS Number	Carcinogenic Listings	Concentration Wt%
NITROGEN	7727-37-9	Not applicable	AP 50 to 65
WATER	7732-18-5	Not applicable	AP 30 to 45
HYDROGEN	1333-74-0	Not applicable	AP 5 to 20
HYDROGEN SULFIDE	7783-06-4	Not applicable	AP 0.1 to 3
SULFUR DIOXIDE	7446-09-5	Not applicable	AP 0.01 to 3
CARBON DIOXIDE	124-38-9	Not applicable	AP 1

SECTION 3: HAZARDS IDENTIFICATION

EMERGENCY OVERVIEW

Signal Word	DANGER!	Color	Colorless
Physical State	Gas	Odor	Offensive rotten egg and/or irritating, suffocating odor
Physical and Health Hazards	Extremely flammable poisonous gas! Harmful or fatal if inhaled. May cause flash fire or explosion. Corrosive irritant to eye, skin and mucous membranes. Irritating to the respiratory tract and may cause respiratory paralysis. Contact with liquefied or compressed gas may cause frostbite or freeze burns. Sudden release of pressure may turn compressed gas cylinder into a projectile. Corrosive to some metals. Possible reproductive/developmental hazard.		
Environmental Hazards	Ecological effects testing has not been conducted on this material Spilled material and any soil or water which it has contacted may be hazardous to plants, animals, and/or aquatic life Releases are expected to cause only localized non-persistent environmental damage		

POTENTIAL HEALTH EFFECTS

Routes of Exposure Inhalation, eye and skin contact, and skin absorption

Signs and Symptoms of Acute Exposure

• Inhalation	<p>Poison, may be fatal if inhaled! A 20 ppm concentration of sulfur dioxide is objectionably irritating. High concentrations may cause severe airway obstruction, pulmonary edema (an accumulation of fluid in the lungs) and death. 500 ppm of sulfur dioxide is so objectionable that a person cannot inhale a single deep breath. The effects of pulmonary edema include coughing and shortness of breath which can be delayed until hours or days after the exposure. These symptoms are aggravated by physical exertion. As a result of severe exposures, permanent lung damage may occur.</p> <p>Concentrations of hydrogen sulfide at or below 250 ppm may cause respiratory tract irritation and pulmonary edema. Exposure to H₂S concentrations between 250 ppm and 500 ppm may result in headache, nausea, irregular heartbeat, and coma. Concentrations of hydrogen sulfide greater than 500 ppm may cause sudden collapse, respiratory paralysis, convulsions and death.</p> <p>Breathing concentrations of CO₂ greater than 2% can effect respiratory function and cause excitation followed by central nervous system depression. Symptoms include increased pulse rate, headache, dizziness, restlessness, disorientation and visual distortion. Exposure may affect the heart and eyes.</p>
• Eye Contact	Corrosive, high concentrations of sulfur dioxide may cause corneal burns. Extremely irritating. May cause sensitivity to light. Direct contact with liquefied/pressurized gas may produce severe and possibly permanent damage from freeze burns (frostbite).
• Skin Contact	Sulfur dioxide will react with moisture on the skin and cause corrosive irritation. Direct contact with a liquefied/pressurized gas may produce severe and possibly permanent damage from freeze burns.
• Ingestion	Ingestion is not an applicable route of exposure for gases.
Chronic Health Effects Summary	<p>Repeated exposure to low levels of SO₂ (below 5 ppm) can cause permanent pulmonary impairment. Possible effects of chronic exposure to low levels of hydrogen sulfide are eye irritation, bronchitis, irregular heartbeat, and nerve damage.</p> <p>Chronic exposure to carbon dioxide may cause an acid-base imbalance in the blood, impaired attentiveness, a fall in blood pressure, and an impaired response of the circulatory system to exercise.</p>
Conditions Aggravated by Exposure	Personnel with eye, skin, respiratory, neurological, or cardiovascular disorders should take additional precautions to minimize or avoid exposure.
Target Organs	Eyes, skin, mucous membranes, respiratory system, central nervous system, and heart.
Carcinogenic Potential	Please refer to Sections 2 and/or 11 for the identification of components, if any, which have been identified as having carcinogenic potential in animals and/or humans.

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to the Emergency Overview in Section 3 and Exposure Controls in Section 8 of this MSDS.

Inhalation	Move the exposed person to fresh air at once. If breathing has stopped, initiate artificial respiration, if the heart has stopped, administer cardiopulmonary resuscitation (CPR). When breathing is difficult, properly trained personnel may administer 100% oxygen. Keep the affected person warm and at rest. Get medical attention as soon as possible.
Eye Contact	Check for and remove contact lenses. If eye tissue is frozen, seek medical attention immediately. If tissue is not frozen, immediately and thoroughly flush the eyes with large amounts of clean low-pressure water for at least 15 minutes, occasionally lifting the upper and lower eyelids. If irritation, pain, swelling, tearing or light sensitivity persists, obtain medical attention as soon as possible.
Skin Contact	If frostbite has occurred, seek medical attention immediately. Do not rub the affected areas or flush them with water. In order to prevent further damage, do not attempt to remove frozen clothing from frostbitten areas. If frostbite has not occurred, immediately and thoroughly flush contaminated skin with lukewarm, gently running water for at least 5 minutes. If irritation persists, obtain medical attention.
Ingestion	Ingestion is not a route of exposure.
Notes to Physician	Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal.

SECTION 5: FIRE FIGHTING MEASURES**FLAMMABLE PROPERTIES**

Flammability Classification	Extremely flammable gas ¹
Flash Point/Method	AP -305°F (-187°C)/estimated, based on hydrogen
Flammable Limits %	LEL: AP 4 UEL: AP 75 based on NFPA "hydrogen"
Auto-Ignition Temperature	AP 500 °F (260°C)/bases on NFPA "hydrogen sulfide".
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, or other harmful, toxic gases including oxides and/or other compounds of sulfur
Special Properties	Extremely flammable gas, exposed to an ignition source it will burn in the open or explode in a confined space Being heavier than air, its flammable vapors may travel long distances along the ground before reaching a source of ignition and flashing back Vapors may collect in low or confined areas Containers may explode when heated

EXTINGUISHING MEDIA

DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS LEAK CAN BE STOPPED!
Cool tanks and containers with water fog or spray in order to prevent pressure build-up, autoignition or explosion Use water, dry chemical, carbon dioxide, or inert gas to extinguish adjacent burning materials

FIRE FIGHTING

Protective Equipment/Clothing Wear a NIOSH-approved positive pressure self-contained breathing apparatus and full-protective equipment No skin area should be exposed

Instructions: STOP GAS FLOW! Evacuate area and fight from a maximum distance or use unmanned hose holders or monitor nozzles Use water spray to reduce vapors or divert vapor cloud drift Containers can build up pressure if exposed to heat, cool with flooding quantities of water until well after the fire is out Do not direct water at source of leak or pressure relief devices, icing may occur Withdraw immediately in case of rising sound from venting safety devices or discoloration of vessel ALWAYS stay away from the ends of "bullet" tanks

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up For more specific information, refer to the Emergency Overview in Section 3 and Exposure Controls in Section 8 of this MSDS

Fully encapsulating, vapor protective clothing should be worn for spills and leaks with no fire Do not touch or walk through spilled material Stop leak if it can be done without risk If possible, turn leaking containers so that gas escapes rather than liquid Prevent entry into waterways, sewers, basements or confined areas Do not direct water at spill or source of leak Use water spray to reduce vapors or divert vapor cloud drift Isolate area until gas has dispersed

Use water spray curtain to divert vapor drift Prevent entry into sewers, basements or confined areas Warn personnel to move away Stop leak if without risk

SECTION 7: HANDLING and STORAGE**Handling**

Keep away from heat, sparks, flame and other sources of ignition Use only in a closed system constructed from resistant materials Keep containers tightly closed Use spark-proof tools and explosion proof equipment Do not enter storage area unless adequately ventilated

Do not breathe this gas, hydrogen sulfide's rotten egg-like odor is not reliable as a warning of possible exposure¹ A continuous monitoring system with alarms is recommended for work area where hydrogen sulfide is routinely present Emergency self-contained breathing apparatus should be readily available Avoid contact with eyes, skin, and clothing Emergency eye wash stations should be available nearby Wash thoroughly after handling

Hydrogen sulfide and sulfur dioxide can be very corrosive in the presence of moisture

Storage

Flammable gas should be stored in a separate safety storage cabinet or room. Keep away from heat, sparks, and all other ignition sources, segregate from incompatible materials. Keep containers tightly closed, plainly labeled, out of closed vehicles, and in a cool, well-ventilated place. A well-ventilated, refrigerated room is preferable for materials with flash points lower than 70°F (AP 21°C). Containers should be able to withstand pressures expected from warming or cooling in storage. Do not puncture or incinerate containers. Do NOT contact with oxidizable materials.

Cylinders must be stored upright and firmly secured, avoid placing them in high-traffic areas. Valve caps should remain on all cylinders not in use. Ground all containers and transfer vessels. Storage and handling facilities should meet the applicable requirements of the National Electrical Code and National Fire Protection Association standards.

SECTION 8: EXPOSURE CONTROLS and PERSONAL PROTECTION**ENGINEERING CONTROLS**

Engineering controls are normally required when handling this material. Use closed systems or other other controls to maintain airborne levels below recommended exposure limits. For ventilation systems, use a corrosion-resistant ventilation system separate from other exhaust ventilation systems. Treatment of exhaust gases to prevent environmental contamination may be required. Supply sufficient replacement air to make up for air removed by exhaust systems. Emergency safety showers and eye wash stations should be readily accessible.

PERSONAL PROTECTIVE EQUIPMENT• *Protective Equipment*• *Eye Protection*

Use a respirator with a full facepiece

• *Skin Protection*- *Hands*

Avoid skin contact. Use chemically resistant gloves suited for acids.

- *Body*

Avoid skin contact, wear chemical resistant protective clothing. This might include apron, slicker suit, boots, and additional facial protection.

• *Respiratory Protection*

A full-face supplied air respirator with escape bottle or a positive-pressure pressure-demand self-contained breathing apparatus (SCBA) is required.

• *General Comments*

IDLH for SO₂ = 100 ppm, IDLH for H₂S = 100 ppm

EXPOSURE GUIDELINES

Substance	Source	Date	Type	Value	Time
HYDROGEN	ACGIH	1997		"Simple	NA
NITROGEN	ACGIH	1997		Asphyxiant"	NA
HYDROGEN SULFIDE	OSHA	1989	PEL	10 ppm	8 hours
HYDROGEN SULFIDE	OSHA	1989	STEL	15 ppm	15 minutes
HYDROGEN SULFIDE	ACGIH	1997	TLV	10 ppm	8 hours
HYDROGEN SULFIDE	ACGIH	1997	STEL	15 ppm	15 minutes
SULFUR DIOXIDE	OSHA	1989	PEL	2 ppm	8 hours
SULFUR DIOXIDE	OSHA	1989	STEL	5 ppm	15 minutes
SULFUR DIOXIDE	ACGIH	1997	TLV	2 ppm	8 hours
SULFUR DIOXIDE	ACGIH	1997	STEL	5 ppm	15 minutes
CARBON DIOXIDE	OSHA	1989	PEL	10,000 ppm	8 hours
CARBON DIOXIDE	OSHA	1989	STEL	30,000 ppm	15 minutes
CARBON DIOXIDE	ACGIH	1997	STEL	30,000 ppm	15 minutes
CARBON DIOXIDE	ACGIH	1997	TLV	5,000 ppm	8 hours

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Gas		
Color	Colorless		
Odor	Offensive rotten egg and/or irritating, suffocating odor		
pH	Acidic		
Vapor Pressure	AP 15 to 35 psia at 70 °F	Viscosity	Not applicable
Vapor Specific Gravity	AP 1.3 (air = 1)	Melting/Freezing Pt.	AP -346 to -121°F (-210 to -85°C)
Volatile Characteristics	Appreciable	Solubility in Water	Appreciable
Boiling Point/Range	AP -321 to -76°F (-196 to -60°C)	Specific Gravity	AP 0.45
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard		

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable		
Conditions to Avoid	Heat, flame, or strong oxidizing or reducing agents SO ₂ will react with water or steam to produce toxic and corrosive vapors		
Incompatibility with Other Materials	Strong oxidizing and/or reducing agents and metal catalysts Corrosive to steel		
Hazardous Decomposition Products	Burning or excessive heating may produce oxides of carbon and sulfur, smoke, and possibly other harmful gases		
Hazardous Polymerization	Will not occur		

SECTION 11: TOXICOLOGICAL INFORMATION**HYDROGEN SULFIDE (H₂S):**

TE _{Lo}	Acute	AP 1 ppm (Human) - Odor Response Threshold
TC _{Lo}	Acute	AP 10 ppm (Human) (15 minutes) - Eye irritation
TC _{Lo}	Acute	50 to 100 ppm (Human) (15 minutes) - Respiratory irritation
LC _{Lo}	Acute	600 ppm (Human) (30 minutes) - Unconsciousness, respiratory paralysis, and death
LC ₁₀₀	Acute	600 to 750 ppm (Human) (15 minutes) - Unconsciousness, respiratory paralysis, and death
LC _{Lo}	Acute	5,700 ug/kg (Human) - Chronic pulmonary edema, coma, and death
LC _{Lo}	Acute	800 ppm (Rat) (5 minutes)
LC ₅₀	Acute	635 ppm (Mouse) (1 hour)
LC ₅₀	Acute	445 ppm (Rat) (4 hours) - Hypermotility, diarrhea, and increased urine volume

Subchronic

5 weeks Rats 100 ppm for 8 hours/day - pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase

Teratogenesis 20 ppm for 24 hours on days 6 through 22 of pregnancy (rat) - developmental physical effects

SULFUR DIOXIDE

LC ₅₀ Rat	2520 ppm/1 hour
LC ₅₀ Mouse	3000 ppm/30 minutes

IARC Group 3 - Not Classifiable
ACGIH A4 - Not classifiable as a human carcinogen

EYE IRRITATION Temporary clouding of the eyes was seen in rabbits, guinea pigs and mice exposed for 4 hours to 400 ppm Very severe eye injury was produced in rabbits exposed to pure sulfur dioxide for 5 seconds

Experimental data has been reported showing reproductive and mutagenic effects

CARBON DIOXIDE (CO₂)

LC_{Lo} Acute 90,000 ppm (Human) (5 minutes)

LC_{Lo} Acute 90,000 ppm (Guinea Pig) (5 minutes)

30-Day GAS Subchronic 10,000 ppm for 24 hours/day (Rat) - Blood changes

30-Day GAS Subchronic 27,000 ppm for 24 hours/day (Rabbit)- Somnolence

42-Day GAS Subchronic 15,000 ppm for 24 hours/day (Human males) -
Headaches, deepened respiration, breathing difficulty upon exertion, metabolic acidosis, and increased
Calcium deposits in soft tissues

GAS TERATOGENESIS Sub-chronic 60,000 ppm for 24 hours on day 10 of
pregnancy (Rat) - Developmental abnormalities of the respiratory, cardiovascular, and musculoskeletal
systems and reduced newborn growth statistics

GAS TERATOGENESIS Sub-chronic 20,000 ppm for 8 hours on day 10 of
pregnancy (Mouse) - Developmental abnormalities of the musculoskeletal system and post-implantation
mortality

GAS TERATOGENESIS Sub-chronic 13,000 ppm for 4 hours on days 9 thru 12
of pregnancy (Rabbit females) - Developmental abnormalities of the musculoskeletal system

GAS TERATOGENESIS Sub-chronic 550,000 ppm for 2 hours on day 3 prior to mating (Mouse males) -
Spermatogenesis

GAS TERATOGENESIS Sub-chronic 550,000 ppm for 4 hours on day 6 prior to mating (Mouse males) -
Reduced male fertility index

Carbon Dioxide can affect male fertility and produce birth defects in laboratory animals Even though no
human reproductive data is available concerning Hydrogen Sulfide, Ammonia, or Carbon Dioxide, this gas
mixture can be expected to be a possible threat to the well-being of the unborn if a pregnant woman is
exposed to a high enough dose to render her unconscious

SECTION 12: ECOLOGICAL INFORMATION

Ecological effects testing has not been conducted on this product Releases have the potential to cause
significant adverse effects until dissipated

Hydrogen sulfide is toxic to both plants and animals and is harmful to aquatic life in very low concentrations If
it is spilled onto the soil, it will be rapidly released to the atmosphere However, it is soluble in water and the
presence of precipitation or ground water at the time of the spill will influence its environmental fate
Residence times in the atmosphere range from one day to more than 40 days, depending upon season, and
atmospheric conditions

Sulfur dioxide is oxidized in the environment to sulfuric acid which is a major component of acid rain Acid rain
has been associated with accelerated leaching of heavy metals from plumbing systems and generally fixed
sites such as insoluble deposits and ores, and with bioaccumulation of heavy metals especially mercury, in
fish Acidified water may cause transformation of mercury to a more toxic form (methylmercury) and can also
be corrosive to tissue

Sulfur dioxide is harmful to aquatic life in very low concentrations Notify local wildlife authorities of water spills
Sulfur dioxide inhibited higher plant photosystem II (PSII) activity via the action of sulfate on binding of chloride
and two extrinsic proteins

SECTION 13: DISPOSAL CONSIDERATIONS

Disposal should be conducted through a facility equipped with and operating an air emission control device in
accordance with the requirements of applicable Clean Air Act regulations

SECTION 14: TRANSPORT INFORMATION

DOT Status A U S Department of Transportation regulated material
Proper Shipping Name Compressed gas, toxic, flammable, corrosive, n o s (hydrogen sulfide, sulfur dioxide)
Inhalation Hazard Zone B
Hazard Class 2 3
UN/NA ID UN3304 **Packing Group(s)** Not applicable.
Reportable Quantity RQ (hydrogen sulfide, sulfur dioxide)

Emergency Response Guide Number 123
HAZMAT STCC Number 49 201 65
MARPOL III Status Not a "Marine Pollutant"

SECTION 15: REGULATORY INFORMATION

TSCA All components of this product are listed on the Toxic Substance Control Act (TSCA) inventory

SARA 302/304 The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires emergency planning and notification based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. **Chemical substances present in this product subject to this statute are: HYDROGEN SULFIDE and SULFUR DIOXIDE.**

SARA 311/312 The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2 **This material would be classified under the following hazard categories: Immediate (acute) and Delayed (chronic) Health Hazards, Fire Hazard, and Sudden Release of Pressure.**

SARA 313 The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires submission of an annual Toxic Chemical Release Inventory Report (Form R) by facilities which receive, import, make, process, or otherwise use "Toxic Chemicals" above specified threshold quantities. These facilities must also notify their customers if a product contains "Toxic Chemicals" regulated under 40 CFR 372.65. This information must also be included in all MSDS's that are copied and distributed for the product. **Chemical substances present in this product subject to this statute are: HYDROGEN SULFIDE.**

CERCLA The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of hazardous substances equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. **Chemical substances present in this product subject to this statute are:**
HYDROGEN SULFIDE RQ: 100 Pound(s) (45 Kg)
SULFUR DIOXIDE RQ: 500 Pound(s) (227 Kg)

California Proposition 65 The California Safe Drinking Water and Toxic Enforcement Act of 1986 (Proposition 65) requires warning be given for ingredients known to the State of California to cause cancer, birth defects, or other reproductive toxicity. **This product contains no known chemical substances subject to this statute.**

Additional Regulatory Remarks The Clean Air Act Section 112(r) (40 CFR 68.130) requires development, implementation, and submission of risk management plans for facilities that manufacture, process, use, store or otherwise handle regulated substances in quantities that exceed listed thresholds. **Substances present in this product which are subject to this statute are: HYDROGEN and HYDROGEN SULFIDE.**

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquefied Gas
Color Colorless liquid; invisible
Odor Faint, unpleasant
gas and vapor, white
frost at release point.

DANGER! High pressure and rapid diffusion hazard!
Extremely flammable gas/liquid; vapor may cause flash fire
or explosion!

High vapor concentrations reduce oxygen available for breathing!
May cause central nervous system (CNS) depression
or suffocation!

Liquid or compressed gas contact may cause frostbite
or freeze burns!

Vapor or mist may irritate mucous membranes and
respiratory tract!

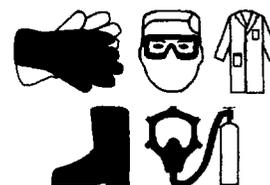

Liquid contact may cause mild to moderate eye and/or
skin irritation!

May be harmful or fatal if inhaled or absorbed through the skin!
Overexposures may cause target organ effects such as lung,
brain, liver, and/or kidney damage!

Prolonged and/or repeated inhalation may increase the heart's
susceptibility to arrhythmias (irregular beats)!

Protective Equipment

Minimum Recommended
See Section 8 for Details

SECTION 1: IDENTIFICATION

Trade Name	Light Overhead Liquids	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	068512914*	Medical Emergency	(918) 495-4700
CAS Number	68512-91-4 or 68476-85-7	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Liquefied Petroleum Gas (LPG or LP-Gas)		
Synonyms	C3-C5 Alkane and Alkene Hydrocarbons Mixture; C3-C5 Hydrocarbons.		

Light Overhead Liquids

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) C3-C5 Hydrocarbons	68783-64-2	100
2) Liquefied Petroleum Gases	68476-85-7	100
3) Propane	74-98-6	10-20
4) Propylene	115-07-1	1-5
5) Isobutane	75-28-5	25-35
6) Butenes or Butylenes	25167-67-3	1-10
7) n-Butane	106-97-8	30-50
8) Iso-Pentane	78-78-4	1-10
9) Pentenes or Pentylenes	68527-11-7	0.5-1.5
10) n-Pentane	109-66-0	1-5

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Skin contact. Eye contact.

Signs and Symptoms of Acute Exposure

Inhalation	At least one component of this gas/liquid mixture is a "simple asphyxiant" (see Section 8) High concentrations of this mixture can displace the amount of oxygen in air available to breathe below that necessary to sustain life (hypoxia), especially if working in confined spaces Breathing vapors may also cause central nervous system (CNS) depression Symptoms may include headache, dizziness, slurred speech, excitation or giddiness, nausea, vomiting, visual disturbances, memory loss, confusion, vertigo, drowsiness, fatigue, rapid or difficult breathing, muscular weakness, loss of consciousness, convulsions, coma, and even death, depending upon the concentration and duration of exposure
Eye Contact	Direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn." Prolonged or repeated vapor exposure may cause irritation. This is based upon animal test results for this product's heavier components
Skin Contact	Direct contact with a liquefied/pressurized gas may produce severe and possibly permanent skin damage from frostbite or freeze burns The liquid form may cause mild to moderate skin irritation and inflammation
Ingestion	Due to its volatile nature, ingestion is not normally an applicable route of exposure for this liquefied gas mixture. However, if swallowed, this material may "freeze burn" the mucous membranes of the mouth, throat, and esophagus or be aspirated into the lungs. Aspiration can result in severe lung damage or death. Cardiovascular effects include shallow rapid pulse and pallor followed by flushing Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may result in death.
Chronic Health Effects Summary	Chronic inhalation to components of this liquefied gas (propane, n-butane, and n-pentane) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline)-like drugs .
Conditions Aggravated by Exposure	Personnel with pre-existing chronic respiratory diseases, central nervous system (CNS) disease, high blood pressure, cardiovascular conditions, or skin disorders should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this liquefied gas mixture. They should take additional precautions to minimize or avoid exposure.
Target Organs	This substance is toxic to eyes, skin, mucous membranes, lungs, central nervous system, brain, heart, and possibly, the liver and/or kidneys.
Carcinogenic Potential	This material does not contain any components at concentrations at or above 0.1% which are considered to be carcinogenic by OSHA, IARC, or NTP.

Light Overhead Liquids

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200)

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	If cough or difficulty in breathing develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. Monitor arterial blood gases and chest x-ray in cases with significant exposure. If contact with pressurized or liquefied gas causes frostbite of the eyes, early ophthalmologic consultation is recommended. This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines and other sympathomimetic drugs such as epinephrine (adrenaline) should be reserved for emergency situations and then used only with special precaution.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas.		
Flash Point Method	CLOSED CUP: < -60°C (-76°F) [Estimated]		
Lower Flammable Limit	AP 1.5%	Upper Flammable Limit	AP 9.5%
Autoignition Temperature	AP 288°C (550°F)		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, and unburned hydrocarbon vapors.		
Special Properties	This liquefied gas is extremely flammable at well below ambient temperatures and readily forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. Some components are lighter than air and rise rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, this material will burn in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources!		

Light Overhead Liquids

- Extinguishing Media** DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.
- Protection of Fire Fighters** Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a hissing sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquefied Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safely stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This liquefied gas or waste mixtures containing this material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling This liquefied gas mixture contains a "simple asphyxiant". Odor is not an adequate warning of potentially hazardous air concentrations. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring for oxygen deficiency and flammability.

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of mixed gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Drain and purge equipment as necessary to remove material residues. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Do not allow vaporizing material to contact eyes, skin or other tissues. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated.

Light Overhead Liquids

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources. Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N F P A 's National Electrical Code (NEC).

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling liquefied gases. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with cold liquid, solid, or vapors.

Body Protection

Prevent potential skin contact with cold liquid or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

Odor is not an adequate warning for potentially hazardous air concentrations! Use a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. Air purifying respirators offer no protection against oxygen deficient atmospheres. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).

General Comments

For an explanation about some of the occupational exposure limits shown below, refer to the definition of "Simple Asphyxiant" presented in the American Conference of Governmental Industrial Hygienists (ACGIH) most current Threshold Limit Values (TLVs) for Chemical Substances and Physical Agents handbook. Releases of this liquefied gas mixture may create flammable, explosive, and/or oxygen-deficient atmospheres (LT 19.5 Vol.% in air). DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance

Applicable Workplace Exposure Levels

Light Overhead Liquids

1) Propylene	Simple asphyxiant
2) Propane	TWA 2500 (ppm) from ACGIH (TLV) TWA 1000 (ppm) from OSHA (PEL) [Proposed]
3) Butanes	TWA 800 (ppm) from ACGIH (TLV) TWA 800 (ppm) from OSHA (PEL) [Proposed]
4) Pentane, all isomers	TWA 600 (ppm) from ACGIH (TLV) TWA 1000 (ppm) from OSHA (PEL)
5) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) TWA 1000 (ppm) from OSHA (PEL) [Proposed]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquefied Gas	Color	Colorless liquid; invisible gas and vapor; white frost at release point	Odor	Faint, unpleasant.
Specific Gravity	0.55 to 0.59 (Water = 1)	pH	Not applicable	Vapor Density	2.0 to 2.5 (Air = 1)
Boiling Point/Range	-42° to 36°C (-44° to 97°F) at 14.7 psia [ASTM D-2887]			Melting/Freezing Point	-188° to -130°C (-305° to -202°F) at 14.7 psia
Vapor Pressure	15 to 190 psia at 40°C (104°F)			Viscosity (cSt @ 40°C)	Not applicable.
Solubility in Water	Slightly soluble in cold water			Volatile Characteristics	This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Gross Heat of Combustion at 60°F = 20,900 to 21,500 Btu/lb or 2,300 to 3,700 Btu/cu ft.; Dry Point Temperature = AP 82°F (28°C) [ASTM D-86]; Average Density at 60°F = ~ 5.0 lbs./gallon [ASTM D-2161].				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	<p>Propylene: GAS (LC₅₀): Chronic: 1,250 ppm for 6 hours/day for 14 weeks [Mouse]. GAS (TC_{Lo}): Chronic: 5,000 ppm for 6 hours/day for 2 years [Rat] - Reduced olfactory sensory response.</p> <p>iso-Butane: GAS (TC_{Lo}): Acute: 1,040 gm/m³ for 2 hours [Mouse] - Excitement. GAS (LC₅₀): Acute: 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress.</p> <p>iso-Butene (Isobutylene or 2-Methylpropene): GAS (LC₅₀): Acute: 415 gm/m³ for 2 hours [Mouse]. GAS (LC₅₀): Acute: 620 gm/m³ for 4 hours [Rat].</p> <p>n-Butane: GAS (LC₅₀): Acute: 658,000 mg/m³ for 4 hours [Rat]. GAS (LC₅₀): Acute: 680,000 mg/m³ for 2 hours [Mouse].</p> <p>n-Pentane: GAS (LC₅₀): Acute: 364,000 mg/m³ for 4 hours [Rat] - Excitement.</p>
----------------------	---

Light Overhead Liquids

INTRAVENOUS (LD₅₀) Acute 446 mg/kg [Mouse]

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on liquefied petroleum gas, no deaths occurred, however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline)

in humans, at concentrations of 6.4% in air or higher, **propylene** causes mild intoxication, dermal sensations, and an inability to concentrate on tasks within two minutes. Gross inhalation of propylene concentrations of 40% or higher for a couple minutes cause reddening of the eyelids and face, tearing, coughing, and sometimes flexing of the legs, reduced blood pressure, and/or disordered heart rhythm. A concentration of 50% causes anesthesia in two minutes, followed by complete recovery without any physiological indications.

Chronic low-level exposures to **propylene** may entail a possible hazard from the formation of a reactive metabolite, **propylene oxide**, which is a "suspect human carcinogen". However, propylene have not been shown to be carcinogenic in rat studies. For example, propylene was tested by the National Cancer Institute (NCI) in a two-year, 6 hours/day, 5 days/week inhalation study using rats and mice with exposure concentrations at 5,000 and 10,000 ppm. The resulting data suggested that propylene induces signs of nasal cavity toxicity (epithelial hyperplasia/metaplasia) including increased incidence of neo-plastic lesions in rats, but not in mice. **Propylene** is NOT considered carcinogenic to either rats or mice even though it may be partially metabolized to **propylene oxide** which has been shown to be mutagenic and produces site of contact tumors in rodents following long-term administration. Propylene has also been found to be a cardiac sensitizer in dogs.

Human volunteers had no apparent effects from exposures of 250 ppm, 500 ppm, and 1,000 ppm concentrations in air of **isobutane** and **n-butane** for periods of 8 hours daily for 10 days to 14 days, respectively. An **n-Butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane** and **butenes** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone. Chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage.

Inhalation of 500 ppm of **isopentane** or **n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects, however, higher exposure concentrations of 90,000 to 120,000 ppm (9 to 12 Wt % in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. **n-Pentane** caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure. Rat 28-day feeding studies on both isopentane and n-pentane using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, the ethylene, propylene, and butene components of this material will readily vaporize and may contribute to generation of atmospheric smog.

Environmental Fate

The atmospheric half-lives of **propane**, **propylene**, and **butenes** under photochemical smog conditions are estimated to be between 5 to 8 hours. Experimental data shows that significant photooxidation of **propylene** and **butenes** occurs rapidly within 7 to 21 hours. The atmospheric half-lives of the **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days. The **pentanes** have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. Photooxidation of **propane**, **isobutane**, and **n-butane** in air (< 8%) are not considered to be environmentally significant.

Refined liquefied petroleum hydrocarbon gases are essentially insoluble in water (< 0.1%); and therefore, this material will not cause harm to aquatic life.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

Light Overhead Liquids

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

This material may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). In addition, conditions of use may cause this material to become a hazardous waste for additional reasons, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this liquefied gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Petroleum gases, liquefied		
Hazard Class	DOT Class. 2.1 (Flammable gas).	Packing Group(s)	Not applicable.
		UN/NA ID	UN1075
Reportable Quantity	There are Reportable Quantity (RQ) substance components present in this material which require DOT HAZMAT bill-of-lading display		
Placards		Emergency Response Guide No.	115
		HAZMAT STCC No.	49 057 29
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. There are no chemical substances present in this material subject to this statute.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, and Acute (Immediate) & Chronic (Delayed) Health Hazards.
SARA 313	This material contains the following component in concentrations which are at or above de minimis levels and it is listed as a "toxic chemical" in 40 CFR Part 372 pursuant to the requirements of Section 313: Propylene or Propene [CAS No. 115-07-1] concentration: 1 to 5%.

Light Overhead Liquids

CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "Hazardous Substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. This material does not contain any chemical substances subject to this statute. However, it is recommended that you contact state and local authorities to determine if there are any other reporting requirements in the event of a spill.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material does not contain any chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it may be not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling, refer to the components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in this material as a "Volatile Organic Compounds (VOC)" which contribute significantly to air pollution which endangers public health and welfare": Propylene (Propene), 1-Butene, Isobutylene, 1-Pentane, and n-Pentane. In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this material which are subject to this statute are: Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), Butane, various Butenes, Isopentane (Butane, 2-methyl), various Pentenes, and n-Pentane.

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

MSDS No. RS0042
Revision Date 12/23/1998

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Liquefied Gas		
Color	Colorless liquid, invisible vapor.	Odor	Strong, foul smelling; rotten egg odor is unreliable as a warning of possible exposure

DANGER! Extremely flammable and poisonous gas/liquid; vapor may cause flash fire or explosion!
High pressure and rapid diffusion hazard!
Contains hydrogen sulfide (H₂S)!
May be harmful or fatal if inhaled or ingested! High concentrations of vapor reduce oxygen available for breathing and may cause central nervous system (CNS) depression or suffocation!
Mist or vapor may cause eye, skin, mucous membrane, and respiratory tract irritation and inflammation!
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
Liquid or compressed gas contact may cause frostbite or freeze burns!
Corrosive to some metals!

SECTION 1: IDENTIFICATION

Trade Name	FCCU Sour Propylene/Propane	Technical Contact	(800) 525-4692
Product Number	068131759	Medical Emergency	(800) 313-7645
CAS Number	68131-75-9	CHEMTREC Emergency	(800) 424-9300
Product Family	Sour Gas		
Synonyms	FCCU Sour P/P Stream; FCCU Untreated Propylene/Propane Stream; Sour P/Ps from the Fluid Catalytic Cracker Unit; Sour Liquefied Petroleum Gas or Sour LP-Gas; C3-C4 Mix with Hydrogen Sulfide		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Sour C3-C4 Catalytic Cracked Hydrocarbons	68131-75-9	100
2) Propylene	115-07-1	70-80
3) Propane	000074-98-6	20-25
4) Hydrogen sulfide	7783-06-4	1-5
5) Iso-Butane	75-28-5	1-3
6) Butenes or Butylenes	25167-67-3	1-2
7) N-Butane	106-97-8	0-2

FCCU Sour Propylene/Propane

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Eye contact. Skin contact Skin absorption

Signs and Symptoms of Acute Exposure

Inhalation	May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. The National Institute for Occupational Safety and Health has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health At concentrations above 500 ppm, H ₂ S causes unconsciousness and respiratory paralysis leading to coma and/or death (See Section 11.)
	Additionally, one or more components of this gas mixture is a "simple asphyxiant". High concentrations of this gas can displace the amount of oxygen available to breathe below that level necessary to sustain life. Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, weakness, nausea, vomiting, loss of coordination, unconsciousness, and coma, depending upon the concentration level and duration of exposure
Eye Contact	Vapors may cause moderate to severe eye irritation and photophobia (light sensitivity) upon short-term exposure <i>Severity depends upon the concentrations of hydrogen sulfide and duration of exposure.</i> Direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn."
Skin Contact	Direct contact with an expanding gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. Hydrogen sulfide can be absorbed through the skin to produce toxic effects
Ingestion	Ingestion is not an applicable route of exposure for gases.
Chronic Health Effects Summary	Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H ₂ S distinct from its acute and subchronic effects is debatable However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures (See Section 11)
Conditions Aggravated by Exposure	Chronic inhalation to components of this gas (propane and n-butane) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of Epinephrine (Adrenaline)-like drugs.
Target Organs	Personnel with eye, skin, cardiac, pulmonary, liver, kidney, or neurological disorders, high blood pressure, and those with a compromised ability to use oxygen (asthmatics, anemics, etc.) should take additional precautions to minimize or avoid exposure
Carcinogenic Potential	The substance is toxic to eyes, skin, mucous membranes, lungs, central and sympathetic nervous systems, brain, heart, and possibly, the endocrine and reproductive systems
	This product does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC, or NTP.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200)

FCCU Sour Propylene/Propane

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids. If pain, redness, swelling, tearing, or light sensitivity persist, obtain medical attention as soon as possible
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Seek medical attention if tissue appears damaged or if pain persists.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry.
Notes to Physician	Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients. This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines such as epinephrine (adrenaline) and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas		
Flash Point/Method	CLOSED CUP AP -107° to -73°C (-160° to -100°F). (Estimated)		
Lower Flammable Limit	AP 1.6 %	Upper Flammable Limit	AP 45 %
Auto-Ignition Temp.	AP 260°C (500°F)		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons, and oxides of sulfur		
Special Properties	This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials		
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.		

FCCU Sour Propylene/Propane

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Compressed Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area upwind. Remove all potential ignition sources. Safely stop the source gas flow using non-sparking tools. Allow the substance to evaporate. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. Prevent this material's entry into waterways, sewers, basements, or confined areas. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This gas or waste mixtures containing this gas should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling

Danger! Poisonous and Flammable Gas! Do NOT breathe vapor, it contains hydrogen sulfide (H₂S). This gas mixture also contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S concentrations, and flammability.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed petroleum gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue.

Storage

Do not store this material near heat or any other potential ignition sources. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Do not store this product in unlabeled containers. Keep containers tightly closed. H₂S is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.)

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

FCCU Sour Propylene/Propane

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls	Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location. Where H ₂ S is routinely stored or handled, install monitoring equipment or system with alarms.
Personal Protective Equipment	Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.
	
Eye Protection	Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.
Hand Protection	Use neoprene or PCV/nitrile gloves. When handling materials that can produce frostbite or cold burns, use leather gloves over these chemically-resistant gloves.
Body Protection	Prevent potential skin contact with cold liquid, solid, or vapors. Use insulated and chemical-resistant clothing (apron, slicker suit, coveralls, boots, etc.). Fire-retardant garments (e.g. Nomex®) should be worn while working with flammable gases and gas/liquids.
Respiratory Protection	A full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).
General Comments	Releases of this gas may create flammable, explosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Odor is an inadequate warning for hazardous air concentrations. Air purifying respirators offer no protection against oxygen deficiency, hydrogen sulfide, and simple asphyxiants.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV)
2) Liquefied Petroleum Gases	TWA: 10 STEL: 15 CEIL: 20 (ppm) from OSHA (PEL)
3) Propylene	TWA: 1000 (ppm) from ACGIH (TLV) [1998]
4) Propane	TWA: 1000 (ppm) from OSHA (PEL) [1989]
5) Butanes	Simple asphyxiant.
	TWA: 2500 (ppm) from ACGIH (TLV) [1998]
	TWA: 1000 (ppm) from OSHA (PEL) [1989]
	TWA: 800 (ppm) from ACGIH (TLV) [1998]
	TWA: 800 (ppm) from OSHA (PEL) [1989]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquefied Gas	Color	Colorless liquid; invisible vapor	Odor	Strong, foul smelling, rotten egg odor is unreliable as a warning of possible exposure
Specific Gravity	AP 0.55 to 0.60 (Water = 1)	pH	Acidic when exposed to air or moisture.	Vapor Density	AP 1.5 (Air = 1)
Boiling Point/Range	AP -60° to -1°C (-75° to 31°F) (by ASTM D-2887)	Melting/Freezing Point			AP -187° to -82°C (-305° to -117°F) at 14.7 psia.
Vapor Pressure	50 to 190 psia at 100°F.	Viscosity (cSt @ 40°C)			Not applicable

FCCU Sour Propylene/Propane

Solubility in Water	Moderately soluble in cold water.	Volatile Characteristics	This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Gross Heat of Combustion at 60°F = AP 21,000 Btu/lb or 2,500 Btu/cu.ft.		

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions. Polymerization can occur under conditions of extremely high temperature and pressure		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Hydrogen sulfide

GAS (TCLo): Acute: 10 ppm for 15 minutes (Human) - Eye irritation
 GAS (TCLo): Acute: 50 to 100 ppm for 15 minutes (Human) - Respiratory irritation
 GAS (LC100): Acute: 600 to 750 ppm for 30 minutes (Human) - Respiratory paralysis and death.
 GAS (LCLo): Acute: 5,700 ug/kg for 8 hours (Human) - Chronic pulmonary edema, coma, and death.

Propylene:

GAS (LC50): Chronic 1,250 ppm for 6 hours/day for 14 weeks [Mouse]
 GAS (TCLo): Chronic 5,000 ppm for 6 hours/day for 2 years [Rat] - Reduced olfactory sensory response

iso-Butane:

GAS (TCLo): Acute: 1,040 gm/m3 for 2 hours [Mouse] - Excitement.
 GAS (LC50): Acute: 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress

n-Butane

GAS (LC50): Acute: 660 gm/m3 for 4 hour(s) [Rat].
 GAS (LC50) Acute. 680 gm/m3 for 2 hours [Mouse].

Hydrogen sulfide (H₂S): H₂S causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (LT 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (GT 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Liquefied Petroleum Gases: When a 4-hour rabbit inhalation screen test was run on a liquefied petroleum gas, no deaths occurred, however, the animal's heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline)

Propane Exposure to 1,000 ppm of propane for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs.

Propylene. In humans, at concentrations of 6-4% in air or higher, propylene causes mild intoxication, dermal sensations, and an inability to concentrate on tasks within two minutes. Gross inhalation of propylene concentrations of 40% or higher for a couple minutes cause reddening of the eyelids and face, tearing, coughing, and sometimes flexing of the legs, reduced blood pressure, and/or disordered heart rhythm. A concentration of 50% causes anesthesia in two minutes, followed by complete recovery without any physiological indications

FCCU Sour Propylene/Propane

Propylene was tested by the National Cancer Institute (NCI) in a two-year, 6 hours/day, 5 days/week inhalation study using rats and mice with exposure concentrations at 5,000 and 10,000 ppm. The resulting data suggested that propylene induces signs of nasal cavity toxicity (epithelial hyperplasia/metaplasia) including increased incidence of neo-plastic lesions in rats, but not in mice. Propylene is NOT considered carcinogenic to either rats or mice; however, it may be partially metabolized to **propylene oxide** which has been shown to be mutagenic and produces site of contact tumors in rodents following long-term administration. Propylene has also been found to be a cardiac sensitizer in dogs.

Butanes Human volunteers had no apparent effects from exposures of 250 ppm, 500 ppm, and 1,000 ppm concentrations in air of **isobutane** and **n-butane** for periods of 8 hours daily for 10 days to 14 days, respectively. Chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage.

An **n-Butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. Laboratory animals have exhibited a higher degree of narcosis when exposed to both **butane** and **butylene** (additive effect), than the degree of narcosis exhibited following exposure to either gas alone.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this material. Releases are expected to cause only localized non-persistent environmental damage; however, hydrogen sulfide is moderately soluble in water so this material and any contaminated soil or water may be hazardous to human, animal, and aquatic life.
Environmental Fate	<p>Refined liquefied petroleum hydrocarbon gases are essentially insoluble in water (LT 0.1%), and therefore, this material will not cause harm to aquatic life. These liquefied gas mixtures will normally evaporate rapidly if spilled. At ambient temperatures and pressure, the propylene, butenes, and hydrogen sulfide components of this material may contribute to generation of atmospheric smog.</p> <p>The atmospheric half-lives of propane, propylene, and butenes under photochemical smog conditions are estimated to be between 5 to 8 hours; and, experimental data shows that significant photooxidation of propylene occurs rapidly within 14 to 21 hours. The atmospheric half-lives of butanes under photochemical smog conditions are estimated to be between 5 and 7 days. Photooxidation of propane, isobutane, and n-butane in air (LT 8%) are not considered to be environmentally significant. Hydrogen sulfide residence times in the atmosphere range from about one day to more than 40 days, depending upon the season, latitude, and presence of other air pollutants. Reduced temperatures increases the residence time.</p>

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

This material may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be in accordance with applicable Federal, State, and local regulations. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U.S. Department of Transportation regulated material.		
Proper Shipping Name	Liquefied gas, flammable, toxic, n.o.s. Inhalation Hazard Zone B (Hydrogen sulfide)		
Hazard Class	Class 2.3 Poisonous gas.	Packing Group(s)	Not applicable.
		UN/NA ID	UN1953
Reportable Quantity	A Reportable Quantity (RQ) has been established for the Hydrogen sulfide component of this material. (See Section 15.)		

FCCU Sour Propylene/Propane

Placards

Emergency Response Guide No.	119
HAZMAT STCC No.	49 057 66
MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. Chemical substances present in this product or refinery stream subject to this statute are: Hydrogen sulfide (CAS No. = 7783-06-4) concentration = 1 to 5 Wt.%.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2 This material would be classified under the following hazard categories: Fire Hazard, Reactive Hazard, Sudden Release of Pressure Hazard, and the Acute (Immediate) and Chronic (Delayed) Health Hazards.
SARA 313	This product contains the following components in concentrations above de minimis levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA. Propylene or Propene (CAS No. = 115-07-1) concentration = 70 to 80 Wt.%; Hydrogen sulfide (CAS No. = 7783-06-4) concentration = 1 to 5 Wt.%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream subject to this statute are. Hydrogen sulfide (RQ = 100 lbs. [45.36 kg]) concentration = 1 to 5 Wt.%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA) Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802
California Proposition 65	The California Safe Drinking Water and Toxic Enforcement Act of 1986 (Proposition 65) requires warning be given for ingredients known to the State of California to cause cancer, birth defects, or other reproductive toxicity. This product does not contain any known chemical substances subject to this statute.
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following component in this material as a "Volatile Organic Compound (VOC)" which contributes significantly to air pollution which endangers public health and welfare" Propylene (Propene) In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds Substances present in this product which are subject to this statute are: Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), Butenes, Butane, and Hydrogen Sulfide

FCCU Sour Propylene/Propane**SECTION 16: OTHER INFORMATION**

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Propylene - FCCU Grade

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0043
Revision Date 01/18/2002

Hazard Rankings		
	HMIS	NFPA
Health Hazard	1	1
Fire Hazard	4	4
Reactivity	1	1

* = Chronic Health Hazard

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview			
Physical State	Liquefied gas		
Color	Colorless liquid, invisible vapor	Odor	Faint, unpleasant, hydrocarbon
DANGER! Extremely flammable compressed gas/liquid; vapor may cause flash fire or explosion.			
High pressure and rapid diffusion hazard.			
High concentrations of vapor reduce oxygen available for breathing and may cause central nervous system (CNS) depression or suffocation.			
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats).			
Liquid or compressed gas contact may cause frostbite or freeze burns.			

Protective Equipment
Minimum Requirements See Section 8 for Details

SECTION 1: IDENTIFICATION

Trade Name	Propylene - FCCU Grade	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	68131759*	Medical Emergency	(800) 313-7645 or (918) 495-4700
CAS Number	68131-75-9	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Liquefied Petroleum Gas (LPG or LP-Gas)		
Synonyms	Fluid Catalytic Cracker Unit-grade, Low-Sulfur, Liquefied Propylene, Technical-grade Propylene, Propene, 1-Propene, Methyl Ethene, Methyl Ethylene, Propene/Propane Mix, Methyl Ethene or Methyl Ethylene/Propane Mix, C3 Olefin/Paraffin Mix		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) C3-C4 Catalytic Cracked Hydrocarbons	68131-75-9	100
2) C3-C4 Hydrocarbons, C3-Rich	68476-49-3	100
3) Liquefied Petroleum Gases	68476-85-7	100
4) Propylene	115-07-1	70-80
5) Propane	74-98-6	18-28
6) Iso-Butane	75-28-5	1-3
7) Butenes or Butylenes	25167-67-3	1-2
8) n-Butane	106-97-8	0-2

Propylene - FCCU Grade

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation Skin contact. Eye contact.

Signs and Symptoms of Acute Exposure

Inhalation	One or more components of this gas mixture are "simple asphyxiants" (see Section 8) Their vapors can displace the amount of oxygen in air available to breathe below that necessary to sustain life, especially if working in confined spaces. Breathing vapors may also irritate the respiratory tract and cause central nervous system (CNS) depression Symptoms may include headache, dizziness, slurred speech, excitation or giddiness, nausea, blurred vision, memory loss, drowsiness, fatigue, rapid or difficult breathing, confusion, vertigo, loss of consciousness, convulsions, coma, and even death, depending upon the concentration and duration of exposure
Eye Contact	This gas is non-irritating, however, direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn "
Skin Contact	Direct contact with a liquefied/pressurized gas may produce severe and possibly permanent skin damage from frostbite or freeze burns
Ingestion	Ingestion is not an applicable route of exposure for gases
Chronic Health Effects Summary	Chronic inhalation to components of this gas (propane and propylene) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of Epinephrine (Adrenaline)-like drugs
Conditions Aggravated by Exposure	Personnel with pre-existing chronic respiratory diseases, central nervous system (CNS) disease, or cardiovascular conditions should avoid exposure Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of "simple asphyxiants"
Target Organs	This material causes damage to the following organs: central nervous system (CNS), heart, skin, mucous membranes, and eyes.
Carcinogenic Potential	This material does not contain any components at concentrations at or above 0.1% which are considered carcinogenic by OSHA or NTP It does contain Propylene which is classified as "3" (Not classifiable for humans) by IARC and "A4" (Not classifiable for humans or animals) by ACGIH

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband If the individual is not breathing, immediately begin rescue breathing If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR) If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual Seek medical attention immediately
Eye Contact	If tissue is frozen, immediately seek medical attention If tissue is not frozen, check for and remove contact lenses Then, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids If pain, redness, swelling, tearing, or light sensitivity persist, obtain medical attention as soon as possible. Do not use eye ointment unless directed by a physician

Propylene - FCCU Grade

Skin Contact	In the event of frostbite or freeze burn, the affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F) DO NOT use dry heat or hot water Rewarming should continue until natural skin tones return to the affected area. Seek medical attention if tissue appears damaged or if pain persists
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry.
Notes to Physician	<p>If cough or difficulty in breathing develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis Monitor arterial blood gases and chest x-ray in cases with significant exposure. If contact with pressurized or liquefied gas causes frostbite of the eyes, early ophthalmologic consultation is recommended</p> <p>This material may also make the heart more susceptible to arrhythmias. Catecholamines such as epinephrine and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution If used, monitor the heart action closely Consider use of other drugs with less arrhythmogenic potential</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas		
Flash Point Method	CLOSED CUP AP -107°C (-160°F) (Estimated)		
Lower Flammable Limit	AP 2.0 %	Upper Flammable Limit	AP 11.1 %
Autoignition Temperature	AP 450°C (842°F)		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, unburned hydrocarbon vapors, and trace oxides of sulfur		
Special Properties	This gas is flammable at well below ambient temperatures and readily forms flammable mixtures with air Exposed to an ignition source, it will burn in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources! Being heavier than air, its flammable vapors can travel long distances close to the ground to an ignition source, and then flash back		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials		
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Compressed Gas! Release causes an immediate fire or explosion hazard Evacuate all non-essential personnel to an area upwind Remove all potential ignition sources Safety stop the source gas flow using non-sparking tools Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres Closed gas systems form white-colored frost at the point of a leak A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse Water spray may be used to reduce vapors Avoid entering a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions Secure the area and control access Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations Allow free liquid to evaporate or burn off This gas or waste mixtures containing this gas should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source Some releases must be reported to the National Response Center (800/424-8802)

Propylene - FCCU Grade

SECTION 7: HANDLING AND STORAGE

Handling

This gas mixture contains "simple asphyxiants" Odor is not an adequate warning of potentially hazardous air concentrations Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring for oxygen deficiency and flammability

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of mixed gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release Use a pressure-reducing regulator when connecting to lower pressure piping systems Prevent liquid entrapment in closed systems. Drain and purge equipment as necessary to remove material residues. Ground all containers when transferring material

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the hazard area Eliminate heat and other ignition sources Use non-sparking and explosion-proof equipment Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8 Do not allow vaporizing material to contact eyes, skin or other tissues Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated

Storage

Do not store this material near heat or any other potential ignition sources Segregate from oxidizers and other combustible materials by a distance of at least 20 feet Do not store this product in unlabeled containers Keep containers tightly closed.

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas Store and use these cylinders or other containers in a cool, well-ventilated place Storage areas should not exceed 100°F Protect from dampness, salt, or corrosive chemicals Do not drag, roll, or slide cylinders Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Both local exhaust and general room ventilation may be essential in work areas to prevent accumulation of potentially explosive gas/air mixtures If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection Ensure that an emergency eye wash station and safety shower are located near the work-station location

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations The following pictograms represent the minimum requirements for personal protective equipment For certain operations, additional PPE may be required

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling liquefied gases Safety glasses equipped with side shields or face shield are recommended when vapor is being discharged or whenever handling high-pressure cylinders and piping systems

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves to protect hands from potential contact with cold liquid, solid, or vapors

Body Protection

Prevent potential skin contact with cold liquid, solid, or vapors Use insulated and chemical-resistant clothing (apron, slicker suit, coveralls, boots, etc.) Fire-retardant garments (e.g. Nomex®) should be worn while working with flammable gases and gas/liquids

Propylene - FCCU Grade

Respiratory Protection Odor is not an adequate warning for potentially hazardous air concentrations. For unknown vapor concentrations, use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator, if adequate protection is provided. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).

General Comments For an explanation about some of the occupational exposure limits shown below, refer to the definition of "Simple Asphyxiant" presented in the American Conference of Governmental Industrial Hygienists (ACGIH) most current **Threshold Limit Values (TLVs) for Chemical Substances and Physical Agents** handbook. Releases of these gases can result in dangerous conditions such as fire and explosive hazards, or atmospheres with inadequate amounts of oxygen to breathe (i.e., less than 19.5 Vol % oxygen in air). DO NOT ENTER such areas or confined spaces without special safety procedures including appropriate monitoring for flammability and oxygen deficiency.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Propylene	Simple asphyxiant
2) Liquefied Petroleum Gases	TWA 1000 (ppm) from ACGIH (TLV) TWA 1000 (ppm) from OSHA (PEL)
3) Propane	TWA 2500 (ppm) from ACGIH (TLV) TWA 1000 (ppm) from OSHA (PEL)
4) Butanes	TWA 800 (ppm) from ACGIH (TLV) TWA 800 (ppm) from OSHA (PEL)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquefied gas	Color	Colorless liquid, invisible vapor	Odor	Faint, unpleasant, hydrocarbon
Specific Gravity	0.53 (Water = 1)	pH	Not applicable	Vapor Density	1.45-1.5 (Air = 1)
Boiling Point/Range	-48° to -9°C (-55° to 15°F) at 14.7 psia (ASTM D-2887)			Melting/Freezing Point	AP -170°C (-275°F) at 14.7 psia
Vapor Pressure	205 to 230 psia at 40°C (104°F)			Viscosity (cSt @ 40°C)	Not applicable
Solubility in Water	Slightly soluble in cold water			Volatile Characteristics	This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Gross Heat of Combustion at 60°F = AP 21,500 Btu/lb or 2,185 Btu/cu ft Dry Point Temperature = AP 11°F (-12°C) (ASTM D-86), Density of the Liquid at 60°F = 4.23 to 4.70 lbs/gal in a vacuum				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions. Polymerization can occur under conditions of extremely high temperature and pressure.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

Propylene - FCCU Grade

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Propylene:

GAS (LC50) Chronic 1,250 ppm for 6 hours/day for 14 weeks [Mouse]
 GAS (TCLo) Chronic 5,000 ppm for 6 hours/day for 2 years [Rat] - Reduced olfactory sensory response

Iso-Butane:

GAS (TCLo) Acute 1,040 gm/m³ for 2 hours [Mouse] - Excitement
 GAS (LC50) Acute 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress

Iso-Butene (Isobutylene or 2-Methylpropene):

GAS (LC50) Acute 415 gm/m³ for 2 hours [Mouse]
 GAS (LC50) Acute 620 gm/m³ for 4 hours [Rat]

n-Butane:

GAS (LC50) Acute 660,000 mg/m³ for 4 hour(s) [Rat]
 GAS (LC50) Acute 680,000 mg/m³ for 2 hours [Mouse]

Liquefied Petroleum Gases:

When a 4-hour rabbit inhalation screen test was run on a liquefied petroleum gas, no deaths occurred, however, the animal's heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline)

Propylene:

In humans, at concentrations of 6.4% in air or higher, Propylene causes mild intoxication, dermal sensations, and an inability to concentrate on tasks within two minutes. Gross inhalation of propylene concentrations of 40% or higher for a couple minutes cause reddening of the eyelids and face, tearing, coughing, and sometimes flexing of the legs, reduced blood pressure, and/or disordered heart rhythm. A concentration of 50% causes anesthesia in two minutes, followed by complete recovery without any physiological indications.

Propylene was tested by the National Cancer Institute (NCI) in a two-year, 6 hours/day, 5 days/week inhalation study using rats and mice with exposure concentrations at 5,000 and 10,000 ppm. The resulting data suggested that propylene induces signs of nasal cavity toxicity (epithelial hyperplasia/metaplasia) including increased incidence of neo-plastic lesions in rats, but not in mice. Propylene is NOT considered carcinogenic to either rats or mice, however, it may be partially metabolized to propylene oxide which has been shown to be mutagenic and produces site of contact tumors in rodents following long-term administration. Propylene has also been found to be a cardiac sensitizer in dogs.

Propane:

Exposure to 1,000 ppm of propane for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol % in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs.

Iso-butane:

Laboratory animals have exhibited a higher degree of narcosis when exposed to both isobutane and butylene (additive effect), than the degree of narcosis exhibited following exposure to either gas alone.

n-Butane:

An n-butane exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Also, butane may decrease the myocardial threshold to epinephrine-induced arrhythmias.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. Releases are expected to cause only localized non-persistent environmental damage.

Propylene - FCCU Grade

Environmental Fate

Refined liquefied petroleum hydrocarbon gases are essentially insoluble in water (LT 0.1%), and therefore, this material will not cause harm to aquatic life. These liquefied gas mixtures will normally evaporate rapidly if spilled. At ambient temperatures and pressure, the **propylene** component of this material will readily vaporize and may contribute to generation of atmospheric smog.

The atmospheric half-lives of **propane, propylene, and butenes** under photochemical smog conditions are estimated to be between 5 to 8 hours, and, experimental data shows that significant photooxidation of propylene occurs rapidly within 14 to 21 hours. The atmospheric half-lives of **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days. Photooxidation of propane, isobutane, and n-butane in air (LT 8%) are not considered to be environmentally significant.

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

This material may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be in accordance with applicable Federal, State, and local regulations. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U S Department of Transportation (DOT) regulated material		
Proper Shipping Name	Petroleum gases, liquefied (or Propylene)		
Hazard Class	DOT Class: 2.1 (Flammable gas)	Packing Group(s)	Not applicable
		UN/NA ID	UN1075 (or UN1077)
Reportable Quantity	A Reportable Quantity (RQ) has not been established for any components of this material		
Placards		Emergency Response Guide No.	115
		HAZMAT STCC No.	49 057 66
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, and Acute (Immediate) Health Hazard.
SARA 313	This material contains the following component in concentrations above de minimis levels and it is listed as "Toxic Chemical" in 40 CFR Part 372 pursuant to the requirements of Section 313: Propylene or Propene (CAS No. 115-07-1) concentration = 70 to 80 Wt.%.

Propylene - FCCU Grade

CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "Hazardous Substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. This product or refinery stream is not known to contain chemical substances subject to this statute. However, it is recommended that you contact state and local authorities to determine if there are any other reporting requirements in the event of a spill.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This stream does not contain any chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling, refer to components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following component in this material as a "Volatile Organic Compound (VOC)" which contributes significantly to air pollution which endangers public health and welfare" Propylene (Propene) . In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this product which are subject to this statute are Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), various Butenes, and n-Butane .

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

MSDS No. RS0044
Revision Date 06/01/1999

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Liquefied Gas.		
Color	Colorless liquid, invisible gas and vapor; white frost at release point.	Odor	Strong, unpleasant, and distinctive of rotten cabbage.

DANGER! Extremely flammable compressed liquefied gas;
vapor may cause flash fire or explosion!
May form explosive peroxides on exposure to air!
High pressure and rapid diffusion hazard!
Liquid or compressed gas contact may cause frostbite or freeze burns!
May be harmful or fatal if inhaled or absorbed through the skin!
High concentrations of vapor reduce oxygen available for breathing and
may cause central nervous system (CNS) depression or suffocation!
Prolonged and/or repeated inhalation may increase the heart's
susceptibility to arrhythmias (irregular beats)!
Overexposures may cause target organ effects such as lung, heart,
central nervous system, blood, liver, and/or kidney damage!

Tower Overhead Stream**

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation Eye contact. Skin contact Skin absorption

Signs and Symptoms of Acute Exposure

Inhalation	May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. The National Institute for Occupational Safety and Health has determined that atmospheres containing 150 ppm or more of methyl mercaptan are immediately dangerous to life and health. At concentrations above 700 ppm, it may cause unconsciousness and respiratory paralysis leading to coma and/or death. (See Section 11)
	Additionally, at least one of the components of this liquefied gas is a "simple asphyxiant" (See Section 8). High concentrations of this material can displace the amount of oxygen available to breathe below that level necessary to sustain life (hypoxia). Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, shortness of breath, nausea, vomiting, confusion, muscular weakness, loss of coordination, convulsions, unconsciousness, coma, and death, depending upon the concentration level and duration of exposure. Oxygen deprivation is possible if working in confined spaces.
Eye Contact	Vapors may cause mild to severe eye irritation upon short-term exposure. Severity depends upon the concentration of methyl mercaptan and duration of exposure. Direct contact with pressurized/liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn."
Skin Contact	Direct contact with an expanding liquefied/pressurized gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. Methyl mercaptan can be absorbed through the skin to produce toxic effects. If the skin is damaged, absorption increases.
Ingestion	Due to its volatile nature, ingestion is not normally an applicable route of exposure for this liquefied gas mixture. However, if swallowed, this material may "freeze burn" the mucous membranes of the mouth, throat, and esophagus.
Chronic Health Effects Summary	Chronic inhalation of this material's components (propane, propylene, and n-butane) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline) -like drugs.
Conditions Aggravated by Exposure	Personnel with pre-existing chronic respiratory diseases, central nervous system (CNS) disease, high blood pressure, cardiovascular conditions, or skin disorders should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this liquefied gas mixture. They should take additional precautions to minimize or avoid exposure.
Target Organs	This stream is toxic to eyes, skin, mucous membranes, lungs, central nervous system, brain, heart, blood, and possibly, the liver and kidneys.
Carcinogenic Potential	This refinery stream does not contain any components at concentrations at or above 0.1% which are considered carcinogenic by OSHA, IARC, and NTP.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

**BRU No. 2 Deisobutanizer
Tower Overhead Stream**

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required. This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines such as epinephrine (adrenaline) and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Liquefied Gas.		
Flash Point/Method	CLOSED CUP: AP -107° to -83°C (-160° to -118°F) (Estimated)		
Lower Flammable Limit	AP 1.6 %	Upper Flammable Limit	AP 21.8 %
Auto-Ignition Temp.	AP 343°C (650°F)		
Hazardous Combustion Products	Carbon dioxide and monoxide, smoke, fumes, oxides of sulfur, and possibly, unburned hydrocarbons or mercaptans.		
Special Properties	This liquefied gas is extremely flammable at well below ambient temperatures and readily forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. Exposed to an ignition source, it will burn in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources! Being heavier than air, its flammable vapors can travel long distances close to the ground to an ignition source, and then flash back.		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide, and/or inert gas (nitrogen) to extinguish adjacent burning materials.		
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.		

**BRU No. 2 Deisobutanizer
Tower Overhead Stream**

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquefied Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This liquefied gas or waste mixtures containing this material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling

Danger! Poisonous and Flammable Gas! Do NOT breathe vapor; it contains **methyl mercaptan and simple asphyxiants**. Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency and flammability.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed petroleum gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8 and wear appropriate personal protective clothing/equipment. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue.

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

BRU No. 2 Deisobutanizer Tower Overhead Stream

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposures, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with cold liquid or vapors.

Body Protection Prevent potential skin contact with cold liquid or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable liquefied gases. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection Odor is not an adequate warning for potentially hazardous air concentrations! Use a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. Air purifying respirators offer no protection against oxygen deficient atmospheres. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).

General Comments Releases of this liquefied gas mixture may create flammable, explosive, and/or oxygen-deficient atmospheres (LT 19.5 Vol % in air). DO NOT ENTER such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions. Air purifying respirators offer no protection against methyl mercaptan and simple asphyxiants.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Methyl mercaptan	TWA: 5 (ppm) from ACGIH (TLV) [1997] TWA: 0.5 (ppm) from ACGIH (TLV) [proposed for 1998] TWA: 0.5 CEIL 10 (ppm) from OSHA [1989]
2) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1989] Simple asphyxiant.
3) Propylene	TWA: 2500 (ppm) from ACGIH (TLV) [1998]
4) Propane	TWA: 1000 (ppm) from OSHA (PEL) [1989]
5) Butanes	TWA: 800 (ppm) from ACGIH (TLV) [1998] TWA: 800 (ppm) from OSHA (PEL) [1989]

**BRU No. 2 Deisobutanizer
Tower Overhead Stream**

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquefied Gas	Color	Colorless liquid; invisible gas and vapor; white frost at release point.	Odor	Strong, unpleasant, and distinctive of rotten cabbage
Specific Gravity	AP 0.56 to 0.58 (Water = 1)	pH	Not applicable	Vapor Density	AP 2.0 (Air = 1)
Boiling Point/Range	AP -48°C to 5°C (-54° to 42°F) at 14.7 psia (ASTM D-2887)	Melting/Freezing Point			AP -187° to -83°C (-305° to -117°F) at 14.7 psia.
Vapor Pressure	50 to 75 psia at 40°C (104°F)	Viscosity (cSt @ 40°C)			Not applicable.
Solubility in Water	Moderately soluble in cold water.	Volatile Characteristics			This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Gross Heat of Combustion at 60°F = AP 21,100 Btu/lb or 3,250 Btu/cu.ft.; Dry Point Temperature = AP 21°F (-6°C) (ASTM D-86); Average Density at 60°F = AP 5.00 lbs./gal (ASTM D-2161)				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions. Polymerization can occur under conditions of extremely high temperature and pressure.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	<p>Methanethiol (Methyl mercaptan). GAS (LC50) Acute: 675 ppm for 4 hours [Rat] - Hypermotility, diarrhea, and reduced respiration. GAS (LC50) Acute: 6,530 ug/m³ for 2 hours [Mouse].</p> <p>Propylene: GAS (LC50). Chronic: 1,250 ppm for 6 hours/day for 14 weeks [Mouse]. GAS (TCLo): Chronic: 5,000 ppm for 6 hours/day for 2 years [Rat] - Reduced olfactory sensory response.</p> <p>Iso-Butane: GAS (TCLo) Acute: 1,040,000 mg/m³ for 2 hours [Mouse] - Excitement. GAS (LC50): Acute: 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress</p> <p>Iso-Butene (Isobutylene or 2-Methylpropene): GAS (LC50). Acute. 415,000 mg/m³ for 2 hours [Mouse]. GAS (LC50) Acute 620,000 mg/m³ for 4 hours [Rat]</p> <p>n-Butane: GAS (LC50): Acute: 660,000 mg/m³ for 4 hours [Rat] GAS (LC50): Acute: 680,000 mg/m³ for 2 hours [Mouse].</p>
----------------------	---

Methyl mercaptan acts as respiratory poison by inhibiting the respiratory control center in the brain and cellular respiration, but only at concentrations exceeding 50 ppm in air. At lower chronic exposures, it can cause pulmonary edema, hemolytic anemia, methemoglobinemia, and kidney and/or liver damage. It is also an eye irritant and has been shown to produce positive responses in various mutagenic assays.

Exposure to 1,000 ppm of propane for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs.

BRU No. 2 Deisobutanizer Tower Overhead Stream

When a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline). **Propylene** has also been found to be a cardiac sensitizer in dogs. An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias.

In humans, at concentrations of 6.4% in air or higher, **propylene** causes mild intoxication, dermal sensations, and an inability to concentrate on tasks within two minutes. Gross inhalation of propylene concentrations of 40% or higher for a couple minutes cause reddening of the eyelids and face, tearing, coughing, and sometimes flexing of the legs, reduced blood pressure, and/or disordered heart rhythm. A concentration of 50% causes anesthesia in two minutes, followed by complete recovery without any physiological indications.

Propylene was tested by the National Cancer Institute (NCI) in a two-year, 6 hours/day, 5 days/week inhalation study using rats and mice with exposure concentrations at 5,000 and 10,000 ppm. The resulting data suggested that propylene induces signs of nasal cavity toxicity (epithelial hyperplasia/metaplasia) including increased incidence of neo-plastic lesions in rats, but not in mice. Propylene is NOT considered carcinogenic to either rats or mice, however, it may be partially metabolized to **propylene oxide** which has been shown to be mutagenic and produces site of contact tumors in rodents following long-term administration.

Human volunteers had no apparent effects from exposure concentrations of 250 ppm, 500 ppm, and 1,000 ppm of **isobutane** and **n-butane** in air for periods of 8 hours daily for 10 days to 14 days, respectively. However, chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage, however, at ambient temperatures and pressure, the **propane, propylene, butenes, and methyl mercaptan** components of this stream may contribute to generation of atmospheric smog. The atmospheric half-lives of **propane, propylene, and butenes** under photochemical smog conditions are estimated to be between 5 to 8 hours. Experimental data shows that significant photooxidation of **propylene** occurs rapidly within 7 to 21 hours. The atmospheric half-lives of the **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days. Photooxidation of **propane, isobutane, and n-butane** in air (LT 8%) are not considered to be environmentally significant.

Environmental Fate

Liquefied petroleum hydrocarbon gases are essentially insoluble in water (LT 0.1%), however, the toxic **methyl mercaptan** component is moderately soluble in water. Therefore, this material could potentially cause harm to aquatic life.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste for additional reasons, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this liquefied gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

**BRU No. 2 Deisobutanizer
Tower Overhead Stream**

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U.S. Department of Transportation regulated material		
Proper Shipping Name	Liquefied gas, flammable, toxic, n.o.s. Inhalation Hazard Zone B (Methyl mercaptan)		
Hazard Class	Class 2.3 Poisonous gas.	Packing Group(s)	Not applicable.
		UN/NA ID	UN1953
Reportable Quantity	The Reportable Quantity (RQ) substance component present in this material which might require DOT HAZMAT bill-of-lading display is Methyl mercaptan .		
Placards			Emergency Response Guide No. 119
		HAZMAT STCC No.	49 203 78
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This stream and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. A chemical substance which might be present in these streams and is subject to this statute is: Methanethiol (Methyl mercaptan) [CAS No. 74-93-1] .
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, Reactivity, and Acute (Immediate) & Chronic (Delayed) Health Hazards.
SARA 313	This stream contains the following component in concentrations which might be at or above de minimis levels and it is listed as a toxic chemical in 40 CFR Part 372 pursuant to the requirements of Section 313: Propylene or Propene [CAS No. 115-07-1] concentration: 0 to 2%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. A chemical substance that might be present in this stream which is subject to this statute is: Methanethiol (Methyl mercaptan) [CAS No. 74-93-1] (RQ = 100 lbs. [45.36 kg]) concentration: 0.1 to 0.5%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This stream does not contain any chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, they are not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in these streams as "Volatile Organic Compounds (VOC)" that contribute significantly to air pollution which endangers public health and welfare": Propylene (Propene), 1-Butene, and Isobutylene.

**BRU No. 2 Deisobutanizer
Tower Overhead Stream**

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances which may be present in this stream that are subject to this statute are: **Methyl mercaptan (Methanethiol), Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), various Butenes, and n-Butane**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Reactivity	1	1

* = Chronic Health Hazard

IMPORTANT. Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

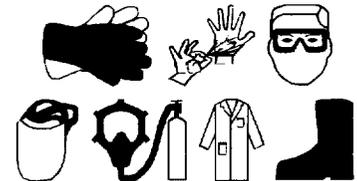

Emergency Overview

Physical State	Liquefied Gas		
Color	Colorless liquid, invisible gas and vapor, white frost at release point	Odor	Strong, unpleasant, and distinctive of skunk or rotten cabbage.

DANGER! Extremely flammable liquefied gas; vapor may cause flash fire or explosion!
May form explosive peroxides on exposure to air!
High pressure and rapid diffusion hazard!
Liquid or compressed gas contact may cause frostbite or freeze burns!
May be harmful or fatal if inhaled or absorbed through the skin!
High concentrations of vapor reduce oxygen available for breathing and may cause central nervous system (CNS) depression or suffocation!
Vapor or mist may cause mild to severe eye, mucous membrane, and respiratory tract irritation and inflammation!
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
Overexposures may cause target organ effects such as lung, brain, central nervous system, heart, blood, liver, and/or kidney damage!
Contains low levels of 1,3-Butadiene! Based upon laboratory animal tests, cancer, mutagenic, and reproductive hazards might exist!
May cause blood system disorders and/or genetic damage!
May adversely affect reproduction or reproductive development!

Protective Equipment

Minimum Requirements
See Section 8 for Details

SECTION 1: IDENTIFICATION

Trade Name	BRU No. 2 Stabilizer Tower Overhead Stream	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	1111110045	Medical Emergency	(918) 495-4700
CAS Number	Mixture—See Section 2	CHEMTREC Emergency	(800) 424-9300
Product Family	Liquefied Petroleum Gas (LPG or LP-Gas)		
Synonyms	BRU No. 2 Deisobutanizer Tower Feed; C3-C6 Olefin/Alkane Hydrocarbons and Mercaptans Mix; Untreated Butanes/Butenes-rich Gas, Untreated B/B Concentrate LPG or LP-Gas, Unsweetened LPG, Raw LPG, High-Sulfur, Liquefied Petroleum Gas, C4-Rich LPG containing Mercaptans; C3-C6 Hydrocarbons and R-SHs.		

