SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. If pain, redness, swelling, tearing, or light sensitivity persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.

Naphtha/Hydrogen Mixed Phase Streams

Notes to Physician

Nitrite as an antidote for acute **hydrogen sulfide** intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients

This material may also make the heart more susceptible to arrhythmias (irregular beats) Catecholamines such as epinephrine (adrenaline) and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended

If ingested, this material presents a significant aspiration/chemical pneumonitis hazard As a result, induction of emesis is not recommended Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position Obtain chest X-ray and liver function tests Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas, Liquefied Gas, and IA Liquid		
Flash Point Method	CLOSED CUP AP -107° to -73°C (-160° to -100°F) (Estimated)		
Lower Flammable Limit	1.6 to 4.0%	Upper Flammable Limit	7 to 45%
Autoignition Temperature	260° to 288°C (500° to 550°F)		
Hazardous Combustion Products	Carbon dioxide and monoxide, smoke, fumes, oxides of sulfur, and possibly, unburned hydrocarbons or mercaptans		
Special Properties	This gas/liquid mixture is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air If released, immediately evacuate personnel to a safe upwind area It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force Keep away from all ignition sources!		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials		
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Compressed Gas/Liquid Mixture! Release causes an immediate fire or explosion hazard Evacuate all non-essential personnel from immediate area to an area far upwind Establish a "regulated zone" with site control and security. Eliminate all ignition sources. If possible, allow this material to evaporate Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak If possible, turn leaking containers so that gas escapes rather than liquid A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing Use water spray to reduce vapors or divert vapor cloud drift A vapor-suppressing foam may also be used to reduce vapors **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid Stop the leak if it can be done without risk Safety stop the source gas flow using non-sparking tools All equipment used when handling this material must be grounded.

Naphtha/Hydrogen Mixed Phase Streams

Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

For large spills, secure the area and control access. If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. Cover spill with a vapor-suppressing foam as soon as possible. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Allow free liquid to evaporate, burn off, or pick it up for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling

Danger! Poisonous and Flammable Gas! Do NOT breathe vapor, it may contain **hydrogen sulfide (H₂S), mercaptans, and/or simple asphyxiants**. Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S and mercaptan concentrations, and flammability.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed petroleum gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC). The H₂S component of this material is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.)

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location. Where H₂S is routinely stored/handled, install monitoring equipment or system with alarms.

Naphtha/Hydrogen Mixed Phase Streams

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection	Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.
Hand Protection	Avoid skin contact and use gloves (e.g. disposable neoprene, nitrile, vinyl, or PVC/NBR). When handling this material which can produce frostbite or cold burns, use leather gloves over these chemically-resistant gloves. Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.
Body Protection	Prevent potential skin contact with cold liquid, solid, or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.
Respiratory Protection	A full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g. ANSI Z88.2).
General Comments	Releases of this gas/liquid mixture may create flammable, explosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning: Odor is an inadequate warning for hazardous conditions, especially since the odor threshold of benzene is several ppm above the occupational exposure guideline levels. Air purifying respirators offer no protection against hydrogen sulfide and simple asphyxiants.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) TWA: 5 (ppm) from ACGIH (TLV) [Proposed] TWA: 10 STEL: 15 CEIL: 20 (ppm) from OSHA (PEL)
2) Hydrogen	Simple asphyxiant
3) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL) [Proposed]
4) Propane	TWA: 2500 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL) [Proposed]
5) Butanes	TWA: 800 (ppm) from ACGIH (TLV) TWA: 800 (ppm) from OSHA (PEL) [Proposed]
6) Pentane, all isomers	TWA: 600 (ppm) from ACGIH (TLV) TWA: 600 STEL: 750 (ppm) from OSHA (PEL) [Proposed] TWA: 1000 (ppm) from OSHA (PEL)
7) Cyclopentane	TWA: 600 (ppm) from ACGIH (TLV) TWA: 600 (ppm) from OSHA (PEL) [Proposed]
8) Hexane, other isomers	TWA: 500 STEL: 1000 (ppm) from ACGIH (TLV) TWA: 500 STEL: 1000 (ppm) from OSHA (PEL) [Proposed]
9) n-Hexane	TWA: 50 (ppm) from ACGIH (TLV) - SKIN TWA: 50 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
10) Cyclohexane	TWA: 100 (ppm) from ACGIH (TLV) TWA: 300 (ppm) from OSHA (PEL)
11) Benzene ("A1" and "Z-2" Carcinogen)	TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) - SKIN TWA: 1 STEL: 5 AL: 0.5 (ppm) from OSHA (PEL) - SKIN
12) Heptane (n-Heptane)	TWA: 400 STEL: 500 (ppm) from ACGIH (TLV) TWA: 400 STEL: 500 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
13) Toluene	TWA: 50 (ppm) from ACGIH (TLV) - SKIN

Naphtha/Hydrogen Mixed Phase Streams

14) Methylcyclohexane	TWA 100 STEL 150 (ppm) from OSHA (PEL) [Proposed] TWA 200 CEIL: 300 (ppm) from OSHA (PEL) TWA 400 (ppm) from ACGIH (TLV) TWA: 400 (ppm) from OSHA (PEL) [Proposed] TWA 500 (ppm) from OSHA (PEL)
15) Octane, all isomers	TWA 300 (ppm) from ACGIH (TLV) TWA 300 STEL 375 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
16) Xylenes (Mixed Isomers)	TWA 100 STEL 150 (ppm) from ACGIH (TLV) TWA: 100 STEL 150 (ppm) from OSHA (PEL) [Proposed] TWA: 100 (ppm) from OSHA (PEL)
17) Ethylbenzene ("A3" Animal Carcinogen)	TWA 100 STEL 125 (ppm) from ACGIH (TLV) TWA 100 STEL 125 (ppm) from OSHA (PEL) [Proposed] TWA 100 (ppm) from OSHA (PEL)
18) Nonane, all isomers	TWA 200 (ppm) from ACGIH (TLV) TWA 200 (ppm) from OSHA (PEL) [Proposed]
19) Trimethylbenzene (mixed isomers)	TWA 25 (ppm) from ACGIH (TLV) TWA: 25 (ppm) from OSHA (PEL) [Proposed]
20) Naphthalene ("A3" = Animal Carcinogen [Proposed])	TWA 10 STEL 15 (ppm) from ACGIH (TLV) - SKIN TWA: 10 STEL: 15 (ppm) from OSHA (PEL) [Proposed] TWA 10 (ppm) from OSHA (PEL)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Gas, Liquefied Gas, and Liquid Mixture.	Color	Transparent, colorless to slightly yellow liquid, invisible gas and vapor, white frost at release point	Odor	Strong, foul smelling, rotten egg odor is unreliable as a warning of possible exposure.
Specific Gravity	0.60 to 0.75 (Water = 1)	pH	In the presence of moisture, H ₂ S can convert to H ₂ SO ₄	Vapor Density	2.0 to 3.5 (Air = 1)
Boiling Point/Range	-89°C to 235°C (-128° to 455°F) [ASTM D-2887]	Melting/Freezing Point	-187° to -46°C (-305° to -50°F) at 14.7 psia.		
Vapor Pressure	10 to 190 psia at 100°F.	Viscosity (cSt @ 40°C)	0.01 to 1.0		
Solubility in Water	Moderately soluble in cold water	Volatile Characteristics	This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud. Volatile Organic Compounds (VOC) Content = 100%, 400 to 750 gm/L.		
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard Hydrogen Sulfide and Mercaptans Content = 0.1 to 3 Vol.%, Alkane, Isoparaffin, and Cycloalkane Hydrocarbons Content = 30 to 90 Wt.% [ASTM D-1319]; C6-C12 Aromatic Hydrocarbons Content = 5 to 30 Wt.% [ASTM D-1319]; Olefin Hydrocarbons Content = 5 to 37 Wt.% [ASTM D-1319], Average Density at 60°F = 5.660 lbs/gal. [ASTM D-2500]; 90% Boiling Point Temperature = 415° to 435°F (213° to 224°C) [ASTM D-86]; Dry Point Temperature = 450°F (232°C) [ASTM D-86].				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, calcium hypochlorite, chlorates, permanganates, nitrates, hydrogen peroxide, mercury oxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS		

Naphtha/Hydrogen Mixed Phase Streams

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Hydrogen sulfide:

- GAS (TC_{Lo}) Acute 10 ppm for 15 minutes (Human) - Eye irritation
- GAS (TC_{Lo}) Acute. 50 to 100 ppm for 15 minutes (Human) - Respiratory irritation.
- GAS (LC₁₀₀) Acute 600 to 750 ppm for 30 minutes (Human) - Respiratory paralysis and death
- GAS (LC_{Lo}) Acute 5,700 ug/kg for 8 hours (Human) - Chronic pulmonary edema, coma, and death.

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (< 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (> 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol % in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred, however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline). An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. **Butane** is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. And, **n-pentane** caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure.

Human volunteers had no apparent effects from exposure concentrations of 250 ppm, 500 ppm, and 1,000 ppm of **isobutane and n-butane** in air for periods of 8 hours daily for 10 days to 14 days, respectively. However, chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane and butylenes** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone.

Inhalation of 500 ppm of **isopentane or n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects, however, higher exposure concentrations of 90,000 to 120,000 ppm (9-12 Wt % in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. Rat 28-day feeding studies done on both **isopentane and n-pentane** using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

Hexane isomers were not mutagenic in the Salmonella/microsome (Ames) assay and are NOT considered to be carcinogenic. **n-Hexane** is NOT a tumor promotor in mice and NOT considered to be carcinogenic, nor is it teratogenic in mice or rats. **n-Hexane**, or its metabolite **2,5-hexanedione**, has been shown to cause degeneration of the testes in rats; but, it did NOT produce spermatotoxicity in a multiple end-point test battery in rats given multiple doses for up to 5 days.

Cyclohexane can cause eye, skin and mucous membrane irritation, CNS depression, narcosis, and death at elevated concentrations. In experimental animals exposed to lethal concentrations by inhalation or oral routes, there was generalized vascular damage and severe degenerative changes in the heart, lungs, liver, kidneys and brain. Cyclohexane does not act as a promotor for tumors on mice when exposed to **dimethylbenzanthracene**. Further, it did not induce unscheduled DNA synthesis in cultured human lymphocytes. It is not mutagenic in the Salmonella/microsome (Ames) or the mouse lymphoma L5178Y assays, with or without metabolic activation, however, it did increase the number of chromosomal aberrations in bone marrow cells of rats exposed to between 100 and 300 ppm for 6 hours/day for 5 days. These chromosomal aberrations did not appear to be dose-related.

Naphtha/Hydrogen Mixed Phase Streams

Benzene has an IDLH (immediately dangerous to life or health) concentration of 500 ppm. Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes. If ingested, benzene's lethal dose for a normal human adult is one teaspoon to one ounce (~10 mL). Studies with pregnant laboratory animals have demonstrated that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice.

Benzene is a known animal carcinogen and a human leukemogen. In addition, NTP, IARC, EPA, OSHA, and ACGIH list benzene as a "Human Carcinogen." Repeated and prolonged overexposure to benzene vapors (GT 20 ppm in air) may cause toxicity to blood-forming tissues. Chronic exposure symptoms include decreased blood cell and platelet counts, leukopenia, aplastic anemia, or acute myelogenous leukemia (AML). Also, chronic inhalation of benzene vapors have been found to cause fatigue, nervousness, irritability, blurred vision, and labored breathing. Overexposure to benzene has been associated with chromosomal aberrations in human white blood cells, both laboratory animal and human bone marrow cell damage, and in vitro mammalian cells DNA damage. Elevated frequencies of chromosomal aberrations have been observed in peripheral white blood cells and bone marrow of workers exposed to high benzene concentrations known to be associated with signs of chronic poisoning. Ethanol consumption may have a synergistic effect and increase blood system changes caused by benzene exposures. Children/teenagers have less resistance.

n-Heptane is a mucous membrane and respiratory tract irritant, but non-irritating to the eyes. It is readily absorbed by inhalation and dermal exposure and repeated direct skin application can produce defatting dermatitis. Exposures may cause decreased red blood cell counts, liver and heart damage, and central nervous system depression. n-Heptane is metabolized in the liver to form alcohols and ketones, including neurotoxic **2,5-heptanedione** which is detectable in small amounts in the urine of exposed humans.

In a controlled study, human volunteers exposed to an airborne concentration of **n-heptane** of 1,000 ppm for 6 minutes or 2,000 ppm for 4 minutes experienced slight dizziness and incoordination. Higher-level exposures produced hilarity, dizziness, and semi-consciousness. Inhaling a concentration of 5,000 ppm for 15 minutes caused stupor and a gasoline-like taste. These higher exposures also decreased the myocardial threshold to the arrhythmogenic effects (irregular heart beats) of epinephrine, producing only a narrow margin of safety between exposures causing CNS effects, cardiac effects, and loss of consciousness.

One occupational exposure study involving a **95% purity n-heptane** from 1 to 9 years duration concluded that it could produce minimal peripheral nerve damage with numbness and tingling of the extremities in the stocking-and-glove areas. In the same study, there was a decrease in motor nerve conduction velocities correlated with duration of exposure and adjusted for age effects, however, the average motor nerve conduction velocity in exposed workers was normal. Polyneuropathy associated with n-heptane exposure was reversible within a year following removal of exposure.

n-Heptane was not neurotoxic in rats exposed for up to 7 months. But based upon limited laboratory animal studies, **n-heptane and its metabolites** were found in low levels (< 135 ppm) in the brain of rats exposed to airborne concentrations of 100, 500, or 1,500 ppm for 6 hours each day, five days per week, for 1 or 2 weeks. These substances disappeared within 2 weeks following removal of exposure. n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not expected to be carcinogenic.

Rats inhaling **methylcyclohexane** at an airborne concentration of 15,250 ppm for 1 hour displayed tremors, loss of coordination, anesthesia, and convulsions. Inhalation of 10,050 ppm for 6 hours per day for 14 days showed rodent weight loss or decreased weight gain and changes in the structure of their salivary glands. Using rabbits, methylcyclohexane was shown to have an LD50 somewhere between 3,300 ppm and 7,300 ppm when exposed repeatedly for 6 hours per day, 5 days per week, for 3 weeks. Death was preceded by conjunctival congestion with mucoid secretion and lacrimation, salivation, coughing, sneezing, labored breathing, and diarrhea. Lethal oral dosing of rabbits caused lethargy, severe diarrhea, and circulatory collapse. Vascular and degenerative lesions were observed in the kidneys and liver.

Toluene (methylbenzene) has been a major solvent of intentional inhalation abuse. Deliberate long-term inhalation of high concentrations of toluene (glue sniffing, etc.) has been shown to cause liver, kidney, central nervous system, and permanent brain damage. Effects such as impaired speech, visual disturbances, and hearing loss, loss of balance and/or muscle control, and memory loss have been reported. Exposures of 100 to 200 ppm in air for 24 hours cause hallucinations, distorted perceptions, and changes in motor activity. Studies have indicated that children of women who sniffed massive exposures of toluene during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. Isolated case reports have suggested a spectrum of congenital defects similar to those seen in fetal alcohol (ethanol) syndrome. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate.

Naphtha/Hydrogen Mixed Phase Streams

Animal studies suggest that **toluene** causes kidney, liver, and/or lung dysfunction and cardiac (heart muscle) sensitization to epinephrine or other adrenalin-like agents. This sensitization may cause fatal changes in heart beat rhythms. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency).

Long-term rodent inhalation studies with **toluene** produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness, and impaired reaction time. Also, rats exposed to 1,200 ppm and 1,400 ppm of toluene in air for 14 hours per day for 5 or 4 weeks (respectively) exhibited high-frequency hearing loss. Several animal studies using pregnant rodents have shown that toluene exposures may cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation studies, toluene has not been shown to be carcinogenic, nor is it mutagenic in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

2,2,4-Trimethylpentane (iso-octane) was highly irritating to mice at a 1,000 ppm in air exposure for 5 minutes and respiratory arrest occurred at exposures above 10,000 ppm for 5 minutes. CNS depression was observed at concentrations between 8,000 and 10,000 ppm in air. Kidney tubule necrosis, hyaline droplet formation, and acute renal failure were seen in male rats following oral administration of 10 gm/kg, 8 mL/kg, or 2,100 mg/kg of iso-octane for 2, 3, and 4 weeks, respectively.

An inhalation study with laboratory animals indicated an association of **xylene** with hearing loss in rats. Several animal studies using pregnant rodents have shown that **mixed xylene isomers (dimethylbenzenes)** may all cause embryo and/or fetotoxicity. Inhalation and feeding studies involving pregnant laboratory animals have produced limited evidence of fetal toxicity including increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes.

Chronic overexposure to **xylene** may produce irreversible damage to the central nervous system, including ototoxicity, that can be increased by the consumption of ethanol (alcoholic drinks). Drinking beverages which contain ethanol in conjunction with xylene exposure increases the alcoholic effects and impairs the clearance of xylenes from the body. Xylene isomers accumulate in the adipose (fat) tissues, from which they are slowly released. Complete clearance may take several days following exposure.

Two-year rat and mouse gavage studies by the National Toxicology Program (NTP) on **mixed xylene isomers including 17% ethylbenzene** showed "no evidence of carcinogenicity". Also, a two-year mixed xylenes skin-painting study on shaved rats and mice showed no incidence of non-neoplastic or neoplastic lesions. And, none of the components were mutagenic when tested in either the modified Ames, Chinese hamster ovary cell with and without metabolic activation, or sister-chromatid mutagenicity assays.

NTP completed a 2-year inhalation bioassay of **ethylbenzene** in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200 and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels. However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level, and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Also, hyperplasia was observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear. However, based upon this data, the IARC has designated ethylbenzene as possibly carcinogenic to humans (Group 2B).

Rats inhaling **n-nonane** at an airborne concentration of 1,500 ppm for 7 days displayed mild tremors and loss of coordination. Inhalation of 1,600 ppm for 6 hours per day for 90 days showed animal weight loss or decreased weight gain and changes in the structure of their salivary glands. And, liver damage and an altered response to drugs were seen in rats given n-nonane for 2 to 7 days.

Trimethylbenzenes are primary skin irritants and may cause asthmatic bronchitis and/or anemia. Levels of total hydrocarbon vapors present in the breathing atmosphere of these workers ranged from 10 to 60 ppm. Its TC_{10} for humans 10 ppm, with somnolence and respiratory tract irritation noted. In inhalation studies with rats, four of ten animals died after exposures of 2,400 ppm for 24 hours. An oral dose of 5 mL/kg resulted in death in one of ten rats. Minimum lethal intraperitoneal doses were 1.5 to 2.0 mL/kg in rats and 1.13 to 12 mL/kg in guinea pigs. **Mesitylene (1,3,5-Trimethylbenzene)** inhalation at concentrations of 1.5, 3.0, and 6.0 mg/L for six hours was associated with dose-related changes in white blood cell counts in rats. No significant effects on the complete blood count were noted with six hours per day exposure for five weeks, but elevations of alkaline phosphatase and SGOT were observed. Central nervous system depression and ataxia were noted in rats exposed to 5,100 to 9,180 ppm for two hours. Based upon animal reproductive/developmental studies, trimethylbenzenes may also cause fetal toxicity.

Naphtha/Hydrogen Mixed Phase Streams

Ethylmethylbenzenes are primary skin irritants. Overexposure has been associated with kidney damage and increased blood cholinesterase levels. In inhalation developmental studies, these and other **C9 aromatic hydrocarbons** have been associated with decreased fetal and newborn pup weights.

Naphthalene is a potential irritant to eyes, skin and lungs. Ingestion of naphthalene has been associated with severe red blood cell and liver damage leading to death. Following prolonged or repeated exposures, naphthalene has been shown to cause cataracts, optical neuritis, hemolytic and aplastic anemia, kidney damage (jaundice), and possibly neurotoxicity. In animal studies, naphthalene caused fetal effects and decreased spleen weights in pregnant female mice. In an NTP sponsored study, naphthalene produced a dose related increase in tumors at the 30 and 60 ppm exposure level in both male and female rats. Higher incidences of respiratory epithelial adenomas, olfactory epithelial neuroblastomas and non-neoplastic lesions of the nose were observed as compared to controls. Cytogenic studies with Chinese hamster ovary cells have demonstrated sister chromatid exchanges and chromosomal aberrations. The relevance of these studies to human health is unclear.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage, however, at ambient temperatures and pressure, the **butenes, hydrogen sulfide, and the mercaptan** components of this material may contribute to generation of atmospheric smog. If released, the volatile **aromatic hydrocarbon components (benzene and toluene)** may also contribute to the creation of atmospheric smog. The atmospheric half-lives of **propane and butenes** under photochemical smog conditions are estimated to be between 5 to 8 hours; and, experimental data shows that significant photooxidation of propylene occurs rapidly within 14 to 21 hours. The atmospheric half-lives of **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days. Photooxidation of **propane, isobutane, and n-butane** in air (< 8%) are not considered environmentally significant.

Hydrogen sulfide residence times in the atmosphere range from about one day to more than 40 days, depending upon the season, latitude, and presence of other air pollutants. Reduced temperatures increase the residence time. The **pentanes, n-hexane, and hexane isomers** all have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. **Toluene** has a half-life of from 3 hours to slightly over 1 day and both **cyclopentane and cyclohexane** have a half-lives of from 6 hours to over 4 days when hydroxyl radicals are present.

If spilled, the liquid portion of this material, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels. Also, the toxic **hydrogen sulfide and the mercaptans** are moderately soluble in water. Volatile **aromatic hydrocarbon components (benzene, toluene, xylenes, ethylbenzene, trimethylbenzene, and naphthalene)** may be released and possibly contribute to the creation of atmospheric smog.

Using Rainbow Trout (*Oncorhynchus mykiss*) and Dungeness Crab (*Cancer magister*), similar naphthas showed a 96-hour TLm (Median Toxic Limit) from 5 ppm to 20 ppm in ambient saltwater. Also, 24-hour and 96-hour TLms produced results from 60 ppm to 200 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), Guppy (*Lebistes reticulatus*) and juvenile American Shad (*Squalius cephalus*) in fresh water. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

Environmental Fate

The naphtha portion of this mixture is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

Naphtha/Hydrogen Mixed Phase Streams

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this gas/liquid to the atmosphere should be avoided. Maximize material recovery for reuse or recycling.

If spilled and the naphtha portion of this mixture is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase and vapor emissions from the process might prove to be a potential health hazard. The naphtha portion of this mixture is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol % of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol %, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitability (D001) and/or toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U S Department of Transportation regulated material		
Proper Shipping Name	Compressed gases, flammable, toxic, n.o.s. Inhalation Hazard Zone B (Hydrogen, Hydrogen sulfide)		
Hazard Class	DOT Class: 2.3 (Poisonous gas) and 2.1 (Flammable gas).	Packing Group(s) UN/NA ID	Not applicable UN1953
Reportable Quantity	The Reportable Quantity (RQ) substance components present in this material which might require DOT HAZMAT bill-of-lading display are Benzene and Xylenes .		
Placards	Emergency Response Guide No. 119		
			HAZMAT STCC No. 49 203 78
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. A chemical substance present in this material that is subject to this statute is Hydrogen sulfide [CAS No. = 7783-06-4] concentration: 0.1 to 1%.

Naphtha/Hydrogen Mixed Phase Streams

SARA 311/312	<p>The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories:</p> <p>Fire, Sudden Release of Pressure, and Acute (Immediate) & Chronic (Delayed) Health Hazards.</p>
SARA 313	<p>This material contains the following components in concentrations which might be at or above de minimis levels and are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313:</p> <p>Hydrogen sulfide [CAS No. = 7783-06-4] concentration: 0.1 to 1% n-Hexane [CAS No. 110-54-3] concentration: 0.5 to 5% Cyclohexane [CAS No. 110-82-7] concentration: 0.5 to 3% Benzene [CAS No. 71-43-2] concentration: 0.1 to 3% Toluene [CAS No. 108-88-3] concentration: 1 to 5% Xylenes [CAS No. 1330-20-7] concentration: 1 to 10% Ethylbenzene [CAS No. 100-41-4] concentration: 0.2 to 2.5% 1,2,4-Trimethylbenzene (Pseudocumene) [CAS No. 95-63-6] concentration: 0.25 to 2.5% Naphthalene [CAS No. 91-20-3] concentration: 0.1 to 0.75%.</p>
CERCLA	<p>The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances which are present in this material that are subject to this statute are:</p> <p>Hydrogen sulfide [CAS No. = 7783-06-4] (RQ = 100 lbs. [45.36 kg]) concentration: 0.1 to 1% n-Hexane [CAS No. 110-54-3] (RQ = 5,000 lbs. [2,270 kg]) concentration: 0.5 to 5% Cyclohexane [CAS No. 110-82-7] (RQ = 1000 lbs. [453.6 kg]) concentration: 0.5 to 3% Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 0.1 to 3% Toluene [CAS No. 108-88-3] (RQ = 1000 lbs. [453.6 kg]) concentration: 1 to 5% 2,2,4-Trimethylpentane (Iso-octane) [CAS No. 540-84-1] (RQ = 1000 lbs. [453.6 kg]) conc.: 0 to 2% Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 1 to 10% Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 0.2 to 2.5% Cumene [CAS No. 98-82-8] (RQ = 5000 lbs. [2268 kg]) concentration: 0.05 to 0.5% Naphthalene [CAS No. 91-20-3] (RQ = 100 lbs. [45.36 kg]) concentration: 0.1 to 0.75%.</p>
CWA	<p>This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.</p>
California Proposition 65	<p>This material contains the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5: Benzene [CAS No. 71-43-2], Toluene [CAS No. 108-88-3], and Naphthalene [CAS No. 91-20-3].</p>
New Jersey Right-to-Know Label	<p>For New Jersey labeling, refer to the components listed in Section 2.</p>
Additional Regulatory Remarks	<p>Under Section 12(b) of the Toxic Substances Control Act: Because it contains detectable amounts of Cyclohexane (CAS No. 110-82-7), this material might be subject to US EPA's one-time only per country export notification requirements.</p> <p>In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in this material as a "Volatile Organic Compounds (VOC)" which contribute significantly to air pollution which endangers public health and welfare": Isopentane [CAS No. 78-78-4], n-Pentane [CAS No. 109-66-0], Cyclohexane [CAS No. 110-82-7], Benzene [CAS No. 106-98-9], Methylcyclohexane [CAS No. 108-87-2], and Toluene [CAS No. 108-88-3], Xylenes [CAS No. 1330-20-7], Ethylbenzene [CAS No. 100-41-4], and Cumene (Isopropylbenzene) [98-82-8].</p> <p>In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances which may be present in this material which are subject to this statute include: Hydrogen sulfide, Hydrogen, Propane, Isobutane (Propane, 2-methyl), n-Butane, Isopentane (Butane, 2-methyl), 2,2-Dimethylpropane (Neopentane), and n-Pentane.</p>

Naphtha/Hydrogen Mixed Phase Streams**SECTION 16: OTHER INFORMATION**

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0120
Revision Date 04/16/1999

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Gas/Liquefied Gas/ Liquid Mixture.		
Color	Colorless liquid; invisible gas and vapor; white frost at release point.	Odor	Strong, foul smelling; rotten egg odor is unreliable as a warning of possible exposure.

DANGER! Extremely flammable and poisonous gas/liquid;
vapor may cause flash fire or explosion!
High pressure and rapid diffusion hazard!
High concentrations of vapor reduce oxygen available for breathing!
Contains Hydrogen Sulfide (H₂S)! Corrosive to some metals!
**May be harmful or fatal if inhaled, ingested, or absorbed through
the skin!**
May cause central nervous system (CNS) depression or suffocation!
Liquid or compressed gas contact may cause frostbite or freeze burns!
**Mist or vapor may cause mild to severe eye, skin, mucous membranes,
and respiratory tract irritation and inflammation!**
**Aspiration into the lungs will cause pulmonary edema and
chemical pneumonia!**
**Overexposures may cause central nervous system (CNS)
depression and target organ effects such as lung, brain,
peripheral nerves, blood and blood-forming tissue,
cardiopulmonary, liver, and/or kidney damage!**
**Prolonged and/or repeated inhalation may increase the heart's
susceptibility to arrhythmias (irregular beats)!**
Cancer hazard! Contains low levels of Benzene and 1,3-Butadiene!
May cause leukemia and/or other blood disorders!
Mutagenic hazard; may cause genetic damage!
May adversely affect reproduction or reproductive development!
Spills may create a slipping hazard!

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Hydrogen	1333-74-0	40-90
2) Carbon dioxide	124-38-9	0-15
3) Nitrogen	7727-37-9	0-12
4) Hydrogen sulfide	7783-06-4	0-2.2
5) Methane	74-82-8	0-12
6) Ethane	74-84-0	0-7
7) Ethylene	74-85-1	0-5
8) Propane	74-98-6	0-5
9) Propylene	115-07-1	0-2
10) Butanes	Mixture	0-3
11) 1,3-Butadiene	106-99-0	0-0.4
12) Butenes or Butylenes	25167-67-3	0-2
13) Pentanes	Mixture	0-5
14) Hexane Isomers	Mixture	6-9
15) n-Hexane	110-54-3	1-7
16) Cyclohexane	110-82-7	0-2
17) Benzene	71-43-2	0.1-1.0
18) Methylcyclohexane	108-87-2	1-3
19) Toluene	108-88-3	0.8-2
20) Xylene, Mixed Isomers	1330-20-7	1-3
21) Ethylbenzene	100-41-4	0.3-0.7
22) Trimethylbenzenes	25551-13-7	0-2

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Eye contact. Skin contact Skin absorption

Signs and Symptoms of Acute Exposure

Inhalation

May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. The National Institute for Occupational Safety and Health has determined that atmospheres containing 100 ppm or more of **hydrogen sulfide (H₂S)** are immediately dangerous to life and health. At concentrations above 500 ppm, H₂S causes unconsciousness and respiratory paralysis leading to coma and/or death. (See Section 11)

Additionally, several components of this gas/liquid mixture are "simple asphyxiants". High concentrations of this mixture can displace the amount of oxygen available to breathe below that level necessary to sustain life (hypoxia). Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, shortness of breath, nausea, vomiting, confusion, muscular weakness, loss of coordination, convulsions, unconsciousness, coma, and death, depending upon the concentration level and duration of exposure. Oxygen deprivation is possible if working in confined spaces.

Breathing high concentrations of the liquid-phase vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon the exposure duration. Approximately 20,000 ppm (or 2 vol.%) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes.

Eye Contact

Vapors may cause mild to severe eye irritation and photophobia (light sensitivity) upon short-term exposure. Severity depends upon the concentrations of **hydrogen sulfide** and duration of exposure. Direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn." Direct liquid contact can cause clouding of the cornea with small areas of superficial corneal necrosis

Sour Naphtha/Hydrogen Mixed Phase Refinery Streams

Skin Contact	Direct contact with an expanding gas may produce severe and possibly permanent skin damage from frostbite or freeze burns. Hydrogen sulfide can be absorbed through the skin to produce toxic effects. Tests on this stream's components suggest that mild to severe skin irritation, inflammation, and blistering is expected to occur upon short-term liquid contact. Certain components of this material, including n-hexane, benzene, toluene, xylenes, and ethylbenzene may be absorbed through the skin, and produce toxic effects such as CNS depression (see "Inhalation" above). If the skin is damaged, absorption increases
Ingestion	Ingestion of this material is highly unlikely due to its volatile nature. However, if swallowed this material may irritate the mucous membranes of the mouth, throat, and esophagus. The liquid-phase can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium. Additional central nervous system (CNS) effects may occur prior to the onset of convulsions, coma, and death. Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Cardiovascular effects include shallow rapid pulse and pallor followed by flushing. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may result in death.
Chronic Health Effects Summary	Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H ₂ S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures. (See Section 11.) Chronic inhalation to components of this mixed stream (carbon dioxide, propane, n-butane, n-pentane, and toluene) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline)-like drugs . Prolonged and/or repeated liquid or mist contact may cause moderate to severe skin irritation and inflammation. Symptoms include defatting, redness, dryness, blistering, lesions, and/or scaly dermatitis. Also, chronic inhalation of light naphtha vapors have been found to cause fatigue, nervousness, irritability, blurred vision, and labored breathing. Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been common results for gasoline and naphtha abusers. Even with acute exposures, n-hexane is toxic to the peripheral nerves, characterized by numbness, tingling, or pain in the extremities, progressively worsening of neuromuscular motor coordination (polyneuritis or polyneuropathy), and even partial paralysis of the feet and/or hands. Benzene is considered to be a cancer causing agent. It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML). Benzene is also capable of causing changes in genetic material (chromosomes). Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy. Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents. Available information indicates that toluene is NOT teratogenic, but it can be toxic to the embryo and fetus and may reduce fertility. In animal tests, high inhaled doses of toluene has caused reduced litter sizes, retarded development of the fetus, and increased incidence of non-lethal abnormalities. 1,3-Butadiene (BD) , a minor component of this stream, has been shown to be mutagenic and produces multiple organ tumors in various tissues of laboratory rodents. BD also causes sexual organ atrophy in test animals.
Conditions Aggravated by Exposure	Personnel with eye, skin, cardiovascular, pulmonary, blood, liver, kidney, or neurological disorders, impaired hearing, high blood pressure, and chronic respiratory diseases or those with a compromised ability to use oxygen (asthmatics, anemics, etc.) should take additional precautions to minimize or avoid exposure.
Target Organs	The substance is toxic to eyes, skin, mucous membranes, lungs, central and sympathetic nervous systems, especially the auditory and peripheral nerves, brain, heart, liver, kidneys, thymus, and possibly, the endocrine and reproductive systems.
Carcinogenic Potential	This refinery stream contains benzene and possibly 1,3-butadiene at concentrations above 0.1%. These substances are considered carcinogenic by OSHA, IARC, and NTP. (See Section 11.)

**Sour Naphtha/Hydrogen
Mixed Phase Refinery Streams**

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. If pain, redness, swelling, tearing, or light sensitivity persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	<p>Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients.</p> <p>Inhalation overexposure can produce other toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.</p> <p>This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines such as epinephrine (adrenaline) and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.</p> <p>If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.</p>

Sour Naphtha/Hydrogen Mixed Phase Refinery Streams

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas, Liquefied Gas, and IA Liquid		
Flash Point/Method	CLOSED CUP AP -107° to -73°C (-160° to -100°F) (Estimated)		
Lower Flammable Limit	AP 1.6 to 4.0%	Upper Flammable Limit	AP 45 to 75%
Auto-Ignition Temp.	AP 260°C (500°F)		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons, and oxides of sulfur and nitrogen.		
Special Properties	This gas/liquid mixture is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.		
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Compressed Gas/Liquid Mixture! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area to an area far upwind. Establish a "regulated zone" with site control and security. Eliminate all ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. Cover spill with a vapor-suppressing foam as soon as possible. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible, in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations. Some releases/spills may need to be reported to the National Response Center (800/424-8802)

Sour Naphtha/Hydrogen Mixed Phase Refinery Streams

SECTION 7: HANDLING AND STORAGE

Handling

Danger! Poisonous and Flammable Gas! Do NOT breathe vapor; it may contain **hydrogen sulfide (H₂S)**. This gas mixture also contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S concentrations, and flammability.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed petroleum gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue.

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC). The H₂S component of this material is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.)

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location. Where H₂S is routinely stored or handled, install monitoring equipment or system with alarms.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.

Hand Protection

Avoid skin contact and use gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). When handling this material which can produce frostbite or cold burns, use leather gloves over these chemically-resistant gloves. Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Sour Naphtha/Hydrogen Mixed Phase Refinery Streams

Body Protection	Prevent potential skin contact with cold liquid, solid, or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded
Respiratory Protection	A full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g. ANSI Z88.2).
General Comments	Releases of this gas/liquid mixture may create flammable, explosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions, especially since the odor threshold of benzene is several ppm above the occupational exposure guideline levels. Air purifying respirators offer no protection against oxygen deficiency, hydrogen sulfide, and simple asphyxiants.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA: 10 STEL 15 (ppm) from ACGIH (TLV) [1998] TWA: 10 STEL 15 CEIL: 20 (ppm) from OSHA (PEL) [1989]
2) Hydrogen	Simple asphyxiant.
3) Carbon dioxide	TWA: 5000 STEL: 30000 (ppm) from ACGIH (TLV) [1998] TWA: 5000 STEL: 30000 (ppm) from OSHA (PEL) [1989]
4) Nitrogen	Simple asphyxiant.
5) Methane	Simple asphyxiant
6) Ethane	Simple asphyxiant
7) Ethylene	Simple asphyxiant.
8) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1989]
9) Propane	TWA: 2500 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1989]
10) Propylene	Simple asphyxiant.
11) Butanes	TWA: 800 (ppm) from ACGIH (TLV) [1998] TWA: 800 (ppm) from OSHA (PEL) [1989]
12) 1,3-Butadiene ("A2" and "Z-2" Carcinogen)	TWA: 2 (ppm) from ACGIH (TLV) [1998] TWA: 2 STEL: 5 AL: 0.5 (ppm) from OSHA (PEL) [1994]
13) Pentanes	TWA: 600 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1976]
14) n-Hexane	TWA: 50 (ppm) from ACGIH (TLV) [1998] SKIN TWA: 500 (ppm) from OSHA (PEL) [1976]
15) Hexane, other isomers	TWA: 500 STEL: 1000 (ppm) from ACGIH (TLV) [1998] TWA: 500 (ppm) from OSHA (PEL) [1989]
16) Cyclohexane	TWA: 300 (ppm) from ACGIH (TLV) [1998] TWA: 200 STEL: 400 (ppm) from ACGIH (TLV) [1999] TWA: 300 (ppm) from OSHA [1976]
17) Benzene ("A1" and "Z-2" Carcinogen)	TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) [1998] - SKIN TWA: 1 STEL: 5 AL: 0.5 (ppm) from OSHA (PEL) [1987] - SKIN
18) Methylcyclohexane	TWA: 400 (ppm) from ACGIH (TLV) [1998] TWA: 500 (ppm) from OSHA (PEL) [1976]
19) Toluene	TWA: 50 (ppm) from ACGIH (TLV) [1998] SKIN TWA: 200 CEIL: 300 (ppm) from OSHA (PEL) [1976]
20) Xylenes	TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [1989] TWA: 100 STEL: 150 (ppm) from ACGIH (TLV) [1998]
21) Ethylbenzene	TWA: 100 STEL: 125 (ppm) from ACGIH (TLV) [1998] TWA: 100 STEL: 125 (ppm) from OSHA (PEL) [1989]
22) Trimethylbenzenes	TWA: 25 (ppm) from ACGIH (TLV) [1998] TWA: 25 (ppm) from OSHA (PEL) [1989]

Sour Naphtha/Hydrogen Mixed Phase Refinery Streams

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Gas/Liquefied Gas/ Liquid Mixture.	Color	Colorless liquid; invisible gas and vapor; white frost at release point.	Odor	Strong, foul smelling; rotten egg odor is unreliable as a warning of possible exposure
Specific Gravity	AP 0.60 to 0.65 (Water = 1)	pH	In the presence of moisture, H ₂ S can convert to acidic H ₂ SO ₄ .	Vapor Density	AP 1.5 (Air = 1)
Boiling Point/Range	AP -253°C to 176°C (-423° to 350°F) (by ASTM D-2887)		Melting/Freezing Point		AP -187° to 12°C (-305° to 55°F) at 14.7 psia
Vapor Pressure	50 to 190 psia at 100°F.		Viscosity (cSt @ 40°C)		Not applicable
Solubility in Water	Moderately soluble in cold water		Volatile Characteristics		This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.
Additional Properties	This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard. Hydrogen, Hydrogen Sulfide, Carbon Dioxide, and Nitrogen Content = 40 to 90 Vol.%; Alkane, Isoparaffin, Alkene, and Cycloalkane Hydrocarbons Content = 8 to 51 Wt.% (ASTM D-1319); C6-C9 Aromatic Hydrocarbon Content = 2 to 9 Wt.% (ASTM D-1319); Average Density at 60°F = 5.21 lbs /gal. (ASTM D-2161).				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions. Polymerization can occur under conditions of extremely high temperature and pressure		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	<p>Hydrogen sulfide: GAS (TCLo): Acute: 10 ppm for 15 minutes (Human) - Eye irritation. GAS (TCLo): Acute: 50 to 100 ppm for 15 minutes (Human) - Respiratory irritation GAS (LC100): Acute: 600 to 750 ppm for 30 minutes (Human) - Respiratory paralysis and death. GAS (LCLo): Acute: 5,700 ug/kg for 8 hours (Human) - Chronic pulmonary edema, coma, and death.</p> <p>Carbon dioxide: GAS (LC50): Acute: 80,000 ppm for 15 minutes (Human) - Tremors, loss of consciousness, and death.</p> <p>Propylene. GAS (LC50): Chronic: 1,250 ppm for 6 hours/day for 14 weeks [Mouse]. GAS (TCLo): Chronic: 5,000 ppm for 6 hours/day for 2 years [Rat] - Reduced olfactory sensory response.</p> <p>Iso-Butane: GAS (TCLo): Acute: 1,040 gm/m³ for 2 hours [Mouse] - Excitement. GAS (LC50): Acute: 57,000 ppm for 15 minutes [Rat] - Tremors, convulsions, and respiratory distress.</p> <p>Iso-Butene (Isobutylene or 2-Methylpropene): GAS (LC50): Acute: 415 gm/m³ for 2 hours [Mouse]. GAS (LC50): Acute: 620 gm/m³ for 4 hours [Rat].</p> <p>n-Butane: GAS (LC50): Acute: 660 gm/m³ for 4 hour(s) [Rat]. GAS (LC50): Acute: 680 gm/m³ for 2 hours [Mouse].</p> <p>1,3-Butadiene: GAS (LC50) Acute: 285 gm/m³ for 4 hour(s) [Rat] GAS (LC50): Acute: 270 gm/m³ for 2 hours [Mouse]. ORAL (LD50): Acute: 5,480 mg/kg [Rat].</p>
----------------------	--

Sour Naphtha/Hydrogen Mixed Phase Refinery Streams

2,2-Dimethylpropane (Neopentane)

INTRAPERITONEAL (LD50) Acute: 100 mg/kg [Mouse].

n-Pentane:

GAS (LC50). Acute. 364 gm/m³ for 4 hour(s) [Rat] - Excitement.

INTRAVENOUS (LD50): Acute: 446 mg/kg [Mouse].

n-Hexane:

GAS (LC50): Acute: 48,000 ppm for 4 hours [Rat].

ORAL (LD50): Acute: 28,710 mg/kg [Rat].

Cyclohexane

GAS (LC50): Acute 22,500 ppm for 4 hours [Rabbit].

ORAL (LD50): Acute. 12,705 mg/kg [Rat]

ORAL (LD50): Acute: 813 to 1,300 mg/kg [Mouse]

ORAL (LD50): Acute: GT 180,000 mg/kg [Rabbit].- Severe diarrhea, vascular damage and collapse, hepatocellular degeneration, and glomerulonephritis.

Benzene:

ORAL (LD50). Acute. 930 mg/kg [Rat] - Tremors and convulsions

ORAL (LD50): Acute: 4,700 mg/kg [Mouse].

ORAL (LD50): Acute: 5,700 mg/kg [Unidentified mammal].

GAS (LC50): Acute: 10,000 ppm for 7 hours [Rat].

GAS (LC50): Acute: 9,980 ppm for 8 hours [Mouse] - General anesthesia, muscle weakness, and dyspnea

DERMAL (LD50): Acute: 48 mg/kg [Mouse].

DERMAL (LD50) Acute. GT 9,400 uL/kg [Rabbit and Guinea Pig].

INTRAPERITONEAL (LD50): Acute: 340 mg/kg [Mouse].

INTRAPERITONEAL (LD50): Acute: 2,890 ug/kg [Rat] - Lung and liver damage plus decreased blood cells.

Methylcyclohexane:

ORAL (LD50): Acute: 2,250 mg/kg [Mouse].

GAS (LC50): Acute: 41,500 mg/m³ for 2 hours [Mouse] - Hypermotility and diarrhea

GAS (LC50): Acute: 15,227 ppm for 1 hour [Rabbit] - General anesthetic, convulsions, and changes in the salivary glands.

Toluene:

ORAL (LD50): Acute: 636 mg/kg or [Rat].

ORAL (LD50): Acute: 4,000 mg/kg or [Cat].

GAS (LC50): Acute: 49,000 mg/m³ for 4 hours [Rat].

GAS (LC50): Acute: 5,320 ppm for 8 hours [Mouse]

GAS (LC50): Acute: 400 ppm for 24 hours [Mouse].

DERMAL (LD50): Acute: 14,100 uL/kg or 12,125 mg/kg [Rabbit].

INTRAVENOUS (LD50): Acute: 1,960 mg/kg [Rat].

INTRAVENOUS (LD50). Acute: 2,000 mg/kg [Mouse].

SUBCUTANEOUS (LD50): Acute: 2,250 mg/kg [Mouse].

INTRAPERITONEAL (LD50): Acute: 59 mg/kg [Mouse].

INTRAPERITONEAL (LD50). Acute. 500 mg/kg [Guinea Pig].

INTRAPERITONEAL (LD50): Acute: 1,332 mg/kg [Rat].

Xylenes:

ORAL (LD50): Acute 4,300 mg/kg [Rat].

GAS (LC50): Acute 4,550 ppm for 4 hours [Rat].

DERMAL (LD50): Acute: 14,100 uL/kg [Rabbit].

SUBCUTANEOUS (LD50): Acute: 1,700 mg/kg [Rat].

INTRAPERITONEAL (LD50): Acute: 2,459 mg/kg [Rat]

INTRAPERITONEAL (LD50): Acute: 1,548 mg/kg [Mouse].

Ethylbenzene:

ORAL (LD50): Acute: 3,500 mg/kg [Rat].

DERMAL (LD50): Acute: 17,800 uL/kg [Rabbit].

ORAL (LD50): Acute: 5,000 mg/kg [Rat]

GAS (LC50): Acute: 18,000 mg/m³ for 4 hours [Rat].

Sour Naphtha/Hydrogen Mixed Phase Refinery Streams

Hydrogen sulfide (H₂S): H₂S causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (LT 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (GT 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Many people have died from overexposure to **carbon dioxide (CO₂) gas**. CO₂ exerts direct toxicity on the heart, resulting in diminished contractile force. It is also a vasodilator, and is the most potent cerebrovascular dilator known. At an airborne concentration of 5,500 ppm for 6 hours, CO₂ has no ill effects, while at 3% (30,000 ppm) it is mildly narcotic and causes reduced hearing, increased blood pressure, and rapid pulse. Concentrations of 50,000 to 80,000 ppm (5 to 8%) produce normal symptoms of hypoxia (see Section 3) within 10 minutes. And, at 8 to 10% in air, CO₂ causes tremors, hypertension, difficulty in breathing, and loss of consciousness within 5 to 10 minutes. Extended exposure to concentrations between 10 and 15% can be lethal. Breathing 20% CO₂ in air for 1 minute causes convulsions, unconsciousness, and usually death.

Long-term exposure to airborne **carbon dioxide** concentrations as low as 0.5 to 1%, while being generally well tolerated, can alter the body's acid-base and calcium-phosphorus balance, resulting in metabolic acidosis and increased calcium deposits in soft tissues. Chronic exposure to levels of 1 to 2% CO₂ in air can stress the adrenal cortex because of constant respiratory stimulation; if not given a period of gradual adaption, this level of exposure is considered dangerous after several hours. CO₂ might also be a threat to the well-being of the unborn if a pregnant woman is exposed enough to cause metabolic acidosis. This decreases the blood supply to the uterus which increases fetal breathing movements and reduces fetal development. Also, laboratory rat studies suggest that CO₂ exposures may adversely affect male reproduction by altering the testes causing premature release of sperm and reduced fertility.

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced **NO ABNORMAL REACTIONS** in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline).

In humans, at concentrations of 6.4% in air or higher, **propylene** causes mild intoxication, dermal sensations, and an inability to concentrate on tasks within two minutes. Gross inhalation of propylene concentrations of 40% or higher for a couple minutes cause reddening of the eyelids and face, tearing, coughing, and sometimes flexing of the legs, reduced blood pressure, and/or disordered heart rhythm. A concentration of 50% causes anesthesia in two minutes, followed by complete recovery without any physiological indications.

Chronic low-level exposures to **ethylene and/or propylene** may entail a possible hazard from the formation of their reactive metabolites, **ethylene oxide and/or propylene oxide**, which are "suspect human carcinogens". However, **ethylene and propylene** have not been shown to be carcinogenic in rat studies. For example, **Propylene** was tested by the National Cancer Institute (NCI) in a two-year, 6 hours/day, 5 days/week inhalation study using rats and mice with exposure concentrations at 5,000 and 10,000 ppm. The resulting data suggested that propylene induces signs of nasal cavity toxicity (epithelial hyperplasia/metaplasia) including increased incidence of neo-plastic lesions in rats, but not in mice. Propylene is NOT considered carcinogenic to either rats or mice even though it may be partially metabolized to **propylene oxide** which has been shown to be mutagenic and produces site of contact tumors in rodents following long-term administration. Propylene has also been found to be a cardiac sensitizer in dogs.

Human volunteers had no apparent effects from exposures of 250 ppm, 500 ppm, and 1,000 ppm concentrations in air of **isobutane and n-butane** for periods of 8 hours daily for 10 days to 14 days, respectively. Chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage.

An **n-Butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane, butylene, and/or 1,3-butadiene** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone.

Sour Naphtha/Hydrogen Mixed Phase Refinery Streams

At very high concentrations, **1,3-butadiene (BD)** produces narcosis with central nervous system depression and/or respiratory paralysis. Lifetime inhalation studies have shown BD or its epoxide metabolites cause multiple organ tumors in various tissues of both rats and mice. It is also a mutagen and causes sexual organ atrophy in test animals. Epidemiology studies amongst BD workers and styrene-butadiene rubber (SBR) workers suggest that BD or BD epoxide metabolite exposures may increase the risk of cancers of the lymphohematopoietic system. Based on these various studies, IARC, NTP, OSHA, ACGIH, and EPA have determined BD to be an "animal carcinogen" and a "probable human carcinogen".

Intentional sniffing abuse of **n-hexane** has caused permanent brain and nervous system damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function, and even paralysis. These neurological effects are pronounced in combination with lack of oxygen supply, especially amongst women. Chronic repeated and/or prolonged overexposure to n-hexane, either by inhalation or skin absorption, has been shown to cause peripheral nerve tissue damage (polyneuropathy). The initial symptoms are numbness of the fingers and toes. Motor weakness can also occur in the digits, but may also involve muscles of the arms, thighs, and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure. The neurotoxic properties of n-hexane may be increased by concurrent exposure to **methyl ethyl ketone, methyl isobutyl ketone, and/or toluene**

n-Hexane is NOT a tumor promotor in mice and NOT considered to be carcinogenic; nor is it teratogenic in mice or rats. n-Hexane, or its metabolite **2,5-hexanedione**, has been shown to cause degeneration of the testes in rats; but, it did NOT produce spermatotoxicity in a multiple end-point test battery in rats given multiple doses for up to 5 days.

Cyclohexane is an eye, skin, and mucous membrane irritant, CNS depressant, and causes narcosis at high concentrations in air. There is a narrow margin between narcosis, loss of reflexes, and death. In experimental animals exposed to lethal concentrations by inhalation or oral route, there was generalized vascular damage and severe degenerative changes in the heart, lungs, liver, kidneys, and brain. Cyclohexane does not act as a promotor for tumors on mice when exposed to dimethylbenzanthracene; and, it did not induce unscheduled DNA synthesis in cultured human lymphocytes. It is not mutagenic in the Salmonella/microsome (Ames) or the mouse lymphoma L5178Y assays, with or without metabolic activation, however, it did increase the number of chromosomal aberrations in bone marrow cells of rats exposed to between 100 and 300 ppm for 6 hours/day for 5 days. These chromosomal aberrations did not appear to be dose-related.

Benzene has an IDLH (immediately dangerous to life or health) concentration = 500 ppm. Its estimated lethal dose for a normal human adult is one teaspoon to one ounce (AP 10 mL). Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes.

Benzene is a known animal carcinogen and a human leukemogen. In addition, NTP, IARC, EPA, OSHA, and ACGIH list benzene as a "Human Carcinogen." Repeated and prolonged overexposure to benzene vapors (GT 20 ppm in air) may cause toxicity to blood-forming tissues. Chronic exposure symptoms include decreased blood cell and platelet counts, leukopenia, aplastic anemia, or acute myelogenous leukemia (AML). Also, chronic inhalation of benzene vapors have been found to cause fatigue, nervousness, irritability, blurred vision, and labored breathing. Overexposure to benzene has been associated with chromosomal aberrations in human white blood cells, both laboratory animal and human bone marrow cell damage, and in vitro mammalian cells DNA damage. Elevated frequencies of chromosomal aberrations have been observed in peripheral white blood cells and bone marrow of workers exposed to high benzene concentrations known to be associated with signs of chronic poisoning. Ethanol consumption may have a synergistic effect and increase blood system changes caused by benzene exposures. Children and teenagers have a lower resistance to bone marrow poisons.

Studies with pregnant laboratory animals have demonstrated that **benzene** is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice.

Rats inhaling **methylcyclohexane** at an airborne concentration of 15,250 ppm for 1 hour displayed tremors, loss of coordination, anesthesia, and convulsions. Inhalation of 10,050 ppm for 6 hours per day for 14 days showed rodent weight loss or decreased weight gain and changes in the structure of their salivary glands. Using rabbits, methylcyclohexane was shown to have an LD50 somewhere between 3,300 ppm and 7,300 ppm when exposed repeatedly for 6 hours per day, 5 days per week, for 3 weeks. Death was preceded by conjunctival congestion with mucoid secretion and lacrimation, salivation, coughing, sneezing, labored breathing, and diarrhea. Lethal oral dosing of rabbits caused lethargy, severe diarrhea, and circulatory collapse. Vascular and degenerative lesions were observed in the kidneys and liver.

Sour Naphtha/Hydrogen Mixed Phase Refinery Streams

Toluene (methylbenzene) has been a major solvent of intentional inhalation abuse. Deliberate long-term inhalation of high concentrations of toluene (glue sniffing, etc.) has been shown to cause liver, kidney, central nervous system, and permanent brain damage. Effects such as impaired speech, visual disturbances, and hearing loss, loss of balance and/or muscle control, and memory loss have been reported. Exposures of 100 to 200 ppm in air for 24 hours cause hallucinations, distorted perceptions, and changes in motor activity. Studies have indicated that children of women who sniffed massive exposures of toluene during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. Isolated case reports have suggested a spectrum of congenital defects similar to those seen in fetal alcohol (ethanol) syndrome. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate.

Long-term rodent inhalation studies with **toluene** produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness, and impaired reaction time. Also, rats exposed to 1,200 ppm and 1,400 ppm of toluene in air for 14 hours per day for 5 or 4 weeks (respectively) exhibited high-frequency hearing loss. Several animal studies using pregnant rodents have shown that toluene exposures may all cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation studies, toluene has not been shown to be carcinogenic; nor is it mutagenic in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

Animal studies suggest that **toluene** causes kidney, liver, and/or lung dysfunction and cardiac (heart muscle) sensitization to epinephrine or other adrenalin-like agents. This sensitization may cause fatal changes in heart beat rhythms. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency).

An inhalation study with laboratory animals indicated an association of **xylene** with hearing loss in rats. Several animal studies using pregnant rodents have shown that **ethylbenzene** and the **mixed xylene isomers (dimethylbenzenes)** may all cause embryo and/or fetotoxicity. Inhalation and feeding studies involving pregnant laboratory animals have produced limited evidence of fetal toxicity including increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes.

Chronic overexposure to **xylene** may produce irreversible damage to the central nervous system that can be increased by the consumption of ethanol (alcoholic drinks). Drinking beverages which contain ethanol in conjunction with xylene exposure increases the alcoholic effects and impairs the clearance of xylenes from the body. Xylene isomers accumulate in the adipose (fat) tissues, from which they are slowly released. Complete clearance may take several days following exposure.

The National Toxicology Program (NTP) recently completed a 2-year inhalation bioassay on **ethylbenzene** in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200, and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels. However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level; and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Hyperplasia was also observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear. NTP, IARC, and OSHA have not designated ethylbenzene as a carcinogen.

Trimethylbenzenes are primary skin irritants and may cause asthmatic bronchitis and/or anemia. Based upon animal reproductive/developmental studies, trimethylbenzenes may also cause fetal toxicity.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, the **propylene**, **butenes**, and **hydrogen sulfide** components of this material may contribute to generation of atmospheric smog. If released, the volatile **aromatic hydrocarbon components (toluene, xylenes, and ethylbenzene)** may also contribute to the creation of atmospheric smog. The atmospheric half-lives of **propane**, **propylene**, and **butenes** under photochemical smog conditions are estimated to be between 5 to 8 hours; and, experimental data shows that significant photooxidation of propylene occurs rapidly within 14 to 21 hours. The atmospheric half-lives of **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days. Photooxidation of **propane**, **isobutane**, and **n-butane** in air (LT 8%) are not considered to be environmentally significant.

Sour Naphtha/Hydrogen Mixed Phase Refinery Streams

Hydrogen sulfide residence times in the atmosphere range from about one day to more than 40 days, depending upon the season, latitude, and presence of other air pollutants. Reduced temperatures increase the residence time. The **pentanes, n-hexane, and hexane isomers** all have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. **Toluene** has a half-life of from 3 hours to slightly over 1 day and **Cyclohexane** has a half-life of from 6 hours to over 4 days when hydroxyl radicals are present.

If spilled, the naphtha portion of this stream, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. Also, toxic **hydrogen sulfide** is moderately soluble in water.

Environmental Fate

The naphtha portion of this mixture is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this gas/liquid to the atmosphere should be avoided. Maximize material recovery for reuse or recycling.

If spilled and the naphtha portion of this mixture is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase and vapor emissions from the process might prove to be a potential health hazard. The naphtha portion of this mixture is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U.S. Department of Transportation regulated material.		
Proper Shipping Name	Liquefied gas, flammable, toxic, n.o.s. Inhalation Hazard Zone B (Hydrogen sulfide)		
Hazard Class	Class 2.3: Poisonous gas.	Packing Group(s)	Not applicable.
		UN/NA ID	UN1953
Reportable Quantity	The Reportable Quantity (RQ) substance components present in this material which might require DOT HAZMAT bill-of-lading display are Benzene, Xylenes, and/or Hydrogen sulfide.		

**Sour Naphtha/Hydrogen
Mixed Phase Refinery Streams**

Emergency Response Guide No. 119

Placards

HAZMAT STCC No.

49 057 66

MARPOL III Status

Not a DOT "Marine Pollutant"
per 49 CFR 171.8.**SECTION 15: REGULATORY INFORMATION**

TSCA Inventory	This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. A chemical substance present in this product or refinery stream subject to this statute is Hydrogen sulfide [CAS No. = 7783-06-4] concentration: 0 to 2.2%.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, Reactivity, and Acute (Immediate) & Chronic (Delayed) Health Hazards.
SARA 313	This material contains the following components in concentrations which might be at or above de minimis levels and are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: Hydrogen sulfide [CAS No. = 7783-06-4] concentration: 0 to 2.2% Ethylene or Ethene [CAS No. = 74-85-1] concentration: 0 to 2% Propylene or Propene [CAS No. = 115-07-1] concentration: 0 to 2% 1,3-Butadiene [CAS No. = 106-99-0] concentration: 0 to 0.4% n-Hexane [CAS No. 110-54-3] concentration: 1 to 7% Cyclohexane [CAS No. 110-82-7] concentration: 0 to 2% Benzene [CAS No. 71-43-2] concentration: 0.1 to 1% Toluene [CAS No. 108-88-3] concentration: 0.8 to 2% Xylenes [CAS No. 1330-20-7] concentration: 1 to 3%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances that might be present in this stream which are subject to this statute are: Hydrogen sulfide [CAS No. = 7783-06-4] (RQ = 100 lbs. [45.36 kg]) concentration: 0 to 2.2% n-Hexane [CAS No. 110-54-3] (RQ = 5,000 lbs. [2,270 kg]) concentration: 1 to 7% Cyclohexane [CAS No. 110-82-7] (RQ = 1000 lbs. [453.6 kg]) concentration: 0 to 2% Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 0.1 to 1% Toluene [CAS No. 108-88-3] (RQ = 1000 lbs. [453.6 kg]) concentration: 0.8 to 2% Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 1 to 3% Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 0.3 to 0.7%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material contains the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, they may be subject to requirements of California Health & Safety Code Section 25249.5: 1,3-Butadiene [CAS No. = 106-99-0], Benzene [CAS No. 71-43-2], and Toluene [CAS No. 108-88-3].
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2.

Sour Naphtha/Hydrogen Mixed Phase Refinery Streams

Additional Regulatory Remarks

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in this material as a "Volatile Organic Compounds (VOC)" which contribute significantly to air pollution which endangers public health and welfare": **Ethylene (Ethene), Propylene (Propene), 1,3-Butadiene, 1-Butene, n-Pentane, Cyclohexane, Benzene, Methylcyclohexane, Toluene, and Xylenes.**

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this product which are subject to this statute are: **Hydrogen, Methane, Ethane, Ethylene, Propane, Propylene (1-Propene), Isobutane (Propane, 2-methyl), various Butenes, Butane, 1,3-Butadiene, Isopentane (Butane, 2-methyl), n-Pentane, 2,2-Dimethylpropane (Neopentane), and Hydrogen Sulfide**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Liquid		
Color	Transparent, colorless to slightly yellow	Odor	Light hydrocarbon to sweet aromatic hydrocarbon Odor threshold is 1 to 7 ppm in air

DANGER! Extremely flammable liquid; vapor may cause flash fire or explosion!
High vapor concentrations reduce oxygen available for breathing!
Mist or vapor may irritate the eyes, nose, and respiratory tract!
Liquid contact may cause mild to moderate eye irritation and/or moderate to severe skin irritation!
May be harmful if inhaled or absorbed through the skin!
Overexposures may cause central nervous system (CNS) depression and target organ effects such as hearing loss and/or liver, kidney, or peripheral nervous system damage!
May be harmful or fatal if ingested! Aspiration into the lungs can cause pulmonary edema and chemical pneumonia!
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
Based upon animal testing, vaporized Gasoline (a similar material) causes tumors! Potential cancer hazard!
Contains low levels of Benzene and Ethylbenzene!
May cause anemia, leukemia, and/or other blood disorders!
Mutagenic hazard; may cause genetic damage!
Based upon animal testing, may adversely affect reproduction!
Spills may create a slipping hazard!

SECTION 3: HAZARDS IDENTIFICATION

Also see *Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.*

Major Route(s) of Entry Skin Contact Eye Contact Absorption Inhalation

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of this mixture's vapor may cause upper respiratory tract irritation, headache, nausea, vomiting, and/or central nervous system (CNS) depression. Components of this mixture may also produce mild narcotic effects. Symptoms may include euphoria, excitation or giddiness, abdominal pain, loss of appetite, fatigue, muscular weakness, and staggering gait. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon the exposure duration. High vapor concentrations can displace the amount of oxygen in air available to breathe below that necessary to sustain life (hypoxia), especially if working in confined spaces. Approximately 20,000 ppm (or 2 vol %) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 to 10,000 ppm for only 5 minutes.
Eye Contact	Actual human exposures indicate that this product can cause mild to moderate eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling. Liquid contact may cause conjunctivitis, small areas of superficial corneal necrosis, and/or permanent clouding of the cornea.
Skin Contact	Actual human exposures indicate that this product can cause moderate to severe skin irritation. Short-term contact symptoms include redness, itching, and burning or blistering of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause severe dermatitis. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and severe tissue damage.

Full-Range Reformate Naphtha (C4-C12 Hydrocarbons)

Ingestion	<p>Due to its volatile nature, ingestion is not normally an applicable route of exposure. However, if swallowed, this material may cause a "freeze burn" or irritation with a burning sensation of the mucous membranes in the mouth, throat, and esophagus. The liquid portion can be readily absorbed by the stomach and intestinal tract. Symptoms include nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above).</p> <p>Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.</p>
Chronic Health Effects Summary	<p>Altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called "Petrol Sniffers Encephalopathy"), delirium, seizures, and sudden death have been common results for gasoline abusers. Intentional misuse by deliberately concentrating and inhaling this material may be harmful or fatal.</p> <p>Even with acute exposures, n-hexane is toxic to the peripheral nerves, characterized by numbness, tingling, or pain in the extremities, progressively worsening of neuromuscular motor coordination (polyneuritis or polyneuropathy), and even partial paralysis. And, based upon animal studies, n-hexane's metabolite, 2,5-hexanedione, has been shown to cause degeneration of the testes.</p> <p>Benzene is considered to be a cancer causing agent. It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML). Benzene is also capable of causing changes in genetic material (chromosomes). Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy. Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents.</p> <p>Available information indicates that toluene is NOT teratogenic, but it can be toxic to the embryo and fetus and may reduce fertility. In animal tests, high inhaled doses of toluene has caused reduced litter sizes, retarded development of the fetus, and increased incidence of non-lethal abnormalities.</p> <p>Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Chronic occupational toluene and xylene exposures have caused auditory nerve degeneration.</p> <p>At high exposure concentrations, ethylbenzene has been associated with multiple organ tumors in laboratory animals.</p> <p>Based upon animal testing, the C8 aromatic hydrocarbon components (xylene isomers and ethylbenzene) might be assumed to cause embryo and fetal toxicity, spontaneous abortions, and/or decreased fetal and newborn weights if overexposures occur during a woman's early gestation period. And, the C9 aromatic hydrocarbons (cumene, n-propylbenzene, trimethylbenzenes, indene, and ethylmethylbenzenes) are presumed to cause fetal toxicity and/or decreased fetal and newborn weights if overexposure occurs during a woman's early gestation period.</p> <p>Naphthalene is considered to be a toxic substance as defined by both human exposure and laboratory testing results. And, based upon animal testing, it might be considered carcinogenic. (See Section 11.)</p>
Conditions Aggravated by Exposure	<p>Personnel with pre-existing nervous system disease, neurological conditions, skin disorders, impaired hearing, liver, or kidney function, blood disorders, or chronic respiratory diseases, and women attempting to conceive should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this material. They should take additional precautions to minimize or avoid exposure.</p> <p>Exposure to high concentrations of this material may increase the sensitivity of the heart to epinephrine (adrenalin) and catecholamine-like drugs. Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians").</p>
Target Organs	<p>The substance is toxic to lungs, nervous system, especially the auditory and peripheral nerves, brain, liver, kidneys, blood and blood-forming tissues, mucous membranes, skin, eyes, and possibly, the heart, thymus, lymph nodes, and reproductive systems.</p>
Carcinogenic Potential	<p>This material contains benzene and ethylbenzene at concentrations above 0.1%. Benzene is considered to be a known human carcinogen by OSHA, IARC and NTP and Ethylbenzene are considered possibly carcinogenic to humans by IARC. (See Section 11.)</p>

Full-Range Reformate Naphtha (C4-C12 Hydrocarbons)

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200)									
OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	<p>Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.</p> <p>If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.</p> <p>Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse). If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IA Flammable Liquid. Extremely flammable!
Flash Point Method	CLOSED CUP -48° to -37°C (-55° to -35°F) (Tagliabue [ASTM D-56])
Lower Flammable Limit	0.9% in Air. Upper Flammable Limit 8.5% in Air.
Autoignition Temperature	225° to 275°C (435° to 527°F) by ASTM E-659
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors.

Full-Range Reformate Naphtha (C4-C12 Hydrocarbons)

Special Properties

Extremely Flammable Liquid¹ This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Mists or sprays may be flammable at temperatures below the flash point. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard if released into confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.

A static electrical charge can accumulate as a result of transfer flow or agitation. Discharge (static spark) can ignite vapors, especially in cold, dry weather conditions. Special slow load and monitoring procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing middle distillates or other higher flash point products. To reduce this hazard, receiving containers should always be grounded and the loading nozzle must be kept in contact with the container during the entire filling process. Do not fill any portable container in or on a vehicle without proper bonding.

Extinguishing Media

SMALL FIRE Use dry chemicals, carbon dioxide (CO₂), foam, water fog, or inert gas (nitrogen). **LARGE FIRE** Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.

Protection of Fire Fighters

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat, cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquid¹ Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Eliminate all potential ignition sources because a liquid spill will vaporize rapidly. A vapor-suppressing foam may be used to reduce vapors. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material even when wearing proper respiratory equipment and fire-resistant protective clothing. Do not direct water at the source of leak, but, use water spray to reduce vapors or divert vapor cloud drift. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible, in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations. Spills will most likely need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Full-Range Reformate Naphtha (C4-C12 Hydrocarbons)

Handling

A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with mild soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room, and preferably refrigerated. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below), then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

The personal protective equipment depicted below is recommended for use only at this facility.

Eye Protection

Safety glasses with side shields are recommended as a minimum protection. When there is a likelihood of misting, splashing, or spraying, use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent). During transfer operations or when this material is being released under pressure, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact and use impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with vapors and liquid. Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use this material as a skin cleaner.

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Full-Range Reformate Naphtha (C4-C12 Hydrocarbons)

Respiratory Protection For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).

General Comments Releases of this product may create flammable, explosive, and/or oxygen-deficient atmospheres (<19.5 Vol % in air). DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability. If the Lower Explosive Limit (LEL) for this product is exceeded, all entry into the contaminated area/confined space should be prohibited. Odor is an inadequate warning for hazardous conditions.

Warning! Use of this hydrocarbon fuel in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and inadequate oxygen levels for breathing.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Gasoline ("A3" Animal Carcinogen)	TWA: 300 STEL: 500 (ppm) from ACGIH (TLV) TWA: 300 STEL: 500 (ppm) from OSHA (PEL)
2) Petroleum Distillates (Naphtha)	TWA: 400 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
3) Butane	TWA: 800 (ppm) from ACGIH (TLV) TWA: 800 (ppm) from OSHA (PEL) [Proposed]
4) Pentane, all isomers	TWA: 600 (ppm) from ACGIH (TLV) TWA: 600 STEL: 750 (ppm) from OSHA (PEL) [Proposed] TWA: 1000 (ppm) from OSHA (PEL)
5) Cyclopentane	TWA: 600 (ppm) from ACGIH (TLV) TWA: 600 (ppm) from OSHA (PEL) [Proposed]
6) Hexane, other isomers	TWA: 500 STEL: 1000 (ppm) from ACGIH (TLV) TWA: 500 STEL: 1000 (ppm) from OSHA (PEL) [Proposed]
7) 1-Hexene	TWA: 30 (ppm) from ACGIH (TLV) TWA: 50 (ppm) from ACGIH (TLV) [Proposed]
8) Hexane (n-Hexane)	TWA: 50 (ppm) from ACGIH (TLV) - SKIN TWA: 50 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
9) Cyclohexane	TWA: 300 (ppm) from ACGIH (TLV) TWA: 100 (ppm) from ACGIH (TLV) [Proposed] TWA: 300 (ppm) from OSHA (PEL)
10) Heptane (n-Heptane)	TWA: 400 STEL: 500 (ppm) from ACGIH (TLV) TWA: 400 STEL: 500 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
11) Methylcyclohexane	TWA: 400 (ppm) from ACGIH (TLV) TWA: 400 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
12) Benzene ("A1" and "Z-2" Known Human Carcinogen)	TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) - SKIN TWA: 1 STEL: 5 AL: 0.5 (ppm) from OSHA (PEL) - SKIN
13) Toluene	TWA: 50 (ppm) from ACGIH (TLV) - SKIN TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [Proposed] TWA: 200 CEIL: 300 (ppm) from OSHA (PEL)
14) Octane, all isomers	TWA: 300 (ppm) from ACGIH (TLV) TWA: 300 STEL: 375 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
15) Xylene, Mixed Isomers	TWA: 100 STEL: 150 (ppm) from ACGIH (TLV) TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [Proposed]
16) Ethylbenzene ("A3" Animal Carcinogen [Proposed])	TWA: 100 STEL: 125 (ppm) from ACGIH (TLV) TWA: 100 STEL: 125 (ppm) from OSHA (PEL) [Proposed]
17) Nonane, all isomers	TWA: 200 (ppm) from ACGIH (TLV) TWA: 200 (ppm) from OSHA (PEL) [Proposed]
18) Cumene	TWA: 50 (ppm) from ACGIH (TLV) TWA: 50 (ppm) from OSHA (PEL) - SKIN [Proposed]
19) Trimethylbenzene (mixed isomers)	TWA: 25 (ppm) from ACGIH (TLV) TWA: 25 (ppm) from OSHA (PEL) [Proposed]
20) Indene	TWA: 10 (ppm) from ACGIH (TLV) TWA: 10 (ppm) from OSHA (PEL) [Proposed]
21) Naphthalene	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) - SKIN TWA: 10 STEL: 15 (ppm) from OSHA (PEL) [Proposed] TWA: 10 (ppm) from OSHA (PEL)

Full-Range Reformate Naphtha (C4-C12 Hydrocarbons)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid	Color	Transparent, colorless to slightly yellow	Odor	Light hydrocarbon to sweet aromatic hydrocarbon. Odor threshold is 1 to 7 ppm in air
Specific Gravity	0.67 to 0.73 (Water = 1)	pH	Not applicable	Vapor Density	2.7 to 3.1 (Air = 1)
Boiling Point/Range	28° to 225°C (82° to 437°F) [ASTM D-86]			Melting/Freezing Point	<-75°C (<-103°F) [ASTM D-97]
Vapor Pressure	15 to 25 mm Hg at 20°C (68°F) or 10 to 16 Reid-psia at 37.8°C (100°F)			Viscosity (cSt @ 40°C)	0.5 to 1.5 [ASTM D-445]
Solubility in Water	Slightly soluble in cold water (<0.2%)			Volatile Characteristics	Volatile Organic Compounds (VOC) Content = 100%, 750 gm/L
Additional Properties	Alkane, Isoparaffin, Cycloalkane, and Naphthene Hydrocarbons Content = 57 to 91.5 Wt.% (ASTM D-3257), C6-C11 Aromatic Hydrocarbons Content = 6 to 25 Wt.% (ASTM D-2267), Olefin Hydrocarbons Content = 3.5 to 18 Wt.% (ASTM D-1319), Average Density at 60°F = 5.827 lbs/gal (ASTM D-2161), Dry Point Temperature = 425°F (218°C) (ASTM D-86), Evaporation Rate = 8 to 10 when n-Butyl acetate = 1.0, Sulfur Content = <0.05 Wt.% (ASTM D-2922); Heat Value = 19,500 to 21,000 Btu				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide, and oxygen		
Hazardous Decomposition Products	No substances are readily identified from composition, but, no degradation data is available		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Full-Range Catalytic Reformed Naphtha (Petroleum)

VAPOR	(LC ₅₀)	Acute	>5,220 mg/L (Rat screen level) (4 hours) - No deaths
ORAL	(LD ₅₀)	Acute	6,620 mg/kg (Male Rat) - Diarrhea, somnolence, and hyperactivity
ORAL	(LD ₅₀)	Acute	5,390 mg/kg (Female Rat) - Diarrhea, somnolence, and hyperactivity
DERMAL	(LD ₅₀)	Acute	>2,000 mg/kg (Rabbit screen level)
DRAIZE EYE		Acute	Mild to moderate eye irritant (Rabbit).
DRAIZE DERMAL		Acute	Moderate to severe skin irritant (Rabbit)
BUEHLER DERMAL		Acute	Non-sensitizing (Guinea Pig)
MUTAGENICITY			
	modified Ames Assay		Negative (Salmonella typhimurium)
	in-vivo Bone Marrow Assay		Negative (Rat)
	in-vitro Lymphoma Assay		Positive with and negative without S9 activation (Mouse)

UNLEADED GASOLINE (a similar material):

VAPOR	(TE _{LO})	Acute	140 ppm (Human) (8 hours) - Mild eye irritant ¹
VAPOR	(TE _{LO})	Acute	500 ppm (Human) (1 hour) - Moderate eye irritant ¹
VAPOR	(TC _{LO})	Acute	900 ppm (Human) (1 hour) - CNS and pulmonary effects
DERMAL	(TD _{LO})	Acute	53 mg/kg (Human) - Skin allergy effects.
VAPOR	(LC ₅₀)	Acute	101,200 ppm (Rat, Mouse, & Guinea Pig) (5 minutes)

Full-Range Reformate Naphtha (C4-C12 Hydrocarbons)

In a large epidemiological study on over 15,000 persons, no increased risk of kidney cancer was seen in association with **gasoline** exposures for employees at several petroleum refineries or amongst residents located near these refineries. In another study, no increased risk of kidney cancer was seen amongst petroleum refinery workers, but there was a slight trend in kidney cancers among service station employees, especially after a 30-year latency period.

Two-year inhalation toxicity studies with **fully vaporized unleaded gasoline** (at 67, 292, & 2,056 ppm in air) produced kidney damage and kidney tumors in male rats, but not in female rats or mice of either sex. Female mice developed a slightly higher incidence of liver tumors compared to controls at the highest concentration. Results from subsequent scientific studies suggest that the kidney damage, and probably the kidney tumor response, is unique to the male rat. An EPA draft policy statement takes account of alpha-2u-globulin findings as a basis for discarding male rat kidney data in determining whether gasoline is a carcinogen. In additional rat studies, the maternal and developmental NOAEL was determined to be 9,000 ppm (75% of the LEL value). Under conditions of the study, **volatilized unleaded gasoline vapor** did NOT produce evidence of any type of developmental toxicity.

There were no benzene-induced blood toxin or leukemia effects noted in laboratory animals following long-term exposures to **fully-volatilized unleaded gasoline vapor containing 2 vol.% benzene**. However, the relative risk to humans for benzene in gasoline is still unknown.

An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. And, **n-pentane** caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure.

Human volunteers had no apparent effects from exposure concentrations of 250 ppm, 500 ppm, and 1,000 ppm of **isobutane and n-butane** in air for periods of 8 hours daily for 10 days to 14 days, respectively. However, chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane and butylenes** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone.

Inhalation of 500 ppm of **isopentane or n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects, however, higher exposure concentrations of 90,000 to 120,000 ppm (9-12 Wt.% in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. Rat 28-day feeding studies done on both **isopentane and n-pentane** using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

Intentional abuse of products containing n-hexane have been associated with permanent brain and nervous system damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function and even paralysis. These neurological effects are pronounced in combination with lack of oxygen supply, especially among women. Chronic repeated or prolonged overexposure to n-hexane, either by inhalation or skin absorption, has been associated with peripheral neuropathy in both human workers and rodents. The neurotoxic properties of n-hexane may increase with concurrent exposure to methyl ethyl ketone, methyl isobutyl ketone or toluene. n-Hexane has been associated with testicular degeneration and epididymal lesions in rats. Also, n-hexane produced fetal toxicity and reduced fetal weight in mice at maternally toxic doses.

Other **hexane isomers** can cause eye and skin irritation; but they were not shown to be mutagenic in the Salmonella/microsome (Ames) assay. They are not considered neurotoxic or carcinogenic.

Cyclohexane can cause eye, skin and mucous membrane irritation, CNS depression, narcosis, and death at elevated concentrations. In experimental animals exposed to lethal concentrations by inhalation or oral routes, there was generalized vascular damage and severe degenerative changes in the heart, lungs, liver, kidneys and brain. Cyclohexane does not act as a promotor for tumors on mice when exposed to dimethylbenzanthracene. Further, it did not induce unscheduled DNA synthesis in cultured human lymphocytes. It is not mutagenic in the Salmonella/microsome (Ames) or the mouse lymphoma L5178Y assays, with or without metabolic activation, however, it did increase the number of chromosomal aberrations in bone marrow cells of rats exposed to between 100 and 300 ppm for 6 hours/day for 5 days. These chromosomal aberrations did not appear to be dose-related.

Benzene has an IDLH (immediately dangerous to life or health) concentration of 500 ppm. Its estimated lethal dose for a normal human adult is one teaspoon to one ounce (AP 10 mL). Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes. Prolonged and repeated exposure to high concentrations of benzene is associated with injury to blood forming organs and anemia. Consumption of alcohol may increase the blood

Full-Range Reformate Naphtha (C4-C12 Hydrocarbons)

system changes related to benzene exposure. It is linked to the development of acute myelogenous leukemia (AML) in humans. NTP, IARC, and OSHA list benzene as carcinogenic to humans. Studies of workers exposed to high levels of benzene have identified humoral and cellular immunity impairment and a decrease in levels of circulating leukocytes. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice. Animal studies have shown testicular effects and alterations in reproductive cycles with some evidence of developmental effects. Studies with pregnant laboratory animals have demonstrated that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity.

n-Heptane is a skin, mucous membrane, and respiratory tract irritant, but non-irritating to the eyes. It is readily absorbed by either inhalation or dermal exposure. Overexposures may cause decreased red blood cell counts, liver and heart damage, and central nervous system depression. These higher exposures also decreased the myocardial threshold to the arrhythmogenic effects (irregular heart beats) of epinephrine, producing only a narrow margin of safety between exposures causing CNS effects, cardiac effects, and loss of consciousness. n-Heptane is metabolized in the liver to form alcohols and ketones, including neurotoxic **2,5-heptanedione** which is detectable in small amounts in the urine of exposed humans. One occupational exposure study with **95% purity n-heptane** from 1 to 9 years duration concluded that it could produce minimal peripheral nerve damage with numbness and tingling of the extremities in the stocking-and-glove areas. Polyneuropathy was reversible within a year following removal of exposure. n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not expected to be carcinogenic.

Rats inhaling **methylcyclohexane** at an airborne concentration of 15,250 ppm for 1 hour displayed tremors, loss of coordination, anesthesia, and convulsions. Inhalation of 10,050 ppm for 6 hours per day for 14 days showed rodent weight loss or decreased weight gain and changes in the structure of their salivary glands. Using rabbits, methylcyclohexane was shown to have an LD50 somewhere between 3,300 ppm and 7,300 ppm when exposed repeatedly for 6 hours per day, 5 days per week, for 3 weeks. Death was preceded by conjunctival congestion with mucoid secretion and lacrimation, salivation, coughing, sneezing, labored breathing, and diarrhea. Lethal oral dosing of rabbits caused lethargy, severe diarrhea, and circulatory collapse. Vascular and degenerative lesions were observed in the kidneys and liver.

Deliberate long-term inhalation of **toluene** at high concentrations (e.g., glue sniffing) has been associated with reversible liver effects, permanent kidney damage, CNS depression, brain damage, and cardiac (heart muscle) sensitization. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency). In addition, intentional abuse behavior increases the risk for reproductive effects including pre-term delivery, prenatal death and growth retardation. Also, case studies of persons abusing toluene have revealed isolated incidences of birth defects. Long-term inhalation studies with toluene produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness and impaired reaction time in laboratory animals. Also, in long-term laboratory studies, rats exposed to high concentrations (1,200 to 1,400 ppm) of toluene exhibited high-frequency hearing loss. Case studies have reported hearing damage in humans exposed elevated concentrations of toluene and other mixed solvents.

Studies have indicated that children of women who sniffed massive exposures of **toluene** during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate. Several animal studies using pregnant rodents have shown that toluene exposures may cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation studies, toluene has not been shown to be carcinogenic, nor is it mutagenic in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

2,2,4-Trimethylpentane (iso-octane) was highly irritating to mice at a 1,000 ppm in air exposure for 5 minutes and respiratory arrest occurred at exposures above 10,000 ppm for 5 minutes. CNS depression was observed at concentrations between 8,000 and 10,000 ppm in air. Kidney tubule necrosis, hyaline droplet formation, and acute renal failure were seen in male rats following oral administration of 10 gm/kg, 8 mL/kg, or 2,100 mg/kg of iso-octane for 2, 3, and 4 weeks, respectively.

Overexposure to **xylene isomers** may cause upper respiratory tract irritation, headache, cyanosis, blood serum changes, CNS damage, and narcosis. Effects may be increased by the consumption of ethanol (alcoholic beverages) which impairs clearance from adipose (fat) tissues. Also, ototoxicity has been associated with chronic overexposure to xylene. An inhalation study with laboratory rats also indicated an association between elevated mixed xylene exposures and hearing loss. Lung inflammation and liver damage were identified as health effects in chronic studies using guinea pigs.

Full-Range Reformate Naphtha (C4-C12 Hydrocarbons)

Two-year rat and mouse gavage studies by the National Toxicology Program (NTP) on **mixed xylene isomers including 17% ethylbenzene (dimethylbenzenes)** showed "no evidence of carcinogenicity" Also, a two-year mixed xylenes skin-painting study on shaved rats and mice showed no incidence of non-neoplastic or neoplastic lesions And, none of the components were mutagenic when tested in either the modified Ames, Chinese hamster ovary cell with and without metabolic activation, or sister-chromatid mutagenicity assays Animal inhalation and feeding studies have also associated embryo and fetotoxicity with maternally toxic dose exposures of mixed xylene isomers and ethylbenzene Fetal toxicity included increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes The significance of these animal study results to humans is not known

NTP completed a 2-year inhalation bioassay of **ethylbenzene** in rodents The study was conducted in rats and mice at exposure concentrations of 0, 75, 200 and 750 ppm No significant effects were observed at the 75 and 200 ppm levels However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level; and male rats had higher incidences of renal tubule carcinomas Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Also, hyperplasia was observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear However, based upon this data, the IARC has designated ethylbenzene as possibly carcinogenic to humans (Group 2B).

Rats inhaling **n-nonane** at an airborne concentration of 1,500 ppm for 7 days displayed mild tremors and loss of coordination Inhalation of 1,600 ppm for 6 hours per day for 90 days showed animal weight loss or decreased weight gain and changes in the structure of their salivary glands And, liver damage and an altered response to drugs were seen in rats given n-nonane for 2 to 7 days.

Trimethylbenzenes are primary skin irritants and may cause asthmatic bronchitis and/or anemia Levels of total hydrocarbon vapors present in the breathing atmosphere of these workers ranged from 10 to 60 ppm Its TC₁₀ for humans 10 ppm, with somnolence and respiratory tract irritation noted. In inhalation studies with rats, four of ten animals died after exposures of 2,400 ppm for 24 hours An oral dose of 5 mL/kg resulted in death in one of ten rats. Minimum lethal intraperitoneal doses were 1.5 to 2.0 mL/kg in rats and 1.13 to 12 mL/kg in guinea pigs. **Mesitylene (1,3,5-Trimethylbenzene)** inhalation at concentrations of 1.5, 3.0, and 6.0 mg/L for six hours was associated with dose-related changes in white blood cell counts in rats. No significant effects on the complete blood count were noted with six hours per day exposure for five weeks, but elevations of alkaline phosphatase and SGOT were observed Central nervous system depression and ataxia were noted in rats exposed to 5,100 to 9,180 ppm for two hours Based upon animal reproductive/developmental studies, trimethylbenzenes may also cause fetal toxicity.

Indene and ethylmethylbenzenes are primary skin irritants Overexposure has been associated with kidney damage and increased blood cholinesterase levels. In inhalation developmental studies, indene and other **C9 aromatic hydrocarbons** have been associated with decreased fetal and newborn pup weights

Naphthalene is a potential irritant to eyes, skin and lungs Ingestion of naphthalene has been associated with severe red blood cell and liver damage leading to death Following prolonged or repeated exposures, naphthalene has been shown to cause cataracts, optical neuritis, hemolytic and aplastic anemia, kidney damage (jaundice), and possibly neurotoxicity In animal studies, naphthalene caused fetal effects and decreased spleen weights in pregnant female mice In an NTP sponsored study, naphthalene produced a dose related increase in tumors at the 30 and 60 ppm exposure level in both male and female rats Higher incidences of respiratory epithelial adenomas, olfactory epithelial neuroblastomas and non-neoplastic lesions of the nose were observed as compared to controls. Cytogenic studies with Chinese hamster ovary cells have demonstrated sister chromatid exchanges and chromosomal aberrations The relevance of these studies to human health is unclear

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this naphtha, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life This material will normally evaporate rapidly if spilled If released, volatile **aromatic hydrocarbon components (benzene, toluene, xylenes, ethylbenzene, cumene, and trimethylbenzenes)** may contribute to the creation of atmospheric smog The atmospheric half-lives of the **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days Photooxidation of **isobutane and n-butane** in air (<8%) is not considered to be environmentally significant **Isopentane, n-pentane, n-hexane, hexane isomers, n-heptane, heptane isomers, and iso-octane** all have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present

Full-Range Reformate Naphtha (C4-C12 Hydrocarbons)

Toluene has a half-life of from 3 hours to slightly over 1 day and **cyclohexane** has a half-life of from 6 hours to over 4 days when hydroxyl radicals are present

This material is potentially toxic to freshwater and saltwater ecosystems. Using Rainbow Trout (*Salmo irideus*), various Gasolines showed an LC100 (the Lethal Level) from 40 ppm to 100 ppm in ambient stream water. A 24-hour TLm (Median Toxic Limit) resulted in 90 ppm when using juvenile American Shad (*Squalius cephalus*). Using Bluegill Sunfish (*Lepomis macrochirus*), Grey Mullet (*Chelon labrosus*), and Gulf Menhaden (*Brevoortia patronus*), Gasoline showed a 96-hour LC50 of 8 ppm, 2 ppm, and 2 ppm, respectively.

Environmental Fate

This material is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol % of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol %, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT)		
Proper Shipping Name	Petroleum distillates, n.o.s. (Hexanes, Heptanes)		
Hazard Class	DOT Class 3 (Flammable liquid)	Packing Group(s)	PG II
		UN/NA ID	UN1268
Reportable Quantity	The Reportable Quantity (RQ) substance components present in this material which might require DOT HAZMAT bill-of-lading display are Cyclohexane, Benzene, and/or Xylenes.		
Placards		Emergency Response Guide No.	128
		HAZMAT STCC No.	49 102 68
		MARPOL III Status	All impacted components were delisted as DOT "Marine Pollutants" per 66 FR 120 (page 33413) dated 6/21/2001

Full-Range Reformate Naphtha (C4-C12 Hydrocarbons)

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2 This material would be classified under the following hazard categories Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.
SARA 313	This material contains the following components in concentrations which might be at or above de minimis levels and are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313 n-Hexane [CAS No. 110-54-3] concentration: 10 to 25% Cyclohexane [CAS No. 110-82-7] concentration: 5 to 15% Benzene [CAS No. 71-43-2] concentration: 0.1 to 1% Toluene [CAS No. 108-88-3] concentration: 1 to 4% Xylenes [CAS No. 1330-20-7] concentration: 1 to 5% Ethylbenzene [CAS No. 100-41-4] concentration: 0.2 to 1% Cumene [CAS No. 92-82-8] concentration: 0 to 2% 1,2,4-Trimethylbenzene (Pseudocumene) [CAS No. 95-63-6] concentration: 0.5 to 1.5% Naphthalene [CAS No. 91-20-3] concentration: 0.1 to 2%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4 As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances that might be present in this material which are subject to this statute are. n-Hexane [CAS No. 110-54-3] (RQ = 5,000 lbs. [2,270 kg]) concentration: 10 to 25% Cyclohexane [CAS No. 110-82-7] (RQ = 1,000 lbs. [453.6 kg]) concentration: 5 to 15% Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 0.1 to 1% Toluene [CAS No. 108-88-3] (RQ = 1,000 lbs. [453.6 kg]) concentration: 1 to 4% 2,2,4-Trimethylpentane (Iso-octane) [CAS No. 540-84-2] (RQ = 1,000 lbs. [453.6 kg]) conc.: 1 to 7% Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 1 to 5% Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 0.2 to 1% Cumene [CAS No. 98-82-8] (RQ = 5000 lbs. [2268 kg]) concentration: 0 to 2% Naphthalene [CAS No. 91-20-3] (RQ = 100 lbs. [45.36 kg]) concentration: 0.1 to 2%
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA) Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802
California Proposition 65	This material contains the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5: Benzene [CAS No. 71-43-2] and Toluene [CAS No. 108-88-3].
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2
Additional Regulatory Remarks	Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13): This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children! Under Section 12(b) of the Toxic Substances Control Act Because it contains detectable amounts of Cyclohexane [CAS No. 110-82-7] , this product might be subject to US EPA's one-time only per country export notification requirements

Full-Range Reformate Naphtha (C4-C12 Hydrocarbons)

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following minor components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare" **1-Butene [CAS No. 106-98-9], Isobutylene [CAS No. 115-11-7], Isopentane [CAS No. 78-78-4], 1-Pentene [CAS No. 109-67-1], n-Pentane [CAS No. 109-66-0], Cyclohexane [CAS No. 110-82-7], Benzene [CAS No. 71-43-2], Methylcyclohexane [CAS No. 108-87-2], Toluene [CAS No. 108-88-3], Xylenes [CAS No. 1330-20-7], Ethylbenzene [CAS No. 100-41-4], and Cumene [CAS No. 98-82-8].**

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this material which are subject to this statute are: **Isobutane (Propane, 2-methyl), various Butenes, n-Butane, Isopentane (Butane, 2-methyl), various Pentenes, and n-Pentane.**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Light Straight-run Naphtha (C4-C10 Hydrocarbons)

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0124
Revision Date 09/08/1999

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquefied Gas/Liquid.
Color Transparent, colorless **Odor** Light hydrocarbon

DANGER! Extremely flammable gas/liquid;
vapor may cause flash fire or explosion!
High pressure and rapid diffusion hazard!
High concentrations of vapor reduce oxygen available for breathing!
Mist or vapor may irritate the eyes, mucous membranes, and/or respiratory tract!
Liquid contact may cause minimal to moderate eye irritation and/or mild to severe skin irritation or frostbite to freeze burns!
May be harmful if inhaled or absorbed through the skin!
Overexposures may cause central nervous system (CNS) depression and target organ effects such as hearing loss, and/or liver, kidney, or peripheral nervous system damage!
May be harmful or fatal if ingested! Aspiration into the lungs can cause pulmonary edema and chemical pneumonia!
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
Potential cancer hazard! Contains low levels of Benzene!
May cause leukemia and/or other blood disorders!
Mutagenic hazard; may cause genetic damage!
Based upon animal testing, may adversely affect reproduction!
Spills may create a slipping hazard!

SECTION 1: IDENTIFICATION

Trade Name	Light Straight-run Naphtha (C4-C10 Hydrocarbons)	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	064741464*	Medical Emergency	(918) 495-4700
CAS Number	64741-46-4	CHEMTREC Emergency	(800) 424-9300
Product Family	C4-C10 Petroleum Hydrocarbons		
Synonyms	Light Straight-run Naphtha (Petroleum); Crude Distillation Unit Light Naphtha; Refinery Crude Tower Light Naphtha; Raw Light Gasoline; Untreated Light Naphtha or Light Gasoline; C4-C10 Solvent; C4-C10 Naphtha.		

Light Straight-run Naphtha (C4-C10 Hydrocarbons)

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Light Straight-run Naphtha (Petroleum)	64741-46-4	100
2) Butanes	Mixture	1-15
3) Pentanes	Mixture	10-25
4) Cyclopentane	287-92-3	0.5-1.5
5) Hexane Isomers	Mixture	5-15
6) Methylcyclopentane	96-37-7	1-3
7) n-Hexane	110-54-3	5-10
8) Cyclohexane	110-82-7	1-3
9) Benzene	71-43-2	1-2
10) Heptanes	Mixture	10-20
11) Methylcyclohexane	108-87-2	1-5
12) Toluene	108-88-3	1-3
13) Octanes	Mixture	5-20
14) Xylene, Mixed Isomers	1330-20-7	1-2
15) Nonanes	Mixture	1-10
16) Trimethylbenzene (mixed isomers)	25551-13-7	0.5-1.5
17) C10 Alkanes, Isoparaffins, and Cycloalkanes	Mixture	1-3

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact Eye Contact Absorption Inhalation

Signs and Symptoms of Acute Exposure

Inhalation	Components of this liquefied gas/naphtha may produce mild narcotic effects. High concentrations of this mixture can displace the amount of oxygen in air available to breathe below that necessary to sustain life (hypoxia), especially if working in confined spaces. Breathing vapors may also cause upper respiratory tract irritation and/or central nervous system (CNS) depression. Symptoms may include headache, dizziness, slurred speech, excitation or giddiness, nausea, vomiting, visual disturbances, memory loss, confusion, vertigo, drowsiness, fatigue, rapid or difficult breathing, muscular weakness, loss of consciousness, convulsions, coma, and even death, depending upon level of concentration and/or duration of exposure. Approximately 20,000 ppm (or 2 vol.%) of the vapor in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 to 10,000 ppm for only 5 minutes.
Eye Contact	Direct contact with the pressurized or liquefied gas portion of this material may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn." Animal test results on similar materials and actual human exposures suggest that this product can cause minimal to moderate eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling.
Skin Contact	Direct contact with the liquefied/pressurized gas portion of this material may produce severe and possibly permanent skin damage from frostbite or freeze burns. Animal test results on similar substances and its components suggest that this material can cause mild to severe skin irritation. Short-term contact symptoms include redness, itching, and burning or blistering of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate to severe dermatitis. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and severe tissue damage.
Ingestion	Due to its volatile nature, ingestion is not normally an applicable route of exposure for this liquefied gas/naphtha. However, if swallowed, this material may cause a "freeze burn" or irritation with a burning sensation of the mucous membranes in the mouth, throat, and esophagus. The liquid portion of this material can be readily absorbed by the stomach and intestinal tract. Symptoms include nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above). Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.

Light Straight-run Naphtha (C4-C10 Hydrocarbons)

Chronic Health Effects Summary

Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Chronic occupational **toluene** and **xylene** exposures have caused auditory nerve degeneration

Altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called "Petrol Sniffers Encephalopathy"), delirium, seizures, and sudden death have been common results for gasoline and naphtha abusers. Also, reports have associated repeated and prolonged occupational overexposure to solvents with irreversible brain and nervous system damage (sometimes referred to as "Solvent or Painter's Syndrome") Intentional misuse by deliberately concentrating and inhaling this material may be harmful or fatal.

Even with acute exposures, **n-hexane** is toxic to the peripheral nerves, characterized by numbness, tingling, or pain in the extremities, progressively worsening of neuromuscular motor coordination (polyneuritis or polyneuropathy), and even partial paralysis. And, based upon animal studies, n-hexane's metabolite, **2,5-hexanedione**, has been shown to cause degeneration of the testes.

Benzene is considered to be a cancer causing agent. It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML) Benzene is also capable of causing changes in genetic material (chromosomes) Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy. Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents

Available information indicates that **toluene** is NOT teratogenic, but it can be toxic to the embryo and fetus and may reduce fertility. In animal tests, high inhaled doses of toluene has caused reduced litter sizes, retarded development of the fetus, and increased incidence of non-lethal abnormalities.

Based upon animal testing, the **C8 aromatic hydrocarbon components (xylenes and ethylbenzene)** might be assumed to cause embryo and fetal toxicity, spontaneous abortions, and/or decreased fetal and newborn weights if overexposures occur during a woman's early gestation period And, the **C9 aromatic hydrocarbons (trimethylbenzenes and ethylmethylbenzenes)** are presumed to cause fetal toxicity and/or decreased fetal and newborn weights if overexposure occurs during a woman's early gestation period. (See Section 11.)

Conditions Aggravated by Exposure

Personnel with pre-existing nervous system disease, neurological conditions, skin disorders, impaired hearing, liver, or kidney function, blood disorders, or chronic respiratory diseases, and women attempting to conceive should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this material. They should take additional precautions to minimize or avoid exposure.

Exposure to high concentrations of this material may increase the sensitivity of the heart to **epinephrine (adrenalin) and catecholamine-like drugs**. Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians").

Target Organs

The substance is toxic to lungs, nervous system, especially the auditory and peripheral nerves, brain, mucous membranes, skin, eyes, and possibly, the heart, blood, liver, kidneys, thymus, and reproductive systems.

Carcinogenic Potential

This stream contains benzene at concentrations above 0.1% **Benzene** is considered carcinogenic by OSHA, IARC, and NTP. (See Section 11)

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910 1200).

OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>

Light Straight-run Naphtha (C4-C10 Hydrocarbons)

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	<p>Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.</p> <p>If contact with pressurized or liquefied gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.</p> <p>If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.</p> <p>Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse). If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IA Flammable Liquid. Extremely flammable!		
Flash Point/Method	CLOSED CUP -46° to -43°C (-50° to -45°F). (Tagliabue [ASTM D-56])		
Lower Flammable Limit	AP 1.2 %	Upper Flammable Limit	AP 7.6 %
Auto-Ignition Temp.	AP 232°C (450°F)		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors		
Special Properties	Extremely Flammable Liquid! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.		

Light Straight-run Naphtha (C4-C10 Hydrocarbons)

Extinguishing Media	SMALL FIRE Use dry chemicals, carbon dioxide (CO ₂), foam, water fog, or inert gas (nitrogen) LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquefied Gas/Naphtha¹ Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors.

Caution: Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of its vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This liquefied gas or waste mixtures containing this material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling

Odor is an inadequate warning of potentially hazardous air concentrations. Releases of this material can cause atmospheres to become oxygen deficient and/or create an immediate fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring for oxygen deficiency and flammability. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Do not allow vaporizing material to contact eyes, skin, or other tissues. Never siphon by mouth. Prevent contact with food, chewing, or smoking materials. Do not take internally.

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of gas/naphthas. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Drain and purge equipment as necessary to remove material residues.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with mild soap and water after handling.

Light Straight-run Naphtha (C4-C10 Hydrocarbons)

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room, and preferably refrigerated. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below), then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling liquefied gas/liquid mixtures. If this material is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Suitable eye wash water should be readily available.

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with cold liquid or vapors. Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Prevent potential skin contact with cold liquid or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gas/liquid mixtures. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

Use a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. Air purifying respirators offer no protection against oxygen deficient atmospheres. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).

General Comments

Releases of this liquefied gas/naphtha may create flammable, explosive, and/or oxygen-deficient atmospheres (LT 19.5 Vol.% in air). DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions.

Light Straight-run Naphtha (C4-C10 Hydrocarbons)

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Liquefied Petroleum Gases	TWA 1000 (ppm) from ACGIH (TLV) [1999] TWA 1000 (ppm) from OSHA (PEL) [1989]
2) Gasoline ("A3" Animal Carcinogen)	TWA 300 STEL: 500 (ppm) from ACGIH (TLV) [1999] TWA 300 STEL: 500 (ppm) from OSHA (PEL) [1989]
3) Petroleum Distillates (Naphtha)	TWA 400 (ppm) from OSHA (PEL) [1989] TWA 500 (ppm) from OSHA (PEL) [1976]
4) Butane	TWA 800 (ppm) from ACGIH (TLV) [1999] TWA 800 (ppm) from OSHA (PEL) [1989]
5) Pentane, all isomers	TWA 600 (ppm) from ACGIH (TLV) [1999] TWA 600 STEL: 750 (ppm) from OSHA (PEL) [1989] TWA 1000 (ppm) from OSHA (PEL) [1976]
6) Cyclopentane	TWA: 600 (ppm) from ACGIH (TLV) [1999] TWA: 600 (ppm) from OSHA (PEL) [1989]
7) Hexane, other isomers	TWA 500 STEL 1000 (ppm) from ACGIH (TLV) [1999] TWA: 500 STEL 1000 (ppm) from OSHA (PEL) [1989]
8) Hexane (n-Hexane)	TWA: 50 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 50 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
9) Cyclohexane	TWA: 300 (ppm) from ACGIH (TLV) [1999] TWA: 200 STEL 400 (ppm) from ACGIH (TLV) [Proposed for 2000] TWA: 300 (ppm) from OSHA (PEL) [1976]
10) Heptane (n-Heptane)	TWA: 400 STEL 500 (ppm) from ACGIH (TLV) [1999] TWA: 400 STEL 500 (ppm) from OSHA (PEL) [1989] TWA 500 (ppm) from OSHA (PEL) [1976]
11) Methylcyclohexane	TWA: 400 (ppm) from ACGIH (TLV) [1999] TWA: 400 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
12) Benzene ("A1" and "Z-2" Carcinogen)	TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 1 STEL 5 AL 0.5 (ppm) from OSHA (PEL) [1987] - SKIN
13) Toluene ("A4" = Not Classifiable)	TWA 50 (ppm) from ACGIH (TLV) [1999] - SKIN TWA 100 STEL: 150 (ppm) from OSHA (PEL) [1989] TWA: 200 CEIL 300 (ppm) from OSHA (PEL) [1976]
14) Octane, all isomers	TWA 300 (ppm) from ACGIH (TLV) [1999] TWA: 300 STEL: 375 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
15) Xylene, Mixed Isomers ("A4" = Not Classifiable)	TWA: 100 STEL: 150 (ppm) from ACGIH (TLV) [1999] TWA 100 STEL: 150 (ppm) from OSHA (PEL) [1989]
16) Nonane, all isomers	TWA: 200 (ppm) from ACGIH (TLV) [1999] TWA 200 (ppm) from OSHA (PEL) [1989]
17) Trimethylbenzene (mixed isomers)	TWA 25 (ppm) from ACGIH (TLV) [1999] TWA 25 (ppm) from OSHA (PEL) [1989]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquefied Gas/Liquid.	Color	Transparent, colorless	Odor	Light hydrocarbon.
Specific Gravity	0.70-0.73 (Water = 1)	pH	Not applicable	Vapor Density	2.5-2.9 (Air = 1)
Boiling Point/Range	-24° to 180°C (-12° to 356°F) (ASTM D-2887)	Melting/Freezing Point			-160° to 7°C (-256° to 45°F)
Vapor Pressure	150 to 175 mm Hg at 20°C (68°F) or 10 to 15 Reid-psi at 40°C (104°F).	Viscosity (cSt @ 40°C)			0.5 to 1.5
Solubility in Water	Slightly soluble in cold water (AP 0.1%).	Volatile Characteristics			Volatile Organic Compounds (VOCs) Content = 100%; AP 675 gm/L This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.

Light Straight-run Naphtha (C4-C10 Hydrocarbons)

Additional Properties Alkane, Isoparaffin, and Cycloalkane Hydrocarbons Content = 90 to 96 Wt.% (ASTM D-3257);
C6-C10 Aromatic Hydrocarbons Content = 4 to 10 Wt.% (ASTM D-2267),
Olefin Hydrocarbons Content = LT 1 Wt.% (ASTM D-1019);
Average Density at 60°F = 5.952 lbs./gal. (ASTM D-2161);
Dry Point Temperature = 350°F (177°C) (ASTM D-86),
Evaporation Rate = 10 to 15 when n-Butyl acetate = 1.0;
Heat Value = 19,000 to 20,000 Btu

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability Stable. **Hazardous Polymerization** Not expected to occur

Conditions to Avoid Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.

Materials Incompatibility Strong acids, alkalis, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide, and oxygen. n-Heptane will dissolve some plastics.

Hazardous Decomposition Products No substances are readily identified from composition, but, no degradation data is available.

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

When a 4-hour rabbit inhalation screen test was run on liquefied petroleum gas, no deaths occurred, however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline). An n-butane exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. And, n-pentane caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure.

Human volunteers had no apparent effects from exposure concentrations of 250 ppm, 500 ppm, and 1,000 ppm of isobutane and n-butane in air for periods of 8 hours daily for 10 days to 14 days, respectively. However, chronic inhalation of high concentrations of isobutane may cause liver and/or kidney damage. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of butane and butylenes (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone.

Inhalation of 500 ppm of isopentane or n-pentane have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of n-pentane for 10 minutes has been reported NOT to produce any ill effects; however, higher exposure concentrations of 90,000 to 120,000 ppm (9-12 Wt % in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. Rat 28-day feeding studies done on both isopentane and n-pentane using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

Intentional sniffing abuse of n-hexane has caused permanent brain and nervous system damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function, and even paralysis. These neurological effects are pronounced in combination with lack of oxygen supply, especially amongst women. Chronic repeated and/or prolonged overexposure to n-hexane, either by inhalation or skin absorption, has been shown to cause peripheral nerve tissue damage (polyneuropathy). The initial symptoms are numbness of the fingers and toes. Motor weakness can also occur in the digits, but may also involve muscles of the arms, thighs, and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure. The neurotoxic properties of n-hexane may be increased by concurrent exposure to methyl ethyl ketone, methyl isobutyl ketone, and/or toluene.

Hexane isomers were not mutagenic in the Salmonella/microsome (Ames) assay and are NOT considered to be carcinogenic. n-Hexane is NOT a tumor promotor in mice and NOT considered to be carcinogenic; nor is it teratogenic in mice or rats. n-Hexane, or its metabolite 2,5-hexanedione, has been shown to cause degeneration of the testes in rats; but, it did NOT produce spermatotoxicity in a multiple end-point test battery in rats given multiple doses for up to 5 days.

Light Straight-run Naphtha (C4-C10 Hydrocarbons)

Cyclohexane is an eye, skin, and mucous membrane irritant, CNS depressant, and causes narcosis at high concentrations in air. There is a narrow margin between narcosis, loss of reflexes, and death. In experimental animals exposed to lethal concentrations by inhalation or oral route, there was generalized vascular damage and severe degenerative changes in the heart, lungs, liver, kidneys, and brain. Cyclohexane does not act as a promoter for tumors on mice when exposed to dimethylbenzanthracene, and, it did not induce unscheduled DNA synthesis in cultured human lymphocytes. It is not mutagenic in the Salmonella/microsome (Ames) or the mouse lymphoma L5178Y assays, with or without metabolic activation; however, it did increase the number of chromosomal aberrations in bone marrow cells of rats exposed to between 100 and 300 ppm for 6 hours/day for 5 days. These chromosomal aberrations did not appear to be dose-related.

Benzene has an IDLH (immediately dangerous to life or health) concentration of 500 ppm. Its estimated lethal dose for a normal human adult is one teaspoon to one ounce (AP 10 mL). Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes. Studies with pregnant laboratory animals have demonstrated that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice.

n-Heptane is a mucous membrane and respiratory tract irritant, but non-irritating to the eyes. It is irritating to skin and readily absorbed by either inhalation or dermal exposure. Exposures may cause decreased red blood cell counts, liver and heart damage, and central nervous system depression. Repeated direct skin application can produce defatting dermatitis. n-Heptane is metabolized in the liver to form alcohols and ketones, including neurotoxic **2,5-heptanedione** which is detectable in small amounts in the urine of exposed humans.

In a controlled study, human volunteers exposed to an airborne concentration of **n-heptane** of 1,000 ppm for 6 minutes or 2,000 ppm for 4 minutes experienced slight dizziness and incoordination. Higher-level exposures produced hilarity, dizziness, and semi-consciousness. Inhaling a concentration of 5,000 ppm for 15 minutes caused stupor and a gasoline-like taste. These higher exposures also decreased the myocardial threshold to the arrhythmogenic effects (irregular heart beats) of epinephrine, producing only a narrow margin of safety between exposures causing CNS effects, cardiac effects, and loss of consciousness.

One occupational exposure study involving a **95% purity n-heptane** from 1 to 9 years duration concluded that it could produce minimal peripheral nerve damage with numbness and tingling of the extremities in the stocking-and-glove areas. In the same study, there was a decrease in motor nerve conduction velocities correlated with duration of exposure and adjusted for age effects; however, the average motor nerve conduction velocity in exposed workers was normal. Polyneuropathy associated with n-heptane exposure was reversible within a year following removal of exposure.

n-Heptane was not neurotoxic in rats exposed for up to 7 months. But based upon limited laboratory animal studies, **n-heptane and its metabolites** were found in low levels (LT 135 ppm) in the brain of rats exposed to airborne concentrations of 100, 500, or 1,500 ppm for 6 hours each day, five days per week, for 1 or 2 weeks. These substances disappeared within 2 weeks following removal of exposure. n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not expected to be carcinogenic.

Rats inhaling **methylcyclohexane** at an airborne concentration of 15,250 ppm for 1 hour displayed tremors, loss of coordination, anesthesia, and convulsions. Inhalation of 10,050 ppm for 6 hours per day for 14 days showed rodent weight loss or decreased weight gain and changes in the structure of their salivary glands. Using rabbits, methylcyclohexane was shown to have an LD50 somewhere between 3,300 ppm and 7,300 ppm when exposed repeatedly for 6 hours per day, 5 days per week, for 3 weeks. Death was preceded by conjunctival congestion with mucoid secretion and lacrimation, salivation, coughing, sneezing, labored breathing, and diarrhea. Lethal oral dosing of rabbits caused lethargy, severe diarrhea, and circulatory collapse. Vascular and degenerative lesions were observed in the kidneys and liver.

Toluene (methylbenzene) has been a major solvent of intentional inhalation abuse. Deliberate long-term inhalation of high concentrations of toluene (glue sniffing, etc.) has been shown to cause liver, kidney, central nervous system, and permanent brain damage. Effects such as impaired speech, visual disturbances, and hearing loss, loss of balance and/or muscle control, and memory loss have been reported. Exposures of 100 to 200 ppm in air for 24 hours cause hallucinations, distorted perceptions, and changes in motor activity. Studies have indicated that children of women who sniffed massive exposures of toluene during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. Isolated case reports have suggested a spectrum of congenital defects similar to those seen in fetal alcohol (ethanol) syndrome. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate.

Light Straight-run Naphtha (C4-C10 Hydrocarbons)

Long-term rodent inhalation studies with **toluene** produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness, and impaired reaction time. Also, rats exposed to 1,200 ppm and 1,400 ppm of toluene in air for 14 hours per day for 5 or 4 weeks (respectively) exhibited high-frequency hearing loss. Several animal studies using pregnant rodents have shown that toluene exposures may cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation studies, toluene has not been shown to be carcinogenic; nor is it mutagenic in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

Animal studies suggest that **toluene** causes kidney, liver, and/or lung dysfunction and cardiac (heart muscle) sensitization to epinephrine or other adrenalin-like agents. This sensitization may cause fatal changes in heart beat rhythms. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency).

2,2,4-Trimethylpentane (iso-octane) was highly irritating to mice at a 1,000 ppm in air exposure for 5 minutes and respiratory arrest occurred at exposures above 10,000 ppm for 5 minutes. CNS depression was observed at concentrations between 8,000 and 10,000 ppm in air. Kidney tubule necrosis, hyaline droplet formation, and acute renal failure were seen in male rats following oral administration of 10 gm/kg, 8 mL/kg, or 2,100 mg/kg of iso-octane for 2, 3, and 4 weeks, respectively.

An inhalation study with laboratory animals indicated an association of **xylene** with hearing loss in rats. Several animal studies using pregnant rodents have shown that **mixed xylene isomers (dimethylbenzenes)** may all cause embryo and/or fetotoxicity. Inhalation and feeding studies involving pregnant laboratory animals have produced limited evidence of fetal toxicity including increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes.

Chronic overexposure to **xylene** may produce irreversible damage to the central nervous system, including ototoxicity, that can be increased by the consumption of ethanol (alcoholic drinks). Drinking beverages which contain ethanol in conjunction with xylene exposure increases the alcoholic effects and impairs the clearance of xylenes from the body. Xylene isomers accumulate in the adipose (fat) tissues, from which they are slowly released. Complete clearance may take several days following exposure.

Two-year rat and mouse gavage studies by the National Toxicology Program (NTP) on **mixed xylene isomers including 17% ethylbenzene** showed "no evidence of carcinogenicity". Also, a two-year mixed xylenes skin-painting study on shaved rats and mice showed no incidence of non-neoplastic or neoplastic lesions. And, none of the components were mutagenic when tested in either the modified Ames, Chinese hamster ovary cell with and without metabolic activation, or sister-chromatid mutagenicity assays.

Rats inhaling **n-nonane** at an airborne concentration of 1,500 ppm for 7 days displayed mild tremors and loss of coordination. Inhalation of 1,600 ppm for 6 hours per day for 90 days showed animal weight loss or decreased weight gain and changes in the structure of their salivary glands. And, liver damage and an altered response to drugs were seen in rats given n-nonane for 2 to 7 days.

Trimethylbenzenes are primary skin irritants and may cause asthmatic bronchitis and/or anemia. Based upon animal reproductive/developmental studies, trimethylbenzenes may also cause fetal toxicity.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this naphtha, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. This material will normally evaporate rapidly if spilled. If released, volatile **aromatic hydrocarbon components (benzene, toluene, xylenes, and ethylbenzene)** may contribute to the creation of atmospheric smog. The atmospheric half-lives of the **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days. Photooxidation of **isobutane** and **n-butane** in air (LT 8%) is not considered to be environmentally significant. **Isopentane, n-pentane, n-hexane, hexane isomers, n-heptane, heptane isomers, and iso-octane** all have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. **Toluene** has a half-life of from 3 hours to slightly over 1 day and **cyclohexane** has a half-life of from 6 hours to over 4 days when hydroxyl radicals are present.

Using Rainbow Trout (*Oncorhynchus mykiss*) and Dungeness Crab (*Cancer magister*), similar naphthas showed a 96-hour TLm (Median Toxic Limit) from 5 ppm to 30 ppm in ambient saltwater. 24-hour TLms resulted in 2,990 ppm and 250 ppm when using Bluegill Sunfish (*Lepomis macrochirus*) and juvenile American Shad (*Squalius cephalus*), respectively.

Light Straight-run Naphtha (C4-C10 Hydrocarbons)

24-hour and 96-hour LC50s for **cyclohexane** and **toluene** produced results from 25 ppm to 60 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), and Guppy (*Lebistes reticulatus*) in fresh water. Using Water Fleas (*Daphnia magna*), **toluene** showed 24-hour TLms of from 100 ppm to 200 ppm. Using Mosquito Fish (*Gambusia affinis*), **cyclohexane** showed a 24-hour TLM of 15,500 ppm and **n-heptane** showed a 24-hour TLM of 4,925 ppm and a LC100 of 10,000 ppm in turbid fresh water. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

Environmental Fate

This naphtha is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Petroleum distillates, n.o.s. (Pentanes, Hexanes)		
Hazard Class	Class 3 Flammable liquid.	Packing Group(s)	PG I
		UN/NA ID	UN1268
Reportable Quantity	The Reportable Quantity (RQ) substance components present in this product which might require DOT HAZMAT bill-of-lading display are Xylenes and Benzene		
Placards		Emergency Response Guide No.	128
		HAZMAT STCC No.	49 102 56
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

**Light Straight-run Naphtha
(C4-C10 Hydrocarbons)**

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.
SARA 313	This material contains the following components in concentrations which might be at or above de minimis levels and are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313: n-Hexane [CAS No. 110-54-3] concentration: 5 to 10% Cyclohexane [CAS No. 110-82-7] concentration: 1 to 3% Benzene [CAS No. 71-43-2] concentration: 1 to 2% Toluene [CAS No. 108-88-3] concentration: 1 to 3% Xylenes [CAS No. 1330-20-7] concentration: 1 to 2%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances that might be present in this product which are subject to this statute are: n-Hexane [CAS No. 110-54-3] (RQ = 5,000 lbs. [2,270 kg]) concentration: 5 to 10% Cyclohexane [CAS No. 110-82-7] (RQ = 1000 lbs. [453.6 kg]) concentration: 1 to 3% Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 1 to 2% Toluene [CAS No. 108-88-3] (RQ = 1000 lbs. [453.6 kg]) concentration: 1 to 3% 2,2,4-Trimethylpentane (Iso-octane) [CAS No. 540-84-2] (RQ = 1000 lbs. [453.6 kg]) conc.: 1 to 4% Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 1 to 2% Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 0.1 to 0.95% Cumene [CAS No. 98-82-8] (RQ = 5000 lbs. [2268 kg]) concentration: 0 to 0.25%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material contains the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5: Benzene [CAS No. 71-43-2] and Toluene [CAS No. 108-88-3].
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2.
Additional Regulatory Remarks	Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13) This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children! Under Section 12(b) of the Toxic Substances Control Act. Because it contains detectable amounts of Methylcyclopentane [CAS No. 96-37-7], Cyclohexane [CAS No. 110-82-7], n-Propylbenzene [CAS No. 103-65-1], Cumene [CAS No. 98-82-8], and other C9 Aromatic Hydrocarbons , this product might be subject to US EPA's one-time only per country export notification requirements In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following minor components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare". Isopentane [CAS No. 78-78-4], n-Pentane [CAS No. 109-66-0], Cyclohexane [CAS No. 110-82-7], Benzene [CAS No. 71-43-2], Methylcyclohexane [CAS No. 108-87-2], Toluene [CAS No. 108-88-3], Xylenes [CAS No. 1330-20-7], Ethylbenzene [CAS No. 100-41-4], and Cumene (Isopropylbenzene) [CAS No. 98-82-8].

Light Straight-run Naphtha (C4-C10 Hydrocarbons)

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this material which are subject to this statute are:
Isobutane (Propane, 2-methyl), n-Butane, Isopentane (Butane, 2-methyl), and n-Pentane

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 3 0
Revision Date 09/08/1999
Print Date Printed on 10/11/1999.

P. O. BOX 2451
HOUSTON, TEXAS 77252-2451

IMPORTANT: Read this MSDS before handling and disposing of this product and pass this information on to employees, customers, and users of this product.

This product is considered a hazardous chemical under the OSHA Hazard Communication Rule.

I. General			
Trade Name	SOUR HYDRODESULFURIZED NAPHTHA (C4-C12 HYDROCARBONS)	Telephone Numbers	
Other Names	HDS SOUR NAPHTHA	EMERGENCY 800/424-9300 CHEMTREC 800/313-7645 HOT LINE CUSTOMER SERVICE 800/525-4692 INFO ONLY	
Chemical Family	PETROLEUM HYDROCARBONS	DOT Hazardous Materials Proper Shipping Name PETROLEUM NAPHTHA	
Generic Name	HYDRODESULFURIZED NAPHTHA	DOT Hazard Class 3 (FLAMMABLE LIQUID)	
CAS No.	SEE SECTION IX	Company ID No.	1111111150
		UN/NA ID No.	UN 1255
II. DANGER Summary of Hazards			
<p>EXTREMELY FLAMMABLE! OSHA/NFPA CLASS-IA FLAMMABLE LIQUID. AVOID ALL IGNITION SOURCES. MAY BE HARMFUL IF INHALED OR ABSORBED THROUGH SKIN! AVOID BREATHING MIST OR VAPORS. (SEE SECTIONS IV AND XI FOR OTHER HEALTH EFFECTS.) MAY CAUSE IRRITATION TO EYES, SKIN, AND RESPIRATORY SYSTEM! AVOID LIQUID, MIST, AND VAPOR CONTACT. HARMFUL OR FATAL IF SWALLOWED! CONTAINS PETROLEUM DISTILLATES! IF SWALLOWED DO NOT INDUCE VOMITING SINCE ASPIRATION INTO THE LUNGS MAY CAUSE CHEMICAL PNEUMONIA. OBTAIN PROMPT MEDICAL ATTENTION. CONTAINS BENZENE, A RECOGNIZED HUMAN CARCINOGEN! (SEE SECT. IV. AND XI.) MAY CONTAIN HYDROGEN SULFIDE (H₂S)! A FLAMMABLE, TOXIC AND POTENTIALLY DEADLY GAS. AVOID BREATHING FUMES AND VAPORS (SEE SECTION IV AND XI).</p>			
III. Fire and Explosion			
Flash Point (Method)	AP -45°F (D-56) SEE "FIRE & EXPLOSION HAZARDS"	Autoignition Temperature (Method)	AP 536°F (E-659) BASED ON NFPA "GASOLINE"
		Flammable Limits (% Vol. in Air) At Normal Atmospheric Temperature and Pressure Lower AP 1.4 Upper AP 7.6 BASED ON NFPA "GASOLINE"	
Fire and Explosion Hazards	<p>EXTREMELY FLAMMABLE! THIS MATERIAL RELEASES VAPORS AT OR BELOW AMBIENT TEMPERATURES WHEN MIXED WITH AIR IN CERTAIN PROPORTIONS AND EXPOSED TO AN IGNITION SOURCE, THESE VAPORS CAN BURN IN THE OPEN OR EXPLODE IN CONFINED SPACES BEING HEAVIER THAN AIR, FLAMMABLE VAPORS MAY TRAVEL LONG DISTANCES ALONG THE GROUND BEFORE REACHING A POINT OF IGNITION AND FLASHING BACK.</p>		
Extinguishing Media	<p>FOAM DRY CHEMICAL CO₂ WATER AND/OR WATER FOG MAY COOL THE FIRE BUT MAY NOT EXTINGUISH THE FIRE</p>		<p>HAZARD RATING: 4 - Extreme 3 - High 2 - Moderate 1 - Slight 0 - Insignificant</p> <div style="text-align: center;"> <p>Fire 4, Health 4, Reactivity 0, Special 0</p> </div> <p>* Chronic Health Hazard - See Section IV.</p>
Special Firefighting Procedures	<p>FOR FIRES INVOLVING THIS MATERIAL, DO NOT ENTER ANY ENCLOSED OR CONFINED FIRE SPACE WITHOUT PROPER PROTECTIVE EQUIPMENT THIS MAY INCLUDE SELF-CONTAINED BREATHING APPARATUS TO PROTECT AGAINST THE HAZARDOUS EFFECTS OF COMBUSTION PRODUCTS AND OXYGEN DEFICIENCIES. COOL TANKS AND CONTAINERS EXPOSED TO FIRE WITH WATER</p>		

IV. Health Hazards

Summary of acute Hazards IRRITATION, TOXIC EFFECTS FROM INHALATION AND SKIN ABSORPTION, RESPIRATORY PARALYSIS AND DEATH, DEPENDING ON CONCENTRATION AND DURATION OF EXPOSURE.

ROUTE OF EXPOSURE	SIGNS AND SYMPTOMS	Primary Route(s)
Inhalation	HYDROGEN SULFIDE IS IRRITATING AND MAY PRODUCE DEATH BY RESPIRATORY PARALYSIS ABOVE 500 PPM. VAPORS OF THIS MATERIAL MAY CAUSE SYMPTOMS OF CNS DEPRESSION DEPENDING ON CONCENTRATION AND DURATION OF EXPOSURE	<input checked="" type="checkbox"/>
Eye Contact	N/DA BUT EYE IRRITATION MAY RESULT FROM CONTACT WITH LIQUID, MIST AND/OR VAPOR. HYDROGEN SULFIDE GAS IS AN EYE IRRITANT.	<input checked="" type="checkbox"/>
Skin Absorption	N/DA; BUT AFTER PROLONGED/REPEATED CONTACT WITH LARGE AMMOUNTS OF THIS MATERIAL, ABSORPTION THROUGH THE SKIN MAY OCCUR AND PRODUCE TOXIC EFFECTS H2S MAY BE ABSORBED THROUGH THE SKIN AND PRODUCE TOXIC EFFECTS.	<input checked="" type="checkbox"/>
Skin Irritation	N/DA BUT SKIN IRRITATION MAY RESULT FROM PROLONGED AND/OR REPEATED SKIN CONTACT	<input checked="" type="checkbox"/>
Ingestion	N/DA; BUT PROBABLY IRRITATION OF MOUTH, THROAT, AND GASTROINTESTINAL TRACT LEADING TO NAUSEA, VOMITING, DIARRHEA, AND RESTLESSNESS. CENTRAL NERVOUS SYSTEM DEPRESSION SIMILAR TO THAT CAUSED BY VAPOR INHALATION.	<input type="checkbox"/>
Summary of Chronic Hazards and Special Health Effects	N/DA; BUT PROLONGED/REPEATED SKIN CONTACT MAY RESULT IN IRRITATION OR MORE SERIOUS SKIN DISORDERS MATERIALS WITH SIMILAR BOILING RANGES AND IDENTIFIED AS PETROLEUM NAPHTHAS HAVE BEEN REPORTED TO INDUCE SKIN TUMORS IN MICE AND KIDNEY DAMAGE IN MALE RATS THIS MATERIAL CONTAINS BENZENE WHICH IS ASSOCIATED WITH LEUKEMIA AND BLOOD DISORDERS (SEE SECTION XI). PERSONNEL WITH PRE-EXISTING CNS DISEASE, SKIN DISORDERS, IMPAIRED LIVER OR KIDNEY FUNCTION, OR CHRONIC RESPIRATORY DISEASES SHOULD AVOID EXPOSURE	

V. Protective Equipment and Other Control Measures

Respiratory	FOR VAPOR/MIST CONCENTRATIONS ABOVE EXPOSURE LIMITS IN SECTION VI, USE A NIOSH/MSHA APPROVED ORGANIC VAPOR/MIST, SUPPLIED-AIR, OR SELF-CONTAINED AIR RESPIRATOR. RESPIRATOR USE SHOULD FOLLOW OSHA 29 CFR 1910.134 OR EQUIVALENT
Eye	INCREASE PROTECTION BEYOND THE NORMAL USE OF SAFETY GLASSES BY WEARING GOGGLES OR FACE SHIELD. CONTACT LENSES SHOULD NOT BE WORN. AN EYE WASH FOUNTAIN SHOULD BE AVAILABLE IN THE VICINITY OF USE
Skin	AVOID PROLONGED AND/OR REPEATED SKIN CONTACT. IF CONDITIONS OR FREQUENCY OF USE MAKE SIGNIFICANT CONTACT LIKELY, CLEAN AND IMPERVIOUS CLOTHING SUCH AS GLOVES, APRON, BOOTS, AND FACIAL PROTECTION SHOULD BE WORN.
Engineering Controls	USE ADEQUATE VENTILATION TO KEEP VAPOR AND MIST CONCENTRATIONS OF THIS MATERIAL BELOW THE OCCUPATIONAL EXPOSURE LIMITS SHOWN IN SECTIONS VI. & XI. ELECTRICAL EQUIPMENT SHOULD FOLLOW NATIONAL ELECTRICAL CODE (NEC) STANDARDS
Other Hygienic and Work Practices	USE GOOD PERSONAL HYGIENE. IN CASE OF SKIN CONTACT, WASH WITH MILD SOAP AND WATER OR A WATERLESS HAND CLEANER. IMMEDIATELY REMOVE SOILED CLOTHING AND WASH THOROUGHLY BEFORE REUSE CLEAN OR DISCARD SOAKED LEATHER GOODS. WASH HANDS WITH PLENTY OF SOAP AND WATER BEFORE EATING, DRINKING, SMOKING OR USE OF TOILET FACILITIES DO NOT USE SOLVENTS OR HARSH ABRASIVE SKIN CLEANERS.

VI. Occupational Exposure Limits

Substance	Source	Date	Type	Value/Units	Time
V M & P. NAPHTHA (SEE SECTION XI)	ACGIH	1989	TWA	300 PPM	8 HRS
			STEL	400 PPM	15 MIN
BENZENE (TYPE "A2"CARCINOGEN)	ACGIH	1989	TWA	1 PPM	8 HRS

SOUR HYDRODESULFURIZED NAPHTHA (C4-C12 HYDROCARBONS)

MSDS No.
RS 127
Rev. Date
09/01/89

VII. Emergency and First Aid			
Inhalation	IMMEDIATELY MOVE PERSONNEL TO AREA OF FRESH AIR. FOR RESPIRATORY DISTRESS, GIVE AIR, OXYGEN, OR ADMINISTER CPR (CARDIOPULMONARY RESUSCITATION). IF NECESSARY. OBTAIN MEDICAL ATTENTION IF BREATHING DIFFICULTIES CONTINUE		
Eye Contact	FLUSH EYES WITH CLEAN, LOW-PRESSURE WATER FOR AT LEAST 15 MINUTES. OCCASIONALLY LIFTING THE EYELIDS IF PAIN OR REDNESS PERSISTS AFTER FLUSHING, OBTAIN MEDICAL ATTENTION		
Skin Contact	REMOVE CONTAMINATED CLOTHING. REMOVE/BRUSH EXCESS MATERIAL FROM CONTAMINATED AREA; THEN FLUSH SKIN WITH SOAP AND WATER		
Ingestion	RINSE MOUTH WITH WATER. DRINK 1-2 GLASSES OF WATER OR MILK. VOMITING MAY BE INDICATED ON PHYSICIAN DIRECTION/SUPERVISION.		
Emergency Medical Treatment Procedures	NOTE ASPIRATION OF MATERIAL INTO LUNGS MAY CAUSE CHEMICAL PNEUMONIA		
VIII. Spill and Disposal			
Precautions if Material is Spilled or Released	CONTAIN SPILL REMOVE ALL IGNITION SOURCES AND SAFELY STOP FLOW OF SPILL. SPILL MAY CREATE SLIPPING HAZARDS. PREVENT FROM ENTERING ALL BODIES OF WATER, IF POSSIBLE. EVACUATE ALL NON-ESSENTIAL PERSONNEL. IN URBAN AREAS, CLEANUP AS SOON AS POSSIBLE; IN NATURAL ENVIRONMENTS, CLEANUP ON ADVICE FROM ECOLOGISTS. THIS MATERIAL WILL FLOAT ON WATER. ABSORBANT MATERIAL AND PADS CAN BE USED. COMPLY WITH ALL APPLICABLE LAWS. SPILLS MAY NEED TO BE REPORTED TO THE NATIONAL RESPONSE CENTER (800/424-8802). THE SPILLED MATERIAL AND ANY WATER OR SOIL WHICH IT HAS CONTACTED MAY BE HAZARDOUS TO ANIMAL/AQUATIC LIFE		
Waste Disposal Methods	MAXIMIZE PRODUCT RECOVERY FOR REUSE OR RECYCLING. DISPOSE OF WASTE MATERIAL AS EPA "IGNITABLE HAZARDOUS WASTE" (D001), UNLESS PROVEN OTHERWISE. USE APPROVED TREATMENT, TRANSPORTERS AND DISPOSAL SITES IN COMPLIANCE WITH ALL LAWS. IF SPILL IS INTRODUCED INTO A WASTEWATER SYSTEM, THE CHEMICAL AND BIOLOGICAL OXYGEN DEMAND WILL LIKELY INCREASE. SPILL MATERIAL IS BIODEGRADABLE IF GRADUALLY EXPOSED TO MICROORGANISMS. A POTENTIAL DISPOSAL METHOD IS INCINERATION		
IX. Components <small>(This may not be a complete list of components)</small>			
Component Name	CAS No.	Carcinogen##	Composition amount (Vol.) (See Qualification on Page 4)
HYDRODESULFURIZED LIGHT NAPHTHA (PETROLEUM)	64742-73-0*	N/AP AP	0 TO 100 PERCENT
HYDRODESULFURIZED HEAVY NAPHTHA (PETROLEUM)	64742-82-1*	N/AP AP	0 TO 100 PERCENT
BENZENE	71-43-2	1,2,3,4 LT	5 PERCENT
HYDROGEN SULFIDE	7783-06-4	N/AP LT	2 PERCENT
##Listed By: 1 = NTP, 2 = IARC, 3 = OSHA, 4 = Other		Compositions given are typical values, not specifications.	

X. Physical and Chemical Data			
Boiling Point -4° TO 374° F		Viscosity Units, Temp. (Method) N/AP	
Freezing Point LT -150° F		Vapor Pressure (REID-PSIA AT 100° F) AP 5	
Specific Gravity (H ₂ O = 1 at 39.2° F) AP 0.66		Vapor Sp. Gr. (Air = 1.0 at 60°-90° F) AP 4	
Hazardous Polymerization NOT EXPECTED TO OCCUR		Solubility in Water NEGLIGIBLE	
Other Physical and Chemical Properties N/P		pH N/AP	
Appearance and Odor		Stability STABLE	
TRANSPARENT, COLORLESS TO LIGHT YELLOW-COLORED LIQUID; PETROLEUM NAPHTHA ODOR.			
Conditions to Avoid HEAT, SPARKS, AND OPEN FLAME			
Materials to Avoid STRONG ACIDS, ALKALIES, AND OXIDIZERS SUCH AS LIQUID CHLORINE AND OXYGEN.			
Hazardous Decomposition Products BURNING OR EXCESSIVE HEATING MAY PRODUCE CARBON MONOXIDE AND OTHER HARMFUL GASES/VAPORS			
XI. Additional Precautions			

Handling, Storage, and Decontamination Procedures	STORE AND TRANSPORT IN ACCORDANCE WITH ALL APPLICABLE LAWS. KEEP AWAY FROM HEAT, SPARKS, AND OPEN FLAME! KEEP CONTAINERS CLOSED AND PLAINLY LABELED! GROUND ALL DRUMS AND TRANSFER VESSELS WHEN HANDLING. USE ONLY WITH ADEQUATE VENTILATION! AVOID BREATHING VAPORS. STORE SAMPLES IN A COOL (LT 80° F.) WELL VENTILATED PLACE. THIS STORAGE AREA AND VENTILATION EQUIPMENT SHOULD COMPLY WITH NFPA STANDARDS CLASS-IA/B FLAMMABLE LIQUIDS AND NEC REQUIREMENT.
General Comments	CONTAINS BENZENE A RECOGNIZED HUMAN CARCINOGEN. THE RISK OF BENZENE-INDUCED BLOOD DISORDERS OR CANCER ASSOCIATED WITH THIS MATERIAL IS NOT KNOWN. SOME PETROLEUM NAPHTHAS HAVE BEEN SHOWN TO PRODUCE KIDNEY DAMAGE IN MALE RATS WHICH HAS BEEN ASSOCIATED WITH ISOPARAFFINS, A COMPONENT OF THIS MATERIAL. ALSO, MATERIALS WITH SIMILAR BOILING POINT RANGES AND IDENTIFIED AS "STRAIGHT RUN NAPHTHAS" HAVE INDUCED SKIN TUMORS IN MICE. THE IMPLICATIONS OF THESE STUDIES FOR HUMAN HEALTH EFFECTS IS NOT KNOWN. HYDROGEN SULFIDE CAN CAUSE SYSTEMIC TOXICITY AND RAPID DEATH FROM RESPIRATORY PARALYSIS WHEN EXPOSURES EXCEED 500 PPM. ODOR IS NOT A RELIABLE WARNING OF POSSIBLE OVEREXPOSURE. SINCE SPECIFIC EXPOSURE STANDARDS/CONTROL LIMITS HAVE NOT BEEN ESTABLISHED FOR THIS MATERIAL, THE EXPOSURE LIMITS SHOWN IN SECTION VI. ARE SUGGESTED AS MINIMUM CONTROL GUIDELINES. THE INFORMATION AND CONCLUSIONS HEREIN REFLECT NORMAL OPERATING CONDITIONS AND MAY BE FROM SOURCES OTHER THAN DIRECT TEST DATA ON THE MIXTURE ITSELF.

Emergency Overview

Physical State Liquid
Color Transparent, colorless **Odor** Light hydrocarbons

DANGER! Extremely flammable liquid;
vapor may cause flash fire or explosion!
May be harmful or fatal if inhaled, ingested or absorbed through the skin!
Mist or vapor may irritate the mucous membranes and respiratory tract!
Liquid contact may cause minimal to moderate eye and/or mild to severe skin irritation and inflammation!
Aspiration into the lungs will cause pulmonary edema and chemical pneumonia!
Overexposures may cause central nervous system (CNS) depression and target organ effects such as lung, brain, cardiopulmonary, blood and blood-forming tissue, liver, kidney, and/or peripheral nervous system damage!
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
Potential cancer hazard! Contains low levels of Benzene!
May cause leukemia and/or other blood disorders!
Mutagenic hazard; may cause genetic damage!
May adversely affect reproduction or reproductive development!
Spills may create a slipping hazard!

SECTION 1: IDENTIFICATION

Trade Name	BTU Depentanizer Tower Bottoms	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	1111110132	Medical Emergency	(918) 495-4700
CAS Number	64742-89-8 or 8030-30-6	CHEMTREC Emergency	(800) 424-9300
Product Family	C5-C9 Petroleum Hydrocarbons		
Synonyms	732 Unit Depentanizer Tower Bottoms; Benzene/Toluene Unit (BTU) AS-101 Tower Bottoms, BTU (732) Reformer Section Feed, Rubber Solvent Naphtha; Light Naphtha; Light Solvent Naphtha; Ligroine (Petroleum); C5-C9 Hydrocarbon Solvent; C5-C9 Solvent		

BTU Depentanizer Tower Bottoms

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Light Aliphatic Solvent Naphtha (Petroleum)	64742-89-8	100
2) Rubber Solvent (Naphtha)	8030-30-6	100
3) Pentanes	Mixture	1-9
4) Cyclopentane	287-92-3	0.5-4
5) Hexane Isomers	Mixture	5-25
6) Methylcyclopentane	96-37-7	1-15
7) n-Hexane	110-54-3	1-15
8) Cyclohexane	110-82-7	1-8
9) Benzene	71-43-2	1-8
10) Heptanes	Mixture	10-50
11) Methylcyclohexane	108-87-2	1-12
12) Toluene	108-88-3	1-10
13) Octanes	Mixture	1-15
14) Xylenes	1330-20-7	1-5
15) Ethylbenzene	100-41-4	0.2-2
16) Nonanes	Mixture	1-10

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Skin Contact. Eye Contact. Skin Absorption.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon the exposure duration. Vapors can reduce the oxygen content in air. Approximately 20,000 ppm (or 2 vol.%) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces.
Eye Contact	Minimal to moderate eye irritation is expected upon short-term exposure. This is based upon animal test results for a similar product and this product's components.
Skin Contact	Tests on a similar product and this product's components suggest that mild to severe skin irritation, inflammation, and blistering is expected to occur upon short-term contact. Certain components of this material, including n-hexane, cyclohexane, benzene, n-heptane, toluene, iso-octane, and xylenes , may be absorbed through the skin, and produce toxic effects such as CNS depression (see "Inhalation" above). If the skin is damaged, absorption increases.
Ingestion	If swallowed this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium. Additional central nervous system (CNS) effects may occur prior to the onset of convulsions, coma, and death. Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Cardiovascular effects include shallow rapid pulse and pallor followed by flushing. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may result in death.
Chronic Health Effects Summary	Prolonged and/or repeated contact may cause moderate to severe skin irritation and inflammation. Symptoms include defatting, redness, dryness, blistering, lesions, and/or scaly dermatitis. Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been common results for gasoline and naphtha abusers. Chronic inhalation to components of this naphtha (n-pentane, n-heptane, and toluene) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline) -like drugs.

BTU Depentanizer Tower Bottoms

Even with acute exposures, **n-hexane** is toxic to the peripheral nerves, characterized by numbness, tingling, or pain in the extremities, progressively worsening of neuromuscular motor coordination (polyneuritis or polyneuropathy), and even partial paralysis.

Benzene is considered to be a cancer causing agent. It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML). Benzene is also capable of causing changes in genetic material (chromosomes). Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy. Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents.

Available information indicates that **toluene** is NOT teratogenic, but it can be toxic to the embryo and fetus and may reduce fertility. In animal tests, high inhaled doses of toluene has caused reduced litter sizes, retarded development of the fetus, and increased incidence of non-lethal abnormalities. (See Section 11.)

Conditions Aggravated by Exposure

Personnel with pre-existing nervous system disease, psychological conditions, skin disorders, impaired hearing, cardiovascular, liver, or kidney function, blood disorders, or chronic respiratory diseases should avoid exposure.

Target Organs

This material is toxic to lungs, nervous system, especially the auditory and peripheral nerves, brain, blood, kidneys, liver, heart, thymus, mucous membranes, skin, eyes, and possibly the reproductive system.

Carcinogenic Potential

This material usually contains benzene in concentrations at or above 0.1%. **Benzene** is considered carcinogenic by OSHA, IARC, and NTP. (See Section 11.)

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

BTU Depentanizer Tower Bottoms

If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IA Flammable Liquid. Extremely flammable!		
Flash Point/Method	CLOSED CUP: -35° to -29°C (-30° to -21°F). (Tagliabue (ASTM D-56))		
Lower Flammable Limit	AP 1.0 %	Upper Flammable Limit	AP 7.5 %
Auto-Ignition Temp.	AP 232°C (450°F)		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors.		
Special Properties	Extremely Flammable Liquid! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.		
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide (CO ₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.		
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers or waterways.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

BTU Depentanizer Tower Bottoms

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits and wear personal protective clothing as shown in Section 8. Promptly remove contaminated clothing. Wash exposed skin thoroughly with mild soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store other toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room, and preferably refrigerated. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposures, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact and use gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

BTU Depentanizer Tower Bottoms

Respiratory Protection For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSi Z88.2).

General Comments Warning! Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Rubber Solvent (Naphtha)	TWA: 400 (ppm) from ACGIH (TLV) [1998]
2) Petroleum Distillates (Naphtha)	TWA: 500 (ppm) from OSHA (PEL) [1976]
3) Pentane, all isomers	TWA: 600 (ppm) from ACGIH (TLV) [1998] TWA: 1000 (ppm) from OSHA (PEL) [1976]
4) Hexane (n-Hexane)	TWA: 50 (ppm) from ACGIH (TLV) [1998] - SKIN TWA: 500 (ppm) from OSHA (PEL) [1976]
5) Hexane, other isomers	TWA: 500 STEL: 1000 (ppm) from ACGIH (TLV) [1998] TWA: 500 (ppm) from OSHA (PEL) [1989]
6) Cyclohexane	TWA: 300 (ppm) from ACGIH (TLV) [1998] TWA: 200 STEL: 400 (ppm) from ACGIH (TLV) [1998] TWA: 300 (ppm) from OSHA [1976]
7) Benzene ("A1" and "Z-2" Carcinogen)	TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) [1998] - SKIN TWA: 1 STEL 5 AL: 0.5 (ppm) from OSHA (PEL) [1987] - SKIN
8) Heptanes	TWA: 400 STEL: 500 (ppm) from ACGIH (TLV) [1998] TWA: 500 (ppm) from OSHA (PEL) [1976]
9) Methylcyclohexane	TWA: 400 (ppm) from ACGIH (TLV) [1998] TWA: 500 (ppm) from OSHA (PEL) [1976]
10) Toluene	TWA: 50 (ppm) from ACGIH (TLV) [1998] - SKIN TWA: 200 CEIL: 300 (ppm) from OSHA (PEL) [1976]
11) Octanes	TWA: 300 STEL: 375 (ppm) from ACGIH (TLV) [1998] TWA: 500 (ppm) from OSHA (PEL) [1976]
12) Xylenes	TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [1989] TWA: 100 STEL: 150 (ppm) from ACGIH (TLV) [1998]
13) Ethylbenzene	TWA: 100 STEL: 125 (ppm) from ACGIH (TLV) [1998] TWA: 100 STEL: 125 (ppm) from OSHA (PEL) [1989]
14) Nonanes	TWA: 200 (ppm) from ACGIH (TLV) [1998] TWA: 200 (ppm) from OSHA (PEL) [1989]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color	Transparent, colorless.	Odor	Light hydrocarbons
Specific Gravity	0.69 to 0.71 (Water = 1)	pH	Not applicable.	Vapor Density	3.4 to 3.9 (Air = 1)
Boiling Point/Range	28° to 151°C (82° to 303°F) (ASTM D-2887)	Melting/Freezing Point			-129° to -25°C (-201° to -13°F)
Vapor Pressure	AP 180 mm Hg at 20°C (68°F) or 2 to 5 psia at 100°F (38°C).	Viscosity (cSt @ 40°C)			1 to 2
Solubility in Water	Slightly soluble in cold water (AP 0.03%).	Volatile Characteristics			Volatile Organic Compounds (VOCs) Content = 100%; AP 725 gm/L.
Additional Properties	Alkane, Isoparaffin, and Cycloalkane Hydrocarbons Content = 75 to 97 Wt.% (ASTM D-1319); C6-C8 Aromatic Hydrocarbon Content = 3 to 25 Wt.% (ASTM D-1319); Average Density at 60°F = 5.827 lbs./gal. (ASTM D-2161); Aniline Cloud Point Temperature = AP 140°F (60°C) (ASTM D-611), Kauri-Butanol (KB) Value = AP 35 to 38 (ASTM D-1133); Dry Point Temperature = 292°F (144°C) (ASTM D-86); Evaporation Rate = AP 5 when n-Butyl acetate = 1.0; Heat Value = 18,000 to 19,000 Btu.				

BTU Depentanizer Tower Bottoms

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide, and oxygen. n-Heptane will dissolve some plastics		
Hazardous Decomposition Products	Burning or excessive heating may produce smoke, carbon monoxide, and carbon dioxide; but, no degradation data is available.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Rubber Solvent (Naphtha) is a minimal to mild eye irritant, mild skin irritant, and non-sensitizer on rabbits and Guinea pigs using standard acute test protocols. And, at a 1.7 mg/L in air concentration, it is a slight eye, nose, and throat irritant for humans. Rats exposed to 1.9, 3.7, and 7.9 mg/L/day of rubber solvent in air for 4 weeks exhibited no ill effects; however, when rabbits were skin painted with 200, 1,000, and 2,000 mg/kg/day for 4 weeks, moderate skin irritation was seen at the lowest dose level and severe irritation at the higher doses. A study using pregnant rodents exposed to 800 and 1,600 ppm of rubber solvent in air for 6 hours/day during days 6 through 15 of gestation showed negative maternal and fetal effects. Rubber solvent produced negative or equivocal mutagenic response in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, and the 8-week dominant lethal assay; however, the IP injection into rat somatic cells assay produced a positive response. The significance of these animal study results to humans is not known.

Inhalation of 500 ppm of **n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **isopentane** and **n-pentane** for 10 minutes has been reported NOT to produce any ill effects; however, higher exposure concentrations of 90,000 to 120,000 ppm (8-12 Wt.% in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. Rat 28-day feeding studies done on **n-pentane** using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

Intentional sniffing abuse of **n-hexane** has caused permanent brain and nervous system damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function, and even paralysis. These neurological effects are pronounced in combination with lack of oxygen supply, especially amongst women. Chronic repeated and/or prolonged overexposure to **n-hexane**, either by inhalation or skin absorption, has been shown to cause peripheral nerve tissue damage (polyneuropathy). The initial symptoms are numbness of the fingers and toes. Motor weakness can also occur in the digits, but may also involve muscles of the arms, thighs, and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure. The neurotoxic properties of **n-hexane** may be increased by concurrent exposure to **methyl ethyl ketone, methyl isobutyl ketone, and/or toluene**

n-Hexane is NOT a tumor promotor in mice and NOT considered to be carcinogenic; nor is it teratogenic in mice or rats. **n-Hexane**, or its metabolite **2,5-hexanedione**, has been shown to cause degeneration of the testes in rats; but, it did NOT produce spermatotoxicity in a multiple end-point test battery in rats given multiple doses for up to 5 days. **Hexane isomers** were not mutagenic in the Salmonella/microsome (Ames) assay and are NOT considered to be carcinogenic.

Cyclohexane is an eye, skin, and mucous membrane irritant, CNS depressant, and causes narcosis at high concentrations in air. There is a narrow margin between narcosis, loss of reflexes, and death. In experimental animals exposed to lethal concentrations by inhalation or oral route, there was generalized vascular damage and severe degenerative changes in the heart, lungs, liver, kidneys, and brain. Cyclohexane does not act as a promotor for tumors on mice when exposed to dimethylbenzanthracene; and, it did not induce unscheduled DNA synthesis in cultured human lymphocytes. It is not mutagenic in the Salmonella/microsome (Ames) or the mouse lymphoma L5178Y assays, with or without metabolic activation; however, it did increase the number of chromosomal aberrations in bone marrow cells of rats exposed to between 100 and 300 ppm for 6 hours/day for 5 days. These chromosomal aberrations did not appear to be dose-related.

BTU Depentanizer Tower Bottoms

Benzene has an IDLH (immediately dangerous to life or health) concentration of 500 ppm. Its estimated lethal dose for a normal human adult is one teaspoon to one ounce (AP 10 mL). Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes. Studies with pregnant laboratory animals have demonstrated that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice.

Benzene is a known animal carcinogen and a human leukemogen. In addition, NTP, IARC, EPA, OSHA, and ACGIH list benzene as a "Human Carcinogen." Repeated and prolonged overexposure to benzene vapors (GT 20 ppm in air) may cause toxicity to blood-forming tissues. Chronic exposure symptoms include decreased blood cell and platelet counts, leukopenia, aplastic anemia, or acute myelogenous leukemia (AML). Also, chronic inhalation of benzene vapors have been found to cause fatigue, nervousness, irritability, blurred vision, and labored breathing. Overexposure to benzene has been associated with chromosomal aberrations in human white blood cells, both laboratory animal and human bone marrow cell damage, and in vitro mammalian cells DNA damage. Elevated frequencies of chromosomal aberrations have been observed in peripheral white blood cells and bone marrow of workers exposed to high benzene concentrations known to be associated with signs of chronic poisoning. Ethanol consumption may have a synergistic effect and increase blood system changes caused by benzene exposures. Children/teenagers have less resistance.

n-Heptane is a mucous membrane and respiratory tract irritant, but non-irritating to the eyes. It is irritating to skin and readily absorbed by either inhalation or dermal exposure. Exposures may cause decreased red blood cell counts, liver and heart damage, and central nervous system depression. Repeated direct skin application can produce defatting dermatitis. n-Heptane is metabolized to form alcohols and ketones, including neurotoxic 2,5-heptanedione which is detectable in small amounts in the urine of exposed humans.

In a controlled study, human volunteers exposed to an airborne concentration of n-heptane of 1,000 ppm for 6 minutes or 2,000 ppm for 4 minutes experienced slight dizziness and incoordination. Higher-level exposures produced hilarity, dizziness, and semi-consciousness. Inhaling a concentration of 5,000 ppm for 15 minutes caused stupor and a gasoline-like taste. These higher exposures also decreased the myocardial threshold to the arrhythmogenic effects (irregular heart beats) of epinephrine, producing only a narrow margin of safety between exposures causing CNS effects, cardiac effects, and loss of consciousness.

One occupational exposure study involving a 95% purity n-heptane from 1 to 9 years duration concluded that it could produce minimal peripheral nerve damage with numbness and tingling of the extremities in the stocking-and-glove areas. In the same study, there was a decrease in motor nerve conduction velocities correlated with duration of exposure and adjusted for age effects; however, the average motor nerve conduction velocity in exposed workers was normal. Polyneuropathy associated with n-heptane exposure was reversible within a year following removal of exposure.

n-Heptane was not neurotoxic in rats exposed for up to 7 months. But based upon limited laboratory animal studies, n-heptane and its metabolites were found in low levels (LT 135 ppm) in the brain of rats exposed to airborne concentrations of 100, 500, or 1,500 ppm for 6 hours each day, five days per week, for 1 or 2 weeks. These substances disappeared within 2 weeks following removal of exposure. n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not expected to be carcinogenic.

Rats inhaling **methylcyclohexane** at an airborne concentration of 15,250 ppm for 1 hour displayed tremors, loss of coordination, anesthesia, and convulsions. Inhalation of 10,050 ppm for 6 hours per day for 14 days showed rodent weight loss or decreased weight gain and changes in the structure of their salivary glands. Using rabbits, methylcyclohexane was shown to have an LD50 somewhere between 3,300 ppm and 7,300 ppm when exposed repeatedly for 6 hours per day, 5 days per week, for 3 weeks. Death was preceded by conjunctival congestion with mucoid secretion and lacrimation, salivation, coughing, sneezing, labored breathing, and diarrhea. Lethal oral dosing of rabbits caused lethargy, severe diarrhea, and circulatory collapse. Vascular and degenerative lesions were observed in the kidneys and liver.

Toluene (methylbenzene) has been a major solvent of intentional inhalation abuse. Deliberate long-term inhalation of high concentrations of toluene (glue sniffing, etc.) has been shown to cause liver, kidney, central nervous system, and permanent brain damage. Effects such as impaired speech, visual disturbances, and hearing loss, loss of balance and/or muscle control, and memory loss have been reported. Exposures of 100 to 200 ppm in air for 24 hours cause hallucinations, distorted perceptions, and changes in motor activity. Studies have indicated that children of women who sniffed massive exposures of toluene during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. Isolated case reports have suggested a spectrum of congenital defects similar to those seen in fetal alcohol (ethanol) syndrome. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate.

BTU Depentanizer Tower Bottoms

Long-term rodent inhalation studies with **toluene** produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness, and impaired reaction time. Also, rats exposed to 1,200 ppm and 1,400 ppm of toluene in air for 14 hours per day for 5 or 4 weeks (respectively) exhibited high-frequency hearing loss. Several animal studies using pregnant rodents have shown that toluene exposures may all cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation studies, toluene has not been shown to be carcinogenic; nor is it mutagenic in the *Salmonella/microsome* (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

Animal studies suggest that **toluene** causes kidney, liver, and/or lung dysfunction and cardiac (heart muscle) sensitization to epinephrine or other adrenalin-like agents. This sensitization may cause fatal changes in heart beat rhythms. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency).

2,2,4-Trimethylpentane (iso-octane) was highly irritating to mice at a 1,000 ppm in air exposure for 5 minutes and respiratory arrest occurred at exposures above 10,000 ppm for 5 minutes. CNS depression was observed at concentrations between 8,000 and 10,000 ppm in air. Kidney tubule necrosis, hyaline droplet formation, and acute renal failure were seen in male rats following oral administration of 10 gm/kg, 8 mL/kg, or 2,100 mg/kg of iso-octane for 2, 3, and 4 weeks, respectively.

Chronic overexposure to **xylene** may produce irreversible damage to the central nervous system that can be increased by the consumption of ethanol (alcoholic drinks). Drinking beverages which contain ethanol in conjunction with xylene exposure increases the alcoholic effects and impairs the clearance of xylenes from the body. Xylene isomers accumulate in the adipose (fat) tissues, from which they are slowly released. Complete clearance may take several days following exposure.

An inhalation study with laboratory animals indicated an association of **xylene** with hearing loss in rats. Several animal studies using pregnant rodents have shown that **ethylbenzene and the mixed xylene isomers (dimethylbenzenes)** may all cause embryo and/or fetotoxicity. Inhalation and feeding studies involving pregnant laboratory animals have produced limited evidence of fetal toxicity including increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes.

The National Toxicology Program (NTP) recently completed a 2-year inhalation bioassay on **ethylbenzene** in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200, and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels. However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level; and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Hyperplasia was also observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear. NTP, IARC, and OSHA have not designated ethylbenzene as a carcinogen.

Rats inhaling **n-nonane** at an airborne concentration of 1,500 ppm for 7 days displayed mild tremors and loss of coordination. Inhalation of 1,600 ppm for 6 hours per day for 90 days showed animal weight loss or decreased weight gain and changes in the structure of their salivary glands. And, liver damage and an altered response to drugs were seen in rats given n-nonane for 2 to 7 days.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this naphtha, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. If released, volatile aromatic hydrocarbon components (**benzene, toluene, xylenes, and ethylbenzene**) may be released and possibly contribute to the creation of atmospheric smog. **n-Pentane, n-hexane, n-heptane, hexane and heptane isomers, and iso-octane** all have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. **Toluene and xylenes** have half-lives of from 3 hours to slightly over 1 day and **Cyclohexane** has a half-life of from 6 hours to over 4 days when hydroxyl radicals are present.

Using Rainbow Trout (*Oncorhynchus mykiss*) and Dungeness Crab (*Cancer magister*), similar naphthas showed a 96-hour TLm (Median Toxic Limit) from 5 ppm to 30 ppm in ambient saltwater. Also, 24-hour and 96-hour TLms produced results from 10 ppm to 60 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), and Guppy (*Lebistes reticulatus*) in fresh water. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

BTU Depentanizer Tower Bottoms**Environmental Fate**

This naphtha is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated with this material might prove to be a potential health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation.		
Proper Shipping Name	Petroleum distillates, n.o.s. (Heptanes, Hexanes)		
Hazard Class	Class 3: Flammable liquid.	Packing Group(s)	PG II
		UN/NA ID	UN1268
Reportable Quantity	The Reportable Quantity (RQ) substance components present in this material which might require DOT HAZMAT bill-of-lading display are Benzene and Xylenes .		
Placards		Emergency Response Guide No.	128
		HAZMAT STCC No.	49 123 87
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

BTU Depentanizer Tower Bottoms

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.
SARA 313	This material contains the following components in concentrations which might be at or above de minimis levels and are listed as a toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313: n-Hexane [CAS No. 110-54-3] concentration: 1 to 15% Cyclohexane [CAS No. 110-82-7] concentration: 1 to 8% Benzene [CAS No. 71-43-2] concentration: 1 to 8% Toluene [CAS No. 108-88-3] concentration: 1 to 10% Xylenes [CAS No. 1330-20-7] concentration: 1 to 5% Ethylbenzene [CAS No. 100-41-4] concentration: 0.2 to 2%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances that might be present in this material which are subject to this statute are: n-Hexane [CAS No. 110-54-3] (RQ = 5,000 lbs. [2,270 kg]) concentration: 1 to 15% Cyclohexane [CAS No. 110-82-7] (RQ = 1000 lbs. [453.6 kg]) concentration: 1 to 8% Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 1 to 8% Toluene [CAS No. 108-88-3] (RQ = 1000 lbs. [453.6 kg]) concentration: 1 to 10% 2,2,4-Trimethylpentane (Iso-octane) [CAS No. 540-84-2] (RQ = 1000 lbs. [453.6 kg]) conc.: 1 to 8% Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 1 to 5% Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 0.2 to 2%
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material contains the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5: Benzene [CAS No. 71-43-2] and Toluene [CAS No. 108-88-3].
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2.
Additional Regulatory Remarks	Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13). This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children! Under Section 12(b) of the Toxic Substances Control Act. Because it contains detectable amounts of Cyclohexane [CAS No. 110-82-7] , this material is subject to US EPA's one-time only per country export notification requirements. In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following minor components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare: Isopentane [CAS No. 78-78-4], n-Pentane [109-66-0], Cyclohexane [110-82-7], Benzene [71-43-2], Methylcyclohexane [108-87-2], Toluene [108-88-3], Xylenes [1330-20-7], and Ethylbenzene [100-41-4]. In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Chemical substances present in this material which are subject to this statute are: Isopentane (Butane, 2-methyl-) [78-78-4] and n-Pentane [109-66-0]

BTU Depentanizer Tower Bottoms**SECTION 16: OTHER INFORMATION**

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Depentanizer OH Accumulator Liquid Draw Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0142
Revision Date 2/21/2005

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Gas/liquid
Color Transparent, colorless. **Odor** Hydrocarbon. Rotten eggs. (Strong.)

DANGER:
EXTREMELY FLAMMABLE LIQUID AND VAPOR, VAPOR MAY CAUSE FLASH FIRE.

Vapor may travel considerable distance to source of ignition and flash back.

Harmful or fatal if swallowed - can enter lungs and cause damage.

Breathing high concentrations can cause irregular heartbeats which may be fatal.

May be harmful if inhaled or absorbed through the skin.

Can cause eye, skin or respiratory tract irritation.

Overexposure can cause central nervous system (CNS) depression and/or other target organ effects.

Harmful to aquatic organisms.

Possible Cancer Hazard (See Section 3)

Hazard Rankings

	HMIS	NFPA
Health Hazard	* 2	2
Fire Hazard	4	4
Reactivity	0	0

* = Chronic Health Hazard

Protective Equipment

Minimum Recommended
See Section 8 for Details

Minimum PPE reflects the requirements for this material at this facility:

LYONDELL-CITGO Refining

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	Depentanizer OH Accumulator Liquid Draw	Technical Contact	(800) 525-4692
Product Number	Not available.	Medical Emergency	(800) 313-7645
CAS Number	64741-74-8	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Not applicable.		
Synonyms	534 Depent Tower Overhead Accumulator Bottoms, 534 Unit D-23 Accumulator Bottoms, 534 Depent OH Liquid		

SECTION 2. COMPOSITION (TYPICAL)

This product may be composed, in whole or in part, of any of the following refinery streams:

Light Thermal Cracked Naphtha (Petroleum) [CAS No.: 64741-74-8]

This product contains the following chemicals as components of the refinery streams listed above:

Component Name(s)	CAS Registry No.	Concentration (%)
-------------------	------------------	-------------------

Depentanizer OH Accumulator Liquid Draw

Hydrocarbons, C5-Rich	68476-55-1	30 - 50
Hexane, other isomers	Mixture	10 - 20
n-Hexane	110-54-3	5 - 15
C6-C9 alpha-Alkenes	68526-99-8	5 - 15
Cyclohexane	110-82-7	1 - 5
Butenes or Butylenes	25167-67-3	1 - 5
Benzene	71-43-2	1 - 3
1, 3-Butadiene	106-99-0	<1
Hydrogen Sulfide	7783-06-4	<0.2

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Inhalation. Ingestion

Signs and Symptoms of Acute Exposure

Inhalation	<p>May be harmful or fatal if inhaled. Contains hydrogen sulfide. Inhalation of gas or vapor may cause severe nose, throat, respiratory tract, and lung irritation, respiratory paralysis, and death, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath.</p> <p>Breathing this material may cause central nervous system depression with symptoms including nausea, headache, dizziness, fatigue, drowsiness, or unconsciousness.</p> <p>Breathing high concentrations of this material, for example, in an enclosed space or by intentional abuse, can cause irregular heartbeats which can cause death.</p>
Eye Contact	<p>This material can cause eye irritation with tearing, redness, or a stinging or burning feeling. Further, it can cause swelling of the eyes with blurred vision. Effects may become more serious with repeated or prolonged contact.</p>
Skin Contact	<p>May cause skin irritation with redness, an itching or burning feeling, and swelling of the skin. Effects may become more serious with repeated or prolonged contact.</p> <p>Skin contact may cause harmful effects in other parts of the body.</p>
Ingestion	<p>Swallowing this material may be harmful.</p> <p>Swallowing this material may cause stomach or intestinal upset with pain, nausea, and/or diarrhea.</p> <p>This material can get into the lungs during swallowing or vomiting. Small amounts in the lungs can cause lung damage, possibly leading to chronic lung dysfunction or death.</p> <p>Swallowing this material may cause effects similar to those described in the inhalation section (see "inhalation" above).</p>

Chronic Health Effects Summary	<p>Subacute exposure to low levels of hydrogen sulfide can produce eye irritation, watering, light sensitivity and corneal opacity. Reported effects from subacute exposure also include bronchitis, pulmonary edema, nausea, abdominal cramps and diarrhea.</p> <p>Aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Altered mental state, drowsiness, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been reported from repeated over-exposure such as gasoline and naphtha abusers.</p> <p>Repeated and prolonged overexposure to n-Hexane has been associated with peripheral nerve tissue damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function and paralysis.</p> <p>This material, or a component of this material, has been shown to cause cancer in laboratory animals. However it is not likely to represent a human cancer hazard.</p> <p>See Toxicological Information (Section 11)</p>
---------------------------------------	---

Conditions Aggravated by Exposure	<p>Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Peripheral Nervous System, Central Nervous System (CNS), Heart (Cardiac)</p>
--	---

Depentanizer OH Accumulator Liquid Draw

Target Organs Contains material which may cause damage to the following organs: blood, kidneys, lungs, the reproductive system, liver, mucous membranes, heart, lymphatic system, peripheral nervous system, upper respiratory tract, immune system, skin, bone marrow, central nervous system (CNS), eye, lens or cornea, testes.

Carcinogenic Potential **CARCINOGENIC EFFECTS** Classified 1 (Proven for human.) by IARC, + (Proven.) by OSHA [Benzene]. Classified + (Proven.) by OSHA+ (Proven.) by NIOSH [1, 3-Butadiene]. Classified A2 (Suspected for human.) by ACGIH, 2A (Probable for human.) by IARC [1, 3-Butadiene].

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Toxic	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.

Eye Contact Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.

Skin Contact Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.

Ingestion Do not induce vomiting unless directed to do so by medical personnel -- this material is an aspiration hazard. Get immediate medical attention. Never give anything by mouth to an unconscious person.

Notes to Physician INHALATION: Inhalation overexposure can produce toxic effects. Treat intoxications as hydrogen sulfide exposures. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Administer supplemental oxygen with assisted ventilation, as required.

This material (or a component) sensitizes the heart to the effects of sympathomimetic amines. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias in individuals exposed to this material. Administration of sympathomimetic drugs should be avoided.

INGESTION: If ingested, this material presents a significant aspiration and chemical pneumonitis hazard. Induction of emesis is not recommended. Consider activated charcoal and/or gastric lavage. If patient is obtunded, protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position.

Depentanizer OH Accumulator Liquid Draw

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas.
Flash Point	Closed cup: <-45°C (-49°F). (Tagliabue.)
Lower Flammable Limit	AP 1 % Upper Flammable Limit AP 13 %
Autoignition Temperature	not available
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons and oxides of sulfur and/or nitrogen.
Special Properties	Flammable Liquid! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. A vapor and air mixture can create an explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide, foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or water spray. Water fog and spray are effective in cooling containers and adjacent structures. However, water can cause frothing and/or may not extinguish the fire. Water can be used to cool the external walls of vessels to prevent excessive pressure, autoignition or explosion. DO NOT use a solid stream of water directly on the fire as the water may spread the fire to a larger area.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid enter sewers or waterways.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent spilled material from entering waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Prevent spilled material from entering sewers, storm drains, other drainage systems, and natural waterways. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free

Depentanizer OH Accumulator Liquid Draw

liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbant pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7. HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire or explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation and personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food and tobacco products. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

A static electrical charge can accumulate when this material is flowing through pipes, nozzles or filters and when it is agitated. A static spark discharge can ignite accumulated vapors particularly during dry weather conditions. Always bond receiving containers to the fill pipe before and during loading. Always keep nozzle in contact with the container throughout the loading process. Do not fill any portable container in or on a vehicle. Do NOT use compressed air for filling, discharging or other handling operations.

Product container is not designed for elevated pressure. Do not pressurize, cut, weld, braze solder, drill, or grind on containers. Do not expose product containers to flames, sparks, heat or other potential ignition sources. Empty containers may contain product residues that can ignite with explosive force. Observe label precautions. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling or disposing of empty containers and/or waste residues of this product.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources. Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room. A refrigerated room is preferable for materials with a flash point temperature lower than 70°F (21°C). All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable regulatory requirements and the National Electrical Code.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor or mists below the applicable workplace exposure limits indicated below. All electrical equipment should comply with the National Electric Code. An emergency eye wash station and safety shower should be located near the work-station.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Depentanizer OH Accumulator Liquid Draw

- Eye Protection** Safety glasses equipped with side shields are recommended as minimum protection in industrial settings. Chemical goggles should be worn during transfer operations or when there is a likelihood of misting, splashing, or spraying of this material. Suitable eye wash water should be readily available.
- Hand Protection** Avoid skin contact. Use heavy duty gloves constructed of chemical resistant materials such as Viton® or heavy nitrile rubber. Wash hands with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities or leaving work. DO NOT use gasoline, kerosene, solvents or harsh abrasives as skin cleaners.
- Body Protection** Avoid skin contact. Wear long-sleeved fire-retardant garments (e.g., Nomex®) while working with flammable and combustible liquids. Additional chemical-resistant protective gear may be required if splashing or spraying conditions exist. This may include an apron, boots and additional facial protection. If product comes in contact with clothing, immediately remove soaked clothing and shower. Promptly remove and discarded contaminated leather goods.
- Respiratory Protection** A full-face supplied air pressure-demand respirator with escape bottle or a pressure-demand self-contained, breathing apparatus (SCBA) is required. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).
- General Comments** Warning! Use of this material in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and/or inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
Hydrocarbons, C5-Rich Hexane, other isomers	Not available. ACGIH (United States). TWA: 500 ppm 8 hour(s). STEL: 1000 ppm 15 minute(s).
n-Hexane	ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
C6-C9 alpha-Alkenes Cyclohexane	Not available. ACGIH (United States). TWA: 100 ppm 8 hour(s). OSHA (United States). TWA: 300 ppm 8 hour(s).
Butenes or Butylenes Benzene	Not available. ACGIH (United States). Skin TWA: 0.5 ppm 8 hour(s). STEL: 2.5 ppm 15 minute(s). OSHA (United States). Skin Notes: See Table Z-2 for exclusions in 20 CFR 1910.1028 to the PEL. TWA: 1 ppm 8 hour(s). STEL: 5 ppm 15 minute(s).
1, 3-Butadiene	ACGIH (United States). Notes: "A2" Suspected Human Carcinogen TWA: 2 ppm 8 hour(s). OSHA (United States). Notes: "Z-2" Suspected Human Carcinogen TWA: 2 ppm 8 hour(s). Action Level: 1 ppm 8 hour(s). STEL: 5 ppm 15 minute(s).
Light Aliphatic Naphthas, Sour (family) Light Catalytic Cracked Naphtha	Not available. Not available.

Depentanizer OH Accumulator Liquid Draw

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Gas/liquid	Color	Transparent, colorless.	Odor	Hydrocarbon. Rotten eggs. (Strong.)
Specific Gravity	0.65 (Water = 1)	pH	Not Applicable.	Vapor Density	>1 (Air = 1)
Boiling Range	-12°C (10.4°F)			Melting/Freezing Point	-160°C (-256°F)
Vapor Pressure	Not applicable.			Volatility	650 g/l VOC (w/v)
Solubility in Water				Viscosity (cSt @ 40°C)	not available
Flash Point	Closed cup: <-45°C (-49°F). (Tagliabue.)				
Additional Properties	No additional information.				

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from heat, sparks and flame.		
Materials Incompatibility	Incompatible with strong acids, strong bases, and strong oxidizers.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

n-Hexane

This material contains n-hexane. Long-term or repeated exposure to n-hexane can cause peripheral nerve damage. Initial symptoms are numbness of the fingers and toes. Also, motor weakness can occur in the digits, but may also involve muscles of the arms, thighs and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure.

Cyclohexane

Cyclohexane can cause eye, skin and mucous membrane irritation, CNS depressant and narcosis at elevated concentrations. In experimental animals exposed to lethal concentrations by inhalation or oral route, generalized vascular damage and degenerative changes in the heart, lungs, liver, kidneys and brain were identified.

Cyclohexane has been the focus of substantial testing in laboratory animals. Cyclohexane was not found to be genotoxic in several tests including unscheduled DNA synthesis, bacterial and mammalian cell mutation assays, and in vivo chromosomal aberration. An increase in chromosomal aberrations in bone marrow cells of rats exposed to cyclohexane was reported in the 1980's. However, a careful re-evaluation of slides from this study by the laboratory which conducted the study indicates these findings were in error, and that no significant chromosomal effects were observed in animals exposed to cyclohexane. Findings indicate long-term exposure to cyclohexane does not promote dermal tumorigenesis.

Depentanizer OH Accumulator Liquid Draw

Benzene:

ORAL (LD50): Acute: 930 mg/kg [Rat]. 4700 mg/kg [Mouse].
 INHALATION (LC50):
 (VAPOR): Acute: 10000 ppm 7 hour(s) [Rat]. 9980 ppm 8 hour(s) [Mouse].

Studies of Workers Over-Exposed to Benzene:

Studies of workers exposed to benzene show clear evidence that over-exposure can cause cancer of the blood forming organs (acute myelogenous leukemia) and aplastic anemia, an often fatal disease. Studies also suggest over-exposure to benzene may be associated with other types of leukemia and other blood disorders. Some studies of workers exposed to benzene have shown an association with increased rates of chromosome aberrations in circulating lymphocytes. One study of women workers exposed to benzene suggested a weak association with irregular menstruation. However, other studies of workers exposed to benzene have not demonstrated clear evidence of an effect on fertility or reproductive outcome in humans. Benzene can cross the placenta and affect the developing fetus. Cases of aplastic anemia have been reported in the offspring of persons severely over-exposed to benzene.

Studies in Laboratory Animals:

Studies in laboratory animals indicate that prolonged, repeated exposure to high levels of benzene vapor can cause bone marrow suppression and cancer in multiple organ systems. Studies in laboratory animals show evidence of adverse effects on male reproductive organs following high levels of exposure but no significant effects on reproduction have been observed. Embryotoxicity has been reported in studies of laboratory animals but effects were limited to reduced fetal weight and skeletal variations.

1, 3-Butadiene

ORAL (LD50): Acute: 5480 mg/kg [Rat].

Studies of Workers Exposed to Butadiene:

Studies show evidence that over-exposure may be associated with an increased incidence of cancers of lymphohematopoietic organ systems, including leukemia.

Studies in Laboratory Animals:

Studies indicate that prolonged, repeated exposure to high levels of butadiene can cause cancer in multiple organs including lymphohematopoietic organ systems. Studies indicate that exposure to high levels of butadiene can cause chromosome damage to somatic and germ cells. Some studies also show limited evidence that exposure to butadiene may induce heritable mutations. Studies show evidence of adverse effects on male and female reproductive organs following exposure to high levels of butadiene. Embryotoxicity has been reported. Effects included increased rates of fetal death and skeletal variations.

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity

No data.

Environmental Fate

This product will normally float on water. Components will evaporate rapidly. This material may be harmful to aquatic organisms and may cause long term adverse effects in the aquatic environment. The log Kow value for this product is expected to be in the range of 3.3 to 6.

Depentanizer OH Accumulator Liquid Draw

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. Conditions of use may cause this material to become a "hazardous waste", as defined by federal or state regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304 Emergency Planning and Notification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: fire, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard
SARA 313 Toxic Chemical Notification and Release Reporting	This product contains the following components in concentrations above de minimis levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: n-Hexane [CAS No.: 110-54-3] Concentration: 10% Cyclohexane [CAS No.: 110-82-7] Concentration: 3% Benzene [CAS No.: 71-43-2] Concentration: 2%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are: n-Hexane [CAS No.: 110-54-3] RQ = 5000 lb. (2268 kg) Concentration: 10% Cyclohexane [CAS No.: 110-82-7] RQ = 1000 lb. (453.6 kg) Concentration: 3% Benzene [CAS No.: 71-43-2] RQ = 10 lb. (4.536 kg) Concentration: 2%

Depentanizer OH Accumulator Liquid Draw

Clean Water Act (CWA)	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material may contain the following components which are known to the State of California to cause cancer, birth defects or other reproductive harm, and may be subject to the requirements of California Proposition 65 (CA Health & Safety Code Section 25249.5): Benzene: 2% 1, 3-Butadiene: 0.9%
New Jersey Right-to-Know Label	For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.
Additional Regulatory Remarks	No additional regulatory remarks.

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 2.0
Revision Date 2/21/2005
Print Date Printed on 2/21/2005.

Light Aromatic Solvent Naphtha (C8-C11 Hydrocarbons)

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0151
Revision Date 2/28/2003

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid.
Color Transparent, colorless. **Odor** Moderate to strong, sweet and pleasant, aromatic hydrocarbon.

WARNING:

Flammable liquid; vapor may cause flash fire.
Harmful or fatal if swallowed - Can enter lungs and cause damage.
Mist or vapor may irritate the respiratory tract.
Liquid contact may cause eye and skin irritation.
Overexposures may cause central nervous system (CNS) depression and target organ effects.
Spills may create a slipping hazard.

Hazard Rankings

	HMIS	NFPA
Health Hazard	* 2	2
Fire Hazard	3	3
Reactivity	0	0

* = Chronic Health Hazard

Protective Equipment

Minimum Recommended
See Section 8 for Details

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

SECTION 1: IDENTIFICATION

Trade Name	Aromatic Naphtha	Technical Contact	(800) 525-4692
Product Number	2185	Medical Emergency	(800) 313-7645
CAS Number	Mixture.	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	C8-C11 Aromatic Hydrocarbon Solvent		
Synonyms	Aromatics Distillation Unit (ADU) Xylene Rerun Tower Bottoms Stream and Reboiler Recycle; ADU Ortho-I and Ortho-II Bottom Tower Bottoms Streams and Reboiler Recycles; Feeds to the ADU Ortho Stabilizer Tower; C8-C11 Aromatic Naphtha; C8-C11 Petroleum Hydrocarbons.		

Light Aromatic Solvent Naphtha (C8-C11 Hydrocarbons)

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Xylene, all isomers	1330-20-7	79-99.5
2) C9+ Aromatic Hydrocarbons	70693-06-0	0-21
3) Cumene	98-82-8	0-3
4) Naphthalene	91-20-3	0-3

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Eye contact. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon the exposure duration. Vapors can reduce the oxygen content in air. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces.
Eye Contact	This product can cause eye irritation with short-term contact with liquid, mists or vapor. Symptoms include stinging, watering, redness, and swelling. In severe cases, permanent eye damage can result.
Skin Contact	Tests on similar materials suggest that moderate skin irritation, inflammation, and blistering is expected to occur upon short-term contact. Certain components of this material may be absorbed through the skin. If the skin is damaged, absorption increases.
Ingestion	If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above). Due to its light viscosity, there is a danger of aspiration into the lungs during swallowing and subsequent vomiting. Aspiration can result in severe lung damage or death. Cardiovascular effects include shallow rapid pulse and pallor followed by flushing. Also, progressive CNS depression, respiratory insufficiency and ventricular fibrillation may result in death.
Chronic Health Effects Summary	Prolonged and/or repeated contact may cause moderate to severe skin irritation and inflammation. Symptoms include defatting, redness, dryness, blistering, lesions, and/or scaly dermatitis. Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Altered mental state, drowsiness, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been common results for gasoline and naphtha abusers.
Conditions Aggravated by Exposure	Personnel with pre-existing central nervous system (CNS) disease, psychological conditions, skin disorders, impaired cardiovascular, liver, or kidney function, or chronic respiratory diseases should avoid exposure.
Target Organs	This material causes damage to the following organs: blood, kidneys, lungs, the reproductive system, liver, mucous membranes, heart, brain, upper respiratory tract, skin, eyes, central nervous system (CNS). Contains material which causes damage to the following organs: the nervous system, eye, lens or cornea.
Carcinogenic Potential	This product does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC or NTP.

Light Aromatic Solvent Naphtha (C8-C11 Hydrocarbons)

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).									
OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
Ingestion	Do not induce vomiting. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	<p>Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory or steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.</p> <p>If ingested, this material presents a significant aspiration and chemical pneumonitis hazard. Accordingly, induction of emesis is not recommended. Consider administration of an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.</p> <p>Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse). If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	NFPA Class-IC flammable liquid.		
Flash Point Method	CLOSED CUP: 32.222°C (90°F).		
Lower Flammable Limit	AP 1 %	Upper Flammable Limit	AP 7 %
Autoignition Temperature	210°C (410°F)		

Light Aromatic Solvent Naphtha (C8-C11 Hydrocarbons)

Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons, aldehydes and other products of incomplete combustion.
Special Properties	Flammable Liquid! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. A vapor and air mixture can create an explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide, foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or water spray. Water fog and spray are effective in cooling containers and adjacent structures. However, water can cause frothing and/or may not extinguish the fire. Water can be used to cool the external walls of vessels to prevent excessive pressure, autoignition or explosion. DO NOT use a solid stream of water directly on the fire as the water may spread the fire to a larger area.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid enter sewers or waterways.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the **Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13** of this MSDS.

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbant pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

Handling	A spill or leak can cause an immediate fire or explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation and personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food and tobacco products. Do not take internally.
	When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Light Aromatic Solvent Naphtha (C8-C11 Hydrocarbons)

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This combustible liquid should be stored in a separate safety cabinet or room. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the NFPA National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor or mists below the applicable workplace exposure limits indicated below. All electrical equipment should comply with the National Electric Code. An emergency eye wash station and safety shower should be located near the work-station.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Eye Protection

Safety glasses equipped with side shields are recommended as minimum protection in industrial settings. Chemical goggles should be worn during transfer operations or when there is a likelihood of misting, splashing, or spraying of this material. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact. Use gloves (e.g., disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Wash hands with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities or leaving work. DO NOT use gasoline, kerosene, solvents or harsh abrasives as skin cleaners.

Body Protection

Avoid skin contact. Wear long-sleeved fire-retardant garments (e.g., Nomex®) while working with flammable and combustible liquids. Additional chemical-resistant protective gear may be required if splashing or spraying conditions exist. This may include an apron, boots and additional facial protection. If product comes in contact with clothing, immediately remove soaked clothing and shower. Promptly remove and discarded contaminated leather goods.

Respiratory Protection

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).

General Comments

Warning! Use of this material in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and/or inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance

Applicable Workplace Exposure Levels

Light Aromatic Solvent Naphtha (C8-C11 Hydrocarbons)

1) Xylene, all isomers	ACGIH (United States). TWA: 100 ppm STEL: 150 ppm OSHA (United States). TWA: 100 ppm
2) Cumene	ACGIH (United States). TWA: 50 ppm OSHA (United States). Skin TWA: 50 ppm
3) Naphthalene	ACGIH (United States, 2000). Skin TWA: 10 ppm STEL: 15 ppm OSHA (United States, 1989). TWA: 10 ppm STEL: 15 ppm TWA: 10 ppm

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Liquid.	Color Transparent, colorless.	Odor	Moderate to strong, sweet and pleasant, aromatic hydrocarbon.
Specific Gravity	0.88 (Water = 1)	pH Not applicable.	Vapor Density	4.3 (Air = 1)
Boiling Range	144° C (292° F) to 260° C (500° F)		Melting/Freezing Point	-25°C (-13°F)
Vapor Pressure	The highest known value is 1.1 kPa (8 mmHg) (at 20°C) (Xylene, all isomers).		Viscosity (cSt @ 40°C)	LT 1.5
Solubility in Water	Very slightly soluble in cold water.		Volatile Characteristics	880 g/l VOC (W/V)

Additional Properties No additional information.

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions.	
Materials Incompatibility	Strong acids, alkalies, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen.	
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.	

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the **Emergency Overview on Page 1** and the **Hazards Identification in Section 3** of this MSDS.

Toxicity Data

Xylene, all isomers:

ORAL (LD50): Acute: 4,300 mg/kg [Rat].

GAS (LC50): Acute: 4,550 ppm for 4 hours [Rat].

DERMAL (LD50): Acute: 14,100 uL/kg [Rabbit].

Overexposure to xylene may cause upper respiratory tract irritation, headache, cyanosis, blood serum changes, CNS damage and narcosis. Effects may be increased by the use of alcoholic beverages. Also, ototoxicity has been associated with chronic overexposure to xylene. An inhalation study with laboratory rats indicated an association between elevated exposures to mixed xylenes and hearing loss. Animal studies have associated embryo and fetotoxicity with maternally toxic dose exposures of mixed xylene isomers and ethylbenzene. Lung inflammation and liver damage were identified as health effects in chronic studies using guinea pigs. The significance of these animal study results to humans is not known.

Light Aromatic Solvent Naphtha (C8-C11 Hydrocarbons)

C9+ Aromatic Hydrocarbons:

C9 aromatic hydrocarbons can cause eye, skin and respiratory irritation. No significant mutagenicity, chromosomal aberrations or neurological effects were observed in evaluations conducted pursuant to a TSCA test rule. A NOEL of 100 ppm was established from developmental toxicity and 3-generation reproductive toxicity studies required under the test rule. Parental toxicity (reduced body weight and food consumption) was present at all exposure levels.

Naphthalene:

ORAL (LD50): Acute: 1800 mg/kg [Rat]. 533 mg/kg [Mouse]. 1200 mg/kg [Guinea pig].
 DERMAL (LD50): Acute: 969 mg/kg [Mouse].
 INHALATION (LC50): Acute: >340 mg/m³ 1 hour(s) [Rat].

Naphthalene is a potential irritant to eyes, skin and lungs. Ingestion of naphthalene has been associated with severe red blood cell and liver damage leading to death. Following prolonged or repeated exposures, naphthalene has been shown to cause cataracts, optical neuritis, hemolytic and aplastic anemia, jaundice and possibly neurotoxicity. In animal studies, naphthalene caused fetal effects and decreased spleen weights in pregnant female mice. In an NTP sponsored study, naphthalene produced a dose related increase in tumors at the 30 and 60 ppm exposure level in both male and female rats. Higher incidences of respiratory epithelial adenomas, olfactory epithelial neuroblastomas and non-neoplastic lesions of the nose were observed as compared to controls. Cytogenic studies with Chinese hamster ovary cells have demonstrated sister chromatid exchanges and chromosomal aberrations. The relevance of these studies to human health is unclear.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Analysis for ecological effects has not been conducted on this product. However, if spilled, this product, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. Also, the coating action associated with this product can be harmful or fatal to aquatic life and waterfowl. Volatile aromatic components may be released and can possibly contribute to the creation of atmospheric smog.

Environmental Fate

This mixture contains components that are potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds.

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a hazardous waste at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

Light Aromatic Solvent Naphtha (C8-C11 Hydrocarbons)

SECTION 14: TRANSPORT INFORMATION

The shipping description below may not represent requirements for all modes of transportation, shipping methods or locations outside of the United States.

US DOT Status	A U.S. Department of Transportation regulated material.		
Proper Shipping Name	Petroleum distillates, n.o.s. (Xylenes)		
Hazard Class	3	Packing Group(s)	III
		UN/NA ID	UN1268
Reportable Quantity	The Reportable Quantity (RQ) substance components in this product which require DOT HAZMAT bill-of-lading display are Xylenes and Naphthalene .		
Placards		Emergency Response Guide No.	128
		HAZMAT STCC No.	49 102 56
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard
SARA 313	This product contains the following components in concentrations above de minimis levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: Xylene, all isomers [CAS No.: 1330-20-7] Concentration: 89.3% Cumene [CAS No.: 98-82-8] Concentration: 1.5% Naphthalene [CAS No.: 91-20-3] Concentration: 2%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are: Xylene, all isomers [CAS No.: 1330-20-7] RQ = 100 lbs. (45.36 kg) Concentration: 89.3% Cumene [CAS No.: 98-82-8] RQ = 5000 lbs. (2268 kg) Concentration: 1.5% Naphthalene [CAS No.: 91-20-3] RQ = 100 lbs. (45.36 kg) Concentration: 1.5%
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material may contain the following components which are known to the State of California to cause cancer, birth defects or other reproductive harm, and may be subject to the requirements of California Proposition 65 (CA Health & Safety Code Section 25249.5): Naphthalene: 1.5% Toluene: 0.002%

Light Aromatic Solvent Naphtha (C8-C11 Hydrocarbons)**New Jersey
Right-to-Know Label**

For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.

**Additional Regulatory
Remarks**

Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13): This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a from suitable for use in the household or by children. Precautionary label dialogue should display the following: **Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children!**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 2.1
Revision Date 2/28/2003
Print Date Printed on 2/28/2003.

Light Naphtha Solvent Extract (C6-C8 Aromatic Hydrocarbons)

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0156
Revision Date 08/25/1999

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid.
Color Transparent, colorless. **Odor** Characteristic, sweet and pleasant, aromatic hydrocarbon.

DANGER! Extremely flammable liquid;
vapor may cause flash fire or explosion!
Mist or vapor may irritate the eyes, mucous membranes,
and respiratory tract!
Liquid contact may cause moderate to severe eye and/or
skin irritation and inflammation!
May be harmful or fatal if ingested!
Aspiration into the lungs will cause pulmonary edema and
chemical pneumonia!
May be harmful if inhaled or absorbed through the skin!
Overexposures may cause central nervous system (CNS) depression
and/or target organ effects such as liver, kidney, sensory nerve,
and blood-forming tissue damage!
Prolonged and/or repeated inhalation may increase the heart's
susceptibility to arrhythmias (irregular beats)!
Cancer hazard; Benzene can cause leukemia and other blood disorders!
May adversely affect reproduction or reproductive development!
Mutagenic hazard; can cause genetic damage!
Spills may create a slipping hazard!

SECTION 1: IDENTIFICATION

Trade Name	Light Naphtha Solvent Extract (C6-C8 Aromatic Hydrocarbons)	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	064741997*	Medical Emergency	(918) 495-4700
CAS Number	64741-99-7	CHEMTREC Emergency	(800) 424-9300
Product Family	C6-C8 Aromatic Hydrocarbons		
Synonyms	BTX Concentrate; BTX Extract, Light Aromatic Concentrate; C6-C8 Alkylbenzenes; C6-C8 Aromatic Hydrocarbon Solvent; Benzene/Toluene/Xylenes/Ethylbenzene Mix		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Light Naphtha Solvent Extract (Petroleum)	64741-99-7	100
2) Benzene	71-43-2	30-64
3) Toluene	108-88-3	25-40
4) Xylenes	1330-20-7	10-25
5) Ethylbenzene	100-41-4	1-5

Light Naphtha Solvent Extract (C6-C8 Aromatic Hydrocarbons)

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact Eye Contact Absorption Inhalation Ingestion.

Signs and Symptoms of Acute Exposure

- Inhalation** Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon the exposure duration. Vapors can reduce the oxygen content in air Approximately 20,000 ppm (or 2 vol.%) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from an exposure of 5,000 to 10,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces
- Eye Contact** Animal test results on similar materials and actual human exposures to its components suggest that this stream can cause moderate to severe eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling. Direct liquid contact may cause conjunctivitis, corneal burns, and/or permanent clouding of the cornea.
- Skin Contact** Animal test results on similar materials and actual human exposures to its components suggest that this stream can cause moderate to severe skin irritation and inflammation Short-term contact symptoms include redness, itching, and burning of the skin This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above) and target organ effects (see below) If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause severe dermatitis. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, lesions, and severe tissue damage.
- Ingestion** If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above)

Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.

Chronic Health Effects Summary

Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. And, chronic inhalation of benzene vapors have been found to cause fatigue, nervousness, irritability, blurred vision, and labored breathing

Reports have associated repeated and proplonged occupational overexposure to solvents with irreversible brain and nervous system damage (sometimes referred to as "Solvent or Painter's Syndrome") Intentional misuse by deliberately concentrating and inhaling this material may be harmful or fatal. Delirium, seizures, and sudden death have been common results for solvent naphtha abusers

Benzene is considered to be a cancer causing agent It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML). Benzene is also capable of causing changes in genetic material (chromosomes). Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy. Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents.

Repeated overexposure to **toluene** has a cumulative effect on the nervous system which gradually progresses to an irreversible state Besides effects on behavior, memory, coordination, and intelligence, chronic occupational exposures have caused optic and auditory nerve degeneration. And, painters exposed to 100 to 1,000 ppm toluene in air have experienced enlargement of their liver, decreased red and white blood cell counts, and an intolerance to **ethyl alcohol**. Chronic occupational **xylene** exposures have also caused auditory nerve degeneration and resultant hearing loss.

**Light Naphtha Solvent Extract
(C6-C8 Aromatic Hydrocarbons)**

Available information indicates that **toluene** is NOT teratogenic, but it can be toxic to the embryo and fetus and may reduce fertility. In animal tests, high inhaled doses of toluene has caused reduced litter sizes, retarded development of the fetus, and increased incidence of non-lethal abnormalities. And, based upon animal testing, the **C8 aromatic hydrocarbon components (xylenes and ethylbenzene)** might be assumed to cause embryo and fetal toxicity, spontaneous abortions, and/or decreased fetal and newborn weights if overexposures occur during a woman's early gestation period. (See Section 11.)

Conditions Aggravated by Exposure

Personnel with pre-existing central nervous system (CNS) disease, neurological conditions, skin or blood disorders, impaired hearing, liver, or kidney function, or chronic respiratory diseases should avoid exposure. Special precautions are necessary for pregnant women and nursing mothers.

Exposure to high concentrations of this material may increase the sensitivity of the heart to **epinephrine (adrenalin) and catecholamine-like drugs**. Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians")

Target Organs

The substance is toxic to lungs, central nervous system, brain, blood, bone marrow and other blood-forming tissues, kidneys, liver, heart, mucous membranes, skin, eyes, and possibly the reproductive system.

Carcinogenic Potential

This material contains **benzene** which is considered carcinogenic by OSHA, IARC, and NTP. See Section 11.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation

Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.

Eye Contact

Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.

Skin Contact

Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.

Ingestion

Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.

Notes to Physician

Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse). If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential.

**Light Naphtha Solvent Extract
(C6-C8 Aromatic Hydrocarbons)**

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IA Flammable Liquid Extremely flammable!		
Flash Point/Method	CLOSED CUP: -12°C (10°F) (Tagliabue [ASTM D-56])		
Lower Flammable Limit	AP 1.0%	Upper Flammable Limit	AP 7.1%
Auto-Ignition Temp.	AP 432° to 466°C (810° to 870°F)		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors.		
Special Properties	Flammable Liquid! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.		
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide (CO ₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.		
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat, cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers or waterways.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

**Light Naphtha Solvent Extract
(C6-C8 Aromatic Hydrocarbons)**

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe the vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room, and preferably refrigerated. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N F P.A.'s National Electrical Code (NEC)

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Chemical splash goggles are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, a hard hat and face shield should also be worn. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact and use gloves (disposable Viton®, PVC, neoprene, nitrile, vinyl, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements for benzene (29 CFR 1910 1028 and 1910 134) or equivalent standard (e.g. ANSI Z88.2).

Light Naphtha Solvent Extract (C6-C8 Aromatic Hydrocarbons)

General Comments Warning! Odor is an inadequate warning for hazardous conditions, especially since the odor threshold of **benzene** is several ppm above the occupational exposure guideline levels. Released vapors may cause extremely flammable, explosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special safety precautions including monitoring for oxygen deficiency and flammability.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Benzene ("A1" and "Z-2" Carcinogen)	TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 1 STEL: 5 AL: 0.5 (ppm) from OSHA (PEL) [1987] - SKIN
2) Toluene ("A4" = Not Classifiable)	TWA: 50 (ppm) from ACGIH (TLV) [1998] - SKIN TWA: 200 CEIL: 300 (ppm) from OSHA (PEL) [1976]
3) Xylene, Mixed Isomers ("A4" = Not Classifiable)	TWA: 100 STEL: 150 (ppm) from ACGIH (TLV) [1999] TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [1989]
4) Ethylbenzene ("A3" Animal Carcinogen proposed for 2000.)	TWA: 100 STEL: 125 (ppm) from ACGIH (TLV) [1999] TWA: 100 STEL: 125 (ppm) from OSHA (PEL) [1989]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color	Transparent, colorless.	Odor	Characteristic, sweet and pleasant, aromatic hydrocarbon.
Specific Gravity	0.88 (Water = 1)	pH	Not applicable	Vapor Density	3.0 to 3.2 (Air = 1)
Boiling Point/Range	80° to 81°C (176° to 177°F) (ASTM D-2887)	Melting/Freezing Point			-95° to 6°C (-139° to 42°F)
Vapor Pressure	15 to 76 mm Hg at 20°C (68°F).	Viscosity (cSt @ 40°C)			1 to 2
Solubility in Water	Slightly soluble in cold water (AP 0.06%); miscible with most organic solvents.	Volatile Characteristics			Volatile Organic Compounds (VOCs) Content = 100%; 878 gm/L.
Additional Properties	C6-C8 Aromatic Hydrocarbons Content = 99 to 100 Wt.% (ASTM D-1319), Average Density at 60°F = 7.328 lbs./gal. (ASTM D-2161); Odor Threshold = 4 to 34 ppm in air; Aniline Cloud Point Temperature = 48°F (8.6°C) (ASTM D-611); Kauri-Butanol (KB) Value = 105 (ASTM D-1133); Dry Point Temperature = 292°F (144°C) (ASTM D-86); Evaporation Rate = AP 3.0 when n-Butyl acetate = 1.0; Heat Value = AP 18,000 Btu.				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from heat, sparks, and other ignition sources, strong oxidizing conditions, and freezing temperatures.		
Materials Incompatibility	Strong acids, especially nitric acid, alkalis, and oxidizers such as liquid chlorine, many fluorides, perchlorates, and other halogens, hydrogen peroxide, and oxygen		
Hazardous Decomposition Products	Burning or excessive heating may produce smoke, carbon monoxide, and carbon dioxide.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Light Naphtha Solvent Extract (C6-C8 Aromatic Hydrocarbons)

Benzene:

ORAL (LD50):	Acute: 930 mg/kg [Rat] - Tremors and convulsions.
ORAL (LD50):	Acute 4,700 mg/kg [Mouse].
ORAL (LD50):	Acute 5,700 mg/kg [Unidentified mammal].
GAS (LC50):	Acute. 10,000 ppm for 7 hours [Rat].
GAS (LC50):	Acute 9,980 ppm for 8 hours [Mouse] - General anesthesia, muscle weakness, and dyspnea
DERMAL (LD50)	Acute: 48 mg/kg [Mouse]
DERMAL (LD50):	Acute: GT 9,400 uL/kg [Rabbit and Guinea Pig].
INTRAPERITONEAL (LD50):	Acute. 340 mg/kg [Mouse].
INTRAPERITONEAL (LD50):	Acute: 2,890 ug/kg [Rat] - Lung and liver damage plus decreased blood cells.

Toluene

ORAL (LD50):	Acute 636 mg/kg or [Rat].
ORAL (LD50):	Acute: 4,000 mg/kg or [Cat].
GAS (LC50):	Acute 49,000 mg/m ³ for 4 hours [Rat].
GAS (LC50):	Acute. 5,320 ppm for 8 hours [Mouse].
GAS (LC50):	Acute: 400 ppm for 24 hours [Mouse].
DERMAL (LD50):	Acute: 14,100 uL/kg or 12,125 mg/kg [Rabbit]
INTRAVENOUS (LD50):	Acute 1,960 mg/kg [Rat].
INTRAVENOUS (LD50):	Acute: 2,000 mg/kg [Mouse]
SUBCUTANEOUS (LD50):	Acute: 2,250 mg/kg [Mouse]
INTRAPERITONEAL (LD50):	Acute. 59 mg/kg [Mouse].
INTRAPERITONEAL (LD50)	Acute: 500 mg/kg [Guinea Pig].
INTRAPERITONEAL (LD50):	Acute 1,332 mg/kg [Rat].

Xylenes:

ORAL (LD50):	Acute. 4,300 mg/kg [Rat].
GAS (LC50):	Acute 4,550 ppm for 4 hours [Rat].
DERMAL (LD50).	Acute 14,100 uL/kg [Rabbit]
SUBCUTANEOUS (LD50)	Acute: 1,700 mg/kg [Rat]
INTRAPERITONEAL (LD50):	Acute: 2,459 mg/kg [Rat]
INTRAPERITONEAL (LD50):	Acute 1,548 mg/kg [Mouse]

Ethylbenzene:

ORAL (LD50):	Acute: 3,500 mg/kg [Rat].
DERMAL (LD50):	Acute: 17,800 uL/kg [Rabbit].
INTRAPERITONEAL (LD50):	Acute: 2,624 mg/kg [Rat].

Benzene has an IDLH (immediately dangerous to life or health) concentration = 500 ppm. Its estimated lethal dose for a normal human adult is one teaspoon to one ounce (AP 10 mL) Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes.

Benzene is a known animal carcinogen and a human leukemogen. In addition, NTP, IARC, EPA, OSHA, and ACGIH list benzene as a "Human Carcinogen." Repeated and prolonged overexposure to benzene vapors (GT 20 ppm in air) may cause toxicity to blood-forming tissues. Chronic exposure symptoms include decreased blood cell and platelet counts, leukopenia, aplastic anemia, or acute myelogenous leukemia (AML) Also, chronic inhalation of benzene vapors have been found to cause fatigue, nervousness, irritability, blurred vision, and labored breathing Overexposure to benzene has been associated with in chromosomal aberrations in human white blood cells, both laboratory animal and human bone marrow cell damage, and in vitro mammalian cells DNA damage. Elevated frequencies of chromosomal aberrations have been observed in peripheral white blood cells and bone marrow of workers exposed to high benzene concentrations known to be associated with signs of chronic poisoning Ethanol consumption may have a synergistic effect and increase blood system changes caused by benzene exposures. Children and teenagers have a lower resistance to bone marrow poisons

Studies with pregnant laboratory animals have demonstrated that **benzene** is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice

Toluene (methylbenzene) has been a major solvent of intentional inhalation abuse. Deliberate long-term inhalation of high concentrations of toluene (glue sniffing, etc.) has been shown to cause liver, kidney, central nervous system, and permanent brain damage. Effects such as impaired speech, visual disturbances, and hearing loss, loss of balance and/or muscle control, and memory loss have been reported Exposures of 100 to 200 ppm in air for 24 hours cause hallucinations, distorted perceptions, and changes in motor activity

Light Naphtha Solvent Extract (C6-C8 Aromatic Hydrocarbons)

Studies have indicated that children of women who sniffed massive exposures of **toluene** during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. Isolated case reports have suggested a spectrum of congenital defects similar to those seen in fetal alcohol (ethanol) syndrome. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate.

Animal studies suggest that **toluene** causes kidney, liver, and/or lung dysfunction and cardiac (heart muscle) sensitization to epinephrine or other adrenalin-like agents. This sensitization may cause fatal changes in heart beat rhythms. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency).

Long-term rodent inhalation studies with **toluene** produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness, and impaired reaction time. Also, rats exposed to 1,200 ppm and 1,400 ppm of toluene in air for 14 hours per day for 5 or 4 weeks (respectively) exhibited high-frequency hearing loss. Several animal studies using pregnant rodents have shown that toluene exposures may cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation studies, toluene has not been shown to be carcinogenic; nor is it mutagenic in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

Chronic overexposure to **xylene** may produce irreversible damage to the central nervous system, including ototoxicity, that can be increased by the consumption of ethanol (alcoholic drinks). Drinking beverages which contain ethanol in conjunction with xylene exposure increases the alcoholic effects and impairs the clearance of xylenes from the body. Xylene isomers accumulate in the adipose (fat) tissues, from which they are slowly released. Complete clearance may take several days following exposure.

An inhalation study with laboratory animals indicated an association of **xylene** with hearing loss in rats. Several animal studies using pregnant rodents have shown that **ethylbenzene and the mixed xylene isomers (dimethylbenzenes)** may all cause embryo and/or fetotoxicity. Inhalation and feeding studies involving pregnant laboratory animals have produced limited evidence of fetal toxicity including increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes.

Two-year rat and mouse gavage studies by the National Toxicology Program (NTP) on **mixed xylene isomers including 17% ethylbenzene** showed "no evidence of carcinogenicity". Also, a two-year mixed xylenes skin-painting study on shaved rats and mice showed no incidence of non-neoplastic or neoplastic lesions. And, none of the components were mutagenic when tested in either the modified Ames, Chinese hamster ovary cell with and without metabolic activation, or sister-chromatid mutagenicity assays.

The NTP recently completed a 2-year inhalation bioassay on **ethylbenzene** in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200, and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels. However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level; and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Hyperplasia was also observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear. NTP, IARC, and OSHA have not designated ethylbenzene as a carcinogen.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

If spilled, this material, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. All of this naphtha's components (**benzene, toluene, xylenes, and ethylbenzene**) are volatile and might contribute to the creation of atmospheric smog. Benzene has a half-life of from 4 to 6 hours when photochemically active hydroxyl radicals are present, especially when atmospheres are polluted with nitrogen oxides or sulfur dioxide. Toluene has a half-life of from 3 hours to slightly over 1 day when photochemically active hydroxyl radicals are present, and it is very effectively washed out of the atmosphere by rain.

Light Naphtha Solvent Extract (C6-C8 Aromatic Hydrocarbons)

Using Rainbow Trout (*Oncorhynchus mykiss*) and Dungeness Crab (*Cancer magister*), all the components in this naphtha (**benzene, toluene, xylene isomers, and ethylbenzene**) showed a 96-hour TLms (Median Toxic Limit) of from 5 ppm to 30 ppm in ambient saltwater. Also, 24-hour and 96-hour TLms produced results from 10 ppm to 60 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), and Guppy (*Lebistes reticulatus*) in fresh water. Using Water Fleas (*Daphnia magna*), these substances showed 24-hour TLms of from 100 ppm to 400 ppm. Based upon actual spill incident investigations, similar aromatic naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

Environmental Fate

This naphtha mixture is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. **Benzene** is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of toluene, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated with this material might prove to be a health hazard.

Recovered non-usable **benzene** is regulated by US EPA as a "listed" hazardous waste (U019) due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT)		
Proper Shipping Name	Petroleum distillates, n.o.s. (Benzene, Toluene)		
Hazard Class	Class 3: Flammable liquid.	Packing Group(s)	PG II
		UN/NA ID	UN1268
Reportable Quantity	The Reportable Quantity (RQ) substance components in this product which require DOT HAZMAT bill-of-lading display are Benzene and Toluene		
Placards		Emergency Response Guide No.	130 or 128
		HAZMAT STCC No.	49 102 56
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

**Light Naphtha Solvent Extract
(C6-C8 Aromatic Hydrocarbons)**

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This stream and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.
SARA 313	This product contains the following components in concentrations at or above de minimis levels which are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: Benzene [CAS No. 71-43-2] concentration: 30 to 64% Toluene [CAS No. 108-88-3] concentration: 25 to 40% Xylenes [CAS No. 1330-20-7] concentration: 10 to 25% Ethylbenzene [CAS No. 100-41-4] concentration: 1 to 5%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this refinery stream subject to this statute are: Benzene (RQ = 10 lbs. [4.54 kg]) concentration: 30 to 64% Toluene (RQ = 1000 lbs. [453.6 kg]) concentration: 25 to 40% Xylenes (RQ = 100 lbs. [45.36 kg]) concentration: 10 to 25% Ethylbenzene (RQ = 1000 lbs. [453.6 kg]) concentration: 1 to 5%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material contains the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and it is subject to requirements of California Health & Safety Code Section 25249.5: Benzene [CAS No. 71-43-2] and Toluene [CAS No. 108-88-3].
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2.
Additional Regulatory Remarks	Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13) This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children! Under Section 12(b) of the Toxic Substances Control Act: Because it might contain small, but detectable, amounts of n-Hexane [CAS No. 110-54-3], Cyclohexane [CAS No. 110-82-7], and/or C9 Aromatic Hydrocarbons , this material might be subject to US EPA's one-time only per country export notification requirements In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following minor components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare": Benzene [CAS No. 71-43-2] and Toluene [CAS No. 108-88-3], Xylenes (mixed) [CAS No. 1330-20-7], and Ethylbenzene [CAS No. 100-41-4].

Emergency Overview

Physical State	Gas/Liquefied Gas/ Liquid Mixture.		
Color	Colorless liquid; invisible gas and vapor; white frost at release point.	Odor	Strong, foul smelling; rotten egg or skunk odor is unreliable as a warning of possible exposure.

DANGER! Extremely flammable and poisonous gas/liquid;
vapor may cause flash fire or explosion.

High pressure and rapid diffusion hazard.

High vapor concentrations reduce oxygen available for breathing.

Contains Hydrogen Sulfide (H₂S) and Mercaptans.

May be harmful or fatal if inhaled or absorbed through the skin.

May cause central nervous system (CNS) depression
or suffocation.

Compressed gas/liquid contact may cause frostbite/freeze burns.

Mist or vapor may cause mild to severe eye, skin, mucous
membrane, and respiratory tract irritation and inflammation.

Aspiration into the lungs will cause pulmonary edema and
chemical pneumonia.

Overexposures may cause central nervous system (CNS)
depression and other target organ effects.

Prolonged and/or repeated inhalation may increase the heart's
susceptibility to arrhythmias (irregular beats).

Potential cancer hazard. Contains Benzene.

May cause leukemia and/or other blood disorders.

Mutagenic hazard; may cause genetic damage.

May adversely affect reproduction or reproductive development.

Spills may create a slipping hazard. Corrosive to some metals.

Protective Equipment

Minimum Recommended
See Section 8 for Details

SECTION 1: IDENTIFICATION

Trade Name	Sour LPG/Light Naphtha LEF Overhead Feeds to BRU	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	1111110160	Medical Emergency	(918) 495-4700
CAS Number	Mixture (See Section 2.)	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Gas/Liquid Phase Mixture of Sour Reformate and LEF Overhead Gases and Light Naphtha		
Synonyms	Mixture of Reformer Stabilizer and Light Ends Fractionator (LEF) Overheads; Feeds to V-33 Accumulator; Feeds to the BRU No. 2 Depropanizer Tower and No. 2, No. 3, and No. 11 Stabilizer Towers; 735 Reformer Stripper and Stabilizer Overhead Streams; 733 Reformer LEF OH Release and Overhead Streams; 734 Coker Naphtha Fractionator (CNF) Overhead Stream; 632 HDS LEF Overhead Stream; LPG/Light Naphtha Blend containing Hydrogen Sulfide and Mercaptans; C3-C8 Hydrocarbons, H ₂ S, and R-SHs.

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Hydrogen sulfide	7783-06-4	0.1-1
2) Methyl mercaptan	74-93-1	0.01-1
3) Ethyl mercaptan	75-08-1	0-1
4) Ethane	74-84-0	0-2
5) Propane	74-98-6	5-20
6) Butanes	Mixture	30-80
7) Butenes or Butylenes	25167-67-3	0-2
8) Pentanes	Mixture	15-45
9) Cyclopentane	287-92-3	1-15
10) Hexane Isomers	Mixture	10-25
11) Methylcyclopentane	96-37-7	0-6
12) n-Hexane	110-54-3	1-15
13) Cyclohexane	110-82-7	1-5
14) Benzene	71-43-2	0.1-4
15) Methylcyclohexane	108-87-2	0.5-5
16) Heptanes	Mixture	5-15
17) Toluene	108-88-3	0.5-6
18) Octanes	Mixture	0-10

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Eye contact. Skin contact. Skin absorption.

Signs and Symptoms of Acute Exposure

Inhalation

May be harmful or fatal if inhaled! Inhalation of the pressurized gas, vapor, or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. The National Institute for Occupational Safety and Health has determined that atmospheres containing 150 ppm or more of **methyl mercaptan** and 100 ppm or more of **hydrogen sulfide (H₂S)** are immediately dangerous to life and health (IDLH). For **ethyl mercaptan**, the NIOSH IDLH is 500 ppm. At concentrations above 500 ppm, H₂S causes unconsciousness and respiratory paralysis leading to coma and/or death. And, at concentrations above 700 ppm, **methyl mercaptan** may cause unconsciousness and respiratory paralysis leading to coma and/or death. (See Section 11.)

Additionally, at least one component of this gas/liquid mixture is a "simple asphyxiant". High concentrations of this mixture can displace the amount of oxygen available to breathe below that level necessary to sustain life (hypoxia). Symptoms of asphyxia include increased breathing rate, headache, dizziness, visual disturbances, shortness of breath, nausea, vomiting, confusion, muscular weakness, loss of coordination, convulsions, unconsciousness, coma, and death, depending upon the concentration level and duration of exposure. Oxygen deprivation is possible if working in confined spaces.

Breathing high concentrations of the liquid-phase vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon the exposure duration. Approximately 20,000 ppm (or 2 vol.%) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes.

Eye Contact

Vapors may cause mild to severe eye irritation and photophobia (light sensitivity) upon short-term exposure. Severity depends upon the concentration of **hydrogen sulfide and mercaptans** and duration of exposure. Direct contact with pressurized/liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn." Direct liquid contact can cause clouding of the cornea with small areas of superficial corneal necrosis.

**Sour LPG/Light Naphtha
LEF Overhead Feeds to BRU**

Skin Contact	Direct contact with a liquefied/pressurized gas portion of this material may produce severe and possibly permanent skin damage from frostbite or freeze burns. Tests on this material's components suggest that moderate to severe skin irritation, inflammation, and blistering is expected to occur upon short-term liquid contact. Certain components of this material, including hydrogen sulfide, methyl and ethyl mercaptans, n-hexane, cyclohexane, benzene, n-heptane, toluene, and iso-octane , may be absorbed through the skin, and produce toxic effects such as CNS depression (see "Inhalation" above). If the skin is damaged, absorption increases.
Ingestion	Ingestion of this material is highly unlikely due to its volatile nature. However, if swallowed this material may irritate the mucous membranes of the mouth, throat, and esophagus. The liquid-phase can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium. Additional central nervous system (CNS) effects may occur prior to the onset of convulsions, coma, and death. Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Cardiovascular effects include shallow rapid pulse and pallor followed by flushing. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may result in death.
Chronic Health Effects Summary	Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H ₂ S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures. Methyl and ethyl mercaptans , at low chronic exposures, may cause pulmonary edema, hemolytic anemia, methemoglobinemia, and kidney and/or liver damage. They have also been shown to produce positive responses in various mutagenic assays. Chronic inhalation to components of this material (propane, n-butane, n-pentane, n-heptane, and toluene) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine (adrenaline)-like drugs . Prolonged and/or repeated liquid or mist contact may cause moderate to severe skin irritation and inflammation. Symptoms include defatting, redness, dryness, blistering, lesions, and/or scaly dermatitis. Also, chronic inhalation of light naphtha vapors have been found to cause fatigue, nervousness, irritability, blurred vision, and labored breathing. Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been common results for gasoline and naphtha abusers. Even with acute exposures, n-hexane is toxic to the peripheral nerves, characterized by numbness, tingling, or pain in the extremities, progressively worsening of neuromuscular motor coordination (polyneuritis or polyneuropathy), and even partial paralysis. And, based upon animal studies, n-hexane's metabolite, 2,5-hexanedione , has been shown to cause degeneration of the testes. Benzene is considered to be a cancer causing agent. It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML). Benzene is also capable of causing changes in genetic material (chromosomes). Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy. Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents. Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Chronic occupational toluene exposures have caused auditory nerve degeneration. Available information indicates that toluene is NOT teratogenic, but it can be toxic to the embryo and fetus and may reduce fertility. In animal tests, high inhaled doses of toluene has caused reduced litter sizes, retarded development of the fetus, and increased incidence of non-lethal abnormalities. (See Section 11.)
Conditions Aggravated by Exposure	Personnel with eye, skin, cardiovascular, pulmonary, blood, liver, kidney, or neurological disorders, impaired hearing, high blood pressure, and chronic respiratory diseases or those with a compromised ability to use oxygen (asthmatics, anemics, etc.) should take additional precautions to minimize or avoid exposure.
Target Organs	These streams are toxic to eyes, skin, mucous membranes, lungs, central and sympathetic nervous systems, especially the auditory and peripheral nerves, brain, heart, liver, kidneys, thymus, and possibly, the endocrine and reproductive systems.
Carcinogenic Potential	This material contains benzene at concentrations above 0.1%. Benzene is considered to be a known human carcinogen by OSHA, IARC and NTP. (See Section 11.)

**Sour LPG/Light Naphtha
LEF Overhead Feeds to BRU**

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. If pain, redness, swelling, tearing, or light sensitivity persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry. However, if any liquid is ingested, do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients.

Inhalation overexposure can produce other toxic effects due to the mercaptans. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required. If seizures occur, administer a benzodiazepine intravenously (Diazepam or Lorazepam) at 4 to 10 mg for an adult or 0.1 to 0.5 mg for a child. Consider use of phenobarbital if seizures recur (30 mg for an adult or a child over 5 years old). For methemoglobinemia symptoms, administer 1 to 2 mg/kg methylene blue slowly intravenously. Additional doses may be required.

This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines such as epinephrine (adrenaline) and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If contact with pressurized gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.

If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

**Sour LPG/Light Naphtha
LEF Overhead Feeds to BRU**

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Extremely flammable! OSHA/NFPA Flammable Gas, Liquefied Gas, and IA Liquid.		
Flash Point Method	CLOSED CUP: AP -107° to -73°C (-160° to -100°F). (Estimated)		
Lower Flammable Limit	1.6 to 4.0%	Upper Flammable Limit	AP 45%
Autoignition Temperature	260° to 288°C (500° to 550°F)		
Hazardous Combustion Products	Carbon dioxide and monoxide, smoke, fumes, oxides of sulfur, and possibly, unburned hydrocarbons or mercaptans.		
Special Properties	This gas/liquid mixture is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.		
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Compressed Gas/Liquid Mixture! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area to an area far upwind. Establish a "regulated zone" with site control and security. Eliminate all ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors. **Caution:** Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safety stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of their vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. Cover spill with a vapor-suppressing foam as soon as possible. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions.

Sour LPG/Light Naphtha LEF Overhead Feeds to BRU

Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off.

SECTION 7: HANDLING AND STORAGE

Handling

Danger! Poisonous and Flammable Gas! Do NOT breathe vapor; it may contain **hydrogen sulfide (H₂S)**, mercaptans, and/or simple asphyxiants. Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow vaporizing material to contact eyes, skin or other tissues, and clothing. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, H₂S concentrations, and flammability.

Refer to applicable OSHA, DOT and local regulation concerning handling, storage, and shipment of mixed petroleum gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. The most common hazard is leakage through faulty pressure regulators. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. The cylinder or other container might even rocket like a missile. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Use a check valve to prevent back-flow into storage containers. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable and poisonous residue.

Storage

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room, and preferably refrigerated. Keep away from all ignition sources! Containers should be able to withstand pressures expected from warming and cooling in storage. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Bond or ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC). The H₂S component of this material is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.)

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location. Where H₂S is routinely stored or handled, install monitoring equipment or system with alarms.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Sour LPG/Light Naphtha LEF Overhead Feeds to BRU

Eye Protection	Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling high-pressure liquefied gas cylinders and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.
Hand Protection	Avoid skin contact and use gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). When handling this material which can produce frostbite or cold burns, use leather gloves over these chemically-resistant gloves. Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.
Body Protection	Prevent potential skin contact with cold liquid, solid, or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gases and gas/liquids. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.
Respiratory Protection	A full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g. ANSI Z88.2).
General Comments	Releases of this gas/liquid mixture may create flammable, explosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions, especially since the odor threshold of benzene is several ppm above the occupational exposure guideline levels. Air purifying respirators offer no protection against hydrogen sulfide, mercaptans, and simple asphyxiants

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) TWA: 5 (ppm) from ACGIH (TLV) [Proposed]
2) Methyl mercaptan	TWA: 10 STEL: 15 CEIL: 20 (ppm) from OSHA (PEL) TWA: 0.5 (ppm) from ACGIH (TLV) TWA: 0.5 CEIL: 10 (ppm) from OSHA [Proposed] CEIL: 10 (ppm) from OSHA (PEL)
3) Ethyl mercaptan	TWA: 0.5 (ppm) from ACGIH (TLV) TWA: 0.5 CEIL: 10 (ppm) from OSHA (PEL) [Proposed] CEIL: 10 (ppm) from OSHA (PEL)
4) Ethane	Simple asphyxiant.
5) Liquefied Petroleum Gases	TWA: 1000 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL) [Proposed]
6) Propane	TWA: 2500 (ppm) from ACGIH (TLV) TWA: 1000 (ppm) from OSHA (PEL) [Proposed]
7) Butanes	TWA: 800 (ppm) from ACGIH (TLV) TWA: 800 (ppm) from OSHA (PEL) [Proposed]
8) Pentane, all isomers	TWA: 600 (ppm) from ACGIH (TLV) TWA: 600 STEL: 750 (ppm) from OSHA (PEL) [Proposed] TWA: 1000 (ppm) from OSHA (PEL)
9) Cyclopentane	TWA: 600 (ppm) from ACGIH (TLV) TWA: 600 (ppm) from OSHA (PEL) [Proposed]
10) Hexane, other isomers	TWA: 500 STEL: 1000 (ppm) from ACGIH (TLV) TWA: 500 STEL: 1000 (ppm) from OSHA (PEL) [Proposed]
11) n-Hexane	TWA: 50 (ppm) from ACGIH (TLV) - SKIN TWA: 50 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
12) Cyclohexane	TWA: 100 (ppm) from ACGIH (TLV) TWA: 300 (ppm) from OSHA (PEL)
13) Benzene ("A1" and "Z-2" Carcinogen)	TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) - SKIN TWA: 1 STEL: 5 AL: 0.5 (ppm) from OSHA (PEL) - SKIN
14) Heptane (n-Heptane)	TWA: 400 STEL: 500 (ppm) from ACGIH (TLV) TWA: 400 STEL: 500 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
15) Toluene	TWA: 50 (ppm) from ACGIH (TLV) - SKIN TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [Proposed] TWA: 200 CEIL: 300 (ppm) from OSHA (PEL)
16) Methylcyclohexane	TWA: 400 (ppm) from ACGIH (TLV) TWA: 400 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
17) Octane, all isomers	TWA: 300 (ppm) from ACGIH (TLV)

**Sour LPG/Light Naphtha
LEF Overhead Feeds to BRU**

17) Octane, all isomers

TWA: 300 (ppm) from ACGIH (TLV)
TWA: 300 STEL: 375 (ppm) from OSHA (PEL) [Proposed]
TWA: 500 (ppm) from OSHA (PEL)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Gas/Liquefied Gas/ Liquid Mixture.	Color	Colorless liquid; invisible gas and vapor; white frost at release point.	Odor	Strong, foul smelling; rotten egg or skunk odor is unreliable as a warning of possible exposure.
Specific Gravity	AP 0.56 to 0.62 (Water = 1)	pH	In the presence of moisture, H ₂ S can convert to H ₂ SO ₄ .	Vapor Density	AP 2.0 to 2.5 (Air = 1)
Boiling Point/Range	AP -89°C to 111°C (-128° to 231°F) [ASTM D-2887]			Melting/Freezing Point	AP -187° to 7°C (-305° to 44°F) at 14.7 psia.
Vapor Pressure	50 to 190 psia at 100°F.			Viscosity (cSt @ 40°C)	Not applicable.
Solubility in Water	Moderately soluble in cold water.			Volatile Characteristics	This material is usually stored as a liquid. If open to the atmosphere, it will evaporate quickly to form a vapor cloud.

Additional Properties This gas' low boiling point intensifies its pressure and rapid diffusion (sudden release) hazard.
Hydrogen Sulfide and Mercaptans Content = 0.1 to 3 Vol.%;
Alkane, Isoparaffin, Alkene, and Cycloalkane Hydrocarbons Content = 87 to 99.3 Wt.% [ASTM D-1319];
C6-C7 Aromatic Hydrocarbon Content = 0.6 to 10 Wt.% [ASTM D-1319];
Average Density at 60°F = < 5.00 lbs./gallon [ASTM D-2161].

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalies, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, calcium hypochlorite, chlorates, permanganates, nitrates, hydrogen peroxide, mercury oxide, and oxygen. Mercaptans and oxidizer mixtures and alkane hydrocarbons and chlorine gas mixtures have produced explosions. Under some conditions, mercaptans may react with water or steam to produce additional toxic and flammable vapors. Methyl and ethyl mercaptans and n-heptane may attack some forms of plastics, coatings, and rubber.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	<p>Methanethiol (Methyl mercaptan): GAS (LC₁₀): Acute: 4 ppm for 15 minutes [Human] - Nausea and headache. GAS (LC₅₀): Acute: 675 ppm for 4 hours [Rat] - Hypermotility, diarrhea, and reduced respiration. GAS (LC₅₀): Acute: 6,530 ug/m³ for 2 hours [Mouse].</p> <p>Ethanethiol (Ethyl mercaptan): GAS (LC₅₀): Acute: 2,770 ppm for 4 hours [Mouse] - Excitment, motor activity changes, and cyanosis. GAS (LC₅₀): Acute: 4,420 ppm for 4 hours [Rat] - Excitment, spastic parapysis, and cyanosis. ORAL (LD₅₀): Acute: 682 mg/kg [Rat] - Muscle weakness, ataxia, and cyanosis. INTRAPERITONEAL (LD50): Acute: 226 mg/kg [Rat] - Muscle weakness, ataxia, and cyanosis.</p> <p>Hydrogen sulfide: GAS (TC₁₀): Acute: 10 ppm for 15 minutes (Human) - Eye irritation. GAS (TC₁₀): Acute: 50 to 100 ppm for 15 minutes (Human) - Respiratory irritation. GAS (LC₁₀₀): Acute: 600 to 750 ppm for 30 minutes (Human) - Respiratory paralysis and death.</p>
----------------------	---

Sour LPG/Light Naphtha
LEF Overhead Feeds to BRU

GAS (LC₁₀): Acute: 5,700 ug/kg for 8 hours (Human) - Chronic pulmonary edema, coma, and death.

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (< 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (> 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Methyl and ethyl mercaptans act as respiratory poisons by inhibiting the respiratory control center in the brain and cellular respiration, but only at concentrations exceeding 50 ppm in air. At lower chronic exposures, they can cause pulmonary edema, hemolytic anemia, methemoglobinemia, and kidney and/or liver damage. They are also eye irritants and have been shown to produce positive responses in various mutagenic assays.

Exposure to 1,000 ppm of **propane** for eight hours per day, five days per week, for approximately two weeks produced NO ABNORMAL REACTIONS in humans, including cardiac, pulmonary, or neurologic functions. However, experimental animal testing (dogs) has shown propane overexposures (1 to 10 vol.% in air) may cause the heart to become sensitized to the arrhythmogenic effects of epinephrine-type drugs. Also, when a 4-hour rabbit inhalation screen test was run on **liquefied petroleum gas**, no deaths occurred; however, their heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline). An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. And, **n-pentane** caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure.

Human volunteers had no apparent effects from exposure concentrations of 250 ppm, 500 ppm, and 1,000 ppm of **isobutane and n-butane** in air for periods of 8 hours daily for 10 days to 14 days, respectively. However, chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane and butylenes** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone.

Inhalation of 500 ppm of **isopentane or n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects; however, higher exposure concentrations of 90,000 to 120,000 ppm (9-12 Wt.% in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. Rat 28-day feeding studies done on both **isopentane and n-pentane** using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

Hexane isomers were not mutagenic in the Salmonella/microsome (Ames) assay and are NOT considered to be carcinogenic. **n-Hexane** is NOT a tumor promotor in mice and NOT considered to be carcinogenic; nor is it teratogenic in mice or rats. **n-Hexane**, or its metabolite **2,5-hexanedione**, has been shown to cause degeneration of the testes in rats; but, it did NOT produce spermatotoxicity in a multiple end-point test battery in rats given multiple doses for up to 5 days.

Cyclohexane can cause eye, skin and mucous membrane irritation, CNS depression, narcosis, and death at elevated concentrations. In experimental animals exposed to lethal concentrations by inhalation or oral routes, there was generalized vascular damage and severe degenerative changes in the heart, lungs, liver, kidneys and brain. Cyclohexane does not act as a promotor for tumors on mice when exposed to dimethylbenzanthracene. Further, it did not induce unscheduled DNA synthesis in cultured human lymphocytes. It is not mutagenic in the Salmonella/microsome (Ames) or the mouse lymphoma L5178Y assays, with or without metabolic activation; however, it did increase the number of chromosomal aberrations in bone marrow cells of rats exposed to between 100 and 300 ppm for 6 hours/day for 5 days. These chromosomal aberrations did not appear to be dose-related.

Sour LPG/Light Naphtha LEF Overhead Feeds to BRU

n-Heptane is a skin, mucous membrane, and respiratory tract irritant, but non-irritating to the eyes. It is readily absorbed by either inhalation or dermal exposure. Overexposures may cause decreased red blood cell counts, liver and heart damage, and central nervous system depression. These higher exposures also decreased the myocardial threshold to the arrhythmogenic effects (irregular heart beats) of epinephrine, producing only a narrow margin of safety between exposures causing CNS effects, cardiac effects, and loss of consciousness. n-Heptane is metabolized in the liver to form alcohols and ketones, including neurotoxic **2,5-heptanedione** which is detectable in small amounts in the urine of exposed humans. One occupational exposure study with **95% purity n-heptane** from 1 to 9 years duration concluded that it could produce minimal peripheral nerve damage with numbness and tingling of the extremities in the stocking-and-glove areas. Polyneuropathy was reversible within a year following removal of exposure. n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not expected to be carcinogenic.

Benzene has an IDLH (immediately dangerous to life or health) concentration of 500 ppm. Its estimated lethal dose for a normal human adult is one teaspoon to one ounce (AP 10 mL). Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes. Prolonged and repeated exposure to high concentrations of benzene is associated with injury to blood forming organs and anemia. Consumption of alcohol may increase the blood system changes related to benzene exposure. It is linked to the development of acute myelogenous leukemia (AML) in humans. NTP, IARC, and OSHA list benzene as carcinogenic to humans. Studies of workers exposed to high levels of benzene have identified humoral and cellular immunity impairment and a decrease in levels of circulating leukocytes. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice. Animal studies have shown testicular effects and alterations in reproductive cycles with some evidence of developmental effects. Studies with pregnant laboratory animals have demonstrated that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity.

Rats inhaling **methylcyclohexane** at an airborne concentration of 15,250 ppm for 1 hour displayed tremors, loss of coordination, anesthesia, and convulsions. Inhalation of 10,050 ppm for 6 hours per day for 14 days showed rodent weight loss or decreased weight gain and changes in the structure of their salivary glands. Using rabbits, methylcyclohexane was shown to have an LD50 somewhere between 3,300 ppm and 7,300 ppm when exposed repeatedly for 6 hours per day, 5 days per week, for 3 weeks. Death was preceded by conjunctival congestion with mucoid secretion and lacrimation, salivation, coughing, sneezing, labored breathing, and diarrhea. Lethal oral dosing of rabbits caused lethargy, severe diarrhea, and circulatory collapse. Vascular and degenerative lesions were observed in the kidneys and liver.

Deliberate long-term inhalation of **toluene** at high concentrations (e.g., glue sniffing) has been associated with reversible liver effects, permanent kidney damage, CNS depression, brain damage, and cardiac (heart muscle) sensitization. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency). In addition, intentional abuse behavior increases the risk for reproductive effects including pre-term delivery, prenatal death and growth retardation. Also, case studies of persons abusing toluene have revealed isolated incidences of birth defects. Long-term inhalation studies with toluene produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness and impaired reaction time in laboratory animals. Also, in long-term laboratory studies, rats exposed to high concentrations (1,200 to 1,400 ppm) of toluene exhibited high-frequency hearing loss. Case studies have reported hearing damage in humans exposed elevated concentrations of toluene and other mixed solvents.

Studies have indicated that children of women who sniffed massive exposures of **toluene** during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate. Several animal studies using pregnant rodents have shown that toluene exposures may cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation studies, toluene has not been shown to be carcinogenic; nor is it mutagenic in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

2,2,4-Trimethylpentane (Iso-octane) was highly irritating to mice at a 1,000 ppm in air exposure for 5 minutes and respiratory arrest occurred at exposures above 10,000 ppm for 5 minutes. CNS depression was observed at concentrations between 8,000 and 10,000 ppm in air. Kidney tubule necrosis, hyaline droplet formation, and acute renal failure were seen in male rats following oral administration of 10 gm/kg, 8 mL/kg, or 2,100 mg/kg of iso-octane for 2, 3, and 4 weeks, respectively.

**Sour LPG/Light Naphtha
LEF Overhead Feeds to BRU**

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. Liquefied gas mixtures will normally evaporate rapidly if spilled. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient temperatures and pressure, the **butenes, hydrogen sulfide, and the mercaptan** components of this material may contribute to generation of atmospheric smog. If released, the **volatile aromatic hydrocarbon components (benzene and toluene)** may also contribute to the creation of atmospheric smog. The atmospheric half-lives of **propane and butenes** under photochemical smog conditions are estimated to be between 5 to 8 hours; and, experimental data shows that significant photooxidation of propylene occurs rapidly within 14 to 21 hours. The atmospheric half-lives of **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days. Photooxidation of **propane, isobutane, and n-butane** in air (< 8%) are not considered environmentally significant.

Hydrogen sulfide residence times in the atmosphere range from about one day to more than 40 days, depending upon the season, latitude, and presence of other air pollutants. Reduced temperatures increase the residence time. The **pentanes, n-hexane, and hexane isomers** all have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. **Toluene** has a half-life of from 3 hours to slightly over 1 day and both **cyclopentane and cyclohexane** have a half-lives of from 6 hours to over 4 days when hydroxyl radicals are present.

Ecological effects testing has not been conducted on these streams. If spilled, the naphtha portion of these streams, their storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels. Also, toxic **hydrogen sulfide and the mercaptans** are moderately soluble in water.

Environmental Fate

The naphtha portion of this mixture is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

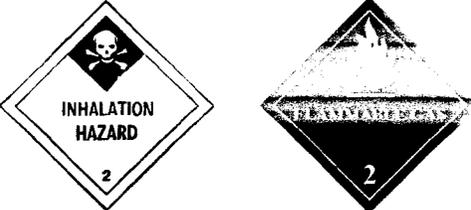

Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by use as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator, if possible and permissible. Venting of this gas/liquid to the atmosphere should be avoided. Maximize material recovery for reuse or recycling.

If spilled and the naphtha portion of this mixture is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase and vapor emissions from the process might prove to be a potential health hazard. The naphtha portion of this mixture is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	A U.S. Department of Transportation regulated material.		
Proper Shipping Name	Liquefied gases, flammable, toxic, n.o.s. Inhalation Hazard Zone B (Hydrogen sulfide, Methyl mercaptan)		
Hazard Class	DOT Class: 2.3 (Poisonous gas) and 2.1 (Flammable gas).	Packing Group(s) UN/NA ID	Not applicable. UN1953
Reportable Quantity	The Reportable Quantity (RQ) substance components present in this material which might require DOT HAZMAT bill-of-lading display are Benzene and Hydrogen sulfide		
Placards			Emergency Response Guide No. 119 HAZMAT STCC No. 49 203 78 MARPOL III Status Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	<p>The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. Chemical substances which are present in this material and subject to this statute are:</p> <p>Hydrogen sulfide [CAS No. = 7783-06-4] concentration: 0.1 to 1% Methanethiol (Methyl mercaptan) [CAS No. = 74-93-1] concentration: 0.01 to 1%.</p>
SARA 311/312	<p>The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories:</p> <p>Fire, Sudden Release of Pressure, and Acute (Immediate) & Chronic (Delayed) Health Hazards.</p>
SARA 313	<p>This material contains the following components in concentrations which might be at or above de minimis levels and are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313:</p> <p>Hydrogen sulfide [CAS No. = 7783-06-4] concentration: 0.1 to 1% Methanethiol (Methyl mercaptan) [CAS No. = 74-93-1] concentration: 0.01 to 1% n-Hexane [CAS No. 110-54-3] concentration: 1 to 15% Cyclohexane [CAS No. 110-82-7] concentration: 1 to 5% Benzene [CAS No. 71-43-2] concentration: 0.1 to 4% Toluene [CAS No. 108-88-3] concentration: 0.5 to 6%.</p>
CERCLA	<p>The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances which might be present in this material that are subject to this statute are:</p> <p>Hydrogen sulfide [CAS No. = 7783-06-4] (RQ = 100 lbs. [45.36 kg]) concentration: 0.1 to 1% Methanethiol (Methyl mercaptan) [CAS No. = 74-93-1] (RQ = 100 lbs. [45.36 kg]) conc.: 0.01 to 1% n-Hexane [CAS No. 110-54-3] (RQ = 5,000 lbs. [2,270 kg]) concentration: 1 to 15% Cyclohexane [CAS No. 110-82-7] (RQ = 1000 lbs. [453.6 kg]) concentration: 1 to 5% Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 0.1 to 4% Toluene [CAS No. 108-88-3] (RQ = 1000 lbs. [453.6 kg]) concentration: 0.5 to 6% 2,2,4-Trimethylpentane (Iso-octane) [CAS No. 540-84-1] (RQ = 1000 lbs. [453.6 kg]) conc.: 0 to 2%.</p>

**Sour LPG/Light Naphtha
LEF Overhead Feeds to BRU**

CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	These streams contain the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5: Benzene [CAS No. 71-43-2] and Toluene [CAS No. 108-88-3] .
New Jersey Right-to-Know Label	For New Jersey labeling, refer to the components listed in Section 2.
Additional Regulatory Remarks	<p>Under Section 12(b) of the Toxic Substances Control Act: Because it contains detectable amounts of Cyclohexane (CAS No. 110-82-7), this material might be subject to US EPA's one-time only per country export notification requirements.</p> <p>In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components in this material as a "Volatile Organic Compounds (VOC)" which contribute significantly to air pollution which endangers public health and welfare": 1-Butene [CAS No. 106-98-9], Isobutylene [CAS No. 115-11-7], Isopentane [CAS No. 78-78-4], 1-Pentene [CAS No. 109-67-1], n-Pentane [CAS No. 109-66-0], Cyclohexane [CAS No. 110-82-7], Benzene [CAS No. 106-98-9], Methylcyclohexane [CAS No. 108-87-2], and Toluene [CAS No. 108-88-3].</p> <p>In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances which may be present in this material which are subject to this statute include: Hydrogen sulfide, Methyl mercaptan (Methanethiol), Ethyl mercaptan (Ethanethiol), Ethane, Propane, Isobutane (Propane, 2-methyl), various Butenes, n-Butane, Isopentane (Butane, 2-methyl), 2,2-Dimethylpropane (Neopentane), various Pentenes, and n-Pentane.</p>

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0165
Revision Date 05/09/2000

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Two-phase Liquid.		
Color	Transparent, colorless to hazy grey	Odor	Characteristic, sweet and pleasant, aromatic hydrocarbon Its odor threshold is 2-5 ppm in air

DANGER! Extremely flammable liquid mixed with pressurized steam; vapor may cause flash fire or explosion!
 Release of vapor/steam reduces oxygen available for breathing!
 Mist or vapor may cause thermal burns on contact or irritate the eyes, mucous membranes, and respiratory tract!
 Liquid contact may cause minimal to severe eye irritation and/or mild to severe skin irritation and inflammation!
 May be harmful if inhaled or absorbed through the skin!
 Overexposures may cause central nervous system (CNS) depression and target organ effects such as hearing loss and/or blood and blood-forming tissue damage!
 May be harmful or fatal if ingested!
 Aspiration into the lungs can cause pulmonary edema and chemical pneumonia!
 Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
 Contains Benzene! Cancer hazard; may cause leukemia and other blood disorders! Mutagenic hazard; may cause genetic damage!
 Based upon animal testing, may adversely affect reproduction!
 Spills may create a slipping hazard!

Hazard Rankings

	HMIS	NFPA
Health Hazard	* 2	2
Fire Hazard	3	3
Reactivity	0	0

* = Chronic Health Hazard

Protective Equipment

Minimum Requirements
See Section 8 for Details

SECTION 1: IDENTIFICATION

Trade Name	Benzene NESHAPS Stripper Tower Overhead	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	0016500165	Medical Emergency	(918) 495-4700
CAS Number	Mixture	CHEMTREC Emergency	(800) 424-9300
Product Family	C6-C9 Petroleum Hydrocarbons and Pressurized Water Vapor		
Synonyms	438 Unit Overhead Stream, Steam-saturated Recovered Solvent; Steam-saturated Slop Aromatic Naphtha; Reclaimed Aromatic Naphtha and Steam Mixture; Recovered BTX Aromatics and Steam; Light Aromatic Naphtha and Steam; C6-C9 Aromatic Hydrocarbons and Steam Mixture		

**Benzene NESHAPS
Stripper Tower Overhead**

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Water	7732-18-5	10-50
2) Benzene	71-43-2	20-35
3) Heptanes	Mixture	0-3
4) Toluene	108-88-3	15-25
5) Octanes	Mixture	0-3
6) Xylene, Mixed Isomers	1330-20-7	5-20
7) Ethylbenzene	100-41-4	1-5
8) Nonanes	Mixture	0-2
9) n-Propylbenzene	103-65-1	0.5-1.5
10) Cumene	98-82-8	0-1.5

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye Contact. Absorption. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon level of exposure concentration and/or duration. Vapors can reduce the oxygen content in air. Approximately 20,000 ppm (or 2 vol %) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from an exposure of 10,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces.
Eye Contact	Upon direct contact, hot material may cause severe thermal burns. Animal test results and actual human exposures of this material's components suggest that this product can cause minimal to severe eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling.
Skin Contact	Skin contact with hot material may result in severe thermal burns. Animal test results and actual human exposures of this material's components suggest that this product can cause minimal to moderate skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate to severe dermatitis. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and severe tissue damage.
Ingestion	If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, abdominal pain, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above). Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.
Chronic Health Effects Summary	Chronic occupational xylene exposures have caused auditory nerve degeneration. Also, chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Reports have associated repeated and prolonged occupational overexposure to solvents with irreversible brain and nervous system damage (sometimes referred to as "Solvent or Painter's Syndrome"). And, altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called "Petrol Sniffers Encephalopathy"), delirium, seizures, and sudden death have been common results for naphtha abusers. Intentional misuse by deliberately concentrating and inhaling this naphtha may be harmful or fatal. Available information indicates that toluene is NOT teratogenic, but it can be toxic to the embryo and fetus and may reduce fertility. In animal tests, high inhaled doses of toluene has caused reduced litter sizes, retarded development of the fetus, and increased incidence of non-lethal abnormalities.

Benzene NESHAPS Stripper Tower Overhead

Benzene is considered to be a cancer causing agent. It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML). Benzene is also capable of causing changes in genetic material (chromosomes). Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy. Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents.

Based upon animal testing, the C8 aromatic hydrocarbon components (xylenes and ethylbenzene) might be assumed to cause embryo and fetal toxicity, spontaneous abortions, and/or decreased fetal and newborn weights if overexposures occur during a woman's early gestation period (See Section 11)

Conditions Aggravated by Exposure

Personnel with pre-existing central nervous system (CNS) disease, neurological conditions, skin disorders, impaired hearing, liver, or kidney function, blood disorders, or chronic respiratory diseases, and women attempting to conceive should avoid exposure. Special precautions are necessary for pregnant women and nursing mothers.

Exposure to high concentrations of this material may increase the sensitivity of the heart to epinephrine (adrenalin) and catecholamine-like drugs. Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians").

Target Organs

This substance is toxic to lungs, central nervous system, especially the auditory nerve, brain, mucous membranes, skin, eyes, and possibly, the blood, bone marrow and other blood-forming tissues, heart, liver, kidneys, thymus, and reproductive systems.

Carcinogenic Potential

This product contains a benzene component at concentrations at or above 0.1%. Benzene is considered carcinogenic by OSHA, IARC, and NTP. See Section 11

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200)

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.

Benzene NESHAPS Stripper Tower Overhead

Notes to Physician

Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases

Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse). If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IA or IB Flammable Liquid for the hydrocarbon portion of the mixture Non-flammable with steam present to extremely or highly flammable without steam ¹		
Flash Point Method	CLOSED CUP: -11° to 4°C (12° to 40°F) for the Hydrocarbon Portion of the Mixture. (Tagliabue [ASTM D-56])		
Lower Flammable Limit	AP 1.0%	Upper Flammable Limit	AP 7.1%
Autoignition Temperature	AP 432°C (810°F) for the Hydrocarbon Portion of the Mixture.		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors		
Special Properties	Flammable Liquid If Steam Is Removed! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.		
Extinguishing Media	SMALL FIRE Use dry chemicals, carbon dioxide (CO ₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.		
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat, cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

Benzene NESHAPS Stripper Tower Overhead

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors, but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible, in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room, and preferably refrigerated. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Benzene NESHAPS Stripper Tower Overhead

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).

General Comments

Warning! Odor is an inadequate warning for hazardous conditions, especially since the odor threshold of benzene is several ppm above the occupational exposure guideline levels. Released vapors may cause extremely flammable, explosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special safety precautions including monitoring for oxygen deficiency and flammability.

Occupational Exposure Guidelines

Substance

Applicable Workplace Exposure Levels

1) Benzene ("A1" and "Z-2" Carcinogen)	TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 1 STEL: 5 AL 0.5 (ppm) from OSHA (PEL) [1987] - SKIN
2) Heptane (n-Heptane)	TWA: 400 STEL: 500 (ppm) from ACGIH (TLV) [1999] TWA: 400 STEL: 500 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
3) Toluene ("A4" = Not Classifiable)	TWA: 50 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [1989] TWA: 200 CEIL: 300 (ppm) from OSHA (PEL) [1976]
4) Octane, all isomers	TWA: 300 (ppm) from ACGIH (TLV) [1999] TWA: 300 STEL: 375 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
5) Xylene, Mixed Isomers ("A4" = Not Classifiable)	TWA: 100 STEL: 150 (ppm) from ACGIH (TLV) [1999] TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [1989]
6) Ethylbenzene ("A3" Animal Carcinogen proposed for 2000.)	TWA: 100 STEL: 125 (ppm) from ACGIH (TLV) [1999] TWA: 100 STEL: 125 (ppm) from OSHA (PEL) [1989]
7) Nonane, all isomers	TWA: 200 (ppm) from ACGIH (TLV) [1999] TWA: 200 (ppm) from OSHA (PEL) [1989]
8) Cumene	TWA: 50 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 50 (ppm) from OSHA (PEL) [1989] - SKIN

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Two-phase liquid.	Color	Transparent, colorless to hazy grey.	Odor	Characteristic, sweet and pleasant, aromatic hydrocarbon. Its odor threshold is 2-5 ppm in air.
Specific Gravity	0.86-1.00 (Water = 1)	pH	6.0 to 8.0 for water portion of this mixture	Vapor Density	3.4 to 3.8 (Air = 1)
Boiling Point/Range	80° to 152°C (176° to 306°F)		Melting/Freezing Point		-95° to 13°C (-139° to 55°F)
Vapor Pressure	23 to 43 mm Hg at 20°C (68°F).		Viscosity (cSt @ 40°C)		1 to 2
Solubility in Water	Slightly soluble in cold water (AP 0.1%).		Volatile Characteristics		Volatile Organic Compounds (VOCs) Content = 100%, 875 to 880 gm/L
Additional Properties	The following properties are related to the hydrocarbon portion of this mixture only: C6-C9 Aromatic Hydrocarbon Content = 85 to 99 Wt.% (ASTM D-1319); Alkane, Isoparaffin, and Cycloalkane Hydrocarbons Content = 0 to 15 Wt.% (ASTM D-1319), Average Density at 60°F = 7.269 lbs/gal. (ASTM D-2161), Dry Point Temperature = 292°F (145°C) (ASTM D-86), Evaporation Rate = 1.5 to 4.5 when n-Butyl acetate = 1.0, Heat Value = 17,800 to 18,500 Btu				

**Benzene NESHAPS
Stripper Tower Overhead**

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from heat, sparks, and other ignition sources, strong oxidizing conditions, and freezing temperatures		
Materials Incompatibility	Strong acids, especially nitric acid, alkalis, and oxidizers such as liquid chlorine, many fluorides, perchlorates, and other halogens, hydrogen peroxide, and oxygen n-Heptane will dissolve some plastics		
Hazardous Decomposition Products	No substances are readily identified from composition, but, no degradation data is available		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data **Benzene and toluene** have IDLH (immediately dangerous to life or health) concentrations = 500 ppm. Its estimated lethal dose for a normal human adult is one teaspoon to one ounce (AP 10 mL). Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes

Benzene is a known animal carcinogen and a human leukemogen. In addition, NTP, IARC, EPA, OSHA, and ACGIH list benzene as a "Human Carcinogen." Repeated and prolonged overexposure to benzene vapors (GT 20 ppm in air) may cause toxicity to blood-forming tissues. Chronic exposure symptoms include decreased blood cell and platelet counts, leukopenia, aplastic anemia, or acute myelogenous leukemia (AML). Also, chronic inhalation of benzene vapors have been found to cause fatigue, nervousness, irritability, blurred vision, and labored breathing. Overexposure to benzene has been associated with in chromosomal aberrations in human white blood cells, both laboratory animal and human bone marrow cell damage, and in vitro mammalian cells DNA damage. Elevated frequencies of chromosomal aberrations have been observed in peripheral white blood cells and bone marrow of workers exposed to high benzene concentrations known to be associated with signs of chronic poisoning. Ethanol consumption may have a synergistic effect and increase blood system changes caused by benzene exposures. Children and teenagers have a lower resistance to bone marrow poisons.

Studies with pregnant laboratory animals have demonstrated that **benzene** is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice.

n-Heptane is a mucous membrane and respiratory tract irritant, but non-irritating to the eyes. It is irritating to skin and readily absorbed by either inhalation or dermal exposure. Exposures may cause decreased red blood cell counts, liver and heart damage, and central nervous system depression. Repeated direct skin application can produce defatting dermatitis. **n-Heptane** is metabolized in the liver to form alcohols and ketones, including neurotoxic **2,5-heptanedione** which is detectable in small amounts in the urine of exposed humans. **n-Heptane** was not mutagenic in the Salmonella/microsome (Ames) assay and is not expected to be carcinogenic.

In a controlled study, human volunteers exposed to an airborne concentration of **n-heptane** of 1,000 ppm for 6 minutes or 2,000 ppm for 4 minutes experienced slight dizziness and incoordination. Higher-level exposures produced hilarity, dizziness, and semi-consciousness. Inhaling a concentration of 5,000 ppm for 15 minutes caused stupor and a gasoline-like taste. These higher exposures also decreased the myocardial threshold to the arrhythmogenic effects (irregular heart beats) of epinephrine, producing only a narrow margin of safety between exposures causing CNS effects, cardiac effects, and loss of consciousness.

One occupational exposure study involving a **95% purity n-heptane** from 1 to 9 years duration concluded that it could produce minimal peripheral nerve damage with numbness and tingling of the extremities in the stocking-and-glove areas. In the same study, there was a decrease in motor nerve conduction velocities correlated with duration of exposure and adjusted for age effects; however, the average motor nerve conduction velocity in exposed workers was normal. Polyneuropathy associated with **n-heptane** exposure was reversible within a year following removal of exposure.

Benzene NESHAPS Stripper Tower Overhead

Toluene (methylbenzene) has been a major solvent of intentional inhalation abuse. Deliberate long-term inhalation of high concentrations of toluene (glue sniffing, etc.) has been shown to cause liver, kidney, central nervous system, and permanent brain damage. Effects such as impaired speech, visual disturbances, and hearing loss, loss of balance and/or muscle control, and memory loss have been reported. Exposures of 100 to 200 ppm in air for 24 hours cause hallucinations, distorted perceptions, and changes in motor activity. Studies have indicated that children of women who sniffed massive exposures of toluene during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. Isolated case reports have suggested a spectrum of congenital defects similar to those seen in fetal alcohol (ethanol) syndrome. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate.

Animal studies suggest that **toluene** causes kidney, liver, and/or lung dysfunction and cardiac (heart muscle) sensitization to epinephrine or other adrenalin-like agents. This sensitization may cause fatal changes in heart beat rhythms. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency).