BRU No. 2 Stabilizer Tower Overhead Stream

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Liquefied Petroleum Gases	68476-85-7	100
2) Saturate Gas Plant Mixed Stream, C4-Rich, Tail Gas	68478-32-0	100
3) C3-C6 Hydrocarbons	68513-26-8	98-100
4) n-Butane	106-97-8	40-62
5) Iso-Butane	75-28-5	30-47
6) Iso-Pentane	78-78-4	1-20
7) Butenes or Butylenes	25167-67-3	1-10
8) n-Pentane	109-66-0	1-5
9) Pentenes or Pentylenes	68527-11-7	0-5
10) 1,3-Butadiene	106-99-0	0 1-3
11) Isobutylene	115-11-7	0-3
12) Hexane Isomers	Mixture	0-2 5
13) Propane	74-98-6	0-1 5
14) Methyl mercaptan	74-93-1	0-1
15) Ethyl mercaptan	75-08-1	0-0.75
16) C3 Mercaptans	Mixture	0-0.5

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation Skin contact. Eye contact. Skin absorption

Signs and Symptoms of Acute Exposure

Inhalation	<p>May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. The National Institute for Occupational Safety and Health has determined that atmospheres containing 150 ppm or more of methyl mercaptan are immediately dangerous to life and health. At concentrations above 700 ppm, it may cause unconsciousness and respiratory paralysis leading to coma and/or death. (See Section 11.)</p> <p>High concentrations of this mixture can displace the amount of oxygen available to breathe below that level necessary to sustain life (hypoxia). Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, shortness of breath, nausea, vomiting, confusion, muscular weakness, loss of coordination, convulsions, unconsciousness, coma, and death, depending upon the concentration level and duration of exposure. Oxygen deprivation is possible if working in confined spaces.</p>
Eye Contact	Vapors may cause mild to severe eye irritation upon short-term exposure. Severity depends upon the concentration of mercaptans and duration of exposure. Direct contact with pressurized/liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn."
Skin Contact	Direct contact with an expanding liquefied/pressurized gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. Methyl mercaptan can be absorbed through the skin to produce toxic effects. If the skin is damaged, absorption increases.
Ingestion	Due to its volatile nature, ingestion is not normally an applicable route of exposure for this liquefied gas mixture. However, if swallowed, this material may "freeze burn" the mucous membranes of the mouth, throat, and esophagus.
Chronic Health Effects Summary	<p>Chronic inhalation to components of this gas (propane, n-butane, and n-pentane) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline)-like drugs.</p> <p>1,3-Butadiene (BD), a minor component of this stream, has been shown to be mutagenic and produces multiple organ tumors in various tissues of laboratory rodents. BD also causes sexual organ atrophy in test animals. (See Section 11.)</p>
Conditions Aggravated by Exposure	Personnel with pre-existing chronic respiratory diseases, central nervous system (CNS) disease, high blood pressure, cardiovascular conditions, or skin disorders should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this liquefied gas mixture. They should take additional precautions to minimize or avoid exposure.

BRU No. 2 Stabilizer Tower Overhead Stream

Target Organs This stream is toxic to eyes, skin, mucous membranes, lungs, central nervous system, brain, heart, and possibly, the liver, kidneys, bladder, and/or reproductive systems

Carcinogenic Potential This stream contains 1,3-butadiene at concentrations at or above 0.1%. **1,3-Butadiene** is considered carcinogenic by OSHA, IARC, and NTP. (See Section 11.)

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required. This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines such as epinephrine (adrenaline) and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Liquefied Gas.		
Flash Point Method	CLOSED CUP. LT -60° to -51°C (-76° to -60°F). (Estimated)		
Lower Flammable Limit	AP 1.4 %	Upper Flammable Limit	AP 21.8 %
Autoignition Temperature	AP 288°C (550°F)		

BRU No. 2 Stabilizer Tower Overhead Stream

Hazardous Combustion Products	Carbon dioxide and monoxide, smoke, fumes, oxides of sulfur, and possibly, unburned hydrocarbons or mercaptans
Special Properties	This liquefied gas is extremely flammable at well below ambient temperatures and readily forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. Exposed to an ignition source, it will burn in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources! Being heavier than air, its flammable vapors can travel long distances close to the ground to an ignition source, and then flash back.
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquefied Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This liquefied gas or waste mixtures containing this material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling	Danger! Poisonous and Flammable Gas! Do NOT breathe vapor, it may contain mercaptans. Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing, chemical splash goggles, and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including monitoring systems with alarms for oxygen deficiency and flammability.
	Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed petroleum gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

BRU No. 2 Stabilizer Tower Overhead Stream

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8 and wear appropriate personal protective clothing/equipment. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue.

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION**Engineering Controls**

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposures, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

**Eye Protection**

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with cold liquid or vapors.

Body Protection

Prevent potential skin contact with cold liquid or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

Odor is not an adequate warning for potentially hazardous air concentrations! Use a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. Air purifying respirators offer no protection against oxygen deficient atmospheres. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).

General Comments

Releases of this liquefied gas mixture may create flammable, explosive, and/or oxygen-deficient atmospheres (LT 19.5 Vol % in air). DO NOT ENTER such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions. Air purifying respirators offer no protection against mercaptans.

BRU No. 2 Stabilizer Tower Overhead Stream**Occupational Exposure Guidelines**

Substance	Applicable Workplace Exposure Levels
1) Methyl mercaptan	TWA: 0.5 (ppm) from ACGIH (TLV) [1999] CEIL: 10 (ppm) from OSHA (PEL) [1989]
2) Ethyl mercaptan	TWA: 0.5 (ppm) from ACGIH (TLV) [1999] CEIL: 10 (ppm) from OSHA (PEL) [1989]
3) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) [1999] TWA: 1000 (ppm) from OSHA (PEL) [1989]
4) Propane	TWA: 2500 (ppm) from ACGIH (TLV) [1999] TWA: 1000 (ppm) from OSHA (PEL) [1989]
5) Butane	TWA: 800 (ppm) from ACGIH (TLV) [1999] TWA: 800 (ppm) from OSHA (PEL) [1989]
6) 1,3-Butadiene ("A2" & "Z-2" Suspected Human Carcinogen)	TWA: 2 (ppm) from ACGIH (TLV) [1999] TWA: 1 STEL: 5 (ppm) from OSHA (PEL) [1994]
7) Pentane, all isomers	TWA: 600 (ppm) from ACGIH (TLV) [1999] TWA: 600 STEL: 750 (ppm) from OSHA (PEL) [1989] TWA: 1000 (ppm) from OSHA (PEL) [1976]
8) Hexane, other isomers	TWA: 500 STEL: 1000 (ppm) from ACGIH (TLV) [1999] TWA: 500 STEL: 1000 (ppm) from OSHA (PEL) [1989]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquefied Gas	Color	Colorless liquid, invisible gas and vapor, white frost at release point	Odor	Strong, unpleasant, and distinctive of skunk or rotten cabbage.
Specific Gravity	AP 0.58 to 0.62 (Water = 1)	pH	Not applicable	Vapor Density	AP 2.0 to 2.3 (Air = 1)
Boiling Point/Range	AP -42° to 63°C (-43° to 146°F) at 14.7 psia (ASTM D-2887)	Melting/Freezing Point			AP -160° to -99°C (-255° to -147°F) at 14.7 psia
Vapor Pressure	AP 20 to 75 psia at 40°C (104°F)	Viscosity (cSt @ 40°C)			Not applicable.
Solubility in Water	Negligible to slightly soluble in cold water.	Volatile Characteristics			This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard Gross Heat of Combustion at 60°F = AP 20,700 to 21,100 Btu/lb or 3,350 Btu/cu ft ; Dry Point Temperature = AP 121°F (49°C) (ASTM D-86); Average Density at 60°F = 5.0 lbs./gal (ASTM D-2161).				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur, but possible.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions. Polymerization can occur under conditions of extremely high temperature and pressure.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS		

BRU No. 2 Stabilizer Tower Overhead Stream

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Methanethiol (Methyl mercaptan):

GAS (LC50): Acute: 675 ppm for 4 hours [Rat] - Hypermotility, diarrhea, and reduced respiration
GAS (LC50): Acute: 6,530 ug/m³ for 2 hours [Mouse].

Ethanethiol (Ethyl mercaptan):

GAS (LC50): Acute: 2,770 ppm for 4 hours [Mouse] - Excitement, motor activity changes, and cyanosis
GAS (LC50): Acute: 4,420 ppm for 4 hours [Rat] - Excitement, spastic paraparesis, and cyanosis.
ORAL (LD50): Acute: 682 mg/kg [Rat] - Muscle weakness, ataxia, and cyanosis.
INTRAPERITONEAL (LD50): Acute: 226 mg/kg [Rat] - Muscle weakness, ataxia, and cyanosis

1-Propanethiol (n-Propyl mercaptan)

GAS (LC50): Acute: 4,010 ppm for 4 hours [Mouse] - Respiratory stimulation, somnolence, and chromidracryorrhea.
GAS (LC50): Acute: 7,300 ppm for 4 hours [Rat] - Respiratory stimulation, somnolence, and lacrimation.
ORAL (LD50) Acute: 1,790 mg/kg [Rat] - Respiratory depression, somnolence, and coma
INTRAPERITONEAL (LD50): Acute: 515 mg/kg [Rat] - Respiratory depression, somnolence, and coma

iso-Butane:

GAS (TCLo): Acute: 1,040,000 mg/m³ for 2 hours [Mouse] - Excitement
GAS (LC50): Acute: 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress.

iso-Butene (isobutylene or 2-Methylpropene)

GAS (LC50): Acute: 415,000 mg/m³ for 2 hours [Mouse]
GAS (LC50) Acute: 620,000 mg/m³ for 4 hours [Rat]

n-Butane

GAS (LC50): Acute: 658,000 mg/m³ for 4 hours [Rat].
GAS (LC50). Acute: 680,000 mg/m³ for 2 hours [Mouse].

1,3-Butadiene (Erythrene or Pyrrolyene):

GAS (LC50) Acute: 285,000 mg/m³ for 4 hour(s) [Rat]
GAS (LC50): Acute: 270,000 mg/m³ for 2 hours [Mouse].
ORAL (LD50): Acute: 5,480 mg/kg [Rat]

2,2-Dimethylpropane (Neopentane):

INTRAPERITONEAL (LD50): Acute: 100 mg/kg [Mouse]

n-Pentane:

GAS (LC50): Acute: 364,000 mg/m³ for 4 hours [Rat] - Excitement.
INTRAVENOUS (LD50). Acute: 446 mg/kg [Mouse]

Methyl and ethyl mercaptans act as respiratory poisons by inhibiting the respiratory control center in the brain and cellular respiration, but only at concentrations exceeding 50 ppm in air. At lower chronic exposures, they can cause pulmonary edema, hemolytic anemia, methemoglobinemia, and kidney and/or liver damage. They are also eye irritants and have been shown to produce positive responses in various mutagenic assays. **Propyl mercaptans** possess similar toxic properties but at somewhat higher exposure levels.

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred, however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline)

Human volunteers had no apparent effects from exposures of 250 ppm, 500 ppm, and 1,000 ppm concentrations in air of **isobutane and n-butane** for periods of 8 hours daily for 10 days to 14 days, respectively. An **n-Butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane, butylene, and/or 1,3-butadiene** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone. Chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage.

At very high concentrations, **1,3-butadiene (BD)** produces narcosis with central nervous system depression and/or respiratory paralysis. Lifetime inhalation studies have shown that BD or its epoxide metabolites cause multiple organ tumors in various tissues of both rats and mice. It is also a mutagen and causes sexual organ atrophy in test animals. Epidemiology studies amongst BD workers and styrene-butadiene rubber (SBR) workers suggest that BD or BD epoxide metabolite exposures may increase the risk of cancers of the lymphohematopoietic system. Based on these various studies, IARC, NTP, OSHA, ACGIH, and EPA have determined BD to be an "animal carcinogen" and a "probable human carcinogen"

BRU No. 2 Stabilizer Tower Overhead Stream

Inhalation of 500 ppm of **isopentane** or **n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects, however, higher exposure concentrations of 90,000 to 120,000 ppm (9 to 12 Wt.% in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. **n-Pentane** caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure. Rat 28-day feeding studies on both **isopentane** and **n-pentane** using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

Hexane isomers were not mutagenic in the Salmonella/microsome (Ames) assay and are NOT considered to be carcinogenic

SECTION 12: ECOLOGICAL INFORMATION**Ecotoxicity**

Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, the **butenes**, **pentenes**, and **1,3-butadiene** components of this material will readily vaporize and may contribute to generation of atmospheric smog. The atmospheric half-lives of **propane**, **butenes**, and **pentenes** under photochemical smog conditions are estimated to be between 5 to 8 hours; and, **1,3-butadiene's** half-life is only 2 to 3 hours. Experimental data shows that significant photooxidation of **1,3-butadiene** occurs rapidly within 7 to 21 hours. The atmospheric half-lives of the **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days. The **pentanes** have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. Photooxidation of **propane**, **isobutane**, and **n-butane** in air (LT 8%) is not considered to be environmentally significant.

Environmental Fate

Liquefied petroleum hydrocarbon gases are essentially insoluble in water (LT 0.1%), however, the toxic **methyl and ethyl mercaptan** components are moderately soluble in water. Therefore, this material could potentially cause harm to aquatic life.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (U153) characteristics. In addition, conditions of use may cause this material to become a hazardous waste for additional reasons, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this liquefied gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT)		
Proper Shipping Name	Liquefied gas, flammable, toxic, n.o.s. (Butanes, Pentanes) Inhalation Hazard Zone B (Methyl mercaptan)		
Hazard Class	DOT CLASS: Poisonous gas.	Packing Group(s)	Not applicable.
		UN/NA ID	UN1953
Reportable Quantity	The Reportable Quantity (RQ) substance component present in this material which might require DOT HAZMAT bill-of-lading display is Methyl mercaptan		

BRU No. 2 Stabilizer Tower Overhead Stream**Placards**

Emergency Response Guide No. 119

HAZMAT STCC No.

49 203 78

MARPOL III Status

Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This stream and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. A chemical substance which might be present in these streams and is subject to this statute is Methanethiol (Methyl mercaptan) [CAS No. 74-93-1] .
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories Fire, Sudden Release of Pressure, Reactivity, and Acute (Immediate) & Chronic (Delayed) Health Hazards.
SARA 313	This refinery stream contains the following component in concentrations which are at or above de minimis levels and it is listed as toxic chemical in 40 CFR Part 372 pursuant to the requirements of Section 313: 1,3-Butadiene [CAS No. 106-99-0] concentration: 0.1 to 3%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4 As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4 A chemical substance that might be present in this material and subject to this statute is: Methanethiol (Methyl mercaptan) [CAS No. 74-93-1] (RQ = 100 lbs. [45.36 kg]) concentration: 0 to 1%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material contains the following chemical substance which is known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5: 1,3-Butadiene [CAS No. = 106-99-0]
New Jersey Right-to-Know Label	For New Jersey labeling, refer to components listed in Section 2
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in this material as "Volatile Organic Compounds (VOC)" which contribute significantly to air pollution which endangers public health and welfare": 1,3-Butadiene, 1-Butene, Isobutylene, 1-Pentene, and n-Pentane. In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances which may be present in this stream that are subject to this statute are: Methyl mercaptan (Methanethiol), Ethyl mercaptan (Ethanethiol), Propane, Isobutane (Propane, 2-methyl), various Butenes, Butane, 1,3-Butadiene, Isopentane (Butane, 2-methyl), various Pentenes, and n-Pentane.

BRU No. 2 Stabilizer Tower Overhead Stream**SECTION 16: OTHER INFORMATION**

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0046
Revision Date 2/25/2005

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Hazard Rankings

	HMIS	NFPA
Health Hazard	* 2	2
Fire Hazard	4	4
Reactivity	0	0

* = Chronic Health Hazard

Emergency Overview

Physical State Liquid.
Color Amber to dark amber **Odor** Hydrocarbon. Rotten eggs.
(Strong.)

DANGER!
Extremely Flammable and Poisonous.
Contains hydrogen sulfide gas. May be fatal if inhaled.
Vapor may cause flash fire or explosion.
Vapor may travel considerable distance to source of ignition and flash back.
Harmful or fatal if swallowed - Can enter lungs and cause damage.
Repeated or excessive exposure to certain components of this mixture have been associated with central nervous system effects.
Harmful to aquatic organisms.
Possible Cancer Hazard (See Section 3)

Protective Equipment

Minimum Recommended
See Section 8 for Details

Minimum PPE reflects the requirements for this material at this facility:
LYONDELL-CITGO Refining
LP Manufacturing Complex

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	637 HDS Feed	Technical Contact	
Product Number	Not available.	Medical Emergency	
CAS Number	Mixture.	CHEMTREC Emergency	(800) 424-9300
		(United States Only)	
Product Family	Not applicable.		
Synonyms	637 HDS Combined Feed, ScanFiner Feed		

SECTION 2. COMPOSITION (TYPICAL)

This product may be composed, in whole or in part, of any of the following refinery streams:

Light Thermal Cracked Naphtha (Petroleum) [CAS No.: 64741-74-8]
Light Catalytic Cracked Naphtha [CAS No.: 64741-55-5]

This product contains the following chemicals as components of the refinery streams listed above:

Component Name(s)	CAS Registry No.	Concentration (%)
-------------------	------------------	-------------------

637 HDS Feed

Hexane, other isomers	Mixture	5.7 - 17.8
C6-C9 alpha-Alkenes	68526-99-8	4.72 - 14.65
n-Hexane	110-54-3	1.91 - 11.75
Cyclohexane	110-82-7	1 - 5
Benzene	71-43-2	1 - 4.86
Hydrocarbons, C5-Rich	68476-55-1	2.1 - 3.5
Toluene	108-88-3	0.93 - 4.65
Butenes or Butylenes	25167-67-3	0.93 - 4.65
Xylene, all isomers	1330-20-7	0.93 - 4.51
Octanes, all isomers	Mixture	0.93 - 4.51
1, 3-Butadiene	106-99-0	<1
Trimethylbenzenes, all isomers	25551-13-7	0.43 - 1.29
Ethylmethylbenzene, all isomers	25550-14-5	0.43 - 1.29
Methylcyclopentane	96-37-7	0.07 - 1.4
Heptane, all isomers	Mixture	0.35 - 1.05
Pentanes, all isomers	Mixture	0.07 - 1.05
Butanes	Mixture	0.07 - 1.05
Ethylbenzene	100-41-4	0.172 - 0.86
Hydrogen Sulfide	7783-06-4	<0.2

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Inhalation. Ingestion

Signs and Symptoms of Acute Exposure

Inhalation	May be harmful or fatal if inhaled. Contains hydrogen sulfide. Inhalation of gas or vapor may cause severe nose, throat, respiratory tract, and lung irritation, respiratory paralysis, and death, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. Breathing this material may cause central nervous system depression with symptoms including nausea, headache, dizziness, fatigue, drowsiness, or unconsciousness. Breathing high concentrations of this material, for example, in an enclosed space or by intentional abuse, can cause irregular heartbeats which can cause death.
Eye Contact	This material can cause eye irritation with tearing, redness, or a stinging or burning feeling. Further, it can cause swelling of the eyes with blurred vision. Effects may become more serious with repeated or prolonged contact.
Skin Contact	May cause skin irritation with redness, an itching or burning feeling, and swelling of the skin. Effects may become more serious with repeated or prolonged contact. Skin contact may cause harmful effects in other parts of the body.
Ingestion	Swallowing this material may be harmful. Swallowing this material may cause stomach or intestinal upset with pain, nausea, and/or diarrhea. This material can get into the lungs during swallowing or vomiting. Small amounts in the lungs can cause lung damage, possibly leading to chronic lung dysfunction or death. Swallowing this material may cause effects similar to those described in the inhalation section (see "inhalation" above).
Chronic Health Effects Summary	Subacute exposure to low levels of hydrogen sulfide can produce eye irritation, watering, light sensitivity and corneal opacity. Reported effects from subacute exposure also include bronchitis, pulmonary edema, nausea, abdominal cramps and diarrhea. Aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Altered mental state, drowsiness, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been reported from repeated over-exposure such as gasoline and naphtha abusers. Repeated and prolonged overexposure to n-Hexane has been associated with peripheral nerve tissue damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function and paralysis. This material, or a component of this material, has been shown to cause cancer in laboratory

637 HDS Feed

animals. However it is not likely to represent a human cancer hazard.
See Toxicological Information (Section 11)

- Conditions Aggravated by Exposure** Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Peripheral Nervous System, Central Nervous System (CNS), Heart (Cardiac)
- Target Organs** Contains material which may cause damage to the following organs: blood, kidneys, lungs, the reproductive system, liver, mucous membranes, heart, lymphatic system, peripheral nervous system, upper respiratory tract, immune system, skin, , bone marrow, central nervous system (CNS), eye, lens or cornea, testes.
- Carcinogenic Potential** **CARCINOGENIC EFFECTS** Classified 1 (Proven for human.) by IARC, + (Proven.) by OSHA [Benzene]. Classified + (Proven.) by OSHA+ (Proven.) by NIOSH [1, 3-Butadiene]. Classified A2 (Suspected for human.) by ACGIH, 2A (Probable for human.) by IARC [1, 3-Butadiene]. Classified 2B (Possible for human.) by IARC [Ethylbenzene].

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Toxic	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

- Inhalation** Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
- Eye Contact** Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
- Skin Contact** Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
- Ingestion** Do not induce vomiting unless directed to do so by medical personnel -- this material is an aspiration hazard. Get immediate medical attention. Never give anything by mouth to an unconscious person.
- Notes to Physician** INHALATION: Inhalation overexposure can produce toxic effects. Treat intoxications as hydrogen sulfide exposures. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Administer supplemental oxygen with assisted ventilation, as required.

This material (or a component) sensitizes the heart to the effects of sympathomimetic amines. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias in individuals exposed to this material. Administration of sympathomimetic drugs should be avoided.

637 HDS Feed

INGESTION: If ingested, this material presents a significant aspiration and chemical pneumonitis hazard. Induction of emesis is not recommended. Consider activated charcoal and/or gastric lavage. If patient is obtunded, protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position.

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	NFPA Class-IB flammable liquid.		
Flash Point	Open cup: <-45°C (-49°F).		
Lower Flammable Limit	AP 2 %	Upper Flammable Limit	Not Available
Autoignition Temperature	The lowest known value is 225°C (437°F) (n-Hexane).		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons and oxides of sulfur and/or nitrogen.		
Special Properties	Flammable Liquid! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. A vapor and air mixture can create an explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.		
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide, foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or water spray. Water fog and spray are effective in cooling containers and adjacent structures. However, water can cause frothing and/or may not extinguish the fire. Water can be used to cool the external walls of vessels to prevent excessive pressure, autoignition or explosion. DO NOT use a solid stream of water directly on the fire as the water may spread the fire to a larger area.		
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid enter sewers or waterways.		

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent spilled material from entering waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Prevent spilled material from entering sewers, storm drains, other drainage systems, and natural waterways. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or

637 HDS Feed

disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbant pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7. HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire or explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation and personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food and tobacco products. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

A static electrical charge can accumulate when this material is flowing through pipes, nozzles or filters and when it is agitated. A static spark discharge can ignite accumulated vapors particularly during dry weather conditions. Always bond receiving containers to the fill pipe before and during loading. Always keep nozzle in contact with the container throughout the loading process. Do not fill any portable container in or on a vehicle. Do NOT use compressed air for filling, discharging or other handling operations.

Product container is not designed for elevated pressure. Do not pressurize, cut, weld, braze solder, drill, or grind on containers. Do not expose product containers to flames, sparks, heat or other potential ignition sources. Empty containers may contain product residues that can ignite with explosive force. Observe label precautions. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling or disposing of empty containers and/or waste residues of this product.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources. Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room. A refrigerated room is preferable for materials with a flash point temperature lower than 70°F (21°C). All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable regulatory requirements and the National Electrical Code.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor or mists below the applicable workplace exposure limits indicated below. All electrical equipment should comply with the National Electric Code. An emergency eye wash station and safety shower should be located near the work-station.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

637 HDS Feed

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

- Eye Protection** Safety glasses equipped with side shields are recommended as minimum protection in industrial settings. Chemical goggles should be worn during transfer operations or when there is a likelihood of misting, splashing, or spraying of this material. Suitable eye wash water should be readily available.
- Hand Protection** Avoid skin contact. Use heavy duty gloves constructed of chemical resistant materials such as Viton® or heavy nitrile rubber. Wash hands with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities or leaving work. DO NOT use gasoline, kerosene, solvents or harsh abrasives as skin cleaners.
- Body Protection** Avoid skin contact. Wear long-sleeved fire-retardant garments (e.g., Nomex®) while working with flammable and combustible liquids. Additional chemical-resistant protective gear may be required if splashing or spraying conditions exist. This may include an apron, boots and additional facial protection. If product comes in contact with clothing, immediately remove soaked clothing and shower. Promptly remove and discarded contaminated leather goods.
- Respiratory Protection** A full-face supplied air pressure-demand respirator with escape bottle or a pressure-demand self-contained, breathing apparatus (SCBA) is required. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).
- General Comments** Warning! Use of this material in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and/or inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
Hexane, other isomers	ACGIH (United States). TWA: 500 ppm 8 hour(s). STEL: 1000 ppm 15 minute(s).
C6-C9 alpha-Alkenes n-Hexane	Not available. ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
Cyclohexane	ACGIH (United States). TWA: 100 ppm 8 hour(s). OSHA (United States). TWA: 300 ppm 8 hour(s).
Benzene	ACGIH (United States). Skin TWA: 0.5 ppm 8 hour(s). STEL: 2.5 ppm 15 minute(s). OSHA (United States). Skin Notes: See Table Z-2 for exclusions in 20 CFR 1910.1028 to the PEL. TWA: 1 ppm 8 hour(s). STEL: 5 ppm 15 minute(s).
Hydrocarbons, C5-Rich Toluene	Not available. ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 200 ppm 8 hour(s). CEIL: 300 ppm PEAK: 500 ppm
Butenes or Butylenes Xylene, all isomers	Not available. ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 150 ppm 15 minute(s).

637 HDS Feed

Octanes, all isomers	OSHA (United States). TWA: 100 ppm 8 hour(s). ACGIH (United States). TWA: 300 ppm 8 hour(s).
1, 3-Butadiene	OSHA (United States). TWA: 500 ppm 8 hour(s). ACGIH (United States). Notes: "A2" Suspected Human Carcinogen TWA: 2 ppm 8 hour(s). OSHA (United States). Notes: "Z-2" Suspected Human Carcinogen TWA: 2 ppm 8 hour(s). Action Level: 1 ppm 8 hour(s). STEL: 5 ppm 15 minute(s).
Trimethylbenzenes, all isomers	ACGIH (United States). TWA: 25 ppm 8 hour(s).
Ethylmethylbenzene, all isomers	Not available.
Methylcyclopentane	Not available.
Heptane, all isomers	ACGIH (United States). TWA: 400 ppm 8 hour(s). STEL: 500 ppm 15 minute(s).
Pentanes, all isomers	OSHA (United States). TWA: 500 ppm 8 hour(s). ACGIH (United States). TWA: 600 ppm 8 hour(s).
Butanes	OSHA (United States). TWA: 1000 ppm 8 hour(s). ACGIH (United States). TWA: 800 ppm 8 hour(s).
Ethylbenzene	ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 125 ppm 15 minute(s).
Hydrogen Sulfide	OSHA (United States). TWA: 100 ppm 8 hour(s). ACGIH TLV (United States). TWA: 10 ppm 8 hour(s). STEL: 15 ppm 15 minute(s). OSHA (United States). CEIL: 20 ppm 8 hour(s). STEL: 50 ppm 15 minute(s). Form: *10 minute peak; once per 8 hour shift
Light Thermal Cracked Naphtha (Petroleum)	Not available.
Light Aliphatic Naphthas, Sour (family)	Not available.

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Liquid.	Color	Amber to dark amber	Odor	Hydrocarbon. Rotten eggs. (Strong.)
Specific Gravity	Weighted average: 0.75 (Water = 1)	pH	Not Applicable.	Vapor Density	The highest known value is 3.1 (Air = 1) (Toluene). Weighted average: 2.98 (Air = 1)
Boiling Range	The lowest known value is 69°C (156.2°F) (n-Hexane). Weighted average: 81.05°C (177.9°F)	Melting/Freezing Point			Not available.
Vapor Pressure	The highest known value is 16.5 kPa (124 mm Hg) (at 20°C) (n-Hexane). Weighted average: 8.4 kPa (63.01 mm Hg) (at 20°C)	Volatility			

637 HDS Feed

Solubility in Water	Very slightly soluble in cold water. (<0.1 % w/w)	Viscosity (cSt @ 40°C)	not available
Flash Point	Open cup: <-45°C (-49°F).		
Additional Properties	No additional information.		

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from heat, sparks and flame.		
Materials Incompatibility	Incompatible with strong acids, strong bases, and strong oxidizers.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data**n-Hexane**

This material contains n-hexane. Long-term or repeated exposure to n-hexane can cause peripheral nerve damage. Initial symptoms are numbness of the fingers and toes. Also, motor weakness can occur in the digits, but may also involve muscles of the arms, thighs and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure.

Cyclohexane

Cyclohexane can cause eye, skin and mucous membrane irritation, CNS depressant and narcosis at elevated concentrations. In experimental animals exposed to lethal concentrations by inhalation or oral route, generalized vascular damage and degenerative changes in the heart, lungs, liver, kidneys and brain were identified.

Cyclohexane has been the focus of substantial testing in laboratory animals. Cyclohexane was not found to be genotoxic in several tests including unscheduled DNA synthesis, bacterial and mammalian cell mutation assays, and in vivo chromosomal aberration. An increase in chromosomal aberrations in bone marrow cells of rats exposed to cyclohexane was reported in the 1980's. However, a careful re-evaluation of slides from this study by the laboratory which conducted the study indicates these findings were in error, and that no significant chromosomal effects were observed in animals exposed to cyclohexane. Findings indicate long-term exposure to cyclohexane does not promote dermal tumorigenesis.

Benzene

ORAL (LD50):	Acute: 930 mg/kg [Rat]. 4700 mg/kg [Mouse].
INHALATION (LC50):	
(VAPOR):	Acute: 10000 ppm 7 hour(s) [Rat]. 9980 ppm 8 hour(s) [Mouse].

Studies of Workers Over-Exposed to Benzene:

Studies of workers exposed to benzene show clear evidence that over-exposure can cause cancer of the blood forming organs (acute myelogenous leukemia) and aplastic anemia, an often fatal disease. Studies also suggest over-exposure to benzene may be associated with other types of leukemia and other blood disorders. Some studies of workers exposed to benzene have shown an association with increased rates of chromosome aberrations in circulating lymphocytes. One study of women workers exposed to benzene suggested a

637 HDS Feed

weak association with irregular menstruation. However, other studies of workers exposed to benzene have not demonstrated clear evidence of an effect on fertility or reproductive outcome in humans. Benzene can cross the placenta and affect the developing fetus. Cases of aplastic anemia have been reported in the offspring of persons severely over-exposed to benzene.

Studies in Laboratory Animals:

Studies in laboratory animals indicate that prolonged, repeated exposure to high levels of benzene vapor can cause bone marrow suppression and cancer in multiple organ systems. Studies in laboratory animals show evidence of adverse effects on male reproductive organs following high levels of exposure but no significant effects on reproduction have been observed. Embryotoxicity has been reported in studies of laboratory animals but effects were limited to reduced fetal weight and skeletal variations.

Toluene:

Effects from Acute Exposure:

Deliberate inhalation of toluene at high concentrations (e.g., glue sniffing and solvent abuse) has been associated with adverse effects on the liver, kidney and nervous system and can cause CNS depression, cardiac arrhythmias and death. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects.

Effects from Repeated or Prolonged Exposure:

Studies of workers indicate long-term exposure may be related to impaired color vision and hearing. Some studies of workers suggest long-term exposure may be related to neurobehavioral and cognitive changes. Some of these effects have been observed in laboratory animals following repeated exposure to high levels of toluene. Several studies of workers suggest long-term exposure may be related to small increases in spontaneous abortions and changes in some gonadotropic hormones. However, the weight of evidence does not indicate toluene is a reproductive hazard to humans. Studies in laboratory animals indicate some changes in reproductive organs following high levels of exposure, but no significant effects on mating performance or reproduction were observed. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects. Findings in laboratory animals were largely negative. Positive findings include small increases in minor skeletal and visceral malformations and developmental delays following very high levels of maternal exposure. Studies of workers indicate long-term exposure may be related to effects on the liver, kidney and blood, but these appear to be limited to changes in serum enzymes and decreased leukocyte counts. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland following very high levels of exposure. The relevance of these findings to humans is not clear at this time.

Xylene, all isomers

Effects from Acute Exposure:

ORAL (LD₅₀), Acute: 4,300 mg/kg [Rat].

INHALATION (LC₅₀), Acute: 4,550 ppm for four hours [Rat].

DERMAL (LD₅₀), Acute: 14,100 uL/kg [Rabbit].

Overexposure to xylene may cause upper respiratory tract irritation, headache, cyanosis, blood serum changes, CNS damage and narcosis. Effects may be increased by the use of alcoholic beverages. Evidence of liver and kidney impairment were reported in workers recovering from a gross over-exposure.

Effects from Prolonged or Repeated Exposure:

Impaired neurological function was reported in workers exposed to solvents including xylene. Studies in laboratory animals have shown evidence of impaired hearing following high levels of exposure. Studies in laboratory animals suggest some changes in reproductive organs following high levels of exposure but no significant effects on reproduction were observed. Studies in laboratory animals indicate skeletal and visceral malformations, developmental delays, and increased fetal resorptions following extremely high levels of maternal exposure. Adverse effects on the liver, kidney, bone marrow (changes in blood cell parameters) were observed in laboratory animals following high levels of exposure. The relevance of these observations to humans is not clear at this time.

1, 3-Butadiene

637 HDS Feed

ORAL (LD50): Acute: 5480 mg/kg [Rat].

Studies of Workers Exposed to Butadiene:

Studies show evidence that over-exposure may be associated with an increased incidence of cancers of lymphohematopoietic organ systems, including leukemia.

Studies in Laboratory Animals:

Studies indicate that prolonged, repeated exposure to high levels of butadiene can cause cancer in multiple organs including lymphohematopoietic organ systems.

Studies indicate that exposure to high levels of butadiene can cause chromosome damage to somatic and germ cells. Some studies also show limited evidence that exposure to butadiene may induce heritable mutations.

Studies show evidence of adverse effects on male and female reproductive organs following exposure to high levels of butadiene. Embryotoxicity has been reported. Effects included increased rates of fetal death and skeletal variations.

Ethylbenzene

Effects from Acute Exposure:

ORAL (LD50), Acute: 3,500 mg/kg [Rat].

DERMAL (LD50), Acute: 17,800 uL/kg [Rabbit].

INTRAPERITONEAL (LD50), Acute: 2,624 mg/kg [Rat].

Effects from Prolonged or Repeated Exposure:

Findings from a 2-year inhalation study in rodents conducted by NTP were as follows: Effects were observed only at the highest exposure level (750 ppm). At this level the incidence of renal tumors was elevated in male rats (tubular carcinomas) and female rats (tubular adenomas). Also, the incidence of tumors was elevated in male mice (alveolar and bronchiolar carcinomas) and female mice (hepatocellular carcinomas). IARC has classified ethyl benzene as "possibly carcinogenic to humans" (Group 2B). Studies in laboratory animals indicate some evidence of post-implantation deaths following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate limited evidence of renal malformations, resorptions, and developmental delays following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland.

Hydrogen Sulfide

INHALATION (LC50): Acute: 444 ppm 1 hour(s) [Rat]. 673 ppm 1 hour(s) [Mouse].

Hydrogen Sulfide (H₂S) has an unpleasant odor that diminishes with increased concentrations. Eye irritation can occur at concentrations above four ppm. Olfactory fatigue occurs rapidly at concentrations above 50. Accordingly, odor is not a reliable warning property. Symptoms increase with exposures above 50 ppm. Respiratory effects including irritation with possible pulmonary edema can occur with exposure above 50 ppm. At concentrations above 500 ppm, an immediate loss of consciousness, depressed respiration and death can occur. NIOSH has determined that H₂S concentrations at or above 100 ppm are immediately dangerous to life and health.

SECTION 12. ECOLOGICAL INFORMATION**Ecotoxicity**

No data.

Environmental Fate

This product will normally float on water. Components will evaporate rapidly. This material may be harmful to aquatic organisms and may cause long term adverse effects in the aquatic environment. The log Kow value for this product is expected to be in the range of 3.3 to 6.

637 HDS Feed**SECTION 13. DISPOSAL CONSIDERATIONS**

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. Conditions of use may cause this material to become a "hazardous waste", as defined by federal or state regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal.

Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304 Emergency Planning and Notification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: fire, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard
SARA 313 Toxic Chemical Notification and Release Reporting	This product contains the following components in concentrations above de minimis levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: n-Hexane [CAS No.: 110-54-3] Concentration: 6.8% Cyclohexane [CAS No.: 110-82-7] Concentration: 3% Benzene [CAS No.: 71-43-2] Concentration: 2.9% Toluene [CAS No.: 108-88-3] Concentration: 2.8% Xylene, all isomers [CAS No.: 1330-20-7] Concentration: 2.7% Ethylbenzene [CAS No.: 100-41-4] Concentration: 0.5%

637 HDS Feed**CERCLA**

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are:

n-Hexane [CAS No.: 110-54-3] RQ = 5000 lb. (2268 kg) Concentration: 6.8%
 Cyclohexane [CAS No.: 110-82-7] RQ = 1000 lb. (453.6 kg) Concentration: 3%
 Benzene [CAS No.: 71-43-2] RQ = 10 lb. (4.536 kg) Concentration: 2.9%
 Toluene [CAS No.: 108-88-3] RQ = 1000 lb. (453.6 kg) Concentration: 2.8%
 Xylene, all isomers [CAS No.: 1330-20-7] RQ = 100 lb. (45.36 kg) Concentration: 2.7%
 Ethylbenzene [CAS No.: 100-41-4] RQ = 1000 lb. (453.6 kg) Concentration: 0.516%
 Hydrogen Sulfide [CAS No.: 7783-06-4] RQ = 100 lb. (45.36 kg) Concentration: 0.18%

Clean Water Act (CWA)

This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

California Proposition 65

This material may contain the following components which are known to the State of California to cause cancer, birth defects or other reproductive harm, and may be subject to the requirements of California Proposition 65 (CA Health & Safety Code Section 25249.5):

Benzene: 2.93%
 Toluene: 2.79%
 1, 3-Butadiene: 0.9%
 Ethylbenzene: 0.516%

New Jersey Right-to-Know Label

For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.

Additional Regulatory Remarks

No additional regulatory remarks.

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 2.0
Revision Date 2/25/2005
Print Date Printed on 2/25/2005.

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Biphasic (gas/liquid)
Color Amber to dark amber **Odor** Hydrocarbon. Rotten eggs.
(Strong.)

DANGER
EXTREMELY FLAMMABLE AND POISONOUS GAS.
Contains hydrogen sulfide gas.
May be fatal if inhaled.
Vapor may travel considerable distance to source of ignition and flash back.
Hydrogen can burn with an invisible flame.
Harmful or fatal if swallowed - can enter lungs and cause damage.
Breathing high concentrations can cause irregular heartbeats which may be fatal.
Suspect cancer hazard.
Repeated or excessive exposure to certain components of this mixture have been associated with central nervous system effects.
Harmful to aquatic organisms.

Protective Equipment

Minimum Recommended
See Section 8 for Details

Minimum PPE reflects the requirements for this material at this facility:
LYONDELL-CITGO Refining
LP Manufacturing Complex

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	637 Feed to R1 & R2 Reactors	Technical Contact	(800) 525-4692
Product Number	Not available.	Medical Emergency	(800) 313-7645
CAS Number	Mixture.	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Not applicable.		
Synonyms	637 Reactor Feed, 637 Reactor Feed + Hydrogen		

SECTION 2. COMPOSITION (TYPICAL)

This product may be composed, in whole or in part, of any of the following refinery streams:

Light Thermal Cracked Naphtha (Petroleum) [CAS No.: 64741-74-8]
Light Catalytic Cracked Naphtha [CAS No.: 64741-55-5]

This product contains the following chemicals as components of the refinery streams listed above:

Component Name(s)	CAS Registry No.	Concentration (%)
-------------------	------------------	-------------------

637 Feed to R1 & R2 Reactors

Hexane, other isomers	Mixture	5.7 - 17.8
C6-C9 alpha-Alkenes	68526-99-8	4.72 - 14.65
n-Hexane	110-54-3	1.91 - 11.75
Cyclohexane	110-82-7	1 - 5
Benzene	71-43-2	1 - 4.86
Hydrocarbons, C5-Rich	68476-55-1	2.1 - 3.5
Toluene	108-88-3	0.93 - 4.65
Butenes or Butylenes	25167-67-3	0.93 - 4.65
Xylene, all isomers	1330-20-7	0.93 - 4.51
Octanes, all isomers	Mixture	0.93 - 4.51
Hydrogen	1333-74-0	2
1, 3-Butadiene	106-99-0	<1
Trimethylbenzenes, all isomers	25551-13-7	0.43 - 1.29
Ethylmethylbenzene, all isomers	25550-14-5	0.43 - 1.29
Methylcyclopentane	96-37-7	0.07 - 1.4
Heptane, all isomers	Mixture	0.35 - 1.05
Butanes	Mixture	0.07 - 1.05
Pentanes, all isomers	Mixture	0.07 - 1.05
Ethylbenzene	100-41-4	0.172 - 0.86
Hydrogen Sulfide	7783-06-4	<0.2

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Inhalation. Ingestion

Signs and Symptoms of Acute Exposure

Inhalation	May be harmful or fatal if inhaled. Contains hydrogen sulfide. Inhalation of gas or vapor may cause severe nose, throat, respiratory tract, and lung irritation, respiratory paralysis, and death, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. Breathing this material may cause central nervous system depression with symptoms including nausea, headache, dizziness, fatigue, drowsiness, or unconsciousness. Breathing high concentrations of this material, for example, in an enclosed space or by intentional abuse, can cause irregular heartbeats which can cause death.
Eye Contact	This material can cause eye irritation with tearing, redness, or a stinging or burning feeling. Further, it can cause swelling of the eyes with blurred vision. Effects may become more serious with repeated or prolonged contact.
Skin Contact	May cause skin irritation with redness, an itching or burning feeling, and swelling of the skin. Effects may become more serious with repeated or prolonged contact. Skin contact may cause harmful effects in other parts of the body.
Ingestion	Swallowing this material may be harmful. Swallowing this material may cause stomach or intestinal upset with pain, nausea, and/or diarrhea. This material can get into the lungs during swallowing or vomiting. Small amounts in the lungs can cause lung damage, possibly leading to chronic lung dysfunction or death. Swallowing this material may cause effects similar to those described in the inhalation section (see "inhalation" above).
Chronic Health Effects Summary	Subacute exposure to low levels of hydrogen sulfide can produce eye irritation, watering, light sensitivity and corneal opacity. Reported effects from subacute exposure also include bronchitis, pulmonary edema, nausea, abdominal cramps and diarrhea. Aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Altered mental state, drowsiness, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been reported from repeated over-exposure such as gasoline and naphtha abusers. Repeated and prolonged overexposure to n-Hexane has been associated with peripheral nerve tissue damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor

637 Feed to R1 & R2 Reactors

function and paralysis.

This material, or a component of this material, has been shown to cause cancer in laboratory animals. However it is not likely to represent a human cancer hazard.

See Toxicological Information (Section 11)

Conditions Aggravated by Exposure Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Peripheral Nervous System, Central Nervous System (CNS), Heart (Cardiac)

Target Organs Contains material which may cause damage to the following organs: blood, kidneys, lungs, the reproductive system, liver, mucous membranes, heart, lymphatic system, peripheral nervous system, upper respiratory tract, immune system, skin, , bone marrow, central nervous system (CNS), eye, lens or cornea, testes.

Carcinogenic Potential **CARCINOGENIC EFFECTS** Classified 1 (Proven for human.) by IARC, + (Proven.) by OSHA [Benzene]. Classified + (Proven.) by OSHA+ (Proven.) by NIOSH [1, 3-Butadiene]. Classified A2 (Suspected for human.) by ACGIH, 2A (Probable for human.) by IARC [1, 3-Butadiene]. Classified 2B (Possible for human.) by IARC [Ethylbenzene].

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Toxic	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.

Eye Contact Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.

Skin Contact Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.

Ingestion Do not induce vomiting unless directed to do so by medical personnel -- this material is an aspiration hazard. Get immediate medical attention. Never give anything by mouth to an unconscious person.

Notes to Physician INHALATION: Inhalation overexposure can produce toxic effects. Treat intoxications as hydrogen sulfide exposures. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Administer supplemental oxygen with assisted ventilation, as required.

This material (or a component) sensitizes the heart to the effects of sympathomimetic amines. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias in individuals

637 Feed to R1 & R2 Reactors

exposed to this material. Administration of sympathomimetic drugs should be avoided.

INGESTION: If ingested, this material presents a significant aspiration and chemical pneumonitis hazard. Induction of emesis is not recommended. Consider activated charcoal and/or gastric lavage. If patient is obtunded, protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position.

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	NFPA Class-IB flammable liquid.		
Flash Point	Open cup: <-45°C (-49°F).		
Lower Flammable Limit	AP 1 %	Upper Flammable Limit	Not Available
Autoignition Temperature	The lowest known value is 225°C (437°F) (n-Hexane).		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons and oxides of sulfur and/or nitrogen.		
Special Properties	This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.		
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.		

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Compressed Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Remove all potential ignition sources. Safely stop the source gas flow using non-sparking tools. Allow any entrained liquid spills to evaporate. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. Do not enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during response operations. This gas may travel great distances and be ignited by a remote ignition source.

637 Feed to R1 & R2 Reactors

SECTION 7. HANDLING AND STORAGE

Handling

This gas mixture contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring for oxygen deficiency and flammability.

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of mixed gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Drain and purge equipment, as necessary, to remove material residues. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Do not allow vaporizing material to contact eyes, skin or other tissues. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated.

Storage

Do not store this material near heat or any other potential ignition sources. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Do not store this product in unlabeled containers. Keep containers tightly closed.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Both local exhaust and general room ventilation may be essential in work areas to prevent accumulation of potentially explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are located near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling liquefied gases. Safety glasses equipped with side shields or face shield are recommended when vapor is being discharged or whenever handling high-pressure cylinders and piping systems.

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves to protect hands from potential contact with cold liquid, solid, or vapors.

637 Feed to R1 & R2 Reactors

- Body Protection** Prevent potential skin contact with cold liquid or vapors. Use insulated and chemical-resistant clothing (apron, slicker suit, coveralls, boots, etc.). Fire-retardant garments (e.g. Nomex®) should be worn while working with flammable gases and gas/liquids.
- Respiratory Protection** Odor is not an adequate warning for potentially hazardous air concentrations. For unknown vapor concentrations, use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator, if adequate protection is provided. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).
- General Comments** Warning! Use of this material in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and/or inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
Hexane, other isomers	ACGIH (United States). TWA: 500 ppm 8 hour(s). STEL: 1000 ppm 15 minute(s).
C6-C9 alpha-Alkenes n-Hexane	Not available. ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
Cyclohexane	ACGIH (United States). TWA: 100 ppm 8 hour(s). OSHA (United States). TWA: 300 ppm 8 hour(s).
Benzene	ACGIH (United States). Skin TWA: 0.5 ppm 8 hour(s). STEL: 2.5 ppm 15 minute(s). OSHA (United States). Skin Notes: See Table Z-2 for exclusions in 20 CFR 1910.1028 to the PEL. TWA: 1 ppm 8 hour(s). STEL: 5 ppm 15 minute(s).
Hydrocarbons, C5-Rich Toluene	Not available. ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 200 ppm 8 hour(s). CEIL: 300 ppm PEAK: 500 ppm
Butenes or Butylenes Xylene, all isomers	Not available. ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 150 ppm 15 minute(s). OSHA (United States). TWA: 100 ppm 8 hour(s).

Trimethylbenzenes, all isomers	ACGIH (United States). TWA: 25 ppm 8 hour(s).
Ethylmethylbenzene, all isomers	Not available.
Methylcyclopentane	Not available.
Heptane, all isomers	ACGIH (United States). TWA: 400 ppm 8 hour(s). STEL: 500 ppm 15 minute(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
Pentanes, all isomers	ACGIH (United States). TWA: 600 ppm 8 hour(s). OSHA (United States). TWA: 1000 ppm 8 hour(s).
Butanes	ACGIH (United States). TWA: 800 ppm 8 hour(s).
Ethylbenzene	ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 125 ppm 15 minute(s). OSHA (United States). TWA: 100 ppm 8 hour(s).
Hydrogen Sulfide	ACGIH TLV (United States). TWA: 10 ppm 8 hour(s). STEL: 15 ppm 15 minute(s). OSHA (United States). CEIL: 20 ppm 8 hour(s). STEL: 50 ppm 15 minute(s). Form: *10 minute peak; once per 8 hour shift
Light Thermal Cracked Naphtha (Petroleum)	Not available.
Light Aliphatic Naphthas, Sour (family)	Not available.

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Biphasic (gas/liquid)	Color	Amber to dark amber	Odor	Hydrocarbon. Rotten eggs. (Strong.)
Specific Gravity	Weighted average: 0.75 (Water = 1)	pH	Not Applicable.	Vapor Density	The highest known value is 3.1 (Air = 1) (Toluene). Weighted average: 2.98 (Air = 1)
Boiling Range	The lowest known value is 69°C (156.2°F) (n-Hexane). Weighted average: 81.05°C (177.9°F)	Melting/Freezing Point			Not available.
Vapor Pressure	The highest known value is 16.5 kPa (124 mm Hg) (at 20°C) (n-Hexane). Weighted average: 8.4 kPa (63.01 mm Hg) (at 20°C)	Volatility			
Solubility in Water	Very slightly soluble in cold water. (<0.1 % w/w)	Viscosity (cSt @ 40°C)			not available
Flash Point	Open cup: <-45°C (-49°F).				
Additional Properties	No additional information.				

637 Feed to R1 & R2 Reactors

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

n-Hexane

This material contains n-hexane. Long-term or repeated exposure to n-hexane can cause peripheral nerve damage. Initial symptoms are numbness of the fingers and toes. Also, motor weakness can occur in the digits, but may also involve muscles of the arms, thighs and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure.

Cyclohexane

Cyclohexane can cause eye, skin and mucous membrane irritation, CNS depressant and narcosis at elevated concentrations. In experimental animals exposed to lethal concentrations by inhalation or oral route, generalized vascular damage and degenerative changes in the heart, lungs, liver, kidneys and brain were identified.

Cyclohexane has been the focus of substantial testing in laboratory animals. Cyclohexane was not found to be genotoxic in several tests including unscheduled DNA synthesis, bacterial and mammalian cell mutation assays, and in vivo chromosomal aberration. An increase in chromosomal aberrations in bone marrow cells of rats exposed to cyclohexane was reported in the 1980's. However, a careful re-evaluation of slides from this study by the laboratory which conducted the study indicates these findings were in error, and that no significant chromosomal effects were observed in animals exposed to cyclohexane. Findings indicate long-term exposure to cyclohexane does not promote dermal tumorigenesis.

Benzene

ORAL (LD50): Acute: 930 mg/kg [Rat]. 4700 mg/kg [Mouse].
 INHALATION (LC50):
 (VAPOR): Acute: 10000 ppm 7 hour(s) [Rat]. 9980 ppm 8 hour(s) [Mouse].

Studies of Workers Over-Exposed to Benzene:

Studies of workers exposed to benzene show clear evidence that over-exposure can cause cancer of the blood forming organs (acute myelogenous leukemia) and aplastic anemia, an often fatal disease. Studies also suggest over-exposure to benzene may be associated with other types of leukemia and other blood disorders. Some studies of workers exposed to benzene have shown an association with increased rates of chromosome aberrations in circulating lymphocytes. One study of women workers exposed to benzene suggested a weak association with irregular menstruation. However, other studies of workers exposed to benzene have not demonstrated clear evidence of an effect on fertility or reproductive outcome in humans. Benzene can cross the placenta and affect the developing fetus. Cases of aplastic anemia have been reported in the offspring of persons severely over-exposed to benzene.

Studies in Laboratory Animals:

Studies in laboratory animals indicate that prolonged, repeated exposure to high levels of

637 Feed to R1 & R2 Reactors

benzene vapor can cause bone marrow suppression and cancer in multiple organ systems. Studies in laboratory animals show evidence of adverse effects on male reproductive organs following high levels of exposure but no significant effects on reproduction have been observed. Embryotoxicity has been reported in studies of laboratory animals but effects were limited to reduced fetal weight and skeletal variations.

Toluene:

Effects from Acute Exposure:

Deliberate inhalation of toluene at high concentrations (e.g., glue sniffing and solvent abuse) has been associated with adverse effects on the liver, kidney and nervous system and can cause CNS depression, cardiac arrhythmias and death. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects.

Effects from Repeated or Prolonged Exposure:

Studies of workers indicate long-term exposure may be related to impaired color vision and hearing. Some studies of workers suggest long-term exposure may be related to neurobehavioral and cognitive changes. Some of these effects have been observed in laboratory animals following repeated exposure to high levels of toluene. Several studies of workers suggest long-term exposure may be related to small increases in spontaneous abortions and changes in some gonadotropic hormones. However, the weight of evidence does not indicate toluene is a reproductive hazard to humans. Studies in laboratory animals indicate some changes in reproductive organs following high levels of exposure, but no significant effects on mating performance or reproduction were observed. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects. Findings in laboratory animals were largely negative. Positive findings include small increases in minor skeletal and visceral malformations and developmental delays following very high levels of maternal exposure. Studies of workers indicate long-term exposure may be related to effects on the liver, kidney and blood, but these appear to be limited to changes in serum enzymes and decreased leukocyte counts. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland following very high levels of exposure. The relevance of these findings to humans is not clear at this time.

Xylene, all isomers

Effects from Acute Exposure:

ORAL (LD₅₀), Acute: 4,300 mg/kg [Rat].

INHALATION (LC₅₀), Acute: 4,550 ppm for four hours [Rat].

DERMAL (LD₅₀), Acute: 14,100 uL/kg [Rabbit].

Overexposure to xylene may cause upper respiratory tract irritation, headache, cyanosis, blood serum changes, CNS damage and narcosis. Effects may be increased by the use of alcoholic beverages. Evidence of liver and kidney impairment were reported in workers recovering from a gross over-exposure.

Effects from Prolonged or Repeated Exposure:

Impaired neurological function was reported in workers exposed to solvents including xylene. Studies in laboratory animals have shown evidence of impaired hearing following high levels of exposure. Studies in laboratory animals suggest some changes in reproductive organs following high levels of exposure but no significant effects on reproduction were observed. Studies in laboratory animals indicate skeletal and visceral malformations, developmental delays, and increased fetal resorptions following extremely high levels of maternal exposure. Adverse effects on the liver, kidney, bone marrow (changes in blood cell parameters) were observed in laboratory animals following high levels of exposure. The relevance of these observations to humans is not clear at this time.

1, 3-Butadiene

ORAL (LD50): Acute: 5480 mg/kg [Rat].

Studies of Workers Exposed to Butadiene:

Studies show evidence that over-exposure may be associated with an increased incidence of cancers of lymphohematopoietic organ systems, including leukemia.

Studies in Laboratory Animals:

Studies indicate that prolonged, repeated exposure to high levels of butadiene can cause

637 Feed to R1 & R2 Reactors

cancer in multiple organs including lymphohematopoietic organ systems. Studies indicate that exposure to high levels of butadiene can cause chromosome damage to somatic and germ cells. Some studies also show limited evidence that exposure to butadiene may induce heritable mutations. Studies show evidence of adverse effects on male and female reproductive organs following exposure to high levels of butadiene. Embryotoxicity has been reported. Effects included increased rates of fetal death and skeletal variations.

Ethylbenzene

Effects from Acute Exposure:

ORAL (LD50), Acute: 3,500 mg/kg [Rat].

DERMAL (LD50), Acute: 17,800 uL/kg [Rabbit].

INTRAPERITONEAL (LD50), Acute: 2,624 mg/kg [Rat].

Effects from Prolonged or Repeated Exposure:

Findings from a 2-year inhalation study in rodents conducted by NTP were as follows: Effects were observed only at the highest exposure level (750 ppm). At this level the incidence of renal tumors was elevated in male rats (tubular carcinomas) and female rats (tubular adenomas). Also, the incidence of tumors was elevated in male mice (alveolar and bronchiolar carcinomas) and female mice (hepatocellular carcinomas). IARC has classified ethyl benzene as "possibly carcinogenic to humans" (Group 2B). Studies in laboratory animals indicate some evidence of post-implantation deaths following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate limited evidence of renal malformations, resorptions, and developmental delays following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland.

Hydrogen Sulfide

INHALATION (LC50): Acute: 444 ppm 1 hour(s) [Rat]. 673 ppm 1 hour(s) [Mouse].

Hydrogen Sulfide (H₂S) has an unpleasant odor that diminishes with increased concentrations. Eye irritation can occur at concentrations above four ppm. Olfactory fatigue occurs rapidly at concentrations above 50. Accordingly, odor is not a reliable warning property. Symptoms increase with exposures above 50 ppm. Respiratory effects including irritation with possible pulmonary edema can occur with exposure above 50 ppm. At concentrations above 500 ppm, an immediate loss of consciousness, depressed respiration and death can occur. NIOSH has determined that H₂S concentrations at or above 100 ppm are immediately dangerous to life and health.

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity	No data.
Environmental Fate	This product will normally float on water. Components will evaporate rapidly. This material may be harmful to aquatic organisms and may cause long term adverse effects in the aquatic environment. The log Kow value for this product is expected to be in the range of 3.3 to 6.

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

637 Feed to R1 & R2 Reactors

Maximize material recovery for reuse or recycling. Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. Conditions of use may cause this material to become a "hazardous waste", as defined by federal or state regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal.

Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304 Emergency Planning and Notification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: fire, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard
SARA 313 Toxic Chemical Notification and Release Reporting	This product contains the following components in concentrations above de minimis levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: n-Hexane [CAS No.: 110-54-3] Concentration: 6.8% Cyclohexane [CAS No.: 110-82-7] Concentration: 3% Benzene [CAS No.: 71-43-2] Concentration: 2.9% Toluene [CAS No.: 108-88-3] Concentration: 2.8% Xylene, all isomers [CAS No.: 1330-20-7] Concentration: 2.7% Ethylbenzene [CAS No.: 100-41-4] Concentration: 0.5%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are: n-Hexane [CAS No.: 110-54-3] RQ = 5000 lb. (2268 kg) Concentration: 6.8% Cyclohexane [CAS No.: 110-82-7] RQ = 1000 lb. (453.6 kg) Concentration: 3% Benzene [CAS No.: 71-43-2] RQ = 10 lb. (4.536 kg) Concentration: 2.9% Toluene [CAS No.: 108-88-3] RQ = 1000 lb. (453.6 kg) Concentration: 2.8% Xylene, all isomers [CAS No.: 1330-20-7] RQ = 100 lb. (45.36 kg) Concentration: 2.7% Ethylbenzene [CAS No.: 100-41-4] RQ = 1000 lb. (453.6 kg) Concentration: 0.516% Hydrogen Sulfide [CAS No.: 7783-06-4] RQ = 100 lb. (45.36 kg) Concentration: 0.18%

637 Feed to R1 & R2 Reactors

Clean Water Act (CWA)	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material may contain the following components which are known to the State of California to cause cancer, birth defects or other reproductive harm, and may be subject to the requirements of California Proposition 65 (CA Health & Safety Code Section 25249.5): Benzene: 2.93% Toluene: 2.79% 1, 3-Butadiene: 0.9% Ethylbenzene: 0.516%
New Jersey Right-to-Know Label	For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.
Additional Regulatory Remarks	No additional regulatory remarks.

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number	2.0
Revision Date	2/25/2005
Print Date	Printed on 2/25/2005.

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Biphasic (gas/liquid)

Color Amber to dark amber **Odor** Hydrocarbon. Rotten eggs. (Strong.)

DANGER

EXTREMELY FLAMMABLE AND POISONOUS GAS.

Contains hydrogen sulfide gas.

May be fatal if inhaled.

Vapor may travel considerable distance to source of ignition and flash back.

Hydrogen can burn with an invisible flame.

Harmful or fatal if swallowed - can enter lungs and cause damage.

Breathing high concentrations can cause irregular heartbeats which may be fatal.

Suspect cancer hazard.

Repeated or excessive exposure to certain components of this mixture have been associated with central nervous system effects.

Harmful to aquatic organisms.

Protective Equipment

Minimum Recommended
See Section 8 for Details

Minimum PPE reflects the requirements for this material at this facility:
LYONDELL-CITGO Refining
LP Manufacturing Complex

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	637 Reactor Effluent	Technical Contact	(800) 525-4692
Product Number	Not available.	Medical Emergency	(800) 313-7645
CAS Number	Mixture.	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Not applicable.		
Synonyms	ScanFiner Reactor Effluent, 637 R2 Reactor Effluent		

SECTION 2. COMPOSITION (TYPICAL)

This product may be composed, in whole or in part, of any of the following refinery streams:

Light Thermal Cracked Naphtha (Petroleum) [CAS No.: 64741-74-8]

Light Catalytic Cracked Naphtha [CAS No.: 64741-55-5]

This product contains the following chemicals as components of the refinery streams listed above:

Component Name(s)	CAS Registry No.	Concentration (%)
-------------------	------------------	-------------------

637 Reactor Effluent

Hexane, other isomers	Mixture	5.7 - 17.8
C6-C9 alpha-Alkenes	68526-99-8	4.72 - 14.65
n-Hexane	110-54-3	1.91 - 11.75
Cyclohexane	110-82-7	1 - 5
Benzene	71-43-2	1 - 4.86
Hydrocarbons, C5-Rich	68476-55-1	2.1 - 3.5
Toluene	108-88-3	0.93 - 4.65
Butenes or Butylenes	25167-67-3	0.93 - 4.65
Xylene, all isomers	1330-20-7	0.93 - 4.51
Octanes, all isomers	Mixture	0.93 - 4.51
Hydrogen	1333-74-0	2
1, 3-Butadiene	106-99-0	<1
Trimethylbenzenes, all isomers	25551-13-7	0.43 - 1.29
Ethylmethylbenzene, all isomers	25550-14-5	0.43 - 1.29
Methylcyclopentane	96-37-7	0.07 - 1.4
Heptane, all isomers	142-82-5	0.35 - 1.05
Butanes	Mixture	0.07 - 1.05
Pentanes, all isomers	Mixture	0.07 - 1.05
Ethylbenzene	100-41-4	0.172 - 0.86
Hydrogen Sulfide	7783-06-4	0.3 - 0.5

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Inhalation. Ingestion

Signs and Symptoms of Acute Exposure

Inhalation	<p>May be harmful or fatal if inhaled. Contains hydrogen sulfide. Inhalation of gas or vapor may cause severe nose, throat, respiratory tract, and lung irritation, respiratory paralysis, and death, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath.</p> <p>Breathing this material may cause central nervous system depression with symptoms including nausea, headache, dizziness, fatigue, drowsiness, or unconsciousness.</p> <p>Breathing high concentrations of this material, for example, in an enclosed space or by intentional abuse, can cause irregular heartbeats which can cause death.</p>
Eye Contact	<p>This material can cause eye irritation with tearing, redness, or a stinging or burning feeling. Further, it can cause swelling of the eyes with blurred vision. Effects may become more serious with repeated or prolonged contact.</p>
Skin Contact	<p>May cause skin irritation with redness, an itching or burning feeling, and swelling of the skin. Effects may become more serious with repeated or prolonged contact.</p> <p>Skin contact may cause harmful effects in other parts of the body.</p>
Ingestion	<p>Swallowing this material may be harmful.</p> <p>Swallowing this material may cause stomach or intestinal upset with pain, nausea, and/or diarrhea.</p> <p>This material can get into the lungs during swallowing or vomiting. Small amounts in the lungs can cause lung damage, possibly leading to chronic lung dysfunction or death.</p> <p>Swallowing this material may cause effects similar to those described in the inhalation section (see "inhalation" above).</p>
Chronic Health Effects Summary	<p>Subacute exposure to low levels of hydrogen sulfide can produce eye irritation, watering, light sensitivity and corneal opacity. Reported effects from subacute exposure also include bronchitis, pulmonary edema, nausea, abdominal cramps and diarrhea.</p> <p>Aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Altered mental state, drowsiness, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been reported from repeated over-exposure such as gasoline and naphtha abusers.</p> <p>Repeated and prolonged overexposure to n-Hexane has been associated with peripheral nerve tissue damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor</p>

637 Reactor Effluent

function and paralysis.

This material, or a component of this material, has been shown to cause cancer in laboratory animals. However it is not likely to represent a human cancer hazard.

See Toxicological Information (Section 11)

Conditions Aggravated by Exposure Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Peripheral Nervous System, Central Nervous System (CNS), Heart (Cardiac)

Target Organs Contains material which may cause damage to the following organs: blood, kidneys, lungs, the reproductive system, liver, mucous membranes, heart, lymphatic system, peripheral nervous system, upper respiratory tract, immune system, skin, , bone marrow, central nervous system (CNS), eye, lens or cornea, testes.

Carcinogenic Potential **CARCINOGENIC EFFECTS** Classified 1 (Proven for human.) by IARC, + (Proven.) by OSHA [Benzene]. Classified + (Proven.) by OSHA+ (Proven.) by NIOSH [1, 3-Butadiene]. Classified A2 (Suspected for human.) by ACGIH, 2A (Probable for human.) by IARC [1, 3-Butadiene]. Classified 2B (Possible for human.) by IARC [Ethylbenzene].

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>

Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.

Eye Contact Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.

Skin Contact Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.

Ingestion Do not induce vomiting unless directed to do so by medical personnel -- this material is an aspiration hazard. Get immediate medical attention. Never give anything by mouth to an unconscious person.

Notes to Physician INHALATION: Inhalation overexposure can produce toxic effects. Treat intoxications as hydrogen sulfide exposures. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Administer supplemental oxygen with assisted ventilation, as required.

This material (or a component) sensitizes the heart to the effects of sympathomimetic amines. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias in individuals

637 Reactor Effluent

exposed to this material. Administration of sympathomimetic drugs should be avoided.

INGESTION: If ingested, this material presents a significant aspiration and chemical pneumonitis hazard. Induction of emesis is not recommended. Consider activated charcoal and/or gastric lavage. If patient is obtunded, protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position.

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	NFPA Class-IB flammable liquid.		
Flash Point	Open cup: <-45°C (-49°F).		
Lower Flammable Limit	AP 1 %	Upper Flammable Limit	Not Available
Autoignition Temperature	The lowest known value is 225°C (437°F) (n-Hexane).		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons and oxides of sulfur and/or nitrogen.		
Special Properties	This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.		
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.		

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Compressed Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Remove all potential ignition sources. Safely stop the source gas flow using non-sparking tools. Allow any entrained liquid spills to evaporate. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. Do not enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during response operations. This gas may travel great distances and be ignited by a remote ignition source.

637 Reactor Effluent

SECTION 7. HANDLING AND STORAGE

Handling

This gas mixture contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring for oxygen deficiency and flammability.

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of mixed gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Drain and purge equipment, as necessary, to remove material residues. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Do not allow vaporizing material to contact eyes, skin or other tissues. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated.

Storage

Do not store this material near heat or any other potential ignition sources. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Do not store this product in unlabeled containers. Keep containers tightly closed.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Both local exhaust and general room ventilation may be essential in work areas to prevent accumulation of potentially explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are located near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling liquefied gases. Safety glasses equipped with side shields or face shield are recommended when vapor is being discharged or whenever handling high-pressure cylinders and piping systems.

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves to protect hands from potential contact with cold liquid, solid, or vapors.

637 Reactor Effluent

- Body Protection** Prevent potential skin contact with cold liquid or vapors. Use insulated and chemical-resistant clothing (apron, slicker suit, coveralls, boots, etc.). Fire-retardant garments (e.g. Nomex®) should be worn while working with flammable gases and gas/liquids.
- Respiratory Protection** Odor is not an adequate warning for potentially hazardous air concentrations. For unknown vapor concentrations, use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator, if adequate protection is provided. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).
- General Comments** Warning! Use of this material in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and/or inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
Hexane, other isomers	ACGIH (United States). TWA: 500 ppm 8 hour(s). STEL: 1000 ppm 15 minute(s).
C6-C9 alpha-Alkenes n-Hexane	Not available. ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
Cyclohexane	ACGIH (United States). TWA: 100 ppm 8 hour(s). OSHA (United States). TWA: 300 ppm 8 hour(s).
Benzene	ACGIH (United States). Skin TWA: 0.5 ppm 8 hour(s). STEL: 2.5 ppm 15 minute(s). OSHA (United States). Skin Notes: See Table Z-2 for exclusions in 20 CFR 1910.1028 to the PEL. TWA: 1 ppm 8 hour(s). STEL: 5 ppm 15 minute(s).
Hydrocarbons, C5-Rich Toluene	Not available. ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 200 ppm 8 hour(s). CEIL: 300 ppm PEAK: 500 ppm
Butenes or Butylenes Xylene, all isomers	Not available. ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 150 ppm 15 minute(s). OSHA (United States). TWA: 100 ppm 8 hour(s).
Octanes, all isomers	ACGIH (United States). TWA: 300 ppm 8 hour(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
1, 3-Butadiene	ACGIH (United States). Notes: "A2" Suspected Human Carcinogen TWA: 2 ppm 8 hour(s). OSHA (United States). Notes: "Z-2" Suspected Human Carcinogen TWA: 2 ppm 8 hour(s). Action Level: 1 ppm 8 hour(s). STEL: 5 ppm 15 minute(s).

637 Reactor Effluent

Trimethylbenzenes, all isomers	ACGIH (United States). TWA: 25 ppm 8 hour(s).
Ethylmethylbenzene, all isomers	Not available.
Methylcyclopentane	Not available.
Heptane, all isomers	ACGIH (United States). TWA: 400 ppm 8 hour(s). STEL: 500 ppm 15 minute(s). OSHA (United States). TWA: 500 ppm 8 hour(s). ACGIH (United States). TWA: 600 ppm 8 hour(s). OSHA (United States). TWA: 1000 ppm 8 hour(s).
Pentanes, all isomers	ACGIH (United States). TWA: 800 ppm 8 hour(s). ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 125 ppm 15 minute(s). OSHA (United States). TWA: 100 ppm 8 hour(s).
Butanes	ACGIH TLV (United States). TWA: 10 ppm 8 hour(s). STEL: 15 ppm 15 minute(s). OSHA (United States). CEIL: 20 ppm 8 hour(s). STEL: 50 ppm 15 minute(s). Form: *10 minute peak; once per 8 hour shift
Ethylbenzene	Not available.
Hydrogen Sulfide	Not available.
Light Thermal Cracked Naphtha (Petroleum)	Not available.
Light Aliphatic Naphthas, Sour (family)	Not available.

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Biphasic (gas/liquid)	Color	Amber to dark amber	Odor	Hydrocarbon. Rotten eggs. (Strong.)
Specific Gravity	Weighted average: 0.75 (Water = 1)	pH	Not Applicable.	Vapor Density	The highest known value is 3.1 (Air = 1) (Toluene). Weighted average: 2.98 (Air = 1)
Boiling Range	The lowest known value is 69°C (156.2°F) (n-Hexane). Weighted average: 81.05°C (177.9°F)	Melting/Freezing Point			Not available.
Vapor Pressure	The highest known value is 16.5 kPa (124 mm Hg) (at 20°C) (n-Hexane). Weighted average: 8.4 kPa (63.01 mm Hg) (at 20°C)	Volatility			
Solubility in Water	Very slightly soluble in cold water. (<0.1 % w/w)	Viscosity (cSt @ 40°C)			not available
Flash Point	Open cup: <-45°C (-49°F).				
Additional Properties	No additional information.				

637 Reactor Effluent

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

n-Hexane

This material contains n-hexane. Long-term or repeated exposure to n-hexane can cause peripheral nerve damage. Initial symptoms are numbness of the fingers and toes. Also, motor weakness can occur in the digits, but may also involve muscles of the arms, thighs and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure.

Cyclohexane

Cyclohexane can cause eye, skin and mucous membrane irritation, CNS depressant and narcosis at elevated concentrations. In experimental animals exposed to lethal concentrations by inhalation or oral route, generalized vascular damage and degenerative changes in the heart, lungs, liver, kidneys and brain were identified.

Cyclohexane has been the focus of substantial testing in laboratory animals. Cyclohexane was not found to be genotoxic in several tests including unscheduled DNA synthesis, bacterial and mammalian cell mutation assays, and in vivo chromosomal aberration. An increase in chromosomal aberrations in bone marrow cells of rats exposed to cyclohexane was reported in the 1980's. However, a careful re-evaluation of slides from this study by the laboratory which conducted the study indicates these findings were in error, and that no significant chromosomal effects were observed in animals exposed to cyclohexane. Findings indicate long-term exposure to cyclohexane does not promote dermal tumorigenesis.

Benzene

ORAL (LD50): Acute: 930 mg/kg [Rat]. 4700 mg/kg [Mouse].
 INHALATION (LC50):
 (VAPOR): Acute: 10000 ppm 7 hour(s) [Rat]. 9980 ppm 8 hour(s) [Mouse].

Studies of Workers Over-Exposed to Benzene:

Studies of workers exposed to benzene show clear evidence that over-exposure can cause cancer of the blood forming organs (acute myelogenous leukemia) and aplastic anemia, an often fatal disease. Studies also suggest over-exposure to benzene may be associated with other types of leukemia and other blood disorders. Some studies of workers exposed to benzene have shown an association with increased rates of chromosome aberrations in circulating lymphocytes. One study of women workers exposed to benzene suggested a weak association with irregular menstruation. However, other studies of workers exposed to benzene have not demonstrated clear evidence of an effect on fertility or reproductive outcome in humans. Benzene can cross the placenta and affect the developing fetus. Cases of aplastic anemia have been reported in the offspring of persons severely over-exposed to benzene.

Studies in Laboratory Animals:

Studies in laboratory animals indicate that prolonged, repeated exposure to high levels of

637 Reactor Effluent

benzene vapor can cause bone marrow suppression and cancer in multiple organ systems. Studies in laboratory animals show evidence of adverse effects on male reproductive organs following high levels of exposure but no significant effects on reproduction have been observed. Embryotoxicity has been reported in studies of laboratory animals but effects were limited to reduced fetal weight and skeletal variations.

Toluene:

Effects from Acute Exposure:

Deliberate inhalation of toluene at high concentrations (e.g., glue sniffing and solvent abuse) has been associated with adverse effects on the liver, kidney and nervous system and can cause CNS depression, cardiac arrhythmias and death. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects.

Effects from Repeated or Prolonged Exposure:

Studies of workers indicate long-term exposure may be related to impaired color vision and hearing. Some studies of workers suggest long-term exposure may be related to neurobehavioral and cognitive changes. Some of these effects have been observed in laboratory animals following repeated exposure to high levels of toluene. Several studies of workers suggest long-term exposure may be related to small increases in spontaneous abortions and changes in some gonadotropic hormones. However, the weight of evidence does not indicate toluene is a reproductive hazard to humans. Studies in laboratory animals indicate some changes in reproductive organs following high levels of exposure, but no significant effects on mating performance or reproduction were observed. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects. Findings in laboratory animals were largely negative. Positive findings include small increases in minor skeletal and visceral malformations and developmental delays following very high levels of maternal exposure. Studies of workers indicate long-term exposure may be related to effects on the liver, kidney and blood, but these appear to be limited to changes in serum enzymes and decreased leukocyte counts. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland following very high levels of exposure. The relevance of these findings to humans is not clear at this time.

Xylene, all isomers

Effects from Acute Exposure:

ORAL (LD₅₀), Acute: 4,300 mg/kg [Rat].

INHALATION (LC₅₀), Acute: 4,550 ppm for four hours [Rat].

DERMAL (LD₅₀), Acute: 14,100 uL/kg [Rabbit].

Overexposure to xylene may cause upper respiratory tract irritation, headache, cyanosis, blood serum changes, CNS damage and narcosis. Effects may be increased by the use of alcoholic beverages. Evidence of liver and kidney impairment were reported in workers recovering from a gross over-exposure.

Effects from Prolonged or Repeated Exposure:

Impaired neurological function was reported in workers exposed to solvents including xylene. Studies in laboratory animals have shown evidence of impaired hearing following high levels of exposure. Studies in laboratory animals suggest some changes in reproductive organs following high levels of exposure but no significant effects on reproduction were observed. Studies in laboratory animals indicate skeletal and visceral malformations, developmental delays, and increased fetal resorptions following extremely high levels of maternal exposure. Adverse effects on the liver, kidney, bone marrow (changes in blood cell parameters) were observed in laboratory animals following high levels of exposure. The relevance of these observations to humans is not clear at this time.

1, 3-Butadiene

ORAL (LD50): Acute: 5480 mg/kg [Rat].

Studies of Workers Exposed to Butadiene:

Studies show evidence that over-exposure may be associated with an increased incidence of cancers of lymphohematopoietic organ systems, including leukemia.

Studies in Laboratory Animals:

Studies indicate that prolonged, repeated exposure to high levels of butadiene can cause

637 Reactor Effluent

cancer in multiple organs including lymphohematopoietic organ systems.

Studies indicate that exposure to high levels of butadiene can cause chromosome damage to somatic and germ cells. Some studies also show limited evidence that exposure to butadiene may induce heritable mutations.

Studies show evidence of adverse effects on male and female reproductive organs following exposure to high levels of butadiene. Embryotoxicity has been reported. Effects included increased rates of fetal death and skeletal variations.

Ethylbenzene

Effects from Acute Exposure:

ORAL (LD50), Acute: 3,500 mg/kg [Rat].

DERMAL (LD50), Acute: 17,800 uL/kg [Rabbit].

INTRAPERITONEAL (LD50), Acute: 2,624 mg/kg [Rat].

Effects from Prolonged or Repeated Exposure:

Findings from a 2-year inhalation study in rodents conducted by NTP were as follows: Effects were observed only at the highest exposure level (750 ppm). At this level the incidence of renal tumors was elevated in male rats (tubular carcinomas) and female rats (tubular adenomas). Also, the incidence of tumors was elevated in male mice (alveolar and bronchiolar carcinomas) and female mice (hepatocellular carcinomas). IARC has classified ethyl benzene as "possibly carcinogenic to humans" (Group 2B). Studies in laboratory animals indicate some evidence of post-implantation deaths following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate limited evidence of renal malformations, resorptions, and developmental delays following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland.

Hydrogen Sulfide

INHALATION (LC50): Acute: 444 ppm 1 hour(s) [Rat]. 673 ppm 1 hour(s) [Mouse].

Hydrogen Sulfide (H₂S) has an unpleasant odor that diminishes with increased concentrations. Eye irritation can occur at concentrations above four ppm. Olfactory fatigue occurs rapidly at concentrations above 50. Accordingly, odor is not a reliable warning property. Symptoms increase with exposures above 50 ppm. Respiratory effects including irritation with possible pulmonary edema can occur with exposure above 50 ppm. At concentrations above 500 ppm, an immediate loss of consciousness, depressed respiration and death can occur. NIOSH has determined that H₂S concentrations at or above 100 ppm are immediately dangerous to life and health.

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity

No data.

Environmental Fate

This product will normally float on water. Components will evaporate rapidly. This material may be harmful to aquatic organisms and may cause long term adverse effects in the aquatic environment. The log Kow value for this product is expected to be in the range of 3.3 to 6.

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

637 Reactor Effluent

Maximize material recovery for reuse or recycling. Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. Conditions of use may cause this material to become a "hazardous waste", as defined by federal or state regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal.

Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304 Emergency Planning and Notification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: fire, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard
SARA 313 Toxic Chemical Notification and Release Reporting	This product contains the following components in concentrations above de minimis levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: n-Hexane [CAS No.: 110-54-3] Concentration: 6.8% Cyclohexane [CAS No.: 110-82-7] Concentration: 3% Benzene [CAS No.: 71-43-2] Concentration: 2.9% Toluene [CAS No.: 108-88-3] Concentration: 2.8% Xylene, all isomers [CAS No.: 1330-20-7] Concentration: 2.7% Ethylbenzene [CAS No.: 100-41-4] Concentration: 0.5%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are: n-Hexane [CAS No.: 110-54-3] RQ = 5000 lb. (2268 kg) Concentration: 6.8% Cyclohexane [CAS No.: 110-82-7] RQ = 1000 lb. (453.6 kg) Concentration: 3% Benzene [CAS No.: 71-43-2] RQ = 10 lb. (4.536 kg) Concentration: 2.9% Toluene [CAS No.: 108-88-3] RQ = 1000 lb. (453.6 kg) Concentration: 2.8% Xylene, all isomers [CAS No.: 1330-20-7] RQ = 100 lb. (45.36 kg) Concentration: 2.7% Ethylbenzene [CAS No.: 100-41-4] RQ = 1000 lb. (453.6 kg) Concentration: 0.516% Hydrogen Sulfide [CAS No.: 7783-06-4] RQ = 100 lb. (45.36 kg) Concentration: 0.18%

637 Reactor Effluent**Clean Water Act (CWA)**

This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

California Proposition 65

This material may contain the following components which are known to the State of California to cause cancer, birth defects or other reproductive harm, and may be subject to the requirements of California Proposition 65 (CA Health & Safety Code Section 25249.5):

Benzene: 2.93%

Toluene: 2.79%

1, 3-Butadiene: 0.9%

Ethylbenzene: 0.516%

New Jersey Right-to-Know Label

For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.

Additional Regulatory Remarks

No additional regulatory remarks.

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 2.0

Revision Date 2/25/2005

Print Date Printed on 2/25/2005.

Thermocracked Tail Gases (C1-C5 Hydrocarbons) Material Safety Data Sheet

LYONDELL-CITGO Refining LP
 12000 Lawndale Avenue
 P.O. Box 2451
 Houston, TX 77252-2451

MSDS No. RS0051
 Revision Date 06/27/2002

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquefied Gas
Color Colorless liquid; invisible gas and vapor; white frost at release point. **Odor** Faint, unpleasant.

DANGER! High pressure and rapid diffusion hazard!
 Extremely flammable gas/liquid; vapor may cause flash fire or explosion!
 High vapor concentrations reduce oxygen available for breathing!
 May cause central nervous system (CNS) depression or suffocation!
 Liquid or compressed gas contact may cause frostbite or freeze burns!
 Vapor or mist may irritate mucous membranes and respiratory tract!
 Liquid contact may cause mild to moderate eye and/or skin irritation!
 May be harmful or fatal if inhaled or absorbed through the skin!
 Overexposures may cause target organ effects such as lung, brain, liver, and/or kidney damage!
 Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!

SECTION 1: IDENTIFICATION

Trade Name	Thermocracked Tail Gases (C1-C5 Hydrocarbons)	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	071808305*	Medical Emergency	(918) 495-4700
CAS Number	71808-30-5 or 68476-85-7	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Liquefied Petroleum Gas (LPG or LP-Gas)		
Synonyms	Delayed Coker Unit Tail Gases; C1-C5 Alkane, Isoparaffin, and Alkene Hydrocarbons Mixture; Thermal Cracker Absorber Tail Gas (Petroleum); Thermocracker Fractionation Stabilizer Tail Gas (Petroleum); Thermocracker Fractionation Reflux Drum Tail Gas (Petroleum).		

Thermocracked Tail Gases (C1-C5 Hydrocarbons)

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Coker Tail Gases (Petroleum)	71808-30-5	100
2) Liquefied Petroleum Gases	68476-85-7	100
3) Methane	74-82-8	1-10
4) Ethane	74-84-0	5-15
5) Ethylene	74-85-1	1-10
6) Propane	74-98-6	10-30
7) Propylene	115-07-1	5-15
8) Isobutane	75-28-5	10-20
9) Butenes or Butylenes	25167-67-3	5-15
10) n-Butane	106-97-8	10-40
11) Iso-Pentane	78-78-4	1-15
12) Pentenes or Pentylenes	68527-11-7	0.5-1.5
13) n-Pentane	109-66-0	1-10

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Skin contact. Eye contact.

Signs and Symptoms of Acute Exposure

Inhalation	At least one component of this gas/liquid mixture is a "simple asphyxiant" (see Section 8). High concentrations of this mixture can displace the amount of oxygen in air available to breathe below that necessary to sustain life (hypoxia), especially if working in confined spaces. Breathing vapors may also cause central nervous system (CNS) depression. Symptoms may include headache, dizziness, slurred speech, excitation or giddiness, nausea, vomiting, visual disturbances, memory loss, confusion, vertigo, drowsiness, fatigue, rapid or difficult breathing, muscular weakness, loss of consciousness, convulsions, coma, and even death, depending upon the concentration and duration of exposure.
Eye Contact	Direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn." Prolonged or repeated vapor exposure may cause irritation. This is based upon animal test results for this product's heavier components.
Skin Contact	Direct contact with a liquefied/pressurized gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. The liquid form may cause mild to moderate skin irritation and inflammation.
Ingestion	Due to its volatile nature, ingestion is not normally an applicable route of exposure for this liquefied gas mixture. However, if swallowed, this material may "freeze burn" the mucous membranes of the mouth, throat, and esophagus or be aspirated into the lungs. Aspiration can result in severe lung damage or death. Cardiovascular effects include shallow rapid pulse and pallor followed by flushing. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may result in death.
Chronic Health Effects Summary	Chronic inhalation to components of this liquefied gas (propane, n-butane, and n-pentane) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline)-like drugs.
Conditions Aggravated by Exposure	Personnel with pre-existing chronic respiratory diseases, central nervous system (CNS) disease, high blood pressure, cardiovascular conditions, or skin disorders should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this liquefied gas mixture. They should take additional precautions to minimize or avoid exposure.
Target Organs	This substance is toxic to eyes, skin, mucous membranes, lungs, central nervous system, brain, heart, and possibly, the liver and/or kidneys.
Carcinogenic Potential	This material does not contain any components at concentrations at or above 0.1% which are considered to be carcinogenic by OSHA, IARC, or NTP.

Thermocracked Tail Gases (C1-C5 Hydrocarbons)

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).									
OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	If cough or difficulty in breathing develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. Monitor arterial blood gases and chest x-ray in cases with significant exposure. If contact with pressurized or liquefied gas causes frostbite of the eyes, early ophthalmologic consultation is recommended. This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines and other sympathomimetic drugs such as epinephrine (adrenaline) should be reserved for emergency situations and then used only with special precaution.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas.		
Flash Point Method	CLOSED CUP: < -60°C (-76°F). (Estimated)		
Lower Flammable Limit	AP 1.4%	Upper Flammable Limit	AP 12.5%
Autoignition Temperature	AP 288°C (550°F)		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, and unburned hydrocarbon vapors.		
Special Properties	This liquefied gas is extremely flammable at well below ambient temperatures and readily forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. Some components are lighter than air and rise rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, this material will burn in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources!		

Thermocracked Tail Gases (C1-C5 Hydrocarbons)

Extinguishing Media

DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.

Protection of Fire Fighters

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquefied Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This liquefied gas or waste mixtures containing this material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling

This liquefied gas mixture contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring for oxygen deficiency and flammability.

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of mixed gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Drain and purge equipment as necessary to remove material residues. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Do not allow vaporizing material to contact eyes, skin or other tissues. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated.

Thermocracked Tail Gases (C1-C5 Hydrocarbons)

Storage Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling liquefied gases. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with cold liquid, solid, or vapors.

Body Protection Prevent potential skin contact with cold liquid or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection Odor is not an adequate warning for potentially hazardous air concentrations! Use a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. Air purifying respirators offer no protection against oxygen deficient atmospheres. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).

General Comments For an explanation about some of the occupational exposure limits shown below, refer to the definition of "Simple Asphyxiant" presented in the American Conference of Governmental Industrial Hygienists (ACGIH) most current Threshold Limit Values (TLVs) for Chemical Substances and Physical Agents handbook. Releases of this liquefied gas mixture may create flammable, explosive, and/or oxygen-deficient atmospheres (LT 19.5 Vol.% in air). DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Thermocracked Tail Gases (C1-C5 Hydrocarbons)

Substance	Applicable Workplace Exposure Levels
1) Methane	Simple asphyxiant.
2) Ethane	Simple asphyxiant.
3) Ethylene	Simple asphyxiant.
4) Propylene	Simple asphyxiant.
5) Propane	TWA: 2500 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL) [Proposed]
6) Butanes	TWA: 800 (ppm) from ACGIH (TLV) TWA: 800 (ppm) from OSHA (PEL) [Proposed]
7) Pentane, all isomers	TWA: 600 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL)
8) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL) [Proposed]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquefied Gas	Color	Colorless liquid; invisible gas and vapor; white frost at release point.	Odor	Faint, unpleasant.
Specific Gravity	0.40 to 0.53 (Water = 1)	pH	Not applicable.	Vapor Density	0.5 to 1.0 (Air = 1)
Boiling Point/Range	-253° to 36°C (-423° to 97°F) at 14.7 psia [ASTM D-2887]			Melting/Freezing Point	-260° to -129°C (-435° to -200°F) at 14.7 psia
Vapor Pressure	100 to 205 psia at 40°C (104°F)			Viscosity (cSt @ 40°C)	Not applicable.
Solubility in Water	Slightly soluble in cold water.			Volatile Characteristics	This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.

Additional Properties This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard.
Gross Heat of Combustion at 60°F = AP 22,000 to 25,000 Btu/lb or 1,000 to 2,000 Btu/cu.ft.;
Dry Point Temperature = AP 82°F (28°C) [ASTM D-86];
Average Density at 60°F = < 5.0 lbs./gal. [ASTM D-2161].

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	<p>Propylene: GAS (LC₅₀): Chronic: 1,250 ppm for 6 hours/day for 14 weeks [Mouse]. GAS (TC₁₀): Chronic: 5,000 ppm for 6 hours/day for 2 years [Rat] - Reduced olfactory sensory response.</p> <p>Iso-Butane: GAS (TC₁₀): Acute: 1,040 gm/m³ for 2 hours [Mouse] - Excitement. GAS (LC₅₀): Acute: 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress.</p> <p>Iso-Butene (Isobutylene or 2-Methylpropene): GAS (LC₅₀): Acute: 415 gm/m³ for 2 hours [Mouse]. GAS (LC₅₀): Acute: 620 gm/m³ for 4 hours [Rat].</p>
----------------------	--

Thermocracked Tail Gases (C1-C5 Hydrocarbons)

n-Butane:

GAS (LC₅₀): Acute: 658,000 mg/m³ for 4 hours [Rat]

GAS (LC₅₀): Acute: 680,000 mg/m³ for 2 hours [Mouse].

n-Pentane:

GAS (LC₅₀): Acute: 364,000 mg/m³ for 4 hours [Rat] - Excitement.

INTRAVENOUS (LD₅₀): Acute: 446 mg/kg [Mouse].

Exposure to 1,000 ppm of propane for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on liquefied petroleum gas, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline).

In humans, at concentrations of 6.4% in air or higher, propylene causes mild intoxication, dermal sensations, and an inability to concentrate on tasks within two minutes. Gross inhalation of propylene concentrations of 40% or higher for a couple minutes cause reddening of the eyelids and face, tearing, coughing, and sometimes flexing of the legs, reduced blood pressure, and/or disordered heart rhythm. A concentration of 50% causes anesthesia in two minutes, followed by complete recovery without any physiological indications.

Chronic low-level exposures to propylene may entail a possible hazard from the formation of a reactive metabolite, propylene oxide, which is a "suspect human carcinogen". However, propylene have not been shown to be carcinogenic in rat studies. For example, propylene was tested by the National Cancer Institute (NCI) in a two-year, 6 hours/day, 5 days/week inhalation study using rats and mice with exposure concentrations at 5,000 and 10,000 ppm. The resulting data suggested that propylene induces signs of nasal cavity toxicity (epithelial hyperplasia/metaplasia) including increased incidence of neo-plastic lesions in rats, but not in mice. Propylene is NOT considered carcinogenic to either rats or mice even though it may be partially metabolized to propylene oxide which has been shown to be mutagenic and produces site of contact tumors in rodents following long-term administration. Propylene has also been found to be a cardiac sensitizer in dogs.

Human volunteers had no apparent effects from exposures of 250 ppm, 500 ppm, and 1,000 ppm concentrations in air of isobutane and n-butane for periods of 8 hours daily for 10 days to 14 days, respectively. An n-Butane exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of butane and butenes (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone. Chronic inhalation of high concentrations of isobutane may cause liver and/or kidney damage.

Inhalation of 500 ppm of isopentane or n-pentane have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of n-pentane for 10 minutes has been reported NOT to produce any ill effects; however, higher exposure concentrations of 90,000 to 120,000 ppm (9 to 12 Wt.% in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. n-Pentane caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure. Rat 28-day feeding studies on both isopentane and n-pentane using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, the ethylene, propylene, and butene components of this material will readily vaporize and may contribute to generation of atmospheric smog.

Environmental Fate

The atmospheric half-lives of ethane, ethylene, propane, propylene, and butenes under photochemical smog conditions are estimated to be between 5 to 8 hours. Experimental data shows that significant photooxidation of ethylene, propylene and butenes occurs rapidly within 7 to 21 hours. The atmospheric half-lives of the butanes under photochemical smog conditions are estimated to be between 5 and 7 days. The pentanes have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. Photooxidation of propane, isobutane, and n-butane in air (< 8%) are not considered to be environmentally significant.

Refined liquefied petroleum hydrocarbon gases are essentially insoluble in water (< 0.1%); and therefore, this material will not cause harm to aquatic life.

Thermocracked Tail Gases (C1-C5 Hydrocarbons)

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

This material may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). In addition, conditions of use may cause this material to become a hazardous waste for additional reasons, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this liquefied gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Compressed gases, flammable, n.o.s. (Butanes, Propane)		
Hazard Class	DOT Class: 2.1 (Flammable gas).	Packing Group(s)	Not applicable.
		UN/NA ID	UN1954
Reportable Quantity	The Reportable Quantity (RQ) substance component that might be present in this product which requires DOT HAZMAT bill-of-lading display is n-Hexane		
Picards	Emergency Response Guide No. 115		
		HAZMAT STCC No.	49 057 29
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. There are no chemical substances present in this material subject to this statute.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, and Acute (Immediate) & Chronic (Delayed) Health Hazards.
SARA 313	This material contains the following components in concentrations which are at or above de minimis levels and are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313: Ethylene or Ethene [CAS No. 74-85-1] concentration: 1 to 10% Propylene or Propene [CAS No. 115-07-1] concentration: 5 to 15%.

Thermocracked Tail Gases (C1-C5 Hydrocarbons)

CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "Hazardous Substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. This material does not contain any chemical substances subject to this statute. However, it is recommended that you contact state and local authorities to determine if there are any other reporting requirements in the event of a spill.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material does not contain any chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it may be not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling, refer to the components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in this material as a "Volatile Organic Compounds (VOC)" which contribute significantly to air pollution which endangers public health and welfare": Ethylene (Ethene), Propylene (Propene), 1-Butene, Isobutylene, 1-Pentane, and n-Pentane. In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this material which are subject to this statute are: Methane, Ethane, Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), Butane, various Butenes, Isopentane (Butane, 2-methyl), various Pentenes, and n-Pentane.

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Reformate Gases (C2-C6 Hydrocarbons)

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0052
Revision Date 05/28/1999

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Liquefied Gas		
Color	Colorless liquid, invisible vapor.	Odor	Faint, unpleasant.

DANGER! Extremely flammable compressed gas/liquid;
vapor may cause flash fire or explosion!
High pressure and rapid diffusion hazard!
High concentrations of vapor reduce oxygen available for breathing and
may cause central nervous system depression or suffocation!
Pressurized gas contact may cause frostbite or freeze burns!
May be harmful or fatal if inhaled or absorbed through the skin!
Vapor or mist may irritate mucous membranes and respiratory tract!
Liquid contact may cause mild to moderate eye and/or skin irritation!
Overexposures may cause target organ effects such as lung, brain,
liver, kidney, and/or peripheral nervous system damage!
Prolonged and/or repeated inhalation may increase the
heart's susceptibility to arrhythmias (irregular beats)!

SECTION 1: IDENTIFICATION

Trade Name	Reformate Gases (C2-C6 Hydrocarbons)	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	068513633*	Medical Emergency	(918) 495-4700
CAS Number	68513-63-3, 68476-47-1, 68478-15-9, and/or 68921-09-5.	CHEMTREC Emergency	(800) 424-9300
Product Family	Liquefied Petroleum Gas (LPG or LP-Gas)		
Synonyms	C2-C6 Catalytic Reformer Hydrocarbons; C2-C6 Alkane and Isoparaffin Hydrocarbons Mixture; Catalytic Reformed Straight-run Distillate (Petroleum); Platformer Product Separator Off Gas (Petroleum); Naphtha Cat Reformer Stabilizer Overhead Stream (Petroleum), Naphtha Unifiner Stripper Distillate (Petroleum).		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Catalytic Reformed Straight-run Distillate (Petroleum)	68513-63-3	100
2) Catalytic Reformer C2-C6 Hydrocarbons	68476-47-1	100
3) Liquefied Petroleum Gases	68476-85-7	100
4) Ethane	74-84-0	5-20
5) Propane	74-98-6	10-30
6) Iso-Butane	75-28-5	10-20
7) n-Butane	106-97-8	20-40
8) Iso-Pentane	78-78-4	1-10
9) n-Pentane	109-66-0	5-15
10) Hexane Isomers	Mixture	1-5
11) n-Hexane	110-54-3	0-3

**Reformate Gases
(C2-C6 Hydrocarbons)**

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Skin contact Eye contact

Signs and Symptoms of Acute Exposure

Inhalation	At least one component of this gas/liquid mixture is a "simple asphyxiant" (see Section 8). High concentrations of this mixture can displace the amount of oxygen in air available to breathe below that necessary to sustain life (hypoxia), especially if working in confined spaces. Breathing vapors may also cause central nervous system (CNS) depression. Symptoms may include headache, dizziness, slurred speech, excitation or giddiness, nausea, vomiting, visual disturbances, memory loss, confusion, vertigo, drowsiness, fatigue, rapid or difficult breathing, muscular weakness, loss of consciousness, convulsions, coma, and even death, depending upon the concentration and duration of exposure
Eye Contact	Direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn." Prolonged or repeated vapor exposure may cause irritation. This is based upon animal test results for this product's heavier components.
Skin Contact	Direct contact with a liquefied/pressurized gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. The liquid form may cause mild to moderate skin irritation and inflammation. The n-hexane component of this material may be absorbed through the skin, and produce toxic effects such as CNS depression (see "Inhalation" above) and/or peripheral nerve damage. If the skin is damaged, absorption increases.
Ingestion	Due to its volatile nature, ingestion is not normally an applicable route of exposure for this liquefied gas mixture. However, if swallowed, this material may "freeze burn" the mucous membranes of the mouth, throat, and esophagus or be aspirated into the lungs. Aspiration can result in severe lung damage or death. Cardiovascular effects include shallow rapid pulse and pallor followed by flushing. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may result in death
Chronic Health Effects Summary	Chronic inhalation to components of this liquefied gas (propane, n-butane, and n-pentane) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline) -like drugs. Even with acute exposures, the n-hexane component is toxic to the peripheral nerves, characterized by numbness, tingling, or pain in the extremities, progressively worsening of neuromuscular motor coordination (polyneuritis or polyneuropathy), and even partial paralysis. (See Section 11.)
Conditions Aggravated by Exposure	Personnel with pre-existing chronic respiratory diseases, nervous system disease, psychological conditions, high blood pressure, cardiovascular conditions, or skin disorders should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this liquefied gas mixture. They should take additional precautions to minimize or avoid exposure.
Target Organs	The substance is toxic to eyes, skin, mucous membranes, lungs, central and peripheral nervous systems, brain, heart, and possibly, the liver, kidneys, and reproductive systems
Carcinogenic Potential	This product does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC, or NTP.

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

Reformate Gases (C2-C6 Hydrocarbons)

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	If cough or difficulty in breathing develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. Monitor arterial blood gases and chest x-ray in cases with significant exposure. If contact with pressurized or liquefied gas causes frostbite of the eyes, early ophthalmologic consultation is recommended. This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines and other sympathomimetic drugs such as epinephrine (adrenaline) should be reserved for emergency situations and then used only with special precaution.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas.		
Flash Point/Method	CLOSED CUP. LT -60°C (-76°F). (Estimated)		
Lower Flammable Limit	AP 1.4%	Upper Flammable Limit	AP 12.5%
Auto-Ignition Temp.	AP 288°C (550°F)		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, and unburned hydrocarbon vapors		
Special Properties	This liquefied gas is extremely flammable at well below ambient temperatures and readily forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. Exposed to an ignition source, it will burn in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources! Being heavier than air, its flammable vapors can travel long distances close to the ground to an ignition source, and then flash back.		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.		
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.		

Reformate Gases (C2-C6 Hydrocarbons)

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquefied Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This liquefied gas or waste mixtures containing this material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling

Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring for oxygen deficiency and flammability. Odor is not an adequate warning of hazardous air concentrations.

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of mixed gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Drain and purge equipment as necessary to remove material residues. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Do not allow vaporizing material to contact eyes, skin or other tissues. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated.

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

Reformate Gases (C2-C6 Hydrocarbons)

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling liquefied gases. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with cold liquid, solid, or vapors.

Body Protection Prevent potential skin contact with cold liquid or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection Odor is not an adequate warning for potentially hazardous air concentrations! Use a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. Air purifying respirators offer no protection against oxygen deficient atmospheres. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).

General Comments Releases of this liquefied gas mixture may create flammable, explosive, and/or oxygen-deficient atmospheres (LT 19.5 Vol.% in air). DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1989]
2) Ethane	Simple asphyxiant.
3) Propane	TWA: 2500 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1989]
4) Butanes	TWA: 800 (ppm) from ACGIH (TLV) [1998] TWA: 800 (ppm) from OSHA (PEL) [1989]
5) Pentanes	TWA: 600 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1976]
6) Hexane, other isomers	TWA: 500 STEL: 1000 (ppm) from ACGIH (TLV) [1998] TWA: 500 (ppm) from OSHA (PEL) [1989]
7) n-Hexane	TWA: 50 (ppm) from ACGIH (TLV) [1998] - SKIN TWA: 500 (ppm) from OSHA (PEL) [1976]

Reformate Gases (C2-C6 Hydrocarbons)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquefied Gas	Color	Colorless liquid; invisible vapor.	Odor	Faint, unpleasant.
Specific Gravity	AP 0.38 to 0.68 (Water = 1)	pH	Not applicable.	Vapor Density	AP 1.0 to 3.0 (Air = 1)
Boiling Point/Range	AP -88° to 69°C (-127° to 156°F) at 14.7 psia (ASTM D-2887)	Melting/Freezing Point			AP -188° to -95°C (-305° to -139°F) at 14.7 psia
Vapor Pressure	AP 15 to 190 psia at 40°C (104°F)	Viscosity (cSt @ 40°C)			Not applicable.
Solubility in Water	Slightly soluble in cold water.	Volatile Characteristics			This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Gross Heat of Combustion at 60°F = AP 20,750 to 21,500 Btu/lb or 2,500 to 4,000 Btu/cu.ft., Dry Point Temperature = AP 146°F (63°C) (ASTM D-86), Average Density at 60°F = AP 5.0 lbs./gal. (ASTM D-2161).				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur, but possible
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Iso-Butane:

GAS (TCLo) Acute: 1,040 gm/m³ for 2 hours [Mouse] - Excitement.

GAS (LC50). Acute 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress.

n-Butane:

GAS (LC50) Acute 658,000 mg/m³ for 4 hours [Rat].

GAS (LC50): Acute 680,000 mg/m³ for 2 hours [Mouse].

n-Pentane:

GAS (LC50): Acute: 364,000 mg/m³ for 4 hours [Rat] - Excitement.

INTRAVENOUS (LD50): Acute. 446 mg/kg [Mouse]

n-Hexane:

GAS (LC50): Acute: 48,000 ppm for 4 hours [Rat].

ORAL (LD50): Acute: 28,710 mg/kg [Rat].

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline).

Human volunteers had no apparent effects from exposures of 250 ppm, 500 ppm, and 1,000 ppm concentrations in air of **isobutane and n-butane** for periods of 8 hours daily for 10 days to 14 days, respectively. An **n-Butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane and butenes** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone. Chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage.

Reformate Gases (C2-C6 Hydrocarbons)

Inhalation of 500 ppm of **isopentane** or **n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects; however, higher exposure concentrations of 90,000 to 120,000 ppm (9 to 12 Wt.% in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. **n-Pentane** caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure. Rat 28-day feeding studies on both isopentane and **n-pentane** using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

Hexane isomers were not mutagenic in the Salmonella/microsome (Ames) assay and are NOT considered to be carcinogenic.

Intentional sniffing abuse of **n-hexane** has caused permanent brain and nervous system damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function, and even paralysis. These neurological effects are pronounced in combination with lack of oxygen supply, especially amongst women. Chronic repeated and/or prolonged overexposure to **n-hexane**, either by inhalation or skin absorption, has been shown to cause peripheral nerve tissue damage (polyneuropathy). The initial symptoms are numbness of the fingers and toes. Motor weakness can also occur in the digits, but may also involve muscles of the arms, thighs, and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure. The neurotoxic properties of **n-hexane** may be increased by concurrent exposure to **methyl ethyl ketone, methyl isobutyl ketone, and/or toluene**.

n-Hexane is NOT a tumor promotor in mice and NOT considered to be carcinogenic; nor is it teratogenic in mice or rats. **n-Hexane**, or its metabolite **2,5-hexanedione**, has been shown to cause degeneration of the testes in rats; but, it did NOT produce spermatotoxicity in a multiple end-point test battery in rats given multiple doses for up to 5 days

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity Ecological effects testing has not been conducted on this material. However, **refined liquefied petroleum hydrocarbon gases** are only slightly soluble in water (LT 0.1%); and therefore, this material is not expected to cause harm to aquatic life.

Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, this material will readily vaporize and may contribute to generation of atmospheric smog.

Environmental Fate The atmospheric half-life of **propane** under photochemical smog conditions is estimated to be between 5 to 8 hours. The atmospheric half-lives of the **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days. **Pentanes and hexanes** have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. Photooxidation of **propane, isobutane, and n-butane** in air (LT 8%) is not considered to be environmentally significant.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

This material may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). In addition, conditions of use may cause this material to become a hazardous waste for additional reasons, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this liquefied gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

**Reformate Gases
(C2-C6 Hydrocarbons)**

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U.S. Department of Transportation regulated material.		
Proper Shipping Name	Petroleum gases, liquefied		
Hazard Class	CLASS 2.1. Flammable gas.	Packing Group(s)	Not applicable.
		UN/NA ID	UN1075
Reportable Quantity	The Reportable Quantity (RQ) substance component that might be present in this product which requires DOT HAZMAT bill-of-lading display is n-Hexane .		
Placards		Emergency Response Guide No.	115
		HAZMAT STCC No.	49 057 68
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. There are no chemical substances present in this material subject to this statute.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, and Acute (Immediate) & Chronic (Delayed) Health Hazards.
SARA 313	This material contains the following component in concentrations which might be at or above de minimis levels and is listed as a toxic chemical in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA. n-Hexane [CAS No. 110-54-3] concentration: 0 to 3%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. A chemical substance that might be present in this material which are subject to this statute is: n-Hexane [CAS No. 110-54-3] (RQ = 5,000 lbs. [2,270 kg]) concentration: 0 to 3%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802
California Proposition 65	This material does not contain any chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it may be not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling, refer to components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following component in this material as a "Volatile Organic Compound (VOC)" which contributes significantly to air pollution which endangers public health and welfare": n-Pentane .

**Reformate Gases
(C2-C6 Hydrocarbons)**

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this material which are subject to this statute are: **Ethane, Propane, Isobutane (Propane, 2-methyl), Butane, Isopentane (Butane, 2-methyl), and n-Pentane.**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

DISCLAIMER OF LIABILITY

THE INFORMATION IN THIS MSDS WAS OBTAINED FROM SOURCES WHICH WE BELIEVE ARE RELIABLE. HOWEVER, THE INFORMATION IS PROVIDED WITHOUT ANY WARRANTY, EXPRESSED OR IMPLIED REGARDING ITS CORRECTNESS. SOME INFORMATION PRESENTED AND CONCLUSIONS DRAWN HEREIN ARE FROM SOURCES OTHER THAN DIRECT TEST DATA ON THE SUBSTANCE ITSELF. THIS MSDS WAS PREPARED AND IS TO BE USED ONLY FOR THIS PRODUCT. IF THE PRODUCT IS USED AS A COMPONENT IN ANOTHER PRODUCT, THIS MSDS INFORMATION MAY NOT BE APPLICABLE. USERS SHOULD MAKE THEIR OWN INVESTIGATIONS TO DETERMINE THE SUITABILITY OF THE INFORMATION OR PRODUCTS FOR THEIR PARTICULAR PURPOSE.

THE CONDITIONS OR METHODS OF HANDLING, STORAGE, USE, AND DISPOSAL OF THE PRODUCT ARE BEYOND OUR CONTROL AND MAY BE BEYOND OUR KNOWLEDGE. FOR THIS AND OTHER REASONS, WE DO NOT ASSUME RESPONSIBILITY AND EXPRESSLY DISCLAIM LIABILITY FOR LOSS, DAMAGE OR EXPENSE ARISING OUT OF OR IN ANY WAY CONNECTED WITH HANDLING, STORAGE, USE OR DISPOSAL OF THE PRODUCT.

***** END OF MSDS *****

Pentanes-Rich Petroleum Ether (C4-C6 Hydrocarbons)

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0053
Revision Date 05/31/2000

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquefied Gas/Liquid
Color Transparent, colorless liquid; invisible vapor
Odor Light hydrocarbons.

DANGER! Extremely flammable compressed gas/liquid;
vapor may cause flash fire or explosion!
High pressure and rapid diffusion hazard!
High concentrations of vapor reduce oxygen available for breathing and
may cause central nervous system depression or suffocation!
Prolonged and/or repeated inhalation may increase the
heart's susceptibility to arrhythmias (irregular beats)!
Pressurized gas contact may cause frostbite or freeze burns!
May be harmful or fatal if inhaled or absorbed through the skin!
Vapor or mist may irritate mucous membranes and respiratory tract!
Liquid contact may cause mild to moderate eye and/or skin irritation!
Overexposures may cause target organ effects such as brain and/or
peripheral nervous system damage!
Based upon animal testing, may adversely affect reproduction!

See Section 8 for Details

SECTION 1: IDENTIFICATION

Trade Name	Pentanes-Rich Petroleum Ether (C4-C6 Hydrocarbons)	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	068476437*	Medical Emergency	(918) 495-4700
CAS Number	68476-43-7 and 64741-87-3	CHEMTREC Emergency	(800) 424-9300
Product Family	Liquefied Petroleum Ether		
Synonyms	Petroleum Ether, Petroleum Benzin; C5 Concentrate, C5 Sweetened Petroleum Ether; C4-C6 Hydrocarbons, C5-Rich; C4-C6 Alkane, Isoparaffin, and Alkene Hydrocarbons Mixture		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) C4-C6, C5-Rich, Hydrocarbons	68476-43-7	100
2) Sweetened Naphtha	64741-87-3	100
3) Iso-Butane	75-28-5	1-10
4) Butenes or Butylenes	25167-67-3	0 5-5
5) n-Butane	106-97-8	5-25
6) Iso-Pentane	78-78-4	25-45
7) Neo-Pentane	463-82-1	1-5
8) Pentenes or Pentylenes	68527-11-7	1-5
9) Cyclopentane	287-92-3	1-5
10) n-Pentane	109-66-0	25-50
11) Hexane Isomers	Mixture	1-15
12) Cyclohexane	110-82-7	0.5-3
13) n-Hexane	110-54-3	0 5-5

**Pentanes-Rich Petroleum Ether
(C4-C6 Hydrocarbons)**

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Skin contact Eye contact

Signs and Symptoms of Acute Exposure

Inhalation	Components of this liquefied gas/naphtha may produce mild narcotic effects. High concentrations of this mixture can displace the amount of oxygen in air available to breathe below that necessary to sustain life (hypoxia), especially if working in confined spaces. Breathing vapors may also cause upper respiratory tract irritation and/or central nervous system (CNS) depression. Symptoms may include headache, dizziness, slurred speech, excitation or giddiness, nausea, vomiting, visual disturbances, memory loss, confusion, vertigo, drowsiness, fatigue, rapid or difficult breathing, muscular weakness, loss of consciousness, convulsions, coma, and even death, depending upon the concentration and duration of exposure. Approximately 20,000 ppm (or 2 vol.%) of the vapor in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes.
Eye Contact	Direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn." Prolonged or repeated vapor exposure may cause irritation. This is based upon animal test results for this product's heavier components.
Skin Contact	Direct contact with a liquefied/pressurized gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. The liquid form may cause mild to moderate skin irritation and inflammation. The n-hexane component of this material may be absorbed through the skin, and produce toxic effects such as CNS depression (see "Inhalation" above) and/or peripheral nerve damage. If the skin is damaged, absorption increases.
Ingestion	Due to its volatile nature, ingestion is not normally an applicable route of exposure for this liquefied gas mixture. However, if swallowed, this material may "freeze burn" the mucous membranes of the mouth, throat, and esophagus or be aspirated into the lungs. Aspiration can result in severe lung damage or death. Cardiovascular effects include shallow rapid pulse and pallor followed by flushing. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may result in death.
Chronic Health Effects Summary	Chronic inhalation to components of this liquefied gas (propane, n-butane, and n-pentane) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline) -like drugs. Even with acute exposures, n-hexane is toxic to the peripheral nerves, characterized by numbness, tingling, or pain in the extremities, progressively worsening of neuromuscular motor coordination (polyneuritis or polyneuropathy), and even partial paralysis. And, based upon animal studies, n-hexane's metabolite, 2,5-hexanedione , has been shown to cause degeneration of the testes. (See Section 11.)
Conditions Aggravated by Exposure	Personnel with pre-existing chronic respiratory diseases, nervous system disease, psychological conditions, high blood pressure, cardiovascular conditions, or skin disorders should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this liquefied gas mixture. They should take additional precautions to minimize or avoid exposure. Exposure to high concentrations of this material may increase the sensitivity of the heart to epinephrine (adrenalin) and catecholamine-like drugs . Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians").
Target Organs	The substance is toxic to eyes, skin, mucous membranes, lungs, central and peripheral nervous systems, brain, heart, and possibly, the liver, kidneys, and reproductive systems.
Carcinogenic Potential	This product does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC, or NTP.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200)

OSHA Health Hazard Classification			OSHA Physical Hazard Classification						
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>

**Pentanes-Rich Petroleum Ether
(C4-C6 Hydrocarbons)**

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Monitor arterial blood gases and chest x-ray in cases with significant exposure. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse). If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential. If contact with pressurized or liquefied gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IA Flammable Liquid. Extremely flammable!		
Flash Point Method	CLOSED CUP: -60° to -40°C (-76° to -40°F) (Estimated)		
Lower Flammable Limit	AP 1.1%	Upper Flammable Limit	AP 10.0%
Autoignition Temperature	232° to 288°C (450° to 550°F)		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, unburned hydrocarbons, and possibly other harmful gases/vapors.		
Special Properties	This liquefied gas is extremely flammable at well below ambient temperatures and readily forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. Exposed to an ignition source, it will burn in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources! Being heavier than air, its flammable vapors can travel long distances close to the ground to an ignition source, and then flash back.		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.		

**Pentanes-Rich Petroleum Ether
(C4-C6 Hydrocarbons)**

**Fire Fighting Protective
Clothing**

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquefied Gas/Naphtha! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors

Caution: Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of its vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This liquefied gas or waste mixtures containing this material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802)

SECTION 7: HANDLING AND STORAGE

Handling

Odor is an inadequate warning of potentially hazardous air concentrations. Releases of this material can cause atmospheres to become oxygen deficient and/or create an immediate fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring for oxygen deficiency and flammability. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Do not allow vaporizing material to contact eyes, skin, or other tissues. Never siphon by mouth. Prevent contact with food, chewing, or smoking materials. Do not take internally

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of mixed gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Drain and purge equipment as necessary to remove material residues

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits and wear personal protective clothing as shown in Section 8. Promptly remove contaminated clothing. Wash exposed skin thoroughly with mild soap and water after handling.

Pentanes-Rich Petroleum Ether (C4-C6 Hydrocarbons)

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and well sealed. All label warnings and precautions must be observed. Return empty containers to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling liquefied gases. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with cold liquid or vapors. Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Prevent potential skin contact with cold liquid or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

Use a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. Air purifying respirators offer no protection against oxygen deficient atmospheres. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).

General Comments

Releases of this liquefied gas mixture may create flammable, explosive, and/or oxygen-deficient atmospheres (LT 19.5 Vol.% in air). DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions.

Pentanes-Rich Petroleum Ether (C4-C6 Hydrocarbons)

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) [1999] TWA: 1000 (ppm) from OSHA (PEL) [1989]
2) Petroleum Distillates (Naphtha)	TWA: 400 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
3) Butanes	TWA: 800 (ppm) from ACGIH (TLV) [1999] TWA: 800 (ppm) from OSHA (PEL) [1989]
4) Pentane, all isomers	TWA: 600 (ppm) from ACGIH (TLV) [1999] TWA: 600 STEL: 750 (ppm) from OSHA (PEL) [1989] TWA: 1000 (ppm) from OSHA (PEL) [1976]
5) Cyclopentane	TWA: 600 (ppm) from ACGIH (TLV) [1999] TWA: 600 (ppm) from OSHA (PEL) [1989]
6) Hexane, other isomers	TWA: 500 STEL 1000 (ppm) from ACGIH (TLV) [1999] TWA: 500 (ppm) from OSHA (PEL) [1989]
7) Cyclohexane	TWA: 300 (ppm) from ACGIH (TLV) [1999] TWA: 200 STEL: 400 (ppm) from ACGIH (TLV) [Proposed for 2000] TWA: 300 (ppm) from OSHA (PEL) [1976]
8) Hexane (n-Hexane)	TWA: 50 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 50 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquefied Gas/Liquid	Color	Transparent, colorless liquid; invisible vapor	Odor	Light hydrocarbons
Specific Gravity	0.60 to 0.64 (Water = 1)	pH	Not applicable.	Vapor Density	2.4 to 2.6 (Air = 1)
Boiling Point/Range	AP -12° to 69°C (11° to 156°F) at 14.7 psia (ASTM D-2887)	Melting/Freezing Point			-160° to -95°C (-255° to -139°F) at 14.7 psia
Vapor Pressure	15 to 30 psia at 40°C (104°F) or GT 140 mm of Hg at 20°C (68°F).	Viscosity (cSt @ 40°C)			LT 1
Solubility in Water	Slightly soluble in cold water (AP 0.1%).	Volatile Characteristics			This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Gross Heat of Combustion at 60°F = 20,750 to 21,100 Btu/lb or 3,250 to 4,750 Btu/cu ft.; Dry Point Temperature = AP 150°F (66°C) (ASTM D-86), Average Density at 60°F = AP 5.15 pounds/gallon (ASTM D-2161)				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur, but possible.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS		

**Pentanes-Rich Petroleum Ether
(C4-C6 Hydrocarbons)**

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Iso-Butane

GAS (TCLo): Acute 1,040 gm/m³ for 2 hours [Mouse] - Excitement

GAS (LC50). Acute 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress

n-Butane:

GAS (LC50): Acute: 658,000 mg/m³ for 4 hours [Rat].

GAS (LC50): Acute: 680,000 mg/m³ for 2 hours [Mouse]

2,2-Dimethylpropane (Neopentane)

INTRAPERITONEAL (LD50) Acute 100 mg/kg [Mouse].

n-Pentane

GAS (LC50): Acute 364 gm/m³ for 4 hour(s) [Rat] - Excitement

INTRAVENOUS (LD50) Acute. 446 mg/kg [Mouse].

Cyclohexane.

GAS (LC50) Acute: 22,500 ppm for 4 hours [Rabbit].

ORAL (LD50). Acute: 12,705 mg/kg [Rat].

ORAL (LD50) Acute: 813 to 1,300 mg/kg [Mouse].

ORAL (LD50): Acute GT 180,000 mg/kg [Rabbit].- Severe diarrhea, vascular damage and collapse, hepatocellular degeneration, and glomerulonephritis

n-Hexane

GAS (LC50): Acute: 48,000 ppm for 4 hours [Rat].

ORAL (LD50) Acute: 28,710 mg/kg [Rat].

Human volunteers had no apparent effects from exposures of 250 ppm, 500 ppm, and 1,000 ppm concentrations in air of **isobutane and n-butane** for periods of 8 hours daily for 10 days to 14 days, respectively. An **n-Butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane and butenes** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone. Chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage.

Inhalation of 500 ppm of **isopentane or n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects; however, higher exposure concentrations of 90,000 to 120,000 ppm (9 to 12 Wt.% in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be be fatal. n-Pentane caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure. Rat 28-day feeding studies on both isopentane and n-pentane using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

Hexane isomers were not mutagenic in the Salmonella/microsome (Ames) assay and are NOT considered to be carcinogenic

Cyclohexane is a minimal to moderate eye, skin, and mucous membrane irritant, CNS depressant, and causes narcosis at high concentrations in air. There is a narrow margin between narcosis, loss of reflexes, and death. In experimental animals exposed to lethal concentrations by inhalation or oral route, there was generalized vascular damage and severe degenerative changes in the heart, lungs, liver, kidneys, and brain. Cyclohexane does not act as a promotor for tumors on mice when exposed to dimethylbenzanthracene; and, it did not induce unscheduled DNA synthesis in cultured human lymphocytes. It is not mutagenic in the Salmonella/microsome (Ames) or the mouse lymphoma L5178Y assays, with or without metabolic activation; however, it did increase the number of chromosomal aberrations in bone marrow cells of rats exposed to between 100 and 300 ppm for 6 hours/day for 5 days. These chromosomal aberrations did not appear to be dose-related.

Intentional sniffing abuse of **n-hexane** has caused permanent brain and nervous system damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function, and even paralysis. These neurological effects are pronounced in combination with lack of oxygen supply, especially amongst women. Chronic repeated and/or prolonged overexposure to n-hexane, either by inhalation or skin absorption, has been shown to cause peripheral nerve tissue damage (polyneuropathy). The initial symptoms are numbness of the fingers and toes. Motor weakness can also occur in the digits, but may also involve muscles of the arms, thighs, and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure. The neurotoxic properties of n-hexane may be increased by concurrent exposure to **methyl ethyl ketone, methyl isobutyl ketone, and/or toluene**.

Pentanes-Rich Petroleum Ether (C4-C6 Hydrocarbons)

n-Hexane is NOT a tumor promotor in mice and NOT considered to be carcinogenic; nor is it teratogenic in mice or rats. **n-Hexane**, or its metabolite **2,5-hexanedione**, has been shown to cause degeneration of the testes in rats, but, it did NOT produce spermatotoxicity in a multiple end-point test battery in rats given multiple doses for up to 5 days.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity	<p>Ecological effects testing has not been conducted on this material. If spilled, this material, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. Liquefied gas/naphtha mixtures will normally evaporate rapidly if spilled.</p> <p>Using Rainbow Trout (<i>Oncorhynchus mykiss</i>) and Dungeness Crab (<i>Cancer magister</i>), similar naphthas showed a 96-hour TLM (Median Toxic Limit) from 5 ppm to 30 ppm in ambient saltwater. 24-hour TLMs resulted in 2,990 ppm and 250 ppm when using Bluegill Sunfish (<i>Lepomis macrochirus</i>) and juvenile American Shad (<i>Squalius cephalus</i>), respectively. Also, 24-hour and 96-hour LC50s for cyclohexane produced results from 25 ppm to 60 ppm when using Bluegill Sunfish (<i>Lepomis macrochirus</i>), Goldfish (<i>Carassius auratus</i>), and Guppy (<i>Lebistes reticulatus</i>) in fresh water. Using Mosquito Fish (<i>Gambusia affinis</i>), cyclohexane showed a 24-hour TLM of 15,500 ppm. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.</p>
Environmental Fate	<p>Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, this material will readily vaporize and its olefinic hydrocarbon components (butenes and pentenes) may contribute to the creation of atmospheric smog. The atmospheric half-lives of the butanes under photochemical smog conditions are estimated to be between 5 and 7 days. Pentanes and hexanes have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. Cyclohexane has a half-life of from 6 hours to over 4 days when hydroxyl radicals are present. Photooxidation of isobutane and n-butane in air (LT 8%) is not considered to be environmentally significant.</p> <p>For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)</p>

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

This material may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). In addition, conditions of use may cause this material to become a hazardous waste for additional reasons, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this liquefied gas/naphtha mixture to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Petroleum ether		
Hazard Class	DOT CLASS 3: Flammable liquid.	Packing Group(s)	PG I
		UN/NA ID	UN1271
Reportable Quantity	The Reportable Quantity (RQ) substance components present in this material which might require DOT HAZMAT bill-of-lading display are Cyclohexane and n-Hexane .		

**Pentanes-Rich Petroleum Ether
(C4-C6 Hydrocarbons)**

Placards

Emergency Response Guide No. 128

HAZMAT STCC No.

49 102 27

MARPOL III Status

Not a DOT "Marine Pollutant"
per 49 CFR 171.8.**SECTION 15: REGULATORY INFORMATION**

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. There are no chemical substances present in this material subject to this statute
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, and Acute (Immediate) & Chronic (Delayed) Health Hazards.
SARA 313	This material contains the following components in concentrations which might be at or above de minimis levels and are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313: Cyclohexane [CAS No. 110-82-7] concentration: 0.5 to 3% n-Hexane [CAS No. 110-54-3] concentration: 0.5 to 5%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. A chemical substance that might be present in this material which are subject to this statute is: Cyclohexane [CAS No. 110-82-7] (RQ = 1000 lbs. [453.6 kg]) concentration: 0.5 to 3% n-Hexane [CAS No. 110-54-3] (RQ = 5,000 lbs. [2,270 kg]) concentration: 0.5 to 5%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material does not contain any chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it may be not subject to requirements of California Health & Safety Code Section 25249.5
New Jersey Right-to-Know Label	For New Jersey labeling, refer to components listed in Section 2.
Additional Regulatory Remarks	Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13): This material contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children! Under Section 12(b) of the Toxic Substances Control Act. Because it contains detectable amounts of Cyclohexane [CAS No. 110-82-7] , this material might be subject to US EPA's one-time only per country export notification requirements. In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in this material as "Volatile Organic Compounds (VOC)" which contribute significantly to air pollution which endangers public health and welfare" 1-Butene [CAS No. 106-98-9], Isobutylene [CAS No. 115-11-7], Isopentane [CAS No. 78-78-4], n-Pentane [CAS No. 109-66-0], and Cyclohexane [CAS No. 110-82-7]

**Pentanes-Rich Petroleum Ether
(C4-C6 Hydrocarbons)**

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this material which are subject to this statute are: **Isobutane (Propane, 2-methyl), Butane, Isopentane (Butane, 2-methyl), various Butenes and Pentenes, and n-Pentane**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Hazard Rankings

	HMIS	NFPA
Health Hazard	* 2	2
Fire Hazard	4	4
Reactivity	0	0

* = Chronic Health Hazard

Emergency Overview

Physical State Gas/liquid
Color Transparent, colorless.
Odor Hydrocarbon. Rotten eggs. (Strong.)

DANGER:
EXTREMELY FLAMMABLE LIQUID AND VAPOR, VAPOR MAY CAUSE FLASH FIRE.

Vapor may travel considerable distance to source of ignition and flash back.

Harmful or fatal if swallowed - can enter lungs and cause damage.

Breathing high concentrations can cause irregular heartbeats which may be fatal.

May be harmful if inhaled or absorbed through the skin.

Can cause eye, skin or respiratory tract irritation.

Overexposure can cause central nervous system (CNS) depression and/or other target organ effects.

Harmful to aquatic organisms.

Possible Cancer Hazard (See Section 3)

Protective Equipment

Minimum Recommended
See Section 8 for Details

Minimum PPE reflects the requirements for this material at this facility:
LYONDELL-CITGO Refining
LP Manufacturing Complex

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	Stabilizer Tower Bottoms Stream	Technical Contact	(800) 525-4692
Product Number	Not available.	Medical Emergency	(800) 313-7645
CAS Number	64741-74-8	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Not applicable.		
Synonyms	C4-C9 Petroleum Hydrocarbons, Unsweetened Light Hydrotreated Naphtha, Unsweetened Light Solvent Naphtha, Unsweetened C4-C9 Solvent, BRU No 3 and No 11 Stabilizer Tower Bottoms Streams		

SECTION 2. COMPOSITION (TYPICAL)

This product may be composed, in whole or in part, of any of the following refinery streams:

Light Thermal Cracked Naphtha (Petroleum) [CAS No.: 64741-74-8]

This product contains the following chemicals as components of the refinery streams listed above:

Component Name(s)	CAS Registry No.	Concentration (%)
-------------------	------------------	-------------------

Stabilizer Tower Bottoms Stream

Hexane, other isomers	Mixture	10 - 50
n-Hexane	110-54-3	10 - 30
Methylcyclopentane	96-37-7	1 - 20
Heptane, all isomers	Mixture	5 - 15
Pentanes, all isomers	Mixture	1 - 15
Butanes	Mixture	1 - 15
C6-C9 alpha-Alkenes	68526-99-8	1 - 10
Toluene	108-88-3	1 - 5
Benzene	71-43-2	1 - 5
Cyclohexane	110-82-7	1 - 5
Xylene, all isomers	1330-20-7	1 - 3
Octanes, all isomers	Mixture	1 - 3
1, 3-Butadiene	106-99-0	<1
Hydrogen Sulfide	7783-06-4	<0.2

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Inhalation. Ingestion

Signs and Symptoms of Acute Exposure

Inhalation	May be harmful or fatal if inhaled. Contains hydrogen sulfide. Inhalation of gas or vapor may cause severe nose, throat, respiratory tract, and lung irritation, respiratory paralysis, and death, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. Breathing this material may cause central nervous system depression with symptoms including nausea, headache, dizziness, fatigue, drowsiness, or unconsciousness. Breathing high concentrations of this material, for example, in an enclosed space or by intentional abuse, can cause irregular heartbeats which can cause death.
Eye Contact	This material can cause eye irritation with tearing, redness, or a stinging or burning feeling. Further, it can cause swelling of the eyes with blurred vision. Effects may become more serious with repeated or prolonged contact.
Skin Contact	May cause skin irritation with redness, an itching or burning feeling, and swelling of the skin. Effects may become more serious with repeated or prolonged contact. Skin contact may cause harmful effects in other parts of the body.
Ingestion	Swallowing this material may be harmful. Swallowing this material may cause stomach or intestinal upset with pain, nausea, and/or diarrhea. This material can get into the lungs during swallowing or vomiting. Small amounts in the lungs can cause lung damage, possibly leading to chronic lung dysfunction or death. Swallowing this material may cause effects similar to those described in the inhalation section (see "inhalation" above).

Chronic Health Effects Summary	Subacute exposure to low levels of hydrogen sulfide can produce eye irritation, watering, light sensitivity and corneal opacity. Reported effects from subacute exposure also include bronchitis, pulmonary edema, nausea, abdominal cramps and diarrhea. Aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Altered mental state, drowsiness, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been reported from repeated over-exposure such as gasoline and naphtha abusers. Repeated and prolonged overexposure to n-Hexane has been associated with peripheral nerve tissue damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function and paralysis. This material, or a component of this material, has been shown to cause cancer in laboratory animals. However it is not likely to represent a human cancer hazard. See Toxicological Information (Section 11)
---------------------------------------	--

Conditions Aggravated by Exposure

Stabilizer Tower Bottoms Stream

Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Peripheral Nervous System, Central Nervous System (CNS), Heart (Cardiac)

Target Organs

Contains material which may cause damage to the following organs: blood, kidneys, lungs, the reproductive system, liver, mucous membranes, heart, lymphatic system, peripheral nervous system, upper respiratory tract, immune system, skin, bone marrow, central nervous system (CNS), eye, lens or cornea, testes.

Carcinogenic Potential

CARCINOGENIC EFFECTS Classified 1 (Proven for human.) by IARC, + (Proven.) by OSHA [Benzene]. Classified + (Proven.) by OSHA+ (Proven.) by NIOSH [1, 3-Butadiene]. Classified A2 (Suspected for human.) by ACGIH, 2A (Probable for human.) by IARC [1, 3-Butadiene].

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Toxic	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation

Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.

Eye Contact

Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.

Skin Contact

Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.

Ingestion

Do not induce vomiting unless directed to do so by medical personnel -- this material is an aspiration hazard. Get immediate medical attention. Never give anything by mouth to an unconscious person.

Notes to Physician

INHALATION: Inhalation overexposure can produce toxic effects. Treat intoxications as hydrogen sulfide exposures. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Administer supplemental oxygen with assisted ventilation, as required.

This material (or a component) sensitizes the heart to the effects of sympathomimetic amines. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias in individuals exposed to this material. Administration of sympathomimetic drugs should be avoided.

INGESTION: If ingested, this material presents a significant aspiration and chemical pneumonitis hazard. Induction of emesis is not recommended. Consider activated charcoal and/or gastric lavage. If patient is obtunded, protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position.

Stabilizer Tower Bottoms Stream

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas.		
Flash Point	Closed cup: <-45°C (-49°F). (Tagliabue.)		
Lower Flammable Limit	AP 1 %	Upper Flammable Limit	AP 13 %
Autoignition Temperature	not available		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons and oxides of sulfur and/or nitrogen.		
Special Properties	Flammable Liquid! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. A vapor and air mixture can create an explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.		
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide, foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or water spray. Water fog and spray are effective in cooling containers and adjacent structures. However, water can cause frothing and/or may not extinguish the fire. Water can be used to cool the external walls of vessels to prevent excessive pressure, autoignition or explosion. DO NOT use a solid stream of water directly on the fire as the water may spread the fire to a larger area.		
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid enter sewers or waterways.		

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent spilled material from entering waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Prevent spilled material from entering sewers, storm drains, other drainage systems, and natural waterways. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free

Stabilizer Tower Bottoms Stream

liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbant pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7. HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire or explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation and personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food and tobacco products. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

A static electrical charge can accumulate when this material is flowing through pipes, nozzles or filters and when it is agitated. A static spark discharge can ignite accumulated vapors particularly during dry weather conditions. Always bond receiving containers to the fill pipe before and during loading. Always keep nozzle in contact with the container throughout the loading process. Do not fill any portable container in or on a vehicle. Do NOT use compressed air for filling, discharging or other handling operations.

Product container is not designed for elevated pressure. Do not pressurize, cut, weld, braze solder, drill, or grind on containers. Do not expose product containers to flames, sparks, heat or other potential ignition sources. Empty containers may contain product residues that can ignite with explosive force. Observe label precautions. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling or disposing of empty containers and/or waste residues of this product.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources. Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room. A refrigerated room is preferable for materials with a flash point temperature lower than 70°F (21°C). All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable regulatory requirements and the National Electrical Code.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor or mists below the applicable workplace exposure limits indicated below. All electrical equipment should comply with the National Electric Code. An emergency eye wash station and safety shower should be located near the work-station.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Stabilizer Tower Bottoms Stream

- Eye Protection** Safety glasses equipped with side shields are recommended as minimum protection in industrial settings. Chemical goggles should be worn during transfer operations or when there is a likelihood of misting, splashing, or spraying of this material. Suitable eye wash water should be readily available.
- Hand Protection** Avoid skin contact. Use heavy duty gloves constructed of chemical resistant materials such as Viton® or heavy nitrile rubber. Wash hands with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities or leaving work. DO NOT use gasoline, kerosene, solvents or harsh abrasives as skin cleaners.
- Body Protection** Avoid skin contact. Wear long-sleeved fire-retardant garments (e.g., Nomex®) while working with flammable and combustible liquids. Additional chemical-resistant protective gear may be required if splashing or spraying conditions exist. This may include an apron, boots and additional facial protection. If product comes in contact with clothing, immediately remove soaked clothing and shower. Promptly remove and discarded contaminated leather goods.
- Respiratory Protection** A full-face supplied air pressure-demand respirator with escape bottle or a pressure-demand self-contained, breathing apparatus (SCBA) is required. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).
- General Comments** Warning! Use of this material in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and/or inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
Hexane, other isomers	ACGIH (United States). TWA: 500 ppm 8 hour(s). STEL: 1000 ppm 15 minute(s).
n-Hexane	ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
Methylcyclopentane Heptane, all isomers	Not available. ACGIH (United States). TWA: 400 ppm 8 hour(s). STEL: 500 ppm 15 minute(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
Pentanes, all isomers	ACGIH (United States). TWA: 600 ppm 8 hour(s). OSHA (United States). TWA: 1000 ppm 8 hour(s).
Butanes	ACGIH (United States). TWA: 800 ppm 8 hour(s).
C6-C9 alpha-Alkenes Toluene	Not available. ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 200 ppm 8 hour(s). CEIL: 300 ppm PEAK: 500 ppm
Benzene	ACGIH (United States). Skin TWA: 0.5 ppm 8 hour(s). STEL: 2.5 ppm 15 minute(s). OSHA (United States). Skin Notes: See Table Z-2 for exclusions in 20 CFR 1910.1028 to the PEL. TWA: 1 ppm 8 hour(s).

Stabilizer Tower Bottoms Stream

Cyclohexane	STEL: 5 ppm 15 minute(s). ACGIH (United States). TWA: 100 ppm 8 hour(s).
Xylene, all isomers	OSHA (United States). TWA: 300 ppm 8 hour(s). ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 150 ppm 15 minute(s). OSHA (United States). TWA: 100 ppm 8 hour(s).
Octanes, all isomers	ACGIH (United States). TWA: 300 ppm 8 hour(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
1, 3-Butadiene	ACGIH (United States). Notes: "A2" Suspected Human Carcinogen TWA: 2 ppm 8 hour(s). OSHA (United States). Notes: "Z-2" Suspected Human Carcinogen TWA: 2 ppm 8 hour(s). Action Level: 1 ppm 8 hour(s). STEL: 5 ppm 15 minute(s).
Hydrogen Sulfide	ACGIH TLV (United States). TWA: 10 ppm 8 hour(s). STEL: 15 ppm 15 minute(s). OSHA (United States). CEIL: 20 ppm 8 hour(s). STEL: 50 ppm 15 minute(s). Form: *10 minute peak; once per 8 hour shift
Light Aliphatic Naphthas, Sour (family)	Not available.

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Gas/liquid	Color	Transparent, colorless.	Odor	Hydrocarbon. Rotten eggs. (Strong.)
Specific Gravity	0.65 (Water = 1)	pH	Not Applicable.	Vapor Density	>1 (Air = 1)
Boiling Range	-12°C (10.4°F)			Melting/Freezing Point	-160°C (-256°F)
Vapor Pressure	Not applicable.			Volatility	650 g/l VOC (w/v)
Solubility in Water				Viscosity (cSt @ 40°C)	not available
Flash Point	Closed cup: <-45°C (-49°F). (Tagliabue.)				
Additional Properties	No additional information.				

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from heat, sparks and flame.		
Materials Incompatibility	Incompatible with strong acids, strong bases, and strong oxidizers.		

Stabilizer Tower Bottoms Stream

Hazardous Decomposition Products

No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

n-Hexane

This material contains n-hexane. Long-term or repeated exposure to n-hexane can cause peripheral nerve damage. Initial symptoms are numbness of the fingers and toes. Also, motor weakness can occur in the digits, but may also involve muscles of the arms, thighs and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure.

Heptane, all isomers

n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not considered to be carcinogenic.

Pentanes, all isomers

Studies of pentane isomers in laboratory animals indicate exposure to extremely high levels (roughly 10 vol.%) may induce cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.

Butanes

Studies in laboratory animals indicate exposure to extremely high levels of butanes (1-10 or higher vol.% in air) may cause cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.

Toluene:

Effects from Acute Exposure:

Deliberate inhalation of toluene at high concentrations (e.g., glue sniffing and solvent abuse) has been associated with adverse effects on the liver, kidney and nervous system and can cause CNS depression, cardiac arrhythmias and death. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects.

Effects from Repeated or Prolonged Exposure:

Studies of workers indicate long-term exposure may be related to impaired color vision and hearing. Some studies of workers suggest long-term exposure may be related to neurobehavioral and cognitive changes. Some of these effects have been observed in laboratory animals following repeated exposure to high levels of toluene. Several studies of workers suggest long-term exposure may be related to small increases in spontaneous abortions and changes in some gonadotropic hormones. However, the weight of evidence does not indicate toluene is a reproductive hazard to humans. Studies in laboratory animals indicate some changes in reproductive organs following high levels of exposure, but no significant effects on mating performance or reproduction were observed. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects. Findings in laboratory animals were largely negative. Positive findings include small increases in minor skeletal and visceral malformations and developmental delays following very high levels of maternal exposure. Studies of workers indicate long-term exposure may be related to effects on the liver, kidney and blood, but these appear to be limited to changes in serum enzymes and decreased leukocyte counts. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland following very high levels of exposure. The relevance of these findings to humans is not clear at this time.

Benzene

ORAL (LD50): Acute: 930 mg/kg [Rat]. 4700 mg/kg [Mouse].
INHALATION (LC50):

Stabilizer Tower Bottoms Stream

(VAPOR): Acute: 10000 ppm 7 hour(s) [Rat]. 9980 ppm 8 hour(s) [Mouse].

Studies of Workers Over-Exposed to Benzene:

Studies of workers exposed to benzene show clear evidence that over-exposure can cause cancer of the blood forming organs (acute myelogenous leukemia) and aplastic anemia, an often fatal disease. Studies also suggest over-exposure to benzene may be associated with other types of leukemia and other blood disorders. Some studies of workers exposed to benzene have shown an association with increased rates of chromosome aberrations in circulating lymphocytes. One study of women workers exposed to benzene suggested a weak association with irregular menstruation. However, other studies of workers exposed to benzene have not demonstrated clear evidence of an effect on fertility or reproductive outcome in humans. Benzene can cross the placenta and affect the developing fetus. Cases of aplastic anemia have been reported in the offspring of persons severely over-exposed to benzene.

Studies in Laboratory Animals:

Studies in laboratory animals indicate that prolonged, repeated exposure to high levels of benzene vapor can cause bone marrow suppression and cancer in multiple organ systems. Studies in laboratory animals show evidence of adverse effects on male reproductive organs following high levels of exposure but no significant effects on reproduction have been observed. Embryotoxicity has been reported in studies of laboratory animals but effects were limited to reduced fetal weight and skeletal variations.

Cyclohexane

Cyclohexane can cause eye, skin and mucous membrane irritation, CNS depressant and narcosis at elevated concentrations. In experimental animals exposed to lethal concentrations by inhalation or oral route, generalized vascular damage and degenerative changes in the heart, lungs, liver, kidneys and brain were identified.

Cyclohexane has been the focus of substantial testing in laboratory animals. Cyclohexane was not found to be genotoxic in several tests including unscheduled DNA synthesis, bacterial and mammalian cell mutation assays, and in vivo chromosomal aberration. An increase in chromosomal aberrations in bone marrow cells of rats exposed to cyclohexane was reported in the 1980's. However, a careful re-evaluation of slides from this study by the laboratory which conducted the study indicates these findings were in error, and that no significant chromosomal effects were observed in animals exposed to cyclohexane. Findings indicate long-term exposure to cyclohexane does not promote dermal tumorigenesis.

Xylene, all isomers

Effects from Acute Exposure:

ORAL (LD₅₀), Acute: 4,300 mg/kg [Rat].

INHALATION (LC₅₀), Acute: 4,550 ppm for four hours [Rat].

DERMAL (LD₅₀), Acute: 14,100 uL/kg [Rabbit].

Overexposure to xylene may cause upper respiratory tract irritation, headache, cyanosis, blood serum changes, CNS damage and narcosis. Effects may be increased by the use of alcoholic beverages. Evidence of liver and kidney impairment were reported in workers recovering from a gross over-exposure.

Effects from Prolonged or Repeated Exposure:

Impaired neurological function was reported in workers exposed to solvents including xylene. Studies in laboratory animals have shown evidence of impaired hearing following high levels of exposure. Studies in laboratory animals suggest some changes in reproductive organs following high levels of exposure but no significant effects on reproduction were observed. Studies in laboratory animals indicate skeletal and visceral malformations, developmental delays, and increased fetal resorptions following extremely high levels of maternal exposure. Adverse effects on the liver, kidney, bone marrow (changes in blood cell parameters) were observed in laboratory animals following high levels of exposure. The relevance of these observations to humans is not clear at this time.

1, 3-Butadiene

ORAL (LD50): Acute: 5480 mg/kg [Rat].

Studies of Workers Exposed to Butadiene:

Stabilizer Tower Bottoms Stream

Studies show evidence that over-exposure may be associated with an increased incidence of cancers of lymphohematopoietic organ systems, including leukemia.

Studies in Laboratory Animals:

Studies indicate that prolonged, repeated exposure to high levels of butadiene can cause cancer in multiple organs including lymphohematopoietic organ systems.

Studies indicate that exposure to high levels of butadiene can cause chromosome damage to somatic and germ cells. Some studies also show limited evidence that exposure to butadiene may induce heritable mutations.

Studies show evidence of adverse effects on male and female reproductive organs following exposure to high levels of butadiene. Embryotoxicity has been reported. Effects included increased rates of fetal death and skeletal variations.

Hydrogen Sulfide

INHALATION (LC50): Acute: 444 ppm 1 hour(s) [Rat]. 673 ppm 1 hour(s) [Mouse].