Long-term rodent inhalation studies with **toluene** produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness, and impaired reaction time. Also, rats exposed to 1,200 ppm and 1,400 ppm of toluene in air for 14 hours per day for 5 or 4 weeks (respectively) exhibited high-frequency hearing loss. Several animal studies using pregnant rodents have shown that toluene exposures may cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation studies, toluene has not been shown to be carcinogenic; nor is it mutagenic in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

2,2,4-Trimethylpentane (iso-octane) was highly irritating to mice at a 1,000 ppm in air exposure for 5 minutes and respiratory arrest occurred at exposures above 10,000 ppm for 5 minutes. CNS depression was observed at concentrations between 8,000 and 10,000 ppm in air. Kidney tubule necrosis, hyaline droplet formation, and acute renal failure were seen in male rats following oral administration of 10 gm/kg, 8 mL/kg, or 2,100 mg/kg of iso-octane for 2, 3, and 4 weeks, respectively.

An inhalation study with laboratory animals indicated an association of **xylene** with hearing loss in rats. Several animal studies using pregnant rodents have shown that **mixed xylene isomers (dimethylbenzenes)** may all cause embryo and/or fetotoxicity. Inhalation and feeding studies involving pregnant laboratory animals have produced limited evidence of fetal toxicity including increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes.

Chronic overexposure to **xylene** may produce irreversible damage to the central nervous system, including ototoxicity, that can be increased by the consumption of ethanol (alcoholic drinks). Drinking beverages which contain ethanol in conjunction with xylene exposure increases the alcoholic effects and impairs the clearance of xylenes from the body. Xylene isomers accumulate in the adipose (fat) tissues, from which they are slowly released. Complete clearance may take several days following exposure.

Two-year rat and mouse gavage studies by the National Toxicology Program (NTP) on **mixed xylene isomers including 17% ethylbenzene** showed "no evidence of carcinogenicity". Also, a two-year mixed xylenes skin-painting study on shaved rats and mice showed no incidence of non-neoplastic or neoplastic lesions. And, none of the components were mutagenic when tested in either the modified Ames, Chinese hamster ovary cell with and without metabolic activation, or sister-chromatid mutagenicity assays.

The National Toxicology Program (NTP) recently completed a 2-year inhalation bioassay on **ethylbenzene** in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200, and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels. However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level, and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Hyperplasia was also observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear. NTP, IARC, and OSHA have not designated ethylbenzene as a carcinogen.

Rats inhaling **n-nonane** at an airborne concentration of 1,500 ppm for 7 days displayed mild tremors and loss of coordination. Inhalation of 1,600 ppm for 6 hours per day for 90 days showed animal weight loss or decreased weight gain and changes in the structure of their salivary glands. And, liver damage and an altered response to drugs were seen in rats given n-nonane for 2 to 7 days.

Benzene NESHAPS Stripper Tower Overhead

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, the aromatic naphtha components of this mixture, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. All of its **aromatic hydrocarbon components (benzene, toluene, xylene isomers, and ethylbenzene)** are volatile and might contribute to the creation of atmospheric smog. **Toluene** has a half-life of from 3 hours to slightly over 1 day when photochemically active hydroxyl radicals are present; and it is very effectively washed out of the atmosphere by rain. **Benzene** has a half-life of from 4 to 6 hours when photochemically active hydroxyl radicals are present, especially when atmospheres are polluted with nitrogen oxides or sulfur dioxide. **Benzene and toluene** are very effectively washed out of the atmosphere by rain. The **n-heptane, heptane isomers, and iso-octane** all have estimated half-lives of between 2 4 and 4 4 days in air when photochemical hydroxyl and/or nitrate radicals are present.

Using Rainbow Trout (*Oncorhynchus mykiss*) and Dungeness Crab (*Cancer magister*), all the components in the aromatic naphtha portion of this mixture (**benzene, toluene, xylene isomers, and ethylbenzene**) showed a 96-hour TLms (Median Toxic Limit) of from 5 ppm to 30 ppm in ambient saltwater. Also, 24-hour and 96-hour TLms produced results from 10 ppm to 60 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), and Guppy (*Lebistes reticulatus*) in fresh water. Using Water Fleas (*Daphnia magna*), all these component substances showed 24-hour TLms of from 95 ppm to 400 ppm. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

Environmental Fate

This aromatic naphtha mixture is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol % of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

**Benzene NESHAPS
Stripper Tower Overhead**

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U S. Department of Transportation (DOT)		
Proper Shipping Name	Petroleum distillates, n.o.s (Benzene, Toluene)		
Hazard Class	Class 3: Flammable liquid	Packing Group(s)	PG II
		UN/NA ID	UN1268
Reportable Quantity	The Reportable Quantity (RQ) substance components in this product which require DOT HAZMAT bill-of-lading display are Benzene and Toluene		
Placards		Emergency Response Guide No.	130 or 128
		HAZMAT STCC No.	49 102 56
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.
SARA 313	This product contains the following components in concentrations that might be at or above de minimis levels and they are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 Benzene [CAS No. 71-43-2] concentration: 25 to 45% Toluene [CAS No. 108-88-3] concentration: 20 to 40% Xylenes [CAS No. 1330-20-7] concentration: 10 to 30% Ethylbenzene [CAS No. 100-41-4] concentration: 2 to 7% Cumene (Isopropylbenzene) [CAS No. 98-82-8] concentration: 0 to 2%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product subject to this statute are Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 25 to 45% Toluene [CAS No. 108-88-3] (RQ = 1000 lbs. [453.6 kg]) concentration: 20 to 40% 2,2,4-Trimethylpentane (Iso-octane) [CAS No. 540-84-2] (RQ = 1000 lbs. [453.6 kg]) conc.: 0 to 2% Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 10 to 30% Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 2 to 7% Cumene (Isopropylbenzene) [CAS No. 98-82-8] (RQ = 5000 lbs. [2268 kg]) concentration: 0 to 2%
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material might contain the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it is subject to requirements of California Health & Safety Code Section 25249.5 Benzene [CAS No. 71-43-2] and Toluene [CAS No. 108-88-3].

Benzene NESHAPS Stripper Tower Overhead

**New Jersey
Right-to-Know Label**

For New Jersey labeling refer to components listed in Section 2.

**Additional Regulatory
Remarks**

Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500 14(b)(3) and 1500 83(a)(13): This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following **Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children!**

Under Section 12(b) of the Toxic Substances Control Act. Because it contains detectable amounts of **n-Propylbenzene [CAS No. 103-65-1] and other C9 Aromatic Hydrocarbons**, this material might be subject to US EPA's one-time only per country export notification requirements

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following minor components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare" **Benzene [CAS No. 71-43-2], Toluene [CAS No. 108-88-3], mixed Xylenes [CAS No. 1330-20-7], Ethylbenzene [CAS No. 100-41-4], and possibly Cumene (Isopropylbenzene) [CAS No. 98-82-8].**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0166
Revision Date 01/21/2002

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Liquid		
Color	Transparent, colorless to slightly yellow.	Odor	Light hydrocarbon to sweet aromatic hydrocarbon. Odor threshold is 1 to 7 ppm in air

DANGER! Extremely flammable liquid; vapor may cause flash fire or explosion!
High vapor concentrations reduce oxygen available for breathing!
Mist or vapor may irritate the eyes, nose, and respiratory tract!
Liquid contact may cause mild to moderate eye irritation and/or moderate to severe skin irritation!
May be harmful if inhaled or absorbed through the skin!
Overexposures may cause central nervous system (CNS) depression and target organ effects such as hearing loss and/or liver, kidney, or peripheral nervous system damage!
May be harmful or fatal if ingested! Aspiration into the lungs can cause pulmonary edema and chemical pneumonia!
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
Based upon animal testing, vaporized Gasoline (a similar material) causes tumors! Potential cancer hazard!
Contains low levels of Benzene and Ethylbenzene!
May cause anemia, leukemia, and/or other blood disorders!
Mutagenic hazard; may cause genetic damage!
Based upon animal testing, may adversely affect reproduction!
Spills may create a slipping hazard!

Minimum Requirements See Section 8 for Details

The personal protective equipment depicted below is recommended for use only at this facility

SECTION 1: IDENTIFICATION

Trade Name	B.T. Reform Feed	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	064741420*	Medical Emergency	(800) 313-7645 or (918) 495-4700
CAS Number	64741-42-0	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	C4-C11 Petroleum Hydrocarbons		
Synonyms	Benzene-Toluene Unit Reformer Feed, C4-C11 Naphtha or Gasoline, Full-range Naphtha or Gasoline, Full-range, Straight-run Naphtha (Petroleum)		

B.T. Reform Feed**SECTION 2: COMPOSITION**

Component Name(s)	CAS Registry No.	Concentration (%)
1) Full-range Straight-run Naphtha (Petroleum)	64741-42-0	100
2) Butanes	Mixture	0.5-1.5
3) Pentanes	Mixture	0.5-10
4) Hexane Isomers	Mixture	2-25
5) Methylcyclopentane	96-37-7	1-5
6) n-Hexane	110-54-3	1-15
7) Cyclohexane	110-82-7	1-25
8) Benzene	71-43-2	0.1-7
9) Heptanes	Mixture	5-30
10) Methylcyclohexane	108-87-2	1-15
11) C7-C12 alpha-Alkenes	68855-57-2	0.1-3
12) Toluene	108-88-3	0.5-16
13) Octanes	Mixture	2-30
14) Xylenes (mixed isomers)	1330-20-7	1-15
15) Ethylbenzene	100-41-4	0.3-5
16) Nonanes	Mixture	1-25
17) Cumene	98-82-8	0-2
18) n-Propylbenzene	103-65-1	0.5-2
19) Trimethylbenzene (mixed isomers)	25551-13-7	1-3
20) 1,2,4-Trimethylbenzene (Pseudocumene)	95-63-6	0.5-1.5
21) Ethylmethylbenzenes (Ethyltoluenes)	25550-14-5	1-3
22) Indene	95-13-6	0.5-1.5
23) Naphthalene	91-20-3	0.1-3
24) C10-C11 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	1-10
25) C10-C11 Alkylbenzenes	70693-06-0	0-2

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact Eye Contact Absorption Inhalation

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of this mixture's vapor may cause upper respiratory tract irritation, headache, nausea, vomiting, and/or central nervous system (CNS) depression. Components of this mixture may also produce mild narcotic effects. Symptoms may include euphoria, excitation or giddiness, abdominal pain, loss of appetite, fatigue, muscular weakness, and staggering gait. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon the exposure duration. High vapor concentrations can displace the amount of oxygen in air available to breathe below that necessary to sustain life (hypoxia), especially if working in confined spaces. Approximately 20,000 ppm (or 2 vol %) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 to 10,000 ppm for only 5 minutes.
Eye Contact	Actual human exposures indicate that this product can cause mild to moderate eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling. Liquid contact may cause conjunctivitis, small areas of superficial corneal necrosis, and/or permanent clouding of the cornea.
Skin Contact	Actual human exposures indicate that this product can cause moderate to severe skin irritation. Short-term contact symptoms include redness, itching, and burning or blistering of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause severe dermatitis. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and severe tissue damage.

B.T. Reform Feed**Ingestion**

Due to its volatile nature, ingestion is not normally an applicable route of exposure. However, if swallowed, this material may cause a "freeze burn" or irritation with a burning sensation of the mucous membranes in the mouth, throat, and esophagus. The liquid portion can be readily absorbed by the stomach and intestinal tract. Symptoms include nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above)

Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.

Chronic Health Effects Summary

Altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called "Petrol Sniffers Encephalopathy"), delirium, seizures, and sudden death have been common results for **gasoline** abusers. Intentional misuse by deliberately concentrating and inhaling this material may be harmful or fatal.

Even with acute exposures, **n-hexane** is toxic to the peripheral nerves, characterized by numbness, tingling, or pain in the extremities, progressively worsening of neuromuscular motor coordination (polyneuritis or polyneuropathy), and even partial paralysis. And, based upon animal studies, **n-hexane's** metabolite, **2,5-hexanedione**, has been shown to cause degeneration of the testes.

Benzene is considered to be a cancer causing agent. It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML). Benzene is also capable of causing changes in genetic material (chromosomes). Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy. Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents.

Available information indicates that **toluene** is NOT teratogenic, but it can be toxic to the embryo and fetus and may reduce fertility. In animal tests, high inhaled doses of toluene has caused reduced litter sizes, retarded development of the fetus, and increased incidence of non-lethal abnormalities.

Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Chronic occupational **toluene and xylene** exposures have caused auditory nerve degeneration.

At high exposure concentrations, **ethylbenzene** has been associated with multiple organ tumors in laboratory animals.

Based upon animal testing, the **C8 aromatic hydrocarbon components (xylene isomers and ethylbenzene)** might be assumed to cause embryo and fetal toxicity, spontaneous abortions, and/or decreased fetal and newborn weights if overexposures occur during a woman's early gestation period. And, the **C9 aromatic hydrocarbons (cumene, n-propylbenzene, trimethylbenzenes, indene, and ethylmethylbenzenes)** are presumed to cause fetal toxicity and/or decreased fetal and newborn weights if overexposure occurs during a woman's early gestation period.

Naphthalene is considered to be a toxic substance as defined by both human exposure and laboratory testing results. And, based upon animal testing, it might be considered carcinogenic. (See Section 11.)

Conditions Aggravated by Exposure

Personnel with pre-existing nervous system disease, neurological conditions, skin disorders, impaired hearing, liver, or kidney function, blood disorders, or chronic respiratory diseases, and women attempting to conceive should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this material. They should take additional precautions to minimize or avoid exposure.

Exposure to high concentrations of this material may increase the sensitivity of the heart to **epinephrine (adrenalin) and catecholamine-like drugs**. Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians").

Target Organs

The substance is toxic to lungs, nervous system, especially the auditory and peripheral nerves, brain, liver, kidneys, blood and blood-forming tissues, mucous membranes, skin, eyes, and possibly, the heart, thymus, lymph nodes, and reproductive systems.

Carcinogenic Potential

This material contains benzene and ethylbenzene at concentrations above 0.1%. Benzene is considered to be a known human carcinogen by OSHA, IARC and NTP and Ethylbenzene are considered possibly carcinogenic to humans by IARC. (See Section 11.)

B.T. Reform Feed

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200)

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	<p>Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.</p> <p>If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.</p> <p>Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse). If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IA Flammable Liquid Extremely flammable!		
Flash Point Method	CLOSED CUP -48° to -37°C (-55° to -35°F) (Tagliabue [ASTM D-56])		
Lower Flammable Limit	0.9% in Air.	Upper Flammable Limit	8.5% in Air.
Autoignition Temperature	225° to 275°C (435° to 527°F) by ASTM E-659.		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors.		

B.T. Reform Feed

Special Properties	<p>Extremely Flammable Liquid¹ This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Mists or sprays may be flammable at temperatures below the flash point. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard if released into confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.</p> <p>A static electrical charge can accumulate as a result of transfer flow or agitation. Discharge (static spark) can ignite vapors, especially in cold, dry weather conditions. Special slow load and monitoring procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing middle distillates or other higher flash point products. To reduce this hazard, receiving containers should always be grounded and the loading nozzle must be kept in contact with the container during the entire filling process. Do not fill any portable container in or on a vehicle without proper bonding.</p>
Extinguishing Media	<p>SMALL FIRE: Use dry chemicals, carbon dioxide (CO₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.</p>
Protection of Fire Fighters	<p>Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat, cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.</p>

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Liquid¹ Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Eliminate all potential ignition sources because a liquid spill will vaporize rapidly. A vapor-suppressing foam may be used to reduce vapors. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material even when wearing proper respiratory equipment and fire-resistant protective clothing. Do not direct water at the source of leak, but, use water spray to reduce vapors or divert vapor cloud drift. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors, but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible, in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations. Spills will most likely need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

B.T. Reform Feed**Handling**

A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with mild soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room, and preferably refrigerated. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION**Engineering Controls**

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below), then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

The personal protective equipment depicted below is recommended for use only at this facility.

**Eye Protection**

Safety glasses with side shields are recommended as a minimum protection. When there is a likelihood of misting, splashing, or spraying, use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent). During transfer operations or when this material is being released under pressure, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact and use impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with vapors and liquid. Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use this material as a skin cleaner.

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

B.T. Reform Feed

Respiratory Protection For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2)

General Comments Releases of this product may create flammable, explosive, and/or oxygen-deficient atmospheres (<19.5 Vol % in air). DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability. If the Lower Explosive Limit (LEL) for this product is exceeded, all entry into the contaminated area/confined space should be prohibited. Odor is an inadequate warning for hazardous conditions.

Warning! Use of this hydrocarbon fuel in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and inadequate oxygen levels for breathing.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Gasoline ("A3" Animal Carcinogen)	TWA: 300 STEL: 500 (ppm) from ACGIH (TLV) TWA: 300 STEL: 500 (ppm) from OSHA (PEL)
2) Petroleum Distillates (Naphtha)	TWA: 400 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
3) Butane	TWA: 800 (ppm) from ACGIH (TLV) TWA: 800 (ppm) from OSHA (PEL) [Proposed]
4) Pentane, all isomers	TWA: 600 (ppm) from ACGIH (TLV) TWA: 600 STEL: 750 (ppm) from OSHA (PEL) [Proposed] TWA: 1000 (ppm) from OSHA (PEL)
5) Cyclopentane	TWA: 600 (ppm) from ACGIH (TLV) TWA: 600 (ppm) from OSHA (PEL) [Proposed]
6) Hexane, other isomers	TWA: 500 STEL: 1000 (ppm) from ACGIH (TLV) TWA: 500 STEL: 1000 (ppm) from OSHA (PEL) [Proposed]
7) Hexane (n-Hexane)	TWA: 50 (ppm) from ACGIH (TLV) - SKIN TWA: 50 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
8) Cyclohexane	TWA: 300 (ppm) from ACGIH (TLV) TWA: 100 (ppm) from ACGIH (TLV) [Proposed] TWA: 300 (ppm) from OSHA (PEL)
9) Heptane (n-Heptane)	TWA: 400 STEL: 500 (ppm) from ACGIH (TLV) TWA: 400 STEL: 500 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
10) Methylcyclohexane	TWA: 400 (ppm) from ACGIH (TLV) TWA: 400 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
11) Benzene ("A1" and "Z-2" Known Human Carcinogen)	TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) - SKIN TWA: 1 STEL: 5 AL: 0.5 (ppm) from OSHA (PEL) - SKIN
12) Toluene	TWA: 50 (ppm) from ACGIH (TLV) - SKIN TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [Proposed] TWA: 200 CEIL: 300 (ppm) from OSHA (PEL)
13) Octane, all isomers	TWA: 300 (ppm) from ACGIH (TLV) TWA: 300 STEL: 375 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
14) Xylene, mixed isomers	TWA: 100 STEL: 150 (ppm) from ACGIH (TLV) TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [Proposed]
15) Ethylbenzene ("A3" Animal Carcinogen [Proposed])	TWA: 100 STEL: 125 (ppm) from ACGIH (TLV) TWA: 100 STEL: 125 (ppm) from OSHA (PEL) [Proposed]
16) Nonane, all isomers	TWA: 200 (ppm) from ACGIH (TLV) TWA: 200 (ppm) from OSHA (PEL) [Proposed]
17) Cumene	TWA: 50 (ppm) from ACGIH (TLV) TWA: 50 (ppm) from OSHA (PEL) - SKIN [Proposed]
18) Trimethylbenzene (mixed isomers)	TWA: 25 (ppm) from ACGIH (TLV) TWA: 25 (ppm) from OSHA (PEL) [Proposed]
19) Indene	TWA: 10 (ppm) from ACGIH (TLV) TWA: 10 (ppm) from OSHA (PEL) [Proposed]
20) Naphthalene	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) - SKIN TWA: 10 STEL: 15 (ppm) from OSHA (PEL) [Proposed] TWA: 10 (ppm) from OSHA (PEL)

B.T. Reform Feed**SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES**

Physical State	Liquid	Color	Transparent, colorless to slightly yellow	Odor	Light hydrocarbon to sweet aromatic hydrocarbon Odor threshold is 1 to 7 ppm in air
Specific Gravity	0.70 to 0.79 (Water = 1)	pH	Not applicable	Vapor Density	2.8 to 3.1 (Air = 1)
Boiling Point/Range	32° to 207°C (90° to 405°F) [ASTM D-86]			Melting/Freezing Point	<-75°C (<-103°F) [ASTM D-97]
Vapor Pressure	2 to 13 mm Hg at 20°C (68°F) or 1 to 7 Reid-psia at 37.8°C (100°F)			Viscosity (cSt @ 40°C)	0.5 to 1.5 [ASTM D-445]
Solubility in Water	Slightly soluble in cold water (<0.2%)			Volatile Characteristics	Volatile Organic Compounds (VOC) Content = 100%, 750 gm/L
Additional Properties	Alkane, Isoparaffin, Cycloalkane, and Naphthene Hydrocarbons Content = 52 to 94.5 Wt.% (ASTM D-3257), C6-C11 Aromatic Hydrocarbons Content = 5.5 to 45 Wt.% (ASTM D-2267); Olefin Hydrocarbons Content = 0.1 to 3 Wt.% (ASTM D-1319); Average Density at 60°F = 6.244 lbs/gal (ASTM D-2161); Dry Point Temperature = 400°F (204°C) (ASTM D-86); Evaporation Rate = 8 to 10 when n-Butyl acetate = 1.0; Sulfur Content = <0.075 Wt.% (ASTM D-2922), Heat Value = 19,500 to 21,000 Btu				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide, and oxygen.		
Hazardous Decomposition Products	No substances are readily identified from composition; but, no degradation data is available		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	Full-Range Straight-run Naphtha (Petroleum):		
	VAPOR (LC ₅₀):	Acute	>5,220 mg/L (Rat screen level) (4 hours) - No deaths
	ORAL (LD ₅₀):	Acute	6,620 mg/kg (Male Rat) - Diarrhea, somnolence, and hyperactivity
	ORAL (LD ₅₀):	Acute	5,390 mg/kg (Female Rat) - Diarrhea, somnolence, and hyperactivity
	DERMAL (LD ₅₀):	Acute	>2,000 mg/kg (Rabbit screen level)
	DRAIZE EYE	Acute	Mild to moderate eye irritant (Rabbit)
	DRAIZE DERMAL	Acute	Moderate to severe skin irritant (Rabbit)
	BUEHLER DERMAL	Acute	Non-sensitizing (Guinea Pig)
	MUTAGENICITY		
	modified Ames Assay		Negative (Salmonella typhimurium)
	in-vivo Bone Marrow Assay		Negative (Rat)
	in-vitro Lymphoma Assay		Positive with and negative without S9 activation (Mouse)
	UNLEADED GASOLINE (a similar material):		
	VAPOR (TE _{Lo}):	Acute	140 ppm (Human) (8 hours) - Mild eye irritant!
	VAPOR (TE _{Lo}):	Acute	500 ppm (Human) (1 hour) - Moderate eye irritant!
	VAPOR (TC _{Lo}):	Acute	900 ppm (Human) (1 hour) - CNS and pulmonary effects
	DERMAL (TD _{Lo}):	Acute	53 mg/kg (Human) - Skin allergy effects
	VAPOR (LC ₅₀):	Acute	101,200 ppm (Rat, Mouse, & Guinea Pig) (5 minutes)

B.T. Reform Feed

In a large epidemiological study on over 15,000 persons, no increased risk of kidney cancer was seen in association with **gasoline** exposures for employees at several petroleum refineries or amongst residents located near these refineries. In another study, no increased risk of kidney cancer was seen amongst petroleum refinery workers, but there was a slight trend in kidney cancers among service station employees, especially after a 30-year latency period.

Two-year inhalation toxicity studies with **fully vaporized unleaded gasoline** (at 67, 292, & 2,056 ppm in air) produced kidney damage and kidney tumors in male rats, but not in female rats or mice of either sex. Female mice developed a slightly higher incidence of liver tumors compared to controls at the highest concentration. Results from subsequent scientific studies suggest that the kidney damage, and probably the kidney tumor response, is unique to the male rat. An EPA draft policy statement takes account of alpha-2u-globulin findings as a basis for discarding male rat kidney data in determining whether gasoline is a carcinogen. In additional rat studies, the *maternal and developmental NOEL was determined to be 9,000 ppm (75% of the LEL value)*. Under conditions of the study, **volatilized unleaded gasoline vapor** did NOT produce evidence of any type of developmental toxicity.

There were no benzene-induced blood toxin or leukemia effects noted in laboratory animals following long-term exposures to **fully-volatilized unleaded gasoline vapor containing 2 vol.% benzene**. However, the relative risk to humans for benzene in gasoline is still unknown.

An **n-butane** exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. And, **n-pentane** caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure.

Human volunteers had no apparent effects from exposure concentrations of 250 ppm, 500 ppm, and 1,000 ppm of **isobutane and n-butane** in air for periods of 8 hours daily for 10 days to 14 days, respectively. However, chronic inhalation of high concentrations of **isobutane** may cause liver and/or kidney damage. Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of **butane and butylenes** (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone.

Inhalation of 500 ppm of **isopentane or n-pentane** have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of **n-pentane** for 10 minutes has been reported NOT to produce any ill effects; however, higher exposure concentrations of 90,000 to 120,000 ppm (9-12 Wt % in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. Rat 28-day feeding studies done on both **isopentane and n-pentane** using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.

Intentional abuse of products containing **n-hexane** have been associated with permanent brain and nervous system damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function and even paralysis. These neurological effects are pronounced in combination with lack of oxygen supply, especially among women. Chronic repeated or prolonged overexposure to n-hexane, either by inhalation or skin absorption, has been associated with peripheral neuropathy in both human workers and rodents. The neurotoxic properties of n-hexane may increase with concurrent exposure to methyl ethyl ketone, methyl isobutyl ketone or toluene. n-Hexane has been associated with testicular degeneration and epididymal lesions in rats. Also, n-hexane produced fetal toxicity and reduced fetal weight in mice at maternally toxic doses.

Other **hexane isomers** can cause eye and skin irritation, but they were not shown to be mutagenic in the Salmonella/microsome (Ames) assay. They are not considered neurotoxic or carcinogenic.

Cyclohexane can cause eye, skin and mucous membrane irritation, CNS depression, narcosis, and death at elevated concentrations. In experimental animals exposed to lethal concentrations by inhalation or oral routes, there was generalized vascular damage and severe degenerative changes in the heart, lungs, liver, kidneys and brain. Cyclohexane does not act as a promotor for tumors on mice when exposed to dimethylbenzanthracene. Further, it did not induce unscheduled DNA synthesis in cultured human lymphocytes. It is not mutagenic in the Salmonella/microsome (Ames) or the mouse lymphoma L5178Y assays, with or without metabolic activation, however, it did increase the number of chromosomal aberrations in bone marrow cells of rats exposed to between 100 and 300 ppm for 6 hours/day for 5 days. These chromosomal aberrations did not appear to be dose-related.

Benzene has an IDLH (immediately dangerous to life or health) concentration of 500 ppm. Its estimated lethal dose for a normal human adult is one teaspoon to one ounce (AP 10 mL). Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes. Prolonged and repeated exposure to high concentrations of benzene is associated with injury to blood forming organs and anemia. Consumption of alcohol may increase the blood system changes related to benzene exposure. It is linked to the development of acute myelogenous leukemia.

B.T. Reform Feed

(AML) in humans NTP, IARC, and OSHA list benzene as carcinogenic to humans. Studies of workers exposed to high levels of benzene have identified humoral and cellular immunity impairment and a decrease in levels of circulating leukocytes. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice. Animal studies have shown testicular effects and alterations in reproductive cycles with some evidence of developmental effects. Studies with pregnant laboratory animals have demonstrated that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity.

n-Heptane is a skin, mucous membrane, and respiratory tract irritant, but non-irritating to the eyes. It is readily absorbed by either inhalation or dermal exposure. Overexposures may cause decreased red blood cell counts, liver and heart damage, and central nervous system depression. These higher exposures also decreased the myocardial threshold to the arrhythmogenic effects (irregular heart beats) of epinephrine, producing only a narrow margin of safety between exposures causing CNS effects, cardiac effects, and loss of consciousness. n-Heptane is metabolized in the liver to form alcohols and ketones, including neurotoxic **2,5-heptanedione** which is detectable in small amounts in the urine of exposed humans. One occupational exposure study with **95% purity n-heptane** from 1 to 9 years duration concluded that it could produce minimal peripheral nerve damage with numbness and tingling of the extremities in the stocking-and-glove areas. Polyneuropathy was reversible within a year following removal of exposure. n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not expected to be carcinogenic.

Rats inhaling **methylcyclohexane** at an airborne concentration of 15,250 ppm for 1 hour displayed tremors, loss of coordination, anesthesia, and convulsions. Inhalation of 10,050 ppm for 6 hours per day for 14 days showed rodent weight loss or decreased weight gain and changes in the structure of their salivary glands. Using rabbits, methylcyclohexane was shown to have an LD50 somewhere between 3,300 ppm and 7,300 ppm when exposed repeatedly for 6 hours per day, 5 days per week, for 3 weeks. Death was preceded by conjunctival congestion with mucoid secretion and lacrimation, salivation, coughing, sneezing, labored breathing, and diarrhea. Lethal oral dosing of rabbits caused lethargy, severe diarrhea, and circulatory collapse. Vascular and degenerative lesions were observed in the kidneys and liver.

Deliberate long-term inhalation of **toluene** at high concentrations (e.g., glue sniffing) has been associated with reversible liver effects, permanent kidney damage, CNS depression, brain damage, and cardiac (heart muscle) sensitization. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency). In addition, intentional abuse behavior increases the risk for reproductive effects including pre-term delivery, prenatal death and growth retardation. Also, case studies of persons abusing toluene have revealed isolated incidences of birth defects. Long-term inhalation studies with toluene produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness and impaired reaction time in laboratory animals. Also, in long-term laboratory studies, rats exposed to high concentrations (1,200 to 1,400 ppm) of toluene exhibited high-frequency hearing loss. Case studies have reported hearing damage in humans exposed elevated concentrations of toluene and other mixed solvents.

Studies have indicated that children of women who sniffed massive exposures of **toluene** during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate. Several animal studies using pregnant rodents have shown that toluene exposures may cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation studies, toluene has not been shown to be carcinogenic, nor is it mutagenic in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

2,2,4-Trimethylpentane (iso-octane) was highly irritating to mice at a 1,000 ppm in air exposure for 5 minutes and respiratory arrest occurred at exposures above 10,000 ppm for 5 minutes. CNS depression was observed at concentrations between 8,000 and 10,000 ppm in air. Kidney tubule necrosis, hyaline droplet formation, and acute renal failure were seen in male rats following oral administration of 10 gm/kg, 8 mL/kg, or 2,100 mg/kg of iso-octane for 2, 3, and 4 weeks, respectively.

Overexposure to **xylene isomers** may cause upper respiratory tract irritation, headache, cyanosis, blood serum changes, CNS damage, and narcosis. Effects may be increased by the consumption of ethanol (alcoholic beverages) which impairs clearance from adipose (fat) tissues. Also, ototoxicity has been associated with chronic overexposure to xylene. An inhalation study with laboratory rats also indicated an association between elevated mixed xylene exposures and hearing loss. Lung inflammation and liver damage were identified as health effects in chronic studies using guinea pigs.

B.T. Reform Feed

Two-year rat and mouse gavage studies by the National Toxicology Program (NTP) on **mixed xylene isomers including 17% ethylbenzene (dimethylbenzenes)** showed "no evidence of carcinogenicity" Also, a two-year mixed xylenes skin-painting study on shaved rats and mice showed no incidence of non-neoplastic or neoplastic lesions And, none of the components were mutagenic when tested in either the modified Ames, Chinese hamster ovary cell with and without metabolic activation, or sister-chromatid mutagenicity assays Animal inhalation and feeding studies have also associated embryo and fetotoxicity with maternally toxic dose exposures of mixed xylene isomers and ethylbenzene Fetal toxicity included increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes The significance of these animal study results to humans is not known.

NTP completed a 2-year inhalation bioassay of **ethylbenzene** in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200 and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level, and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Also, hyperplasia was observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice The relevance of these findings to human health is unclear However, based upon this data, the IARC has designated ethylbenzene as possibly carcinogenic to humans (Group 2B)

Rats inhaling **n-nonane** at an airborne concentration of 1,500 ppm for 7 days displayed mild tremors and loss of coordination. Inhalation of 1,600 ppm for 6 hours per day for 90 days showed animal weight loss or decreased weight gain and changes in the structure of their salivary glands. And, liver damage and an altered response to drugs were seen in rats given n-nonane for 2 to 7 days

Trimethylbenzenes are primary skin irritants and may cause asthmatic bronchitis and/or anemia. Levels of total hydrocarbon vapors present in the breathing atmosphere of these workers ranged from 10 to 60 ppm. Its TC_{L_50} for humans 10 ppm, with somnolence and respiratory tract irritation noted. In inhalation studies with rats, four of ten animals died after exposures of 2,400 ppm for 24 hours An oral dose of 5 mL/kg resulted in death in one of ten rats Minimum lethal intraperitoneal doses were 1.5 to 2.0 mL/kg in rats and 1.13 to 12 mL/kg in guinea pigs. **Mesitylene (1,3,5-Trimethylbenzene)** inhalation at concentrations of 1.5, 3.0, and 6.0 mg/L for six hours was associated with dose-related changes in white blood cell counts in rats. No significant effects on the complete blood count were noted with six hours per day exposure for five weeks, but elevations of alkaline phosphatase and SGOT were observed. Central nervous system depression and ataxia were noted in rats exposed to 5,100 to 9,180 ppm for two hours Based upon animal reproductive/developmental studies, trimethylbenzenes may also cause fetal toxicity

Indene and ethylmethylbenzenes are primary skin irritants. Overexposure has been associated with kidney damage and increased blood cholinesterase levels In inhalation developmental studies, indene and other **C9 aromatic hydrocarbons** have been associated with decreased fetal and newborn pup weights

Naphthalene is a potential irritant to eyes, skin and lungs Ingestion of naphthalene has been associated with severe red blood cell and liver damage leading to death. Following prolonged or repeated exposures, naphthalene has been shown to cause cataracts, optical neuritis, hemolytic and aplastic anemia, kidney damage (jaundice), and possibly neurotoxicity In animal studies, naphthalene caused fetal effects and decreased spleen weights in pregnant female mice In an NTP sponsored study, naphthalene produced a dose related increase in tumors at the 30 and 60 ppm exposure level in both male and female rats. Higher incidences of respiratory epithelial adenomas, olfactory epithelial neuroblastomas and non-neoplastic lesions of the nose were observed as compared to controls Cytogenic studies with Chinese hamster ovary cells have demonstrated sister chromatid exchanges and chromosomal aberrations The relevance of these studies to human health is unclear

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this naphtha, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life This material will normally evaporate rapidly if spilled If released, volatile **aromatic hydrocarbon components (benzene, toluene, xylenes, ethylbenzene, cumene, and trimethylbenzenes)** may contribute to the creation of atmospheric smog. The atmospheric half-lives of the **butanes** under photochemical smog conditions are estimated to be between 5 and 7 days Photooxidation of **isobutane and n-butane** in air (<8%) is not considered to be environmentally significant. **Isopentane, n-pentane, n-hexane, hexane isomers, n-heptane, heptane isomers, and iso-octane** all have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present

B.T. Reform Feed

Toluene has a half-life of from 3 hours to slightly over 1 day and **cyclohexane** has a half-life of from 6 hours to over 4 days when hydroxyl radicals are present

This material is potentially toxic to freshwater and saltwater ecosystems. Using Rainbow Trout (*Salmo irideus*), various Gasolines showed an LC100 (the Lethal Level) from 40 ppm to 100 ppm in ambient stream water. A 24-hour TLM (Median Toxic Limit) resulted in 90 ppm when using juvenile American Shad (*Squalius cephalus*). Using Bluegill Sunfish (*Lepomis macrochirus*), Grey Mullet (*Chelon labrosus*), and Gulf Menhaden (*Brevoortia patronus*), Gasoline showed a 96-hour LC50 of 8 ppm, 2 ppm, and 2 ppm, respectively.

Environmental Fate

This material is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol % of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol %, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status This material is regulated by the U.S. Department of Transportation (DOT)

Proper Shipping Name Petroleum distillates, n.o.s. (Hexanes, Heptanes)

Hazard Class DOT Class 3 (Flammable liquid).

Packing Group(s) PG II

UN/NA ID

UN1268

Reportable Quantity The Reportable Quantity (RQ) substance components present in this material which might require DOT HAZMAT bill-of-lading display are **Cyclohexane, Benzene, and/or Xylenes.**

Placards

Emergency Response Guide No. 128

HAZMAT STCC No.

49 102 68

MARPOL III Status

All impacted components were delisted as DOT "Marine Pollutants" per 66 FR 120 (page 33413) dated 6/21/2001

B.T. Reform Feed

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.
SARA 313	This material contains the following components in concentrations which might be at or above de minimis levels and are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313: n-Hexane [CAS No. 110-54-3] concentration: 1 to 15% Cyclohexane [CAS No. 110-82-7] concentration: 1 to 25% Benzene [CAS No. 71-43-2] concentration: 0.1 to 7% Toluene [CAS No. 108-88-3] concentration: 0.5 to 16% Xylenes [CAS No. 1330-20-7] concentration: 1 to 15% Ethylbenzene [CAS No. 100-41-4] concentration: 0.3 to 5% Cumene [CAS No. 92-82-8] concentration: 0 to 2% 1,2,4-Trimethylbenzene (Pseudocumene) [CAS No. 95-63-6] concentration: 0.5 to 1.5% Naphthalene [CAS No. 91-20-3] concentration: 0.1 to 3%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances that might be present in this material which are subject to this statute are: n-Hexane [CAS No. 110-54-3] (RQ = 5,000 lbs. [2,270 kg]) concentration: 1 to 15% Cyclohexane [CAS No. 110-82-7] (RQ = 1,000 lbs. [453.6 kg]) concentration: 1 to 25% Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 0.1 to 7% Toluene [CAS No. 108-88-3] (RQ = 1,000 lbs. [453.6 kg]) concentration: 0.5 to 16% 2,2,4-Trimethylpentane (Iso-octane) [CAS No. 540-84-2] (RQ = 1,000 lbs. [453.6 kg]) conc.: 0 to 5% Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 1 to 15% Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 0.3 to 5% Cumene [CAS No. 98-82-8] (RQ = 5000 lbs. [2268 kg]) concentration: 0 to 2% Naphthalene [CAS No. 91-20-3] (RQ = 100 lbs. [45.36 kg]) concentration: 0.1 to 3%
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material contains the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5: Benzene [CAS No. 71-43-2] and Toluene [CAS No. 108-88-3].
New Jersey Right-to-Know Label	For New Jersey labeling, refer to components listed in Section 2.
Additional Regulatory Remarks	Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13): This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children! Under Section 12(b) of the Toxic Substances Control Act: Because it contains detectable amounts of Cyclohexane [CAS No. 110-82-7] , this product might be subject to US EPA's one-time only per country export notification requirements.

B.T. Reform Feed

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following minor components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare" **Isopentane [CAS No. 78-78-4], 1-Pentene [CAS No. 109-67-1], n-Pentane [CAS No. 109-66-0], Cyclohexane [CAS No. 110-82-7], Benzene [CAS No. 71-43-2], Methylcyclohexane [CAS No. 108-87-2], Toluene [CAS No. 108-88-3], Xylenes [CAS No. 1330-20-7], Ethylbenzene [CAS No. 100-41-4], and Cumene [CAS No. 98-82-8].**

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this material which are subject to this statute are: **Isobutane (Propane, 2-methyl), n-Butane, Isopentane (Butane, 2-methyl), various Pentenes, and n-Pentane**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

MSDS No. RS0167
Revision Date 10/2/2002

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid.
Color Transparent, colorless. Odor Light hydrocarbons.

DANGER! Extremely flammable liquid;
vapor may cause flash fire or explosion.
May be harmful or fatal if inhaled, ingested or absorbed
through the skin.
Liquid contact may cause mild to severe skin irritation,
inflammation, and/or blistering.
Mist or vapor may irritate the mucous membranes and
respiratory tract.
Aspiration into the lungs will cause pulmonary edema
and chemical pneumonia.
Overexposures may cause central nervous system (CNS)
depression and target organ effects such as auditory
and/or peripheral nerve, liver, and/or kidney damage.
Prolonged and/or repeated inhalation may increase the heart's
susceptibility to arrhythmias (irregular beats).
Potential cancer hazard. Contains Benzene!
May cause leukemia and/or other blood disorders.
Mutagenic hazard; may cause genetic damage!
May adversely affect reproduction or reproductive development.
Spills may create a slipping hazard.

Hazard Rankings

SECTION 1: IDENTIFICATION

Trade Name	BTU C8 Splitter Overhead	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	1111110167	Medical Emergency	(800) 313-7645 or (918) 495-4700
CAS Number	68956-52-5 or 64741-63-5	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	C4-C8 Petroleum Hydrocarbons		
Synonyms	Benzene-Toluene Unit C8 Splitter Tower Overhead; 732 Unit C8 Splitter Overhead; BTU Light Reformate; Light Reformer Splitter Naphtha; BTU Extractor Tower Feed; Light Naphtha; C4-C8 Solvent; BT Solvent.		

BTU C8 Splitter Overhead

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) C4-C8 Hydrocarbons	68956-52-5	100
2) Light Catalytic Reformed Naphtha (Petroleum)	64741-63-5	100
3) Butanes	Mixture	0.5-2
4) Pentanes	Mixture	1-10
5) Hexane Isomers	Mixture	10-25
6) n-Hexane	110-54-3	1-5
7) Benzene	71-43-2	5-20
8) Heptanes	Mixture	10-25
9) Methylcyclohexane	108-87-2	1-5
10) Toluene	108-88-3	25-40
11) Octanes	Mixture	1-10
12) Ethylbenzene	100-41-4	0.1-0.5

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Skin Contact. Eye Contact. Skin Absorption.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon level of exposure concentration and/or duration. Vapors can reduce the oxygen content in air. Approximately 20,000 ppm (or 2 vol.%) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces.
Eye Contact	Animal test results on similar materials suggest that this product can cause mild to severe eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling.
Skin Contact	Tests on this material's components suggest that mild to severe skin irritation, inflammation, and blistering is expected to occur upon short-term liquid contact. Certain components of this material, including n-hexane, cyclohexane, benzene, n-heptane, toluene, and iso-octane may be absorbed through the skin, and produce toxic effects such as CNS depression (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate to severe skin irritation and inflammation. Symptoms include defatting, redness, dryness, blistering, lesions, and/or scaly dermatitis.
Ingestion	If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above).

Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.

Chronic Health Effects Summary Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction.

Reports have associated repeated and prolonged occupational overexposure to solvents with irreversible brain and nervous system damage (sometimes referred to as "Solvent or Painter's Syndrome"). And, altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been common results for gasoline/naphtha abusers. Intentional misuse by deliberately concentrating and inhaling this product may be harmful or fatal.

Chronic inhalation to components of this light naphtha (**n-butane, n-pentane, n-heptane, and toluene**) may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of epinephrine

BTU C8 Splitter Overhead

(adrenaline)-like drugs.

Even with acute exposures, **n-hexane** is toxic to the peripheral nerves, characterized by numbness, tingling, or pain in the extremities, progressively worsening of neuromuscular motor coordination (polyneuritis or polyneuropathy), and even partial paralysis. And, based upon animal studies, n-hexane's metabolite, **2,5-hexanedione**, has been shown to cause degeneration of the testes.

Benzene is considered to be a cancer causing agent. It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML). Benzene is also capable of causing changes in genetic material (chromosomes). Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy. Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents.

Available information indicates that **toluene** is NOT teratogenic, but it can be toxic to the embryo and fetus and may reduce fertility. In animal tests, high inhaled doses of toluene has caused reduced litter sizes, retarded development of the fetus, and increased incidence of non-lethal abnormalities.

Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Chronic occupational **toluene and xylene** exposures have caused auditory nerve degeneration.

At high exposure concentrations, **ethylbenzene** has been associated with multiple organ tumors in laboratory animals.

Based upon animal testing, the **C8 aromatic hydrocarbon components (xylene isomers and ethylbenzene)** might be assumed to cause embryo and fetal toxicity, spontaneous abortions, and/or decreased fetal and newborn weights if overexposures occur during a woman's early gestation period.

Conditions Aggravated by Exposure

Personnel with pre-existing central nervous system (CNS) disease, neurological conditions, skin disorders, impaired hearing, liver, or kidney function, or chronic respiratory diseases, and women attempting to conceive should avoid exposure.

Exposure to high concentrations of this material may increase the sensitivity of the heart to **epinephrine (adrenalin) and catecholamine-like drugs**. Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians").

Target Organs

This material is toxic to lungs, nervous systems, especially the auditory and peripheral nerves, brain, blood, kidneys, liver, heart, thymus, mucous membranes, skin, eyes, and possibly the reproductive systems.

Carcinogenic Potential

This material contains benzene and ethylbenzene at concentrations above at or above 0.1%. **Benzene** is considered to be a known human carcinogen by OSHA, IARC and NTP and **Ethylbenzene** is considered possibly carcinogenic to humans by IARC. (See Section 11.)

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>

BTU C8 Splitter Overhead

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If contacted by liquid, check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment unless directed to by a physician. If pain, redness, swelling, or tearing, persist, obtain medical attention as soon as possible.
Skin Contact	The affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. Then remove contaminated shoes and clothing. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	<p>If contact with pressurized or liquefied gas causes frostbite of the eyes, early ophthalmologic consultation is recommended. This material may also make the heart more susceptible to arrhythmias (irregular beats). Catecholamines and other sympathomimetic drugs such as epinephrine (adrenline) should be reserved for emergency situations and then used only with special precaution.</p> <p>Inhalation overexposure can produce toxic effects. Monitor for respiratory distress, arterial blood gases, and chest x-ray in cases with significant exposure. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.</p> <p>If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Continue monitoring for cardiac function, respiratory distress, and arterial blood gases in severe exposure cases.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IA Flammable Liquid. Extremely flammable!		
Flash Point Method	CLOSED CUP: -45° to -42°C (-50° to -45°F). (Tagliabue [ASTM D-56])		
Lower Flammable Limit	AP 1.4 %	Upper Flammable Limit	AP 8.3 %
Autoignition Temperature	AP 232°C (450°F)		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly sulfur oxides and/or unburned mercaptans.		
Special Properties	Extremely Flammable Light Naphtha! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.		

BTU C8 Splitter Overhead

Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide (CO ₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers or waterways.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable Light Naphtha! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Establish a "regulated zone" with site control and security. Remove all potential ignition sources. If possible, allow this material to evaporate. Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. If possible, turn leaking containers so that gas escapes rather than liquid. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Do not touch, walk through spilled material, or enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. A vapor-suppressing foam may also be used to reduce vapors.

Caution: Many materials become brittle and are likely to break without warning when they contact this cryogenic gas/liquid. Stop the leak if it can be done without risk. Safely stop the source gas flow using non-sparking tools. All equipment used when handling this material must be grounded. Prevent its entry into waterways, sewers, basements, or confined areas, especially where there is danger of its vapors being ignited by a remote ignition source. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Remove spillage immediately from hard, smooth walking areas.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/2 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This material should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases/spills may need to be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling	Odor is an inadequate warning of potentially hazardous air concentrations. Releases of this material can cause atmospheres to become oxygen deficient and/or create an immediate fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring for oxygen deficiency and flammability. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Do not allow vaporizing material to contact eyes, skin, or other tissues. Never siphon by mouth. Prevent contact with food, chewing, or smoking materials. Do not take internally.
	Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of mixed gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Drain and purge equipment as necessary to remove material residues.

BTU C8 Splitter Overhead

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits and wear personal protective clothing as shown in Section 8. Promptly remove contaminated clothing. Wash exposed skin thoroughly with mild soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store other toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and well sealed. All label warnings and precautions must be observed. Return empty containers to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable material should be stored in a separate safety cabinet or room, and preferably refrigerated. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposures, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling liquefied gas/liquid mixtures. If this material is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Suitable eye wash water should be readily available.

Hand Protection

Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves (e.g. disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) to protect hands from potential contact with cold liquid or vapors. Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

BTU C8 Splitter Overhead

Body Protection	Prevent potential skin contact with cold liquid or vapors. Wear insulated and chemical-resistant clothing (e.g. Tyvek®, nitrile, or neoprene) over fire-retardant garments (e.g. Nomex®) while working with flammable gas/liquid mixtures. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.
Respiratory Protection	Use a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. Air purifying respirators offer no protection against oxygen deficient atmospheres. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2).
General Comments	Releases of this light naphtha may create flammable, explosive, and/or oxygen-deficient atmospheres (< 19.5 Vol.% in air). DO NOT ENTER such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Gasoline ("A3 Animal Carcinogen)	TWA: 300 STEL: 500 (ppm) from ACGIH (TLV) TWA: 300 STEL: 500 (ppm) from OSHA (PEL) [Proposed]
2) Petroleum Distillates (Naphtha)	TWA: 500 (ppm) from OSHA (PEL)
3) Butanes	TWA: 800 (ppm) from ACGIH (TLV) TWA: 800 (ppm) from OSHA (PEL) [Proposed]
4) Pentane, all isomers	TWA: 600 (ppm) from ACGIH (TLV) TWA: 600 STEL: 750 (ppm) from OSHA (PEL) [Proposed] TWA: 1000 (ppm) from OSHA (PEL)
5) Hexane, other isomers	TWA: 500 STEL: 1000 (ppm) from ACGIH (TLV) TWA: 500 STEL: 1000 (ppm) from OSHA (PEL) [Proposed]
6) Hexane (n-Hexane)	TWA: 50 (ppm) from ACGIH (TLV) - SKIN TWA: 50 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
7) Benzene ("A1" and "Z-2" Known Human Carcinogen)	TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) - SKIN TWA: 1 STEL: 5 (ppm) from OSHA (PEL) - SKIN
8) Heptane (n-Heptane)	TWA: 400 STEL: 500 (ppm) from ACGIH (TLV) TWA: 400 STEL: 500 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
9) Methylcyclohexane	TWA: 400 (ppm) from ACGIH (TLV) TWA: 400 STEL: 500 (ppm) from OSHA (PEL) [Proposed]
10) Toluene	TWA: 50 (ppm) from ACGIH (TLV) - SKIN TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [Proposed] TWA: 200 CEIL: 300 (ppm) from OSHA (PEL)
11) Octane, all isomers	TWA: 300 (ppm) from ACGIH (TLV) TWA: 300 STEL: 375 (ppm) from OSHA (PEL) [Proposed] TWA: 500 (ppm) from OSHA (PEL)
12) Ethylbenzene ("A3" Animal Carcinogen)	TWA: 100 STEL: 125 (ppm) from ACGIH (TLV) TWA: 100 STEL: 125 (ppm) from OSHA (PEL) [Proposed] TWA: 100 (ppm) from OSHA (PEL)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color Transparent, colorless.	Odor	Light hydrocarbons.
Specific Gravity	0.73 to 0.77 (Water = 1)	pH Not applicable.	Vapor Density	2.9 to 3.2 (Air = 1)
Boiling Point/Range	-12° to 141°C (10° to 285°F) at 14.7 psia [ASTM D-2887]		Melting/Freezing Point	-160° to 5°C (-256° to 42°F) at 14.7 psia
Vapor Pressure	AP 6 to 20 psia at 40°C (104°F)		Viscosity (cSt @ 40°C)	< 0.5 to 1.0
Solubility in Water	Slightly soluble in cold water (< 0.1%).		Volatile Characteristics	Volatile Organic Compounds (VOCs) Content = 100%; AP 700 gm/L.

BTU C8 Splitter Overhead

Additional Properties Alkane, Isoparaffin, and Cycloalkane Hydrocarbons Content = 34 to 70 Wt.% [ASTM D-1319];
 C6-C8 Aromatic Hydrocarbon Content = 30 to 66 Wt.% [ASTM D-1319];
 Average Density at 60°F = 6.244 lbs./gallon [ASTM D-2161];
 Dry Point Temperature = 282°F (139°C) [ASTM D-86];
 Evaporation Rate = 4.5 to 6.5 when n-Butyl acetate = 1.0.

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, fluorine and fluoride compounds, bromine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions. This material may dissolve some plastics.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the **Emergency Overview on Page 1** and the **Hazards Identification in Section 3** of this MSDS.

Toxicity Data	<p>An n-butane exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Butane is also thought to decrease the myocardial threshold to epinephrine-induced arrhythmias. And, n-pentane caused cardiac sensitization in rabbits at a 100,000 ppm concentration in air within 4 hours of exposure.</p> <p>Human volunteers had no apparent effects from exposure concentrations of 250 ppm, 500 ppm, and 1,000 ppm of isobutane and n-butane in air for periods of 8 hours daily for 10 days to 14 days, respectively. However, chronic inhalation of high concentrations of isobutane may cause liver and/or kidney damage.</p> <p>Laboratory animals have exhibited a higher degree of narcosis when exposed to the combination of butane and butylenes (additive effect), than the degree of narcosis exhibited following exposure to any one gas alone.</p> <p>Inhalation of 500 ppm of isopentane or n-pentane have been reported NOT to produce any ill effects in humans. Additionally, the inhalation of 5,000 ppm of n-pentane for 10 minutes has been reported NOT to produce any ill effects; however, higher exposure concentrations of 90,000 to 120,000 ppm (9-12 Wt.% in air) have caused central nervous system depression and narcosis. Approximately 130,000 ppm can be fatal. Rat 28-day feeding studies done on both isopentane and n-pentane using a 10,000 mg/kg dosage produced test animal weight loss or decreased weight gain, especially in their bladders, and some deaths.</p> <p>Intentional sniffing abuse of n-hexane has caused permanent brain and nervous system damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function, and even paralysis. These neurological effects are pronounced in combination with lack of oxygen supply, especially amongst women. Chronic repeated and/or prolonged overexposure to n-hexane, either by inhalation or skin absorption, has been shown to cause peripheral nerve tissue damage (polyneuropathy). The initial symptoms are numbness of the fingers and toes. Motor weakness can also occur in the digits, but may also involve muscles of the arms, thighs, and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure. The neurotoxic properties of n-hexane may be increased by concurrent exposure to methyl ethyl ketone, methyl isobutyl ketone, and/or toluene.</p> <p>Hexane isomers were not mutagenic in the Salmonella/microsome (Ames) assay and are NOT considered to be carcinogenic. n-Hexane is NOT a tumor promotor in mice and NOT considered to be carcinogenic; nor is it teratogenic in mice or rats. n-Hexane, or its metabolite 2,5-hexanedione, has been shown to cause degeneration of the testes in rats; but, it did NOT produce spermatotoxicity in a multiple end-point test battery in rats given multiple doses for up to 5 days.</p> <p>Benzene has an IDLH (immediately dangerous to life or health) concentration of 500 ppm. Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes. If ingested, benzene's lethal dose for a normal</p>
----------------------	---

BTU C8 Splitter Overhead

human adult is one teaspoon to one ounce (~10 mL). Studies with pregnant laboratory animals have demonstrated that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice.

Benzene is a known animal carcinogen and a human leukemogen. In addition, NTP, IARC, EPA, OSHA, and ACGIH list benzene as a "Human Carcinogen." Repeated and prolonged overexposure to benzene vapors (GT 20 ppm in air) may cause toxicity to blood-forming tissues. Chronic exposure symptoms include decreased blood cell and platelet counts, leukopenia, aplastic anemia, or acute myelogenous leukemia (AML). Also, chronic inhalation of benzene vapors have been found to cause fatigue, nervousness, irritability, blurred vision, and labored breathing. Overexposure to benzene has been associated with in chromosomal aberrations in human white blood cells, both laboratory animal and human bone marrow cell damage, and in vitro mammalian cells DNA damage. Elevated frequencies of chromosomal aberrations have been observed in peripheral white blood cells and bone marrow of workers exposed to high benzene concentrations known to be associated with signs of chronic poisoning. Ethanol consumption may have a synergistic effect and increase blood system changes caused by benzene exposures. Children/teenagers have less resistance.

n-Heptane is a mucous membrane and respiratory tract irritant, but non-irritating to the eyes. It is readily absorbed by inhalation and dermal exposure and repeated direct skin application can produce defatting dermatitis. Exposures may cause decreased red blood cell counts, liver and heart damage, and central nervous system depression. n-Heptane is metabolized in the liver to form alcohols and ketones, including neurotoxic **2,5-heptanedione** which is detectable in small amounts in the urine of exposed humans.

In a controlled study, human volunteers exposed to an airborne concentration of **n-heptane** of 1,000 ppm for 6 minutes or 2,000 ppm for 4 minutes experienced slight dizziness and incoordination. Higher-level exposures produced hilarity, dizziness, and semi-consciousness. Inhaling a concentration of 5,000 ppm for 15 minutes caused stupor and a gasoline-like taste. These higher exposures also decreased the myocardial threshold to the arrhythmogenic effects (irregular heart beats) of epinephrine, producing only a narrow margin of safety between exposures causing CNS effects, cardiac effects, and loss of consciousness.

One occupational exposure study involving a **95% purity n-heptane** from 1 to 9 years duration concluded that it could produce minimal peripheral nerve damage with numbness and tingling of the extremities in the stocking-and-glove areas. In the same study, there was a decrease in motor nerve conduction velocities correlated with duration of exposure and adjusted for age effects; however, the average motor nerve conduction velocity in exposed workers was normal. Polyneuropathy associated with n-heptane exposure was reversible within a year following removal of exposure.

Rats inhaling **methylcyclohexane** at an airborne concentration of 15,250 ppm for 1 hour displayed tremors, loss of coordination, anesthesia, and convulsions. Inhalation of 10,050 ppm for 6 hours per day for 14 days showed rodent weight loss or decreased weight gain and changes in the structure of their salivary glands. Using rabbits, methylcyclohexane was shown to have an LD50 somewhere between 3,300 ppm and 7,300 ppm when exposed repeatedly for 6 hours per day, 5 days per week, for 3 weeks. Death was preceded by conjunctival congestion with mucoid secretion and lacrimation, salivation, coughing, sneezing, labored breathing, and diarrhea. Lethal oral dosing of rabbits caused lethargy, severe diarrhea, and circulatory collapse. Vascular and degenerative lesions were observed in the kidneys and liver.

n-Heptane was not neurotoxic in rats exposed for up to 7 months. But based upon limited laboratory animal studies, **n-heptane and its metabolites** were found in low levels (< 135 ppm) in the brain of rats exposed to airborne concentrations of 100, 500, or 1,500 ppm for 6 hours each day, five days per week, for 1 or 2 weeks. These substances disappeared within 2 weeks following removal of exposure. n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not expected to be carcinogenic.

Toluene (methylbenzene) has been a major solvent of intentional inhalation abuse. Deliberate long-term inhalation of high concentrations of toluene (glue sniffing, etc.) has been shown to cause liver, kidney, central nervous system, and permanent brain damage. Effects such as impaired speech, visual disturbances, and hearing loss, loss of balance and/or muscle control, and memory loss have been reported. Exposures of 100 to 200 ppm in air for 24 hours cause hallucinations, distorted perceptions, and changes in motor activity. Studies have indicated that children of women who sniffed

BTU C8 Splitter Overhead

massive exposures of toluene during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. Isolated case reports have suggested a spectrum of congenital defects similar to those seen in fetal alcohol (ethanol) syndrome. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate.

Animal studies suggest that **toluene** causes kidney, liver, and/or lung dysfunction and cardiac (heart muscle) sensitization to epinephrine or other adrenalin-like agents. This sensitization may cause fatal changes in heart beat rhythms. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency).

Long-term rodent inhalation studies with **toluene** produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness, and impaired reaction time. Also, rats exposed to 1,200 ppm and 1,400 ppm of toluene in air for 14 hours per day for 5 or 4 weeks (respectively) exhibited high-frequency hearing loss. Several animal studies using pregnant rodents have shown that toluene exposures may cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation studies, toluene has not been shown to be carcinogenic; nor is it mutagenic in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

2,2,4-Trimethylpentane (Iso-octane) was highly irritating to mice at a 1,000 ppm in air exposure for 5 minutes and respiratory arrest occurred at exposures above 10,000 ppm for 5 minutes. CNS depression was observed at concentrations between 8,000 and 10,000 ppm in air. Kidney tubule necrosis, hyaline droplet formation, and acute renal failure were seen in male rats following oral administration of 10 gm/kg, 8 mL/kg, or 2,100 mg/kg of iso-octane for 2, 3, and 4 weeks, respectively.

Two-year rat and mouse gavage studies by the National Toxicology Program (NTP) on **mixed xylene isomers including 17% ethylbenzene** showed "no evidence of carcinogenicity". And, none of the components were mutagenic when tested in either the modified Ames, Chinese hamster ovary cell with and without metabolic activation, or sister-chromatid mutagenicity assays.

NTP completed a 2-year inhalation bioassay of **ethylbenzene** in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200 and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels. However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level; and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Also, hyperplasia was observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear. However, based upon this data, the IARC has designated ethylbenzene as possibly carcinogenic to humans (Group 2B).

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this material. If spilled, the naphtha portion of this material, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. Using Rainbow Trout (<i>Oncorhynchus mykiss</i>) and Dungeness Crab (<i>Cancer magister</i>), similar naphthas showed a 96-hour TLm (Median Toxic Limit) from 5 ppm to 30 ppm in ambient saltwater. 24-hour TLms resulted in 2,990 ppm and 250 ppm when using Bluegill Sunfish (<i>Lepomis macrochirus</i>) and juvenile American Shad (<i>Squalius cephalus</i>), respectively. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.
Environmental Fate	This material will normally evaporate rapidly if spilled. Releases are expected to cause environmental damage. At ambient temperatures and pressure, the volatile aromatic hydrocarbon components (benzene and toluene) of this material may contribute to the creation of atmospheric smog. The atmospheric half-lives of the butanes under photochemical smog conditions are estimated to be between 5 and 7 days. Photooxidation of isobutane and n-butane in air (< 8%) is not considered to be environmentally significant. The pentanes, n-hexane, n-heptane, hexane and heptane isomers, and iso-octane all have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present. Benzene and toluene have half-lives of less than 3 hours

BTU C8 Splitter Overhead

to slightly over 1 day and **Cyclohexane** has a half-life of from 6 hours to over 4 days when hydroxyl radicals are present.

This material is potentially toxic to freshwater and saltwater ecosystems. Its heavier components will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this material, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Petroleum distillates, n.o.s. (Toluene, Heptanes and/or Hexanes)		
Hazard Class	DOT Class: 3 (Flammable liquid).	Packing Group(s)	PG I
		UN/NA ID	UN1256
Reportable Quantity	The Reportable Quantity (RQ) substance components present in this material which might require DOT HAZMAT bill-of-lading display are Toluene and Benzene .		
Placards		Emergency Response Guide No.	128
		HAZMAT STCC No.	49 102 56
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

BTU C8 Splitter Overhead

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. This material does not contain any chemical substances subject to this statute.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard and Acute (Immediate) and Chronic (Delayed) Health Hazards.
SARA 313	This material contains the following components in concentrations which might be at or above de minimis levels and are listed as a "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313: n-Hexane [CAS No. 110-54-3] concentration: 1 to 5% Benzene [CAS No. 71-43-2] concentration: 5 to 20% Toluene [CAS No. 108-88-3] concentration: 25 to 40% Ethylbenzene [CAS No. 100-41-4] concentration: 0.01 to 0.5%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances that might be present in this material which are subject to this statute are: n-Hexane [CAS No. 110-54-3] (RQ = 5,000 lbs. [2,270 kg]) concentration: 1 to 5% Cyclohexane [CAS No. 110-82-7] (RQ = 1000 lbs. [453.6 kg]) concentration: 0.1 to 0.5% Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 5 to 20% Toluene [CAS No. 108-88-3] (RQ = 1000 lbs. [453.6 kg]) concentration: 25 to 40% 2,2,4-Trimethylpentane (Iso-octane) [CAS No. 540-84-2] (RQ = 1000 lbs. [453.6 kg]) conc.: 0.1 to 2.5% Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 0.1 to 0.9% Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 0.01 to 0.5%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material contains the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it may be subject to requirements of California Health & Safety Code Section 25249.5: Benzene [CAS No. 71-43-2] and Toluene [CAS No. 108-88-3].
New Jersey Right-to-Know Label	For New Jersey labeling, refer to the components listed in Section 2.
Additional Regulatory Remarks	Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13): This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children! Under Section 12(b) of the Toxic Substances Control Act: Because it contains detectable amounts of Cyclohexane (CAS No. 110-82-7) , this material might be subject to US EPA's one-time only per country export notification requirements. In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare": Isopentane [CAS No. 78-78-4], 1-Pentene [CAS No. 109-67-1], n-Pentane [CAS No. 109-66-0], Cyclohexane [CAS No. 110-82-7], Benzene [CAS No. 71-43-2], Methylcyclohexane [CAS No. 108-87-2], Toluene [CAS No. 108-88-3], Xylenes [CAS No. 1330-20-7], and Ethylbenzene [CAS No. 100-41-4].

BTU C8 Splitter Overhead

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. Substances present in this material which are subject to this statute are: **Isobutane (Propane, 2-methyl) [CAS No. 75-28-5]**, various **Butenes [CAS No. 25167-67-3]**, **n-Butane [CAS No. 106-97-8]**, **Isopentane (Butane, 2-methyl) [CAS No. 78-78-4]**, various **Pentenenes [CAS No. 68527-11-7]**, and **n-Pentane [CAS No. 109-66-0]**.

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 1.0
Revision Date 10/2/2002
Print Date Printed on 10/2/2002.

Kerosine, Straight-run (C9-C16 Hydrocarbons)

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0206
Revision Date 09/05/1999

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid.
Color Transparent, colorless **Odor** Characteristic, kerosene-like.
to water-white.

WARNING! Combustible liquid; vapor may cause flash fire!
Mist or vapor may irritate the eyes, mucous membranes, and respiratory tract!

Liquid contact may cause minimal to mild eye and/or moderate to severe skin irritation and inflammation!

Based upon laboratory animal studies, may cause skin cancer following extended contact!

May be harmful if inhaled or absorbed through the skin!
Overexposures may cause central nervous system (CNS) depression and/or other target organ effects!

May be harmful or fatal if ingested!
Aspiration into the lungs can cause pulmonary edema and lipid or chemical pneumonia!

Based upon animal testing, may adversely affect reproduction!
Spills may create a slipping hazard!

If used as fuel, its engine exhaust may cause upper respiratory tract irritation and reversible pulmonary effects!

Hazard Rankings

SECTION 1: IDENTIFICATION

Trade Name	Kerosine, Straight-run (C9-C16 Hydrocarbons)	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	008008206*	Medical Emergency	(918) 495-4700
CAS Number	8008-20-6	CHEMTREC Emergency	(800) 424-9300
Product Family	Petroleum Hydrocarbon Middle Distillate		
Synonyms	Straight-run Kerosine, Unrefined, Untreated, or Raw Kerosine or Kerosene, Water White Distillate from a Petroleum Crude Still; Crude Tower Light Distillate; Straight-run Light Middle Distillate, High-Sulfur No. 1 Fuel; Untreated No. 1 Fuel Oil; Unrefined 2-K Kerosene; Unfinished Jet Fuel, Stove Oil, Lamp Oil, or Range Oil; C9-C16 Petroleum Hydrocarbons		

Kerosine, Straight-run (C9-C16 Hydrocarbons)

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Kerosine (Petroleum)	8008-20-6	100
2) Nonanes	Mixture	10-20
3) Trimethylbenzene (mixed isomers)	25551-13-7	0.5-1.5
4) Ethylmethylbenzenes (Ethyltoluenes)	25550-14-5	1-3
5) C10 Alkanes, Isoparaffins, and Cycloalkanes	Mixture	15-50
6) Naphthalene	91-20-3	1-3
7) C10-C11 Alkylbenzenes	70693-06-0	1-10
8) C11 Alkanes, Isoparaffins, and Cycloalkanes	Mixture	10-20
9) C12 Alkanes, Isoparaffins, and Cycloalkanes	Mixture	5-15
10) Biphenyl (Diphenyl)	92-52-4	0.5-1.5
11) C13-C16 Alkanes, Isoparaffins, and Cycloalkanes	Mixture	5-20

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye Contact. Absorption. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon level of exposure concentration and/or duration. Vapors can reduce the oxygen content in air. Approximately 20,000 ppm (or 2 vol.%) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces.
Eye Contact	Animal test results on similar materials suggest that this product can cause minimal to mild eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling.
Skin Contact	Animal test results on similar materials suggest that this product can cause moderate to severe skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause severe dermatitis and/or more serious skin disorders. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and/or severe tissue damage.
Ingestion	If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above). Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.
Chronic Health Effects Summary	Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. People chronically exposed to jet fuel (similar to straight-run kerosine) at an average concentration of 250 mg/m ³ (~ 85 ppm) in air for 4 to 32 years showed higher incidence of neuropsychiatric symptoms than unexposed persons. Symptoms included anxiety, sleep disturbances, irritability, attention deficits, memory impairment, depression, fatigue, mood and personality changes, and neurasthenic syndrome. Also, reports have associated repeated and prolonged occupational overexposure to similar solvents with irreversible brain and nervous system damage (sometimes referred to as "Solvent or Painter's Syndrome"). This straight-run kerosine is a middle distillate similar to those shown to produce skin tumors on laboratory animals following repeated applications. All tumors appeared at the site of application during the latter portion of the typical 2-year lifespan of the animals. Toxic effects are unlikely to occur if good personal hygiene is practiced.

Kerosine, Straight-run (C9-C16 Hydrocarbons)

Based upon animal testing, the **C9 aromatic hydrocarbon components (trimethylbenzenes and ethylmethylbenzenes)** are presumed to cause fetal toxicity and/or decreased fetal and newborn weights if overexposure occurs during a woman's early gestation period

Naphthalene, a component of this product, is considered to be a toxic substance as defined by both human exposure and laboratory testing results.

Biphenyl (Diphenyl) may cause liver and/or nerve damage. (See Section 11.)

Conditions Aggravated by Exposure	Personnel with pre-existing central nervous system (CNS) disease, neurological conditions, skin disorders, impaired liver or kidney function, or chronic respiratory diseases, and women attempting to conceive should avoid exposure.
Target Organs	This substance is toxic to lungs, nervous systems, brain, mucous membranes, skin, eyes, and possibly, the blood, liver, kidneys, and reproductive system.
Carcinogenic Potential	This material contains middle distillates at above 0.1% and it is considered carcinogenic by IARC and OSHA. (See Section 11)

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input checked="" type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to **Exposure Controls and Personal Protection** in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required. If ingested, this material presents a significant aspiration/lipoid or chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

Kerosine, Straight-run (C9-C16 Hydrocarbons)

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-II Combustible Liquid. Highly combustible!		
Flash Point/Method	CLOSED CUP 49° to 57°C (120° to 135°F). (Tagliabue (ASTM D-56))		
Lower Flammable Limit	AP 0.7 %	Upper Flammable Limit	AP 5.0 %
Auto-Ignition Temp.	AP 210°C (410°F)		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors.		
Special Properties	<p>Combustible Liquid! This material releases vapors at or approaching the flash point temperature. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Mists or sprays may be flammable at temperatures below the flash point. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.</p> <p>A static electrical charge can accumulate as a result of transfer flow or agitation. Discharge (static spark) can ignite vapors, especially in cold, dry weather conditions. Special slow load and monitoring procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point products. To reduce this hazard, receiving containers should always be grounded and the loading nozzle must be kept in contact with the container during the entire filling process. Do not fill any portable container in or on a vehicle without proper bonding.</p>		
Extinguishing Media	<p>SMALL FIRE: Use dry chemicals, carbon dioxide (CO₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.</p>		
Fire Fighting Protective Clothing	<p>Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.</p>		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Combustible Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

Kerosine, Straight-run (C9-C16 Hydrocarbons)

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This combustible liquid should be stored in a separate safety cabinet or room. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).

Kerosine, Straight-run (C9-C16 Hydrocarbons)

General Comments

Warning! Use of this hydrocarbon fuel in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance

Applicable Workplace Exposure Levels

1) Diesel fuel/Kerosene ("A3" Animal Carcinogen)	TWA: 100 (mg/m ³) from ACGIH (TLV) [Proposed for 2000] - SKIN
2) Nonane, all isomers	TWA: 200 (ppm) from ACGIH (TLV) [1999] TWA: 200 (ppm) from OSHA (PEL) [1989]
3) Trimethylbenzene (mixed isomers)	TWA: 25 (ppm) from ACGIH (TLV) [1999] TWA: 25 (ppm) from OSHA (PEL) [1989]
4) Naphthalene ("A4" = Not Classifiable")	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 10 STEL: 15 (ppm) from OSHA (PEL) [1989] TWA: 10 (ppm) from OSHA (PEL) [1976]
5) Biphenyl (Diphenyl)	TWA: 0.2 (ppm) from ACGIH (TLV) [1999] TWA: 0.2 (ppm) from OSHA (PEL) [1989]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color	Transparent, colorless to water-white.	Odor	Characteristic, kerosene-like.
Specific Gravity	0.81 to 0.84 at 60°F (Water = 1)	pH	Not applicable	Vapor Density	5.0 to 5.2 (Air = 1 at 70°F)
Boiling Point/Range	155° to 300°C (310° to 572°F) (ASTM D-2887)	Melting/Freezing Point			LT -25°C (-13° F) (ASTM D-2386)
Vapor Pressure	1.6 to 1.8 mm Hg at 20°C (68°F)	Viscosity (cSt @ 40°C)			2 to 4 (ASTM D-445) and LT 8 cSt at -20°C.
Solubility in Water	Negligible to slightly soluble in cold water (AP 0.005 to 0.04%).	Volatile Characteristics			Volatile Organic Compounds (VOCs) Content = 100%; AP 825 gm/L.
Additional Properties	Alkane, Isoparaffin, and Cycloalkane Hydrocarbons Content = 80 to 90 Wt.% (ASTM D-1319); C8-C15 Aromatic Hydrocarbon Content = 10 to 20 Wt.% (ASTM D-1319); Average Density at 60°F = 6.869 lbs./gal (ASTM D-2161); Cetane Number GT 40 (ASTM D-613 or D-976); Saybolt Viscosity = 32.5 to 39 SUS at 100°F (ASTM D-2161); Sulfur Content = LT 0.3 Wt %) (ASTM D-2622, D-1266, or D-1552), Ash Content = 0.1 to 0.01 Wt % (ASTM D-482); 90% Boiling Point Temperature = LT 500°F (260°C) (ASTM D-86), Dry Point Temperature = 565°F (296°C) (ASTM D-86), Evaporation Rate = AP 0.04 when n-Butyl acetate = 1.0; Net Heat of Combustion Value = GT 18,400 Btu/lb. (ASTM D-1405 or D-2382).				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen.		
Hazardous Decomposition Products	No substances are readily identified from composition; and, no degradation data is available.		

**Kerosine, Straight-run
(C9-C16 Hydrocarbons)**

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Kerosine (Petroleum)

ORAL (LD50): Acute GT 5,000 mg/kg [Rat screen] - Diarrhea, hypoactivity, and somnolence.
 ORAL (LD50) Acute. 2,835 mg/kg [Rabbit] - Respiratory stimulation and muscle weakness.
 ORAL (LD50): Acute 20 mg/kg [Guinea Pig] - Respiratory stimulation and muscle weakness.
 INTRAVENOUS (LD50): Acute 180 mg/kg [Rabbit] - Respiratory stimulation, tremors, and coma.
 INTRATRACHEAL (LD50): Acute 800 mg/kg [Rat] - Convulsions, dyspnea, and cyanosis.
 INTRATRACHEAL (LD50) Acute 200 mg/kg [Rabbit] - Convulsions and cyanosis.
 INTRAPERITONEAL (LD50) Acute: 6,600 mg/kg [Rabbit] - Pulmonary edema, emphysema, and changes to the bronchi.

Hydrodesulfurized Kerosine (similar to Straight-run Kerosine).

ORAL (LD50): Acute: GT 5,000 mg/kg [Rat screen] - Excess salivation, diarrhea, hair loss, hypoactivity, and somnolence.
 GAS (LC50): Acute: GT 5,200 mg/L for 4 hours [Rat screen]] - Dyspnea.
 DERMAL (LD50): Acute: GT 2,000 mg/kg [Rabbit screen].

n-Nonane:

GAS (LC50): Acute: 3,200 ppm for 4 hours [Rat].
 INTRAVENOUS (LD50): Acute: 218 mg/kg [Mouse]

Trimethylbenzenes:

ORAL (LD50) Acute: 8,970 mg/kg [Rat]

Ethylmethylbenzenes (Ethyltoluenes):

GAS (LC50) Acute: 50,000 mg/m³ for 2 hours [Cat].
 GAS (LC50) Acute: 54,000 mg/m³ for 4 hours [Mouse].

Naphthalene:

ORAL (LD50): Acute 490 mg/kg [Rat].
 ORAL (LD50): Acute: 533 mg/kg [Mouse]
 ORAL (LD50): Acute: 1,200 mg/kg [Guinea Pig].
 SUBCUTANEOUS (LD50): Acute: 969 mg/kg [Mouse].
 INTRAVENOUS (LD50): Acute: 100 mg/kg [Mouse].
 INTRAPERITONEAL (LD50): Acute: 150 mg/kg [Mouse].

Biphenyl (Diphenyl or 1,1'-Biphenyl):

GAS (TCLo): Acute 4,400 ug/m³ for 4 hours [Human] - Flaccid paralysis of peripheral nerves without anesthesia and nausea or vomiting
 ORAL (LD50). Acute GT 2,600 mg/kg [Cat screen]
 ORAL (LD50): Acute 2,400 mg/kg [Rat and Rabbit]
 ORAL (LD50). Acute: 1,900 mg/kg [Mouse] - Somnolence, hypermotility, and diarrhea
 DERMAL (LD50): Acute: GT 5,010 mg/kg [Rabbit screen].
 INTRAVENOUS (LD50): Acute 56 mg/kg [Mouse].

Laboratory data associated some mixtures of petroleum hydrocarbons with boiling ranges between 300° and 650°F., commonly referred to as "middle distillates, including kerosine" have caused increased incidence of skin tumors at the site of contact when applied repeatedly (twice per week) over the lifetime of the test animals (12 to 24 months). A few studies have shown that washing the animal's skin with soap and water between applications greatly reduces the carcinogenic effect of these middle distillates. Kerosine has not been identified as a carcinogen by IARC, NTP, or OSHA. These similar materials have also been associated with liver and kidney damage in subchronic (90-day) inhalation studies with male rats.

Untreated (straight-run) kerosine produced negative mutagenic responses in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, and the in-vitro Chinese hamster ovary (CHO) sister chromatid exchange (SCE) assay; however, the in-vivo mouse SCE assay and in-vitro S9-activated CHO SCE assay produced positive responses. The significance of these animal study results to human health is unclear.

Rats inhaling n-nonane at an airborne concentration of 1,500 ppm for 7 days displayed mild tremors and loss of coordination. Inhalation of 1,600 ppm for 6 hours per day for 90 days showed animal weight loss or decreased weight gain and changes in the structure of their salivary glands. And, liver damage and an altered response to drugs were seen in rats given n-nonane for 2 to 7 days

Trimethylbenzenes are primary skin irritants and may cause asthmatic bronchitis and/or anemia. Based upon animal reproductive/developmental studies, trimethylbenzenes may also cause fetal toxicity

Kerosine, Straight-run (C9-C16 Hydrocarbons)

Ethylmethylbenzenes are primary skin irritants and overexposures might cause liver and/or kidney damage or increase blood cholinesterase levels. Inhalation of these and other **C9 aromatic hydrocarbons** by pregnant mice and rats during gestational days 6 through 15 resulted in decreased fetal and newborn weights.

Naphthalene is a potential irritant to eyes, skin, and lungs. Following prolonged and/or repeated exposures, naphthalene has been shown to cause eye damage (cataracts and/or optical neuritis), premature destruction of red blood cells (hemolytic and aplastic anemia), and kidney damage (jaundice), and possibly neurotoxicity. Naphthalene-induced blood disorders in humans are characterized by variability in size, shape, and number of red blood cells, anemia, and decreased hemoglobin. Also, there have been reported anemia deaths amongst children exposed to moth ball (naphthalene) saturated blankets. Peripheral lens opacities occurred in 8 of 21 workers exposed to elevated levels of naphthalene vapors for 5 years. Repeated ingestion of a naphthalene-isopropanol mixture caused tremors, restlessness, hallucinations, and extreme apprehension. Also, naphthalene may cause fetal toxicity or damage. Laboratory studies produced limited evidence of fetal toxicity in pregnant female mice including decreased spleen weights.

Biphenyl (Diphenyl) inhalation overexposures have caused poisoning characterized by liver atrophy and central and/or peripheral nerve damage. Biphenyl vapors have also caused transient nausea, vomiting, flaccid paralysis, and/or bronchitis.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this kerosene, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. If present, volatile aromatic hydrocarbon components (**trimethylbenzenes, ethylmethylbenzenes, and naphthalene**) may be released and possibly contribute to the creation of atmospheric smog.

Using Rainbow Trout (*Oncorhynchus mykiss*), Dungeness Crab (*Cancer magister*), and juvenile American Shad (*Squalus cephalus*), similar kerosenes and some of this material's components showed a 96-hour TLms (Median Toxic Limit) of from 5 ppm to 20 ppm in ambient saltwater. Also, 24-hour and 96-hour TLms produced results from 10 ppm to 200 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), and Guppy (*Lebistes reticulatus*) in fresh water. Based upon actual spill incident investigations, similar naphtha and kerosene mixtures have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

Environmental Fate

This kerosene is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, this hydrocarbon oil layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U S National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this material, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal.

Kerosine, Straight-run (C9-C16 Hydrocarbons)

Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status This material is regulated by the U.S. Department of Transportation (DOT)

Proper Shipping Name Kerosene

This material has a flash point temperature of between 100° and 141°F (38° to 60°C). For bulk shipments, it is classified as a DOT "Flammable Liquid". However, according to 49 CFR 173.120(b)(2) and 173.150(f)(1), this material may be reclassified as a "Combustible Liquid" and exempted from certain transportation-related requirements, such as labeling, when shipped in non-bulk "limited-quantity" containers of less than 119 gallons capacity. According to 49 CFR 173.150(f)(2) and (3), this provision does not apply to "limited-quantities" offered for or transported via vessel or aircraft or products which are defined as DOT "Marine Pollutants". It is recommended that "Flammable Liquid" products which are reclassified be so identified on the bill-of-lading as "Combustible liquid, n.o.s. (Kerosene) or (Nonanes, Trimethylbenzenes)" with identification number "NA1993".

Hazard Class Class 3 Flammable liquid. **Packing Group(s)** PG III
UN/NA ID UN1223 or NA1993

Reportable Quantity The Reportable Quantity (RQ) substance components in this material which require DOT HAZMAT bill-of-lading display are **Naphthalene and Xylenes**.

Placards  **Emergency Response Guide No.** 128
HAZMAT STCC No. 49 122 71
MARPOL III Status Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory

SARA 302/304 The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.

SARA 311/312 The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories:

Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.

SARA 313 This material contains the following components in concentrations which might be at or above de minimis levels and they are listed as a toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313

Naphthalene [CAS No. 91-20-3] concentration: 1 to 3%

Biphenyl (Diphenyl) [CAS No. 92-52-4] concentration: 0.5 to 1.5%.

CERCLA The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this material subject to this statute are.

Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 0.1 to 0.9%

Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 0 to 0.25%

Cumene [CAS No. 98-82-8] (RQ = 5000 lbs. [2270 kg]) concentration: 0 to 0.5%

Naphthalene [CAS No. 91-20-3] (RQ = 100 lbs. [45.36 kg]) concentration: 1 to 3%.

**Kerosine, Straight-run
(C9-C16 Hydrocarbons)**

CWA

This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

**California
Proposition 65**

This material does not contain any chemical substances which is known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.

**New Jersey
Right-to-Know Label**

For New Jersey labeling refer to components listed in Section 2

**Additional Regulatory
Remarks**

Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13) This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following:
Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children!

Under Section 12(b) of TSCA: Because it contains detectable amounts of **C9 Aromatic Hydrocarbons**, this material might be subject to US EPA's one-time only per country export notification requirements.

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare": **Xylenes (mixed) [CAS No. 1330-20-7], Ethylbenzene [CAS No. 100-41-4], Cumene [CAS No. 98-82-8], and Biphenyl (Diphenyl) [CAS No. 92-52-4].**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid
Color Transparent to opaque, slightly pale to yellow
Odor Pungent, characteristic, heating oil-like

WARNING! Vapors and fumes may be hazardous or fatal!
Hot vapor (125° to 200°F) might contain hydrogen sulfide, a flammable, toxic, sensitizing, and potentially deadly gas!
When heated, may cause thermal burns on contact!
Mist or vapor may severely irritate the eyes, mucous membranes, and respiratory tract!
Liquid contact may cause minimal eye irritation and/or mild to severe skin irritation and inflammation!
May contain a low level of 4- to 6-membered condensed-ring (polynuclear) aromatic hydrocarbons (PNAs)! Based upon laboratory animal studies, may cause skin cancer following extended contact!
May be harmful if inhaled or absorbed through the skin!
Overexposures may cause central nervous system (CNS) depression and/or other target organ effects!
May be harmful or fatal if ingested! Aspiration into the lungs can cause pulmonary edema and lipid or chemical pneumonia!
Spills may create a slipping hazard!
If used as fuel, its engine exhaust may cause upper respiratory tract irritation and reversible pulmonary effects!
Long-term exposure to fuel exhaust particulates may cause cancer!

SECTION 1: IDENTIFICATION

Trade Name	Vacuum Tower Condensate (C11-C25 Hydrocarbons)	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	064741497*	Medical Emergency	(918) 495-4700
CAS Number	64741-49-7	CHEMTREC Emergency	(800) 424-9300
Product Family	Petroleum Hydrocarbon Intermediate Distillate		
Synonyms	Vacuum Tower Condensate (Petroleum), Vacuum Tower Overhead, VTO, Vacuum Tower Light Distillate; Lightest Component of Vacuum Distillation; 536 and 537 Vacuum Unit Overheads, C11-C25 Petroleum Hydrocarbons		

Vacuum Tower Condensate (C11-C25 Hydrocarbons)

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Vacuum Tower Condensate (Petroleum)	64741-43-1	100
2) C11 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	1-10
3) C11 Alkylbenzenes	Mixture	1-5
4) Biphenyl (Diphenyl)	92-52-4	0.5-2
5) C12 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	5-15
6) C12-C23 Aromatic Hydrocarbons	Mixture	10-30
7) C13-C25 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	38-82
8) Polynuclear Aromatic Hydrocarbons (4- to 6-member condensed-ring type)	68487-58-6	0.1-1.5

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye Contact. Absorption. Inhalation

Signs and Symptoms of Acute Exposure

Inhalation	May be harmful or fatal if inhaled ¹ . Inhalation of the vapor or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath and may cause transient central nervous system (CNS) depression. The National Institute for Occupational Safety and Health has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health. Concentrations of H ₂ S at or below 250 ppm may cause respiratory tract irritation and pulmonary edema. H ₂ S concentrations between 250 ppm and 500 ppm may result in headache, nausea, disorientation, irregular heartbeat, and/or low blood pressure. At greater than 500 ppm, H ₂ S causes sudden collapse, unconsciousness, and respiratory paralysis leading to convulsions, coma, and/or death. (See Section 11.)
Eye Contact	Upon direct contact, hot material may cause severe thermal burns. Animal test results on similar unheated materials suggest that this product may cause minimal eye irritation upon short-term exposure. Symptoms include stinging, watering, and redness. H ₂ S vapors may cause moderate to severe eye irritation and photophobia (sensitivity to light).
Skin Contact	Skin contact with hot material may result in severe thermal burns. Animal test results on similar materials suggest that this product can cause mild to moderate skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate to severe dermatitis and/or more serious skin disorders. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and/or severe tissue damage.
Ingestion	Contact with hot material may cause thermal burns. If swallowed, this material may irritate the mucous membranes of the mouth, throat, esophagus, and stomach. It can be readily absorbed by the stomach and intestinal tract. Ingestion can produce a burning sensation of the mouth and esophagus and central nervous system depression. Symptoms of CNS depression may include nausea, vomiting, dizziness, staggering gait, drowsiness, shallow rapid pulse, diarrhea, restlessness, sedation, inadequate respiratory function, and heart irregularities. Higher doses may cause loss of consciousness and delirium prior to the onset of convulsions, coma, and death (see "Inhalation" above). A lethal dose may be as low as one-half ounce for a child and one ounce for an adult human.

Due to its low viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration of a small amount of liquid can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.

Chronic Health Effects Summary Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction.

This material is a **middle distillate** similar to those shown to produce skin tumors on laboratory animals following repeated applications. All tumors appeared at the site of application during the latter portion of the typical 2-year lifespan of the animals. Toxic effects are unlikely to occur if good personal hygiene is practiced.

Biphenyl (Diphenyl) may cause liver and/or nerve damage.

Vacuum Tower Condensate (C11-C25 Hydrocarbons)

Subchronic exposure to low levels of **hydrogen sulfide** can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H₂S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures (See Section 11.)

Conditions Aggravated by Exposure Personnel with pre-existing central nervous system (CNS) disease, neurological conditions, skin disorders, impaired liver or kidney function, or chronic respiratory diseases should avoid exposure

Target Organs This substance is toxic to lungs, nervous systems, brain, mucous membranes, skin, eyes, and possibly, the liver and kidneys

Carcinogenic Potential This **vacuum tower condensate** is an **intermediate distillate** and contains certain **polynuclear aromatic hydrocarbons** at above 0.1%. It is considered carcinogenic by IARC and OSHA. (See Section 11.)

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If hot vapor gets into the eyes, irrigate with large amounts of room-temperature water. Seek medical attention immediately. If ambient temperature material is splashed into eyes, check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	If burned by hot material, cool skin by quenching with large amounts of cool water. Do not remove material from the skin. Seek medical attention immediately. For contact at ambient temperatures, remove contaminated shoes and clothing. Wipe off excess material. Wash exposed skin with soap and water. If tissue appears damaged or if irritation or pain persists, apply a clean dressing and seek medical attention. Do not use ointments. Thoroughly clean contaminated clothing before reuse. Discard contaminated leather goods.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	Inhalation overexposure can produce toxic effects. Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients. If only cough or difficulty in breathing develop, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis using pulmonary function tests and chest x-rays. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

Vacuum Tower Condensate (C11-C25 Hydrocarbons)

If ingested, this material presents a significant aspiration/lipoid or chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	NFPA Class-III B Combustible Material Slightly combustible ¹		
Flash Point Method	CLOSED CUP 95° to 121°C (203° to 250°F) (Pensky-Martens Closed Cup [ASTM D-93])		
Lower Flammable Limit	AP 0.6% to 4%	Upper Flammable Limit	AP 5.8% to 44%
Autoignition Temperature	AP 262°C (505°F)		
Hazardous Combustion Products	Burning or excessive heating may produce carbon monoxide, carbon dioxide, and possibly smoke, fumes, unburned hydrocarbons, and oxides of sulfur		
Special Properties	<p>This material releases vapors at or approaching the flash point temperature. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Mists or sprays may be flammable at temperatures below the flash point. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.</p> <p>A static electrical charge can accumulate as a result of transfer flow or agitation. Discharge (static spark) can ignite vapors, especially in cold, dry weather conditions. Special slow load and monitoring procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point products. To reduce this hazard, receiving containers should always be grounded and the loading nozzle must be kept in contact with the container during the entire filling process. Do not fill any portable container in or on a vehicle without proper bonding.</p>		
Extinguishing Media	<p>SMALL FIRE: Use dry chemicals, carbon dioxide (CO₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.</p>		
Fire Fighting Protective Clothing	<p>Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat, cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.</p>		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material should be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

Vacuum Tower Condensate (C11-C25 Hydrocarbons)

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak may cause a potential fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources. Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This combustible liquid should be stored in a separate safety cabinet or room. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

Hydrogen sulfide vapors might be emitted during production. H₂S is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.) Where H₂S is routinely stored, install monitoring equipment or system with alarms.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Vacuum Tower Condensate (C11-C25 Hydrocarbons)

Hand Protection

Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR) Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners

Body Protection

Avoid contact It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded

Respiratory Protection

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided Protection factors vary depending upon the type of respirator used Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2)

General Comments

WARNING! Do not use this material as a fuel without adequate ventilation Inadequate ventilation can result in hazardous levels of combustion products and inadequate oxygen levels for breathing. Odor is not adequate to warn of hazardous conditions

The standards for "coal tar pitch volatiles, as benzene solubles" are based upon coal coking, not upon petroleum-derived oils However, in 29 CFR 1910.1200.1002, OSHA has defined "coal tar pitch volatiles" to include the fused polycyclic hydrocarbons which volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood and other organic matter Accordingly, the coal tar pitch volatile standard may apply to the aerosol form of this material The "hydrogen sulfide" standards apply only to generated vapors

Occupational Exposure Guidelines

Substance

Applicable Workplace Exposure Levels

1) Diesel fuel/Kerosene ("A3" Animal Carcinogen)	TWA: 100 (mg/M ³) from ACGIH (TLV) [Proposed for 2001] - SKIN
2) Biphenyl (Diphenyl)	TWA 0.2 (ppm) from ACGIH (TLV) [2000] TWA 0.2 (ppm) from OSHA (PEL) [1989]
3) Oil mist, mineral	TWA: 5 STEL 10 (mg/M ³) from ACGIH (TLV) [2000] TWA: 5 (mg/M ³) from OSHA (PEL) [1976]
4) Hydrogen sulfide	TWA 10 STEL 15 (ppm) from ACGIH (TLV) [2000] TWA 5 (ppm) from ACGIH (TLV) [Proposed for 2001] TWA 10 STEL 15 CEIL 20 (ppm) from OSHA (PEL) [1989]
5) Coal tar pitch volatiles, as benzene solubles ("A1" Confirmed Human Carcinogen)	TWA 0.2 (mg/M ³) from ACGIH (TLV) [2000] TWA: 0.2 (mg/M ³) from OSHA (PEL) [1989]
6) Oil mist, mineral, sum total of 15 PAHs listed as carcinogens by US NTP	TWA 0.005 (mg/M ³) from ACGIH (TLV) [Proposed for 2001]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid	Color	Transparent to opaque, slightly pale to yellow	Odor	Pungent, characteristic, heating oil-like
Specific Gravity	0.88 to 0.89 at 60°F (Water = 1)	pH	Not applicable	Vapor Density	5.5 to 10.0 (Air = 1 at 70°F)
Boiling Point/Range	205° to 400°C (401° to 752°F) (ASTM D-86)	Melting/Freezing Point			1° to 7°C (34° to 45°F) (ASTM D-97)
Vapor Pressure	0.1 to 0.4 Reid-psia at 38°C (100°F)	Viscosity (cSt @ 40°C)			7.35 to 11.75 (ASTM D-445)
Solubility in Water	Negligible to slightly soluble in cold water (0.001 to 0.02%).	Volatile Characteristics			Slight; no Volatile Organic Compounds (VOCs) present at 400°F (204°C).
Additional Properties	Alkane, Isoparaffin, Cycloalkane, and Naphthene Hydrocarbons Content = 63 to 88.5 Wt % (ASTM D-1319); C11-C25 Aromatic Hydrocarbon Content = 11.5 to 37 Wt % (ASTM D-1319), Average Density at 60°F = 7.369 lbs./gal (ASTM D-2161), Cetane Number = GT 32 (ASTM D-613 or D-976), Saybolt Viscosity = 40 to 55 SUS at 100°F (ASTM D-2161); Sulfur Content = LT 0.5 Wt % (by ASTM D-2622); 90% Boiling Point Temperature = 734° to 745°F (390° to 396°C) (ASTM D-86), Evaporation Rate = LT 0.01 when n-Butyl acetate = 1.0				

Vacuum Tower Condensate (C11-C25 Hydrocarbons)

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen		
Hazardous Decomposition Products	Composition suggests that sulfur compounds might be generated, but, no degradation data is available		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Straight-run Middle Distillate and Light Paraffinic Distillate (Petroleum) [similar materials]:

GAS (LC50) Acute: 1.72 to 1.82 mg/L for 4 hours [Rat]
 ORAL (LD50): Acute: GT 5,000 mg/kg [Rat screen] - Diarrhea, hypoactivity, and somnolence
 DERMAL (LD50): Acute: GT 2,000 mg/kg [Rabbit screen]
 BUEHLER DERMAL: Acute: Non-sensitizing [Guinea Pig]
 INTRAVENOUS (LD50): Acute: 180 mg/kg [Rabbit] - Respiratory stimulation, tremors, and coma
 28-Day DERMAL Subchronic: Minimal to moderate irritation at 200 to 2,000 mg/kg with no other treatment-related clinical effects observed

Biphenyl (Diphenyl or 1,1'-Biphenyl):

GAS (TCLo) Acute: 4,400 ug/m³ for 4 hours [Human] - Flaccid paralysis of peripheral nerves without anesthesia and nausea or vomiting
 ORAL (LD50): Acute: GT 2,600 mg/kg [Cat screen]
 ORAL (LD50): Acute: 2,400 mg/kg [Rat and Rabbit]
 ORAL (LD50): Acute: 1,900 mg/kg [Mouse] - Somnolence, hypermotility, and diarrhea
 DERMAL (LD50) Acute: GT 5,010 mg/kg [Rabbit screen]
 INTRAVENOUS (LD50). Acute: 56 mg/kg [Mouse]

Hydrogen sulfide:

GAS (TCLo): Acute: 10 ppm for 15 minutes [Human] - Eye irritation
 GAS (TCLo): Acute: 50 to 100 ppm for 15 minutes [Human] - Respiratory irritation
 GAS (LC₁₀₀): Acute: 600 to 750 ppm for 30 minutes [Human] - Respiratory paralysis and death
 GAS (LCLo) Acute: 5,700 ug/kg for 8 hours [Human] - Chronic pulmonary edema, coma, and death.

Laboratory data associated some mixtures of petroleum hydrocarbons with boiling ranges between 300° and 700°F., commonly referred to as "middle distillates, including vacuum tower condensate" have caused increased incidence of skin tumors at the site of contact when applied repeatedly (twice per week) over the lifetime of the test animals (12 to 24 months). A few studies have shown that washing the animal's skin with soap and water between applications greatly reduces the carcinogenic effect of these middle distillates. Untreated and vacuum distillates including straight-run gas oil have been identified as skin carcinogens by IARC. These similar materials have also been associated with liver and kidney damage in subchronic (90-day) inhalation studies with male rats.

Untreated (straight-run and vacuum) middle distillates and light gas oils produced negative mutagenic responses in the Salmonella/microsome (Ames) assay, the in-vitro Chinese hamster ovary (CHO) sister chromatid exchange (SCE) assay, the in-vivo mouse SCE assay, and the in-vivo rat bone marrow cell chromosome aberrations assay, however, the in-vitro mouse lymphoma assay with and without S9 activation produced both mixed positive and negative responses. The significance of these animal study results to human health is unclear.

Studies with mice and rats have shown that some petroleum middle distillate fuels similar to this material have caused liver tumors and kidney damage and/or tumors. However, the kidney effects were sex hormone dependent and not seen in similar studies involving Guinea pigs, dogs, or monkeys. Also, the significance of the liver tumors in rodents is highly speculative relative to humans.

Studies with mice and rats have also shown that chronic exposures (8 hours/day, 7 days/week, for 24 months) to unfiltered diesel fuel exhaust produced lung tumors and lymphomas. On the basis of these studies, NIOSH recommended that complete diesel exhaust be regarded as a "potential carcinogen".

Vacuum Tower Condensate (C11-C25 Hydrocarbons)

Numerous epidemiology studies have been carried out to test the hypothesis that lung and/or bladder cancers are associated with chronic exposure to **diesel engine exhaust**. The most comprehensive case-control and retrospective cohort studies on U S railroad workers showed an increased risk for lung cancer and this risk significantly increased with extended duration exposures. There are some indications that an elevated frequency of bladder cancer amongst bus and truck drivers may be due to diesel engine exhaust exposure

Biphenyl (Diphenyl) inhalation overexposures have caused poisoning characterized by liver atrophy and central and/or peripheral nerve damage Biphenyl vapors have also caused transient nausea, vomiting, flaccid paralysis, and/or bronchitis

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air At low concentrations (LT 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (GT 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material If spilled, this intermediate distillate, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. If present, a volatile **aromatic hydrocarbon component (biphenyl)** may be released and possibly contribute to the creation of atmospheric smog.

Using Rainbow Trout (*Oncorhynchus mykiss*), Dungeness Crab (*Cancer magister*), and juvenile American Shad (*Squalus cephalus*), similar middle distillates and one of this material's components showed a 96-hour TLms (Median Toxic Limit) of from 5 ppm to 20 ppm in ambient saltwater Also, 96-hour LC₅₀ testing produced results from 20 ppm to 320 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Banded Killifish (*Fundulus diaphanus*), American Eel (*Anguilla rostrata*), White Perch (*Perca fluviatilis*), and Striped Mullet (*Mugil cephalis*). Based upon actual spill incident investigations, similar middle distillates and oils containing **polynuclear aromatic hydrocarbon compounds** similar to this material were shown to bioaccumulate in tissues of various fish and other aquatic organisms from less than 1 to 10 ppm levels

Environmental Fate

This middle distillate is potentially toxic to freshwater and saltwater ecosystems It will normally float on water with its lighter components evaporating rapidly In stagnant or slow-flowing waterways, this hydrocarbon oil layer can cover a large surface area As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U S National Library of Medicine (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

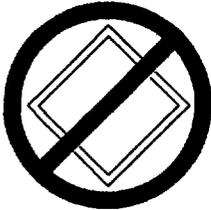

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment In sewage-seeded wastewater, at or below concentrations of 0.2 vol % of this material, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol %, it doubles the required digestion period Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Vacuum Tower Condensate (C11-C25 Hydrocarbons)

Conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is not regulated by the U.S. Department of Transportation (DOT)		
Proper Shipping Name	Petroleum oil, N.O.I.B.N.		
Hazard Class	Not a DOT controlled material	Packing Group(s)	Not applicable
		UN/NA ID	Not applicable
Reportable Quantity	Not applicable.		
Placards		Emergency Response Guide No.	Not applicable
		HAZMAT STCC No.	Not applicable
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Acute (Immediate) Health Hazard and Chronic (Delayed) Health Hazard.
SARA 313	This material contains the following component in concentrations which might be at or above de minimis levels and are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313: Biphenyl (Diphenyl) [CAS No. 92-52-4] concentration: 0.5 to 2%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. A chemical substance present in this material subject to this statute is: Chrysene (Benzo[a]phenanthrene) [CAS No. 218-01-9] (RQ = 100 lbs. [45.36 kg]) conc.: 0.001 to 0.003%
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material, especially if it is used as a fuel, contains the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it might be subject to requirements of California Health & Safety Code Section 25249.5: Chrysene (Benzo[a]phenanthrene) [CAS No. 218-01-9] Diesel Engine Exhaust (following combustion)
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2.

Vacuum Tower Condensate (C11-C25 Hydrocarbons)

Additional Regulatory Remarks

Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500 14(b)(3) and 1500 83(a)(13): This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following **Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children!**

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60 489), the EPA classifies the following component of this material as a "Volatile Organic Compound (VOC)" which contributes significantly to air pollution which endangers public health and welfare" **Biphenyl (Diphenyl) [CAS No. 92-52-4]**.

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

IMPORTANT. Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Liquid.		
Color	Transparent to slightly opaque, water-white to pale yellow.	Odor	Characteristic, kerosene-like.

WARNING! Combustible liquid; vapor may cause flash fire! Mist or vapor may irritate the eyes, mucous membranes, and respiratory tract!

Liquid contact may cause minimal eye irritation and/or mild to severe skin irritation and inflammation! Based upon laboratory animal studies, may cause skin cancer following extended contact!

May be harmful if inhaled or absorbed through the skin!

Overexposures may cause central nervous system (CNS) depression and/or other target organ effects!

May be harmful or fatal if ingested!

Aspiration into the lungs can cause pulmonary edema and lipid or chemical pneumonia!

Based upon animal testing, may adversely affect reproduction!

Spills may create a slipping hazard!

If used as fuel, its engine exhaust may cause upper respiratory tract irritation and reversible pulmonary effects!

Long-term exposure to fuel exhaust particulates may cause cancer!

Protective Equipment

Minimum Requirements
See Section 8 for Details

SECTION 1: IDENTIFICATION

Trade Name	Straight-run Middle Distillate (C11-C20 Hydrocarbons)	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	064741442*	Medical Emergency	(918) 495-4700
CAS Number	64741-44-2	CHEMTREC Emergency	(800) 424-9300
Product Family	Petroleum Hydrocarbon Middle Distillate		
Synonyms	Straight-run Diesel; Straight-run Medium Distillate; Water White Distillate from a Petroleum Crude Still; Crude Tower Diesel, Crude Tower Middle Distillate, Untreated, Unrefined, or Raw Diesel Fuel, Untreated High-Sulfur No. 2 Fuel Oil; Unfinished Heating Oil, Furnace Oil, or Burner Fuel; C10-C20 Petroleum Hydrocarbons		

Straight-run Middle Distillate (C11-C20 Hydrocarbons)

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Straight-run Middle Distillate (Petroleum)	64741-44-2	100
2) Naphthalene	91-20-3	0.5-1.5
3) C10-C11 Alkylbenzenes	70693-06-0	1-3
4) C11 Alkanes, Isoparaffins, and Cycloalkanes	Mixture	15-25
5) C12 Alkanes, Isoparaffins, and Cycloalkanes	Mixture	20-40
6) Biphenyl (Diphenyl)	92-52-4	1-3
7) C10-C17 Aromatics	68333-88-0	10-20
8) C13-C20 Alkanes, Isoparaffins, and Cycloalkanes	Mixture	20-35

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact Eye Contact Absorption Inhalation

Signs and Symptoms of Acute Exposure

Inhalation	Breathing mist or vapors may irritate the mucous membranes of the nose, throat, bronchi, and lungs, and may cause transient central nervous system (CNS) depression. CNS symptoms include headache, dizziness, nausea, intoxication, blurred vision, slurred speech, flushed face, confusion, weakness, fatigue, loss of consciousness, convulsions, coma, and death, depending on the concentration and/or duration of exposure.
Eye Contact	Animal test results on similar materials suggest that this product can cause minimal eye irritation upon short-term exposure. Symptoms include stinging, watering, and redness.
Skin Contact	Animal test results on similar materials suggest that this product can cause minimal to mild skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause mild to severe dermatitis and/or more serious skin disorders. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and/or severe tissue damage.
Ingestion	If swallowed, this material may irritate the mucous membranes of the mouth, throat, esophagus, and stomach. It can be readily absorbed by the stomach and intestinal tract. Ingestion can produce a burning sensation of the mouth and esophagus and central nervous system depression. Symptoms of CNS depression may include nausea, vomiting, dizziness, staggering gait, drowsiness, shallow rapid pulse, diarrhea, restlessness, sedation, inadequate respiratory function, and heart irregularities. Higher doses may cause loss of consciousness and delirium prior to the onset of convulsions, coma, and death (see "Inhalation" above). A lethal dose may be as low as one-half ounce for a child and one ounce for an adult human. Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration of a small amount of liquid can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.
Chronic Health Effects Summary	Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. This straight-run middle distillate is a middle distillate similar to those shown to produce skin tumors on laboratory animals following repeated applications. All tumors appeared at the site of application during the latter portion of the typical 2-year lifespan of the animals. Toxic effects are unlikely to occur if good personal hygiene is practiced. Naphthalene , a minor component of this product, is considered to be a toxic substance as defined by both human exposure and laboratory testing results. Biphenyl (Diphenyl) may cause liver and/or nerve damage. (See Section 11.)
Conditions Aggravated by Exposure	Personnel with pre-existing central nervous system (CNS) disease, neurological conditions, skin disorders, impaired liver or kidney function, or chronic respiratory diseases, and women attempting to conceive should avoid exposure.
Target Organs	This substance is toxic to lungs, nervous systems, brain, mucous membranes, skin, eyes, and possibly, the blood, liver, kidneys, and reproductive system.

**Straight-run Middle Distillate
(C11-C20 Hydrocarbons)**

Carcinogenic Potential

This material contains **middle distillates** at above 0.1% and it is considered carcinogenic by IARC and OSHA. (See Section 11.)

						Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	<p>Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.</p> <p>If ingested, this material presents a significant aspiration/lipoid or chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-II Combustible Liquid Highly combustible ¹		
Flash Point/Method	CLOSED CUP 61° to 79°C (142° to 174°F). (Tagliabue [ASTM D-56])		
Lower Flammable Limit	AP 0.6 %	Upper Flammable Limit	AP 5.0 %
Auto-Ignition Temp.	AP 257°C (495°F)		
Hazardous Combustion Products	Burning or excessive heating may produce carbon monoxide, carbon dioxide, and possibly smoke, fumes, unburned hydrocarbons, and oxides of sulfur		

Straight-run Middle Distillate (C11-C20 Hydrocarbons)

Special Properties	<p>Combustible Liquid! This material releases vapors at or approaching the flash point temperature. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Mists or sprays may be flammable at temperatures below the flash point. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.</p> <p>A static electrical charge can accumulate as a result of transfer flow or agitation. Discharge (static spark) can ignite vapors, especially in cold, dry weather conditions. Special slow load and monitoring procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point products. To reduce this hazard, receiving containers should always be grounded and the loading nozzle must be kept in contact with the container during the entire filling process. Do not fill any portable container in or on a vehicle without proper bonding.</p>
Extinguishing Media	<p>SMALL FIRE: Use dry chemicals, carbon dioxide (CO₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.</p>
Fire Fighting Protective Clothing	<p>Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.</p>

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Combustible Liquid! Release causes a potential fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause a potential fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Straight-run Middle Distillate (C11-C20 Hydrocarbons)

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This combustible liquid should be stored in a separate safety cabinet or room. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).

General Comments

Warning! Use of this hydrocarbon fuel in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance

- 1) Diesel fuel/Kerosene ("A3" Animal Carcinogen)
- 2) Naphthalene ("A4" = Not Classifiable")
- 3) Biphenyl (Diphenyl)

Applicable Workplace Exposure Levels

TWA: 100 (mg/m³) from ACGIH (TLV) [Proposed for 2000] - SKIN
 TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) [1999] - SKIN
 TWA: 10 STEL: 15 (ppm) from OSHA (PEL) [1989]
 TWA: 10 (ppm) from OSHA (PEL) [1976]
 TWA: 0.2 (ppm) from ACGIH (TLV) [1999]
 TWA: 0.2 (ppm) from OSHA (PEL) [1989]

Straight-run Middle Distillate (C11-C20 Hydrocarbons)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color	Transparent to slightly opaque, water-white to pale yellow	Odor	Characteristic, kerosene-like.
Specific Gravity	0.83 to 0.87 at 60°F (Water = 1)	pH	Not applicable.	Vapor Density	AP 5.2 (Air = 1 at 70°F)
Boiling Point/Range	215° to 345°C (420° to 653°F) (ASTM D-86)			Melting/Freezing Point	-25° to -15°C (-13° to 4°F) (ASTM D-97)
Vapor Pressure	LT 0.1 psia at 38°C (100°F).			Viscosity (cSt @ 40°C)	2.5 to 4 (ASTM D-445)
Solubility in Water	Negligible to slightly soluble in cold water (AP 0.005 to 0.04%).			Volatile Characteristics	Slight; no Volatile Organic Compounds (VOCs) present at 400°F (204°C)
Additional Properties	Alkane, Isoparaffin, and Cycloalkane Hydrocarbons Content = 72 to 88 Wt.% (ASTM D-1319); C10-C18 Aromatic Hydrocarbon Content = 12 to 28 Wt.% (ASTM D-1319); Average Density at 60°F = 7.078 lbs./gal. (ASTM D-2161); Cetane Number = GT 40 (ASTM D-613 or D-976); Saybolt Viscosity = 34.3 to 39 SUS at 100°F (ASTM D-2161); Sulfur Content = LT 0.3 Wt.% (by ASTM D-2622) or LT 0.5 Wt.% (by ASTM D-129), 90% Boiling Point Temperature = 600° to 640°F (315° to 338°C) (ASTM D-86), Evaporation Rate = LT 0.04 when n-Butyl acetate = 1.0.				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen.		
Hazardous Decomposition Products	No substances are readily identified from composition; and, no degradation data is available		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	<p>Straight-run Middle Distillate (Petroleum): GAS (LC50): Acute: 1.72 mg/L for 4 hours [Male Rat] GAS (LC50): Acute: 1.82 mg/L for 4 hours [Female Rat]. ORAL (LD50): Acute: GT 5,000 mg/kg [Rat screen] - Diarrhea, hypoactivity, and somnolence. DERMAL (LD50) Acute: GT 2,000 mg/kg [Rabbit screen] BUEHLER DERMAL: Acute: Non-sensitizing [Guinea Pig]. INTRAVENOUS (LD50): Acute: 180 mg/kg [Rabbit] - Respiratory stimulation, tremors, and coma. 28-Day DERMAL: Subchronic. Minimal to moderate irritation at 200 to 2,000 mg/kg with no other treatment-related clinical effects observed</p> <p>Naphthalene: ORAL (LD50): Acute: 490 mg/kg [Rat] ORAL (LD50): Acute: 533 mg/kg [Mouse]. ORAL (LD50) Acute: 1,200 mg/kg [Guinea Pig]. SUBCUTANEOUS (LD50). Acute. 969 mg/kg [Mouse] INTRAVENOUS (LD50): Acute 100 mg/kg [Mouse]. INTRAPERITONEAL (LD50): Acute. 150 mg/kg [Mouse]</p> <p>Biphenyl (Diphenyl or 1,1'-Biphenyl). GAS (TCLo): Acute: 4,400 ug/m³ for 4 hours [Human] - Flaccid paralysis of peripheral nerves without anesthesia and nausea or vomiting. ORAL (LD50) Acute: GT 2,600 mg/kg [Cat screen]. ORAL (LD50): Acute: 2,400 mg/kg [Rat and Rabbit]. ORAL (LD50): Acute: 1,900 mg/kg [Mouse] - Somnolence, hypermotility, and diarrhea. DERMAL (LD50): Acute: GT 5,010 mg/kg [Rabbit screen]. INTRAVENOUS (LD50): Acute 56 mg/kg [Mouse].</p>
----------------------	--

Straight-run Middle Distillate (C11-C20 Hydrocarbons)

Laboratory data associated some mixtures of petroleum hydrocarbons with boiling ranges between 300° and 700°F., commonly referred to as "middle distillates, including straight-run middle distillate" have caused increased incidence of skin tumors at the site of contact when applied repeatedly (twice per week) over the lifetime of the test animals (12 to 24 months). A few studies have shown that washing the animal's skin with soap and water between applications greatly reduces the carcinogenic effect of these middle distillates. Untreated and vacuum distillates including straight-run middle distillate have been identified as skin carcinogens by IARC. These similar materials have also been associated with liver and kidney damage in subchronic (90-day) inhalation studies with male rats.

Untreated (straight-run and vacuum) middle distillates produced negative mutagenic responses in the Salmonella/microsome (Ames) assay, the in-vitro Chinese hamster ovary (CHO) sister chromatid exchange (SCE) assay, the in-vivo mouse SCE assay, and the in-vivo rat bone marrow cell chromosome aberrations assay; however, the in-vitro mouse lymphoma assay with and without S9 activation produced both mixed positive and negative responses. The significance of these animal study results to human health is unclear.

Studies with mice and rats have shown that some petroleum middle distillate fuels similar to this material have caused liver tumors and kidney damage and/or tumors. However, the kidney effects were sex hormone dependent and not seen in similar studies involving Guinea pigs, dogs, or monkeys. Also, the significance of the liver tumors in rodents is highly speculative relative to humans.

Studies with mice and rats have also shown that chronic exposures (8 hours/day, 7 days/week, for 24 months) to unfiltered diesel fuel exhaust produced lung tumors and lymphomas. On the basis of these studies, NIOSH recommended that complete diesel exhaust be regarded as a "potential carcinogen".

Numerous epidemiology studies have been carried out to test the hypothesis that lung and/or bladder cancers are associated with chronic exposure to diesel engine exhaust. The most comprehensive case-control and retrospective cohort studies on U.S. railroad workers showed an increased risk for lung cancer and this risk significantly increased with extended duration exposures. There are some indications that an elevated frequency of bladder cancer amongst bus and truck drivers may be due to diesel engine exhaust exposure.

Naphthalene is a potential irritant to eyes, skin, and lungs. Following prolonged and/or repeated exposures, naphthalene has been shown to cause eye damage (cataracts and/or optical neuritis), premature destruction of red blood cells (hemolytic and aplastic anemia), and kidney damage (jaundice), and possibly neurotoxicity. Naphthalene-induced blood disorders in humans are characterized by variability in size, shape, and number of red blood cells, anemia, and decreased hemoglobin. Also, there have been reported anemia deaths amongst children exposed to moth ball (naphthalene) saturated blankets. Peripheral lens opacities occurred in 8 of 21 workers exposed to elevated levels of naphthalene vapors for 5 years. Repeated ingestion of a naphthalene-isopropanol mixture caused tremors, restlessness, hallucinations, and extreme apprehension. Also, naphthalene may cause fetal toxicity or damage. Laboratory studies produced limited evidence of fetal toxicity in pregnant female mice including decreased spleen weights.

Biphenyl (Diphenyl) inhalation overexposures have caused poisoning characterized by liver atrophy and central and/or peripheral nerve damage. Biphenyl vapors have also caused transient nausea, vomiting, flaccid paralysis, and/or bronchitis.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this kerosene, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. If present, volatile aromatic hydrocarbon components (naphthalene and biphenyl) may be released and possibly contribute to the creation of atmospheric smog.

Using Rainbow Trout (*Oncorhynchus mykiss*), Dungeness Crab (*Cancer magister*), and juvenile American Shad (*Squalius cephalus*), similar middle distillates and some of this material's components showed a 96-hour TL_{Ms} (Median Toxic Limit) of from 10 ppm to 20 ppm in ambient saltwater. Also, 96-hour LC₅₀ testing produced results from 20 ppm to 320 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Banded Killifish (*Fundulus diaphanus*), American Eel (*Anguilla rostrata*), White Perch (*Perca fluviatilis*), and Striped Mullet (*Mugil cephalis*). Based upon actual spill incident investigations, similar middle distillates have been shown to bioaccumulate in tissues of various fish from less than 1 to 10 ppm levels.

Straight-run Middle Distillate (C11-C20 Hydrocarbons)

Environmental Fate

This middle distillate is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, this hydrocarbon oil layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this material, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status This material is regulated by the U.S. Department of Transportation (DOT) only when transported in bulk containers, via vessel, or via aircraft.

Proper Shipping Name Not regulated in non-bulk container shipments, Combustible liquid, n.o.s. (Petroleum Distillates) or (Diesel Fuel) in bulk containers.

This product has a flash point temperature of between 141° and 200°F (60.5° to 93°C). For bulk shipments, it is classified as a DOT "Combustible liquid". However, according to 49 CFR 173.150(f)(2), certain transportation-related requirements, such as labeling, may not apply to this product when shipped in non-bulk packaging of less than 119 gallons capacity. However, pursuant to 49 CFR 173.150(b), "limited-quantities" offered for or transported via aircraft may be subject to DOT regulation.

Hazard Class	Not applicable or "Combustible liquid"	Packing Group(s)	Not applicable or PG III
		UN/NA ID	Not applicable or NA1993

Reportable Quantity The Reportable Quantity (RQ) substance component in this material which might require DOT HAZMAT bill-of-lading display is **Naphthalene**.

Placards

A Combustible placard may not be required for this material when transported in a non-bulk container with a maximum capacity LT 450 L (LT 119 Gal)

Emergency Response Guide No. Not applicable or 128

HAZMAT STCC No. 49 141 12

MARPOL III Status Not a DOT "Marine Pollutant" per 49 CFR 171.8

**Straight-run Middle Distillate
(C11-C20 Hydrocarbons)**

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.
SARA 313	This material contains the following components in concentrations which might be at or above de minimis levels and are listed as a toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313: Naphthalene [CAS No. 91-20-3] concentration: 0.5 to 1.5% Biphenyl (Diphenyl) [CAS No. 92-52-4] concentration: 1 to 3%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. A chemical substance present in this material subject to this statute is. Naphthalene [CAS No. 91-20-3] (RQ = 100 lbs. [45.36 kg]) concentration: 0.5 to 1.5%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	If this material is used as a fuel, it might be considered to contain the following chemical substance which is known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it might be subject to requirements of California Health & Safety Code Section 25249.5 Diesel Engine Exhaust (following combustion).
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2
Additional Regulatory Remarks	Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13): This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children! Under Section 12(b) of TSCA: Because it contains detectable amounts of 1,1'-Biphenyl [CAS No. 92-52-4], this material might be subject to US EPA's one-time only per country export notification requirements. In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following component of this material as a "Volatile Organic Compound (VOC)" which contributes significantly to air pollution which endangers public health and welfare": Biphenyl (Diphenyl) [CAS No. 92-52-4].

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Atmospheric Gas Oil (AGO) (C11-C25 Hydrocarbons) Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0258
Revision Date 8/23/2005

Hazard Rankings

	HMIS	NFPA
Health Hazard	* 2	0
Fire Hazard	1	1
Reactivity	0	0

* = Chronic Health Hazard

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid.
Color Slightly opaque, pale yellow to amber. **Odor** Characteristic, heating oil-like.

WARNING!

Mist or vapor may irritate the eyes, mucous membranes, and respiratory tract!
Liquid contact may cause minimal eye irritation and/or mild to severe skin irritation and inflammation! Based upon laboratory animal studies, may cause skin cancer following extended contact!
May be harmful if inhaled or absorbed through the skin!
Overexposures may cause central nervous system (CNS) depression and/or other target organ effects!
May be harmful or fatal if ingested!
Aspiration into the lungs can cause pulmonary edema and lipid or chemical pneumonia!
Will burn, but not ignite readily! Keep away from all ignition sources.
Spills may create a slipping hazard!
Organic vapors and potentially hydrogen sulfide gas can accumulate in the vapor space of tanks, vessels and containers.

Protective Equipment

Minimum Recommended
See Section 8 for Details

Minimum PPE reflects the requirements for this material at this facility:
LYONDELL-CITGO Refining
LP Manufacturing Complex

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	Atmospheric Gas Oil (AGO) (C11-C25 Hydrocarbons)	Technical Contact	(800) 525-4692
Product Number	064741431*	Medical Emergency	(800) 313-7645
CAS Number	64741-43-1	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Not applicable. Gas Oil, Atmospheric		
Synonyms	AGO; Intermediate Gas Oil; Intermediate Straight-run Distillate; Atmospheric Tower Gas Oil from a Petroleum Crude Still; Straight-run Gas Oil; SRGO; Untreated, Unrefined, or Raw Gas Oil; Untreated Diesel Fuel Blending Component; Unfinished Heating Oil, Furnace Oil, or Burner Fuel Blending Component; C11-C25 Petroleum Hydrocarbons.		

Atmospheric Gas Oil (AGO) (C11-C25 Hydrocarbons)

SECTION 2. COMPOSITION (TYPICAL)

Component Name(s)	CAS Registry No.	Concentration (%)
C10-C20 Petroleum Hydrocarbons	64741-43-1	100
C13-C30 Alkanes, Isoparaffins, and Naphthenes	Mixture	40 - 60
C12 Alkanes, Isoparaffins and Cycloalkanes		10 - 30
C12-C23 Aromatics	Mixture	10 - 25
C11 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes		5 - 15
C11 Alkylbenzenes	Mixture	1 - 3
Biphenyl (Diphenyl)	92-52-4	1 - 3
Polynuclear Aromatic Hydrocarbons (4- to 6- member condensed rings)	68487-58-6	0.1 - 1

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye Contact. Absorption. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing mist or vapors may irritate the mucous membranes of the nose, throat, bronchi, and lungs, and may cause transient central nervous system (CNS) depression. CNS symptoms include headache, dizziness, nausea, intoxication, blurred vision, slurred speech, flushed face, confusion, weakness, fatigue, loss of consciousness, convulsions, coma, and death, depending on the concentration and/or duration of exposure.
Eye Contact	Animal test results on similar materials suggest that this product can cause minimal eye irritation upon short-term exposure. Symptoms include stinging, watering, and redness.
Skin Contact	Animal test results on similar materials suggest that this product can cause minimal to mild skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause mild to severe dermatitis and/or more serious skin disorders. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and/or severe tissue damage.
Ingestion	Breathing mist or heated vapors may irritate the mucous membranes of the nose, the throat, bronchi, and lungs. Aspiration into the lungs may cause chemical pneumonia. Swallowing large amounts of this material may cause stomach or intestinal upset with pain, nausea, vomiting, and/or diarrhea. Swallowing this material may cause effects similar to those described in the inhalation section (see "inhalation" above).

Chronic Health Effects Summary Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction.

This straight-run gas oil is a middle distillate similar to those shown to produce skin tumors on laboratory animals following repeated applications. All tumors appeared at the site of application during the latter portion of the typical 2-year lifespan of the animals. Toxic effects are unlikely to occur if good personal hygiene is practiced.

Biphenyl (Diphenyl) may cause liver and/or nerve damage. (See Section 11.)

Atmospheric Gas Oil (AGO) (C11-C25 Hydrocarbons)

- Conditions Aggravated by Exposure** Personnel with pre-existing central nervous system (CNS) disease, neurological conditions, skin disorders, impaired liver or kidney function, or chronic respiratory diseases should avoid exposure.
- Target Organs** This substance is toxic to lungs, nervous systems, brain, mucous membranes, skin, eyes, and possibly, the liver and kidneys.
- Carcinogenic Potential** This material, or a component of this material, has been shown to cause cancer in laboratory animals. The relevance of this to humans is not clear.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Toxic	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

- Inhalation** Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
- Eye Contact** Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
- Skin Contact** Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
- Ingestion** Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
- Notes to Physician** Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

If ingested, this material presents a significant aspiration/lipoid or chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

Atmospheric Gas Oil (AGO) (C11-C25 Hydrocarbons)

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IIIB Liquid. Slightly combustible!	
Flash Point	CLOSED CUP: 96° to 104°C (205° to 220°F) (Pensky-Martens Closed Cup [ASTM D-93]).	
Lower Flammable Limit	AP 0.6 %	Upper Flammable Limit AP 5.0 %
Autoignition Temperature	AP 263° to 288°C (505° to 550°F)	
Hazardous Combustion Products	Burning or excessive heating may produce carbon monoxide, carbon dioxide, and possibly smoke, fumes, unburned hydrocarbons, and oxides of sulfur.	
Special Properties		

This material releases vapors at or approaching its flash point temperature. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Mists or sprays may be flammable at temperatures below the flash point. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.

A static electrical charge can accumulate as a result of transfer flow or agitation. Discharge (static spark) can ignite vapors, especially in cold, dry weather conditions. Special slow load and monitoring procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point products. To reduce this hazard, receiving containers should always be grounded and the loading nozzle must be kept in contact with the container during the entire filling process. Do not fill any portable container in or on a vehicle without proper bonding.

Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide (CO ₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Release causes an potential fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and

Atmospheric Gas Oil (AGO) (C11-C25 Hydrocarbons)

transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbant pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7. HANDLING AND STORAGE

Handling

A spill or leak may cause a potential fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This liquid should be stored in a separate safety cabinet or room. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Atmospheric Gas Oil (AGO) (C11-C25 Hydrocarbons)

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

- Eye Protection** Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.
- Hand Protection** Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.
- Body Protection** Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.
- Respiratory Protection** For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).
- General Comments** Warning! Use of this hydrocarbon fuel in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
C10-C20 Petroleum Hydrocarbons	ACGIH (United States, 1998). Skin TWA: 100 mg/m ³
Biphenyl (Diphenyl)	ACGIH TLV (United States). TWA: 0.2 ppm 8 hour(s). OSHA PEL Z2 (United States). TWA: 0.2 ppm 8 hour(s).

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Liquid.	Color	Slightly opaque, pale yellow to amber.	Odor	Characteristic, heating oil-like.
Specific Gravity	0.89 to 0.94 at 60°F (Water = 1)	pH	Not applicable.	Vapor Density	AP 10 (Air = 1 at 70°F)
Boiling Range	204° to 400°C (400° to 752°F) (ASTM D-86)			Melting/Freezing Point	-20° to -4°C (-4° to 25°F) (ASTM D-97)
				Volatility	

Atmospheric Gas Oil (AGO) (C11-C25 Hydrocarbons)

Vapor Pressure	LT 0.1 Reid-psia at 38°C (100°F).	Viscosity (cSt @ 40°C)	Slight; no Volatile Organic Compounds (VOCs) present at 400°F (204°C).
Solubility in Water	Negligible to slightly soluble in cold water (AP 0.001 to 0.01%).	7.4 to 54 (ASTM D-445)	
Flash Point	CLOSED CUP: 96° to 104°C (205° to 220°F) (Pensky-Martens Closed Cup [ASTM D-93]).		
Additional Properties	No Addition Properties.		

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen.		
Hazardous Decomposition Products	No substances are readily identified from composition; and, no degradation data is available.		

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Biphenyl (Diphenyl)

Studies in Humans Overexposed to Biphenyl:
Evidence of adverse effects on the liver and the nervous system have been described in studies of workers exposed to high levels for prolonged periods.

Studies in Laboratory Animals:

Evidence of adverse effects on the kidney and liver, and changes in whole blood (reduced hematocrit and hemoglobin levels) have been observed in laboratory rodents following subchronic exposure to biphenyl.

Genotoxicity & Carcinogenicity:

Biphenyl tested negative in bacteriological systems but some evidence of positive responses have been reported in mammalian cell systems in the presence of metabolic activation. The EPA has determined human and animal data are inadequate to classify the carcinogenic potential of biphenyl.

Polynuclear Aromatic Hydrocarbons (4- to 6- member condensed rings)

ORAL (LD50): Acute: >5000 mg/kg [Rat].
DERMAL (LD50): Acute: >2000 mg/kg [Rabbit].

Cancer is the most significant toxicity endpoint for PNAs. Certain PNA compounds are weak carcinogens which only become potent carcinogens after undergoing metabolism. Chronic or repeated exposure increases the likelihood of tumor initiation as well as the potential for metabolism of a PNA procarcinogen into a carcinogen. Increased incidence of tumors of the skin, bladder, lung and gastrointestinal tract have been described in individuals exposed to elevated concentrations of certain PNAs.

PNA compounds have been associated with photosensitivity and eye irritation. Inhalation exposures to PNA compounds have been associated with respiratory tract irritation, cough

Atmospheric Gas Oil (AGO) (C11-C25 Hydrocarbons)

and bronchitis. Dermal exposures may cause precancerous lesions, erythema, dermal burns, photosensitivity, acneiform lesions and irritation. Oral exposure to some PNAs have been associated with precancerous growths of the mouth (leukoplakia). Also, mild nephrotoxicity, indicated by increased kidney size, congestion and renal cortical hemorrhages, plus elevated liver function tests and histopathologic abnormalities have occurred in rats following chronic ingestion.

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this kerosene, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. If present, volatile aromatic hydrocarbon components (biphenyl) may be released and possibly contribute to the creation of atmospheric smog.

Using Rainbow Trout (*Oncorhynchus mykiss*), Dungeness Crab (*Cancer magister*), and juvenile American Shad (*Squalius cephalus*), similar middle distillates showed a 96-hour TLms (Median Toxic Limit) of from 10 ppm to 20 ppm in ambient saltwater. Also, 96-hour LC 50 testing produced results from 20 ppm to 320 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Banded Killifish (*Fundulus diaphanus*), American Eel (*Anguilla rostrata*), White Perch (*Perca fluviatilis*), and Striped Mullet (*Mugil cephalis*). Based upon actual spill incident investigations, similar middle distillates have been shown to bioaccumulate in tissues of various fish from less than 1 to 10 ppm levels.

Environmental Fate

This middle distillate is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, this hydrocarbon oil layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this material, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and

Atmospheric Gas Oil (AGO) (C11-C25 Hydrocarbons)

disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304 Emergency Planning and Notification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Acute (Immediate) and Chronic (Delayed) Health Hazards.
SARA 313 Toxic Chemical Notification and Release Reporting	This product contains the following components in concentrations above de minimis levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: Biphenyl (Diphenyl) [CAS No.: 92-52-4] Concentration: 2% Polynuclear Aromatic Hydrocarbons (4- to 6- member condensed rings) [CAS No.: 68487-58-6] Concentration: 0.6%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. This product or refinery stream is not known to contain chemical substances subject to this statute. However, it is recommended that you contact state and local authorities to determine if there are any other reporting requirements in the event of a spill.
Clean Water Act (CWA)	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material may contain the following components which are known to the State of California to cause cancer, birth defects or other reproductive harm, and may be subject to the requirements of California Proposition 65 (CA Health & Safety Code Section 25249.5): Polynuclear Aromatic Hydrocarbons (4- to 6- member condensed rings): 0.55%
New Jersey Right-to-Know Label	For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.

Atmospheric Gas Oil (AGO) (C11-C25 Hydrocarbons)

Additional Regulatory Remarks

Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13): This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following: **Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children!**

Under Section 12(b) of TSCA: Because it contains detectable amounts of **1,1'-Biphenyl [CAS No. 92-52-4]** this material might be subject to US EPA's one-time only per country export notification requirements.

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following component of this material as a "Volatile Organic Compound (VOC)" which contributes significantly to air pollution which endangers public health and welfare": **Biphenyl (Diphenyl) [CAS No. 92-52-4]**.

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 3.0
Revision Date 8/23/2005
Print Date Printed on 8/23/2005.

MATERIAL SAFETY DATA SHEET

SOUR INTERMEDIATE DISTILLATE/HYDROGEN MIXED PHASE STREAMS

MSDS No.
RS0262Rev. Date
11/07/95

LYONDELL-CITGO REFINING COMPANY, LTD.
12000 LAWNDALE AVENUE
P. O. BOX 2451
HOUSTON, TEXAS 77252-2451

IMPORTANT: Read this MSDS before handling and disposing of this product and pass this information on to employees, customers, and users of this product.

This product is considered a hazardous chemical under the OSHA Hazard Communication Rule.

I. General		
Trade Name	SOUR INTERMEDIATE DISTILLATE/HYDROGEN MIXED PHASE STREAMS	Telephone Numbers EMERGENCY 800/424-9300 CHEMTREC 800/313-7645 HOT LINE CUSTOMER SERVICE 800/525-4692 INFO ONLY
Other Names	HDS DIESEL REACTOR EFFLUENT HDS INTERMEDIATE DIESEL/HYDROGEN/HYDROGEN SULFIDE MIX DIESEL HYDRODESULFURIZATION UNIT MIXED PHASE FEEDSTOCK	
Chemical Family	PETROLEUM HYDROCARBONS/HYDROGEN/H ₂ S/NH ₄	DOT Hazardous Materials Proper Shipping Name COMPRESSED GASES, TOXIC, FLAMMABLE, N.O.
Generic Name	SOUR MIDDLE DISTILLATE AND HYDROGEN	DOT Hazard Class 2.3 (POISON GAS, FLAMMABLE GAS)
CAS No.	SEE SECTION IX	Company ID No. 111111262 UN/NA ID No. UN 1954
II. DANGER		SEE SUPPLEMENT BEGINNING ON PAGE 7
<h3 style="margin: 0;">Summary of Hazards</h3> <p>MAY CAUSE MODERATE EYE AND SKIN IRRITATION OR MORE SERIOUS SKIN DISORDERS! AVOID PROLONGED OR REPEATED LIQUID, MIST, AND VAPOR CONTACT WITH EYES, SKIN, AND RESPIRATORY TRACT. LONG-TERM TESTS SHOW THAT SIMILAR MIDDLE PETROLEUM DISTILLATES HAVE PRODUCED SKIN TUMORS ON LABORATORY ANIMALS FOLLOWING EXTENDED CONTACT. WASH THOROUGHLY AFTER HANDLING.</p> <p>MAY BE HARMFUL IF INHALED! CONTAINS HYDROGEN SULFIDE, A POISONOUS GAS! HARMFUL OR FATAL IF SWALLOWED! CONTAINS PETROLEUM DISTILLATES! IF SWALLOWED, DO NOT INDUCE VOMITING SINCE ASPIRATION INTO THE LUNGS WILL CAUSE CHEMICAL PNEUMONIA. OBTAIN PROMPT MEDICAL ATTENTION.</p> <p>EXTREMELY FLAMMABLE! OSHA/NFPA CLASS-IA FLAMMABLE GAS/LIQUID. KEEP AWAY FROM HEAT, SPARKS, AND OPEN FLAME. AVOID THE "SWITCH LOADING" HAZARD. (SEE SECTION XI.).</p> <p>MAY CAUSE KIDNEY AND/OR LIVER DAMAGE BASED ON ANIMAL STUDY RESULTS! LOW BOILING POINT INTENSIFIES THE PRESSURE AND RAPID DIFFUSION HAZARD!</p>		
III. Fire and Explosion		
Flash Point (Method)	Autoignition Temperature (Method)	Flammable Limits (% Vol. in Air) At Normal Atmospheric Temperature and Pressure
LT 200° F (D-56) SEE "FIRE & EXPLOSION HAZARDS"	AP 410° F (E-659) BASED ON NFPA "FUEL OIL"	Lower AP 0.7 Upper AP 75.0 BASED ON "FUEL OIL/HYDROGEN"
Fire and Explosion Hazards	THIS GAS RELEASES FLAMMABLE VAPORS AT WELL BELOW AMBIENT TEMPERATURES AND READILY FORMS FLAMMABLE MIXTURES WITH AIR. EXPOSED TO AN IGNITION SOURCE, IT WILL BURN IN THE OPEN OR BE EXPLOSIVE IN CONFINED SPACES. ITS VAPORS ARE HEAVIER THAN AIR AND MAY TRAVEL LONG DISTANCES TO A POINT OF IGNITION, AND THEN FLASH BACK. ALKANE/CHLORINE GAS MIXTURES HAVE PRODUCED EXPLOSIONS.	
Extinguishing Media	FOAM DRY CHEMICAL CO ₂ USE OF WATER FOG/SPRAY CAN COOL THE FIRE, BUT MAY NOT ACHIEVE EXTINGUISHMENT. SHUT OFF GAS SOURCE!	WATERSPRAY INERT GAS - HALON/N ₂
		HAZARD RATING: 4 - Extreme 3 - High 2 - Moderate 1 - Slight 0 - Insignificant
		* Chronic Health Hazard - See Section IV.
Special Firefighting Procedures	FIRES INVOLVING THIS MATERIAL SHOULD NOT BE EXTINGUISHED UNLESS THE SOURCE FLOW CAN BE STOPPED IMMEDIATELY. SHUT OFF THE SOURCE AND ALLOW THE FIRE TO BURN ITSELF OUT. IF IT CANNOT BE SHUT OFF IMMEDIATELY, ALL EXPOSED EQUIPMENT AND SURFACES MUST BE COOLED WITH WATER TO PREVENT OVER-HEATING, FLASH-BACKS, OR EXPLOSIONS. CONTROL FIRE UNTIL SOURCE SUPPLY CAN BE SHUT OFF. FIREMEN MUST USE PROPER PROTECTIVE EQUIPMENT INCLUDING RESPIRATORY APPARATUS TO PROTECT AGAINST HAZARDOUS COMBUSTION PRODUCTS/OXYGEN DEFICIENCIES.	

IV. Health Hazards		SEE SUPPLEMENT BEGINNING ON PAGE 7			
Summary of Acute Hazards	LIQUID, MIST, OR VAPOR CONTACT CAN IRRITATE EYES, SKIN, AND THE RESPIRATORY AND DIGESTIVE TRACTS. IT MAY ALSO CAUSE CENTRAL NERVOUS SYSTEM DEPRESSION.				
ROUTE OF EXPOSURE	SIGNS AND SYMPTOMS	Primary Route(s)			
Inhalation	VAPORS OR MISTS FROM THIS MATERIAL CAN IRRITATE THE NOSE, THROAT, AND LUNGS, AND CAN CAUSE SIGNS AND SYMPTOMS OF CENTRAL NERVOUS SYSTEM (CNS) DEPRESSION, DEPENDING ON THE CONCENTRATION AND DURATION OF EXPOSURE.	<input checked="" type="checkbox"/>			
Eye Contact	MILD EYE IRRITATION MAY RESULT FROM CONTACT WITH LIQUID, MIST, AND/OR VAPORS.	<input checked="" type="checkbox"/>			
Skin Absorption	NO SIGNIFICANT SYSTEMIC EFFECTS ARE EXPECTED UNDER CONDITIONS OF ANTICIPATED USE.	<input type="checkbox"/>			
Skin Irritation	CONTACT WITH LIQUID AND/OR MISTS MAY RESULT IN MODERATE SKIN IRRITATION. PROLONGED AND/OR REPEATED SKIN CONTACT MAY RESULT IN DERMATITIS OR MORE SERIOUS SKIN DISORDERS. (SEE "SUMMARY OF CHRONIC HAZARDS" BOX BELOW.)	<input checked="" type="checkbox"/>			
Ingestion	THIS MATERIAL CAN IRRITATE THE MOUTH, THROAT, AND STOMACH, AND CAUSE NAUSEA, VOMITING, DIARRHEA AND RESTLESSNESS. IF ASPIRATED INTO THE LUNGS, IT WILL CAUSE CHEMICAL PNEUMONIA.	<input type="checkbox"/>			
Summary of Chronic Hazards and Special Health Effects	THIS PRODUCT CONTAINS PETROLEUM DISTILLATES SIMILAR TO THOSE SHOWN TO PRODUCE SKIN TUMORS ON LABORATORY ANIMALS. ALL TUMORS NOTED APPEARED DURING THE LATTER PORTION OF THE TYPICAL 2-YEAR LIFESPAN OF THE ANIMALS. THERE MAY BE A SLIM POTENTIAL RISK OF SKIN CANCER TO HUMANS FROM PROLONGED OR REPEATED CONTACT WITH THIS PRODUCT. (SEE SUPPLEMENTAL SECTION XIII.) PERSONNEL WITH PRE-EXISTING CENTRAL NERVOUS SYSTEM DISEASE, SKIN DISORDERS, OR CHRONIC RESPIRATORY DISEASES SHOULD AVOID EXPOSURE TO THIS MATERIAL.				
V. Protective Equipment and Other Control Measures					
Respiratory	IF EXCESSIVE MISTS OR VAPOR RESULT FROM CONDITIONS OF USE, WEAR PROPER NIOSH/MSHA-APPROVED RESPIRATORY EQUIPMENT. THIS IS NOT EXPECTED TO OCCUR BECAUSE THIS MATERIAL POSSESSES A LOW VAPOR PRESSURE.				
Eye	EYE PROTECTION SHOULD BE WORN WHENEVER THERE IS A LIKELIHOOD OF MISTING OR SPLASHING/SPRAYING LIQUID. SUITABLE EYE WASH WATER SHOULD BE AVAILABLE. HARD CONTACT LENSES MUST NOT BE WORN.				
Skin	AVOID SKIN CONTACT. IF CONDITIONS OR FREQUENCY OF USE MAKE CONTACT UNAVOIDABLE, CLEAN AND IMPERVIOUS PROTECTIVE CLOTHING SUCH AS GLOVES, APRON, BOOTS, AND FACIAL PROTECTION SHOULD BE WORN.				
Engineering Controls	USE ADEQUATE VENTILATION TO KEEP VAPOR AND MIST CONCENTRATIONS OF THIS MATERIAL BELOW APPLICABLE EXPOSURE LIMITS. (SEE SECTIONS VI. AND XI.). ALL EQUIPMENT SHOULD COMPLY WITH NATIONAL ELECTRICAL CODE (NEC) STANDARDS.				
Other Hygienic and Work Practices	USE GOOD PERSONAL HYGIENE PRACTICES. WASH HANDS BEFORE EATING, DRINKING, SMOKING OR USE OF TOILET FACILITIES. IMMEDIATELY REMOVE SOILED CLOTHING AND WASH THOROUGHLY BEFORE REUSE. CLEAN OR DISCARD CONTAMINATED LEATHER GOODS. RESPIRATOR USE SHOULD COMPLY WITH OSHA STANDARD 29 CFR 1910.134 OR EQUIVALENT. SEE SECTION XI. FOR ADDITIONAL INFORMATION.				
VI. Occupational Exposure Limits		SEE ADDITIONAL DATA BEGINNING ON PAGE 7

SOUR INTERMEDIATE DISTILLATE/HYDROGEN MIXED PHASE STREAMS

MSDS No.
RSD262
Rev. Date
11/07/95**VII. Emergency and First Aid**

Inhalation	IMMEDIATELY MOVE PERSONNEL TO AREA OF FRESH AIR. FOR RESPIRATORY DISTRESS, GIVE AIR, OXYGEN, OR ADMINISTER CPR (CARDIOPULMONARY RESUSCITATION), IF NECESSARY. OBTAIN MEDICAL ATTENTION FOR ANY BREATHING DIFFICULTIES.
Eye Contact	FLUSH WITH CLEAN LOW-PRESSURE WATER FOR AT LEAST 15 MINUTES. RETRACT THE EYELIDS OFTEN. OBTAIN MEDICAL ATTENTION.
Skin Contact	PROMPTLY REMOVE CONTAMINATED CLOTHING AND THOROUGHLY CLEAN BEFORE REUSE. CLEAN OR DISCARD CONTAMINATED LEATHER GOODS. THOROUGHLY WASH AFFECTED SKIN WITH SOAP AND WATER.
Ingestion	RINSE MOUTH WITH WATER. IF VICTIM IS CONSCIOUS AND ALERT, GIVE 1-2 GLASSES OF WATER OR MILK. DO NOT INDUCE VOMITING UNLESS DIRECTED BY MEDICAL PERSONNEL DUE TO RISK OF LUNG DAMAGE. PROMPTLY OBTAIN MEDICAL ATTENTION.
Emergency Medical Treatment Procedures	SEE ABOVE PROCEDURES.

VIII. Spill and Disposal

Precautions if Material is Spilled or Released	CONTAIN SPILL. REMOVE ALL IGNITION SOURCES AND SAFELY STOP FLOW OF SPILL. SPILL MAY CREATE SLIPPING HAZARDS. PREVENT FROM ENTERING ALL BODIES OF WATER, IF POSSIBLE. EVACUATE ALL NON-ESSENTIAL PERSONNEL. IN URBAN AREAS, CLEANUP AS SOON AS POSSIBLE; IN NATURAL ENVIRONMENTS, CLEANUP ON ADVICE FROM ECOLOGISTS. THIS MATERIAL WILL FLOAT ON WATER. ABSORBENT MATERIAL AND PADS CAN BE USED. COMPLY WITH ALL APPLICABLE LAWS. SPILLS MAY NEED TO BE REPORTED TO THE NATIONAL RESPONSE CENTER (800/424-8802). THE SPILLED MATERIAL AND ANY WATER OR SOIL WHICH IT HAS CONTACTED MAY BE HAZARDOUS TO ANIMAL/AQUATIC LIFE.
Waste Disposal Methods	MAXIMIZE PRODUCT RECOVERY FOR REUSE OR RECYCLING. UNUSED LIQUID PRODUCT IS LIKELY AN EPA "IGNITABLE HAZARDOUS WASTE" (D001). USE APPROVED TREATMENT, TRANSPORTERS, AND DISPOSAL SITES IN COMPLIANCE WITH ALL APPLICABLE LAWS. IF SPILL IS INTRODUCED INTO A WASTEWATER SYSTEM, THE CHEMICAL AND BIOLOGICAL OXYGEN DEMAND WILL LIKELY INCREASE. SPILL MATERIAL IS BIODEGRADABLE IF GRADUALLY EXPOSED TO MICROORGANISMS. POTENTIAL DISPOSAL METHODS INCLUDE INCINERATION AND LAND DISPOSAL, IF PERMITTED.

IX. Components (This may not be a complete list of components)

Component Name	CAS No.	Carcinogen##		Composition amount (Vol.) (See Qualification on Page 4.)	
TWO PHASE STREAM		N/AP	EQ	100 PERCENT	
GAS PHASE:		N/AP	AP	40 TO	60 PERCENT
HYDROGEN	1333-74-0	N/AP	AP	70 TO	85 PERCENT
METHANE	74-82-8	N/AP	AP	5 TO	15 PERCENT
HYDROGEN SULFIDE	7783-06-4	N/AP	AP	2 TO	5 PERCENT
AMMONIA	7664-41-7	N/AP	AP	0.5 TO	2.0 PERCENT
LIQUID PHASE:		N/AP	AP	40 TO	60 PERCENT
STRAIGHT-RUN MIDDLE DISTILLATE (PETROLEUM)	64741-44-2*	N/AP	AP	0 TO	60 PERCENT
LIGHT THERMAL-CRACKED DISTILLATE	64741-82-8*	N/AP	AP	0 TO	60 PERCENT
LIGHT CATALYTIC CRACKED DISTILLATE WHICH CONTAINS:	64741-59-9*	N/AP	AP	0 TO	60 PERCENT
HYDROCARBONS BOILING BETWEEN 325° F. AND 690° F.		N/AP	AP	40 TO	60 PERCENT
TRIMETHYL BENZENE (TOTAL OF ALL ISOMERS)	25551-13-7*	N/AP	AP	1 PERCENT	
1,2,4-TRIMETHYLBENZENE (PSEUDOCUMENE)	95-63-6	N/AP	LT	1 PERCENT	
NAPHTHALENE	91-20-3	N/AP	AP	1 TO	3 PERCENT
BIPHENYL (DIPHENYL)	92-52-4	N/AP	AP	1 PERCENT	

Compositions given are typical values, not specifications.

X. Physical and Chemical Data			
Boiling Point 320° TO 555° F	Viscosity Units, Temp. (Method) AP 2 CST AT 100° F (D-445)		Dry Point N/DA
Freezing Point LT -50° F	Vapor Pressure (REID-PSIA AT 100° F) LT 0.1		Volatile Characteristics SLIGHT
Specific Gravity (H₂O = 1 at 39.2° F) AP 0.79 TO 0.83	Vapor Sp. Gr. (Air = 1.0 at 60°-90° F) AP 6	Solubility in Water NEGLIGIBLE	pH N/AP
Hazardous Polymerization NOT EXPECTED TO OCCUR	Other Chemical Reactivity N/P		Stability STABLE
Other Physical and Chemical Properties	SULFUR CONTENT = LT 0.6 WT.% (ASTM D-2622); POUR POINT TEMPERATURE = LT 0° F.; VISCOSITY @ -4° F. = LT 8 CENTISTOKES (D-2602).		
Appearance and Odor	NEARLY COLORLESS TO LIGHT YELLOW-COLORED LIQUID; KEROSENE ODOR.		
Conditions to Avoid	HEAT, SPARKS, AND OPEN FLAME.		
Materials to Avoid	STRONG ACIDS, ALKALIES, AND OXIDIZERS SUCH AS LIQUID CHLORINE AND OXYGEN.		
Hazardous Decomposition Products	EXCESSIVE HEATING AND/OR INCOMPLETE COMBUSTION MAY PRODUCE CARBON MONOXIDE, CARBON DIOXIDE, AND OTHER HARMFUL GASES/VAPORS INCLUDING OXIDES AND/OR OTHER COMPOUNDS OF SULFUR.		
XI. Additional Precautions			
Handling, Storage, and Decontamination Procedures	<p>SPECIAL SLOW LOAD PROCEDURES FOR "SWITCH LOADING" MUST BE FOLLOWED TO AVOID THE STATIC IGNITION HAZARD THAT CAN EXIST WHEN THIS MATERIAL IS LOADED INTO TANKS PREVIOUSLY CONTAINING GASOLINE OR OTHER LOW FLASH POINT PRODUCTS. (SEE A.P.I. PUBLICATION 2003.) KEEP CONTAINERS CLOSED AND AWAY FROM HEAT AND IGNITION SOURCES! ALL ELECTRICAL EQUIPMENT IN AREAS WHERE PRODUCT IS STORED/HANDLED SHOULD BE INSTALLED IN ACCORDANCE WITH APPLICABLE REQUIREMENTS OF THE NATIONAL ELECTRIC CODE, N.E.C. DO NOT USE THIS PRODUCT AS A CLEANING AGENT. EMPTY CONTAINERS RETAIN SOME LIQUID AND VAPOR RESIDUES, AND HAZARD PRECAUTIONS MUST BE OBSERVED WHEN HANDLING EMPTY CONTAINERS.</p> <p>WARNING: USE OF ANY HYDROCARBON FUEL IN SPACES WITHOUT ADEQUATE VENTILATION MAY RESULT IN GENERATION OF HAZARDOUS LEVELS OF COMBUSTION PRODUCTS AND INADEQUATE OXYGEN LEVELS FOR BREATHING.</p>		
General Comments	<p>SINCE SPECIFIC EXPOSURE STANDARDS/CONTROL LIMITS HAVE NOT BEEN ESTABLISHED FOR THIS MATERIAL, THE EXPOSURE LIMITS LISTED IN SECTION VI. ARE SUGGESTED AS MINIMUM CONTROL GUIDELINES.</p> <p>THIS MATERIAL CONTAINS A "PETROLEUM DISTILLATE", AS DEFINED BY 16 CFR 1500.14(B)(3) AND 1500.83(A)(13), WHICH REQUIRES SPECIAL LABELING PURSUANT TO THE FEDERAL HAZARDOUS SUBSTANCES ACT AND RELATED STATUTES AND REGULATIONS, IF IT IS DISTRIBUTED IN A MANNER INTENDED, OR PACKAGED IN A FORM SUITABLE, FOR USE IN THE HOUSEHOLD OR BY CHILDREN.</p> <p>SOME OF THE INFORMATION PRESENTED AND CONCLUSIONS DRAWN HEREIN ARE FROM SOURCES OTHER THAN DIRECT TEST DATA ON THE MIXTURE ITSELF.</p>

Physical Hazards:	EXTREMELY FLAMMABLE GAS! EXPLOSIVE SLIPPING HAZARD ON SMOOTH, HARD WALKING AREA.	HIGHLY COMPRESSED GAS SUDDEN RELEASE/RAPID DIFFUSION HAZARD CORROSIVE TO SOME METALS
Health Hazards:	HIGH INGESTION, SKIN, AND INHALATION HAZARD SKIN, EYE, AND MUCOUS MEMBRANE IRRITANT MAY CAUSE LIVER AND/OR KIDNEY DAMAGE MAY CAUSE ALLERGIC REACTION SIMILAR MATERIAL CAUSES CANCER IN TEST ANIMALS	VAPOR REDUCES OXYGEN AVAILABLE FOR BREATHING! MIST/VAPOR MAY IRRITATE NOSE, THROAT, AND LUNGS IF ASPIRATED, MAY CAUSE CHEMICAL PNEUMONIA MAY PARALYZE THE DIAPHRAGM MUSCLE MAY AFFECT REPRODUCTION
Precautionary Measures:	DO NOT HANDLE NEAR HEAT, SPARKS, OR OPEN FLAME. SPILL/LEAK CAN CAUSE FIRE/EXPLOSION. STORE IN TIGHTLY CLOSED CONTAINERS. DO NOT BREATHE GAS. USE ONLY WITH ADEQUATE VENTILATION/PERSONAL PROTECTION. HAVE AVAILABLE EMERGENCY SELF-CONTAINED OR SUPPLIED AIR RESPIRATOR. AVOID CONTACT WITH EYES, SKIN, AND CLOTHING. WASH THOROUGHLY AFTER HANDLING. PREVENT CONTACT WITH FOOD, CHEWING, OR SMOKING MATERIALS. DO NOT TAKE INTERNALLY.	
DOT Information:	UN/NA ID Number-- UN 1954 Hazard Class-- 2.3 (POISON GAS, FLAMMABLE GAS) Proper Shipping-- COMPRESSED GASES, TOXIC, FLAMMABLE, N.O.S. (HYDROGEN SULFIDE, METHANE)	
Instructions:	FOAM DRY CHEMICAL CO2	WATERSPRAY INERT GAS - HALON/N2
First Aid -Inhalation	IMMEDIATELY MOVE PERSONNEL TO AREA OF FRESH AIR. FOR RESPIRATORY DISTRESS, GIVE AIR, OXYGEN, OR ADMINISTER CPR (CARDIOPULMONARY RESUSCITATION), IF NECESSARY. OBTAIN MEDICAL ATTENTION FOR ANY BREATHING DIFFICULTIES.	
-Eye Contact	FLUSH WITH CLEAN LOW-PRESSURE WATER FOR AT LEAST 15 MINUTES. RETRACT THE EYELIDS OFTEN. OBTAIN MEDICAL ATTENTION.	
-Skin Contact	PROMPTLY REMOVE CONTAMINATED CLOTHING AND THOROUGHLY CLEAN BEFORE REUSE. CLEAN OR DISCARD CONTAMINATED LEATHER GOODS. THOROUGHLY WASH AFFECTED SKIN WITH SOAP AND WATER.	
-Ingestion	RINSE MOUTH WITH WATER. IF VICTIM IS CONSCIOUS AND ALERT, GIVE 1-2 GLASSES OF WATER OR MILK. DO NOT INDUCE VOMITING UNLESS DIRECTED BY MEDICAL PERSONNEL DUE TO RISK OF LUNG DAMAGE. PROMPTLY OBTAIN MEDICAL ATTENTION.	
In case of spill,	CONTAIN SPILL. REMOVE ALL IGNITION SOURCES AND SAFELY STOP FLOW OF SPILL. SPILL MAY CREATE SLIPPING HAZARDS. PREVENT FROM ENTERING ALL BODIES OF WATER, IF POSSIBLE. EVACUATE ALL NON-ESSENTIAL PERSONNEL. IN URBAN AREAS, CLEANUP AS SOON AS POSSIBLE; IN NATURAL ENVIRONMENTS, CLEANUP ON ADVICE FROM ECOLOGISTS. THIS MATERIAL WILL FLOAT ON WATER. ABSORBENT MATERIAL AND PADS CAN BE USED. COMPLY WITH ALL APPLICABLE LAWS. SPILLS MAY NEED TO BE REPORTED TO THE NATIONAL RESPONSE CENTER (800/424-8802). THE SPILLED MATERIAL AND ANY WATER OR SOIL WHICH IT HAS CONTACTED MAY BE HAZARDOUS TO ANIMAL/AQUATIC LIFE.	
Protective Equipment:	IF EXCESSIVE MISTS OR VAPOR RESULT FROM CONDITIONS OF USE, WEAR PROPER NIOSH/MSHA-APPROVED RESPIRATORY EQUIPMENT. THIS IS NOT EXPECTED TO OCCUR	
-Respiratory	EYE PROTECTION SHOULD BE WORN WHENEVER THERE IS A LIKELIHOOD OF MISTING OR SPLASHING/SPRAYING LIQUID. SUITABLE EYE WASH WATER SHOULD BE AVAILABLE.	
-Eye	AVOID SKIN CONTACT. IF CONDITIONS OR FREQUENCY OF USE MAKE CONTACT UNAVOIDABLE, CLEAN AND IMPERVIOUS PROTECTIVE CLOTHING SUCH AS GLOVES.	
-Skin

XIV. Supplement**ACUTE AND CHRONIC EFFECTS (CONTINUED FROM SECTIONS II. AND IV.)**

THIS PRODUCT CONTAINS A PETROLEUM DISTILLATE, AND AS WITH MANY PETROLEUM PRODUCTS, IT MAY CAUSE IRRITATION TO THE EYES, LUNGS, OR SKIN AFTER PROLONGED OR REPEATED EXPOSURE. EXTREME EXPOSURE OR ASPIRATION INTO THE LUNGS MAY CAUSE PNEUMONIA. OVEREXPOSURE MAY CAUSE WEAKNESS, HEADACHE, NAUSEA, CONFUSION, BLURRED VISION, DROWSINESS AND OTHER NERVOUS SYSTEM EFFECTS; GREATER EXPOSURE MAY CAUSE DIZZINESS, SLURRED SPEECH, FLUSHED FACE, UNCONSCIOUSNESS, OR CONVULSIONS.

NAPHTHALENE IS A POTENTIAL IRRITANT TO EYES, SKIN, AND LUNGS AND MAY DAMAGE THE EYES (CATARACTS AND/OR OPTICAL NEURITIS), BLOOD (HEMOLYTIC ANEMIA), AND KIDNEY FOLLOWING PROLONGED OR REPEATED EXPOSURE. NAPHTHALENE MAY ALSO CAUSE FETAL TOXICITY OR DAMAGE. THE NATIONAL TOXICOLOGY PROGRAM (NTP) HAS IDENTIFIED NAPHTHALENE AS HAVING "SOME EVIDENCE OF CARCINOGENIC ACTIVITY" IN LABORATORY ANIMALS.

BIPHENYL (DIPHENYL) INHALATION OVEREXPOSURES HAVE CAUSED POISONING CHARACTERIZED BY LIVER AND CENTRAL AND/OR PERIPHERAL NERVE DAMAGE. DEATHS RESULTED FROM LIVER ATROPHY. BIPHENYL VAPORS HAVE ALSO CAUSED TRANSIENT NAUSEA, VOMITING, FLACCID PARALYSIS, AND/OR BRONCHITIS.

TRIMETHYLBENZENES ARE PRIMARY SKIN IRRITANTS AND MAY CAUSE ASTHMATIC BRONCHITIS AND/OR ANEMIA. BASED UPON ANIMAL REPRODUCTIVE/DEVELOPMENTAL STUDIES, TRIMETHYLBENZENES MAY CAUSE FETAL TOXICITY.

THIS PRODUCT MAY HAVE A TOXIC DOSE AS LOW AS 1 OUNCE TO 1 PINT FOR A HUMAN ADULT. INGESTION OF LESS THAN 1 OUNCE WITH RETENTION MAY PRODUCE GENERAL DEPRESSION, SEDATION, INADEQUATE RESPIRATORY AND/OR CARDIAC FUNCTION, AND POSSIBLY, COMA.

MATERIALS SIMILAR TO SOME COMPONENTS IN THIS PRODUCT WERE FOUND TO BE MUTAGENIC IN "IN VITRO" AND "IN VIVO" TESTS. THE RELATIONSHIP BETWEEN THESE RESULTS AND POSSIBLE HUMAN EFFECTS IS NOT KNOWN.

STUDIES WITH MICE OR RATS HAVE SHOWN THAT SOME PETROLEUM DISTILLATE FUELS HAVE CAUSED DAMAGE AND/OR TUMORS TO KIDNEYS AND LIVER. HOWEVER, THE KIDNEY EFFECTS WERE SEX HORMONAL DEPENDENT AND NOT SEEN IN SIMILAR STUDIES INVOLVING GUINEA PIGS, DOGS, OR MONKEYS. ALSO, THE SIGNIFICANCE OF LIVER TUMORS IN RODENTS IS HIGHLY SPECULATIVE.

LIFETIME MOUSE SKIN PAINTING STUDIES HAVE SHOWN THAT PETROLEUM MIDDLE DISTILLATES (BOILING RANGE OF 180°F TO 700°F; AROMATIC OR HEAVY NAPHTHAS, KEROSENE, JET FUEL, DIESEL FUEL, ETC.) CAN CAUSE SKIN TUMORS WHEN REPEATEDLY APPLIED AND NEVER WASHED FROM THE ANIMAL'S SKIN. THE RELATIVE SIGNIFICANCE OF THIS TO HUMAN HEALTH IS UNCERTAIN SINCE THE PETROLEUM DISTILLATES WERE NOT WASHED FROM THE SKIN AND RESULTING SKIN EFFECTS (IRRITATION, CELL DAMAGE, ETC.) MAY PLAY A ROLE IN THE WEAK TUMORIGENIC RESPONSE. A FEW STUDIES HAVE SHOWN THAT WASHING THE ANIMAL'S SKIN WITH SOAP AND WATER BETWEEN TREATMENTS GREATLY REDUCES THE CARCINOGENIC EFFECT OF SOME PETROLEUM OILS.

STUDIES IN MICE AND RATS HAVE SHOWN THAT CHRONIC EXPOSURE (8 HOURS/DAY, 7 DAYS/WEEK, 24 MONTHS) TO UNFILTERED DIESEL EXHAUST PRODUCED TUMORS OF THE LUNG AND ALSO LYMPHOMAS. ON THE BASIS OF THESE STUDIES, NIOSH RECOMMENDS THAT COMPLETE DIESEL EXHAUST BE REGARDED AS A "POTENTIAL CARCINOGEN."

NUMEROUS EPIDEMIOLOGICAL STUDIES HAVE BEEN CARRIED OUT TO TEST THE HYPOTHESIS THAT LUNG AND BLADDER CANCERS ARE ASSOCIATED WITH EXPOSURE TO DIESEL EXHAUST. THE MOST COMPREHENSIVE CASE-CONTROL AND RETROSPECTIVE COHORT STUDIES ON U.S. RAILROAD WORKERS SHOWED INCREASED RISK FOR LUNG CANCER. IN THE COHORT STUDY, THE RISK INCREASED SIGNIFICANTLY WITH DURATION OF EXPOSURE. THERE ARE ALSO SOME INDICATIONS THAT AN ELEVATED FREQUENCY OF BLADDER CANCER IN TRUCK AND BUS DRIVERS MAY BE DUE TO DIESEL EXHAUST EXPOSURES.

D.O.T. HAZARDOUS MATERIALS PROPER SHIPPING NAME

THIS PRODUCT HAS A FLASH POINT OF BETWEEN 100° AND 140°F. (38°-60°C.). FOR BULK SHIPMENTS, ITS D.O.T. HAZARDOUS MATERIALS PROPER SHIPPING NAME IS "FLAMMABLE LIQUID, N.O.S. (KEROSENE)". HOWEVER, ACCORDING TO 49 CFR 173.120 AND 173.150, THIS PRODUCT MAY BE RECLASSIFIED AS A "COMBUSTIBLE LIQUID" AND EXCEPTED FROM LABELING REQUIREMENTS WHEN SHIPPED IN NON-BULK "LIMITED QUANTITY" CONTAINERS OF

XIV.**Supplement Continued**

LESS THAN 119 GALLONS. THIS PROVISION DOES NOT APPLY TO "LIMITED QUANTITY" CONTAINERS OFFERED FOR TRANSPORTATION OR TRANSPORTED BY VESSEL OR AIRCRAFT. IT IS RECOMMENDED THAT "FLAMMABLE LIQUID" PRODUCTS WHICH ARE RECLASSIFIED BE SO IDENTIFIED ON THE BILL-OF-LADING AS "COMBUSTBLE LIQUID, N.O.S. (KEROSENE)" WITH AN IDENTIFICATION NUMBER OF "NA 1993".

Atmospheric Tower Light Gas Oil (ALGO)

Material Safety Data Sheet

LYONDELL-CITGO Refining LP

P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0265
Revision Date 10/01/2002

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid.
Color Transparent; water-white to slightly yellow. **Odor** Characteristic, kerosene-like.

WARNING! Combustible liquid; vapor may cause flash fire. Mist or vapor may irritate the eyes, mucous membranes, and respiratory tract.

Liquid contact may cause minimal to mild eye and/or mild to severe skin irritation and inflammation.

Based upon laboratory animal studies, may cause skin cancer following extended contact.

May be harmful if inhaled or absorbed through the skin.

Overexposures may cause central nervous system (CNS) depression and/or other target organ effects.

May be harmful or fatal if ingested.

Aspiration into the lungs can cause pulmonary edema and lipid or chemical pneumonia.

Spills may create a slipping hazard.

If used as fuel, its engine exhaust may cause upper respiratory tract irritation and reversible pulmonary effects.

SECTION 1: IDENTIFICATION

Trade Name	Atmospheric Tower Light Gas Oil (ALGO)	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	008008206*	Medical Emergency	(800) 313-7645 or (918) 495-4700
CAS Number	8008-20-6	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Petroleum Hydrocarbon Middle Distillate		
Synonyms	Atmospheric Tower Light Distillate; Straight-run Light Distillate; 533 Water White Distillate; 533 Crude Still Light Gas Oil; Grade "A" Crude Unit Light Gas Oil; 633 HDS Unit Feed; Straight-run Kerosene; Kerosine (Petroleum); C10-C16 Petroleum Hydrocarbons.		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Kerosene (Petroleum)	8008-20-6	100
2) C10 Alkanes, Isoparaffins, and Cycloalkanes	Mixture	25-50
3) Naphthalene	91-20-3	1-3
4) C10-C11 Alkylbenzenes	70693-06-0	10-20
5) C11 Alkanes, Isoparaffins, and Cycloalkanes	Mixture	10-20
6) C12 Alkanes, Isoparaffins, and Cycloalkanes	Mixture	5-15
7) Biphenyl (Diphenyl)	92-52-4	1-3
8) C12-C16 Aromatic Hydrocarbons	Mixture	1-10
9) C13-C16 Alkanes, Isoparaffins, Cycloalkanes, and Naphthenes	Mixture	5-20

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye Contact. Absorption. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon level of exposure concentration and/or duration. Vapors can reduce the oxygen content in air. Approximately 20,000 ppm (or 2 vol.%) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces.
Eye Contact	Animal test results on similar materials suggest that this material can cause minimal to mild eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling.
Skin Contact	Animal test results on similar materials suggest that this material can cause mild to moderate skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate to severe dermatitis and/or more serious skin disorders. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and/or severe tissue damage.
Ingestion	If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above).

Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.

Chronic Health Effects Summary Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction.

This kerosine is a middle distillate similar to those shown to produce skin tumors on laboratory animals following repeated applications. All tumors appeared at the site of application during the latter portion of the typical 2-year lifespan of the animals. Toxic effects are unlikely to occur if good personal hygiene is practiced.

Naphthalene is considered to be a toxic substance as defined by both human exposure and laboratory testing results. And, based upon animal testing, it might be considered carcinogenic.

Biphenyl (Diphenyl) may cause liver and/or nerve damage. (See Section 11.)

Conditions Aggravated by Exposure Personnel with pre-existing central nervous system (CNS) disease, neurological conditions, skin disorders, impaired liver or kidney function, or chronic respiratory diseases should avoid exposure.

Atmospheric Tower Light Gas Oil (AL)

Target Organs

This substance is toxic to lungs, nervous systems, brain, mucous membranes, skin, eyes, and possibly, the blood, liver, kidneys, and reproductive system.

Carcinogenic Potential

This material contains naphthalene at concentrations above 0.1%. Naphthalene is considered possibly carcinogenic to humans by IARC. (See Section 11.)

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input checked="" type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
Ingestion	Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	<p>Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.</p> <p>If ingested, this material presents a significant aspiration/lipoid or chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-II Combustible Liquid. Highly combustible!		
Flash Point Method	CLOSED CUP: 55° to 60°C (131° to 140°F). [Pensky-Martens (ASTM D-93)]		
Lower Flammable Limit	AP 0.7%	Upper Flammable Limit	AP 5.0%
Autoignition Temperature	AP 210°C (410°F)		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors.		

Atmospheric Tower Light Gas Oil (AL)

Special Properties

Combustible Liquid! This material releases vapors at or approaching the flash point temperature. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Mists or sprays may be flammable at temperatures below the flash point. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.

A static electrical charge can accumulate as a result of transfer flow or agitation. Discharge (static spark) can ignite vapors, especially in cold, dry weather conditions. Special slow load and monitoring procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when this material is loaded into tanks previously containing gasoline or other low flash point products. To reduce this hazard, receiving containers should always be grounded and the loading nozzle must be kept in contact with the container during the entire filling process. Do not fill any portable container in or on a vehicle without proper bonding.

Extinguishing Media

SMALL FIRE: Use dry chemicals, carbon dioxide (CO₂), foam, water fog, or inert gas (nitrogen). **LARGE FIRE:** Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.

Protection of Fire Fighters

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Combustible Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

Atmospheric Tower Light Gas Oil (AL)

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This combustible liquid should be stored in a separate safety cabinet or room. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, Viton®, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).

General Comments

Warning! Use of this hydrocarbon fuel in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Atmospheric Tower Light Gas Oil (AL)

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Diesel fuel/Kerosene ("A3" Animal Carcinogen)	TWA: 100 (mg/M ³) from ACGIH (TLV) - SKIN [Proposed]
2) Oil mist, mineral	TWA: 5 STEL: 10 (mg/M ³) from ACGIH (TLV)
	TWA: 5 (mg/M ³) from OSHA (PEL)
3) Naphthalene	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) - SKIN
	TWA: 10 STEL: 15 (ppm) from OSHA (PEL) [Proposed]
	TWA: 10 (ppm) from OSHA (PEL)
4) Biphenyl (Diphenyl)	TWA: 0.2 (ppm) from ACGIH (TLV)
	TWA: 0.2 (ppm) from OSHA (PEL) [Proposed]
5) Diesel exhaust, particulate aerodynamic diameter < 1 um ("A2" and "Z2" Suspected Human Carcinogen)	TWA: 0.05 (mg/M ³) from ACGIH (TLV) [Proposed]
	TWA: 0.02 (mg/M ³) from OSHA (PEL) [Proposed]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color Transparent; water-white to slightly yellow.	Odor	Characteristic, kerosene-like.
Specific Gravity	0.82 to 0.84 at 60°F (Water = 1)	pH Not applicable.	Vapor Density	4.5 to 5.0 (Air = 1 at 70°F)
Boiling Point/Range	174° to 293°C (345° to 560°F) [ASTM D-86]		Melting/Freezing Point	< -40°C (-40° F) (ASTM D-2386)
Vapor Pressure	1.6 to 2.0 mm Hg at 20°C (68°F) or 0.1 to 0.5 Reid-psi(a) at 100°F (38°C).		Viscosity (cSt @ 40°C)	1.4 to 2.2 at 40°C (ASTM D-445) and < 8 cSt at -20°C.
Solubility in Water	Negligible to slightly soluble in cold water (0.005 to 0.04%).		Volatile Characteristics	Volatile Organic Compounds (VOCs) Content = 100%; 820 to 830 gm/L.
Additional Properties	Alkane, Isoparaffin, Cycloalkane, and Naphthene Hydrocarbons Content = 69 to 88 Wt. % [ASTM D-1319]; C10-C16 Aromatic Hydrocarbon Content = 12 to 31 Wt. % [ASTM D-1319]; Average Density at 60°F = 6.911 lbs./gallon [ASTM D-2161]; Saybolt Viscosity = 30.6 to 33.3 SUS at 100°F [ASTM D-2161]; Sulfur Content = < 0.3 Wt. % [by ASTM D-2622, D-1552, or D-1266]; 90% Boiling Point Temperature = AP 500°F (260°C) [ASTM D-86]; Dry Point Temperature = AP 555°F (290°C) [ASTM D-86]; Evaporation Rate = AP 0.04 when n-Butyl acetate = 1.0; Net Heat of Combustion Value = > 18,400 Btu/lb. [ASTM D-1405 or D-2382].			

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalies, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide, and oxygen.		
Hazardous Decomposition Products	No substances are readily identified from composition; and, no degradation data is available.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Atmospheric Tower Light Gas Oil (AL)

Kerosine (Petroleum):

ORAL (LD ₅₀):	Acute: > 5,000 mg/kg [Rat screen] - Diarrhea, hypoactivity, and somnolence.
ORAL (LD ₅₀):	Acute: 2,835 mg/kg [Rabbit] - Respiratory stimulation and muscle weakness.
ORAL (LD ₅₀):	Acute: 20 mg/kg [Guinea Pig] - Respiratory stimulation and muscle weakness.
GAS (LC ₅₀):	Acute: > 5,200 mg/L for 4 hours [Rat screen] - Dyspnea.
INTRAVENOUS (LD ₅₀):	Acute: 180 mg/kg [Rabbit] - Respiratory stimulation, tremors, and coma.
INTRATRACHEAL (LD ₅₀):	Acute: 800 mg/kg [Rat] - Convulsions, dyspnea, and cyanosis.
INTRATRACHEAL (LD ₅₀):	Acute: 200 mg/kg [Rabbit] - Convulsions and cyanosis.
INTRAPERITONEAL (LD ₅₀):	Acute: 6,600 mg/kg [Rabbit] - Pulmonary edema, emphysema, and changes to the bronchi.

Naphthalene:

ORAL (LD ₅₀):	Acute: 490 mg/kg [Rat].
ORAL (LD ₅₀):	Acute: 533 mg/kg [Mouse].
ORAL (LD ₅₀):	Acute: 1,200 mg/kg [Guinea Pig].
SUBCUTANEOUS (LD ₅₀):	Acute: 969 mg/kg [Mouse].
INTRAVENOUS (LD ₅₀):	Acute: 100 mg/kg [Mouse].
INTRAPERITONEAL (LD ₅₀):	Acute: 150 mg/kg [Mouse].

Biphenyl (Diphenyl or 1,1'-Biphenyl):

GAS (TCLo):	Acute: 4,400 ug/m ³ for 4 hours [Human] - Flaccid paralysis of peripheral nerves without anesthesia and nausea or vomiting.
ORAL (LD ₅₀):	Acute: > 2,600 mg/kg [Cat screen].
ORAL (LD ₅₀):	Acute: 2,400 mg/kg [Rat and Rabbit].
ORAL (LD ₅₀):	Acute: 1,900 mg/kg [Mouse] - Somnolence, hypermotility, and diarrhea.
DERMAL (LD ₅₀):	Acute: > 5,010 mg/kg [Rabbit screen].
INTRAVENOUS (LD ₅₀):	Acute: 56 mg/kg [Mouse].

Laboratory data associated some mixtures of petroleum hydrocarbons with boiling ranges between 300° and 650°F., commonly referred to as "middle distillates, including kerosine", have caused increased incidence of skin tumors at the site of contact when applied repeatedly (twice per week) over the lifetime of the test animals (12 to 24 months). A few studies have shown that washing the animal's skin with soap and water between applications greatly reduces the carcinogenic effect of these middle distillates. Kerosine has not been identified as a carcinogen by IARC, NTP, or OSHA.

Kerosine produced negative mutagenic responses in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, and the in-vitro Chinese hamster ovary (CHO) sister chromatid exchange (SCE) without activation assay; however, the in-vivo mouse SCE assay and in-vitro S9-activated CHO SCE assay produced positive responses. The significance of these animal study results to human health is unclear.

Similar materials have been associated with liver and kidney damage in subchronic (90-day) inhalation studies with male rats. Also, there are additional studies with mice and rats have shown that some petroleum middle distillate fuels similar to this material have caused liver tumors and kidney damage and/or tumors. But, the kidney effects were sex hormone dependent and not seen in similar studies involving Guinea pigs, dogs, or monkeys. Also, the significance of the liver tumors in rodents is highly speculative relative to humans.

Naphthalene is a potential irritant to eyes, skin, and lungs. Following prolonged and/or repeated exposures, naphthalene has been shown to cause eye damage (cataracts and/or optical neuritis), premature destruction or red blood cells (hemolytic and aplastic anemia), and kidney damage (jaundice), and possibly neurotoxicity. Naphthalene-induced blood disorders in humans are characterized by variability in size, shape, and number of red blood cells, anemia, and decreased hemoglobin. Also, there have been reported anemia deaths amongst children exposed to moth ball (naphthalene) saturated blankets. Peripheral lens opacities occurred in eight of 21 workers exposed to elevated levels of naphthalene vapors for five years. Repeated ingestion of a naphthalene-isopropanol mixture caused tremors, restlessness, hallucinations, and extreme apprehension. Based upon animal studies, naphthalene may cause fetal toxicity or damage and decreased spleen weights in pregnant female mice.

The National Toxicology Program (NTP) recently completed a 2-year inhalation bioassay of naphthalene. The study was conducted in male and female F344/N rats at exposure concentrations of 0, 10, 30, and 60 ppm. No significant effects were observed at the 10 ppm levels. However, compared to chamber controls, there was a dose-related increase in tumors generated at the 30 and 60 ppm levels in both males and females. Higher incidences of respiratory epithelial adenomas, olfactory epithelial neuroblastomas, and non-neoplastic lesions of the nose were observed when compared to chamber controls. Additionally, in cytogenic tests with Chinese hamster ovary cells, naphthalene induced significant increases in sister chromatid exchanges with and without metabolic activation (S9) and chromosomal aberrations with S9. The relevance of these findings to human health is unclear; however, based upon this data, the IARC has determined naphthalene to be possibly carcinogenic to humans (Class 2B).

Atmospheric Tower Light Gas Oil (AL)

Biphenyl (Diphenyl) inhalation overexposures have caused poisoning characterized by liver atrophy and central and/or peripheral nerve damage. Biphenyl vapors have also caused transient nausea, vomiting, flaccid paralysis, and/or bronchitis.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this material, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. If present, volatile aromatic hydrocarbon components (naphthalene and biphenyl) may be released and possibly contribute to the creation of atmospheric smog.

Using Rainbow Trout (*Oncorhynchus mykiss*), Dungeness Crab (*Cancer magister*), and juvenile American Shad (*Squalus cephalus*), similar middle distillates and some of this material's components showed a 96-hour TLms (Median Toxic Limit) of from 5 ppm to 20 ppm in ambient saltwater. Also, 24-hour and 96-hour TLms produced results from 10 ppm to 200 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), and Guppy (*Lebistes reticulatus*) in fresh water. When kerosene was applied to the shell surfaces of bird eggs, decreased hatchability, deformed bills and beaks, and dead embryos resulted. Based upon actual spill incident investigations, similar mixtures have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

Environmental Fate

This material is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, this hydrocarbon oil layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this material, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or toxic (U165) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal.

Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

Atmospheric Tower Light Gas Oil (AL)

SECTION 14: TRANSPORT INFORMATION

DOT Status This material is regulated by the U.S. Department of Transportation (DOT).
Proper Shipping Name Kerosene

This material has a flash point temperature of between 100° and 141°F (38° to 60°C). For bulk shipments, it is classified as a DOT "Flammable Liquid". However, according to 49 CFR 173.120(b)(2) and 173.150(f)(1), this material may be reclassified as a "Combustible Liquid" and exempted from certain transportation-related requirements, such as labeling, when shipped in non-bulk "limited-quantity" containers of less than 119 gallons capacity. According to 49 CFR 173.150(f)(2) and (3), this provision does not apply to "limited-quantities" offered for or transported via vessel or aircraft or products which are defined as DOT "Marine Pollutants". It is recommended that "Flammable Liquid" products which are reclassified be so identified on the bill-of-lading as "Combustible liquid, n.o.s. (Kerosene) or (Decanes, Naphthalene)" with identification number "NA1993".

Hazard Class DOT Class: 3 (Flammable liquid) or Combustible liquid. **Packing Group(s)** PG III
UN/NA ID UN1223 or NA1993

Reportable Quantity A Reportable Quantity (RQ) substance component in this material which might require DOT HAZMAT bill-of-lading display is **Naphthalene**.

Placards

Emergency Response Guide No. 128

HAZMAT STCC No. 49 122 71

MARPOL III Status All impacted components were delisted as DOT "Marine Pollutants" per 66 FR 120 (page 33413) dated 6/21/2001.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.

SARA 302/304 The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.

SARA 311/312 The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories:
Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.

SARA 313 This material contains the following components in concentrations which might be at or above de minimis levels and are listed as a "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313:
Naphthalene [CAS No. 91-20-3] concentration: 1 to 3%
Biphenyl (Diphenyl) [CAS No. 92-52-4] concentration: 1 to 3%.

CERCLA The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. A chemical substance present in this material subject to this statute is: **Naphthalene [CAS No. 91-20-3] (RQ = 100 lbs. [45.36 kg]) concentration: 1 to 3%.**

CWA This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

Atmospheric Tower Light Gas Oil (AL)

**California
Proposition 65**

This material, especially if used as a fuel, might contain detectable levels of the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it might be considered subject to requirements of California Health & Safety Code Section 25249.5: **Naphthalene [CAS No. 91-20-3] concentration: 1 to 3% and Diesel Engine Exhaust (following combustio**

**New Jersey
Right-to-Know Label**

For New Jersey labeling, refer to the components listed in Section 2.

**Additional Regulatory
Remarks**

Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13): This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a from suitable for use in the household or by children. Precautionary label dialogue should display the following: **Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children!**

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following component of this material as "Volatile Organic Compound (VOC)" which contributes significantly to air pollution which endangers public health and welfare": **Biphenyl (Diphenyl) [CAS No. 92-52-4].**

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid.
Color Black **Odor** Slight burnt or cracked oil

WARNING! Vapors and fumes may be hazardous or fatal!
Long-term heated storage (100° to 150°F) might evolve hydrogen sulfide, a flammable, toxic, sensitizing, and potentially deadly gas!
When heated, may cause thermal burns on contact! If hot product contacts water, a violent eruption of steam and vapor may occur!
Vapor may severely irritate the eyes and respiratory tract!
Liquid contact may cause minimal eye and/or mild to moderate skin irritation and inflammation!
Contains 4- to 6-membered condensed-ring (polynuclear) aromatic hydrocarbons (PNAs), and possibly carbozoles!
May cause skin cancer following extended contact!
May be harmful to target organs and/or adversely affect reproduction if absorbed through the skin! Wash thoroughly after handling.
Spills may create a slipping hazard!

SECTION 1: IDENTIFICATION

Trade Name	Fluid Unit Fresh Feed	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	3228432284	Medical Emergency	(918) 495-4700
CAS Number	Mixture—See Section 2	CHEMTREC Emergency	(800) 424-9300
Product Family	Mixture of Petroleum Hydrocarbon Medium and Heavy Distillates		
Synonyms	Fluid Catalytic Cracker Unit (FCCU) Feedstock, Cat Cracker Feedstock, Fluid Unit Fresh Feed, Medium and Heavy Vacuum Gas Oil Blend, MVGO/HVGO Mix, Intermediate and Heavy Vacuum Distillates, Vacuum Tower Sidestreams, Hydrodesulfurized Gas Oil Blend; Unfinished Heavy Oil or Bunker Fuel, 634 HDS Unit Product; 533 Crude Still Resid, C-13-C50 Petroleum Hydrocarbons		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Heavy Vacuum Gas Oil (Petroleum)	64741-57-7	0-100
2) Hydrodesulfurized Heavy Vacuum Gas Oil (Petroleum)	64742-86-5	0-100
3) Hydrodesulfurized Atmospheric Tower Residue (Petroleum)	64742-78-5	0-100
4) Intermediate Vacuum Distillate (Petroleum)	70592-76-6	0-50
5) Hydrodesulfurized Light Vacuum Gas Oil (Petroleum)	64742-87-6	0-50
6) C-13-C50 Saturated Hydrocarbons and Naphthenes	Mixture	85-95
7) Polynuclear Aromatic Hydrocarbons (4- to 6-member condensed-ring type)	68487-58-6	5-15

Fluid Unit Fresh Feed

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye Contact. Absorption. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	May be harmful or fatal if inhaled ¹ . Inhalation of the vapor or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath and may cause transient central nervous system (CNS) depression. The National Institute for Occupational Safety and Health has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health. Concentrations of H ₂ S at or below 250 ppm may cause respiratory tract irritation and pulmonary edema. H ₂ S concentrations between 250 ppm and 500 ppm may result in headache, nausea, disorientation, irregular heartbeat, and/or low blood pressure. At greater than 500 ppm, H ₂ S causes sudden collapse, unconsciousness, and respiratory paralysis leading to convulsions, coma, and/or death. (See Section 11.)
Eye Contact	Upon direct contact, hot material may cause severe thermal burns. Animal test results on similar unheated materials suggest that this product may cause minimal eye irritation upon short-term exposure. Symptoms include stinging, watering, and redness. H ₂ S vapors may cause moderate to severe eye irritation and photophobia (sensitivity to light).
Skin Contact	Skin contact with hot material may result in severe thermal burns. Animal test results on similar materials suggest that this material can cause mild to moderate skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate dermatitis and/or more serious skin disorders. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and/or severe tissue damage. Based upon a similar product's animal test results, a mild allergic skin response may be expected on some sensitive individuals following repeated exposures.
Ingestion	Contact with hot material may cause thermal burns. If swallowed, no significant adverse health effects are anticipated; however, this material can cause a laxative effect. Ingestion of large quantities can cause intestinal obstruction.
Chronic Health Effects Summary	This mixture's various vacuum and hydrosulfurized distillate components are heavy distillates similar to those shown to produce skin tumors and adverse effects in the liver and kidneys of laboratory animals following prolonged and repeated applications. All tumors appeared at the site of application. Toxic effects are unlikely to occur if good personal hygiene is practiced. Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H ₂ S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures. (See Section 11.)
Conditions Aggravated by Exposure	Personnel with pre-existing nervous system disease, cardiac or neurological conditions, skin disorders, impaired lung, liver, kidney, or spleen function, or chronic respiratory diseases should avoid exposure.
Target Organs	This substance is toxic to lungs, nervous systems, brain, mucous membranes, skin, eyes, and possibly, the liver, kidneys, spleen, and testes.
Carcinogenic Potential	This material is a mixture of vacuum distillates and contains polynuclear aromatic hydrocarbons at above 0.1%. It is considered carcinogenic by IARC, NTP, and OSHA. (See Section 11.)

Fluid Unit Fresh Feed

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If hot material is splashed into eyes, irrigate with large amounts of room-temperature water. Seek medical attention immediately. If ambient temperature material is splashed into eyes, check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	If burned by hot material, cool skin by quenching with large amounts of cool water. Do not remove material from the skin. Seek medical attention immediately. For contact at ambient temperatures, remove contaminated shoes and clothing. Wipe off excess material. Wash exposed skin with soap and water. If tissue appears damaged or if irritation or pain persists, apply a clean dressing and seek medical attention. Do not use ointments. Thoroughly clean contaminated clothing before reuse. Discard contaminated leather goods.
Ingestion	Do not induce vomiting or give anything by mouth. Rinse out mouth with water. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Do not leave victim unattended. Allow small quantities to pass through system. If large amounts are swallowed or irritation or discomfort occurs, seek medical attention immediately.
Notes to Physician	Inhalation overexposure can produce toxic effects. Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients. If only cough or difficulty in breathing develop, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis using pulmonary function tests and chest x-rays. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required. This material may affect the hematopoietic system or cause hepatotoxicity and/or nephrotoxicity. A complete blood count, liver function tests, renal function tests and urinalysis are suggested for significant exposures. In addition, monitoring arterial blood gases is suggested for significant exposures.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IIIB Liquid. Slightly combustible!		
Flash Point Method	CLOSED CUP: AP 175°C (347°F) (Pensky-Martens Closed Cup [ASTM D-93]).		
Lower Flammable Limit	AP 0.9 to 4%	Upper Flammable Limit	AP 7 to 44%
Autoignition Temperature	AP 260° to 455°C (500° to 850°F)		
Hazardous Combustion Products	Burning or excessive heating may produce carbon monoxide, carbon dioxide, and possibly smoke, fumes, unburned hydrocarbons, and oxides of sulfur and nitrogen.		

Fluid Unit Fresh Feed**Special Properties**

This material releases vapors at or approaching its flash point temperature. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Mists or sprays may be flammable at temperatures below the flash point. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.

If stored under heat for extended periods or significantly agitated, this material might evolve or release **hydrogen sulfide**, a flammable gas, which can raise and widen this material's actual flammability limits and significantly lower its autoignition temperature (See Section 7)

Extinguishing Media

SMALL FIRE: Use dry chemicals, carbon dioxide (CO₂), foam, water fog, or inert gas (nitrogen). **LARGE FIRE:** Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. **NEVER** use a water jet directly on the fire because it may spread the fire to a larger area.

Fire Fighting Protective Clothing

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat, cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Evacuate non-essential personnel and remove all ignition sources. Carefully contain spill and stop source of spill if it can be done without risk. Do not touch or walk through spilled material. Allow material to cool. Cleanup crews must wear proper heat-resistant protective clothing. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce heat or disperse vapors, but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create a fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE**Handling**

Avoid water contact or contamination, especially when heated. Do not handle hot material, if possible. Handle material as close to ambient temperatures as feasible. Avoid contact with oxidizing agents. Do not breathe vapor and avoid repeated or prolonged skin contact. Use only with adequate ventilation and personal protection. Wash thoroughly after handling. Prevent contact with food, chewing, and smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner.

Fluid Unit Fresh Feed

Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and properly labeled. Keep away from all ignition sources! Do not store with strong oxidizing agents. **Hydrogen sulfide** vapors may be evolved from long-term heated storage and/or agitated transport. H₂S is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking (See appropriate API and NACE standards.) Where H₂S is routinely stored, install monitoring equipment or system with alarms.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION**Engineering Controls**

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

**Eye Protection**

Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).

General Comments

WARNING! Do not use this material as a fuel without adequate ventilation. Inadequate ventilation can result in hazardous levels of combustion products and inadequate oxygen levels for breathing. Odor is not adequate to warn of hazardous conditions.

The standards for "coal tar pitch volatiles, as benzene solubles" are based upon coal coking, not upon petroleum-derived oils. However, in 29 CFR 1910.1200.1002, OSHA has defined "coal tar pitch volatiles" to include the fused polycyclic hydrocarbons which volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood and other organic matter. Accordingly, the coal tar pitch volatile standard may apply to the aerosol form of this material. The "hydrogen sulfide" standards apply only to vapors evolved from long-term heated storage and/or transport.

Occupational Exposure Guidelines**Substance****Applicable Workplace Exposure Levels**

1) Hydrogen sulfide	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) [1999] TWA: 5 (ppm) from ACGIH (TLV) [Proposed for 2000]
2) Oil mist, mineral	TWA: 10 STEL: 15 CEIL: 20 (ppm) from (PEL) OSHA [1989] TWA: 5 STEL: 10 (mg/M ³) from ACGIH (TLV) [1999] TWA: 5 (mg/M ³) from OSHA (PEL) [1976]
3) Coal tar pitch volatiles, as benzene solubles ("A1" Confirmed Human Carcinogen)	TWA: 0.2 (mg/M ³) from ACGIH (TLV) [1999] TWA: 0.2 (mg/M ³) from OSHA (PEL) [1989]
4) Oil mist, mineral, sum total of 15 PAHs listed as carcinogens by US NTP	TWA: 0.005 (mg/M ³) from ACGIH (TLV) [Proposed for 2000.]

Fluid Unit Fresh Feed

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color	Black.	Odor	Slight burnt or cracked oil.
Specific Gravity	0.94 to 0.98 at 60°F (Water = 1)	pH	Not applicable	Vapor Density	GT 10 (Air = 1 at 70°F)
Boiling Point/Range	230° to 600°C (446° to 1,112°F) (ASTM D-86)	Melting/Freezing Point		24° to 49°C (75° to 120°F) (ASTM D-97)	
Vapor Pressure	LT 0.1 Reid-psia at 38°C (100°F).	Viscosity (cSt @ 40°C)		250 to 450 (ASTM D-445)	
Solubility in Water	Negligible in cold water (LT 0.001%)	Volatile Characteristics		Negligible, no Volatile Organic Compounds (VOCs) present at 438°F (225°C)	
Additional Properties	Alkane, Isoparaffin, Cycloalkane, and Naphthene Hydrocarbons Content = 85 to 95 Wt.% (ASTM D-1319); C13-C50 Aromatic Hydrocarbon Content = 5 to 15 Wt.% (ASTM D-1319); Average Density at 60°F = 7.995 lbs./gal. (ASTM D-2161); Saybolt Viscosity = 1,000 to 2,500 SUS at 100°F (ASTM D-2161); 90% Boiling Point Temperature = 1,025° to 1,075°F (552° to 580°C) (ASTM D-86); Evaporation Rate = LT 0.01 when n-Butyl acetate = 1.0				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen.		
Hazardous Decomposition Products	Composition suggests that sulfur and nitrogen compounds might be generated; but, no degradation data is available.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Hydrogen sulfide.

- GAS (TCLo): Acute: 10 ppm for 15 minutes [Human] - Eye irritation.
- GAS (TCLo): Acute: 50 to 100 ppm for 15 minutes [Human] - Respiratory irritation.
- GAS (LC₁₀₀): Acute: 600 to 750 ppm for 30 minutes [Human] - Respiratory paralysis and death.
- GAS (LCLo): Acute: 5,700 ug/kg for 8 hours [Human] - Chronic pulmonary edema, coma, and death

This mixture of **vacuum distillates** has not been tested for its acute or subchronic toxicity characteristics

Laboratory data associated some **mixtures of petroleum hydrocarbons with boiling ranges between 650° and 1,100°F.**, commonly referred to as "**heavy distillates**", including all this mixture's various **vacuum and hydrodesulfurized distillate components** have caused increased incidence of skin tumors at the site of contact when applied repeatedly (twice per week) over the lifetime of the test animals (12 to 24 months). A few studies have shown that washing the animal's skin with soap and water between applications greatly reduces the carcinogenic effect of these **heavy distillates**

The International Agency for Research on Cancer (IARC) has specifically evaluated **high-boiling untreated and vacuum distillates, including these vacuum distillates**, and determined them to be carcinogenic to experimental animals, and potentially humans. Also, the National Toxicology Program (NTP), U.S. Environmental Protection Agency (EPA), and American Conference of Governmental Industrial Hygienists (ACGIH) have independently classified various **polynuclear aromatic hydrocarbon (PNA) compounds** present in this product as "confirmed human (A1), suspected human (A2), or animal carcinogens (A3)".

This material contains **polycyclic aromatic hydrocarbons (PHAs or PNAs)**, some of which have been reported to cause skin cancer on humans under conditions of poor personal hygiene, prolonged/repeated contact, and exposure to sunlight. This material may also contain **alkyl- and alkylbenzocarbozoles** which if absorbed through the skin might be responsible, in whole or part, for systemic toxicity to the liver, kidneys, spleen, and/or testes based upon limited laboratory animal studies.

Fluid Unit Fresh Feed

Untreated (straight-run) crude petroleum fractions with similar boiling point ranges produced negative mutagenic responses in the Salmonella/microsome (Ames) assay, the cell transformation assay with and without S9 activation, the in-vivo mouse sister chromatid exchange (SCE) assay, and the in-vivo rat unscheduled DNA synthesis assay; however, the unscheduled DNA synthesis in rat hepatocyte cultures assay produced mixed positive and negative responses and the in-vitro Chinese hamster ovary (CHO) SCE assay with and without S9 activation produced positive responses. The significance of these animal study results to human health is unclear.

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (LT 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (GT 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this heavy distillate, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. This material is estimated to have a slow rate of biodegradation. Based upon spill investigation analysis, oils containing **polynuclear aromatic hydrocarbon compounds** similar to this material were shown to bioaccumulate in tissues of various aquatic organisms.

Environmental Fate

This heavy distillate is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components gradually evaporating. In stagnant or slow-flowing waterways, this hydrocarbon oil layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase slowly. This material is slowly biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment with plenty of agitation. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this material, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol %, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds.

Conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

Fluid Unit Fresh Feed

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is not regulated by the U S Department of Transportation (DOT).		
Proper Shipping Name	Petroleum oil, N.O.I.B N		
Hazard Class	Not a DOT controlled material	Packing Group(s)	Not applicable
		UN/NA ID	Not applicable
Reportable Quantity	Not applicable.		
Placards		Emergency Response Guide No.	Not applicable
		HAZMAT STCC No.	Not applicable.
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. A minor component substance of this material subject to the reporting requirements under this statute is: Chrysene (Benzo[a]phenanthrene) [CAS No. 218-01-9] .
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2 This material would be classified under the following hazard categories Acute (Immediate) and Chronic (Delayed) Health Hazards.
SARA 313	This material does not contain any components in concentrations which are at or above de minimis levels and listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4 As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4 Chemical substances present in this material subject to this statute are: Chrysene (Benzo[a]phenanthrene) [CAS No. 218-01-9] (RQ = 100 lbs. [45.36 kg]) conc.: 0.003 to 0.015% 7,12-Dimethylbenz[a]anthracene [CAS No. 57-97-6] (RQ = 1 lb. [0.4536 kg]) conc.: 0.001 to 0.003% Benzo[a]pyrene [CAS No. 50-32-8] (RQ = 1 lb. [0.4536 kg]) concentration: 0.0005 to 0.003% Benzo[b]fluoranthene [CAS No. 205-99-2] (RQ = 1 lb. [0.4536 kg]) concentration: 0.0005 to 0.002% Indeno[1,2,3-c,d]pyrene [CAS No. 193-39-5] (RQ = 100 lbs. [45.36 kg]) concentration: 0.0005 to 0.002% Hydrogen sulfide [CAS No. 7783-06-4] (RQ = 100 lbs. [45.36 kg]) concentration: 0 to 0.001%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA) Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material contains low level concentrations of the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it might be subject to requirements of California Health & Safety Code Section 25249.5: Chrysene (Benzo[a]phenanthrene) [CAS No. 218-01-9] 5-Methylchrysene [CAS No. 3697-24-3] 7,12-Dimethylbenz[a]anthracene [CAS No. 57-97-6] Benzo[a]pyrene [CAS No. 50-32-8] Benzo[b]fluoranthene [CAS No. 205-99-2] Benzo[j]fluoranthene [CAS No. 205-82-3] Indeno[1,2,3-c,d]pyrene [CAS No. 193-39-5].

Fluid Unit Fresh Feed**New Jersey
Right-to-Know Label**

For New Jersey labeling refer to components listed in Section 2

**Additional Regulatory
Remarks**

No additional regulatory remarks.

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

MATERIAL SAFETY DATA SHEET

THERMOCRACKED RESIDUE (C20+ HYDROCARBONS)

MSDS No.
R50401Rev. Date
01/29/86

ARCO PRODUCTS COMPANY
DIVISION OF ATLANTIC RICHFIELD COMPANY
1055 WEST SEVENTH STREET
LOS ANGELES, CALIFORNIA 90051

IMPORTANT: Read this MSDS before handling and disposing of this product and pass this information on to employees, customers, and users of this product

This product is considered a hazardous chemical under the OSHA Hazard Communication Rule.

I. General			
Trade Name	THERMOCRACKED RESIDUE (C20+ HYDROCARBONS)	Telephone Numbers	
Other Names	COCKER HEATER FEED	EMERGENCY 213/484-5151 LA POISON 800/424-9300 CHEMTREC CUSTOMER SERVICE 800/322-2726 INFO ONLY	
Chemical Family	PETROLEUM HYDROCARBONS	DOT Hazardous Materials Proper Shipping Name NOT DEFINED AS A "HAZARDOUS MATERIAL"	
Generic Name	THERMOCRACKED RESIDUUM (PETROLEUM)	DOT Hazard Class NOT REGULATED	
CAS No.	64741-80-6*	Company ID No.	064741806*
		UN/NA ID No.	NOT REGULATED
II. DANGER Summary of Hazards			
<p>VAPOR MAY BE HAZARDOUS OR FATAL! (SEE SECTIONS IV., VI., AND XI.) AVOID BREATHING VAPORS AND FUMES. HOT MATERIAL MAY EMIT HYDROGEN SULFIDE (H₂S), A FLAMMABLE, TOXIC, AND POTENTIALLY DEADLY GAS. POSSIBLE SKIN CANCER HAZARD BASED ON TESTS WITH LABORATORY ANIMALS!* MAY CAUSE IRRITATION AND/OR MAY BE HARMFUL IF ABSORBED THROUGH THE SKIN! AVOID EYE CONTACT AND PROLONGED AND/OR REPEATED SKIN CONTACT. WASH THOROUGHLY AFTER HANDLING. MAY CAUSE THERMAL BURNS! PRODUCT IS NORMALLY HANDLED HOT (AP 100 F. TO 200 F.). WEAR PROPER PROTECTIVE CLOTHING/EQUIPMENT.</p> <p style="text-align: center;">*CONTAINS 4- TO 6-MEMBERED CONDENSED-RING AROMATIC HYDROCARBONS. (SECT. IV.)</p>			
III. Fire and Explosion			
Flash Point (Method)	Autoignition Temperature (Method)	Flammable Limits (% Vol. in Air) At Normal Atmospheric Temperature and Pressure	
GT 250° F (D-93) SEE "FIRE & EXPLOSION HAZARDS"	AP 765° F (E-659) BASED ON NFPA "FUEL OIL NO. 6"	Lower AP 1.0 Upper AP 5.0 BASED ON NFPA, "FUEL OIL NO. 6"	
Fire and Explosion Hazards	SLIGHTLY COMBUSTIBLE! OSHA/NFPA CLASS-IIIB COMBUSTIBLE LIQUID. WHEN HEATED ABOVE THE FLASH POINT, THIS PRODUCT MAY RELEASE FLAMMABLE VAPORS WHICH CAN BURN IN THE OPEN OR BE EXPLOSIVE IN CONFINED SPACES IF EXPOSED TO AN IGNITION SOURCE. MISTS OR SPRAYS MAY BE FLAMMABLE AT LOWER TEMPERATURES. TO AVOID STEAM EXPLOSION HAZARDS, DO NOT HEAT ABOVE 200° F.		
Extinguishing Media	DRY CHEMICAL, HALON, AND CARBON DIOXIDE. FOAM AND WATER FOG ARE EFFECTIVE, BUT MAY CAUSE FROTHING.		
Special Firefighting Procedures	FOR FIRES INVOLVING THIS MATERIAL, DO NOT ENTER ANY ENCLOSED OR CONFINED FIRE SPACE WITHOUT PROPER PROTECTIVE EQUIPMENT. THIS MAY INCLUDE SELF-CONTAINED BREATHING APPARATUS TO PROTECT AGAINST THE HAZARDOUS EFFECTS OF COMBUSTION PRODUCTS AND OXYGEN DEFICIENCIES. COOL TANKS AND CONTAINERS EXPOSED TO FIRE WITH WATER. IMPROPER USE OF WATER AND EXTINGUISHING MEDIA CONTAINING WATER MAY CAUSE FROTHING WHICH CAN SPREAD THE FIRE OVER A LARGER AREA.		

IV. Health Hazards

Summary of Acute Hazards EYE AND SKIN BURNS CAN RESULT FROM CONTACT WITH HEATED MATERIAL. LIQUID, MIST, OR VAPOR CONTACT CAN IRRITATE EYES, SKIN, AND RESPIRATORY TRACT.

ROUTE OF EXPOSURE	SIGNS AND SYMPTOMS	Primary Route(s)
Inhalation	HYDROGEN SULFIDE GAS EVOLVED WHEN STORED/HANDLED AT ELEVATED TEMPERATURES MAY CAUSE IRRITATION AND/OR SYSTEMIC EFFECTS. DEPENDING ON EXPOSURE, LIGHT COMPONENT VAPORS MAY CAUSE SYMPTOMS OF CENTRAL NERVOUS SYSTEM DEPRESSION.	<input checked="" type="checkbox"/>
Eye Contact	N/DA BUT EYE IRRITATION MAY RESULT FROM VAPORS AND/OR LIQUID CONTACT. UPON DIRECT CONTACT, HOT MATERIAL WILL CAUSE SEVERE THERMAL BURNS. HYDROGEN SULFIDE GAS CAN CAUSE EYE IRRITATION.	<input checked="" type="checkbox"/>
Skin Absorption	N/DA BUT AFTER PROLONGED OR REPEATED CONTACT WITH LARGE AMOUNTS OF THIS MATERIAL, ABSORPTION THROUGH THE SKIN MAY OCCUR AND PRODUCE TOXIC EFFECTS.	<input type="checkbox"/>
Skin Irritation	N/DA BUT SKIN IRRITATION MAY OCCUR. MORE SERIOUS SKIN DISORDERS MAY OCCUR UPON PROLONGED OR REPEATED SKIN CONTACT. CONTACT WITH HOT MATERIAL MAY CAUSE THERMAL BURNS.	<input checked="" type="checkbox"/>
Ingestion	N/DA BUT NO SIGNIFICANT SIGNS OR SYMPTOMS INDICATIVE OF ANY ADVERSE HEALTH EFFECTS ARE EXPECTED UPON SHORT-TERM EXPOSURE.	<input type="checkbox"/>

Summary of Chronic Hazards and Special Health Effects HYDROGEN SULFIDE, AN IRRITANT GAS AT 5 PPM CONCENTRATION AND ABOVE CAN CAUSE SYSTEMIC TOXICITY. AT CONCENTRATIONS GREATER THAN 500 PPM, RAPID DEATH DUE TO RESPIRATORY PARALYSIS CAN OCCUR. MINIMIZE EMPLOYEE EXPOSURE! SIMILAR HEAVY OILS HAVE PRODUCED SKIN TUMORS ON LABORATORY ANIMALS FOLLOWING PROLONGED AND REPEATED APPLICATION. PERSONNEL WITH PRE-EXISTING SKIN DISORDERS OR CHRONIC RESPIRATORY DISEASES SHOULD AVOID EXPOSURE TO THIS PRODUCT.

V. Protective Equipment and Other Control Measures

Respiratory	FOR VAPOR/MIST CONCENTRATIONS ABOVE EXPOSURE LIMITS IN SECTION VI, USE A NIOSH/MSHA APPROVED ORGANIC VAPOR/MIST, SUPPLIED-AIR, OR SELF-CONTAINED AIR RESPIRATOR. RESPIRATOR USE SHOULD FOLLOW OSHA 29 CFR 1910.134 OR EQUIVALENT
Eye	WEAR EYE PROTECTION. IN THE LIKELIHOOD OF SPLASHING OR SPRAYING, AND ESPECIALLY IF MATERIAL IS HOT, WEAR GOGGLES AND/OR FACE SHIELD. EYE WASH WATER SHOULD BE AVAILABLE.
Skin	WHEN SKIN CONTACT IS POSSIBLE, AND ESPECIALLY WHEN HANDLING HOT MATERIAL, PROTECTIVE CLOTHING SUCH AS IMPERVIOUS HEAT-RESISTANT GLOVES, IMPERVIOUS APRON, LONG-SLEEVES, BOOTS, GOGGLES AND/OR FACE SHIELD MUST BE WORN.
Engineering Controls	USE ADEQUATE VENTILATION TO KEEP OIL MISTS/VAPORS BELOW EXPOSURE CONTROL LEVELS SHOWN IN SECTION VI. (ALSO SEE SECTION XI.) SPECIAL VENTILATION MAY BE REQUIRED FOR HANDLING CONDITIONS AT ELEVATED TEMPERATURES.
Other Hygienic and Work Practices	EMERGENCY EYE WASH FOUNTAINS AND SAFETY SHOWERS SHOULD BE AVAILABLE IN THE VICINITY OF ANY POTENTIAL EXPOSURE. OBTAIN, STUDY, AND FOLLOW RECOMMENDATIONS MADE ON MSDS CONCERNING HYDROGEN SULFIDE AND OTHER PETROLEUM RESIDUA. RESPIRATOR USE SHOULD COMPLY WITH OSHA STANDARD 29 CFR 1910.134 OR EQUIVALENT. SEE SECTION XI. FOR ADDITIONAL INFORMATION.

VI. Occupational Exposure Limits

Substance	Source	Date	Type	Value/Units	Time
HYDROGEN SULFIDE (SEE SECTION XI.)	ACGIH	1988	TWA	10 PPM	8 HRS
			STEL	15 PPM	15 MIN
PPAH (BENZENE SOLUBLES) SEE SECTION XI.	ACGIH	1988	TWA	0.2 MG/M3	8 HRS
			CTPV (BENZENE SOLUBLES) SEE SECTION XI.	OSHA	1988
OIL MIST, MINERAL (SEE SECTION XI.)	ACGIH	1988	TWA	5 MG/M3	8 HRS
			STEL	10 MG/M3	15 MIN
HYDROGEN SULFIDE	OSHA	1989	PEL	10 PPM	8 HRS
			STEL	15 PPM	15 MIN

THERMOCRACKED RESIDUE (C20+ HYDROCARBONS)

MSDS No.
RS0401
Rev. Date
01/29/86**VII. Emergency and First Aid**

Inhalation IMMEDIATELY MOVE PERSONNEL TO AREA OF FRESH AIR. FOR RESPIRATORY DISTRESS, GIVE AIR, OXYGEN, OR ADMINISTER CPR (CARDIOPULMONARY RESUSCITATION), IF NECESSARY. OBTAIN MEDICAL ATTENTION IF BREATHING DIFFICULTIES CONTINUE.

Eye Contact FLUSH EYES WITH CLEAN, LOW-PRESSURE WATER FOR AT LEAST 15 MINUTES OCCASIONALLY LIFTING THE EYELIDS. IF PAIN OR REDNESS PERSISTS AFTER FLUSHING, OBTAIN MEDICAL ATTENTION.

Skin Contact REMOVE CONTAMINATED CLOTHING. REMOVE/BRUSH EXCESS MATERIAL FROM CONTAMINATED AREA; THEN FLUSH SKIN WITH SOAP AND WATER.

Ingestion RINSE MOUTH WITH WATER. DRINK 1-2 GLASSES OF WATER OR MILK. DO NOT INDUCE VOMITING UNLESS DIRECTED BY MEDICAL PERSONNEL. OBTAIN MEDICAL ATTENTION.

Emergency Medical Treatment Procedures SEE ABOVE PROCEDURES.

VIII. Spill and Disposal

Precautions if Material is Spilled or Released CONTAIN SPILL. REMOVE ALL IGNITION SOURCES AND SAFELY STOP FLOW OF SPILL. SPILL MAY CREATE SLIPPING HAZARDS. PREVENT FROM ENTERING ALL BODIES OF WATER, IF POSSIBLE. EVACUATE ALL NON-ESSENTIAL PERSONNEL. IN URBAN AREAS, CLEANUP AS SOON AS POSSIBLE; IN NATURAL ENVIRONMENTS, CLEANUP ON ADVICE FROM ECOLOGISTS. THIS MATERIAL WILL FLOAT ON WATER. ABSORBANT MATERIAL AND PADS CAN BE USED. COMPLY WITH ALL APPLICABLE LAWS. SPILLS MAY NEED TO BE REPORTED TO THE NATIONAL RESPONSE CENTER (800/424-8802). THE SPILLED MATERIAL AND ANY WATER OR SOIL WHICH IT HAS CONTACTED MAY BE HAZARDOUS TO ANIMAL/AQUATIC LIFE.

Waste Disposal Methods MAXIMIZE PRODUCT RECOVERY FOR REUSE OR RECYCLING. CONDITIONS OF USE MAY CAUSE THIS MATERIAL TO BECOME A "HAZARDOUS WASTE" AS DEFINED BY STATE OR FEDERAL LAWS. USE APPROVED TREATMENT, TRANSPORTERS, AND DISPOSAL SITES IN COMPLIANCE WITH ALL LAWS. IF SPILL IS INTRODUCED INTO A WASTEWATER SYSTEM, THE CHEMICAL AND BIOLOGICAL OXYGEN DEMAND WILL LIKELY INCREASE. SPILL MATERIAL IS BIODEGRADABLE IF GRADUALLY EXPOSED TO MICROORGANISMS. POTENTIAL TREATMENT AND DISPOSAL METHODS INCLUDE LAND FARMING, INCINERATION, AND LAND DISPOSAL, IF PERMITTED.

IX. Components (This may not be a complete list of components)

Component Name	CAS No.	Carcinogen##	Composition amount (Vol.) (See Qualification on Page 4)
THERMAL CRACKED RESIDUUM (PETROLEUM) WHICH CONTAINS:	64741-80-6*	N/AP EQ	100 PERCENT
HYDROGEN SULFIDE (THIS MATERIAL IS LIKELY TO CONTAIN GREATER THAN 5 WEIGHT PERCENT OF 4- TO 6-MEMBERED CONDENSED-RING AROMATIC HYDROCARBONS.)	7783-06-4	N/AP LT	1 PERCENT
		N/AP	

##Listed By: 1 = NTP, 2 = IARC, 3 = OSHA, 4 = Other

Compositions given are typical values, not specifications.

X. Physical and Chemical Data

Boiling Point GT 500° F	Viscosity Units, Temp. (Method) AP 900 TO 9000 SUS AT 100° F (D2161)	Dry Point N/AP
Freezing Point N/AP	Vapor Pressure (REID-PSIA AT 100° F) LT 1.0	Volatile Characteristics SLIGHT
Specific Gravity (H₂O = 1 at 39.2° F) AP 0.95 TO 1.00	Vapor Sp. Gr. (Air = 1.0 at 60° - 90° F) AP 7	Solubility in Water NEGLIGIBLE
Hazardous Polymerization NOT EXPECTED TO OCCUR	Other Chemical Reactivity N/P	pH N/AP
Hazardous Polymerization NOT EXPECTED TO OCCUR	Other Chemical Reactivity N/P	Stability STABLE
Other Physical and Chemical Properties	BLENDED TO MEET REGULATORY & CUSTOMER REQUIREMENTS INCLUDING VISCOSITY, POUR, SULFUR, & HEAVY METALS.	
Appearance and Odor	BROWN TO BLACK-COLORED, VISCOUS LIQUID; SLIGHTLY CRACKED OR BURNT TO ASPHALTIC ODOR.	
Conditions to Avoid	EXTREME HEAT AND OPEN FLAME.	
Materials to Avoid	STRONG ACIDS, ALKALIES, AND OXIDIZERS SUCH AS LIQUID CHLORINE AND OXYGEN.	
Hazardous Decomposition Products	BURNING OR EXCESSIVE HEATING MAY PRODUCE CARBON MONOXIDE AND OTHER HARMFUL GASES/VAPORS INCLUDING OXIDES AND/OR OTHER COMPOUNDS OF SULFUR AND NITROGEN, POSSIBLY HYDROGEN SULFIDE AND METALS.	

XI. Additional Precautions

Handling, Storage and Decontamination Procedures	PARTS AND EQUIPMENT USING OR CONTAINING THIS MATERIAL SHOULD BE STEAM-CLEANED IF POSSIBLE PRIOR TO ALL MAINTENANCE PROCEDURES. ALL MATERIAL SAMPLING SHOULD BE CONDUCTED IN A MANNER WHICH AVOIDS VAPOR INHALATION OR SKIN CONTACT. HYDROGEN SULFIDE VAPORS MAY ACCUMULATE IN TANKS AND TRANSPORT COMPARTMENTS. AVOID BREATHING VAPORS WHEN OPENING HATCHES AND DOME COVERS BY STAYING UPWIND, VENTING SLOWLY, AND KEEPING YOUR FACE AWAY FROM COMPARTMENT OPENINGS. USE ONLY IN A WELL-VENTILATED AREA! HYDROGEN SULFIDE ODOR IS NOT RELIABLE AS A WARNING OF POSSIBLE OVEREXPOSURE!		
General Comments	HANDS OR OTHER POTENTIAL SKIN CONTACT AREAS SHOULD BE WASHED WITH SOAP AND WATER WHEN LEAVING WORK. WASH HANDS BEFORE EATING, DRINKING, SMOKING, OR USE OF TOILET FACILITIES. TAKE A SHOWER AFTER WORK IF GENERAL CONTACT OCCURS. REMOVE CONTAMINATED CLOTHING AND LAUNDRY BEFORE REUSE. DISCARD CONTAMINATED LEATHER GLOVES AND SHOES IF LAUNDERING IS INADEQUATE.		
General Comments	SOME OSHA PERMISSIBLE EXPOSURE LIMITS ARE NOT SHOWN IN SECTION VI BECAUSE THEY ARE LESS RESTRICTIVE THAN THE ACGIH EXPOSURE LIMITS ALREADY LISTED. SINCE SPECIFIC EXPOSURE STANDARDS/CONTROL LIMITS HAVE NOT BEEN ESTABLISHED FOR THIS MATERIAL, THE EXPOSURE LIMITS SHOWN IN SECTION VI ARE SUGGESTED AS MINIMUM CONTROL GUIDELINES. THE STANDARDS FOR PARTICULATE POLYCYCLIC AROMATIC HYDROCARBONS (PPAH) AND COAL TAR PITCH VOLATILES (CTPV) (AS BENZENE SOLUBLES) ARE BASED UPON COAL COKING, NOT UPON PETROLEUM HEAVY FUEL OILS. THESE TWO EXPOSURE LIMITS APPLY ONLY TO THE AEROSOL FORM OF THIS PRODUCT.		
General Comments	THE INFORMATION AND CONCLUSIONS HEREIN REFLECT NORMAL OPERATING CONDITIONS AND MAY BE FROM SOURCES OTHER THAN DIRECT TEST DATA ON THE MIXTURE ITSELF.		
Note	Qualifications:	EQ = Equal LT = Less Than GT = Greater Than	AP = Approximately UK = Unknown TR = Trace

FIRE HAZARD

SECTION 313
NO CHEMICALS IN THIS PRODUCT EXCEED THE DE MINIMUS REPORTING LEVEL ESTABLISHED BY SARA
TITLE III, SECTION 313 AND 40 CFR 372.

TOXIC SUBSTANCES CONTROL ACT (TSCA)
ALL COMPONENTS OF THIS PRODUCT ARE LISTED ON THE TSCA INVENTORY.

COMPREHENSIVE ENVIRONMENTAL RESPONSE, COMPENSATION AND LIABILITY ACT (CERCLA)
THIS PRODUCT CONTAINS THE FOLLOWING CHEMICALS SUBJECT TO THE REPORTING REQUIREMENTS OF CERCLA:
REPORTABLE QUANTITY (RQ), LBS
HYDROGEN SULFIDE 100#/45.4KG

CALIFORNIA SAFE DRINKING WATER AND TOXIC ENFORCEMENT ACT OF 1986 - PROPOSITION 65
BASED ON INFORMATION CURRENTLY AVAILABLE, THIS PRODUCT IS NOT KNOWN TO CONTAIN ANY CHEMICALS
CURRENTLY LISTED AS CARCINOGENS OR REPRODUCTIVE TOXINS UNDER CALIFORNIA PROPOSITION 65 AT LEVELS
WHICH WOULD BE SUBJECT TO THE PROPOSITION. IF YOU REFORMULATE OR FURTHER PROCESS THIS PRODUCT,
YOU SHOULD FURTHER EVALUATE THIS PRODUCT BASED UPON SUCH REFORMULATION OR PROCESSING, AS WELL AS
UPON ITS FINAL COMPOSITION AND USE.

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Plastic semi-solid when cold; viscous liquid when hot.		
Color	Black.	Odor	Slightly burnt or cracked hydrocarbon to asphaltic. H ₂ S vapor has a rotten egg odor at low concentrations in air.

WARNING! Vapors and fumes may be hazardous or fatal!
 Long-term heated storage (100° to 150°F) might evolve hydrogen sulfide, a flammable, toxic, sensitizing, and potentially deadly gas!
 When heated, may cause thermal burns on contact! If hot product contacts water, a violent eruption of steam and vapor may occur!
 Vapor may severely irritate the eyes and respiratory tract!
 Liquid contact may cause minimal to mild eye and/or skin irritation and inflammation!
 Contains 4- to 6-membered condensed-ring (polynuclear) aromatic hydrocarbons (PNAs), and possibly carbozoles!
 May cause skin cancer following extended contact!
 May be harmful to target organs and/or adversely affect reproduction if absorbed through the skin! Wash thoroughly after handling.
 Spills may create a slipping hazard!

Protective Equipment

Minimum Requirements
 See Section 8 for Details

This recommendation reflects minimum PPE when product is at elevated temperatures.

SECTION 1: IDENTIFICATION

Trade Name: Vacuum Tower Bottoms (VTB)

Product Number: 064741566*

CAS Number: 64741-56-6

Product Family: Petroleum Hydrocarbon Heavy Residuum

Synonyms: Vacuum Resid; Vacuum Bottoms; Vacuum Tower Residuum from a Petroleum Crude Still; Untreated Coker Feedstock; Crude Residual Oil; Crude Resid; Bottom of the Barrel; No. 6 Fuel Oil Blending Component; Heavy Fuel Oil Blending Component; Unfinished Bunker Fuel; C34-C50+ Petroleum Hydrocarbons.

Technical Contact: *Handwritten:* Jack Clarence (800) 525-4692 or (713) 321-4269 (M-F)
 Barbara Melinda (918) 495-4700
Medical Emergency: *Handwritten:* M.O.I. (800) 424-9300
 CHEMTREC Emergency (United States Only) *Handwritten:* enaigbt2 Medical

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Vacuum Residues (Petroleum)	64741-56-6	100
2) C34-C50+ Saturated Hydrocarbons and Naphthenes	Mixture	80-95
3) Polynuclear Aromatic Hydrocarbons (4- to 6-member condensed-ring type)	68487-58-6	5-20
4) Hydrogen Sulfide	7783-06-4	0.0001-0.01

Vacuum Tower Bottoms (VTB)

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye Contact. Absorption. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	May be harmful or fatal if inhaled! Inhalation of the vapor or spray mist may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath and may cause transient central nervous system (CNS) depression. The National Institute for Occupational Safety and Health has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health. Concentrations of H ₂ S at or below 250 ppm may cause respiratory tract irritation and pulmonary edema. H ₂ S concentrations between 250 ppm and 500 ppm may result in headache, nausea, disorientation, irregular heartbeat, and/or low blood pressure. At greater than 500 ppm, H ₂ S causes sudden collapse, unconsciousness, and respiratory paralysis leading to convulsions, coma, and/or death. (See Section 11.)
Eye Contact	Upon direct contact, hot material may cause severe thermal burns. Animal test results on similar unheated materials suggest that this product may cause minimal eye irritation upon short-term exposure. Symptoms include stinging, watering, and redness. H ₂ S vapors may cause moderate to severe eye irritation and photophobia (sensitivity to light).
Skin Contact	<p>Skin contact with hot material may result in severe thermal burns. Animal test results on similar materials suggest that this material can cause minimal skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases.</p> <p>Prolonged and/or repeated contact may cause minimal to moderate dermatitis and/or more serious skin disorders. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and/or severe tissue damage. Based upon a similar product's animal test results, a mild allergic skin response may be expected on some sensitive individuals following repeated exposures.</p>
Ingestion	Contact with hot material may cause thermal burns. If swallowed, no significant adverse health effects are anticipated; however, this material can cause a laxative effect. Ingestion of large quantities can cause intestinal obstruction.
Chronic Health Effects Summary	<p>A 104-week laboratory animal skin painting study using this vacuum residuum did NOT show a dose-related skin tumor incidence; however, this substance is similar to residual oils and heavy vacuum gas oil which did produce skin tumors and adverse effects in the liver and kidneys of laboratory animals following prolonged and repeated applications. All tumors appeared at the site of application. Toxic effects are unlikely to occur if good personal hygiene is practiced.</p> <p>Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H₂S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures. (See Section 11.)</p>
Conditions Aggravated by Exposure	Personnel with pre-existing nervous system disease, cardiac or neurological conditions, skin disorders, impaired lung, liver, kidney, or spleen function, or chronic respiratory diseases should avoid exposure.
Target Organs	This substance may cause damage to the lungs, nervous systems, brain, mucous membranes, skin, eyes, and possibly, the liver, kidneys, spleen, and testes.
Carcinogenic Potential	This material contains 4- to 6-membered condensed-ring (polynuclear) aromatic hydrocarbons (PNA) at concentrations above 0.1%. Some of these compounds has been determined to be carcinogenic by OSHA, IARC, and NTP.

Vacuum Tower Bottoms (VTB)

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	If hot material is splashed into eyes, irrigate with large amounts of room-temperature water. Seek medical attention immediately. If ambient temperature material is splashed into eyes, check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	If burned by hot material, cool skin by quenching with large amounts of cool water. Do not remove material from the skin. Seek medical attention immediately. For contact at ambient temperatures, remove contaminated shoes and clothing. Wipe off excess material. Wash exposed skin with soap and water. If tissue appears damaged or if irritation or pain persist, apply a clean dressing and seek medical attention. Do not use ointments. Thoroughly clean contaminated clothing before reuse. Discard contaminated leather goods.
Ingestion	Do not induce vomiting or give anything by mouth. Rinse out mouth with water. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Do not leave victim unattended. Allow small quantities to pass through system. If large amounts are swallowed or irritation or discomfort occurs, seek medical attention immediately.
Notes to Physician	Inhalation overexposure can produce toxic effects. Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients. If only cough or difficulty in breathing develop, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis using pulmonary function tests and chest x-rays. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

This material may affect the hematopoietic system or cause hepatotoxicity and/or nephrotoxicity. A complete blood count, liver function tests, renal function tests and urinalysis are suggested for significant exposures. In addition, monitoring arterial blood gases is suggested for significant exposures.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-III B Liquid. Slightly combustible!		
Flash Point Method	190° to 232°C (375° to 450°F) (Pensky-Martens Closed Cup [ASTM D-93]).		
Lower Flammable Limit	AP 1.0%	Upper Flammable Limit	7.0 to 44%
Autoignition Temperature	260° to 455°C (500° to 850°F)		
Hazardous Combustion Products	Burning or excessive heating may produce carbon monoxide, carbon dioxide, and possibly smoke, fumes, unburned hydrocarbons, and oxides of sulfur and nitrogen.		

Vacuum Tower Bottoms (VTB)

Special Properties

This material releases vapors at or approaching its flash point temperature. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Mists or sprays may be flammable at temperatures below the flash point. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.

If stored under heat for extended periods or significantly agitated, this material might evolve or release **hydrogen sulfide**, a flammable gas, which can raise and widen this material's actual flammability limits and significantly lower its autoignition temperature. (See Section 7.)

Extinguishing Media

SMALL FIRE: Use dry chemicals, carbon dioxide (CO₂), foam, water fog, or inert gas (nitrogen). **LARGE FIRE:** Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. **NEVER** use a water jet directly on the fire because it may spread the fire to a larger area.

Fire Fighting Protective Clothing

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Evacuate non-essential personnel and remove all ignition sources. Carefully contain spill and stop source of spill if it can be done without risk. Do not touch or walk through spilled material. Allow material to cool. Cleanup crews must wear proper heat-resistant protective clothing. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce heat or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create a fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

Handling

Avoid water contact or contamination, especially when heated. Do not handle hot material, if possible. Handle material as close to ambient temperatures as feasible. Avoid contact with oxidizing agents. Do not breathe vapor and avoid repeated or prolonged skin contact. Use only with adequate ventilation and personal protection. Wash thoroughly after handling. Prevent contact with food, chewing, and smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Vacuum Tower Bottoms (VTB)

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and properly labeled. Keep away from all ignition sources! Do not store with strong oxidizing agents. **Hydrogen sulfide** vapors may be evolved from long-term heated storage and/or agitated transport. H₂S is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.) Where H₂S is routinely stored, install monitoring equipment or system with alarms.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor, mists, and/or fumes below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

This recommendation reflects minimum PPE when product is at elevated temperatures.

Eye Protection

Safety glasses with side shields are recommended as a minimum protection. During sampling or transfer operations, especially if material is heated above 125°F (or 51°C) or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Hand Protection

When handling this material at elevated temperatures, use long-cuffed leather or heat-resistant gloves over chemical-resistant gloves. At ambient temperatures, use disposable nitrile, neoprene or butyl rubber gloves with repeated or prolonged use. Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with this material. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).

General Comments

WARNING! Do not use this material as a fuel without adequate ventilation. Inadequate ventilation can result in hazardous levels of combustion products and inadequate oxygen levels for breathing. Odor is not adequate to warn of hazardous conditions.

The standards for "coal tar pitch volatiles, as benzene solubles" are based upon coal coking, not upon petroleum-derived oils. However, in 29 CFR 1910.1200.1002, OSHA has defined "coal tar pitch volatiles" to include the fused polycyclic hydrocarbons which volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood and other organic matter. Accordingly, the coal tar pitch volatile standard may apply to the aerosol form of this material. The "hydrogen sulfide" standards apply only to vapors evolved from long-term heated storage and/or transport.

Occupational Exposure Guidelines

Vacuum Tower Bottoms (VTB)

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) [2001] TWA: 5 (ppm) from ACGIH (TLV) [Proposed for 2001.]
2) Oil mist, mineral	TWA: 10 STEL: 15 CEIL: 20 (ppm) from (PEL) OSHA [1989] TWA: 5 STEL: 10 (mg/M ³) from ACGIH (TLV) [2001] TWA: 5 (mg/M ³) from OSHA (PEL) [1976]
3) Coal tar pitch volatiles, as benzene solubles ("A1" Confirmed Human Carcinogen)	TWA: 0.2 (mg/M ³) from ACGIH (TLV) [2001] TWA: 0.2 (mg/M ³) from OSHA (PEL) [1989]
4) Oil mist, mineral, sum total of 15 PAHs listed as carcinogens by US NTP ("A2" Suspected Human Carcinogen)	TWA: 0.2 (mg/M ³) from ACGIH (TLV) [Proposed for 2001.]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Plastic semi-solid when cold; viscous liquid when hot.	Color Black.	Odor	Slightly burnt or cracked hydrocarbon to asphaltic. H ₂ S vapor has a rotten egg odor at low concentrations in air.
Specific Gravity	0.95 to 1.02 at 60°F (Water = 1)	pH	Not applicable.	Vapor Density >10 (Air = 1 at 70°F)
Boiling Point/Range	350° to 760°C (660° to 1,400°F) [ASTM D-86]	Melting/Freezing Point	38° to 49°C (100° to 120°F) [ASTM D-97]	
Vapor Pressure	<0.1 Reid-psia at 38°C (100°F).	Viscosity (cSt @ 40°C)	125 to 320 at 135°C [ASTM D-445]	
Solubility in Water	Negligible in cold water (<0.001%).	Volatile Characteristics	Negligible; no Volatile Organic Compounds (VOCs) present at 500°F (260°C).	
Additional Properties	Average Calculated Density at 60°F = 8.210 lbs./gallon; Saybolt Viscosity = 900 to 1,500 SUS at 275°F [ASTM D-2161]; Evaporation Rate =<0.005 when n-Butyl acetate = 1.0.			

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, strong acids and alkalis, and strong oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide, and oxygen.		
Hazardous Decomposition Products	Composition suggests that sulfur and nitrogen compounds might be generated; but, no degradation data is available.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	The American Petroleum Institute (API) sponsored a battery of laboratory tests to determine the acute toxicity characteristics of Vacuum Residues (Petroleum) . It was shown to be a minimal skin irritant and minimal to mild eye irritant in rabbits and non-sensitizing to the skin of Guinea pigs. A rabbit skin painting study at 3 doses of 2,000 mg/kg per week for 4 weeks showed mild to moderate irritation, white discharges from the treated sites, and decreased food intake. A 104-week mouse skin-painting study produced a negative dose-related tumor response and mutagenicity studies showed negative responses in the modified Ames assay, in-vivo rat bone marrow assay, and in-vitro mouse lymphoma cell assay without S9 activation. The in-vitro mouse lymphoma cell assay with S9 activation showed a weakly positive result.
----------------------	---

Laboratory data associated some mixtures of petroleum hydrocarbons with boiling ranges between 650° and 1,100°F., commonly referred to as "heavy distillates", including vacuum residuum have caused increased incidence of skin tumors at the site of contact when applied repeatedly (twice per week) over the lifetime of the test animals (12 to 24 months). A few studies have shown that washing the animal's skin with soap and water between applications greatly reduces the carcinogenic effect of these heavy distillates.

Vacuum Tower Bottoms (VTB)

The International Agency for Research on Cancer (IARC) has not specifically evaluated **vacuum residues**; however, IARC has determined that **high-boiling untreated and vacuum distillates, including heavy vacuum gas oil** are carcinogenic to experimental animals, and potentially humans. Also, the National Toxicology Program (NTP), U.S. Environmental Protection Agency (EPA), and American Conference of Governmental Industrial Hygienists (ACGIH) have independently classified various **polynuclear aromatic hydrocarbon (PNA) compounds** present in this product as "confirmed human (A1), suspected human (A2), or animal carcinogens (A3)".

This material contains **polycyclic aromatic hydrocarbons (PHAs or PNAs)** some of which have been reported to cause skin cancer on humans under conditions of poor personal hygiene, prolonged/repeated contact, and exposure to sunlight. This material may also contain **alkyl- and alkylbenzocarbozoles** which if absorbed through the skin might be responsible, in whole or part, for systemic toxicity to the liver, kidneys, spleen, and/or testes based upon limited laboratory animal studies.

Hydrogen sulfide:

- GAS (TCLo): Acute: 10 ppm for 15 minutes [Human] - Eye irritation.
- GAS (TCLo): Acute: 50 to 100 ppm for 15 minutes [Human] - Respiratory irritation.
- GAS (LC₁₀₀): Acute: 600 to 750 ppm for 30 minutes [Human] - Respiratory paralysis and death.
- GAS (LCLo): Acute: 5,700 ug/kg for 8 hours [Human] - Chronic pulmonary edema, coma, and death.

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (LT 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (GT 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, this heavy residuum, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. This material is estimated to have a very slow rate of biodegradation. Based upon spill investigation analysis, oils containing **polynuclear aromatic hydrocarbon compounds** similar to this material were shown to bioaccumulate in tissues of various aquatic organisms at 1 to 100 ppm levels.

Environmental Fate

This heavy residuum is potentially toxic to freshwater and saltwater ecosystems. It may or may not float on water. In stagnant or slow-flowing waterways, a hydrocarbon oil layer may cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Vacuum Tower Bottoms (VTB)

**California
Proposition 65**

This material does not contain any chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.

**New Jersey
Right-to-Know Label**

For New Jersey labeling refer to components listed in Section 2.

**Additional Regulatory
Remarks**

In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. A chemical substance present in this material which is subject to this statute is: **Hydrogen Sulfide**.

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

SECTION 1: IDENTIFICATION

Trade Name	Atmospheric Tower Bottoms	MSDS No.	RS0405
Product Number	064741453*	Revision Date	7/24/97
CAS Number	64741-45-3*		
Synonyms	Atmospheric Tower Residuum, Atmospheric Residuum, Crude Tower Bottoms, Crude Residuum		
Generic Name	Atmospheric Tower Residuum (Petroleum)		
Chemical Family	C20-C50 Petroleum Hydrocarbons		
Manufacturer	LYONDELL-CITGO Refining Company Ltd. 12000 Lawndale Avenue P O Box 2451 Houston, Texas 77252-2451	Telephone Numbers	800/424-9300 CHEMTREC 800/313-7645 Company Hot Line 713/321-4215 MSDS Requests

SECTION 2: COMPOSITION

Component Name	CAS Number	Carcinogenic Listings	Concentration Wt%
ATMOSPHERIC TOWER RESIDUUM (PETROLEUM) WHICH CONTAINS 4-6 FUSED-RING POLYNUCLEAR AROMATIC HYDROCARBONS (PNAs) HYDROGEN SULFIDE (H ₂ S)	64741-45-3 NA 68487-58-6 7783-06-4	Not applicable NA IARC, NTP, OSHA, EPA Not applicable	EQ 100 NA AP 5 to 25 0 001 to 0 01

SECTION 3: HAZARDS IDENTIFICATION

EMERGENCY OVERVIEW

Signal Word	WARNING!	Color	Black
Physical State	Plastic semi-solid when cold, viscous liquid when hot	Odor	Slightly burnt or cracked hydrocarbon to asphaltic Hydrogen sulfide vapor has a rotten egg odor at low concentrations in air
Physical and Health Hazards	When heated, may cause thermal burns on contact! Long-term heated storage (100° to 150°F) might evolve hydrogen sulfide (H ₂ S), a flammable, poisonous gas! If hot product contacts water, a violent eruption of steam and vapor may occur! Mist or vapor may irritate the eyes and respiratory tract! Liquid contact may cause minimal to mild eye and skin irritation and inflammation! Contains 4- to 6-membered condensed-ring (polynuclear) aromatic hydrocarbons (PNAs), and possibly carbazoles! May cause skin cancer following prolonged and/or repeated contact! May be harmful to target organs and/or adversely affect reproduction if absorbed through the skin! Spills may create a slipping hazard!		
Environmental Hazards	Ecological effects testing has not been conducted on this product. However, if spilled, this product, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life.		

POTENTIAL HEALTH EFFECTS

Routes of Exposure	Inhalation, Skin and eye contact, Skin Absorption
Signs and Symptoms of Acute Exposure	
• Inhalation	Breathing heated mist or vapor may irritate the mucous membranes of the nose, throat, bronchi, and lungs. Hydrogen sulfide (H ₂ S) gas evolved from this material while stored or handled at elevated temperatures may be harmful or fatal if inhaled. Concentrations of H ₂ S at or below 250 ppm may cause respiratory tract irritation and pulmonary edema. H ₂ S concentrations between 250 ppm and 500 ppm may result in headache, nausea, disorientation, irregular heartbeat, low blood pressure, and/or coma. Greater than 500 ppm H ₂ S may cause sudden collapse, respiratory paralysis, convulsions, and death.
• Eye Contact	Upon direct contact, hot material may cause severe thermal burns. Unheated material may cause minimal to mild eye irritation. H ₂ S vapors may cause moderate to severe eye irritation and photophobia (sensitivity to light).
• Skin Contact	Based upon animal test results, minimal to mild skin irritation and inflammation is expected from short-term exposure. Animal studies have also shown that target organ effects may be caused by prolonged or repeated contact and/or skin absorption. (See the "Inhalation" above, "Chronic Health Effects Summary" below, and Section 11.)
• Ingestion	Ingestion is highly unlikely. If swallowed, no significant adverse health effects are expected to occur from short-term exposure, however, it might cause a laxative effect. Contact with hot material may cause thermal burns.
Chronic Health Effects Summary	Prolonged and/or repeated contact may produce mild to moderate skin irritation and inflammation. Also, oils similar to this product have been shown to be mutagenic, induce skin tumors, and cause adverse effects in the liver, kidneys, thymus, adrenal glands, bone marrow, testes, and embryo/fetus of laboratory animals following prolonged and repeated application. Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H ₂ S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures. (See Section 11.)
Conditions Aggravated by Exposure	Personnel with pre-existing eye or skin disorders, chronic respiratory diseases, central nervous system (CNS) disease, cardiac or neurological conditions, impaired pulmonary, cardiovascular, liver, kidney, thymus, bone marrow function, anemia, red blood cell abnormalities, or immune system deficiencies should avoid exposure.
Target Organs	Eyes, skin, mucous membranes, respiratory system, lungs, central nervous system, heart, liver, kidneys, bone marrow, blood, thymus, adrenal gland and/or immune system, and possibly the reproductive systems or unborn embryo/fetus.
Carcinogenic Potential	Please refer to Sections 2 and/or 11 for the identification of components, if any, which have been identified as having carcinogenic potential in animals and/or humans.

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to the Emergency Overview in Section 3 and Exposure Controls in Section 8 of this MSDS.

Inhalation	Move the exposed person to fresh air at once. If breathing has stopped, initiate artificial respiration, if the heart has stopped, initiate CPR. When breathing is difficult, properly trained personnel may administer 100% oxygen. Keep the affected person warm and at rest. Get medical attention as soon as possible.
Eye Contact	Check for and remove contact lenses. Immediately wash the eyes with large amounts of clean low-pressure water, occasionally lifting the upper and lower lids. If irritation persists, promptly seek medical attention.
Skin Contact	If hot oil contacts the skin, immediately flush with large amounts of water to cool the affected tissue, obtain medical treatment immediately. Otherwise, promptly remove excess oil and contaminated clothing, wash the contaminated area thoroughly with a waterless cleanser followed by mild soap and water. If irritation occurs after washing, seek medical attention. Thoroughly clean contaminated clothing before reuse, discard contaminated leather goods.
Ingestion	Ingestion is not expected to cause harm. However, if more than a half-cup full of this material is swallowed and patient is conscious, give quantities of water, and obtain medical attention. Do not induce vomiting.
Notes to Physician	Treat symptomatically. Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal.

SECTION 5: FIRE FIGHTING MEASURES**FLAMMABLE PROPERTIES**

Flammability Classification	Slightly Combustible ¹ OSHA/NFPA Class-III-B Combustible Liquid
Flash Point/Method	AP 450° to 550°F (232° to 288°C) by ASTM D-93
Flammable Limits %	LEL: AP 1.0% UEL: AP 7.0% (At or approaching the Flash Point)
Auto-Ignition Temperature	AP 950°F (510°C) (Estimated)
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, aldehydes, and other harmful gases/vapors including oxides and/or other compounds of sulfur and nitrogen, possibly hydrogen sulfide, alkyl mercaptans, and some heavy metals
Special Properties	When heated above its flash point temperature, this material will release flammable vapors which, if exposed to an ignition source, can burn in the open or be explosive in confined spaces. Mists or sprays may be flammable at temperatures below the flash point

EXTINGUISHING MEDIA

Small Fire Use dry chemicals, carbon dioxide (CO₂), foam, water fog, or inert gas
 Large Fire Use foam, water fog, or waterspray. Water fog and spray are effective but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.

FIRE FIGHTING

Protective Equipment/Clothing: Wear a NIOSH-approved positive pressure self-contained breathing apparatus and firefighter's turnout gear

Instructions: Evacuate area and fight from a maximum distance or use unmanned hose holders or monitor nozzles. Disperse vapors with water spray, cover pooling liquid with foam. Containers can build up pressure if exposed to heat, cool with flooding quantities of water until well after the fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of vessel.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview in Section 3 and Exposure Controls in Section 8 of this MSDS.

Contain spill and prevent it from entering all bodies of water, if possible. Safely stop flow of spill. Evacuate non-essential personnel from immediate area due to slipping hazard.

Maximize product recovery for reuse or recycling. Absorb spill with inert material (e.g., dry sand, earth, or other non-combustible absorbents) and place in a chemical waste container for later disposal. In urban areas, cleanup spill as soon as possible; in natural environments, cleanup on advice from ecologists. This material will float on water. Absorbent pads and similar materials can be used. Comply with all laws and regulations.

SECTION 7: HANDLING and STORAGE**Handling**

Remove spillage immediately from hard, smooth walking areas. Avoid oxidizing agents and ignition sources. Avoid contact with eyes, skin, and clothing. Avoid breathing of mist or vapor. Use only with adequate ventilation and personal protection. Wash thoroughly after handling. Prevent contact with food, chewing, or smoking materials.

Water contamination should be avoided and minimum feasible handling temperatures should be maintained. Periods of exposure to high temperatures (GT 200°F) should be minimized.

Parts and equipment using or containing this product must be steam-cleaned prior to all maintenance procedures. All material sampling should be conducted in a manner which avoids vapor inhalation or skin contact. Use of good personal hygiene practices by maintenance personnel is required.

Storage

Keep containers tightly closed. DO NOT puncture or incinerate containers.

Hydrogen sulfide's (rotten egg) odor is not a reliable warning of possible overexposure! Sampling, transportation, and shipping personnel should use extreme caution when opening a sealed container or entering confined areas using heated storage. H₂S vapors may accumulate in tanks, sump pits, and transport compartments. Avoid breathing vapors when opening hatches and dome covers by staying upwind, venting slowly, and keeping your face away from compartment openings. Proper respiratory equipment should be used when entering any area where these vapors are being emitted.

Hydrogen sulfide is very corrosive to all electro-chemical series metals. It can cause pipes and valves to corrode and become blistered, pitted and brittle. Lines and fittings likely to contain H₂S should be inspected frequently and receive special attention, monitoring, and maintenance to prevent leaks. Metal components used in H₂S service should be resistant to sulfide stress cracking.

SECTION 8: EXPOSURE CONTROLS and PERSONAL PROTECTION**ENGINEERING CONTROLS**

Engineering controls are normally required when handling hot material. Use process enclosures, local exhaust ventilation, or other controls to maintain airborne levels below recommended exposure limits. Engineering controls should meet applicable requirements of the National Electrical Code. Storage or handling facilities should be equipped with an emergency eyewash station and safety shower.

PERSONAL PROTECTIVE EQUIPMENT**• Protective Equipment****• Eye Protection**

If sampling or working with heated material, especially if material is heated above 125°F (or 51°C), a full-face supplied-air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Otherwise, safety glasses should be adequate protection under most other conditions of use.

• Skin Protection**- Hands**

Use disposable vinyl, nitrile, neoprene, butyl, latex, PVC/nitrile, or PVC/NBR gloves. When handling hot materials, use leather gloves over chemically-resistant gloves.

- Body

Avoid skin contact. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek® or neoprene) should be worn. This might include apron, slicker suit, boots, and additional facial protection.

• Respiratory Protection

For unknown vapor concentrations, use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the exposure guidelines, a full-face supplied-air respirator with escape bottle or a positive-pressure, pressure-demand, SCBA is required. Respirator use should follow OSHA requirements 29 CFR 1910.134 or equivalent (e.g. ANSI Z88.2).

• *General Comments*

Use good personal hygiene practices. Wash hands and other exposed skin areas with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities, or leaving work. DO NOT use gasoline, kerosene, solvents, or harsh abrasive skin cleaners.

Since specific exposure standards/control limits have not been established for this product, the "oil mist, mineral" exposure limits shown below are suggested as minimum control guidelines. The standards for "coal tar pitch volatiles (CTPV), as benzene solubles" are based upon coal coking, not upon petroleum-derived, high-boiling fraction oils. These exposure limits apply only to the aerosol form of this product. The "hydrogen sulfide" standards apply only to vapors evolved from long-term heated storage and/or handling.

EXPOSURE GUIDELINES

Substance	Source	Date	Type	Value	Time
HYDROGEN SULFIDE	OSHA	1989	PEL	10 ppm	8 Hours
HYDROGEN SULFIDE	OSHA	1989	STEL	15 ppm	15 Mins
HYDROGEN SULFIDE	OSHA	1989	CEILING	20 ppm	NA
HYDROGEN SULFIDE	ACGIH	1996	TLV	10 ppm	8 Hours
HYDROGEN SULFIDE	ACGIH	1996	STEL	15 ppm	15 Mins
OIL MIST, MINERAL	OSHA	1989	PEL	5 mg/M3	8 Hours
OIL MIST, UNREFINED MINERAL (Proposed)	ACGIH	1995	TLV	0.2 mg/M3	8 Hours
COAL TAR PITCH VOLATILES, AS BENZENE SOLUBLES	OSHA	1989	PEL	0.2 mg/M3	8 Hours
COAL TAR PITCH VOLATILES, AS BENZENE SOLUBLES	ACGIH	1996	TLV	0.2 mg/M3	8 Hours

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Plastic semi-solid when cold, viscous liquid when hot		
Color	Black		
Odor	Slightly burnt or cracked hydrocarbon to asphaltic Hydrogen sulfide vapor has a rotten egg odor at low concentrations in air		
pH	Not applicable		
Vapor Pressure	LT 0.1 mm of Hg at 70°F	Viscosity	AP 900 to 5,000 SUS at 100°F (ASTM D-2161)
Vapor Specific Gravity	GT 10 when Air = 1.0 at 70°F	Melting/Freezing Pt.	AP 100°F (38°C) (ASTM D-97)
Volatile Characteristics	Negligible	Solubility in Water	Negligible
Boiling Point/Range	660° to AP 1,400°F (350° to 760°C)(ASTM D-86)	Specific Gravity	AP 0.94 to 0.99 (ASTM D-1250)
Additional Properties	Average Calculated Density = AP 8.080 lbs/gal, Kinematic Viscosity = AP 195 to 1,080 cSt at 40°C (ASTM D-445), Sulfur Content = AP 1.0 to 4.0 Wt % (ASTM D-2622)		

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable
Conditions to Avoid	Extreme heat, open flame, and strong agitation or stirring
Incompatibility with Other Materials	Strong acids, alkalis, and oxidizers such as liquid chlorine and oxygen. Hydrogen sulfide is dangerously reactive with strong oxidizing materials (nitric acid, chlorine, fluorine, etc.), some metals, metal oxides, and metal powders. H ₂ S is corrosive to some metals and alloys, especially those containing copper and/or tungsten.
Hazardous Decomposition Products	No degradation data available. Free aromatic amines may be released in a reducing environment.
Hazardous Polymerization	Not expected to occur.

SECTION 11: TOXICOLOGICAL INFORMATION**Vacuum Residuum (a similar material)**

ORAL (LD50)	Acute	GT 5,000 mg/kg (Rat screen level) - Hypoactivity, diarrhea, and dark-stained anal region
DERMAL (LD50)	Acute	GT 2,000 mg/kg (Rabbit screen level)
DRAIZE EYE	Acute	Minimal irritant (Rabbit)
DRAIZE DERMAL	Acute	Minimal irritant (Rabbit)
BUEHLER DERMAL	Acute	Non-sensitizing (Guinea Pig)
28-Day DERMAL	Sub-Chronic	Mild skin irritant at highest dose (Rabbit)
104-Week DERMAL	Chronic	No dose-related skin tumors at site of application (Mouse)
MUTAGENICITY		
in-vitro Lymphoma Assay		Negative without S9 activation and weakly positive with S9 activation (Mouse)

The International Agency for Research on Cancer (IARC) has not specifically evaluated atmospheric tower residuum, however, similar residual fuel oils, high-boiling catalytic cracked oils, and heavy vacuum gas oil have been determined to be carcinogenic to experimental animals. IARC has also determined that there is inadequate evidence for the carcinogenicity of heavy fuel oils or on humans.

The National Toxicology Program (NTP), U.S. Environmental Protection Agency (EPA), and American Conference of Governmental Industrial Hygienists (ACGIH) have independently classified various polynuclear aromatic hydrocarbon (PNA) compounds present in this product as "confirmed human, suspected human, or animal carcinogens".