Hydrogen Sulfide (H₂S) has an unpleasant odor that diminishes with increased concentrations. Eye irritation can occur at concentrations above four ppm. Olfactory fatigue occurs rapidly at concentrations above 50. Accordingly, odor is not a reliable warning property. Symptoms increase with exposures above 50 ppm. Respiratory effects including irritation with possible pulmonary edema can occur with exposure above 50 ppm. At concentrations above 500 ppm, an immediate loss of consciousness, depressed respiration and death can occur. NIOSH has determined that H₂S concentrations at or above 100 ppm are immediately dangerous to life and health.

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity

No data.

Environmental Fate

This product will normally float on water. Components will evaporate rapidly. This material may be harmful to aquatic organisms and may cause long term adverse effects in the aquatic environment. The log Kow value for this product is expected to be in the range of 3.3 to 6.

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. Conditions of use may cause this material to become a "hazardous waste", as defined by federal or state regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal.

Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

Stabilizer Tower Bottoms Stream

SECTION 15. REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304 Emergency Planning and Notification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: fire, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard
SARA 313 Toxic Chemical Notification and Release Reporting	This product contains the following components in concentrations above de minimis levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: n-Hexane [CAS No.: 110-54-3] Concentration: 10% Cyclohexane [CAS No.: 110-82-7] Concentration: 3% Benzene [CAS No.: 71-43-2] Concentration: 2%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are: n-Hexane [CAS No.: 110-54-3] RQ = 5000 lbs. (2268 kg) Concentration: 20% Toluene [CAS No.: 108-88-3] RQ = 1000 lbs. (453.6 kg) Concentration: 3% Benzene [CAS No.: 71-43-2] RQ = 10 lbs. (4.536 kg) Concentration: 3% Cyclohexane [CAS No.: 110-82-7] RQ = 1000 lbs. (453.6 kg) Concentration: 3% Xylene, all isomers [CAS No.: 1330-20-7] RQ = 100 lbs. (45.36 kg) Concentration: 2% Hydrogen Sulfide [CAS No.: 7783-06-4] RQ = 100 lbs. (45.36 kg) Concentration: 0.18%
Clean Water Act (CWA)	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material may contain the following components which are known to the State of California to cause cancer, birth defects or other reproductive harm, and may be subject to the requirements of California Proposition 65 (CA Health & Safety Code Section 25249.5): Benzene: 2% 1, 3-Butadiene: 0.9%
New Jersey Right-to-Know Label	For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.
Additional Regulatory Remarks	No additional regulatory remarks.

Stabilizer Tower Bottoms Stream

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0055
Revision Date 05/24/1999

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Liquefied Gas		
Color	Colorless liquid; invisible gas and vapor, white frost at release point.	Odor	Strong, unpleasant, and distinctive of skunk or rotten cabbage.

**DANGER! Extremely flammable liquefied gas;
vapor may cause flash fire or explosion!**
May form explosive peroxides on exposure to air!
High pressure and rapid diffusion hazard!
Liquid or compressed gas contact may cause frostbite or freeze burns!
May be harmful or fatal if inhaled or absorbed through the skin!
**High concentrations of vapor reduce oxygen available for breathing and
may cause central nervous system (CNS) depression or suffocation!**
**Vapor or mist may cause mild to severe eye, mucous membrane, and
respiratory tract irritation and inflammation!**
**Prolonged and/or repeated inhalation may increase the heart's
susceptibility to arrhythmias (irregular beats)!**
**Overexposures may cause target organ effects such as lung, brain,
central nervous system, heart, blood, liver, and/or kidney damage!**
**Contains low levels of 1,3-Butadiene! Based upon laboratory animal
tests, cancer, mutagenic, and reproductive hazards might exist!**
May cause blood system disorders and/or genetic damage!
May adversely affect reproduction or reproductive development!

SECTION 1: IDENTIFICATION

Trade Name	n-Butane to the Caustic Treaters	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	1111110055	Medical Emergency	(918) 495-4700
CAS Number	Mixture (See Section 2)	CHEMTREC Emergency	(800) 424-9300
Product Family	Liquefied Petroleum Gas (LPG or LP-Gas)		
Synonyms	Untreated Technical-Grade normal-Butane; High-Sulfur, Refinery-grade, n-Butane-rich, Liquefied C4/C5 Gas; Unsweetened Butane LPG; Raw n-Butane; Untreated NC4/IC5 Concentrate LPG or LP-Gas, BRU No 2 Deisobutanizer Tower Bottoms; C4/C5 Olefin/Alkane Hydrocarbons and Mercaptans Mix; Feeds to Merox Unit 1st & 2nd Stage Caustic Settlers and n-Butane Product Settler, NC4-Rich LPG containing Mercaptans; C3-C6 Hydrocarbons and R-SHs		

n-Butane to the Caustic Treaters

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Liquefied Petroleum Gases	68476-85-7	100
2) C3-C6 Hydrocarbons	68513-26-8	98-100
3) n-Butane	106-97-8	65-96
4) Iso-Pentane	78-78-4	1-30
5) Iso-Butane	75-28-5	1-25
6) Butenes or Butylenes	25167-67-3	1-15
7) n-Pentane	109-66-0	1-15
8) Pentenes or Pentylenes	68527-11-7	0-10
9) Isobutylene	115-11-7	0-7
10) 1,3-Butadiene	106-99-0	0.1-6
11) Hexane Isomers	Mixture	0-5
12) Propane	74-98-6	0-1.5
13) Methyl mercaptan	74-93-1	0-0.5
14) Ethyl mercaptan	75-08-1	0-0.5
15) C3 Mercaptans	Mixture	0-0.5

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Skin contact. Eye contact. Skin absorption.

Signs and Symptoms of Acute Exposure

Inhalation	<p>May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. The National Institute for Occupational Safety and Health has determined that atmospheres containing 150 ppm or more of methyl mercaptan are immediately dangerous to life and health. At concentrations above 700 ppm, it may cause unconsciousness and respiratory paralysis leading to coma and/or death. (See Section 11)</p> <p>High concentrations of this mixture can displace the amount of oxygen available to breathe below that level necessary to sustain life (hypoxia). Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, shortness of breath, nausea, vomiting, confusion, muscular weakness, loss of coordination, convulsions, unconsciousness, coma, and death, depending upon the concentration level and duration of exposure. Oxygen deprivation is possible if working in confined spaces</p>
Eye Contact	Vapors may cause mild to severe eye irritation upon short-term exposure. Severity depends upon the concentration of mercaptans and duration of exposure. Direct contact with pressurized/liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn."
Skin Contact	Direct contact with an expanding liquefied/pressurized gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. Methyl mercaptan can be absorbed through the skin to produce toxic effects. If the skin is damaged, absorption increases
Ingestion	Due to its volatile nature, ingestion is not normally an applicable route of exposure for this liquefied gas mixture. However, if swallowed, this material may "freeze burn" the mucous membranes of the mouth, throat, and esophagus.
Chronic Health Effects Summary	<p>Chronic inhalation to components of this gas (propane, n-butane, and n-pentane) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline)-like drugs.</p> <p>1,3-Butadiene (BD), a minor component of this stream, has been shown to be mutagenic and produces multiple organ tumors in various tissues of laboratory rodents. BD also causes sexual organ atrophy in test animals (See Section 11.)</p>
Conditions Aggravated by Exposure	Personnel with pre-existing chronic respiratory diseases, central nervous system (CNS) disease, high blood pressure, cardiovascular conditions, or skin disorders should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this liquefied gas mixture. They should take additional precautions to minimize or avoid exposure.
Target Organs	This stream is toxic to eyes, skin, mucous membranes, lungs, central nervous system, brain, heart, and possibly, the liver, kidneys, bladder, and/or reproductive systems

n-Butane to the Caustic Treaters

Carcinogenic Potential This stream contains 1,3-butadiene at concentrations at or above 0.1%. 1,3-Butadiene is considered carcinogenic by OSHA, IARC, and NTP. (See Section 11.)

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required. This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines such as epinephrine (adrenaline) and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Liquefied Gas.		
Flash Point/Method	CLOSED CUP: LT -60° to -51°C (-76° to -60°F) (Estimated)		
Lower Flammable Limit	AP 1.4 %	Upper Flammable Limit	AP 21.8 %
Auto-Ignition Temp.	AP 288°C (550°F)		
Hazardous Combustion Products	Carbon dioxide and monoxide, smoke, fumes, oxides of sulfur, and possibly, unburned hydrocarbons or mercaptans		

n-Butane to the Caustic Treaters

Special Properties	This liquefied gas is extremely flammable at well below ambient temperatures and readily forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. Exposed to an ignition source, it will burn in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources! Being heavier than air, its flammable vapors can travel long distances close to the ground to an ignition source, and then flash back.
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquefied Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This liquefied gas or waste mixtures containing this material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling **Danger! Poisonous and Flammable Gas!** Do NOT breathe vapor, it may contain mercaptans. Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency and flammability.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed petroleum gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

n-Butane to the Caustic Treaters

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8 and wear appropriate personal protective clothing/equipment. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue.

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposures, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with cold liquid or vapors.

Body Protection

Prevent potential skin contact with cold liquid or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

Odor is not an adequate warning for potentially hazardous air concentrations! Use a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. Air purifying respirators offer no protection against oxygen deficient atmospheres. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).

General Comments

Releases of this liquefied gas mixture may create flammable, explosive, and/or oxygen-deficient atmospheres (LT 19.5 Vol.% in air). DO NOT ENTER such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions. Air purifying respirators offer no protection against mercaptans.

n-Butane to the Caustic Treaters**Occupational Exposure Guidelines**

Substance	Applicable Workplace Exposure Levels
1) Methyl mercaptan	TWA: 5 (ppm) from ACGIH (TLV) [1997] TWA: 0.5 (ppm) from ACGIH (TLV) [proposed for 1998]
2) Ethyl mercaptan	TWA: 0.5 CEIL: 10 (ppm) from OSHA [1989] TWA: 0.5 (ppm) from ACGIH (TLV) [proposed for 1998]
3) Liquefied Petroleum Gases	TWA: 0.5 CEIL: 10 (ppm) from OSHA (PEL) [1989] TWA: 1000 (ppm) from ACGIH (TLV) [1998]
4) Propane	TWA: 1000 (ppm) from OSHA (PEL) [1989] TWA: 2500 (ppm) from ACGIH (TLV) [1998]
5) Butanes	TWA: 1000 (ppm) from OSHA (PEL) [1989] TWA: 800 (ppm) from ACGIH (TLV) [1998]
6) 1,3-Butadiene ("A2" and "Z-2" Carcinogen)	TWA: 800 (ppm) from OSHA (PEL) [1989] TWA: 2 (ppm) from ACGIH (TLV) [1998]
7) Pentanes	TWA: 2 STEL: 5 AL: 1 (ppm) from OSHA (PEL) [1994] TWA: 600 (ppm) from ACGIH (TLV) [1998]
8) Hexane, other isomers	TWA: 1000 (ppm) from OSHA (PEL) [1976] TWA: 500 STEL: 1000 (ppm) from ACGIH (TLV) [1998] TWA: 500 (ppm) from OSHA (PEL) [1989]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquefied Gas	Color	Colorless liquid; invisible gas and vapor; white frost at release point	Odor	Strong, unpleasant, and distinctive of skunk or rotten cabbage
Specific Gravity	AP 0.58 to 0.62 (Water = 1)	pH	Not applicable.	Vapor Density	AP 2.0 to 2.3 (Air = 1)
Boiling Point/Range	AP -42° to 63°C (-43° to 146°F) at 14.7 psia (ASTM D-2887)	Melting/Freezing Point			AP -160° to -99°C (-255° to -147°F) at 14.7 psia
Vapor Pressure	AP 20 to 75 psia at 40°C (104°F)	Viscosity (cSt @ 40°C)			Not applicable.
Solubility in Water	Negligible to slightly soluble in cold water.	Volatile Characteristics			This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Gross Heat of Combustion at 60°F = AP 20,700 to 21,100 Btu/lb or 3,350 Btu/cu.ft.; Dry Point Temperature = AP 121°F (49°C) (ASTM D-86); Average Density at 60°F = 5.0 lbs./gal. (ASTM D-2161)				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur, but possible.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions. Polymerization can occur under conditions of extremely high temperature and pressure.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

n-Butane to the Caustic Treaters

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Methanethiol (Methyl mercaptan):

GAS (LC50): Acute: 675 ppm for 4 hours [Rat] - Hypermotility, diarrhea, and reduced respiration
 GAS (LC50): Acute: 6,530 ug/m³ for 2 hours [Mouse].

Ethanethiol (Ethyl mercaptan):

GAS (LC50): Acute: 2,770 ppm for 4 hours [Mouse] - Excitement, motor activity changes, and cyanosis.
 GAS (LC50): Acute: 4,420 ppm for 4 hours [Rat] - Excitement, spastic paraparesis, and cyanosis.
 ORAL (LD50): Acute: 682 mg/kg [Rat] - Muscle weakness, ataxia, and cyanosis.
 INTRAPERITONEAL (LD50): Acute: 226 mg/kg [Rat] - Muscle weakness, ataxia, and cyanosis.

1-Propanethiol (n-Propyl mercaptan):

GAS (LC50): Acute: 4,010 ppm for 4 hours [Mouse] - Respiratory stimulation, somnolence, and chromidracryorrhea
 GAS (LC50): Acute: 7,300 ppm for 4 hours [Rat] - Respiratory stimulation, somnolence, and lacrimation
 ORAL (LD50): Acute: 1,790 mg/kg [Rat] - Respiratory depression, somnolence, and coma.
 INTRAPERITONEAL (LD50): Acute: 515 mg/kg [Rat] - Respiratory depression, somnolence, and coma.

Iso-Butane:

GAS (TCLo): Acute: 1,040,000 mg/m³ for 2 hours [Mouse] - Excitement.
 GAS (LC50): Acute: 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress.

Iso-Butene (Isobutylene or 2-Methylpropene):

GAS (LC50): Acute: 415,000 mg/m³ for 2 hours [Mouse].
 GAS (LC50): Acute: 620,000 mg/m³ for 4 hours [Rat].

n-Butane:

GAS (LC50): Acute: 658,000 mg/m³ for 4 hours [Rat].
 GAS (LC50): Acute: 680,000 mg/m³ for 2 hours [Mouse].

1,3-Butadiene (Erythrene or Pyrrolyene):

GAS (LC50): Acute: 285,000 mg/m³ for 4 hour(s) [Rat].
 GAS (LC50): Acute: 270,000 mg/m³ for 2 hours [Mouse].
 ORAL (LD50): Acute: 5,480 mg/kg [Rat].

2,2-Dimethylpropane (Neopentane)

INTRAPERITONEAL (LD50): Acute: 100 mg/kg [Mouse].

n-Pentane:

GAS (LC50): Acute: 364,000 mg/m³ for 4 hours [Rat] - Excitement.
 INTRAVENOUS (LD50): Acute: 446 mg/kg [Mouse]

Methyl and ethyl mercaptans act as respiratory poisons by inhibiting the respiratory control center in the brain and cellular respiration, but only at concentrations exceeding 50 ppm in air. At lower chronic exposures, they can cause pulmonary edema, hemolytic anemia, methemoglobinemia, and kidney and/or liver damage. They are also eye irritants and have been shown to produce positive responses in various mutagenic assays. **Propyl mercaptans** possess similar toxic properties but at somewhat higher exposure levels.

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline).

Human volunteers had no apparent effects from exposures of 250 ppm, 500 ppm, and 1,000 ppm concentrations in air of **isobutane** and **n-butane** for periods of 8 hours daily for 10 days to 14 days, respectively. An **n-Butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane**, **butylene**, and/or **1,3-butadiene** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone. Chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage.

At very high concentrations, **1,3-butadiene (BD)** produces narcosis with central nervous system depression and/or respiratory paralysis. Lifetime inhalation studies have shown that BD or its epoxide metabolites cause multiple organ tumors in various tissues of both rats and mice. It is also a mutagen and causes sexual organ atrophy in test animals. Epidemiology studies amongst BD workers and styrene-butadiene rubber (SBR) workers suggest that BD or BD epoxide metabolite exposures may increase the risk of cancers of the lymphohematopoietic system. Based on these various studies, IARC, NTP, OSHA, ACGIH, and EPA have determined BD to be an "animal carcinogen" and a "probable human carcinogen".

n-Butane to the Caustic Treaters

Inhalation of 500 ppm of **isopentane** or **n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects; however, higher exposure concentrations of 90,000 to 120,000 ppm (9 to 12 Wt.% in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. **n-Pentane** caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure. Rat 28-day feeding studies on both **isopentane** and **n-pentane** using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

Hexane isomers were not mutagenic in the Salmonella/microsome (Ames) assay and are NOT considered to be carcinogenic.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, the butenes, pentenes, and 1,3-butadiene components of this material will readily vaporize and may contribute to generation of atmospheric smog. The atmospheric half-lives of propane, butenes, and pentenes under photochemical smog conditions are estimated to be between 5 to 8 hours; and, 1,3-butadiene's half-life is only 2 to 3 hours. Experimental data shows that significant photooxidation of 1,3-butadiene occurs rapidly within 7 to 21 hours. The atmospheric half-lives of the butanes under photochemical smog conditions are estimated to be between 5 and 7 days. The pentanes have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. Photooxidation of propane, isobutane, and n-butane in air (LT 8%) is not considered to be environmentally significant.
Environmental Fate	<p>Liquefied petroleum hydrocarbon gases are essentially insoluble in water (LT 0.1%); however, the toxic methyl and ethyl mercaptan components are moderately soluble in water. Therefore, this material could potentially cause harm to aquatic life.</p> <p>For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine (See Section 2 for components.)</p>

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste for additional reasons, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this liquefied gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U.S. Department of Transportation regulated material		
Proper Shipping Name	Liquefied gas, flammable, toxic, n.o.s. Inhalation Hazard Zone B (Methyl mercaptan)		
Hazard Class	DOT CLASS: Poisonous gas.	Packing Group(s)	Not applicable.
		UN/NA ID	UN1953
Reportable Quantity	The Reportable Quantity (RQ) substance component present in this material which might require DOT HAZMAT bill-of-lading display is Methyl mercaptan .		

n-Butane to the Caustic Treaters**Placards****Emergency Response Guide No.** 119**HAZMAT STCC No.**

49 203 78

MARPOL III StatusNot a DOT "Marine Pollutant"
per 49 CFR 171.8.**SECTION 15: REGULATORY INFORMATION****TSCA Inventory**

This stream and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.

SARA 302/304The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. A chemical substance which might be present in these streams and is subject to this statute is **Methanethiol (Methyl mercaptan) [CAS No. 74-93-1]**.**SARA 311/312**

The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories.

Fire, Sudden Release of Pressure, Reactivity, and Acute (Immediate) & Chronic (Delayed) Health Hazards.**SARA 313**This stream contains the following component in concentrations which are at or above de minimis levels and it is listed as toxic chemical in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA:
1,3-Butadiene [CAS No. = 106-99-0] concentration: 0.1 to 6%.**CERCLA**

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. A chemical substance that might be present in these streams which is subject to this statute is:

Methanethiol (Methyl mercaptan) [CAS No. 74-93-1] (RQ = 100 lbs. [45.36 kg]) concentration: 0 to 0.5%**CWA**

This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

California Proposition 65This material contains the following chemical substance which is known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5: **1,3-Butadiene [CAS No. = 106-99-0]****New Jersey Right-to-Know Label**

For New Jersey labeling, refer to components listed in Section 2

Additional Regulatory RemarksIn regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in this material as a "Volatile Organic Compounds (VOC)" which contribute significantly to air pollution which endangers public health and welfare": **1,3-Butadiene, 1-Butene, Isobutylene, 1-Pentene, and n-Pentane.**In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances which may be present in these streams that are subject to this statute are: **Methyl mercaptan (Methanethiol), Ethyl mercaptan (Ethanethiol), Propane, Isobutane (Propane, 2-methyl), various Butenes, Butane, 1,3-Butadiene, Isopentane (Butane, 2-methyl), various Pentenes, and n-Pentane.**

n-Butane to the Caustic Treaters**SECTION 16: OTHER INFORMATION**

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid.
Color Light amber to amber **Odor** Hydrocarbon.Gasoline.
(Strong.)

DANGER!
Extremely Flammable.
Vapor may cause flash fire or explosion.
Vapor may travel considerable distance to source of ignition and flash back.
Harmful or fatal if swallowed - Can enter lungs and cause damage.
Repeated or excessive exposure to certain components of this mixture have been associated with central nervous system effects.
Harmful to aquatic organisms.
Possible Cancer Hazard (See Section 3)

Trade Name	Full Range Hydrotreated Naphtha	Technical Contact	(800) 525-4692
Product Number	Not available.	Medical Emergency	(800) 313-7645
CAS Number	Mixture	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Not applicable.		
Synonyms			

SECTION 2. COMPOSITION (TYPICAL)

This product may be composed, in whole or in part, of any of the following refinery streams:

Heavy Hydrodesulfurized Naphtha, [CAS No. 64742-82-1]

Light Hydrodesulfurized Naphtha, [CAS No. 64742-73-0]

This product contains the following chemicals as components of the refinery streams listed above:

Component Name(s)	CAS Registry No.	Concentration (%)
-------------------	------------------	-------------------

Full Range Hydrotreated Naphtha

C10-C11 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	20 - 60
Pentanes, all isomers	Mixture	5 - 20
Octanes, all isomers	Mixture	3 - 10
Nonane, all isomers	Mixture	3 - 10
Heptane, all isomers	142-82-5	1 - 10
Hexane Isomers	Mixture	1 - 10
Xylene, all isomers	1330-20-7	1 - 8
Cyclohexane	110-82-7	1 - 5
n-Hexane	110-54-3	1 - 5
Pentenes or Pentylenes	68527-11-7	1 - 5
Benzene	71-43-2	1 - 3
Toluene	108-88-3	1 - 3
Ethylbenzene	100-41-4	0.5 - 1.5

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Inhalation. Ingestion

Signs and Symptoms of Acute Exposure

Inhalation	Breathing this material may cause central nervous system depression with symptoms including nausea, headache, dizziness, fatigue, drowsiness, or unconsciousness. Breathing high concentrations of this material, for example, in an enclosed space or by intentional abuse, can cause irregular heartbeats which can cause death. Breathing this material may cause central nervous system depression with symptoms including nausea, headache, dizziness, fatigue, drowsiness, or unconsciousness.
Eye Contact	This material can cause eye irritation with tearing, redness, or a stinging or burning feeling. Further, it can cause swelling of the eyes with blurred vision. Effects may become more serious with repeated or prolonged contact.
Skin Contact	May cause skin irritation with redness, an itching or burning feeling, and swelling of the skin. Effects may become more serious with repeated or prolonged contact. Skin contact may cause harmful effects in other parts of the body.
Ingestion	Swallowing this material may be harmful. Swallowing this material may cause stomach or intestinal upset with pain, nausea, and/or diarrhea. This material can get into the lungs during swallowing or vomiting. Small amounts in the lungs can cause lung damage, possibly leading to chronic lung dysfunction or death. Swallowing this material may cause effects similar to those described in the inhalation section (see "inhalation" above).

Chronic Health Effects Summary	Subacute exposure to low levels of hydrogen sulfide can produce eye irritation, watering, light sensitivity and corneal opacity. Reported effects from subacute exposure also include bronchitis, pulmonary edema, nausea, abdominal cramps and diarrhea. Aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Altered mental state, drowsiness, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been reported from repeated over-exposure such as gasoline and naphtha abusers. Repeated and prolonged overexposure to n-Hexane has been associated with peripheral nerve tissue damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function and paralysis. This material, or a component of this material, has been shown to cause cancer in laboratory animals. However it is not likely to represent a human cancer hazard. See Toxicological Information (Section 11)
---------------------------------------	---

Conditions Aggravated by Exposure	Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Peripheral Nervous System, Central Nervous System (CNS), Heart (Cardiac)
--	--

Full Range Hydrotreated Naphtha

Target Organs Contains material which may cause damage to the following organs: blood, kidneys, lungs, the reproductive system, liver, mucous membranes, heart, lymphatic system, peripheral nervous system, upper respiratory tract, immune system, skin, , bone marrow, central nervous system (CNS), eye, lens or cornea, testes.

Carcinogenic Potential **CARCINOGENIC EFFECTS** Classified 1 (Proven for human.) by IARC, + (Proven.) by OSHA [Benzene]. Classified + (Proven.) by OSHA+ (Proven.) by NIOSH [1, 3-Butadiene]. Classified A2 (Suspected for human.) by ACGIH, 2A (Probable for human.) by IARC [1, 3-Butadiene]. Classified 2B (Possible for human.) by IARC [Ethylbenzene].

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.

Eye Contact Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.

Skin Contact Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.

Ingestion Do not induce vomiting unless directed to do so by medical personnel -- this material is an aspiration hazard. Get immediate medical attention. Never give anything by mouth to an unconscious person.

Notes to Physician INHALATION: Inhalation overexposure can produce toxic effects. Treat intoxications as hydrogen sulfide exposures. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Administer supplemental oxygen with assisted ventilation, as required.

This material (or a component) sensitizes the heart to the effects of sympathomimetic amines. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias in individuals exposed to this material. Administration of sympathomimetic drugs should be avoided.

INGESTION: If ingested, this material presents a significant aspiration and chemical pneumonitis hazard. Induction of emesis is not recommended. Consider activated charcoal and/or gastric lavage. If patient is obtunded, protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position.

Full Range Hydrotreated Naphtha

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	NFPA Class-IB flammable liquid.
Flash Point	Closed cup: <-45°C (-49°F). (Tagliabue.)
Lower Flammable Limit	AP 1 % Upper Flammable Limit AP 7 %
Autoignition Temperature	not available
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons and oxides of sulfur and/or nitrogen.
Special Properties	Flammable Liquid! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. A vapor and air mixture can create an explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide, foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or water spray. Water fog and spray are effective in cooling containers and adjacent structures. However, water can cause frothing and/or may not extinguish the fire. Water can be used to cool the external walls of vessels to prevent excessive pressure, autoignition or explosion. DO NOT use a solid stream of water directly on the fire as the water may spread the fire to a larger area.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid enter sewers or waterways.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent spilled material from entering waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Prevent spilled material from entering sewers, storm drains, other drainage systems, and natural waterways. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free

Full Range Hydrotreated Naphtha

liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbant pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7. HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire or explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation and personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food and tobacco products. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

A static electrical charge can accumulate when this material is flowing through pipes, nozzles or filters and when it is agitated. A static spark discharge can ignite accumulated vapors particularly during dry weather conditions. Always bond receiving containers to the fill pipe before and during loading. Always keep nozzle in contact with the container throughout the loading process. Do not fill any portable container in or on a vehicle. Do NOT use compressed air for filling, discharging or other handling operations.

Product container is not designed for elevated pressure. Do not pressurize, cut, weld, braze solder, drill, or grind on containers. Do not expose product containers to flames, sparks, heat or other potential ignition sources. Empty containers may contain product residues that can ignite with explosive force. Observe label precautions. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling or disposing of empty containers and/or waste residues of this product.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources. Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room. A refrigerated room is preferable for materials with a flash point temperature lower than 70°F (21°C). All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable regulatory requirements and the National Electrical Code.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor or mists below the applicable workplace exposure limits indicated below. All electrical equipment should comply with the National Electric Code. An emergency eye wash station and safety shower should be located near the work-station.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Full Range Hydrotreated Naphtha

- Eye Protection** Safety glasses equipped with side shields are recommended as minimum protection in industrial settings. Chemical goggles should be worn during transfer operations or when there is a likelihood of misting, splashing, or spraying of this material. Suitable eye wash water should be readily available.
- Hand Protection** Avoid skin contact. Use heavy duty gloves constructed of chemical resistant materials such as Viton® or heavy nitrile rubber. Wash hands with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities or leaving work. DO NOT use gasoline, kerosene, solvents or harsh abrasives as skin cleaners.
- Body Protection** Avoid skin contact. Wear long-sleeved fire-retardant garments (e.g., Nomex®) while working with flammable and combustible liquids. Additional chemical-resistant protective gear may be required if splashing or spraying conditions exist. This may include an apron, boots and additional facial protection. If product comes in contact with clothing, immediately remove soaked clothing and shower. Promptly remove and discarded contaminated leather goods.
- Respiratory Protection** A full-face supplied air pressure-demand respirator with escape bottle or a pressure-demand self-contained, breathing apparatus (SCBA) is required. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).
- General Comments** Warning! Use of this material in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and/or inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
C10-C11 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Not available.
Pentanes, all isomers	ACGIH (United States). TWA: 600 ppm 8 hour(s).
Octanes, all isomers	OSHA (United States). TWA: 1000 ppm 8 hour(s).
Nonane, all isomers	ACGIH (United States). TWA: 300 ppm 8 hour(s).
Heptane, all isomers	OSHA (United States). TWA: 500 ppm 8 hour(s).
Hexane Isomers	ACGIH (United States). TWA: 200 ppm 8 hour(s).
Xylene, all isomers	ACGIH (United States). TWA: 400 ppm 8 hour(s). STEL: 500 ppm 15 minute(s).
Cyclohexane	OSHA (United States). TWA: 500 ppm 8 hour(s).
n-Hexane	ACGIH TLV (United States). TWA: 50 ppm 8 hour(s).
	ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 150 ppm 15 minute(s).
	OSHA (United States). TWA: 100 ppm 8 hour(s).
	ACGIH (United States). TWA: 100 ppm 8 hour(s).
	OSHA (United States). TWA: 300 ppm 8 hour(s).
	ACGIH (United States). Skin TWA: 50 ppm 8 hour(s).
	OSHA (United States). TWA: 500 ppm 8 hour(s).

Full Range Hydrotreated Naphtha

Pentenes or Pentylenes	Not available.
Benzene	<p>ACGIH (United States). Skin TWA: 0.5 ppm 8 hour(s). STEL: 2.5 ppm 15 minute(s).</p> <p>OSHA (United States). Skin Notes: See Table Z-2 for exclusions in 20 CFR 1910.1028 to the PEL. TWA: 1 ppm 8 hour(s). STEL: 5 ppm 15 minute(s).</p>
Toluene	<p>ACGIH (United States). Skin TWA: 50 ppm 8 hour(s).</p> <p>OSHA (United States). TWA: 200 ppm 8 hour(s). CEIL: 300 ppm PEAK: 500 ppm</p>
Ethylbenzene	<p>ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 125 ppm 15 minute(s).</p> <p>OSHA (United States). TWA: 100 ppm 8 hour(s).</p>

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Liquid.	Color	Light amber to amber	Odor	Hydrocarbon.Gasoline. (Strong.)
Specific Gravity	Weighted average: 0.76 (Water = 1)	pH	Not Applicable.	Vapor Density	>1 (Air = 1)
Boiling Range	85°C to 89.31°C			Melting/Freezing Point	Not available.
Vapor Pressure	The highest known value is 16.5 kPa (124 mm Hg) (at 20°C) (n-Hexane). Weighted average: 4.91 kPa (36.83 mm Hg) (at 20°C)			Volatility	760 g/l VOC (w/v)
Solubility in Water	Very slightly soluble in cold water. (<0.1 % w/w)			Viscosity (cSt @ 40°C)	not available
Flash Point	Closed cup: <-45°C (-49°F). (Tagliabue.)				
Additional Properties	No additional information.				

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from heat, sparks and flame.		
Materials Incompatibility	Incompatible with strong acids, strong bases, and strong oxidizers.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

Full Range Hydrotreated Naphtha

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Pentanes, all isomers

Studies of pentane isomers in laboratory animals indicate exposure to extremely high levels (roughly 10 vol.%) may induce cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.

Heptane, all isomers

n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not considered to be carcinogenic.

Xylene, all isomers

Effects from Acute Exposure:

ORAL (LD₅₀), Acute: 4,300 mg/kg [Rat].

INHALATION (LC₅₀), Acute: 4,550 ppm for four hours [Rat].

DERMAL (LD₅₀), Acute: 14,100 uL/kg [Rabbit].

Overexposure to xylene may cause upper respiratory tract irritation, headache, cyanosis, blood serum changes, CNS damage and narcosis. Effects may be increased by the use of alcoholic beverages. Evidence of liver and kidney impairment were reported in workers recovering from a gross over-exposure.

Effects from Prolonged or Repeated Exposure:

Impaired neurological function was reported in workers exposed to solvents including xylene. Studies in laboratory animals have shown evidence of impaired hearing following high levels of exposure. Studies in laboratory animals suggest some changes in reproductive organs following high levels of exposure but no significant effects on reproduction were observed. Studies in laboratory animals indicate skeletal and visceral malformations, developmental delays, and increased fetal resorptions following extremely high levels of maternal exposure. Adverse effects on the liver, kidney, bone marrow (changes in blood cell parameters) were observed in laboratory animals following high levels of exposure. The relevance of these observations to humans is not clear at this time.

Cyclohexane

Cyclohexane can cause eye, skin and mucous membrane irritation, CNS depressant and narcosis at elevated concentrations. In experimental animals exposed to lethal concentrations by inhalation or oral route, generalized vascular damage and degenerative changes in the heart, lungs, liver, kidneys and brain were identified.

Cyclohexane has been the focus of substantial testing in laboratory animals. Cyclohexane was not found to be genotoxic in several tests including unscheduled DNA synthesis, bacterial and mammalian cell mutation assays, and in vivo chromosomal aberration. An increase in chromosomal aberrations in bone marrow cells of rats exposed to cyclohexane was reported in the 1980's. However, a careful re-evaluation of slides from this study by the laboratory which conducted the study indicates these findings were in error, and that no significant chromosomal effects were observed in animals exposed to cyclohexane. Findings indicate long-term exposure to cyclohexane does not promote dermal tumorigenesis.

n-Hexane

This material contains n-hexane. Long-term or repeated exposure to n-hexane can cause peripheral nerve damage. Initial symptoms are numbness of the fingers and toes. Also, motor weakness can occur in the digits, but may also involve muscles of the arms, thighs and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure.

Benzene

ORAL (LD50): Acute: 930 mg/kg [Rat]. 4700 mg/kg [Mouse].

INHALATION (LC50):

Full Range Hydrotreated Naphtha

(VAPOR): Acute: 10000 ppm 7 hour(s) [Rat]. 9980 ppm 8 hour(s) [Mouse].

Studies of Workers Over-Exposed to Benzene:

Studies of workers exposed to benzene show clear evidence that over-exposure can cause cancer of the blood forming organs (acute myelogenous leukemia) and aplastic anemia, an often fatal disease. Studies also suggest over-exposure to benzene may be associated with other types of leukemia and other blood disorders. Some studies of workers exposed to benzene have shown an association with increased rates of chromosome aberrations in circulating lymphocytes. One study of women workers exposed to benzene suggested a weak association with irregular menstruation. However, other studies of workers exposed to benzene have not demonstrated clear evidence of an effect on fertility or reproductive outcome in humans. Benzene can cross the placenta and affect the developing fetus. Cases of aplastic anemia have been reported in the offspring of persons severely over-exposed to benzene.

Studies in Laboratory Animals:

Studies in laboratory animals indicate that prolonged, repeated exposure to high levels of benzene vapor can cause bone marrow suppression and cancer in multiple organ systems. Studies in laboratory animals show evidence of adverse effects on male reproductive organs following high levels of exposure but no significant effects on reproduction have been observed. Embryotoxicity has been reported in studies of laboratory animals but effects were limited to reduced fetal weight and skeletal variations.

Toluene:

Effects from Acute Exposure:

Deliberate inhalation of toluene at high concentrations (e.g., glue sniffing and solvent abuse) has been associated with adverse effects on the liver, kidney and nervous system and can cause CNS depression, cardiac arrhythmias and death. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects.

Effects from Repeated or Prolonged Exposure:

Studies of workers indicate long-term exposure may be related to impaired color vision and hearing. Some studies of workers suggest long-term exposure may be related to neurobehavioral and cognitive changes. Some of these effects have been observed in laboratory animals following repeated exposure to high levels of toluene. Several studies of workers suggest long-term exposure may be related to small increases in spontaneous abortions and changes in some gonadotropic hormones. However, the weight of evidence does not indicate toluene is a reproductive hazard to humans. Studies in laboratory animals indicate some changes in reproductive organs following high levels of exposure, but no significant effects on mating performance or reproduction were observed. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects. Findings in laboratory animals were largely negative. Positive findings include small increases in minor skeletal and visceral malformations and developmental delays following very high levels of maternal exposure. Studies of workers indicate long-term exposure may be related to effects on the liver, kidney and blood, but these appear to be limited to changes in serum enzymes and decreased leukocyte counts. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland following very high levels of exposure. The relevance of these findings to humans is not clear at this time.

Ethylbenzene

Effects from Acute Exposure:

ORAL (LD50), Acute: 3,500 mg/kg [Rat].

DERMAL (LD50), Acute: 17,800 uL/kg [Rabbit].

INTRAPERITONEAL (LD50), Acute: 2,624 mg/kg [Rat].

Effects from Prolonged or Repeated Exposure:

Findings from a 2-year inhalation study in rodents conducted by NTP were as follows: Effects were observed only at the highest exposure level (750 ppm). At this level the incidence of renal tumors was elevated in male rats (tubular carcinomas) and female rats (tubular adenomas). Also, the incidence of tumors was elevated in male mice (alveolar and bronchiolar carcinomas) and female mice (hepatocellular carcinomas). IARC has classified ethyl benzene as "possibly carcinogenic to humans" (Group 2B). Studies in laboratory

Full Range Hydrotreated Naphtha

animals indicate some evidence of post-implantation deaths following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate limited evidence of renal malformations, resorptions, and developmental delays following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland.

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity	No data.
Environmental Fate	This product will normally float on water. Components will evaporate rapidly. This material may be harmful to aquatic organisms and may cause long term adverse effects in the aquatic environment. The log Kow value for this product is expected to be in the range of 3.3 to 6.

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. Conditions of use may cause this material to become a "hazardous waste", as defined by federal or state regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304 Emergency Planning and Notification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: fire, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard

Full Range Hydrotreated Naphtha

SARA 313 Toxic Chemical Notification and Release Reporting

This product contains the following components in concentrations above de minimis levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA:

Xylene, all isomers [CAS No.: 1330-20-7] Concentration: 4.5%
Cyclohexane [CAS No.: 110-82-7] Concentration: 3%
n-Hexane [CAS No.: 110-54-3] Concentration: 3%
Benzene [CAS No.: 71-43-2] Concentration: 2%
Toluene [CAS No.: 108-88-3] Concentration: 2%
Ethylbenzene [CAS No.: 100-41-4] Concentration: 1%

CERCLA

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are:

Xylene, all isomers [CAS No.: 1330-20-7] RQ = 100 lb. (45.36 kg) Concentration: 4.5%
Cyclohexane [CAS No.: 110-82-7] RQ = 1000 lb. (453.6 kg) Concentration: 3%
n-Hexane [CAS No.: 110-54-3] RQ = 5000 lb. (2268 kg) Concentration: 3%
Benzene [CAS No.: 71-43-2] RQ = 10 lb. (4.536 kg) Concentration: 2%
Toluene [CAS No.: 108-88-3] RQ = 1000 lb. (453.6 kg) Concentration: 2%
Ethylbenzene [CAS No.: 100-41-4] RQ = 1000 lb. (453.6 kg) Concentration: 1%

Clean Water Act (CWA)

This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

California Proposition 65

This material may contain the following components which are known to the State of California to cause cancer, birth defects or other reproductive harm, and may be subject to the requirements of California Proposition 65 (CA Health & Safety Code Section 25249.5):

Benzene: 3%
Toluene: 3%
Ethylbenzene: 0.6%

New Jersey Right-to-Know Label

For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.

Additional Regulatory Remarks

No additional regulatory remarks.

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 3.0
Revision Date 2/28/2005
Print Date Printed on 2/28/2005.

Emergency Overview

Physical State	Liquefied Gas.		
Color	Colorless liquid; invisible gas and vapor; white frost at release point.	Odor	Strong, foul smelling; rotten egg or skunk odor is unreliable as a warning of possible exposure

DANGER! Extremely flammable and poisonous liquefied gas; vapor may cause flash fire or explosion!
May form explosive peroxides on exposure to air!
High pressure and rapid diffusion hazard!
Liquid or compressed gas contact may cause frostbite or freeze burns!
Contains Hydrogen Sulfide (H₂S)! Corrosive to some metals!
May be harmful or fatal if inhaled or absorbed through the skin!
High concentrations of vapor reduce oxygen available for breathing and may cause central nervous system (CNS) depression or suffocation!
Vapor or mist may cause mild to severe eye, mucous membrane, and respiratory tract irritation and inflammation!
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
Overexposures may cause target organ effects such as eye, lung, brain, sympathetic and central nervous systems, heart, blood, liver, and/or kidney damage!
Contains low levels of 1,3-Butadiene! Based upon laboratory animal tests, cancer, mutagenic, and reproductive hazards might exist!
May cause blood system disorders and/or genetic damage!
May adversely affect reproduction or reproductive development!

Protective Equipment

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Eye contact. Skin contact. Skin absorption.

Signs and Symptoms of Acute Exposure

Inhalation May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. The National Institute for Occupational Safety and Health has determined that atmospheres containing 100 ppm or more of **hydrogen sulfide (H₂S)** are immediately dangerous to life and health. At concentrations above 500 ppm, H₂S causes unconsciousness and respiratory paralysis leading to coma and/or death. (See Section 11.)

Additionally, at least one component of this liquefied gas mixture is a "simple asphyxiant". High concentrations of this mixture can displace the amount of oxygen available to breathe below that level necessary to sustain life (hypoxia). Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, shortness of breath, nausea, vomiting, confusion, muscular weakness, loss of coordination, convulsions, unconsciousness, coma, and death, depending upon the concentration level and duration of exposure. Oxygen deprivation is possible if working in confined spaces.

Eye Contact Vapors may cause moderate to severe eye irritation and photophobia (light sensitivity) upon short-term exposure. Severity depends upon the concentration of **hydrogen sulfide** and duration of exposure. Direct contact with pressurized/liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn."

Skin Contact Direct contact with an expanding liquefied/pressurized gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. **Hydrogen sulfide and methyl mercaptan** can be absorbed through the skin to produce toxic effects. If the skin is damaged, absorption increases.

Ingestion Due to its volatile nature, ingestion is not normally an applicable route of exposure for this liquefied gas mixture. However, if swallowed, this material may "freeze burn" the mucous membranes of the mouth, throat, and esophagus.

Chronic Health Effects Summary Subchronic exposure to low levels of **hydrogen sulfide** can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H₂S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures.

Chronic inhalation to components of this mixture (**propane, propene, n-butane, and n-pentane**) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of **epinephrine (adrenaline)-like** drugs.

1,3-Butadiene (BD), a minor component of this stream, has been shown to be mutagenic and produces multiple organ tumors in various tissues of laboratory rodents. BD also causes sexual organ atrophy in test animals. (See Section 11.)

**Sour Butane/Butene Feeds
to B/B Extractor Pretreaters**

Conditions Aggravated by Exposure	Personnel with eye, skin, cardiovascular, pulmonary, blood, liver, kidney, or neurological disorders, high blood pressure, and chronic respiratory diseases or those with a compromised ability to use oxygen (asthmatics, anemics, etc.) should take additional precautions to minimize or avoid exposure.
Target Organs	These streams are toxic to eyes, skin, mucous membranes, lungs, central and sympathetic nervous systems, brain, heart, liver, kidneys, and possibly, the endocrine and reproductive systems.
Carcinogenic Potential	These refinery streams contain 1,3-butadiene at concentrations above 0.1%. 1,3-Butadiene is considered carcinogenic by OSHA, IARC, and NTP. (See Section 11.)

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910 1200).

OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input checked="" type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. If pain, redness, swelling, tearing, or light sensitivity persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, obtain medical attention as soon as possible. Do not use ointments.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients. Inhalation overexposure can produce other toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required. This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines such as epinephrine (adrenline) and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.

Sour Butane/Butene Feeds to B/B Extractor Pretreaters

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Liquefied Gas.		
Flash Point/Method	CLOSED CUP AP -107° to -73°C (-160° to -100°F) (Estimated)		
Lower Flammable Limit	AP 1.6	Upper Flammable Limit	AP 45%
Auto-Ignition Temp.	AP 260°C (500°F)		
Hazardous Combustion Products	Carbon dioxide and monoxide, smoke, fumes, oxides of sulfur, and possibly, unburned hydrocarbons or mercaptans.		
Special Properties	This liquefied gas mixture is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.		
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquefied Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This liquefied gas or waste mixtures containing this material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

Sour Butane/Butene Feeds to B/B Extractor Pretreaters

SECTION 7: HANDLING AND STORAGE

Handling

Danger! Poisonous and Flammable Gas! Do NOT breathe vapor; it may contain hydrogen sulfide (H₂S), mercaptans, and/or simple asphyxiants. Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S concentrations, and flammability.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed petroleum gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue.

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC). The H₂S component of this material is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking (See appropriate API and NACE standards.)

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location. Where H₂S is routinely stored or handled, install monitoring equipment or system with alarms.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Sour Butane/Butene Feeds to B/B Extractor Pretreaters

Hand Protection	Avoid skin contact and use gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). When handling this material which can produce frostbite or cold burns, use leather gloves over these chemically-resistant gloves.
Body Protection	Prevent potential skin contact with cold liquid, solid, or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable liquefied gases. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.
Respiratory Protection	A full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g. ANSI Z88.2)
General Comments	Releases of this liquefied gas mixture may create flammable, explosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions. Air purifying respirators offer no protection against hydrogen sulfide, mercaptans, and simple asphyxiants.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) [1998] TWA: 10 STEL: 15 CEIL: 20 (ppm) from OSHA (PEL) [1989]
2) Methyl mercaptan	TWA: 5 (ppm) from ACGIH (TLV) [1997] TWA: 0.5 (ppm) from ACGIH (TLV) [proposed for 1998] TWA: 0.5 CEIL: 10 (ppm) from OSHA [1989]
3) Ethyl mercaptan	TWA: 0.5 (ppm) from ACGIH (TLV) [proposed for 1998] TWA: 0.5 CEIL: 10 (ppm) from OSHA (PEL) [1989]
4) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1989]
5) Propane	TWA: 2500 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1989]
6) Propylene	Simple asphyxiant
7) Butanes	TWA: 800 (ppm) from ACGIH (TLV) [1998] TWA: 800 (ppm) from OSHA (PEL) [1989]
8) 1,3-Butadiene ("A2" and "Z-2" Carcinogen)	TWA: 2 (ppm) from ACGIH (TLV) [1998] TWA: 2 STEL: 5 AL: 1 (ppm) from OSHA (PEL) [1994]
9) Pentanes	TWA: 600 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1976]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquefied Gas	Color	Colorless liquid; invisible gas and vapor; white frost at release point.	Odor	Strong, foul smelling; rotten egg or skunk odor is unreliable as a warning of possible exposure
Specific Gravity	AP 0.56 to 0.62 (Water = 1)	pH	In the presence of moisture, H ₂ S can convert to acidic H ₂ SO ₄ .	Vapor Density	AP 1.9 to 2.1 (Air = 1)
Boiling Point/Range	AP -60°C to 36°C (-75° to 97°F) at 14.7 psia (ASTM D-2887)	Melting/Freezing Point		AP	-187° to -83°C (-305° to -117°F) at 14.7 psia
Vapor Pressure	45 to 190 psia at 100°F	Viscosity (cSt @ 40°C)		AP	Not applicable
Solubility in Water	Moderately soluble in cold water.	Volatile Characteristics		AP	This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Hydrogen Sulfide and Mercaptans Content = 0.1 to 3 Vol.%; C3-C5 Alkane, Isoparaffin, and Alkene Hydrocarbons Content = 97 to 99.3 Wt.% (ASTM D-1319), Gross Heat of Combustion at 60°F = AP 21,300 Btu/lb or 2,350 Btu/cu.ft., Average Density at 60°F = AP 5.00 lbs./gal. (ASTM D-2161).				

Sour Butane/Butene Feeds to B/B Extractor Pretreaters

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions. Polymerization can occur under conditions of extremely high temperature and pressure.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	<p>Hydrogen sulfide GAS (TCLo): Acute: 10 ppm for 15 minutes (Human) - Eye irritation GAS (TCLo): Acute: 50 to 100 ppm for 15 minutes (Human) - Respiratory irritation GAS (LC100) Acute: 600 to 750 ppm for 30 minutes (Human) - Respiratory paralysis and death GAS (LCLo): Acute: 5,700 ug/kg for 8 hours (Human) - Chronic pulmonary edema, coma, and death.</p> <p>Methanethiol (Methyl mercaptan) GAS (LC50): Acute: 675 ppm for 4 hours [Rat] - Hypermotility, diarrhea, and reduced respiration. GAS (LC50): Acute: 6,530 ug/m³ for 2 hours [Mouse].</p> <p>Ethanethiol (Ethyl mercaptan) GAS (LC50): Acute: 2,770 ppm for 4 hours [Mouse] - Excitment, motor activity changes, and cyanosis. GAS (LC50): Acute: 4,420 ppm for 4 hours [Rat] - Excitment, spastic parapysis, and cyanosis ORAL (LD50): Acute: 682 mg/kg [Rat] - Muscle weakness, ataxia, and cyanosis INTRAPERITONEAL (LD50): Acute: 226 mg/kg [Rat] - Muscle weakness, ataxia, and cyanosis.</p> <p>Propylene. GAS (LC50): Chronic: 1,250 ppm for 6 hours/day for 14 weeks [Mouse]. GAS (TCLo): Chronic: 5,000 ppm for 6 hours/day for 2 years [Rat] - Reduced olfactory sensory response.</p> <p>Iso-Butane: GAS (TCLo): Acute: 1,040,000 mg/m³ for 2 hours [Mouse] - Excitment. GAS (LC50): Acute: 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress.</p> <p>Iso-Butene (Isobutylene or 2-Methylpropene) GAS (LC50) Acute: 415,000 mg/m³ for 2 hours [Mouse]. GAS (LC50): Acute: 620,000 mg/m³ for 4 hours [Rat].</p> <p>n-Butane: GAS (LC50): Acute: 660,000 mg/m³ for 4 hours [Rat]. GAS (LC50): Acute: 680,000 mg/m³ for 2 hours [Mouse].</p> <p>1,3-Butadiene (Erythrene or Pyrrolyene): GAS (LC50): Acute: 285,000 mg/m³ for 4 hour(s) [Rat]. GAS (LC50): Acute: 270,000 mg/m³ for 2 hours [Mouse]. ORAL (LD50): Acute: 5,480 mg/kg [Rat].</p> <p>n-Pentane: GAS (LC50): Acute: 364,000 mg/m³ for 4 hour(s) [Rat] - Excitment. INTRAVENOUS (LD50) Acute: 446 mg/kg [Mouse]</p>
----------------------	--

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (LT 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (GT 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Sour Butane/Butene Feeds to B/B Extractor Pretreaters

Methyl and ethyl mercaptans act as respiratory poisons by inhibiting the respiratory control center in the brain and cellular respiration, but only at concentrations exceeding 50 ppm in air. At lower chronic exposures, they can cause pulmonary edema, hemolytic anemia, methemoglobinemia, and kidney and/or liver damage. They are also eye irritants and have been shown to produce positive responses in various mutagenic assays.

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline). **Propylene** has also been found to be a cardiac sensitizer in dogs. An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. And, **n-pentane** caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure.

In humans, at concentrations of 6-4% in air or higher, **propylene** causes mild intoxication, dermal sensations, and an inability to concentrate on tasks within two minutes. Gross inhalation of propylene concentrations of 40% or higher for a couple minutes cause reddening of the eyelids and face, tearing, coughing, and sometimes flexing of the legs, reduced blood pressure, and/or disordered heart rhythm. A concentration of 50% causes anesthesia in two minutes, followed by complete recovery without any physiological indications.

Propylene was tested by the National Cancer Institute (NCI) in a two-year, 6 hours/day, 5 days/week inhalation study using rats and mice with exposure concentrations at 5,000 and 10,000 ppm. The resulting data suggested that propylene induces signs of nasal cavity toxicity (epithelial hyperplasia/metaplasia) including increased incidence of neo-plastic lesions in rats, but not in mice. Propylene is NOT considered carcinogenic to either rats or mice; however, it may be partially metabolized to **propylene oxide** which has been shown to be mutagenic and produces site of contact tumors in rodents following long-term administration.

Human volunteers had no apparent effects from exposure concentrations of 250 ppm, 500 ppm, and 1,000 ppm of **isobutane and n-butane** in air for periods of 8 hours daily for 10 days to 14 days, respectively. However, chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage.

At very high concentrations, **1,3-butadiene (BD)** produces narcosis with central nervous system depression and/or respiratory paralysis. Lifetime inhalation studies have shown BD or its epoxide metabolites cause multiple organ tumors in various tissues of both rats and mice. It is also a mutagen and causes sexual organ atrophy in test animals. Epidemiology studies amongst BD workers and styrene-butadiene rubber (SBR) workers suggest that BD or BD epoxide metabolite exposures may increase the risk of cancers of the lymphohematopoietic system. Based on these various studies, IARC, NTP, OSHA, ACGIH, and EPA have determined BD to be an animal carcinogen and a probable human carcinogen. Laboratory animals have exhibited a higher degree of narcosis when exposed to combinations of butane, butenes, and 1,3-butadiene (additive effect), than the degree of narcosis exhibited following exposure to each gas alone.

Inhalation of 500 ppm of **isopentane or n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects; however, higher exposure concentrations of 90,000 to 120,000 ppm (9-12 Wt.% in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. Rat 28-day feeding studies done on both **isopentane and n-pentane** using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, the **propane, propylene, butenes, hydrogen sulfide, and the mercaptan** components of these streams may contribute to generation of atmospheric smog. The atmospheric half-lives of **propane, propylene, and butenes** under photochemical smog conditions are estimated to be between 5 to 8 hours, and, **1,3-butadiene's** half-life is only 2 to 3 hours. Experimental data shows that significant photooxidation of **propylene and 1,3-butadiene** occurs rapidly within 7 to 21 hours. The atmospheric half-lives of the **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days. The **pentanes** have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. Photooxidation of **propane, isobutane, and n-butane** in air (LT 8%) are not considered to be environmentally significant. **Hydrogen sulfide** residence times in the atmosphere range from about one day to more than 40 days, depending upon the season, latitude, and presence of other air pollutants. Reduced temperatures increase the residence time.

Sour Butane/Butene Feeds to B/B Extractor Pretreaters

Environmental Fate

Liquefied petroleum hydrocarbon gases are essentially insoluble in water (LT 0.1%), however, the toxic hydrogen sulfide, methyl mercaptan, and ethyl mercaptan components are moderately soluble in water. Therefore, this material could potentially cause harm to aquatic life.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste for additional reasons, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this liquefied gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U S. Department of Transportation regulated material		
Proper Shipping Name	Liquefied gas, flammable, toxic, n.o.s. Inhalation Hazard Zone B (Hydrogen sulfide, Methyl mercaptan)		
Hazard Class	Class 2.3 Poisonous gas.	Packing Group(s)	Not applicable
		UN/NA ID	UN1953
Reportable Quantity	The Reportable Quantity (RQ) substance components present in this material which might require DOT HAZMAT bill-of-lading display are Hydrogen sulfide and Methyl mercaptan		
Placards			Emergency Response Guide No. 119
		HAZMAT STCC No.	49 203 78
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. Chemical substances which might be present in these streams and are subject to this statute are: Hydrogen sulfide [CAS No. 7783-06-4] and Methanethiol (Methyl mercaptan) [CAS No. 74-93-1]
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories Fire, Sudden Release of Pressure, Reactivity, and Acute (Immediate) & Chronic (Delayed) Health Hazards.

Sour Butane/Butene Feeds to B/B Extractor Pretreaters

SARA 313	These streams contain the following components in concentrations which might be at or above de minimis levels and are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313: Propylene or Propene [CAS No. 115-07-1] concentration: 0 to 2% 1,3-Butadiene [CAS No. 106-99-0] concentration: 0.1 to 1%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances that might be present in these streams which are subject to this statute are: Hydrogen sulfide [CAS No. 7783-06-4] (RQ = 100 lbs. [45.36 kg]) concentration: 0.1 to 1% Methanethiol (Methyl mercaptan) [CAS No. 74-93-1] (RQ = 100 lbs. [45.36 kg]) conc.: 0 to 1%
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA) Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802
California Proposition 65	These streams contain the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5: 1,3-Butadiene [CAS No. 106-99-0].
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in these streams as "Volatile Organic Compounds (VOC)" that contribute significantly to air pollution which endangers public health and welfare". Propylene (Propene), 1,3-Butadiene, 1-Butene, Isobutylene, Isopentane, 1-Pentene, and n-Pentane. In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances which may be present in these streams that are subject to this statute are: Hydrogen sulfide, Methyl mercaptan (Methanethiol), Ethyl mercaptan (Ethanethiol), Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), various Butenes, n-Butane, 1,3-Butadiene, Isopentane (Butane, 2-methyl), 2,2-Dimethylpropane (Neopentane), various Pentenes, and n-Pentane

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

BTU Recycle Gas

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0058
Revision Date 01/31/2002

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Compressed gas/liquid
Color Colorless **Odor** Odorless and tasteless

DANGER! Extremely flammable compressed gas;
vapor may cause flash fire or explosion!
High pressure and rapid diffusion hazard!
**High concentrations of vapor reduce oxygen available for
breathing and may cause central nervous system (CNS)
depression or suffocation!**
Compressed gas or liquid contact may cause frostbite or freeze burns!
**Prolonged and/or repeated inhalation may increase the heart's
susceptibility to arrhythmias (irregular beats)!**

SECTION 1: IDENTIFICATION

Trade Name	BTU Recycle Gas	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	068478002*	Medical Emergency	(918) 495-4700
CAS Number	68478-00-2	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Hydrogen and C1-C4 Alkane Hydrocarbons		
Synonyms	High-Hydrogen Content Gas, Demoisurized Hydrogen with C1-C4 Hydrocarbons, Recycle Gas from the Benzene-Toluene Unit, Hydrogen-rich Recycle Gases (Petroleum)		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Hydrogen	1333-74-0	80-95
2) Methane	74-82-8	1-10
3) Ethane	74-84-0	1-5
4) Propane	74-98-6	1-3
5) Isobutane	75-28-5	0-2
6) Nitrogen	7727-37-9	0-2

BTU Recycle Gas

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation Skin contact Eye Contact

Signs and Symptoms of Acute Exposure

Inhalation	Several components of this gas mixture are "simple asphyxiants" (see Section 8) Their vapors can displace the amount of oxygen in air available to breathe below that necessary to sustain life, especially if working in confined spaces Breathing vapors may also irritate the respiratory tract and cause central nervous system (CNS) depression Symptoms may include headache, dizziness, slurred speech, excitation or giddiness, nausea, blurred vision, memory loss, drowsiness, fatigue, rapid or difficult breathing, confusion, vertigo, loss of consciousness, convulsions, coma, and even death, depending upon concentration level and duration of exposure
Eye Contact	This gas is non-irritating, however, direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn "
Skin Contact	Direct contact with an pressurized/liquefied expanding gas may produce severe and possibly permanent skin damage from frostbite or freeze burns
Ingestion	Ingestion is not an applicable route of exposure for gases
Chronic Health Effects Summary	There is no evidence that long-term, low-level exposure to components of this gas mixture cause any chronic adverse health effects in animals or humans
Conditions Aggravated by Exposure	Personnel with pre-existing chronic respiratory diseases, central nervous system (CNS) disease, or cardiovascular conditions should avoid exposure Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of "simple asphyxiants"
	Exposure to high concentrations of propane , a minor component of this material, may increase the sensitivity of the heart to epinephrine (adrenalin) and catecholamine-like drugs . Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians")
Target Organs	The substance is toxic to mucous membranes, skin, eyes, central nervous system (CNS), and possibly the heart
Carcinogenic Potential	This material does not contain any components at concentrations at or above 0.1% which are considered to be carcinogenic by OSHA, IARC, or NTP

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200)

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual Seek medical attention immediately
Eye Contact	Check for and remove contact lenses Irrigate the eyes with copious amounts of clean, low-pressure, room-temperature water Do not use hot water! Do not use eye ointment unless directed to by a physician Seek medical attention if excessive tearing, irritation, or pain persists

BTU Recycle Gas

Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F) DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area Seek medical attention if tissue appears damaged or if pain persists
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry
Notes to Physician	If cough or difficulty in breathing develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis Monitor arterial blood gases and chest x-ray in cases with significant exposure If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse) If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas		
Flash Point Method	-185°C (-301°F) (Estimated)		
Lower Flammable Limit	AP 2.0%	Upper Flammable Limit	AP 75%
Autoignition Temperature	AP 400°C (752°F)		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes and unburned hydrocarbons		
Special Properties	This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air If released, immediately evacuate personnel to a safe upwind area It is lighter than air and rises rapidly collecting in the upper portions of confined spaces Exposed to an ignition source, it can ignite with explosive force Keep away from all ignition sources!		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.		
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Compressed Gas! Release causes an immediate fire or explosion hazard Evacuate all non-essential personnel to an area upwind Remove all potential ignition sources Safety stop the source gas flow using non-sparking tools Allow the substance to evaporate Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres

Closed gas systems form white-colored frost at the point of a leak Do not direct water at the source of leak If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse Do not touch or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing Use water spray to reduce vapors or divert vapor cloud drift Prevent this material's entry into waterways, sewers, basements, or confined areas
Caution: Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid

BTU Recycle Gas

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This gas or waste mixtures containing this gas should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling

This gas mixture contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring for oxygen deficiency and flammability.

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of mixed gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Drain and purge equipment as necessary to remove material residues. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Do not allow vaporizing material to contact eyes, skin or other tissues. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated.

Storage

Do not store this material near heat or any other potential ignition sources. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Do not store this product in unlabeled containers. Keep containers tightly closed.

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling pressurized and/or liquefied gases. Safety glasses equipped with side shields or face shield are recommended when vapor is being discharged or whenever handling high-pressure cylinders and piping systems.

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves to protect hands from potential contact with cold liquid, solid, or vapors.

BTU Recycle Gas

Body Protection	Prevent potential skin contact with cold liquid, solid, or vapors. Use insulated and chemical-resistant clothing (apron, slicker suit, coveralls, boots, etc.) Fire-retardant garments (e.g. Nomex®) should be worn while working with flammable gases and gas/liquids.
Respiratory Protection	Odor is not an adequate warning for potentially hazardous air concentrations. For unknown vapor concentrations, use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator, if adequate protection is provided. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).
General Comments	For an explanation about some of the occupational exposure limits shown below, refer to the definition of " Simple Asphyxiant " presented in the American Conference of Governmental Industrial Hygienists (ACGIH) most current Threshold Limit Values (TLVs) for Chemical Substances and Physical Agents handbook. Releases of these gases may cause atmospheres, some oxygen-deficient (LT 21 Vol % in air), which can have flammable/explosive potential. DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen	Simple asphyxiant
2) Nitrogen	Simple asphyxiant
3) Methane	Simple asphyxiant
4) Ethane	Simple asphyxiant
5) Propane	TWA. 2500 (ppm) from ACGIH (TLV) TWA. 1000 (ppm) from OSHA (PEL)
6) Liquefied Petroleum Gas (L P G)	TWA. 1000 (ppm) from ACGIH (TLV) TWA. 1000 (ppm) from OSHA (PEL)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Compressed gas/liquid	Color	Colorless	Odor	Odorless and tasteless
Specific Gravity	0.07 to 0.38 (Water = 1)	pH	Not applicable	Vapor Density	0.07 to 1.04 (Air = 1)
Boiling Point/Range	-253° to -41°C (-423° to -43°F) at 14.7 psia			Melting/Freezing Point	-260° to -169°C (-435° to -272°F) at 14.7 psia
Vapor Pressure	205 to 250 psia at 40°C (104°F)			Viscosity (cSt @ 40°C)	Not applicable
Solubility in Water	Negligible in cold water (LT 0.01 Wt %)			Volatile Characteristics	This material is normally a gas. If released in liquid form, it will completely evaporate very quickly.
Additional Properties	This gas' low boiling point temperature intensifies its pressure and rapid diffusion (sudden release) hazard. Gross Heat of Combustion at 60°F = AP 22,000 Btu/lb or 1,000 Btu/cu ft.				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

BTU Recycle Gas**SECTION 11: TOXICOLOGICAL INFORMATION**

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Hydrogen, methane, and ethane, major components of this material, are "simple asphyxiants" High concentrations of this gas can displace the amount of oxygen available to breathe below that level necessary to sustain life (hypoxia), especially if trapped in confined spaces Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, shortness of breath, nausea, vomiting, confusion, muscular weakness, loss of coordination, convulsions, unconsciousness, coma, and death, depending upon the concentration level and duration of exposure

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol % in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs

SECTION 12: ECOLOGICAL INFORMATION**Ecotoxicity**

Ecological effects testing has not been conducted on this material Releases are expected to cause only localized non-persistent environmental damage

Environmental Fate

Hydrogen and light alkane/alkene gases are essentially insoluble in water (LT 0.1%); and therefore, this material will not cause harm to aquatic life These pressurized gas mixtures will normally disperse rapidly in air if released

The atmospheric half-lives of **methane, ethane, and propane** under photochemical smog conditions are estimated to be between 5 to 8 hours Photooxidation of **propane** in air (LT 8%) is not considered environmentally significant

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine (See Section 2 for components)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

This material may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001) Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible Venting of this gas to the atmosphere should be avoided Treatment, storage, transportation, and disposal must be in accordance with applicable Federal, State, and local regulations Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags

SECTION 14: TRANSPORT INFORMATION**DOT Status**

This material is regulated by the U.S. Department of Transportation (DOT).

Proper Shipping Name

Hydrogen and methane mixtures, compressed

Hazard Class

DOT Class. 2.1 (Flammable gas).

Packing Group(s)

Reportable Quantity

A Reportable Quantity (RQ) has not been established for any components of this material

BTU Recycle Gas**Placards****Emergency Response Guide No.** 115**HAZMAT STCC No.**

49 057 29

MARPOL III StatusNot a DOT "Marine Pollutant"
per 49 CFR 171.8**SECTION 15: REGULATORY INFORMATION**

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Sudden Release of Pressure Hazard, and Acute (Immediate) Health Hazard
SARA 313	This material does not contain any components in concentrations at or above de minimis levels and are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. This material is not known to contain chemical substances subject to this statute. However, it is recommended that you contact state and local authorities to determine if there are any other reporting requirements in the event of a release.
CWA	This material is NOT classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA).
California Proposition 65	This material does not contain any chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling, refer to the components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this material which are subject to this statute are Hydrogen, Methane, Ethane, Propane, and Isobutane.

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

MSDS No. RS0060
Revision Date 10/16/2001

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product

Emergency Overview

Physical State Liquid
Color Transparent, colorless **Odor** Light hydrocarbon Odor threshold is 1 to 7 ppm in air

DANGER! Extremely flammable liquid; vapor may cause flash fire or explosion!
High vapor concentrations reduce oxygen available for breathing!
Mist or vapor may irritate the eyes, nose, and respiratory tract!
Liquid contact may cause mild to moderate eye irritation and/or mild to severe skin irritation!
May be harmful if inhaled or absorbed through the skin!
Overexposures may cause central nervous system (CNS) depression and target organ effects such as hearing loss and/or liver, kidney, or peripheral nervous system damage!
May be harmful or fatal if ingested! Aspiration into the lungs can cause pulmonary edema and chemical pneumonia!
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
Contains low levels of Benzene! Potential cancer hazard!
May cause anemia, leukemia, and/or other blood disorders!
Mutagenic hazard; may cause genetic damage!
Based upon animal testing, may adversely affect reproduction!
Spills may create a slipping hazard!

* = Chronic Health Hazard

Protective Equipment

Minimum Requirements See Section 8 for Details

The personal protective equipment depicted below is recommended for use only at this facility

SECTION 1: IDENTIFICATION

Trade Name	Coker Naphtha Splitter Overhead	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	3641836418	Medical Emergency	(800) 313-7645 or (918) 495-4700
CAS Number	64741-74-8	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	C4-C8 Petroleum Hydrocarbons		
Synonyms	534 Still Depentanizer Overhead Product; Thermocracked Naphtha Splitter Overhead, Light Thermocracked Naphtha, Light Thermal Cracked Naphtha (Petroleum), Unstabilized Light Coker Naphtha, Untreated Coker Gasoline; Light Delayed Coker Gasoline, Coker Pentenes/Hexenes, C4-C8 Alkanes/Alkene Hydrocarbons Mix.		

Coker Naphtha Splitter Overhead

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Light Thermal Cracked Naphtha (Petroleum)	64741-74-8	100
2) Butanes	Mixture	1-10
3) Butenes or Butylenes	25167-67-3	1-5
4) Pentanes	Mixture	15-35
5) Pentenes or Pentylenes	68527-11-7	15-25
6) Cyclopentane	287-92-3	1-3
7) Hexane Isomers	Mixture	15-25
8) C6-C8 alpha-Alkenes	68526-99-8	5-10
9) Methylcyclopentane	96-37-7	1-5
10) n-Hexane	110-54-3	5-15
11) Cyclohexane	110-82-7	1-3
12) Benzene	71-43-2	0 1-1
13) Heptanes	Mixture	2-5
14) Octanes	Mixture	0-2

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact Eye Contact Absorption Inhalation

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of this mixture's vapor may cause upper respiratory tract irritation, headache, nausea, vomiting, and/or central nervous system (CNS) depression. Components of this mixture may also produce mild narcotic effects. Symptoms may include euphoria, excitation or giddiness, abdominal pain, loss of appetite, fatigue, muscular weakness, and staggering gait. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon the exposure duration. High vapor concentrations can displace the amount of oxygen in air available to breathe below that necessary to sustain life (hypoxia), especially if working in confined spaces. Approximately 20,000 ppm (or 2 vol %) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 to 10,000 ppm for only 5 minutes.
Eye Contact	Actual human exposures indicate that this product can cause mild to moderate eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling. Liquid contact may cause conjunctivitis, small areas of superficial corneal necrosis, and/or permanent clouding of the cornea.
Skin Contact	Actual human exposures indicate that this product can cause mild to severe skin irritation. Short-term contact symptoms include redness, itching, and burning or blistering of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate to severe dermatitis. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and severe tissue damage.
Ingestion	Due to its volatile nature, ingestion is not normally an applicable route of exposure. However, if swallowed, this material may cause a "freeze burn" or irritation with a burning sensation of the mucous membranes in the mouth, throat, and esophagus. The liquid portion can be readily absorbed by the stomach and intestinal tract. Symptoms include nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above). Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.
Chronic Health Effects Summary	Altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called "Petrol Sniffers Encephalopathy"), delirium, seizures, and sudden death have been common results for naphtha and gasoline abusers. Intentional misuse by deliberately concentrating and inhaling this material may be harmful or fatal. Even with acute exposures, n-hexane is toxic to the peripheral nerves, characterized by numbness, tingling, or pain in the extremities, progressively worsening of neuromuscular motor coordination (polyneuritis or polyneuropathy), and even partial paralysis. And, based upon animal studies, n-hexane's metabolite, 2,5-hexanedione , has been shown to cause degeneration of the testes.

Coker Naphtha Splitter Overhead

Benzene is considered to be a cancer causing agent. It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML). Benzene is also capable of causing changes in genetic material (chromosomes). Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy. Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents. (See Section 11.)

Conditions Aggravated by Exposure Personnel with pre-existing nervous system disease, neurological conditions, skin disorders, impaired hearing, liver, or kidney function, blood disorders, or chronic respiratory diseases, and women attempting to conceive should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this material. They should take additional precautions to minimize or avoid exposure.

Exposure to high concentrations of this material may increase the sensitivity of the heart to **epinephrine (adrenalin) and catecholamine-like drugs**. Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians").

Target Organs The substance is toxic to lungs, nervous system, especially the peripheral nerves, brain, liver, kidneys, blood and blood-forming tissues, mucous membranes, skin, eyes, and possibly, the heart, lymph nodes, and reproductive systems.

Carcinogenic Potential This material contains benzene at concentrations above 0.1%. Benzene is considered to be a known human carcinogen by OSHA, IARC and NTP. (See Section 11.)

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input checked="" type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.

Coker Naphtha Splitter Overhead

Notes to Physician

Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse). If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IA Flammable Liquid. Extremely flammable ¹		
Flash Point Method	CLOSED CUP <-45°C (-50°F) (Tagliabue [ASTM D-56])		
Lower Flammable Limit	0.9% in Air	Upper Flammable Limit	7.8% in Air
Autoignition Temperature	260° to 280°C (500° to 535°F) by ASTM E-659.		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors.		
Special Properties	Extremely Flammable Liquid ¹ . This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Mists or sprays may be flammable at temperatures below the flash point. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard if released into confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.		
Extinguishing Media	A static electrical charge can accumulate as a result of transfer flow or agitation. Discharge (static spark) can ignite vapors, especially in cold, dry weather conditions. Special slow load and monitoring procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing middle distillates or other higher flash point products. To reduce this hazard, receiving containers should always be grounded and loading nozzle must be kept in contact with container during the entire filling process. Do not fill any portable container in or on a vehicle without proper bonding.		
Protection of Fire Fighters	SMALL FIRE: Use dry chemicals, carbon dioxide (CO ₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.		
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat, cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.		