Catalytic Cracked Clarified Oil (a similar material)

ORAL (LD50)	Acute	5,270 mg/kg (Rat males) & 4,320 mg/kg (Rat females) - Somnolence, diarrhea, hypermotility, ataxia, prostration, lacrimation, eye opacity, piloerection, and hair loss
DERMAL (LD50)	Acute	GT 2,000 mg/kg (Rabbit screen level)
DRAIZE EYE	Acute	Mild eye irritant (Rabbit)
DRAIZE DERMAL	Acute	Minimal to mild skin irritant (Rabbit)
BUEHLER DERMAL	Acute	Non-sensitizing (Guinea Pig)
I/P DERMAL	Acute	Tumor initiator & possibly promoter activity (Mouse)
28-Day DERMAL	Sub-chronic	0% Mortality at 200, 10% at 400, 40% at 1,000, & 100% at 2,000 & 4,000 mg/kg/day (Rat & Rabbit) - Edema, skin ulceration, and depression. Minimal to moderate diffuse hepatocytomegaly in all animals at 400 mg/kg/day, slight skin hyperplasia and hyperkeratosis. Liver, thymus, & testes damage and increased liver- to-body weight ratios at 400 & 1,000 mg/kg/day. Studies at 2,000 & 4,000 mg/kg/day were terminated on day 11 due to early deaths.
12-Week DERMAL	Sub-chronic	5% Mortality at 40, 35% at 200, & 100% at 400 mg/kg/ day (Rat) - Hepatocellular necrosis and generalized systemic toxicity
52-Week DERMAL	Chronic	5 uL/kg 2x/week (Mouse) - Significant increase in contact- point skin tumors with 22-week mean latency, increased liver and liver-to-body weight ratios, & decreased survivability (87% mortality)
104-Week DERMAL	Chronic	0.5 uL/kg 2x/week (Mouse) - 90% of the animals had contact-point skin tumors with 72-week mean latency
MUTAGENICITY Many different in-vivo and in-vitro mutagenic assays have shown "positive" responses with or without S9 metabolic activation. The only "negative" mutagenic responses were when using the Mouse Cell Transformation Assay without S9 activation, the in-vitro Chinese Hamster Ovary Cell Assay, and the in-vivo Mouse Bone Marrow Assay.		
TERATOGENESIS		
in-vitro Ovarian Tumor Attachment Inhibition Assay		Suspect teratogen (rating 3) (Mouse)
Embryonic Palatal HEPM Cell Growth Inhibition Assay		Suspect teratogen (rating 3) with and without S9 metabolic activation (Human)

Hydrogen Sulfide (H₂S):

GAS (TELo)	Acute	AP 1 ppm (Human) - Odor response threshold
GAS (TCLo)	Acute	AP 10 ppm (Human) (15 minutes) - Eye irritation
GAS (TCLo)	Acute	50 to 100 ppm (Human) (15 minutes) - Respiratory irritation
GAS (LCLo)	Acute	600 ppm (Human) (30 minutes) - Unconsciousness, respiratory paralysis, and death
GAS (LC100)	Acute	600 to 750 ppm (Human) (15 minutes) - Unconsciousness, respiratory paralysis, and death
GAS (LCLo)	Acute	5,700 ug/kg (Human) - Chronic pulmonary

			edema, coma, and death
GAS	(LCLo)	Acute	800 ppm (Rat) (5 minutes)
GAS	(LC50)	Acute	635 ppm (Mouse) (1 hour)
GAS	(LC50)	Acute	445 ppm (Rat) (4 hours) - Hypermotility, diarrhea, and increased urine volume
5-Day GAS	Sub-chronic	1,200 mg/M3 (Rat) (2 hours/day)	- Decreased cholinesterase and degenerative brain changes
35-Day GAS	Sub-chronic	100 ppm (Rat) (8 hours/day)	- Decreased cytochrome oxidases and degenerative brain and pulmonary effects
90-Day GAS	Sub-chronic	80 ppm (Rat & Mouse) (6 hours/day)	- Decreased brain weight and weight loss or decreased weight gain
TERATOGENESIS	Sub-chronic	20 ppm for 24 hours on days 6 thru 22 of pregnancy (Rat)	- Developmental physical effects

OTHER REPRODUCTIVE EFFECTS One unconfirmed study mentions H₂S as causing damage to the human testes and/or male reproduction. Recent studies do not confirm this association. Other studies mention increased risk of miscarriage, abortion, and difficulties during pregnancy and labor, but these studies involved mixed chemical exposures and/or physical confounders such as lifting heavy weights.

SECTION 12: ECOLOGICAL INFORMATION

Ecological effects testing has not been conducted on this product. However, if spilled, this product, its storage tank, water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. This product's coating action can also be harmful or fatal to aquatic life and waterfowl.

This product is estimated to have a slow (LT 20 vol %) rate of biodegradation. Based upon actual spill investigations, heavy aromatic oils similar to this product were shown to bioaccumulate in tissues of various aquatic animals at 1 to 100 ppm levels.

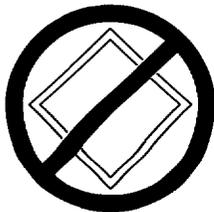

SECTION 13: DISPOSAL CONSIDERATIONS

Conditions of use may cause this material to become a "hazardous waste", as defined by state or federal laws. Use approved storage, treatment, transporters, and disposal sites in compliance with all applicable regulations. If this material is introduced into a wastewater treatment system, chemical and biological oxygen demand will likely increase slowly. It is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment with plenty of agitation. Potential treatment and disposal methods include land farming and incineration.

SECTION 14: TRANSPORT INFORMATION

DOT Status	Not a U.S. Department of Transportation regulated material		
Proper Shipping Name	Not regulated		
Hazard Class	Not regulated		
UN/NA ID	Not applicable	Packing Group(s)	Not applicable
Reportable Quantity	RQ (HYDROGEN SULFIDE)		

Placards

Emergency Response Guide Number	Not applicable
HAZMAT STCC Number	Not applicable
MARPOL III Status	Not a "Marine Pollutant"

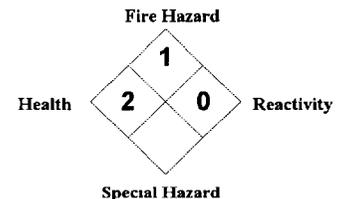

SECTION 15: REGULATORY INFORMATION

TSCA	All components of this product are listed on the Toxic Substance Control Act (TSCA) inventory
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires emergency planning and notification based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) listed in 40 CFR 302.4 and 40 CFR 355. Components present in this product which are subject to the reporting requirements under this statute are: HYDROGEN SULFIDE (CAS No. 7783-06-4)
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Immediate (Acute) and Delayed (Chronic) Health Hazards.
SARA 313	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires submission of an annual Toxic Chemical Release Inventory Report (Form R) by facilities which receive, import, make, process, or otherwise use "Toxic Chemicals" above specified threshold quantities. These facilities must also notify their customers if a product contains "Toxic Chemicals" regulated under 40 CFR 372.65. This information must also be included in all MSDS's that are copied and distributed for the product. This product contains no known chemical substances subject to this statute which exceed de minimus levels.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "Hazardous Substances" equal to or greater than the "Reportable Quantities (RQs)" listed in 40 CFR 302.4. Components present in this product which are subject to the reporting requirements under this statute are: HYDROGEN SULFIDE RQ: 100 Pounds (45.4 Kg)
California Proposition 65	The California Safe Drinking Water and Toxic Enforcement Act of 1986 (Proposition 65) requires warning be given for ingredients known to the State of California to cause cancer, birth defects, or other reproductive toxicity. Minor components of this product which require warnings are: BENZO[a]PHENANTHRENE (CHRYSENE) (CAS No. 218-01-9) 7,12-DIMETHYLBENZO[a]ANTHRACENE (CAS No. 57-97-6) INDENO[1,2,3-c,d]PYRENE (CAS No. 193-39-5) 5-METHYLCHRYSENE (CAS No. 3697-24-3).
Additional Regulatory Remarks	This product is classified as an oil under Section 311 of the Clean Water Act (40 CFR 110) and the Oil Pollution Act of 1990 (40 CFR 112). Discharge or spills which produce a visible sheen on either navigable surface water, or in waterways and sewers which lead to navigable surface water, must be reported to the National Response Center (800-424-8802).

MATERIAL SAFETY DATA SHEET

MAIN FRACTIONATOR FEED - FCCU

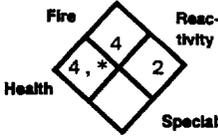

MSDS No.
RS 501

Rev. Date
09/01/89

LYONDELL-CITGO REFINING COMPANY, LTD.
12000 LAWDALE AVENUE
P. O. BOX 2451
HOUSTON, TEXAS 77252-2451

IMPORTANT: Read this MSDS before handling and disposing of this product and pass this information on to employees, customers, and users of this product.

This product is considered a hazardous chemical under the OSHA Hazard Communication Rule.

I. General		
Trade Name	MAIN FRACTIONATOR FEED - FCCU	Telephone Numbers EMERGENCY 800/424-9300 CHEMTREC 800/525-4692 HOT LINE CUSTOMER SERVICE 713/475-4215 INFO ONLY
Other Names	REACTOR OVERHEAD - FLUID CATALYTIC CRACKER UNIT	
Chemical Family	PETROLEUM HYDROCARBONS	DOT Hazardous Materials Proper Shipping Name PETROLEUM DISTILLATE, N.O.S.
Generic Name	FLUID FRACTIONATOR FEED STOCK	DOT Hazard Class 3 (FLAMMABLE LIQUID)
CAS No.	SEE SECTION IX	Company ID No. 1111111130 UN/NA ID No. UN 1268
II. DANGER Summary of Hazards		
<p>EXTREMELY FLAMMABLE ! KEEP AWAY FROM HEAT, SPARKS AND OPEN FLAME. MAY CAUSE EYE IRRITATION ! AVOID CONTACT WITH LIQUID AND/OR VAPORS. IF SWALLOWED, DO NOT INDUCE VOMITING SINCE ASPIRATION INTO THE LUNGS MAY CAUSE THERMAL PNEUMONIA. OBTAIN PROMPT MEDICAL ATTENTION. MAY CONTAIN HYDROGEN SULFIDE (H2S) A FLAMMABLE, TOXIC AND POTENTIALLY DEADLY GAS. VAPORS MAY PRODUCE CENTRAL NERVOUS SYSTEM DEPRESSION. SEE SECTION IV.</p> <p>MAY BE HARMFUL IF ABSORBED THROUGH THE SKIN. PROLONGED AND REPEATED SKIN CONTACT MAY CREATE CANCER RISK, ORGAN DAMAGE, AND ADVERSELY AFFECT FETAL DEVELOPMENT AND FETAL SURVIVAL.</p> <p>*CONTAINS 4 TO 6-MEMBER CONDENSED-RING AROMATIC HYDROCARBONS. (SEE SECT. IV)</p>		
III. Fire and Explosion		
Flash Point (Method)	Autoignition Temperature (Method)	Flammable Limits (% Vol. in Air) At Normal Atmospheric Temperature and Pressure
AP -75° F (EST.) SEE "FIRE & EXPLOSION HAZARDS"	AP 500° F (EST.) BASED ON NFPA "BUTANE"	Lower AP 1.6 Upper AP 8.4 BASED ON NFPA "BUTANE"
Fire and Explosion Hazards	EXTREMELY FLAMMABLE! THIS MATERIAL RELEASES VAPORS AT OR BELOW AMBIENT TEMPERATURES. WHEN MIXED WITH AIR IN CERTAIN PROPORTIONS AND EXPOSED TO AN IGNITION SOURCE, THESE VAPORS CAN BURN IN THE OPEN OR EXPLODE IN CONFINED SPACES. BEING HEAVIER THAN AIR, FLAMMABLE VAPORS MAY TRAVEL LONG DISTANCES ALONG THE GROUND BEFORE REACHING A POINT OF IGNITION AND FLASHING BACK.	
Extinguishing Media	DRY CHEMICAL, HALON, AND CARBON DIOXIDE. FOAM AND WATER FOG ARE EFFECTIVE BUT MAY CAUSE FROTHING.	<p>HAZARD RATING:</p> <p>4 - Extreme 3 - High 2 - Moderate 1 - Slight 0 - Insignificant</p> <div style="display: flex; align-items: center; justify-content: center;">  </div> <p>* Chronic Health Hazard - See Section IV.</p>
Special Firefighting Procedures	FOR FIRES INVOLVING THIS MATERIAL, DO NOT ENTER ANY ENCLOSED OR CONFINED FIRE SPACE WITHOUT PROPER PROTECTIVE EQUIPMENT. THIS MAY INCLUDE SELF-CONTAINED BREATHING APPARATUS TO PROTECT AGAINST THE HAZARDOUS EFFECTS OF COMBUSTION PRODUCTS AND OXYGEN DEFICIENCIES. COOL TANKS AND CONTAINERS EXPOSED TO FIRE WITH WATER.	

IV. Health Hazards					
Summary of Acute Hazards	LIQUID, MIST, OR VAPORS MAY CAUSE CENTRAL NERVOUS SYSTEM DEPRESSION. ASPIRATION INTO THE LUNGS WILL CAUSE CHEMICAL PNEUMONIA.				
ROUTE OF EXPOSURE	SIGNS AND SYMPTOMS Primary Route(s)				
Inhalation	MAY CONTAIN H ₂ S A TOXIC AND POTENTIALLY DEADLY GAS. VAPORS AND/OR MIST MAY PRODUCE CNS DEPRESSION, HEADACHE, FATIGUE, DIZZINESS, UNCONSCIOUSNESS, CONVULSIONS AND DEATH DEPENDING ON CONCENTRATION AND DURATION OF EXPOSURE. <input checked="" type="checkbox"/>				
Eye Contact	TESTS ON SIMILAR MATERIALS INDICATED THAT EYE IRRITATION MAY RESULT FROM CONTACT WITH LIQUID, MIST, AND/OR VAPORS. HYDROGEN SULFIDE IS AN EYE IRRITANT. <input checked="" type="checkbox"/>				
Skin Absorption	TESTS ON SIMILAR MATERIALS HAVE SHOWN THAT AFTER PROLONGED OR REPEATED SKIN CONTACT, ABSORPTION THROUGH THE SKIN MAY OCCUR PRODUCING TOXIC EFFECTS (SEE SUMMARY OF CHRONIC HAZARDS). <input checked="" type="checkbox"/>				
Skin Irritation	SKIN IRRITATION MAY OCCUR. MORE SERIOUS SKIN DISORDERS MAY OCCUR UPON PROLONGED OR REPEATED SKIN CONTACT. (SEE THE "SUMMARY OF CHRONIC HAZARDS AND SPECIAL HEALTH EFFECTS" BOX BELOW.) <input checked="" type="checkbox"/>				
Ingestion	THIS MATERIAL MAY INDUCE NAUSEA, VOMITING, DIARRHEA AND RESTLESSNESS AFTER INGESTION. <input type="checkbox"/>				
Summary of Chronic Hazards and Special Health Effects	AFTER REPEATED AND PROLONGED SKIN EXPOSURE, TESTS ON SIMILAR MATERIALS HAVE PRODUCED SKIN TUMORS AND ADVERSE EFFECTS IN THE LIVER, KIDNEYS, THYMUS, BONE MARROW, BLOOD, SPLEEN, LYMPH NODES AND REPRODUCTIVE ORGANS. THIS MATERIAL APPLIED TO THE SKIN OF PREGNANT RATS OVER TWENTY DAYS PRODUCED MATERNAL AND FETAL TOXICITY AND MALFORMATIONS. PERSONNEL WITH PRE-EXISTING SKIN DISORDERS OR CHRONIC RESPIRATORY DISEASES SHOULD AVOID EXPOSURE TO THIS PRODUCT.				
V. Protective Equipment and Other Control Measures					
Respiratory	FOR EXCESSIVE GAS CONCENTRATIONS, USE ONLY NIOSH/MSHA-APPROVED, SELF-CONTAINED BREATHING APPARATUS. (SEE "OTHER HYGIENE AND WORK PRACTICES" BELOW, AND SECTION XI.)				
Eye	INCREASE PROTECTION BEYOND THE NORMAL USE OF SAFETY GLASSES BY WEARING GOGGLES OR FACE SHIELD. CONTACT LENSES SHOULD NOT BE WORN. AN EYE WASH FOUNTAIN SHOULD BE AVAILABLE IN THE VICINITY OF USE.				
Skin	AVOID ALL SKIN CONTACT, WEAR OIL IMPERVIOUS (EG: NITRILE) CLOTHING AND GLOVES. IF SKIN CONTACT OCCURS, IMMEDIATELY USE WATERLESS HAND CLEANER, DRY WIPE, THEN FLUSH AREA WITH SOAP AND WATER.				
Engineering Controls	USE ADEQUATE VENTILATION TO KEEP VAPOR AND MIST CONCENTRATIONS OF THIS MATERIAL BELOW THE OCCUPATIONAL EXPOSURE LIMITS SHOWN IN SECTIONS VI. & XI. ELECTRICAL EQUIPMENT SHOULD FOLLOW NATIONAL ELECTRICAL CODE (NEC) STANDARDS				
Other Hygienic and Work Practices	USE GOOD PERSONAL HYGIENE. IN CASE OF SKIN CONTACT, WASH WITH MILD SOAP AND WATER OR A WATERLESS HAND CLEANER. IMMEDIATELY REMOVE SOILED CLOTHING AND WASH THOROUGHLY BEFORE REUSE. CLEAN OR DISCARD SOAKED LEATHER GOODS. PERSONNEL SHOULD NOT ENTER AREAS WHERE THE ATMOSPHERE IS BELOW 19.5 VOL.% OXYGEN WITHOUT SPECIAL PROCEDURES/EQUIPMENT. RESPIRATOR USE SHOULD COMPLY WITH OSHA 29 CFR 1910.134 OR EQUIVALENT. (SEE SECTION XI.-GENERAL COMMENTS)				
VI. Occupational Exposure Limits					
Substance	Source	Date	Type	Value/Units	Time
PPAH (TYPE A1A CARCINOGEN).	ACGIH	1989	TWA	0.2 MG/M3	8 HRS
HYDROGEN - SIMPLE ASPHYXIANT	ACGIH	1989			
HYDROGEN SULFIDE	ACGIH	1989	TWA	10 PPM	8 HRS
			STEL	15 PPM	15 MIN

MAIN FRACTIONATOR FEED - FCCU

MSDS No.
RS 501
Rev. Date
09/01/89

VII. Emergency and First Aid			
Inhalation	IMMEDIATELY MOVE PERSONNEL TO AREA OF FRESH AIR. FOR RESPIRATORY DISTRESS, GIVE AIR, OXYGEN, OR ADMINISTER CPR (CARDIOPULMONARY RESUSCITATION), IF NECESSARY. OBTAIN MEDICAL ATTENTION IF BREATHING DIFFICULTIES CONTINUE.		
Eye Contact	FLUSH EYES WITH CLEAN, LOW-PRESSURE WATER FOR AT LEAST 15 MINUTES. OCCASIONALLY LIFTING THE EYELIDS. IF PAIN OR REDNESS PERSISTS AFTER FLUSHING, OBTAIN MEDICAL ATTENTION.		
Skin Contact	REMOVE CONTAMINATED CLOTHING. REMOVE/BRUSH EXCESS MATERIAL FROM CONTAMINATED AREA; THEN FLUSH SKIN WITH SOAP AND WATER.		
Ingestion	RINSE MOUTH WITH WATER. DRINK 1-2 GLASSES OF WATER OR MILK. DO NOT INDUCE VOMITING UNLESS DIRECTED BY MEDICAL PERSONNEL. OBTAIN MEDICAL ATTENTION.		
Emergency Medical Treatment Procedures	DELAYED SKIN REACTION MAY OCCUR TO AFFECTED SKIN AREAS WITH SUBSEQUENT EXPOSURE TO SUN LIGHT OR ULTRAVIOLET LIGHT (PHOTOSENSITIZATION). IF THIS DEVELOPS, SEEK MEDICAL ATTENTION.		
VIII. Spill and Disposal			
Precautions if Material is Spilled or Released	CONTAIN SPILL. REMOVE ALL IGNITION SOURCES AND SAFELY STOP FLOW OF SPILL. SPILL MAY CREATE SLIPPING HAZARDS. PREVENT FROM ENTERING ALL BODIES OF WATER, IF POSSIBLE. EVACUATE ALL NON-ESSENTIAL PERSONNEL. IN URBAN AREAS, CLEANUP AS SOON AS POSSIBLE; IN NATURAL ENVIRONMENTS, CLEANUP ON ADVICE FROM ECOLOGISTS. THIS MATERIAL WILL FLOAT ON WATER. ABSORBENT MATERIAL AND PADS CAN BE USED. COMPLY WITH ALL APPLICABLE LAWS. SPILLS MAY NEED TO BE REPORTED TO THE NATIONAL RESPONSE CENTER (800/424-8802). THE SPILLED MATERIAL AND ANY WATER OR SOIL WHICH IT HAS CONTACTED MAY BE HAZARDOUS TO ANIMAL/AQUATIC LIFE.		
Waste Disposal Methods	MAXIMIZE PRODUCT RECOVERY FOR REUSE OR RECYCLING. DISPOSE OF PRODUCT AND CONTAMINATED MATERIAL AS EPA "IGNITABLE HAZARDOUS WASTE" (D001), UNLESS PROVEN OTHERWISE. USE APPROVED TREATMENT, TRANSPORTERS AND DISPOSAL SITES IN COMPLIANCE WITH ALL LAWS. IF SPILL IS INTRODUCED INTO A WASTEWATER SYSTEM, THE CHEMICAL AND BIOLOGICAL OXYGEN DEMAND WILL LIKELY INCREASE. SPILL MATERIAL IS BIODEGRADABLE IF GRADUALLY EXPOSED TO MICRO-ORGANISMS. A POTENTIAL DISPOSAL METHOD IS INCINERATION.		
IX. Components <small>(This may not be a complete list of components)</small>			
Component Name	CAS No.	Carcinogen##	Composition amount (Vol.) (See Qualification on Page 4)
LIGHT CATALYTIC CRACKED NAPHTHA (PETROLEUM)	64741-55-5*	N/AP AP	25 TO 30 PERCENT
HEAVY CATALYTIC CRACKED NAPHTHA (PETROLEUM)	64741-54-4*	N/AP AP	25 TO 30 PERCENT
LIGHT CATALYTIC CRACKED DISTILLATE (PETROLEUM)	64741-59-9*	N/AP AP	20 TO 25 PERCENT
C1-C3 HYDROCARBONS	68527-16-2*	N/AP LT	15 PERCENT
C4 HYDROCARBONS	68527-19-5*	N/AP AP	10 PERCENT
HYDROGEN	1333-74-0	N/AP LT	5 PERCENT
CATALYTIC CRACKED CLARIFIED OIL (PETROLEUM)	64741-62-4*	,2, ,4 LT	5 PERCENT
BENZENE	71-43-2	1,2,3,4 LT	5 PERCENT
HEAVY CATALYTIC CRACKED DISTILLATE (PETROLEUM)	64741-61-3*	,2, ,4 LT	2 PERCENT
HYDROGEN SULFIDE	7783-06-4	N/AP LT	1 PERCENT
##Listed By: 1 = NTP, 2 = IARC, 3 = OSHA, 4 = Other		Compositions given are typical values, not specifications.	

X. Physical and Chemical Data

Conditions to Avoid HEAT AND IGNITION SOURCES.			
Materials to Avoid STRONG ACIDS, ALKALIES, AND OXIDIZERS SUCH AS LIQUID CHLORINE AND OXYGEN.			
Hazardous Decomposition Products BURNING OR EXCESSIVE HEATING MAY PRODUCE CARBON MONOXIDE AND OTHER HARMFUL GASES/VAPORS INCLUDING OXIDES AND/OR OTHER COMPOUNDS OF SULFUR AND NITROGEN.			
XI. Additional Precautions			
<p>Handling, Storage, and Decontamination Procedures</p> <p>STORE AND TRANSPORT IN ACCORDANCE WITH ALL APPLICABLE LAWS. KEEP AWAY FROM HEAT, SPARKS, AND OPEN FLAME! KEEP CONTAINERS CLOSED AND PLAINLY LABELED! GROUND ALL DRUMS AND TRANSFER VESSELS WHEN HANDLING. USE ONLY WITH ADEQUATE VENTILATION! AVOID BREATHING VAPORS. STORE SAMPLES IN A COOL (LT. 80° F.) WELL VENTILATED PLACE. THIS STORAGE AREA AND VENTILATION EQUIPMENT SHOULD COMPLY WITH NFPA STANDARDS CLASS-IA/B FLAMMABLE LIQUIDS AND NEC REQUIREMENT.</p>			
<p>General Comments</p> <p>H₂S ODOR IS UNRELIABLE AS A WARNING OF POSSIBLE OVEREXPOSURE. MAY CONTAIN BENZENE WHICH MAY PRODUCE ANEMIA OR MORE SERIOUS BLOOD DISORDERS INCLUDING LEUKEMIA. THE RISK OF BENZENE-INDUCED BLOOD DISORDERS FROM THIS MATERIAL IS NOT KNOWN. SOME PETROLEUM NAPHTHAS, ESPECIALLY ALKYLATES, HAVE BEEN SHOWN TO PRODUCE KIDNEY DAMAGE IN MALE RATS AND SKIN TUMORS ON MICE. THE IMPLICATIONS OF THESE DATA FOR HUMAN HEALTH EFFECTS IS NOT KNOWN.</p> <p>SINCE SPECIFIC EXPOSURE STANDARDS/CONTROL LIMITS HAVE NOT BEEN ESTABLISHED FOR THIS MATERIAL, THE EXPOSURE LIMITS SHOWN IN SECTION IV. ARE SUGGESTED AS MINIMAL CONTROL GUIDELINES. THE STANDARDS FOR PARTICULATE POLYCYCLIC AROMATIC HYDROCARBONS (PPAH) AND COAL TAR PITCH VOLATILES (CTPV) (AS BENZENE SOLUBLES) ARE BASED UPON COAL COKING NOT ON PETROLEUM HEAVY FRACTIONS. THESE TWO EXPOSURE LIMITS APPLY ONLY TO THE AEROSOL FORM OF THIS MATERIAL.</p> <p>THE INFORMATION AND CONCLUSIONS HEREIN REFLECT NORMAL OPERATING CONDITIONS AND MAY BE FROM SOURCES OTHER THAN DIRECT TEST DATA ON THE MIXTURE ITSELF.</p>			
<p>--- Note --- Qualifications: EQ = Equal AP = Approximately N/P = No Applicable Information Found LT = Less Than UK = Unknown N/AP = Not Applicable GT = Greater Than TR = Trace N/DA = No Data Available</p>

MSDS No. RS0904
Revision Date 11/04/1999

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Liquid.		
Color	Water white, yellow, brown, or black.	Odor	Odorless to strong, unpleasant, and possibly distinctive of rotten eggs or ammoniacal.

DANGER! Contains Bound Hydrogen Sulfide (H₂S) and Ammonia (NH₃)! Flammable and toxic vapor may be released if mixture is subjected to high heat or hot surfaces, contact with acids, or severe agitation! Concentrated vapor may cause flash fire or explosion! May react with acids, acidic solutions, or halogenated materials! Reactions may generate extremely flammable hydrogen (H₂) gas! May be harmful or fatal if inhaled or ingested! High concentrations of vapor reduce oxygen available for breathing and may cause nervous system depression or paralysis and suffocation! Eye and/or skin irritation may result from vapor or liquid contact! Spills may create a slipping hazard!

SECTION 1: IDENTIFICATION

Trade Name	Stripped Sour Water	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	1111111140	Medical Emergency	(918) 495-4700
CAS Number	Mixture---See Section 2	CHEMTREC Emergency	(800) 424-9300
Product Family	Decontaminated process water.		
Synonyms	Aqueous Solution Containing Low Concentrations of Hydrogen Sulfide and Ammonia; Stripped Condensate Water; H ₂ S/NH ₃ -Stripped Wastewater; Effluent from the Sour Water Stripper Tower		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Water	7732-18-5	99.95-100
2) Hydrogen sulfide	7783-06-4	0-0.03
3) Ammonia	7664-41-7	0-0.02

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact Eye contact Inhalation Skin Absorption Ingestion

Signs and Symptoms of Acute Exposure

Stripped Sour Water

Inhalation	Inhalation is not considered a normal route of exposure for this aqueous solution. However, breathing high concentrations of mist or liquid droplets may cause respiratory tract irritation, mucous membrane tissue burns, and possibly, pulmonary edema and chemical pneumonia. Generated vapor may be harmful or fatal if inhaled! Inhalation of the released vapor may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Ammonia vapors may cause severe lung effects which might be delayed in onset. Symptoms are characterized by coughing, choking, or shortness of breath. NIOSH has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health. At concentrations above 500 ppm, H ₂ S cause unconsciousness and respiratory paralysis leading to coma and/or death. Also, NIOSH has determined that atmospheres containing 300 ppm or more of ammonia (NH₃) are immediately dangerous to life and health. (See Section 11.)
Eye Contact	Direct liquid contact may cause eye irritation upon short-term exposure and can produce severe, and possibly permanent, tissue damage if not promptly removed. The severity of the effects depend on the concentration of the ammonia component and how soon after exposure the eyes are washed. Generated vapor may cause severe eye irritation and photophobia (light sensitivity) upon short-term exposure. Severity depends upon the concentrations of hydrogen sulfide and ammonia and duration of exposure.
Skin Contact	May be moderately to severely irritating to the skin. Irritation may follow an initial delay between the time that the exposure occurs and the sense of irritation begins. This latency period can vary as much as several hours for a dilute solutions (LT 0.04 wt % ammonia). Prolonged or repeated contact, even to dilute concentrations of ammonia solutions , may cause some degree of permanent tissue destruction. Hydrogen sulfide can be absorbed through the skin to produce toxic effects. If the skin is damaged, absorption increases.
Ingestion	Ingestion is unlikely. However, if swallowed, this material may cause gastrointestinal tract irritation, nausea, and vomiting, in addition to a burning sensation in the mouth, throat, and digestive tract. Depending upon the ammonia concentration, ulceration of the gastrointestinal tract may also occur.
Chronic Health Effects Summary	Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H ₂ S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures. Chronic dyspnea, obstructive lung disease, and bronchial hyper-reactivity were adverse effects experienced by several workers two years after their occupational overexposures to mists or aerosols of ammonia . Also, when ingested by rats, aqueous ammonia solutions have been shown to cause gastrointestinal tract tumors. (See Section 11.)
Conditions Aggravated by Exposure	Personnel with pre-existing eye, skin, or gastrointestinal disorders, nervous system diseases, impaired kidney function, or chronic respiratory diseases neurological disorders, high blood pressure, and those with a compromised ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this material's components. They should take additional precautions to minimize or avoid vapor exposure.
Target Organs	Components of this mixture are potentially toxic to eyes, skin, mucous membranes, lungs, nervous systems, brain, kidneys, and possibly the blood, heart, and/or the endocrine and reproductive systems.
Carcinogenic Potential	This material does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC, or NTP. (See Section 11.)

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

Stripped Sour Water

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Do not attempt to remove contact lenses. Immediately irrigate eyes with copious amounts of cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Flush thoroughly with water under a cool or cold shower for at least 15 minutes while removing contaminated shoes and clothing. Gently and thoroughly wash contaminated skin with running water and non-abrasive soap. Be particularly careful to clean folds, crevices, creases, and groin area. Seek medical attention if tissue appears damaged or if irritation or pain persists. Thoroughly clean contaminated clothing before reuse.
Ingestion	Do not induce vomiting. If spontaneous vomiting is about to occur, place victim's head below knees. Do not attempt to neutralize. Have victim rinse mouth with water then drink two to three large glasses of milk or water. Never give anything by mouth to a person who is not fully conscious. Keep airway clear. Seek medical attention immediately.
Notes to Physician	<p>If after exposed skin has been washed gently with running water and non-abrasive soap, one may neutralize severely irritated or burned tissue with a dilute solution of boric acid or acetic acid.</p> <p>Inhalation overexposure can produce other toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.</p> <p>Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Stripped sour water is non-flammable under normal conditions of use, however, if improperly handled, generated H ₂ S or H ₂ vapors are Extremely Flammable!		
Flash Point/Method	Not applicable or AP -73°C (-100°F) for H ₂ S		
Lower Flammable Limit	Not applicable or AP 4.0% for H ₂ S.	Upper Flammable Limit	Not applicable or 45% for H ₂ S.
Auto-Ignition Temp.	Not applicable or AP 260°C (500°F) for H ₂ S		
Hazardous Combustion Products	Contact with some metals might generate extremely flammable hydrogen (H ₂) gas. This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!		
Special Properties	High heat, hot surface contact, or mixing with acids may spring steam, extremely flammable H ₂ S, and/or toxic NH ₃ vapors out of this solution. H ₂ S is heavier than air and may travel long distances along the ground to an ignition source and flash back. It may also create a vapor/air explosion hazard in confined spaces such as in sewers. Adding this mixture directly to unbuffered water may cause a slightly exothermic reaction.		
Extinguishing Media	Non-combustible, if handled and stored properly. Use extinguishing media suitable for the surrounding fire. In an advanced or massive fire, evacuate area and fight fire from a safe distance or a protected location. Approach fire from upwind. Use unmanned monitors and hoseholders to keep cooling streams of water on fire-exposed cylinders or tanks until well after the fire is out. If possible, isolate materials not yet involved in the fire and protect personnel. Move containers away from fire area if it can be done without risk.		
Fire Fighting Protective Clothing	This material is not expected to burn. However, in the event that gases are being generated or surrounding materials are involved in a fire, firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies.		

Stripped Sour Water

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Avoid contact with damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to containers. All clean-up materials should be removed for proper treatment or disposal. For large spills, dike far ahead of spill to maximize later product recovery or disposal. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and proper protective clothing during cleanup operations. This material may react strongly with acids. Never flush to the sewer. In urban areas, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists to minimize physical habitat damage. If appropriate, neutralize with a dilute solution of boric acid or acetic acid. A vacuum truck may be used to collect the bulk. Spills on other than pavement may be handled by removing the affected soil and placing it into approved containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE**Handling**

Do not breathe mist or vapor. Do not get in eyes, on skin, or on clothing. Wear suitable personal protective equipment to prevent eye and skin contact. Wash thoroughly after handling.

Danger! Irritating Liquid and/or Poisonous and Flammable Gas! Do NOT breathe mist or vapor; it may contain hydrogen sulfide (H₂S), and/or ammonia (NH₃). Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow material to contact eyes, skin or other tissues, and clothing. Wear corrosion-resistant protective work clothing and chemical splash goggles and face shield when contact is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create an immediate fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for H₂S concentrations and flammability.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable, corrosive, and/or poisonous residue.

Storage

Store in containers appropriate for dilute ammonia solutions and away from acids. Diluted material may accelerate corrosion of metal containers.

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room. The H₂S component of this material is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.)

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION**Engineering Controls**

No special ventilation is required under normal conditions of use. Where engineering controls are feasible, use adequate local exhaust ventilation wherever mist, spray, or vapor may be generated. Where hydrogen sulfide and/or ammonia may be generated, special ventilation will be required. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Stripped Sour Water

Eye Protection	Safety glasses with side shields are recommended as a minimum protection. When there is a likelihood of misting, splashing, or spraying, chemical-resistant goggles and full-face shield should be worn. Thermal protection should be provided if the solution has a temperature above 120 degrees F. Suitable eye wash water should be readily available.
Hand Protection	Avoid skin contact. Use of chemical-resistant gloves (e.g., PVC, neoprene, rubber, or vinyl) is required. Thermal protection should be used whenever the solution has a temperature above 120 degrees F. Wash hands and other exposed skin with mild soap and water before eating, drinking, smoking, or using the toilet facilities.
Body Protection	Avoid all skin contact. If splashing or spraying is expected, chemical-resistant protective clothing (e.g., vinyl, Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. Thermal protection should be provided when the solution has a temperature above 120 degrees F. If general contact occurs, IMMEDIATELY remove soaked clothing and shower thoroughly. Contaminated leather goods should be removed immediately and discarded.
Respiratory Protection	Misting or vapor generation is not expected under normal conditions of use; so respiratory protection is not anticipated under normal use conditions and with adequate ventilation. However, when anticipated or if generated hydrogen sulfide or ammonia are present at concentrations above applicable workplace exposure levels, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g. ANSI Z88.2).
General Comments	Releases of residual hydrogen sulfide and/or ammonia may create flammable, explosive, toxic, and/or oxygen-deficient atmospheres (LT 19.5 Vol.% in air). DO NOT ENTER such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions. Air purifying respirators offer no protection against oxygen deficiency and hydrogen sulfide. Use good personal hygiene practices. Wash hands and other exposed skin areas with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities, or leaving work. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners. Exposure standards/control limits for some of the components apply to airborne concentrations of dust, and are not truly applicable to liquid solutions. Use of personal protective equipment and good personal hygiene are essential to controlling exposures to this aqueous solution.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) [1999] TWA: 5 (ppm) from ACGIH (TLV) [2000]
2) Ammonia	TWA: 10 STEL: 15 CEIL: 20 (ppm) from OSHA (PEL) [1989] TWA: 25 STEL: 35 (ppm) from ACGIH (TLV) [1999] STEL: 35 (ppm) from OSHA (PEL) [1989] TWA: 50 STEL: 35 (ppm) from OSHA (PEL) [1976]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color	Water white, yellow, brown, or black.	Odor	Odorless to strong, unpleasant, and possibly distinctive of rotten eggs or ammoniacal.
Specific Gravity	1.00 to 1.02 (Water = 1)	pH	7.0 to 9.0 [Moderately Basic.]	Vapor Density	0.59 to 1.18
Boiling Point/Range	-79° to 100°C (-110° to 212°F) at 14.7 psia	Melting/Freezing Point			-129° to 0°C (-200° to 32°F) at 14.7 psia.
Vapor Pressure	212 to 394 psia at 100°F (based upon H ₂ S and NH ₃)	Viscosity (cSt @ 40°C)			Not applicable
Solubility in Water	Completely soluble in cold water; but may cause an exothermic reaction.	Volatile Characteristics			Negligible volatility in proper storage.
Additional Properties	A 0.02% solution of ammonia has about an 8.0 pH. Ammonia has a vapor density lighter than air and will disperse rapidly, however, hydrogen sulfide has a vapor density heavier than air and will tend to accumulate in low places or travel along the ground creating a flashback fire hazard.				

Stripped Sour Water

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from strong acids, heat and hot surfaces, strong oxidizing conditions, and severe agitation Contact with some metals can generate extremely flammable hydrogen (H ₂) gas Avoid direct contact with organic halogen compounds.		
Materials Incompatibility	Strong acids, halogenated compounds, and some heavy metals. Ammonia solutions are corrosive to chromium and silver and alloys containing these metals and will react violently with their powdered forms.		
Hazardous Decomposition Products	Free aromatic amines may be released in a reducing environment.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Hydrogen sulfide

GAS (TCLo): Acute: 10 ppm for 15 minutes [Human] - Eye irritation.

GAS (TCLo): Acute: 50 to 100 ppm for 15 minutes [Human] - Respiratory irritation.

GAS (LC₁₀₀): Acute: 600 to 750 ppm for 30 minutes [Human] - Respiratory paralysis and death.

GAS (LCLo): Acute: 5,700 ug/kg for 8 hours [Human] - Chronic pulmonary edema, coma, and death

Ammonia:

ORAL (LDLo) Acute: 132 mg/kg [Human].

ORAL (TDLo) Acute: 15 uL/kg [Human] - Structural changes in the esophagus.

GAS (TCLo): Acute: 20 ppm for 1hour [Human] - Eye irritation, ulcerated nasal septum, and structural changes in the trachea or bronchi.

GAS (LCLo) Acute: 5,000 ppm for 5 minutes [Human].

GAS (LCLo): Acute: 5,000 ppm for 5 minutes [Guinea Pig]

GAS (LC₅₀): Acute: 2,000 ppm for 4 hours [Rat].

GAS (LC₅₀): Acute: 7,000 mg/m³ for 1 hour [Cat and Rabbit] - Excitement and flaccid paralysis without anesthesia.

GAS (LC₅₀): Acute: 4,230 ppm for 1 hour [Mouse] - Ataxia, tremors, and convulsions.

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (LT 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (GT 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Ammonia is a strong base and forms **ammonium hydroxide** upon contact with water. This material is corrosive to many organic compounds. If ingested, ammonia can cause severe pain, bloody diarrhea, cardiovascular collapse, and death. Concentrated ammonia is a strong corrosive which can cause burns of the following types: cryogenic from contact with refrigerated liquid, thermal from exothermic reaction with water, and chemical from its alkalinity. It gelatinizes the tissue, forming deep and painful lesions. At low concentrations, aqueous ammonia is a moderate to strong irritant to the eyes, skin, mucous membranes, and respiratory and digestive tracts. Its effects on the lungs can be severe and delayed in onset; respiratory support may be required following acute inhalation. However, there seems to be a wide variability in the human sensitivity to ammonia.

Chronic dyspnea, restrictive lung dysfunction, obstructive lung disease, and bronchial hyper-reactivity were adverse effects experienced by several employees two years after their occupational overexposures to mists and aerosols of **ammonia**. An **aqueous ammonia solution** caused gastrointestinal cicatricial tumors in rats following a 24-week feeding assay. NH₃ produced a positive mutagenic response in the Ames Assay and caused chromosomal aberrations during a 16-week cytogenic study using rats. However, in general, pH alterations produce false positive results in short-term genetic assays.

Stripped Sour Water**SECTION 12: ECOLOGICAL INFORMATION**

Ecotoxicity	Ecological effects testing has not been conducted on this material. Vapor releases from this material are expected to cause significant immediate impact but only localized non-persistent environmental damage. Due caution should be exercised to prevent an accidental release into the environment. Volatile components may contribute to smog formation
Environmental Fate	This material is wastewater and is expected to readily disperse in marine environments. Caustic solutions have produced slight to moderate toxicity in laboratory tests with aquatic organisms. It is expected to be slightly alkaline. If released to surface water, it may cause a pH rise depending upon the buffering capacity of the waterbody. Aquatic organisms become increasingly stressed as pH concentration exceeds 9.0, with many species being intolerant of pH of 10.0 or higher. The dilute nature of this mixture precludes any significant impact on large water bodies. Substances in this mixture do not bioaccumulate. For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a hazardous waste at the time of disposal. Maximize component recovery prior for reuse or recycling. Potential treatment and disposal methods include steam stripping, bio-oxidation, incineration, and land disposal, if permitted. Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT)		
Proper Shipping Name	Toxic liquid, flammable, n.o.s. Inhalation Hazard Zone B (Hydrogen sulfide, Ammonia)		
Hazard Class	DOT CLASS: 6.1 (Poison B).	Packing Group(s)	PG III
		UN/NA ID	UN1992
Reportable Quantity	A Reportable Quantity (RQ) substance components in this material which require DOT HAZMAT bill-of-lading display are Hydroxide sulfide and Ammonia .		
Placards			Emergency Response Guide No. 131
		HAZMAT STCC No.	49 203 78
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. This material contains detectable concentrations of the following chemical substances subject to this statute. Hydrogen sulfide [CAS No. 7783-06-4] and Ammonia [CAS No. 7664-41-7] .

Stripped Sour Water

SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Acute (Immediate) & Chronic (Delayed) Health, Sudden Release of Pressure, and Fire Hazards.
SARA 313	This material does not contain any components in concentrations which are at or above de minimis levels and are listed as a toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this material subject to this statute are: Hydroxide sulfide [CAS No. 7783-06-4] (RQ = 100 lbs. [45.4 kg]) concentration: 0 to 0.03% Ammonia [CAS No. 7664-41-7] (RQ = 100 lbs. [45.4 kg]) concentration: 0 to 0.02%
CWA	This material is NOT classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA).
California Proposition 65	This material does not contain any ingredients for which the State of California has found to cause cancer, birth defects, or other reproductive harm, and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. A chemical substance present in this material which is subject to this statute is: Hydroxide sulfide [CAS No. 7783-06-4].

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 2 0
Revision Date 11/04/1999
Print Date Printed on 02/16/2000.

Emergency Overview

Physical State Liquid.

Color Transparent, white to grey color. **Odor** Hydrocarbon.

WARNING:

NON-POTABLE WATER.

Do not use for Drinking, Washing or Cooking.

Process water may be hot and can cause thermal burns.

Process Water may contain toxic gases and flammable hydrocarbons. Check vapor spaces of vessels and storage tanks for flammable vapors and toxic gases prior to commencing hot work or confined space entry.

Protective Equipment

Minimum Recommended
See Section 8 for Details

Minimum PPE reflects the requirements for this material at this facility:

LYONDELL-CITGO Refining
LP Manufacturing Complex

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	Oily Wastewater	Technical Contact	(800) 525-4692
Product Number	RS0911	Medical Emergency	(800) 313-7645
CAS Number	Mixture.	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Refinery Intermediate Stream		
Synonyms	Contaminated Process Water; Oil-contaminated Water; Wastewaters from Refinery Process Areas; Wastewaters containing Benzene and Aromatics; Water, C6-C50 Hydrocarbons, Hydrogen Sulfide, and Ammonia Mixture.		

SECTION 2. COMPOSITION (TYPICAL)

Component Name(s)	CAS Registry No.	Concentration (%)
Oily Wastewater	Mixture	100

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Inhalation. Ingestion.

Signs and Symptoms of Acute Exposure

Oily Wastewater

Inhalation	Depending upon the source of the process water, volatile hydrocarbons may be liberated from this material. Signs and symptoms of exposure include respiratory irritation, excitation or giddiness, headache, nausea, vomiting and similar effects of central nervous system depression. This material may liberate hydrogen sulfide. Symptoms of hydrogen sulfide exposure marked by an initial foul rotten egg odor include irritation of eyes and respiratory tract. At high levels, hydrogen sulfide paralyzes the respiratory system, leading to death by asphyxiation. Odor cannot be relied upon to warn of the continuous presence of hydrogen sulfide.
Eye Contact	This material can cause eye irritation with tearing, redness, or a stinging or burning feeling. Effects may become more serious with repeated or prolonged contact.
Skin Contact	May cause mild skin irritation with redness and/or an itching or burning feeling. Effects may become more serious with repeated or prolonged contact.
Ingestion	Swallowing this material may cause stomach or intestinal upset with pain, nausea, and/or diarrhea.
Chronic Health Effects Summary	No chronic health effects anticipated. See toxicological Information (section 11)
Conditions Aggravated by Exposure	Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Skin
Target Organs	May cause damage to the following organs: skin, eye, lens or cornea.
Carcinogenic Potential	This product is not known to contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC or NTP.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification			OSHA Physical Hazard Classification						
Irritant	<input type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Toxic	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately. Keep the affected individual warm and at rest.
Eye Contact	Check for and remove contact lenses. Flush eyes with cool, clean, low-pressure water for at least 15 minutes while occasionally lifting and lowering eyelids. Do not use eye ointment unless directed to by a physician. Seek medical attention if excessive tearing, irritation, or pain persists.
Skin Contact	If burned by hot material, cool skin by quenching with large amounts of cool water. For contact with product at ambient temperatures, remove contaminated shoes and clothing. Wipe off excess material. Wash exposed skin with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists. Thoroughly clean contaminated clothing before reuse. Discard contaminated leather goods. If material is injected under the skin, seek medical attention immediately.

Oily Wastewater

Ingestion	Do not induce vomiting unless directed to by a physician. Do not give anything to drink unless directed to by a physician. Never give anything by mouth to a person who is not fully conscious. Seek medical attention immediately.
Notes to Physician	Treat symptomatically.

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	Not applicable.	
Flash Point	Not applicable.	
Lower Flammable Limit	Not determined.	Upper Flammable Limit Not determined.
Autoignition Temperature	Not applicable.	
Hazardous Combustion Products	Aqueous phase does not support combustion. Burning of oil layer (if any) will liberate carbon dioxide, carbon monoxide, smoke, fumes, and/or unburned hydrocarbons.	
Special Properties	This material is not expected to burn nor support combustion. The vapor spaces of storage tanks containing petroleum contact water may contain flammable vapor. Always check for flammable vapors prior to performing any hot work on these structures.	
Extinguishing Media	Use extinguishing media suitable for the surrounding fire. In an advanced or massive fire, evacuate area and fight fire from a safe distance or a protected location. Approach fire from upwind. Use unmanned monitors and hoseholders to keep cooling streams of water on fire-exposed cylinders or tanks until well after the fire is out. If possible, isolate materials not yet involved in the fire and protect personnel. Move containers away from fire area if it can be done without risk.	
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.	

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Stop leak if you can do so without risk. For small spills, absorb or cover with dry earth, sand, or other inert non-combustible absorbent material and place into waste containers for later disposal. Contain large spills to maximize recovery or disposal. Avoid entry into waterways or uncontrolled storm sewers. In natural environments, seek cleanup advice from specialists to minimize physical habitat damage. This material is miscible in water. For oil sheen, absorbent pads and similar materials can be used.

SECTION 7. HANDLING AND STORAGE

Handling	Avoid contact with eyes, skin, and clothing. Avoid breathing mist or vapor. Use only with adequate ventilation and personal protective equipment. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling or disposing of empty containers and/or waste residues of this product.
Storage	Do not store with strong acids or water reactive materials. Do not store in open or unlabeled containers.

Oily Wastewater

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls Use in well ventilated areas. In confined spaces, mechanical ventilation may be required to maintain airborne concentrations below applicable workplace exposure levels. Potential airborne contaminant concentrations must be evaluated by designated and properly trained personnel.

Personal Protective Equipment Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Eye Protection Safety glasses equipped with side shields are recommended as minimum protection in industrial settings. Chemical goggles should be worn during transfer operations or when there is a likelihood of misting, splashing, or spraying of this material. Suitable eye wash water should be readily available.

Hand Protection Avoid skin contact. Use disposable neoprene, rubber, or vinyl gloves. Thermal protective gloves are required when water temperatures are above 120° F. Wash hands and other exposed skin with mild soap and water before eating, drinking, smoking, or using the toilet facilities.

Body Protection Avoid skin contact. Wear long-sleeved fire-retardant garments (e.g., Nomex®) while working with flammable and combustible liquids. Additional chemical-resistant protective gear may be required if splashing or spraying conditions exist. This may include an apron, boots and additional facial protection. If product comes in contact with clothing, immediately remove soaked clothing and shower. Promptly remove and discarded contaminated leather goods.

Respiratory Protection For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).

General Comments Use good personal hygiene practices. Wash hands and other exposed skin areas with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities, or leaving work. DO NOT use gasoline, kerosene, solvents, or harsh abrasive skin cleaners.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
-----------	--------------------------------------

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Liquid.	Color	Transparent, white to grey color.	Odor	Hydrocarbon.
Specific Gravity	1 (Water = 1) (Estimated.)	pH	Not Applicable.	Vapor Density	>1 (Air = 1)
Boiling Range	100°C (212°F)			Melting/Freezing Point	0°C (32°F)

Oily Wastewater

Vapor Pressure	Not determined.	Volatility	Slightly volatile.
Solubility in Water	Easily soluble in cold water. Soluble in methanol.	Viscosity (cSt @ 40°C)	Not determined.
Additional Properties	No additional information.		

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from water reactive materials.		
Materials Incompatibility	May react or be incompatible with acids.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	Oily Wastewater This material may contain ammonium bisulfide, hydrogen sulfide and light hydrocarbons including oxygenates in the aqueous phase up to the limit of water-solubility of these compounds. The oil phase (if present) may contain a full range of hydrocarbons, depending upon the source of the stream. Since this material has not been fully characterized according to components, measures should be taken to minimize exposure to vapors and to avoid skin contact.
----------------------	--

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this material.
Environmental Fate	This product is miscible in water and is expected to readily disperse in marine environments.

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. Conditions of use may cause this material to become a "hazardous waste", as defined by federal or state regulations. Use approved treatment, transporters, and disposal sites in compliance with applicable regulations.

Oily Wastewater

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304 Emergency Planning and Notification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: No SARA 311/312 hazard categories identified.
SARA 313 Toxic Chemical Notification and Release Reporting	This product contains the following components in concentrations above de minimis levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: No components were identified.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. This product or refinery stream is not known to contain chemical substances subject to this statute. However, it is recommended that you contact state and local authorities to determine if there are any other reporting requirements in the event of a spill.
Clean Water Act (CWA)	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This product is not known to contain the any components for which the State of California has found to cause cancer, birth defects or other reproductive harm.
New Jersey Right-to-Know Label	For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.
Additional Regulatory Remarks	

Oily Wastewater

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Houston, TX 77252-2451

MSDS No. RS0914
Revision Date 01/07/2000

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Liquid		
Color	Colorless, water white, yellow, brown, or black.	Odor	Faint to strong, unpleasant, and possibly distinctive of rotten eggs or ammoniacal.

DANGER! Contains Hydrogen Sulfide (H₂S) and Ammonia (NH₃)! Extremely flammable and toxic vapor may be released if this mixture is subjected to high heat or hot surfaces, contact with acids, or severe agitation! Vapor may cause flash fire or explosion! May react violently with acids, acidic solutions, or halogenated materials! Reactions may generate extremely flammable hydrogen (H₂) gas! May be harmful or fatal if inhaled or ingested! High concentrations of vapor may cause nervous system depression or paralysis and suffocation! Eye and/or skin irritation may result from vapor or liquid contact! May be corrosive to some metallic substances! Spills may create a slipping hazard!

2) Hydrogen sulfide	7783-06-4	0 0005-0 1
3) Ammonia	7664-41-7	0.0001-0 01

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact Eye contact. Inhalation Skin Absorption. Ingestion

Signs and Symptoms of Acute Exposure

Sour Water at Crude Units

Inhalation	Inhalation is not considered a normal route of exposure for this aqueous solution. However, breathing high concentrations of mist or liquid droplets may cause respiratory tract irritation, mucous membrane tissue burns, and possibly, pulmonary edema and chemical pneumonia. Generated vapor may be harmful or fatal if inhaled! Inhalation of the released vapor may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Ammonia vapors may cause severe lung effects which might be delayed in onset. Symptoms are characterized by coughing, choking, or shortness of breath. NIOSH has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health. At concentrations above 500 ppm, H ₂ S cause unconsciousness and respiratory paralysis leading to coma and/or death. Also, NIOSH has determined that atmospheres containing 300 ppm or more of ammonia (NH₃) are immediately dangerous to life and health. (See Section 11.)
Eye Contact	Direct liquid contact may cause eye irritation upon short-term exposure and can produce severe, and possibly permanent, tissue damage if not promptly removed. The severity of the effects depend on the concentration of the ammonia component and how soon after exposure the eyes are washed. Generated vapor may cause severe eye irritation and photophobia (light sensitivity) upon short-term exposure. Severity depends upon the concentrations of hydrogen sulfide and ammonia and duration of exposure.
Skin Contact	May be slightly irritating to corrosive to the skin. Irritation may follow an initial delay between the time that the exposure occurs and the sense of irritation begins. This latency period can vary as much as several hours to a day for a dilute solutions (LT 0.04 wt.% ammonia). Prolonged or repeated contact, even to dilute concentrations of ammonia solutions , may cause some degree of permanent tissue destruction. Hydrogen sulfide can be absorbed through the skin to produce toxic effects. If the skin is damaged, absorption increases.
Ingestion	Ingestion is unlikely. However, if swallowed, this material may cause gastrointestinal tract irritation, nausea, and vomiting, in addition to a burning sensation in the mouth, throat, and digestive tract. Depending upon the ammonia concentration, ulceration of the gastrointestinal tract may also occur.
Chronic Health Effects Summary	Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H ₂ S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures. Chronic dyspnea, obstructive lung disease, and bronchial hyper-reactivity were adverse effects experienced by several workers two years after their occupational overexposures to mists or aerosols of ammonia . Also, when ingested by rats, aqueous ammonia solutions have been shown to cause gastrointestinal tract tumors. (See Section 11.)
Conditions Aggravated by Exposure	Personnel with pre-existing eye, skin, or gastrointestinal disorders, nervous system diseases, impaired kidney function, or chronic respiratory diseases neurological disorders, high blood pressure, and those with a compromised ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this material's components. They should take additional precautions to minimize or avoid exposure.
Target Organs	The material is potentially toxic to eyes, skin, mucous membranes, lungs, nervous systems, brain, kidneys, and possibly the blood, heart, and/or the endocrine and reproductive systems.
Carcinogenic Potential	This material does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC, or NTP. (See Section 11.)

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification

Sour Water at Crude Units

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Do not attempt to remove contact lenses. Immediately irrigate eyes with copious amounts of cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Flush thoroughly with water under a cool or cold shower for at least 15 minutes while removing contaminated shoes and clothing. Gently and thoroughly wash contaminated skin with running water and non-abrasive soap. Be particularly careful to clean folds, crevices, creases, and groin area. Seek medical attention if tissue appears damaged or if irritation or pain persists. Thoroughly clean contaminated clothing before reuse.
Ingestion	Do not induce vomiting. If spontaneous vomiting is about to occur, place victim's head below knees. Do not attempt to neutralize. Have victim rinse mouth with water then drink two to three large glasses of milk or water. Never give anything by mouth to a person who is not fully conscious. Keep airway clear. Seek medical attention immediately.
Notes to Physician	<p>If after exposed skin has been washed gently with running water and non-abrasive soap, one may neutralize severely irritated or burned tissue with a dilute solution of boric acid or acetic acid.</p> <p>Inhalation overexposure can produce other toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.</p> <p>Nitrite as an antidote for acute hydrogen sulfide intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Sour water is non-flammable under normal conditions of use, however, if improperly handled, generated H ₂ S or H ₂ vapors are Extremely Flammable!		
Flash Point/Method	Not applicable or AP -73°C (-100°F) for H ₂ S		
Lower Flammable Limit	Not applicable or AP 4.0% for H ₂ S.	Upper Flammable Limit	Not applicable or 45% for H ₂ S
Auto-Ignition Temp.	Not applicable or AP 260°C (500°F) for H ₂ S		
Hazardous Combustion Products	Contact with some metals can generate extremely flammable hydrogen (H ₂) gas. This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!		
Special Properties	High heat, hot surface contact, or mixing with acids may spring steam, extremely flammable H ₂ S, and/or toxic NH ₃ vapors out of this solution. H ₂ S is heavier than air and may travel long distances along the ground to an ignition source and flash back. It may also create a vapor/air explosion hazard in confined spaces such as in sewers. Adding this mixture directly to unbuffered water may cause a slightly exothermic reaction.		
Extinguishing Media	Non-combustible, if handled and stored properly. Use extinguishing media suitable for the surrounding fire. In an advanced or massive fire, evacuate area and fight fire from a safe distance or a protected location. Approach fire from upwind. Use unmanned monitors and hoseholders to keep cooling streams of water on fire-exposed cylinders or tanks until well after the fire is out. If possible, isolate materials not yet involved in the fire and protect personnel. Move containers away from fire area if it can be done without risk.		
Fire Fighting Protective Clothing	This material is not expected to burn. However, in the event that gases are being generated or surrounding materials are involved in a fire, firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies.		

Sour Water at Crude Units

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Avoid contact with damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to containers. All clean-up materials should be removed for proper treatment or disposal. For large spills, dike far ahead of spill to maximize later product recovery or disposal. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and proper protective clothing during cleanup operations. This material may react strongly with acids. Never flush to the sewer. In urban areas, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists to minimize physical habitat damage. If appropriate, neutralize with a dilute solution of boric acid or acetic acid. A vacuum truck may be used to collect the bulk. Spills on other than pavement may be handled by removing the affected soil and placing it into approved containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

Handling

Do not breathe mist or vapor. Do not get in eyes, on skin, or on clothing. Wear suitable personal protective equipment to prevent eye and skin contact. Wash thoroughly after handling.

Danger! Corrosive or Irritating Liquid and/or Poisonous and Flammable Gas! Do NOT breathe mist or vapor; it may contain hydrogen sulfide (H₂S), and/or ammonia (NH₃). Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow material to contact eyes, skin or other tissues, and clothing. Wear corrosion-resistant protective work clothing and chemical splash goggles and face shield when contact is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create an immediate fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for H₂S concentrations and flammability.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable, corrosive, and/or poisonous residue.

Storage

Store in containers appropriate for dilute ammonia solutions and away from acids. Diluted material may accelerate corrosion of metal containers.

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room. The H₂S component of this material is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.)

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

No special ventilation is required under normal conditions of use. Where engineering controls are feasible, use adequate local exhaust ventilation wherever mist, spray, or vapor may be generated. Where hydrogen sulfide and/or ammonia may be generated, special ventilation will be required. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Sour Water at Crude Units

Eye Protection	Safety glasses with side shields are recommended as a minimum protection. When there is a likelihood of misting, splashing, or spraying, chemical-resistant goggles and full-face shield should be worn. Thermal protection should be provided if the solution has a temperature above 120 degrees F. Suitable eye wash water should be readily available.
Hand Protection	Avoid skin contact. Use of chemical-resistant gloves (e.g., PVC, neoprene, rubber, or vinyl) is required. Thermal protection should be used whenever the solution has a temperature above 120 degrees F. Wash hands and other exposed skin with mild soap and water before eating, drinking, smoking, or using the toilet facilities.
Body Protection	Avoid all skin contact. If splashing or spraying is expected, chemical-resistant protective clothing (e.g., vinyl, Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. Thermal protection should be provided when the solution has a temperature above 120 degrees F. If general contact occurs, IMMEDIATELY remove soaked clothing and shower thoroughly. Contaminated leather goods should be removed immediately and discarded.
Respiratory Protection	Misting or vapor generation is not expected under normal conditions of use; so respiratory protection is not anticipated under normal use conditions and with adequate ventilation. However, when anticipated or if generated hydrogen sulfide or ammonia are present at concentrations above applicable workplace exposure levels, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g., ANSI Z88.2).
General Comments	Releases of loosely bound hydrogen sulfide and/or ammonia may create flammable, explosive, toxic, and/or oxygen-deficient atmospheres (LT 19.5 Vol % in air). DO NOT ENTER such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions. Air purifying respirators offer no protection against oxygen deficiency and hydrogen sulfide. Use good personal hygiene practices. Wash hands and other exposed skin areas with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities, or leaving work. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners. Exposure standards/control limits for some of the components apply to airborne concentrations of dust, and are not truly applicable to liquid solutions. Use of personal protective equipment and good personal hygiene are essential to controlling exposures to this aqueous solution.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) [1999] TWA: 5 (ppm) from ACGIH (TLV) [2000]
2) Ammonia	TWA: 10 STEL: 15 CEIL: 20 (ppm) from OSHA (PEL) [1989] TWA: 25 STEL: 35 (ppm) from ACGIH (TLV) [1999] STEL: 35 (ppm) from OSHA (PEL) [1989] TWA: 50 STEL: 35 (ppm) from OSHA (PEL) [1976]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color	Colorless, water white, yellow, brown, or black.	Odor	Faint to strong, unpleasant, and possibly distinctive of rotten eggs or ammoniacal.
Specific Gravity	1.0 to 1.01 (Water = 1)	pH	4.0 to 8.0 [Moderately Acidic to Neutral]	Vapor Density	0.59 to 1.18
Boiling Point/Range	-79° to 100°C (-110° to 212°F) at 14.7 psia	Melting/Freezing Point		Viscosity (cSt @ 40°C)	-129° to 0°C (-200° to 32°F) at 14.7 psia.
Vapor Pressure	212 to 394 psia at 100°F (based upon H ₂ S and NH ₃)	Volatility Characteristics		Additional Properties	Not applicable
Solubility in Water	Completely soluble in cold water.			Volatility Characteristics	Negligible volatility in proper storage.
Additional Properties	No additional information				

Sour Water at Crude Units

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from strong acids, heat and hot surfaces, strong oxidizing conditions, and severe agitation. Contact with some metals can generate extremely flammable hydrogen (H ₂) gas. Avoid direct contact with organic halogen compounds		
Materials Incompatibility	Strong acids, halogenated compounds, and some heavy metals. Ammonia solutions are corrosive to chromium and silver and alloys containing these metals and will react violently with their powdered forms		
Hazardous Decomposition Products	Free aromatic amines may be released in a reducing environment.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Hydrogen sulfide

- GAS (TCLo): Acute: 10 ppm for 15 minutes [Human] - Eye irritation.
- GAS (TCLo): Acute: 50 to 100 ppm for 15 minutes [Human] - Respiratory irritation
- GAS (LC₁₀₀): Acute: 600 to 750 ppm for 30 minutes [Human] - Respiratory paralysis and death
- GAS (LCLo): Acute: 5,700 ug/kg for 8 hours [Human] - Chronic pulmonary edema, coma, and death.

Ammonia:

- ORAL (LDLo): Acute: 132 mg/kg [Human].
- ORAL (TDL0): Acute: 15 uL/kg [Human] - Structural changes in the esophagus.
- GAS (TCLo): Acute: 20 ppm for 1hour [Human] - Eye irritation, ulcerated nasal septum, and structural changes in the trachea or bronchi.
- GAS (LCLo) Acute: 5,000 ppm for 5 minutes [Human].
- GAS (LCLo) Acute: 5,000 ppm for 5 minutes [Guinea Pig].
- GAS (LC₅₀) Acute 2,000 ppm for 4 hours [Rat]
- GAS (LC₅₀): Acute: 7,000 mg/m³ for 1 hour [Cat and Rabbit] - Excitement and flaccid paralysis without anesthesia.
- GAS (LC₅₀): Acute: 4,230 ppm for 1 hour [Mouse] - Ataxia, tremors, and convulsions.

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (LT 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (GT 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Ammonia is a strong base and forms **ammonium hydroxide** upon contact with water. This material is corrosive to many organic compounds. If ingested, ammonia can cause severe pain, bloody diarrhea, cardiovascular collapse, and death. Concentrated ammonia is a strong corrosive which can cause burns of the following types: cryogenic from contact with refrigerated liquid, thermal from exothermic reaction with water, and chemical from its alkalinity. It gelatinizes the tissue, forming deep and painful lesions. At low concentrations, aqueous ammonia is a moderate to strong irritant to the eyes, skin, mucous membranes, and respiratory and digestive tracts. Its effects on the lungs can be severe and delayed in onset, respiratory support may be required following acute inhalation. However, there seems to be a wide variability in the human sensitivity to ammonia.

Chronic dyspnea, restrictive lung dysfunction, obstructive lung disease, and bronchial hyper-reactivity were adverse effects experienced by several employees two years after their occupational overexposures to mists and aerosols of ammonia. An aqueous ammonia solution caused gastrointestinal cicatricial tumors in rats following a 24-week feeding assay. NH₃ produced a positive mutagenic response in the Ames Assay and caused chromosomal aberrations during a 16-week cytogenic study using rats. However, in general, pH alterations produce false positive results in short-term genetic assays.

Sour Water at Crude Units

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this material. Vapor releases from this material are expected to cause significant immediate impact but only localized non-persistent environmental damage. Due caution should be exercised to prevent an accidental release into the environment. This material and any contaminated soil or other water may be hazardous to human, animal, and aquatic life. Volatile components may contribute to smog formation.
Environmental Fate	This material is soluble in water and is expected to readily disperse in marine environments. Acidic solutions have produced slight to moderate toxicity in laboratory tests with aquatic organisms. It is expected to be moderately acidic or neutral. If released to surface water, it may cause a pH reduction depending upon the buffering capacity of the waterbody. Aquatic organisms become increasingly stressed as pH concentration approaches 5.0, with many species being intolerant of pH of 4.0 or lower. Substances in this mixture do not bioaccumulate. For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a hazardous waste at the time of disposal. Maximize component recovery prior for reuse or recycling. Potential treatment and disposal methods include steam stripping, bio-oxidation, incineration, and land disposal, if permitted. Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Flammable liquid, toxic, n.o.s. Inhalation Hazard Zone B (Hydrogen sulfide, Ammonia)		
Hazard Class	DOT CLASS: 3 (Flammable liquid).	Packing Group(s)	PG II
		UN/NA ID	UN1992
Reportable Quantity	A Reportable Quantity (RQ) substance components in this material which require DOT HAZMAT bill-of-lading display are Hydroxide sulfide and Ammonia.		
Placards			Emergency Response Guide No. 131
			HAZMAT STCC No. 49 203 78
			MARPOL III Status Not a DOT "Marine Pollutant" per 49 CFR 171.8.

Sour Water at Crude Units

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. This material contains detectable concentrations of the following chemical substances subject to this statute: Hydrogen sulfide [CAS No. 7783-06-4] and Ammonia [CAS No. 7664-41-7] .
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Acute (Immediate) & Chronic (Delayed) Health, Sudden Release of Pressure, Fire, and Reactivity Hazards
SARA 313	This material does not contain any components in concentrations which might be at or above de minimis levels and are listed as a toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this material subject to this statute are: Hydroxide sulfide [CAS No. 7783-06-4] (RQ = 100 lbs. [45.4 kg]) concentration: 0.0005 to 0.1% Ammonia [CAS No. 7664-41-7] (RQ = 100 lbs. [45.4 kg]) concentration: 0.0001 to 0.01%
CWA	This material is NOT classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA).
California Proposition 65	This material does not contain any ingredients for which the State of California has found to cause cancer, birth defects, or other reproductive harm; and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. A chemical substance present in this material which is subject to this statute is: Hydroxide sulfide [CAS No. 7783-06-4]

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Emergency Overview

Physical State Liquid.
Color Colorless to light yellow.
Odor Hydrogen sulfide or ammoniacal

DANGER!

Contains extremely flammable and poisonous gas.
Contains Hydrogen Sulfide gas (H₂S) and ammonia. May be fatal if inhaled.
Extremely flammable and poisonous gas may be released if this material is heated or comes in contact with acids. Vapor may cause flash fire or explosion.
Liquid contact may cause eye and skin irritation.

Protective Equipment

Minimum Recommended
See Section 8 for Details

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	Sour Water	Technical Contact	(800) 525-4692
Product Number	RS0915	Medical Emergency	(800) 313-7645
CAS Number	Mixture.	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Refinery Intermediate Stream		
Synonyms	Feed to Sour Water Stripper; Aqueous Solution Containing Hydrogen Sulfide and Ammonia		

SECTION 2. COMPOSITION (TYPICAL)

All liquids are listed on a weight % basis while gases are listed on a mole % basis.

Component Name(s)	CAS Registry No.	Concentration (%)
Water	7732-18-5	94-99.9
Hydrogen Sulfide	7783-06-4	0.01-4
Ammonia	7664-41-7	0.1-2

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Inhalation. Ingestion.

Signs and Symptoms of Acute Exposure

Sour Water

Inhalation	Inhalation is not a normal route of exposure for an aqueous liquid. However, vapor generated from this material may be harmful or fatal if inhaled. Contains hydrogen sulfide. Inhalation of gas or vapor may cause severe nose, throat, respiratory tract, and lung irritation, respiratory paralysis, and death, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath.
Eye Contact	Causes severe eye irritation with tearing, redness, or a stinging or burning feeling. May cause swelling of the eyes with blurred vision. Can injure eye tissue. Effects may become more serious with repeated or prolonged contact. Vapors may cause eye irritation and light sensitivity. Severity depends upon the concentration and duration of exposure.
Skin Contact	May cause skin irritation with redness, an itching or burning feeling, and swelling of the skin. Effects may become more serious with repeated or prolonged contact.
Ingestion	May cause nausea, vomiting and/or diarrhea, in addition to burning sensation in the mouth, throat, and digestive tract.
Chronic Health Effects Summary	Subacute exposure to low levels of hydrogen sulfide can produce eye irritation, watering, light sensitivity and corneal opacity. Reported effects from subacute exposure also include bronchitis, pulmonary edema, nausea, abdominal cramps and diarrhea. See toxicological Information (section 11).
Conditions Aggravated by Exposure	Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Respiratory System, Central Nervous System (CNS)
Target Organs	May cause damage to the following organs: lungs, mucous membranes, upper respiratory tract, skin, central nervous system (CNS), eye, lens or cornea.
Carcinogenic Potential	This product is not known to contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC or NTP.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification			OSHA Physical Hazard Classification						
Irritant	<input type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Toxic	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. Flush eyes with cool, clean, low-pressure water for at least 15 minutes while occasionally lifting and lowering eyelids. Do not use eye ointment unless directed to by a physician. Seek medical attention if excessive tearing, irritation, or pain persists.

Sour Water

Skin Contact	Wash exposed skin well with plenty of soap and water. If on clothing or shoes, remove and wash well before reuse. If symptoms develop and continue, get medical attention.
Ingestion	Do not induce vomiting unless directed to by a physician. Do not give anything to drink unless directed to by a physician. Never give anything by mouth to a person who is not fully conscious. Seek medical attention immediately.
Notes to Physician	<p>INHALATION: Inhalation overexposure can produce toxic effects. Treat intoxications as hydrogen sulfide exposures. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Administer supplemental oxygen with assisted ventilation, as required.</p> <p>Treat symptomatically.</p>

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	Non-flammable under normal conditions of use but may generate highly flammable H ₂ S or H ₂ vapor under certain conditions.		
Flash Point	Not applicable.		
Lower Flammable Limit	Not applicable for aqueous stream; 4% for H ₂ S	Upper Flammable Limit	Not applicable for aqueous stream; 45% for H ₂ S
Autoignition Temperature	Not determined.		
Hazardous Combustion Products	Aqueous phase does not support combustion. Burning of oil layer (if any) will liberate carbon dioxide, carbon monoxide, smoke, fumes, and/or unburned hydrocarbons.		
Special Properties	This material may evolve hydrogen sulfide (H ₂ S), a highly flammable and poisonous gas. Always check for hazardous vapors and take appropriate precautions.		
Extinguishing Media	Use extinguishing media suitable for the surrounding fire. In an advanced or massive fire, evacuate area and fight fire from a safe distance or a protected location. Approach fire from upwind. Use unmanned monitors and hoseholders to keep cooling streams of water on fire-exposed cylinders or tanks until well after the fire is out. If possible, isolate materials not yet involved in the fire and protect personnel. Move containers away from fire area if it can be done without risk.		
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.		

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Extremely Flammable and Poisonous Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area far upwind. Remove all potential ignition sources. Safely stop the source gas flow using non-sparking tools. Allow any entrained liquid spills to evaporate. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

Closed gas systems form white-colored frost at the point of a leak. Do not direct water at the source of leak. Do not enter a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing. Use water spray to reduce vapors or divert vapor cloud drift. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during response operations. This gas may travel great distances and be ignited by a remote ignition source.

Sour Water

SECTION 7. HANDLING AND STORAGE

Handling	<p>Monitor for H₂S during tank gauging and similar operations.</p> <p>Do not breathe vapor or mist. Do not get in eyes, on skin or on clothing. Wear suitable personal protective equipment to prevent eye and skin contact. Wash thoroughly after handling.</p> <p>Use appropriate respiratory protection.</p>
Storage	<p>Store in containers appropriate for dilute caustic solutions and away from acids. Material may accelerate corrosion of metal containers.</p>

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls Local exhaust and general room ventilation may be required in work areas to prevent accumulation of mixtures of gas and air that may ignite with explosive force. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are located near the work-station. Where H₂S is routinely stored or handled, install monitoring equipment or system with alarms.

Personal Protective Equipment Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection	Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling sampling cylinders, pressurized containers and piping systems. If gas is being transferred or released, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required.
Hand Protection	Avoid skin contact. Use disposable neoprene, rubber, or vinyl gloves. Thermal protective gloves are required when water temperatures are above 120° F. Wash hands and other exposed skin with mild soap and water before eating, drinking, smoking, or using the toilet facilities.
Body Protection	Avoid skin contact. Wear protective clothing if splashing or spraying is expected. Protective clothing may include long-sleeved clothing, apron, slicker suit and/or boots. Thermal protection is required for process waters above 120° F.
Respiratory Protection	Contaminant air concentrations determine the level of respiratory protection required. Use only NIOSH-approved respiratory equipment within the limits of the protection factors for that equipment. Use supplied air respirators when H ₂ S concentrations are expected to exceed applicable workplace exposure levels. Do not use air purifying respiratory equipment when considering elevated H ₂ S concentrations. Respiratory equipment must be selected on the basis of the maximum expected air concentration.
General Comments	Use good personal hygiene practices. Wash hands and other exposed skin areas with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities, or leaving work.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
-----------	--------------------------------------

Sour Water

Hydrogen Sulfide	ACGIH TLV (United States). TWA: 10 ppm 8 hour(s). STEL: 15 ppm 15 minute(s). OSHA (United States). CEIL: 20 ppm 8 hour(s). STEL: 50 ppm 15 minute(s). Form: *10 minute peak; once per 8 hour shift
Ammonia anhydrous	ACGIH (United States, 2000). TWA: 25 ppm STEL: 35 ppm OSHA (United States, 1989). STEL: 35 ppm TWA: 50 ppm STEL: 35 ppm

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Liquid.	Color	Colorless to light yellow.	Odor	Hydrogen sulfide or ammoniacal
Specific Gravity	1 (Water = 1) (Estimated.)	pH	8-12	Vapor Density	>1 (Air = 1)
Boiling Range	AP 100° C (AP 212° F)			Melting/Freezing Point	0°C (32°F)
Vapor Pressure	The highest known value is 2.3 kPa (17.5 mm Hg) (at 20°C) (Water).			Volatility	Non-volatile.
Solubility in Water	Easily soluble in cold water. Soluble in methanol.			Viscosity (cSt @ 40°C)	Not determined.
Flash Point	Not applicable.				
Additional Properties	No additional information.				

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from water reactive materials. Keep away from extreme heat, strong acids and strong oxidizing conditions.		
Materials Incompatibility	May react or be incompatible with acids.		
Hazardous Decomposition Products	Depending upon the conditions of use, low concentrations of hydrogen sulfide can be released.		

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Sour Water

Toxicity Data

Hydrogen Sulfide

INHALATION (LC50): Acute: 444 ppm 1 hour(s) [Rat]. 673 ppm 1 hour(s) [Mouse]. Hydrogen Sulfide (H₂S) has an unpleasant odor that diminishes with increased concentrations. Eye irritation can occur at concentrations above four ppm. Olfactory fatigue occurs rapidly at concentrations above 50. Accordingly, odor is not a reliable warning property. Symptoms increase with exposures above 50 ppm. Respiratory effects including irritation with possible pulmonary edema can occur with exposure above 50 ppm. At concentrations above 500 ppm, an immediate loss of consciousness, depressed respiration and death can occur. NIOSH has determined that H₂S concentrations above 100 ppm are immediately dangerous to life and health.

SECTION 12. ECOLOGICAL INFORMATION

- Ecotoxicity** An environmental fate analysis has not been conducted on this specific product. Releases are expected to cause significant immediate impact but only localized non-persistent environmental damage.
- Environmental Fate** This product is not expected to bioaccumulate through food chains in the environment.

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitability (D001) and/or its toxic (D018) characteristics. Conditions of use may cause this material to become a "hazardous waste", as defined by federal or state regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

- TSCA Inventory** This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
- SARA 302/304
Emergency Planning
and Notification** The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. Hydrogen sulfide (I), CAS Number, 7783-06-4 Concentration: 2.005%

Sour Water

SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: fire, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard
SARA 313 Toxic Chemical Notification and Release Reporting	This product contains the following components in concentrations above <i>de minimis</i> levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: Hydrogen Sulfide [CAS No.: 7783-06-4] Concentration: 2%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are: Hydrogen Sulfide [CAS No.: 7783-06-4] RQ = 100 lbs. (45.36 kg) Concentration: 2%
Clean Water Act (CWA)	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This product is not known to contain any components for which the State of California has found to cause cancer, birth defects or other reproductive harm.
New Jersey Right-to-Know Label	For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.
Additional Regulatory Remarks	No additional regulatory remarks.

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 1.00
Revision Date 9/6/2006
Print Date Printed on 9/6/2006.

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0921
Revision Date 10/28/1999

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Liquid.		
Color	Transparent, water white to opaque black.	Odor	Characteristic ethereal or pleasant and sweet aromatic hydrocarbon. Its odor threshold is 2-7 ppm in air.

DANGER! Extremely flammable liquid; vapor may cause flash fire or explosion!
Mist or vapor may irritate the eyes, mucous membranes, and respiratory tract!
Liquid contact may cause minimal to severe eye irritation and/or mild to severe skin irritation and inflammation!
May be harmful if inhaled or absorbed through the skin!
Overexposures may cause central nervous system (CNS) depression and target organ effects like blood or blood-forming tissue damage!
May be harmful or fatal if ingested! Aspiration into the lungs may cause pulmonary edema and chemical pneumonia!
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
May contain low levels of Benzene!
Possible cancer hazard; may cause leukemia and other blood disorders!
Mutagenic hazard; may cause genetic damage!
Based on component animal testing, may adversely affect reproduction!
Spills may create a slipping hazard!

SECTION 1: IDENTIFICATION

Trade Name	Recovered Light Slop Oil from Waste Water Treatment Plant	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	068956707*	Medical Emergency	(918) 495-4700
CAS Number	68956-70-7	CHEMTREC Emergency	(800) 424-9300
Product Family	C6-C12 Hydrocarbons and possibly Water and/or Methyl tert-Butyl Ether		
Synonyms	A.P.I. Separator Forebay Skimmings; Light Slop Oil, Slop Naphthas, Recovered Naphthas; Reclaimed Light Oil; Wastewater Treatment Plant Reclaimed Light Oil		

Recovered Light Slop Oil from Waste Water Treatment Plant

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Slop Oil, C6 and Greater Hydrocarbons	68956-70-7	98-99.9
2) C6-C12 Hydrocarbons	8006-61-9	98-99.9
3) Hexane Isomers	Mixture	5-15
4) n-Hexane	110-54-3	1-5
5) Benzene	71-43-2	0-0.5
6) Heptanes	Mixture	10-20
7) Octanes	Mixture	10-20
8) Nonanes	Mixture	5-15
9) Water	7732-18-5	0.1-2
10) Methyl tertiary-butyl ether (MTBE)	1634-04-4	0-1.5

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact Eye Contact Absorption Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon level of exposure concentration and/or duration. Vapors can reduce the oxygen content in air. Approximately 20,000 ppm (or 2 vol %) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from an exposure of 5,000 to 10,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces.
Eye Contact	Animal test results and actual human exposures of this material's components suggest that this product can cause minimal to severe eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling.
Skin Contact	Animal test results and actual human exposures of this material's components suggest that this product can cause mild to moderate skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate to severe dermatitis. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and severe tissue damage.
Ingestion	If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, abdominal pain, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above). Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.
Chronic Health Effects Summary	Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Reports have associated repeated and prolonged occupational overexposure to solvent naphthas with irreversible brain and nervous system damage (sometimes referred to as "Solvent or Painter's Syndrome"). And, altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called "Petrol Sniffers Encephalopathy"), delirium, seizures, and sudden death have been common results for naphtha abusers. Intentional misuse by deliberately concentrating and inhaling the gasoline portion of this material may be harmful or fatal. Acute symptoms caused by methyl tertiary-butyl ether (MTBE) appear to be mild and transient. Laboratory rodents exposed to high doses of MTBE exhibited blood chemistry changes and liver and kidney abnormalities. The no observable effect level (NOEL) was reported to be 800 ppm and the NOEL for neurotoxicity was determined to be 2,880 mg/m ³ . In animal studies, developmental and reproductive toxicity were only observed at materially toxic levels of MTBE.

Recovered Light Slop Oil from Waste Water Treatment Plant

Various oncogenicity studies resulted in kidney, liver, and/or testicular tumors following exposures by inhalation and/or ingestion. These tumors are believed to be caused by **MTBE's formaldehyde metabolite**; however, IARC and ACGIH have listed **MTBE** as "possibly carcinogenic to humans (2B)" and as an "animal carcinogen (A3)", respectively. Available epidemiology studies do not confirm an increased risk of cancer in exposed humans and NTP's Board of Scientific Counselors declared that "available evidence suggests that **MTBE** is not reasonably anticipated to cause cancer in humans except under uncommon or unlikely routes or levels of exposure"

Even with acute exposures, **n-hexane** is toxic to the peripheral nerves, characterized by numbness, tingling, or pain in the extremities, progressively worsening of neuromuscular motor coordination (polyneuritis or polyneuropathy), and even partial paralysis. And, based upon animal studies, **n-hexane's metabolite, 2,5-hexanedione**, has been shown to cause degeneration of the testes.

Benzene is considered to be a cancer causing agent. It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML). Benzene is also capable of causing changes in genetic material (chromosomes). Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy. Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents. (See Section 11.)

Conditions Aggravated by Exposure

Personnel with pre-existing central nervous system (CNS) disease, neurological conditions, skin disorders, liver or kidney function, blood disorders, or chronic respiratory diseases, and women attempting to conceive should avoid exposure. Special precautions are necessary for pregnant women and nursing mothers.

Exposure to high concentrations of this material may increase the sensitivity of the heart to **epinephrine (adrenalin) and catecholamine-like drugs**. Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians").

Target Organs

This substance is toxic to lungs, nervous system, especially the peripheral nerves, brain, mucous membranes, skin, eyes, and possibly, the blood, bone marrow and other blood-forming tissues, heart, liver, kidneys, and reproductive systems.

Carcinogenic Potential

This material may contain **benzene** and/or **methyl tert-butyl ether (MTBE)** components at concentrations at or above 0.1%. **Benzene** is considered carcinogenic by OSHA, IARC, and NTP and **MTBE** is considered possibly carcinogenic by IARC. See Section 11.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input checked="" type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input checked="" type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation

Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.

Eye Contact

Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.

Skin Contact

Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.

Recovered Light Slop Oil from Waste Water Treatment Plant

Ingestion

Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.

Notes to Physician

Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse). If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IA Flammable Liquid Extremely flammable!		
Flash Point/Method	CLOSED CUP: -35° to -18°C (-30° to 0°F). (Tagliabue [ASTM D-56])		
Lower Flammable Limit	AP 1.0%	Upper Flammable Limit	AP 15.1%
Auto-Ignition Temp.	AP 232°C (450°F)		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors.		
Special Properties	Extremely Flammable Liquid! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.		
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide (CO ₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.		
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Recovered Light Slop Oil from Waste Water Treatment Plant

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible, in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room, and preferably refrigerated. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Recovered Light Slop Oil from Waste Water Treatment Plant

Eye Protection

Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).

General Comments

Warning! Odor is an inadequate warning for hazardous conditions, especially since the odor threshold of benzene is several ppm above the occupational exposure guideline levels. Released vapors may cause extremely flammable, explosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special safety precautions including monitoring for oxygen deficiency and flammability.

Occupational Exposure Guidelines

Substance

Applicable Workplace Exposure Levels

1) Gasoline ("A3" Animal Carcinogen)	TWA: 300 STEL: 500 (ppm) from ACGIH (TLV) [1999] TWA: 300 STEL: 500 (ppm) from OSHA (PEL) [1989]
2) Petroleum Distillates (Naphtha)	TWA: 400 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
3) Methyl tert-butyl ether (MTBE) ("A3" Animal Carcinogen)	TWA: 40 (ppm) from ACGIH (TLV) [1999]
4) Hexane (n-Hexane)	TWA: 50 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 50 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
5) Hexane, other isomers	TWA: 500 STEL: 1000 (ppm) from ACGIH (TLV) [1999] TWA: 500 STEL: 1000 (ppm) from OSHA (PEL) [1989]
6) Benzene ("A1" and "Z-2" Carcinogen)	TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 1 STEL: 5 AL: 0.5 (ppm) from OSHA (PEL) [1987] - SKIN
7) Heptane (n-Heptane)	TWA: 400 STEL: 500 (ppm) from ACGIH (TLV) [1999] TWA: 400 STEL: 500 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
8) Octane, all isomers	TWA: 300 (ppm) from ACGIH (TLV) [1999] TWA: 300 STEL: 375 (ppm) from OSHA (PEL) [1989] TWA: 500 (ppm) from OSHA (PEL) [1976]
9) Nonane, all isomers	TWA: 200 (ppm) from ACGIH (TLV) [1999] TWA: 200 (ppm) from OSHA (PEL) [1989]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color	Transparent, water white to opaque black.	Odor	Characteristic ethereal or pleasant and sweet aromatic hydrocarbon. Its odor threshold is 2-7 ppm in air.
Specific Gravity	0.70 to 0.86 (Water = 1)	pH	Not applicable or 6.0 to 7.0	Vapor Density	3.0 to 3.2 (Air = 1)
Boiling Point/Range	-12° to 204°C (10° to 400°F)	Melting/Freezing Point			-160° to 13°C (-255° to 55°F)
Vapor Pressure	95 to 245 mm Hg at 20°C (68°F).	Viscosity (cSt @ 40°C)			0.5 to 2
Solubility in Water	The MTBE portion of this mixture will readily solubilize in cold water, but the hydrocarbons are only slightly soluble in cold water (0.1 to 0.5%).	Volatile Characteristics			Volatile Organic Compounds (VOCs) Content = 0.1 to 1%, Volatile portion = 700 to 900 gm/L

Recovered Light Slop Oil from Waste Water Treatment Plant

Additional Properties

C6-C9 Aromatic Hydrocarbon Content = 0.01 to 1 Wt.% (ASTM D-1319);
 Alkane, Isoparaffin, and Cycloalkane Hydrocarbons Content = 98 to 99 Wt.% (ASTM D-1319);
 Average Density at 60°F = 5.994 to 7.161 lbs./gal (ASTM D-2161);
 Dry Point Temperature = 392°F (200°C) (ASTM D-86);
 Evaporation Rate = 5 to 10 when n-Butyl acetate = 1.0

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from heat, sparks, and other ignition sources, strong oxidizing conditions, and freezing temperatures.		
Materials Incompatibility	Strong acids, especially nitric acid, alkalis, and oxidizers such as liquid chlorine, many fluorides, perchlorates, and other halogens, hydrogen peroxide, and oxygen. n-Heptane will dissolve some plastics.		
Hazardous Decomposition Products	No substances are readily identified from composition; but, no degradation data is available.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Unleaded Gasoline:

GAS (TELo) Acute: 140 ppm (Human) (8 hours) - Mild eye irritant!
 GAS (TELo) Acute: 500 ppm (Human) (1 hour) - Moderate eye irritant!
 GAS (TCLo) Acute: 900 ppm (Human) (1 hour) - CNS and pulmonary effects
 DERMAL (TDLo): Acute: 53 mg/kg (Human) - Skin allergy effects.

Methyl tertiary-Butyl Ether (MTBE):

ORAL (LD50): Acute: 4,000 mg/kg [Rat]
 ORAL (LD50): Acute: 5,900 uL/kg [Mouse]
 GAS (LC50): Acute: 23,576 ppm for 4 hours [Rat].
 GAS (LC50): Acute: 14,000 mg/m³ for 15 minutes [Mouse] - General anesthesia.
 INTRAPERITONEAL (LD50): Acute: 1,700 uL/kg [Mouse]

n-Hexane:

GAS (LC50): Acute: 48,000 ppm for 4 hours [Rat].
 ORAL (LD50): Acute: 28,710 mg/kg [Rat].

Benzene:

ORAL (LD50): Acute: 930 mg/kg [Rat] - Tremors and convulsions
 ORAL (LD50): Acute: 4,700 mg/kg [Mouse].
 ORAL (LD50): Acute: 5,700 mg/kg [Unidentified mammal]
 GAS (LC50): Acute: 10,000 ppm for 7 hours [Rat].
 GAS (LC50): Acute: 9,980 ppm for 8 hours [Mouse] - General anesthesia, muscle weakness, and dyspnea.

DERMAL (LD50) Acute: 48 mg/kg [Mouse].
 DERMAL (LD50): Acute: GT 9,400 uL/kg [Rabbit and Guinea Pig].
 INTRAPERITONEAL (LD50): Acute: 340 mg/kg [Mouse].
 INTRAPERITONEAL (LD50): Acute: 2,890 ug/kg [Rat] - Lung and liver damage plus decreased blood cells.

n-Heptane:

GAS (LC50): Acute: 103,000 mg/m³ for 4 hours [Rat] - Convulsions.
 DERMAL (LD50): Acute: GT 2,000 mg/kg [Rabbit].
 INTRAVENOUS (LD50): Acute: 222 mg/kg [Mouse].

n-Octane:

GAS (LC50): Acute: 118,000 mg/m³ for 4 hours [Rat]

n-Nonane

GAS (LC50) Acute: 3,200 ppm for 4 hours [Rat]
 INTRAVENOUS (LD50): Acute: 218 mg/kg [Mouse].

Recovered Light Slop Oil from Waste Water Treatment Plant

Two-year inhalation toxicity studies with **fully-vaporized unleaded gasoline** at concentrations of 67, 292, and 2,056 ppm in air produced kidney damage and kidney tumors in male rats, but not in female rats or mice of either sex. Female mice developed a slightly higher incidence of liver tumors compared to controls at the highest concentration. Results from subsequent scientific studies suggest that the kidney damage, and probably the kidney tumor response, is unique to the male rat. Two-year inhalation toxicity studies with fully vaporized unleaded gasoline (at 67, 292, & 2,056 ppm in air) produced kidney damage and kidney tumors in male rats, but not in female rats or mice of either sex. Female mice developed a slightly higher incidence of liver tumors compared to controls at the highest concentration. Results from subsequent scientific studies suggest that the kidney damage, and probably the kidney tumor response, is unique to the male rat. An EPA draft policy statement takes account of alpha-2u-globulin findings as a basis for discarding male rat kidney data in determining whether gasoline is a carcinogen.

There were no benzene-induced blood toxin or leukemia effects noted in laboratory animals following long-term exposures to **fully-volatilized unleaded gasoline vapors containing 2 Vol.% benzene**. However, the relative risk to humans for benzene in gasoline is still unknown.

Laboratory rodents exposed to high doses of **methyl tertiary-butyl ether (MTBE)** exhibited blood chemistry changes and liver and kidney abnormalities. The no observable effect level (NOEL) was reported to be 800 ppm. And in rats, the NOEL for neurotoxicity was determined to be 2,880 mg/m³. Acute symptoms caused by MTBE appear to be mild and transient.

Most mutagenicity test results on **MTBE** including the Petroleum-modified Ames Test, indicate that it is NOT mutagenic. However, the Mouse Lymphoma Assay showed a positive response under certain conditions. This positive result is thought to be due to a metabolite (formaldehyde), not directly from MTBE. Also, there is a high incidence of false positive findings in this particular assay. Therefore, it can be concluded that this positive finding was an aberrant response.

MTBE vapors caused an increased incidence of liver tumors in female mice following 18 months of 8,000 ppm exposure. Lower exposure concentrations did NOT cause liver tumor response. Following 24 months of this 8,000 ppm MTBE exposure, male rats showed an increased incidence of kidney and testicular tumors. Also, additional oncogenicity studies on two different strains of rats resulted in testicular tumors following exposures by inhalation and/or ingestion. These tumors are believed to be caused by **MTBE's formaldehyde metabolite**; however, IARC and ACGIH have listed MTBE as "possibly carcinogenic to humans (2B)" and as an "animal carcinogen (A3)", respectively. Available epidemiology studies do not confirm an increased risk of cancer in exposed humans and NTP's Board of Scientific Counselors declared that "available evidence suggests that MTBE is not reasonably anticipated to cause cancer in humans except under uncommon or unlikely routes or levels of exposure."

In animal studies, developmental and reproductive toxicity was only observed at materially toxic levels of **MTBE**. No maternal toxicity or birth defects were observed in rabbits up to 8,000 ppm, in rats up to 2,500 ppm, and in mice up to 1,000 ppm of MTBE exposure. However, MTBE was shown to cause maternal toxicity at 4,000 and 8,000 ppm levels when mice were exposed for 6 hours per day during their pregnancy. A decrease in the number of successful pregnancies and a reduction in birth weight was also seen at these exposure levels. A significant number of pups had a birth defect (cleft palate) at the 8,000 ppm level. These results suggest that the risk of birth defects in humans from MTBE is negligible at anticipated exposure concentrations from **gasoline**.

Benzene has an IDLH (immediately dangerous to life or health) concentration = 500 ppm. Its estimated lethal dose for a normal human adult is one teaspoon to one ounce (AP 10 mL). Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes.

Benzene is a known animal carcinogen and a human leukemogen. In addition, NTP, IARC, EPA, OSHA, and ACGIH list benzene as a "Human Carcinogen." Repeated and prolonged overexposure to benzene vapors (GT 20 ppm in air) may cause toxicity to blood-forming tissues. Chronic exposure symptoms include decreased blood cell and platelet counts, leukopenia, aplastic anemia, or acute myelogenous leukemia (AML). Also, chronic inhalation of benzene vapors have been found to cause fatigue, nervousness, irritability, blurred vision, and labored breathing. Overexposure to benzene has been associated with chromosomal aberrations in human white blood cells, both laboratory animal and human bone marrow cell damage, and in vitro mammalian cells DNA damage. Elevated frequencies of chromosomal aberrations have been observed in peripheral white blood cells and bone marrow of workers exposed to high benzene concentrations known to be associated with signs of chronic poisoning. Ethanol consumption may have a synergistic effect and increase blood system changes caused by benzene exposures. Children and teenagers have a lower resistance to bone marrow poisons.

Recovered Light Slop Oil from Waste Water Treatment Plant

Studies with pregnant laboratory animals have demonstrated that **benzene** is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice

Intentional sniffing abuse of **n-hexane** has caused permanent brain and nervous system damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function, and even paralysis. These neurological effects are pronounced in combination with lack of oxygen supply, especially amongst women. Chronic repeated and/or prolonged overexposure to **n-hexane**, either by inhalation or skin absorption, has been shown to cause peripheral nerve tissue damage (**polyneuropathy**). The initial symptoms are numbness of the fingers and toes. Motor weakness can also occur in the digits, but may also involve muscles of the arms, thighs, and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure. The neurotoxic properties of **n-hexane** may be increased by concurrent exposure to **methyl ethyl ketone, methyl isobutyl ketone, and/or toluene**

n-Hexane is NOT a tumor promotor in mice and NOT considered to be carcinogenic, nor is it teratogenic in mice or rats. **n-Hexane**, or its metabolite **2,5-hexanedione**, has been shown to cause degeneration of the testes in rats, but, it did NOT produce spermatotoxicity in a multiple end-point test battery in rats given multiple doses for up to 5 days

n-Heptane is a mucous membrane and respiratory tract irritant, but non-irritating to the eyes. It is irritating to skin and readily absorbed by either inhalation or dermal exposure. Exposures may cause decreased red blood cell counts, liver and heart damage, and central nervous system depression. Repeated direct skin application can produce defatting dermatitis. **n-Heptane** is metabolized in the liver to form alcohols and ketones, including neurotoxic **2,5-heptanedione** which is detectable in small amounts in the urine of exposed humans.

In a controlled study, human volunteers exposed to an airborne concentration of **n-heptane** of 1,000 ppm for 6 minutes or 2,000 ppm for 4 minutes experienced slight dizziness and incoordination. Higher-level exposures produced hilarity, dizziness, and semi-consciousness. Inhaling a concentration of 5,000 ppm for 15 minutes caused stupor and a gasoline-like taste. These higher exposures also decreased the myocardial threshold to the arrhythmogenic effects (irregular heart beats) of epinephrine, producing only a narrow margin of safety between exposures causing CNS effects, cardiac effects, and loss of consciousness.

One occupational exposure study involving a **95% purity n-heptane** from 1 to 9 years duration concluded that it could produce minimal peripheral nerve damage with numbness and tingling of the extremities in the stocking-and-glove areas. In the same study, there was a decrease in motor nerve conduction velocities correlated with duration of exposure and adjusted for age effects; however, the average motor nerve conduction velocity in exposed workers was normal. Polyneuropathy associated with **n-heptane** exposure was reversible within a year following removal of exposure.

n-Heptane was not neurotoxic in rats exposed for up to 7 months. But based upon limited laboratory animal studies, **n-heptane and its metabolites** were found in low levels (LT 135 ppm) in the brain of rats exposed to airborne concentrations of 100, 500, or 1,500 ppm for 6 hours each day, five days per week, for 1 or 2 weeks. These substances disappeared within 2 weeks following removal of exposure. **n-Heptane** was not mutagenic in the Salmonella/microsome (Ames) assay and is not expected to be carcinogenic.

2,2,4-Trimethylpentane (iso-octane) was highly irritating to mice at a 1,000 ppm in air exposure for 5 minutes and respiratory arrest occurred at exposures above 10,000 ppm for 5 minutes. CNS depression was observed at concentrations between 8,000 and 10,000 ppm in air. Kidney tubule necrosis, hyaline droplet formation, and acute renal failure were seen in male rats following oral administration of 10 gm/kg, 8 mL/kg, or 2,100 mg/kg of iso-octane for 2, 3, and 4 weeks, respectively.

Rats inhaling **n-nonane** at an airborne concentration of 1,500 ppm for 7 days displayed mild tremors and loss of coordination. Inhalation of 1,600 ppm for 6 hours per day for 90 days showed animal weight loss or decreased weight gain and changes in the structure of their salivary glands. And, liver damage and an altered response to drugs were seen in rats given **n-nonane** for 2 to 7 days.

Recovered Light Slop Oil from Waste Water Treatment Plant

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, the **naphtha and MTBE** components of this mixture, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. Its **MTBE** and prominent **aromatic hydrocarbon component (benzene)** are highly volatile and might contribute to the creation of atmospheric smog. **Benzene** has a half-life of from 4 to 6 hours when photochemically active hydroxyl radicals are present, especially when atmospheres are polluted with nitrogen oxides or sulfur dioxide. **Benzene** is very effectively washed out of the atmosphere by rain. **n-Hexane, n-heptane, hexane isomers, heptane isomers, and iso-octane** all have estimated half-lives of between 2.4 and 4.4 days in air when photochemical hydroxyl and/or nitrate radicals are present.

Using Rainbow Trout (*Oncorhynchus mykiss*) and Dungeness Crab (*Cancer magister*), the *naphtha* portion of this mixture showed a 96-hour TLms (Median Toxic Limit) of from 5 ppm to 30 ppm in ambient saltwater. Also, 24-hour and 96-hour TLms produced results from 10 ppm to 60 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), and Guppy (*Lebistes reticulatus*) in fresh water. Using Water Fleas (*Daphnia magna*), all these component substances showed 24-hour TLms of from 95 ppm to 400 ppm. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

Environmental Fate

This naphtha and possibly MTBE mixture is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. As the water temperature is lowered, the more the MTBE component will dissolve into the water phase increasing its toxicity. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination of MTBE and/or total hydrocarbons.

MTBE is not expected to persist in the atmosphere or hydrolyze, photolyze, or be absorbed in sediments or suspended particulate matter. Nor is it expected to bioconcentrate. However, it is expected to be highly mobile in soil with leaching into ground water likely.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol % of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol %, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

**Recovered Light Slop Oil from
Waste Water Treatment Plant**

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT)		
Proper Shipping Name	Flammable liquid, n o s (Heptanes, Octanes)		
Hazard Class	Class 3 Flammable liquid	Packing Group(s)	PG II
		UN/NA ID	UN1993
Reportable Quantity	The Reportable Quantity (RQ) substance components in this material which require DOT HAZMAT bill-of-lading display are n-Hexane and 2,2,4-Trimethylpentane (Iso-octane).		
Placards		Emergency Response Guide No.	128
		HAZMAT STCC No.	49 101 31
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.
SARA 313	This material may contain the following components in concentrations at or above de minimis levels and they are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313. n-Hexane [CAS No. 110-54-3] concentration: 1 to 5% Benzene [CAS No. 71-43-2] concentration: 0 to 0.5%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances which might be present in this material subject to this statute are: Methyl tert-butyl ether (MTBE) [CAS No. 1634-04-4] (RQ = 1000 lbs. [453.6 kg]) conc.: 0 to 1.5% n-Hexane [CAS No. 110-54-3] (RQ = 5,000 lbs. [2,270 kg]) concentration: 1 to 5% Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 0 to 0.5% Toluene [CAS No. 108-88-3] (RQ = 1000 lbs. [453.6 kg]) concentration: 0 to 0.2% 2,2,4-Trimethylpentane (Iso-octane) [CAS No. 540-84-2] (RQ = 1000 lbs. [453.6 kg]) conc.: 0 to 5% Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 0 to 0.3% Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 0 to 0.1%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material might contain the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it is subject to requirements of California Health & Safety Code Section 25249.5: Unleaded Gasoline (Wholly Vaporized) [CAS No. 8006-61-9], Benzene [CAS No. 71-43-2], and Toluene [CAS No. 108-88-3].
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2

Recovered Light Slop Oil from Waste Water Treatment Plant

Additional Regulatory Remarks

Under Section 12(b) of the Toxic Substances Control Act: Because it may contain detectable amounts of **Methyl tertiary-Butyl Ether (MTBE) [CAS No. 1634-04-4]**, **Methylcyclopentane [CAS No. 96-37-7]**, **n-Hexane [CAS No. 110-54-3]**, **Cyclohexane [CAS No. 110-82-7]**, **n-Propylbenzene [CAS No. 103-65-1]** and other **C9 Aromatic Hydrocarbons**, this material might be subject to US EPA's one-time only per country export notification requirements

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following minor components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare": **Benzene [CAS No. 71-43-2]** and possibly **Cyclohexane [CAS No. 110-82-7]**, **Methylcyclohexane [CAS No. 108-87-2]**, **Toluene [CAS No. 108-88-3]**, **mixed Xylenes [CAS No. 1330-20-7]**, and **Ethylbenzene [CAS No. 100-41-4]**.

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0922

Revision Date 10/04/1999

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Liquid.	Odor	Characteristic, sweet and pleasant, aromatic hydrocarbon its odor threshold is 2-5 ppm in air
Color	Transparent, water white to hazy grey.		

DANGER or WARNING! Flammable liquid; vapor may cause flash fire!
Mist or vapor may irritate the eyes, mucous membranes, and respiratory tract!

Liquid contact may cause minimal to severe eye and/or mild to severe skin irritation and inflammation!

May be harmful if inhaled or absorbed through the skin!

Overexposures may cause central nervous system (CNS) depression and target organ effects such as hearing loss and/or blood and blood-forming tissue damage!

May be harmful or fatal if ingested! Aspiration into the lungs may cause pulmonary edema and chemical pneumonia!

Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!

Contains Benzene! Cancer hazard; may cause leukemia and other blood disorders! Mutagenic hazard; may cause genetic damage!

Based on component animal testing, may adversely affect reproduction!
Spills may create a slipping hazard!

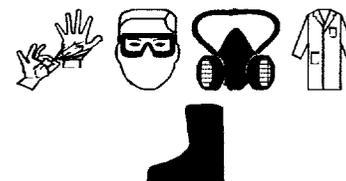

Hazard Rankings

See Section 8 for Details

SECTION 1: IDENTIFICATION

Trade Name	Benzene NESHAPS Stripper Tower Feed	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	0092200922	Medical Emergency	(918) 495-4700
CAS Number	Mixture	CHEMTREC Emergency	(800) 424-9300
Product Family	Water and C6-C9 Petroleum Hydrocarbons		
Synonyms	Feed to 438 Unit; Sump Slop Collection or Wastewaters from Aromatics Units and Crude Desalters; Wastewaters containing Benzene and Light (BTX) Aromatics; Waterwater and Slop Aromatic Naphtha; Wastewater and C6-C9 Aromatic Hydrocarbon Mixture.		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Water	7732-18-5	85-99.9
2) Benzene	71-43-2	0.1-5
3) Toluene	108-88-3	0-4
4) Xylene, Mixed Isomers	1330-20-7	0-3

**Benzene NESHAPS
Stripper Tower Feed**

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact Eye Contact Absorption Inhalation

Signs and Symptoms of Acute Exposure

- Inhalation** Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon level of exposure concentration and/or duration. Vapors can reduce the oxygen content in air. Approximately 20,000 ppm (or 2 vol.%) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from an exposure of 10,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces.
- Eye Contact** Animal test results and actual human exposures of this material's components suggest that this product can cause minimal to severe eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling.
- Skin Contact** Animal test results and actual human exposures of this material's components suggest that this product can cause minimal to moderate skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate to severe dermatitis. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and severe tissue damage.
- Ingestion** If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, abdominal pain, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above).

Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.

Chronic Health Effects Summary Chronic occupational **xylene** exposures have caused auditory nerve degeneration. Also, chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction.

Reports have associated repeated and prolonged occupational overexposure to solvents with irreversible brain and nervous system damage (sometimes referred to as "Solvent or Painter's Syndrome"). And, altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called "Petrol Sniffers Encephalopathy"), delirium, seizures, and sudden death have been common results for naphtha abusers. Intentional misuse by deliberately concentrating and inhaling this naphtha may be harmful or fatal.

Benzene is considered to be a cancer causing agent. It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML). Benzene is also capable of causing changes in genetic material (chromosomes). Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy. Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents.

Available information indicates that **toluene** is NOT teratogenic, but it can be toxic to the embryo and fetus and may reduce fertility. In animal tests, high inhaled doses of toluene has caused reduced litter sizes, retarded development of the fetus, and increased incidence of non-lethal abnormalities.

Based upon animal testing, the **C8 aromatic hydrocarbon components (xylenes and ethylbenzene)** might be assumed to cause embryo and fetal toxicity, spontaneous abortions, and/or decreased fetal and newborn weights if overexposures occur during a woman's early gestation period (See Section 11)

**Benzene NESHAPS
Stripper Tower Feed**

Conditions Aggravated by Exposure Personnel with pre-existing central nervous system (CNS) disease, neurological conditions, skin disorders, impaired hearing, liver, or kidney function, blood disorders, or chronic respiratory diseases, and women attempting to conceive should avoid exposure. Special precautions are necessary for pregnant women and nursing mothers

Exposure to high concentrations of this material may increase the sensitivity of the heart to **epinephrine (adrenalin) and catecholamine-like drugs**. Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians").

Target Organs This substance is toxic to lungs, central nervous system, especially the auditory nerve, brain, mucous membranes, skin, eyes, and possibly, the blood, bone marrow and other blood-forming tissues, heart, liver, kidneys, thymus, and reproductive systems.

Carcinogenic Potential This product contains a **benzene** component at concentrations at or above 0.1%. **Benzene** is considered carcinogenic by OSHA, IARC, and NTP. See Section 11.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910 1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

- Inhalation** Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
- Eye Contact** Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
- Skin Contact** Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
- Ingestion** Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.

Notes to Physician

Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse). If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential.

**Benzene NESHAPS
Stripper Tower Feed**

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IA, IB, or IC Flammable Liquid, or Class II Combustible Liquid Extremely, highly, or moderately flammable!		
Flash Point/Method	CLOSED CUP: -11° to 40°C (12° to 140°F). (Tagliabue [ASTM D-56])		
Lower Flammable Limit	AP 1.0%	Upper Flammable Limit	AP 7.1%
Auto-Ignition Temp.	AP 432°C (810°F)		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, and possibly other harmful gases/vapors.		
Special Properties	Flammable or Combustible Liquid! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.		
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide (CO ₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.		
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors, but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

Benzene NESHAPS Stripper Tower Feed

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room, and preferably refrigerated. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).

Benzene NESHAPS Stripper Tower Feed

General Comments

Warning! Odor is an inadequate warning for hazardous conditions, especially since the odor threshold of benzene is several ppm above the occupational exposure guideline levels. Released vapors may cause extremely flammable, explosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special safety precautions including monitoring for oxygen deficiency and flammability

Occupational Exposure Guidelines

Substance

- 1) Benzene ("A1" and "Z-2" Carcinogen)
- 2) Toluene ("A4" = Not Classifiable)
- 3) Xylene, Mixed Isomers ("A4" = Not Classifiable)

Applicable Workplace Exposure Levels

TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) [1999] - SKIN
 TWA: 1 STEL: 5 AL: 0.5 (ppm) from OSHA (PEL) [1987] - SKIN
 TWA: 50 (ppm) from ACGIH (TLV) [1999] - SKIN
 TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [1989]
 TWA: 200 CEIL: 300 (ppm) from OSHA (PEL) [1976]
 TWA: 100 STEL: 150 (ppm) from ACGIH (TLV) [1999]
 TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [1989]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color	Transparent, water white to hazy grey.	Odor	Characteristic, sweet and pleasant, aromatic hydrocarbon its odor threshold is 2-5 ppm in air.
Specific Gravity	0.86 to 1.00 (Water = 1)	pH	6.0 to 7.0	Vapor Density	0 to 3.7 (Air = 1)
Boiling Point/Range	80° to 152°C (176° to 306°F)	Melting/Freezing Point			-95° to 13°C (-139° to 55°F)
Vapor Pressure	0 to 43 mm Hg at 20°C (68°F).	Viscosity (cSt @ 40°C)			0.1 to 2
Solubility in Water	Hydrocarbons portion of this mixture is slightly soluble in cold water (0.1 to 0.2%)	Volatile Characteristics			Volatile Organic Compounds (VOCs) Content = 0.1 to 15%; Volatile portion = 875 to 880 gm/L.
Additional Properties	C6-C9 Aromatic Hydrocarbon Content = 0.1 to 13 Wt.% (ASTM D-1319); Alkane, Isoparaffin, and Cycloalkane Hydrocarbons Content = 0 to 1.5 Wt.% (ASTM D-1319); Average Density at 60°F = 7.269 to 8.345 lbs/gal. (ASTM D-2161), Dry Point Temperature = 292°F (145°C) (ASTM D-86), Evaporation Rate = 0 to 4.5 when n-Butyl acetate = 1.0; Heat Value = 0 to 18,500 Btu.				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from heat, sparks, and other ignition sources, strong oxidizing conditions, and freezing temperatures.		
Materials Incompatibility	Strong acids, especially nitric acid, alkalis, and oxidizers such as liquid chlorine, many fluorides, perchlorates, and other halogens, hydrogen peroxide, and oxygen.		
Hazardous Decomposition Products	No substances are readily identified from composition, but, no degradation data is available		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	Benzene and toluene have IDLH (immediately dangerous to life or health) concentrations = 500 ppm. Its estimated lethal dose for a normal human adult is one teaspoon to one ounce (AP 10 mL). Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes.
----------------------	---

Benzene NESHAPS Stripper Tower Feed

Benzene is a known animal carcinogen and a human leukemogen. In addition, NTP, IARC, EPA, OSHA, and ACGIH list benzene as a "Human Carcinogen." Repeated and prolonged overexposure to benzene vapors (GT 20 ppm in air) may cause toxicity to blood-forming tissues. Chronic exposure symptoms include decreased blood cell and platelet counts, leukopenia, aplastic anemia, or acute myelogenous leukemia (AML). Also, chronic inhalation of benzene vapors have been found to cause fatigue, nervousness, irritability, blurred vision, and labored breathing. Overexposure to benzene has been associated with in chromosomal aberrations in human white blood cells, both laboratory animal and human bone marrow cell damage, and in vitro mammalian cells DNA damage. Elevated frequencies of chromosomal aberrations have been observed in peripheral white blood cells and bone marrow of workers exposed to high benzene concentrations known to be associated with signs of chronic poisoning. Ethanol consumption may have a synergistic effect and increase blood system changes caused by benzene exposures. Children and teenagers have a lower resistance to bone marrow poisons.

Studies with pregnant laboratory animals have demonstrated that **benzene** is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice.

Toluene (methylbenzene) has been a major solvent of intentional inhalation abuse. Deliberate long-term inhalation of high concentrations of toluene (glue sniffing, etc.) has been shown to cause liver, kidney, central nervous system, and permanent brain damage. Effects such as impaired speech, visual disturbances, and hearing loss, loss of balance and/or muscle control, and memory loss have been reported. Exposures of 100 to 200 ppm in air for 24 hours cause hallucinations, distorted perceptions, and changes in motor activity. Studies have indicated that children of women who sniffed massive exposures of toluene during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. Isolated case reports have suggested a spectrum of congenital defects similar to those seen in fetal alcohol (ethanol) syndrome. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate.

Animal studies suggest that **toluene** causes kidney, liver, and/or lung dysfunction and cardiac (heart muscle) sensitization to epinephrine or other adrenalin-like agents. This sensitization may cause fatal changes in heart beat rhythms. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency).

Long-term rodent inhalation studies with **toluene** produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness, and impaired reaction time. Also, rats exposed to 1,200 ppm and 1,400 ppm of toluene in air for 14 hours per day for 5 or 4 weeks (respectively) exhibited high-frequency hearing loss. Several animal studies using pregnant rodents have shown that toluene exposures may cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation studies, toluene has not been shown to be carcinogenic, nor is it mutagenic in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

An inhalation study with laboratory animals indicated an association of **xylene** with hearing loss in rats. Several animal studies using pregnant rodents have shown that **mixed xylene isomers (dimethylbenzenes)** may all cause embryo and/or fetotoxicity. Inhalation and feeding studies involving pregnant laboratory animals have produced limited evidence of fetal toxicity including increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes.

Chronic overexposure to **xylene** may produce irreversible damage to the central nervous system, including ototoxicity, that can be increased by the consumption of ethanol (alcoholic drinks). Drinking beverages which contain ethanol in conjunction with xylene exposure increases the alcoholic effects and impairs the clearance of xylenes from the body. Xylene isomers accumulate in the adipose (fat) tissues, from which they are slowly released. Complete clearance may take several days following exposure.

Two-year rat and mouse gavage studies by the National Toxicology Program (NTP) on **mixed xylene isomers including 17% ethylbenzene** showed "no evidence of carcinogenicity." Also, a two-year mixed xylenes skin-painting study on shaved rats and mice showed no incidence of non-neoplastic or neoplastic lesions. And, none of the components were mutagenic when tested in either the modified Ames, Chinese hamster ovary cell with and without metabolic activation, or sister-chromatid mutagenicity assays.

Benzene NESHAPS Stripper Tower Feed

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity

Ecological effects testing has not been conducted on this material. If spilled, the aromatic naphtha components of this mixture, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. All of its **aromatic hydrocarbon components (benzene, toluene, xylene isomers, and possibly ethylbenzene)** are volatile and might contribute to the creation of atmospheric smog. Toluene has a half-life of from 3 hours to slightly over 1 day when photochemically active hydroxyl radicals are present; and it is very effectively washed out of the atmosphere by rain. Benzene has a half-life of from 4 to 6 hours when photochemically active hydroxyl radicals are present, especially when atmospheres are polluted with nitrogen oxides or sulfur dioxide. Benzene and toluene are very effectively washed out of the atmosphere by rain.

Using Rainbow Trout (*Oncorhynchus mykiss*) and Dungeness Crab (*Cancer magister*), all the components in the aromatic naphtha portion of this mixture (**benzene, toluene, xylene isomers, and ethylbenzene**) showed a 96-hour TLms (Median Toxic Limit) of from 5 ppm to 30 ppm in ambient saltwater. Also, 24-hour and 96-hour TLms produced results from 10 ppm to 60 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), and Guppy (*Lebistes reticulatus*) in fresh water. Using Water Fleas (*Daphnia magna*), all these component substances showed 24-hour TLms of from 95 ppm to 400 ppm. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

Environmental Fate

This water and aromatic naphtha mixture is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

**Benzene NESHAPS
Stripper Tower Feed**

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Flammable liquid, n.o.s. (Benzene, Toluene)		
Hazard Class	Class 3: Flammable liquid.	Packing Group(s)	PG II or PG III
		UN/NA ID	UN1993
Reportable Quantity	The Reportable Quantity (RQ) substance components in this product which require DOT HAZMAT bill-of-lading display are Benzene and Toluene .		
Placards		Emergency Response Guide No.	128
		HAZMAT STCC No.	49 101 31
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.
SARA 313	This product contains the following components in concentrations that might be at or above de minimis levels and they are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 Benzene [CAS No. 71-43-2] concentration: 0.1 to 5% Toluene [CAS No. 108-88-3] concentration: 0 to 4% Xylenes [CAS No. 1330-20-7] concentration: 0 to 3%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances which might be present in this material subject to this statute are: Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 0.1 to 5% Toluene [CAS No. 108-88-3] (RQ = 1000 lbs. [453.6 kg]) concentration: 0 to 4% 2,2,4-Trimethylpentane (Iso-octane) [CAS No. 540-84-2] (RQ = 1000 lbs. [453.6 kg]) conc.: 0 to 0.2% Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 0 to 3% Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 0 to 0.7% Cumene (Isopropylbenzene) [CAS No. 98-82-8] (RQ = 5000 lbs. [2268 kg]) concentration: 0 to 0.2%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802
California Proposition 65	This material might contain the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it is subject to requirements of California Health & Safety Code Section 25249.5: Benzene [CAS No. 71-43-2] and Toluene [CAS No. 108-88-3].
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2.

Benzene NESHAPS Stripper Tower Feed

Additional Regulatory Remarks

Under Section 12(b) of the Toxic Substances Control Act. Because it may contain detectable amounts of **n-Propylbenzene [CAS No. 103-65-1]** and **other C9 Aromatic Hydrocarbons**, this material might be subject to US EPA's one-time only per country export notification requirements.

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following minor components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare": **Benzene [CAS No. 71-43-2]** and possibly **Toluene [CAS No. 108-88-3]**, **mixed Xylenes [CAS No. 1330-20-7]**, **Ethylbenzene [CAS No. 100-41-4]**, and **Cumene (Isopropylbenzene) [CAS No. 98-82-8]**.

SECTION 16: OTHER INFORMATION

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid.
Color Dark. **Odor** Ammoniacal. Rotten eggs.
(Strong.)

DANGER!

Corrosive. Causes eye and skin burns.

Causes respiratory irritation and can cause damage to respiratory system.

May be harmful or fatal if swallowed.

Aspiration hazard if swallowed -- Can enter lungs and cause damage.

If swallowed, seek medical attention immediately.

Contains Hydrogen Sulfide Gas!

Harmful to aquatic organisms.

Protective Equipment

**Minimum Recommended
See Section 8 for Details**

Minimum PPE reflects the requirements for this material at this facility:
LYONDELL-CITGO Refining
LP Manufacturing Complex

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	Rich aqueous amine solution.	Technical Contact	(800) 525-4692
Product Number	Not available.	Medical Emergency	(800) 313-7645. Also see Notes to Physician.
CAS Number	Mixture.	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Refinery Process Chemical		
Synonyms	Aqueous Diethanolamine/Proprietary Amine Solution Containing Hydrogen Sulfide and Ammonia; Rich Amine; Hydrogen Sulfide Extractant Solution; Sour Contactor Solvent Solution.		

SECTION 2. COMPOSITION (TYPICAL)

All liquid components are listed on a weight % basis and all gases are listed on a mole % basis.

Component Name(s)	CAS Registry No.	Concentration (%)
Water	7732-18-5	60 - 70
Proprietary Amines	Mixture	12 - 16
Diethanolamine	111-42-2	18 - 24
Hydrogen Sulfide	7783-06-4	0.5 - 20
Ammonia	7664-41-7	0 - 5

Rich DEA

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Eye contact. Inhalation. Ingestion.

Signs and Symptoms of Acute Exposure

- Inhalation** Not considered a normal route of exposure for this aqueous solution. However, breathing high concentrations of vapor, mist, or liquid droplets may cause respiratory tract irritation, mucous membrane tissue burns, and possibly, chemical pneumonia.
- Eye Contact** Causes irritation, experienced as pain, with excess blinking and tear production, and seen as extreme redness and swelling of the eye and chemical burns of the eye. Severe eye damage may cause blindness. This product contains one or more amines which may produce temporary and reversible hazy or blurred vision. Symptoms disappear when exposure is terminated.
- Skin Contact** Causes severe irritation with pain, redness and swelling, chemical burns, blister formation, and possible tissue destruction. Irritation may follow an initial delay between the time that the exposure occurs and the sense of irritation begins.
- Ingestion** May cause mucous membrane irritation or chemical burns to the mouth, throat, and gastrointestinal tract with accompanying nausea, abdominal pain, diarrhea, thirst weakness and collapse. Aspiration may occur during swallowing or vomiting, resulting in lung damage.
- Chronic Health Effects Summary** Repeated skin contact may cause a persistent irritation or dermatitis. Repeated inhalation may cause lung damage.

Conditions Aggravated by Exposure Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Skin, Respiratory System

Target Organs Not available.

Carcinogenic Potential This product is not known to contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC or NTP.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Toxic	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input checked="" type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

- Inhalation** Immediately move exposed individual to fresh air. Monitor for respiratory distress. If the individual is not breathing, immediately begin rescue breathing. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately. Persons providing mouth-to-mouth rescue breathing may be placing themselves at risk either from exposure to toxic materials or communicable disease.

Rich DEA

Eye Contact	Do not attempt to remove contact lenses. Immediately irrigate eyes with copious amounts of cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Flush thoroughly with cool water under a shower of water for at least 15 minutes while removing contaminated shoes and clothing. Use cold water. Neutralize exposed skin with a dilute solution of boric acid or acetic acid. Gently and thoroughly wash contaminated skin with running water and non-abrasive soap. Be particularly careful to clean folds, crevices, creases and groin. Seek medical attention if tissue appears damaged or if pain or irritation persists. Thoroughly clean contaminated clothing before reuse. Discard contaminated leather goods.
Ingestion	Do not induce vomiting. If spontaneous vomiting is about to occur, place victim's head below knees. Do not attempt to neutralize. Have victim rinse mouth with water then drink two to three large glasses of milk or water. Never give anything by mouth to a person who is not fully conscious. Keep airway clear. Seek medical attention immediately.
Notes to Physician	<p>INHALATION: Treat as corrosive material. Monitor for pharyngeal and pulmonary edema. Onset may be delayed up to 24 hours from exposure. Administer supplemental oxygen with assisted ventilation, as required.</p> <p>SKIN: Treat as corrosive material. Wash contaminated skin thoroughly with water or saline.</p> <p>INGESTION: Due to the potential for esophageal or gastrointestinal tract burns following ingestion, do not induce emesis. Careful gastric lavage may be considered. Immediate dilution with water or milk may be beneficial. Do not treat with sodium bicarbonate or attempt to neutralize as this can cause exothermic gas generation and, in severe cases, cause perforation.</p> <p>Proprietary amine mixture is UCARSOL (TM) LE SOLVENT 713. Medical Information can be obtained from the Dow Chemical Company at telephone (989) 636-4400.</p>

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	not available
Flash Point	The lowest known value is Open cup: 134°C (273.2°F). (Diethanolamine)
Lower Flammable Limit	No data.
Upper Flammable Limit	No data.
Autoignition Temperature	Not available.
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, and/or unburned hydrocarbons. nitrogen oxides (NO, NO ₂ ...)
Special Properties	This material will release vapors when heated above the flash point temperature that can ignite when exposed to a source of ignition. In enclosed spaces, vapors can ignite with explosive force. Mists or sprays may burn at temperatures below the flash point.
Extinguishing Media	Not expected to present a fire or explosion hazard. Use foam, waterspray, dry chemical, or carbon dioxide (CO ₂) as extinguishing agents should this material become involved in a fire.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

Rich DEA

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Do not get water inside containers. Minor leaks or spills can be diluted and neutralized with plenty of water. To avoid the evolution of poisonous hydrogen sulfide gas, this acid must not be allowed to contact sulfide wastes (as in sewers). Absorb or cover the neutralized residue with dry earth, sand, or other non-combustible material and transfer to containers. All clean-up materials should be removed for proper treatment or disposal. Contain large spills to maximize product recovery or disposal. Prevent entry into waterways or sewers. In urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from ecologists to minimize physical habitat damage. Comply with all laws and regulations.

SECTION 7. HANDLING AND STORAGE

Handling	Do not breathe vapor or mist. Do not get in eyes, on skin or on clothing. Wash thoroughly after handling.
Storage	Store in glass or other approved containers away from chemicals and combustible materials. Store in a cool, dry, secure and well ventilated area away from sunlight. Keep away from heat, sparks and flame. Keep container tightly closed. Storage area should be equipped with an appropriate chemical resistant floor. Drainage facilities should be constructed for containment of small spills.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls	No special ventilation is required under normal conditions of use. Where engineering controls are feasible, use adequate local exhaust ventilation wherever mist, spray, or vapor may be generated. Where carbon dioxide or sulfur dioxide may be generated, special ventilation may be required. Ensure that an emergency eye wash station and safety shower are located near the work-station.
Personal Protective Equipment	Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required. Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Eye Protection	Safety glasses equipped with side shields are recommended as minimum protection in industrial settings. When there is a likelihood of misting, splashing, or spraying, chemical-resistant goggles and full-face shield should be worn. Suitable eye wash water should be readily available.
Hand Protection	Avoid skin contact. Disposable neoprene, rubber, or vinyl gloves are required for use. Wash hands and other exposed skin with mild soap and water before eating, drinking, smoking, or using the toilet facilities.