Coker Naphtha Splitter Overhead

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Eliminate all potential ignition sources because a liquid spill will vaporize rapidly. A vapor-suppressing foam may be used to reduce vapors. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material even when wearing proper respiratory equipment and fire-resistant protective clothing. Do not direct water at the source of leak, but, use water spray to reduce vapors or divert vapor cloud drift. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors, but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible, in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations. Spills will most likely need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with mild soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room, and preferably refrigerated. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

Coker Naphtha Splitter Overhead

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below), then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

The personal protective equipment depicted below is recommended for use only at this facility.

- Eye Protection** Safety glasses with side shields are recommended as a minimum protection. When there is a likelihood of misting, splashing, or spraying, use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent). During transfer operations or when this material is being released under pressure, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Suitable eye wash water should be readily available.
- Hand Protection** Avoid skin contact and use impervious, chemically-resistant gloves (e.g., disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with vapors and liquid. Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use this material as a skin cleaner.
- Body Protection** Avoid skin contact. It is recommended that fire-retardant garments (e.g., Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.
- Respiratory Protection** For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g., ANSI Z88.2).
- General Comments** Releases of this product may create flammable, explosive, and/or oxygen-deficient atmospheres (<19.5 Vol % in air). DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability. If the Lower Explosive Limit (LEL) for this product is exceeded, all entry into the contaminated area/confined space should be prohibited. Odor is an inadequate warning for hazardous conditions.

Warning! Use of this hydrocarbon fuel in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and inadequate oxygen levels for breathing.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Gasoline ("A3" Animal Carcinogen)	TWA: 300 STEL: 500 (ppm) from ACGIH (TLV) TWA: 300 STEL: 500 (ppm) from OSHA (PEL)
2) Petroleum Distillates (Naphtha)	TWA: 400 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
3) Butane	TWA: 800 (ppm) from ACGIH (TLV) TWA: 800 (ppm) from OSHA (PEL) [Proposed]
4) Pentane, all isomers	TWA: 600 (ppm) from ACGIH (TLV) TWA: 600 STEL: 750 (ppm) from OSHA (PEL) [Proposed] TWA: 1000 (ppm) from OSHA (PEL)
5) Cyclopentane	TWA: 600 (ppm) from ACGIH (TLV) TWA: 600 (ppm) from OSHA (PEL) [Proposed]
6) Hexane, other isomers	TWA: 500 STEL: 1000 (ppm) from ACGIH (TLV)

Coker Naphtha Splitter Overhead

7) 1-Hexene	TWA 500 STEL 1000 (ppm) from OSHA (PEL) [Proposed] TWA: 30 (ppm) from ACGIH (TLV)
8) Hexane (n-Hexane)	TWA 50 (ppm) from ACGIH (TLV) [Proposed] TWA 50 (ppm) from ACGIH (TLV) - SKIN TWA 50 (ppm) from OSHA (PEL) [Proposed] TWA 500 (ppm) from OSHA (PEL)
9) Cyclohexane	TWA 300 (ppm) from ACGIH (TLV) TWA 100 (ppm) from ACGIH (TLV) [Proposed] TWA 300 (ppm) from OSHA (PEL)
10) Heptane (n-Heptane)	TWA 400 STEL 500 (ppm) from ACGIH (TLV) TWA: 400 STEL 500 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
11) Benzene ("A1" and "Z-2" Known Human Carcinogen)	TWA: 0.5 STEL 2.5 (ppm) from ACGIH (TLV) - SKIN TWA 1 STEL 5 AL 0.5 (ppm) from OSHA (PEL) - SKIN
12) Octane, all isomers	TWA 300 (ppm) from ACGIH (TLV) TWA 300 STEL 375 (ppm) from OSHA (PEL) [Proposed] TWA 500 (ppm) from OSHA (PEL)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color	Transparent, colorless.	Odor	Light hydrocarbon. Odor threshold is 1 to 7 ppm in air
Specific Gravity	0.63 to 0.68 (Water = 1)	pH	Not applicable.	Vapor Density	2.0 to 3.2 (Air = 1)
Boiling Point/Range	-12° to 99°C (10° to 210°F) [ASTM D-3710]	Melting/Freezing Point			-160° to 7°C (-255° to 45°F) at 14.7 psia [ASTM D-97]
Vapor Pressure	110 to 125 mm of Hg at 20°C (68°F) or 35 to 52 psia at 37.8°C (100°F)	Viscosity (cSt @ 40°C)			0.5 to 1.0 [ASTM D-445]
Solubility in Water	Slightly soluble in cold water (<0.2%)	Volatile Characteristics			Volatile Organic Compounds (VOC) Content = 100%, 900 gm/L
Additional Properties	Alkane, Isoparaffin, Cycloalkane, and Naphthene Hydrocarbons Content = 58 to 79 Wt % (ASTM D-3257), C6-C7 Aromatic Hydrocarbons Content = 0.15 to 2 Wt % (ASTM D-2267), Olefin Hydrocarbons Content = 21 to 40 Wt % (ASTM D-1319), Average Density at 60°F = 5.452 lbs/gal (ASTM D-2161), Dry Point Temperature = 230°F (110°C) (ASTM D-86), Evaporation Rate = 7 to 10 when n-Butyl acetate = 1.0, Sulfur Content = <0.05 Wt % (ASTM D-2922); Heat Value = 20,000 to 21,000 Btu or AP 4,000 Btu/cu.ft.				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Polymerization can occur under conditions of extremely high temperature and pressure
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide, and oxygen		
Hazardous Decomposition Products	No substances are readily identified from composition; but, no degradation data is available		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Coker Naphtha Splitter Overhead

Thermal Cracked Naphtha (a similar material):

VAPOR	(LC ₅₀)	Acute	>5,000 mg/M ³ (Rat screen level) (4 hours) - Somnolence
ORAL	(LD ₅₀)	Acute	>5,000 mg/kg (Rat screen level) - Diarrhea, somnolence, & hypermotility.
DERMAL	(LD ₅₀)	Acute	>2,000 mg/kg (Rat screen level)
BUEHLER DERMAL		Acute	Non-sensitizing (Guinea Pig)

Unleaded Gasoline (a similar material):

VAPOR	(TE _{Lo})	Acute	140 ppm (Human) (8 hours) - Mild eye irritant!
VAPOR	(TE _{Lo})	Acute	500 ppm (Human) (1 hour) - Moderate eye irritant!
VAPOR	(TC _{Lo})	Acute	900 ppm (Human) (1 hour) - CNS and pulmonary effects
DERMAL	(TD _{Lo})	Acute	53 mg/kg (Human) - Skin allergy effects.
VAPOR	(LC ₅₀)	Acute	101,200 ppm (Rat, Mouse, & Guinea Pig) (5 minutes)

In a large epidemiological study on over 15,000 persons, no increased risk of kidney cancer was seen in association with **gasoline** exposures for employees at several petroleum refineries or amongst residents located near these refineries. In another study, no increased risk of kidney cancer was seen amongst petroleum refinery workers, but there was a slight trend in kidney cancers among service station employees, especially after a 30-year latency period.

Two-year inhalation toxicity studies with **fully vaporized unleaded gasoline** (at 67, 292, & 2,056 ppm in air) produced kidney damage and kidney tumors in male rats, but not in female rats or mice of either sex. Female mice developed a slightly higher incidence of liver tumors compared to controls at the highest concentration. Results from subsequent scientific studies suggest that the kidney damage, and probably the kidney tumor response, is unique to the male rat. An EPA draft policy statement takes account of alpha-2u-globulin findings as a basis for discarding male rat kidney data in determining whether gasoline is a carcinogen. In additional rat studies, the maternal and developmental NOAEL was determined to be 9,000 ppm (75% of the LEL value). Under conditions of the study, **volatilized unleaded gasoline vapor** did NOT produce evidence of any type of developmental toxicity.

There were no benzene-induced blood toxin or leukemia effects noted in laboratory animals following long-term exposures to **fully-volatilized unleaded gasoline vapor containing 2 vol.% benzene**. However, the relative risk to humans for benzene in gasoline is still unknown.

An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. And, **n-pentane** caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure.

Human volunteers had no apparent effects from exposure concentrations of 250 ppm, 500 ppm, and 1,000 ppm of **isobutane and n-butane** in air for periods of 8 hours daily for 10 days to 14 days, respectively. However, chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane and butylenes** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone.

Inhalation of 500 ppm of **isopentane or n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects; however, higher exposure concentrations of 90,000 to 120,000 ppm (9-12 Wt % in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. Rat 28-day feeding studies done on both **isopentane and n-pentane** using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

Intentional abuse of products containing **n-hexane** have been associated with permanent brain and nervous system damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function and even paralysis. These neurological effects are pronounced in combination with lack of oxygen supply, especially among women. Chronic repeated or prolonged overexposure to **n-hexane**, either by inhalation or skin absorption, has been associated with peripheral neuropathy in both human workers and rodents. The neurotoxic properties of **n-hexane** may increase with concurrent exposure to methyl ethyl ketone, methyl isobutyl ketone or toluene. **n-Hexane** has been associated with testicular degeneration and epididymal lesions in rats. Also, **n-hexane** produced fetal toxicity and reduced fetal weight in mice at maternally toxic doses.

Other **hexane isomers** can cause eye and skin irritation, but they were not shown to be mutagenic in the Salmonella/ microsome (Ames) assay. They are not considered neurotoxic or carcinogenic.

Cyclohexane can cause eye, skin and mucous membrane irritation, CNS depression, narcosis, and death at elevated concentrations. In experimental animals exposed to lethal concentrations by inhalation or oral routes, there was generalized vascular damage and severe degenerative changes in the heart, lungs, liver, kidneys

Coker Naphtha Splitter Overhead

and brain Cyclohexane does not act as a promotor for tumors on mice when exposed to dimethylbenzanthracene Further, it did not induce unscheduled DNA synthesis in cultured human lymphocytes. It is not mutagenic in the Salmonella/microsome (Ames) or the mouse lymphoma L5178Y assays, with or without metabolic activation, however, it did increase the number of chromosomal aberrations in bone marrow cells of rats exposed to between 100 and 300 ppm for 6 hours/day for 5 days These chromosomal aberrations did not appear to be dose-related

Benzene has an IDLH (immediately dangerous to life or health) concentration of 500 ppm Its estimated lethal dose for a normal human adult is one teaspoon to one ounce (AP 10 mL). Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes Prolonged and repeated exposure to high concentrations of benzene is associated with injury to blood forming organs and anemia Consumption of alcohol may increase the blood system changes related to benzene exposure It is linked to the development of acute myelogenous leukemia (AML) in humans NTP, IARC, and OSHA list benzene as carcinogenic to humans Studies of workers exposed to high levels of benzene have identified humoral and cellular immunity impairment and a decrease in levels of circulating leukocytes. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice Animal studies have shown testicular effects and alterations in reproductive cycles with some evidence of developmental effects. Studies with pregnant laboratory animals have demonstrated that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity

n-Heptane is a skin, mucous membrane, and respiratory tract irritant, but non-irritating to the eyes It is readily absorbed by either inhalation or dermal exposure Overexposures may cause decreased red blood cell counts, liver and heart damage, and central nervous system depression These higher exposures also decreased the myocardial threshold to the arrhythmogenic effects (irregular heart beats) of epinephrine, producing only a narrow margin of safety between exposures causing CNS effects, cardiac effects, and loss of consciousness n-Heptane is metabolized in the liver to form alcohols and ketones, including neurotoxic **2,5-heptanedione** which is detectable in small amounts in the urine of exposed humans One occupational exposure study with **95% purity n-heptane** from 1 to 9 years duration concluded that it could produce minimal peripheral nerve damage with numbness and tingling of the extremities in the stocking-and-glove areas Polyneuropathy was reversible within a year following removal of exposure n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not expected to be carcinogenic

2,2,4-Trimethylpentane (iso-octane) was highly irritating to mice at a 1,000 ppm in air exposure for 5 minutes and respiratory arrest occurred at exposures above 10,000 ppm for 5 minutes CNS depression was observed at concentrations between 8,000 and 10,000 ppm in air Kidney tubule necrosis, hyaline droplet formation, and acute renal failure were seen in male rats following oral administration of 10 gm/kg, 8 mL/kg, or 2,100 mg/kg of iso-octane for 2, 3, and 4 weeks, respectively

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this naphtha, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life This material will normally evaporate rapidly if spilled If released, volatile **aromatic hydrocarbon components (benzene and toluene)** may contribute to the creation of atmospheric smog. The atmospheric half-lives of the **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days Photooxidation of **isobutane and n-butane** in air (<8%) is not considered to be environmentally significant **Isopentane, n-pentane, n-hexane, hexane isomers, n-heptane, heptane isomers, and iso-octane** all have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present **Cyclohexane** has a half-life of from 6 hours to over 4 days when hydroxyl radicals are present

This material is potentially toxic to freshwater and saltwater ecosystems Using Rainbow Trout (*Salmo irideus*), various Gasolines showed an LC100 (the Lethal Level) from 40 ppm to 100 ppm in ambient stream water. A 24-hour TLm (Median Toxic Limit) resulted in 90 ppm when using juvenile American Shad (*Squalus cephalus*). Using Bluegill Sunfish (*Lepomis macrochirus*), Grey Mullet (*Chelon labrosus*), and Gulf Menhaden (*Brevoortia patronus*), Gasoline showed a 96-hour LC50 of 8 ppm, 2 ppm, and 2 ppm, respectively

Environmental Fate

This material is potentially toxic to freshwater and saltwater ecosystems It will normally float on water with its lighter components evaporating rapidly In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material

Coker Naphtha Splitter Overhead

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine (See Section 2 for components)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT)		
Proper Shipping Name	Petroleum distillates, n.o.s. (Pentanes, Pentenes, and/or Hexanes)		
Hazard Class	DOT Class: 3 (Flammable liquid).	Packing Group(s)	PG I
		UN/NA ID	UN1268
Reportable Quantity	The Reportable Quantity (RQ) substance components present in this material which might require DOT HAZMAT bill-of-lading display are Benzene, n-Hexane, and/or Cyclohexane .		
Placards		Emergency Response Guide No.	128
		HAZMAT STCC No.	49 123 87
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.

Coker Naphtha Splitter Overhead**SARA 313**

This material contains the following components in concentrations which might be at or above de minimis levels and are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313

n-Hexane [CAS No. 110-54-3] concentration: 5 to 15%
Cyclohexane [CAS No. 110-82-7] concentration: 1 to 3%
Benzene [CAS No. 71-43-2] concentration: 0.1 to 1%.

CERCLA

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances that might be present in this material which are subject to this statute are:

n-Hexane [CAS No. 110-54-3] (RQ = 5,000 lbs. [2,270 kg]) concentration: 5 to 15%
Cyclohexane [CAS No. 110-82-7] (RQ = 1,000 lbs. [453.6 kg]) concentration: 1 to 3%
Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 0.1 to 1%
Toluene [CAS No. 108-88-3] (RQ = 1,000 lbs. [453.6 kg]) concentration: 0.05 to 0.9%
2,2,4-Trimethylpentane (Iso-octane) [CAS No. 540-84-2] (RQ = 1,000 lbs. [453.6 kg]) conc.: 0 to 1%.

CWA

This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

California Proposition 65

This material contains the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5: **Benzene [CAS No. 71-43-2] and Toluene [CAS No. 108-88-3].**

New Jersey Right-to-Know Label

For New Jersey labeling refer to components listed in Section 2.

Additional Regulatory Remarks

Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13). This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: **Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children!**

Under Section 12(b) of the Toxic Substances Control Act. Because it contains detectable amounts of **Cyclohexane [CAS No. 110-82-7]**, this product might be subject to US EPA's one-time only per country export notification requirements.

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following minor components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare: **1-Butene [CAS No. 106-98-9], Isopentane [CAS No. 78-78-4], 1-Pentene [CAS No. 109-67-1], n-Pentane [CAS No. 109-66-0], Cyclohexane [CAS No. 110-82-7], Benzene [CAS No. 71-43-2], Methylcyclohexane [CAS No. 108-87-2], and Toluene [CAS No. 108-88-3].**

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this material which are subject to this statute are **Isobutane (Propane, 2-methyl), various Butenes, n-Butane, Isopentane (Butane, 2-methyl), various Pentenes, and n-Pentane.**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Liquefied Gas.		
Color	Colorless liquid, invisible gas and vapor; white frost at release point.	Odor	Strong, unpleasant, and distinctive of skunk or rotten cabbage.

DANGER! Extremely flammable liquefied gas; vapor may cause flash fire or explosion!
 May form explosive peroxides on exposure to air!
 High pressure and rapid diffusion hazard!
 Liquid or compressed gas contact may cause frostbite or freeze burns!
 May be harmful or fatal if inhaled or absorbed through the skin!
 High concentrations of vapor reduce oxygen available for breathing and may cause central nervous system (CNS) depression or suffocation!
 Vapor or mist may cause mild to severe eye, mucous membrane, and respiratory tract irritation and inflammation!
 Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
 Overexposures may cause target organ effects such as lung, brain, central nervous system, heart, blood, liver, and/or kidney damage!
 Contains low levels of 1,3-Butadiene! Based upon laboratory animal tests, cancer, mutagenic, and reproductive hazards might exist!
 May cause blood system disorders and/or genetic damage!
 May adversely affect reproduction or reproductive development!

SECTION 1: IDENTIFICATION

Trade Name	Feeds to the B/B Extractor and B/B Settler	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	1111110061	Medical Emergency	(918) 495-4700
CAS Number	Mixture (See Section 2)	CHEMTREC Emergency	(800) 424-9300
Product Family	Liquefied Gas Mixture of Partially Treated Thermal and Catalytic Cracked C4 Hydrocarbon Streams		
Synonyms	Partially-treated C4-Rich Liquefied Petroleum Gases, Unsweetened Butanes/Butenes Mixture; Unsweetened B/B Stock, Unsweetened C4-Rich Gases, Unsweetened Technical-grade Butene; BRU V-101 and V-102 Caustic Treater Effluent; LPG Blend containing Mercaptans; C3-C5 Hydrocarbons and R-SHs.		

Feeds to the B/B Extractor and B/B Settler

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Liquefied Petroleum Gases	68476-85-7	100
2) C4-Rich Gases	68477-85-0	99-100
3) Butenes or Butylenes	25167-67-3	40-60
4) Iso-Butane	75-28-5	25-40
5) Isobutylene	115-11-7	5-20
6) n-Butane	106-97-8	5-15
7) Iso-Pentane	78-78-4	1-5
8) Propane	74-98-6	0-3
9) Propylene	115-07-1	0-2
10) n-Pentane	109-66-0	0-2
11) 1,3-Butadiene	106-99-0	0.1-1
12) Methyl mercaptan	74-93-1	0-0.5
13) Ethyl mercaptan	75-08-1	0-0.5

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Eye contact. Skin contact. Skin absorption

Signs and Symptoms of Acute Exposure

Inhalation	<p>May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. The National Institute for Occupational Safety and Health has determined that atmospheres containing 150 ppm or more of methyl mercaptan are immediately dangerous to life and health. At concentrations above 700 ppm, it may cause unconsciousness and respiratory paralysis leading to coma and/or death. (See Section 11.)</p> <p>Additionally, at least one component of this liquefied gas mixture is a "simple asphyxiant". High concentrations of this mixture can displace the amount of oxygen available to breathe below that level necessary to sustain life (hypoxia). Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, shortness of breath, nausea, vomiting, confusion, muscular weakness, loss of coordination, convulsions, unconsciousness, coma, and death, depending upon the concentration level and duration of exposure. Oxygen deprivation is possible if working in confined spaces.</p>
Eye Contact	Vapors may cause mild to severe eye irritation upon short-term exposure. Severity depends upon the concentration of mercaptans and duration of exposure. Direct contact with pressurized/liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn."
Skin Contact	Direct contact with an expanding liquefied/pressurized gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. Methyl mercaptan can be absorbed through the skin to produce toxic effects. If the skin is damaged, absorption increases.
Ingestion	Due to its volatile nature, ingestion is not normally an applicable route of exposure for this liquefied gas mixture. However, if swallowed, this material may "freeze burn" the mucous membranes of the mouth, throat, and esophagus.
Chronic Health Effects Summary	<p>Chronic inhalation to components of this mixture (propane, propene, n-butane, and n-pentane) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline)-like drugs.</p> <p>1,3-Butadiene (BD), a minor component of this stream, has been shown to be mutagenic and produces multiple organ tumors in various tissues of laboratory rodents. BD also causes sexual organ atrophy in test animals. (See Section 11.)</p>
Conditions Aggravated by Exposure	Personnel with pre-existing chronic respiratory diseases, central nervous system (CNS) disease, high blood pressure, cardiovascular conditions, or skin disorders should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this liquefied gas mixture. They should take additional precautions to minimize or avoid exposure.
Target Organs	These streams are toxic to eyes, skin, mucous membranes, lungs, central nervous system, brain, heart, and possibly, the liver, kidneys, bladder, and reproductive systems.

Feeds to the B/B Extractor and B/B Settler

Carcinogenic Potential These refinery streams contain 1,3-butadiene at concentrations above 0.1%. 1,3-Butadiene is considered carcinogenic by OSHA, IARC, and NTP. (See Section 11.)

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910 1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required. This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines such as epinephrine (adrenaline) and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Liquefied Gas.		
Flash Point/Method	CLOSED CUP: AP -107° to -73°C (-160° to -100°F). (Estimated)		
Lower Flammable Limit	AP 1.6 %	Upper Flammable Limit	AP 21.8 %
Auto-Ignition Temp.	AP 288°C (550°F)		
Hazardous Combustion Products	Carbon dioxide and monoxide, smoke, fumes, oxides of sulfur, and possibly, unburned hydrocarbons or mercaptans		

Feeds to the B/B Extractor and B/B Settler

Special Properties	This liquefied gas is extremely flammable at well below ambient temperatures and readily forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. Exposed to an ignition source, it will burn in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources! Being heavier than air, its flammable vapors can travel long distances close to the ground to an ignition source, and then flash back.
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquefied Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This liquefied gas or waste mixtures containing this material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling **Danger! Poisonous and Flammable Gas!** Do NOT breathe vapor, it may contain mercaptans and/or simple asphyxiants. Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency and flammability.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed petroleum gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

Feeds to the B/B Extractor and B/B Settler

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8 and wear appropriate personal protective clothing/equipment. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue.

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposures, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with cold liquid or vapors.

Body Protection

Prevent potential skin contact with cold liquid or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable liquefied gases. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

Odor is not an adequate warning for potentially hazardous air concentrations! Use a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. Air purifying respirators offer no protection against oxygen deficient atmospheres. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).

General Comments

Releases of this liquefied gas mixture may create flammable, explosive, and/or oxygen-deficient atmospheres (LT 19.5 Vol.% in air). DO NOT ENTER such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions. Air purifying respirators offer no protection against mercaptans and simple asphyxiants.

Feeds to the B/B Extractor and B/B Settler

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Methyl mercaptan	TWA: 5 (ppm) from ACGIH (TLV) [1997] TWA: 0.5 (ppm) from ACGIH (TLV) [proposed for 1998]
2) Ethyl mercaptan	TWA: 0.5 CEIL: 10 (ppm) from OSHA [1989] TWA: 0.5 (ppm) from ACGIH (TLV) [proposed for 1998]
3) Liquefied Petroleum Gases	TWA: 0.5 CEIL: 10 (ppm) from OSHA (PEL) [1989] TWA: 1000 (ppm) from ACGIH (TLV) [1998]
4) Propylene	TWA: 1000 (ppm) from OSHA (PEL) [1989]
5) Propane	Simple asphyxiant TWA: 2500 (ppm) from ACGIH (TLV) [1998]
6) Butanes	TWA: 1000 (ppm) from OSHA (PEL) [1989] TWA: 800 (ppm) from ACGIH (TLV) [1998]
7) 1,3-Butadiene ("A2" and "Z-2" Carcinogen)	TWA: 800 (ppm) from OSHA (PEL) [1989] TWA: 2 (ppm) from ACGIH (TLV) [1998]
8) Pentanes	TWA: 2 STEL: 5 AL: 1 (ppm) from OSHA (PEL) [1994] TWA: 600 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1976]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquefied Gas	Color	Colorless liquid; invisible gas and vapor, white frost at release point	Odor	Strong, unpleasant, and distinctive of skunk or rotten cabbage.
Specific Gravity	AP 0.58 to 0.61 (Water = 1)	pH	Not applicable.	Vapor Density	AP 1.9 to 2.1 (Air = 1)
Boiling Point/Range	AP -48°C to 36°C (-54° to 97°F) at 14.7 psia (ASTM D-2887)	Melting/Freezing Point			AP -160° to -101°C (-255° to -150°F) at 14.7 psia
Vapor Pressure	50 to 75 psia at 100°F	Viscosity (cSt @ 40°C)			Not applicable.
Solubility in Water	Moderately soluble in cold water	Volatile Characteristics			This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Gross Heat of Combustion at 60°F = AP 20,600 to 21,100 Btu/lb or 3,250 Btu/cu ft ; Dry Point Temperature = AP 95°F (35°C) (ASTM D-86); Average Density at 60°F = AP 5.00 lbs./gal (ASTM D-2161).				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions. Polymerization can occur under conditions of extremely high temperature and pressure		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS		

Feeds to the B/B Extractor and B/B Settler

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Methanethiol (Methyl mercaptan):

GAS (LC50): Acute: 675 ppm for 4 hours [Rat] - Hypermotility, diarrhea, and reduced respiration
GAS (LC50): Acute: 6,530 ug/m³ for 2 hours [Mouse]

Ethanethiol (Ethyl mercaptan):

GAS (LC50): Acute: 2,770 ppm for 4 hours [Mouse] - Excitment, motor activity changes, and cyanosis.
GAS (LC50): Acute: 4,420 ppm for 4 hours [Rat] - Excitment, spastic parapysis, and cyanosis
ORAL (LD50): Acute: 682 mg/kg [Rat] - Muscle weakness, ataxia, and cyanosis
INTRAPERITONEAL (LD50): Acute 226 mg/kg [Rat] - Muscle weakness, ataxia, and cyanosis.

Propylene

GAS (LC50): Chronic: 1,250 ppm for 6 hours/day for 14 weeks [Mouse].
GAS (TCLo): Chronic: 5,000 ppm for 6 hours/day for 2 years [Rat] - Reduced olfactory sensory response.

Iso-Butane:

GAS (TCLo): Acute 1,040,000 mg/m³ for 2 hours [Mouse] - Excitment
GAS (LC50) Acute. 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress.

Iso-Butene (Isobutylene or 2-Methylpropene).

GAS (LC50) Acute: 415,000 mg/m³ for 2 hours [Mouse]
GAS (LC50): Acute: 620,000 mg/m³ for 4 hours [Rat].

n-Butane:

GAS (LC50): Acute: 660,000 mg/m³ for 4 hours [Rat].
GAS (LC50): Acute: 680,000 mg/m³ for 2 hours [Mouse]

1,3-Butadiene (Erythrene or Pyrrolyene).

GAS (LC50): Acute: 285,000 mg/m³ for 4 hour(s) [Rat].
GAS (LC50): Acute: 270,000 mg/m³ for 2 hours [Mouse].
ORAL (LD50) Acute: 5,480 mg/kg [Rat].

n-Pentane:

GAS (LC50): Acute: 364,000 mg/m³ for 4 hour(s) [Rat] - Excitment
INTRAVENOUS (LD50): Acute: 446 mg/kg [Mouse]

Methyl and ethyl mercaptans act as respiratory poisons by inhibiting the respiratory control center in the brain and cellular respiration, but only at concentrations exceeding 50 ppm in air. At lower chronic exposures, they can cause pulmonary edema, hemolytic anemia, methemoglobinemia, and kidney and/or liver damage. They are also eye irritants and have been shown to produce positive responses in various mutagenic assays

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinepherine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinepherine (adrenaline). **Propylene** has also been found to be a cardiac sensitizer in dogs. An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. And, **n-pentane** caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure.

In humans, at concentrations of 6.4% in air or higher, **propylene** causes mild intoxication, dermal sensations, and an inability to concentrate on tasks within two minutes. Gross inhalation of propylene concentrations of 40% or higher for a couple minutes cause redding of the eyelids and face, tearing, coughing, and sometimes flexng of the legs, reduced blood pressure, and/or disordered heart rhythm. A concentration of 50% causes anesthesia in two minutes, followed by complete recovery without any physiological indications

Propylene was tested by the National Cancer Institute (NCI) in a two-year, 6 hours/day, 5 days/week inhalation study using rats and mice with exposure concentrations at 5,000 and 10,000 ppm. The resulting data suggested that propylene induces signs of nasal cavity toxicity (epithelial hyperplasia/metaplasia) including increased incidence of neo-plastic lesions in rats, but not in mice. Propylene is NOT considered carcinogenic to either rats or mice, however, it may be partially metabolized to **propylene oxide** which has been shown to be mutagenic and produces site of contact tumors in rodents following long-term administration

Human volunteers had no apparent effects from exposure concentrations of 250 ppm, 500 ppm, and 1,000 ppm of **isobutane** and **n-butane** in air for periods of 8 hours daily for 10 days to 14 days, respectively. However, chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage.

Feeds to the B/B Extractor and B/B Settler

At very high concentrations, **1,3-butadiene (BD)** produces narcosis with central nervous system depression and/or respiratory paralysis. Lifetime inhalation studies have shown BD or its epoxide metabolites cause multiple organ tumors in various tissues of both rats and mice. It is also a mutagen and causes sexual organ atrophy in test animals. Epidemiology studies amongst BD workers and styrene-butadiene rubber (SBR) workers suggest that BD or BD epoxide metabolite exposures may increase the risk of cancers of the lymphohematopoietic system. Based on these various studies, IARC, NTP, OSHA, ACGIH, and EPA have determined BD to be an animal carcinogen and a probable human carcinogen. Laboratory animals have exhibited a higher degree of narcosis when exposed to combinations of butane, butenes, and 1,3-butadiene (additive effect), than the degree of narcosis exhibited following exposure to each gas alone.

Inhalation of 500 ppm of **isopentane** or **n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects; however, higher exposure concentrations of 90,000 to 120,000 ppm (9-12 Wt.% in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. Rat 28-day feeding studies done on both **isopentane** and **n-pentane** using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, the **propane, propylene, butenes, and the mercaptan** components of these streams may contribute to generation of atmospheric smog. The atmospheric half-lives of **propane, propylene, and butenes** under photochemical smog conditions are estimated to be between 5 to 8 hours; and, **1,3-butadiene's** half-life is only 2 to 3 hours. Experimental data shows that significant photooxidation of **propylene and 1,3-butadiene** occurs rapidly within 7 to 21 hours. The atmospheric half-lives of the **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days. The **pentanes** have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. Photooxidation of **propane, isobutane, and n-butane** in air (LT 8%) are not considered to be environmentally significant.

Environmental Fate

Liquefied petroleum hydrocarbon gases are essentially insoluble in water (LT 0.1%), however, the toxic **methyl and ethyl mercaptan** components are moderately soluble in water. Therefore, this material could potentially cause harm to aquatic life.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste for additional reasons, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this liquefied gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

and B/B Settler**

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U.S. Department of Transportation regulated material.		
Proper Shipping Name	Liquefied gas, flammable, toxic, n.o.s Inhalation Hazard Zone B (Methyl mercaptan)		
Hazard Class	Class 2.3: Poisonous gas.	Packing Group(s)	Not applicable.
		UN/NA ID	UN1953
Reportable Quantity	The Reportable Quantity (RQ) substance component present in this material which might require DOT HAZMAT bill-of-lading display is Methyl mercaptan .		
Placards	 	Emergency Response Guide No.	119
		HAZMAT STCC No.	49 203 78
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. A chemical substance which might be present in these streams and is subject to this statute is: Methanethiol (Methyl mercaptan) [CAS No. 74-93-1]
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2 This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, Reactivity, and Acute (Immediate) & Chronic (Delayed) Health Hazards.
SARA 313	These streams contain the following components in concentrations which might be at or above de minimis levels and are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313: Propylene or Propene [CAS No. 115-07-1] concentration: 0 to 2% 1,3-Butadiene [CAS No. 106-99-0] concentration: 0.1 to 1%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4 A chemical substance that might be present in these streams which is subject to this statute is: Methanethiol (Methyl mercaptan) [CAS No. 74-93-1] (RQ = 100 lbs. [45.36 kg]) concentration: 0 to 0.5%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA) Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802
California Proposition 65	These streams contain the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5 1,3-Butadiene [CAS No. 106-99-0].
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in these streams as "Volatile Organic Compounds (VOC)" that contribute significantly to air pollution which endangers public health and welfare": Propylene (Propene), 1,3-Butadiene, 1-Butene, Isobutylene, Isopentane, 1-Pentene, and n-Pentane.

Feeds to the B/B Extractor and B/B Settler

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances which may be present in these streams that are subject to this statute are: **Methyl mercaptan (Methanethiol), Ethyl mercaptan (Ethanethiol), Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), various Butenes, n-Butane, 1,3-Butadiene, Isopentane (Butane, 2-methyl), 2,2-Dimethylpropane (Neopentane), various Pentenes, and n-Pentane**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 1 0
Revision Date 05/27/1999
Print Date Printed on 06/04/1999.

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Liquefied Gas.		
Color	Colorless liquid, invisible gas and vapor, white frost at release point	Odor	Strong, unpleasant, and distinctive of rotten cabbage.

DANGER! Extremely flammable compressed liquefied gas;
vapor may cause flash fire or explosion!
High pressure and rapid diffusion hazard!
Liquid or compressed gas contact may cause frostbite or freeze burns!
May be harmful or fatal if inhaled or absorbed through the skin!
High concentrations of vapor reduce oxygen available for breathing and
may cause central nervous system (CNS) depression or suffocation!
Prolonged and/or repeated inhalation may increase the heart's
susceptibility to arrhythmias (irregular beats)!
Overexposures may cause target organ effects such as lung, heart,
central nervous system, blood, liver, and/or kidney damage!

Hazard Rankings

	HMIS	NFPA
Health Hazard	* 2	2
Fire Hazard	4	4
Reactivity	1	1

* = Chronic Health Hazard

SECTION 1: IDENTIFICATION

Trade Name	Feeds to the P/P Caustic Treater and Wash Drum	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	1111110062	Medical Emergency	(918) 495-4700
CAS Number	Mixture (See Section 2.)	CHEMTREC Emergency	(800) 424-9300
Product Family	Liquefied Gas Mixture of Thermal and Catalytic Cracked C3 Hydrocarbon Streams		
Synonyms	Unsweetened Propylene/Propane Mixture; Unsweetened P/P Stock, Unsweetened C3-Rich Gases, Unsweetened Technical-grade Propylene; Partially-refined C3-Rich Liquefied Petroleum Gases; C3-Rich Catalytically and Thermally Cracked Gases; P/P Treater Feeds, FCCU (732) Depropanizer Scrubber Overhead Stream, 736 and 737 Coker Units Propane/Propylene Scrubber Overhead Streams, LPG Blend containing Mercaptans, C3-C4 Hydrocarbons and R-SHs.		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) C3-C4 Hydrocarbons, C3-Rich, Cracked and Distilled (Petroleum)	68131-75-9	100
2) Liquefied Petroleum Gases	68476-85-7	100
3) Propylene	115-07-1	55-78
4) Propane	000074-98-6	20-40
5) Iso-Butane	75-28-5	1-5
6) Butenes or Butylenes	25167-67-3	0.5-1.5
7) Ethane	74-84-0	0-1.5
8) Methyl mercaptan	74-93-1	0.1-1

Feeds to the P/P Caustic Treater and Wash Drum

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Eye contact. Skin contact Skin absorption.

Signs and Symptoms of Acute Exposure

Inhalation	May be harmful or fatal if inhaled! Inhalation of the pressurized gas may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure Symptoms are characterized by coughing, choking, or shortness of breath. The National Institute for Occupational Safety and Health has determined that atmospheres containing 150 ppm or more of methyl mercaptan are immediately dangerous to life and health At concentrations above 700 ppm, it may cause unconsciousness and respiratory paralysis leading to coma and/or death. (See Section 11)
	Additionally, several components of this liquefied gas mixture are "simple asphyxiants" (See Section 8). High concentrations of this material can displace the amount of oxygen available to breathe below that level necessary to sustain life (hypoxia) Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, shortness of breath, nausea, vomiting, confusion, muscular weakness, loss of coordination, convulsions, unconsciousness, coma, and death, depending upon the concentration level and duration of exposure Oxygen deprivation is possible if working in confined spaces
Eye Contact	Vapors may cause mild to severe eye irritation upon short-term exposure. Severity depends upon the concentration of mercaptans and duration of exposure. Direct contact with pressurized/liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn."
Skin Contact	Direct contact with an expanding liquefied/pressurized gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. Methyl mercaptan can be absorbed through the skin to produce toxic effects If the skin is damaged, absorption increases.
Ingestion	Due to its volatile nature, ingestion is not normally an applicable route of exposure for this liquefied gas mixture. However, if swallowed, this material may "freeze burn" the mucous membranes of the mouth, throat, and esophagus
Chronic Health Effects Summary	Chronic inhalation of this material's components (propane and propylene) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline) -like drugs.
Conditions Aggravated by Exposure	Personnel with pre-existing chronic respiratory diseases, central nervous system (CNS) disease, high blood pressure, cardiovascular conditions, or skin disorders should avoid exposure Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this liquefied gas mixture They should take additional precautions to minimize or avoid exposure
Target Organs	These streams are toxic to eyes, skin, mucous membranes, lungs, central nervous system, brain, heart, blood, and possibly, the liver and kidneys.
Carcinogenic Potential	These refinery streams do not contain any components at concentrations at or above 0.1% which are considered carcinogenic by OSHA, IARC, and NTP

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910 1200)

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required. This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines such as epinephrine (adrenaline) and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Liquefied Gas		
Flash Point/Method	CLOSED CUP: AP -107° to -83°C (-160° to -118°F). (Estimated)		
Lower Flammable Limit	AP 2.0 %	Upper Flammable Limit	AP 21.8 %
Auto-ignition Temp.	AP 450°C (842°F)		
Hazardous Combustion Products	Carbon dioxide and monoxide, smoke, fumes, oxides of sulfur, and possibly, unburned hydrocarbons or mercaptans		
Special Properties	This liquefied gas is extremely flammable at well below ambient temperatures and readily forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. Exposed to an ignition source, it will burn in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources! Being heavier than air, its flammable vapors can travel long distances close to the ground to an ignition source, and then flash back.		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.		

Feeds to the P/P Caustic Treater and Wash Drum

Fire Fighting Protective Clothing

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquefied Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This liquefied gas or waste mixtures containing this material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling

Danger! Poisonous and Flammable Gas! Do NOT breathe vapor; it contains methyl mercaptan and simple asphyxiants. Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency and flammability.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed petroleum gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8 and wear appropriate personal protective clothing/equipment. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue.

Feeds to the P/P Caustic Treater and Wash Drum

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposures, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with cold liquid or vapors.

Body Protection

Prevent potential skin contact with cold liquid or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable liquefied gases. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

Odor is not an adequate warning for potentially hazardous air concentrations! Use a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. Air purifying respirators offer no protection against oxygen deficient atmospheres. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).

General Comments

Releases of this liquefied gas mixture may create flammable, explosive, and/or oxygen-deficient atmospheres (LT 19.5 Vol.% in air). DO NOT ENTER such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions. Air purifying respirators offer no protection against methyl mercaptan and simple asphyxiants.

Feeds to the P/P Caustic Treater and Wash Drum

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Methyl mercaptan	TWA: 5 (ppm) from ACGIH (TLV) [1997] TWA: 0.5 (ppm) from ACGIH (TLV) [proposed for 1998] TWA: 0.5 CEIL: 10 (ppm) from OSHA [1989]
2) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1989]
3) Ethane	Simple asphyxiant.
4) Propylene	Simple asphyxiant.
5) Propane	TWA: 2500 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1989]
6) Butanes	TWA: 800 (ppm) from ACGIH (TLV) [1998] TWA: 800 (ppm) from OSHA (PEL) [1989]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquefied Gas.	Color	Colorless liquid; invisible gas and vapor; white frost at release.	Odor	Strong, unpleasant, and distinctive of rotten cabbage.
Specific Gravity	AP 0.51 to 0.52 (Water = 1)	pH	Not applicable.	Vapor Density	AP 1.45 to 1.5 (Air = 1)
Boiling Point/Range	AP -88°C to 5°C (-127° to 42°F) at 14.7 psia (ASTM D-2887)	Melting/Freezing Point			AP -187° to -160°C (-305° to -255°F) at 14.7 psia
Vapor Pressure	190 to 205 psia at 40°C (104°F)	Viscosity (cSt @ 40°C)			Not applicable.
Solubility in Water	Moderately soluble in cold water	Volatile Characteristics			This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Gross Heat of Combustion at 60°F = AP 21,500 Btu/lb or 2,550 Btu/cu.ft.; Dry Point Temperature = AP 11°F (-12°C) (ASTM D-86).				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions. Polymerization can occur under conditions of extremely high temperature and pressure.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	<p>Methanethiol (Methyl mercaptan): GAS (LC50): Acute: 675 ppm for 4 hours [Rat] - Hypermotility, diarrhea, and reduced respiration. GAS (LC50): Acute: 6,530 ug/m³ for 2 hours [Mouse].</p> <p>Propylene: GAS (LC50): Chronic: 1,250 ppm for 6 hours/day for 14 weeks [Mouse]. GAS (TCLo) Chronic: 5,000 ppm for 6 hours/day for 2 years [Rat] - Reduced olfactory sensory response</p> <p>Iso-Butane: GAS (TCLo): Acute: 1,040,000 mg/m³ for 2 hours [Mouse] - Excitement. GAS (LC50): Acute: 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress.</p> <p>Iso-Butene (isobutylene or 2-Methylpropene): GAS (LC50): Acute: 415,000 mg/m³ for 2 hours [Mouse]. GAS (LC50): Acute: 620,000 mg/m³ for 4 hours [Rat].</p>
----------------------	---

Feeds to the P/P Caustic Treater and Wash Drum

Methyl mercaptan acts as respiratory poison by inhibiting the respiratory control center in the brain and cellular respiration, but only at concentrations exceeding 50 ppm in air. At lower chronic exposures, it can cause pulmonary edema, hemolytic anemia, methemoglobinemia, and kidney and/or liver damage. It is also an eye irritant and has been shown to produce positive responses in various mutagenic assays.

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline). **Propylene** has also been found to be a cardiac sensitizer in dogs.

In humans, at concentrations of 6.4% in air or higher, **propylene** causes mild intoxication, dermal sensations, and an inability to concentrate on tasks within two minutes. Gross inhalation of propylene concentrations of 40% or higher for a couple minutes cause reddening of the eyelids and face, tearing, coughing, and sometimes flexing of the legs, reduced blood pressure, and/or disordered heart rhythm. A concentration of 50% causes anesthesia in two minutes, followed by complete recovery without any physiological indications.

Propylene was tested by the National Cancer Institute (NCI) in a two-year, 6 hours/day, 5 days/week inhalation study using rats and mice with exposure concentrations at 5,000 and 10,000 ppm. The resulting data suggested that propylene induces signs of nasal cavity toxicity (epithelial hyperplasia/metaplasia) including increased incidence of neo-plastic lesions in rats, but not in mice. Propylene is NOT considered carcinogenic to either rats or mice, however, it may be partially metabolized to **propylene oxide** which has been shown to be mutagenic and produces site of contact tumors in rodents following long-term administration.

Human volunteers had no apparent effects from exposure concentrations of 250 ppm, 500 ppm, and 1,000 ppm of **isobutane** in air for periods of 8 hours daily for 10 days. However, chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, the **ethane, propane, propylene, butenes, and methyl mercaptan** components of these streams may contribute to generation of atmospheric smog. The atmospheric half-lives of **ethane, propane, propylene, and butenes** under photochemical smog conditions are estimated to be between 5 to 8 hours. Experimental data shows that significant photooxidation of **propylene** occurs rapidly within 7 to 21 hours. Photooxidation of **ethane, propane, isobutane, and n-butane** in air (LT 8%) are not considered to be environmentally significant.

Environmental Fate

Liquefied petroleum hydrocarbon gases are essentially insoluble in water (LT 0.1%); however, the toxic **methyl mercaptan** component is moderately soluble in water. Therefore, this material could potentially cause harm to aquatic life.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

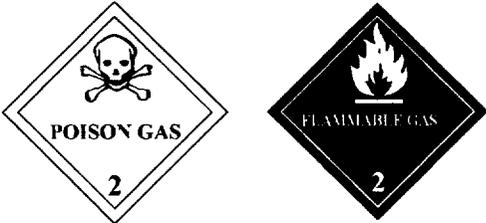

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste for additional reasons, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

Feeds to the P/P Caustic Treater and Wash Drum

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this liquefied gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U.S. Department of Transportation regulated material.		
Proper Shipping Name	Liquefied gas, flammable, toxic, n.o.s. Inhalation Hazard Zone B (Methyl mercaptan)		
Hazard Class	Class 2.3: Poisonous gas	Packing Group(s)	Not applicable.
		UN/NA ID	UN1953
Reportable Quantity	The Reportable Quantity (RQ) substance component present in this material which might require DOT HAZMAT bill-of-lading display is Methyl mercaptan .		
Placards			Emergency Response Guide No. 119 HAZMAT STCC No. 49 203 78 MARPOL III Status Not a DOT "Marine Pollutant" per 49 CFR 171.8

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	These streams and/or their components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. A chemical substance which might be present in these streams and is subject to this statute is: Methanethiol (Methyl mercaptan) [CAS No. 74-93-1]
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, Reactivity, and Acute (Immediate) & Chronic (Delayed) Health Hazards.
SARA 313	These streams contain the following component in concentrations which are above de minimis levels and it is listed as a toxic chemical in 40 CFR Part 372 pursuant to the requirements of Section 313: Propylene or Propene [CAS No. 115-07-1] concentration: 55 to 78%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. A chemical substance that might be present in these streams which is subject to this statute is: Methanethiol (Methyl mercaptan) [CAS No. 74-93-1] (RQ = 100 lbs. [45.36 kg]) concentration: 0.1 to 1%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	These streams do not contain any chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, they are not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2

Feeds to the P/P Caustic Treater and Wash Drum

Additional Regulatory Remarks

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in these streams as "Volatile Organic Compounds (VOC)" that contribute significantly to air pollution which endangers public health and welfare": **Propylene (Propene), 1-Butene, and Isobutylene.**

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances which may be present in these streams that are subject to this statute are: **Methyl mercaptan (Methanethiol), Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), and various Butenes.**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Emergency Overview			
Physical State	Gas/Liquefied Gas.		
Color	Colorless liquid, invisible vapor	Odor	Odorless to a strong, foul smelling, rotten egg odor which is unreliable as a warning of possible exposure
<p>DANGER! Extremely flammable and potentially poisonous gas/liquid; vapor may cause flash fire or explosion! High pressure and rapid diffusion hazard! Compressed gas or liquid contact may cause frostbite or freeze burns! High concentrations of vapor reduce oxygen available for breathing and may cause central nervous system (CNS) depression or suffocation! Contains low levels of hydrogen sulfide (H₂S)! May be harmful or fatal if inhaled! Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)! Overexposures may cause target organ effects! Mist or vapor may cause mild to severe eye, skin, mucous membrane, and respiratory tract irritation and inflammation! May be harmful if absorbed through the skin! Based upon laboratory animal tests, reproductive hazards might exist!</p>			

Protective Equipment
<p>Minimum Requirements See Section 8 for Details</p>

SECTION 1: IDENTIFICATION

Trade Name	Depentanizer Tower Overhead Gases	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	068478057*	Medical Emergency	(337) 708-6215 or (918) 495-4700
CAS Number	68478-05-7	CHEMTREC Emergency	(800) 424-9300
Product Family	Alkane and Alkene Hydrocarbons, Hydrogen, and Hydrogen Sulfide		
Synonyms	534 Depentanizer Overhead Gas, Untreated High-pressure Gas from the 534 Unit Depentanizer Tower; Coker Naphtha Depentanizer Tower Overhead Gases; Delayed Coker Naphtha Splitter Overhead Gas, Thermal Cracking Distillation Gases (Petroleum), Thermocracker Depentanizer Overhead Gas, Sour Light Gas Mixture, C1-C6 Hydrocarbons, Hydrogen, and Hydrogen Sulfide		

Depentanizer Tower Overhead Gases

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Thermal Cracking Distillation Gases (Petroleum)	68478-05-7	100
2) Hydrogen sulfide	7783-06-4	0.3-0.5
3) Nitrogen	7727-37-9	0-1.6
4) Carbon monoxide	630-08-0	0-1.5
5) Carbon dioxide	124-38-9	0-1-1.5
6) Hydrogen	1333-74-0	1-10
7) Methane	74-82-8	1-15
8) Ethane	74-84-0	5-20
9) Propane	74-98-6	10-30
10) Iso-Butane	75-28-5	5-20
11) Butenes or Butylenes	25167-67-3	0-2
12) n-Butane	106-97-8	15-40
13) Iso-Pentane	78-78-4	1-10
14) Pentenes or Pentylenes	68527-11-7	0-2
15) n-Pentane	109-66-0	5-15
16) Hexane Isomers	Mixture	0-5

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation Eye contact Skin contact Skin absorption

Signs and Symptoms of Acute Exposure

Inhalation	<p>May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. The National Institute for Occupational Safety and Health has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health. At concentrations above 500 ppm, H₂S causes unconsciousness and respiratory paralysis leading to coma and/or death. (See Section 11.)</p> <p>Additionally, several components of this gas/liquid mixture are "simple asphyxiants." High concentrations of this mixture can displace the amount of oxygen available to breathe below that level necessary to sustain life (hypoxia). Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, shortness of breath, nausea, vomiting, confusion, muscular weakness, loss of coordination, convulsions, unconsciousness, coma, and death, depending upon the concentration level and duration of exposure. Oxygen deprivation is possible if working in confined spaces.</p>
Eye Contact	Vapors may cause moderate to severe eye irritation and photophobia (light sensitivity) upon short-term exposure. Severity depends upon the concentrations of hydrogen sulfide and duration of exposure. Direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn."
Skin Contact	Direct contact with an expanding gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. Hydrogen sulfide can be absorbed through the skin to produce toxic effects.
Ingestion	Ingestion is not an applicable route of exposure for gases. However, if the condensate portion of this material is ingested, there is a danger of aspiration into the lungs if vomiting occurs. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.
Chronic Health Effects Summary	<p>Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H₂S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures.</p> <p>Chronic inhalation of some of this gas' components (propane, propylene, n-butane, and n-pentane) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline)-like drugs.</p>

Depentanizer Tower Overhead Gases

Long-term exposure to airborne **carbon dioxide** concentrations as low as 0.5 to 1% can alter the body's acid-base and calcium-phosphorus balance, resulting in metabolic acidosis and increased calcium deposits in soft tissues. Chronic exposure to levels of 1 to 2% CO₂ in air can stress the adrenal cortex because of constant respiratory stimulation, this level of exposure may be considered dangerous after several hours. CO₂ might also be a threat to the well-being of the unborn if a pregnant woman is exposed enough to cause metabolic acidosis.

Whether or not there is a chronic **CO** poisoning distinct from the acute effects is controversial. However, chronic CO exposure can aggravate angina pectoris in persons with coronary artery disease. (See Section 11.)

Conditions Aggravated by Exposure

Personnel with eye, skin, cardiac, liver or kidney function, or neurological disorders, pre-existing chronic respiratory diseases, central nervous system (CNS) disease, and high blood pressure, or attempting to conceive should take additional precautions to minimize or avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of "simple asphyxiants". They should take additional precautions to minimize or avoid exposure.

Exposure to high concentrations of this material may increase the sensitivity of the heart to **epinephrine (adrenalin) and catecholamine-like drugs**. Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians").

Target Organs

The substance is toxic to eyes, skin, mucous membranes, lungs, central and sympathetic nervous systems, brain, heart, blood, and possibly, the endocrine and reproductive systems.

Carcinogenic Potential

This product does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC, or NTP.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation

Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.

Eye Contact

If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.

Skin Contact

The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.

Ingestion

Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.

Depentanizer Tower Overhead Gases

Notes to Physician

Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. If cough or difficulty in breathing develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients.

This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines such as epinephrine (adrenaline) and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If contact with pressurized or liquefied gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.

If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Flammable Gas/Liquefied Gas Extremely flammable ¹		
Flash Point Method	CLOSED CUP: AP -157° to -73°C (-250° to -100°F) (Estimated)		
Lower Flammable Limit	1.6 to 4.0 %	Upper Flammable Limit	45 to 75 %
Autoignition Temperature	AP 260°C (500°F)		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons, and oxides of sulfur		
Special Properties	This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. The hydrogen component of this gas is lighter than air and readily forms flammable mixtures with air. It will rise rapidly and collect in the upper portions of confined spaces. Exposed to an ignition source, it will burn with an invisible, blue-colored flame in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources ¹ .		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.		
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Containers can build pressure if exposed to radiant heat, cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Depentanizer Tower Overhead Gases

Extremely Flammable Liquefied Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This gas or waste mixtures containing this gas should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling

Danger! Poisonous and Flammable Gas! Do NOT breathe vapor; it contains **hydrogen sulfide (H₂S)**. This gas mixture also contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S concentrations, and flammability.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue. Do not allow vaporizing material to contact eyes, skin or other tissues. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated.

Storage

Do not store this material near heat or any other potential ignition sources. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Do not store this product in unlabeled containers. Keep containers tightly closed. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N F P A's National Electrical Code (NEC). H₂S is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.)

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

Depentanizer Tower Overhead Gases

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location. Where H₂S is routinely stored or handled, fixed or personal monitors can be used for detection and as an exposure monitoring system.

Personal Protective Equipment Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection Avoid skin contact and use gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). When handling this material which can produce frostbite or cold burns, use leather gloves over these chemically-resistant gloves. Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection Prevent potential skin contact with cold liquid, solid, or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection A full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g. ANSI Z88.2).

General Comments For an explanation about some of the occupational exposure limits shown below, refer to the definition of "Simple Asphyxiant" presented in the American Conference of Governmental Industrial Hygienists (ACGIH) most current **Threshold Limit Values (TLVs) for Chemical Substances and Physical Agents** handbook. Releases of this liquefied gas mixture may create flammable, explosive, and/or oxygen-deficient atmospheres (LT 20 Vol % in air). Do not enter such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Odor is an inadequate warning for hazardous air concentrations. Air purifying respirators offer no protection against oxygen deficiency, hydrogen sulfide, and simple asphyxiants.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) [2000] TWA: 5 (ppm) from ACGIH (TLV) [Proposed for 2001] TWA: 10 STEL: 15 CEIL: 20 (ppm) from OSHA (PEL) [1989]
2) Carbon monoxide	TWA: 25 (ppm) from ACGIH (TLV) [2000] TWA: 35 CEIL: 200 (ppm) from OSHA (PEL) [1989] TWA: 50 (ppm) from OSHA (PEL) [1882]
3) Carbon dioxide	TWA: 5000 STEL: 30000 (ppm) from ACGIH (TLV) [2000] TWA: 5000 STEL: 30000 (ppm) from OSHA (PEL) [1989]
4) Nitrogen	Simple asphyxiant [2000]
5) Hydrogen	Simple asphyxiant [2000]
6) Methane	Simple asphyxiant [2000]
7) Ethane	Simple asphyxiant [2000].
8) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) [2000] TWA: 1000 (ppm) from OSHA (PEL) [1989] TWA: 2500 (ppm) from ACGIH (TLV) [2000] TWA: 1000 (ppm) from OSHA (PEL) [1989]
9) Propane	

Depentanizer Tower Overhead Gases

10) Butanes	TWA: 800 (ppm) from ACGIH (TLV) [2000] TWA: 800 (ppm) from OSHA (PEL) [1989]
11) Pentane, all isomers	TWA: 600 (ppm) from ACGIH (TLV) [2000] TWA: 600 STEL 750 (ppm) from OSHA (PEL) [1989] TWA: 1000 (ppm) from OSHA (PEL) [1976]
12) Hexane, other isomers	TWA: 500 STEL 1000 (ppm) from ACGIH (TLV) [2000] TWA: 500 STEL 1000 (ppm) from OSHA (PEL) [1989]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Gas/Liquefied Gas	Color	Colorless liquid, invisible vapor	Odor	Odorless to a strong, foul smelling, rotten egg odor which is unreliable as a warning of possible exposure
Specific Gravity	AP 0.51 to 0.62 (Water = 1)	pH	In the presence of moisture, H ₂ S can convert to acidic H ₂ SO ₄ .	Vapor Density	1.0 to 1.4 (Air = 1)
Boiling Point/Range	-253° to 36°C (-423° to 97°F) (by ASTM D-2887)	Melting/Freezing Point			AP -260° to -82°C (-435° to -117°F) at 14.7 psia
Vapor Pressure	50 to 300 psia at 38°C (100°F) or GT 140 mm Hg at 20°C (68°F)	Viscosity (cSt @ 40°C)			Not applicable
Solubility in Water	Moderately soluble in cold water (>0.5%)	Volatile Characteristics			This material is usually stored as a liquefied gas mixture. If open to the atmosphere, it will evaporate quickly to form a vapor cloud
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard Alkane, Isoparaffin, and Alkene Hydrocarbons Content = 60 to 99 Wt.% (ASTM D-1319), Average Density at 60°F = 4.20 to 4.90 lbs./gal. (ASTM D-2161), Gross Heat of Combustion at 60°F = 20,000 to 21,000 Btu/lb or 2,500 to 3,500 Btu/cu ft				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions. Although unlikely, polymerization can occur under conditions of extremely high temperature and pressure.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	<p>Hydrogen sulfide: GAS (TCLo): Acute 10 ppm for 15 minutes (Human) - Eye irritation. GAS (TCLo): Acute 50 to 100 ppm for 15 minutes (Human) - Respiratory irritation GAS (LC100) Acute 600 to 750 ppm for 30 minutes (Human) - Respiratory paralysis and death GAS (LCLo). Acute: 5,700 ug/kg for 8 hours (Human) - Chronic pulmonary edema, coma, and death</p> <p>Iso-Butane: GAS (TCLo). Acute: 1,040 gm/m³ for 2 hours [Mouse] - Excitement. GAS (LC50) Acute 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress.</p>
----------------------	--

Depentanizer Tower Overhead Gases

Iso-Butene (Isobutylene or 2-Methylpropene):

GAS (LC50) Acute 415 gm/m³ for 2 hours [Mouse]

GAS (LC50) Acute 620 gm/m³ for 4 hours [Rat]

n-Butane:

GAS (LC50) Acute 660 gm/m³ for 4 hour(s) [Rat]

GAS (LC50) Acute 680 gm/m³ for 2 hours [Mouse]

n-Pentane:

GAS (LC50): Acute: 364 gm/m³ for 4 hour(s) [Rat] - Excitement

INTRAVENOUS (LD50) Acute 446 mg/kg [Mouse]

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (LT 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (GT 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Carbon monoxide (CO) is extremely toxic with permanent effects from acute exposure. CO is toxic because it binds to hemoglobin in the blood, preventing oxygen binding, reducing blood transport capacity, and thus cellular respiration. Breathing CO at 5 to 30 ppm in air, or smoking one pack of cigarettes per day, increases the blood carboxyhemoglobin (COHb) level in an adult to between 1 and 5%. Exposure to ambient CO levels of 30 to 60 ppm in air, or smoking up to 3 packs of cigarettes per day, increases blood COHb to a range of 5 to 9%. At this COHb level, persons with coronary artery disease can develop chest pain upon moderate exertion. Binding of CO to hemoglobin is slowly reversible, with a half-life of approximately 5 to 7 hours while breathing room air.

Acute CO poisoning occurs frequently and is the most common cause of lethal poisonings in the U.S.A. and France (17.5 deaths per 100,000 population from fires, automobile exhaust, defective heaters and stoves, and improper use of charcoal briquettes). Also, almost every known neurological disorder has been associated with CO poisoning, including deafness, blindness, and Parkinsonism. Structural damage of the brain can be seen on the CAT scans of persons who survived high-level acute CO exposures. Neurological deterioration may be delayed following recovery. Acute CO exposure also affects the heart, producing damage to the myocardium, because it requires a high level of oxygenation.

Whether or not there is a chronic CO poisoning distinct from the acute effects is controversial. However, chronic CO exposure can aggravate angina pectoris in persons with coronary artery disease.

Many people have died from overexposure to **carbon dioxide (CO₂) gas**. CO₂ exerts direct toxicity on the heart, resulting in diminished contractile force. It is also a vasodilator, and is the most potent cerebrovascular dilator known. At an airborne concentration of 5,500 ppm for 6 hours, CO₂ has no ill effects, while at 3% (30,000 ppm) it is mildly narcotic and causes reduced hearing, increased blood pressure, and rapid pulse. Its IDLH has been determined to be 40,000 ppm (4%) in air. Concentrations of 50,000 to 80,000 ppm (5 to 8%) produce normal symptoms of hypoxia (see Section 3) within 10 minutes. And, at 8 to 10% in air, CO₂ causes tremors, hypertension, difficulty in breathing, and loss of consciousness within 5 to 10 minutes. Extended exposure to concentrations between 10 and 15% can be lethal. Breathing 20% CO₂ in air for 1 minute causes convulsions, unconsciousness, and usually death.

Long-term exposure to airborne **carbon dioxide** concentrations as low as 0.5 to 1%, while being generally well tolerated, can alter the body's acid-base and calcium-phosphorus balance, resulting in metabolic acidosis and increased calcium deposits in soft tissues. Chronic exposure to levels of 1 to 2% CO₂ in air can stress the adrenal cortex because of constant respiratory stimulation, if not given a period of gradual adaptation, this level of exposure is considered dangerous after several hours. CO₂ might also be a threat to the well-being of the unborn if a pregnant woman is exposed enough to cause metabolic acidosis. This decreases the blood supply to the uterus which increases fetal breathing movements and reduces fetal development. Also, laboratory rat studies suggest that CO₂ exposures may adversely affect male reproduction by altering the testes causing premature release of sperm and reduced fertility.

Depentanizer Tower Overhead Gases

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol % in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline). An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. And, **n-pentane** caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure.

Human volunteers had no apparent effects from exposure concentrations of 250 ppm, 500 ppm, and 1,000 ppm of **isobutane and n-butane** in air for periods of 8 hours daily for 10 days to 14 days, respectively. However, chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane and butylenes** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone.

Inhalation of 500 ppm of **isopentane or n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects, however, higher exposure concentrations of 90,000 to 120,000 ppm (9-12 Wt.% in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. Rat 28-day feeding studies done on both **isopentane and n-pentane** using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

Hexane isomers were not mutagenic in the Salmonella/microsome (Ames) assay and are NOT considered to be carcinogenic.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. Releases are expected to cause only localized non-persistent environmental damage, however, at ambient temperatures and pressure, the **butenes, pentenes, and hydrogen sulfide** components of this material may contribute to generation of atmospheric smog.

The atmospheric half-lives of **ethane, propane, and butanes** under photochemical smog conditions are estimated to be between 5 to 8 hours. Experimental data shows that significant photooxidation of ethylene and propylene occurs rapidly within 7 to 21 hours. Photooxidation of **hydrogen, methane, ethane, propane, isobutane, and n-butane** in air (LT 8%) are not considered environmentally significant. The **n-pentane, pentane isomers, n-hexane, and hexane isomers** all have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. **Hydrogen sulfide** residence times in the atmosphere range from about one day to more than 40 days, depending upon the season, latitude, and presence of other air pollutants. Reduced temperatures increase the residence time.

Environmental Fate

Refined liquefied petroleum hydrocarbon gases are essentially insoluble in water (LT 0.1%); and therefore, this material will not cause harm to aquatic life. However, the liquefied condensate portion of this mixture is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water and evaporate rapidly. In cold stagnant or slow-flowing waterways, a hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

Depentanizer Tower Overhead Gases

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

This material may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be in accordance with applicable Federal, State, and local regulations. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

SECTION 14: TRANSPORT INFORMATION

DOT Status This material is regulated by the U S Department of Transportation (DOT)

Proper Shipping Name Liquefied gas, flammable, toxic, n o s Inhalation Hazard Zone B (Hydrogen sulfide)

Hazard Class Class 2.3 Poisonous gas

Packing Group(s) Not applicable

UN/NA ID UN1953

Reportable Quantity A Reportable Quantity (RQ) substance component present in this material which might require DOT HAZMAT bill-of-lading display is **Hydrogen sulfide**. (See Section 15.)

Placards

Emergency Response Guide No. 119

HAZMAT STCC No. 49 057 66

MARPOL III Status Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory

SARA 302/304 The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. A chemical substance present in this material which is subject to this statute is **Hydrogen sulfide [CAS No. 7783-06-4] concentration: 0.3 to 0.5 Wt.%**

SARA 311/312 The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories
Fire, Sudden Release of Pressure, and Acute (Immediate) & Chronic (Delayed) Health Hazards.

SARA 313 This material does not contain any components in concentrations which might be at or above de minimis levels and are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313

CERCLA The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. A chemical substance present in this material subject to this statute is
Hydrogen sulfide [CAS No. 7783-06-4] (RQ = 100 lbs. [45.36 kg]) concentration: 0.3 to 0.5%.

CWA This material might be classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802

Depentanizer Tower Overhead Gases

**California
Proposition 65**

This material does not contain any chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5

**New Jersey
Right-to-Know Label**

For New Jersey labeling refer to components listed in Section 2.

**Additional Regulatory
Remarks**

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in this material as "Volatile Organic Compounds (VOC)" which contribute significantly to air pollution and endanger public health and welfare: **Ethylene (Ethene) [CAS No. 74-85-1], Propylene (Propene) [CAS No. 115-07-1], 1-Butene [CAS No. 106-98-9], Isobutylene [CAS No. 115-11-7], Isopentane [CAS No. 78-78-4], 1-Pentene [CAS No. 109-67-1], and n-Pentane [CAS No. 109-66-0].**

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this material which are subject to this statute are: **Hydrogen, Methane, Ethane, Ethylene (Ethene), Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), various Butenes, Butane, Isopentane (Butane, 2-methyl), various Pentenes, Pentane, and Hydrogen Sulfide.**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0066
Revision Date 9/6/2006

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Biphasic liquid/gas.
Color Light amber to amber **Odor** Rotten Egg Hydrocarbon. (Strong.)

DANGER!

Extremely Flammable.

Contains Hydrogen Sulfide Gas.

Vapor may cause flash fire or explosion.

Vapor may travel considerable distance to source of ignition and flash back.

Harmful or fatal if swallowed - Can enter lungs and cause damage.

Repeated or excessive exposure to certain components of this mixture have been associated with central nervous system effects.

Harmful to aquatic organisms.

Possible Cancer Hazard (See Section 3)

Hazard Rankings

	HMIS	NFPA
Health Hazard	* 4	4
Fire Hazard	4	4
Reactivity	0	0

* = Chronic Health Hazard

Protective Equipment

Minimum Recommended
See Section 8 for Details

Minimum PPE reflects the requirements for this material at this facility:

LYONDELL-CITGO Refining
LP Manufacturing Complex

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	Stripper OH (Stream 35)	Technical Contact	(800) 525-4692
Product Number	Not available.	Medical Emergency	(800) 313-7645
CAS Number	Mixture	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Not applicable.		
Synonyms	None		

SECTION 2. COMPOSITION (TYPICAL)

This product may be composed, in whole or in part, of any of the following refinery streams:

Heavy Hydrodesulfurized Naphtha, [CAS No. 64742-82-1]

Light Hydrodesulfurized Naphtha, [CAS No. 64742-73-0]

This product contains the following chemicals as components of the refinery streams listed above, with all liquid components being listed on a weight % basis and all gases on a mole % basis:

Component Name(s)	CAS Registry No.	Concentration (%)
-------------------	------------------	-------------------

Stripper Overhead

Water	7732-18-5	20 - 30
C10-C11 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	10 - 30
Toluene	108-88-3	10 - 20
Iso-Pentane	78-78-4	9 - 19.4
Methane	74-82-8	10 - 15
Hydrogen sulfide	7783-06-4	10 - 15
Pentanes, all isomers	Mixture	5 - 20
Hydrogen	1333-74-0	10 - 15
Cumene	98-82-8	8 - 12
Ethane	74-84-0	5 - 10
Nonane, all isomers	Mixture	3 - 10
Heptane, all isomers	142-82-5	1 - 10
Hexene Isomers	Mixture	1 - 10
Xylene, all isomers	1330-20-7	0 - 10
Ethylbenzene	100-41-4	0 - 8
Propane	74-98-6	1 - 5
n-Hexane	110-54-3	1 - 5
Cyclohexane	110-82-7	1 - 5
Pentenes or Pentylenes	68527-11-7	1 - 5
Octanes, all isomers	Mixture	0 - 5
Benzene	71-43-2	1 - 3
n-Pentane	109-66-0	0.3 - 2
Methylcyclohexane	108-87-2	0 - 2

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Inhalation. Ingestion

Signs and Symptoms of Acute Exposure

Inhalation	Breathing this material may cause central nervous system depression with symptoms including nausea, headache, dizziness, fatigue, drowsiness, or unconsciousness. Breathing high concentrations of this material, for example, in an enclosed space or by intentional abuse, can cause irregular heartbeats which can cause death. Breathing this material may cause central nervous system depression with symptoms including nausea, headache, dizziness, fatigue, drowsiness, or unconsciousness.
Eye Contact	This material can cause eye irritation with tearing, redness, or a stinging or burning feeling. Further, it can cause swelling of the eyes with blurred vision. Effects may become more serious with repeated or prolonged contact.
Skin Contact	May cause skin irritation with redness, an itching or burning feeling, and swelling of the skin. Effects may become more serious with repeated or prolonged contact. Skin contact may cause harmful effects in other parts of the body.
Ingestion	Swallowing this material may be harmful. Swallowing this material may cause stomach or intestinal upset with pain, nausea, and/or diarrhea. This material can get into the lungs during swallowing or vomiting. Small amounts in the lungs can cause lung damage, possibly leading to chronic lung dysfunction or death. Swallowing this material may cause effects similar to those described in the inhalation section (see "inhalation" above).

Chronic Health Effects Summary Subacute exposure to low levels of hydrogen sulfide can produce eye irritation, watering, light sensitivity and corneal opacity. Reported effects from subacute exposure also include bronchitis, pulmonary edema, nausea, abdominal cramps and diarrhea. Aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Altered mental state, drowsiness, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been reported from repeated over-exposure such as gasoline and naphtha abusers. Repeated and prolonged overexposure to n-Hexane has been associated with peripheral nerve tissue damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor

Stripper Overhead

function and paralysis.

This material, or a component of this material, has been shown to cause cancer in laboratory animals. However it is not likely to represent a human cancer hazard.

See Toxicological Information (Section 11)

Conditions Aggravated by Exposure Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Peripheral Nervous System, Central Nervous System (CNS), Heart (Cardiac)

Target Organs Contains material which may cause damage to the following organs: blood, kidneys, lungs, the reproductive system, liver, mucous membranes, heart, lymphatic system, peripheral nervous system, upper respiratory tract, immune system, skin, , bone marrow, central nervous system (CNS), eye, lens or cornea, testes.

Carcinogenic Potential **CARCINOGENIC EFFECTS** Classified 2B (Possible for human.) by IARC [Ethylbenzene]. Classified 1 (Proven for human.) by IARC, + (Proven.) by OSHA [Benzene].

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Toxic	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.

Eye Contact Flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. If easily accomplished, check for and remove contact lenses. If contact lenses cannot be removed, seek immediate medical attention. Do not use eye ointment. Seek medical attention.

Skin Contact Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.

Ingestion Do not induce vomiting unless directed to do so by medical personnel -- this material is an aspiration hazard. Get immediate medical attention. Never give anything by mouth to an unconscious person.

Notes to Physician INHALATION: Inhalation overexposure can produce toxic effects. Treat intoxications as hydrogen sulfide exposures. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Administer supplemental oxygen with assisted ventilation, as required.

This material (or a component) sensitizes the heart to the effects of sympathomimetic amines. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias in individuals exposed to this material. Administration of sympathomimetic drugs should be avoided.

Stripper Overhead

INGESTION: If ingested, this material presents a significant aspiration and chemical pneumonitis hazard. Induction of emesis is not recommended. Consider activated charcoal and/or gastric lavage. If patient is obtunded, protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position.

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	NFPA flammable liquid.	
Flash Point	Closed cup: <-45°C (-49°F). (Tagliabue.)	
Lower Flammable Limit	AP 1 %	Upper Flammable Limit AP 7 %
Autoignition Temperature	not available	
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons and oxides of sulfur and/or nitrogen.	
Special Properties	Flammable Liquid! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. A vapor and air mixture can create an explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.	
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide, foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or water spray. Water fog and spray are effective in cooling containers and adjacent structures. However, water can cause frothing and/or may not extinguish the fire. Water can be used to cool the external walls of vessels to prevent excessive pressure, autoignition or explosion. DO NOT use a solid stream of water directly on the fire as the water may spread the fire to a larger area.	
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities of potential fire and explosion hazard if liquid enter sewers or waterways.	

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent spilled material from entering waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Prevent spilled material from entering sewers, storm drains, other drainage systems, and natural waterways. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or

Stripper Overhead

disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all applicable local, state and federal laws and regulations.

SECTION 7. HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire or explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation and personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food and tobacco products. Do not take internally.