Rich DEA

Body Protection	Avoid all skin contact. If splashing or spraying is expected, chemical-resistant protective clothing should be worn. Protective clothing should include long-sleeves, apron, slicker suit, boots and additional facial protection. Use a full-body corrosives suit whenever appropriate. If general contact occurs, IMMEDIATELY get under an emergency shower and remove contaminated clothing. Then take a thorough shower. Contaminated leather goods should be removed immediately and discarded.
Respiratory Protection	For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).
General Comments	Use good personal hygiene practices. Wash hands and other exposed skin areas with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities, or leaving work. Do not use gasoline, kerosene, solvents, or harsh abrasive skin cleaners. Use of personal protective equipment and good personal hygiene are essential to controlling exposures to this aqueous solution.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
Water	Not available.
Diethanolamine	ACGIH TLV (United States). Skin TWA: 2 mg/m ³ 8 hour(s).
	NIOSH (United States). TWA: 3 ppm 8 hour(s).
Hydrogen Sulfide	ACGIH TLV (United States). TWA: 10 ppm 8 hour(s). STEL: 15 ppm 15 minute(s).
	OSHA (United States). CEIL: 20 ppm 8 hour(s). STEL: 50 ppm 15 minute(s). Form: *10 minute peak; once per 8 hour shift
Ammonia	ACGIH TLV (United States, 2000). TWA: 25 ppm 8 hour(s). ACGIH (United States, 2000). STEL: 35 ppm OSHA (United States, 1989). STEL: 35 ppm TWA: 50 ppm STEL: 35 ppm

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Liquid.	Color	Dark.	Odor	Ammoniacal. Rotten eggs. (Strong.)
Specific Gravity	AP 1	pH	AP 9.5	Vapor Density	AP 1.4
Boiling Range	The lowest known value is 100°C (212°F) (Water).		Melting/Freezing Point	Not available.	
Vapor Pressure	Not available.		Volatility	Slightly volatile.	
Solubility in Water	Easily soluble in cold water. Soluble in hot water, methanol, diethyl ether.		Viscosity (cSt @ 40°C)	not available	
Flash Point	The lowest known value is Open cup: 134°C (273.2°F). (Diethanolamine)				
Additional Properties	No additional information.				

Rich DEA

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization Not expected to occur.
Conditions to Avoid	Keep away from strong acids, heat and hot surfaces, strong oxidizing conditions, and severe agitation. Contact with some metals can generate extremely flammable hydrogen (H ₂) gas. Avoid direct contact with organic halogen compounds.	
Materials Incompatibility	This material is incompatible with acids and oxidizers.	
Hazardous Decomposition Products	Toxic levels of ammonia, oxides of nitrogen, carbon monoxide, carbon dioxide, irritating aldehydes and ketones may be formed on burning in a limited air supply.	

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	Diethanolamine ORAL (LD50):	Acute: 3300 mg/kg [Mouse]. 2200 mg/kg [Rabbit].
----------------------	---------------------------------------	---

Standard Draize Test:
Skin (rabbit) 500 mg/24H - Mild
Eye (rabbit) 750 ug/24H - Severe

In studies conducted by National Toxicology Program (NTP), F344/N male and female rats were dermally administered diethanolamine in ethanol at various doses for 2 years. In addition, B6C3F1 mice were dermally administered diethanolamine in ethanol at various dose levels for 2 years. NTP concluded that, under the conditions of these studies, there was no evidence of carcinogenic activity of diethanolamine in either sex of F344/N rats. Also, NTP determined that there was clear evidence of carcinogenic activity of diethanolamine in mice based on an increased incidence of liver neoplasms in males and females and increased incidences of renal tubule neoplasms in males. The significance of these findings to humans is unclear.

Hydrogen Sulfide
INHALATION (LC50): Acute: 444 ppm 1 hour(s) [Rat]. 673 ppm 1 hour(s) [Mouse].
Hydrogen Sulfide (H₂S) has an unpleasant odor that diminishes with increased concentrations. Eye irritation can occur at concentrations above four ppm. Olfactory fatigue occurs rapidly at concentrations above 50. Accordingly, odor is not a reliable warning property. Symptoms increase with exposures above 50 ppm. Respiratory effects including irritation with possible pulmonary edema can occur with exposure above 50 ppm. At concentrations above 500 ppm, an immediate loss of consciousness, depressed respiration and death can occur. NIOSH has determined that H₂S concentrations at or above 100 ppm are immediately dangerous to life and health.

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this material. Vapor releases from this material are expected to cause significant immediate impact but only localized non-persistent environmental damage. Due caution should be exercised to prevent an accidental release into the environment. This material and any contaminated soil or other water may be hazardous to human, animal, and aquatic life.
Environmental Fate	This product is miscible in water and is expected to readily disperse in marine environments.

Rich DEA

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Recovery and reuse, rather than disposal, should be the ultimate goal for handling this corrosive alkaline material. Conditions of use may cause this material to become a "hazardous waste", as defined by federal or state regulations. It is the responsibility of the user to determine if the material is a hazardous waste at the time of disposal. Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304 Emergency Planning and Notification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. Hydrogen sulfide, CAS Number, 7783-06-4 Concentration: 10.25% , CAS Number, 7664-41-7 Concentration: 2.5%
SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard
SARA 313 Toxic Chemical Notification and Release Reporting	This product contains the following components in concentrations above <i>de minimis</i> levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: Diethanolamine [CAS No.: 111-42-2] Concentration: 32.5% Hydrogen sulfide [CAS No.: 7783-06-4] Concentration: 10.3%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are: Diethanolamine [CAS No.: 111-42-2] RQ = 100 lbs. (45.36 kg) Concentration: 32.5% Hydrogen sulfide [CAS No.: 7783-06-4] RQ = 100 lbs. (45.36 kg) Concentration: 10.3% [CAS No.: 7664-41-7] RQ = 100 lbs. (45.36 kg) Concentration: 2.5%

Rich DEA**Clean Water Act
(CWA)**

This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

**California
Proposition 65**

This product is not known to contain any components for which the State of California has found to cause cancer, birth defects or other reproductive harm.

**New Jersey
Right-to-Know Label**

For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.

**Additional Regulatory
Remarks****SECTION 16. OTHER INFORMATION**

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

* = Chronic Health Hazard

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid.

Color Dark. **Odor** Slight.

DANGER!

Corrosive. Causes eye and skin burns.

Causes respiratory irritation and can cause damage to respiratory system.

May be harmful or fatal if swallowed.

Aspiration hazard if swallowed -- Can enter lungs and cause damage.

If swallowed, seek medical attention immediately.

Contains Hydrogen Sulfide Gas!

Protective Equipment

Minimum Recommended
See Section 8 for Details

Minimum PPE reflects the requirements for this material at this facility:

LYONDELL-CITGO Refining
LP Manufacturing Complex

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	Lean aqueous amine solution	Technical Contact	(800) 525-4692
Product Number	Not available.	Medical Emergency	(800) 313-7645 Also see Notes to Physician.
CAS Number	Mixture.	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Refinery Process Chemical		
Synonyms	Aqueous Diethanolamine Solution/Proprietary Amine mixture Containing Trace Amounts of Hydrogen Sulfide and Ammonia; Lean Amine; Steam-stripped Amine Solution; Stripped Amine Solution; H ₂ S/NH ₃ Extractant Solution; Sour Contactor Solvent Solution; Effluent from the Amine Stripper Tower.		

SECTION 2. COMPOSITION (TYPICAL)

All liquids are listed on a weight % basis.

Component Name(s)	CAS Registry No.	Concentration (%)
Water	7732-18-5	60 - 70
Diethanolamine	111-42-2	18 - 24
Hydrogen Sulfide	7783-06-4	0 - 0.05
Ammonia	7664-41-7	0 - 0.005
Proprietary Amines	Mixture	12 - 16

Lean DEA

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Eye contact. Inhalation. Ingestion.

Signs and Symptoms of Acute Exposure

Inhalation	Not considered a normal route of exposure for this aqueous solution. However, breathing high concentrations of vapor, mist, or liquid droplets may cause respiratory tract irritation, mucous membrane tissue burns, and possibly, chemical pneumonia.
Eye Contact	Causes irritation, experienced as pain, with excess blinking and tear production, and seen as extreme redness and swelling of the eye and chemical burns of the eye. Severe eye damage may cause blindness. This product contains one or more amines which may produce temporary and reversible hazy or blurred vision. Symptoms disappear when exposure is terminated.
Skin Contact	Causes severe irritation with pain, redness and swelling, chemical burns, blister formation, and possible tissue destruction. Irritation may follow an initial delay between the time that the exposure occurs and the sense of irritation begins.
Ingestion	May cause mucous membrane irritation or chemical burns to the mouth, throat, and gastrointestinal tract with accompanying nausea, abdominal pain, diarrhea, thirst weakness and collapse. Aspiration may occur during swallowing or vomiting, resulting in lung damage.
Chronic Health Effects Summary	Repeated skin contact may cause a persistent irritation or dermatitis. Repeated inhalation may cause lung damage.
Conditions Aggravated by Exposure	Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Skin, Respiratory System
Target Organs	Not available.
Carcinogenic Potential	This product is not known to contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC or NTP.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification			OSHA Physical Hazard Classification						
Irritant	<input checked="" type="checkbox"/>	Sensitizer	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Toxic	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input checked="" type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress. If the individual is not breathing, immediately begin rescue breathing. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately. Persons providing mouth-to-mouth rescue breathing may be placing themselves at risk either from exposure to toxic materials or communicable disease.
-------------------	---

Lean DEA

Eye Contact	Do not attempt to remove contact lenses. Immediately irrigate eyes with copious amounts of cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Flush thoroughly with cool water under a shower of water for at least 15 minutes while removing contaminated shoes and clothing. Use cold water. Neutralize exposed skin with a dilute solution of boric acid or acetic acid. Gently and thoroughly wash contaminated skin with running water and non-abrasive soap. Be particularly careful to clean folds, crevices, creases and groin. Seek medical attention if tissue appears damaged or if pain or irritation persists. Thoroughly clean contaminated clothing before reuse. Discard contaminated leather goods.
Ingestion	Do not induce vomiting. If spontaneous vomiting is about to occur, place victim's head below knees. Do not attempt to neutralize. Have victim rinse mouth with water then drink two to three large glasses of milk or water. Never give anything by mouth to a person who is not fully conscious. Keep airway clear. Seek medical attention immediately.
Notes to Physician	<p>INHALATION: Treat as corrosive material. Monitor for pharyngeal and pulmonary edema. Onset may be delayed up to 24 hours from exposure. Administer supplemental oxygen with assisted ventilation, as required.</p> <p>SKIN: Treat as corrosive material. Wash contaminated skin thoroughly with water or saline.</p> <p>INGESTION: Due to the potential for esophageal or gastrointestinal tract burns following ingestion, do not induce emesis. Careful gastric lavage may be considered. Immediate dilution with water or milk may be beneficial. Do not treat with sodium bicarbonate or attempt to neutralize as this can cause exothermic gas generation and, in severe cases, cause perforation.</p> <p>The proprietary amine mixture is UCARSOL (TM) LE SOLVENT 713. Medical Information can be obtained from The Dow Chemical Company at telephone (989) 636-4400.</p>

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	not available
Flash Point	The lowest known value is Open cup: 134°C (273.2°F). (Diethanolamine)
Lower Flammable Limit	No data.
Upper Flammable Limit	No data.
Autoignition Temperature	Not available.
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, and/or unburned hydrocarbons. nitrogen oxides (NO, NO ₂ ...)
Special Properties	This material will release vapors when heated above the flash point temperature that can ignite when exposed to a source of ignition. In enclosed spaces, vapors can ignite with explosive force. Mists or sprays may burn at temperatures below the flash point.
Extinguishing Media	Not expected to present a fire or explosion hazard. Use foam, waterspray, dry chemical, or carbon dioxide (CO ₂) as extinguishing agents should this material become involved in a fire.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

Lean DEA

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Do not get water inside containers. Minor leaks or spills can be diluted and neutralized with plenty of water. To avoid the evolution of poisonous hydrogen sulfide gas, this acid must not be allowed to contact sulfide wastes (as in sewers). Absorb or cover the neutralized residue with dry earth, sand, or other non-combustible material and transfer to containers. All clean-up materials should be removed for proper treatment or disposal. Contain large spills to maximize product recovery or disposal. Prevent entry into waterways or sewers. In urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from ecologists to minimize physical habitat damage. Comply with all laws and regulations.

SECTION 7. HANDLING AND STORAGE

Handling	Do not breathe vapor or mist. Do not get in eyes, on skin or on clothing. Wash thoroughly after handling.
Storage	Store in glass or other approved containers away from chemicals and combustible materials. Store in a cool, dry, secure and well ventilated area away from sunlight. Keep away from heat, sparks and flame. Keep container tightly closed. Storage area should be equipped with an appropriate chemical resistant floor. Drainage facilities should be constructed for containment of small spills.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls	No special ventilation is required under normal conditions of use. Where engineering controls are feasible, use adequate local exhaust ventilation wherever mist, spray, or vapor may be generated. Where carbon dioxide or sulfur dioxide may be generated, special ventilation may be required. Ensure that an emergency eye wash station and safety shower are located near the work-station.
Personal Protective Equipment	Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required. Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Eye Protection	Safety glasses equipped with side shields are recommended as minimum protection in industrial settings. When there is a likelihood of misting, splashing, or spraying, chemical-resistant goggles and full-face shield should be worn. Suitable eye wash water should be readily available.
Hand Protection	Avoid skin contact. Disposable neoprene, rubber, or vinyl gloves are required for use. Wash hands and other exposed skin with mild soap and water before eating, drinking, smoking, or using the toilet facilities.

Lean DEA

Body Protection	Avoid all skin contact. If splashing or spraying is expected, chemical-resistant protective clothing should be worn. Protective clothing should include long-sleeves, apron, slicker suit, boots and additional facial protection. Use a full-body corrosives suit whenever appropriate. If general contact occurs, IMMEDIATELY get under an emergency shower and remove contaminated clothing. Then take a thorough shower. Contaminated leather goods should be removed immediately and discarded.
Respiratory Protection	For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).
General Comments	Use good personal hygiene practices. Wash hands and other exposed skin areas with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities, or leaving work. Do not use gasoline, kerosene, solvents, or harsh abrasive skin cleaners. Use of personal protective equipment and good personal hygiene are essential to controlling exposures to this aqueous solution.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
Water	Not available.
Diethanolamine	ACGIH TLV (United States). Skin TWA: 2 mg/m ³ 8 hour(s). NIOSH (United States). TWA: 3 ppm 8 hour(s).
Hydrogen Sulfide	ACGIH TLV (United States). TWA: 10 ppm 8 hour(s). STEL: 15 ppm 15 minute(s). OSHA (United States). CEIL: 20 ppm 8 hour(s). STEL: 50 ppm 15 minute(s). Form: *10 minute peak; once per 8 hour shift
Ammonia	ACGIH TLV (United States, 2000). TWA: 25 ppm 8 hour(s). ACGIH (United States, 2000). STEL: 35 ppm OSHA (United States, 1989). STEL: 35 ppm TWA: 50 ppm STEL: 35 ppm

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Liquid.	Color	Dark.	Odor	Slight.
Specific Gravity	AP 1	pH	AP 9.5	Vapor Density	AP 1.4
Boiling Range	The lowest known value is 100°C (212°F) (Water).	Melting/Freezing Point			Not available.
Vapor Pressure	Not available.	Volatility			Slightly volatile.
Solubility in Water	Easily soluble in cold water. Soluble in hot water, methanol, diethyl ether.	Viscosity (cSt @ 40°C)			not available
Flash Point	The lowest known value is Open cup: 134°C (273.2°F). (Diethanolamine)				
Additional Properties	No additional information.				

Lean DEA

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization Not expected to occur.
Conditions to Avoid	Keep away from strong acids, heat and hot surfaces, strong oxidizing conditions, and severe agitation. Contact with some metals can generate extremely flammable hydrogen (H ₂) gas. Avoid direct contact with organic halogen compounds.	
Materials Incompatibility	This material is incompatible with acids and oxidizers.	
Hazardous Decomposition Products	Toxic levels of ammonia, oxides of nitrogen, carbon monoxide, carbon dioxide, irritating aldehydes and ketones may be formed on burning in a limited air supply.	

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Diethanolamine

ORAL (LD50): Acute: 3300 mg/kg [Mouse]. 2200 mg/kg [Rabbit].

Standard Draize Test:

Skin (rabbit) 500 mg/24H - Mild

Eye (rabbit) 750 ug/24H - Severe

In studies conducted by National Toxicology Program (NTP), F344/N male and female rats were dermally administered diethanolamine in ethanol at various doses for 2 years. In addition, B6C3F1 mice were dermally administered diethanolamine in ethanol at various dose levels for 2 years. NTP concluded that, under the conditions of these studies, there was no evidence of carcinogenic activity of diethanolamine in either sex of F344/N rats. Also, NTP determined that there was clear evidence of carcinogenic activity of diethanolamine in mice based on an increased incidence of liver neoplasms in males and females and increased incidences of renal tubule neoplasms in males. The significance of these findings of humans is unclear.

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this material. Vapor releases from this material are expected to cause significant immediate impact but only localized non-persistent environmental damage. Due caution should be exercised to prevent an accidental release into the environment. This material and any contaminated soil or other water may be hazardous to human, animal, and aquatic life.
Environmental Fate	This product is miscible in water and is expected to readily disperse in marine environments.

Lean DEA

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Recovery and reuse, rather than disposal, should be the ultimate goal for handling this corrosive alkaline material. Conditions of use may cause this material to become a "hazardous waste", as defined by federal or state regulations. It is the responsibility of the user to determine if the material is a hazardous waste at the time of disposal. Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304 Emergency Planning and Notification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard
SARA 313 Toxic Chemical Notification and Release Reporting	This product contains the following components in concentrations above <i>de minimis</i> levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: Diethanolamine [CAS No.: 111-42-2] Concentration: 22.5%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are: Diethanolamine [CAS No.: 111-42-2] RQ = 100 lbs. (45.36 kg) Concentration: 22.5%
Clean Water Act (CWA)	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

Lean DEA**California
Proposition 65**

This product is not known to contain any components for which the State of California has found to cause cancer, birth defects or other reproductive harm.

**New Jersey
Right-to-Know Label**

For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.

**Additional Regulatory
Remarks****SECTION 16. OTHER INFORMATION**

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Material Safety Data Sheet

Company

Houston Refining
One Houston Center, Suite 700
1221 McKinney St.
P.O. Box 2583
Houston, Texas 77252-2583

MSDS No. RS0963
Revision Date 11/01/06

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Liquid.		
Color	Hazy grey to black	Odor	Characteristic, sweet and pleasant, aromatic hydrocarbon. Its odor threshold is 2-5 ppm in air.

WARNING! Flammable liquid; vapor may cause flash fire!
Mist or vapor may irritate the eyes, mucous membranes, and respiratory tract!
Liquid contact may cause minimal to moderate eye and/or minimal to severe skin irritation and inflammation!
May be harmful if inhaled or absorbed through the skin!
Overexposures may cause central nervous system (CNS) depression and target organ effects such as hearing loss and/or liver, blood, and blood-forming tissue damage!
May be harmful or fatal if ingested!
Aspiration into the lungs can cause pulmonary edema and chemical pneumonia!
Prolonged and/or repeated inhalation may increase the heart's susceptibility to arrhythmias (irregular beats)!
Contains Benzene! Cancer hazard; may cause leukemia and other blood disorders! Mutagenic hazard; may cause genetic damage!
Based upon animal testing, may adversely affect reproduction!
Spills may create a slipping hazard!

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact. Eye Contact. Absorption. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon level of exposure concentration and/or duration. Vapors can reduce the oxygen content in air. Approximately 20,000 ppm (or 2 vol.%) in air is fatal to humans in 5 to 10 minutes. Sudden death from cardiac arrest (heart attack) may result from an exposure of 10,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces.
Eye Contact	Animal test results and actual human exposures of this material's components suggest that this product can cause minimal to moderate eye irritation upon short-term exposure. Symptoms include stinging, watering, redness, and swelling.
Skin Contact	Animal test results and actual human exposures of this material's components suggest that this product can cause minimal to moderate skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. This material may also be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause moderate to severe dermatitis. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and severe tissue damage.
Ingestion	If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, abdominal pain, vomiting, jaundice (yellowing of skin color), dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above).

Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration can result in severe lung damage or death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.

Chronic Health Effects Summary Chronic occupational xylene exposures have caused auditory nerve degeneration. Prolonged exposure and/or overexposures to sulfolane (tetrahydrothiophene-1,1-dioxide) may cause damage to the liver, white blood cells, and/or central nervous system. Also, chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction.

Reports have associated repeated and prolonged occupational overexposure to solvents with irreversible brain and nervous system damage (sometimes referred to as "Solvent or Painter's Syndrome"). Also, altered mental state, drowsiness, menstrual problems, peripheral motor neuropathy, irreversible brain damage (so-called "Petrol Sniffers Encephalopathy"), delirium, seizures, and sudden death have been common results for gasoline and naphtha abusers. Intentional misuse by deliberately concentrating and inhaling this product may be harmful or fatal.

Available information indicates that toluene is NOT teratogenic, but it can be toxic to the embryo and fetus and may reduce fertility. In animal tests, high inhaled doses of toluene has caused reduced litter sizes, retarded development of the fetus, and increased incidence of non-lethal abnormalities.

Light Aromatics (BTX) Plus Sulfolane

Benzene is considered to be a cancer causing agent. It damages blood cells, the bone marrow, and other blood-forming tissues causing leukopenia, aplastic anemia, and/or acute myelogenous leukemia (AML). Benzene is also capable of causing changes in genetic material (chromosomes). Chronic overexposures have caused vaginal bleeding, heavy menstrual bleeding, and hemorrhagic complications during pregnancy. Available information indicates that benzene is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. In limited animal tests, high inhaled doses of benzene have caused decreased fetal body weights, increased skeletal variations, and alterations in the formation and development of blood cells in the bone marrow of rodents.

Based upon animal testing, the C8 aromatic hydrocarbon components (xylenes and ethylbenzene) might be assumed to cause embryo and fetal toxicity, spontaneous abortions, and/or decreased fetal and newborn weights if overexposures occur during a woman's early gestation period. (See Section 11)

Conditions Aggravated by Exposure

Personnel with pre-existing central nervous system (CNS) disease, neurological conditions, skin disorders, impaired hearing, liver, or kidney function, blood disorders, or chronic respiratory diseases, and women attempting to conceive should avoid exposure. Special precautions are necessary for pregnant women and nursing mothers.

Exposure to high concentrations of this material may increase the sensitivity of the heart to epinephrine (adrenalin) and catecholamine-like drugs. Personnel with pre-existing cardiac disorders may be more susceptible to this effect (see Section 4, "Note to Physicians").

Target Organs

This substance is toxic to lungs, central nervous system, especially the auditory nerve, brain, mucous membranes, skin, eyes, and possibly, the blood, bone marrow and other blood-forming tissues, heart, liver, kidneys, thymus, and reproductive systems.

Carcinogenic Potential

This product contains a benzene component at concentrations at or above 0.1%. Benzene is considered carcinogenic by OSHA, IARC, and NTP. See Section 11.

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation

Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.

Eye Contact

Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.

Skin Contact

Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.

Ingestion

Do not induce vomiting or give anything by mouth. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.

**Light Aromatics (BTX)
Plus Sulfolane**

Notes to Physician

Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

If ingested, this material presents a significant aspiration/chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Administer an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias (irregular beating) in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse). If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	OSHA/NFPA Class-IB, IC, or II Flammable Liquid. Highly or moderately flammable!		
Flash Point/Method	CLOSED CUP: 4° to 60°C (40° to 140°F) (Tagliabue [ASTM D-56])		
Lower Flammable Limit	AP 1.0%	Upper Flammable Limit	AP 7.1%
Auto-Ignition Temp.	AP 432°C (810°F)		
Hazardous Combustion Products	Burning or excessive heating may produce smoke, carbon monoxide, carbon dioxide, sulfur oxides, and possibly hydrogen sulfide.		
Special Properties	Flammable Liquid! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. May create vapor/air explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.		
Extinguishing Media	SMALL FIRE Use dry chemicals, carbon dioxide (CO ₂), foam, water fog, or inert gas (nitrogen). LARGE FIRE Use foam, water fog, or waterspray. Water fog and spray are effective in cooling containers and adjacent structures but might cause frothing and/or may not achieve extinguishment. A water jet may be used to cool the vessel's external walls to prevent pressure build-up, autoignition, or explosion. NEVER use a water jet directly on the fire because it may spread the fire to a larger area.		
Fire Fighting Protective Clothing	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from venting safety devices or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid(s) enter sewers/waterways.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

Light Aromatics (BTX) Plus Sulfolane

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbent pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire/explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Bond and ground all equipment before transferring this material from one container to another. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation/personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food, chewing, or smoking materials. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This flammable liquid should be stored in a separate safety cabinet or room, and preferably refrigerated. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the N.F.P.A.'s National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor and/or mists below the pertinent exposure limits (see below). All electrical equipment should comply with the NFPA NEC Standards. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Safety glasses with side shields are recommended as a minimum protection. During transfer operations or when there is a likelihood of misting, splashing, or spraying, chemical goggles and face shield should be worn. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact and use gloves (disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Before eating, drinking, smoking, use of toilet facilities, or leaving work, wash hands with plenty of mild soap and water. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners.

Light Aromatics (BTX) Plus Sulfolane

Body Protection

Avoid skin contact. It is recommended that fire-retardant garments (e.g. Nomex™) be worn while working with flammable and combustible liquids. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. If general contact occurs, IMMEDIATELY remove soaked clothing and take a shower. Contaminated leather goods should be removed promptly and discarded.

Respiratory Protection

For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent standard (e.g. ANSI Z88.2).

General Comments

Warning! Odor is an inadequate warning for hazardous conditions, especially since the odor threshold of benzene is several ppm above the occupational exposure guideline levels. Released vapors may cause extremely flammable, explosive, and/or oxygen-deficient atmospheres. Do not enter such areas or confined spaces without taking special safety precautions including monitoring for oxygen deficiency and flammability.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Oil mist, mineral	TWA: 5 STEL 10 (mg/M ³) from ACGIH (TLV) [1999] TWA: 5 (mg/M ³) from OSHA (PEL) [1976]
2) Benzene ("A1" and "Z-2" Carcinogen)	TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 1 STEL: 5 AL 0.5 (ppm) from OSHA (PEL) [1987] - SKIN
3) Toluene ("A4" = Not Classifiable)	TWA: 50 (ppm) from ACGIH (TLV) [1999] - SKIN TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [1989] TWA: 200 CEIL: 300 (ppm) from OSHA (PEL) [1976]
4) Xylene, Mixed Isomers ("A4" = Not Classifiable)	TWA: 100 STEL: 150 (ppm) from ACGIH (TLV) [1999] TWA: 100 STEL: 150 (ppm) from OSHA (PEL) [1989]
5) Ethylbenzene ("A3" Animal Carcinogen proposed for 2000.)	TWA: 100 STEL: 125 (ppm) from ACGIH (TLV) [1999] TWA: 100 STEL: 125 (ppm) from OSHA (PEL) [1989]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid.	Color	Hazy grey to black	Odor	Characteristic, sweet and pleasant, aromatic hydrocarbon Its odor threshold is 2-5 ppm in air.
Specific Gravity	0.89-0.99 (Water = 1)	pH	Not applicable	Vapor Density	3.4 to 4.2 (Ar = 1)
Boiling Point/Range	80° to 285°C (176° to 545°F)			Melting/Freezing Point	-95° to 10°C (-139° to 50°F)
Vapor Pressure	23 to 43 mm Hg at 20°C (68°F)			Viscosity (cSt @ 40°C)	2 to 4
Solubility in Water	Significantly soluble in cold water (35 to 85%); miscible with most organic solvents.			Volatile Characteristics	Volatile Organic Compounds (VOCs) Content = 16 to 60%; AP 875 gm/L.
Additional Properties	C6-C9 Aromatic Hydrocarbon Content = 16 to 60 Wt % (ASTM D-1319); Alkane, Isoparaffin, and Cycloalkane Hydrocarbons Content = LT 1 Wt % (ASTM D-1319); Average Density at 60°F = 7.828 lbs./gal (ASTM D-2161); Dry Point Temperature = 545°F (285°C) (ASTM D-86)				

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from heat, sparks, and other ignition sources, strong oxidizing conditions, and freezing temperatures.		
Materials Incompatibility	Strong acids, especially nitric acid, alkalis, and oxidizers such as liquid chlorine, many fluorides, perchlorates, and other halogens, hydrogen peroxide, and oxygen		
Hazardous Decomposition Products	Sulfur oxides and possibly hydrogen sulfide; but, no degradation data is available. Toxic sulfur dioxide will be given off of sulfolane if it is heated above 220°C (428°F).		

Light Aromatics (BTX)
Plus Sulfolane

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Sulfolane (Tetrahydrothiophene-1,1-dioxide):

ORAL (LD50): Acute: 1,500 to 5,000 mg/kg or [Rat].
GAS (LC50): Acute: GT 12,000 mg/m³ for 4 hours [Rat screen level]
DERMAL (LD50): Acute: GT 2,000 mg/kg [Rabbit screen level].

Benzene:

ORAL (LD50): Acute: 930 mg/kg [Rat] - Tremors and convulsions.
ORAL (LD50): Acute: 4,700 mg/kg [Mouse].
ORAL (LD50): Acute: 5,700 mg/kg [Unidentified mammal]
GAS (LC50): Acute: 10,000 ppm for 7 hours [Rat]
GAS (LC50): Acute: 9,980 ppm for 8 hours [Mouse] - General anesthesia, muscle weakness, and dyspnea

DERMAL (LD50): Acute: 48 mg/kg [Mouse].
DERMAL (LD50): Acute: GT 9,400 uL/kg [Rabbit and Guinea Pig].
INTRAPERITONEAL (LD50) Acute: 340 mg/kg [Mouse]
INTRAPERITONEAL (LD50): Acute: 2,890 ug/kg [Rat] - Lung and liver damage plus decreased blood cells

Toluene:

ORAL (LD50): Acute: 636 mg/kg or [Rat]
ORAL (LD50): Acute: 4,000 mg/kg or [Cat]
GAS (LC50): Acute: 49,000 mg/m³ for 4 hours [Rat]
GAS (LC50): Acute: 5,320 ppm for 8 hours [Mouse].
GAS (LC50): Acute: 400 ppm for 24 hours [Mouse].
DERMAL (LD50): Acute: 14,100 uL/kg or 12,125 mg/kg [Rabbit]
INTRAVENOUS (LD50). Acute: 1,960 mg/kg [Rat].
INTRAVENOUS (LD50) Acute: 2,000 mg/kg [Mouse].
SUBCUTANEOUS (LD50): Acute: 2,250 mg/kg [Mouse].
INTRAPERITONEAL (LD50): Acute: 59 mg/kg [Mouse]
INTRAPERITONEAL (LD50): Acute: 500 mg/kg [Guinea Pig].
INTRAPERITONEAL (LD50): Acute: 1,332 mg/kg [Rat].

Xylenes:

ORAL (LD50): Acute: 4,300 mg/kg [Rat].
GAS (LC50): Acute: 4,550 ppm for 4 hours [Rat]
DERMAL (LD50): Acute: 14,100 uL/kg [Rabbit].
SUBCUTANEOUS (LD50): Acute: 1,700 mg/kg [Rat]
INTRAPERITONEAL (LD50): Acute: 2,459 mg/kg [Rat]
INTRAPERITONEAL (LD50): Acute: 1,548 mg/kg [Mouse].

Ethylbenzene:

ORAL (LD50): Acute: 3,500 mg/kg [Rat]
DERMAL (LD50): Acute: 17,800 uL/kg [Rabbit].
INTRAPERITONEAL (LD50): Acute: 2,624 mg/kg [Rat].

n-Propylbenzene:

ORAL (LD50): Acute: 6,040 mg/kg [Rat].
GAS (LC50): Acute: 65,000 ppm for 2 hours [Rat]

Results from repeated inhalation exposure (8 hours/day for up to 27 days) to an aerosolized sulfolane concentration of 495 mg/m³ showed pale-colored hearts and livers with fatty metamorphosis of the liver (monkeys), chronic liver inflammation (rats), chronic lung inflammation (monkeys, dogs, rats, and Guinea pigs), vomiting and convulsions (monkeys and dogs), decreased white blood cell counts (monkeys and rats), and deaths (monkeys). Acute inhalation overexposures and longer continuous exposures at various lower concentrations showed similar adverse effects, but without deaths. The "no observed effect level (NOEL)" for sulfolane was noted to be 20 mg/m³. Sulfolane showed no evidence of mutagenic activity using an assorted battery of testing protocols.

Benzene and toluene have IDLH (immediately dangerous to life or health) concentrations = 500 ppm. Its estimated lethal dose for a normal human adult is one teaspoon to one ounce (AP 10 mL). Inhalation of 20,000 ppm in air is lethal to adults in 5 to 10 minutes.

Light Aromatics (BTX) Plus Sulfolane

Benzene is a known animal carcinogen and a human leukemogen. In addition, NTP, IARC, EPA, OSHA, and ACGIH list benzene as a "Human Carcinogen." Repeated and prolonged overexposure to benzene vapors (GT 20 ppm in air) may cause toxicity to blood-forming tissues. Chronic exposure symptoms include decreased blood cell and platelet counts, leukopenia, aplastic anemia, or acute myelogenous leukemia (AML). Also, chronic inhalation of benzene vapors have been found to cause fatigue, nervousness, irritability, blurred vision, and labored breathing. Overexposure to benzene has been associated with chromosomal aberrations in human white blood cells, both laboratory animal and human bone marrow cell damage, and in vitro mammalian cells DNA damage. Elevated frequencies of chromosomal aberrations have been observed in peripheral white blood cells and bone marrow of workers exposed to high benzene concentrations known to be associated with signs of chronic poisoning. Ethanol consumption may have a synergistic effect and increase blood system changes caused by benzene exposures. Children and teenagers have a lower resistance to bone marrow poisons.

Studies with pregnant laboratory animals have demonstrated that **benzene** is NOT teratogenic, but is fetotoxic at exposure levels which result in mild maternal toxicity. There are also reports of human benzene exposure inducing vaginal bleeding, menstrual cycle disorders, and hemorrhagic complications during pregnancy. Benzene can be detected in maternal milk and it passes through the placental barrier. Limited evidence of developmental toxicity are suggested by decreased fetal body weight and increased skeletal variations in rodents. Also, alterations in the formation and development of blood cells in the bone marrow were observed in the fetus and offspring of pregnant mice.

Toluene (methylbenzene) has been a major solvent of intentional inhalation abuse. Deliberate long-term inhalation of high concentrations of toluene (glue sniffing, etc.) has been shown to cause liver, kidney, central nervous system, and permanent brain damage. Effects such as impaired speech, visual disturbances, and hearing loss, loss of balance and/or muscle control, and memory loss have been reported. Exposures of 100 to 200 ppm in air for 24 hours cause hallucinations, distorted perceptions, and changes in motor activity. Studies have indicated that children of women who sniffed massive exposures of toluene during pregnancy are at significant risk for pre-term delivery, perinatal death, growth retardation, and other adverse developmental effects. Isolated case reports have suggested a spectrum of congenital defects similar to those seen in fetal alcohol (ethanol) syndrome. These children's defects included microcephaly (small head size), central nervous system (CNS) deficiencies, facial abnormalities, and reduced growth rate.

Animal studies suggest that **toluene** causes kidney, liver, and/or lung dysfunction and cardiac (heart muscle) sensitization to epinephrine or other adrenalin-like agents. This sensitization may cause fatal changes in heart beat rhythms. Also, this latter effect was shown to be enhanced by hypoxia (oxygen deficiency).

Long-term rodent inhalation studies with **toluene** produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness, and impaired reaction time. Also, rats exposed to 1,200 ppm and 1,400 ppm of toluene in air for 14 hours per day for 5 or 4 weeks (respectively) exhibited high-frequency hearing loss. Several animal studies using pregnant rodents have shown that toluene exposures may cause embryo and/or fetotoxicity. Adverse effects included decreased fetal body weight and increased skeletal variations. In chronic feeding and inhalation studies, toluene has not been shown to be carcinogenic, nor is it mutagenic in the Salmonella/microsome (Ames) assay, the in-vivo rat bone marrow cell chromosome aberrations assay, the in-vitro mouse lymphoma assay, 8-week dominant lethal assay, and the in-vitro human adult male lymphocyte sister chromatid exchanges assay. The significance of these animal study results to humans is not known.

An inhalation study with laboratory animals indicated an association of **xylene** with hearing loss in rats. Several animal studies using pregnant rodents have shown that mixed **xylene isomers (dimethylbenzenes)** may all cause embryo and/or fetotoxicity. Inhalation and feeding studies involving pregnant laboratory animals have produced limited evidence of fetal toxicity including increased incidence of spontaneous abortions, decreased fetal weight, delayed bone development, non-lethal abnormalities such as musculoskeletal and craniofacial variations, and reduced litter sizes.

Chronic overexposure to **xylene** may produce irreversible damage to the central nervous system, including ototoxicity, that can be increased by the consumption of ethanol (alcoholic drinks). Drinking beverages which contain ethanol in conjunction with xylene exposure increases the alcoholic effects and impairs the clearance of xylenes from the body. Xylene isomers accumulate in the adipose (fat) tissues, from which they are slowly released. Complete clearance may take several days following exposure.

Two-year rat and mouse gavage studies by the National Toxicology Program (NTP) on mixed **xylene isomers including 17% ethylbenzene** showed "no evidence of carcinogenicity." Also, a two-year mixed xylenes skin-painting study on shaved rats and mice showed no incidence of non-neoplastic or neoplastic lesions. And, none of the components were mutagenic when tested in either the modified Ames, Chinese hamster ovary cell with and without metabolic activation, or sister-chromatid mutagenicity assays.

**Light Aromatics (BTX)
Plus Sulfolane**

The National Toxicology Program (NTP) recently completed a 2-year inhalation bioassay on ethylbenzene in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200, and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels. However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level; and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Hyperplasia was also observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear. NTP, IARC, and OSHA have not designated ethylbenzene as a carcinogen.

SECTION 12: ECOLOGICAL INFORMATION**Ecotoxicity**

Ecological effects testing has not been conducted on this material. If spilled, the aromatic naphtha components of this mixture, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. All of its aromatic hydrocarbon components (benzene, toluene, xylene isomers, and ethylbenzene) are volatile and might contribute to the creation of atmospheric smog. Toluene has a half-life of from 3 hours to slightly over 1 day when photochemically active hydroxyl radicals are present; and it is very effectively washed out of the atmosphere by rain. Benzene has a half-life of from 4 to 6 hours when photochemically active hydroxyl radicals are present, especially when atmospheres are polluted with nitrogen oxides or sulfur dioxide. Benzene and toluene are very effectively washed out of the atmosphere by rain.

Sulfolane dissolves rapidly in water and is practically non-toxic to freshwater fish and aquatic algae. It is only slightly toxic to aquatic invertebrates. Unacclimated bacterial activated sludge systems can accept a shock loading of 200 mg/L of sulfolane and it is ultimately biodegradable. It does not bioaccumulate.

Using Rainbow Trout (*Oncorhynchus mykiss*) and Dungeness Crab (*Cancer magister*), all the components in the aromatic naphtha portion of this mixture (benzene, toluene, xylene isomers, and ethylbenzene) showed a 96-hour TLms (Median Toxic Limit) of from 5 ppm to 30 ppm in ambient saltwater. Also, 24-hour and 96-hour TLms produced results from 10 ppm to 60 ppm when using Bluegill Sunfish (*Lepomis macrochirus*), Goldfish (*Carassius auratus*), and Guppy (*Lebistes reticulatus*) in fresh water. Using Water Fleas (*Daphnia magna*), all these component substances showed 24-hour TLms of from 95 ppm to 400 ppm. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.

Environmental Fate

This aromatic naphtha mixture is potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a naphtha hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds. Additionally, potable water and boiler feed water systems should NEVER be allowed more than 5 ppm contamination from this material.

For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. If spilled material is introduced into a wastewater treatment system, chemical and biological oxygen demand (COD and BOD) will likely increase. This material is biodegradable if gradually exposed to microorganisms, preferably in an aerobic environment. In sewage-seeded wastewater, at or below concentrations of 0.2 vol.% of this naphtha, there is little or no effect on bio-oxidation and/or digestion. However, at 1 vol.%, it doubles the required digestion period. Higher concentrations interfere with floc formation and sludge settling and also plug filters or exchange beds. Vapor emissions from a bio-oxidation process contaminated by this material might prove to be a health hazard.

Light Aromatics (BTX) Plus Sulfolane

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT).		
Proper Shipping Name	Petroleum distillates, n.o.s. (Benzene, Toluene)		
Hazard Class	Class 3: Flammable liquid	Packing Group(s)	PG II
		UN/NA ID	UN1268
Reportable Quantity	The Reportable Quantity (RQ) substance components in this product which require DOT HAZMAT bill-of-lading display are Benzene and Toluene		
Placards		Emergency Response Guide No.	130 or 128
		HAZMAT STCC No.	49 102 56
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1989 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire Hazard, Acute (Immediate) Health Hazard, and Chronic (Delayed) Health Hazard.
SARA 313	This product contains the following components in concentrations at or above de minimis levels and are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313: Benzene [CAS No. 71-43-2] concentration: 10 to 25% Toluene [CAS No. 108-88-3] concentration: 5 to 20% Xylenes [CAS No. 1330-20-7] concentration: 1 to 10% Ethylbenzene [CAS No. 100-41-4] concentration: 0 to 3%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product subject to this statute are: Benzene [CAS No. 71-43-2] (RQ = 10 lbs. [4.54 kg]) concentration: 10 to 25% Toluene [CAS No. 108-88-3] (RQ = 1000 lbs. [453.6 kg]) concentration: 5 to 20% Xylenes [CAS No. 1330-20-7] (RQ = 100 lbs. [45.36 kg]) concentration: 1 to 10% Ethylbenzene [CAS No. 100-41-4] (RQ = 1000 lbs. [453.6 kg]) concentration: 0 to 3%.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

**California
Proposition 65**

This material might contain the following chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm; and therefore, it is subject to requirements of California Health & Safety Code Section 25249.5: Benzene [CAS No. 71-43-2] and Toluene [CAS No. 108-88-3].

**New Jersey
Right-to-Know Label**

For New Jersey labeling refer to components listed in Section 2.

**Additional Regulatory
Remarks**

Under the Federal Hazardous Substances Act, related statutes, and Consumer Product Safety Commission regulations, as defined by 16 CFR 1500.14(b)(3) and 1500.83(a)(13). This product contains "Petroleum Distillates" which may require special labeling if distributed in a manner intended or packaged in a form suitable for use in the household or by children. Precautionary label dialogue should display the following **Contains Petroleum Distillates! May be harmful or fatal if swallowed! Keep Out of Reach of Children!**

Under Section 12(b) of the Toxic Substances Control Act: Because it contains **Tetrahydrothiophene-1,1-dioxide (Sulfolane) [CAS No. 126-33-0]** and detectable amounts of **n-Propylbenzene [CAS No. 103-65-1]** and other C9 Aromatic Hydrocarbons, this material might be subject to US EPA's one-time only per country export notification requirements

In regulations promulgated pursuant to the Clean Air Act - Section 111 "Standards of Performance for New Stationary Sources" (40 CFR 60.489), the EPA classifies the following minor components of this material as "Volatile Organic Compounds (VOCs)" which contribute significantly to air pollution which endangers public health and welfare": Benzene [CAS No. 71-43-2], Toluene [CAS No. 108-88-3], mixed Xylenes [CAS No. 1330-20-7], and Ethylbenzene [CAS No. 100-41-4].

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0968
Revision Date 10/03/2001

IMPORTANT. Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product

Emergency Overview

Physical State	Liquid		
Color	Yellow to brown or black	Odor	Faint to strong, unpleasant, and possibly distinctive of rotten eggs or ammoniacal
	Heating of MDEA solutions above 140°F will darken the liquid mixture		

WARNING!

Contains low levels of Hydrogen Sulfide (H₂S) and Ammonia (NH₃)! Extremely flammable and toxic vapor may be released if this mixture is subjected to high heat, steam, or hot surfaces, contact with acids, or severe agitation.

Vapor may cause flash fire or explosion.

May react violently with acids, acidic solutions, or halogenated materials.

Reactions may generate extremely flammable H₂ and H₂S gas release.

May be harmful or fatal if inhaled or ingested.

High concentrations of vapor reduce oxygen available for breathing and may cause nervous system depression or paralysis and suffocation.

If swallowed, may cause severe irritation to the mouth, throat, esophagus, and stomach. Overexposures may cause target organ effects such as liver, kidney, and/or blood damage.

Eye damage or skin and/or respiratory tract irritation may result from vapor or liquid contact.

Might be corrosive to some metallic substances.

Spills may create a slipping hazard.

SECTION 1: IDENTIFICATION

Trade Name	Lean MDEA	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	0096800968	Medical Emergency	(918) 495-4700
CAS Number	Mixture---See Section 2.	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Alkaline process water		
Synonyms	Lean Amine, Lean Methyl Diethanolamine Solution, Steam-stripped MDEA Solution, Aqueous Solution Containing 2,2'-(Methylimino)-Bisethanol Plus Low Levels of Hydrogen Sulfide and Ammonia, Alkanolamine Extraction Solution, Extractant Solution Containing Low Levels of H ₂ S and NH ₃ , Sour Contactor Influent, Effluent from the Amine Steam Stripper and Tail Gas Stripper Towers		

Lean MDEA - 101

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Water	7732-18-5	60-80
2) Methyl diethanolamine (MDEA) / UCAFSOL-101	105-59-9	20-40
3) Hydrogen sulfide	7783-06-4	0-0.05
4) Ammonia	7664-41-7	0-0.005

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact Eye contact Inhalation Skin Absorption Ingestion

Signs and Symptoms of Acute Exposure

Inhalation	<p>Inhalation is not considered a normal route of exposure for this aqueous solution. However, breathing high concentrations of mist or liquid droplets may cause respiratory tract and mucous membrane irritation, and possibly, pulmonary edema and chemical pneumonia.</p> <p>Generated vapor may be harmful or fatal if inhaled! Inhalation of the released vapor may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Ammonia (NH₃) vapors may cause severe lung effects which might be delayed in onset. Symptoms are characterized by coughing, choking, or shortness of breath. NIOSH has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health. At concentrations above 500 ppm, H₂S cause unconsciousness and respiratory paralysis leading to coma and/or death. Also, NIOSH has determined that atmospheres containing 300 ppm or more of NH₃ are immediately dangerous to life and health. (See Section 11.)</p>
Eye Contact	<p>Direct liquid contact may cause eye irritation upon short-term exposure and can produce severe, and possibly permanent, tissue damage if not promptly removed. The severity of the effects depend on the concentration of the diethanolamine and ammonia components and how soon after exposure the eyes are washed.</p> <p>Generated vapor may cause severe eye irritation and photophobia (light sensitivity) upon short-term exposure. Severity depends upon the concentrations of hydrogen sulfide and ammonia and duration of exposure.</p>
Skin Contact	<p>May be mildly to moderately irritating to the skin. Irritation may follow an initial delay between the time that the exposure occurs and the sense of irritation begins. This latency period can vary as much as several hours for a dilute solution (0.04 wt % ammonia) to minutes with more concentrated solutions. Prolonged or repeated contact, even to dilute concentrations of ammonia solutions, may cause some degree of permanent tissue destruction. Methyl diethanolamine and hydrogen sulfide can be absorbed through the skin to produce toxic effects. If the skin is damaged, absorption increases.</p>
Ingestion	<p>Ingestion is unlikely. However, if swallowed, this material may cause gastrointestinal tract irritation, nausea, and vomiting, in addition to a burning sensation in the mouth, throat, and digestive tract. Depending upon the methyl diethanolamine and ammonia concentrations, ulceration of the gastrointestinal tract may also occur.</p>
Chronic Health Effects Summary	<p>Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H₂S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures.</p> <p>Chronic dyspnea, obstructive lung disease, and bronchial hyper-reactivity were adverse effects experienced by several workers two years after their occupational overexposures to mists or aerosols of ammonia. Also, when ingested by rats, aqueous ammonia solutions have been shown to cause gastrointestinal tract tumors.</p> <p>If ingested or absorbed through intact skin, methyl diethanolamine can cause mucous membrane, kidney, liver, and/or blood damage based upon rodent studies. (See Section 11.)</p>

Lean MDEA - 161

Conditions Aggravated by Exposure	Personnel with pre-existing eye, skin, or gastrointestinal disorders, nervous system diseases, impaired liver or kidney function, or chronic respiratory diseases neurological disorders, high blood pressure, and those with a compromised ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this material's components. They should take additional precautions to minimize or avoid exposure
Target Organs	This material is potentially toxic to eyes, skin, mucous membranes, lungs, nervous systems, brain, liver, kidneys, and possibly the blood
Carcinogenic Potential	This material does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC, or NTP

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200)

OSHA Health Hazard Classification		OSHA Physical Hazard Classification							
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Do not attempt to remove contact lenses. Immediately irrigate eyes with copious amounts of cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Flush thoroughly with water under a cool or cold shower for at least 15 minutes while removing contaminated shoes and clothing. Gently and thoroughly wash contaminated skin with running water and non-abrasive soap. Be particularly careful to clean folds, creases, and groin area. Seek medical attention if tissue appears damaged or if irritation or pain persists. Thoroughly clean contaminated clothing before reuse.
Ingestion	Do not induce vomiting. If spontaneous vomiting is about to occur, place victim's head below knees. Do not attempt to neutralize. Have victim rinse mouth with water then drink two to three large glasses of milk or water. Never give anything by mouth to a person who is not fully conscious. Keep airway clear. Seek medical attention immediately.

Notes to Physician
If after exposed skin has been washed gently with running water and non-abrasive soap, one may neutralize severely irritated tissue with a **dilute solution of boric acid or acetic acid**. Prolonged irrigation may be required in severe cases, occasionally from 12 up to 24 hours. pH testing of the skin at least 15 minutes after stopping irrigation allows alkali time to diffuse to the skin surface and helps guide the need for further irrigation. Continue irrigation until skin pH is neutral.

Exposure to **methyl diethanolamine** vapor may cause minor transient edema of the corneal epithelium. This condition, referred to as "glaucompsia, blue haze, or blue-gray haze", produces a blurring of vision against a general bluish background and the appearance of halos around bright objects. This effect disappears spontaneously within a few hours of the end of exposure and leaves no after-effects. Although not detrimental to the eye per se, glaucompsia predisposes an affected individual to physical accidents and reduces the ability to undertake skilled tasks, such as driving a motorized vehicle.

Inhalation overexposure can produce other toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

Nitrite as an antidote for acute **hydrogen sulfide** intoxication may only be effective within the first few

Lean MDEA - 101

minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	This mixture is non-flammable under normal conditions of use, however, if improperly handled, generated H ₂ S or H ₂ vapors are Extremely Flammable and Explosive!		
Flash Point Method	Not applicable or AP -73°C (-100°F) for H₂S and AP 126°C (259°F) for undiluted methyl diethanolamine [ASTM D-56]		
Lower Flammable Limit	Not applicable or AP 4.0% for H ₂ S.	Upper Flammable Limit	Not applicable or 45% for H ₂ S
Autoignition Temperature	Not applicable or AP 260°C (500°F) for H₂S and AP 650°C (1200°F) for undiluted methyl diethanolamine .		
Hazardous Combustion Products	Contact with some metals can generate extremely flammable hydrogen (H₂) gas. This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!		
Special Properties	High heat, hot surface contact, or mixing with acids may spring steam, extremely flammable H ₂ S, and/or toxic NH ₃ vapors out of this solution. H ₂ S is heavier than air and may travel long distances along the ground to an ignition source and flash back. It may also create a vapor/air explosion hazard in confined spaces such as in sewers. Adding this mixture directly to unbuffered water may cause a slightly exothermic reaction.		
Extinguishing Media	Non-combustible, if handled and stored properly. Use extinguishing media suitable for the surrounding fire. In an advanced or massive fire, evacuate area and fight fire from a safe distance or a protected location. Approach fire from upwind. Use unmanned monitors and hoseholders to keep cooling streams of water on fire-exposed cylinders or tanks until well after the fire is out. If possible, isolate materials not yet involved in the fire and protect personnel. Move containers away from fire area if it can be done without risk.		
Protection of Fire Fighters	This material is not expected to burn. However, in the event that gases are being generated or surrounding materials are involved in a fire, firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Avoid contact with damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to containers. All clean-up materials should be removed for proper treatment or disposal. For large spills, dike far ahead of spill to maximize later product recovery or disposal. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and proper protective clothing during cleanup operations. This material may react strongly with acids. Never flush to the sewer. In urban areas, cleanup spill as soon as possible, in natural environments, cleanup on advice from specialists to minimize physical habitat damage. If appropriate, neutralize with a dilute solution of **boric acid or acetic acid**. A vacuum truck may be used to collect the bulk. Spills on other than pavement may be handled by removing the affected soil and placing it into approved containers for later disposal. Comply with all laws and regulations.

Lean MDEA - 101

SECTION 7: HANDLING AND STORAGE**Handling**

Do not breathe mist or vapor. Do not get in eyes, on skin, or on clothing. Wear suitable personal protective equipment to prevent eye and skin contact. Wash thoroughly after handling.

Danger! Corrosive or Irritating Liquid and/or Poisonous and Flammable Gas! Do NOT breathe mist or vapor, it may contain **hydrogen sulfide (H₂S)**, and/or **ammonia (NH₃)**. Odor is not an adequate warning of potentially hazardous air concentrations. Use only with adequate ventilation and personal protective equipment. Do not allow material to contact eyes, skin or other tissues, and clothing. Wear corrosion-resistant protective work clothing and chemical splash goggles and face shield when contact is anticipated. Releases of this material can cause atmospheres to become oxygen deficient and/or create an immediate fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for H₂S concentrations and flammability.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Drain and purge equipment as necessary to remove material residues. However, empty containers may still contain flammable, corrosive, and/or poisonous residue.

Storage

Store in containers appropriate for **dilute diethanolamine and ammonia solutions** and away from acids. Diluted material may accelerate corrosion of metal containers.

Store and transport in accordance with all applicable laws. Do not store this material in unlabeled containers. Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. If possible, store containers in a separate safety cabinet or room. The H₂S component of this material is corrosive to most metals. It can cause steel pipe to become blistered, pitted, and brittle. Metal components used for storage should be resistant to sulfide stress cracking. (See appropriate API and NACE standards.)

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION**Engineering Controls**

No special ventilation is required under normal conditions of use. Where engineering controls are feasible, use adequate local exhaust ventilation wherever mist, spray, or vapor may be generated. Where **hydrogen sulfide and/or ammonia** may be generated, special ventilation will be required. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

**Eye Protection**

Safety glasses with side shields are recommended as a minimum protection. When there is a likelihood of misting, splashing, or spraying, chemical-resistant goggles and full-face shield should be worn. Thermal protection should be provided if the solution has a temperature above 120 degrees F. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact. Use of chemical-resistant gloves (e.g., PVC, neoprene, or nitrile) is required. Thermal protection should be used whenever the solution has a temperature above 120 degrees F. Wash hands and other exposed skin with mild soap and water before eating, drinking, smoking, or using the toilet facilities.

Lean MDEA - 101

Body Protection	Avoid all skin contact. If splashing or spraying is expected, chemical-resistant protective clothing (e.g., vinyl, Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. Thermal protection should be provided when the solution has a temperature above 120 degrees F. If general contact occurs, IMMEDIATELY remove soaked clothing and shower thoroughly. Contaminated leather goods should be removed immediately and discarded.
Respiratory Protection	Misting or vapor generation is not expected under normal conditions of use, so respiratory protection is not anticipated under normal use conditions and with adequate ventilation. However, when anticipated or if generated hydrogen sulfide or ammonia are present at concentrations above applicable workplace exposure levels, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g., ANSI Z88.2).
General Comments	Releases of loosely bound hydrogen sulfide and/or ammonia may create flammable, explosive, toxic, and/or oxygen-deficient atmospheres (LT 19.5 Vol % in air). DO NOT ENTER such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions. Air purifying respirators offer no protection against oxygen deficiency and hydrogen sulfide. Use good personal hygiene practices. Wash hands and other exposed skin areas with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities, or leaving work. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners. Use of personal protective equipment and good personal hygiene are essential to controlling exposures to this aqueous solution.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA 10 STEL 15 (ppm) from ACGIH (TLV) TWA 5 (ppm) from ACGIH (TLV) [Proposed]
2) Ammonia	TWA 10 STEL 15 CEIL 20 (ppm) from OSHA (PEL) TWA 25 STEL 35 (ppm) from ACGIH (TLV) STEL 35 (ppm) from OSHA (PEL) TWA 50 STEL 35 (ppm) from OSHA (PEL)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid	Color	Yellow to brown or black. Heating of MDEA solutions above 140°F will darken the liquid mixture.	Odor	Faint to strong, unpleasant, and possibly distinctive of rotten eggs or ammoniacal.
Specific Gravity	1.02 to 1.05 (Water = 1)	pH	11.0 to 11.5 [Moderately Basic]	Vapor Density	0.59 to 3.21 (Air = 1)
Boiling Point/Range	-79° to 148°C (-110° to 299°F) at 14.7 psia	Melting/Freezing Point			-129° to 0°C (-200° to 32°F) at 14.7 psia
Vapor Pressure	LT 0.1 mm of Hg at 68°F (20°C) for the aqueous solution; 212 to 394 psia at 100°F (38°C) based upon released H ₂ S and NH ₃ .	Viscosity (cSt @ 40°C)			1-2
Solubility in Water	Completely soluble in cold water, but may cause an exothermic reaction.	Volatile Characteristics			Negligible volatility in proper storage.
Additional Properties	A 1% solution of ammonia has a greater than 9.0 pH and methyl diethanolamine has an 11.0 to 11.5 pH. Ammonia has a vapor density lighter than air and will disperse rapidly, however, hydrogen sulfide has a vapor density heavier than air and will tend to accumulate in low places or travel along the ground creating a flashback fire hazard.				

Lean MDEA - 101

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur
Conditions to Avoid	Keep away from strong acids, heat and hot surfaces, steam, strong oxidizing conditions, and severe agitation Avoid direct contact with organic halogen compounds		
Materials Incompatibility	Strong acids and other oxidizing agents, halogenated compounds, and some heavy metals Ammonia solutions are corrosive to chromium and silver and alloys containing these metals and will react violently with their powdered forms Methyl diethanolamine solutions are corrosive to copper, aluminum, and zinc and alloys containing these metals including galvanized iron and will react with nitrite compounds to form carcinogenic nitrosamine compounds		
Hazardous Decomposition Products	Contact with some metals can generate extremely flammable hydrogen (H ₂) gas Free aromatic amines may be released in a reducing environment		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data**Hydrogen sulfide:**

GAS (TCLo). Acute	10 ppm for 15 minutes [Human] - Eye irritation
GAS (TCLo) Acute	50 to 100 ppm for 15 minutes [Human] - Respiratory irritation
GAS (LC ₁₀₀) Acute	600 to 750 ppm for 30 minutes [Human] - Respiratory paralysis and death.
GAS (LCLo) Acute	5,700 ug/kg for 8 hours [Human] - Chronic pulmonary edema, coma, and death

Ammonia:

ORAL (LDLo) Acute	132 mg/kg [Human]
ORAL (TDLo) Acute	15 uL/kg [Human] - Structural changes in the esophagus
GAS (TCLo) Acute	20 ppm for 1hour [Human] - Eye irritation, ulcerated nasal septum, and structural changes in the trachea or bronchi
GAS (LCLo) Acute	5,000 ppm for 5 minutes [Human]
GAS (LCLo) Acute	5,000 ppm for 5 minutes [Guinea Pig]
GAS (LC ₅₀) Acute	2,000 ppm for 4 hours [Rat]
GAS (LC ₅₀) Acute	7,000 mg/m ³ for 1 hour [Cat and Rabbit] - Excitement and flaccid paralysis without anesthesia
GAS (LC ₅₀) Acute	4,230 ppm for 1 hour [Mouse] - Ataxia, tremors, and convulsions

Methyl diethanolamine (MDEA or 2,2'-Methyliminodiethanol):

ORAL (LD ₅₀) Acute	1,945 mg/kg [Rat] - Hypermotility, diarrhea, ataxia, and chromodacryorrhea
ORAL (LD ₅₀) Acute	5,990 uL/kg [Rabbit]
INTRAPERITONEAL (LD ₅₀). Acute	500 mg/kg [Mouse].

Aqueous methyl diethanolamine (MDEA) solutions are alkaline and may be absorbed through the intact skin At low concentrations, it is a mild to moderate irritant to the eyes, skin, mucous membranes, and respiratory and digestive tracts MDEA was shown not to be genotoxic in various mutagenicity and clastogenicity assays **If reacted with nitrites, MDEA can form nitrosamine compounds**, which are "suspected human carcinogens".

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air At low concentrations (LT 20 ppm), H₂S has an odor of rotten eggs At higher concentrations (GT 50 ppm), H₂S odor is not apparent NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis At concentrations between 600 and 750 ppm, death occurs within 15 minutes The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects

Ammonia is a strong base and forms **ammonium hydroxide** upon contact with water This material is corrosive to many organic compounds If ingested, ammonia can cause severe pain, bloody diarrhea,

Lean MDEA - 101

cardiovascular collapse, and death. Concentrated ammonia is a strong corrosive which can cause burns of the following types: cryogenic from contact with refrigerated liquid, thermal from exothermic reaction with water, and chemical from its alkalinity. It gelatinizes the tissue, forming deep and painful lesions. At low concentrations, aqueous ammonia is a moderate to strong irritant to the eyes, skin, mucous membranes, and respiratory and digestive tracts. Its effects on the lungs can be severe and delayed in onset, respiratory support may be required following acute inhalation. However, there seems to be a wide variability in the human sensitivity to ammonia.

Chronic dyspnea, restrictive lung dysfunction, obstructive lung disease, and bronchial hyper-reactivity were adverse effects experienced by several employees two years after their occupational overexposures to mists and aerosols of ammonia. An **aqueous ammonia solution** caused gastrointestinal cicatricial tumors in rats following a 24-week feeding assay. NH_3 produced a positive mutagenic response in the Ames Assay and caused chromosomal aberrations during a 16-week cytogenic study using rats. However, in general, pH alterations produce false positive results in short-term genetic assays.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this material. Vapor releases from this material are expected to cause significant immediate impact but only localized non-persistent environmental damage. Due caution should be exercised to prevent an accidental release into the environment. This material and any contaminated soil or other water may be hazardous to human, animal, and aquatic life. Volatile components may contribute to smog formation.
Environmental Fate	This material is soluble in water and is expected to readily disperse in marine environments. Caustic solutions have produced slight to moderate toxicity in laboratory tests with aquatic organisms. It is expected to be moderately alkaline. If released to surface water, it may cause a pH rise depending upon the buffering capacity of the waterbody. Aquatic organisms become increasingly stressed as pH concentration exceeds 9.0, with many species being intolerant of pH of 10.0 or higher. Substances in this mixture do not bioaccumulate. For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

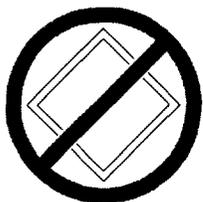

Conditions of use may cause this material to become a "corrosive" hazardous waste (D002), as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a hazardous waste at the time of disposal. Maximize component recovery prior for reuse or recycling. Potential treatment and disposal methods include steam stripping, bio-oxidation, incineration, and land disposal, if permitted. Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is not regulated by the U.S. Department of Transportation (DOT)		
Proper Shipping Name	Not regulated		
Hazard Class	Not a DOT controlled material	Packing Group(s)	Not applicable
		UN/NA ID	Not applicable
Reportable Quantity	A Reportable Quantity (RQ) substance components in this material which require DOT HAZMAT bill-of-lading display are Hydroxide sulfide and Ammonia .		

Lean MDEA - 101

Placards

Emergency Response Guide No.	Not applicable.
HAZMAT STCC No.	Not applicable
MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. This material might contain detectable concentrations of the following chemical substances subject to this statute: Hydrogen sulfide [CAS No. 7783-06-4] and Ammonia [CAS No. 7664-41-7]
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Acute (Immediate) and Chronic (Delayed) Health, and Reactivity Hazards
SARA 313	This material does not contain any components in concentrations which are at or above de minimis levels and are listed as "toxic chemicals" in 40 CFR Part 372 pursuant to the requirements of Section 313.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances which might be present in this material subject to this statute are: Hydroxide sulfide [CAS No. 7783-06-4] (RQ = 100 lbs. [45.4 kg]) concentration: 0 to 0.05% Ammonia [CAS No. 7664-41-7] (RQ = 100 lbs. [45.4 kg]) concentration: 0 to 0.005%.
CWA	This material is NOT classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA).
California Proposition 65	This material does not contain any ingredients for which the State of California has found to cause cancer, birth defects, or other reproductive harm, and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2.
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. A chemical substance which might be present in this material that is subject to this statute is: Hydroxide sulfide [CAS No. 7783-06-4]

Lean MDEA ~ (0)

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Version Number 3 1
Revision Date 10/03/2001
Print Date Printed on 10/03/2001.

Houston, TX 77252-2451

MSDS No. RS0969
Revision Date 10/03/2001

IMPORTANT Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product

Emergency Overview

Physical State	Liquid		
Color	Yellow to brown or black	Odor	Faint to strong, unpleasant, and possibly distinctive of rotten eggs or ammoniacal
	Heating of MDEA solutions above 140°F will darken the liquid mixture		

DANGER!

Contains Hydrogen Sulfide (H₂S) and Ammonia (NH₃)!
Extremely flammable and toxic vapor may be released if this mixture is subjected to high heat, steam, or hot surfaces, contact with acids, or severe agitation.

Vapor may cause flash fire or explosion.

May react violently with acids, acidic solutions, or halogenated materials.

Reactions may generate extremely flammable H₂ and H₂S gas release.

May be harmful or fatal if inhaled or ingested.

High concentrations of vapor reduce oxygen available for breathing and may cause nervous system depression or paralysis and suffocation.

If swallowed, may cause severe irritation or chemical burns to the mouth, throat, esophagus, and stomach. Overexposures may cause target organ effects such as liver, kidney, and/or blood damage.

Eye damage or skin and/or respiratory tract irritation may result from vapor or liquid contact.

May be corrosive to some metallic substances.

Spills may create a slipping hazard.

SECTION 1: IDENTIFICATION

Trade Name	Rich MDEA	Technical Contact	(800) 525-4692 or (713) 321-4269 (M-F)
Product Number	0096900969	Medical Emergency	(918) 495-4700
CAS Number	Mixture---See Section 2	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Alkaline process water		
Synonyms	Rich Amine, Rich Methyl Diethanolamine Solution, Saturated MDEA Solution, Aqueous Solution Containing 2,2'-(Methylimino)-Bisethanol, Hydrogen Sulfide, and Ammonia, Saturated Alkanolamine Extraction Solution, Extractant Solution Containing H ₂ S and NH ₃ , Sour Contactor Effluent, Feed to the Amine Steam Stripper and Tail Gas Stripper Towers		

Rich MDEA - 101

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Water	7732-18-5	49-79
2) Methyl diethanolamine (MDEA) / UCARSOL - 101	105-59-9	20-50
3) Hydrogen sulfide	7783-06-4	0.5-15
4) Ammonia	7664-41-7	0.5-5

SECTION 3: HAZARDS IDENTIFICATION

Also see *Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.*

Major Route(s) of Entry Skin Contact Eye contact Inhalation Skin Absorption Ingestion

Signs and Symptoms of Acute Exposure

Inhalation	<p>Inhalation is not considered a normal route of exposure for this aqueous solution. However, breathing high concentrations of mist or liquid droplets may cause respiratory tract irritation, mucous membrane tissue burns, and possibly, pulmonary edema and chemical pneumonia</p> <p>Generated vapor may be harmful or fatal if inhaled! Inhalation of the released vapor may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure Ammonia (NH₃) vapors may cause severe lung effects which might be delayed in onset. Symptoms are characterized by coughing, choking, or shortness of breath. NIOSH has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health. At concentrations above 500 ppm, H₂S cause unconsciousness and respiratory paralysis leading to coma and/or death. Also, NIOSH has determined that atmospheres containing 300 ppm or more of NH₃ are immediately dangerous to life and health. (See Section 11)</p>
Eye Contact	<p>Direct liquid contact may cause eye irritation upon short-term exposure and can produce severe, and possibly permanent, tissue damage if not promptly removed. The severity of the effects depend on the concentration of the diethanolamine and ammonia components and how soon after exposure the eyes are washed</p> <p>Generated vapor may cause severe eye irritation and photophobia (light sensitivity) upon short-term exposure. Severity depends upon the concentrations of hydrogen sulfide and ammonia and duration of exposure</p>
Skin Contact	<p>May be moderately irritating or corrosive to the skin. Irritation may follow an initial delay between the time that the exposure occurs and the sense of irritation begins. This latency period can vary as much as several hours for a dilute solution (0.04 wt % ammonia) to minutes with more concentrated solutions. Prolonged or repeated contact, even to dilute concentrations of ammonia solutions, may cause some degree of permanent tissue destruction. Methyl diethanolamine and hydrogen sulfide can be absorbed through the skin to produce toxic effects. If the skin is damaged, absorption increases</p>
Ingestion	<p>Ingestion is unlikely. However, if swallowed, this material may cause gastrointestinal tract irritation, nausea, and vomiting, in addition to a burning sensation in the mouth, throat, and digestive tract. Depending upon the methyl diethanolamine and ammonia concentrations, ulceration of the gastrointestinal tract may also occur</p>
Chronic Health Effects Summary	<p>Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H₂S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures</p> <p>Chronic dyspnea, obstructive lung disease, and bronchial hyper-reactivity were adverse effects experienced by several workers two years after their occupational overexposures to mists or aerosols of ammonia. Also, when ingested by rats, aqueous ammonia solutions have been shown to cause gastrointestinal tract tumors</p> <p>If ingested or absorbed through intact skin, methyl diethanolamine can cause mucous membrane, kidney, liver, and/or blood damage based upon rodent studies. (See Section 11)</p>

Rich MDEA - (01)

Conditions Aggravated by Exposure Personnel with pre-existing eye, skin, or gastrointestinal disorders, nervous system diseases, impaired liver or kidney function, or chronic respiratory diseases neurological disorders, high blood pressure, and those with a compromised ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of this material's components. They should take additional precautions to minimize or avoid exposure.

Target Organs This material is potentially toxic to eyes, skin, mucous membranes, lungs, nervous systems, brain, liver, kidneys, and possibly the blood, heart, and/or the reproductive systems.

Carcinogenic Potential This material does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC, or NTP.

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input checked="" type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input checked="" type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input checked="" type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

- Inhalation** Move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
- Eye Contact** Do not attempt to remove contact lenses. Immediately irrigate eyes with copious amounts of cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
- Skin Contact** Flush thoroughly with water under a cool or cold shower for at least 15 minutes while removing contaminated shoes and clothing. Gently and thoroughly wash contaminated skin with running water and non-abrasive soap. Be particularly careful to clean folds, crevices, creases, and groin area. Seek medical attention if tissue appears damaged or if irritation or pain persists. Thoroughly clean contaminated clothing before reuse.
- Ingestion** Do not induce vomiting. If spontaneous vomiting is about to occur, place victim's head below knees. Do not attempt to neutralize. Have victim rinse mouth with water then drink two to three large glasses of milk or water. Never give anything by mouth to a person who is not fully conscious. Keep airway clear. Seek medical attention immediately.
- Notes to Physician** If after exposed skin has been washed gently with running water and non-abrasive soap, one may neutralize severely irritated or burned tissue with a dilute solution of boric acid or acetic acid. Prolonged irrigation may be required in severe cases, occasionally from 12 up to 24 hours. pH testing of the skin at least 15 minutes after stopping irrigation allows alkali time to diffuse to the skin surface and helps guide the need for further irrigation. Continue irrigation until skin pH is neutral.
- Exposure to **methyl diethanolamine** vapor may cause minor transient edema of the corneal epithelium. This condition, referred to as "glaucompsia, blue haze, or blue-gray haze", produces a blurring of vision against a general bluish background and the appearance of halos around bright objects. This effect disappears spontaneously within a few hours of the end of exposure and leaves no after-effects. Although not detrimental to the eye per se, glaucompsia predisposes an affected individual to physical accidents and reduces the ability to undertake skilled tasks, such as driving a motorized vehicle.
- Inhalation overexposure can produce other toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.
- Nitrite as an antidote for acute **hydrogen sulfide** intoxication may only be effective within the first few

Rich MDEA - 101

minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	This mixture is non-flammable under normal conditions of use, however, if improperly handled, generated H ₂ S or H ₂ vapors are Extremely Flammable and Explosive!
Flash Point Method	Not applicable or AP -73°C (-100°F) for H ₂ S and AP 126°C (259°F) for undiluted methyl diethanolamine [ASTM D-56]
Lower Flammable Limit	Not applicable or AP 4.0% for H ₂ S.
Upper Flammable Limit	Not applicable or 45% for H ₂ S
Autoignition Temperature	Not applicable or AP 260°C (500°F) for H ₂ S and AP 650°C (1200°F) for undiluted methyl diethanolamine .
Hazardous Combustion Products	Contact with some metals can generate extremely flammable hydrogen (H₂) gas. This gas is extremely flammable at well below ambient temperatures and immediately forms explosive mixtures with air. If released, immediately evacuate personnel to a safe upwind area. It is lighter than air and rises rapidly collecting in the upper portions of confined spaces. Exposed to an ignition source, it can ignite with explosive force. Keep away from all ignition sources!
Special Properties	High heat, hot surface contact, or mixing with acids may spring steam, extremely flammable H ₂ S, and/or toxic NH ₃ vapors out of this solution. H ₂ S is heavier than air and may travel long distances along the ground to an ignition source and flash back. It may also create a vapor/air explosion hazard in confined spaces such as in sewers. Adding this mixture directly to unbuffered water may cause a slightly exothermic reaction.
Extinguishing Media	Non-combustible, if handled and stored properly. Use extinguishing media suitable for the surrounding fire. In an advanced or massive fire, evacuate area and fight fire from a safe distance or a protected location. Approach fire from upwind. Use unmanned monitors and hoseholders to keep cooling streams of water on fire-exposed cylinders or tanks until well after the fire is out. If possible, isolate materials not yet involved in the fire and protect personnel. Move containers away from fire area if it can be done without risk.
Protection of Fire Fighters	This material is not expected to burn. However, in the event that gases are being generated or surrounding materials are involved in a fire, firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Avoid contact with damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to containers. All clean-up materials should be removed for proper treatment or disposal. For large spills, dike far ahead of spill to maximize later product recovery or disposal. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and proper protective clothing during cleanup operations. This material may react strongly with acids. Never flush to the sewer. In urban areas, cleanup spill as soon as possible, in natural environments, cleanup on advice from specialists to minimize physical habitat damage. If appropriate, neutralize with a dilute solution of **boric acid or acetic acid**. A vacuum truck may be used to collect the bulk. Spills on other than pavement may be handled by removing the affected soil and placing it into approved containers for later disposal. Comply with all laws and regulations.

Rich MDEA - 101

SECTION 7: HANDLING AND STORAGE**Handling**

Do not breathe mist or vapor Do not get in eyes, on skin, or on clothing Wear suitable personal protective equipment to prevent eye and skin contact Wash thoroughly after handling

Danger! Corrosive or Irritating Liquid and/or Poisonous and Flammable Gas! Do NOT breathe mist or vapor, it may contain **hydrogen sulfide (H₂S), and/or ammonia (NH₃)** Odor is not an adequate warning of potentially hazardous air concentrations Use only with adequate ventilation and personal protective equipment Do not allow material to contact eyes, skin or other tissues, and clothing Wear corrosion-resistant protective work clothing and chemical splash goggles and face shield when contact is anticipated Releases of this material can cause atmospheres to become oxygen deficient and/or create an immediate fire or explosion hazard Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for H₂S concentrations and flammability

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area Eliminate heat and other ignition sources Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8 Drain and purge equipment as necessary to remove material residues However, empty containers may still contain flammable, corrosive, and/or poisonous residue

Storage

Store in containers appropriate for **dilute diethanolamine and ammonia solutions** and away from acids Diluted material may accelerate corrosion of metal containers

Store and transport in accordance with all applicable laws Do not store this material in unlabeled containers Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles If possible, store containers in a separate safety cabinet or room The H₂S component of this material is corrosive to most metals It can cause steel pipe to become blistered, pitted, and brittle Metal components used for storage should be resistant to sulfide stress cracking (See appropriate API and NACE standards)

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION**Engineering Controls**

No special ventilation is required under normal conditions of use Where engineering controls are feasible, use adequate local exhaust ventilation wherever mist, spray, or vapor may be generated Where **hydrogen sulfide and/or ammonia** may be generated, special ventilation will be required Ensure that an emergency eye wash station and safety shower are near the work-station location

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations The following pictograms represent the minimum requirements for personal protective equipment For certain operations, additional PPE may be required

**Eye Protection**

Safety glasses with side shields are recommended as a minimum protection When there is a likelihood of misting, splashing, or spraying, chemical-resistant goggles and full-face shield should be worn Thermal protection should be provided if the solution has a temperature above 120 degrees F Suitable eye wash water should be readily available

Hand Protection

Avoid skin contact Use of chemical-resistant gloves (e.g., PVC, neoprene, or nitrile) is required Thermal protection should be used whenever the solution has a temperature above 120 degrees F Wash hands and other exposed skin with mild soap and water before eating, drinking, smoking, or using the toilet facilities

Rich MDEA - 101

- Body Protection** Avoid all skin contact. If splashing or spraying is expected, chemical-resistant protective clothing (e.g., vinyl, Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. Thermal protection should be provided when the solution has a temperature above 120 degrees F. If general contact occurs, IMMEDIATELY remove soaked clothing and shower thoroughly. Contaminated leather goods should be removed immediately and discarded.
- Respiratory Protection** Mist or vapor generation is not expected under normal conditions and with adequate ventilation. However, when anticipated or if generated **hydrogen sulfide or ammonia** are present at concentrations above applicable workplace exposure levels, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g., ANSI Z88.2).
- General Comments** Releases of loosely bound **hydrogen sulfide and/or ammonia** may create flammable, explosive, toxic, and/or oxygen-deficient atmospheres (LT 19.5 Vol % in air). DO NOT ENTER such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions. Air-purifying respirators offer no protection against oxygen deficiency and hydrogen sulfide.
- Use good personal hygiene practices. Wash hands and other exposed skin areas with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities, or leaving work. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners. Use of personal protective equipment and good personal hygiene are essential to controlling exposures to this aqueous solution.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Hydrogen sulfide	TWA 10 STEL 15 (ppm) from ACGIH (TLV) TWA 5 (ppm) from ACGIH (TLV) [Proposed]
2) Ammonia	TWA 10 STEL 15 CEIL 20 (ppm) from OSHA (PEL) TWA 25 STEL 35 (ppm) from ACGIH (TLV) STEL 35 (ppm) from OSHA (PEL) [1989] TWA 50 STEL 35 (ppm) from OSHA (PEL)

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid	Color	Yellow to brown or black. Heating of MDEA solutions above 140°F will darken the liquid mixture.	Odor	Faint to strong, unpleasant, and possibly distinctive of rotten eggs or ammoniacal.
Specific Gravity	1.02 to 1.05 (Water = 1)	pH	11.0 to 11.5 [Moderately Basic]	Vapor Density	0.59 to 3.21 (Air = 1)
Boiling Point/Range	-79° to 148°C (-110° to 299°F) at 14.7 psia			Melting/Freezing Point	-129° to 0°C (-200° to 32°F) at 14.7 psia
Vapor Pressure	LT 0.1 mm of Hg at 68°F (20°C) for the aqueous solution, 212 to 394 psia at 100°F (38°C) based upon released H ₂ S and NH ₃ .			Viscosity (cSt @ 40°C)	1-2
Solubility in Water	Completely soluble in cold water; but may cause an exothermic reaction.			Volatile Characteristics	Negligible volatility in proper storage.
Additional Properties	A 1% solution of ammonia has a greater than 9.0 pH and methyl diethanolamine has an 11.0 to 11.5 pH. Ammonia has a vapor density lighter than air and will disperse rapidly, however, hydrogen sulfide has a vapor density heavier than air and will tend to accumulate in low places or travel along the ground creating a flashback fire hazard.				

Rich MDEA - 101

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization Not expected to occur
Conditions to Avoid	Keep away from strong acids, heat and hot surfaces, steam, strong oxidizing conditions, and severe agitation. Avoid direct contact with organic halogen compounds.	
Materials Incompatibility	Strong acids and other oxidizing agents, halogenated compounds, and some heavy metals. Ammonia solutions are corrosive to chromium and silver and alloys containing these metals and will react violently with their powdered forms. Methyl diethanolamine solutions are corrosive to copper, aluminum, and zinc and alloys containing these metals including galvanized iron and will react with nitrite compounds to form carcinogenic nitrosamine compounds.	
Hazardous Decomposition Products	Contact with some metals can generate extremely flammable hydrogen (H ₂) gas. Free aromatic amines may be released in a reducing environment.	

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data	Hydrogen sulfide:	
	GAS (TCLo) Acute	10 ppm for 15 minutes [Human] - Eye irritation
	GAS (TCLo) Acute	50 to 100 ppm for 15 minutes [Human] - Respiratory irritation
	GAS (LC ₁₀₀) Acute	600 to 750 ppm for 30 minutes [Human] - Respiratory paralysis and death
	GAS (LCLo) Acute	5,700 ug/kg for 8 hours [Human] - Chronic pulmonary edema, coma, and death
	Ammonia:	
	ORAL (LDLo) Acute	132 mg/kg [Human]
	ORAL (TDLo) Acute	15 uL/kg [Human] - Structural changes in the esophagus
	GAS (TCLo) Acute	20 ppm for 1 hour [Human] - Eye irritation, ulcerated nasal septum, and structural changes in the trachea or bronchi
	GAS (LCLo) Acute	5,000 ppm for 5 minutes [Human]
	GAS (LCLo) Acute	5,000 ppm for 5 minutes [Guinea Pig]
	GAS (LC ₅₀) Acute	2,000 ppm for 4 hours [Rat]
	GAS (LC ₅₀) Acute	7,000 mg/m ³ for 1 hour [Cat and Rabbit] - Excitement and flaccid paralysis without anesthesia
	GAS (LC ₅₀) Acute	4,230 ppm for 1 hour [Mouse] - Ataxia, tremors, and convulsions
	Methyl diethanolamine (MDEA or 2,2'-Methyliminodiethanol):	
	ORAL (LD ₅₀) Acute	1.945 mg/kg [Rat] - Hypermotility, diarrhea, ataxia, and chromodacryorrhea
	ORAL (LD ₅₀) Acute	5,990 uL/kg [Rabbit]
	INTRAPERITONEAL (LD ₅₀) Acute	500 mg/kg [Mouse]

Aqueous methyl diethanolamine (MDEA) solutions are alkaline and may be absorbed through the intact skin. At low concentrations, it is a mild to moderate irritant to the eyes, skin, mucous membranes, and respiratory and digestive tracts. MDEA was shown not to be genotoxic in various mutagenicity and clastogenicity assays. **If reacted with nitrites, MDEA can form nitrosamine compounds**, which are "suspected human carcinogens".

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (LT 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (GT 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Ammonia is a strong base and forms **ammonium hydroxide** upon contact with water. This material is corrosive to many organic compounds. If ingested, ammonia can cause severe pain, bloody diarrhea,

Rich MDEA - 101

cardiovascular collapse, and death. Concentrated ammonia is a strong corrosive which can cause burns of the following types: cryogenic from contact with refrigerated liquid, thermal from exothermic reaction with water, and chemical from its alkalinity. It gelatinizes the tissue, forming deep and painful lesions. At low concentrations, aqueous ammonia is a moderate to strong irritant to the eyes, skin, mucous membranes, and respiratory and digestive tracts. Its effects on the lungs can be severe and delayed in onset, respiratory support may be required following acute inhalation. However, there seems to be a wide variability in the human sensitivity to ammonia.

Chronic dyspnea, restrictive lung dysfunction, obstructive lung disease, and bronchial hyper-reactivity were adverse effects experienced by several employees two years after their occupational overexposures to mists and aerosols of ammonia. An aqueous ammonia solution caused gastrointestinal cicatricial tumors in rats following a 24-week feeding assay. NH₃ produced a positive mutagenic response in the Ames Assay and caused chromosomal aberrations during a 16-week cytogenetic study using rats. However, in general, pH alterations produce false positive results in short-term genetic assays.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this material. Vapor releases from this material are expected to cause significant immediate impact but only localized non-persistent environmental damage. Due caution should be exercised to prevent an accidental release into the environment. This material and any contaminated soil or other water may be hazardous to human, animal, and aquatic life. Volatile components may contribute to smog formation.
Environmental Fate	This material is soluble in water and is expected to readily disperse in marine environments. Caustic solutions have produced slight to moderate toxicity in laboratory tests with aquatic organisms. It is expected to be moderately alkaline. If released to surface water, it may cause a pH rise depending upon the buffering capacity of the waterbody. Aquatic organisms become increasingly stressed as pH concentration exceeds 9.0, with many species being intolerant of pH of 10.0 or higher. Substances in this mixture do not bioaccumulate. For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Conditions of use may cause this material to become a "corrosive" hazardous waste (D002), as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a hazardous waste at the time of disposal. Maximize component recovery prior for reuse or recycling. Potential treatment and disposal methods include steam stripping, bio-oxidation, incineration, and land disposal, if permitted. Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT)		
Proper Shipping Name	Corrosive liquid, toxic, n.o.s. Inhalation Hazard Zone B (Hydrogen sulfide, Ammonia)		
Hazard Class	DOT Class 8 (Corrosive liquid)	Packing Group(s)	PG II
		UN/NA ID	UN2922
Reportable Quantity	A Reportable Quantity (RQ) substance components in this material which require DOT HAZMAT bill-of-lading display are Hydroxide sulfide and Ammonia .		

Rich MDEA -101

Placards

Emergency Response Guide No.	154
HAZMAT STCC No.	49 360 15
MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. This material contains detectable concentrations of the following chemical substances subject to this statute: Hydrogen sulfide [CAS No. 7783-06-4] and Ammonia [CAS No. 7664-41-7]
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Acute (Immediate) and Chronic (Delayed) Health, and Reactivity Hazards.
SARA 313	This material contains the following components in concentrations which might be at or above de minimis levels and are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313: Hydroxide sulfide [CAS No. 7783-06-4] concentration: 0.5 to 10% Ammonia [CAS No. 7664-41-7] concentration: 0.5 to 5%.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this material subject to this statute are: Hydroxide sulfide [CAS No. 7783-06-4] (RQ = 100 lbs. [45.4 kg]) concentration: 0.5 to 10% Ammonia [CAS No. 7664-41-7] (RQ = 100 lbs. [45.4 kg]) concentration: 0.5 to 5%.
CWA	This material is NOT classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA).
California Proposition 65	This material does not contain any ingredients for which the State of California has found to cause cancer, birth defects, or other reproductive harm, and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds. A chemical substance present in this material which is subject to this statute is: Hydroxide sulfide [CAS No. 7783-06-4]

Rich MDEA -101

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0975
Revision Date 09/01/2000

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid
Color Light to dark blue
Odor Odorless to strong, unpleasant, and possibly distinctive of rotten eggs or skunk.

DANGER! or WARNING! Highly to Moderately Corrosive!
May cause severe burns, perforation, and irreversible tissue damage!
Eye and/or skin irritation or dermal sensitization may result from prolonged or repeated contact with dilute caustic solutions!
Health effects may be delayed! Avoid contact. Wash skin thoroughly but gently with soap and water after contact. Launder or neutralize contaminated clothing and protective equipment before wearing.
May be harmful or fatal if inhaled or swallowed!
May cause severe respiratory and/or gastrointestinal tract ulceration! Aspiration into the lungs can cause pulmonary edema and chemical pneumonia! If swallowed, seek medical attention immediately.
May be corrosive to some organic and metallic substances!
May react violently with acids, acidic solutions, or halogenated materials!
Reactions may generate extremely flammable hydrogen and/or H₂S gas!
Contains bound Hydrogen Sulfide (H₂S) and Mercaptans! Flammable and toxic gas may be released if this mixture is subjected to high heat or hot surfaces, contact with acids, or severe agitation!
Do not store in open, unmarked, or incompatible containers.
Spills may create a slipping hazard!

SECTION 1: IDENTIFICATION

Trade Name	Merox Rich Caustic	Technical Contact	(800) 525-4692 or (630) 257-4288 (M-F)
Product Number	0097500975	Medical Emergency	(918) 495-4700
CAS Number	Mixture—See Section 2	CHEMTREC Emergency	(800) 424-9300
Product Family	Alkaline or highly basic aqueous process solution		
Synonyms	Rich Caustic, Circulation Caustic, Mercaptan Conversion Caustic, Merox Extractor and Settler Tower Bottoms Streams, V205 Oxidizer Tower Feed, Sodium Hydroxide and Cobalt Catalyst Process Solution, Mercaptan Conversion Solution		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Water	7732-18-5	55-84
2) Sodium hydroxide	1310-73-2	15-30
3) Disulfides, Dialkyl and Di-pH, Naphtha Sweetening	68955-96-4	1-10
4) Hydrogen sulfide	7783-06-4	0 1-5
5) Methyl mercaptan	74-93-1	0 01-10
6) Ethyl mercaptan	75-08-1	0-5

Merx Rich Caustic**SECTION 3: HAZARDS IDENTIFICATION**

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin Contact Eye contact Inhalation Skin Absorption

Signs and Symptoms of Acute Exposure

Inhalation	<p>Inhalation is not considered a normal route of exposure for this aqueous solution. However, breathing high concentrations of mist or liquid droplets may cause respiratory tract irritation, mucous membrane tissue burns, and possibly, pulmonary edema and chemical pneumonia.</p> <p>Generated methyl mercaptan and/or ethyl mercaptan vapors may cause central nervous system depression and/or peripheral nerve damage with repeated exposures.</p> <p>Generated vapor may be harmful or fatal if inhaled! Inhalation of the released vapor may cause severe nose, throat, respiratory tract, and lung irritation, depending on the concentration and duration of exposure. Symptoms are characterized by coughing, choking, or shortness of breath. NIOSH has determined that atmospheres containing 100 ppm or more of hydrogen sulfide (H₂S) are immediately dangerous to life and health. At concentrations above 500 ppm, H₂S and/or methyl mercaptan cause unconsciousness and respiratory paralysis leading to coma and/or death. (See Section 11.)</p>
Eye Contact	<p>Irritating and may injure eye tissue if not promptly removed. The severity of the effects depend on the concentration of the sodium hydroxide and how soon after exposure the eyes are washed.</p> <p>Generated vapor may cause moderate to severe eye irritation and photophobia (light sensitivity) upon short-term exposure. Severity depends upon the concentrations of hydrogen sulfide, methyl mercaptan, and ethyl mercaptan and duration of exposure.</p>
Skin Contact	<p>May be irritating or corrosive to the skin. Irritation may follow an initial delay between the time that the exposure occurs and the sense of irritation begins. This latency period can vary as much as several hours for a dilute solution (0.04 wt % caustic) to minutes with more concentrated solutions. Prolonged or repeated contact, even to dilute concentrations of sodium hydroxide solutions may cause a high degree of permanent tissue destruction.</p> <p>Generated hydrogen sulfide and methyl mercaptan vapor can be absorbed through the skin to produce toxic effects. If the skin is damaged, absorption increases.</p>
Ingestion	<p>If swallowed, this material may cause severe pain, nausea, vomiting, and/or bloody diarrhea, in addition to a burning sensation in the mouth, throat, and digestive tract. Depending upon caustic solution concentration, ulceration of the gastrointestinal tract may also occur. This material is toxic and may be fatal.</p>
Chronic Health Effects Summary	<p>Prolonged and/or repeated contact can defat the skin and may produce moderate to severe irritation and inflammation and/or alkali burns. Repeated exposure to mists or aerosols of sodium hydroxide can produce either obstructive airway disease or a tolerance to its respiratory irritant effects.</p> <p>Subchronic exposure to low levels of hydrogen sulfide can produce eye irritation and corneal opacity, bronchitis, pulmonary edema, excessive salivation, nausea, diarrhea, CNS depression, and cardiac irregularities. Whether or not there is a chronic toxicity of H₂S distinct from its acute and subchronic effects is debatable. However, headaches, bronchitis, a grey-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been reported due to prolonged and/or repeated exposures. (See Section 11.)</p>
Conditions Aggravated by Exposure	<p>Personnel with pre-existing eye, skin, or gastrointestinal disorders or chronic respiratory diseases should avoid exposure.</p>
Target Organs	<p>The substance is toxic to eyes, skin, mucous membranes, lungs, and possibly the blood, heart, and/or nervous systems.</p>
Carcinogenic Potential	<p>This material does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC, or NTP.</p>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Do not attempt to remove contact lenses. Immediately irrigate eyes with copious amounts of cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Flush thoroughly with water under a cool or cold shower for at least 15 minutes while removing contaminated shoes and clothing. Gently and thoroughly wash contaminated skin with running water and non-abrasive soap. Be particularly careful to clean folds, crevices, creases, and groin area. Seek medical attention if tissue appears damaged or if irritation or pain persists. Thoroughly clean contaminated clothing before reuse. Discard contaminated leather goods.
Ingestion	Do not induce vomiting. If spontaneous vomiting is about to occur, place victim's head below knees. Do not attempt to neutralize. Have victim rinse mouth with water then drink two to three large glasses of milk or water. Never give anything by mouth to a person who is not fully conscious. Keep airway clear. Seek medical attention immediately.

Notes to Physician

If after exposed skin has been washed gently with running water and non-abrasive soap, one may neutralize severely irritated or burned tissue with a **dilute solution of boric acid or acetic acid**.

Inhalation overexposure can produce other toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

Nitrite as an antidote for acute **hydrogen sulfide** intoxication may only be effective within the first few minutes after the exposure. Conditions thereafter may actually slow sulfide removal from the body's tissues. Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Not applicable or Extremely Flammable, if improperly handled!		
Flash Point Method	Not applicable or AP -73°C (-100°F) for H ₂ S		
Lower Flammable Limit	Not applicable or AP 4.0% for H ₂ S and Methyl mercaptan	Upper Flammable Limit	Not applicable or 45% for H ₂ S
Autoignition Temperature	Not applicable or AP 260°C (500°F) for H ₂ S		
Hazardous Combustion Products	Contact with some metals can generate extremely flammable hydrogen gas		
Special Properties	High heat, hot surface contact, or mixing with acids may spring extremely flammable H ₂ S and/or mercaptan vapors out of this solution. Adding this material directly to unbuffered water may cause an exothermic reaction sufficient enough to make the water boil.		

Merox Rich Caustic

Extinguishing Media	Non-combustible, if handled and stored properly Use extinguishing media suitable for the surrounding fire In an advanced or massive fire, evacuate area and fight fire from a safe distance or a protected location. <i>Approach fire from upwind. Use unmanned monitors and hoseholders to keep cooling streams of water on fire-exposed cylinders or tanks until well after the fire is out</i> If possible, isolate materials not yet involved in the fire and protect personnel Move containers away from fire area if it can be done without risk
Fire Fighting Protective Clothing	This material is not expected to burn However, in the event that gases are being generated or surrounding materials are involved in a fire, firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Avoid contact with damaged containers or spilled material unless wearing appropriate protective clothing *Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas* Absorb or cover with dry earth, sand, or other non-combustible material and transfer to containers All clean-up materials should be removed for proper treatment or disposal For large spills, dike far ahead of spill to maximize later product recovery or disposal Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and proper protective clothing during cleanup operations. This material may react strongly with acids Never flush to the sewer In urban areas, cleanup spill as soon as possible, in natural environments, cleanup on advice from specialists to minimize physical habitat damage. If appropriate, neutralize with a dilute solution of **boric acid or acetic acid** A vacuum truck may be used to collect the bulk Spills on other than pavement may be handled by removing the affected soil and placing it into approved containers for later disposal Comply with all laws and regulations

SECTION 7: HANDLING AND STORAGE

Handling	Do not breathe mist or vapor Do not get in eyes, on skin, or on clothing Wear suitable personal protective equipment to prevent eye and skin contact Wash thoroughly after handling Danger! Corrosive Liquid and/or Poisonous and Flammable Gas! Do NOT breathe mist or vapor, it may contain sodium hydroxide, hydrogen sulfide (H₂S), and/or mercaptans Odor is not an adequate warning of potentially hazardous air concentrations Use only with adequate ventilation and personal protective equipment Do not allow material to contact eyes, skin or other tissues, and clothing Wear corrosion-resistant protective work clothing and chemical splash goggles and face shield when contact is anticipated Releases of this material can cause atmospheres to become oxygen deficient and/or create an immediate fire or explosion hazard Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for H ₂ S concentrations and flammability When performing repairs or maintenance on contaminated equipment, keep unnecessary persons from the hazard area. Eliminate heat and other ignition sources Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8 Drain and purge equipment as necessary to remove material residues However, empty containers may still contain corrosive and poisonous residue
Storage	Store in containers appropriate for concentrated or dilute caustic solutions and away from acids Diluted material may accelerate corrosion of metal containers Store and transport in accordance with all applicable laws Do not store this material in unlabeled containers <i>Keep containers tightly closed and stored in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles</i> If possible, store containers in a separate safety cabinet or room The H ₂ S component of this material is corrosive to most metals It can cause steel pipe to become blistered, pitted, and brittle Metal components used for storage should be resistant to sulfide stress cracking (See appropriate API and NACE standards.)

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls	No special ventilation is required under normal conditions of use Where engineering controls are feasible, use adequate local exhaust ventilation wherever mist, spray, or vapor may be generated. Where hydrogen sulfide and/or mercaptans may be generated, special ventilation will be required Ensure that an emergency eye wash station and safety shower are near the work-station location
-----------------------------	--

Merox Rich Caustic**Personal Protective Equipment**

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

**Eye Protection**

Safety glasses with side shields are recommended as a minimum protection. When there is a likelihood of misting, splashing, or spraying, chemical-resistant goggles and full-face shield should be worn. Thermal protection should be provided if the solution has a temperature above 120 degrees F. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact. Use of chemical-resistant gloves (e.g., PVC, neoprene, rubber, or vinyl) is required. Thermal protection should be used whenever the solution has a temperature above 120 degrees F. Wash hands and other exposed skin with mild soap and water before eating, drinking, smoking, or using the toilet facilities.

Body Protection

Avoid all skin contact. If splashing or spraying is expected, chemical-resistant protective clothing (e.g., vinyl, Tyvek®, nitrile, or neoprene) should be worn. This might include long-sleeves, apron, slicker suit, boots, and additional facial protection. Thermal protection should be provided when the solution has a temperature above 120 degrees F. If general contact occurs, IMMEDIATELY remove soaked clothing and shower thoroughly. Contaminated leather goods should be removed immediately and discarded.

Respiratory Protection

Misting or vapor generation are not expected under normal conditions of use. Therefore, the need for respiratory protection from **diluted sodium hydroxide** is not anticipated under normal use conditions and with adequate ventilation. If generated **hydrogen sulfide or mercaptans** are present at concentrations above applicable workplace exposure levels, or when they are anticipated, a full-face supplied air respirator with escape bottle or a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA) is required. Respirator use should follow OSHA requirements (29 CFR 1910.134 and 1910.1028) or equivalent (e.g., ANSI Z88.2).

General Comments

Use good personal hygiene practices. Wash hands and other exposed skin areas with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities, or leaving work. DO NOT use gasoline, kerosene, other solvents, or harsh abrasive skin cleaners. Exposure standards/control limits for some of the components apply to airborne concentrations of dust, and are not truly applicable to liquid solutions. Use of personal protective equipment and good personal hygiene are essential to controlling exposures to this aqueous solution.

Releases of bound **hydrogen sulfide and/or mercaptans** may create flammable, explosive, and/or oxygen-deficient atmospheres (LT 19.5 Vol % in air). DO NOT ENTER such areas or confined spaces without taking special precautions including monitoring for oxygen deficiency and flammability. Warning! Odor is an inadequate warning for hazardous conditions. Air purifying respirators offer no protection against oxygen deficiency, hydrogen sulfide, methyl mercaptan,

Occupational Exposure Guidelines**Substance****Applicable Workplace Exposure Levels**

1) Sodium hydroxide	CEIL 2 (mg/M ³) from ACGIH (TLV) [1999] CEIL 2 (mg/M ³) from OSHA (PEL) [1989] TWA 2 (mg/M ³) from OSHA (PEL) [1977]
2) Hydrogen sulfide	TWA 10 STEL 15 (ppm) from ACGIH (TLV) [1999] TWA 5 (ppm) from ACGIH (TLV) [2000] TWA 10 STEL 15 CEIL 20 (ppm) from OSHA (PEL) [1989]
3) Methyl mercaptan	TWA 0.5 (ppm) from ACGIH (TLV) [1999] CEIL 10 (ppm) from OSHA (PEL) [1989]
4) Ethyl mercaptan	TWA 0.5 (ppm) from ACGIH (TLV) [1999] CEIL 10 (ppm) from OSHA (PEL) [1989]

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid	Color	Light to dark blue	Odor	Odorless to strong, unpleasant, and possibly distinctive of rotten eggs or skunk
Specific Gravity	1.01 to 1.22 (Water = 1)	pH	12.0 to 14.0 [Highly Basic]	Vapor Density	Not applicable
Boiling Point/Range	100° to 113°C (212° to 235°F)	Melting/Freezing Point			-32° to 0°C (-25° to 32°F)

Merox Rich Caustic

Vapor Pressure	110 to 145 mm of Hg @ 60°C (140°F)	Viscosity (cSt @ 40°C)	Not available
Solubility in Water	Completely soluble in cold water, but causes an exothermic reaction	Volatile Characteristics	Negligible volatility in proper storage.
Additional Properties	Boiling point and melting point temperatures increase with the level of sodium hydroxide present A 7.5% solution of sodium hydroxide has a pH of 14.0		

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Caustic solutions may react with strong acids, releasing heat, hydrogen sulfide, mercaptans, and other acid gases. Contact with some metals can generate extremely flammable hydrogen gas. Avoid direct contact with water, leather, wool, and organic halogen or nitro compounds.		
Materials Incompatibility	Strong acids, some heavy metals, and some organic chemicals. Caustic solutions are corrosive to tin, aluminum, zinc, and alloys containing these metals and will react violently with their powdered forms. Toxic carbon monoxide gas can form when caustic solutions contact with reducing sugars, food, and beverage products in enclosed spaces and it can cause death. Appropriate tank entry procedures must be followed.		
Hazardous Decomposition Products	None		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the **Emergency Overview on Page 1** and the **Hazards Identification in Section 3** of this MSDS.

Toxicity Data**Sodium Hydroxide**

DERMAL (LD50) Acute 1,350 mg/kg [Rabbit]
INTRAPERITONEAL (LD50) Acute 40 mg/kg [Mouse]

Hydrogen sulfide

GAS (TCLo) Acute 10 ppm for 15 minutes (Human) - Eye irritation
GAS (TCLo) Acute 50 to 100 ppm for 15 minutes (Human) - Respiratory irritation
GAS (LC100) Acute 600 to 750 ppm for 30 minutes (Human) - Respiratory paralysis and death
GAS (LCLo) Acute 5,700 ug/kg for 8 hours (Human) - Chronic pulmonary edema, coma, and death

Methanethiol (Methyl mercaptan)

GAS (LC50) Acute 675 ppm for 4 hours [Rat] - Hypermotility, diarrhea, and reduced respiration
GAS (LC50) Acute 6,530 ug/m³ for 2 hours [Mouse]

Ethanethiol (Ethyl mercaptan)

GAS (LC50) Acute 2,770 ppm for 4 hours [Mouse] - Excitement, motor activity changes, and cyanosis
GAS (LC50): Acute 4,420 ppm for 4 hours [Rat] - Excitement, spastic paraparesis, and cyanosis.
ORAL (LD50) Acute 682 mg/kg [Rat] - Muscle weakness, ataxia, and cyanosis.
INTRAPERITONEAL (LD50) Acute 226 mg/kg [Rat] - Muscle weakness, ataxia, and cyanosis

Sodium hydroxide (Lye) is strongly alkaline and very corrosive to many organic compounds. If ingested, sodium hydroxide can cause severe pain, bloody diarrhea, cardiovascular collapse, and death. It is a severe eye, skin, and respiratory tract irritant and in an undiluted form it can burn tissue upon contact. It gelatinizes the tissue, forming deep and painful lesions. Squamous cell carcinomas (cicatrical tumors) frequently develop in healing tissue at the site of chemical burns or in scar tissue after a delay of 10 to 20 years. Sodium hydroxide has also been shown to cause chromosomal aberrations in hamster ovary cells and grasshoppers. In general, however, pH alterations produce false positive results in short-term genetic assays.

Hydrogen sulfide (H₂S) causes eye and/or respiratory tract irritation at concentrations of 4 to 100 ppm in air. At low concentrations (LT 20 ppm), H₂S has an odor of rotten eggs. At higher concentrations (GT 50 ppm), H₂S odor is not apparent. NIOSH has determined that atmospheres containing 100 ppm or more H₂S are immediately dangerous to life and health. For the average human adult, exposure to H₂S concentrations above 500 ppm causes unconsciousness and death by respiratory paralysis. At concentrations between 600 and 750 ppm, death occurs within 15 minutes. The effects from repeated or prolonged exposures to low concentrations of H₂S is unclear. Headaches, bronchitis, a gray-green line on the gums, eye disorders, cardiac arrhythmias, and neurological symptoms including psychological disorders have been associated with long-term, low-level exposures to H₂S. An inhalation study using rats exposed to 100 ppm of H₂S for 8 hours per day for 5 weeks showed pulmonary effects, degenerative brain changes, and decreases in cytochrome oxidase. And, when pregnant rats were exposed to 20 ppm for 24 hours during days 6 through 22 of their pregnancy, their off-spring slowed developmental physical effects.

Merox Rich Caustic

Methyl and ethyl mercaptans act as respiratory poisons by inhibiting the respiratory control center in the brain and cellular respiration, but only at concentrations exceeding 50 ppm in air. At lower chronic exposures, they can cause pulmonary edema, hemolytic anemia, methemoglobinemia, and kidney and/or liver damage. They are also eye irritants and have been shown to produce positive responses in various mutagenic assays.

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this material. Releases are expected to cause only localized non-persistent environmental damage, however, due caution should be exercised to prevent the accidental release of this material into the environment. The sodium hydroxide and mercaptan components are toxic by ingestion. Contaminated food stuffs must not be eaten by humans or animals.
Environmental Fate	This material is soluble in water and is expected to readily disperse in marine environments. Caustic solutions have produced slight to moderate toxicity in laboratory tests with aquatic organisms. It is expected to be strongly alkaline. If released to surface water, it will cause the pH rise depending upon the buffering capacity of the waterbody. Aquatic organisms become increasingly stressed as pH concentration exceeds 9.0, with many species being intolerant of pH of 10.0 or higher. Substances in this mixture do not bioaccumulate.
	For additional ecological information concerning components of this product, users should refer to the Hazardous Substances Data Bank® and the Oil and Hazardous Materials/Technical Assistance Data System (OHM/TADS) maintained by the U.S. National Library of Medicine. (See Section 2 for components.)

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Recovery and reuse, rather than disposal, should be the ultimate goal for handling this corrosive alkaline material. However, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a hazardous waste at the time of disposal. Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

DOT Status	This material is regulated by the U.S. Department of Transportation (DOT)		
Proper Shipping Name	Corrosive liquid, toxic, n.o.s. (Sodium hydroxide, Methyl mercaptan)		
Hazard Class	DOT CLASS. 8 (Corrosive liquid)	Packing Group(s)	PG II or PG III
		UN/NA ID	UN2922
Reportable Quantity	A Reportable Quantity (RQ) substance component in this stream which requires DOT HAZMAT bill-of-lading display is Sodium hydroxide and Methyl mercaptan		
Placards			Emergency Response Guide No. 154
		HAZMAT STCC No.	49 352 30
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

Merox Rich Caustic**SECTION 15: REGULATORY INFORMATION**

TSCA Inventory	This product and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. This material might contain the following chemical substance subject to this statute Methanethiol (Methyl Mercaptan) [CAS No. 74-93-1]
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2 This material would be classified under the following hazard categories Acute (Immediate) Health, Chronic (Delayed) Health, and Reactivity Hazards
SARA 313	This material contains the following components in concentrations which might be at or above de minimis levels and are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 Hydrogen sulfide [CAS No. 7783-06-4] concentration: 0.1 to 5% Methanethiol (Methyl mercaptan) [CAS No. 74-93-1] concentration: 0.01 to 10% Ethanethiol (Ethyl mercaptan) [CAS No. 75-08-1] concentration: 0 to 5%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4 As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4 Chemical substances present in this material subject to this statute are. Sodium Hydroxide (RQ = 1000 lbs. [453.6 kg]) concentration: 15 to 30% Methanethiol (Methyl mercaptan) (RQ = 100 lbs. [45.4 kg]) concentration: 0.01 to 10%
CWA	This material is NOT classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA)
California Proposition 65	This material does not contain any ingredients for which the State of California has found to cause cancer, birth defects, or other reproductive harm, and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5
New Jersey Right-to-Know Label	For New Jersey labeling refer to components listed in Section 2
Additional Regulatory Remarks	In regulations promulgated pursuant to the Clean Air Act - Section 112(r) (40 CFR 68.130), the EPA requires development, implementation, and submission of risk management plans (RMPs) for facilities that manufacture, process, use, or otherwise handle regulated substances in quantities that exceed listed thresholds Chemical substances which may be present in this material that are subject to this statute are Hydrogen sulfide, Methyl mercaptan (Methanethiol), and Ethyl mercaptan (Ethanethiol).

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0986
Revision Date 2/28/2003

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State	Highly Volatile Liquid		
Color	Colorless liquid and vapor. Forms white cloud with sudden release.	Odor	Rotten eggs. (Hydrogen sulfide odor).

DANGER!

Extremely flammable compressed gas/liquid.
Vapor may cause flash fire or explosion.
High pressure and rapid diffusion hazard.
Contact with liquid may cause frostbite or freeze burns.
High concentrations of vapor reduce oxygen available for breathing.
May increase the heart's susceptibility to arrhythmias (irregular beats).

HARMFUL IF INHALED

Contains Methyl Mercaptan.
Vapors have a strong, offensive odor.
High concentrations can cause unconsciousness and coma.

Hazard Rankings

	HMIS	NFPA
Health Hazard	* 2	2
Fire Hazard	4	4
Reactivity	0	0

* = Chronic Health Hazard

Protective Equipment

Minimum Recommended
See Section 8 for Details

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

SECTION 1: IDENTIFICATION

Trade Name	2 Depropanizer Bottoms (LCRC)	Technical Contact	(800) 525-4692
Product Number	Not available	Medical Emergency	(800) 313-7645
CAS Number	Mixture.	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Liquefied Petroleum Gas (LPG or LP-Gas)		
Synonyms	Not available.		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) n-Butane	106-97-8	30-60
2) Iso-Butane	75-28-5	10-25
3) Pentanes, all isomers	Mixture	10-20
4) Butenes, all isomers	Mixture	6-14
5) C6 and heavier hydrocarbons	Mixture	10-20
6) Alkyl mercaptans	74-93-1	0.03-1

2 Depropanizer Bottoms

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Eye contact. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	One or more components of this gas mixture are "simple asphyxiants" (see Section 8). Their vapors can displace the amount of oxygen in air available to breathe below that necessary to sustain life, especially if working in confined spaces. Breathing vapors may also irritate the respiratory tract and cause central nervous system (CNS) depression. Symptoms may include headache, dizziness, slurred speech, excitation or giddiness, nausea, blurred vision, memory loss, drowsiness, fatigue, rapid or difficult breathing, confusion, vertigo, loss of consciousness, convulsions, coma, and even death, depending upon the concentration and duration of exposure. This material contains alkyl mercaptans. Symptoms of exposure include strong and disagreeable odor, irritation of eyes and respiratory system. High concentrations can produce narcosis and hematological effects.
Eye Contact	This gas is non-irritating; however, direct contact with pressurized or liquefied gas may result in severe, possibly permanent, eye tissue damage commonly referred to as a "freeze burn."
Skin Contact	Non-irritating; but, direct contact with an expanding gas may produce skin damage from frostbite or freeze burns.
Ingestion	Ingestion is not an applicable route of exposure for gases.
Chronic Health Effects Summary	Chronic inhalation to components of this gas may increase the heart's susceptibility to irregular beating and its sensitivity to the effects of Epinephrine (Adrenaline)-like drugs.
Conditions Aggravated by Exposure	Personnel with pre-existing chronic respiratory diseases, central nervous system (CNS) disease, or cardiovascular conditions should avoid exposure. Persons who are compromised in their ability to use oxygen, such as asthmatics and those with reduced pulmonary function or anemia, may be more sensitive to excess concentrations of "simple asphyxiants".
Target Organs	This material may cause damage to the following organs: cardiovascular system, central nervous system (CNS).
Carcinogenic Potential	This product does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC or NTP.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input checked="" type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
-------------------	---

2 Depropanizer Bottoms

Eye Contact	If tissue is frozen, immediately seek medical attention. If tissue is not frozen, check for and remove contact lenses. Then, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids. If pain, redness, swelling, tearing, or light sensitivity persist, obtain medical attention as soon as possible. Do not use eye ointment unless directed by a physician.
Skin Contact	In the event of frostbite or freeze burn, the affected frozen tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water. Rewarming should continue until natural skin tones return to the affected area. Seek medical attention if tissue appears damaged or if pain persists.
Ingestion	Due to the volatile nature of this material, ingestion is not a likely route of entry.
Notes to Physician	<p>If cough or difficulty in breathing develops, evaluate for respiratory tract irritation, bronchitis, or pneumonitis. Monitor arterial blood gases and chest x-ray in cases with significant exposure. If contact with pressurized or liquefied gas causes frostbite of the eyes, early ophthalmologic consultation is recommended.</p> <p>This material may also make the heart more susceptible to arrhythmias. Catecholamines such as epinephrine and other similar sympathomimetic drugs should be reserved for emergencies and then used only with special precaution. If used, monitor the heart action closely. Consider use of other drugs with less arrhythmogenic potential.</p>

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	Flammable gas.		
Flash Point Method	CLOSED CUP: <-40°C (-40°F).		
Lower Flammable Limit	AP 1.6 %	Upper Flammable Limit	AP 8.4 %
Autoignition Temperature	Not available.		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, unburned hydrocarbon vapors, and trace oxides of sulfur.		
Special Properties	This gas is flammable at well below ambient temperatures and readily forms flammable mixtures with air. Exposed to an ignition source, it will burn in the open and may cause a flash fire, or in enclosed spaces, it can ignite with explosive force. Keep away from all ignition sources! Being heavier than air, its flammable vapors can travel long distances close to the ground to an ignition source, and then flash back.		
Extinguishing Media	DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! If the source cannot be shut off immediately, cool tanks, containers, equipment, and other structural surfaces exposed to the fire with water fog or spray in order to prevent metal fatigue, pressure build-ups, autoignition, and/or explosions. Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Use water, dry chemical, carbon dioxide (CO ₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.		
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

2 Depropanizer Bottoms

Extremely Flammable Compressed Gas! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel to an area upwind. Remove all potential ignition sources. Safely stop the source gas flow using non-sparking tools. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres. Closed gas systems form white-colored frost at the point of a leak. A liquid spill will vaporize forming a cold, dense vapor cloud that does not readily disperse. Water spray may be used to reduce vapors. Avoid entering a vapor cloud even when wearing proper respiratory equipment and fire-resistant protective clothing.

If tanks or tank cars are involved, evacuate all non-essential personnel to at least 1/4 mile in all directions. Secure the area and control access. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. Allow free liquid to evaporate or burn off. This gas or waste mixtures containing this gas should not be allowed to enter drains or sewers where there is danger of their vapors being ignited by a remote ignition source. Some releases must be reported to the National Response Center (800/424-8802).

SECTION 7: HANDLING AND STORAGE

Handling

This gas mixture contains "simple asphyxiants". Odor is not an adequate warning of potentially hazardous air concentrations. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring for oxygen deficiency and flammability.

Refer to applicable OSHA, DOT, and local regulations concerning handling, storage, and shipment of mixed gases. If upon inspection, a cylinder or other container is found to be in poor operating condition, promptly contact the supplier. Excessive pressure can cause explosive decomposition at the cylinder head or relief valve resulting in a dangerous gas release. Use a pressure-reducing regulator when connecting to lower pressure piping systems. Prevent liquid entrapment in closed systems. Drain and purge equipment, as necessary, to remove material residues. Ground all containers when transferring material.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Do not allow vaporizing material to contact eyes, skin or other tissues. Wear protective work clothing and chemical splash goggles and face shield when contact with escaping compressed gas is anticipated.

Storage

Do not store this material near heat or any other potential ignition sources. Segregate from oxidizers and other combustible materials by a distance of at least 20 feet. Do not store this product in unlabeled containers. Keep containers tightly closed.

Always chain gas cylinders securely in the up-right position and avoid placement in high traffic areas. Store and use these cylinders or other containers in a cool, well-ventilated place. Storage areas should not exceed 100°F. Protect from dampness, salt, or corrosive chemicals. Do not drag, roll, or slide cylinders. Valve caps should remain on cylinders not connected for use. Separate full containers from empty ones. Empty and partially filled containers should be returned to the supplier. Do not puncture or incinerate cylinders.

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Both local exhaust and general room ventilation may be essential in work areas to prevent accumulation of potentially explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are located near the work-station location.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

2 Depropanizer Bottoms

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Eye Protection	Use chemical-type goggles and face shield (ANSI Z87.1 or approved equivalent) when handling liquefied gases. Safety glasses equipped with side shields or face shield are recommended when vapor is being discharged or whenever handling high-pressure cylinders and piping systems.
Hand Protection	Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves to protect hands from potential contact with cold liquid, solid, or vapors.
Body Protection	Prevent potential skin contact with cold liquid or vapors. Use insulated and chemical-resistant clothing (apron, slicker suit, coveralls, boots, etc.). Fire-retardant garments (e.g. Nomex®) should be worn while working with flammable gases and gas/liquids.
Respiratory Protection	Odor is not an adequate warning for potentially hazardous air concentrations. For unknown vapor concentrations, use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator, if adequate protection is provided. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).
General Comments	For an explanation about some of the occupational exposure limits shown below, refer to the definition of " Simple Asphyxiant " presented in the American Conference of Governmental Industrial Hygienists (ACGIH) most current Threshold Limit Values (TLVs) for Chemical Substances and Physical Agents handbook. Releases of these gases can result in dangerous conditions such as fire and explosive hazards, or atmospheres with inadequate amounts of oxygen to breathe (i.e., less than 19.5 Vol.% oxygen in air). DO NOT ENTER such areas or confined spaces without special safety procedures including appropriate monitoring for flammability and oxygen deficiency.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) n-Butane	ACGIH (United States). TWA: 800 ppm
2) Iso-Butane	ACGIH (United States). TWA: 800 ppm
3) Pentanes, all isomers	ACGIH (United States). TWA: 600 ppm OSHA (United States). TWA: 1000 ppm
4) Alkyl mercaptans	ACGIH TLV (United States). TWA: 0.5 ppm OSHA PEL Z2 (United States). CEIL: 10 ppm
5) Liquefied Petroleum Gases	ACGIH (United States). TWA: 1000 ppm OSHA (United States). TWA: 1000 ppm

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Highly Volatile Liquid	Color	Colorless liquid and vapor. Forms white cloud with sudden release.	Odor	Rotten eggs. (Hydrogen sulfide odor).
Specific Gravity	0.52 (Water = 1)	pH	Not Applicable.	Vapor Density	Not available.
Boiling Range	Not available.			Melting/Freezing Point	Not available.
Vapor Pressure	Not available.			Viscosity (cSt @ 40°C)	Not available

2 Depropanizer Bottoms

Solubility in Water Not available.

**Volatile
Characteristics**

This material is usually stored as a liquid. If open to the atmosphere it will evaporate quickly to form a vapor cloud.

Additional Properties No additional information.

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame, and strongly oxidizing conditions. Polymerization can occur under conditions of extremely high temperature and pressure.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen. Alkane hydrocarbons and chlorine gas mixtures have produced explosions.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the **Emergency Overview on Page 1** and the **Hazards Identification in Section 3** of this MSDS.

Toxicity Data

n-Butane:

INHALATION (LC50): Acute: 660000 mg/m³ 4 hour(s) [Rat]. 680000 mg/m³ 2 hour(s) [Mouse].

An n-butane exposure of 5,000 ppm in air has been shown to affect the heart in dogs, causing lower contractile force and other effects. Also, butane may decrease the myocardial threshold to epinephrine-induced arrhythmias.

Iso-Butane:

INHALATION (LC50): Acute: 57000 ppm 0.25 hour(s) [Rat].

Laboratory animals have exhibited a higher degree of narcosis when exposed to both isobutane and butylene (additive effect), than the degree of narcosis exhibited following exposure to either gas alone.

Pentanes, all isomers:

n-Pentane was associated with cardiac sensitization in rabbits at a concentration of 100,000 ppm in air within four hours of exposure. Pentane can act as an anesthetic by inhalation. Mice exhibited signs of respiratory irritation and mild central nervous system effects at concentrations of 32,000 to 69,000 ppm for five minutes.

Butenes, all isomers:

Butenes are simple asphyxiants. At high concentrations they depress the central nervous system (CNS), producing anesthetic effects. Cardiac sensitization effects have been reported in animal studies. CNS effects are not expected to occur at concentrations less than the lower flammable limit, (1.8% in air).

Alkyl mercaptans:

At concentrations above 50 ppm, methyl and ethyl mercaptans can inhibit respiration. Chronic exposures have been associated with pulmonary edema, hemolytic anemia, methemoglobinemia, kidney and liver damage. Also, these mercaptans can cause eye irritation.

Liquefied Petroleum Gases:

When a 4-hour rabbit inhalation screen test was run on a liquefied petroleum gas, no deaths occurred; however, the animal's heart muscles became sensitized to sympathomimetic drugs such as epinephrine (adrenaline).

2 Depropanizer Bottoms

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this material. Releases are expected to cause only localized non-persistent environmental damage.
Environmental Fate	Refined liquefied petroleum hydrocarbon gases are essentially insoluble in water (LT 0.1%); and therefore, this material will not cause harm to aquatic life. These liquefied gas mixtures will normally evaporate rapidly if spilled. At ambient temperatures and pressure, this material will readily vaporize. Olefin components may contribute to generation of atmospheric smog.

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Material residues may be a RCRA Hazardous Waste on disposal due to its ignitibility characteristic (D001). Allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. If possible and permissible, this material may be disposed of as an auxiliary fuel or by controlled burning in a properly designed flare or incinerator. Venting of this gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be in accordance with applicable Federal, State, and local regulations. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

SECTION 14: TRANSPORT INFORMATION

The shipping description below may not represent requirements for all modes of transportation, shipping methods or locations outside of the United States.

US DOT Status	A U.S. Department of Transportation regulated material.		
Proper Shipping Name	Liquefied petroleum gas (n-Butane, Iso-Butane)		
Hazard Class	2.1	Packing Group(s)	A Packaging Group has not been assigned for this product.
		UN/NA ID	1075
Reportable Quantity	Not determined.		
Placards		Emergency Response Guide No.	115
		HAZMAT STCC No.	490575
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

2 Depropanizer Bottoms

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Sudden Release of Pressure, Acute (Immediate) Health Hazard.
SARA 313	This product contains the following components in concentrations above de minimis levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: No components were identified.
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. This product or refinery stream is not known to contain chemical substances subject to this statute. However, it is recommended that you contact state and local authorities to determine if there are any other reporting requirements in the event of a spill.
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This product is not known to contain the any components for which the State of California has found to cause cancer, birth defects or other reproductive harm.
New Jersey Right-to-Know Label	For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.
Additional Regulatory Remarks	No additional regulatory remarks.

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Emergency Overview

Physical State Liquid.
Color Clear to light amber. **Odor** Pungent, unpleasant odor similar to onions.

WARNING!

Combustible liquid; vapor may cause flash fire.
Harmful or fatal if swallowed - can enter lungs and cause damage.
Mist or vapor can irritate the respiratory tract.
Liquid contact can cause eye or skin irritation.
May be harmful if inhaled or absorbed through the skin.
Overexposure can cause central nervous system (CNS) depression and/or other target organ effects.
Spills may create a slipping hazard.
Contains Disulfide Oil. Vapors have a strong offensive odor which may cause headaches, nausea, and vomiting.

See Section 8 for Details

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

SECTION 1: IDENTIFICATION

Trade Name	Aviation Kerosene	Technical Contact	(800) 525-4692
Product Number	Not available.	Medical Emergency	(800) 313-7645
CAS Number	Mixture.	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Kerosene		
Synonyms	Not available.		

SECTION 2: COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
1) Hydrodesulfurized Kerosine (Petroleum)	64742-81-0	0-100
2) Disulfides, Dialkyl and Di-Ph, Naphtha Sweetening	68955-96-4	0.2-1
3) Nonane, all isomers	Mixture	20-30
4) Ethylmethylbenzenes (Ethyltoluenes)	25550-14-5	1-3
5) Naphthalene	91-20-3	0-2
6) Trimethylbenzenes, all isomers	25551-13-7	0-2
7) Biphenyl (Diphenyl)	92-52-4	0-2
8) Ethylbenzene	100-41-4	0-1
9) Xylene, all isomers	1330-20-7	0-1

Kerosene with DSO

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Inhalation.

Signs and Symptoms of Acute Exposure

- Inhalation** Breathing mist or vapors concentrations well above occupational exposure levels can irritate the mucous membranes of the nose, throat, bronchi, and lungs, and may cause transient central nervous system (CNS) depression. CNS symptoms include headache, dizziness, nausea, intoxication, blurred vision, slurred speech, flushed face, confusion, weakness, fatigue, loss of consciousness, convulsions, coma, and death, depending on the concentration and/or duration of exposure.
- Eye Contact** This product can cause eye irritation with short-term contact with liquid, mists or vapor. Symptoms include stinging, watering, redness, and swelling. In severe cases, permanent eye damage can result.
- Skin Contact** Animal test results on similar materials suggest that this product can cause moderate to severe skin irritation. Short-term contact symptoms include redness, itching, and burning of the skin. Also, certain components of this material may be absorbed through the skin and produce CNS depression effects (see "Inhalation" above). If the skin is damaged, absorption increases. Prolonged and/or repeated contact may cause severe dermatitis and/or more serious skin disorders. Chronic symptoms may include drying, swelling, scaling, blistering, cracking, and/or severe tissue damage.
- Ingestion** If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness, and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above).