A static electrical charge can accumulate when this material is flowing through pipes, nozzles or filters and when it is agitated. A static spark discharge can ignite accumulated vapors particularly during dry weather conditions. Always bond receiving containers to the fill pipe before and during loading. Always keep nozzle in contact with the container throughout the loading process. Do not fill any portable container in or on a vehicle. Do NOT use compressed air for filling, discharging or other handling operations.

Product container is not designed for elevated pressure. Do not pressurize, cut, weld, braze solder, drill, or grind on containers. Do not expose product containers to flames, sparks, heat or other potential ignition sources. Empty containers may contain product residues that can ignite with explosive force. Observe label precautions. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling or disposing of empty containers and/or waste residues of this product.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources. Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room. A refrigerated room is preferable for materials with a flash point temperature lower than 70°F (21°C). All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable regulatory requirements and the National Electrical Code.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide ventilation or other engineering controls to keep the airborne concentrations of vapor or mists below the applicable workplace exposure limits indicated below. All electrical equipment should comply with the National Electric Code. An emergency eye wash station and safety shower should be located near the work-station.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Stripper Overhead

- Eye Protection** Safety glasses equipped with side shields are recommended as minimum protection in industrial settings. Chemical goggles should be worn during transfer operations or when there is a likelihood of misting, splashing, or spraying of this material. A suitable emergency eye wash water and safety shower should be located near the work station.
- Hand Protection** Avoid skin contact. Use heavy duty gloves constructed of chemical resistant materials such as Viton® or heavy nitrile rubber. Wash hands with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities or leaving work. DO NOT use gasoline, kerosene, solvents or harsh abrasives as skin cleaners.
- Body Protection** Avoid skin contact. Wear long-sleeved fire-retardant garments (e.g., Nomex®) while working with flammable and combustible liquids. Additional chemical-resistant protective gear may be required if splashing or spraying conditions exist. This may include an apron, boots and additional facial protection. If product comes in contact with clothing, immediately remove soaked clothing and shower. Promptly remove and discarded contaminated leather goods.
- Respiratory Protection** A full-face supplied air pressure-demand respirator with escape bottle or a pressure-demand self-contained, breathing apparatus (SCBA) is required. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).
- General Comments** Warning! Use of this material in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and/or inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
Toluene	ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 200 ppm 8 hour(s). CEIL: 300 ppm PEAK: 500 ppm
Iso-Pentane	Not available.
Methane	Simple asphyxiant.
Hydrogen sulfide	ACGIH TLV (United States). TWA: 10 ppm 8 hour(s). STEL: 15 ppm 15 minute(s). OSHA (United States). CEIL: 20 ppm 8 hour(s). STEL: 50 ppm 15 minute(s). Form: *10 minute peak; once per 8 hour shift
Pentanes, all isomers	ACGIH (United States). TWA: 600 ppm 8 hour(s). OSHA (United States). TWA: 1000 ppm 8 hour(s). Simple asphyxiant.
Hydrogen Cumene	ACGIH (United States). TWA: 50 ppm 8 hour(s). OSHA (United States). Skin TWA: 50 ppm 8 hour(s). Simple asphyxiant.
Ethane	Simple asphyxiant.
Nonane, all isomers	ACGIH (United States). TWA: 200 ppm 8 hour(s).
Heptane, all isomers	ACGIH (United States). TWA: 400 ppm 8 hour(s). STEL: 500 ppm 15 minute(s). OSHA (United States). TWA: 500 ppm 8 hour(s). Not available.
Hexene Isomers	ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 150 ppm 15 minute(s).
Xylene, all isomers	OSHA (United States). TWA: 100 ppm 8 hour(s).

Stripper Overhead

Ethylbenzene	TWA: 100 ppm 8 hour(s). ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 125 ppm 15 minute(s). OSHA (United States).
Propane	TWA: 100 ppm 8 hour(s). ACGIH (United States). TWA: 2500 ppm 8 hour(s). OSHA (United States). TWA: 1000 ppm 8 hour(s).
n-Hexane	Simple asphyxiant. ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
Cyclohexane	ACGIH (United States). TWA: 100 ppm 8 hour(s). OSHA (United States). TWA: 300 ppm 8 hour(s).
Pentenes or Pentylenes	Not available.
Octanes, all isomers	ACGIH (United States). TWA: 300 ppm 8 hour(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
Benzene	ACGIH (United States). Skin TWA: 0.5 ppm 8 hour(s). STEL: 2.5 ppm 15 minute(s). OSHA (United States). Skin Notes: See Table Z-2 for exclusions in 20 CFR 1910.1028 to the PEL. TWA: 1 ppm 8 hour(s). STEL: 5 ppm 15 minute(s).
n-Pentane	ACGIH (United States, 1998). TWA: 600 ppm OSHA (United States, 1976). TWA: 1000 ppm
Methylcyclohexane	ACGIH (United States). TWA: 400 ppm 8 hour(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
Light Aliphatic Naphthas, Sour (family)	Not available.
Liquefied Petroleum Gases	ACGIH (United States). TWA: 1000 ppm 8 hour(s). OSHA (United States). TWA: 1000 ppm 8 hour(s).

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Biphasic liquid/gas.	Color	Light amber to amber	Odor	Rotten Egg Hydrocarbon. (Strong.)
Specific Gravity	Not available	pH	Not Applicable.	Vapor Density	>1 (Air = 1)
Boiling Range	Not available			Melting/Freezing Point	Not available.
Vapor Pressure	The highest known value is 53.3 kPa (400 mm Hg) (at 20°C) (n-Pentane). Weighted average: 4.04 kPa (30.3 mm Hg) (at 20°C)			Volatility	Not available
Solubility in Water	Very slightly soluble in cold water. (<0.1 % w/w)			Viscosity (cSt @ 40°C)	not available
Flash Point	Closed cup: <-45°C (-49°F). (Tagliabue.)				

Stripper Overhead

Additional Properties

No additional information.

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from heat, sparks and flame.		
Materials Incompatibility	Incompatible with strong acids, strong bases, and strong oxidizers.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Toluene:

Effects from Acute Exposure:

Deliberate inhalation of toluene at high concentrations (e.g., glue sniffing and solvent abuse) has been associated with adverse effects on the liver, kidney and nervous system and can cause CNS depression, cardiac arrhythmias and death. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects.

Effects from Repeated or Prolonged Exposure:

Studies of workers indicate long-term exposure may be related to impaired color vision and hearing. Some studies of workers suggest long-term exposure may be related to neurobehavioral and cognitive changes. Some of these effects have been observed in laboratory animals following repeated exposure to high levels of toluene. Several studies of workers suggest long-term exposure may be related to small increases in spontaneous abortions and changes in some gonadotropic hormones. However, the weight of evidence does not indicate toluene is a reproductive hazard to humans. Studies in laboratory animals indicate some changes in reproductive organs following high levels of exposure, but no significant effects on mating performance or reproduction were observed. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects. Findings in laboratory animals were largely negative. Positive findings include small increases in minor skeletal and visceral malformations and developmental delays following very high levels of maternal exposure. Studies of workers indicate long-term exposure may be related to effects on the liver, kidney and blood, but these appear to be limited to changes in serum enzymes and decreased leukocyte counts. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland following very high levels of exposure. The relevance of these findings to humans is not clear at this time.

Iso-Pentane

ORAL LDLo: Subchronic: 10000 mg/kg [Rat].

Hydrogen sulfide

INHALATION (LC50): Acute: 444 ppm 1 hour(s) [Rat]. 673 ppm 1 hour(s) [Mouse]. Hydrogen Sulfide (H₂S) has an unpleasant odor that diminishes with increased concentrations. Eye irritation can occur at concentrations above four ppm. Olfactory fatigue occurs rapidly at concentrations above 50. Accordingly, odor is not a reliable warning property. Symptoms increase with exposures above 50 ppm. Respiratory effects including irritation with possible pulmonary edema can occur with exposure above 50 ppm. At concentrations above 500 ppm, an immediate loss of consciousness, depressed respiration and death can occur. NIOSH has determined that H₂S concentrations above 100 ppm are

Stripper Overhead

immediately dangerous to life and health.

Pentanes, all isomers

Studies of pentane isomers in laboratory animals indicate exposure to extremely high levels (roughly 10 vol.%) may induce cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.

Cumene:

Effects from Acute Exposure:

Overexposure to cumene may cause upper respiratory tract irritation and severe CNS depression.

Effects from Prolonged or Repeated Exposure:

Studies in laboratory animals indicate evidence of adverse effects on the kidney and adrenal glands following high level exposure. The relevance of these findings to humans is not clear at this time.

Heptane, all isomers

n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not considered to be carcinogenic.

Xylene, all isomers

Effects from Acute Exposure:

ORAL (LD₅₀), Acute: 4,300 mg/kg [Rat].

INHALATION (LC₅₀), Acute: 4,550 ppm for four hours [Rat].

DERMAL (LD₅₀), Acute: 14,100 uL/kg [Rabbit].

Overexposure to xylene may cause upper respiratory tract irritation, headache, cyanosis, blood serum changes, CNS damage and narcosis. Effects may be increased by the use of alcoholic beverages. Evidence of liver and kidney impairment were reported in workers recovering from a gross over-exposure.

Effects from Prolonged or Repeated Exposure:

Impaired neurological function was reported in workers exposed to solvents including xylene. Studies in laboratory animals have shown evidence of impaired hearing following high levels of exposure. Studies in laboratory animals suggest some changes in reproductive organs following high levels of exposure but no significant effects on reproduction were observed. Studies in laboratory animals indicate skeletal and visceral malformations, developmental delays, and increased fetal resorptions following extremely high levels of maternal exposure. Adverse effects on the liver, kidney, bone marrow (changes in blood cell parameters) were observed in laboratory animals following high levels of exposure. The relevance of these observations to humans is not clear at this time.

Ethylbenzene

Effects from Acute Exposure:

ORAL (LD₅₀), Acute: 3,500 mg/kg [Rat].

DERMAL (LD₅₀), Acute: 17,800 uL/kg [Rabbit].

INTRAPERITONEAL (LD₅₀), Acute: 2,624 mg/kg [Rat].

Effects from Prolonged or Repeated Exposure:

Findings from a 2-year inhalation study in rodents conducted by NTP were as follows: Effects were observed only at the highest exposure level (750 ppm). At this level the incidence of renal tumors was elevated in male rats (tubular carcinomas) and female rats (tubular adenomas). Also, the incidence of tumors was elevated in male mice (alveolar and bronchiolar carcinomas) and female mice (hepatocellular carcinomas). IARC has classified ethyl benzene as "possibly carcinogenic to humans" (Group 2B). Studies in laboratory animals indicate some evidence of post-implantation deaths following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate limited evidence of renal malformations, resorptions, and developmental delays following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland.

Propane

Stripper Overhead

Studies in laboratory animals indicate exposure to extremely high levels of propane (1 to 10 vol.% in air) may cause cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.

n-Hexane

This material contains n-hexane. Long-term or repeated exposure to n-hexane can cause permanent peripheral nerve damage. Initial symptoms are numbness of the fingers and toes. Also, motor weakness can occur in the digits, but may also involve muscles of the arms, thighs and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure. Co-exposure to methylethyl ketone or methyl isobutyl ketone increases the neurotoxic properties of n-hexane. In laboratory studies, prolonged exposure to elevated concentrations of n-hexane was associated with decreased sperm count and degenerative changes in the testicles of rats.

Cyclohexane

Cyclohexane can cause eye, skin and mucous membrane irritation, CNS depressant and narcosis at elevated concentrations. In experimental animals exposed to lethal concentrations by inhalation or oral route, generalized vascular damage and degenerative changes in the heart, lungs, liver, kidneys and brain were identified.

Cyclohexane has been the focus of substantial testing in laboratory animals. Cyclohexane was not found to be genotoxic in several tests including unscheduled DNA synthesis, bacterial and mammalian cell mutation assays, and in vivo chromosomal aberration. An increase in chromosomal aberrations in bone marrow cells of rats exposed to cyclohexane was reported in the 1980's. However, a careful re-evaluation of slides from this study by the laboratory which conducted the study indicates these findings were in error, and that no significant chromosomal effects were observed in animals exposed to cyclohexane. Findings indicate long-term exposure to cyclohexane does not promote dermal tumorigenesis.

Benzene

ORAL (LD50):	Acute: 930 mg/kg [Rat]. 4700 mg/kg [Mouse].
INHALATION (LC50):	
(VAPOR):	Acute: 10000 ppm 7 hour(s) [Rat]. 9980 ppm 8 hour(s) [Mouse].

Studies of Workers Over-Exposed to Benzene:

Studies of workers exposed to benzene show clear evidence that over-exposure can cause cancer of the blood forming organs (acute myelogenous leukemia) and aplastic anemia, an often fatal disease. Studies also suggest over-exposure to benzene may be associated with other types of leukemia and other blood disorders. Some studies of workers exposed to benzene have shown an association with increased rates of chromosome aberrations in circulating lymphocytes. One study of women workers exposed to benzene suggested a weak association with irregular menstruation. However, other studies of workers exposed to benzene have not demonstrated clear evidence of an effect on fertility or reproductive outcome in humans. Benzene can cross the placenta and affect the developing fetus. Cases of aplastic anemia have been reported in the offspring of persons severely over-exposed to benzene.

Studies in Laboratory Animals:

Studies in laboratory animals indicate that prolonged, repeated exposure to high levels of benzene vapor can cause bone marrow suppression and cancer in multiple organ systems. Studies in laboratory animals show evidence of adverse effects on male reproductive organs following high levels of exposure but no significant effects on reproduction have been observed. Embryotoxicity has been reported in studies of laboratory animals but effects were limited to reduced fetal weight and skeletal variations.

n-Pentane

n-Pentane was associated with cardiac sensitization in rabbits at a 100,000 ppm concentration in air within four hours of exposure.

Stripper Overhead

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity	No data.
Environmental Fate	This product will normally float on water. Components will evaporate rapidly. This material may be harmful to aquatic organisms and may cause long term adverse effects in the aquatic environment. The octanol-water partition coefficient (log Kow) for this product is expected to be in the range of 2.1 to 5.

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. Conditions of use may cause this material to become a "hazardous waste", as defined by federal or state regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304 Emergency Planning and Notification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. Hydrogen sulfide, CAS Number, 7783-06-4 Concentration: 12.5%
SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: fire, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard

Stripper Overhead

SARA 313 Toxic Chemical Notification and Release Reporting

This product contains the following components in concentrations above *de minimis* levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA:

Toluene [CAS No.: 108-88-3] Concentration: 15%
 Hydrogen sulfide [CAS No.: 7783-06-4] Concentration: 12.5%
 Cumene [CAS No.: 98-82-8] Concentration: 10%
 Xylene, all isomers [CAS No.: 1330-20-7] Concentration: 5%
 Ethylbenzene [CAS No.: 100-41-4] Concentration: 4%
 n-Hexane [CAS No.: 110-54-3] Concentration: 3%
 Cyclohexane [CAS No.: 110-82-7] Concentration: 3%
 Benzene [CAS No.: 71-43-2] Concentration: 2%

CERCLA

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are:

Toluene [CAS No.: 108-88-3] RQ = 1000 lbs. (453.6 kg) Concentration: 15%
 Hydrogen sulfide [CAS No.: 7783-06-4] RQ = 100 lbs. (45.36 kg) Concentration: 12.5%
 Cumene [CAS No.: 98-82-8] RQ = 5000 lbs. (2268 kg) Concentration: 10%
 Xylene, all isomers [CAS No.: 1330-20-7] RQ = 100 lbs. (45.36 kg) Concentration: 5%
 Ethylbenzene [CAS No.: 100-41-4] RQ = 1000 lbs. (453.6 kg) Concentration: 4%
 n-Hexane [CAS No.: 110-54-3] RQ = 5000 lbs. (2268 kg) Concentration: 3%
 Cyclohexane [CAS No.: 110-82-7] RQ = 1000 lbs. (453.6 kg) Concentration: 3%
 Benzene [CAS No.: 71-43-2] RQ = 10 lbs. (4.536 kg) Concentration: 2%

Clean Water Act (CWA)

This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

California Proposition 65

This material may contain the following components which are known to the State of California to cause cancer, birth defects or other reproductive harm, and may be subject to the requirements of California Proposition 65 (CA Health & Safety Code Section 25249.5):

Toluene: 15%
 Ethylbenzene: 4%
 Benzene: 2%

New Jersey Right-to-Know Label

For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.

Additional Regulatory Remarks

No additional regulatory remarks.

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 1.0
 Revision Date 9/6/2006
 Print Date Printed on 9/6/2006.

Sour Vent Gas

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0067
Revision Date 9/26/2006

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Hazard Rankings

	HMIS	NFPA
Health Hazard	* 4	3
Fire Hazard	4	4
Reactivity	1	1

* = Chronic Health Hazard

Emergency Overview

Physical State Gas.

Color Colorless to light yellow. **Odor** Hydrocarbon. Rotten eggs. (Strong.)

DANGER!

Extremely Flammable and Poisonous Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Remove all potential ignition sources. Safely stop the source gas flow using non-sparking tools. Allow any entrained liquid spills to evaporate. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. Do not enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during response operations. This gas may travel great distances and be ignited by a remote ignition source.

**Contains Hydrogen Sulfide Gas!
Harmful to aquatic organisms.**

May contains known animal carcinogens.

Protective Equipment

Minimum Recommended
See Section 8 for Details

Minimum PPE reflects the requirements for this material at this facility:
LYONDELL-CITGO Refining
LP Manufacturing Complex

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	Vent Waste Sour Gas (C1-C6 Hydrocarbons)	Technical Contact	(800) 525-4692
Product Number	Not available.	Medical Emergency	(800) 313-7645
CAS Number	68814-47-1	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Sour Gas		
Synonyms	Refinery Vent Waste Gas Mixture, Refinery Gas Mixture, Untreated Low-Pressure (Low-Line) Gas, Low-Line Gathering System Gas, Untreated Fuel Gas, C1-C6 Hydrocarbons with Hydrogen Sulfide, Stripper Vent Gas, Drier Vent Unit 631.		

Sour Vent Gas

SECTION 2. COMPOSITION (TYPICAL)

All liquid components are listed on a weight % basis while all gases are listed on a mole % basis.

Component Name(s)	CAS Registry No.	Concentration (%)
Methane	74-82-8	0 - 40
n-Butane	106-97-8	15 - 20
Hydrogen sulfide	7783-06-4	0.1 - 30
Hydrogen	1333-74-0	0 - 30
n-Pentane	109-66-0	10 - 15
Ethane	74-84-0	0 - 20
Toluene	108-88-3	1 - 15
Propane	74-98-6	5 - 10
Ethylene	74-85-1	2 - 5
Iso-Butane	75-28-5	1 - 5
Hexane, other isomers	Mixture	1 - 5
n-Hexane	110-54-3	1 - 3
Octanes, all isomers	Mixture	1 - 3
Pentanes, all isomers	Mixture	1 - 3
Ammonia	7664-41-7	1 - 2
Xylene, all isomers	1330-20-7	1 - 2
Propylene	115-07-1	1 - 2
Ethylbenzene	100-41-4	0.1 - 2
Butenes or Butylenes	25167-67-3	0.5 - 1.5
Methylcyclohexane	108-87-2	0 - 2
Cumene	98-82-8	0 - 1

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation

May be harmful or fatal if inhaled. Contains hydrogen sulfide. The National Institute for Occupational Safety and Health has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health. At concentrations above 500 to 1000 ppm, H₂S causes unconsciousness and respiratory paralysis leading to coma and/or death.

Inhalation of gas or vapor may cause respiratory paralysis, severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath.

Additionally, one or more components of this gas mixture is a "simple asphyxiant". High concentrations of this gas can displace the amount of oxygen available to breathe below that level necessary to sustain life. Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, weakness, nausea, vomiting, loss of coordination, unconsciousness, and coma, depending upon the concentration level and duration of exposure.

Eye Contact

Vapors may cause eye irritation and light sensitivity. Severity depends upon the concentration and duration of exposure. High concentrations of hydrogen sulfide can cause chemical burns.

Skin Contact

Direct contact with an expanding gas may produce skin damage from frostbite or freeze burns. Skin absorption of hydrogen sulfide appears to be minimal in humans.

Ingestion

Ingestion is not an applicable route of exposure for gases.

Chronic Health Effects Summary

Subacute exposure to low levels of hydrogen sulfide can produce eye irritation, watering, light sensitivity and corneal opacity. Reported effects from subacute exposure also include bronchitis, pulmonary edema, nausea, abdominal cramps and diarrhea.

Sour Vent Gas

Conditions Aggravated by Exposure Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Respiratory System, Central Nervous System (CNS), Heart (Cardiac)

Target Organs Contains material which may cause damage to the following organs: mucous membranes, heart, skin, central nervous system (CNS), eye, lens or cornea.

Carcinogenic Potential **CARCINOGENIC EFFECTS** Classified 2B (Possible for human.) by IARC [Ethylbenzene].

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Toxic	<input type="checkbox"/>	Highly Toxic	<input checked="" type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.

Eye Contact If tissue is frozen, immediately seek medical attention. If tissue is not frozen, check for and remove contact lenses. Then, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure luke warm water for at least 15 minutes, occasionally lifting the upper and lower eyelids. If pain, redness, swelling, tearing, or light sensitivity persist, obtain medical attention as soon as possible. Do not use eye ointment unless directed by a physician.

Skin Contact In the event of frostbite or freeze burn, the affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water. Rewarming should continue until natural skin tones return to the affected area. Seek medical attention if tissue appears damaged or if pain persists.

Ingestion Due to the volatile nature of this material, ingestion is not a likely route of entry.

Notes to Physician INHALATION: Inhalation overexposure can produce toxic effects. Treat intoxications as hydrogen sulfide exposures. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Administer supplemental oxygen with assisted ventilation, as required.

This material (or a component) sensitizes the heart to the effects of sympathomimetic amines. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias in individuals exposed to this material. Administration of sympathomimetic drugs should be avoided.

Treat symptomatically.

Sour Vent Gas

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas.
Flash Point	Not available.
Lower Flammable Limit	AP 1 %
Upper Flammable Limit	AP 13 %
Autoignition Temperature	The lowest known value is 430°C (806°F) (Butane, all isomers).
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons, and oxides of sulfur and nitrogen.
Special Properties	This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable and Poisonous Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Remove all potential ignition sources. Safely stop the source gas flow using non-sparking tools. Allow any entrained liquid spills to evaporate. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. Do not enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during response operations. This gas may travel great distances and be ignited by a remote ignition source.

SECTION 7. HANDLING AND STORAGE

Sour Vent Gas

Handling

DANGER: Poisonous and Flammable Gas. Do NOT breathe vapor; it contains hydrogen sulfide (H₂S). This gas mixture also contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow escaping material to contact eyes or skin. Wear appropriate respiratory protection, protective work clothing, eye and face protection when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S concentrations, and flammability.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. Empty containers may still contain flammable and poisonous residue.

Storage

Do not store this material near heat or any other potential ignition sources. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Do not store this product in unlabeled containers. Keep containers tightly closed. H₂S is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.) Where H₂S is routinely stored, install monitoring equipment or system with alarms.

Store sample cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F (38° C). Protect from dampness, salt or corrosive chemicals.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may be required in work areas to prevent accumulation of mixtures of gas and air that may ignite with explosive force. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are located near the work-station. Where H₂S is routinely stored or handled, install monitoring equipment or system with alarms.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling sampling cylinders, pressurized containers and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection

Use neoprene or PCV/nitrile gloves. When handling materials that can produce frostbite or cold burns, use leather gloves over these chemically-resistant gloves.

Sour Vent Gas

- Body Protection** Prevent potential skin contact with cold liquid or vapors. Use insulated and chemical-resistant clothing (apron, slicker suit, coveralls, boots, etc.). Fire-retardant garments (e.g. Nomex®) should be worn while working with flammable gases and gas/liquids.
- Respiratory Protection** A full-face supplied air pressure-demand respirator with escape bottle or a pressure-demand self-contained, breathing apparatus (SCBA) is required. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).
- General Comments** Releases of this gas may create flammable, explosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency, flammability and toxic gas levels. Odor is NOT adequate to warn of hazardous conditions. Air purifying respirators offer no protection against oxygen deficiency, hydrogen sulfide, and simple asphyxiants.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
Methane	Simple asphyxiant.
n-Butane	ACGIH (United States). TWA: 800 ppm 8 hour(s).
Hydrogen sulfide	ACGIH TLV (United States). TWA: 10 ppm 8 hour(s). STEL: 15 ppm 15 minute(s). OSHA (United States). CEIL: 20 ppm 8 hour(s). STEL: 50 ppm 15 minute(s). Form: *10 minute peak; once per 8 hour shift
Hydrogen	Simple asphyxiant.
n-Pentane	ACGIH (United States, 1998). TWA: 600 ppm OSHA (United States, 1976). TWA: 1000 ppm
Ethane	Simple asphyxiant.
Toluene	ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 200 ppm 8 hour(s). CEIL: 300 ppm PEAK: 500 ppm
Propane	ACGIH (United States). TWA: 2500 ppm 8 hour(s). OSHA (United States). TWA: 1000 ppm 8 hour(s). Simple asphyxiant.
Ethylene	Simple asphyxiant.
Iso-Butane	ACGIH (United States). TWA: 800 ppm 8 hour(s).
Hexane, other isomers	ACGIH TLV (United States). TWA: 500 ppm 8 hour(s). STEL: 1000 ppm 15 minute(s).
Hexane, other isomers	ACGIH (United States). TWA: 500 ppm 8 hour(s). STEL: 1000 ppm 15 minute(s).
n-Hexane	ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
Octanes, all isomers	ACGIH (United States). TWA: 300 ppm 8 hour(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
Pentanes, all isomers	ACGIH (United States). TWA: 600 ppm 8 hour(s).

TWA: 50 ppm 8 hour(s).

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Gas.	Color	Colorless to light yellow.	Odor	Hydrocarbon. Rotten eggs. (Strong.)
Specific Gravity	Not available	pH	Not Applicable.	Vapor Density	>1 (Air = 1)
Boiling Range	Not available.			Melting/Freezing Point	Not available.
Vapor Pressure	Not applicable.			Volatility	Not available.
Solubility in Water	Partially soluble in cold water.			Viscosity (cSt @ 40°C)	not available
Flash Point	Not available.				
Additional Properties	No additional information.				

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong oxidizers.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

Sour Vent Gas

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

n-Butane

INHALATION (LC50): Acute: 660000 mg/m³ 4 hour(s) [Rat]. 680000 mg/m³ 2 hour(s) [Mouse].

An n-butane exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Also, butane may decrease the myocardial threshold to epinephrine-induced arrhythmias.

Hydrogen sulfide

INHALATION (LC50): Acute: 444 ppm 1 hour(s) [Rat]. 673 ppm 1 hour(s) [Mouse].

Hydrogen Sulfide (H₂S) has an unpleasant odor that diminishes with increased concentrations. Eye irritation can occur at concentrations above four ppm. Olfactory fatigue occurs rapidly at concentrations above 50. Accordingly, odor is not a reliable warning property. Symptoms increase with exposures above 50 ppm. Respiratory effects including irritation with possible pulmonary edema can occur with exposure above 50 ppm. At concentrations above 500 ppm, an immediate loss of consciousness, depressed respiration and death can occur. NIOSH has determined that H₂S concentrations above 100 ppm are immediately dangerous to life and health.

n-Pentane

n-Pentane was associated with cardiac sensitization in rabbits at a concentration of 100,000 ppm in air within four hours of exposure. Pentane can act as an anesthetic by inhalation. Mice exhibited signs of respiratory irritation and mild central nervous system effects at concentrations of 32,000 to 69,000 ppm for five minutes.

Toluene:

Effects from Acute Exposure:

Deliberate inhalation of toluene at high concentrations (e.g., glue sniffing and solvent abuse) has been associated with adverse effects on the liver, kidney and nervous system and can cause CNS depression, cardiac arrhythmias and death. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects.

Effects from Repeated or Prolonged Exposure:

Studies of workers indicate long-term exposure may be related to impaired color vision and hearing. Some studies of workers suggest long-term exposure may be related to neurobehavioral and cognitive changes. Some of these effects have been observed in laboratory animals following repeated exposure to high levels of toluene. Several studies of workers suggest long-term exposure may be related to small increases in spontaneous abortions and changes in some gonadotropic hormones. However, the weight of evidence does not indicate toluene is a reproductive hazard to humans. Studies in laboratory animals indicate some changes in reproductive organs following high levels of exposure, but no significant effects on mating performance or reproduction were observed. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects. Findings in laboratory animals were largely negative. Positive findings include small increases in minor skeletal and visceral malformations and developmental delays following very high levels of maternal exposure. Studies of workers indicate long-term exposure may be related to effects on the liver, kidney and blood, but these appear to be limited to changes in serum enzymes and decreased leukocyte counts. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland following very high levels of exposure. The relevance of these findings to humans is not clear at this time.

Propane

Studies in laboratory animals indicate exposure to extremely high levels of propane (1 to 10 vol.% in air) may cause cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.

Sour Vent Gas

n-Hexane

This material contains n-hexane. Long-term or repeated exposure to n-hexane can cause permanent peripheral nerve damage. Initial symptoms are numbness of the fingers and toes. Also, motor weakness can occur in the digits, but may also involve muscles of the arms, thighs and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure. Co-exposure to methylethyl ketone or methyl isobutyl ketone increases the neurotoxic properties of n-hexane. In laboratory studies, prolonged exposure to elevated concentrations of n-hexane was associated with decreased sperm count and degenerative changes in the testicles of rats.

Pentanes, all isomers

Studies of pentane isomers in laboratory animals indicate exposure to extremely high levels (roughly 10 vol.%) may induce cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.

Xylene, all isomers

Effects from Acute Exposure:

ORAL (LD₅₀), Acute: 4,300 mg/kg [Rat].

INHALATION (LC₅₀), Acute: 4,550 ppm for four hours [Rat].

DERMAL (LD₅₀), Acute: 14,100 uL/kg [Rabbit].

Overexposure to xylene may cause upper respiratory tract irritation, headache, cyanosis, blood serum changes, CNS damage and narcosis. Effects may be increased by the use of alcoholic beverages. Evidence of liver and kidney impairment were reported in workers recovering from a gross over-exposure.

Effects from Prolonged or Repeated Exposure:

Impaired neurological function was reported in workers exposed to solvents including xylene. Studies in laboratory animals have shown evidence of impaired hearing following high levels of exposure. Studies in laboratory animals suggest some changes in reproductive organs following high levels of exposure but no significant effects on reproduction were observed. Studies in laboratory animals indicate skeletal and visceral malformations, developmental delays, and increased fetal resorptions following extremely high levels of maternal exposure. Adverse effects on the liver, kidney, bone marrow (changes in blood cell parameters) were observed in laboratory animals following high levels of exposure. The relevance of these observations to humans is not clear at this time.

Ethylbenzene

Effects from Acute Exposure:

ORAL (LD₅₀), Acute: 3,500 mg/kg [Rat].

DERMAL (LD₅₀), Acute: 17,800 uL/kg [Rabbit].

INTRAPERITONEAL (LD₅₀), Acute: 2,624 mg/kg [Rat].

Effects from Prolonged or Repeated Exposure:

Findings from a 2-year inhalation study in rodents conducted by NTP were as follows: Effects were observed only at the highest exposure level (750 ppm). At this level the incidence of renal tumors was elevated in male rats (tubular carcinomas) and female rats (tubular adenomas). Also, the incidence of tumors was elevated in male mice (alveolar and bronchiolar carcinomas) and female mice (hepatocellular carcinomas). IARC has classified ethyl benzene as "possibly carcinogenic to humans" (Group 2B). Studies in laboratory animals indicate some evidence of post-implantation deaths following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate limited evidence of renal malformations, resorptions, and developmental delays following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland.

Sour Vent Gas

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this material.
Environmental Fate	An environmental fate analysis has not been conducted on this specific product. Releases are expected to cause significant immediate impact but only localized non-persistent environmental damage.

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Material residues may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. If possible and permissible, this material may be disposed of as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator. Venting of this gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be in accordance with applicable Federal, State, and local regulations. Contact your regional US EPA office for guidance concerning case specific disposal issues. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304 Emergency Planning and Notification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. Hydrogen sulfide, CAS Number, 7783-06-4 Concentration: 15.05%
SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: fire, Sudden Release of Pressure, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard

Sour Vent Gas**SARA 313 Toxic
Chemical Notification
and Release Reporting**

This product contains the following components in concentrations above *de minimis* levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA:

Hydrogen sulfide [CAS No.: 7783-06-4] Concentration: 15.1%
Toluene [CAS No.: 108-88-3] Concentration: 8%
n-Hexane [CAS No.: 110-54-3] Concentration: 2%
Xylene, all isomers [CAS No.: 1330-20-7] Concentration: 1.5%
Propylene [CAS No.: 115-07-1] Concentration: 1.5%
Ethylbenzene [CAS No.: 100-41-4] Concentration: 1.1%

CERCLA

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are:

Hydrogen sulfide [CAS No.: 7783-06-4] RQ = 100 lbs. (45.36 kg) Concentration: 15.1%
Toluene [CAS No.: 108-88-3] RQ = 1000 lbs. (453.6 kg) Concentration: 8%
n-Hexane [CAS No.: 110-54-3] RQ = 5000 lbs. (2268 kg) Concentration: 2%
Xylene, all isomers [CAS No.: 1330-20-7] RQ = 100 lbs. (45.36 kg) Concentration: 1.5%
Ethylbenzene [CAS No.: 100-41-4] RQ = 1000 lbs. (453.6 kg) Concentration: 1.1%
Cumene [CAS No.: 98-82-8] RQ = 5000 lbs. (2268 kg) Concentration: 0.5%

**Clean Water Act
(CWA)**

This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

**California
Proposition 65**

This material may contain the following components which are known to the State of California to cause cancer, birth defects or other reproductive harm, and may be subject to the requirements of California Proposition 65 (CA Health & Safety Code Section 25249.5):
Toluene: 8%
Ethylbenzene: 1.05%

**New Jersey
Right-to-Know Label**

For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.

**Additional Regulatory
Remarks**

No additional regulatory remarks.

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

MSDS No. AP1156

Revision Date 11/01/06

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Liquid.	Odor	Pungent phenolic or sulfurous-type.
Color	Slightly turbid, light green to light blue.		

DANGER! Highly Corrosive!

May cause severe burns, perforation, and irreversible tissue damage.

Eye and/or skin irritation or dermal sensitization may result from prolonged or repeated contact with dilute solutions.

Health effects may be delayed. Avoid contact. Wash skin thoroughly but gently with soap and water after contact. Launder or neutralize contaminated clothing and protective equipment before wearing.

May be harmful or fatal if inhaled or swallowed.

May cause severe respiratory tract and/or gastrointestinal tract ulceration.

Aspiration into the lungs can cause pulmonary edema and chemical pneumonia.

May be corrosive to some organic and metallic substances.

May react violently with acids, acidic solutions, some metallic powders, or halogenated materials.

Reactions may generate extremely flammable hydrogen (H₂).

Spills may create a slipping hazard.

Hazard Rankings

Minimum Requirements
See Section 8 for Details

SECTION 1: IDENTIFICATION

Trade Name Sulfidic Caustic Solution

Product Number 0115601156

CAS Number Mixture—Section 2.

Product Family Alkaline or highly basic process water.

Synonyms Phenolic Caustic; Phenolate Caustic; Caustic Phenolate; Crude Sodium Phenolates and Xylenolates; Mixture of Substituted Phenolates in Sodium Hydroxide Caustic Solution; Aqueous NaOH Solution of Phenols; Dilute Sulfide/Sulfite/Sulfate/Phenolate Caustic Solution; Sodium Salts of Tar Acids in Caustic Solution; Spent Sodium Hydroxide Neutralizing Agent and Sodium Phenolates; Diluted Neutralizing Agent (Petroleum).

Business Contact

LYONDELL 800-245-4532

Sulfidic Caustic Solution

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Sodium Salts of Phenols & Sulfur Compounds Residue from Gasoline Alkali Scrubbers	68988-99-8	100
2) Spent Sodium Hydroxide Neutralizing Agent (Petroleum)	64742-40-1	100
3) Water	7732-18-5	40-85
4) Sodium Hydroxide	1310-73-2	5-20
5) Sodium Phenolate	139-02-6	5-15
6) Sodium Xylenolates	95-65-8	1-10
7) p-Ethyl Phenolate	19277-91-9	1-10
8) Dialkyl & Di-Ph Disulfides from Naphtha Sweetening	68955-96-4	1-5
9) Sodium Chloride	7647-14-5	0.5-1.5
10) Sodium Sulfate	7757-82-6	0.5-1.5
11) Sodium Sulfite	7757-83-7	0.1-0.9
12) Sodium Bisulfite	7631-90-5	0.1-0.5

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye contact. Inhalation. Skin Absorption.

Signs and Symptoms of Acute Exposure

Inhalation	Inhalation is not considered a normal route of exposure for this aqueous solution. However, breathing high concentrations of mist or liquid droplets may cause respiratory tract irritation, mucous membrane tissue burns, and possibly, pulmonary edema and chemical pneumonia. (See Section 11.)
Eye Contact	Irritating and may injure eye tissue if not promptly removed. The severity of the effects depend on the concentration of the sodium hydroxide and how soon after exposure the eyes are washed.
Skin Contact	May be irritating or corrosive to the skin. Irritation may follow an initial delay between the time that the exposure occurs and the sense of irritation begins. This latency period can vary as much as several hours for a dilute solution (0.04 wt.% caustic) to minutes with more concentrated solutions. Prolonged or repeated contact, even to dilute concentrations of sodium hydroxide solutions, may cause a high degree of permanent tissue destruction.
Ingestion	If swallowed, this material may cause severe pain, nausea, vomiting, and/or bloody diarrhea, in addition to a burning sensation in the mouth, throat, and digestive tract. Depending upon caustic solution concentration, ulceration of the gastrointestinal tract may also occur. This material is toxic and may be fatal.
Chronic Health Effects Summary	Prolonged and/or repeated contact can defat the skin and may produce moderate to severe irritation and inflammation and/or alkali burns. Repeated exposure to mists or aerosols of sodium hydroxide can produce either obstructive airway disease or a tolerance to its respiratory irritant effects. (See Section 11.)
Conditions Aggravated by Exposure	Personnel with pre-existing eye, skin, or gastrointestinal disorders, liver or kidney dysfunction, and chronic respiratory or nervous system diseases should avoid exposure.
Target Organs	The substance is toxic to eyes, skin, mucous membranes, lungs, and possibly the blood, bone marrow, liver, kidneys, and/or central nervous system.
Carcinogenic Potential	This material does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC, or NTP.

Sulfidic Caustic Solution

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification		OSHA Physical Hazard Classification		
Irritant <input checked="" type="checkbox"/>	Toxic <input checked="" type="checkbox"/>	Combustible <input type="checkbox"/>	Explosive <input type="checkbox"/>	Pyrophoric <input type="checkbox"/>
Sensitizer <input checked="" type="checkbox"/>	Highly Toxic <input type="checkbox"/>	Flammable <input type="checkbox"/>	Oxidizer <input type="checkbox"/>	Water-reactive <input checked="" type="checkbox"/>
Corrosive <input checked="" type="checkbox"/>	Carcinogenic <input type="checkbox"/>	Compressed Gas <input type="checkbox"/>	Organic Peroxide <input type="checkbox"/>	Unstable <input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Do not attempt to remove contact lenses. Immediately irrigate eyes with copious amounts of cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Flush thoroughly with water under a cool or cold shower for at least 15 minutes while removing contaminated shoes and clothing. Gently and thoroughly wash contaminated skin with running water and non-abrasive soap. Be particularly careful to clean folds, crevices, creases, and groin area. Seek medical attention if tissue appears damaged or if irritation or pain persists. Thoroughly clean contaminated clothing before reuse. Discard contaminated leather goods.
Ingestion	Do not induce vomiting. If spontaneous vomiting is about to occur, place victim's head below knees. Do not attempt to neutralize. Have victim rinse mouth with water then drink two to three large glasses of milk or water. Never give anything by mouth to a person who is not fully conscious. Keep airway clear. Seek medical attention immediately.
Notes to Physician	<p>If after exposed skin has been washed gently with running water and non-abrasive soap, one may neutralize severely irritated or burned tissue with a dilute solution of boric acid or acetic acid</p> <p>Inhalation overexposure can produce other toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.</p> <p>Mucosal injury following ingestion may contraindicate the induction of vomiting. If gastric lavage is performed, intubation should be done with great care. In cases of severe esophageal tissue corrosion, the use of therapeutic doses of steroids should be considered. Also, the patient should receive general supportive measures with scrupulous monitoring of gas exchange, acid-base balance, electrolytes, and fluid intake.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Non-flammable liquid.		
Flash Point Method	Not applicable.		
Lower Flammable Limit	Not applicable.	Upper Flammable Limit	Not applicable.
Autoignition Temperature	Not applicable.		
Hazardous Combustion Products	Contact with some metals can generate extremely flammable hydrogen gas.		
Special Properties	High heat, hot surface contact, or mixing with acids may spring extremely flammable H ₂ S or disulfide vapors out of this solution. Adding this material directly to unbuffered water may cause an exothermic reaction sufficient enough to make the water boil.		

Sulfidic Caustic Solution

- Extinguishing Media** Non-combustible, if handled and stored properly. Use extinguishing media suitable for the surrounding fire. In an advanced or massive fire, evacuate area and fight fire from a safe distance or a protected location. Approach fire from upwind. Use unmanned monitors and hoseholders to keep cooling streams of water on fire-exposed cylinders or tanks until well after the fire is out. If possible, isolate materials not yet involved in the fire and protect personnel. Move containers away from fire area if it can be done without risk.
- Protection of Fire Fighters** This material is not expected to burn. However, in the event that gases are being generated or surrounding materials are involved in a fire, firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Avoid contact with damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to containers. All clean-up materials should be removed for proper treatment or disposal. For large spills, dike far ahead of spill to maximize later product recovery or disposal. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and proper protective clothing during cleanup operations. This material may react strongly with acids. Never flush to the sewer. In urban areas, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists to minimize physical habitat damage. If appropriate, neutralize with a dilute solution of boric acid or acetic acid. A vacuum truck may be used to collect the bulk. Spills on other than pavement may be handled by removing the affected soil and placing it into approved containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

- Handling** **Danger! Corrosive Liquid!** Do NOT breathe mist or vapor; it may contain sodium hydroxide. Odor is not an adequate warning of potentially hazardous air concentrations. Do not get in eyes, on skin, or on clothing. Wear suitable personal protective equipment to prevent eye and skin contact. Use only with adequate ventilation and wear suitable personal protective equipment. Do not allow material to contact eyes, skin or other tissues, and clothing. Wear corrosion-resistant protective work clothing and chemical splash goggles and face shield when contact is anticipated. Wash thoroughly after handling. Prevent contact with food, chewing, or smoking materials.
- When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits shown in Section 8. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.
- Empty containers may contain material corrosive residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.
- Storage** Store and transport in accordance with all applicable laws. Store in containers appropriate for concentrated or dilute caustic solutions and away from strong acids. Diluted material may accelerate corrosion of metal containers. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. The sulfite component of this material is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.)

Sulfidic Caustic Solution

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls No special ventilation is required under normal conditions of use. Where engineering controls are feasible, use adequate local exhaust ventilation wherever mist, spray, or vapor may be generated. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection Safety glasses with side shields are recommended as a minimum protection. When there is a likelihood of misting, splashing, or spraying, chemical-resistant goggles and full-face shield should be worn. Thermal protection should be provided if the solution has a temperature above 120 degrees F. Suitable eye wash water should be readily available.

Hand Protection Avoid skin contact. Use of chemical-resistant gloves (e.g., PVC, neoprene, nitrile, or PVC/NBR) is required. Thermal protection should be used whenever the solution has a temperature above 120 degrees F. Wash hands and other exposed skin with mild soap and water before eating, drinking, smoking, or using the toilet facilities.

Body Protection Avoid all skin contact. If splashing or spraying is expected, chemical-resistant protective clothing (e.g., vinyl, Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, sticker suit, boots, and additional facial protection. Thermal protection should be provided when the solution has a temperature above 120 degrees F. If general contact occurs, IMMEDIATELY remove soaked clothing and shower thoroughly. Contaminated leather goods should be removed immediately and discarded.

Respiratory Protection Misting or vapor generation are not expected under normal conditions of use. Therefore, the need for respiratory protection from diluted sodium hydroxide is not anticipated under normal use conditions and with adequate ventilation. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g. ANSI Z88.2).

General Comments Use good personal hygiene practices. Wash hands and other exposed skin areas with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities, or leaving work. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners. Exposure standards/control limits for some of the components apply to airborne concentrations of dust, and are not truly applicable to liquid solutions. Use of personal protective equipment and good personal hygiene are essential to controlling exposures to this aqueous solution.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Sodium hydroxide	CEIL: 2 (mg/M ³) from ACGIH (TLV) CEIL: 2 (mg/M ³) from OSHA (PEL) [Proposed] TWA: 2 (mg/M ³) from OSHA (PEL)
2) Sodium Bisulfite	TWA: 5 (mg/M ³) from ACGIH (TLV) TWA: 5 (mg/M ³) from OSHA (PEL)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color	Slightly turbid, light green to light blue.	Odor	Pungent phenolic or sulfurous-type.
Specific Gravity	1.11 to 1.22 (Water = 1)	pH	13.0 to 14.0 [Highly Basic.]	Vapor Density	3.7 to 3.9 (Air = 1)
Boiling Point/Range	100° to 113°C (212° to 235°F)		Melting/Freezing Point	-32° to -10°C (-25° to 14°F)	
Vapor Pressure	110 to 135 mm of Hg at 60°C (140°F)		Viscosity (cSt @ 40°C)	No data available.	

Sulfidic Caustic Solution

Solubility in Water	Partially soluble in cold water, but causes an exothermic reaction.	Volatile Characteristics	Negligible volatility in proper storage.
Additional Properties	Boiling point and melting point temperatures increase with the level of sodium hydroxide present. A 7.5% solution of sodium hydroxide has a pH of 14.0. Average Calculated Density = 9.75 lbs./gallon at 60°F (15.5°C).		

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Caustic solutions may react with strong acids, releasing heat and acid gases. Contact with some metals can generate extremely flammable hydrogen gas. Avoid direct contact with water, leather, wool, and organic halogen or nitro compounds.		
Materials Incompatibility	Strong acids, some heavy metals, and some organic chemicals. Caustic solutions are corrosive to tin, aluminum, zinc, and alloys containing these metals and will react violently with their powdered forms. Toxic carbon monoxide gas can form when caustic solutions contact with reducing sugars, food, and beverage products in enclosed spaces and it can cause death. Appropriate tank entry procedures must be followed.		
Hazardous Decomposition Products	None is expected; but no degradation data is available.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Sodium Hydroxide:	
DERMAL (LD ₅₀):	Acute: 1,350 mg/kg [Rabbit].
INTRAPERITONEAL (LD ₅₀):	Acute: 40 mg/kg [Mouse].
Sodium Bisulfite:	
ORAL (LD ₅₀):	Acute: 2,000 mg/kg [Rat].
INTRAPERITONEAL (LD ₅₀):	Acute: 244 mg/kg [Dog] - Respiratory depression, cyanosis, and convulsions.
INTRAPERITONEAL (LD ₅₀):	Acute: 300 mg/kg [Rabbit] - Respiratory depression, cyanosis, and convulsions.
INTRAPERITONEAL (LD ₅₀):	Acute: 475 mg/kg [Rat] - Altered sleep times and convulsions.
INTRAPERITONEAL (LD ₅₀):	Acute: 487 mg/kg [Hamster].
INTRAPERITONEAL (LD ₅₀):	Acute: 675 mg/kg [Mouse] - Respiratory depression, cyanosis, and convulsions.
INTRAPERITONEAL (LD ₅₀):	Acute: 779 mg/kg [Guinea Pig].
INTRAVENOUS (LD ₅₀):	Acute: 65 mg/kg [Rabbit] - Respiratory depression and convulsions.
INTRAVENOUS (LD ₅₀):	Acute: 95 mg/kg [Hamster] - Respiratory depression and convulsions.
INTRAVENOUS (LD ₅₀):	Acute: 115 mg/kg [Rat] - Respiratory depression and convulsions.
INTRAVENOUS (LD ₅₀):	Acute: 130 mg/kg [Mouse] - Respiratory depression and convulsions.

Sodium hydroxide (Lye) is strongly alkaline and very corrosive to many organic compounds. If ingested, sodium hydroxide can cause severe pain, bloody diarrhea, cardiovascular collapse, and death. It is a severe eye, skin, and respiratory tract irritant and in an undiluted form it can burn tissue upon contact. It gelatinizes the tissue, forming deep and painful lesions. Squamous cell carcinomas (cicatrical tumors) frequently develop in healing tissue at the site of chemical burns or in scar tissue after a delay of 10 to 20 years. Sodium hydroxide has also been shown to cause chromosomal aberrations in hamster ovary cells and grasshoppers. In general, however, pH alterations produce false positive results in short-term genetic assays.

Sodium phenolates are severe eye, skin, mucous membrane, and upper respiratory tract irritants.

Some **sulfates and sulfites** have been known to cause allergic reactions of the skin and/or respiratory systems of sensitized individuals. **Sodium sulfite** has caused retarded growth, neuritis, bone marrow atrophy, depression, and paralysis in experimental animals. Additionally, it has been found to cause reproductive and mutagenic effects in some plant and animal tests.

Sodium bisulfite and sodium sulfate have been shown to be embryotoxic and teratogenic in mice. The actual human reproductive hazard is unknown.

Sulfidic Caustic Solution

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this material. Releases are expected to cause only localized non-persistent environmental damage; however, due caution should be exercised to prevent the accidental release of this material into the environment. Sodium hydroxide is toxic by ingestion. Contaminated food stuffs must not be eaten by humans or animals.
Environmental Fate	This material is soluble in water and is expected to readily disperse in marine environments. Caustic solutions have produced slight to moderate toxicity in laboratory tests with aquatic organisms. It is expected to be strongly alkaline. If released to surface water, it will cause the pH rise depending upon the buffering capacity of the waterbody. Aquatic organisms become increasingly stressed as pH concentration exceeds 9.0, with many species being intolerant of pH of 10.0 or higher. Substances in this mixture do not bioaccumulate.
	For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHMTADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Recovery and reuse, rather than disposal, should be the ultimate goal for handling this corrosive alkaline material. However, conditions of use may cause this material to become a hazardous waste (D002), as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a hazardous waste at the time of disposal. Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Phenolates, liquid or Sodium hydroxide, solution		
Hazard Class	8 (Corrosive)	Packing Group(s)	PG II or PG III
		UN/NA ID	UN2904 or UN1824
Reportable Quantity	A Reportable Quantity (RQ) substance components in this stream which require DOT HAZMAT bill-of-lading display are Sodium Hydroxide and Sodium Bisulfite .		
Placards		Emergency Response Guide No.	154
		HAZMAT STCC No.	49 356 47 or 49 366 53
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. This material might contain the following chemical substance subject to this statute: Sulfur Dioxide [CAS No. 7446-09-5] concentration: 0 to 0.05%.

HoustonRefining

A Lyondell Company

Sulfidic Caustic Solution

SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Acute (Immediate) Health, Chronic (Delayed) Health, and Reactivity Hazards
SARA 313	This material does not contain any components in concentrations above de minimis levels that are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this material subject to this statute are: Sodium Hydroxide [CAS No. 1310-73-2] (RQ = 1000 lbs. [453.6 kg]) concentration: 10 to 20% Sodium Bisulfite [CAS No. 7631-90-5] (RQ = 5,000 lbs. [2,268 kg]) concentration: 0.1 to 0.5%.
CWA	This material is NOT classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA).
California Proposition 65	This material does not contain any ingredients for which the State of California has found to cause cancer, birth defects, or other reproductive harm; and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	
Additional Regulatory Remarks	No additional regulatory remarks.

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION	Logo and Manufacturer name change.
Version Number	3.2
Revision Date	11/01/06

SECTION 1: IDENTIFICATION

Trade Name	Slop Oil	MSDS No.	AP1170
Product Number	008002060*	Revision Date	11/01/06
CAS Number	Mixture		
Synonyms	Reclaimed Petroleum Waste Oil; Off-test Refinery Streams Slop.		
Generic Name	Petroleum Slop	Business Contact	
Chemical Family	Petroleum Hydrocarbons and Water	Product Safety	800-700-0946
		24 Hour Emergency Contact	
		CHEMTREC	800-424-9300
		CANLITEC-Canada	613-996-6666
		LYONDELL	800-245-4532

SECTION 2: COMPOSITION

Component Name	CAS Number	Carcinogenic Listings	Concentration Wt%
SLOP OILS, MIXED WHICH CONTAINS	Mixture	Not applicable	EQ 100
SLOP OIL, C20+ HYDROCARBONS	68476-53-9	Not applicable	67 to 97
SLOP OIL, C7 - C10 HYDROCARBONS	68956-48-9	Not applicable	1 to 5
SLOP OIL, C5 - C12 HYDROCARBONS	68956-70-7	Not applicable	1 to 5
4-6 FUSED-RING POLYNUCLEAR AROMATIC HYDROCARBONS (PNA'S)	68487-58-6	IARC,NTP,OSHA,ACGIH	1 to 20
XYLENE (TOTAL OF ALL ISOMERS)	1330-20-7	Not applicable	1 to 2
ETHYL BENZENE	100-41-4	IARC (Group 2B),ACGIH	0.2 to 0.5
NAPHTHALENE	91-20-3	IARC (Group 2B)	0.1 to 0.5
BENZENE	71-43-2	IARC,NTP,OSHA,ACGIH	0.01 to 0.5
HYDROGEN SULFIDE	7783-06-4	Not applicable	LT 0.1 to 0.25
WATER	7732-18-5	Not applicable	0.1 to 1

SECTION 3: HAZARDS IDENTIFICATION

EMERGENCY OVERVIEW

Signal Word	DANGER!	Color	Dark yellow to brown or greenish-black.
Physical State	Viscous liquid.	Odor	Faint, pleasant hydrocarbon to pungent, offensive sulfurous. Odor threshold is 0.1 to 0.5 ppm in air.
Physical and Health Hazards	Extremely to moderately flammable liquid! Vapor may cause flash fire or explosion! May release toxic Hydrogen Sulfide vapors, especially when heated and/or agitated! May cause eye, skin, mucous membrane, and respiratory tract irritation or dermal sensitization! May be harmful or fatal if inhaled, ingested, or absorbed through the skin! Aspiration into the lungs will cause pulmonary edema and lipid pneumonia! Overexposures may cause central nervous system (CNS) depression and/or damage the lungs, liver, and kidneys! Potential skin cancer hazard! Contains low levels of Benzene, a known human leukemogen, which can cause blood abnormalities. Contains low levels of Ethylbenzene, a suspect human carcinogen, based upon animal studies. Potential slipping hazard on smooth, hard walking area. If heated, may react violently with water.		

Environmental Hazards

Emission of vapors into the atmosphere occurs everywhere along the production, collection, handling, and marketing distribution chain, beginning at the oil field, continuing through bulk storage and handling, transport, and unloading operations at the petroleum refinery. Vapors released into the ambient air are subject to processes of transport, dilution, and dispersion, which reduce their concentrations, but spread them over wide areas.

Toxic Aromatic Hydrocarbon compounds (Benzene, Xylenes, etc.) from petroleum are both volatile and water soluble; and therefore, they are commonly found in contaminated groundwater and the vapor phase above it. Petroleum oils spilled on oceans and waterways annually causes significant loss of aquatic and avian animal populations.

POTENTIAL HEALTH EFFECTS

Routes of Exposure Inhalation; Eye Contact; Skin Contact; and Skin Absorption.

Signs and Symptoms of Acute Exposure

- **Inhalation** Breathing mist or vapors may irritate the mucous membranes of the nose, throat, bronchi, and lungs, and may cause transient central nervous system (CNS) depression, depending on the concentration and/or duration of exposure. CNS symptoms include headache, dizziness, nausea, intoxication, blurred vision, slurred speech, flushed face, confusion, weakness, fatigue, loss of consciousness, convulsions, coma, and death.
- **Eye Contact** Mild to moderate eye irritation may result from short-term contact with liquid, mist, and/or vapor. Hydrogen Sulfide vapors can cause eye irritation which may lead to light (photo-) sensitivity and eye damage.
- **Skin Contact** Minimal to mild skin irritation may result from short-term contact with liquid or mist. Absorption from massive or prolonged liquid contact may cause poisoning. Repeated skin contact may also cause allergic reactions in highly-sensitive individuals and has been shown to increase toxicity of other skin sensitizing agents.
- **Ingestion** Ingestion is highly unlikely; however, if swallowed, this product may cause irritation to the mouth, throat, and stomach and/or gastrointestinal disturbances. Retention may produce nausea, vomiting, diarrhea, restlessness, sedation, and inadequate respiratory and/or cardiac function. Aspiration into the lungs, which is likely to occur during the swallowing or vomiting, will cause pneumonia.

Chronic Health Effects Summary

Prolonged and/or repeated contact may cause skin defatting, oil acne, redness, itching, dryness, blistering, lesions, scaly dermatitis, and possibly, secondary infection. The presence of various heavy metals in crude petroleum oils may also pose a bioaccumulation potential which could lead to systemic toxicity by repeated or prolonged inhalation, ingestion, or skin absorption.

The International Agency for Research on Cancer (IARC) has concluded that for Crude Petroleum Oils there is limited evidence of carcinogenicity in experimental animals and inadequate evidence for assessing its carcinogenicity in humans. However, rodent studies have shown that the Heavy Naphtha, Distillate, and higher-boiling fractions of some Crude Petroleum Oils have produced skin tumors and/or target organ damage following prolonged and repeated application. Usually, these tumors appeared during the latter portion of the typical 2-year lifespan of the animals. Crude Petroleum Oils also contain Polynuclear Aromatic Hydrocarbons (PAHs or PNAs), some of which have been reported to cause skin cancer on humans under conditions of poor personal hygiene, prolonged/repeated contact, and exposure to sunlight. Toxic effects are unlikely to occur if good personal hygiene is practiced.

Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Chronic occupational xylene exposures have caused auditory nerve degeneration.

At high exposure concentrations, ethylbenzene has been associated with multiple organ tumors in laboratory animals.

Based upon animal testing, the C8 aromatic hydrocarbon components (xylene isomers and ethylbenzene) might be assumed to cause embryo and fetal toxicity, spontaneous abortions, and/or decreased fetal and newborn weights if overexposures occur during a woman's early gestation period.

Naphthalene is considered to be a toxic substance as defined by both human exposure and laboratory testing results. And, based upon animal testing, it might be considered carcinogenic. (See Section 11.)

Conditions Aggravated by Exposure	Personnel with pre-existing CNS disease, skin disorders, impaired liver or kidney function, or chronic respiratory diseases should avoid exposure.
Target Organs	Eyes, skin, mucous membranes, lungs, nervous system, liver, kidneys, thymus, spleen, blood and bone marrow, lymph nodes, and reproductive organs.
Carcinogenic Potential	Please refer to Sections 2 and/or 11 for the identification of components, if any, which have been identified as having carcinogenic potential in animals and/or humans.

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to the Emergency Overview in Section 3 and Exposure Controls in Section 8 of this MSDS -

Inhalation	If vapors are still suspected to be present, the rescuer must wear an appropriate supplied-air respirator or self-contained breathing apparatus (SCBA). Evacuate the victim to a safe area as soon as possible. If the victim is breathing, check for unusual breath odors. Loosen tight clothing such as a collar, tie, belt, or waistband. If breathing is difficult, administer air or oxygen. If the victim is not breathing, perform cardiopulmonary resuscitation (CPR), as necessary. Maintain an open airway. WARNING: Persons providing mouth-to-mouth resuscitation may be placing themselves at risk either from toxic materials or communicable disease.
Eye Contact	IMMEDIATELY flush the eye(s) with large volumes of clean, low-pressure water for at least 15 minutes, occasionally lifting both the upper and lower eyelids. If pain or redness persists after flushing, obtain medical attention.
Skin Contact	Remove contaminated clothing as soon as possible. Wash affected skin thoroughly with mild soap and water. If irritation persists or if tissue appears damaged, seek medical attention. Wash contaminated clothing before reuse. Discard contaminated leather shoes and gloves.
Ingestion	DO NOT INDUCE VOMITING! Risk of damage to the lungs generally exceeds the poisoning risk. (See "Ingestion" in Section 3.) If the patient is completely conscious and alert, give one to two pints of lukewarm water or milk. Obtain medical attention IMMEDIATELY .
Notes to Physician	Aspiration of this material into the lungs will cause lipid or chemical pneumonia. As a result, induction of emesis is NOT recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as Magnesium Citrate or Sorbitol. For quantities above a few drops, use careful gastric lavage with a tight-fitting, cuffed endotracheal tube for complete emptying. Treat symptomatically.

SECTION 5: FIRE FIGHTING MEASURES

FLAMMABLE PROPERTIES

Flammability Classification	Extremely Flammable! OSHA/NFPA Class-IB Flammable Liquid.
Flash Point/Method	LT 40°F (4°C) by ASTM D-56.
Flammable Limits %	LEL: AP 0.9% UEL: AP 7.0% (Based on NFPA "Crude Petroleum")
Auto-Ignition Temperature	AP 500°F (260°C) (Based on NFPA "Hydrogen Sulfide")
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, aldehydes, and other harmful gases/vapors including oxides and/or other compounds of heavy metals, nitrogen, sulfur, and possibly, hydrogen sulfide and alkyl mercaptans. Hydrogen sulfide is corrosive to many materials when moisture is present.
Special Properties	<p>Evolved Hydrogen Sulfide vapor may cause a flash fire or explosion! Keep away from all ignition sources! This vapor may be released at well below ambient temperatures and readily forms flammable mixtures with air. Exposed to an ignition source, it will burn in the open or explode in confined spaces. Being heavier than air, its flammable vapors may travel long distances along the ground before reaching a point of ignition and flashing back.</p> <p>When heated above its flash point temperature, this material will release flammable vapors which if exposed to an ignition source can burn in the open or be explosive in confined spaces. Mists or sprays may be flammable at temperatures below the flash point.</p> <p>A static electrical charge may accumulate as a result of transfer flow or agitation. Discharge (static spark) may ignite vapors, especially in cold, dry weather conditions. Special slow load and monitoring procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing Gasoline or other low flash point products</p>

EXTINGUISHING MEDIA

SMALL FIRE: Use dry chemicals, carbon dioxide (CO₂), foam, water fog, or inert gas (Halon or nitrogen). LARGE FIRE: Use water fog, waterspray, or foam. Foam and water are effective but may cause frothing. NEVER use a water jet because it may spread the fire to a larger area.

FIRE FIGHTING

Do not enter any enclosed or confined fire space without proper protective clothing and equipment. This must include a self-contained breathing apparatus to protect against the hazardous effects of combustion products and/or oxygen deficiencies. Cool tanks and containers exposed to fire with water. Withdraw immediately in case of rising sound from venting safety device or discoloration of the vessel, tank, or pipeline. Be aware that burning liquid will float on water. Notify the appropriate authorities if liquid(s) enter sewers or waterways.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview in Section 3 and Exposure Controls in Section 8 of this MSDS.

Flammable Liquid! Release causes a potential fire or explosion hazard. Remove all ignition sources and safely stop flow of spill. Evacuate all non-essential personnel from immediate area, kill or isolate all ignition sources, and limit area access to only HAZWOPER-trained and properly equipped emergency personnel. Contain spill and prevent it from entering sewers or waterways. Material will float on water and its run-off may create an explosion or fire hazard. Absorb spill with an inert material and place in an appropriate waste disposal container.

Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate protective clothing/equipment, including organic respirators or supplied air. Dike far ahead of a liquid spill to ensure complete collection. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Some spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING and STORAGE**Handling**

Do not handle near heat, sparks, or open flame. Spill/leak can cause fire/explosion. Keep container tightly closed. Do not contact with oxidizable materials. Use only with adequate ventilation/personal protection. Do not breathe vapor. Avoid contact with eyes, skin, and clothing. Wash thoroughly after handling. Prevent contact with food, chewing, or smoking materials. Do not take internally. Keep containers closed and do not handle near heat, sparks, or open flame. A spill or leak can cause fire/explosion. Remove spillage immediately from hard, smooth walking areas. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Avoid contact with eyes, skin, and clothing. Wash thoroughly after handling. Prevent contact with food, chewing, or smoking materials. Do not take internally.

Sampling, transportation, and shipping personnel should use extreme caution when opening a sealed container or entering confined areas of stored petroleum oils. Hydrogen sulfide vapors may accumulate in tanks and transport compartments. Avoid breathing vapors when opening hatches and dome covers by staying upwind, venting slowly, and keeping your face away from compartment openings. Proper respiratory equipment should be used when entering any area where these vapors are being emitted. Hydrogen sulfide's (rotten egg) odor is not reliable as a warning of possible overexposure!

All material sampling should be conducted in a manner which avoids vapor inhalation or skin contact. All electrical equipment in areas where product is handled/stored should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC). Parts and equipment using or containing this material should be steam-cleaned if possible prior to all maintenance procedures. Empty containers retain some liquid and vapor residues, so all hazard precautions must be observed when handling empty containers.

Storage

Flammable materials should be stored in floating-roof tank or a separate safety storage cabinet or room. Keep containers tightly closed in a cool, dry, well-ventilated place. Ground all equipment containing this material. A refrigerated room would be preferable for materials with a Flash Point lower than 70°F (AP 21°C). Keep away from heat and all other sources of ignition. **KEEP OUT OF CHILDREN'S REACH!**

SECTION 8: EXPOSURE CONTROLS and PERSONAL PROTECTION**ENGINEERING CONTROLS**

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. Ensure that an eyewash station and safety shower are proximal to the work-station location.

PERSONAL PROTECTIVE EQUIPMENT• *Protective Equipment*• *Eye Protection*

Safety glasses with side shields are recommended as a minimum protection. Whenever there is a likelihood of misting or splashing/spraying liquid, chemical goggles and/or a face shield should be worn. Suitable eye wash water should be readily available. Hard contact lenses **MUST NOT** be worn.

• *Skin Protection*- *Hands*

Gloves (impervious, Neoprene or Nitrile). Wash hands with plenty of mild soap and water before eating, drinking, smoking, using toilet facilities, or leaving work. **DO NOT** use Kerosene, solvents, or harsh abrasive skin cleaners.

- *Body*

Avoid skin contact. If splashing or spraying is expected, impervious (Neoprene or Tyvek) protective clothing should be worn. This clothing might include long sleeves, apron, lab coat, boots, and additional facial protection. If general contact occurs, **IMMEDIATELY** take a shower. Remove soaked clothing as soon as possible and launder thoroughly before reuse. Discard contaminated leather gloves and shoes.

• *Respiratory Protection*

For unknown vapor concentrations use a self contained breathing apparatus (SCBA). For known vapor concentrations, above the exposure guidelines shown in this Section, also use a NIOSH/MSHA-approved SCBA or supplied air. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent.

• *General Comments*

Warning! Burning this material in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Since specific exposure standards/control limits have not been established for this product, the "Oil Mist, Mineral" exposure limits shown below are suggested as minimum control guidelines.

EXPOSURE GUIDELINES

Substance	Source	Date	Type	Value	Time
HYDROGEN SULFIDE	OSHA	1989	PEL	10 ppm	8 Hrs
HYDROGEN SULFIDE	OSHA	1989	STEL	15 ppm	15 Mins
HYDROGEN SULFIDE	OSHA	1989	CEILING	20 ppm	1 Min

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Viscous liquid.		
Color	Dark yellow to brown or greenish-black.		
Odor	Faint, pleasant hydrocarbon to pungent, offensive sulfurous. Odor threshold is 0.1 to 0.5 ppm in air.		
pH	Not applicable.		
Vapor Pressure	AP 0.8 to 2.6 psia at 100°F. or 100 to 800 mm of Hg at 68°F.	Viscosity	AP 300 to 1000 SUS at 100°F. (ASTM D-2161)
Vapor Specific Gravity	AP 5 to 9 when Air = 1 at 70°F.	Melting/Freezing Pt.	LT 32°F (0°C) (ASTM D-97)
Volatile Characteristics	Appreciable (10 to 50 Wt.%)	Solubility in Water	Slight (0.1 to 1.0 Wt.%)
Boiling Point/Range	AP 50° to 1200°F (ASTM D-86) (AP 10° to 650°C)	Specific Gravity	AP 0.74 to 0.99 (ASTM D-1250)
Additional Properties	API Gravity ranges from 22 to 30.		

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.
Conditions to Avoid	Heat, sparks, and open flames. Extended-period, heated storage of petroleum oil may evolve hydrogen sulfide, a flammable, toxic, and potentially deadly gas.
Incompatibility with Other Materials	Strong acids, alkalis, and oxidizers such as liquid chlorine, concentrated oxygen, and sodium or calcium hypochlorite.
Hazardous Decomposition Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, aldehydes, and other harmful gases/vapors including oxides and/or other compounds of heavy metals, nitrogen, sulfur, and possibly, hydrogen sulfide and alkyl mercaptans. Hydrogen sulfide is corrosive to many materials when moisture is present.
Hazardous Polymerization	Not expected to occur.

SECTION 11: TOXICOLOGICAL INFORMATION**PETROLEUM:**

ORAL (LD50):	Acute: GT 4,300 mg/kg (Rat screen level).
ORAL (LD50):	Acute: GT 4,300 mg/kg (Mouse screen level).
DRAIZE EYE:	Acute: Mild to moderate eye irritant (Rabbit).
DRAIZE DERMAL:	Acute: Minimal to mild skin irritant (Rabbit).
BUEHLER DERMAL:	Acute: Sensitizer (Guinea Pig).
4-Day ORAL (TDLo):	Sub-chronic: 1,250 uL/kg (Rat) - Changes in liver enzymes & proteins.
4-Day ORAL (TDLo):	Sub-chronic: 40 mL/kg (Domestic Bird) - Changes in blood cells & counts.
21-Day ORAL (TDLo):	Sub-chronic: 30 gm/M3 (Rat) - Changes in blood serum, enzyme effects, & stomach absorption rates.
8-Week ORAL (TDLo):	Sub-chronic: 140,000 mg/kg (Duck) - Changes in spleen & ovarian weights.
26-Week ORAL (TDLo):	Chronic: 455,000 mg/kg (Duck) - Changes in liver weight & blood composition
10-Week DERMAL:	Sub-chronic: 40,000 mg/kg (Mouse) - Skin tumors at site of application.
104-Week DERMAL:	Chronic: 210 to 3,745 mg/kg (Mouse) - Skin tumors at site of application.
87-Weeks INTRAPLEURAL:	Chronic: 182,000 mg/kg (Rat) - Lung & thorax tumors.
MUTAGENICITY:	
in-vivo Sister Chromatid Exchange:	Positive (Mouse).
in-vivo Micronuclei Exchange:	Positive (Mouse).
in-vitro Lymphoma Assay.	Positive (Mouse).
in-vitro SCE Ovary Assay.	Positive (Chinese Hamster).

Lifetime mouse skin painting studies have shown that some **Petroleum Crude Oils and their Middle Distillate fractions (boiling range of 300° to 700°F)** can cause skin tumors when repeatedly applied and never washed from an animal's skin. The skin tumor potency seems to increase with the Sulfur content and/or boiling point range. The 700° to 1,070°F boiling point fractions were highly active, as were all fractions containing Polynuclear Aromatic Hydrocarbons (PNA's or PAH's). The relative significance of these results to human health is uncertain since these oils were not washed from the skin and the resulting skin effects (defatting, irritation, cell damage, etc.) may play a role in the weak tumorigenic response. A few studies have shown that washing the animal's skin with soap and water between applications greatly reduces the carcinogenic effect of some Petroleum Middle Distillates.

Several epidemiological studies have shown an association between exposure to **Crude Petroleum Oils (or Crude Oil refining operations)** and cancer. Deaths from cancers of the lung, nasal cavity and sinuses, and skin were higher in U.S. counties where Petroleum industries were concentrated during the period of 1950 through 1969. In a Canadian study, employees exposed daily to Crude Petroleum Oils or their products had more than three times the risk of dying from esophageal and stomach cancer and twice the risk for lung cancer as non-exposed employees. In one Petroleum refinery in Washington state, workers were found to have an 8.5-fold excess risk of dying from astrocytic tumors in the brain as compared with age-matched controls. Other small population Petroleum refinery studies have shown increased death risks due to intestinal, kidney, and bladder cancers.

Crude Petroleum Oils and some of its components were found to be mutagenic by "in vitro" and "in vivo" testing. The genetic activity is expected due to "Aromatic Hydrocarbon compounds". The relationship between these results and possible human effects is not known.

Benzene has an IDLH (immediately dangerous to life or health) concentration of 500 ppm. Its estimated lethal dose for a normal human adult is one teaspoon to one ounce (AP 10 mL). Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes. Studies with pregnant laboratory animals have demonstrated that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice.

There were no Benzene-induced blood toxin or leukemia effects noted in laboratory animals following long-term exposures to fully-volatilized **Unleaded Gasoline vapors containing 2 Vol.% Benzene**. However, the relative risk to humans for Benzene is still unknown.

An inhalation study with laboratory animals indicated an association of **xylene** with hearing loss in rats. Chronic overexposure to xylene may produce irreversible damage to the central nervous system, including ototoxicity, that can be increased by the consumption of ethanol (alcoholic drinks). Drinking beverages which contain ethanol in conjunction with xylene exposure increases the alcoholic effects and impairs the clearance of xylenes from the body. Xylene isomers accumulate in the adipose (fat) tissues, from which they are slowly released. Complete clearance may take several days following exposure.

Several animal studies using pregnant rodents have shown that **mixed xylene isomers (dimethylbenzenes) and ethylbenzene** may all cause embryo and/or fetotoxicity. Inhalation and feeding studies involving pregnant laboratory animals have produced limited evidence of fetal toxicity including increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes. The significance of these animal study results to humans is not known. Xylenes may also cause teratogenic effects.

Two-year rat and mouse gavage (forced feeding) studies by the National Toxicology Program (NTP) using **mixed xylene isomers including 17% ethylbenzene** showed "no evidence of carcinogenicity". Also, a two-year mixed xylenes skin-painting study with shaved rats and mice showed "no incidence of non-neoplastic or neoplastic lesions". And, none of the components were mutagenic when tested in the modified Ames assay, Chinese hamster ovary (CHO) cell assay (with and without metabolic activation), or the in-vitro CHO sister-chromatid exchange (SCE) assay.

The National Toxicology Program (NTP) completed a 2-year inhalation bioassay of ethylbenzene (EB) in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200, and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels. However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level; and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Hyperplasia was also observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear. However, based upon this data, the International Agency for Research on Cancer (IARC) has designated EB as possibly carcinogenic to humans (Group 2B).

Naphthalene is a potential irritant to eyes, skin, and lungs. Following prolonged and/or repeated exposures, naphthalene has been shown to cause eye damage (cataracts and/or optical neuritis), premature destruction of red blood cells (hemolytic and aplastic anemia), and kidney damage (jaundice), and possibly neurotoxicity. Naphthalene-induced blood disorders in humans are characterized by variability in size, shape, and number of red blood cells, anemia, and decreased hemoglobin. Also, there have been reported anemia deaths amongst children exposed to moth ball (naphthalene) saturated blankets. Peripheral lens opacities occurred in 8 of 21 workers exposed to elevated levels of naphthalene vapors for 5 years. Repeated ingestion of a naphthalene-isopropanol mixture caused tremors, restlessness, hallucinations, and extreme apprehension. Based upon animal studies, naphthalene may cause fetal toxicity or damage and decreased spleen weights in pregnant female mice.

The National Toxicology Program (NTP) recently completed a 2-year inhalation bioassay of naphthalene. The study was conducted in male and female F344/N rats at exposure concentrations of 0, 10, 30, and 60 ppm. No significant effects were observed at the 10 ppm levels. However, compared to chamber controls, there was a dose-related increase in tumors generated at the 30 and 60 ppm levels in both males and females. Higher incidences of respiratory epithelial adenomas, olfactory epithelial neuroblastomas, and non-neoplastic lesions of the nose were observed when compared to chamber controls. Additionally, in cytogenic tests with Chinese hamster ovary cells, naphthalene induced significant increases in sister chromatid exchanges with and without metabolic activation (S9) and in chromosomal aberrations with S9. The relevance of these findings to human health is unclear.

SECTION 12: ECOLOGICAL INFORMATION

Toxic aromatic hydrocarbon compounds (benzene, xylene isomers, ethylbenzene, etc.) from petroleum oils are volatile; and therefore, they may be released to the atmosphere and react with photochemically-produced hydroxyl radicals to create smog.

Petroleum will normally float on water. In stagnant or slow-flowing waterways, an oil layer can cover a large surface area. As a result, this oil layer might limit or eliminate natural atmospheric oxygen transport into the water. Over time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This oil coating action can also kill plankton, algae, and water birds. Contaminated groundwater is also an important exposure pathway for humans.

Crude Petroleum Oils' water-soluble fractions are potentially toxic to freshwater and saltwater ecosystems. Using shrimp (*Mysidopsis almyra*), various Crude Oils showed a 48-hour TLM (Median Toxic Limit) from 6 ppm to 20 ppm in ambient saltwater. A 24-hour TLM resulted in 10,000 ppm when using freshwater *Daphnia* (*magna* and *pulex*) with many of the organisms being trapped in the oil layer. Based upon actual spill incident investigations, Crude Petroleum Oils have been shown to bioaccumulate in tissues of various fish from 1 to 5 ppm levels.

SECTION 13: DISPOSAL CONSIDERATIONS

Maximize product recovery for reuse or recycling. When disposing of this product, its storage tank water bottoms, sludge, contaminated soil, or water one must assume the waste material to be an EPA "Ignitable Hazardous Waste" (D001) and/or "Toxic Waste" (U018), unless proven otherwise by thorough analytical testing. Use approved treatment, transporters, and disposal sites in compliance with all applicable regulations. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. Vapor emissions from a bio-oxidation process might prove to be a potential health hazard. Potential treatment and disposal methods include incineration, land farming, and/or bioremediation, if permitted.

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U.S. Department of Transportation regulated material.		
Proper Shipping Name	Petroleum Oil		
Hazard Class	3		
UN/NA ID	UN1270	Packing Group(s)	PG II or PG III
Reportable Quantity	RQs [4-6 FUSED-RING POLYNUCLEAR AROMATIC HYDROCARBONS (PNA's or PAH's), XYLENE (TOTAL OF ALL ISOMERS), ETHYLBENZENE, BENZENE, and NAPHTHALENE.]		
Placards		Emergency Response Guide Number	128
		HAZMAT STCC Number	Not available
		MARPOL III Status	This product might be a "Marine Pollutant".

SECTION 15: REGULATORY INFORMATION

TSCA	All components of this product are listed on the Toxic Substance Control Act (TSCA) inventory.										
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires emergency planning based on Threshold Planning Quantities (TPQs) and release reporting based on Reportable Quantities (RQs) established in 40 CFR Parts 302.4 and 355. Components present in this product which may require reporting are: <table border="0" style="width: 100%;"> <tr> <td>XYLENE (TOTAL OF ALL ISOMERS)</td> <td>HYDROGEN SULFIDE</td> </tr> <tr> <td>1,3-BUTADIENE</td> <td>BENZENE</td> </tr> </table>	XYLENE (TOTAL OF ALL ISOMERS)	HYDROGEN SULFIDE	1,3-BUTADIENE	BENZENE						
XYLENE (TOTAL OF ALL ISOMERS)	HYDROGEN SULFIDE										
1,3-BUTADIENE	BENZENE										
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Immediate (Acute) Health and Delayed (Chronic) Health Hazards; Fire Hazard.										
SARA 313	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires submission of an annual release report of "Toxic Chemicals" that appear in 40 CFR 372 (used for SARA 313). This information must be included in all MSDSs that are copied and distributed for this material. Components present in this product at a level which could require reporting under the statute are: <table border="0" style="width: 100%;"> <tr> <td>BENZENE</td> <td>XYLENE (TOTAL OF ALL ISOMERS)</td> </tr> </table>	BENZENE	XYLENE (TOTAL OF ALL ISOMERS)								
BENZENE	XYLENE (TOTAL OF ALL ISOMERS)										
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center of release of quantities of "Hazardous Substances" equal to or greater than the "Reportable Quantities (RQs)" in 40 CFR 302.4. Components present in this product at a level which could require reporting under the statute are: <table border="0" style="width: 100%;"> <tr> <td>4-6 FUSED-RING POLYNUCLEAR AROMATICS (PNA's)</td> <td>RQ: 1 to 100 Pounds (0.45 to 45 Kg.)</td> </tr> <tr> <td>XYLENE (TOTAL OF ALL ISOMERS)</td> <td>RQ: 100 Pounds (45 Kg.)</td> </tr> <tr> <td>ETHYLBENZENE</td> <td>RQ: 100 Pounds (45 Kg.)</td> </tr> <tr> <td>BENZENE</td> <td>RQ: 10 Pounds (4.5 Kg.)</td> </tr> <tr> <td>NAPHTHALENE</td> <td>RQ: 100 Pounds (45 Kg.)</td> </tr> </table>	4-6 FUSED-RING POLYNUCLEAR AROMATICS (PNA's)	RQ: 1 to 100 Pounds (0.45 to 45 Kg.)	XYLENE (TOTAL OF ALL ISOMERS)	RQ: 100 Pounds (45 Kg.)	ETHYLBENZENE	RQ: 100 Pounds (45 Kg.)	BENZENE	RQ: 10 Pounds (4.5 Kg.)	NAPHTHALENE	RQ: 100 Pounds (45 Kg.)
4-6 FUSED-RING POLYNUCLEAR AROMATICS (PNA's)	RQ: 1 to 100 Pounds (0.45 to 45 Kg.)										
XYLENE (TOTAL OF ALL ISOMERS)	RQ: 100 Pounds (45 Kg.)										
ETHYLBENZENE	RQ: 100 Pounds (45 Kg.)										
BENZENE	RQ: 10 Pounds (4.5 Kg.)										
NAPHTHALENE	RQ: 100 Pounds (45 Kg.)										
California Proposition 65	Per the California Safe Drinking Water and Toxic Enforcement Act of 1986, this product contains the following ingredients for which the State of California has found to cause cancer, birth defects or other reproductive harm, which would require a warning under the statute: 4-6 FUSED-RING POLYNUCLEAR AROMATIC HYDROCARBONS (PNA's or PAH's) <table border="0" style="width: 100%;"> <tr> <td>BENZENE</td> <td>TOLUENE (METHYLBENZENE)</td> </tr> </table> 1,3-BUTADIENE (ERYTHRENE OR PYRROLYENE)	BENZENE	TOLUENE (METHYLBENZENE)								
BENZENE	TOLUENE (METHYLBENZENE)										
Additional Regulatory Remarks	Resource Conservation and Recovery Act (RCRA): This substance, when discarded or disposed of, is not specifically listed as a "Hazardous Waste" in Federal regulations; however, it is considered to be hazardous because it is "toxic" and "ignitable" according to Environmental Protection Agency definitions (40 CFR 261). Additionally, it could be designated as hazardous according to various state and local regulations. This substance could also become a "Hazardous Waste" if it is mixed with or comes in contact with a "Hazardous Waste". If such contact or mixing may have occurred, check 40 CFR 261 to determine its status. If it is a "Hazardous Waste", regulations at 40 CFR 262, 263, and 264 apply. The transportation, storage, treatment, and disposal of "Hazardous Waste" materials must be conducted in compliance with all applicable Federal, state, and local regulations.										

This product is classified as an oil under Section 311 of the Clean Water Act (40 CFR 110) and the Oil Pollution Act of 1990 (40 CFR 112). Discharge or spills which produce a visible sheen on either navigable surface water, or in waterways and sewers which lead to navigable surface water, must be reported to the National Response Center (800-424-8802).

The Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13): This product contains "Petroleum Distillates" which require special labeling if distributed in a manner intended, or packaged in a form suitable, for use in the household or by children. Precautionary label dialogue must display the following: **Contains Petroleum Distillates! May be harmful or fatal if swallowed! KEEP OUT OF REACH OF CHILDREN! DO NOT SIPHON BY MOUTH!**

Toxic Substances Control Act (TSCA) - Section 12(b): Because this product probably contains detectable amounts of METHYLCYCLOPENTANE, CYCLOHEXANE, n-HEXANE, and/or 1,3,5-TRIMETHYLBENZENE (MESITYLENE), it might be subject to the Export Notification requirements of the Environmental Protection Agency.

Emergency Overview

Physical State Liquid
Color Transparent, clear to slightly yellow. **Odor** Moderate, sweet and pleasant, aromatic hydrocarbon to gasoline-like.

DANGER! Extremely flammable liquid;
vapor may cause flash fire or explosion!
Mist or vapor may irritate the eyes, mucous membranes, and respiratory tract!
Liquid contact may cause mild to severe eye and/or moderate to severe skin irritation and inflammation!
May be harmful if inhaled or absorbed through the skin!
Overexposures may cause central nervous system (CNS) depression and/or other target organ effects!
May be harmful or fatal if ingested!
Aspiration into the lungs can cause pulmonary edema and chemical pneumonia!
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
Potential cancer hazard! Contains Benzene and Ethylbenzene!
May cause leukemia and/or other blood disorders!
Mutagenic hazard; may cause genetic damage!
May adversely affect reproduction or reproductive development!
Spills may create a slipping hazard!

SECTION 1: IDENTIFICATION

Trade Name	Heavy Thermocracked Naphtha (C6-C12 Hydrocarbons)	Technical Contact	(800) 525-4892 or (713) 321-4269 (M-F)
Product Number	064741839*	Medical Emergency	(918) 495-4700
CAS Number	64741-83-9	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	C6-C12 Petroleum Hydrocarbons		
Synonyms	Heavy Coker Naphtha; Delayed Coker Heavy Gasoline or Naphtha; Thermal Cracked Heavy Gasoline; 534 Depentanizer Tower Bottoms; Coker Naphtha Splitter Tower Bottoms; 632 HDS Feed; Coker Naphtha Fractionator (CNF) Bottoms; Heavy Thermal Cracked Naphtha (Petroleum); HTC.N.		

Heavy Thermocracked Naphtha (C6-C12 Hydrocarbons)

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Heavy Thermal Cracked Naphtha (Petroleum)	64741-83-9	100
2) Hexane isomers	Mixture	0.5-2
3) Benzene	71-43-2	0.1-0.9
4) Heptanes	Mixture	5-15
5) Methylcyclohexane	108-87-2	1-5
6) Toluene	108-88-3	1-5
7) C7-C12 alpha-Alkenes	68855-57-2	5-15
8) Octanes	Mixture	15-25
9) Xylene, Mixed Isomers	1330-20-7	5-10
10) Ethylbenzene	100-41-4	1-2
11) Nonanes	Mixture	10-25
12) n-Propylbenzene	103-65-1	0.5-1.5
13) Trimethylbenzene (mixed isomers)	25551-13-7	5-10
14) 1,2,4-Trimethylbenzene (Pseudocumene)	85-63-6	3-8
15) Ethylmethylbenzenes (Ethyltoluenes)	25550-14-5	1-10
16) Indene	95-13-6	0.5-1.5
17) Naphthalene	91-20-3	0.5-1.5
18) C10-C12 Alkylbenzenes	70693-06-0	2-10
19) C10-C12 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	5-10

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye Contact. Absorption. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon level of exposure concentration and/or duration. Vapors can reduce the oxygen content in air. Approximately 20,000 ppm (or 2 vol.%) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces.
Eye Contact	Animal test results on similar materials suggest that this product can cause mild to severe eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling.
Skin Contact	Animal test results on similar materials suggest that this product can cause moderate to severe skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate to severe dermatitis. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and severe tissue damage.
Ingestion	If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above).
	Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.

Heavy Thermocracked Naphtha (C6-C12 Hydrocarbons)

Chronic Health Effects Summary

Reports have associated repeated and proplonged occupational overexposure to solvents with irreversible brain and nervous system damage (sometimes referred to as "Solvent or Painter's Syndrome") And, altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delinum, seizures, and sudden death have been common results for gasoline/naphtha abusers. Intentional misuse by deliberately concentrating and inhaling this product may be harmful or fatal

Benzene is considered to be a cancer causing agent. It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML). Benzene is also capable of causing changes in genetic material (chromosomes) Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents

Available information indicates that **toluene** is NOT teratogenic, but it can be toxic to the embryo and fetus and may reduce fertility In animal tests, high inhaled doses of toluene has caused reduced litter sizes, retarded development of the fetus, and increased incidence of non-lethal abnormalities

Chronic effects of ingestion and subsequent aspiraton into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction Chronic occupational **toluene and xylene** exposures have caused auditory nerve degeneration.

At high exposure concentrations, **ethylbenzene** has been associated with multiple organ tumors in laboratory animals.

Based upon animal testing, the **C8 aromatic hydrocarbon components (xylene isomers and ethylbenzene)** might be assumed to cause embryo and fetal toxicity, spontaneous abortions, and/or decreased fetal and newborn weights if overexposures occur during a woman's early gestation period And, the **C9 aromatic hydrocarbons (cumene, n-propylbenzene, trimethylbenzenes, Indene, and ethylmethylbenzenes)** are presumed to cause fetal toxicity and/or decreased fetal and newborn weights if overexposure occurs during a woman's early gestation period.

Naphthalene is considered to be a toxic substance as defined by both human exposure and laboratory testing results. And, based upon animal testing, it might be considered carcinogenic (See Section 11.)

Conditions Aggravated by Exposure

Personnel with pre-existing central nervous system (CNS) disease, neurological conditions, skin disorders, impaired hearing, liver, or kidney function, or chronic respiratory diseases, and women attempting to conceive should avoid exposure.

Exposure to high concentrations of this material may increase the sensitivity of the heart to **epinepherine (adrenalin) and catecholamine-like drugs**. Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians").

Target Organs

This material is toxic to lungs, central nervous system, especially the auditory nerves, brain, blood, kidneys, liver, heart, thymus, mucous membranes, skin, eyes, and possibly the reproductive system.

Carcinogenic Potential

This material contains benzene and ethylbenzene at concentrations above 0 1%. Benzene is considered to be a known human carcinogen by OSHA, IARC and NTP and Ethylbenzene are considered possibly carcinogenic to humans by IARC. (See Section 11.)

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200)

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>

Heavy Thermocracked Naphtha (C6-C12 Hydrocarbons)

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	<p>Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonia. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.</p> <p>If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.</p> <p>Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse). If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IA Flammable Liquid. Extremely flammable!		
Flash Point Method	CLOSED CUP: -37° to 0°C (-35° to -18°F). (Tagliabue [ASTM D-56])		
Lower Flammable Limit	AP 0.9 %	Upper Flammable Limit	AP 7.6%
Autoignition Temperature	225° to 280°C (435° to 536°F) by ASTM E-659.		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors including oxides of sulfur and nitrogen.		
Special Properties	Extremely Flammable Liquid! This material releases vapors at or well below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.		
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide (CO ₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.		

Heavy Thermocracked Naphtha (C6-C12 Hydrocarbons)

Protection of Fire Fighters Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

Handling A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room, and preferably refrigerated. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

Heavy Thermocracked Naphtha (C6-C12 Hydrocarbons)

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Hand Protection Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).

General Comments Warning! Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Gasoline ("A3" Animal Carcinogen)	TWA: 300 STEL: 500 (ppm) from ACGIH (TLV) TWA: 300 STEL: 500 (ppm) from OSHA (PEL) [Proposed]
2) Petroleum Distillates (Naphtha)	TWA: 400 (ppm) from OSHA (PEL) TWA: 500 (ppm) from OSHA (PEL)
3) Hexane, other isomers	TWA: 500 STEL: 1000 (ppm) from ACGIH (TLV) TWA: 500 STEL: 1000 (ppm) from OSHA (PEL) [Proposed]
4) Benzene ("A1" and "Z-2" Known Human Carcinogen)	TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) - SKIN TWA: 1 STEL: 5 (ppm) from OSHA (PEL) - SKIN
5) Heptane (n-Heptane)	TWA: 400 STEL: 500 (ppm) from ACGIH (TLV) TWA: 400 STEL: 500 (ppm) from OSHA (PEL) [Proposed]
6) Methylcyclohexane	TWA: 500 (ppm) from OSHA (PEL) TWA: 400 (ppm) from ACGIH (TLV) TWA: 400 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
7) Toluene	TWA: 50 (ppm) from ACGIH (TLV) - SKIN TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [Proposed] TWA: 200 CEIL: 300 (ppm) from OSHA (PEL)
8) Octane, all isomers	TWA: 300 (ppm) from ACGIH (TLV) TWA: 300 STEL: 375 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
9) Xylene, Mixed Isomers	TWA: 100 STEL: 150 (ppm) from ACGIH (TLV) TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [Proposed] TWA: 100 (ppm) from OSHA (PEL)

Heavy Thermocracked Naphtha (C6-C12 Hydrocarbons)

10) Ethylbenzene ("A3" Animal Carcinogen)	TWA: 100 STEL: 125 (ppm) from ACGIH (TLV) TWA: 100 STEL: 125 (ppm) from OSHA (PEL) [Proposed]
11) Nonane, all isomers	TWA: 100 (ppm) from OSHA (PEL) TWA: 200 (ppm) from ACGIH (TLV) TWA: 200 (ppm) from OSHA (PEL) [Proposed]
12) Trimethylbenzene (mixed isomers)	TWA: 25 (ppm) from ACGIH (TLV) TWA: 25 (ppm) from OSHA (PEL) [Proposed]
13) Indene	TWA: 10 (ppm) from ACGIH (TLV) TWA: 10 (ppm) from OSHA (PEL) [Proposed]
14) Naphthalene ("A3" = Animal Carcinogen [Proposed])	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) - SKIN TWA: 10 STEL: 15 (ppm) from OSHA (PEL) [Proposed] TWA: 10 (ppm) from OSHA (PEL)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color Transparent, clear to slightly yellow.	Odor	Moderate, sweet and pleasant, aromatic hydrocarbon to gasoline-like.
Specific Gravity	0.83 to 0.85 (Water = 1)	pH Not applicable.	Vapor Density	3.1 to 3.5 (Air = 1)
Boiling Point/Range	60° to 235°C (140° to 455°F) [ASTM D-2887]		Melting/Freezing Point	< -46°C (-50°F)
Vapor Pressure	2.0 to 2.2 Reid-psi at 38°C (100°F).		Viscosity (cSt @ 40°C)	1 to 2
Solubility in Water	Soluble in methanol and diethyl ether. Slightly soluble in cold water (< 0.1%).		Volatile Characteristics	Volatile Organic Compounds (VOCs) Content = 100%; 750 to 875 gm/L.
Additional Properties	Alkane, Isoparaffin, and Cycloalkane Hydrocarbons Content = 35 to 75 Wt.% [ASTM D-1319]; C6-C12 Aromatic Hydrocarbons Content = 20 to 50 Wt.% [ASTM D-1319]; Olefin Hydrocarbons Content = 5 to 15 Wt.% [ASTM D-1319]; Average Density at 60°F = 6.202 lbs./gal. [ASTM D-2500]; Evaporation Rate = 0.35 to 2.0 when n-Butyl acetate = 1.0; 90% Boiling Point Temperature = 415° to 435°F (213° to 224°C) [ASTM D-86]; Dry Point Temperature = 450°F (232°C) [ASTM D-86]; Net Heat of Combustion Value = 18,600 to 20,600 Btu/lb. [ASTM D-1405 or D-2382].			

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalies, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide, and oxygen.		
Hazardous Decomposition Products	No substances are readily identified from composition; and, no degradation data is available.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	Heavy Thermal Cracked Naphtha (Petroleum): ORAL (LD50): Acute: > 5,000 mg/kg [Rat screen] - Somnolence, diarrhea, and hypermotility. GAS (LC50): Acute: > 5,740 mg/L for 4 hours [Rat screen level] - Somnolence. DERMAL (LD50): Acute: > 2,000 mg/kg [Rabbit screen level].
	n-Heptane: GAS (LC50): Acute: 103,000 mg/m ³ for 4 hours [Rat] - Convulsions. DERMAL (LD50): Acute: > 2,000 mg/kg [Rabbit]. INTRAVENOUS (LD50): Acute: 222 mg/kg [Mouse].

Heavy Thermocracked Naphtha (C6-C12 Hydrocarbons)

Benzene:

ORAL (LD50): Acute 930 mg/kg [Rat] - Tremors and convulsions
 ORAL (LD50): Acute 4,700 mg/kg [Mouse].
 ORAL (LD50) Acute: 5,700 mg/kg [Unidentified mammal]
 GAS (LC50) Acute: 10,000 ppm for 7 hours [Rat].
 GAS (LC50) Acute 9,980 ppm for 8 hours [Mouse] - General anesthesia, muscle weakness, and
 dyspnea
 DERMAL (LD50) Acute 48 mg/kg [Mouse].
 DERMAL (LD50). Acute > 9,400 uL/kg [Rabbit and Guinea Pig]
 INTRAPERITONEAL (LD50) Acute: 340 mg/kg [Mouse].
 INTRAPERITONEAL (LD50) Acute 2,890 ug/kg [Rat] - Lung and liver damage plus
 decreased blood cells

Toluene:

ORAL (LD50): Acute. 636 mg/kg [Rat].
 ORAL (LD50): Acute: 4,000 mg/kg [Cat].
 GAS (LC50). Acute: 49,000 mg/m³ for 4 hours [Rat].
 GAS (LC50) Acute: 5,320 ppm for 8 hours [Mouse].
 GAS (LC50): Acute: 400 ppm for 24 hours [Mouse]
 DERMAL (LD50): Acute. 14,100 uL/kg or 12,125 mg/kg [Rabbit]
 INTRAVENOUS (LD50). Acute 1,960 mg/kg [Rat]
 INTRAVENOUS (LD50): Acute: 2,000 mg/kg [Mouse]
 SUBCUTANEOUS (LD50) Acute: 2,250 mg/kg [Mouse]
 INTRAPERITONEAL (LD50). Acute 59 mg/kg [Mouse].
 INTRAPERITONEAL (LD50) Acute 500 mg/kg [Guinea Pig]
 INTRAPERITONEAL (LD50). Acute 1,332 mg/kg [Rat].

Methylcyclohexane:

ORAL (LD50) Acute: 2,250 mg/kg [Mouse]
 GAS (LC50) Acute. 41,500 mg/m³ for 2 hours [Mouse] - Hypermotility and diarrhea
 GAS (LC50). Acute 15,227 ppm for 1 hour [Rabbit] - General anesthetic, convulsions,
 and changes in the salivary glands

n-Octane:

GAS (LC50): Acute 118,000 mg/m³ for 4 hours [Rat].

Xylenes:

ORAL (LD50): Acute: 4,300 mg/kg [Rat].
 GAS (LC50): Acute: 4,550 ppm for 4 hours [Rat].
 DERMAL (LD50): Acute: 14,100 uL/kg [Rabbit]
 SUBCUTANEOUS (LD50): Acute 1,700 mg/kg [Rat].
 INTRAPERITONEAL (LD50): Acute: 2,459 mg/kg [Rat]
 INTRAPERITONEAL (LD50): Acute: 1,548 mg/kg [Mouse].

Ethylbenzene:

ORAL (LD50): Acute: 3,500 mg/kg [Rat].
 DERMAL (LD50). Acute: 17,800 uL/kg [Rabbit].
 INTRAPERITONEAL (LD50). Acute 2,624 mg/kg [Rat].

n-Nonane:

GAS (LC50): Acute: 3,200 ppm for 4 hours [Rat]
 INTRAVENOUS (LD50): Acute: 218 mg/kg [Mouse]

Trimethylbenzenes:

ORAL (LD50): Acute. 8,970 mg/kg [Rat]

1,2,4-Trimethylbenzene:

ORAL (LD50): Acute: 5,000 mg/kg [Rat].
 GAS (LC50): Acute: 18,000 mg/m³ for 4 hours [Rat].

Ethylmethylbenzenes (Ethyltoluenes):

GAS (LC50): Acute: 50,000 mg/m³ for 2 hours [Cat]
 GAS (LC50): Acute 54,000 mg/m³ for 4 hours [Mouse]

Indene:

ORAL (LD50): Acute: 2,300 mg/kg [Rat]
 ORAL (LD50) Acute: 1,800 mg/kg [Mouse]
 GAS (LC50). Acute: 14,000 mg/m³ for 4 hours [Rat].

Naphthalene:

ORAL (LD50). Acute: 490 mg/kg [Rat].
 ORAL (LD50): Acute: 533 mg/kg [Mouse].
 ORAL (LD50): Acute 1,200 mg/kg [Guinea Pig].
 SUBCUTANEOUS (LD50): Acute: 969 mg/kg [Mouse].
 INTRAVENOUS (LD50) Acute: 100 mg/kg [Mouse].
 INTRAPERITONEAL (LD50): Acute: 150 mg/kg [Mouse].

Heavy Thermocracked Naphtha (C6-C12 Hydrocarbons)

Subchronic (28-day) oral and dermal studies with **heavy thermal cracked naphtha (petroleum)** using rats and rabbits showed animal weight loss or reduced weight gain, renal tubule changes and acute tubular necrosis, plus slight to moderate skin irritation without sensitization. Heavy catalytic cracked naphtha also produced equivocal mutagenic responses in the Salmonella/microsome (Ames) Assay and positive responses in the in-vitro Mouse Lymphoma Assay with and without S9 activation. The significance of these animal mutagenicity study results to human health is unclear.

Long-term mouse skin painting studies sponsored by the American Petroleum Institute (API) showed **heavy thermal cracked naphtha** caused a slight increased incidence of skin tumors at the site of contact when applied repeatedly (twice per week) over the lifetime of the test animals (12 to 24 months). Average latency period was 72 weeks. A few studies have shown that washing the animal's skin with soap and water between applications greatly reduces the carcinogenic effect of similar and heavier **petroleum distillates**.

Benzene has an IDLH (immediately dangerous to life or health) concentration of 500 ppm. Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes. If ingested, benzene's lethal dose for a normal human adult is one teaspoon to one ounce (~10 mL). Studies with pregnant laboratory animals have demonstrated that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice.

Benzene is a known animal carcinogen and a human leukemogen. In addition, NTP, IARC, EPA, OSHA, and ACGIH list benzene as a "Human Carcinogen." Repeated and prolonged overexposure to benzene vapors (GT 20 ppm in air) may cause toxicity to blood-forming tissues. Chronic exposure symptoms include decreased blood cell and platelet counts, leukopenia, aplastic anemia, or acute myelogenous leukemia (AML). Also, chronic inhalation of benzene vapors have been found to cause fatigue, nervousness, irritability, blurred vision, and labored breathing. Overexposure to benzene has been associated with chromosomal aberrations in human white blood cells, both laboratory animal and human bone marrow cell damage, and in vitro mammalian cells DNA damage. Elevated frequencies of chromosomal aberrations have been observed in peripheral white blood cells and bone marrow of workers exposed to high benzene concentrations known to be associated with signs of chronic poisoning. Ethanol consumption may have a synergistic effect and increase blood system changes caused by benzene exposures. Children/teenagers have less resistance.

n-Heptane is a mucous membrane and respiratory tract irritant, but non-irritating to the eyes. It is readily absorbed by inhalation and dermal exposure and repeated direct skin application can produce defatting dermatitis. Exposures may cause decreased red blood cell counts, liver and heart damage, and central nervous system depression. n-Heptane is metabolized in the liver to form alcohols and ketones, including neurotoxic **2,5-heptanedione** which is detectable in small amounts in the urine of exposed humans.

In a controlled study, human volunteers exposed to an airborne concentration of **n-heptane** of 1,000 ppm for 6 minutes or 2,000 ppm for 4 minutes experienced slight dizziness and incoordination. Higher-level exposures produced hilarity, dizziness, and semi-consciousness. Inhaling a concentration of 5,000 ppm for 15 minutes caused stupor and a gasoline-like taste. These higher exposures also decreased the myocardial threshold to the arrhythmogenic effects (irregular heart beats) of epinephrine, producing only a narrow margin of safety between exposures causing CNS effects, cardiac effects, and loss of consciousness.

One occupational exposure study involving a **95% purity n-heptane** from 1 to 9 years duration concluded that it could produce minimal peripheral nerve damage with numbness and tingling of the extremities in the stocking-and-glove areas. In the same study, there was a decrease in motor nerve conduction velocities correlated with duration of exposure and adjusted for age effects; however, the average motor nerve conduction velocity in exposed workers was normal. Polyneuropathy associated with n-heptane exposure was reversible within a year following removal of exposure.

n-Heptane was not neurotoxic in rats exposed for up to 7 months. But based upon limited laboratory animal studies, **n-heptane and its metabolites** were found in low levels (< 135 ppm) in the brain of rats exposed to airborne concentrations of 100, 500, or 1,500 ppm for 6 hours each day, five days per week, for 1 or 2 weeks. These substances disappeared within 2 weeks following removal of exposure. n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not expected to be carcinogenic.

2,2,4-Trimethylpentane (Iso-octane) was highly irritating to mice at a 1,000 ppm in air exposure for 5 minutes and respiratory arrest occurred at exposures above 10,000 ppm for 5 minutes. CNS depression was observed at concentrations between 8,000 and 10,000 ppm in air. Kidney tubule necrosis, hyaline droplet formation, and acute renal failure were seen in male rats following oral administration of 10 gm/kg, 8 mL/kg, or 2,100 mg/kg of iso-octane for 2, 3, and 4 weeks, respectively.

Heavy Thermocracked Naphtha (C6-C12 Hydrocarbons)

Rats inhaling **methylcyclohexane** at an airborne concentration of 15,250 ppm for 1 hour displayed tremors, loss of coordination, anesthesia, and convulsions. Inhalation of 10,050 ppm for 6 hours per day for 14 days showed rodent weight loss or decreased weight gain and changes in the structure of their salivary glands. Using rabbits, methylcyclohexane was shown to have an LD50 somewhere between 3,300 ppm and 7,300 ppm when exposed repeatedly for 6 hours per day, 5 days per week, for 3 weeks. Death was preceded by conjunctival congestion with mucoid secretion and lacrimation, salivation, coughing, sneezing, labored breathing, and diarrhea. Lethal oral dosing of rabbits caused lethargy, severe diarrhea, and circulatory collapse. Vascular and degenerative lesions were observed in the kidneys and liver.

Toluene (methylbenzene) has been a major solvent of intentional inhalation abuse. Deliberate long-term inhalation of high concentrations of toluene (glue sniffing, etc.) has been shown to cause liver, kidney, central nervous system, and permanent brain damage. Effects such as impaired speech, visual disturbances, and hearing loss, loss of balance and/or muscle control, and memory loss have been reported. Exposures of 100 to 200 ppm in air for 24 hours cause hallucinations, distorted perceptions, and changes in motor activity. Studies have indicated that children of women who sniffed massive exposures of toluene during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. Isolated case reports have suggested a spectrum of congenital defects similar to those seen in fetal alcohol (ethanol) syndrome. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate.

Animal studies suggest that **toluene** causes kidney, liver, and/or lung dysfunction and cardiac (heart muscle) sensitization to epinephrine or other adrenalin-like agents. This sensitization may cause fatal changes in heart beat rhythms. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency).

Long-term rodent inhalation studies with **toluene** produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness, and impaired reaction time. Also, rats exposed to 1,200 ppm and 1,400 ppm of toluene in air for 14 hours per day for 5 or 4 weeks (respectively) exhibited high-frequency hearing loss. Several animal studies using pregnant rodents have shown that toluene exposures may cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation studies, toluene has not been shown to be carcinogenic, nor is it mutagenic in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

An inhalation study with laboratory animals indicated an association of **xylene** with hearing loss in rats. Several animal studies using pregnant rodents have shown that **mixed xylene isomers (dimethylbenzenes)** may all cause embryo and/or fetotoxicity. Inhalation and feeding studies involving pregnant laboratory animals have produced limited evidence of fetal toxicity including increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes.

Chronic overexposure to **xylene** may produce irreversible damage to the central nervous system, including ototoxicity, that can be increased by the consumption of ethanol (alcoholic drinks). Drinking beverages which contain ethanol in conjunction with xylene exposure increases the alcoholic effects and impairs the clearance of xylenes from the body. Xylene isomers accumulate in the adipose (fat) tissues, from which they are slowly released. Complete clearance may take several days following exposure.

Two-year rat and mouse gavage studies by the National Toxicology Program (NTP) on **mixed xylene isomers including 17% ethylbenzene** showed "no evidence of carcinogenicity". Also, a two-year mixed xylenes skin-painting study on shaved rats and mice showed no incidence of non-neoplastic or neoplastic lesions. And, none of the components were mutagenic when tested in either the modified Ames, Chinese hamster ovary cell with and without metabolic activation, or sister-chromatid mutagenicity assays.

NTP completed a 2-year inhalation bioassay of **ethylbenzene** in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200 and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels. However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level; and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Also, hyperplasia was observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear. However, based upon this data, the IARC has designated ethylbenzene as possibly carcinogenic to humans (Group 2B).

Heavy Thermocracked Naphtha (C6-C12 Hydrocarbons)

Rats inhaling *n*-nonane at an airborne concentration of 1,500 ppm for 7 days displayed mild tremors and loss of coordination. Inhalation of 1,600 ppm for 6 hours per day for 90 days showed animal weight loss or decreased weight gain and changes in the structure of their salivary glands. And, liver damage and an altered response to drugs were seen in rats given *n*-nonane for 2 to 7 days.

Trimethylbenzenes are primary skin irritants and may cause asthmatic bronchitis and/or anemia. Levels of total hydrocarbon vapors present in the breathing atmosphere of these workers ranged from 10 to 60 ppm. Its TC_{L_50} for humans 10 ppm, with somnolence and respiratory tract irritation noted. In inhalation studies with rats, four of ten animals died after exposures of 2,400 ppm for 24 hours. An oral dose of 5 mL/kg resulted in death in one of ten rats. Minimum lethal intraperitoneal doses were 1.5 to 2.0 mL/kg in rats and 1.13 to 12 mL/kg in guinea pigs. Mesitylene (1,3,5-Trimethylbenzene) inhalation at concentrations of 1.5, 3.0, and 6.0 mg/L for six hours was associated with dose-related changes in white blood cell counts in rats. No significant effects on the complete blood count were noted with six hours per day exposure for five weeks, but elevations of alkaline phosphatase and SGOT were observed. Central nervous system depression and ataxia were noted in rats exposed to 5,100 to 9,180 ppm for two hours. Based upon animal reproductive/developmental studies, trimethylbenzenes may also cause fetal toxicity.

Indene and ethylmethylbenzenes are primary skin irritants. Overexposure has been associated with kidney damage and increased blood cholinesterase levels. In inhalation developmental studies, these and other C9 aromatic hydrocarbons have been associated with decreased fetal and newborn pup weights.

Naphthalene is a potential irritant to eyes, skin and lungs. Ingestion of naphthalene has been associated with severe red blood cell and liver damage leading to death. Following prolonged or repeated exposures, naphthalene has been shown to cause cataracts, optical neuritis, hemolytic and aplastic anemia, kidney damage (jaundice), and possibly neurotoxicity. In animal studies, naphthalene caused fetal effects and decreased spleen weights in pregnant female mice. In an NTP sponsored study, naphthalene produced a dose related increase in tumors at the 30 and 60 ppm exposure level in both male and female rats. Higher incidences of respiratory epithelial adenomas, olfactory epithelial neuroblastomas and non-neoplastic lesions of the nose were observed as compared to controls. Cytogenic studies with Chinese hamster ovary cells have demonstrated sister chromatid exchanges and chromosomal aberrations. The relevance of these studies to human health is unclear.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this naphtha, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. Volatile aromatic hydrocarbon components (benzene, toluene, xylenes, ethylbenzene, cumene, and trimethylbenzenes) may be released and possibly contribute to the creation of atmospheric smog.

Using Rainbow Trout (*Oncorhynchus mykiss*) and Dungeness Crab (*Cancer magister*), similar naphthas showed a 96-hour TLm (Median Toxic Limit) from 5 ppm to 20 ppm in ambient saltwater. Also, 24-hour and 96-hour TLms produced results from 60 ppm to 200 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), Guppy (*Lebistes reticulatus*) and juvenile American Shad (*Squalius cephalus*) in fresh water. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

Environmental Fate

This naphtha mixture is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

Heavy Thermocracked Naphtha (C6-C12 Hydrocarbons)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and toxicity (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Petroleum distillates, n.o.s. (Octanes, Nonanes)		
Hazard Class	DOT Class: 3 (Flammable liquid).	Packing Group(s)	PG II
		UN/NA ID	UN1268
Reportable Quantity	The Reportable Quantity (RQ) substance components in this product which might require DOT HAZMAT bill-of-lading display are Xylenes and Benzene.		
Placards		Emergency Response Guide No.	128
		HAZMAT STCC No.	49 102 56
		MARPOL III Status	All impacted components were delisted as DOT "Marine Pollutants" per 66 FR 120 (page 33413) dated 6/21/2001.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.

Heavy Thermocracked Naphtha (C6-C12 Hydrocarbons)

SARA 313

This material might contain the following components in concentrations at or above de minimis levels and they are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313:

Benzene [CAS No. 71-43-2] concentration: 0.1 to 0.6%
Toluene [CAS No. 108-88-3] concentration: 1 to 5%
Xylenes [CAS No. 1330-20-7] concentration: 5 to 10%
Ethylbenzene [CAS No. 100-41-4] concentration: 1 to 2%
1,2,4-Trimethylbenzene (Pseudocumene) [CAS No. 95-63-6] concentration: 3 to 6%
Naphthalene [CAS No. 91-20-3] concentration: 0.5 to 1.5%

CERCLA

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this material subject to this statute are:

n-Hexane [CAS No. 110-54-3] (RQ = 5000 lbs. [2268 kg]) concentration: 0.1 to 0.9%
Cyclohexane [CAS No. 110-82-7] (RQ = 1000 lbs. [453.6 kg]) concentration: 0.1 to 0.9%
Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 0.1 to 0.9%
Toluene [CAS No. 108-88-3] (RQ = 1000 lbs. [453.6 kg]) concentration: 1 to 5%
2,2,4-Trimethylpentane (Iso-octane) [CAS No. 640-84-2] (RQ = 1000 lbs. [453.6 kg]) conc.: 0.15 to 2.6%
Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 5 to 10%
Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 1 to 2%
Cumene [CAS No. 98-82-8] (RQ = 5000 lbs. [2268 kg]) concentration: 0.001 to 0.25%
Naphthalene [CAS No. 91-20-3] (RQ = 100 lbs. [45.36 kg]) concentration: 0.5 to 1.5%

CWA

This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

**California
Proposition 65**

This material contains the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5:

Benzene [CAS No. 71-43-2] and Toluene [CAS No. 108-88-3].

**New Jersey
Right-to-Know Label**

For New Jersey labeling, refer to the components listed in Section 2.

**Additional Regulatory
Remarks**

Under Section 12(b) of the Toxic Substances Control Act: Because it contains detectable amounts of **Cyclohexane [CAS No. 110-82-7]**, this product might be subject to US EPA's one-time only per country export notification requirements.

Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13): This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: **Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children!**

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following minor components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare": **Cyclohexane [CAS No. 110-82-7]**, **Benzene [CAS No. 71-43-2]**, **Methylcyclohexane [CAS No. 108-87-2]**, **Toluene [CAS No. 108-88-3]**, **Xylenes [CAS No. 1330-20-7]**, **Ethylbenzene [CAS No. 100-41-4]**, and **Cumene (Isopropylbenzene) [98-82-8]**.

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 2.0
Revision Date 08/28/2002
Print Date Printed on 08/26/2002.

Hydrodesulfurized Light Naphtha

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0112
Revision Date 9/8/2006

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Gas.
Color Colorless to light yellow.
Odor Hydrocarbon. Rotten eggs. (Strong.)

Extremely Flammable and Poisonous Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Remove all potential ignition sources. Safely stop the source gas flow using non-sparking tools. Allow any entrained liquid spills to evaporate. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. Do not enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during response operations. This gas may travel great distances and be ignited by a remote ignition source. May Contains Hydrogen Sulfide!

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	Hydrodesulfurized Light Naphtha (C4-C11 Hydrocarbons)	Technical Contact	(800) 525-4692
Product Number	Not available.	Medical Emergency	(800) 313-7645
CAS Number	64742-73-0	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Sour Gas		
Synonyms	Hydrodesulfurized Light Naphtha (Petroleum), Light Hydrodesulfurized (HDS) Naphtha, HDS Light Naphtha, Treated Naphtha or Gasoline, Desulfurized Light Naphtha, C4-C11 Solvent, C4-C11 Naphtha.		

Hydrodesulfurized Light Naphtha

SECTION 2. COMPOSITION (TYPICAL)

Component Name(s)	CAS Registry No.	Concentration (%)
Heptane, all isomers	142-82-5	10 - 20
Pentanes	Mixture	10 - 20
Octanes, all isomers	Mixture	10 - 15
Hexane, other isomers	Mixture	5 - 15
Butane, all isomers	106-97-8	1 - 15
n-Hexane	110-54-3	5 - 10
Nonane, all isomers	Mixture	5 - 10
Methylcyclohexane	108-87-2	1 - 5
Xylene, all isomers	1330-20-7	1 - 5
C10-C12 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	0.5 - 5
Cyclohexane	110-82-7	1 - 3
Toluene	108-88-3	1 - 3
Methylcyclopentane	96-37-7	1 - 3
Ethylmethylbenzene, all isomers	25550-14-5	1 - 2
Trimethylbenzenes, all isomers	25551-13-7	0.5 - 1.5
Cyclopentane	287-92-3	0.5 - 1.5
Benzene	71-43-2	<1
Ethylbenzene	100-41-4	0.2 - 1.3

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing this gas keeps the body from getting enough oxygen. Symptoms include dizziness, confusion, headache, and nausea. Continued breathing of this gas may lead to unconsciousness and death from suffocation. Breathing this material may cause central nervous system depression with symptoms including nausea, headache, dizziness, fatigue, drowsiness, or unconsciousness.
Eye Contact	Eye contact with compressed liquid or escaping gas can cause frostbite injury. This material can cause eye irritation with tearing, redness, or a stinging or burning feeling. Further, it can cause swelling of the eyes with blurred vision. Effects may become more serious with repeated or prolonged contact.
Skin Contact	Certain components of this material can be absorbed through the skin and produce target organ effects. This material can be absorbed by the skin and produce central nervous system depression (headache, nausea, fatigue and/or other symptoms including unconsciousness). Skin contact may cause harmful effects in other parts of the body, and may cause death.
Ingestion	Ingestion is not an applicable route of exposure for gases.

Chronic Health Effects Summary This material (or a component) causes harm to the fetus including birth defects in humans. Prolonged or repeated overexposure to toluene, a component of this product, has been associated with reproductive effects in experimental animals and in long-term chemical abuse situations. Long-term overexposure to toluene has been associated with impaired color vision. Also, long-term overexposure to toluene in occupational environments have been associated with hearing damage. Repeated and prolonged overexposure to n-hexane has been associated with peripheral nerve tissue damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function and paralysis. Benzene, a component of this product, causes blood disorders and damages the bone marrow (certain types of anemia, leukemia, and lymphoma). It is also capable of causing changes in living cells' genetic material (chromosomes). Benzene is considered to be a mutagen and a cancer-causing agent (leukemogen). Prolonged or repeated overexposure to xylene, a component of this product, has been associated with hearing damage in laboratory animals.

Hydrodesulfurized Light Naphtha

Conditions Aggravated by Exposure Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Exposure to high concentrations of this material may increase the sensitivity of the heart to epinephrine (adrenaline) and catecholamine-like drugs. (See Section 4, "Note to Physicians"). Respiratory System, Central Nervous System (CNS), Heart (Cardiac) Personnel with pre-existing central nervous system (CNS) disease, psychological conditions, skin disorders, impaired cardiovascular, liver, or kidney function, or chronic respiratory diseases should avoid exposure. Personnel with pre-existing skin, pulmonary, gastrointestinal, liver, kidney, or urinary disorders should avoid exposure.

Target Organs Contains material which may cause damage to the following organs: blood, kidneys, lungs, liver, mucous membranes, heart, peripheral nervous system, upper respiratory tract, skin, central nervous system (CNS), eye, lens or cornea, testes.

Carcinogenic Potential **CARCINOGENIC EFFECTS** Classified 1 (Proven for human.) by IARC, + (Proven.) by OSHA [Benzene]. Classified 2B (Possible for human.) by IARC [Ethylbenzene].

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Toxic	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.

Eye Contact If tissue is frozen, immediately seek medical attention. If tissue is not frozen, check for and remove contact lenses. Then, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure luke warm water for at least 15 minutes, occasionally lifting the upper and lower eyelids. If pain, redness, swelling, tearing, or light sensitivity persist, obtain medical attention as soon as possible. Do not use eye ointment unless directed by a physician.

Skin Contact In the event of frostbite or freeze burn, the affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water. Rewarming should continue until natural skin tones return to the affected area. Seek medical attention if tissue appears damaged or if pain persists.

Ingestion Due to the volatile nature of this material, ingestion is not a likely route of entry.

Notes to Physician INHALATION: Inhalation overexposure can produce toxic effects. Treat intoxications as hydrogen sulfide exposures. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Administer supplemental oxygen with assisted ventilation, as required.

This material (or a component) sensitizes the heart to the effects of sympathomimetic amines. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias in individuals exposed to this material. Administration of sympathomimetic drugs should be avoided.

Hydrodesulfurized Light Naphtha

Treat symptomatically.

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas.
Flash Point	Open cup: <-45°C (-49°F).
Lower Flammable Limit	AP 1 %
Upper Flammable Limit	AP 13 %
Autoignition Temperature	The lowest known value is 430°C (806°F) (Butane, all isomers).
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons, and oxides of sulfur and nitrogen.
Special Properties	This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable and Poisonous Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Remove all potential ignition sources. Safely stop the source gas flow using non-sparking tools. Allow any entrained liquid spills to evaporate. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. Do not enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during response operations. This gas may travel great distances and be ignited by a remote ignition source.

Hydrodesulfurized Light Naphtha

SECTION 7. HANDLING AND STORAGE

Handling

DANGER: Poisonous and Flammable Gas. Do NOT breathe vapor; it contains hydrogen sulfide (H₂S). This gas mixture also contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow escaping material to contact eyes or skin. Wear appropriate respiratory protection, protective work clothing, eye and face protection when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S concentrations, and flammability.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. Empty containers may still contain flammable and poisonous residue.

Storage

Do not store this material near heat or any other potential ignition sources. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Do not store this product in unlabeled containers. Keep containers tightly closed. H₂S is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.) Where H₂S is routinely stored, install monitoring equipment or system with alarms.

Store sample cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F (38° C). Protect from dampness, salt or corrosive chemicals.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may be required in work areas to prevent accumulation of mixtures of gas and air that may ignite with explosive force. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are located near the work-station. Where H₂S is routinely stored or handled, install monitoring equipment or system with alarms.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling sampling cylinders, pressurized containers and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection

Use neoprene or PCV/nitrile gloves. When handling materials that can produce frostbite or cold burns, use leather gloves over these chemically-resistant gloves.

Hydrodesulfurized Light Naphtha

- Body Protection** Prevent potential skin contact with cold liquid or vapors. Use insulated and chemical-resistant clothing (apron, slicker suit, coveralls, boots, etc.). Fire-retardant garments (e.g. Nomex®) should be worn while working with flammable gases and gas/liquids.
- Respiratory Protection** A full-face supplied air pressure-demand respirator with escape bottle or a pressure-demand self-contained, breathing apparatus (SCBA) is required. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).
- General Comments** Releases of this gas may create flammable, explosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency, flammability and toxic gas levels. Odor is NOT adequate to warn of hazardous conditions. Air purifying respirators offer no protection against oxygen deficiency, hydrogen sulfide, and simple asphyxiants.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
Heptane, all isomers	ACGIH (United States). TWA: 400 ppm 8 hour(s). STEL: 500 ppm 15 minute(s).
Pentanes	OSHA (United States). TWA: 500 ppm 8 hour(s). ACGIH (United States). TWA: 600 ppm 8 hour(s).
Octanes, all isomers	OSHA (United States). TWA: 1000 ppm 8 hour(s). ACGIH (United States). TWA: 300 ppm 8 hour(s).
Hexane, other isomers	OSHA (United States). TWA: 500 ppm 8 hour(s). ACGIH TLV (United States). TWA: 500 ppm 8 hour(s). STEL: 1000 ppm 15 minute(s).
Butane, all isomers	ACGIH (United States). TWA: 800 ppm 8 hour(s).
n-Hexane	ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
Nonane, all isomers	ACGIH (United States). TWA: 200 ppm 8 hour(s).
Methylcyclohexane	ACGIH (United States). TWA: 400 ppm 8 hour(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
Xylene, all isomers	ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 150 ppm 15 minute(s). OSHA (United States). TWA: 100 ppm 8 hour(s).
C10-C12 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Not available.
Cyclohexane	ACGIH (United States). TWA: 100 ppm 8 hour(s). OSHA (United States). TWA: 300 ppm 8 hour(s).
Toluene	ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 200 ppm 8 hour(s). CEIL: 300 ppm PEAK: 500 ppm
Methylcyclopentane	Not available.

Hydrodesulfurized Light Naphtha

Ethylmethylbenzene, all isomers Trimethylbenzenes, all isomers	Not available. ACGIH (United States). TWA: 25 ppm 8 hour(s).
Cyclopentane	ACGIH (United States). TWA: 600 ppm 8 hour(s).
Benzene	ACGIH (United States). Skin TWA: 0.5 ppm 8 hour(s). STEL: 2.5 ppm 15 minute(s). OSHA (United States). Skin Notes: See Table Z-2 for exclusions in 20 CFR 1910.1028 to the PEL. TWA: 1 ppm 8 hour(s). STEL: 5 ppm 15 minute(s).
Ethylbenzene	ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 125 ppm 15 minute(s). OSHA (United States). TWA: 100 ppm 8 hour(s).

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Gas.	Color	Colorless to light yellow.	Odor	Hydrocarbon. Rotten eggs. (Strong.)
Specific Gravity	0.65 (Water = 1)	pH	Not Applicable.	Vapor Density	>1 (Air = 1)
Boiling Range	-12°C (10.4°F)			Melting/Freezing Point	-160°C (-256°F)
Vapor Pressure	Not applicable.			Volatility	650 g/l VOC (w/v)
Solubility in Water	Partially soluble in cold water.			Viscosity (cSt @ 40°C)	not available
Flash Point	Open cup: <-45°C (-49°F).				
Additional Properties	No additional information.				

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong oxidizers.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Hydrodesulfurized Light Naphtha

Toxicity Data

Heptane, all isomers

n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not considered to be carcinogenic.

Pentanes

Studies of pentane isomers in laboratory animals indicate exposure to extremely high levels (roughly 10 vol.%) may induce cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.

Butane, all isomers

Studies in laboratory animals indicate exposure to extremely high levels of butanes (1-10 or higher vol.% in air) may cause cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.

n-Hexane

This material contains n-hexane. Long-term or repeated exposure to n-hexane can cause permanent peripheral nerve damage. Initial symptoms are numbness of the fingers and toes. Also, motor weakness can occur in the digits, but may also involve muscles of the arms, thighs and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure. Co-exposure to methylethyl ketone or methyl isobutyl ketone increases the neurotoxic properties of n-hexane. In laboratory studies, prolonged exposure to elevated concentrations of n-hexane was associated with decreased sperm count and degenerative changes in the testicles of rats.

Xylene, all isomers

Effects from Acute Exposure:

ORAL (LD₅₀), Acute: 4,300 mg/kg [Rat].

INHALATION (LC₅₀), Acute: 4,550 ppm for four hours [Rat].

DERMAL (LD₅₀), Acute: 14,100 uL/kg [Rabbit].

Overexposure to xylene may cause upper respiratory tract irritation, headache, cyanosis, blood serum changes, CNS damage and narcosis. Effects may be increased by the use of alcoholic beverages. Evidence of liver and kidney impairment were reported in workers recovering from a gross over-exposure.

Effects from Prolonged or Repeated Exposure:

Impaired neurological function was reported in workers exposed to solvents including xylene. Studies in laboratory animals have shown evidence of impaired hearing following high levels of exposure. Studies in laboratory animals suggest some changes in reproductive organs following high levels of exposure but no significant effects on reproduction were observed. Studies in laboratory animals indicate skeletal and visceral malformations, developmental delays, and increased fetal resorptions following extremely high levels of maternal exposure. Adverse effects on the liver, kidney, bone marrow (changes in blood cell parameters) were observed in laboratory animals following high levels of exposure. The relevance of these observations to humans is not clear at this time.

Cyclohexane

Cyclohexane can cause eye, skin and mucous membrane irritation, CNS depressant and narcosis at elevated concentrations. In experimental animals exposed to lethal concentrations by inhalation or oral route, generalized vascular damage and degenerative changes in the heart, lungs, liver, kidneys and brain were identified.

Cyclohexane has been the focus of substantial testing in laboratory animals. Cyclohexane was not found to be genotoxic in several tests including unscheduled DNA synthesis, bacterial and mammalian cell mutation assays, and in vivo chromosomal aberration. An increase in chromosomal aberrations in bone marrow cells of rats exposed to cyclohexane was reported in the 1980's. However, a careful re-evaluation of slides from this study by the laboratory which conducted the study indicates these findings were in error, and that no significant chromosomal effects were observed in animals exposed to cyclohexane. Findings indicate long-term exposure to cyclohexane does not promote dermal tumorigenesis.

Toluene:

Effects from Acute Exposure:

Deliberate inhalation of toluene at high concentrations (e.g., glue sniffing and solvent abuse)

Hydrodesulfurized Light Naphtha

has been associated with adverse effects on the liver, kidney and nervous system and can cause CNS depression, cardiac arrhythmias and death. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects.

Effects from Repeated or Prolonged Exposure:

Studies of workers indicate long-term exposure may be related to impaired color vision and hearing. Some studies of workers suggest long-term exposure may be related to neurobehavioral and cognitive changes. Some of these effects have been observed in laboratory animals following repeated exposure to high levels of toluene. Several studies of workers suggest long-term exposure may be related to small increases in spontaneous abortions and changes in some gonadotropic hormones. However, the weight of evidence does not indicate toluene is a reproductive hazard to humans. Studies in laboratory animals indicate some changes in reproductive organs following high levels of exposure, but no significant effects on mating performance or reproduction were observed. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects. Findings in laboratory animals were largely negative. Positive findings include small increases in minor skeletal and visceral malformations and developmental delays following very high levels of maternal exposure. Studies of workers indicate long-term exposure may be related to effects on the liver, kidney and blood, but these appear to be limited to changes in serum enzymes and decreased leukocyte counts. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland following very high levels of exposure. The relevance of these findings to humans is not clear at this time.

Trimethylbenzenes, all isomers

Studies of Workers:

Levels of total hydrocarbon vapors present in the breathing atmosphere of these workers ranged from 10 to 60 ppm. The TCLo for humans is 10 ppm, with somnolence and respiratory tract irritation noted.

Studies in Laboratory Animals:

In inhalation studies with rats, four of ten animals died after exposures of 2400 ppm for 24 hours. An oral dose of 5 mL/kg resulted in death in one of ten rats. Minimum lethal intraperitoneal doses were 1.5 to 2.0 mL/kg in rats and 1.13 to 12 mL/kg in guinea pigs. Mesitylene (1, 3, 5 Trimethylbenzene) inhalation at concentrations of 1.5, 3.0, and 6.0 mg/L for six hours was associated with dose-related changes in white blood cell counts in rats. No significant effects on the complete blood count were noted with six hours per day exposure for five weeks, but elevations of alkaline phosphatase and SGOT were observed. Central nervous system depression and ataxia were noted in rats exposed to 5,100 to 9,180 ppm for two hours.

Benzene

ORAL (LD50): Acute: 930 mg/kg [Rat]. 4700 mg/kg [Mouse].
 INHALATION (LC50):
 (VAPOR): Acute: 10000 ppm 7 hour(s) [Rat]. 9980 ppm 8 hour(s) [Mouse].

Studies of Workers Over-Exposed to Benzene:

Studies of workers exposed to benzene show clear evidence that over-exposure can cause cancer of the blood forming organs (acute myelogenous leukemia) and aplastic anemia, an often fatal disease. Studies also suggest over-exposure to benzene may be associated with other types of leukemia and other blood disorders. Some studies of workers exposed to benzene have shown an association with increased rates of chromosome aberrations in circulating lymphocytes. One study of women workers exposed to benzene suggested a weak association with irregular menstruation. However, other studies of workers exposed to benzene have not demonstrated clear evidence of an effect on fertility or reproductive outcome in humans. Benzene can cross the placenta and affect the developing fetus. Cases of aplastic anemia have been reported in the offspring of persons severely over-exposed to benzene.

Studies in Laboratory Animals:

Studies in laboratory animals indicate that prolonged, repeated exposure to high levels of benzene vapor can cause bone marrow suppression and cancer in multiple organ systems. Studies in laboratory animals show evidence of adverse effects on male reproductive organs

Hydrodesulfurized Light Naphtha

following high levels of exposure but no significant effects on reproduction have been observed. Embryotoxicity has been reported in studies of laboratory animals but effects were limited to reduced fetal weight and skeletal variations.

Ethylbenzene

Effects from Acute Exposure:

ORAL (LD50), Acute: 3,500 mg/kg [Rat].

DERMAL (LD50), Acute: 17,800 uL/kg [Rabbit].

INTRAPERITONEAL (LD50), Acute: 2,624 mg/kg [Rat].

Effects from Prolonged or Repeated Exposure:

Findings from a 2-year inhalation study in rodents conducted by NTP were as follows: Effects were observed only at the highest exposure level (750 ppm). At this level the incidence of renal tumors was elevated in male rats (tubular carcinomas) and female rats (tubular adenomas). Also, the incidence of tumors was elevated in male mice (alveolar and bronchiolar carcinomas) and female mice (hepatocellular carcinomas). IARC has classified ethyl benzene as "possibly carcinogenic to humans" (Group 2B). Studies in laboratory animals indicate some evidence of post-implantation deaths following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate limited evidence of renal malformations, resorptions, and developmental delays following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland.

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material.

Environmental Fate

An environmental fate analysis has not been conducted on this specific product. Releases are expected to cause significant immediate impact but only localized non-persistent environmental damage.

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Material residues may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. If possible and permissible, this material may be disposed of as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator. Venting of this gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be in accordance with applicable Federal, State, and local regulations. Contact your regional US EPA office for guidance concerning case specific disposal issues. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

Hydrodesulfurized Light Naphtha

SECTION 15. REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304 Emergency Planning and Notification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: fire, Sudden Release of Pressure, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard
SARA 313 Toxic Chemical Notification and Release Reporting	This product contains the following components in concentrations above <i>de minimis</i> levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: No components were identified.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are: n-Hexane [CAS No.: 110-54-3] RQ = 5000 lbs. (2268 kg) Concentration: 7.5% Xylene, all isomers [CAS No.: 1330-20-7] RQ = 100 lbs. (45.36 kg) Concentration: 3% Cyclohexane [CAS No.: 110-82-7] RQ = 1000 lbs. (453.6 kg) Concentration: 2% Toluene [CAS No.: 108-88-3] RQ = 1000 lbs. (453.6 kg) Concentration: 2% Benzene [CAS No.: 71-43-2] RQ = 10 lbs. (4.536 kg) Concentration: 0.9% Ethylbenzene [CAS No.: 100-41-4] RQ = 1000 lbs. (453.6 kg) Concentration: 0.75%
Clean Water Act (CWA)	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material may contain the following components which are known to the State of California to cause cancer, birth defects or other reproductive harm, and may be subject to the requirements of California Proposition 65 (CA Health & Safety Code Section 25249.5): Toluene: 2% Benzene: 0.9% Ethylbenzene: 0.75%
New Jersey Right-to-Know Label	For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.
Additional Regulatory Remarks	No additional regulatory remarks.

Hydrodesulfurized Light Naphtha

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 5.0
Revision Date 9/8/2006
Print Date Printed on 9/8/2006.

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons)

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0113
Revision Date 10/2/2002

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid.
Color Transparent, colorless to slightly yellow. **Odor** Moderate, sweet and pleasant, aromatic hydrocarbon.

DANGER!

Highly flammable liquid; vapor may cause flash fire.
Mist or vapor may irritate the eyes, mucous membranes, and respiratory tract.
Liquid contact may cause mild to moderate eye and/or moderate to severe skin irritation and inflammation.
May be harmful if inhaled or absorbed through the skin.
Overexposures may cause central nervous system (CNS) depression and/or other target organ effects.
May be harmful or fatal if ingested.
Aspiration into the lungs can cause pulmonary edema and chemical pneumonia.
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats).
Potential cancer hazard.
Contains Ethylbenzene and Naphthalene.
May cause blood disorders and kidney and/or liver damage.
Mutagenic hazard; may cause genetic damage.
May adversely affect reproduction or reproductive development.
Spills may create a slipping hazard.

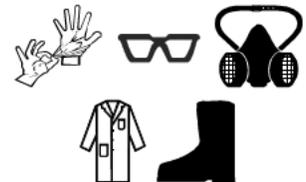

Hazard Rankings

SECTION 1: IDENTIFICATION

Trade Name	Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons)	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	064742821*	Medical Emergency	(800) 313-7645 or (918) 495-4700
CAS Number	64742-82-1	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	C7-C12 Petroleum Hydrocarbons		
Synonyms	Heavy HDS Naphtha; Heavy HDS Gasoline; 632 HDS Unit LEF Bottoms; HDS Light Ends Fractionation Tower Bottoms; 735 Magnaformer Feedstock; High-Octane Gasoline Blending Component; OP-400 Blend Stock; Heavy Hydrodesulfurized Naphtha (Petroleum); HHDSN.		

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons)

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Heavy Hydrodesulfurized Naphtha (Petroleum)	64742-82-1	100
2) Heptanes	Mixture	5-15
3) Methylcyclohexane	108-87-2	1-5
4) Toluene	108-88-3	1-5
5) Octanes	Mixture	15-30
6) Xylenes (Mixed Isomers)	1330-20-7	5-15
7) Ethylbenzene	100-41-4	1-5
8) Nonanes	Mixture	15-25
9) n-Propylbenzene	103-65-1	0.5-2
10) Trimethylbenzenes	25551-13-7	5-10
11) 1,2,4-Trimethylbenzene (Pseudocumene)	95-63-6	2.5-5
12) Ethylmethylbenzenes (Ethyltoluenes)	25550-14-5	1-10
13) C10-C12 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	5-10
14) Naphthalene	91-20-3	0.1-0.9
15) C10-C12 Alkylbenzenes	70693-06-0	1-5

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye Contact. Absorption. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon level of exposure concentration and/or duration. Vapors can reduce the oxygen content in air. Approximately 20,000 ppm (or 2 vol.%) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces.
Eye Contact	Animal test results on similar materials suggest that this material can cause minimal to moderate eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling.
Skin Contact	Animal test results on similar materials and components suggest that this material can cause moderate to severe skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate to severe dermatitis. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and severe tissue damage.
Ingestion	If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above).

Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.

Chronic Health Effects Summary	Reports have associated repeated and prolonged occupational overexposure to solvents with irreversible brain and nervous system damage (sometimes referred to as "Solvent or Painter's Syndrome"). And, altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been common results for gasoline/naphtha abusers. Intentional misuse by deliberately concentrating and inhaling this product may be harmful or fatal.
---------------------------------------	--

Toluene may cause a weak cardiac sensitization to epinephrine (adrenalin)-like drugs. Available information indicates that **toluene** is NOT teratogenic, but it can be toxic to the embryo and fetus and may

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons)

reduce fertility. In animal tests, high inhaled doses of toluene has caused reduced litter sizes, retarded development of the fetus, and increased incidence of non-lethal abnormalities.

Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Chronic occupational **toluene and xylene** exposures have caused auditory nerve degeneration.

At high exposure concentrations, **ethylbenzene** has been associated with multiple organ tumors in laboratory animals.

Based upon animal testing, the **C8 aromatic hydrocarbon components (xylene isomers and ethylbenzene)** might be assumed to cause embryo and fetal toxicity, spontaneous abortions, and/or decreased fetal and newborn weights if overexposures occur during a woman's early gestation period. And, the **C9 aromatic hydrocarbons (cumene, n-propylbenzene, trimethylbenzenes, indene, and ethylmethylbenzenes)** are presumed to cause fetal toxicity and/or decreased fetal and newborn weights if overexposure occurs during a woman's early gestation period.

Naphthalene is considered to be a toxic substance as defined by both human exposure and laboratory testing results. And, based upon animal testing, it might be considered carcinogenic. (See Section 11.)

Conditions Aggravated by Exposure	Personnel with pre-existing central nervous system (CNS) disease, psychological conditions, skin disorders, impaired hearing, cardiovascular, liver, or kidney function, blood disorders, or chronic respiratory diseases should avoid exposure.
Target Organs	The substance is toxic to lungs, central nervous system, especially the auditory nerves, brain, blood, kidneys, liver, heart, thymus, mucous membranes, skin, eyes, and possibly the reproductive system.
Carcinogenic Potential	This material contains ethylbenzene and naphthalene at concentrations above 0.1%. Ethylbenzene and naphthalene are considered possibly carcinogenic to humans by IARC and "A3 Animal Carcinogens" by ACGIH. (See Section 11.)

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons)

Notes to Physician

Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IB Flammable Liquid. Highly flammable!		
Flash Point Method	CLOSED CUP: -6° to -4°C (21° to 25°F) (Tagliabue [ASTM D-56])		
Lower Flammable Limit	AP 0.9%	Upper Flammable Limit	AP 7.6%
Autoignition Temperature	AP 232°C (450°F) [ASTM E-659]		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors.		
Special Properties	<p>Flammable Liquid! This material releases vapors at or approaching its flash point temperature. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.</p> <p>A static electrical charge can accumulate as a result of transfer flow or agitation. Discharge (static spark) can ignite vapors, especially in cold, dry weather conditions. Special slow load and monitoring procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point products. To reduce this hazard's potential, receiving containers should always be grounded and the loading nozzle must be kept in contact with the container during the entire filling process. Do not fill any portable container in or on a vehicle without proper bonding. (See American Petroleum Institute Publication 2003).</p>		
Extinguishing Media	<p>SMALL FIRE: Use dry chemicals, carbon dioxide (CO₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.</p>		
Protection of Fire Fighters	<p>Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify authorities if liquid(s) enter sewers or waterways.</p>		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons)

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store other toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons)

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection	Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.
Hand Protection	Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, Silver Shield®, PVC/NBR, or fluoroelastomers such as Viton® or Teflon®). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.
Body Protection	Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.
Respiratory Protection	For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).
General Comments	Warning! Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Petroleum Distillates (Naphtha)	TWA: 400 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
2) Heptane (n-Heptane)	TWA: 400 STEL: 500 (ppm) from ACGIH (TLV) TWA: 400 STEL: 500 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
3) Methylcyclohexane	TWA: 400 (ppm) from ACGIH (TLV) TWA: 400 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
4) Toluene	TWA: 50 (ppm) from ACGIH (TLV) - SKIN TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [Proposed] TWA: 200 CEIL: 300 (ppm) from OSHA (PEL)
5) Octane, all isomers	TWA: 300 (ppm) from ACGIH (TLV) TWA: 300 STEL: 375 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
6) Xylenes (Mixed Isomers)	TWA: 100 STEL: 150 (ppm) from ACGIH (TLV) TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [Proposed] TWA: 100 (ppm) from OSHA (PEL)
7) Ethylbenzene ("A3" Animal Carcinogen)	TWA: 100 STEL: 125 (ppm) from ACGIH (TLV) TWA: 100 STEL: 125 (ppm) from OSHA (PEL) [Proposed] TWA: 100 (ppm) from OSHA (PEL)
8) Nonane, all isomers	TWA: 200 (ppm) from ACGIH (TLV) TWA: 200 (ppm) from OSHA (PEL) [Proposed]
9) Trimethylbenzene (mixed isomers)	TWA: 25 (ppm) from ACGIH (TLV) TWA: 25 (ppm) from OSHA (PEL) [Proposed]
10) Naphthalene ("A3" Animal Carcinogen [Proposed])	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) - SKIN TWA: 10 STEL: 15 (ppm) from OSHA (PEL) [Proposed] TWA: 10 (ppm) from OSHA (PEL)

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color Transparent, colorless to slightly yellow.	Odor	Moderate, sweet and pleasant, aromatic hydrocarbon.
Specific Gravity	0.80 to 0.83 (Water = 1)	pH Not applicable.	Vapor Density	3.5 to 4.0 (Air = 1)
Boiling Point/Range	85° to 235°C (185° to 455°F) [ASTM D-2887]		Melting/Freezing Point	< -70°C (< -95°F) [ASTM D-97]
Vapor Pressure	2 to 5 mm Hg at 20°C (68°F) or 1.0 to 2.0 Reid-psi at 100°F (37.8°C).		Viscosity (cSt @ 40°C)	1 to 3
Solubility in Water	Soluble in methanol and diethyl ether. Slightly soluble in cold water (< 0.05%).		Volatile Characteristics	Volatile Organic Compounds (VOCs) Content = 100%; 870 to 880 gm/L.
Additional Properties	Alkane, Isoparaffin, and Cycloalkane Hydrocarbons Content = 48 to 85.5 Wt.% [ASTM D-1319]; C7-C12 Aromatic Hydrocarbon Content = 14.5 to 52 Wt.% [ASTM D-1319]; Average Density at 60°F = 6.786 lbs./gallon [ASTM D-2161]; Dry Point Temperature = AP 437°F (225°C) [ASTM D-86]; Octane Rating = AP 89 [ASTM D-2885]; Sulfur Content = AP 0.01 Wt.% [ASTM D-2622 or D-1266]; Evaporation Rate = 0.5 to 1.7 when n-Butyl acetate = 1.0; Heat Value = 18,500 to 20,600 Btu.			

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide, and oxygen.		
Hazardous Decomposition Products	No substances are readily identified from composition; and, no degradation data is available.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the **Emergency Overview on Page 1** and the **Hazards Identification in Section 3** of this MSDS.