Due to its light viscosity, there is a danger of aspiration into the lungs during vomiting. Aspiration of a small amount of liquid can cause severe pulmonary edema and lipid or chemical pneumonia which can result in death. Progressive CNS depression, respiratory insufficiency, and ventricular fibrillation may also result in death.

Chronic Health Effects Summary Secondary effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction.

This product contains petroleum middle distillates similar to those shown to produce skin tumors on laboratory rodents following repeated application. All tumors appeared during the latter portion of the typical 2-year lifespan of the animals. Certain studies have shown that washing the animal's exposed skin with soap and water between treatments greatly reduces the potential tumorigenic effects. These effects are unlikely to occur if good personal hygiene is practiced.

This material and/or its components have been associated with developmental and/or reproductive toxicity, genotoxicity, immunotoxicity, and carcinogenicity. Refer to Section 11 of this MSDS for additional health-related information.

Conditions Aggravated by Exposure Medical conditions aggravated by exposure to this material may include skin disorders, chronic respiratory diseases, neurological conditions, liver or kidney dysfunction.

Target Organs This material may cause damage to the following organs: kidneys, liver, upper respiratory tract, skin.

Carcinogenic Potential This material may contain ethylbenzene and naphthalene at concentrations above 0.1%. IARC has identified ethylbenzene and naphthalene as possibly carcinogenic to humans (Group 2B) based on laboratory animal studies.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification

Kerosene with DSO

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately. Keep the affected individual warm and at rest.
Eye Contact	Check for and remove contact lenses. Flush eyes with cool, clean, low-pressure water for at least 15 minutes while occasionally lifting and lowering eyelids. Do not use eye ointment unless directed to by a physician. Seek medical attention if excessive tearing, irritation, or pain persists.
Skin Contact	Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
Ingestion	Do not induce vomiting. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
Notes to Physician	Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

If ingested, this material presents a significant aspiration/lipoid or chemical pneumonitis hazard. As a result, induction of emesis is not recommended. Consider administration of an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by placement in Trendelenburg and left lateral decubitus position or by cuffed endotracheal intubation. If vital signs become abnormal or symptoms develop, obtain a chest x-ray and liver function tests. Antibiotics are indicated if pulmonary bacterial infection occurs. Monitor for cardiac function and arterial blood gases in severe exposure cases.

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	NFPA Class-II combustible liquid.		
Flash Point Method	CLOSED CUP: 38°C (100°F). (Pensky-Martens. (minimum))		
Lower Flammable Limit	AP 0.7 %	Upper Flammable Limit	AP 5 %
Autoignition Temperature	Not available.		
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons and trace oxides of sulfur and/or nitrogen.		
Special Properties	Combustible Liquid! This material releases vapors when heated above ambient temperatures. Vapors can cause a flash fire. Vapors can travel to a source of ignition and flashback. A vapor and air mixture can create an explosion hazard in confined spaces such as sewers. Use only with adequate ventilation. If container is not properly cooled, it can rupture in the heat of a fire.		
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide, foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or water spray. Water fog and spray are effective in cooling containers and adjacent structures. However, water can cause frothing and/or may not extinguish the fire. Water can be used to cool the external walls of vessels to prevent excessive pressure, autoignition or explosion. DO NOT use a solid stream of water directly on the fire as the water may spread the fire to a larger area.		

Kerosene with DSO

Protection of Fire Fighters Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid enter sewers or waterways.

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Combustible Liquid! Release can result in a fire hazard. Evacuate all non-essential personnel from release area. Establish a regulated zone with site control and security. Eliminate all ignition sources. Stop the leak if it can be done without risk. A vapor-suppressing foam may be used to reduce vapors. Properly bond or ground all equipment used when handling this material. Avoid skin contact. Do not walk through spilled material. Verify that responders are properly trained and wearing appropriate personnel protective equipment. Dike far ahead of a liquid spill. Do not allow released material to enter waterways, sewers, basements, or confined areas. This material will float on water. Absorb or cover with dry earth, sand or other non-combustible material. Use clean, non-sparking tools to collect absorbed material. Place spent sorbent materials, free liquids and other clean-up debris into proper waste containers for appropriate disposal. Certain releases must be reported to the National Response Center (800/424-8802) and state or regulatory authorities. Comply with all laws and regulations.

SECTION 7: HANDLING AND STORAGE

Handling

Combustible Liquid!

A static electrical charge can accumulate when this material is flowing through pipes, nozzles or filters and when it is agitated. A static spark discharge can ignite accumulated vapors particularly during dry weather conditions. Always bond receiving containers to the fill pipe before and during loading. Always keep nozzle in contact with the container throughout the loading process. Do not fill any portable container in or on a vehicle. Special precautions, such as reduced loading rates and increased monitoring, must be observed during "switch loading" operations (i.e., loading this material in tanks or shipping compartments that previously containing gasoline or similar low flash point products).

Fire hazard increases as product temperature approaches its flash point. Use non-sparking tools. Keep container closed and drum bungs in place. Remove spillage immediately from walking areas. Do not handle or store near heat, sparks or other potential ignition sources. Do not handle or store with oxidizing agents. Avoid breathing mist or vapor. Never siphon by mouth. Do not taste or swallow. Avoid contact with eyes, skin and clothing. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure levels. Avoid water contamination. Wash thoroughly after handling. Prevent contact with food or tobacco products.

Cutting or welding of empty containers can ignite residues with explosive force. Do not pressurize or expose empty containers to flames, sparks or heat. Observe all label warnings and precautions. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling or disposing of empty containers and/or waste residues of this product. Return empty drums to a qualified reconditioner. When performing repairs and maintenance on contaminated equipment, keep unnecessary persons from hazard area. Eliminate heat, flame and other potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Storage

Store in a cool, dry, well-ventilated place. Keep containers tightly closed. Do not store this product near heat, flame or other potential ignition sources. Do not store with oxidizers. Do not store this product in unlabeled containers. Do not puncture or incinerate containers. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling or disposing of empty containers or waste residues of this product. Ground all equipment containing this material. All electrical equipment in areas where this material is stored or handled must meet all applicable requirements of the NFPA's National Electrical Code (NEC). Store and transport in accordance with all applicable laws.

Kerosene with DSO

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor or mists below the applicable workplace exposure limits indicated below. All electrical equipment should comply with the National Electric Code. An emergency eye wash station and safety shower should be located near the work-station.

Personal Protective Equipment Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Eye Protection Safety glasses equipped with side shields are recommended as minimum protection in industrial settings. Chemical goggles should be worn during transfer operations or when there is a likelihood of misting, splashing, or spraying of this material. Suitable eye wash water should be readily available.

Hand Protection Avoid skin contact. Use gloves (e.g., disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Wash hands with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities or leaving work. DO NOT use gasoline, kerosene, solvents or harsh abrasives as skin cleaners.

Body Protection Avoid skin contact. Wear long-sleeved fire-retardant garments (e.g., Nomex®) while working with flammable and combustible liquids. Additional chemical-resistant protective gear may be required if splashing or spraying conditions exist. This may include an apron, boots and additional facial protection. If product comes in contact with clothing, immediately remove soaked clothing and shower. Promptly remove and discarded contaminated leather goods.

Respiratory Protection A full-face supplied air pressure-demand respirator with escape bottle or a pressure-demand self-contained, breathing apparatus (SCBA) is required. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).

General Comments Warning! Use of this material in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and/or inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Kerosene (Petroleum)	NIOSH TWA: 100 mg/m ³

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Liquid.	Color	Clear to light amber.	Odor	Pungent, unpleasant odor similar to onions.
Specific Gravity	AP 0.82 (Water = 1)	pH	Not Applicable.	Vapor Density	AP 4 (Air = 1)
Boiling Range	>150°C (>302°F)			Melting/Freezing Point	AP -32°C (-26°F)
Vapor Pressure	<0.3 kPa (<2 mmHg) (at 20°C)			Viscosity (cSt @ 40°C)	Not available
Solubility in Water	Very slightly soluble in cold water.			Volatile Characteristics	AP 825 g/l VOC (W/V)
Additional Properties	Viscosity (ASTM D2161) = 30 - 40 SUS @ 100° F				

Kerosene with DSO

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization Not expected to occur.
Conditions to Avoid	Keep away from heat, flame and other potential ignition sources. Keep away from strong oxidizing conditions and agents.	
Materials Incompatibility	Strong acids, alkalies, and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide and oxygen.	
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.	

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data**Kerosene (Petroleum):**

ORAL (LD50): Acute: 2835 mg/kg [Rabbit]. >5000 mg/kg [Rat].
 DERMAL (LD50): Acute: 2000 mg/kg [Rabbit].
 INHALATION (LC50): Acute: >5000 mg/m³ 4 hour(s) [Rat].

Disulfides, Dialkyl and Di-Ph, Naphtha Sweetening:

ORAL (LD50): Acute: 1,590 mg/kg (Female Rat).
 DERMAL (LD50): Acute: 1800 mg/kg (Rabbit).
 INHALATION (LC50): Acute: > 4,840 mg/L (4 Hours) (Rat).

High levels of dimethyl disulfide, a component of disulfides, di-alkyl and di-phenyl, naphtha sweetening, (Disulfide Oil), may cause hemolytic anemia with potential for development of kidney failure from red blood cell breakdown products excreted in the urine. In experimental animals, dimethyl disulfide overexposures produced hepatic encephalopathy with coma and convulsions. Rats exposed to concentrations of 7 to 26mg/L for 30 to 25 minutes had pulmonary irritation with lung blood vessel damage and convulsions. But, at 805 ppm of dimethyl disulfide for 4 hours, rats had no mortality and only slight liver and spleen damage. Inhalation of 2 ppm for 3 months caused microscopic liver damage. In chickens and other domestic fowl, hemolytic Heinz body anemia was produced by oral administration.

Middle distillates, petroleum:

The products represented by this MSDS contain a mixture of petroleum hydrocarbons commonly referred to as "middle distillates." Laboratory data have associated some middle distillates with skin cancer when the material is applied repeatedly over the lifetime of the test animal. Middle distillates similar to the products represented by this MSDS have been associated with liver and kidney damage in subchronic (90-day) inhalation studies of male rats. The relevance of these findings to human health is unclear.

Naphthalene:

ORAL (LD50): Acute: 1800 mg/kg [Rat]. 533 mg/kg [Mouse]. 1200 mg/kg [Guinea pig].
 DERMAL (LD50): Acute: 969 mg/kg [Mouse].
 INHALATION (LC50): Acute: >340 mg/m³ 1 hour(s) [Rat].

Naphthalene is a potential irritant to eyes, skin and lungs. Ingestion of naphthalene has been associated with severe red blood cell and liver damage leading to death. Following prolonged or repeated exposures, naphthalene has been shown to cause cataracts, optical neuritis, hemolytic and aplastic anemia, jaundice and possibly neurotoxicity. In animal studies, naphthalene caused fetal effects and decreased spleen weights in pregnant female mice. In an NTP sponsored study, naphthalene produced a dose related increase in tumors at the 30 and 60 ppm exposure level in both male and female rats. Higher incidences of respiratory epithelial adenomas, olfactory epithelial neuroblastomas and non-neoplastic lesions of the nose were observed as compared to controls. Cytogenic studies with Chinese hamster ovary cells have demonstrated sister chromatid exchanges and chromosomal aberrations. The relevance of these studies to human health is unclear.

Trimethylbenzenes, all isomers:

The TClO for humans is 10 ppm, with somnolence and respiratory tract irritation noted. In inhalation

Kerosene with DSO

studies with rats, four of ten animals died after exposures of 2400 ppm for 24 hours. An oral dose of 5 mL/kg resulted in death in one of ten rats. Minimum lethal intraperitoneal doses were 1.5 to 2.0 mL/kg in rats and 1.13 to 12 mL/kg in guinea pigs. Levels of total hydrocarbon vapors present in the breathing atmosphere of these workers ranged from 10 to 60 ppm. Mesitylene (1, 3, 5 Trimethylbenzene) inhalation at concentrations of 1.5, 3.0, and 6.0 mg/L for six hours was associated with dose-related changes in white blood cell counts in rats. No significant effects on the complete blood count were noted with six hours per day exposure for five weeks, but elevations of alkaline phosphatase and SGOT were observed. Central nervous system depression and ataxia were noted in rats exposed to 5,100 to 9,180 ppm for two hours.

Biphenyl (Diphenyl):

INHALATION, TCl₀, Acute: 4,400 ug/m³ for 4 hours [Human] - Flaccid paralysis of peripheral nerves without anesthesia and nausea or vomiting.

ORAL, LD₅₀, Acute: >2,600 mg/kg [Cat screening level].

ORAL, LD₅₀, Acute: 2,400 mg/kg [Rat and Rabbit].

ORAL, LD₅₀, Acute: 1,900 mg/kg [Mouse] - Somnolence, hypermotility and diarrhea.

DERMAL, LD₅₀, Acute: >5,010 mg/kg [Rabbit screening level].

Ethylbenzene:

ORAL (LD₅₀): Acute: 3,500 mg/kg [Rat].

DERMAL (LD₅₀): Acute: 17,800 uL/kg [Rabbit].

INTRAPERITONEAL (LD₅₀): Acute: 2,624 mg/kg [Rat].

NTP completed a 2-year inhalation bioassay of ethylbenzene in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200 and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels. However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level; and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Also, hyperplasia was observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear. However, based upon this data, the IARC has designated ethylbenzene as possibly carcinogenic to humans (Group 2B).

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity	Ecotoxicity data are not available for this product. Based on data from similar products, this material is toxic to aquatic organisms.
Environmental Fate	<p>If spilled, this material will normally evaporate. Hydrocarbon components may contribute to atmospheric smog. If released to the subsoils, petroleum middle distillate fuels will strongly adsorb to soils. Groundwater should be considered as an exposure pathway. Liquid and vapor can migrate through the subsurface and preferential pathways (such as utility line backfill) to downgradient receptors.</p> <p>Middle distillates are potentially toxic to freshwater and saltwater ecosystems. Distillate fuels will normally float on water. In stagnant or slow-flowing waterways, a hydrocarbon layer can cover a large surface area. As a result, this oil layer can limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway can cause a fish kill or create an anaerobic environment. Also, this coating action can also kill plankton, algae, and water birds.</p>

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Kerosene with DSO

Conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a hazardous waste at the time of disposal. Potential treatment and disposal methods include land farming and incineration. Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

The shipping description below may not represent requirements for all modes of transportation, shipping methods or locations outside of the United States.

US DOT Status	A U.S. Department of Transportation (DOT) regulated material.		
Proper Shipping Name	Not determined.		
Hazard Class	Not determined.	Packing Group(s)	Not determined.
		UN/NA ID	Not determined.
Reportable Quantity	A Reportable Quantity (RQ) has not been established for this material.		
Placards		Emergency Response Guide No.	Not determined.
		HAZMAT STCC No.	Not determined.
		MARPOL III Status	Not determined.
	Not Available (No disponible)		

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard
SARA 313	This product contains the following components in concentrations above de minimis levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: Naphthalene [CAS No.: 91-20-3] Concentration: 0 - 3% Ethylbenzene [CAS No.: 100-41-4] Concentration: 0 - 1%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are: Naphthalene [CAS No.: 91-20-3] RQ = 100 lbs. (45.36 kg) Concentration: 0 - 2% Ethylbenzene [CAS No.: 100-41-4] RQ = 1000 lbs. (453.6 kg) Concentration: 0 - 1% Xylene, all isomers [CAS No.: 1330-20-7] RQ = 100 lbs. (45.36 kg) Concentration: 0 - 1%
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

Kerosene with DSO

California Proposition 65	This material may contain the following components which are known to the State of California to cause cancer, birth defects or other reproductive harm, and may be subject to the requirements of California Proposition 65 (CA Health & Safety Code Section 25249.5): Naphthalene: 0 - 3%
New Jersey Right-to-Know Label	Kerosene
Additional Regulatory Remarks	No additional regulatory remarks.

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons) with DSO

Material Safety Data Sheet

LYONDELL-CITGO Refining LP
12000 Lawndale Avenue
P.O. Box 2451
Houston, TX 77252-2451

MSDS No. RS0992
Revision Date 2/28/2003

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid.

Color Transparent, colorless to slightly yellow **Odor** Pungent, Disagreeable odor similar to onions.

DANGER:
Extremely flammable liquid; vapor may cause flash fire or explosion. Vapor may travel considerable distance to source of ignition and flash back.
High concentrations of vapor can reduce oxygen available for breathing and cause suffocation.
Harmful or fatal if swallowed - Can enter lungs and cause damage.
May be harmful if inhaled or absorbed through the skin.
Mist or vapor may irritate the eyes, mucous membranes and respiratory tract.
Liquid contact may cause eye or skin irritation.
Overexposures may cause central nervous system (CNS) depression and target organ effects.
Spills may create a slipping hazard.

Contains Benzene - Cancer Hazard. Can cause leukemia and other blood disorders.

Contains Disulfide Oil. Vapors have a strong offensive odor which may cause headaches, nausea, and vomiting.

SECTION 1: IDENTIFICATION

Trade Name	Heavy Hydrodesulfurized Naphtha (C7-C-12 Hydrocarbons)	Technical Contact	(800) 525-4692
Product Number	Not available.	Medical Emergency	(800) 313-7645
CAS Number	64742-82-1	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Heavy Aromatic Naphtha		
Synonyms	Not Applicable.		

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons) with DSO

SECTION 2: COMPOSITION

This product can be described as 100% of any of the following chemical substances and associated CAS numbers:

Heavy Hydrodesulfurized Naphtha (Petroleum) [CAS No.: 64742-82-1]

This product contains the following chemical components:

Component Name(s)	CAS Registry No.	Concentration (%)
1) Disulfides, Dialkyl and Di-Ph, Naphtha Sweetening	68955-96-4	0.2-1
2) Benzene	71-43-2	0-0.2
3) n-Hexane	110-54-3	0-1.6
4) Hexane, other isomers	Mixture	0.2-1
5) C7 Naphthenes	Mixture	7-9
6) Toluene	108-88-3	3-4.5
7) Heptane, all isomers	Mixture	8.8-13
8) Ethylbenzene	100-41-4	1.4-2
9) Xylene, all isomers	1330-20-7	6-8
10) Octanes, all isomers	Mixture	13-20
11) C8 Naphthenes	Mixture	5-11
12) C9 Aromatic Hydrocarbons	Mixture	2.5-7.5
13) Nonane, all isomers	Mixture	10-17
14) C9 Naphthenes	Mixture	3.8-8.1
15) C10+ Aromatic Hydrocarbons	Mixture	1.2-6.2
16) C9+ Saturates	Mixture	11-15
17) Total Olefins	Mixture	0-1.2

SECTION 3: HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Eye contact. Inhalation.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing high concentrations of vapor may cause respiratory irritation, euphoria, excitation or giddiness, headache, nausea, vomiting, abdominal pain, loss of appetite, fatigue, muscular weakness, staggering gait, and central nervous system (CNS) depression. CNS effects include dizziness, drowsiness, disorientation, vertigo, memory loss, visual disturbances, difficulty with breathing, convulsions, unconsciousness, paralysis, coma, and even death, depending upon the exposure duration. Vapors can reduce the oxygen content in air. Sudden death from cardiac arrest (heart attack) may result from exposure to 5,000 ppm for only 5 minutes. Oxygen deprivation is possible if working in confined spaces.
Eye Contact	No irritation to minimal eye irritation is expected upon short-term exposure. This is based upon animal test results for similar materials.
Skin Contact	Tests on similar materials suggest that moderate skin irritation, inflammation, and blistering is expected to occur upon short-term contact. Certain components of this material may be absorbed through the skin. If the skin is damaged, absorption increases.
Ingestion	If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggering gait, drowsiness, loss of consciousness and delirium, as well as additional central nervous system (CNS) effects (see "Inhalation" above).

Due to its light viscosity, there is a danger of aspiration into the lungs during swallowing and subsequent vomiting. Aspiration can result in severe lung damage or death. Cardiovascular effects include shallow rapid pulse and pallor followed by flushing. Also, progressive CNS depression, respiratory insufficiency and ventricular fibrillation may result in death.

Chronic Health Effects Summary	Prolonged and/or repeated contact may cause moderate to severe skin irritation and inflammation. Symptoms include defatting, redness, dryness, blistering, lesions, and/or scaly dermatitis. Chronic effects of ingestion and subsequent aspiration into the lungs may cause pneumatocele (lung cavity) formation and chronic lung dysfunction. Altered mental state, drowsiness, peripheral motor neuropathy, irreversible brain damage (so-called Petrol Sniffers Encephalopathy), delirium, seizures, and sudden death have been common results for gasoline and naphtha abusers.
---------------------------------------	--

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons) with DSO

- Conditions Aggravated by Exposure** Personnel with pre-existing central nervous system (CNS) disease, psychological conditions, skin disorders, impaired cardiovascular, liver, or kidney function, or chronic respiratory diseases should avoid exposure.
- Target Organs** Contains material which may cause damage to the following organs: lungs, liver, mucous membranes, skin, eyes.
- Carcinogenic Potential** **CARCINOGENIC EFFECTS:** Classified 1 (Proven for human.) by IARC, + (Proven.) by OSHA [Benzene]. Classified 2B (Possible for human.) by IARC [Ethylbenzene].

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	<input checked="" type="checkbox"/>	Toxic	<input type="checkbox"/>	Combustible	<input type="checkbox"/>	Explosive	<input type="checkbox"/>	Pyrophoric	<input type="checkbox"/>
Sensitizer	<input type="checkbox"/>	Highly Toxic	<input type="checkbox"/>	Flammable	<input checked="" type="checkbox"/>	Oxidizer	<input type="checkbox"/>	Water-reactive	<input type="checkbox"/>
Corrosive	<input type="checkbox"/>	Carcinogenic	<input type="checkbox"/>	Compressed Gas	<input type="checkbox"/>	Organic Peroxide	<input type="checkbox"/>	Unstable	<input type="checkbox"/>

SECTION 4: FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

- Inhalation** Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
- Eye Contact** Check for and remove contact lenses. If irritation or redness develops, flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
- Skin Contact** Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.
- Ingestion** Do not induce vomiting. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.
- Notes to Physician** Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Vigorous anti-inflammatory or steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required.

If ingested, this material presents a significant aspiration and chemical pneumonitis hazard. Accordingly, induction of emesis is not recommended. Consider administration of an aqueous slurry of activated charcoal followed by a cathartic such as magnesium citrate or sorbitol. Also, treatment may involve careful gastric lavage if performed soon after ingestion or in patients who are comatose or at risk of convulsing. Protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position. Obtain chest X-ray and liver function tests. Monitor for cardiac function, respiratory distress and arterial blood gases in severe exposure cases.

Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias in persons exposed to high concentrations of this material (e.g., in enclosed spaces or with deliberate abuse). If used, monitor heart action closely. Consider use of other drugs with less arrhythmogenic potential.

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons) with DSO

SECTION 5: FIRE FIGHTING MEASURES

NFPA Flammability Classification	NFPA Class-IB flammable liquid.		
Flash Point Method	CLOSED CUP: -6°C (21°F).		
Lower Flammable Limit	AP 0.9 %	Upper Flammable Limit	AP 7.6 %
Autoignition Temperature	232°C (449.6°F)		
Hazardous Combustion Products	Combustion gases may contain carbon monoxide, carbon dioxide, and irritating or acrid combustion products.		
Special Properties	Flammable Liquid! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. A vapor and air mixture can create an explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.		
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide, foam, water fog, or inert gas (nitrogen). LARGE FIRE: Use foam, water fog, or water spray. Water fog and spray are effective in cooling containers and adjacent structures. However, water can cause frothing and/or may not extinguish the fire. Water can be used to cool the external walls of vessels to prevent excessive pressure, autoignition or explosion. DO NOT use a solid stream of water directly on the fire as the water may spread the fire to a larger area.		
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities if liquid enter sewers or waterways.		

SECTION 6: ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Dimethyl Disulfide, a component of this product, has a strong, offensive odor. If this material is released into a work area, evacuate the area immediately. Isolate hazard area. Keep unnecessary and unprotected personnel from entering.

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can be done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent its entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbant pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all laws and regulations.

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons) with DSO

SECTION 7: HANDLING AND STORAGE

Handling

A spill or leak can cause an immediate fire or explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Do not contact with oxidizable materials. Do not breathe vapor. Use only with adequate ventilation and personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food and tobacco products. Do not take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Provide ventilation to maintain exposure potential below applicable exposure limits. Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Empty containers may contain material residues which can ignite with explosive force. Misuse of empty containers can be dangerous if used to store toxic, flammable, or reactive materials. Cutting or welding of empty containers can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Store and transport in accordance with all applicable laws. Keep containers tightly closed and store in a cool, dry, well-ventilated place, plainly labeled, and out of closed vehicles. Keep away from all ignition sources! Ground all equipment containing this material. Containers should be able to withstand pressures expected from warming and cooling in storage. This combustible liquid should be stored in a separate safety cabinet or room. All electrical equipment in areas where this material is stored or handled should be installed in accordance with applicable requirements of the NFPA National Electrical Code (NEC).

SECTION 8: EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapor or mists below the applicable workplace exposure limits indicated below. All electrical equipment should comply with the National Electric Code. An emergency eye wash station and safety shower should be located near the work-station.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Safety glasses equipped with side shields are recommended as minimum protection in industrial settings. Chemical goggles should be worn during transfer operations or when there is a likelihood of misting, splashing, or spraying of this material. Suitable eye wash water should be readily available.

Hand Protection

Avoid skin contact. Use gloves (e.g., disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Wash hands with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities or leaving work. DO NOT use gasoline, kerosene, solvents or harsh abrasives as skin cleaners.

Body Protection

Avoid skin contact. Wear long-sleeved fire-retardant garments (e.g., Nomex®) while working with flammable and combustible liquids. Additional chemical-resistant protective gear may be required if splashing or spraying conditions exist. This may include an apron, boots and additional facial protection. If product comes in contact with clothing, immediately remove soaked clothing and shower. Promptly remove and discarded contaminated leather goods.

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons) with DSO

Respiratory Protection For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).

General Comments Warning! Use of this material in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and/or inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
1) Benzene	ACGIH (United States). Skin TWA: 0.5 ppm STEL: 2.5 ppm OSHA (United States). Skin Notes: See Table Z-2 for exclusions in 20 CFR 1910.1028 to the PEL. TWA: 1 ppm STEL: 5 ppm
2) n-Hexane	ACGIH (United States). Skin TWA: 50 ppm OSHA (United States). TWA: 500 ppm
3) Hexane, other isomers	ACGIH (United States). TWA: 500 ppm STEL: 1000 ppm
4) C7 Naphthenes	ACGIH TLV (United States). TWA: 400 ppm Form: (Methylcyclohexane)
5) Toluene	ACGIH (United States). Skin TWA: 50 ppm OSHA (United States). TWA: 200 ppm CEIL: 300 ppm PEAK: 500 ppm
6) Heptane, all isomers	ACGIH (United States). TWA: 400 ppm STEL: 500 ppm OSHA (United States). TWA: 500 ppm
7) Ethylbenzene	ACGIH (United States). TWA: 100 ppm STEL: 125 ppm OSHA (United States). TWA: 100 ppm
8) Xylene, all isomers	ACGIH (United States). TWA: 100 ppm STEL: 150 ppm OSHA (United States). TWA: 100 ppm
9) Octanes, all isomers	ACGIH (United States). TWA: 300 ppm OSHA (United States). TWA: 500 ppm
10) C9 Aromatic Hydrocarbons	ACGIH TLV (United States). TWA: 25 ppm Form: (Trimethylbenzene)
11) Nonane, all isomers	ACGIH (United States). TWA: 200 ppm

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons) with DSO

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Liquid.	Color Transparent, colorless to slightly yellow	Odor	Pungent, Disagreeable odor similar to onions.
Specific Gravity	0.76 (Water = 1)	pH Not Applicable.	Vapor Density	3.75 (Air = 1)
Boiling Range	60° C (140° F) to 199° C (391° F)		Melting/Freezing Point	Not available.
Vapor Pressure	4.1 kPa (31 mmHg) (at 20°C)		Viscosity (cSt @ 40°C)	Not available
Solubility in Water	Very slightly soluble in cold water.		Volatile Characteristics	760 g/l VOC (W/V)
Additional Properties	Alkane, Isoparaffin and Cycloalkane Hydrocarbons content = 11 to 55 Wt. %[ASTM D-1319]; C7-C12 Aromatic Hydrocarbon Content = 44 to 88 Wt. %[ASTM D-1319]; C7-C12 Olefinic Hydrocarbon Content = <1 Wt. % [ASTM D-1319]; Average Density at 60° F = 6.994 lbs./gallon [ASTM D-2161]; Dry Point Temperature = AP 437° F (225° C) [ASTM D-86]; Octane Rating = AP 92 [ASTM D-2885]; Sulfur Content = AP 0.01 Wt.% [ASTM D-2622 or D-1266]; Evaporation Rate = 0.2 to 1.7 when n-Butyl acetate = 1.0; Heat Value = 18,000 to 18,500 Btu			

SECTION 10: STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, strong acids, and strong oxidizing conditions.		
Materials Incompatibility	Strong acids, alkalis, and oxidizers such as liquid chlorine, hydrogen peroxide, and oxygen.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11: TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Disulfides, Dialkyl and Di-Ph, Naphtha Sweetening:

ORAL (LD₅₀): Acute: 1,590 mg/kg (Female Rat).
 DERMAL (LD₅₀): Acute: 1800 mg/kg (Rabbit).
 INHALATION (LC₅₀): Acute: > 4,840 mg/L (4 Hours) (Rat).

High levels of dimethyl disulfide, a component of disulfides, di-alkyl and di-phenyl, naphtha sweetening, (Disulfide Oil), may cause hemolytic anemia with potential for development of kidney failure from red blood cell breakdown products excreted in the urine. In experimental animals, dimethyl disulfide overexposures produced hepatic encephalopathy with coma and convulsions. Rats exposed to concentrations of 7 to 26mg/L for 30 to 25 minutes had pulmonary irritation with lung blood vessel damage and convulsions. But, at 805 ppm of dimethyl disulfide for 4 hours, rats had no mortality and only slight liver and spleen damage. Inhalation of 2 ppm for 3 months caused microscopic liver damage. In chickens and other domestic fowl, hemolytic Heinz body anemia was produced by oral administration.

Benzene:

ORAL (LD₅₀): Acute: 930 mg/kg [Rat] - Tremors and convulsions.
 ORAL (LD₅₀): Acute: 4,700 mg/kg [Mouse].
 GAS (LC₅₀): Acute: 10,000 ppm for 7 hours [Rat].
 GAS (LC₅₀): Acute: 9,980 ppm for 8 hr. [Mouse] - General anesthesia, muscle weakness, and

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons) with DSO

dyspnea.

Prolonged and repeated exposure to high concentrations of benzene is associated with injury to blood forming organs and anemia. It is linked to the development of acute myelogenous leukemia (AML) in humans. Studies of workers exposed to high levels of benzene have identified humoral and cellular immunity impairment and a decrease in levels of circulating leukocytes. NTP, IARC and OSHA list benzene as carcinogenic to humans. Consumption of alcohol may increase the blood system changes related to benzene exposure. Animal studies have shown testicular effects and alterations in reproductive cycles, but teratogenic effects have not been reported even at maternally toxic doses. Also, animal studies show some evidence of fetotoxic and developmental effects.

Toluene:

Deliberate long-term inhalation of toluene at high concentrations (e.g., glue sniffing) has been associated with liver effects, kidney damage, CNS depression, brain damage and cardiac sensitization. In addition, intentional abuse behavior increases the risk for reproductive effects including pre-term delivery, prenatal death and growth retardation. Also, case studies of persons abusing toluene have revealed isolated incidences of birth defects. Long-term inhalation studies with toluene produced kidney damage, enlargement of the liver and thymus, heart palpitations, brain damage, general weakness and impaired reaction time in laboratory animals. Case studies have reported hearing damage in humans exposed elevated concentrations of toluene and other mixed solvents.

Heptane, all isomers:

n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not considered to be carcinogenic.

Ethylbenzene:

ORAL (LD₅₀): Acute: 3,500 mg/kg [Rat].

DERMAL (LD₅₀): Acute: 17,800 uL/kg [Rabbit].

INTRAPERITONEAL (LD₅₀): Acute: 2,624 mg/kg [Rat].

NTP completed a 2-year inhalation bioassay of ethylbenzene in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200 and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels. However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level; and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Also, hyperplasia was observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear. However, based upon this data, the IARC has designated ethylbenzene as possibly carcinogenic to humans (Group 2B).

Xylene, all isomers:

ORAL (LD50): Acute: 4,300 mg/kg [Rat].

GAS (LC50): Acute: 4,550 ppm for 4 hours [Rat].

DERMAL (LD50): Acute: 14,100 uL/kg [Rabbit].

Overexposure to xylene may cause upper respiratory tract irritation, headache, cyanosis, blood serum changes, CNS damage and narcosis. Effects may be increased by the use of alcoholic beverages. Also, ototoxicity has been associated with chronic overexposure to xylene. An inhalation study with laboratory rats indicated an association between elevated exposures to mixed xylenes and hearing loss. Animal studies have associated embryo and fetotoxicity with maternally toxic dose exposures of mixed xylene isomers and ethylbenzene. Lung inflammation and liver damage were identified as health effects in chronic studies using guinea pigs. The significance of these animal study results to humans is not known.

C9 Aromatic Hydrocarbons:

C9 aromatic hydrocarbons can cause eye, skin and respiratory irritation. No significant mutagenicity, chromosomal aberrations or neurological effects were observed in evaluations conducted pursuant to a TSCA test rule. A NOEL of 100 ppm was established from developmental toxicity and 3-generation reproductive toxicity studies required under the test rule. Parental toxicity (reduced body weight and food consumption) was present at all exposure levels.

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons) with DSO

SECTION 12: ECOLOGICAL INFORMATION

Ecotoxicity	<p>Ecological effects testing has not been conducted on this material. If spilled, this naphtha, its storage tank water bottoms and sludge, and any contaminated soil or water may be hazardous to human, animal, and aquatic life. Volatile aromatic hydrocarbon components may be released and possibly contribute to the creation of atmospheric smog.</p> <p>Using Rainbow Trout (<i>Oncorhynchus mykiss</i>) and Dungeness Crab (<i>Cancer magister</i>), similar naphthas showed a 96-hour TLm (Median Toxic Limit) from 5 ppm to 30 ppm in ambient saltwater. Also, 24-hour and 96-hour TLms produced results from 60 ppm to 200 ppm when using Bluegill Sunfish (<i>Lepomis macrochirus</i>), Goldfish (<i>Carassius auratus</i>), Guppy (<i>Lebistes reticulatus</i>) and juvenile American Shad (<i>Squalius cephalus</i>) in fresh water. Also, 24-hour and 96-hour LC50s for toluene produced results from 25 ppm to 60 ppm when using Bluegill Sunfish (<i>Lepomis macrochirus</i>), Goldfish (<i>Carassius auratus</i>), and Guppy (<i>Lebistes reticulatus</i>) in fresh water. Using Water Fleas (<i>Daphnia magna</i>), toluene showed 24-hour TLms of from 100 ppm to 200 ppm. Based upon actual spill incident investigations, similar naphthas have been shown to bioaccumulate in tissues of various fish from a 1 ppm to 10 ppm levels.</p>
Environmental Fate	<p>This mixture contains components that are potentially toxic to freshwater and saltwater ecosystems. It will normally float on water with its lighter components evaporating rapidly. In stagnant or slow-flowing waterways, a hydrocarbon layer can cover a large surface area. As a result, this covering layer might limit or eliminate natural atmospheric oxygen transport into the water. With time, if not removed, oxygen depletion in the waterway might be enough to cause a fish kill or create an anaerobic environment. This coating action can also be harmful or fatal to plankton, algae, aquatic life, and water birds.</p>

SECTION 13: DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a hazardous waste at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14: TRANSPORT INFORMATION

The shipping description below may not represent requirements for all modes of transportation, shipping methods or locations outside of the United States.

US DOT Status	A U.S. Department of Transportation regulated material.		
Proper Shipping Name	Petroleum distillates, n.o.s. (Octanes, Nonanes)		
Hazard Class	3	Packing Group(s)	II
		UN/NA ID	UN1268
Reportable Quantity	100 lbs. (45.36 kg)		
Placards			

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons) with DSO

Emergency Response Guide No.	128
HAZMAT STCC No.	491026
MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15: REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Fire, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard
SARA 313	This product contains the following components in concentrations above de minimis levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: Benzene [CAS No.: 71-43-2] Concentration: 0.1% Toluene [CAS No.: 108-88-3] Concentration: 3.8% Ethylbenzene [CAS No.: 100-41-4] Concentration: 1.7% Xylene, all isomers [CAS No.: 1330-20-7] Concentration: 7%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are: Benzene [CAS No.: 71-43-2] RQ = 10 lbs. (4.536 kg) Concentration: 0.1% n-Hexane [CAS No.: 110-54-3] RQ = 5000 lbs. (2268 kg) Concentration: 0.8% Toluene [CAS No.: 108-88-3] RQ = 1000 lbs. (453.6 kg) Concentration: 3.8% Ethylbenzene [CAS No.: 100-41-4] RQ = 1000 lbs. (453.6 kg) Concentration: 1.7% Xylene, all isomers [CAS No.: 1330-20-7] RQ = 100 lbs. (45.36 kg) Concentration: 7%
CWA	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material may contain the following components which are known to the State of California to cause cancer, birth defects or other reproductive harm, and may be subject to the requirements of California Proposition 65 (CA Health & Safety Code Section 25249.5): Benzene: 0.1% Toluene: 3.75%
New Jersey Right-to-Know Label	For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.
Additional Regulatory Remarks	No additional regulatory remarks.

Heavy Hydrodesulfurized Naphtha (C7-C12 Hydrocarbons) with DSO

SECTION 16: OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview			
Physical State	Gas.		
Color	Colorless.	Odor	Odorless.
WARNING!			
Hot gas contact will cause burns and tissue damage.			
May be harmful or fatal if inhaled.			
Gas reduces oxygen available for breathing and may cause central nervous system (CNS) depression or suffocation.			
May contain toxic Carbon Monoxide (CO).			

Protective Equipment
Minimum Recommended See Section 8 for Details This recommendation reflects minimum PPE when product is at elevated temperatures

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	Refinery Heater Flue Gas	Technical Contact	(800) 525-4692
Product Number	RS1000	Medical Emergency	(800) 313-7645
CAS Number	Mixture---See Section 2.	CHEMTREC Emergency (United States Only)	(800) 424-9300
Product Family	Refinery Waste Gas		
Synonyms	Heater Flue Gas; Flue Gas		

SECTION 2. COMPOSITION

Component Name(s)	CAS Registry No.	Concentration (%)
Nitrogen	7727-37-9	70-75
Carbon dioxide	124-38-9	7-9
Water	7732-18-5	16-18
Oxygen	7782-44-7	3-6

Refinery Heater Flue Gas

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Inhalation. Skin Contact. Eye Contact.

Signs and Symptoms of Acute Exposure

Inhalation **Nitrogen**, the major component of this material, is a "simple asphyxiant" (see Section 8). Its vapors can displace the amount of oxygen in air available to breathe below that necessary to sustain life, especially if working in confined spaces. Symptoms of oxygen deficiency may include increased breathing rate; accelerated heart beat; impaired attention, thinking and coordination.

Carbon monoxide is toxic to humans and has been determined to be "immediately hazardous to life and health (IDLH)" at a concentration of 1,200 ppm in air. (See Section 11.)

Eye Contact Upon direct contact, hot gas may cause severe thermal burns.

Skin Contact Skin contact with hot gas may result in severe thermal burns.

Ingestion Ingestion is not an applicable route of exposure for gases.

Chronic Health Effects Summary Chronic **carbon monoxide (CO)** inhalation exposure may cause mild effects on the heart, blood, nervous system, and reproductive system. Also, the human fetus may be highly susceptible to the neurological effects of carbon monoxide because the generated levels of bound carboxyhemoglobin (COHb) are often the same as the mother. Fetal oxygen demand is higher than that of the mother and its blood COHb releases CO more slowly. COHb levels of 10% or higher can cause brain damage in the fetus, with greater risk during late pregnancy. (See Section 11.)

Conditions Aggravated by Exposure Personnel with pre-existing chronic respiratory or central nervous system (CNS) diseases or skin, blood, and/or cardiovascular conditions should avoid exposure. Persons who smoke 2 or more packs of cigarettes per day or who are compromised in their ability to use oxygen, such as asthmatics and those with heart disease, reduced pulmonary function, or anemia, may be more sensitive to excess concentrations of "simple asphyxiants" and **carbon monoxide**.

Target Organs This material causes damage to the following organs: mucous membranes, skin, eyes, central nervous system, brain, and possibly, the heart, blood and reproductive system.

Carcinogenic Potential This material does not contain any components at concentrations above 0.1% which are considered carcinogenic by OSHA, IARC, or NTP.

OSHA Health Hazard Classification				OSHA Physical Hazard Classification

Refinery Heater Flue Gas

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress and loosen any tight clothing such as a collar, tie, belt, or waistband. If the individual is not breathing, immediately begin rescue breathing (CPR), as necessary. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately.
Eye Contact	Check for and remove contact lenses. If tissue is frozen, immediately seek medical attention. If tissue is not frozen, immediately and thoroughly flush the eye(s) gently with large amounts of clean, low-pressure warm water (105° to 115°F) for at least 15 minutes, occasionally lifting the upper and lower eyelids to ensure complete irrigation of the eye and eyelid tissue. Do not use hot water! Do not use eye ointment. If pain, redness, swelling, or tearing persist, obtain medical attention as soon as possible.
Skin Contact	If burned by hot gas, cool affected skin by quenching with cool water. Seek medical attention immediately. If frozen, the affected tissue area should be placed in a warm water bath with temperatures at or below 40°C (104°F). DO NOT use dry heat or hot water! Rewarming should continue until natural skin tones return to the affected area. If skin surface is damaged or if pain or irritation persists, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water.
Ingestion	Due to the gaseous nature of this material, ingestion is not a likely route of entry.
Notes to Physician	Cardiac and arterial blood gas monitoring, 100 percent oxygen supplementation, chest x-ray, and supportive care for CNS complications are indicated for asphyxiated patients. Inhalation overexposure can produce other toxic effects. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, or pneumonitis. Vigorous anti-inflammatory/steroid treatment may be required at first evidence of upper airway or pulmonary edema. Administer 100 percent humidified supplemental oxygen with assisted ventilation, as required. Monitor arterial blood gases and chest x-ray in cases with significant exposure.

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	Non-flammable Gas Mixture.		
Flash Point	Not applicable		
Lower Flammable Limit	AP 12.5% for Carbon Monoxide.	Upper Flammable Limit	AP 74% for Carbon Monoxide.
Autoignition Temperature	609°C (1128°F) for Carbon Monoxide.		
Hazardous Combustion Products	Not applicable		
Special Properties	If released, immediately evacuate personnel to a safe upwind area. This mixture may be lighter than air and rises rapidly collecting in the upper portions of confined spaces. The heavier components of this mixture will stay near the ground. Exposed to an ignition source, they could ignite with explosive force. Keep away from all ignition sources!		
Extinguishing Media			

Refinery Heater Flue Gas

DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS THE GAS FLOW CAN BE STOPPED! Control the fire until the source gas supply can be shut off and then allow the fire to burn itself out. Cool tanks, containers, other structures, equipment, and surfaces exposed to the fire with water fog or spray in order to prevent pressure build-up, autoignition, or explosion. Use water, dry chemical, carbon dioxide (CO₂), and/or inert gas (nitrogen) to extinguish adjacent burning materials.

Protection of Fire Fighters

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion/decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Non-flammable Compressed Gas! Evacuate all non-essential personnel to an area upwind. Safely stop the source gas flow using non-sparking tools. Ventilate enclosed areas to prevent formation of flammable or oxygen-deficient atmospheres.

SECTION 7. HANDLING AND STORAGE

Handling

WARNING! May contain a Poisonous Gas! Do NOT breathe vapor; it might contain carbon monoxide (CO) and/or a simple asphyxiant. Odor is not an adequate warning of potentially hazardous air concentrations. Use only with proper personal protective equipment including supplied breathing air. Releases of this material can cause atmospheres to become oxygen deficient and/or create a fire or explosion hazard. Do not enter such areas/confined spaces without adequate safety procedures including appropriate monitoring system with alarms for oxygen deficiency, CO concentrations, and flammability.

When performing repairs or maintenance on contaminated equipment, keep unnecessary persons away from the hazard area. Eliminate heat and other ignition sources. Use non-sparking and explosion-proof equipment. Provide ventilation to maintain exposures below the applicable workplace exposure limits shown in Section 8. Do not allow gas to contact eyes, skin or other tissues. Wear protective work clothing and chemical splash goggles and face shield or supplied air when contact with escaping compressed gas is anticipated.

Storage

Do not store this material near heat. Segregate from oxidizers and combustible materials by a distance of at least 20 feet. Do not store this product in unlabeled containers. Keep containers tightly closed.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Local exhaust and general room ventilation may both be essential in work areas to prevent accumulation of explosive gas/air mixtures. If mechanical ventilation is used, all equipment must comply with the National Electrical Code (NEC) Standards. If engineering controls and work practices are not effective in controlling exposure to this material, then wear suitable personal protection equipment including approved supplied air respiratory protection. Ensure that an emergency eye wash station and safety shower are near the work-station location.

Refinery Heater Flue Gas

Personal Protective Equipment Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

This recommendation reflects minimum PPE when product is at elevated temperatures.

- Eye Protection** Use full-face respirator and face shield (ANSI Z87.1 or approved equivalent) when handling this gas mixture.
- Hand Protection** Use insulated, chemical-resistant gloves or leather gloves over impervious, chemically-resistant gloves to protect hands from potential contact with hot or cold vapors.
- Body Protection** Prevent potential skin contact with hot or cold vapors. Use insulated and chemical-resistant clothing (apron, slicker suit, coveralls, boots, etc.). Fire-retardant garments (e.g. Nomex®) should be worn while working with flammable gases.
- Respiratory Protection** Odor is not an adequate warning for potentially hazardous air concentrations! Use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA), especially when entering a confined space or area where the oxygen concentration may be reduced because of an accumulation of gas vapors. Otherwise, use a NIOSH-approved supplied air respirator. Respirator use should follow OSHA requirements (29 CFR 1910.134) or equivalent (e.g. ANSI Z88.2)
- General Comments** For an explanation about the occupational exposure limits shown below, refer to the definition of "**Simple Asphyxiant**" presented in the American Conference of Governmental Industrial Hygienists (ACGIH) most current **Threshold Limit Values (TLVs) for Chemical Substances and Physical Agents** handbook. Releases of these gases may cause atmospheres, some oxygen-deficient (< 19.5 Vol.% in air), which may have flammable/explosive potential. **DO NOT ENTER** such areas/confined spaces without special safety procedures including appropriate monitoring for oxygen deficiency and flammability.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
Nitrogen	Simple asphyxiant.
Carbon dioxide	TWA: 5,000 (ppm) from ACGIH (TLV) 30,000 (ppm) from ACGIH (STEL) TWA: 5,000 (ppm) from OSHA (PEL) 30,000 (ppm) from OSHA (STEL) [Proposed]
Carbon monoxide	TWA: 25 (ppm) from ACGIH (TLV) TWA: 50 (ppm) from OSHA (PEL) TWA: 35 CEIL. 200 (ppm) from OSHA [Proposed]

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Gas.	Color	Colorless.	Odor	Odorless.
Specific Gravity	0.81 to 0.83 (Water = 1)	pH	Water contact might produce an acidic solution.	Vapor Density	0.97 to 1.5 (Air = 1)
Boiling Range	-195° to -78°C (-320° to -109°F) (ASTM-2887)	Melting/Freezing Point			-218° to -206°C (-361° to -340°F)

Refinery Heater Flue Gas

Vapor Pressure	50 to 100 psia at 100°F (38°C)	Volatility	If open to the atmosphere, it will disperse rapidly or might form a vapor cloud depending upon its temperature and the terrain.
Solubility in Water	Negligible to slightly soluble in cold water depending upon its temperature.	Viscosity (cSt @ 40°C)	Not applicable.
Additional Properties	Not applicable.		

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	Keep away from extreme heat, sparks, open flame and strongly reducing conditions.		
Materials Incompatibility	Strong acids, alkalies, halogens, and organic materials.		
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.		

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Carbon monoxide (CO) is extremely toxic with permanent effects from acute exposure. CO is toxic because it binds to hemoglobin in the blood, preventing oxygen binding, reducing blood transport capacity, and thus cellular respiration. Breathing CO at 5 to 30 ppm in air, or smoking one pack of cigarettes per day, increases the blood carboxyhemoglobin (COHb) level in an adult to between 1 and 5%. Exposure to ambient CO levels of 30 to 60 ppm in air, or smoking up to 3 packs of cigarettes per day, increases blood COHb to a range of 5 to 9%. At this COHb level, persons with coronary artery disease can develop chest pain upon moderate exertion. Binding of CO to hemoglobin is slowly reversible, with a half-life of approximately 5 to 7 hours while breathing room air.

Acute CO poisoning occurs frequently and is the most common cause of lethal poisonings in the U.S.A. and France (17.5 deaths per 100,000 population from fires, automobile exhaust, defective heaters and stoves, and improper use of charcoal briquettes). Also, almost every known neurological disorder has been associated with CO poisoning, including deafness, blindness, and Parkinsonism. Structural damage of the brain can be seen on the CAT scans of persons who survived high-level acute CO exposures. Neurological deterioration may be delayed following recovery. Acute CO exposure also affects the heart, producing damage to the myocardium, because it requires a high level of oxygenation.

Whether or not there is a chronic CO poisoning distinct from the acute effects is controversial. However, chronic CO exposure can aggravate angina pectoris in persons with coronary artery disease.

Refinery Heater Flue Gas

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity	Ecological effects testing has not been conducted on this gas mixture. Releases are expected to cause only localized non-persistent environmental damage; however, at ambient or higher temperatures and pressure, the carbon monoxide component of this material will readily vaporize and may contribute to generation of atmospheric smog.
Environmental Fate	Carbon monoxide residence times in the atmosphere range from about one day to more than 40 days, depending upon the season, latitude, and presence of other air pollutants. Reduced temperatures increase the residence time.

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

This material is probably not a RCRA Hazardous Waste on disposal. However, allow fugitive concentrations to dissipate to well below the lower explosive limit shown in Section 5 before proceeding with its clean-up. This material may be disposed of by controlled high-temperature burning in a properly designed incinerator, if possible and permissible. Venting of this gas to the atmosphere should be avoided. Treatment, storage, transportation, and disposal must be in accordance with applicable Federal, State, and local regulations. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues. Defective, empty, or partially used portable containers should be returned to the supplier with appropriate tags.

SECTION 14. TRANSPORT INFORMATION

The shipping description below may not represent requirements for all modes of transportation, shipping methods or locations outside of the United States.

US DOT Status	A U.S. Department of Transportation (DOT) regulated material.		
Proper Shipping Name	Nitrogen and rare gases mixture		
Hazard Class	2.2 (Non-flammable gas)	Packing Group(s)	Not applicable.
		UN/NA Number	UN1981
Reportable Quantity	A Reportable Quantity (RQ) has not been established for this material.		
Placard(s)		Emergency Response Guide No.	121
		HAZMAT STCC No.	49 045 69
		MARPOL III Status	Not a DOT "Marine Pollutant" per 49 CFR 171.8.

Refinery Heater Flue Gas

SECTION 15. REGULATORY INFORMATION

TSCA Inventory	This material and/or its components are listed on the Toxic Substance Control Act (TSCA) inventory.
SARA 302/304 Emergency Planning and Notification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. Chemical substances present in this material and are not subject to this statute.
SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Sudden Release of Pressure, and Acute (Immediate) and Chronic (Delayed) Health Hazards.
SARA 313 Toxic Chemical Notification and Release Reporting	This material does not contain any components in concentrations which are at or above de minimis levels which are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. Chemical substances present in this material are not subject to this statute.
Clean Water Act (CWA)	This material is NOT classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA).
California Proposition 65	This material does not contain any chemical substances which are known to the State of California to cause cancer, birth defects, or other reproductive harm, and therefore, it is not subject to requirements of California Health & Safety Code Section 25249.5.
New Jersey Right-to-Know Label	For New Jersey labeling, refer to the components listed in Section 2.
Additional Regulatory Remarks	No additional regulatory remarks.

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

Houston, TX 77252-2451

MSDS No. RS6806
Revision Date 11/3/2003

IMPORTANT: Read this MSDS before handling or disposing of this product and pass this information on to employees, customers and users of this product.

Emergency Overview

Physical State Liquid.
Color Brown to black. (Dark.) **Odor** Faint Odor (Hydrogen sulfide odor).

DANGER!

Corrosive. Causes eye and skin burns.
Causes respiratory irritation and can cause damage to respiratory system.
May be harmful or fatal if swallowed.
If swallowed, seek medical attention immediately.

Contains bound Hydrogen Sulfide and Mercaptans. Flammable and poisonous gas may be released if this material comes into contact with acids, heat or agitation.

This material contains ethylbenzene at concentrations at or above 0.1%. Ethylbenzene is considered possibly carcinogenic to humans by IARC.

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Eye contact. Inhalation. Ingestion.

Signs and Symptoms of Acute Exposure

Inhalation	Breathing vapors or aerosols from this material can cause irritation of the throat and lungs with cough and difficult breathing.
Eye Contact	Contact can cause burns and permanent injury to eye tissue. Can cause blindness.
Skin Contact	Contact can cause skin burns and permanent skin damage.
Ingestion	Swallowing this material may be harmful or cause death. Harmful effects include burns and permanent damage to the digestive tract, including the mouth, throat, stomach and intestines. Symptoms may include severe abdominal pain and vomiting of blood. Blood loss through damaged tissue can lead to low blood pressure and shock.

Chronic Health Effects Summary Prolonged and/or repeated skin contact may produce severe irritation and inflammation. This material, or a component of this material is a suspect cancer hazard and may cause cancer in humans.
See Toxicological Information (section 11)

Conditions Aggravated by Exposure Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Skin

Target Organs This material causes damage to the following organs: skin, eye, lens or cornea.

Carcinogenic Potential **CARCINOGENIC EFFECTS:** Classified 2B (Possible for human.) by IARC [Ethylbenzene].

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

Merox Lift Station Hydrocarbon/Caustic Stream

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to **Exposure Controls and Personal Protection in Section 8 of this MSDS.**

Inhalation	Immediately move exposed individual to fresh air. Monitor for respiratory distress. If the individual is not breathing, immediately begin rescue breathing. If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately. Persons providing mouth-to-mouth rescue breathing may be placing themselves at risk either from exposure to toxic materials or communicable disease.
Eye Contact	Do not attempt to remove contact lenses. Immediately irrigate eyes with copious amounts of cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. Do not use eye ointment. Seek medical attention immediately.
Skin Contact	Flush thoroughly with cool water under a shower of water for at least 15 minutes while removing contaminated shoes and clothing. Seek medical attention if tissue appears damaged or if pain or irritation persists. Thoroughly clean contaminated clothing before reuse. Discard contaminated leather goods.
Ingestion	Do not induce vomiting. If spontaneous vomiting is about to occur, place victim's head below knees. Do not attempt to neutralize. Have victim rinse mouth with water then drink two to three large glasses of milk or water. Never give anything by mouth to a person who is not fully conscious. Keep airway clear. Seek medical attention immediately.
Notes to Physician	<p>INHALATION: Treat as corrosive material. Monitor for pharyngeal and pulmonary edema. Onset may be delayed up to 24 hours from exposure. Administer supplemental oxygen with assisted ventilation, as required.</p> <p>SKIN: Treat as corrosive material. Wash contaminated skin thoroughly with water or saline.</p> <p>INGESTION: Due to the potential for esophageal or gastrointestinal tract burns following ingestion, do not induce emesis. Careful gastric lavage may be considered. Immediate dilution with water or milk may be beneficial. Do not treat with sodium bicarbonate or attempt to neutralize as this can cause exothermic gas generation and, in severe cases, cause perforation.</p>

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification	Not applicable.		
Flash Point	Not applicable.		
Lower Flammable Limit	Not determined.	Upper Flammable Limit	Not determined.
Autoignition Temperature	Not applicable.		
Hazardous Combustion Products	Material does not support combustion. No hazardous decomposition products are expected.		
Special Properties	This material may react with water and acid solutions. This material is not expected to burn and therefore no special procedures should be necessary.		
Extinguishing Media	Not expected to present a fire or explosion hazard. Use foam, waterspray, dry chemical, or carbon dioxide (CO ₂) as extinguishing agents should this material become involved in a fire.		

Merox Lift Station Hydrocarbon/Caustic Stream

Protection of Fire Fighters

Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the **Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.**

Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Do not get water inside containers. Minor leaks or spills can be diluted and neutralized with plenty of water. To avoid the evolution of poisonous hydrogen sulfide gas, this acid must not be allowed to contact sulfide wastes (as in sewers). Absorb or cover the neutralized residue with dry earth, sand, or other non-combustible material and transfer to containers. All clean-up materials should be removed for proper treatment or disposal. Contain large spills to maximize product recovery or disposal. Prevent entry into waterways or sewers. In urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from ecologists to minimize physical habitat damage. Comply with all laws and regulations.

SECTION 7. HANDLING AND STORAGE

Handling

Do not breathe vapor or mist. Do not get in eyes, on skin or on clothing. Wash thoroughly after handling.

Storage

Store in glass or other approved containers away from chemicals and combustible materials. Store in a cool, dry, secure and well ventilated area away from sunlight. Keep away from heat, sparks and flame. Keep container tightly closed. Storage area should be equipped with an appropriate chemical resistant floor. Drainage facilities should be constructed for containment of small spills.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

No special ventilation is required under normal conditions of use. Where engineering controls are feasible, use adequate local exhaust ventilation wherever mist, spray, or vapor may be generated. Where carbon dioxide or sulfur dioxide may be generated, special ventilation may be required. Ensure that an emergency eye wash station and safety shower are located near the work-station.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Minimum PPE reflects the requirements for this material at this facility: LYONDELL-CITGO Refining LP Manufacturing Complex

Merox Lift Station Hydrocarbon/Caustic Stream

Eye Protection	Safety glasses equipped with side shields are recommended as minimum protection in industrial settings. When there is a likelihood of misting, splashing, or spraying, chemical-resistant goggles and full-face shield should be worn. Suitable eye wash water should be readily available.
Hand Protection	Avoid skin contact. Disposable neoprene, rubber, or vinyl gloves are required for use. Wash hands and other exposed skin with mild soap and water before eating, drinking, smoking, or using the toilet facilities.
Body Protection	Avoid all skin contact. If splashing or spraying is expected, chemical-resistant protective clothing (Tyvek®, butyl rubber, or neoprene) should be worn. Protective clothing should include long-sleeves, apron, slicker suit, boots and additional facial protection. Use a full-body corrosives suit whenever appropriate. If general contact occurs, IMMEDIATELY get under an emergency shower and remove contaminated clothing. Then take a thorough shower. Contaminated leather goods should be removed immediately and discarded.
Respiratory Protection	For unknown vapor concentrations use a positive-pressure, pressure-demand, self-contained breathing apparatus (SCBA). For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved acid gas-organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134).
General Comments	Use good personal hygiene practices. Wash hands and other exposed skin areas with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities, or leaving work. Do not use gasoline, kerosene, solvents, or harsh abrasive skin cleaners. Use of personal protective equipment and good personal hygiene are essential to controlling exposures to this aqueous solution.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
C9 Aromatic Hydrocarbons	ACGIH TLV (United States). TWA: 25 ppm 8 hour(s). Form: (Trimethylbenzene)
Xylene, all isomers	ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 150 ppm 15 minute(s). OSHA (United States). TWA: 100 ppm 8 hour(s).
Ethylbenzene	ACGIH (United States). TWA: 100 ppm 8 hour(s). STEL: 125 ppm 15 minute(s). OSHA (United States). TWA: 100 ppm 8 hour(s).
Toluene	ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 200 ppm 8 hour(s). CEIL: 300 ppm PEAK: 500 ppm
n-Hexane	ACGIH (United States). Skin TWA: 50 ppm 8 hour(s). OSHA (United States). TWA: 500 ppm 8 hour(s).
Benzene	ACGIH (United States). Skin TWA: 0.5 ppm 8 hour(s). STEL: 2.5 ppm 15 minute(s). OSHA (United States). Skin Notes: See Table Z-2 for exclusions in 20 CFR 1910.1028 to the PEL. TWA: 1 ppm 8 hour(s). STEL: 5 ppm 15 minute(s).

Merox Lift Station Hydrocarbon/Caustic Stream

Ethyl mercaptan	ACGIH (United States). TWA: 0.5 ppm 8 hour(s). CEIL: 10 ppm
Alkyl mercaptans	ACGIH TLV (United States). TWA: 0.5 ppm 8 hour(s). OSHA PEL Z2 (United States). CEIL: 10 ppm
Hydrogen Sulfide	ACGIH TLV (United States). TWA: 10 ppm 8 hour(s). STEL: 15 ppm 15 minute(s). OSHA (United States). CEIL: 20 ppm 8 hour(s). STEL: 50 ppm 15 minute(s). Form: *10 minute peak; once per 8 hour shift
Sodium Hydroxide	ACGIH TLV (United States). CEIL: 2 mg/m ³ OSHA (United States). TWA: 2 mg/m ³ 8 hour(s).

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Liquid.	Color	Brown to black. (Dark.)	Odor	Faint Odor (Hydrogen sulfide odor).
Specific Gravity	>1 (Water = 1) (Estimated.)	pH	> 12.5	Vapor Density	> 1
Boiling Range	AP 100° C (AP 212° F)			Melting/Freezing Point	<0°C (32°F)
Vapor Pressure	The highest known value is 2.3 kPa (17.5 mmHg) (at 20°C) (Water).			Volatility	Non-volatile.
Solubility in Water	Easily soluble in cold water. Soluble in methanol.			Viscosity (cSt @ 40°C)	Not determined.
Additional Properties	No additional information.				

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability	Stable.	Hazardous Polymerization	Not expected to occur.
Conditions to Avoid	This material is incompatible with acids and oxidizers.		
Materials Incompatibility	May react or be incompatible with acids.		
Hazardous Decomposition Products	This material is expected to be unreactive with most common materials. No hazardous chemical reaction products are expected.		

Merox Lift Station Hydrocarbon/Caustic Stream

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Ethylbenzene:

ORAL (LD50): Acute: 3,500 mg/kg [Rat].

DERMAL (LD50): Acute: 17,800 uL/kg [Rabbit].

INTRAPERITONEAL (LD50): Acute: 2,624 mg/kg [Rat].

NTP completed a 2-year inhalation bioassay of ethylbenzene in rodents. The study was conducted in rats and mice at exposure concentrations of 0, 75, 200 and 750 ppm. No significant effects were observed at the 75 and 200 ppm levels. However, compared to chamber controls, the severity of nephropathy was increased in rats at the 750 ppm level; and male rats had higher incidences of renal tubule carcinomas. Step section analyses of the kidneys found a significant increase hyperplasia and renal tubule adenomas in both male and female rats. Also at this 750 ppm level, male mice had a higher incidence of alveolar/bronchiolar adenomas and carcinomas and female mice had increased hepatocellular adenomas and carcinomas when compared to chamber controls. Also, hyperplasia was observed in the thyroid gland of both sexes of mice and in the pituitary gland of female mice. The relevance of these findings to human health is unclear. Based upon this data, IARC has designated ethylbenzene as possibly carcinogenic to humans (Group 2B).

Disulfides, Dialkyl and Di-Ph, Naphtha Sweetening:

ORAL (LD50): Acute: 1,590 mg/kg (Female Rat).

DERMAL (LD50): Acute: 1800 mg/kg (Rabbit).

INHALATION (LC50): Acute: > 4,840 mg/L (4 Hours) (Rat).

High levels of dimethyl disulfide, a component of disulfides, di-alkyl and di-phenyl, naphtha sweetening, (Disulfide Oil), may cause hemolytic anemia with potential for development of kidney failure from red blood cell breakdown products excreted in the urine. In experimental animals, dimethyl disulfide overexposures produced hepatic encephalopathy with coma and convulsions. Rats exposed to concentrations of 7 to 26mg/L for 30 to 25 minutes had pulmonary irritation with lung blood vessel damage and convulsions. But, at 805 ppm of dimethyl disulfide for 4 hours, rats had no mortality and only slight liver and spleen damage. Inhalation of 2 ppm for 3 months caused microscopic liver damage. In chickens and other domestic fowl, hemolytic Heinz body anemia was produced by oral administration.

Sodium Hydroxide:

DERMAL (LD50): Acute: 1350 mg/kg [Rabbit].

A severe eye, skin and respiratory tract irritant. Corrosive to many organic compounds. If ingested, sodium hydroxide can cause severe pain, bloody diarrhea, cardiovascular collapse and death.

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity	An environmental fate analysis has not been conducted on this specific product.
Environmental Fate	This product is miscible in water and is expected to readily disperse in marine environments.

Merox Lift Station Hydrocarbon/Caustic Stream

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its corrosivity (D002). In addition, conditions of use may cause this material to become a hazardous waste, as defined by Federal or State regulations. It is the responsibility of the user to determine if the material is a hazardous waste at the time of disposal. Transportation, treatment, storage, and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR Parts 260 through 271). State and/or local regulations might be even more restrictive. Contact the RCRA/Superfund Hotline at (800) 424-9346 or your regional US EPA office for guidance concerning case specific disposal issues.

SECTION 14. TRANSPORT INFORMATION

This material has not been evaluated for proper Department of Transportation shipping name and hazard classification. If shipped in commerce, it may be a DOT Hazardous Material. Contact your transportation specialist or call the technical contact on this MSDS for assistance.

SECTION 15. REGULATORY INFORMATION

TSCA Inventory	This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.
SARA 302/304 Emergency Planning and Notification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.
SARA 311/312 Hazard Identification	The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories: Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard
SARA 313 Toxic Chemical Notification and Release Reporting	This product contains the following components in concentrations above de minimis levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA: Ethylbenzene [CAS No.: 100-41-4] Concentration: 0.1%
CERCLA	The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are: Xylene, all isomers [CAS No.: 1330-20-7] RQ = 100 lbs. (45.36 kg) Concentration: 0.45% Benzene [CAS No.: 71-43-2] RQ = 10 lbs. (4.536 kg) Concentration: 0.007%

Merox Lift Station Hydrocarbon/Caustic Stream

Clean Water Act (CWA)	This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.
California Proposition 65	This material may contain the following components which are known to the State of California to cause cancer, birth defects or other reproductive harm, and may be subject to the requirements of California Proposition 65 (CA Health & Safety Code Section 25249.5): Toluene: 0.25% Benzene: 0.0065%
New Jersey Right-to-Know Label	For New Jersey R-T-K labeling requirements, refer to components listed in Section 2.
Additional Regulatory Remarks	No additional regulatory remarks.

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

REVISION INFORMATION

Table 1-1 Regulatory Cross Reference Table

§154.1045	Brief Citation Description	SRPP Section
Response plan development and evaluation criteria for facilities that handle, store, or transport Group I through Group IV petroleum oils.		
(a)	...facility that handles...Group I through Group IV petroleum oils..	---
(a)(1)	..criteria in Table 1 ...identification of appropriate equipment..	---
(a)(2)	...resources must be evaluated...including, but not limited to -	---
(a)(2)(i)...(v)	Ice conditions; Debris; ... other appropriate...	---
(a)(3)(i)..(ii)	The COTP may reclassify a specific body of water or location ...	---
(b)(1)...(3)	Response equipment must ---	§5.0, Table 3-4, Figure 3-7, Figure 3-8
(c)	...identify response resources...average most probable discharge...	§5.2
(c)(1)	1,000 feet of containment boom or two times the length of the largest vessel ... and the means of deploying and anchoring the boom ... within 1 hour of the detection of a spill;	§5.2
(c)(2)	...recovery devices and oil storage capacity ... within 2 hours ...	§5.2
(d)	... identify response resources ... maximum most probable discharge...	§5.2
(d)(1)	... include sufficient containment boom, oil recovery devices, and storage capacity for any recovery of up to the maximum most probable discharge planning volume...	§5.2
(d)(2)	... resources must be appropriate for each group of oil ...	§5.2
(d)(3)	... must be positioned ... arrive ... scene of a discharge ...	§5.2
(d)(3)(i)	... within the specified times ...	§5.2
(d)(3)(ii)	In higher volume port areas ... within 6 hours ...	§5.2
(d)(3)(iii)	In all other locations, ... within 12 hours ...	§5.2
(d)(4)	... COTP may impose additional operational restrictions ...	---
(e)	... identify the response resources ... worst case discharge ...	§5.2
(e)(1)	The location must be suitable to meet the response times identified..	§5.2
(e)(2)	The response resources must be appropriate for ---	---
(e)(2)(i)	The volume of the facility's worst case discharge;	§5.2
(e)(2)(ii)	Group(s) of oil...handled, stored or transported by the facility; and	§5.2
(e)(2)(iii)	The geographic area(s) in which the facility operates.	§5.2
(e)(3)	... sufficient boom, oil recovery devices, and storage capacity to recover the worst case discharge planning volumes.	§5.2
(e)(4)	... quantity of response resources ... to respond ... to the worst case discharge to the maximum extent practicable.	§5.2
(e)(5)	... The following percentages of the response equipment ... must be capable of operating in waters of 6 feet or less depth.	---
(e)(5)(i)	Offshore - 10 percent.	---
(e)(5)(ii)	Nearshore/inland/Great Lakes/rivers and canals - 20 percent.	§5.2

Table 1-1 Regulatory Cross Reference Table

§154.1045	Brief Citation Description	SRPP Section
(e)(6)	... COTP may impose additional operational restrictions ...	---
(f)	Response equipment ... must be capable of arriving on scene within the times specified in this paragraph ...	§5.2
(g)	... response equipment identified for Tier 1 plan credit must be capable of being mobilized and en route to the scene of a discharge within 2 hours of notification ...	§5.2
(g)(1)	Either directly or through the qualified individual; and	§5.2
(g)(2)	Within 30 minutes of a discovery ...	§5.2
(h)	Response resources identified for Tier 2 and Tier 3 plan credit must be capable of arriving on scene within the time specified ...	§5.2
(i)	... a facility that handles, stores, or transports Group II through IV petroleum oils... must identify their response plan...	§3.6 , Table 3-4 , Figure 3-7 , Figure 3-8
(i)(1)	... must be capable of commencing dispersant-application operations at the site of a discharge within 7 hours...	§3.3.2
(i)(2)	Dispersant response resources must include all of the following:	§3.3.2
(i)(2)(i)	Sufficient volumes of dispersants for application as required by...	§3.3.2
(i)(2)(ii)	Dispersant-application platforms capable of delivering...	§3.3.2
(i)(2)(iii)	Dispersant-application systems that are consistent in design with...	§3.3.2
(i)(2)(iv)	Dispersant-application personnel trained in and capable of ...	§3.3.2
(i)(3)	Dispersant stockpiles, application platforms and other support resources must...	§3.3.2
(j)	... identify response resources necessary to provide aerial oil tracking.... The aerial oil tracking resources must:	§3.3.2
(j)(1)	Be capable of arriving at the site of the discharge... up to 50 miles from shore...	§3.3.2
(j)(2)	Be capable of support OSROs continuously for three 10-hour operational periods during the initial 72 hours of discharge.	§3.3.2
(j)(3)	Include appropriately located aircraft and personnel capable of...	§3.3.2
(j)(4)	Include sufficient number of aircraft, pilots, and trained observation personnel...	§3.3.2
(j)(4)(i)	The protocols of oil-spill reporting and assessment...	§3.3.2
(j)(4)(ii)	The use of assessment techniques in ASTM F1779-08...	§3.3.2
(k)	... identify response resources with firefighting capability ...	EAP , Table 3-4 ,
(l)	... identify equipment and required personnel ... to protect fish and wildlife and sensitive environments.	Table 3-1 , Table 3-4 ,
(l)(1)	... the identified response resources must include the quantities of boom sufficient to protect	Table 3-4 , Table 5-2
(l)(2)	... resources and response methods ... must be consistent with the ... ACP in effect 6 months prior to initial plan submission or the annual plan review ...	§5.2
(m)	The response plan for a facility that handles, stores, or transports Groups I through IV petroleum oils must identify an oil spill removal organization(s) with response resources that are available...	Figure 3-3 , Figure 3-4
(m)(1)	Except as required in paragraph (l)(2) ... shoreline clean-up response resources required must be determined as described in Appendix C of this part.	§5.2
(m)(2)	... resources and response methods ... must be consistent with the ... ACP in effect 6 months prior to initial plan submission or the annual plan review ...	§5.2

Table 1-1 Regulatory Cross Reference Table

40 CFR §112	Brief Citation Description	SRPP Section
112.3	Requirement to prepare and implement a Spill Prevention Control and Countermeasure Plan	---
(a,b,c)	Owners or operators must prepare and implement a Plan...	Entire Plan
(d)	A licensed Professional Engineer must review and certify a Plan for it to be effective...	Figure 1-2
(e)	Maintain a complete copy of the Plan at the facility if the facility is normally attended at least 4 hours per day, or at the nearest field office...	§2.0
112.5	Amendment of Spill Prevention Control and Countermeasures Plan by owners or operators	---
(a)	Amend the SPCC ...when there is a change in facility design, construction, operation or maintenance which materially affects the facility's potential for the discharge of oil...	§1.4
(b)	...complete a review and evaluation of the SPCC at least once every five years... amend the SPCC within six months of the review...implement within six months of preparation of any amendment.	§1.4
(c)	Have a Professional Engineer certify any technical amendment...	§1.4
112.7	Guidelines for the preparation and implementation of a Spill Prevention Control and Countermeasures Plan	---
----	...must prepare a Plan...have full approval of management...in writing.	Figure 1-6
----	If the plan calls for additional facilities or procedures, methods, or equipment not yet fully operational, these items should be discussed in separate paragraphs, and the details of installation and operational start-up should be explained separately.	---
----	...follow the sequence specified (or cross-reference)...	Table 1-1
(a)(2)	Comply with all applicable requirements in this part... [or] state reasons for non-conformance ... and describe alternate methods...	---
(a)(3)	Describe ... physical layout ... and include diagram	§2.0, Figure 2-2, Figure 2-4, Figure 2-5, Figure 2-6, Figure 2-7
(a)(3)(i)	... [address in your Plan] .. the type of oil in each container and its ... capacity ...	Table 2-1
(a)(3)(ii)	... discharge prevention measures including routine handling of products ...	§2.0, §7.0, §8.0
(a)(3)(iii)	...Drainage or discharge controls ... and procedures for control of a discharge ...	§2.0
(a)(3)(iv)	Countermeasures for discharge discovery, response, and cleanup (both ... facility's ... and contractor)	§5.0, §7.0, §8.0
(a)(3)(v)	Methods of disposal of recovered materials ...	§5.4
(a)(3)(vi)	Contact list and phone numbers ...	Table 3-1, Table 3-2
(a)(4)	Relate information ... [on a discharge] ...	Table 3-3
(a)(5)	Organize portions of the Plan ... that will make them readily usable....	TOC
(b)	Where experience indicates a reasonable potential for equipment failure...include in your plan a prediction of the direction, rate of flow....	§4.5
(c)(1)	Onshore facilities.	---
(c)(1)(i)	Dikes, berms or retaining walls sufficiently impervious to contain spilled oil	§2.0
(c)(1)(ii)	Curbing	---
(c)(1)(iii)	Sumps and collection systems	§2.0
(c)(1)(iv)	Culverting, gutters or other drainage systems	§2.0
(c)(1)(v)	Weirs, booms or other barriers	§2.0
(c)(1)(v)	Spill diversion ponds	§2.0
(c)(1)(vi)	Retention ponds	§2.0

Table 1-1 Regulatory Cross Reference Table

40 CFR §112	Brief Citation Description	SRPP Section
(c)(1)(vii)	Sorbent materials	§2.0
(c)(2)	Offshore Facilities.	---
(c)(2)(i)	Curbing, drip pans	---
(c)(2)(ii)	Sumps and collection systems	---
(d)	If you determine that the installation of structures or equipment listed in paragraphs (c) and (h)(1) of this section...is not practicable...clearly explain in your Plan...and provide...	---
(d)(1)	A strong oil spill contingency plan following...40 CFR 109.	§2.5, Table 2-6
(d)(2)	A written commitment of manpower, equipment and materials required to expeditiously control and remove any harmful quantity of oil discharged.	---
(e)	Inspection, tests, and records. ...in accordance with written procedures that you or the certifying engineer develop...with the SPCC Plan for a period of three years	---
(f)	Personnel, training and spill prevention procedures	---
(f)(1)	...train your oil-handling personnel in the operation and maintenance of equipment to prevent the discharges...	§7.0
(f)(2)	Designate a person...accountable for oil spill prevention...	---
(f)(3)	Schedule and conduct spill prevention briefings...highlight and describe known spill discharges...or failures, malfunctioning components, and recently developed precautionary measures.	§8.0
(g)	Describe in your Plan how you secure and control access to oil handling, processing, and storage areas...	Figure 1-6
(h)	Facility tank car and tank truck loading/unloading rack	§2.6
(h)(1)	Where loading/unloading area drainage does not flow into a catchment basin or treatment facility designed to handle discharges, use a quick drainage system... ..design any containment system to hold at least maximum capacity of any single compartment of a tank car or tank truck loaded or unloaded at the facility.	§2.6
(h)(2)	Provide an interlocked warning light or physical barrier system, warning signs, wheel chokes, or vehicle break to prevent vehicular departure before complete disconnect of flexible or fixed oil transfer lines.	§2.6
(h)(3)	Prior to filling and departure of any tank car or tank truck, closely inspect for discharges the lowermost drain and all outlets of such vehicles should be closely examined for leakage, and if necessary, that they are tightened, adjusted, or replaced to prevent liquid leakage while in transit.	§2.6
(i)	If a field-constructed aboveground container undergoes a repair, alteration, reconstruction, or change in service that might affect the risk of a discharge or failure due to brittle fracture...evaluate the container for risk...	§7.0
(j)	In addition...include a complete discussion of conformance with applicable requirements...or any more stringent, with State rules, regulations and guidelines.	§1.0
(k)	Qualified Oil-filled Operational Equipment; The owner or operator of a facility with oil-filled operational equipment that meets... may choose...	---
(k)(1)	Qualification Criteria—Reportable Discharge History: The owner or operator of a facility that has had no single discharge ...	---
(k)(2)	... If secondary containment is not provided for qualified oil-filled operational equipment...	---
(k)(2)(i)	Establish and document the facility procedures for inspections or a monitoring program to detect equipment failure and/or a discharge; and	---
(k)(2)(ii)	Unless you have submitted a response plan under § 112.20, provide in your Plan the following:	---
(k)(2)(ii)(A)	An oil spill contingency plan following the provisions of part 109...	---
(k)(2)(ii)(B)	A written commitment of manpower, equipment, and materials required to...	---

Table 1-1 Regulatory Cross Reference Table

40 CFR §112	Brief Citation Description	SRPP Section
112.8	Spill Prevention, Control, and Countermeasure Plan requirements for onshore facilities (excluding production facilities)	---
(a)	Meet the general requirements for the Plan listed under § 112.7, and...	---
(b)(1)	Restrain drainage from diked storage areas by valves or other positive means to prevent a spill...into the drainage system or in-plant effluent treatment system, except where plan systems are designed to handle such leakage. You may empty diked areas by pumps or ejectors; however you must be manually activate these pumps...and inspect the condition of the accumulation before starting...	§2.0
(b)(2)	Use valves of manual, open-and-closed design... If facility drainage drains directly into water course...you must inspect and drain uncontaminated retained storm water, as provided in...paragraphs (c)(3)(ii)(iii), and (iv).	§2.0
(b)(3)	Design facility drainage systems from undiked areas... to flow into ponds, lagoons or catchment basins, designed to retain oil or return it to the facility. You must not locate catchment basins in areas subject to periodic flooding.	§2.0
(b)(4)	If...not engineered as in paragraphs (b)(3), equip the final discharge of all ditches with a diversion system that would...retain the oil in the facility.	--
(b)(5)	Where drainage waters are treated in more than one treatment unit... provide two "lift" pumps and permanently install at least one of the pumps. Whatever techniques are used, facility drainage systems engineer... to prevent a discharge as described in § 112.1(b) in case there is an equipment failure or human error...	§2.0
(c)	Bulk storage containers (onshore)	---
(c)(1)	Not use a container for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage...	§2.0
(c)(2)	Construct all bulk storage container installations so that you provide a secondary means of containment for the entire contents of the largest single container plus sufficient freeboard to allow for precipitation. You must ensure that diked areas are sufficiently impervious to contain discharged oil.	§2.0
(c)(3)	Not allow drainage of uncontaminated rainwater from the diked area into a storm drain or discharge of an effluent discharge into an open water course, lake, or pond, bypassing the in-plant treatment system unless you:	§2.0
(c)(3)(i)	Normally keep the bypass valve sealed closed.	§2.0
(c)(3)(ii)	Inspect the retained rainwater to ensure that its presence will not cause a discharge as described in § 112.1(b).	§2.0
(c)(3)(iii)	Open the bypass valve and reseal it following drainage...under responsible supervision.	§2.0
(c)(3)(iv)	Keep adequate records of such events.	§2.0
(c)(4)	Protect any completely buried metallic storage tank installed on or after January 10, 1974 from corrosion by coatings or cathodic protection...	§2.0
(c)(5)	Not use partially buried metallic tanks for the storage of oil unless the buried section of the tank is adequately coated...	§2.0
(c)(6)	Test each aboveground container for integrity testing on a regular schedule. Keep comparison records... In addition...frequently inspect the outside of the container for signs of deterioration, discharges, or accumulation of oil inside diked areas. Records of inspections and tests kept under usual and customary business practices will suffice for the purposes of this paragraph.	§2.0 , §7.0
(c)(7)	Control leakage through defective internal heating coils by monitoring the steam return and exhaust lines...	§2.0
(c)(8)	Engineer or update each container installation in accordance with good engineering practice to avoid discharges (and) provide at least one of the following devices:	§2.0
(c)(8)(i)	High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities, an audible air vent may suffice.	§2.0

Table 1-1 Regulatory Cross Reference Table

40 CFR §112	Brief Citation Description	SRPP Section
(c)(8)(ii)	High liquid level pump cutoff devices set to stop flow at a predetermined container content level.	§2.0
(c)(8)(iii)	Direct audible or code signal communication between the container gauger and the pumping station.	§2.0
(c)(8)(iv)	A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges.	§2.0
(c)(8)(v)	You must regularly test liquid level sensing devices to ensure proper operation.	§2.0
(c)(9)	Observe effluent treatment facilities frequently enough to detect possible system upsets that could cause a discharge...	§2.0
(c)(10)	Promptly correct visible discharges which result in a loss of oil from container including...seam, gaskets, piping, pumps, valves...	§2.0
(c)(11)	Position or locate mobile or portable oil storage container to prevent a discharge as described in § 112.1(b)...furnish a secondary means of containment...for the largest single compartment or container with sufficient freeboard...	§2.0
(d)	Facility transfer operations, pumping, and facility process	---
(d)(1)	Provide buried piping... installed or replaced on or after August 16, 2002, with a protective wrapping and coating...cathodically protect. If a section of buried line is exposed...carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated...	§2.0
(d)(2)	Cap or blank-flange the terminal connection...and mark it as to origin when piping is not in service, or in standby service for an extended time.	§2.0
(d)(3)	Properly design pipe supports to minimize abrasion and corrosion and allow for expansion and contraction.	§2.0
(d)(4)	Regularly inspect all aboveground valves, piping, and appurtenances. ...also conduct integrity and leak testing on buried piping at the time of installation, modification, construction, relocation, or replacement.	§7.0
(d)(5)	Warn all vehicles entering the facility to be sure that no vehicle will endanger aboveground piping or other oil transfer operations.	§2.0

Table 1-1 Regulatory Cross Reference Table

49 CFR §194	Brief Citation Description	SRPP Section
194.105(a)	... determine the worst case discharge ... provide methodology, including calculations, used to arrive at the volume.	---
(b)	The worst case discharge is the largest volume, in barrels, of the following:	---
(b)(1)	... maximum release time in hours, plus the maximum shutdown response time in hours, multiplied by the maximum flow rate expressed in barrels per hour, plus the largest line drainage volume after shutdown of the line section(s) ...; or	§4.0
(b)(2)	The largest foreseeable discharge for the line section(s) within a response zone, expressed in barrels, based on the maximum historic discharge, if one exists, adjusted for any subsequent corrective or preventative action taken; or	---
(b)(3)	If the response zone contains one or more breakout tanks, the capacity of the single largest tank or battery of tanks within a single secondary containment system, adjusted for the capacity or size of the secondary containment system, expressed in barrels.	§4.0
(b)(4)	Operators may claim prevention credits for breakout tank secondary containment and other specific spill prevention measures as follows:...	§4.0
194.107(a)	Each response plan must plan for resources for responding, to the maximum extent practicable, to a worst case discharge, and to a substantial threat of such a discharge.	---
(b)	An operator must certify in the plan ... reviewed NCP and each applicable ACP...	§1.4
(b)(1)	As a minimum to be consistent with the NCP as a facility response plan must:	---
(b)(1)(i)	Demonstrate an operator's clear understanding of the function of the Federal response structure...	EAP
(b)(1)(ii)	Establish provisions to ensure the protection of safety at the response site; and	EAP
(b)(1)(iii)	Identify the procedures to obtain any required Federal and State permissions for using alternative response strategies such as in-situ burning and dispersants...	§2.0
(b)(2)	As a minimum, to be consistent with the applicable ACP the plan must:	---
(b)(2)(i)	Address the removal of a worst case discharge and the mitigation or prevention of a substantial threat of a worst case discharge;	§3.0 , §5.0
(b)(2)(ii)	Identify environmentally and economically sensitive areas;	Figure 5-1
(b)(2)(iii)	Describe the responsibilities of the operator and operator and of Federal, State and local agencies in removing a discharge and in mitigating or preventing a substantial threat of a discharge; and	EAP
(b)(2)(iv)	Establish the procedures for obtaining an expedited decision on use of dispersants or other chemicals.	§2.0
(c)	Each response plan must include:	---
(c)(1)	A core plan consisting of ...	---
(c)(1)(i)	An information summary as required in §194.113,	Figure 1-7 , Figure 1-8
(c)(1)(ii)	Immediate notification procedures,	EAP , Table 3-1 , Table 3-2
(c)(1)(iii)	Spill detection and mitigation procedures,	Table 5-2
(c)(1)(iv)	The name, address, and telephone number of the oil spill response organization, if appropriate,	Table 3-2 , Figure 3-3 , Figure 3-4
(c)(1)(v)	Response activities and response resources,	§3.0 , Table 5-2
(c)(1)(vi)	Names and telephone numbers of Federal, state, and local agencies which the operator expects to have pollution control responsibilities or support,	Table 3-2
(c)(1)(vii)	Training procedures,	§8.0
(c)(1)(viii)	Equipment testing,	EAP

Table 1-1 Regulatory Cross Reference Table

49 CFR §194	Brief Citation Description	SRPP Section
(c)(1)(ix)	Drill program – an operator will satisfy the requirement for a drill program by following the National Preparedness for Response Exercise Program (PREP) guidelines. An operator choosing not to follow PREP guidelines must have a drill program that is equivalent to PREP. The operator must describe the drill program in the response plan and OPS will determine if the program is equivalent to PREP.	EAP
(c)(1)(x)	Plan review and update procedures;	§1.4
(c)(2)	An appendix for each response zone that includes the information required in paragraph (c)(1)(i)-(ix) of this section and the worst case discharge calculations that are specific to that response zone. An operator submitting a response plan for a single response zone does not need to have a core plan and a response zone appendix. The operator of a single response zone onshore pipeline shall have a single summary in the plan that contains the required information in §194.113.7; and.	---
(c)(3)	A description of the operator's response management system including the functional areas of finance, logistics, operations, planning, and command. The plan must demonstrate that the operator's response management system uses common terminology and has a manageable span of control, a clearly defined chain of command, and sufficient trained personnel to fill each position.	EAP
194.111(a)	Each operator shall maintain relevant portions of its response plan at the operator's headquarters and at other locations from which response activities may be conducted, for example, in field offices, supervisor's vehicles, or spill response trailers.	§1.4
194.113 (a)	The information summary for the core plan, required by §194.107, must include:	---
(a)(1)	The name and address of the operator.	Figure 1-7
(a)(2)	For each response zone which contains one or more line sections that meet the criteria for determining significant and substantial harm as described in §194.103, a listing and description of the response zones, including county(s) and state(s).	---
(b)	The information summary for the response zone appendix, required in §194.107, must include:	---
(b)(1)	The information summary for the core plan.	Figure 1-7, Figure 1-8
(b)(2)	The names or titles and 24-hour telephone numbers of the qualified individual(s) and at least one alternate qualified individual(s);	Figure 1-7
(b)(3)	The description of the response zone, including county(s) and state(s), for those zones in which a worst case discharge could cause substantial harm to the environment.	Figure 1-7
(b)(4)	A list of line sections for each pipeline contained in the response zone, identified by milepost or survey station number, or other operator designation.	Figure 2-7
(b)(5)	The basis for the operator's determination of significant and substantial harm.	Figure 1-8
(b)(6)	The type of oil and volume of the worst case discharge.	Table 2-1
194.115(a)	Each operator shall identify and ensure, by contract or other approved means, the resources necessary to remove, to the maximum extent practicable, a worst case discharge and to mitigate or prevent a substantial threat of a worst case discharge.	§3.0, Figure 3-3 thru 3-8
(b)	An operator shall identify in the response plan the response resources which are available to respond within the time specified, after discovery of a worst case discharge, or to mitigate the substantial threat of such a discharge.	Figure 3-3 thru 3-8
194.117(a)	Each operator shall conduct training to ensure that:	---
(a)(1)	All personnel know –	---
(a)(1)(i)	Their responsibilities under the response plan	§8.0
(a)(1)(ii)	The name and address of, and the procedure for contacting, the operator on a 24-hour basis	Figure 1-7

Table 1-1 Regulatory Cross Reference Table

49 CFR §194	Brief Citation Description	SRPP Section
(a)(1)(iii)	The name of, and procedures for contacting, the qualified individual on a 24-hour basis	Figure 1-7, Table 3-1
(a)(2)	Reporting personnel know --	---
(a)(2)(i)	The content of the information summary of the response plan.	§8.0, Figure 1-7, Table 3-3
(a)(2)(ii)	The toll-free telephone number of the National Response Center	Table 3-2
(a)(2)(iii)	The notification process	§3.0, EAP
(a)(3)	Personnel engaged in response activities know --	---
(a)(3)(i)	The characteristics and hazards of the oil discharged	MSDS
(a)(3)(ii)	The conditions that are likely to worsen emergencies, including the consequences of facility malfunctions or failures, and the appropriate corrective actions.	§5.0
(a)(3)(iii)	The steps necessary to control any accidental discharge of oil and to minimize the potential for fire, explosion, toxicity, or environmental damage	§5.0
(a)(3)(iv)	The proper firefighting procedures and use of equipment, fire suits, and breathing apparatus	EAP
(b)	Each operator shall maintain a training record for each individual that has been trained as required by this section. These records must be maintained in the following manner as long as the individual is assigned duties under the response plan	---
(b)(1)	Records for operator personnel must be maintained at the operator's headquarters	§8.0
(b)(2)	Records for personnel engaged in response, other than operator personnel, shall be maintained as determined by the operator.	§8.0
(b)(3)	Nothing in this section relieves an operator from the responsibility to ensure that all response personnel are trained to meet the OSHA standards for emergency response operations in 29 CFR 1910.120 ...	§8.0
194.119(a)	Each owner shall submit two copies...	§1.0
(b)	...PHMSA will notify the operator of any alleged deficiencies...	---
(c)	The operator...may petition PHMSA for reconsideration within 30 days...	---
(d)	...PHMSA will approve the Response Plan...	---
(e)	...The operator may submit a certification to PHMSA...that the operator has obtained, through contract or other approved means, the necessary private personnel and equipment to record, to the maximum extent practicable, to a worst case discharge...	Figure 1-4
(f)	...PHMSA may require an operator to provide a copy of the response plan to the OSC...	---
194.121(a)	Each operator shall update its response plan to address new or different operating conditions or information. In addition, each operator shall review its response plan in full at least every 5 years from the date of the last submission or the last approval as follows:	Figure 1-4
(a)(1)	For substantial harm plans, an operator shall resubmit every 5 years from the last approval date.	Figure 1-4
(a)(2)	For significant and substantial harm plans, an operator shall resubmit every 5 years from the last approval date.	---
(b)	If a new or different operating condition or information would substantially affect the implementation of a response plan, the operator must immediately modify its response plan to address such a change...	Figure 1-4
(b)(1)	An extension of the existing pipeline or construction of a new pipeline in a response zone not covered by the previously approved plan;	Figure 1-4
(b)(2)	Relocation or replacement of the pipeline in a way that substantially affects the information included in the response plan, such as a change to the worst case discharge volume;	Figure 1-4

Table 1-1 Regulatory Cross Reference Table

49 CFR §194	Brief Citation Description	SRPP Section
(b)(3)	The type of oil transported, if the type affects the required response resources, such as a change from crude oil to gasoline;	Figure 1-4
(b)(4)	The name of the spill removal organization;	Figure 1-4
(b)(5)	Emergency response procedures;	Figure 1-4
(b)(6)	The qualified individual;	Figure 1-4
(b)(7)	A change in the NCP or an ACP that has significant impact on the equipment appropriate for response activities; and	Figure 1-4
(b)(8)	Any other information relating to circumstances that may affect full implementation of the plan.	Figure 1-4
(c)	If PHMSA determines that a change to a response plan does not meet the requirements of this part, PHMSA will notify the operator of any alleged deficiencies, and provide operator...opportunity to correct deficiencies.	---
(d)	An operator who disagrees with a determination that proposed revisions to a plan are deficient may petition PHMSA for reconsideration, within 30 days from the date of receipt of PHMSA's notice...	---

Table 1-2 Definitions

The definitions listed below are from §33 CFR 154.1020 and §33 CFR 154.105.

§33 CFR 154.1020:

Adverse weather means the weather conditions that will be considered when identifying response systems and equipment in a response plan for the applicable operating environment. Factors to consider include significant wave height as specified in §154.1045, §154.1047, or §154.1049, as appropriate, ice conditions, temperatures, weather-related visibility, and currents within the COTP zone in which the systems or equipment are intended to function.

Average most probable discharge means a discharge of the lesser of 50 barrels or 1 percent of the volume of the worst-case discharge.

Captain of the Port (COTP) Zone means a zone specified in §33 CFR Part 3 and, where applicable, the seaward extension of that zone to the outer boundary of the exclusive economic zone (EEZ).

Exclusive economic zone (EEZ) means the zone contiguous to the territorial sea of the United States extending to a distance up to 200 nautical miles from the baseline from which the breadth of the territorial sea is measured.

Facility that could reasonably be expected to cause significant and substantial harm means any MTR facility (including piping and any structures that are used for the transfer of oil between a vessel and facility) classified as a "significant and substantial harm" facility under §154.1015 (c) including a facility specifically designated by the COTP under §154.1016(a).

Facility that could reasonably be expected to cause substantial harm means any MTR facility classified as a "substantial harm" facility under §154.1015 (b) including a facility specifically designated by the COTP under §154.1016(a).

Great Lakes means Lakes Superior, Michigan, Huron, Erie, and Ontario, their connecting and tributary waters, the Saint Lawrence River as far as Saint Regis, and adjacent port areas.

Table 1-2 Definitions

Higher volume port area means the following ports:

1. Boston, MA.
2. New York, NY.
3. Delaware Bay and River to Philadelphia, PA.
4. St. Croix, VI.
5. Pascagoula, MS.
6. Mississippi River from Southwest Pass, LA. to Baton Rouge, LA.
7. Louisiana Offshore Oil Port (LOOP), LA.
8. Lake Charles, LA.
9. Sabine - Neches River, TX.
10. Galveston Bay and Houston Ship Channel, TX.
11. Corpus Christi, TX.
12. Los Angeles/Long Beach Harbor, CA.
13. San Francisco Bay, San Pablo Bay, Carquinez Strait, & Suisun Bay to Antioch, CA.
14. Straits of Juan De Fuca from Port Angeles, WA to and including Puget Sound, WA.
15. Prince William Sound, AK

Inland area means the area shoreward of the boundary lines defined in §46 CFR Part 7, except in the Gulf of Mexico. In the Gulf of Mexico, it means the area shoreward of the lines of demarcation (COLREG lines) defined in §80.740 through §80.850 of this chapter. The inland area does not include the Great Lakes.

Inland area means the area shoreward of the boundary lines defined in §46 CFR Part 7, except in the Gulf of Mexico. In the Gulf of Mexico, it means the area shoreward of the lines of demarcation (COLREG lines) defined in §80.740 through §80.850 of this chapter. The inland area does not include the Great Lakes.

Marine transportation-related facility (MTR facility) means any onshore facility or segment of a complex regulated under section §311(j) of the Federal Water Pollution Control Act (FWPCA) by two or more Federal agencies, including piping and any structure used or intended to be used to transfer oil to or from a vessel, subject to regulation under this part and any deepwater port subject to regulation under part 150 of this chapter. For a facility or segment of a complex regulated by two or more Federal agencies under section §311(j) of the FWPCA, the MTR portion of the complex extends from the facility oil transfer system's connection with the vessel to the first valve inside the secondary containment surrounding tanks in the non-transportation related portion of the facility or, in the absence of secondary containment, to the valve or manifold adjacent to the tanks comprising the non-transportation-related portion of the facility, unless another location has otherwise been agreed to by the COTP and the appropriate Federal official.

Table 1-2 Definitions

Maximum extent practicable means the planned capability to respond to a worst case discharge in adverse weather, as contained in a response plan that meets the criteria in this subpart or in a specific plan approved by the cognizant COTP.

Maximum most probable discharge means a discharge of the lesser of 1,200 barrels or 10 percent of the volume of a worst-case discharge.

Near shore area means the area extending seaward 12 miles from the boundary lines defined in §46 CFR Part 7, except in the Gulf of Mexico. In the Gulf of Mexico, it means the area extending seaward 12 miles from the line of demarcation (COLREG lines) defined in §80.740 through §80.850 of this chapter.

Non-persistent or Group I Oil means a petroleum-based oil that, at the time of shipment, consists of hydrocarbon fractions:

1. At least 50s of which by volume, distill at a temperature of 340 degrees C (645 deg F); and
2. At least 95% of which by volume, distill at a temperature of degrees C (700 deg F).

Non-petroleum oil means oil of any kind that is not petroleum based. It includes, but is not limited to, animal and vegetable oils.

Ocean means the **offshore area and near shore** area as defined in this subpart.

Offshore area means the area beyond 12 nautical miles measured from the boundary lines defined in §46 CFR part 7 extending seaward to 50 nautical miles, except in the Gulf of Mexico. In the Gulf of Mexico, it is the area beyond 12 nautical miles of the line of demarcation (COLREG lines) defined in §80.740 through §80.850 of this chapter extending seaward to 50 nautical miles.

Oil means oil of any kind or in any form, including, but not limited to, petroleum oil, fuel oil, sludge, oil refuse, and oil mixed with wastes other than dredge spoil.

Oil spill removal organization means an entity that provides response resources.

On-Scene Coordinator (OSC) means the definition in the National Oil and Hazardous Substances Pollution Contingency Plan (§40 CFR part 300).

Operating area means rivers and canals, inland, near shore, Great Lakes, or offshore geographic location(s) in which a facility is handling, storing, or transporting oil.

Table 1-2 Definitions

Operating environment means rivers and canals, inland, Great Lakes, or ocean. These terms are used to define the conditions in which response equipment is designed to function.

Operating in compliance with the plan means operating in compliance with the provisions of this subpart including, ensuring the availability of the response resources by contract or other approved means, and conducting the necessary training and drills.

Persistent oil means petroleum-based oil that does not meet the distillation criteria for non-persistent oil. For the purposes of this subpart, persistent oils are further classified based on specific gravity as follows:

1. Group II-specific gravity less than .85.
2. Group III-specific gravity between .85 and less than .95.
3. Group IV-specific gravity .95 or greater.
4. Group V-specific gravity greater than 1.0.

Qualified individual and alternate qualified individual means a person located in the United States who meets the requirements of §154.1026.

Response activities means the containment and removal of oil from the land, water, and shorelines, the temporary storage and disposal of recovered oil, or the taking of other actions as necessary to minimize or mitigate damage to the public health or welfare or the environment.

Response resources mean the personnel, equipment, supplies, and other capability necessary to perform the response activities identified in a response plan.

Rivers and canals means a body of water confined within the inland area, including the Intracoastal Waterways and other waterways artificially created for navigation that has a project depth of 12 feet or less.

Spill management team means the personnel identified to staff the organizational structure identified in a response plan to manage response plan implementation.

Substantial threat of a discharge means any incident or condition involving a facility that may create a risk of discharge of oil. Such incidents include, but are not limited to storage tank or piping failures, above ground or underground leaks, fires, explosions, flooding, spills contained within the facility, or other similar occurrences.

Table 1-2 Definitions

Worst-case discharge means in the case of an onshore facility and deepwater port, the largest foreseeable discharge in adverse weather conditions meeting the requirements of §154.1029.

§33 CFR 154.105:

Barrel means a quantity of liquid equal to 42 U.S. gallons.

Captain of the Port (COTP) means the U.S. Coast Guard officer commanding a Captain of the Port Zone described in Part 3 of this chapter, or that person's authorized representative.

Commandant means the Commandant of the Coast Guard or an authorized representative.

Contiguous Zone means the entire zone established by the United States under Article 24 of the Convention on the Territorial Sea and the Contiguous Zone, but not extending beyond 12 miles from the baseline from which the breadth of the territorial sea is measured.

Contiguous Zone means the entire zone established by the United States under Article 24 of the Convention on the Territorial Sea and the Contiguous Zone, but not extending beyond 12 miles from the baseline from which the breadth of the territorial sea is measured.

District Commander means the officer of the Coast Guard designated by the Commandant to command a Coast Guard District, as described in Part 3 of this chapter or an authorized representative.

Facility means either an onshore facility or an offshore facility and includes, but is not limited to structures, equipment, and appurtenances thereto, used or capable of being used to transfer oil or hazardous material to or from a vessel or a public vessel. A facility includes federal, state, municipal, and private facilities.

Facility operator means the person who owns, operates, or is responsible for the operation of the facility.

Hazardous material means a liquid material or substance, other than oil or liquefied gases, listed under §46 CFR 153.40(a), (b), (c), or (e).

MARPOL 73/78 means the International Convention for the Prevention of Pollution from Ships, 1973 (done at London, November 2, 1973) as modified by the Protocol of 1978 relating to the International Convention for the Prevention of Pollution from Ships, 1973 (done at London, February 17, 1978).

Table 1-2 Definitions

Mobile facility means any facility that can readily change location, such as a tank truck or tank car, other than a vessel or public vessel.

Monitoring device means any fixed or portable sensing device used to monitor for a discharge of oil or hazardous material onto the water, within or around a facility, and designed to notify operating personnel of a discharge of oil or hazardous material.

Officer in Charge, Marine Inspection (OCMI) means the U.S. Coast Guard officer commanding a Marine Inspection Zone described in Part 3 of this chapter, or an authorized representative.

Offshore facility means any facility of any kind located in, on, or under any of the navigable waters of the United States other than a vessel or a public vessel.

Oil means oil of any kind or in any form, including but not limited to, petroleum, fuel oil, sludge, oil refuse, and oil mixed with wastes other than dredged spoil.

Person in charge means an individual designated as a person in charge of transfer operations under §154.710 (for facilities) or §155.700 (for vessels) of this chapter.

Tank barge means any tank vessel not equipped with a means of self-propulsion.

Tank vessel means any vessel that carries oil or hazardous material in bulk as cargo or in residue.

Transfer means any movement of oil or hazardous material to, from, or within a vessel by means of pumping, gravitation, or displacement.

Vessel operator means a person who owns, operates, or is responsible for the operation of a vessel.

Table 1-3 Record of Revisions

Date	Section or Page	Change	Initials
02/29/96	IS-1 to IS-5	Change telephone numbers and alternate qualified individuals.	JMB
02/29/96	1-4	Record changes to Plan in Table 1-1	JMB
02/29/96	Appendix Q	Replace entire List of Hazardous Substances and Reportable Quantities.	JMB

11/20/01	ERAP	Revised Evacuation Procedure & Emergency Planning and Training Plan	MM
11/20/01	Preface, pages IS-1 and IS-2	Name change	MM
11/20/01	1-1 thru 1-3	Minor revisions. Updated Table 1-1.	MM
11/20/01	2-1 thru 2-9	Minor revisions. Replaced pp 2-1 thru 2-11 with pp 2-1 thru 2-9	MM
11/20/01	Table 2-1	Minor revisions. Replace Table 2-1	MM
11/20/01	Figure 2-3	Minor revisions. Remove Figure 2-3	MM
11/20/01	3-1 and 3-2	Minor revisions due to Reduction of duplication in plan.	MM
11/20/01	Remove "Evacuation and Personnel Accounting Procedures".	Minor revisions due to Reduction of duplication in plan.	MM
11/20/01	6-1	Minor revisions to 6-1. Revised pages 6-2 & 6-3 are site-specific hazardous materials lists.	MM
11/20/01	6-2 and 6-3	Minor revisions to 6-1. Added pages 6-2 & 6-3 are site-specific hazardous materials lists.	MM
11/20/01	Attachment 2	Replace these with updated procedures.	MM
11/20/01	Attachment 31 - 35	Replace these with updated procedures.	MM
11/20/01	A-1, A-1.1, A1.2, A-1.3, A-1.4, and A-1.5	Minor revisions – added new pages	MM
11/20/01	D-1	Minor revisions – added new pages	MM
11/20/01	Appendix E	Replace all pages of Appendix E with new pages Revisions to tank basin volumes.	MM
11/20/01	Appendix G.	Updated and replaced all Dock SOPs	MM
11/20/01	Appendix I	Insert a reference to the revised "Emergency Response Notification Systems" to the ERAP at the front of the plan.	MM
11/20/01	Appendix K	Add certifications to both sections. Remove Clean Channel Response Manual and replace with new one.	MM
11/20/01	N-1 thru N-11	Updated and replaced spill history.	MM
11/20/01	P-1, P-2, P-3	Minor revisions – updates	MM
11/20/01	Appendix Q	Added site-specific hazardous and extremely hazardous list inserted into Section 6.0.	MM
11/20/01	Appendix Q	Remove everything and insert page to reference back to Section 6.0 of the plan.	MM

09/30/02	ERAP	Added new front page of ERAP	MM
09/30/02	ERAP	Added new TOC	MM
09/30/02	ERAP	Revised "How to Report an Incident or Emergency"	MM
09/30/02	ERAP	Added new Figure 3.0	MM
09/30/02	ERAP	Added new Figure 3.0(a)	MM
09/30/02	ERAP	Added new Table 3-1	MM
09/30/02	ERAP	Added new LCR Spill Response Equipment Inventory.	MM
09/30/02	Table 1-1	Revised Record of Change/Review to reflect revisions for 2002.	MM
09/16/02	Section 2	Revised format of text, revised description of facility to more accurately reflect the names of types of units, and included information on secondary containment for all Docks, including Dock C (Section 2.4).	MM
09/16/02	Section 3	Revised the format of the text. Revised tables and figures to provide updated telephone numbers, and on contracted response capabilities (Garner and Clean Channel Association). Revised "Emergency Operations" description, site security and control description, and emergency response command description.	MM
09/16/02	4-2	Section 4.4: Updated oil spill history reference.	MM
09/30/02	7-1 and 7-2	Revised to include a description of secondary containment for block valves at Dock C.	MM
09/16/02	Section 8, Attachment 2	Updated the Emergency Management Training and Exercise Planning Schedule thru 2003. Notification Drills for QI updated to weekly and annually, rather than quarterly and annually.	MM
09/17/02	Appendix D	Revised Tank Failures: Supplement to the Storage Tank Summary Table thru YTD 2002.	MM
09/17/02	Appendix E	Revised Tanks with Tank Dike Walls as Secondary Containment to reflect reference to 40 CFR Part 112.8	MM
09/17/02	Appendix F	Revised Drainage Basins to more clearly define Outfall 002	MM
09/17/02	Appendix G	Annual review of Dock Emergency Operating Procedures: Revisions, and new EOPs.	MM
09/18/02	Appendix I	Revised SOP: Report an Incident or an Emergency	MM
09/30/02	Appendix J	Revised information on LCR's spill response equipment inventory.	MM
09/18/02	Appendix K	Increased response capabilities and new Spill Response Contractor Information (Garner Environmental).	MM

10/01/02	Appendix N	Revised Reportable Oil Spill History information to include thru YTD (September, 2002)	MM
09/12/02	Appendix O:	Revised On-Site Waste Activities SOP	MM
06/24/03	Table 1-1	Updated Record of Revisions	MM
06/24/03	Figure 3.0	Minor revisions to Emergency Response Procedures	MM
06/24/03	Figure 3.0	Revised names for Qualified Individuals and Emergency Response Members	MM
06/24/03	Section 3	Revisions to Site Security description	MM
06/24/03	Section 3	Minor revisions to "Emergency Operations" SOP and "Emergency Response Command" SOP.	MM
06/24/03	5-13	Addition of names and telephone numbers for contacts on wildlife rehabilitation.	MM
06/24/03	Section 8	Minor revisions to "Emergency Management Training and Exercise Planning Schedules", "ERT Spill Team Trainings and Drill Guidelines", a new "ERT Spill Drill – Quarterly Drill", revised "Spill Drill – Unannounced Drill", and revised "Notification Drill (Annual) – QI Notification Exercise.	MM
06/24/03	Appendix D	Updated History of Tank Failures	MM
06/24/03	Appendix G	Revised Marine Docks Operating and Emergency Procedures.	MM
06/24/03	Appendix K	Revised telephone numbers for Clean Channel Association Emergency Telephone Numbers.	MM
06/24/03	Appendix N:	Updated Reportable Oil Spill History thru June 1, 2003	MM
06/24/03	Appendix P	Revised Waste Transporters and Disposal Facilities lists of waste transporters and disposal facilities.	MM
08/24/04	Figure 3.0(A)	Due to telephone contact changes replaced Figure 3.0(A) in the EARP.	RMA Inc
08/24/04	EARP	Added Emergency Management Training and Exercise Plan to the back of the EARP.	RMA Inc
08/24/04	1-1 thru 1-3	Due to wording changes related to the new guidance by EPA replaced the Introduction pages including updated signature pages to the Spill Plan..	RMA Inc
08/24/04	1-4h	Added the revision tracking page to the back of Table 1.	RMA Inc
08/24/04	Table 1-1	Added Record of revision page to back of Table 1-1 after completion.	RMA Inc
08/24/04	2-1 thru 2-12	Based on a change to update wording in section 2, replace pages 2-1 thru the end of table 2-2.	RMA Inc
08/24/04	3-1 thru 3-6	Based on new Federal guidelines numerous changes to the Spill Response Plan replaced pages 3-1 thru 3-6.	RMA Inc
08/24/04	Table 3.0 and 3.0A	Based on an update in contact information replaced table 3.0 and 3.0A.	RMA Inc

Table 1-3 Record of Revisions

Date	Section or Page	Change	Initials
08/24/04	5-1 thru 5-6	Based on new Federal guidelines numerous changes to the Spill Mitigation Procedures replaced pages 5-1 thru 5-6.	RMA Inc
08/24/04	Figure 5-1 thru 5-2	To update the "Environmentally Sensitive" area map Removed Figure 5-1 and 5-2 from the spill plan and replaced with pages 5-1a to 5-1d.	RMA Inc
08/24/04	A-2 thru A-3	To add new regulatory cross reference information, removed pages A-2 and A-3, and replace with pages A-2a thru A-3.	RMA Inc
08/24/04	D-1 thru D-32	Updated the "Tanks Table" for improved readability and minor corrections.	RMA Inc
08/24/04	E-1 thru E-3	Based on revised wording replaced Appendix E-1 thru E-3.	RMA Inc
08/24/04	Appendix J	To ensure the most up-to-date equipment inventory list in Appendix J, replaced "Spill Response Equipment Inventory" page.	RMA Inc
08/24/04	Appendix K	To reflect a better description of contents in Appendix K The title page "Contractor Spill Equipment" was replaced with the new title page, "Contractor and GLO Spill Equipment".	RMA Inc
08/24/04	Appendix K	Added the GLO equipment map to the back of Appendix K	RMA Inc
08/24/04	N-18	Updated information	RMA Inc
08/25/05	Figure 3.0 (EARP)	Updated Internal Notification information	MRC
08/25/05	Figure 3.0 (EARP)	Updated External Notification information	MRC
08/25/05	Figure 3.0	Updated Internal Notification information	MRC
08/25/05	Figure 3.0	Updated External Notification information	MRC
11/08/05	Table J-1	Update Spill Response Equipment List	MRC
10/26/06	Entire Spill Plan	Name Change Update from Lyondell-Citgo to Lyondell Houston Refinery. Includes all text and drawings with reference to Lyondell Citgo and its logo.	MRC
06/05/07	Appendix D Tank Table	Deleted demolished tanks 135TK0598 and 135TK0599. Added new tanks 134TK0912 and 135TK0100	MRC
06/05/07	Table E-1	Added new tank 134TK0912	MRC
06/12/07	Figure 3.0(A)	Added GLO phone number to table.	JDL
08/31/07	Table 2-2	Corrected line descriptions	JDL
08/31/07	Table 2-3	Updated permit renewal dates.	JDL

Table 1-3 Record of Revisions

Date	Section or Page	Change	Initials
08/31/07	Table 1-1	Updated Record of Revisions	JDL
09/25/07	2-3	Removed Section 2.2.4 referencing two USTs.	JDL
09/25/07	2-3	Added Section 2.2.4 referencing two ASTs for storing gasoline and diesel fuel.	JDL
09/25/07	Table 1-1	Updated Record of Revisions	JDL
09/26/07	3-1 thru 3-5	Updated format and replaced entire section.	JDL
09/26/07	Figure 3	Updated format and replaced table.	JDL
09/26/07	Figure 3.0(A)	Updated format, replaced External Notifications Reference table, and relabeled to Table 3-1.	JDL
09/26/07	4-1 thru 4-2	Updated format, revised text, and replaced pages.	JDL
09/26/07	Appendix J	Updated Figure for GLO staged equipment locations	JDL
09/27/07	5-1 thru 5-14	Updated format, revised text, and replaced pages.	JDL
09/27/07	6-1	Updated format, revised text, and replaced page.	JDL
09/28/07	Appendix D	Updated format and listing of Tank Failures: Supplement to the Storage Tank Summary Table	JDL
09/28/07	7-1 thru 7-2	Updated format, revised text, and replaced pages.	JDL
09/28/07	Appendix E	Updated Attachments 3 thru 30 with refinery name change and replaced pages.	JDL
09/28/07	Appendix E	Updated Emergency Management Training and Exercise Plan with refinery name change and replace pages.	JDL
09/28/07	8-1 thru 8-10	Updated format, revised text, and replaced pages.	JDL
09/28/07	Section 8	Updated Attachments 9, 10, 14-16, 26, and Table Top Exercise Documentation with refinery name change and replaced pages.	JDL
09/28/07	Appendix A	Updated 40 CFR 112 Appendix F cross-reference table and replaced page.	JDL
09/28/07	Appendix B	Updated Acronyms list and replaced page.	JDL
09/28/07	Appendix C	Updated Oils Handled page with refinery name change and replaced pages.	JDL
09/28/07	E-1 thru E-2	Updated Tanks With Tank Dikes As Secondary Containment section with refinery name change, revised text, and replaced pages.	JDL
09/28/07	Table E-1	Updated format and replaced table.	JDL
10/01/07	5-9	Deleted Section 5.3.2 <i>Non-Mechanical Treatment Options</i> and renumber remaining sections in 5.3	JDL
10/18/07	Table 1-1	Updated Record of Revisions	JDL
10/18/07	Plan	Completed annual review	JDL
08/15/08	Table 3-2	Updated external contact information for Wildlife Assistance and CCA	JDL

Table 1-3 Record of Revisions

Date	Section or Page	Change	Initials
08/15/08	Table 1-1	Updated Record of Revisions	JDL
08/18/08	Table 5-2	Removed 430TK0869 from Tank Table (demolished for Degassing Unit)	JDL
08/18/08	Table 1-1	Updated Record of Revisions	JDL
08/19/08	Table E-1	Removed demolished tank 134TK0607 from table.	JDL
08/19/08	Table E-2	Removed demolished tanks 134TK0607, 136TK0598, and 136TK0599 from table, and added 136TK0100.	JDL
08/19/08	Plan	Completed annual review	JDL
07/01/09	Cover & Spline	Updated revision date	JDL
07/01/09	Inside Cover	Updated revision date	JDL
07/01/09	5-14	Updated contact name and numbers for US Fish & Wildlife Services.	JDL
07/01/09	Table 1-1	Updated Record of Revisions	JDL
07/01/09	Plan	Completed annual review	JDL
04/29/10	5.1.1	Added section on Secondary Spill Containment	JDL
04/29/10	Appendix E	Added section on Tank Dike Wall Valve Operation	JDL
06/07/10	Table 3-2	Updated External Notification phone numbers	JDL
06/08/10	5.14	Updated contact name and numbers for US Fish & Wildlife Services.	JDL
06/08/10	Table 1-1	Updated Record of Revisions	JDL
06/08/10	Plan	Completed annual review	JDL
06/09/11	5.14	Updated contact name and numbers for US Fish & Wildlife Services.	JDL
06/09/11	Table 1-1	Updated Record of Revisions	JDL
06/09/11	Plan	Completed annual review	JDL
11/02/11	Table 2-3	Updated new effective date of GCA Affluent Permit	JDL
11/02/11	Table 1-1	Updated Record of Revisions	JDL
06/26/12	Table 3-2	Changed name of "Wildlife Rehabilitation & Education" to "Wildlife Center of Texas"	JDL
06/26/12	5.6	Changed name of "Wildlife Rehabilitation & Education" to "Wildlife Center of Texas"	JDL
06/26/12	Cover & Spline	Updated revision date	JDL
06/26/12	Inside Cover	Updated revision date	JDL
06/26/12	Table 1-1	Updated Record of Revisions	JDL
07/30/12	2.1	Inserted hyperlinks to Figures 2-1 and 2-2 and revised section text.	JDL
07/30/12	2.1.3	Inserted hyperlinks to MSDSs, modified section text, and inserted Top Ten Oils table from Appendix C	JDL

Table 1-3 Record of Revisions

Date	Section or Page	Change	Initials
07/30/12	3.7	Changed HSE Coordinator to Emergency Management Coordinator	JDL
07/30/12	3.7	Updated source of accurate weather information and location of weather station	JDL
07/30/12	8.1.1	Changed section title	JDL
07/30/12	8.1.2	Changed section title	JDL
07/30/12	8.1.4	Changed section title	JDL
08/24/12	3.8.3	Added new section for Evacuation and Personnel Evacuation and included hyperlinks to procedure and Evacuation Plan diagram.	JDL
08/29/12	Plan	Completed annual review and update to SRPP including reformat and restructure into a single web-based document for easy online access and navigation by use of hyperlinks.	JDL
02/22/13	Figure 1-1	3 rd Party Certification (Witt Obrien's) – Added Corrective Action Items.	JDL
02/22/13	Figure 1-2	3 rd Party Certification (Witt Obrien's) – Modified date of facility site visit.	JDL
02/22/13	Figure 1-5	3 rd Party Certification (Witt Obrien's) – Added reference to SPCC elements table.	JDL
02/22/13	Figure 1-6	3 rd Party Certification (Witt Obrien's) – Added new figure for Facility Information.	JDL
02/22/13	Figure 1-7	3 rd Party Certification (Witt Obrien's) – Added new figure for DOT PHMSA Operator's Statement of Significant and Substantial Harm	JDL
02/22/13	1.4	3 rd Party Certification (Witt Obrien's) – Added language that SPCC technical amendments, certification, and Plan revisions.	JDL
02/22/13	2.2.3	3 rd Party Certification (Witt Obrien's) – Added secondary containment systems checklist	JDL
02/22/13	2.2.3	3 rd Party Certification (Witt Obrien's) – Added statement about alternates requirement for qualified oil-filled operational equipment.	JDL
02/22/13	2.2.4	3 rd Party Certification (Witt Obrien's) – Added statement about buried or bunkered storage tanks.	JDL
02/22/13	Table 2-3	3 rd Party Certification (Witt Obrien's) – Added phone number for Weather Report.	JDL
02/22/13	Table 3-3	3 rd Party Certification (Witt Obrien's) – Added Notification Data Sheet.	JDL
02/22/13	3.6.1	3 rd Party Certification (Witt Obrien's) – Added statement about retention of inspection records on response equipment.	JDL

Table 1-3 Record of Revisions

Date	Section or Page	Change	Initials
02/22/13	3.8.3	3 rd Party Certification (Witt Obrien's) – Added reference to EAP-003, Section 3.8.3.	JDL
02/22/13	4.1	3 rd Party Certification (Witt Obrien's) – Added statement about distance to navigable waterway.	JDL
02/22/13	5.5.1	3 rd Party Certification (Witt Obrien's) – Added list of immediate actions for spills on land	JDL
02/22/13	5.2.3	3 rd Party Certification (Witt Obrien's) – Added statement about distance to navigable waterway.	JDL
02/22/13	5.2.4	3 rd Party Certification (Witt Obrien's) – Added statement about distance to navigable waterway.	JDL
02/22/13	5.7	3 rd Party Certification (Witt Obrien's) – Added new section for Vulnerability Analysis.	JDL
02/22/13	7.1	3 rd Party Certification (Witt Obrien's) – Added new tank inspection checklist.	JDL
02/22/13	8.1.1	3 rd Party Certification (Witt Obrien's) – Added new bullets about prevention briefings for oil-handling personnel.	JDL
02/22/13	Figure 8-3	3 rd Party Certification (Witt Obrien's) – Added new figure for Inspector Qualification Matrix.	JDL
03/05/13	Figure 1-2	3 rd Party Certification (Witt Obrien's) – Added firm registration number.	JDL
03/08/13	1.1	Minor language modification	JDL
03/12/13	2.2.3	Complete rewrite of first 2 paragraphs to address the refinery containment philosophy, oil-filled operational equipment, and the May 2011 aerial survey	JDL
03/25/13	Figure 3-2	Complete revision of Emergency Operations Structure diagram.	JDL
03/28/13	Figure 1-3	Renumber to Figure 1-4 and updated references	JDL
03/28/13	Figure 1-4	Renumber to Figure 1-5 and updated references	JDL
03/28/13	Figure 1-5	Renumber to Figure 1-6 and updated references	JDL
03/28/13	Figure 1-6	Renumber to Figure 1-7 and updated references	JDL
03/28/13	Figure 1-7	Renumber to Figure 1-8 and updated references	JDL
03/28/13	Figure 1-3	Created new figure for Certification of the Applicability of Substantial Harm Criteria	JDL
03/29/13	Figure 1-2	3 rd Party Certification (Witt Obrien's) – Issued signed Engineer's Certification	JDL
04/10/13	2.2.3	Added referenced to Oil-Filled Electrical Equipment Table & Cathodic Protection Rectifier Location Plan	JDL
04/10/13	Table 2-7	Renumbered to Table 2-8 and updated references	JDL
04/10/13	Table 2-6	Renumbered to Table 2-7 and updated references	JDL
04/10/13	Table 2-5	Renumbered to Table 2-6 and updated references	JDL

Table 1-3 Record of Revisions

Date	Section or Page	Change	Initials
04/10/13	Table 2-4	Renumbered to Table 2-5 and updated references	JDL
04/10/13	Table 2-4	Added new table for list of Oil-Filled Electrical Equipment and updated references	JDL
04/10/13	Figure 2-3	Renumbered to Figure 2-4 and updated references	JDL
04/10/13	Figure 2-4	Renumbered to Figure 2-5 and updated references	JDL
04/10/13	Figure 2-5	Renumbered to Figure 2-6 and updated references	JDL
04/10/13	Figure 2-6	Renumbered to Figure 2-7 and updated references	JDL
04/10/13	Figure 2-7	Renumbered to Figure 2-8 and updated references	JDL
04/10/13	Figure 2-8	Renumbered to Figure 2-9 and updated references	JDL
04/10/13	Figure 2-3a	Added new Cathodic Protection Rectifier Location Plan diagram	JDL
04/16/13	Figure 2-3b	Added new Contractor Oil Storage Location diagram	JDL
04/16/13	Plan	Completed annual review	JDL
04/17/13	Figure 1-3	Signed by Site Manager	JDL
04/17/13	Figure 1-3	Signed by Site Manager	JDL
04/17/13	Figure 1-4	Signed by Site Manager	JDL
04/17/13	Figure 1-5	Signed by Site Manager	JDL
04/17/13	Figure 1-6	Signed by Site Manager	JDL
04/17/13	Figure 1-8	Signed by Site Manager	JDL
04/23/13	Plan	Converted Plan to Adobe pdf document for transmittal to agencies.	JDL
05/01/13	Figure 1-1	Signed by Site Manager after completion of all Plan Implementation Requirements	JDL
06/10/13	Table 5.5	Renumbered to Table 5-6 and updated references	JDL
06/10/13	Table 5.4	Renumbered to Table 5-5 and updated references	JDL
06/10/13	Table 5.4	Add new table for Waste Transporters and Disposal Facilities and updated references	JDL
06/10/13	ERAP	Added HSE-ENV-610 - On-Site Waste Activities	JDL
06/11/13	5.4.2	Added reference to HSE-ENV-610 procedure	JDL
06/11/13	5.4.3	Added reference to new Table 5-4	JDL
06/11/13	3.3.2	Added language related to dispersant application and aerial observation requirements.	JDL
06/12/13	4.1	Added language to address 4 breakout tanks in STF	JDL
06/12/13	Table 2-8	Added note at bottom of table to address uses of chemical agents and in-situ burning.	JDL
06/13/13	4.5	Added new section to address discharge characteristics from equipment failure.	JDL
06/13/13	2.6.1	Added sentence about loading railcar/tank truck loading rack containment area.	JDL

Table 1-3 Record of Revisions

Date	Section or Page	Change	Initials
06/13/13	1.4	Added sentence indicating Plan will be submitted electronically to DOT every 5 years.	JDL
06/13/13	5.7	Expanded section on vulnerability analysis and updated references.	JDL
06/13/13	Figure 3-9	Replaced TxGLO Staged Equipment diagram with current illustration.	JDL
06/13/13	Figure 5-1	Replaced Environmentally Sensitive Impact Areas with current TxGLO maps.	JDL
06/13/13	Table 1-1	Updated Regulatory Cross Reference Table.	JDL
06/14/13	Table 1-3	Updated Record of Revisions.	JDL
08/20/13	Table 3-2	Added phone numbers for USCG Sector Houston – Galveston and EPA Region 6 Spill Line	JDL
08/20/13	Table 4-2	Renamed to Table 4-3	JDL
08/20/13	Table 5-1	Renamed to Table 4-2, changed table title, and revised heading.	JDL
08/21/13	Table 5-2	Renamed to Table 5-1	JDL
08/21/13	Table 5-3	Renamed to Table 5-2	JDL
08/21/13	Table 5-4	Renamed to Table 5-3	JDL
08/21/13	Table 5-5	Renamed to Table 5-4	JDL
08/21/13	Table 5-6	Renamed to Table 5-5	JDL
08/22/13	4.1	Revised section to clarify EPA, DOT, and USCG worst-case calculations.	JDL
08/22/13	5.1	Removed reference to Table 5-1	JDL
08/22/13	Figure 3-2	Updated diagram to identify Finance Section under Logistics Section Chief	JDL
08/22/13	3.3.4	Added new Logistics section to describe Finance Section in HRO's IC Structure.	JDL
08/22/13	Table 2-1	Added footnotes and references	JDL
08/23/13	Figure 1-7	Added Facility-Specific Information paragraph	JDL
08/23/13	TOC	Updated Table of Contents	JDL
08/23/13	TOC	Updated List of Tables	JDL
08/23/13	Table 1-3	Updated Record of Revisions.	JDL
10/01/13	Table 2-1	Removed demolished 887 Tank from table.	JDL
10/09/13	Table 2-8	Renamed and updated	RFG
10/09/13	2.10	Minor language modification	RFG
10/09/13	List of Tables	Updated Table 2-8 title	RFG
10/09/13	2.2.1	Revised number of storage tanks	RFG
10/09/13	5.4.2	Minor language modification	RFG
02/17/14	2.2.3	Minor language modification for drawing oil from tank	RFG

Table 1-3 Record of Revisions

Date	Section or Page	Change	Initials
02/18/14	1.4	Changed language to state Plan will be submitted to DOT every 5-years from submittal date	RFG
02/18/14	Table 3-1	Updated phone number for Alternate QI	RFG
02/18/14	8.1.1	Revised language to state SRPP training records as long are maintained as personnel are assigned duties under the SRPP	RFG
02/18/14	8.1.2	Revised language to state HAZWOPER training records are maintained as long as personnel are assigned duties under the SRPP	RFG
02/18/14	8.1.4	Revised language to state Spill Response Team training records are maintained as long as personnel are assigned duties under the SRPP	RFG
02/18/14	8.2.4	Revised language to state Marine Spill Team training records are maintained as long as personnel are assigned duties under the SRPP	RFG
02/19/14	4.1	Updated USCG worst-case discharge to include length of #1 Crude line at docks	RFG
02/19/14	4.1	Updated DOT worst-case pipeline discharge to include length of 36" crude line	RFG
02/19/14	4.1	Added statement indicating DOT worst-case pipeline discharge is based on best engineering judgment	RFG
02/19/14	4.4	Update year to include 2013 tank failures	RFG
02/19/14	Table 4-3	Updated table to include 2013 tank failures	RFG

Table 2-1 Tank Capacities

Function Location Number	Material Stored	Container Design**	Year Built	Shell Capacity (bbls)	Max Fil Capacity (bbls)	Average Capacity (bbls)
035TK1901	Diesel Fuel	Horizontal	----	(b) (7)(F), (b) (3)

* Indicates tanks used in marine transfer operations to/from barges and cargo ships. Only B-Dock and C-Dock are capable of loading/unloading cargo ships whereas all four docks are capable of loading/unloading barges. D-Dock is dedicated to only loading molten sulfur.