Toxicity Data	Heavy Catalytic Reformate Naphtha (Petroleum) (a similar material): ORAL (LD50): Acute: 4,820 mg/kg [Rat males] - Somnolence, diarrhea, and hypermotility. ORAL (LD50): Acute: 5,040 mg/kg [Rat females] - Somnolence, diarrhea, and hypermotility. GAS (LC50): Acute: > 5,540 mg/L for 4 hours [Rat screen level] - No deaths; somnolence. DERMAL (LD50): Acute: > 2,000 mg/kg (Rabbit screen level). DRAIZE EYE: Acute: Mild to moderate eye irritant. [Rabbit]. DRAIZE DERMAL: Acute: Moderate to severe skin irritant. [Rabbit]. DERMAL (LD50): Acute: > 6,000 mg/kg [Rabbit screen level]. BUELER DERMAL: Acute: Non-sensitizing [Guinea Pig]. 28-Day DERMAL: Sub-Chronic: Moderate skin irritant at 200 mg/kg and severe skin irritant at 1,000 and 2,000 mg/kg [Rabbit]. MUTAGENICITY: Negative or equivocal responses for the modified Ames [Salmonella typhimurium], in vitro Lymphoma [Mouse] with and without S1 activation, and in vivo Bone Marrow Cytogenetics [Rat] assays. n-Heptane: GAS (LC50): Acute: 103,000 mg/m ³ for 4 hours [Rat] - Convulsions. DERMAL (LD50): Acute: > 2,000 mg/kg [Rabbit].
----------------------	--

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons)

INTRAVENOUS (LD50): Acute: 222 mg/kg [Mouse].

INTRAPERITONEAL (LD50): Acute: 150 mg/kg [Mouse].

Methylcyclohexane:

ORAL (LD50): Acute: 2,250 mg/kg [Mouse].

GAS (LC50): Acute: 41,500 mg/m³ for 2 hours [Mouse] - Hypermotility and diarrhea.

GAS (LC50): Acute: 15,227 ppm for 1 hour [Rabbit] - General anesthetic, convulsions,
and changes in the salivary
glands.

Toluene:

ORAL (LD50): Acute: 636 mg/kg [Rat].

ORAL (LD50): Acute: 4,000 mg/kg [Cat].

GAS (LC50): Acute: 49,000 mg/m³ for 4 hours [Rat].

GAS (LC50): Acute: 5,320 ppm for 8 hours [Mouse].

GAS (LC50): Acute: 400 ppm for 24 hours [Mouse].

DERMAL (LD50): Acute: 14,100 uL/kg or 12,125 mg/kg [Rabbit].

INTRAVENOUS (LD50): Acute: 1,960 mg/kg [Rat].

INTRAVENOUS (LD50): Acute: 2,000 mg/kg [Mouse].

SUBCUTANEOUS (LD50): Acute: 2,250 mg/kg [Mouse].

INTRAPERITONEAL (LD50): Acute: 59 mg/kg [Mouse].

INTRAPERITONEAL (LD50): Acute: 500 mg/kg [Guinea Pig].

INTRAPERITONEAL (LD50): Acute: 1,332 mg/kg [Rat].

n-Octane:

GAS (LC50): Acute: 118,000 mg/m³ for 4 hours [Rat].

Xylenes:

ORAL (LD50): Acute: 4,300 mg/kg [Rat].

GAS (LC50): Acute: 4,550 ppm for 4 hours [Rat].

DERMAL (LD50): Acute: 14,100 uL/kg [Rabbit].

SUBCUTANEOUS (LD50): Acute: 1,700 mg/kg [Rat].

INTRAPERITONEAL (LD50): Acute: 2,459 mg/kg [Rat].

INTRAPERITONEAL (LD50): Acute: 1,548 mg/kg [Mouse].

Ethylbenzene:

ORAL (LD50): Acute: 3,500 mg/kg [Rat].

DERMAL (LD50): Acute: 17,800 uL/kg [Rabbit].

INTRAPERITONEAL (LD50): Acute: 2,624 mg/kg [Rat].

n-Nonane:

GAS (LC50): Acute: 3,200 ppm for 4 hours [Rat].

INTRAVENOUS (LD50): Acute: 218 mg/kg [Mouse].

INTRAPERITONEAL (LD₅₀): Acute: 150 mg/kg [Mouse].

n-Propylbenzene:

ORAL (LD50): Acute: 6,040 mg/kg [Rat].

GAS (LC50): Acute: 65,000 ppm for 2 hours [Rat].

Trimethylbenzenes:

ORAL (LD50): Acute: 8,970 mg/kg [Rat].

1,2,4-Trimethylbenzene:

ORAL (LD50): Acute: 5,000 mg/kg [Rat].

GAS (LC50): Acute: 18,000 mg/m³ for 4 hours [Rat].

Ethylmethylbenzenes (Ethyltoluenes):

GAS (LC50): Acute: 50,000 mg/m³ for 2 hours [Cat].

GAS (LC50): Acute: 54,000 mg/m³ for 4 hours [Mouse].

n-Decane:

GAS (LC50): Acute: 72,300 mg/m³ for 2 hours [Mouse].

Naphthalene:

ORAL (LD50): Acute: 490 mg/kg [Rat].

ORAL (LD50): Acute: 533 mg/kg [Mouse].

ORAL (LD50): Acute: 1,200 mg/kg [Guinea Pig].

Subchronic (28-day) dermal studies with **heavy catalytic reformed naphtha (petroleum)** using rabbits showed animal weight loss or reduced weight gain, renal tubule changes and acute tubular necrosis, plus moderate to severe skin irritation without sensitization. Heavy catalytic reformed naphtha also produced negative or equivocal responses mutagenic responses in series of various assays. The significance of these animal mutagenicity study results to human health is unclear.

Long-term mouse skin painting studies sponsored by the American Petroleum Institute (API) showed **heavy catalytic reformed naphtha (petroleum)** did not produce any increased incidence of benign skin

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons)

tumors at the site of contact when applied repeatedly (twice per week) over the lifetime of the test animals (12 to 24 months). Average latency period was 80 weeks. All animals survived throughout the study. A few studies have shown that washing the animal's skin with soap and water between applications greatly reduces the carcinogenic effect of similar and heavier **petroleum distillates**.

n-Heptane is a mucous membrane and respiratory tract irritant, but non-irritating to the eyes. It is readily absorbed by inhalation and dermal exposure and repeated direct skin application can produce defatting dermatitis. Exposures may cause decreased red blood cell counts, liver and heart damage, and central nervous system depression. n-Heptane is metabolized in the liver to form alcohols and ketones, including neurotoxic **2,5-heptanedione** which is detectable in small amounts in the urine of exposed humans.

In a controlled study, human volunteers exposed to an airborne concentration of **n-heptane** of 1,000 ppm for 6 minutes or 2,000 ppm for 4 minutes experienced slight dizziness and incoordination. Higher-level exposures produced hilarity, dizziness, and semi-consciousness. Inhaling a concentration of 5,000 ppm for 15 minutes caused stupor and a gasoline-like taste. These higher exposures also decreased the myocardial threshold to the arrhythmogenic effects (irregular heart beats) of epinephrine, producing only a narrow margin of safety between exposures causing CNS effects, cardiac effects, and loss of consciousness.

One occupational exposure study involving a **95% purity n-heptane** from 1 to 9 years duration concluded that it could produce minimal peripheral nerve damage with numbness and tingling of the extremities in the stocking-and-glove areas. In the same study, there was a decrease in motor nerve conduction velocities correlated with duration of exposure and adjusted for age effects; however, the average motor nerve conduction velocity in exposed workers was normal. Polyneuropathy associated with n-heptane exposure was reversible within a year following removal of exposure.

n-Heptane was not neurotoxic in rats exposed for up to 7 months. But based upon limited laboratory animal studies, **n-heptane and its metabolites** were found in low levels (< 135 ppm) in the brain of rats exposed to airborne concentrations of 100, 500, or 1,500 ppm for 6 hours each day, five days per week, for 1 or 2 weeks. These substances disappeared within 2 weeks following removal of exposure. n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not expected to be carcinogenic.

Rats inhaling **methylcyclohexane** at an airborne concentration of 15,250 ppm for one hour displayed tremors, loss of coordination, anesthesia, and convulsions. Inhalation of 10,050 ppm for six hours per day for 14 days showed rodent weight loss or decreased weight gain and changes in the structure of their salivary glands. Using rabbits, methylcyclohexane was shown to have an LD₅₀ somewhere between 3,300 ppm and 7,300 ppm when exposed repeatedly for six hours per day, five days per week, for three weeks. Death was preceded by conjunctival congestion with mucoid secretion and lacrimation, salivation, coughing, sneezing, labored breathing, and diarrhea. Lethal oral dosing of rabbits caused lethargy, severe diarrhea, and circulatory collapse. Vascular and degenerative lesions were observed in the kidneys and liver.

Toluene (methylbenzene) has been a major solvent of intentional inhalation abuse. Deliberate long-term inhalation of high concentrations of toluene (glue sniffing, etc.) has been shown to cause liver, kidney, central nervous system, and permanent brain damage. Effects such as impaired speech, visual disturbances, and hearing loss, loss of balance and/or muscle control, and memory loss have been reported. Exposures of 100 to 200 ppm in air for 24 hours cause hallucinations, distorted perceptions, and changes in motor activity. Studies have indicated that children of women who sniffed massive exposures of toluene during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. Isolated case reports have suggested a spectrum of congenital defects similar to those seen in fetal alcohol (ethanol) syndrome. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate.

Animal studies suggest that **toluene** causes kidney, liver, and/or lung dysfunction and cardiac (heart muscle) sensitization to epinephrine or other adrenalin-like agents. This sensitization may cause fatal changes in heart beat rhythms. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency).

Long-term rodent inhalation studies with **toluene** produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness, and impaired reaction time. Also, rats exposed to 1,200 ppm and 1,400 ppm of toluene in air for 14 hours per day for 5 or 4 weeks (respectively) exhibited high-frequency hearing loss. Several animal studies using pregnant rodents have shown that toluene exposures may cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons)

studies, toluene has not been shown to be carcinogenic; nor is it mutagenic in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

2,2,4-Trimethylpentane (Iso-octane) was highly irritating to mice at a 1,000 ppm in air exposure for 5 minutes and respiratory arrest occurred at exposures above 10,000 ppm for 5 minutes. CNS depression was observed at concentrations between 8,000 and 10,000 ppm in air. Kidney tubule necrosis, hyaline droplet formation, and acute renal failure were seen in male rats following oral administration of 10 gm/kg, 8 mL/kg, or 2,100 mg/kg of iso-octane for 2, 3, and 4 weeks, respectively.

An inhalation study with laboratory animals indicated an association of **xylene** with hearing loss in rats. Several animal studies using pregnant rodents have shown that **mixed xylene isomers (dimethylbenzenes)** may all cause embryo and/or fetotoxicity. Inhalation and feeding studies involving pregnant laboratory animals have produced limited evidence of fetal toxicity including increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes.

Chronic overexposure to **xylene** may produce irreversible damage to the central nervous system, including ototoxicity, that can be increased by the consumption of ethanol (alcoholic drinks). Drinking beverages which contain ethanol in conjunction with xylene exposure increases the alcoholic effects and impairs the clearance of xylenes from the body. Xylene isomers accumulate in the adipose (fat) tissues, from which they are slowly released. Complete clearance may take several days following exposure.

Two-year rat and mouse gavage studies by the National Toxicology Program (NTP) on **mixed xylene isomers including 17% ethylbenzene** showed "no evidence of carcinogenicity". Also, a two-year mixed xylenes skin-painting study on shaved rats and mice showed no incidence of non-neoplastic or neoplastic lesions. And, none of the components were mutagenic when tested in either the modified Ames, Chinese hamster ovary cell with and without metabolic activation, or sister-chromatid mutagenicity assays.

NTP completed a 2-year inhalation bioassay of **ethylbenzene** in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200 and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels. However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level; and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Also, hyperplasia was observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear. However, based upon this data, the IARC has designated ethylbenzene as possibly carcinogenic to humans (Group 2B).

Rats inhaling **n-nonane** at an airborne concentration of 1,500 ppm for 7 days displayed mild tremors and loss of coordination. Inhalation of 1,600 ppm for 6 hours per day for 90 days showed animal weight loss or decreased weight gain and changes in the structure of their salivary glands. And, liver damage and an altered response to drugs were seen in rats given n-nonane for 2 to 7 days.

Prolonged and/or repeated overexposure to **cumene (isopropylbenzene)** via inhalation or skin absorption can cause liver and/or kidney damage.

Trimethylbenzenes are primary skin irritants and may cause asthmatic bronchitis and/or anemia. Levels of total hydrocarbon vapors present in the breathing atmosphere of these workers ranged from 10 to 60 ppm. Its TC_{L_0} for humans 10 ppm, with somnolence and respiratory tract irritation noted. In inhalation studies with rats, four of ten animals died after exposures of 2,400 ppm for 24 hours. An oral dose of 5 mL/kg resulted in death in one of ten rats. Minimum lethal intraperitoneal doses were 1.5 to 2.0 mL/kg in rats and 1.13 to 12 mL/kg in guinea pigs. **Mesitylene (1,3,5-Trimethylbenzene)** inhalation at concentrations of 1.5, 3.0, and 6.0 mg/L for six hours was associated with dose-related changes in white blood cell counts in rats. No significant effects on the complete blood count were noted with six hours per day exposure for five weeks, but elevations of alkaline phosphatase and SGOT were observed. Central nervous system depression and ataxia were noted in rats exposed to 5,100 to 9,180 ppm for two hours. Based upon animal reproductive/developmental studies, trimethylbenzenes may also cause fetal toxicity.

Ethylmethylbenzenes are primary skin irritants and overexposures might cause liver and/or kidney

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons)

damage or increase blood cholinesterase levels. Inhalation of these and other **C9 aromatic hydrocarbons** by pregnant mice and rats during gestational days 6 through 15 resulted in decreased fetal and newborn weights.

Naphthalene is a potential irritant to eyes, skin, and lungs. Following prolonged and/or repeated exposures, naphthalene has been shown to cause eye damage (cataracts and/or optical neuritis), premature destruction or red blood cells (hemolytic and aplastic anemia), and kidney damage (jaundice), and possibly neurotoxicity. Naphthalene-induced blood disorders in humans are characterized by variability in size, shape, and number of red blood cells, anemia, and decreased hemoglobin. Also, there have been reported anemia deaths amongst children exposed to moth ball (naphthalene) saturated blankets. Peripheral lens opacities occurred in eight of 21 workers exposed to elevated levels of naphthalene vapors for five years. Repeated ingestion of a naphthalene-isopropanol mixture caused tremors, restlessness, hallucinations, and extreme apprehension. Based upon animal studies, naphthalene may cause fetal toxicity or damage and decreased spleen weights in pregnant female mice.

The National Toxicology Program (NTP) recently completed a 2-year inhalation bioassay of **naphthalene**. The study was conducted in male and female F344/N rats at exposure concentrations of 0, 10, 30, and 60 ppm. No significant effects were observed at the 10 ppm levels. However, compared to chamber controls, there was a dose-related increase in tumors generated at the 30 and 60 ppm levels in both males and females. Higher incidences of respiratory epithelial adenomas, olfactory epithelial neuroblastomas, and non-neoplastic lesions of the nose were observed when compared to chamber controls. Additionally, in cytogenic tests with Chinese hamster ovary cells, naphthalene induced significant increases in sister chromatid exchanges with and without metabolic activation (S9) and chromosomal aberrations with S9. The relevance of these findings to human health is unclear; however, based upon this data, the IARC has determined naphthalene to be possibly carcinogenic to humans (Class 2B).

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this naphtha, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. Volatile **aromatic hydrocarbon components (toluene, xylenes, ethylbenzene, cumene, indene, trimethylbenzenes, and naphthalene)** may be released and possibly contribute to the creation of atmospheric smog. **Toluene** has a half-life of from 3 hours to slightly over 1 day when hydroxyl radicals are present.

Using Rainbow Trout (*Oncorhynchus mykiss*) and Dungeness Crab (*Cancer magister*), similar naphthas showed a 96-hour TLm (Median Toxic Limit) from 5 ppm to 30 ppm in ambient saltwater. Also, 24-hour and 96-hour TLms produced results from 60 ppm to 200 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), Guppy (*Lebistes reticulatus*) and juvenile American Shad (*Squalius cephalus*) in fresh water. Also, 24-hour and 96-hour LC50s for **toluene** produced results from 25 ppm to 60 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), and Guppy (*Lebistes reticulatus*) in fresh water. Using Water Fleas (*Daphnia magna*), toluene showed 24-hour TLms of from 100 ppm to 200 ppm. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

Environmental Fate

This naphtha mixture is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated with this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (U220) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Petroleum distillates, n.o.s. (Octanes, Nonanes)		
Hazard Class	DOT Class: 3 (Flammable liquid).	Packing Group(s)	PG II
		UN/NA ID	UN1268
Reportable Quantity	The Reportable Quantity (RQ) substance components in this material which may require DOT HAZMAT bill-of-lading display are Xylenes and Toluene or 2,2,4-Trimethylpentane (Iso-octane) or Ethylbenzene.		
Placards		Emergency Response Guide No.	128
		HAZMAT STCC No.	49 102 56
		MARPOL III Status	All impacted components were delisted as DOT "Marine Pollutants" per 66 FR 120 (page 33413) dated 6/21/2001.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) Inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories:

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons)**Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.****SARA 313**

This material contains the following components in concentrations which might be at or above de minimis levels and are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313:

Toluene [CAS No. 108-88-3] concentration: 1 to 5%
Xylenes [CAS No. 1330-20-7] concentration: 5 to 15%
Ethylbenzene [CAS No. 100-41-4] concentration: 1 to 5%
Cumene (Isopropylbenzene) [CAS No. 92-82-8] concentration: 0.1 to 0.9%
1,2,4-Trimethylbenzene (Pseudocumene) [CAS No. 95-63-6] concentration: 2.5 to 5%
Naphthalene [CAS No. 91-20-3] concentration: 0.1 to 0.9%.

CERCLA

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this material subject to this statute are:

Toluene [CAS No. 108-88-3] (RQ = 1000 lbs. [453.6 kg]) concentration: 1 to 5%
2,2,4-Trimethylpentane (Iso-octane) [CAS No. 540-84-2] (RQ = 1000 lbs. [453.6 kg]) conc.: 1 to 10%
Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 5 to 15%
Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 1 to 5%
Cumene [CAS No. 92-82-8] (RQ = 5000 lbs. [2268 kg]) concentration: 0.1 to 0.9%
Naphthalene [CAS No. 91-20-3] (RQ = 100 lbs. [45.36 kg]) concentration: 0.1 to 0.9%.

CWA

This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

**California
Proposition 65**

This material contains the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5: **Toluene [CAS No. 108-88-3] and Naphthalene [CAS No. 91-20-3].**

**New Jersey
Right-to-Know Label**

For New Jersey labeling, refer to the components listed in Section 2.

**Additional Regulatory
Remarks**

Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13): This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: **Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children!**

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following minor components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare": **Toluene (CAS No. 108-88-3), Xylenes (mixed) (CAS No. 1330-20-7), Ethylbenzene (CAS No. 100-41-4), and Cumene (Isopropylbenzene) (CAS No. 98-82-8).**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 3.0
Revision Date 10/2/2002
Print Date Printed on 10/3/2002.

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquefied Gas/Liquid
Color Transparent, colorless **Odor** Light hydrocarbon

DANGER! Extremely flammable gas/liquid;
vapor may cause flash fire or explosion!
High pressure and rapid diffusion hazard!
High concentrations of vapor reduce oxygen available for breathing!
Mist or vapor may irritate the eyes, mucous membranes, and/or respiratory tract!
Liquid contact may cause minimal to moderate eye irritation and/or mild to severe skin irritation or frostbite to freeze burns!
May be harmful if inhaled or absorbed through the skin!
Overexposures may cause central nervous system (CNS) depression and target organ effects such as hearing loss, and/or liver, kidney, or peripheral nervous system damage!
May be harmful or fatal if ingested! Aspiration into the lungs can cause pulmonary edema and chemical pneumonia!
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
Potential cancer hazard! Contains low levels of Benzene!
May cause leukemia and/or other blood disorders!
Mutagenic hazard; may cause genetic damage!
Based upon animal testing, may adversely affect reproduction!
Spills may create a slipping hazard!

20) C11 Alkanes, Isoparaffins, and Cycloalkanes	Mixture	0.5-2

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye Contact. Absorption. Inhalation

Signs and Symptoms of Acute Exposure

Inhalation	Components of this liquefied gas/naphtha may produce mild narcotic effects. High concentrations of this mixture can displace the amount of oxygen in air available to breathe below that necessary to sustain life (hypoxia), especially if working in confined spaces. Breathing vapors may also cause upper respiratory tract irritation and/or central nervous system (CNS) depression. Symptoms may include headache, dizziness, slurred speech, excitation or giddiness, nausea, vomiting, visual disturbances, memory loss, confusion, vertigo, drowsiness, fatigue, rapid or difficult breathing, muscular weakness, loss of consciousness, convulsions, coma, and even death, depending upon level of concentration and/or duration of exposure. Approximately 20,000 ppm (or 2 vol.%) of the vapor in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 to 10,000 ppm for only 5 minutes.
Eye Contact	Direct contact with the pressurized or liquefied gas portion of this material may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn." Animal test results on similar materials and actual human exposures suggest that this product can cause minimal to moderate eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling.
Skin Contact	Direct contact with the liquefied/pressurized gas portion of this material may produce severe and possibly permanent skin damage from frostbite or freeze burns. Animal test results on similar substances and its components suggest that this material can cause mild to severe skin irritation. Short-term contact symptoms include redness, itching, and burning or blistering of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate to severe dermatitis. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and severe tissue damage.
Ingestion	Due to its volatile nature, ingestion is not normally an applicable route of exposure for this liquefied gas/naphtha. However, if swallowed, this material may cause a "freeze burn" or irritation with a burning sensation of the mucous membranes in the mouth, throat, and esophagus. The liquid portion of this material can be readily absorbed by the stomach and intestinal tract. Symptoms include nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above).
	Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.

Straight-run Naphtha (C4-C11 Hydrocarbons)

Chronic Health Effects Summary

Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Chronic occupational **toluene** and **xylene** exposures have caused auditory nerve degeneration.

Altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called "Petrol Sniffers Encephalopathy"), delirium, seizures, and sudden death have been common results for gasoline and naphtha abusers. Also, reports have associated repeated and prolonged occupational overexposure to solvents with irreversible brain and nervous system damage (sometimes referred to as "Solvent or Painter's Syndrome"). Intentional misuse by deliberately concentrating and inhaling this material may be harmful or fatal.

Even with acute exposures, **n-hexane** is toxic to the peripheral nerves, characterized by numbness, tingling, or pain in the extremities, progressively worsening of neuromuscular motor coordination (polyneuritis or polyneuropathy), and even partial paralysis. And, based upon animal studies, n-hexane's metabolite, **2,5-hexanedione**, has been shown to cause degeneration of the testes.

Benzene is considered to be a cancer causing agent. It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML). Benzene is also capable of causing changes in genetic material (chromosomes). Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy. Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents.

Available information indicates that **toluene** is NOT teratogenic, but it can be toxic to the embryo and fetus and may reduce fertility. In animal tests, high inhaled doses of toluene has caused reduced litter sizes, retarded development of the fetus, and increased incidence of non-lethal abnormalities.

Based upon animal testing, the **C8 aromatic hydrocarbon components (xylenes and ethylbenzene)** might be assumed to cause embryo and fetal toxicity, spontaneous abortions, and/or decreased fetal and newborn weights if overexposures occur during a woman's early gestation period. And, the **C9 aromatic hydrocarbons (trimethylbenzenes and ethylmethylbenzenes)** are presumed to cause fetal toxicity and/or decreased fetal and newborn weights if overexposure occurs during a woman's early gestation period. (See Section 11.)

Conditions Aggravated by Exposure

Personnel with pre-existing nervous system disease, neurological conditions, skin disorders, impaired hearing, liver, or kidney function, blood disorders, or chronic respiratory diseases, and women attempting to conceive should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this material. They should take additional precautions to minimize or avoid exposure.

Exposure to high concentrations of this material may increase the sensitivity of the heart to **epinephrine (adrenalin) and catecholamine-like drugs**. Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians").

Target Organs

The substance is toxic to lungs, nervous system, especially the auditory and peripheral nerves, brain, mucous membranes, skin, eyes, and possibly, the heart, blood, liver, kidneys, thymus, and reproductive systems.

Carcinogenic Potential

This stream contains benzene at concentrations above 0.1%. **Benzene** is considered carcinogenic by OSHA, IARC, and NTP. (See Section 11.)

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>

Straight-run Naphtha (C4-C11 Hydrocarbons)

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F) DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	<p>Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.</p> <p>If contact with pressurized or liquefied gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.</p> <p>If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.</p> <p>Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse). If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IA Flammable Liquid. Extremely flammable!		
Flash Point/Method	CLOSED CUP: -43° to -37°C (-45° to -35°F). (Tagliabue [ASTM D-56])		
Lower Flammable Limit	AP 1.1 %	Upper Flammable Limit	AP 7.6 %
Auto-Ignition Temp.	AP 232°C (450°F)		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors		
Special Properties	Extremely Flammable Liquid! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.		

Straight-run Naphtha (C4-C11 Hydrocarbons)

Extinguishing Media

SMALL FIRE Use dry chemicals, carbon dioxide (CO₂), foam, water fog, or inert gas (nitrogen). **LARGE FIRE:** Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. **NEVER** use a water jet directly on the fire because it may spread the fire to a larger area

Fire Fighting Protective Clothing

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat, cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquefied Gas/Naphtha! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors

Caution: Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safely stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of its vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This liquefied gas or waste mixtures containing this material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling

Odor is an inadequate warning of potentially hazardous air concentrations. Releases of this material can cause atmospheres to become oxygen deficient and/or create an immediate fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring for oxygen deficiency and flammability. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Do not allow vaporizing material to contact eyes, skin, or other tissues. Never siphon by mouth. Prevent contact with food, chewing, or smoking materials. Do not take internally.

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of gas/naphthas. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Drain and purge equipment as necessary to remove material residues

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with mild soap and water after handling.

Straight-run Naphtha (C4-C11 Hydrocarbons)

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room, and preferably refrigerated. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below), then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling liquefied gas/liquid mixtures. If this material is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Suitable eye wash water should be readily available.

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with cold liquid or vapors. Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Prevent potential skin contact with cold liquid or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gas/liquid mixtures. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

Use a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. Air purifying respirators offer no protection against oxygen deficient atmospheres. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).

General Comments

Releases of this liquefied gas/naphtha may create flammable, explosive, and/or oxygen-deficient atmospheres (LT 19.5 Vol.% in air). DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions.

Straight-run Naphtha (C4-C11 Hydrocarbons)

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) [1999] TWA: 1000 (ppm) from OSHA (PEL) [1989]
2) Gasoline ("A3" Animal Carcinogen)	TWA: 300 STEL: 500 (ppm) from ACGIH (TLV) [1999] TWA: 300 STEL: 500 (ppm) from OSHA (PEL) [1989]
3) Petroleum Distillates (Naphtha)	TWA: 400 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
4) Butane	TWA: 800 (ppm) from ACGIH (TLV) [1999] TWA: 800 (ppm) from OSHA (PEL) [1989]
5) Pentane, all isomers	TWA: 600 (ppm) from ACGIH (TLV) [1999] TWA: 600 STEL: 750 (ppm) from OSHA (PEL) [1989] TWA: 1000 (ppm) from OSHA (PEL) [1976]
6) Cyclopentane	TWA: 600 (ppm) from ACGIH (TLV) [1999] TWA: 600 (ppm) from OSHA (PEL) [1989]
7) Hexane, other isomers	TWA: 500 STEL: 1000 (ppm) from ACGIH (TLV) [1999] TWA: 500 STEL: 1000 (ppm) from OSHA (PEL) [1989]
8) Hexane (n-Hexane)	TWA: 50 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 50 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
9) Cyclohexane	TWA: 300 (ppm) from ACGIH (TLV) [1999] TWA: 200 STEL: 400 (ppm) from ACGIH (TLV) [Proposed for 2000] TWA: 300 (ppm) from OSHA (PEL) [1976]
10) Heptane (n-Heptane)	TWA: 400 STEL: 500 (ppm) from ACGIH (TLV) [1999] TWA: 400 STEL: 500 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
11) Methylcyclohexane	TWA: 400 (ppm) from ACGIH (TLV) [1999] TWA: 400 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
12) Benzene ("A1" and "Z-2" Carcinogen)	TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 1 STEL: 5 AL: 0.5 (ppm) from OSHA (PEL) [1987] - SKIN
13) Toluene ("A4" = Not Classifiable)	TWA: 50 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [1989] TWA: 200 CEIL: 300 (ppm) from OSHA (PEL) [1976]
14) Octane, all isomers	TWA: 300 (ppm) from ACGIH (TLV) [1999] TWA: 300 STEL: 375 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
15) Xylene, Mixed Isomers ("A4" = Not Classifiable)	TWA: 100 STEL: 150 (ppm) from ACGIH (TLV) [1999] TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [1989]
16) Ethylbenzene ("A3" Animal Carcinogen)	TWA: 100 STEL: 125 (ppm) from ACGIH (TLV) [1999] TWA: 100 STEL: 125 (ppm) from OSHA (PEL) [1989]
17) Nonane, all isomers	TWA: 200 (ppm) from ACGIH (TLV) [1999] TWA: 200 (ppm) from OSHA (PEL) [1989]
18) Trimethylbenzene (mixed isomers)	TWA: 25 (ppm) from ACGIH (TLV) [1999] TWA: 25 (ppm) from OSHA (PEL) [1989]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquefied Gas/Liquid. Color Transparent, colorless. Odor Light hydrocarbon
Specific Gravity	0.71-0.75 pH Not applicable. Vapor Density 2.5-3.0 (Air = 1) (Water = 1)
Boiling Point/Range	-20° to 204°C (-4° to 400°F) Melting/Freezing Point -160° to 7°C (ASTM D-2887) (-256° to 45°F)
Vapor Pressure	AP 150 mm Hg at 20°C (68°F) or Viscosity (cSt @ 40°C) 0.5 to 2 10 to 20 Reid-psia at 40°C (104°F)
Solubility in Water	Slightly soluble in cold water (AP 0.1%). Volatile Characteristics Volatile Organic Compounds (VOCs) Content = 100%; AP 700 gm/L. This material is usually stored as a liquid If open to the atmosphere, it will evaporate quickly to form a vapor cloud

Straight-run Naphtha (C4-C11 Hydrocarbons)

Additional Properties Alkane, Isoparaffin, and Cycloalkane Hydrocarbons Content = 80 to 95 Wt % (ASTM D-1319),
C6-C10 Aromatic Hydrocarbons Content = 4 to 14 Wt.% (ASTM D-1319),
Olefin Hydrocarbons Content = 1 to 6 Wt.% (ASTM D-1319);
Average Density at 60°F = 6.077 lbs./gal. (ASTM D-2161);
Dry Point Temperature = 383°F (195°C) (ASTM D-86);
Evaporation Rate = 9 to 15 when n-Butyl acetate = 1.0;
Heat Value = 16,500 to 17,500 Btu.

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability Stable **Hazardous Polymerization** Not expected to occur.

Conditions to Avoid Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.

Materials Incompatibility Strong acids, alkalis, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide, and oxygen. n-Heptane will dissolve some plastics

Hazardous Decomposition Products No substances are readily identified from composition, but, no degradation data is available.

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

When a 4-hour rabbit inhalation screen test was run on liquefied petroleum gas, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline). An n-butane exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. And, n-pentane caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure.

Human volunteers had no apparent effects from exposure concentrations of 250 ppm, 500 ppm, and 1,000 ppm of isobutane and n-butane in air for periods of 8 hours daily for 10 days to 14 days, respectively. However, chronic inhalation of high concentrations of isobutane may cause liver and/or kidney damage. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of butane and butylenes (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone

Inhalation of 500 ppm of isopentane or n-pentane have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of n-pentane for 10 minutes has been reported NOT to produce any ill effects; however, higher exposure concentrations of 90,000 to 120,000 ppm (9-12 Wt % in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. Rat 28-day feeding studies done on both isopentane and n-pentane using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths

Intentional sniffing abuse of n-hexane has caused permanent brain and nervous system damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function, and even paralysis. These neurological effects are pronounced in combination with lack of oxygen supply, especially amongst women. Chronic repeated and/or prolonged overexposure to n-hexane, either by inhalation or skin absorption, has been shown to cause peripheral nerve tissue damage (polyneuropathy). The initial symptoms are numbness of the fingers and toes. Motor weakness can also occur in the digits, but may also involve muscles of the arms, thighs, and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure. The neurotoxic properties of n-hexane may be increased by concurrent exposure to methyl ethyl ketone, methyl isobutyl ketone, and/or toluene.

Hexane isomers were not mutagenic in the Salmonella/microsome (Ames) assay and are NOT considered to be carcinogenic. n-Hexane is NOT a tumor promoter in mice and NOT considered to be carcinogenic; nor is it teratogenic in mice or rats. n-Hexane, or its metabolite 2,5-hexanedione, has been shown to cause degeneration of the testes in rats; but, it did NOT produce spermatotoxicity in a multiple end-point test battery in rats given multiple doses for up to 5 days.

Straight-run Naphtha (C4-C11 Hydrocarbons)

Cyclohexane is an eye, skin, and mucous membrane irritant, CNS depressant, and causes narcosis at high concentrations in air. There is a narrow margin between narcosis, loss of reflexes, and death. In experimental animals exposed to lethal concentrations by inhalation or oral route, there was generalized vascular damage and severe degenerative changes in the heart, lungs, liver, kidneys, and brain. Cyclohexane does not act as a promoter for tumors on mice when exposed to dimethylbenzanthracene, and, it did not induce unscheduled DNA synthesis in cultured human lymphocytes. It is not mutagenic in the Salmonella/microsome (Ames) or the mouse lymphoma L5178Y assays, with or without metabolic activation; however, it did increase the number of chromosomal aberrations in bone marrow cells of rats exposed to between 100 and 300 ppm for 6 hours/day for 5 days. These chromosomal aberrations did not appear to be dose-related.

Benzene has an IDLH (immediately dangerous to life or health) concentration of 500 ppm. Its estimated lethal dose for a normal human adult is one teaspoon to one ounce (AP 10 mL). Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes. Studies with pregnant laboratory animals have demonstrated that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice

n-Heptane is a mucous membrane and respiratory tract irritant, but non-irritating to the eyes. It is irritating to skin and readily absorbed by either inhalation or dermal exposure. Exposures may cause decreased red blood cell counts, liver and heart damage, and central nervous system depression. Repeated direct skin application can produce defatting dermatitis. n-Heptane is metabolized in the liver to form alcohols and ketones, including neurotoxic **2,5-heptanedione** which is detectable in small amounts in the urine of exposed humans.

In a controlled study, human volunteers exposed to an airborne concentration of **n-heptane** of 1,000 ppm for 6 minutes or 2,000 ppm for 4 minutes experienced slight dizziness and incoordination. Higher-level exposures produced hilarity, dizziness, and semi-consciousness. Inhaling a concentration of 5,000 ppm for 15 minutes caused stupor and a gasoline-like taste. These higher exposures also decreased the myocardial threshold to the arrhythmogenic effects (irregular heart beats) of epinephrine, producing only a narrow margin of safety between exposures causing CNS effects, cardiac effects, and loss of consciousness

One occupational exposure study involving a **95% purity n-heptane** from 1 to 9 years duration concluded that it could produce minimal peripheral nerve damage with numbness and tingling of the extremities in the stocking-and-glove areas. In the same study, there was a decrease in motor nerve conduction velocities correlated with duration of exposure and adjusted for age effects; however, the average motor nerve conduction velocity in exposed workers was normal. Polyneuropathy associated with n-heptane exposure was reversible within a year following removal of exposure

n-Heptane was not neurotoxic in rats exposed for up to 7 months. But based upon limited laboratory animal studies, **n-heptane and its metabolites** were found in low levels (LT 135 ppm) in the brain of rats exposed to airborne concentrations of 100, 500, or 1,500 ppm for 6 hours each day, five days per week, for 1 or 2 weeks. These substances disappeared within 2 weeks following removal of exposure. n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not expected to be carcinogenic.

Rats inhaling **methylcyclohexane** at an airborne concentration of 15,250 ppm for 1 hour displayed tremors, loss of coordination, anesthesia, and convulsions. Inhalation of 10,050 ppm for 6 hours per day for 14 days showed rodent weight loss or decreased weight gain and changes in the structure of their salivary glands. Using rabbits, methylcyclohexane was shown to have an LD50 somewhere between 3,300 ppm and 7,300 ppm when exposed repeatedly for 6 hours per day, 5 days per week, for 3 weeks. Death was preceded by conjunctival congestion with mucoid secretion and lacrimation, salivation, coughing, sneezing, labored breathing, and diarrhea. Lethal oral dosing of rabbits caused lethargy, severe diarrhea, and circulatory collapse. Vascular and degenerative lesions were observed in the kidneys and liver

Toluene (methylbenzene) has been a major solvent of intentional inhalation abuse. Deliberate long-term inhalation of high concentrations of toluene (glue sniffing, etc.) has been shown to cause liver, kidney, central nervous system, and permanent brain damage. Effects such as impaired speech, visual disturbances, and hearing loss, loss of balance and/or muscle control, and memory loss have been reported. Exposures of 100 to 200 ppm in air for 24 hours cause hallucinations, distorted perceptions, and changes in motor activity. Studies have indicated that children of women who sniffed massive exposures of toluene during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. Isolated case reports have suggested a spectrum of congenital defects similar to those seen in fetal alcohol (ethanol) syndrome. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate.

Straight-run Naphtha (C4-C11 Hydrocarbons)

Long-term rodent inhalation studies with **toluene** produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness, and impaired reaction time. Also, rats exposed to 1,200 ppm and 1,400 ppm of toluene in air for 14 hours per day for 5 or 4 weeks (respectively) exhibited high-frequency hearing loss. Several animal studies using pregnant rodents have shown that toluene exposures may cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation studies, toluene has not been shown to be carcinogenic; nor is it mutagenic in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

Animal studies suggest that **toluene** causes kidney, liver, and/or lung dysfunction and cardiac (heart muscle) sensitization to epinephrine or other adrenalin-like agents. This sensitization may cause fatal changes in heart beat rhythms. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency).

2,2,4-Trimethylpentane (iso-octane) was highly irritating to mice at a 1,000 ppm in air exposure for 5 minutes and respiratory arrest occurred at exposures above 10,000 ppm for 5 minutes. CNS depression was observed at concentrations between 8,000 and 10,000 ppm in air. Kidney tubule necrosis, hyaline droplet formation, and acute renal failure were seen in male rats following oral administration of 10 gm/kg, 8 mL/kg, or 2,100 mg/kg of iso-octane for 2, 3, and 4 weeks, respectively.

An inhalation study with laboratory animals indicated an association of **xylene** with hearing loss in rats. Several animal studies using pregnant rodents have shown that **mixed xylene isomers (dimethylbenzenes)** may all cause embryo and/or fetotoxicity. Inhalation and feeding studies involving pregnant laboratory animals have produced limited evidence of fetal toxicity including increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes.

Chronic overexposure to **xylene** may produce irreversible damage to the central nervous system, including ototoxicity, that can be increased by the consumption of ethanol (alcoholic drinks). Drinking beverages which contain ethanol in conjunction with xylene exposure increases the alcoholic effects and impairs the clearance of xylenes from the body. Xylene isomers accumulate in the adipose (fat) tissues, from which they are slowly released. Complete clearance may take several days following exposure.

Two-year rat and mouse gavage studies by the National Toxicology Program (NTP) on **mixed xylene isomers including 17% ethylbenzene** showed "no evidence of carcinogenicity". Also, a two-year mixed xylenes skin-painting study on shaved rats and mice showed no incidence of non-neoplastic or neoplastic lesions. And, none of the components were mutagenic when tested in either the modified Ames, Chinese hamster ovary cell with and without metabolic activation, or sister-chromatid mutagenicity assays.

The National Toxicology Program (NTP) recently completed a 2-year inhalation bioassay on **ethylbenzene** in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200, and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels. However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level; and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Hyperplasia was also observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear. NTP, IARC, and OSHA have not designated ethylbenzene as a carcinogen.

Rats inhaling **n-nonane** at an airborne concentration of 1,500 ppm for 7 days displayed mild tremors and loss of coordination. Inhalation of 1,600 ppm for 6 hours per day for 90 days showed animal weight loss or decreased weight gain and changes in the structure of their salivary glands. And, liver damage and an altered response to drugs were seen in rats given n-nonane for 2 to 7 days.

Trimethylbenzenes are primary skin irritants and may cause asthmatic bronchitis and/or anemia. Based upon animal reproductive/developmental studies, trimethylbenzenes may also cause fetal toxicity.

Ethylmethylbenzenes are primary skin irritants and overexposures might cause liver and/or kidney damage or increase blood cholinesterase levels. Inhalation of these and other **C9 aromatic hydrocarbons** by pregnant mice and rats during gestational days 6 through 15 resulted in decreased fetal and newborn weights.

Straight-run Naphtha (C4-C11 Hydrocarbons)

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this naphtha, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. This material will normally evaporate rapidly if spilled. If released, volatile aromatic hydrocarbon components (benzene, toluene, xylenes, and ethylbenzene) may contribute to the creation of atmospheric smog. The atmospheric half-lives of the butanes under photochemical smog conditions are estimated to be between 5 and 7 days. Photooxidation of isobutane and n-butane in air (LT 8%) is not considered to be environmentally significant. Isopentane, n-pentane, n-hexane, hexane isomers, n-heptane, heptane isomers, and iso-octane all have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. Toluene has a half-life of from 3 hours to slightly over 1 day and cyclohexane has a half-life of from 6 hours to over 4 days when hydroxyl radicals are present.

Using Rainbow Trout (*Oncorhynchus mykiss*) and Dungeness Crab (*Cancer magister*), similar naphthas showed a 96-hour TLM (Median Toxic Limit) from 5 ppm to 30 ppm in ambient saltwater. 24-hour TLMs resulted in 2,990 ppm and 250 ppm when using Bluegill Sunfish (*Lepomis macrochirus*) and juvenile American Shad (*Squalius cephalus*), respectively. Also, 24-hour and 96-hour LC50s for cyclohexane and toluene produced results from 25 ppm to 60 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), and Guppy (*Lebistes reticulatus*) in fresh water. Using Water Fleas (*Daphnia magna*), toluene showed 24-hour TLMs of from 100 ppm to 200 ppm. Using Mosquito Fish (*Gambusia affinis*), cyclohexane showed a 24-hour TLM of 15,500 ppm and n-heptane showed a 24-hour TLM of 4,925 ppm and a LC100 of 10,000 ppm in turbid fresh water. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

Environmental Fate

This naphtha is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

**Straight-run Naphtha
(C4-C11 Hydrocarbons)**

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Petroleum distillates, n o s (Hexanes, Pentanes or Heptanes)		
Hazard Class	Class 3: Flammable liquid.	Packing Group(s)	PG II
		UN/NA ID	UN1268
Reportable Quantity	The Reportable Quantity (RQ) substance components present in this product which might require DOT HAZMAT bill-of-lading display are Xylenes and Benzene .		
Placards		Emergency Response Guide No.	128
		HAZMAT STCC No.	49 102 56
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.
SARA 313	This material contains the following components in concentrations which might be at or above de minimis levels and are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313: n-Hexane [CAS No. 110-54-3] concentration: 5 to 10% Cyclohexane [CAS No. 110-82-7] concentration: 1 to 3% Benzene [CAS No. 71-43-2] concentration: 0.1 to 0.9% Toluene [CAS No. 108-88-3] concentration: 1 to 3% Xylenes [CAS No. 1330-20-7] concentration: 1 to 5% Ethylbenzene [CAS No. 100-41-4] concentration: 0.2 to 1.3%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances that might be present in this product which are subject to this statute are: n-Hexane [CAS No. 110-54-3] (RQ = 5,000 lbs. [2,270 kg]) concentration: 5 to 10% Cyclohexane [CAS No. 110-82-7] (RQ = 1000 lbs. [453.6 kg]) concentration: 1 to 3% Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 0.1 to 0.9% Toluene [CAS No. 108-88-3] (RQ = 1000 lbs. [453.6 kg]) concentration: 1 to 3% 2,2,4-Trimethylpentane (iso-octane) [CAS No. 540-84-2] (RQ = 1000 lbs. [453.6 kg]) conc.: 1 to 5% Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 1 to 5% Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 0.2 to 1.3% Cumene [CAS No. 98-82-8] (RQ = 5000 lbs. [2268 kg]) concentration: 0 to 0.25%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA) Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

Straight-run Naphtha (C4-C11 Hydrocarbons)

California Proposition 65

This material contains the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5:

Benzene [CAS No. 71-43-2] and Toluene [CAS No. 108-88-3].

New Jersey Right-to-Know Label

For New Jersey labeling refer to components listed in Section 2.

Additional Regulatory Remarks

Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13): This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: **Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children!**

Under Section 12(b) of the Toxic Substances Control Act. Because it contains detectable amounts of **Methylcyclopentane [CAS No. 96-37-7], Cyclohexane [CAS No. 110-82-7], n-Propylbenzene [CAS No. 103-65-1], Cumene [CAS No. 98-82-8], and other C9 Aromatic Hydrocarbons**, this product might be subject to US EPA's one-time only per country export notification requirements.

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following minor components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare": **Isopentane [CAS No. 78-78-4], n-Pentane [CAS No. 109-66-0], Cyclohexane [CAS No. 110-82-7], Benzene [CAS No. 71-43-2], Methylcyclohexane [CAS No. 108-87-2], Toluene [CAS No. 108-88-3], Xylenes [CAS No. 1330-20-7], Ethylbenzene [CAS No. 100-41-4], and Cumene (Isopropylbenzene) [CAS No. 98-82-8].**

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this material which are subject to this statute are: **Isobutane (Propane, 2-methyl), n-Butane, Isopentane (Butane, 2-methyl), and n-Pentane.**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 4.0
Revision Date 09/07/1999
Print Date Printed on 10/08/1999.

* = Chronic Health Hazard

Emergency Overview

Physical State

Color Colorless to light yellow. **Odor** Rotten eggs. (Hydrogen sulfide odor).

DANGER!

Extremely Flammable and Poisonous.

Contains hydrogen sulfide gas (H₂S). May be fatal if inhaled.

Vapor may cause flash fire or explosion.

Vapor may travel considerable distance to source of ignition and flash back.

Harmful or fatal if swallowed - Can enter lungs and cause damage.

Contains Benzene - Cancer Hazard. Can cause leukemia and other blood disorders.

Protective Equipment

Minimum Recommended
See Section 8 for Details

Minimum PPE reflects the requirements for this material at this facility:

LYONDELL-CITGO Refining
LP Manufacturing Complex

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	FCCU Raw Gasoline	Technical Contact	(800) 525-4692
Product Number	RS 0116	Medical Emergency	(800) 313-7645
CAS Number	Mixture.	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Refinery Intermediate Stream		
Synonyms	Full-Range Catalytic Cracked Naphtha (Petroleum); Full-Range Gasoline from a Fluid Catalytic Cracker Unit		

SECTION 2. COMPOSITION (TYPICAL)

Component Name(s)	CAS Registry No.	Concentration (%)
Light Catalytic Cracked Naphtha	64741-55-5	25-35
Heavy Catalytic Cracked Naphtha	64741-54-4	25-35
Xylene, all isomers	1330-20-7	5-10
C9 Aromatic Hydrocarbons	Mixture	1-5
Toluene	108-88-3	1-5
n-Hexane	110-54-3	0.5-5
Methane	74-82-8	0-5
Hydrogen	1333-74-0	0-5
Benzene	71-43-2	0.1-3
Cumene	98-82-8	0.1-1
Ethylbenzene	100-41-4	0.1-1
Hydrogen Sulfide	7783-06-4	0-1

FCCU Raw Gasoline

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Inhalation. Ingestion.

Signs and Symptoms of Acute Exposure

- Inhalation** May be harmful or fatal if inhaled. Contains hydrogen sulfide. Inhalation of gas or vapor may cause severe nose, throat, respiratory tract, and lung irritation, respiratory paralysis, and death, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. Breathing this material may cause central nervous system depression with symptoms including nausea, headache, dizziness, fatigue, drowsiness, or unconsciousness. Breathing high concentrations of this material, for example, in an enclosed space or by intentional abuse, can cause irregular heartbeats which can cause death.
- Eye Contact** This material can cause eye irritation with tearing, redness, or a stinging or burning feeling. Further, it can cause swelling of the eyes with blurred vision. Effects may become more serious with repeated or prolonged contact.
- Skin Contact** May cause skin irritation with redness, an itching or burning feeling, and swelling of the skin. Effects may become more serious with repeated or prolonged contact. Skin contact may cause harmful effects in other parts of the body.
- Ingestion** Swallowing this material may be harmful. Swallowing this material may cause stomach or intestinal upset with pain, nausea, and/or diarrhea. This material can get into the lungs during swallowing or vomiting. Small amounts in the lungs can cause lung damage, possibly leading to chronic lung dysfunction or death. Swallowing this material may cause effects similar to those described in the inhalation section (see "inhalation" above).

- Chronic Health Effects Summary** Subacute exposure to low levels of hydrogen sulfide can produce eye irritation, watering, light sensitivity and corneal opacity. Reported effects from subacute exposure also include bronchitis, pulmonary edema, nausea, abdominal cramps and diarrhea. Aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Altered mental state, drowsiness, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been reported from repeated over-exposure such as gasoline and naphtha abusers. Repeated and prolonged overexposure to n-Hexane has been associated with peripheral nerve tissue damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function and paralysis. This material, or a component of this material, has been shown to cause cancer in laboratory animals. However it is not likely to represent a human cancer hazard. See Toxicological Information (Section 11)

- Conditions Aggravated by Exposure** Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Respiratory System, Central Nervous System (CNS), Heart (Cardiac), Blood-forming system, auditory system
- Target Organs** May cause damage to the following organs: blood, kidneys, lungs, the reproductive system, liver, mucous membranes, heart, lymphatic system, peripheral nervous system, upper respiratory tract, immune system, skin, adrenal, bone marrow, central nervous system (CNS), eye, lens or cornea, testes.

- Carcinogenic Potential** **CARCINOGENIC EFFECTS** Classified 1 (Proven for human.) by IARC, + (Proven.) by OSHA [Benzene]. Classified 2B (Possible for human.) by IARC [Ethylbenzene].

FCCU Raw Gasoline

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Toxic	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.

Eye Contact Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.

Skin Contact Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.

Ingestion Do not induce vomiting unless directed to do so by medical personnel -- this material is an aspiration hazard. Get immediate medical attention. Never give anything by mouth to an unconscious person.

Notes to Physician INHALATION: Inhalation overexposure can produce toxic effects. Treat intoxications as hydrogen sulfide exposures. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Administer supplemental oxygen with assisted ventilation, as required.

This material (or a component) sensitizes the heart to the effects of sympathomimetic amines. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias in individuals exposed to this material. Administration of sympathomimetic drugs should be avoided.

INGESTION: If ingested, this material presents a significant aspiration and chemical pneumonitis hazard. Induction of emesis is not recommended. Consider activated charcoal and/or gastric lavage. If patient is obtunded, protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position.

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification NFPA Class-IB flammable liquid.

Flash Point Closed cup: Lower than -18°C (0°F).

Lower Flammable Limit AP 1 %

Upper Flammable Limit > 13 %

FCCU Raw Gasoline

Autoignition Temperature	The lowest known value is 480°C (896°F) (Toluene).
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons and trace oxides of sulfur and/or nitrogen.
Special Properties	This gas is flammable at well below ambient temperatures and readily forms flammable mixtures with air. Exposed to an ignition source, it will burn in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources! Being heavier than air, its flammable vapors can travel long distances close to the ground to an ignition source, and then flash back.
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable and Poisonous Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Remove all potential ignition sources. Safely stop the source gas flow using non-sparking tools. Allow any entrained liquid spills to evaporate. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. Do not enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during response operations. This gas may travel great distances and be ignited by a remote ignition source.

SECTION 7. HANDLING AND STORAGE

Handling A spill or leak can cause an immediate fire or explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation and personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food and tobacco products. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of

FCCU Raw Gasoline

toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources. Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room. A refrigerated room is preferable for materials with a flash point temperature lower than 70°F (21°C). All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable regulatory requirements and the National Electrical Code.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor or mists below the applicable workplace exposure limits indicated below. All electrical equipment should comply with the National Electric Code. An emergency eye wash station and safety shower should be located near the work-station.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Eye Protection

Safety glasses equipped with side shields are recommended as minimum protection in industrial settings. Chemical goggles should be worn during transfer operations or when there is a likelihood of misting, splashing, or spraying of this material. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact. Use gloves (e.g., disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Wash hands with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities or leaving work. DO NOT use gasoline, kerosene, solvents or harsh abrasives as skin cleaners.

Body Protection

Avoid skin contact. Wear long-sleeved fire-retardant garments (e.g., Nomex®) while working with flammable and combustible liquids. Additional chemical-resistant protective gear may be required if splashing or spraying conditions exist. This may include an apron, boots and additional facial protection. If product comes in contact with clothing, immediately remove soaked clothing and shower. Promptly remove and discarded contaminated leather goods.

Respiratory Protection

A full-face supplied air pressure-demand respirator with escape bottle or a pressure-demand self-contained, breathing apparatus (SCBA) is required. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).

General Comments

Warning! Use of this material in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and/or inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance

Applicable Workplace Exposure Levels

FCCU Raw Gasoline

Benzene	<p>ACGIH (United States). Skin TWA: 0.5 ppm 8 hour(s). STEL: 2.5 ppm 15 minute(s). OSHA (United States). Skin Notes: See Table Z-2 for exclusions in 20 CFR 1910.1028 to the PEL. TWA: 1 ppm 8 hour(s). STEL: 5 ppm 15 minute(s).</p>
Hydrogen Sulfide	<p>ACGIH TLV (United States). TWA: 10 ppm 8 hour(s). STEL: 15 ppm 15 minute(s). OSHA (United States). CEIL: 20 ppm 8 hour(s). STEL: 50 ppm 15 minute(s). Form: *10 minute peak; once per 8 hour shift</p>
C9 Aromatic Hydrocarbons	<p>ACGIH TLV (United States). TWA: 25 ppm 8 hour(s). Form: (Trimethylbenzene)</p>
n-Hexane	<p>ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 500 ppm 8 hour(s).</p>
Toluene	<p>ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 200 ppm 8 hour(s). CEIL: 300 ppm PEAK: 500 ppm</p>
Cumene	<p>ACGIH (United States). TWA: 50 ppm 8 hour(s). OSHA (United States). Skin TWA: 50 ppm 8 hour(s).</p>
Xylene, all isomers	<p>ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 150 ppm 15 minute(s). OSHA (United States). TWA: 100 ppm 8 hour(s).</p>
Ethylbenzene	<p>ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 125 ppm 15 minute(s). OSHA (United States). TWA: 100 ppm 8 hour(s).</p>

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Color	Colorless to light yellow.	Odor	Rotten eggs. (Hydrogen sulfide odor).	
Specific Gravity	0.75 (Water = 1) (Estimated.)	pH	Not Applicable.	Vapor Density	>1 (Air = 1)
Boiling Range	-128 to 455° C		Melting/Freezing Point	Not determined.	
Vapor Pressure	The highest known value is 2.9 kPa (22 mm Hg) (at 20°C) (Toluene). Weighted average: 1.61 kPa (12.08 mm Hg) (at 20°C)		Volatility	This material is usually stored as a liquid. If open to the atmosphere it will evaporate quickly to form a vapor cloud.	
Solubility in Water	Very slightly soluble in cold water. (<0.1 % w/w)		Viscosity (cSt @ 40°C)	Not determined.	
Additional Properties	No additional information.				

FCCU Raw Gasoline

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from heat, sparks and flame.		
Materials Incompatibility	Incompatible with strong acids, strong bases, and strong oxidizers.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	Benzene	
	ORAL (LD50):	Acute: 930 mg/kg [Rat]. 4700 mg/kg [Mouse].
	INHALATION (LC50):	
	(VAPOR):	Acute: 10000 ppm 7 hour(s) [Rat]. 9980 ppm 8 hour(s) [Mouse].

Studies of Workers Over-Exposed to Benzene:

Studies of workers exposed to benzene show clear evidence that over-exposure can cause cancer of the blood forming organs (acute myelogenous leukemia) and aplastic anemia, an often fatal disease. Studies also suggest over-exposure to benzene may be associated with other types of leukemia and other blood disorders. Some studies of workers exposed to benzene have shown an association with increased rates of chromosome aberrations in circulating lymphocytes. One study of women workers exposed to benzene suggested a weak association with irregular menstruation. However, other studies of workers exposed to benzene have not demonstrated clear evidence of an effect on fertility or reproductive outcome in humans. Benzene can cross the placenta and affect the developing fetus. Cases of aplastic anemia have been reported in the offspring of persons severely over-exposed to benzene.

Studies in Laboratory Animals:

Studies in laboratory animals indicate that prolonged, repeated exposure to high levels of benzene vapor can cause bone marrow suppression and cancer in multiple organ systems. Studies in laboratory animals show evidence of adverse effects on male reproductive organs following high levels of exposure but no significant effects on reproduction have been observed. Embryotoxicity has been reported in studies of laboratory animals but effects were limited to reduced fetal weight and skeletal variations.

Xylene, all isomers**Effects from Acute Exposure:**

ORAL (LD50):	Acute: 4,300 mg/kg [Rat].
GAS (LC50):	Acute: 4,550 ppm for 4 hours [Rat].
DERMAL (LD50):	Acute: 14,100 uL/kg [Rabbit].

Overexposure to xylene may cause upper respiratory tract irritation, headache, cyanosis, blood serum changes, CNS damage and narcosis. Effects may be increased by the use of alcoholic beverages. Evidence of liver and kidney impairment were reported in workers recovering from a gross over-exposure.

Effects from Prolonged or Repeated Exposure:

Impaired neurological function was reported in workers exposed to solvents including xylene. Studies in laboratory animals have shown evidence of impaired hearing following high levels of exposure. Studies in laboratory animals suggest some changes in reproductive organs following high levels of exposure but no significant effects on reproduction were observed. Studies in laboratory animals indicate skeletal and visceral malformations, developmental delays, and increased fetal resorptions following extremely high levels of maternal exposure.

FCCU Raw Gasoline

The relevance of these observations to humans is not clear at this time. Adverse effects on the liver, kidney, bone marrow (changes in blood cell parameters) were observed in laboratory animals following high levels of exposure. The relevance of these observations to humans is not clear at this time.

C9 Aromatic Hydrocarbons

Embryotoxicity was reported in studies of laboratory animals. Adverse effects included increased implantation losses, reduced fetal weights, delayed ossification and an increased incidence of cleft palate.

Toluene:

Effects from Acute Exposure:

Deliberate inhalation of toluene at high concentrations (e.g., glue sniffing and solvent abuse) has been associated with adverse effects on the liver, kidney and nervous system and can cause CNS depression, cardiac arrhythmias and death. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects.

Effects from Repeated or Prolonged Exposure:

Studies of workers indicate long-term exposure may be related to impaired color vision and hearing. Some studies of workers suggest long-term exposure may be related to neurobehavioral and cognitive changes. Some of these effects have been observed in laboratory animals following repeated exposure to high levels of toluene. Several studies of workers suggest long-term exposure may be related to small increases in spontaneous abortions and changes in some gonadotropic hormones. However, the weight of evidence does not indicate toluene is a reproductive hazard to humans. Studies in laboratory animals indicate some changes in reproductive organs following high levels of exposure, but no significant effects on mating performance or reproduction were observed. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects. Findings in laboratory animals were largely negative. Positive findings include small increases in minor skeletal and visceral malformations and developmental delays following very high levels of maternal exposure. Studies of workers indicate long-term exposure may be related to effects on the liver, kidney and blood, but these appear to be limited to changes in serum enzymes and decreased leukocyte counts. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland following very high levels of exposure. The relevance of these findings to humans is not clear at this time.

Hydrogen Sulfide

INHALATION (LC50): Acute: 444 ppm 1 hour(s) [Rat]. 673 ppm 1 hour(s) [Mouse].

Hydrogen Sulfide (H₂S) has an unpleasant odor that diminishes with increased concentrations. Eye irritation can occur at concentrations above four ppm. Olfactory fatigue occurs rapidly at concentrations above 50. Accordingly, odor is not a reliable warning property. Symptoms increase with exposures above 50 ppm. Respiratory effects including irritation with possible pulmonary edema can occur with exposure above 50 ppm. At concentrations above 500 ppm, an immediate loss of consciousness, depressed respiration and death can occur. NIOSH has determined that H₂S concentrations above 100 ppm are immediately dangerous to life and health.

Ethylbenzene

Effects from Acute Exposure:

ORAL (LD50), Acute: 3,500 mg/kg [Rat].

DERMAL (LD50), Acute: 17,800 uL/kg [Rabbit].

INTRAPERITONEAL (LD50), Acute: 2,624 mg/kg [Rat].

Effects from Prolonged or Repeated Exposure:

Findings from a 2-year inhalation study in rodents conducted by NTP were as follows: Effects were observed only at the highest exposure level (750 ppm). At this level the incidence of renal tumors was elevated in male rats (tubular carcinomas) and female rats (tubular adenomas). Also, the incidence of tumors was elevated in male mice (alveolar and bronchiolar carcinomas) and female mice (hepatocellular carcinomas). IARC has classified ethyl benzene as "possibly carcinogenic to humans" (Group 2B). Studies in laboratory animals indicate some evidence of post-implantation deaths following high levels of maternal

FCCU Raw Gasoline

exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate limited evidence of renal malformations, resorptions, and developmental delays following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland.

n-Hexane

This material contains n-hexane. Long-term or repeated exposure to n-hexane can cause peripheral nerve damage. Initial symptoms are numbness of the fingers and toes. Also, motor weakness can occur in the digits, but may also involve muscles of the arms, thighs and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure.

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity No data. Ecological effects testing has not been conducted on this material.

Environmental Fate This product is not expected to bioaccumulate through food chains in the environment.

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitability (D001) and/or its toxic (D018) characteristics. Conditions of use may cause this material to become a "hazardous waste", as defined by federal or state regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

TSCA Inventory This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.

**SARA 302/304
Emergency Planning
and Notification** The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.

FCCU Raw Gasoline

SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: fire, Sudden Release of Pressure, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard
SARA 313 Toxic Chemical Notification and Release Reporting	This product contains the following components in concentrations above de minimis levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: Benzene [CAS No.: 71-43-2] Concentration: 1.6% Xylene, all isomers [CAS No.: 1330-20-7] Concentration: 7.5% Toluene [CAS No.: 108-88-3] Concentration: 3% Ethylbenzene [CAS No.: 100-41-4] Concentration: 0.6% n-Hexane [CAS No.: 110-54-3] Concentration: 2.8%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are: Benzene [CAS No.: 71-43-2] RQ = 10 lbs. (4.536 kg) Concentration: 1.6% Xylene, all isomers [CAS No.: 1330-20-7] RQ = 100 lbs. (45.36 kg) Concentration: 7.5% Toluene [CAS No.: 108-88-3] RQ = 1000 lbs. (453.6 kg) Concentration: 3% Hydrogen Sulfide [CAS No.: 7783-06-4] RQ = 100 lbs. (45.36 kg) Concentration: 0.5% Ethylbenzene [CAS No.: 100-41-4] RQ = 1000 lbs. (453.6 kg) Concentration: 0.55% Cumene [CAS No.: 98-82-8] RQ = 5000 lbs. (2268 kg) Concentration: 0.55% n-Hexane [CAS No.: 110-54-3] RQ = 5000 lbs. (2268 kg) Concentration: 2.8%
Clean Water Act (CWA)	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material may contain the following components which are known to the State of California to cause cancer, birth defects or other reproductive harm, and may be subject to the requirements of California Proposition 65 (CA Health & Safety Code Section 25249.5): Benzene: 1.55% Toluene: 3%
New Jersey Right-to-Know Label	For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.
Additional Regulatory Remarks	No additional regulatory remarks.

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 2.00
Revision Date 4/12/2004
Print Date Printed on 4/12/2004.

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0119
Revision Date 09/12/2002

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Gas, Liquefied Gas, and Liquid Mixture.		
Color	Transparent, colorless to slightly yellow liquid, invisible gas and vapor; white frost at release point.	Odor	Strong, foul smelling; rotten egg odor is unreliable as a warning of possible exposure

DANGER! Extremely flammable and poisonous gas/liquid; vapor may cause flash fire or explosion.
High pressure and rapid diffusion hazard.
High vapor concentrations reduce oxygen available for breathing.
Contains Hydrogen Sulfide (H₂S).
May be harmful or fatal if inhaled or absorbed through the skin.
May cause central nervous system (CNS) depression or suffocation.
Compressed gas/liquid contact may cause frostbite/freeze burns.
Mist or vapor may cause mild to severe eye, skin, mucous membrane, and respiratory tract irritation and inflammation.
Aspiration into the lungs will cause pulmonary edema and chemical pneumonia.
Overexposures may cause central nervous system (CNS) depression and other target organ effects such as hearing loss and/or peripheral nerve damage.
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats).
Potential cancer hazard.
Contains Benzene, Ethylbenzene, and Naphthalene.
May cause leukemia and/or other blood disorders.
Mutagenic hazard; may cause genetic damage.
May adversely affect reproduction or reproductive development.
Spills may create a slipping hazard. Corrosive to some metals.

SECTION 1: IDENTIFICATION

Trade Name	Naphtha/Hydrogen Mixed Phase Streams	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	1111111153	Medical Emergency	(918) 495-4700
CAS Number	Mixture (See Section 2.)	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Gas/Liquid Phase Mixture of a Full-range Naphthas		
Synonyms	HDS-Treated Full-range Reformate Naphtha, Reformate or HDS Naphtha With Hydrogen and Hydrogen Sulfide; Sour Liquefied Gas/Gasoline Mixture; 2-Phase Naphtha Reactor Mixture; Light Gas/Naphtha Mix Containing Some Hydrogen Sulfide; C4-C12 Hydrocarbons, Hydrogen, and H ₂ S.		

Naphtha/Hydrogen Mixed Phase Streams

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Hydrogen sulfide	7783-06-4	0.1-1
2) Hydrogen	1333-74-0	20-40
3) Full-range Reformed Naphtha (Petroleum)	68919-37-9	0-60
4) Full-range Straight-run Naphtha (Petroleum)	64741-42-0	0-60
5) Hydrodesulfurized Light Naphtha (Petroleum)	64742-73-0	0-40
6) Hydrodesulfurized Heavy Naphtha (Petroleum)	64742-82-1	0-40
7) Propane	74-98-6	0-2
8) Butanes	Mixture	10-20
9) Pentanes	Mixture	10-25
10) Cyclopentane	287-92-3	0 5-5
11) Hexane Isomers	Mixture	10-25
12) Methylcyclopentane	96-37-7	0.1-3
13) n-Hexane	110-54-3	0 5-5
14) Cyclohexane	110-82-7	0 5-3
15) Benzene	71-43-2	0.1-3
16) Methylcyclohexane	108-87-2	0 5-5
17) Heptanes	Mixture	5-15
18) Toluene	108-88-3	1-5
19) Octanes	Mixture	1-10
20) Xylenes (Mixed Isomers)	1330-20-7	1-10
21) Ethylbenzene	100-41-4	0.2-2.5
22) Nonanes	Mixture	1-10
23) Trimethylbenzene (mixed isomers)	25551-13-7	0 5-5
24) 1, 2, 4-Trimethylbenzene (Pseudocumene)	95-63-6	0 25-2 5
25) Ethylmethylbenzenes (Ethyltoluenes)	25550-14-5	0.5-5
26) C10-C12 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	1-5
27) Naphthalene	91-20-3	0.1-0.75
28) C10-C12 Alkylbenzenes	70693-06-0	1-5

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Eye contact Skin contact. Skin absorption.

Signs and Symptoms of Acute Exposure

Inhalation

May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. The National Institute for Occupational Safety and Health has determined that atmospheres containing 100 ppm or more of **hydrogen sulfide (H₂S)** are immediately dangerous to life and health (IDLH). At concentrations above 500 ppm, H₂S causes unconsciousness and respiratory paralysis leading to coma and/or death. (See Section 11.)

This gas/liquid mixture contains "simple asphyxiants". High concentrations can displace the amount of oxygen available to breathe below that level necessary to sustain life (hypoxia). Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, shortness of breath, nausea, vomiting, confusion, muscular weakness, loss of coordination, convulsions, unconsciousness, coma, and death, depending upon the concentration level and duration of exposure. Oxygen deprivation is possible if working in confined spaces.

Breathing high concentrations of the liquid-phase vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon the exposure duration. Approximately 20,000 ppm (or 2 vol %) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes.

Naphtha/Hydrogen Mixed Phase Streams

Eye Contact	Vapors may cause mild to severe eye irritation and photophobia (light sensitivity) upon short-term exposure. Severity depends upon the concentration of hydrogen sulfide and duration of exposure. Direct contact with pressurized/liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn." Direct liquid contact can cause clouding of the cornea with small areas of superficial corneal necrosis.
Skin Contact	Direct contact with a liquefied/pressurized gas portion of this material may produce severe and possibly permanent skin damage from frostbite or freeze burns. Tests on this material's components suggest that moderate to severe skin irritation, inflammation, and blistering is expected to occur upon short-term liquid contact. Certain components of this material, including hydrogen sulfide, n-hexane, cyclohexane, benzene, n-heptane, toluene, iso-octane, and xylene isomers may be absorbed through the skin, and produce toxic effects such as CNS depression (see "Inhalation" above). If the skin is damaged, absorption increases.
Ingestion	Ingestion of this material is highly unlikely due to its volatile nature. However, if swallowed this material may irritate the mucous membranes of the mouth, throat, and esophagus. The liquid-phase can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium. Additional central nervous system (CNS) effects may occur prior to the onset of convulsions, coma, and death. Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Cardiovascular effects include shallow rapid pulse and pallor followed by flushing. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may result in death.
Chronic Health Effects Summary	Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H ₂ S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures. Chronic inhalation to components of this material (propane, n-butane, n-pentane, n-heptane, and toluene) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline)-like drugs . Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Prolonged and/or repeated liquid or mist contact may cause moderate to severe skin irritation and inflammation. Symptoms include defatting, redness, dryness, blistering, lesions, and/or scaly dermatitis. Also, chronic inhalation of light naphtha vapors have been found to cause fatigue, nervousness, irritability, blurred vision, and labored breathing. Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been common results for gasoline and naphtha abusers. Even with acute exposures, n-hexane is toxic to the peripheral nerves, characterized by numbness, tingling, or pain in the extremities, progressively worsening of neuromuscular motor coordination (polyneuritis or polyneuropathy), and even partial paralysis. And, based upon animal studies, n-hexane's metabolite, 2,5-hexanedione , has been shown to cause degeneration of the testes. Benzene is considered to be a cancer causing agent. It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML). Benzene is also capable of causing changes in genetic material (chromosomes). Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy. Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents. Reports have associated repeated and prolonged occupational overexposure to solvents with irreversible brain and nervous system damage (sometimes referred to as "Solvent or Painter's Syndrome"). And, altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been common results for gasoline and naphtha abusers. Intentional misuse by deliberately concentrating and inhaling this product may be harmful or fatal. Chronic occupational toluene and xylene exposures have caused auditory nerve degeneration. Available information indicates that toluene is NOT teratogenic, but it can be toxic to the embryo and fetus and may reduce fertility. In animal tests, high inhaled doses of toluene has caused reduced litter sizes, retarded development of the fetus, and increased incidence of non-lethal abnormalities. At high exposure concentrations, ethylbenzene has been associated with multiple organ tumors in lab animals.

Naphtha/Hydrogen Mixed Phase Streams

Based upon animal testing, the **C8 aromatic hydrocarbon components (xylenes and ethylbenzene)** might be assumed to cause embryo and fetal toxicity, spontaneous abortions, and/or decreased fetal and newborn weights if overexposures occur during a woman's early gestation period. Also based upon animal testing, the **C9 aromatic hydrocarbon components (trimethylbenzenes and ethylmethylbenzenes)** are presumed to cause fetal toxicity and/or decreased fetal and newborn weights if overexposures occur during a woman's early gestation period.

Naphthalene is considered to be a toxic substance as defined by both human exposure and laboratory testing results. And, based upon animal testing, it might be considered carcinogenic. (See Section 11)

Conditions Aggravated by Exposure Personnel with eye, skin, cardiovascular, pulmonary, blood, liver, kidney, or neurological disorders, impaired hearing, high blood pressure, women attempting to conceive, and chronic respiratory diseases or those with a compromised ability to use oxygen (asthmatics, anemics, etc) should take additional precautions to minimize or avoid exposure

Exposure to high concentrations of this material may increase the sensitivity of the heart to **epinephrine (adrenalin) and catecholamine-like drugs**. Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians")

Target Organs This material is toxic to eyes, skin, mucous membranes, lungs, central and sympathetic nervous systems, especially the auditory and peripheral nerves, brain, heart, liver, kidneys, thymus, and possibly, the blood, endocrine, and reproductive systems.

Carcinogenic Potential This material contains benzene, ethylbenzene, and naphthalene at concentrations above 0.1%. **Benzene** is considered to be a known human carcinogen by OSHA, IARC and NTP and both **ethylbenzene and naphthalene** are considered possibly carcinogenic to humans by IARC (See Section 11)