** Container Design Reference:
EFR – External Floating Roof Tank
IFR – Internal Floating Roof Tank
VFR – Vertical Fixed Roof Tank

Tank containment dike areas, lowest dike wall elevations, and basin floor elevations from aerial topographic data prepared by Gulf Coast Aerial Mapping, Baton Rouge, LA (May 2011).

Tank containment areas with insufficient volumes located within or adjacent to operating process areas are contained within refinery surface impoundment basins.

Table 2-7 HRO Pipeline in Tunnel Under Roadways

Operator List ID#	Assigned Pipeline No.	Line Description	Size (in)	Service	Location Description	Operator
1	PL01	OP Transfer Line	12	Naphtha Heating Oil Delivery	Pipeline Tunnel (under Highway 225)	HRO
1	PL01	OP Transfer Line	12	Naphtha, Heating Oil	Pipeline Tunnel @ #2 Gate (under Lawndale)	HRO
2	PL02	Gasoline to shops	4	Gasoline (Out-of-Service)	Pipeline Tunnel @ #2 Gate (under Lawndale)	HRO

Table 4-3 Historical Tank Failures (1996 – 2013)

Tank No.	Date	Root Cause	Actions Taken
133TK0883	07/15/96	Hole in floor of tank	11 bbls of low sulfur diesel fuel spilled inside dike wall. Spill was cleaned up, and tank was emptied and repaired.
136TK0764	06/02/97	Hole in bottom of tank	~ 4 bbls of auto transmission fluid spilled into dike wall. Spill cleaned up, tank emptied and taken out of service.
137TK0815	12/18/97	Hole in tank floor	~ 4 bbls of Coker Naphtha spilled inside dike wall. Spill cleaned up, tank emptied and repaired.
430TK0871	11/02/98	Hole in side of tank	~ 2 bbls of molten sulfur spilled inside dike wall. Spill cleaned up, tank emptied and repaired.
432TK0855	12/12/98	Holes in tank roof.	Tank was removed from service, cleaned and degassed, and new roof installed in 1999.
432TK0855	09/20/99	Roof was sunk due to an operational upset which punctured two holes in the tank bottom.	Tank was removed from service, cleaned and degassed, new roof installed, and the tank floor repaired.
		No tank failures in 2000	
135TK565	04/12/01	Seal on mixer motor developed a leak causing gasoline to leak to ground.	Tank emptied to get level below mixer motor seal and mixer motor seal was replaced.
133TK0890	06/09/01	Tank roof sunk during Tropical Storm Allison	Area cleaned up, tank emptied and degassed, and roof replaced.
134TK0618	06/09/01	Tank roof sunk during Tropical Storm Allison	Area cleaned up, tank emptied and degassed, and roof replaced.
135TK0564	06/09/01	Tank roof sunk during Tropical Storm Allison	Area cleaned up, tank emptied and degassed, and roof replaced.
136TK0441	06/09/01	Tank roof sunk during Tropical Storm Allison	Area cleaned up, tank emptied and degassed, and roof replaced.
137TK0800	06/09/01	Tank roof sunk during Tropical Storm Allison	Area cleaned up, tank emptied and degassed, and roof replaced.
137TK0805	06/09/01	Tank roof sunk during Tropical Storm Allison	Area cleaned up, tank emptied and degassed, and roof replaced.
138TK0893	06/13/01	During routine inspection, corrosion was found on the floor seam and roof pontoons	Corrosion was repaired and water was removed from pontoons.

Table 4-3 Historical Tank Failures (1996 – 2013)

Tank No.	Date	Root Cause	Actions Taken
		were found with water.	
138TK0652	11/01/01	Hole found in tank floor.	Oil pumped from tank, tank removed from service, and tank floor replaced in 2002.
		No tank failures in 2002	
		No tank failures in 2003	
136TK0441	02/10/04	Roof drain was found leaking toluene into the dike wall and stormwater drain.	Blocked in roof drain
133TK0878	07/22/04	Tank was found leaking at the tank floor.	Tank was removed from service and may be demolished
138TK0893	09/30/04	Water found in #4 pontoon during routine inspection.	Water was removed from pontoon and corrosion was repaired.
138TK0771	11/11/04	Tank overflowed into the lube area north of 533CT3701.	The area was barricaded and the equipment isolated.
133TK0883	01/10/05	Leaking from north east side around base of tank.	Tank removed from service.
136TK0584	01/21/05	Tank roof drain leak to soil.	Isolated roof drain and dispatched a vacuum truck.
136TK0583	03/06/06	Crude found on roof due to faulty seals.	Roof was cleaned and seal repairs completed.
137TK0798	04/03/06	Orthoxylene found on tank roof due to faulty seal.	Roof cleaned and seal repaired.
138TK0893	05/05/06	Crude found on tank roof and dripping from roof drain due to faulty seal.	Area cleaned and seal repaired.
137TK0412	05/16/06	During routine inspection, corrosion was found on the floor seam.	Tank removed from service and new floor was installed above old floor.
138TK0202	05/23/06	Suction valve failed causing pale oil to spill to ground.	Area cleaned and valve repaired.
136TK0600	05/25/06	Product found on tank roof due to cracked roof weld.	Roof was clean, tank removed from service, and crack repaired.
138TK0893	06/06/06	Crude found on tank roof and dripping from roof drain due to roof corrosion.	Area cleaned and roof repaired.

Table 4-3 Historical Tank Failures (1996 – 2013)

Tank No.	Date	Root Cause	Actions Taken
137TK0804	06/21/06	Coker slop oil found on tank roof and dripping from roof drain due to faulty seal.	Area cleaned and seal repaired.
138TK0651	07/07/06	During routine inspection, lube oil distillate found leaking from tank floor seam.	Area cleaned, tank removed from service, emptied and degassed, and floor seam repaired.
135TK0806	08/02/06	During routine inspection, two small holes found in tank roof.	Roof was cleaned and pinholes were repaired.
133TK0886	08/03/06	Crude found on tank roof from secondary seal failure.	Cleaned product from roof and repaired holes in secondary seal.
134TK0774	08/03/06	Crude found on tank roof from leaking seal.	Cleaned product from roof and seal was repaired.
134TK0775	08/18/06	Crude found coming from roof drain onto ground.	Closed roof drain, cleaned up spill, and repaired roof seal.
138TK0893	08/20/06	Two small holes were found in roof during routine inspection.	Holes were repaired using Belzona.
134TK0802	09/19/06	Crude found on tank roof from leaking seal.	Cleaned product from roof and repaired roof seal.
135TK0563	10/03/06	During routine inspection, small pinhole found on internal roof drain.	Pinhole was repaired.
136TK0600	11/21/06	Product found on tank roof and dripping from roof drain due to tear in primary seal.	Area cleaned, tank removed from service, emptied and degassed, and seal repaired.
136TK0584	01/11/07	Crude found on roof due to faulty seals.	Roof cleaned, tank removed from service, emptied and degassed, and seal repaired.
136TK0583	01/23/07	Crude found on tank roof and dripping from roof drain due to faulty seal.	Area cleaned and seal repaired.
137TK0412	02/06/07	During routine inspection, tank roof seals were found defective.	Tank removed from service, emptied and degassed, and new roof seals were installed.
138TK0856	06/09/07	During routine inspection, 2 gallons of pale oil leaked from tank floor seam.	Area cleaned, tank removed from service, and turned over to maintenance for repaired.
136TK0594	08/12/08	~65 bbls of crude found on roof due to roof displacement from gas bubble.	Area cleaned and seal inspected and repaired as needed.

Table 4-3 Historical Tank Failures (1996 – 2013)

Tank No.	Date	Root Cause	Actions Taken
137TK0803	11/21/08	~16 bbls of slop oil found on roof due to overfilling the tank.	Area cleaned and seal inspected and repaired as needed.
137TK0425	11/22/08	~11 bbls of slop oil found on roof due to overfilling the tank.	Area cleaned and seal inspected and repaired as needed.
134TK0597	12/16/08	~ 5 gal of VGO found on roof following 634 HDS shutdown	Area cleaned and seal repaired.
134TK0597	03/02/09	~2.5 bbls of VGO found on roof following 634 HDS compressor trip.	Area cleaned and seal repaired.
133TK0880	05/20/09	Internal floating roof was found not floating.	Tank was isolated, emptied, degassed, cleaned and tank roof/seals repaired.
138TK0892	08/12/09	~3 gal of Grade A crude found on roof from pinhole leak.	Area cleaned and holes were repaired using Belzona.
138TK0893	08/20/09	~10 gal of Grade A crude found on roof from pinhole leak.	Area cleaned and holes were repaired using Belzona.
138TK0893	10/19/09	~0.25 gal of crude was found leaking from old leak repair.	Area cleaned and holes were repaired using Belzona.
138TK0893	12/03/09	~10 gal of Grade A crude found on roof from pinhole leak.	Area cleaned and holes were repaired using Belzona.
138TK0273	12/10/09	~1.5 bbls of lube oil was found leaking from pinholes on tank shell.	Tank was isolated, emptied, degassed, cleaned and tank shell repaired.
430TK4001	05/26/10	Internal floating roof was found not floating.	Tank was isolated, emptied, degassed, cleaned and tank roof/seals repaired.
135TK0560	07/03/10	~37 bbls of gasoline was from leaking from roof seal.	Tank was isolated, emptied, degassed, cleaned and roof seal repaired.
430TK4002	07/22/10	~15 bbls of oil was from leaking from roof seal.	Tank was isolated, emptied, degassed, cleaned and roof seal repaired.
138TK0650	08/02/10	~5 gal of lube oil was from leaking from roof floor plate.	Tank was isolated, emptied, degassed, cleaned and tank floor repaired.
138TK0892	08/06/10	~15 gal of Grade A crude found on roof from pinhole leak.	Area cleaned and holes were repaired using Belzona.

Table 4-3 Historical Tank Failures (1996 – 2013)

Tank No.	Date	Root Cause	Actions Taken
136TK0594	10/12/10	~25 gal of crude found on roof due to undetermined cause.	Area cleaned and seal inspected.
136TK0594	11/22/10	~60 bbls of crude found on roof and containment area due to gas bubble under the roof.	Area cleaned and seal inspected and repaired as needed.
432KT0810	12/30/10	~1.5 bbls of slop oil was found leaking from pinhole roof leak.	Area cleaned and holes were repaired using Belzona.
137TK0804	02/28/11	~3 bbls of slop oil was from leaking from roof seal.	Tank was isolated, emptied, degassed, cleaned and roof seal repaired.
136TK0594	05/21/11	~21 bbls of crude found on roof from release of hot material to the tank that burped seals.	Area cleaned and seal inspected.
136TK0594	06/29/11	~1 bbls of crude found on roof from burping seals during 634 HDS upset.	Area cleaned and seal inspected.
136TK0594	08/02/11	~3.5 bbls of crude found on roof from burping seals during 634 HDS shutdown.	Area cleaned and seal inspected.
138TK0892	09/10/11	~1 gal of Grade A crude found on roof from pinhole leak.	Area cleaned and holes were repaired using Belzona.
136TK0597	01/11/12	Internal roof drain piping failed causing a release of ~20 bbls of VGO from roof drain.	Area cleaned and roof drain piping were repaired/replaced
138TK0893	02/05/12	~ 2 gal of Grade A crude was found leaking from roof drain due to pinhole roof leaks.	Tank was isolated, emptied, degassed, cleaned and tank roof repaired by IUP.
135TK0565	07/01/12	~10 gal of gasoline was found leaking from roof drain due to faulty gasket on hatch.	Area cleaned and hatch gasket was replaced.
138TK0892	08/08/12	~3 gal of Grade A crude was found on roof from pinhole leak.	Tank was placed on DOR pending repair of 138TK0893
135TK0573	11/03/12	~5 gal of kerosene was found leaking from roof drain.	No product visible on roof so source is undetermined
136TK0583	11/20/12	~3 bbls of VGO was found leaking from roof drain.	Area cleaned and seal inspected.
136TK0582	12/07/12	~4 bbls of LSVGO was found on the roof.	Area cleaned and seal inspected.

Table 4-3 Historical Tank Failures (1996 – 2013)

Tank No.	Date	Root Cause	Actions Taken
135TK0577	01/03/13	~1 gal of gasoline was found coming from in the roof drain just after tank was returned to service.	Roof drain was blocked in and maintenance is troubleshooting cause.
136TK0582	02/18/13	~2 bbls of HVGO was found on roof.	Area cleaned and seal inspected.
135TK0576	10/04/13	~35 gal of Raffinate was found on the roof and coming from the roof drain.	The roof and area was cleaned and was seal inspected.
136TK0583	11/04/13	~20 gal of LSVGO was found leaking from roof drain.	No product visible on roof so source is undetermined
136TK0583	12/18/13	~1.3 bbls of LSVGO was found on the roof and coming from the roof drain.	The roof and area was cleaned and was seal inspected.
136TK0597	12/24/13	~1 bbl of LSVGO was found leaking from the roof drain	Area cleaned and seal inspected.

Table 5-1 Response Options for Substances with Properties Similar to Oil

Mechanism	River Bank	Man-Made Shore	Dredge Spoil Bank	Marsh

<p>P = Preferred</p> <p>O = Optional</p> <p>X = Not advisable</p> <p>XX = Avoid</p> <p>* Texas Water Commission, Spill Response Map Series, Coastal Region</p> <p>** A federal on-scene coordinator may authorize dispersant use only with the concurrence of all members of the EPA Region VI Response Team</p>				

Table 5-2 Oil Spill Protection Response Options

Response options	Protection Clean-up Technique	Description	Primary Use of Clean-up Technique	Technique Requirements	Biological Effect of Use
PROTECTION	Exclusion Booms	Boom is deployed across or around sensitive area and anchored in place	Use where the currents are less than 1 knot and breaking waves are	Access by boat. Access by vehicle requires good trafficability.	Minor disturbance of area
	Diversion Booms	Boom is deployed at an angle to the approaching oil. Oil is diverted away from the sensitive area to a less sensitive area for recovery.	Use where the current is greater than 1 knot and the breaking waves are less than 25 cm	Access by boat. Access by vehicle requires good trafficability.	Minor disturbances at shoreline anchor points but will cause heavy oil contamination on the down stream side
	Sorbent Booms and Barriers	Anchor along a shoreline as described above to protect sensitive areas and absorb oil	Used on quiet waters with minor oil contamination	Access by boat. Access by vehicle requires good trafficability.	Minor disturbance to shoreline at the anchor points
	Ditches and Dikes	Construct berms from tidal material to protect tidal flat areas accessible and can support earth moving equipment	Use where booms cannot be deployed. Prevent oil from reaching backshore areas during one to two tidal cycles	Heavy equipment access. Fair to good trafficability.	Major disturbance of shoreline and vegetation
	Herdng	Use low pressure water or propeller backwash to move or "herd" oil to a collection point. The protection boom remains stationary	Use in quiet waters where the current is too slow to move oil to a common collection point.	Access by boat. Access by vehicle requires good trafficability.	Minor disturbance of the area, but exercise care to prevent pushing oil under the protective boom.
CLEANING/ MIXING	Burning	Not advised	Not advised	Not advised	Kills surface organisms caught in burn area.
	Mixing	Tractor pulls discing equipment along contaminated area	Used on non-recreational sand or gravel beaches that are lightly contaminated	Heavy equipment access. Fair to good trafficability. High energy environment	Disturbs shallow burrowing organisms. Possible toxic effects from buried oil.
	Natural Cleaning	No action taken. Oil left to degrade naturally. Nutrients and microbes may be sprayed over the area to accelerate biological degradation of the oil. Used for slight oil contamination in muddy tidal flats and marsh areas where trafficability is very poor and boat access is limited.	Limited access for equipment and boats	Minimal disturbance, but potential toxic effects and smothering by the oil.	Potential elimination of habitat if organisms will not settle on residual oil.
REMOVAL/ DISPOSAL	Manual Removal	Oiled sediments and debris are removed by hand, shovels, rakes, and wheelbarrows. Apply Sorbent pads to soak up oil.	Used on mud and sand beaches when oil contamination is light or sporadic and oil penetration is slight or on beaches where access for heavy equipment is not available.	Foot or light vehicular access. Sorbent pads can be applied from a boat.	Removes and disturbs shallow burrowing organisms. Rapid recovery.

Table 5-2 Oil Spill Protection Response Options

Response options	Protection Clean-up Technique	Description	Primary Use of Clean-up Technique	Technique Requirements	Biological Effect of Use
	Mechanical Removal	Oiled sediments and debris are removed with various types of heavy equipment, i.e., backhoe, front end loader, bulldozer, etc.	Used on sand beaches or where oiled vegetation needs removal	Good trafficability. Heavy to light equipment access.	Removes shallow burrowing organisms. Severe disturbance of the surface and vegetation.
	Vacuum Pumping	Truck is backed up to oil pool or recovery site where oil is picked up via the vacuum hose.	Used to pick up oil on shorelines where pools of oil have formed in either natural depressions or where trapped by deployed exclusion or diversion booms	Heavy equipment access. Large enough pools on land or thick enough oil on water for technique to be effective. Sorbent pads may be needed to remove remaining residual vacuum truck cannot pick up.	Removal of some organisms. Potential for longer-term toxic effects associated with oil left on the land or in the water.
	Vegetation Cropping	Oiled vegetation is cut by hand, collected and stuffed into bags or containers for disposal.	Used on oil contaminated vegetation.	Foot or boat access. Cutting tools	Removes and crushes some organisms. Rapid recovery if foot traffic is minimized.
ONSHORE DISPERSION	Dispersants on shore)	A federal on-scene coordinator may authorize dispersant use only with the concurrence of all members of the Region VI Regional Response Team			
	High-Pressure Flushing	High pressure water streams remove oil from substrate where it is channeled to recovery area.	Used to remove oil coatings from rip rap, concrete and manmade structures	Light vehicular access. Recovery equipment.	Removes some organisms and shells from the substrate, damage to remaining organisms variable. Oil not recovered can be toxic to organisms downslope of cleanup activities.
	Low-Pressure Flushing	Low Pressure water spray flushes oil from substrate where it is channeled to recovery points.	Used to flush light oils that are not sticky from lightly contaminated rip- rap, concrete, manmade structures and vegetation.	Leaves most organisms alive and in place. Oil not recovered can be toxic to organisms downslope of cleanup.	
	Sand Blasting	Sand moving at high velocity removes oil from substrate.	Used to remove thin accumulations of oil residue from manmade structures.	Light vehicular access. Oil must be semi-solid. Supply of clean sand.	Removes all organisms and shells from the substrate. Oil not recovered can be toxic to organisms downslope of cleanup activities.
	Steam Cleaning	Steam removes oil from substrate where it is channeled to recovery area.	Used to remove oil coatings from rip rap, rocks, concrete and manmade structures.	Light vehicular access. Recovery equipment. Fresh water supply.	Removes some organisms from substrate but mortality due to the heat is more likely. Oil not recovered can be toxic to organisms downslope of cleanup activities.

Table 5-5 Federally Endangered Species – Harris County, TX

Species	Species Description	Habitat	Comments
American Alligator	A large lizard-like reptile with a broadly rounded snout. General adult coloration is grayish-black.	Broad river valleys, meandering streams, oxbow lakes, marshes, swamps, estuaries, bayous, and creeks with minimal water flow.	Currently occur in more than 90% of their historic range. They also occur in suitable inland habitat.
Artic Peregrine Falcon	Artic Peregrine Falcons are salty gray above and whitish below, and have a black head with vertical "bandit's mask" pattern over the eyes. This falcon can be distinguished from the American peregrine falcon by its smaller size and lighter coloration. They are very adept and exceedingly fast flyers, reaching speeds of more than 200 mph in dives. The dark brown or blue-gray backs of peregrines distinguish them from the sandy brown prairie falcon.	Nests in the Artic tundra. Winters in the United States, Central and South America, especially along coastlines and in mountains.	Occurs statewide in Texas during the fall and spring migrations, with a few wintering along the Texas Gulf Coast. Concentrates in April and October on North and South Padre Islands.
Whooping Crane	A large, snowy white, long necked bird with long legs that normally trail behind in flight, black primary feathers, a red crown, and wedge-shaped patch of black feathers behind the eye.	Marshes, river bottoms, potholes, prairies, cropland. Whooping cranes feed on small grains in agricultural fields, green forage, aquatic plants, insects, crustaceans and small vertebrate animals.	
Least Tern	Small birds (21 cm long) black crown, white forehead, grayish back and dorsal wing surfaces, jet black wing tips, snowy white under parts, and a black-tipped yellow bill. The male's bill is orange to bright yellow and the female's is light or dull yellow or straw-colored.	Premier nesting sites are salt flats, broad sandbars, and barren shores along wide, shallow rivers. Vegetation, if present, is usually located well away from the colony, with the exception of bugseed, eastern cottonwood and sandbar willow. As natural nesting sites have become sparse, birds have used dredge islands, dike fields, fly-ash lagoons, sandpits, and gravel levee roads as nesting sites.	Occur as remnant colonies within their historic distribution. Winters along the Gulf Coast.
Piping Plover	NO DATA IN ACP		
Bald Eagle	A large eagle with white head and tail in adult, wingspan 6 to 7.5 ft. Tarsi are bar of feathers. Juveniles are dark or mottled.	Nests near water; requires large trees for nesting. Winters along major rivers and reservoirs, and occasionally in rangeland areas. Fish, waterfowl and carrion are the primary food sources.	Counties shown as present distribution are those that contain large wintering population. Winter concentrations occur around large bodies of water from December to March.
Texas Prairie Dawn-Flower	A small single-stemmed or branching annual reaching a height of up to 6 inches. Leaves clustered at the plant base are spoon-shaped. Stem leaves are alternate, narrow with parallel sides, and no or few teeth on the margin. Seeds are cone-shaped, obscurely 4-angled, and hairy.	Occurs in sparsely vegetated areas of fine- sandy compacted soil. These mostly barren areas are sparsely vegetated and the soil is often covered with a blue-green alga. It can also occur on disturbed soils such as rice fields, vacant lots, and pastures if the soil structure remains relatively intact.

Dates and Types of Substantial Expansions: Under operation by Sinclair, the refinery's 732 Fluidized Catalytic Cracking Unit (FCCU) and the 630/631 Hydrodesulfurization (HDS) units were commissioned in 1953 and 1958, respectively. In the early 1960s, the Lubes Complex was constructed for processing Grade A naphthenic crude oil and select feedstocks to produce several grades of white oils and lubricating oils. When Sinclair merged with ARCO in 1969, the 736 Coker was commissioned. In 1976, a major expansion of the refining occurred which included commissioning of the 230 Gas Plant, 633 HDS, 634 HDS, 635 HDS, 433 Claus, 434 Claus, 435 Tail Gas Unit, and 536 Crude. Just after the formation of Lyondell-CITGO Refining, another major expansion of the refining occurred in 1996/97 which included commissioning of the 439 Claus, 440 Tail Gas Unit, 636 HDS, 537 Crude, and 737 Coker. Following this last major expansion, the 637 HDS was placed into service in 2006 to meet ultra-low sulfur standards, and the 433 and 434 Claus were completely rebuilt with O₂ enrichment in 2011 and 2012, respectively.

EMERGENCY NOTIFICATION SYSTEM

The refinery Emergency Notification System (ENS) is used to advise personnel of emergency response and evacuation orders (See the [HSE-EAP-003 Evacuation and Personnel Accounting Procedure](#)).

The ENS is an integrated multi-media system designed for the purpose of communicating emergency messages to plant occupants. The system consists of tone, voice, and text messaging to a combination of sub-systems throughout the facility.

Upon notification of an emergency, the Main Gate Dispatcher activates the ENS. The ENS will provide information on the Alert level, type of emergency, location, and evacuation requirements. Additionally, the system is used to advise of any further special information. An All Clear is issued over the ENS to terminate the emergency.

The ENS may also be used to inform / notify personnel of refinery situations that they should be aware of, but do not meet the definition of an emergency (i.e., unit start ups and shut downs, adverse weather situations, etc.)

EMERGENCY CLASSIFICATION

Emergencies are classified by the level of response that is required and the type of emergency.

Responses are tiered into four alert levels. The level of a particular event is dependent on its magnitude from minor to serious. Each alert level activates emergency response groups according to predetermined response orders.

The type of emergencies may be either:

- Medical
- Rescue
- Fire
- Gas release
- Spill
- General emergency (i.e., weather event, power failure, process upset, etc.)

The Main Gate Dispatcher disseminates information provided and dispatches the appropriate level of Alert. After the initial Alert, the level may subsequently be escalated by the Plant Coordinator, the Incident Commander or the Field Coordinator.

DOCUMENT NO:	HSE-EAP-002	PAGE:	2 OF 5
DOCUMENT NAME: EMERGENCY NOTIFICATION & RESPONSE			

The tiered alert levels are defined below. General emergency management group response orders for each alert level are listed in [Appendix 1 - Response Classifications: Alert Levels](#).

ALERT 1: Medical, Rescue, Fire, Gas Release, or Spill

Minor emergency requiring only a limited emergency response. The impact of the event is contained to one source or within its area of origin. There is no potential for the incident to effect areas outside of the facility.

Examples of an Alert 1 emergency include, but may not be limited to, the following:

- Fires contained to one source or unit
- Minor spill or release which is confined within the area of origin
- Medical emergency with less than three (3) injuries or illnesses
- Malfunction or damage of radiography equipment unshielding source

ALERT 2: Medical, Rescue, Fire, Gas Release, or Spill

Emergency requiring activation of the Emergency Operations Center due to

- Actual or potential for off-site impact
- News media coverage
- The need for additional emergency management, technical or logistical support
- Significant regulatory agency involvement

Examples of an Alert 2 emergencies include, but may not be limited to, the following:

- Explosion and fire impacting more than an isolated area
- Major spill or release that is or may impact areas outside of facility
- Medical emergency with more than three (3) serious injuries or illnesses
- Incident involving a fatality
- Incident involving multiple units or buildings

ALERT 3: Medical, Rescue, Fire, Gas Release, or Spill

Emergency requiring activation of off-site emergency response team members and all emergency management support and resources.

Examples of an Alert 3 emergency include, but may not be limited to, the following:

- Major fire or explosion affecting a large area
- Fully involved fire in a large storage tank
- Major spill or release impacting areas outside of facility
- Mass casualty medical emergency
- Emergency of a long duration or other circumstances that make additional responders necessary

DOCUMENT NO:	HSE-EAP-002	PAGE:	3 OF 5
DOCUMENT NAME: EMERGENCY NOTIFICATION & RESPONSE			

ALERT 4: Medical, Rescue, Fire, Gas Release, or Spill

Emergency requiring outside mutual aid assistance and support.

An Alert 4 activates resources from Channel Industries Mutual Aid (CIMA). The Main Gate Dispatcher or Incident Commander activates the CIMA predetermined list as indicated below:

- CIMA first, second or third alarm
- CIMA Mass Casualty Incident: MCI-10, MCI-20 or MCI-30

Note that a CIMA "Special Call" does not in and of itself constitute an Alert 4 Response.

ALL CLEAR

When the emergency is over and it is safe for personnel to return to normal work activity, Main Gate Dispatch will activate the "All-Clear" via the ENS.

SRU THERMAL OXIDIZER / FLARE RELEASES

The Plant Shift Superintendent is responsible for ensuring that appropriate responses are made to SRU incinerator or flare releases.

Incinerator or flare releases, which may affect or are affecting the refinery or areas outside the plant boundaries, shall be alerted according to the alert levels described above. Those events that impact or are visible to areas outside of the refinery, should result in consideration of community notification via the CAER Line.

Effect or impact from SRU releases may be determined using known facts and observable information as follows:

- SRU Operating conditions
- H₂S and SO₂ Emissions Analyzer data
- Visual observations
- Atmospheric conditions

DOCUMENT NAME: EVACUATION AND PERSONNEL ACCOUNTABILITY			

SUMMARY

This Evacuation and Accountability Plan provides procedures for the orderly evacuation of personnel from a unit or area affected by an emergency condition to a safe area. The plan also provides emergency accountability procedures for all personnel within the plant.

SCOPE

These Evacuation and Accountability Procedures apply to all Houston Refining, LP employees, contractors, delivery personnel and visitors within the confines and jurisdiction of the Houston Refinery. The procedures shall be followed in the event of a facility emergency or a building fire / fire alarm.

DEFINITIONS

Accountability Coordinator - Assigned persons or supervisors who manage accountability for their assigned area during a non-essential personnel evacuation of a unit / area or a Building Fire Alarm Evacuation. Some Accountability Coordinators may also serve in the Building Point Coordinator role.

Accountability Reader – An electronic badge reader specifically utilized for accountability. There is at least one Accountability Reader near each Rally Point and at each Evacuation Point. Accountability Reader locations are listed in [Appendix 2](#), are marked via signage and are shown on the Refinery Evacuation Map [Appendix 1](#).

Building Evacuation Point – The designated location(s) outside of a building to which building occupants should report in the event of a building fire or fire alarm. Building Evacuation Points for each building are shown on each respective Building Evacuation Drawing.

Building Point Coordinators – Assigned persons to which Accountability Coordinators and/or individual personnel report that they have evacuated the building during a building fire evacuation.

Essential Personnel - Operations personnel assigned to the unit(s) that is impacted by the event, and emergency response personnel responding to the event.

Evacuation - The necessity to leave one area of the plant and report to another area of the plant due to the potential for unsafe conditions. Evacuation does not necessarily indicate a need to leave the refinery.

DOCUMENT NO:	HSE-EAP-003	PAGE:	3 OF 15
DOCUMENT NAME:			
EVACUATION AND PERSONNEL ACCOUNTABILITY			

Evacuation Point - Pre-designated locations to which personnel can report if they can not safely get to their primary Rally Point or to an alternate Rally Point. Evacuation Points are also utilized during an All Personnel Evacuations or when personnel must be moved from Rally Points due to the potential of changing conditions. Like Rally Points, Evacuation Points provide the means for personnel to report that they are safe and accounted for. The five Evacuation Points are listed in [Appendix 2](#), are marked via signage and are shown on the Refinery Evacuation Map [Appendix 1](#).

Facility Accountability Coordinator(s) – Assigned persons that gather accountability information during any “All Personnel” or “Plant-Wide” evacuation.

Non-Essential Personnel – All personnel who do not fit within the definition of Essential Personnel.

Rally Point – A pre-designated location to which personnel report during an event that calls for Non-Essential Personnel to Report to Rally points, or All Personnel Evacuations of a unit / area. Rally Points are either permanently located or temporarily designated (as an example, a turnaround may designate a temporary rally point for personnel working that turnaround). Rally Points are located in most major buildings. Accountability Readers are located near each Rally Point to provide the means for personnel to report that they are safe and accounted for.

ROLES & RESPONSIBILITIES

Accountability Coordinators

- Maintain an Accountability Board / Roster for your area of responsibility that provides In / Out / Location status for each person.
- Be able to quickly gather the In / Out / Location status of assigned personnel should you need to evacuate.
- Maintain a phone roster of area personnel for emergency contact.
- Understand the Accountability reporting structure for various evacuation levels and for your area of responsibility.
- Work with area supervision to assign and train an alternate Accountability Coordinator(s) during periods of absence / unavailability.
- Receive accountability reports from personnel who have had to evacuate a unit / area during Non-Essential Personnel Evacuations of a Unit / Area.
- Assist emergency management personnel in reconciling a persons' location if there is any question with regard to that person's accountability.
- Know area/building egress points and assist personnel during building fire evacuations.
- Gather and report accountability of assigned area personnel and visitors during building fire evacuations.
- Provide training for area personnel on accountability and evacuation procedures, emergency phone numbers, accountability locations, etc.

DOCUMENT NO:	HSE-EAP-003	PAGE:	4 OF 15
DOCUMENT NAME: EVACUATION AND PERSONNEL ACCOUNTABILITY			

All personnel within the refinery

- Required to be familiar with the evacuation and accountability requirements applicable to them and the areas in which they are working.
- Responsible for ensuring they are accounted for if they have been required to evacuate an area / building.

Building Point Coordinator

- Dons a blue "Building Point Coordinator" identification vest and reports with a plant radio to the Building Evacuation Point.
- Gathers personnel accountability information during a Building Fire Alarm Evacuation and reports that to the ERT Shift Commander or the Security Patrol Officer investigating the alarm.
- Assists personnel during building fire evacuations.
- Assists emergency management personnel in reconciling a person's location if there is any question with regard to that person's accountability.

Contractor Point of Contacts

- Serve as the Accountability Coordinator for non-resident contractors working under their supervision.
- Ensure non-resident contractors understand evacuation and accountability procedures applicable to them and their work location.

Employees or contractors hosting visitors

- Ensure their visitors or vendors are appropriately evacuated and accounted for.

Facility Accountability Coordinator(s)

- Report to EOC during any "Plant-Wide" or "All Personnel" evacuation.
- Gather personnel accountability information through the Lennel Access Control System during any "Plant-Wide" or "All Personnel" evacuation.

Security Officers (at Entry Points / Gates)

- Ensure each visitor / driver / vendor, etc is provided with a Visitors Safety Brochure.
- Instruct unescorted drivers to return to point of entry if alarm sounds while they are in transit.
- Ensure that the inbound side of all non manned gates and turnstiles is locked during any "Plant-Wide" or "All Personnel" evacuation to prevent unauthorized entry.

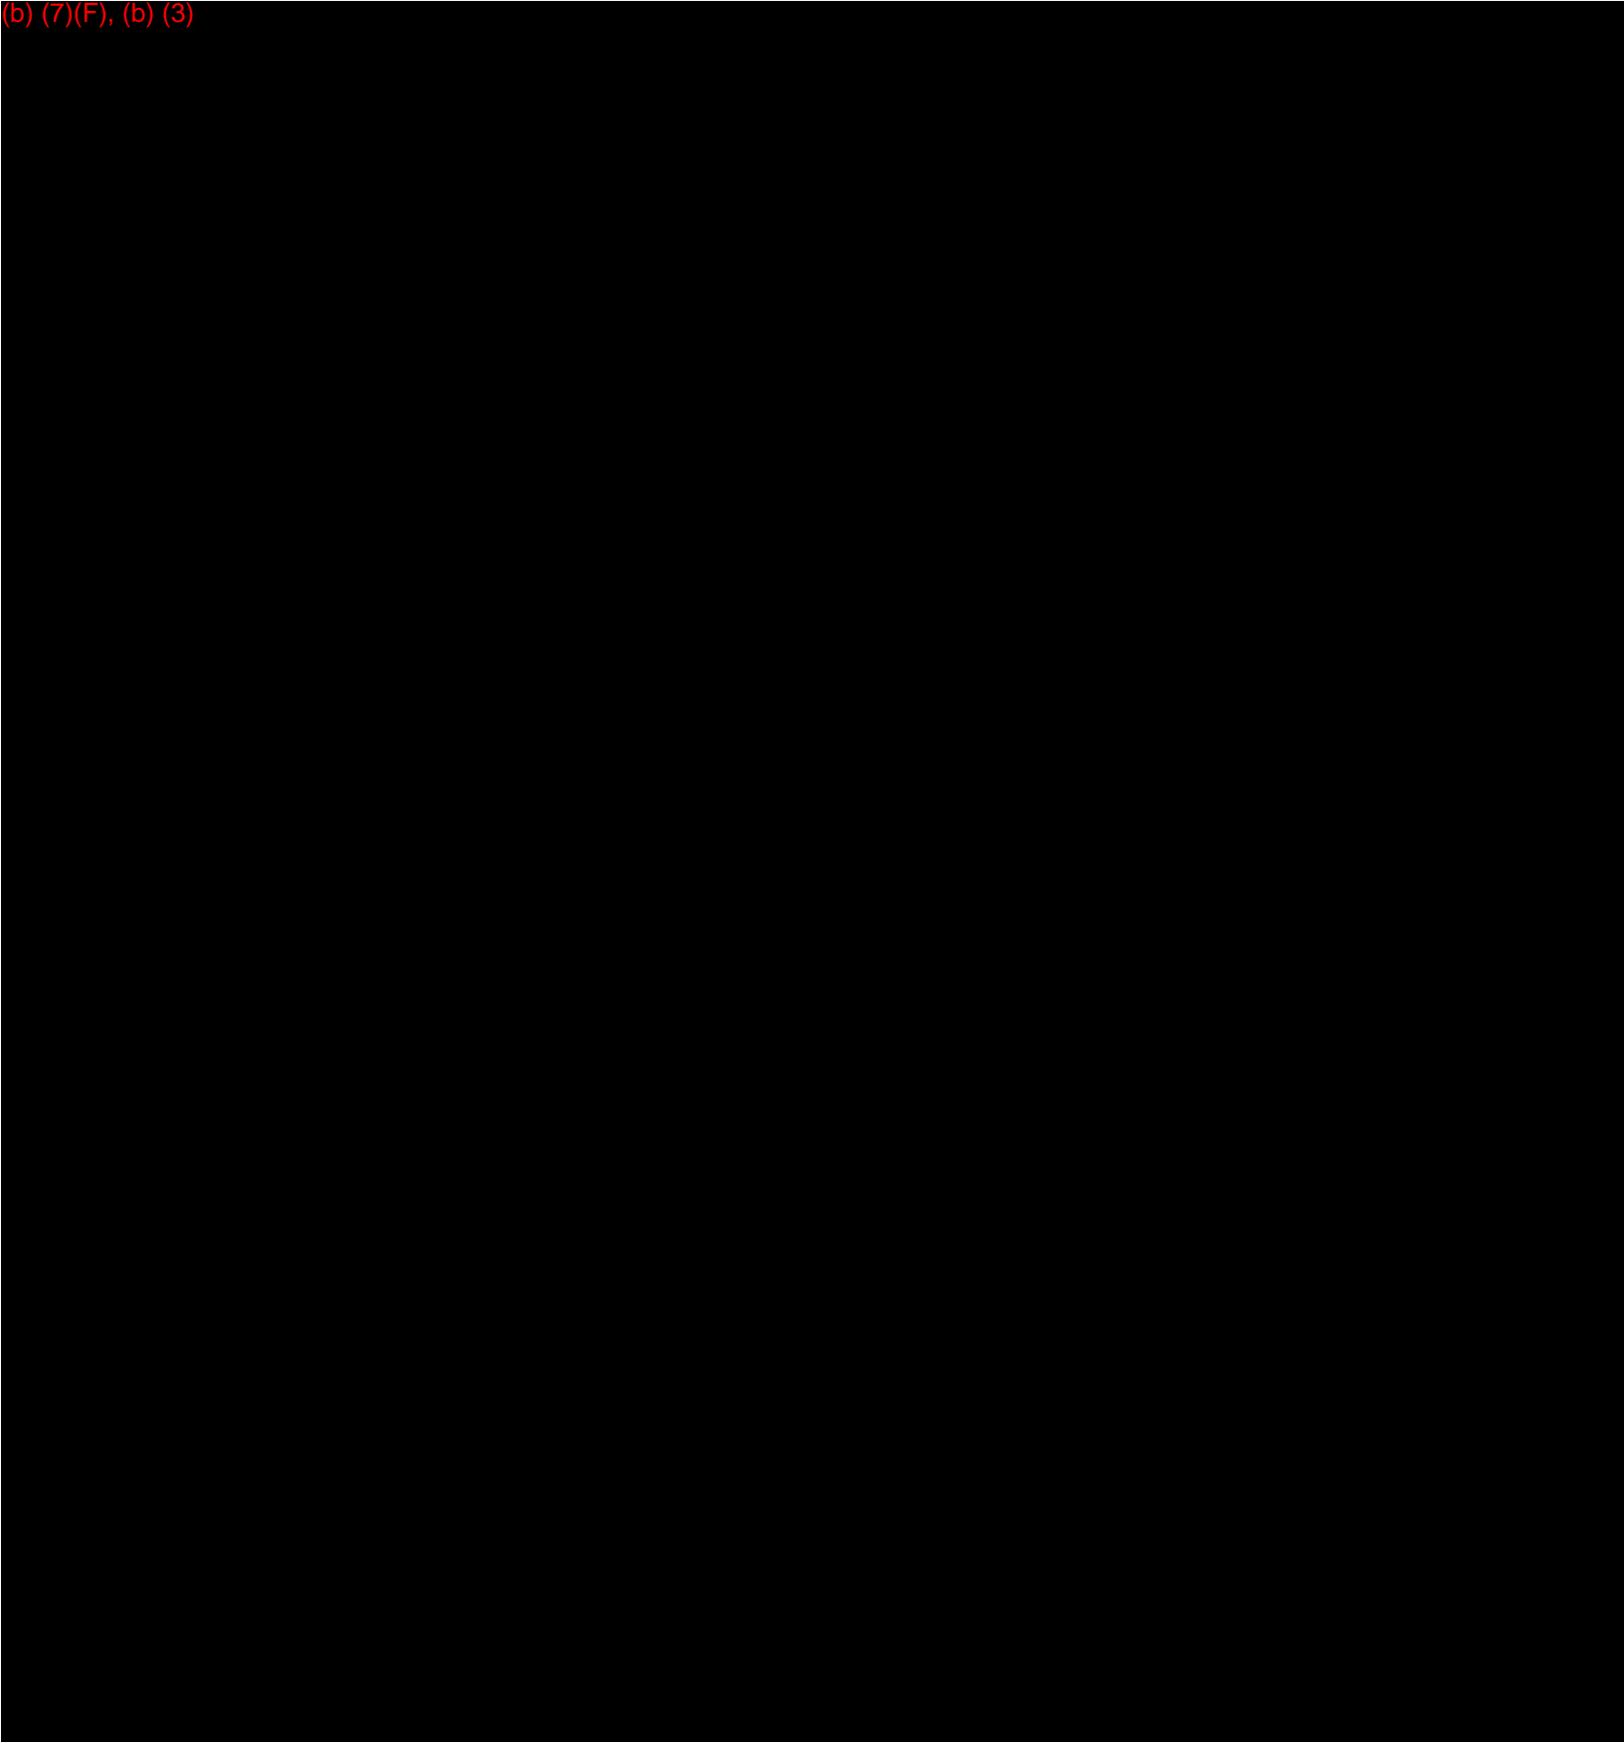

Supervision

- Ensure personnel within their area of responsibility have been trained on the evacuation and accountability procedures applicable to them and the areas that they may be working in.
- May serve as Accountability Coordinator for their area of responsibility.

REVISION SUMMARY

NOTE: If the changes proposed in this change log are typos or minor grammatical corrections that do NOT affect the intent of the policy only approval from the "Document Owner" is required. All policy intent changes must be approved by the HSSE Manager.

Date	Proposed By	Description of Change	Approved By/Date
03/31/2010	J. Windham	Major Revision - Incorporated language applicable to electronic accountability process, removed Zones, removed Off-Site Evacuation Areas, revised on-site evacuation areas.	MLR 02/18/10
07/27/2010	J. Windham	Added language to require shift operations to account via Accountability Readers in addition to reporting manually. Added clarification for personnel not to re-enter evacuated areas until authorized to do so.	CFM 08/01/2010
11/01/2010	J. Windham	Revised procedure to reflect new ENS message syntax. Other miscellaneous clarifications	CFM 11/05/2010
2/28/2011	S. Kuhfeldt	Reformat, reorganize and regulatory review of procedure

DOCUMENT NAME: INCIDENT COMMAND SYSTEM & ORGANIZATION			

INCIDENT COMMAND SYSTEM (ICS)

The Incident Command System (ICS) is the national standard process for managing responses to emergency incidents. The ICS consists of personnel, facilities, equipment, communications, and procedures, all operating within a common organizational structure to gain control of and mitigate an incident. The ICS can develop into a complex organization with the major functions being Command, Operations, Planning, Logistics, Liaison, and Safety.

The ICS is designed to allow for multi-agency adoption within industrial, federal, state, and local emergency agencies. Therefore, terminology used in the ICS is designed to be acceptable and understandable to across different emergency management organizations.

Houston Refining, LP has adopted the CIMA Incident Command System for use during all emergencies that occur at the facility.

Organization of the Incident Command System begins to develop from the time that initial resources arrive at an incident. The organization starts with management of major functions initially being the responsibility of one or just a few persons. As the incident develops in size and / or complexity, activities management is assigned to additional individuals in order to maintain a reasonable span of control. Necessary aspects of the organization are maintained through all active phases of the incident. Command is terminated at the point that active operations or incident hazards no longer present a need for operational control.

The basic organizational structure is also applicable to small incidents and incidents not directly involving releases, such as hurricanes, floods, rescues, or medical incidents. The system's organizational structure is able to adapt to any emergency incident or planned event that might occur on the facility.

DOCUMENT NO:	HSE-EAP-007	PAGE:	3 OF 30
DOCUMENT NAME:			
INCIDENT COMMAND SYSTEM & ORGANIZATION			

INCIDENT COMMAND / INCIDENT MANAGEMENT FACILITIES

Field Command Post: The Command Post is the location from which the Incident Commander, Field Coordinator and necessary support staff operate to direct and coordinate incident control activities. The Command Post will normally be in the Command Vehicle near the scene of the incident. In some cases however, the Command Post may be located away from the incident scene.

Emergency Operations Center (EOC)

The Emergency Operations Center is the location from which the Emergency Operations organization operates. The primary EOC is in the Administration Building – HSSE Wing. The EOC is provided with resources and equipment necessary for the EOC staff to perform their responsibilities including access to emergency plans, radios, telephones systems, a fax machine, checklists, plot plans, and networked computer systems.

Alternate EOC

The Alternate EOC is located at the Houston Refinery Training Center at 317 Allen Genoa Road in the Computer Training Room. Limited radio capability is available at the Alternate EOC via portable base radio stations and handheld radios. Additional handheld radios should be obtained prior to moving to the Alternate EOC. Electronic resource material such as emergency plans, plot plans, checklists, and telephone numbers / call lists are accessible from Alternate EOC networked computer systems. Hard copy material must be moved when the Alternate EOC is established.

Central Control Room Building (CCRB)

The CCRB is utilized by the Emergency Operations – Manufacturing Organization to provide tactical level operational support to the EOC.

Logistics Support Center

The Logistics Support Center is the locations to which logistics support personnel not directly assigned to EOC report to await orders from the Logistics Coordinator. The logistics Support Center is located in the Administration Building HSSE Wing – Old EOC Conference Room.

Media Information Center

The Media Information Center is the location from which the Public Information Officer or designee will provide information and briefings to members of the media. The Media Information Center will normally be established in Training Room D in the HRO Training Center when necessary. If that area is inadequate, the Employee Recreation Center or the Admin Building Main Office Conference Room can be utilized.

Agency Information Center

The Agency Information Center is the location from which information is shared with representatives of regulatory agencies. The Agency Information Center will normally be established in the Administration Building – West Wing Conference Room C. In the event Conference Room C is unavailable or inadequate, the Administration Building Main Office Conference Room should be utilized.

DOCUMENT NO:	HSE-EAP-007	PAGE:	4 OF 30
DOCUMENT NAME:			
INCIDENT COMMAND SYSTEM & ORGANIZATION			

Staging Area

The Staging Area is a location near the incident, designated by Command to which unassigned emergency response resources will respond, check-in for accountability and wait for an assignment.

CIMA Staging Area

A CIMA Staging Area is established for temporary location of mutual aid resources. The staging areas are instituted by Command to control non-refinery resources that are not immediately assigned. Incoming mutual aid resources report to CIMA staging where they are checked in until requested by Command or the Operations Section Chief. The CIMA Staging Area Manager manages all aspects of the area. Primary CIMA Staging is located in the far east side of the Maintenance Parking Lot. Alternative CIMA Staging is located at the Credit Union Parking Lot or in the Lawndale Road corridor.

Medical Department: The HRO Medical Department may be utilized for various incident medical functions including but not limited to triage, treatment, or rehabilitation support.

Landing Zone (LZ): The Landing Zone(s) are the areas in which helicopters should be directed to land (i.e, Life Flight, Coast Guard). Landing Zones are located in the parking lot south of the Time Office – Adjacent to Gate 3, and in the northeast portion of the plant, NE of the SRU Complex. As an alternate, the Lawndale Road corridor, or any cleared parking lot can be used.

COMMAND STAFF

Incident Command

“Command” is the radio identifier used to distinguish the individual in charge of emergency response team efforts. The first arriving ERT officer establishes Command. If the Field Coordinator is on scene first, initial Command responsibilities become theirs. Command will then be transitioned to an appropriate ERT officer upon their arrival. See [Duties and Responsibilities: Incident Commander](#)

Safety Officer

A Safety Officer is established by Emergency Response – Command at every emergency involving a release of hazardous materials for the purpose of evaluating and monitoring safety hazards and related conditions. A Safety Officer may be established on non-release emergencies as well. Evaluation of all field operations and development of the Site Safety Plan is performed by or under the direction of the Safety Officer. Additional resources will be assigned as necessary to assist in safety observations during large incidents. When other safety assistants are established, they will be coordinated through the Safety Officer. See [Duties and Responsibilities: Safety Officer](#)

Industrial Hygiene Officer

The on-call Health & Safety Representative reports to the Command Post and becomes the Industrial Hygiene Officer during emergencies involving or having a potential to involve a release. With Command, the IH Officer will identify the materials involved, develop a

DOCUMENT NO:	HSE-EAP-007	PAGE:	5 OF 30
DOCUMENT NAME: INCIDENT COMMAND SYSTEM & ORGANIZATION			

monitoring strategy, and coordinate tactical implementation of the monitoring plan. The Industrial Hygiene Officer, will also support the Safety Officer in developing the Site Safety Plan. During minor events, the IH Officer personally implements monitoring actions or contacts additional Health and Safety resources as necessary. For large events, the IH Officer coordinates and supervises all industrial hygiene activities from the Command Van. See [Duties and Responsibilities: Industrial Hygiene Officer](#)

Environmental Officer

The on-call Environmental Representative reports to the Command Post and becomes the Environmental Officer during emergencies involving or having a potential to involve a release. With Command, the Environmental Officer will ensure proper notifications are made and that environmentally focused mitigation efforts are appropriate. The Environmental Officer is also responsible for coordinating agency interface during Alert 1 events. The Environmental Officer will attain additional resources and coordinate on-scene environmental support activities, as necessary. See [Duties and Responsibilities: Environmental Officer](#)

Security Coordinator

Security Patrol Unit 49 responds directly to the scene and checks in with Command. The Security Coordinator will immediately begin securing the area. The Security Coordinator will ensure communications with Command and will supervise all other personnel involved with scene security. See [Duties and Responsibilities: Security Coordinator](#)

Staging Area Manager

The Staging Area Manager position is established by Command to manage unassigned resources. During Mutual Aid events, a Channel Industries Mutual Aid (CIMA) Emergency Response Specialist may be asked to work with the Houston Refinery Staging Area Manager to manage outside resources. The Staging Area Manager establishes the Staging Area. The Staging Area Manager will track ERT resources as assigned or unassigned. The Staging Area Manager will dispatch resources to assignments as requested by Command or the Operations Section Chief. See [Duties and Responsibilities: Staging Area Manager](#)

Operations / Tactical Supervision

Operations Section Chief

As an incident organization grows or incident complexity becomes apparent, Command may establish an Operations Section Chief to direct deployment of resources, and oversee control and coordination of Branch Directors and Division / Group Supervisors. See [Duties and Responsibilities: Operations Section Chief](#)

Branch Director(s)

Branch Directors may be established as an intermediate supervisory layer of the incident command organization to maintain an effective span of control. When established, Branch directors will report to the Operations Section Chief and supervise Division / group Supervisors. See [Duties and Responsibilities: Branch Directors](#)

DOCUMENT NO:	HSE-EAP-007	PAGE:	6 OF 30
DOCUMENT NAME:			
INCIDENT COMMAND SYSTEM & ORGANIZATION			

Tactical Divisions and Groups

Divisions and Groups are tactical level supervisors assembled to direct tactical action plans. Division / Group supervisors oversee task level resources assigned to them.

Division Supervisor(s)

Division Supervisors oversee operations within a defined geographical area and are responsible for supervision and accountability of assigned task level resources (i.e. North, South, or 1st. Floor Division). Division Supervisors will use their Division designation as a radio identifier (North Division). See [Duties and Responsibilities: Division Supervisor\(s\)](#)

Group Supervisor(s)

Group Supervisors oversee operations of a functional discipline (i.e., Hazmat, Rescue, or Medical Group) without regard for geographic division and are responsible for supervision and accountability of assigned task level resources. Group Supervisors will use their Group designation as a radio identifier (Hazmat Group). See [Duties and Responsibilities: Group Supervisor\(s\)](#)

Spill Group (Oil Spill Water)

The Spill Group Supervisor directs emergency response efforts relating to the control of spills on waterways. When established, the Spill Group will coordinate and direct the deployment of boats and boom to control a spill.

The Spill Group Supervisor will report to the affected dock or area and coordinate the operations from the shore position. From the dock, the Spill Group Supervisor will communicate tactical directions to spill team members deployed on shore and in boats.

The Spill Group may also be required to communicate or direct outside / contract spill personnel working in the affected area.

Hazmat Group

The Hazmat Group Supervisor directs emergency response efforts relating to the control of hazardous material releases. When established, the Hazmat Group Supervisor directly coordinates advanced tactical hazmat operations and supervises task level hazmat team leaders.

For further procedures see [Hazardous Materials Response Plan HSE-EAP-009](#)

Medical Group

When established, the Medical Group Supervisor directs response efforts in relating to Emergency Medical Services (EMS). The Medical Group may also be given the responsibility to set up a rehab area for evaluating Emergency Response Team (ERT) members.

The Medical Group will coordinate efforts with the Houston Fire Department (HFD) EMS Division and other medical service entities. The Operations Section Chief, Branch Director, or the Medical Group will normally have the HFD EMS Supervisor assigned with them to better manage the incident.

DOCUMENT NAME:			
INCIDENT COMMAND SYSTEM & ORGANIZATION			

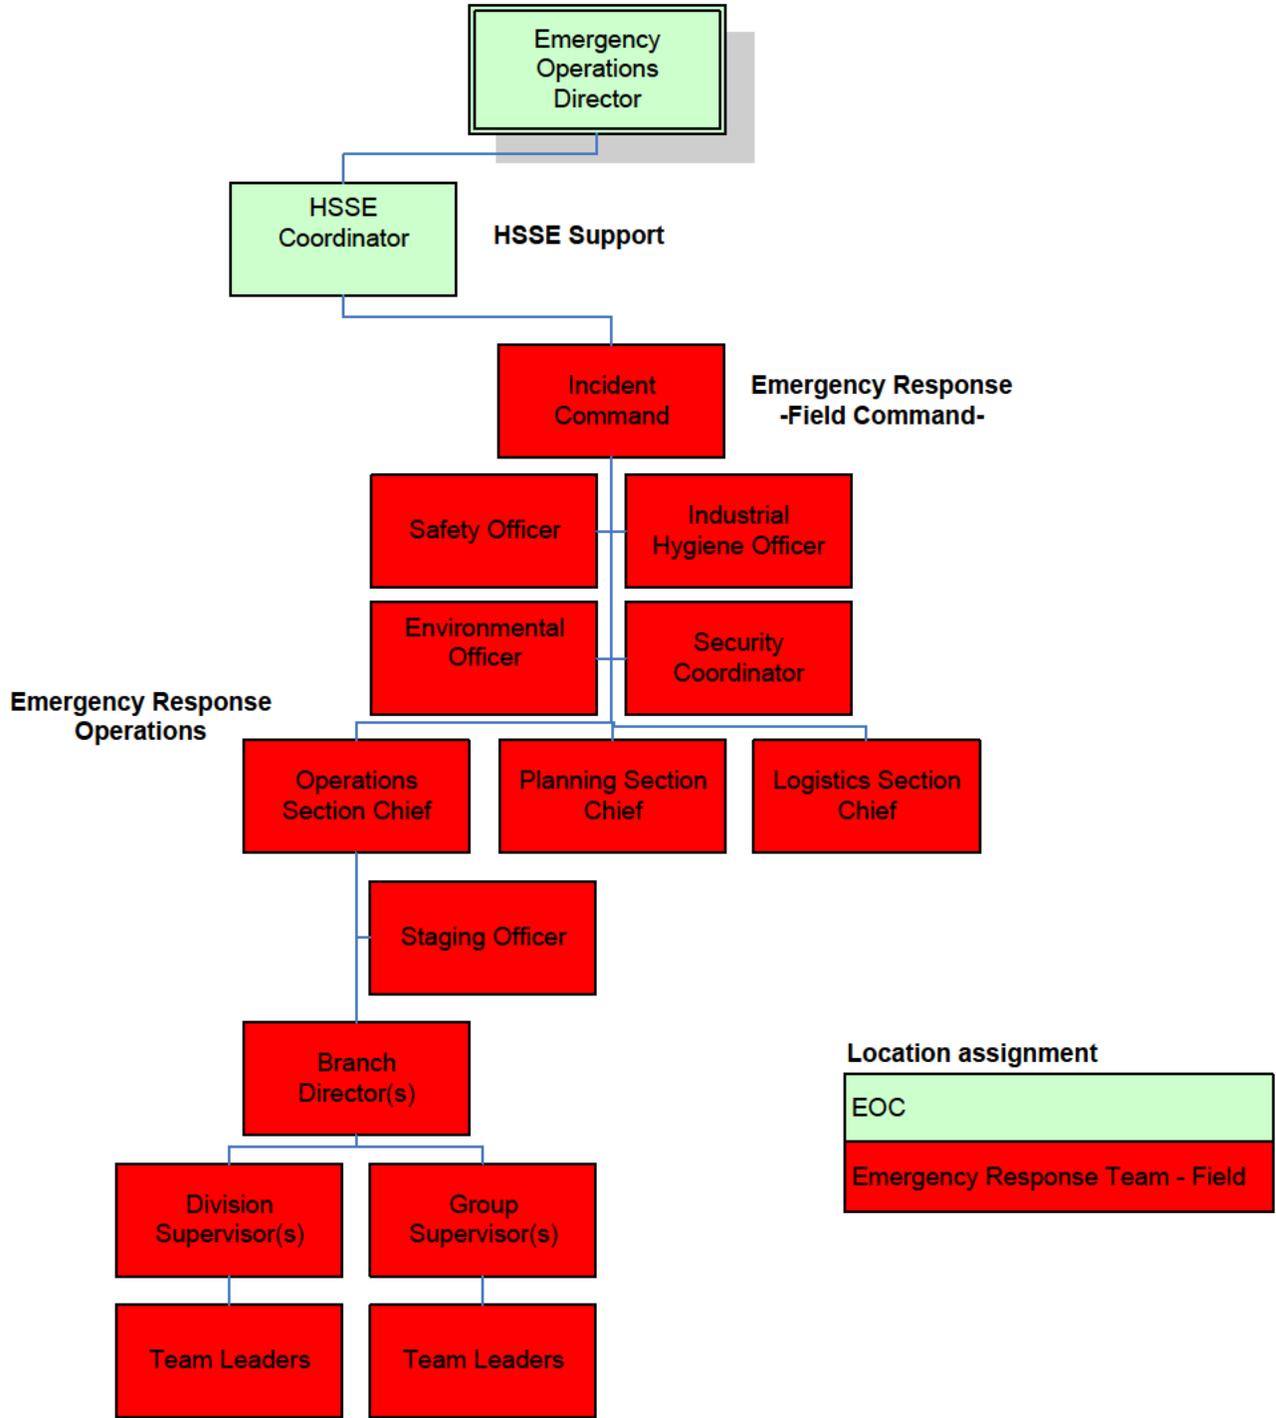

For further information see [Emergency Medical Services Plan HSE-EAP-010](#) and the [Rescue Response Plan HSE-EAP-011](#).

Rescue Group

When established, the Rescue Group Supervisor directs response efforts focused toward accomplishing safe and effective confined space and high angle rescue operations. The Rescue Group Supervisor position is established to supervise Rescue Team Leaders / rescue team personnel and coordinate activities with other functional areas in order to establish and maintain proper patient care.

INCIDENT COMMAND SYSTEM & ORGANIZATION			

Duties and Responsibilities: Staging Area Manager

- The Staging Area Manager coordinates all staging activities.
- Establishes all functions of staging outside resources.
- Keeps Command or the Operations Section Chief respectively informed of resource status.
- Documents all staged resources according to CIMA procedures. Maintains log of companies in staging area and keeps appropriate inventory of information.
- May be assigned to request resources.
- Assigns additional staging personnel as required to manage scene. Coordinates staging personnel activities
- Maintains records of ERT personnel responding.
- Coordinates operations of Cascade Unit
- Manages routing of resources to appropriate Divisions or Groups. Works with Security Coordinator to provide appropriate direction or escorts into facility.
- Ensures all apparatus are parked and organized in an appropriate manner.
- Assists Command in determining what level of staging to maintain (usually 50% of committed resources).
- Assist with management of Rehab supplies.

REVISION SUMMARY

NOTE: If the changes proposed in this change log are typos or minor grammatical corrections that do NOT affect the intent of the policy only approval from the "Document Owner" is required.
All policy intent changes must be approved by the HSSE Manager.

Date	Proposed By	Description of Change	Approved By/Date
05/09/2011	Jeff Windham	Reformat, reorganize and regulatory review of procedure	

Houston Refining LP	DOCUMENT NUMBER:	HSE-EAP-008	Page: 1 of 13	Approval Date:	06/30/2011
Document Title:	COMMUNICATIONS				
Approver: CHRIS MATTHEWS	<i>Electronic Signature On File</i>		Effective Date:	07/01/2011	
Document Owner: Jeff Windham	<i>Electronic Signature On File</i>		Review Date:	05/10/2011	

Communications are a critical element of the emergency response and management effort. During emergencies communications must be immediate and accurate.

This Communications Plan provides information on the communications systems available to communicate to internal and external stakeholders during various emergency events.

EMERGENCY COMMUNICATIONS AND NOTIFICATION

Main Gate Dispatch is equipped with two-way radios, telephones, paging systems and a refinery Emergency Notifications System (ENS). The Dispatch Center is staffed 24 hours a day by a security representative trained for routine and emergency situations. Dispatchers also maintain a current telephone call-out list and the telephone numbers for all support agencies whose assistance might be needed during any type of emergency or incident. The ENS provides emergency and evacuation instructions to personnel throughout the facility. Consequently, the Main Gate is the focal point for emergency communications both inside and outside the refinery.

A secondary point for emergency communications is the Central Control Room (CCRB). The primary focus of the CCRB is communications with the process operating units during routine and emergency operations. The CCRB is equipped with radios, telephones, and a redundant Emergency Notification System (ENS) control console. These systems make the control room a fully functional secondary dispatch center.

Refinery Radio System

The refinery operates a trunked type radio system, which provides radio communication between personnel, vehicles, and key locations. A hub console, located at the Main Gate, can control all radio traffic for the entire system.

See [Appendix 5](#) for a list of radio system talkgroups

Radio Announcement System

The Radio Announcement System broadcasts a simultaneous message to every talkgroup channel on the radio system. The Announce System can be utilized for emergency and general plant announcements.

The Radio Announce System can be activated from the Main Gate Dispatch Console, and several specially programmed radios in the facility. Additionally, for emergencies, the Radio Announce System is integrated with the refinery Emergency Notification System (ENS).

NOTE: The Radio Announce System (activated from the Dispatch Radio Console) is the backup in the case of complete ENS failure.

DOCUMENT NO:	HSE-EAP-008	PAGE:	2 OF 15
DOCUMENT NAME:			
COMMUNICATIONS			

Radio Repeater Backup Systems

In the event of repeater failure the trunked radio system has two (2) backup modes available:

❑ Failsaft

During a partial system failure, radio talkgroups will be automatically pooled, or routed, onto three (3) repeaters by the system controller. This allows for limited radio communication. All users should limit communication to short messages that are absolutely necessary.

Users can recognize a failsaft condition by an audible soft tone heard on all radios every ten (10) seconds. Radios will indicate the condition by displaying the text "FAILSOFT" on the LCD screen every ten (10) seconds.

❑ Total Failure

A total radio system failure will be indicated by an audible soft tone heard on all radios every ten (10) seconds accompanied by the text "OUT OF RANGE" on the LCD screen every ten (10) seconds.

In the case of total system failure (repeater failure), Talkaround or Simplex Channels have been established for emergency communications. Talkaround channels do not utilize the trunked repeater system, thus allowing a fail-safe design that enables users to communicate "radio to radio" with limited range.

Talkaround channels are available and during a total system failure shall be allocated as indicated below:

Ops T/A 1	FCCU, Oil Movements
Ops T/A 2	Crudes, HDS, Light HDS
Ops T/A 3	Cokers
Ops T/A 4	SRU. Lubes
Maint T/A 1	South Maintenance
Maint T/A 2	North maintenance
ERT Tac 1	Primary HSSE and Emergency
ERT Tac 2	Secondary HSSE and Emergency
ERT Tac 3	Secondary HSSE and Emergency
ERT Tac 4	Secondary HSSE and Emergency
ERT Tac 5	Secondary HSSE and Emergency

DOCUMENT NO:	HSE-EAP-008	PAGE:	3 OF 15
DOCUMENT NAME: COMMUNICATIONS			

Backup Radio System

In addition to the talkaround channel plan, a backup radio system is available and may be placed in service. The backup radio system is a self-contained mobile radio system, which provides five (5) fully functional repeaters; four (4) of which are available for voice communication. With the backup system in service, normal radio system talkgroups can be used. This system cannot be used in conjunction with Talkaround channels. In the event this system is forced into service, users will be directed to return to their normally assigned talkgroups. Keeping communication to a minimum is imperative while using the backup system due to its limited number of repeaters and concurrent use by process units.

(b) (7)(F), (b) (3)

Emergency Notification System ENS

The refinery Emergency Notification System (ENS) is used to advise personnel of emergency response and evacuation orders (See the [HSE-EAP-002 Emergency Notification and Response](#), and [HSE-EAP-003 Evacuation and Personnel Accounting Procedure](#)).

The ENS is an integrated multi-media system designed for the purpose of communicating emergency messages to plant occupants. The system consists of tone, voice, and text messaging to a combination of sub-systems throughout the facility.

The ENS may also be used to inform personnel of situations such as non-emergency incidents, severe weather conditions, or abnormal operational issues.

NOTE: the Main Gate Dispatcher conducts a full ENS test every Thursday at noon.

DOCUMENT NO:	HSE-EAP-008	PAGE:	4 OF 15
DOCUMENT NAME:			
COMMUNICATIONS			

ENS Components

ENS components can be described as follows:

ENS Media System Components	Type of Message and Location
Plant Radio Announce Talkgroup	Signal tone and voice message on all refinery radio system Talkgroups (Channels).
Building Public Address (PA) Systems	Signal tone and voice message on public address systems in buildings (Indoor public address sites).
Siren/Speaker Sites and Distributed Audio Systems	Signal tone, voice message, and signal strobe light from Plant/Siren Sites and Distributed Audio Speakers in operating area and units (Outdoor sites).
Message Signs	Text message signs located at refinery main entry points and gates.
Emergency Management Pager System	Text message sent to emergency management group pagers. Appendix 4 : lists the various emergency management pager groups.
Workstation PC Messaging	Pop-up text message sent to all LAN PC workstations.

The ENS components can be initiated by a single activation for Emergency Alerts, or may be set off individually for specific or special emergency notification or message requirements.

See [Appendix 1](#) for an illustration of the ENS architecture.

See [Appendix 2](#) for a description of the ENS component activation logic.

ENS Activation

Upon notification of an emergency, the Main Gate Dispatcher activates the ENS from the primary console. Emergency activation of the ENS will communicate emergency information by tone, voice and text message. Information provided will include Alert Level, Type of Emergency, Location, Wind Direction and Evacuation Type. Additionally, the system is used to advise of any further special information.

An All Clear is issued over the ENS to indicate that the emergency has been terminated.

DOCUMENT NO:	HSE-EAP-008	PAGE:	5 OF 15
DOCUMENT NAME:			
COMMUNICATIONS			

Backup ENS Capability

In the event of primary ENS console failure, three (3) fully capable backup consoles may activate the ENS from the following locations.

- ❑ Central Control Room (CCRB)

The CCRB console may also be used by Operations as a secondary means of communications to Operating Units or Areas.

- ❑ Command Van
- ❑ Maintenance Radio Shop at Site D

NOTE: The Radio Announce System (activated from the Dispatch Radio Console) is the backup in the case of complete ENS failure.

ENS Signal Tones

There are three signal tones generated by the ENS:

High Low Signal	Alert for fire, spill, gas release or other emergency / event requiring action by plant personnel
Steady Tone Signal	All Clear
Pulse Signal	All personnel plant-wide report to Evacuation Points

Unit Distributive Audio

Distributive Audio Systems provide unit specific communications with the placement of speakers throughout an area. The ENS System is directly linked to unit distributive audio where available. Distributive systems may also be directly linked to hazard detection systems in order to expediently warn personnel and evacuate a process unit. Process areas with Distributive Audio Systems are listed as follows:

- ❑ SRU 434
 - Includes units 433/434/435/437
 - System directly linked to H₂S detection systems.
- ❑ SRU 439
 - Includes units 439/440/441/442
 - System directly linked to H₂S detection systems.
- ❑ 636 Hydrotreater
- ❑ 736 Coker
- ❑ 737 Coker
- ❑ 537 Crude Still

DOCUMENT NO:	HSE-EAP-008	PAGE:	6 OF 15
DOCUMENT NAME:			
COMMUNICATIONS			

Emergency Management Pager System

Primary emergency notification to off-site emergency management / response personnel is conducted through the emergency management pager system. The pager system is a module of the Emergency Notification System. ENS Alert activation results in automatic activation of the pre-determined pager group(s). Manual activation of pager groups and individual pagers is accomplished by the Main Gate Dispatcher.

Emergency management pagers are established into three different cap code pager groups:

Alert 1 Pager Group Cap Code: 0399998	ERT Officers HSSE Personnel Security Personnel Refinery Leadership Team
Alert 2 + Pager Group: Cap Code: 0300103	ERT Members (non-officers) Other identified emergency management support personnel
ERT Pager Group Cap Code: 0399999	All ERT Members

See [Appendix 3](#) for a description of the pager group activation logic and examples of additional programmed pager groups.

Emergency Pager Backup Systems

Two (2) pager backup systems are available:

- Quickpage System

The Quickpage system is a portable system capable of initiating alphanumeric pages to Emergency Management groups.

- AutoDial System

An AutoDial telephone system is programmed to send numeric coded messages to Emergency Management groups. The numeric coding system consists of three groups of numbers. In sequence, the groups represent response classification, incident type and zone of incident. For details and examples see Appendix 2.

A numeric code message may also be sent from any phone.

See [Appendix 4](#) for a description of the numeric paging codes for emergency situations.

DOCUMENT NO:	HSE-EAP-008	PAGE:	7 OF 15
DOCUMENT NAME: COMMUNICATIONS			

TELEPHONE SYSTEMS

The facility telephone and cellular phone systems provide a key means of communication with both internal and external stakeholders. Utilization of telephone and cellular lines during an emergency assists in keeping radio frequencies open for emergency radio traffic.

In the event of power failure, the plant telephone system is provided with emergency power. The system will shift back to normal power upon system restoration.

Various Telephone Lists to include the refinery phone system, fax machines, EOC phones, CCRB phones, Command Van cell phones numbers, outside line phone numbers and the Emergency network System phone numbers are accessible from the [EOC Website](#).

Outside Telephone Lines

In the event of a total telephone system failure, EOC is provided with six (6) outside telephone lines that are independent of the plant telephone system. These phones are labeled as "Outside Line".

Emergency Network System

As an additional backup and in the event local telephone service is overloaded, telephones attached to the Deer Park Emergency Network System may be used. These phones are located in EOC and are labeled as "Emergency Network System". The emergency Network System phone numbers and locations are available on the [EOC Website](#).

Emergency Notification Manual

The Emergency Management Database contains a telephone number listing of entities that may need to be contacted to provide assistance, or otherwise be notified in the event of an emergency.

In case of information system failure, hardcopy *Emergency Notification Manuals* are provided in the following locations:

- MainGate Dispatch
- Emergency Operations Center (EOC)
- Field Command Post
- Plant Shift Superintendents Office.

DOCUMENT NO:	HSE-EAP-008	PAGE:	8 OF 15
DOCUMENT NAME:			
COMMUNICATIONS			

EMPLOYEE COMMUNICATIONS

Refinery Emergency Information Line

Additionally, the Refinery Emergency Information Line provides employees and their families an opportunity to call and receive updated information during emergencies or abnormal situations such as weather events. To hear messages on the Emergency Information Line, call:

(713) 321-5775

LyondellBasell Information Line

In the event local phone service is not available, employees and their families may call the LyondellBasell Information Line to obtain emergency or abnormal situation updates. To access the LyondellBasell Information Line, call :

1 (888) 457-6118

- Press 2 and then 6 to access HRO, then
- Press 1 to hear an update on plant status
- Press 2 to leave your contact information / location
- Press 3 to leave a message or ask a question and receive a return call

www.hrohome.com

The Internet website www.hrohome.com has been established as a mechanism for two-way, interactive communication between refinery management and employees. Although primarily established for hurricane evacuation situations, hrohome.com may be activated for other types of abnormal situations. To access the website:

- go to www.hrohome.com from any Internet capable device
- Login with your normal Network Logon ID
- Utilize the last four digits of the SSN as the Password

General information including site status and return to work requirements are provided in the Site Status tab at the top of the page.

Employees can provide information on their status, location and contact information via the Adverse Condition Reporting tab at the top of the page.

hrocheckin@lyondellbasell.com

As a last resort in the event employees are unable to contact their supervisor or another refinery contact person, employees may send an email or text message with their personal status and location, or a location a question or concern to hrocheckin@lyondellbasell.com.

APPENDIX 4:

NUMERIC PAGING CODES FOR EMERGENCIES

The numeric paging codes are sent from an autodial system at Maingate Dispatch or any phone line. This system is a backup to the alphanumeric systems. The codes are sent in three groups of numbers. The following describes each group and the meaning of the numbers displayed:

First Three Numbers:

Response Classification

- Alert 1: 111
- Alert 2: 222
- Alert 3: 333
- Alert 4: 444
- Alert 5: 555

Second Two Numbers:

Type of Emergency

- Fire: 111
- Gas Release: 222
- Spill: 333
- Medical: 444
- Rescue: 555

Third Three Numbers: (Optional if in Operating Unit, Area or Tank Farm)

Location of Emergency

- Process Unit or Area Number Examples: 536, 732, 533
- Tank Number Examples: 688, 564

Examples:

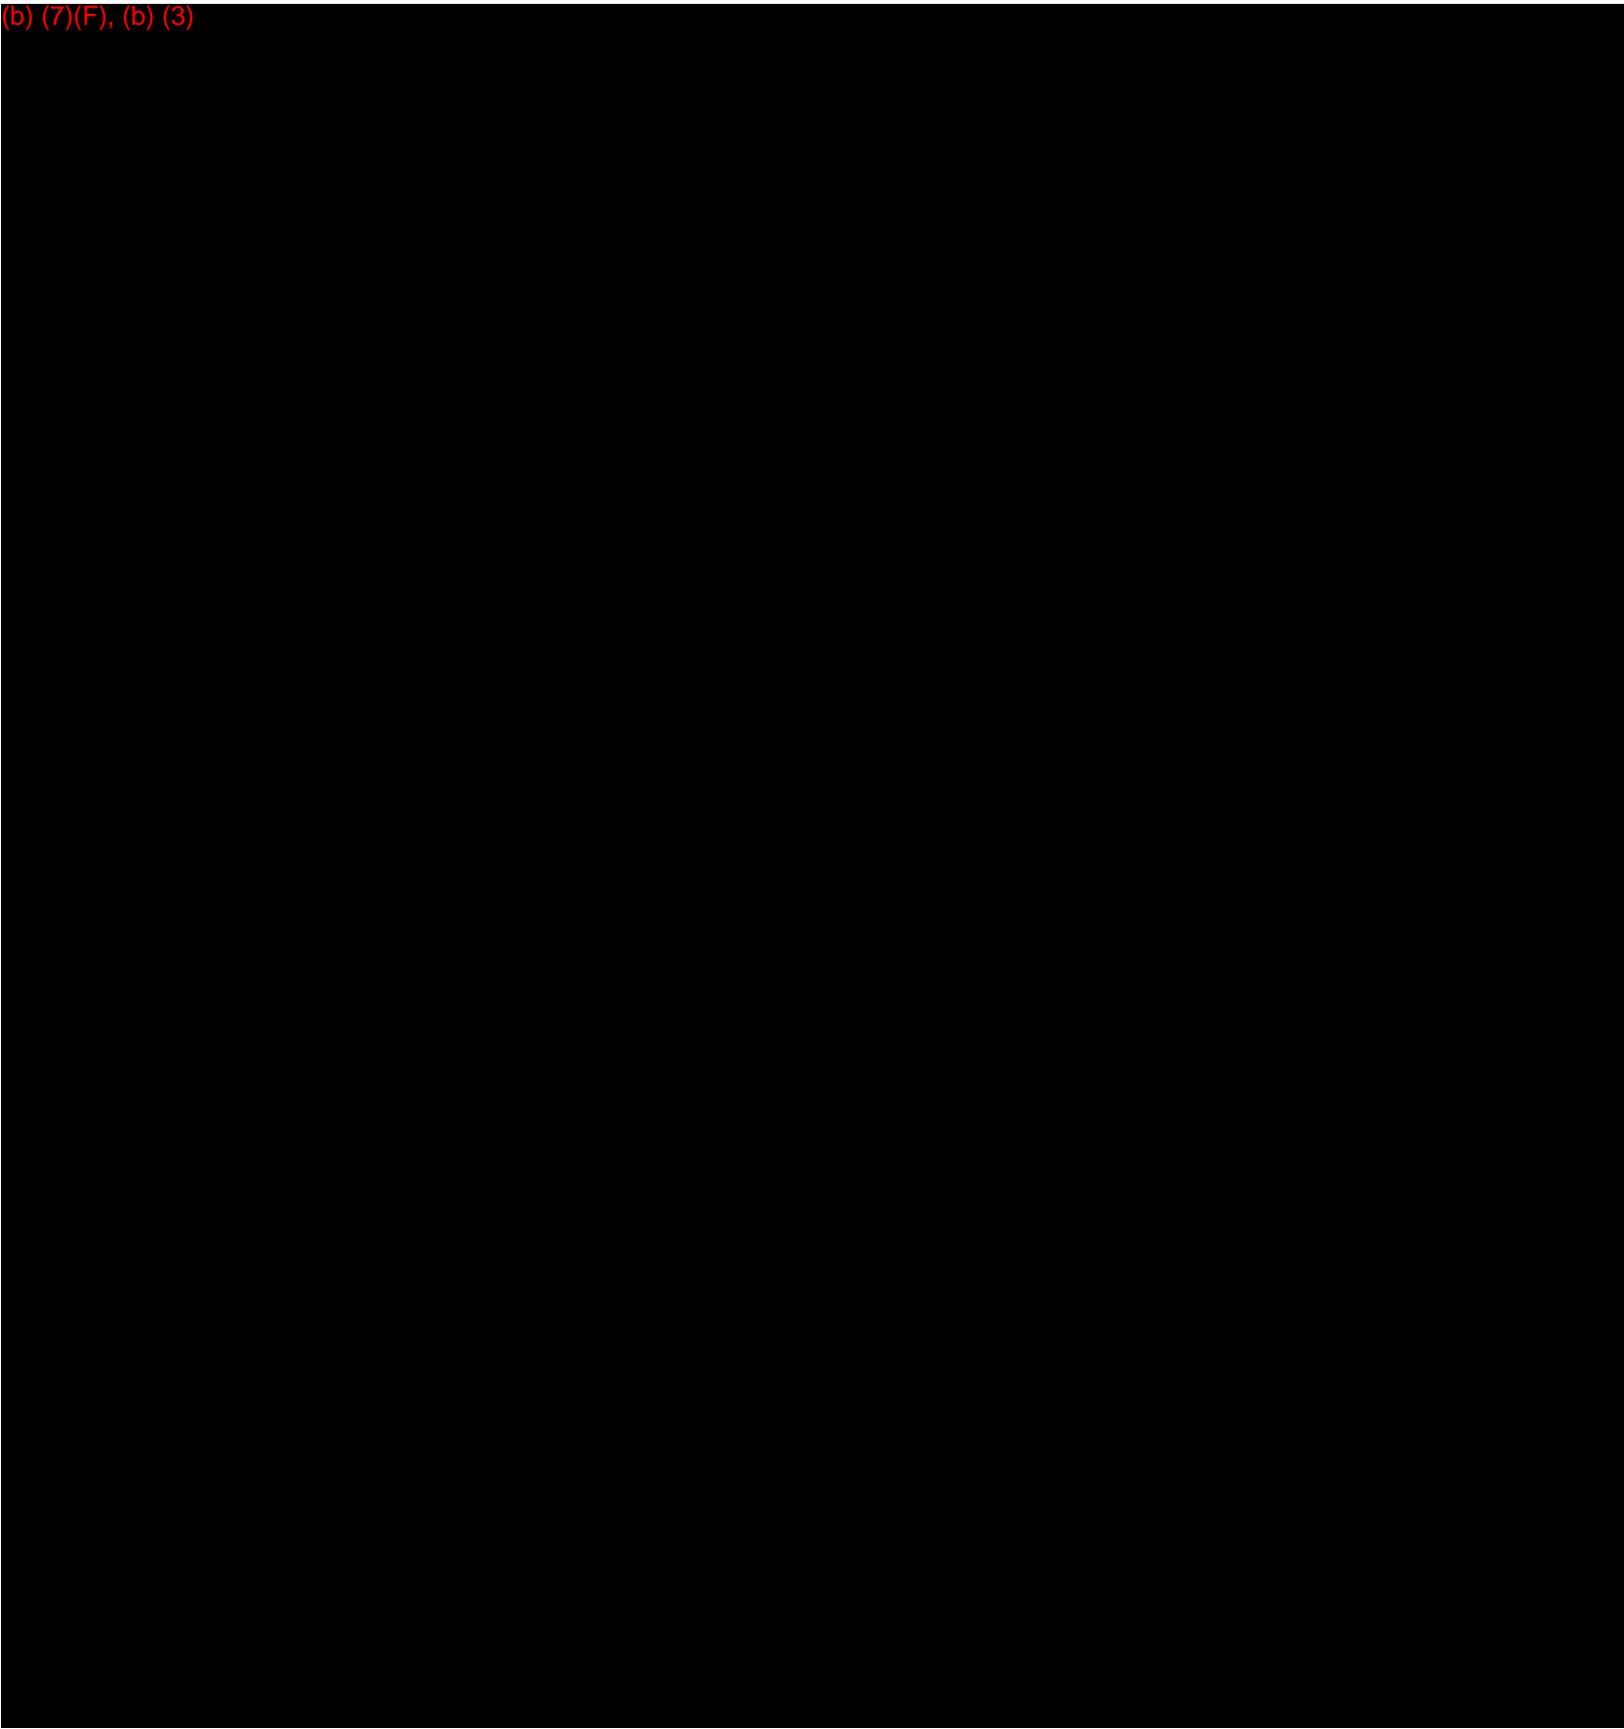

- Alert 1 Fire 536 Crude Still: 111-111-536
- Alert 2 Fire 735 Magnaformer: 222-111-735
- Alert 3 Three Medical 636 Reformer: 333-444-636

OUTSIDE RESOURCES AND MUTUAL AID			

SUMMARY

The following describes procedures for the request and management of outside or mutual aid resources for emergencies. Additionally, the plan provides procedures for refinery responses to mutual aid requests (requests for refinery emergency resources).

CIMA Mutual aid resources are activated during Alert 4 Emergencies. However, limited requests for outside support may be made without the issuance of an Alert 4.

The Houston Refinery is located in the City of Houston. However, it is bordered on the east side by the City of Pasadena. Therefore, a multi-city response is possible dependent on the location and significance of the incident.

Due to the refinery being located in the City of Houston, the Houston Fire Department may be notified and requested to respond during an Alert 2 or greater event. This notice does not constitute an Alert 4 condition.

For a complete list of contact numbers see the Emergency Notification Manual.

CHANNEL INDUSTRIES MUTUAL AID (CIMA)

The Channel Industries Mutual Aid (CIMA) organization is an emergency response mutual aid group. The organization represents the joining together of over one hundred Houston Ship Channel area industries, government agencies and municipalities for the purpose of providing firefighting, rescue and emergency medical assistance for emergency situations -- either natural or man-made.

CIMA Zones

CIMA is divided into four (4) geographic zones:

- Zone 1 - All areas north of the Houston Ship Channel and the northern shore of Galveston Bay.
- Zone 2 - Area south of the Houston Ship Channel, west to downtown Houston, east to Beltway 8 and all areas south of the above mentioned boundaries.
- Zone 3 - Area south of the Houston Ship Channel and east of Beltway 8, south to Spencer Highway and east to the City of La Porte west city limits.
- Zone 4 - Area south of Spencer Highway, west to Beltway 8, east to the Galveston Bay Shores of the cities of Morgan's Point, La Porte, Shoreacres, Pasadena and Seabrook, and south to Interstate 45.

THE HOUSTON REFINERY IS LOCATED IN ZONE 2

DOCUMENT NO:	HSE-EAP-014	PAGE:	3 OF 24
DOCUMENT NAME: OUTSIDE RESOURCES AND MUTUAL AID			

Classifications of CIMA Emergencies

Fires or emergencies of different magnitudes are roughly classified below under the call designation which will be used on the CIMA Radio System. Members must understand the classifications of emergencies and the operations of the Zone system, and have planned for emergencies so the proper calls can be made in each instance.

Special Call

This call is issued in the form of a request for specific pieces of equipment, or manpower crews not to exceed a total of 2 pieces of equipment / crews. A Special Call also results in the response of one CIMA Officer, but DOES NOT automatically activate the CIMA Specialists and Command Van response.

Standby

A CIMA Standby is for an emergency event that is currently being managed with in-plant manpower and equipment, but which has the potential to develop into a larger emergency requiring outside assistance. This call activates the CIMA Specialists, Officer's and Command Van response.

Alarm List Activation

Alarm list activation is used for a fire or emergency which is beyond the control of in-plant manpower and materials to the extent that specific assistance is needed from members in the form of materials, equipment and/or manpower. The stricken company/agency activates a predetermined Alarm List. This call also activates the CIMA Specialists and Command Van response.

- 1st. Alarm Assignment
- 2nd. Alarm Assignment
- 3rd. Alarm Assignment
- MCI 10
- MCI 20
- MCI 30

DOCUMENT NO:	HSE-EAP-014	PAGE:	4 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

All Clear

The “all clear” will be given by the member who issued one of the above calls when the particular emergency condition which promoted the original call no longer exists.

CAER Alert

CIMA members, for expediency in making CAER notifications to neighboring CIMA facilities, may choose to use the CIMA radio system. However, it must be noted that the issuance of a CAER Alert over the CIMA radio system (regardless of the level), is for awareness only and does not constitute a CIMA Alert of any type. No response of the CIMA organization, including CIMA Specialist, is appropriate for a CAER Alert.

Road Block

Several CIMA members have made arrangements with adjacent facilities that upon notification, roads can be quickly blocked by personnel from those facilities until law enforcement can respond. This request can also be made on the CIMA radio system and DOES NOT, in and of itself, constitute a CIMA call of any type.

CIMA Alarm List

CIMA Alarm Lists provide a predetermined response catalogue for CIMA assistance to process events, tank fires, large volume water supply and EMS Mass Casualty (MCI) incidents.

Events that do not cleanly fit into one of the categories above will typically result in assignment of a process fire alarm list response.

The various CIMA Alarm Lists for Houston Refining can be accessed via the CIMA Database on the CIMA Website.

CIMA Radio System

CIMA owns and manages a radio system used by its members for dispatching and communicating. The refinery uses the CIMA radio system for requesting assistance and managing mutual aid responses in the facility. For further information on the CIMA Radio System, see [HSE-EAP-0008 Communications](#).

CIMA Dispatch

CIMA maintains two (2) dispatch centers operated 24-hrs a day in order to provide coverage for CIMA members during emergencies. CIMA dispatch is designated to dispatch Standbys, First Alarm Assistance, and Mass Casualty (MCI) calls.

The primary dispatch center for the Houston Refinery is CIMA Dispatch Baytown. CIMA Dispatch Baytown should be contacted to request a CIMA response to refinery events.

DOCUMENT NO:	HSE-EAP-014	PAGE:	5 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

(b) (7)(F), (b) (3)

Refinery CIMA Representative

A CIMA Representative must be designated for each member facility. The CIMA Representative for a member company is the official contact and voting member representing the organization.

The CIMA Representative and alternates for the refinery are as follows:

- Primary: Fire Chief
- First Alternate: Emergency Management Coordinator
- Second Alternate: Assistant Fire Chief, or designated ERT Officer

CIMA Emergency Response Specialist

CIMA Emergency Response Specialists are designated emergency responders in the organization who immediately report to any Standby or Assistance call for the purpose of supporting the stricken company with managing CIMA resources.

CIMA Assistance Procedures (Request for Assistance)

The Houston Refinery may require CIMA assistance for major emergencies requiring additional manpower and equipment support (Refinery Alert 4 response classification). Limited request for assistance (e.g., Houston Fire Department Emergency Medical Ambulance support), or a CIMA Special Call (request for not more than two (2) CIMA apparatus), may not constitute the issuance of a refinery Alert 4.

The following procedures outline the process for requesting and managing CIMA resources in the refinery.

DOCUMENT NO:	HSE-EAP-014	PAGE:	6 OF 24
DOCUMENT NAME: OUTSIDE RESOURCES AND MUTUAL AID			

Authorization for the Request of CIMA Assistance

Any standby or assistance request to CIMA may be authorized by the following personnel:

- Emergency Operations Director
- EOC HSE Coordinator
- Incident Command
- Field Coordinator

Special Call or Alarm List Activation

The Main Gate Dispatcher may be requested to make the initial call. However, most assistance calls will be issued directly from the field command post. All subsequent communications with CIMA will be made by Incident Command.

Procedures for activation are as follows:

- Request for Standby or Assistance call shall be made via phone or over the CIMA Radio System to **CIMA Dispatch Baytown**. The preferable method is by the CIMA Radio System.
- Requests may include, but not be limited to the following:
 - ⇒ Request for Special Call (equipment or manpower)
 - ⇒ Request for Standby
 - ⇒ Request for Alarm List Activation
 - ⇒ Request for CIMA Mass Casualty Incident Response

Managing CIMA Resources

The following steps are to be used for managing CIMA resources entering the facility:

Note: Security will follow applicable Security Procedures when checking CIMA resources into the physical boundaries of the refinery to ensure compliance with TWIC requirements

- Incident Command shall designate which staging area will be used and assign a Staging Area Manager from Houston Refining.
- On arrival and assignment of CIMA resources into operational positions, Incident Command **shall give direction to move all emergency response radio traffic to the appropriate CIMA tactical channel talk group.**
- The Staging Area Manager will work with the EOC Security Coordinator to formulate plans for attaining plant resources required to escort CIMA resources from Staging to the respective assignment. The Staging Area Manager will document all incoming CIMA resources and shall track their assignment on the Staging Log.

DOCUMENT NO:	HSE-EAP-014	PAGE:	7 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

- The first CIMA Specialist arriving at the facility will be escorted to Incident Command at the Field Command Post.
 - The second arriving CIMA Specialist will typically be assigned to Staging.
 - Incident Command may request that additional CIMA resources be dispatched by a CIMA Specialist designated as CIMA Dispatch.
 - All other CIMA Specialists will report to the Staging Area for assignment. CIMA Specialists will typically be assigned as follows:
 - ⇒ Field Command Post – CIMA Incident Command Liaison
 - ⇒ Staging Area Manager
 - ⇒ Operations Section Chief
 - ⇒ Planning Section Chief
 - ⇒ Division / Group Supervisor(s)
- CIMA Specialists will often be assigned to Houston Refining Emergency Response Officers to assist and liaison with CIMA resources.
- An All Clear for the CIMA request shall be given by Incident Command after all CIMA resources have been decommissioned and returned to service.

CIMA Assistance Procedures -- Rendering Mutual Aid

The Houston Refinery is listed on many CIMA member company and municipal agency alarm lists. The following procedure shall be followed to allow for a prompt assistance call response.

CIMA Standbys and Alerts will be received primarily over the CIMA Radio System. Main Gate Dispatch is responsible for monitoring the CIMA radio on a 24-hr basis and notifying the appropriate personnel as stated in this procedure. Main Gate Dispatch will maintain a current catalogue of member company alarm lists which include Houston Refinery resources.

Personnel Authorized To Release Resources for CIMA

The listed personnel are authorized to release refinery resources for CIMA Assistance Calls.

- Plant Shift Superintendent
- Refinery RLT Member
- Fire Chief
- Assistant Fire Chief
- Emergency Management Coordinator

DOCUMENT NO:	HSE-EAP-014	PAGE:	8 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

CIMA Standby

- On receipt of a CIMA Standby for any zone, the Main Gate Dispatcher shall notify:
 - ⇒ the ERT Officers
 - ⇒ ERT Members on-site
 - ⇒ the Plant Shift Superintendent

These notifications should be made via:

- ⇒ the Emergency Management Pager System, and
- ⇒ the Announce Frequency of the Radio Notification System
- ⇒ Telephone

These notifications shall include as much of the following information as is available:

- ⇒ Stricken facilities name
 - ⇒ Address
 - ⇒ Zone number
 - ⇒ Type of incident (if available)
 - ⇒ Other applicable information (i.e., Houston Refining is on the 1st Alarm)
- Refinery CIMA Specialist(s) shall respond directly to the stricken facility according to CIMA response procedures.
 - The Shift Commander on duty will assemble a standby crew when:
 - ⇒ The Standby is issued for Zone 2.
 - ⇒ A Standby is issued for a member company which lists refinery resources on their first or second alarms.
 - ⇒ A significant event exists that will most surely involve a refinery response.
 - The standby crew should pick up the requested equipment and assemble at the facility Main Gate

*The Officer in charge of the crew should be the ranking Officer from the respective discipline or equipment requested. *Example: Foam Engine 3, Sr. Captain - Fire Suppression; Hazmat Unit, Sr. Captain - Hazmat.* Ranking Officers may assign or take charge of respective crews.
 - The Standby Crew shall remain at the facility Main Gate until called to respond, released, or an All Clear is issued.

DOCUMENT NO:	HSE-EAP-014	PAGE:	9 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

CIMA Special Call or Alarm List Activation

The following procedures shall be followed when a request for refinery resources is received:

- On receipt of a CIMA request for assistance, the Main Gate Dispatcher shall notify:
 - ⇒ The ERT Officer's
 - ⇒ ERT Members on-site
 - ⇒ The Plant Shift Superintendent

These notifications should be made via

- ⇒ The Emergency Management Pager System
- ⇒ The Announce Frequency of the Radio Notification System
- ⇒ Telephone

These notifications shall include as much of the following information as is available:

- ⇒ Stricken facility's name
 - ⇒ Address
 - ⇒ Zone number
 - ⇒ Type of incident (if available)
 - ⇒ Refinery resources being requested
 - ⇒ Other applicable information (i.e., Shell has issued a 1st Alarm, and Houston Refining is one the 2nd Alarm)
- Refinery CIMA Specialist(s) shall respond directly to the stricken facility according to CIMA response procedures.
 - The Shift Commander on duty will assemble a response or standby crew as appropriate when:
 - ⇒ Refinery resources are requested to respond.
 - ⇒ Refinery resources are listed on the next Alarm level
 - ⇒ A significant emergency exists that will most surely involve a refinery response.

*The Officer in charge of the crew should be the ranking Officer from the respective discipline or equipment requested. *Example: Foam Engine 3, Sr. Captain - Fire Suppression; Hazmat Unit, Sr. Captain - Hazmat.* Ranking Officers may assign or take charge of respective crews.

Response Procedures

The following procedures shall be followed when responding to a CIMA Assistance Call:

- The CIMA Crew Officer will be responsible for:

DOCUMENT NO:	HSE-EAP-014	PAGE:	10 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

- ⇒ Providing crew leadership and supervision.
 - ⇒ All equipment and resources used at the scene.
 - ⇒ Crew safety and health.
 - ⇒ All radio communications with CIMA units and the Main Gate Dispatcher.
 - ⇒ On scene communications with CIMA tactical officers.
- If multiple apparatus are requested to respond in the *Off Hours*:
 - ⇒ The most necessary apparatus will be responded first by ERT Members on-site.
 - ⇒ Additional apparatus or equipment will be staffed by off-site ERT members.
 - The Plant Shift Superintendent **must** be notified when equipment leaves the facility.
 - In accordance with CIMA standard operating procedures:
 - ⇒ All response personnel must have full turnout gear and SCBA. The exception is personnel responding to an EMS assistance call on Medic 1.
 - ⇒ A minimum crew of four (4) personnel is required on an apparatus. A minimum crew of two (2) personnel is required on Medic 1.
 - ⇒ Responding personnel must have CIMA radio communications. The CIMA patch may be utilized as necessary. (See **Communications.**)
 - ⇒ Responding resources shall announce their response over CIMA Channel C1 (i.e., "Lyondell Houston Aerial 1 Responding")
 - For some responses, it may be necessary to respond with a support vehicle with appropriate state required emergency warning devices.
 - All response procedures as stated in CIMA standard operating procedures will be followed.

Other Considerations

- The refinery status must always be considered when responding to outside emergencies. **The refinery must be adequately protected.**

In certain instances, it may be prudent to advise another CIMA member facility to place a crew on standby to assist in plant protection while refinery special equipment and personnel are committed.
- If a refinery Alert is issued while refinery resources are committed to a CIMA Assistance Call, the Team Leader and Refinery CIMA Response Specialists shall evaluate the Alert and request a release from the outside scene as deemed necessary.

DOCUMENT NO:	HSE-EAP-014	PAGE:	11 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

- Most requests for refinery resources will be for a single apparatus and crew only. However, a significant disaster may require a second team and further apparatus to respond. The Houston Refinery is on several member companies' alarm lists with a request for multiple apparatuses.
- Consideration must always be given to properly relieving crews for long duration events. The Shift commander on duty will coordinate assignment of relief crews.

CIMA Member Companies and Agencies

Names, telephone numbers, alarm lists, and equipment lists for CIMA members are listed in the **CIMA DATABASE on the CIMA WEBSITE**.

For further details concerning CIMA procedures and resource lists see the CIMA WEBSITE.

FIRE PROTECTION: LOCAL FIRE DEPARTMENTS

Although they are members of CIMA, two municipal fire fighting organizations and the Houston Port Authority are available to assist with facility fire protection.

For CIMA fire protection capabilities see **Channel Industries Mutual Aid**.

Houston Fire Department

The Houston Fire Department (HFD) has primary fire suppression jurisdiction for the Houston Refinery.

At Incident Command's discretion, HFD may be notified and requested to respond during the activation of an Alert 2 incident. HFD will automatically be called for an Alert 3 or greater – Fire, Spill, or Gas Release.

The Houston Fire Department will also be contacted for emergency medical services (EMS). See **Emergency Medical Services Plan**.

Houston Fire Department Procedures

- The first arriving or HFD Command Officer and his respective unit (District Chief, Captain, or apparatus officer) shall be escorted directly to Incident Command at the Command Post.
- All other apparatus shall be instructed to stage on Lawndale (Initial Staging Area) until instructed to move up to an in-plant Staging Area (CIMA Staging Area). ER - Command may assign a Houston Refining Staging Area Manager to organize the staging effort (see Staging Officer).
- Per HFD Command's request, a liaison through the Houston Fire Department's Hazardous Materials Response Team (HM-22) may be organized.

DOCUMENT NO:	HSE-EAP-014	PAGE:	12 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

- HFD resources shall be utilized by Command as deemed necessary. Additional resources may be requested.
- A unified command structure may be organized as necessary.
- An HFD Officer will be requested to stay at the Command Post until the event is under control.

Pasadena Fire Department

With the exception of the (b) (7)(F), (b) (3) [REDACTED], the refinery is not in the immediate jurisdiction of the Pasadena Fire Department (PFD). However, refinery emergencies may affect the City of Pasadena or PFD may be responding due to a citizen report.

Pasadena Fire Department Procedures

- The first arriving or PFD Command Officer and his respective unit (District Chief, Captain, or apparatus officer) shall be escorted directly to Incident Command at the Command Post.
- All other apparatus shall be instructed to stage on Lawndale (Initial Staging Area) until instructed to move up to an in-plant Staging Area (CIMA Staging Area). Command may assign a Houston Refining Staging Area Manager to organize the staging effort (see Staging Officer).
- The PFD Command Officer will be informed concerning the emergency. If the event impacts the City of Pasadena, the officer will be requested to stay at the Command Post until the event is under control. PFD resources may be requested by Command as deemed necessary. Additional resources may be requested.
- A unified command structure may be organized as necessary.

Houston Port Authority Fire Department

The Houston Port Authority Fire Department operates three (3) Fire Boats on the Houston Ship Channel. The Port Authority has jurisdiction on the Houston Ship Channel shoreline with boundaries from the turning basin to the Bayport Channel. These Fire Boats are available for waterfront and ship / barge firefighting support. The fire boats also have the capabilities of supplying water to the refinery fire water system.

Fire Boat assistance may be requested through the:

- **Port Authority Dispatch (713) 670-2647 (primary number)**
- CIMA Dispatch, CIMA Channel C1 - Dispatch
- Houston Fire Department Dispatch.

DOCUMENT NO:	HSE-EAP-014	PAGE:	13 OF 24
DOCUMENT NAME: OUTSIDE RESOURCES AND MUTUAL AID			

Fire Boat Procedures for Ship or Dock Fire

- Responding Fire Boats will monitor CIMA Channel C1 - Dispatch.
- In route, the Fire Boats shall be advised at which dock the emergency is located and all hazards involved.
- When the Fire Boat arrives, a Houston Refinery ERT Officer shall be placed on the vessel as soon as practical. This will allow enhanced radio communications with Incident Command.
- If possible, a senior Officer with the Port Authority shall be requested to stay at the Command Post until the event is under control.
- A unified command structure may be organized as necessary.

NOTE: Fire protection for ship and barge fires is not the direct responsibility of Houston Refinery. The Houston Refinery may support vessel fire efforts and will initiate action necessary to protect the Houston Refinery dock and shoreline facilities.

Fire Boat Procedures for Water Supply

- Responding Fire Boats will monitor CIMA Channel C1 - Dispatch.
- In route, the Fire Boats shall be advised at which dock to report.
- When the Fire Boat arrives, a Houston Refinery ERT Officer shall meet the vessel at the docks and assist in supply line connection and for communication with Incident Command.
- 5" Storz supply lines shall be used if possible. 2.5" NST supply lines may be used, but are not preferred. Enough supply lines shall be set up to provide for full pumping capacity of the Fire Boat. An in-line bleeder should be used to evacuate supply lines when removing them from service.
- Water flow should be opened and closed slowly to prevent piping damage to boats and associated refinery equipment.
- If Fire Boat master streams are utilized, adjacent electrical equipment shall be isolated.
- Rehabilitation for Fire Boat Crews should be considered.

DOCUMENT NO:	HSE-EAP-014	PAGE:	14 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

EMERGENCY MEDICAL AND RESCUE SERVICES

Emergency Medical Services (EMS) are available from the Houston Fire Department and Memorial-Hermann Hospital Lifelight (Medivac). CIMA resources are available for mass casualty events.

For CIMA Mass Casualty Incident Plan management and available Rescue Resources, see the **CIMA WEBSITE**.

Houston Fire Department Emergency Medical and Rescue Services

The Houston Fire Department (HFD) has secondary EMS and Rescue duty responsibilities for the Houston Refinery.

The Houston Fire Department will be contacted for emergency medical services (EMS) requiring transportation by outside ambulance to area hospitals.

The HFD EMS Division responds (dispatches units) on a tiered system dependent on the type of emergency. Therefore, the type of assistance received is directly related to patient information provided to the HFD Dispatcher.

HFD EMS and Rescue responses may include but not be limited to the following:

- Ambulance -- Basic Life Support (BLS) Unit
- Medic Unit -- Advanced Life Support (ALS) Unit
- Engine Company -- Engine Company dispatched as first responder or to assist Medic Unit on life-threatening incidents, i.e., CPR in progress.
- Ladder Company -- Ladder trucks provide first responder and light rescue capabilities, and may respond to assist in EMS / rescue operations.
- Heavy Rescue Unit -- Rescue unit staffed and equipped for high angle, confined space, and trench rescue.

Houston Fire Department EMS and Rescue Procedures

- Incident Command must ensure that adequate patient information is provided to Main Gate Dispatch for HFD EMS requests.
- If an Engine or Ladder Company arrives first, they will be escorted to the scene upon direction from Command.
- Ambulances, medic units, EMS Supervisors, or rescue units shall be escorted to the scene as directed by Command.
- Other HFD resources shall be utilized by Command as deemed necessary. Additional resources may be requested if necessary. Additional HFD resources will be directed to stage on Lawndale or in the CIMA Staging Area.

DOCUMENT NO:	HSE-EAP-014	PAGE:	15 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

- A unified command structure may be organized as necessary for mass casualty incidents.
- Adequate patient information shall be provided to the HFD EMS Officer in charge. This information should be in writing (see EMS Form in EAP volume titled **ADMINISTRATIVE PLANS**) and reviewed directly with the Officer. During this transition process, communications are critical.
- For mass casualty incidents, an HFD Command Officer will be requested to stay with Command at the Field Command Post. Additional HFD EMS Officers may be assigned to or assist the Triage, Treatment and Transport Unit Leader(s).

Lifelight - Memorial-Hermann Hospital

Primary medivac operations are conducted by Memorial-Hermann Hospital Lifelight. Lifelight helicopters deliver EMS personnel to the scene and provide expedient transportation to the trauma center at Memorial-Hermann Hospital.

The requesting of Lifelight may be, but is not limited to, the following types of emergency medical incidents:

- Multi-system Trauma
- Large percent burns
- Burns to specific body regions
- Severe head/neck injuries

Helicopter Landing Zones

Helicopter Landing Zones have been designated for the refinery. These Landing Zones may be used to support medivac (Lifelight) and other emergency helicopter operations. Helicopter Landing Zones are designated as one of the following:

- Heliports
- Designated Landing Zones (LZ)

LANDING ZONE	LOCATION
Heliport	East side of Gate 3 (Main Gate)
Heliport	Northeast side of the facility between the Ship Channel and the East Guard Basin
Designated Landing Zone	Designated location on Lawndale Street

ER - Command may alter and set up additional Landing Zones as circumstances require.

DOCUMENT NO:	HSE-EAP-014	PAGE:	16 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

Heliport Procedures

A heliport is an area of land used for helicopter landing and takeoff operations. For the purpose of this document, this area is permanently marked and designed for the intended use.

The following procedures should be followed when using heliports:

- Mark the LZ:

During night operations, if the area does not have designation lighting, the area shall be marked by flares or portable strobe lights.
- Incident Command shall ensure that the heliport is secured from unauthorized personnel.
- Establish ground contact with landing aircraft. Incident Command shall be ground contact unless this duty is assigned to another officer.
- *For heliports a fire/rescue standby is not required.*

Designated Landing Zone Procedures

Designated Landing Zones are temporary areas established for helicopter landing and takeoff operations.

The following procedures should be followed to set up a safe landing zone for helicopter operations:

- Determine the location of the LZ:

If possible all LZ locations should be on a hard paved surface. All refinery pre-determined locations are on a paved surface.

The LZ must be: **60' square (Day)**
 100' square (Night)

For LZ diagram see [Attachment 3: Landing Zone Operations](#).

If a dust hazard exists, the area may be lightly wetted down.
- Mark the LZ:

The LZ shall be marked by flares or portable strobe lights. Fluorescent orange cones may be used during the day.
- Establish ground contact with landing aircraft. Incident Command shall be ground contact unless this duty is assigned to another officer.

DOCUMENT NO:	HSE-EAP-014	PAGE:	17 OF 24
DOCUMENT NAME: OUTSIDE RESOURCES AND MUTUAL AID			

Ground to Air Contact

PRIMARY

SECONDARY

(b) (7)(F), (b) (3)

Medivac Helicopter units may not land without a confirmed ground contact.

- Communicate LZ location and hazard information.

Advise the pilot of the following conditions:

- ⇒ Terrain hazards (e.g., level or slope, rocks or brush, paved or dusty roads)
- ⇒ Obstacles (e.g., street signs, vehicles, trees, antennas or utility lines)
- ⇒ Wind direction (e.g., wind direction, flare, portable strobes or marking cones on each corner of LZ with a fifth marking on the upwind side.)

To facilitate LZ safety, a fire and rescue standby should be placed at landing zones as follows:

- A foam pumper staged and readied for immediate fire attack.
- A standby crew of at least two (2) personnel in full turnout gear and SCBA placed for immediate rescue operations.
- All personnel will stage behind the foam engine during landing and take-off.
- At night, turn off all strobe lights on vehicles near the LZ to prevent vision problems for the pilot.
- Do not illuminate the LZ with flood lights to prevent possible blinding of the pilot. Illumination used in the area should be directed towards the ground onto the scene and away from the LZ.
- Approach the helicopter from the front and ONLY when signaled to do so by the pilot or a crew member.

DOCUMENT NO:	HSE-EAP-014	PAGE:	18 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

Medivac (Lifelight) Procedures

Requests for Lifelight, or any other medivac service, should be made to the helicopter dispatcher by phone (landline).

By landline provide the following information:

- Patient information
- Landing location
- Ground contact radio channel and frequency

Proper radio procedures are to await the incoming flight's call for landing instructions and patient information. Previous to this, the pilot will not be monitoring for a ground contact.

- Incident Command must ensure that adequate patient information is provided to Main Gate Dispatch for Lifelight requests.
- Proper Landing Zone (LZ) must be provided and ground contact established.
- On arrival, the Lifelight EMS Officer shall be escorted directly to the scene or to a safe location to await delivery of patient.
- Adequate patient information shall be provided to the Lifelight Officer in charge. This information should be in writing and reviewed directly with the Officer. During this transition process, communication is critical.
- For mass casualty incidents, the refinery incident command system may request to have a Lifelight Medical Officer working with the Triage Unit Leader.

HAZARDOUS MATERIALS RESPONSE - HAZMAT TEAMS

The Houston Fire Department is available to assist with facility hazardous materials spills or releases.

For CIMA Hazmat capabilities see **Channel Industries Mutual Aid**.

Houston Fire Department

The Houston Fire Department (HFD) may provide hazardous materials support with their Hazardous Materials Response Team (HM-22).

HFD will may be notified and requested to respond during the activation of an Alert 2 or greater emergency - Fire, Spill, or Gas Release.

Procedures for Hazardous Materials Response

DOCUMENT NO:	HSE-EAP-014	PAGE:	19 OF 24
DOCUMENT NAME: OUTSIDE RESOURCES AND MUTUAL AID			

Due to the nature of the refinery emergencies, procedures to be followed for a HFD Hazmat Response are typically similar to that of a fire suppression response. The Houston Fire Department HAZMAT Team automatically responds with all HFD alarm assignments for fires, spills or releases.

OIL SPILL WATER - OIL SPILL RESPONSE TEAMS

Beyond initial spill containment response and some degree of minor cleanup for marine spills, Houston Refining relies on outside contractors and a spill association to provide material and manpower for complete spill containment, removal of floating spillage, and clean-up of affected areas.

The following contractor and spill association are under contract with Houston Refining.

- Garner Environmental
- Clean Channel Association

A companion document to be used in conjunction with the Emergency Action Plan is the Houston Refining *SPILL RESPONSE AND PREVENTION PLAN*. The Spill Response and Prevention Plan describes how Houston Refining will respond to spills that occur in the facility. These spills can be land-based within the refinery resulting from a variety of operations including, but not limited to, tank or pipeline liquid releases or from liquid spills to water at Houston Refining's Marine Terminal.

For detailed information on outside resources for spill response, see the SPILL RESPONSE AND PREVENTION PLAN (SRPP)

LAW ENFORCEMENT: LOCAL LAW ENFORCEMENT AGENCIES

Several local, state and federal law enforcement agencies provide assistance and govern laws within the facility and surrounding community.

(b) (7)(F), (b) (3)

Law enforcement agencies may be called or may respond to the facility for reasons such as the following:

DOCUMENT NO:	HSE-EAP-014	PAGE:	20 OF 24
DOCUMENT NAME: OUTSIDE RESOURCES AND MUTUAL AID			

- Criminal investigations
- Fire investigations
- Searches
- Serving of warrants
- Crime in progress
- Pursuit of suspect through the facility
- Trespassing violations
- Public safety
- Securing of public roads adjacent to the facility.

Law Enforcement Procedures

Entry into the Facility

- On arrival of any law enforcement official, the **Plant Shift Superintendent, the Manager – Emergency Services & Security, and the Security Supervisor shall be notified**. Depending on the sense of urgency concerning the response, having one of these personnel meet with the law enforcement officials may be beneficial.
- The law enforcement official **should be escorted through the facility** as they request.
- If the law enforcement agency enters the refinery rapidly, e.g., in pursuit of a suspect or to make a felony arrest, Houston Refining Security personnel shall **safely** ensue and observe the actions in order to promote the safety of refinery personnel. Security personnel shall follow all orders of law enforcement personnel under such circumstances.
- Houston Refining Safety and Security personnel shall assist law enforcement personnel for investigations and other requests.
- Responsible attempts should be made to inform officials of refinery safety regulations and hazards.
- For minor investigations, an HSE Security Representative may be the company liaison. For substantial investigations, a liaison or liaison group may be appointed by management. This liaison group may include a representative from legal.

DOCUMENT NO:	HSE-EAP-014	PAGE:	21 OF 24
DOCUMENT NAME: OUTSIDE RESOURCES AND MUTUAL AID			

Response To Refinery Emergency Alerts

- The first arriving or Law Enforcement Command Officer shall meet with Security Support or with the Security Coordinator if the Security Supervisor is not on site. Depending on the immediate need for support, the officer may be escorted directly to Incident Command at the Command Post.

The Security Support Unit serves as the primary liaison with law enforcement agencies.

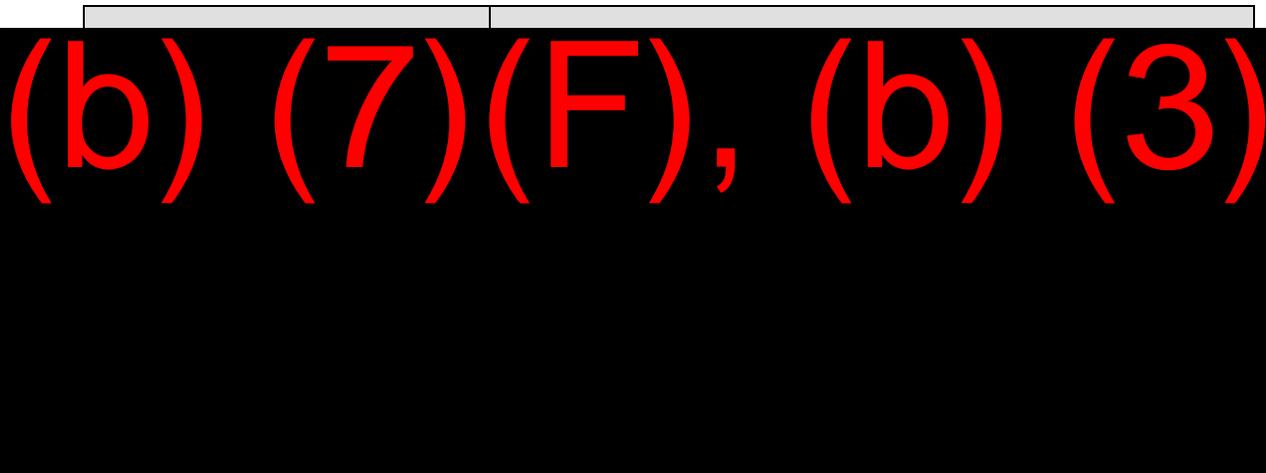

- Law enforcement resources may be utilized by incident Command or Emergency Operations as deemed necessary.
- A unified command structure may be organized as necessary.
- A law enforcement official may be requested to stay at the Command Post or in EOC to assist in managing law enforcement resources.

For securing adjacent off-site roadways, see the [HSE-EAP-004 Emergency Site Security and Control](#).

REFINERY STAGING AREAS

A staging area is established for temporary location of available mutual aid resources on three-minute notice. The staging areas are established by Incident Command to control resources not immediately assigned. The Staging Area Manager manages all aspects of the area. A staging area may include temporary sanitation services and fueling areas. All incoming resources report to staging where they are checked in until requested.

Staging areas for the refinery have been pre-designated to position incoming outside emergency equipment and resources. Incident Command will provide orders on which area to use or may opt to substitute another area as event circumstances require.

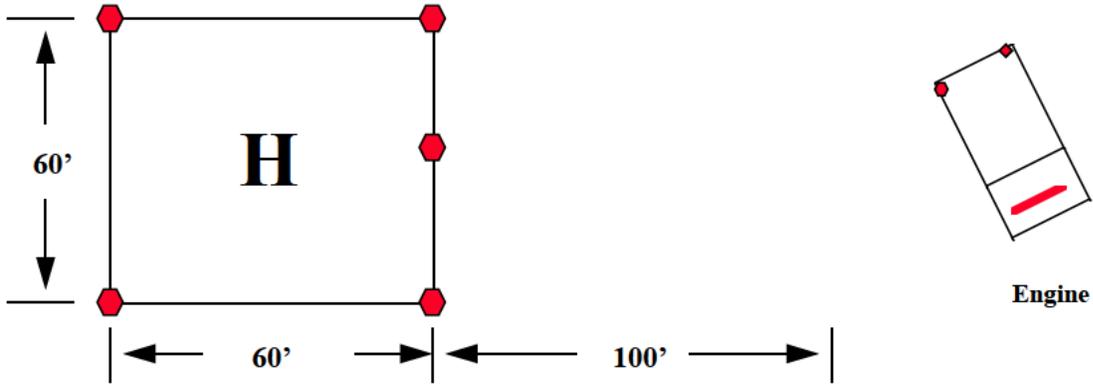

DOCUMENT NO:	HSE-EAP-014	PAGE:	22 OF 24
DOCUMENT NAME:			
OUTSIDE RESOURCES AND MUTUAL AID			

Pre-designated Refinery Staging Areas are used for emergency equipment staging only. These areas may not be used for any other purpose without the expressed written consent of the Manager, HSE.

REVISION SUMMARY

NOTE: If the changes proposed in this change log are typos or minor grammatical corrections that do NOT affect the intent of the policy only approval from the "Document Owner" is required. All policy intent changes must be approved by the HSSE Manager.

Date	Proposed By	Description of Change	Approved By/Date
2/24/2011	J. Windham	Reformat, reorganize and regulatory review of procedure	

UNIT Channel Industries Mutual Aid	REVISION NUMBER 00	ORIGINATION DATE 20-Dec-06
MANUAL None	PAGE 1 of 4	PRIOR REVISION DATE No Prior Revision
DOCUMENT TITLE Emergency Response Safety Plan (ERSP)	REVIEW Annually	REVISION DATE No Prior Revision
DOCUMENT NUMBER AD-01-024	DOCUMENT AUTHOR(S) Stephen Greco	APPROVER'S SIGNATURE George "Bud" Melder

EMERGENCY RESPONSE SAFETY PLAN (ERSP)

1) PURPOSE

The Emergency Response Safety Plan (ERSP) establishes procedures for monitoring and assessing hazardous and unsafe conditions and for developing methods that help ensure responder safety during CIMA emergencies.

2) SCOPE

This standard operating procedure applies to all incidents that require the activation of a CIMA 1st Alarm assignment or above, MCI event, or Special Operations to another site or municipality that has requested CIMA assistance, regardless of the type of incident (i.e., fire, hazmat, MCI, etc.). This includes the initiation of a response via the Reciprocal Aid Agreement with neighboring mutual aid organizations or the CIMA Non-Member Services Agreement.

This procedure applies to all CIMA industrial and governmental members.

The implementation of the ERSP is not required for a CIMA Stand-by Alarm or Special Call (however, it may be utilized whenever Incident Command requests its use).

The ERSP and its related procedure is for use by CIMA response personnel only and is not to be used as the affected facility's site safety plan required by 29 CFR 1910.120.

3) RESPONSIBILITIES

a) Incident Command

- i) Responsible to ensure that the ERSP is initiated and its' requirements are implemented throughout the incident until the "All-Clear" has been given.
- ii) Ensures that safety procedures and hazard review are a part of the overall strategic objectives for an incident.

b) Incident Safety Officer

- i) Responsible for the ERSP's completion and that its' requirements are communicated and implemented through all levels of the CIMA/NIMS Incident Command System.

c) CIMA Safety Officer

- i) The CIMA Specialist/Technical Specialist assigned to the role of CIMA Safety Officer shall be responsible for the annual review of this procedure and will periodically assess the effectiveness of the use of the ERSP.

UNIT Channel Industries Mutual Aid	REVISION NUMBER 00	ORIGINATION DATE 20-Dec-06
MANUAL None	PAGE 2 of 4	PRIOR REVISION DATE No Prior Revision
DOCUMENT TITLE Emergency Response Safety Plan (ERSP)	REVIEW Annually	REVISION DATE No Prior Revision
DOCUMENT NUMBER AD-01-024	DOCUMENT AUTHOR(S) Stephen Greco	APPROVER'S SIGNATURE George "Bud" Melder

4) **COMPLETION AND IMPLEMENTATION OF THE EMERGENCY RESPONSE SAFETY PLAN (ERSP)** (See [Attachment A](#))

a) **Incident Command**

- i) Appoints **Safety Officer** (Attachment A – **Step 1**)
 - (1) According to **CIMA Specialist** procedures, the third arriving **CIMA Specialist** assumes the **Safety Officer** position unless Incident Command assigns another **Specialist, Technical Specialist** or **IHST** member this position.
- ii) Develops Major Strategic Objectives (Attachment A – **Step 2**)
 - (1) Incident Command shall include safety-related strategies and objectives in the overall strategies for managing the incident.
- iii) Completes Incident Action Plan (Attachment A – **Step 9**)
 - (1) Based on information received from various sources, including the **ERSP**, Incident Command develops an Incident Action Plan (IAP).

b) **Incident Safety Officer**

- i) Initiate TAB1 of **ERSP** (Attachment A – **Step 3**)
 - (1) The **Safety Officer (SO)** ensures completion of TAB1 of the **ERSP** within a reasonable amount of time after initiation of the Incident Command organization.
 - (2) TAB1 of the **ERSP** shall be documented and reviewed with Incident Command.
- ii) Will incident require completion of TAB2 of the **ERSP**? (Attachment A – **Step 4**)
 - (1) **SO** will determine based on the size, complexity, estimated time duration, and response needs of the incident, whether or not TAB2 of the **ERSP** shall be completed.
 - (2) If air monitoring and/or decontamination will be required, then TAB2 will be required to be completed.
- iii) Complete TAB1 (Attachment A – **Step 6**)
 - (1) **SO** ensures that TAB1 is completed and the information reviewed with Incident Command.
- iv) Communicate **ERSP** requirements to Incident Command (Attachment A – **Step 8**)
 - (1) **SO** communicates **ERSP** requirements to Incident Command, and ensures that primary safety-related requirements are included in the overall response strategy for the incident.
 - (2) Incident Command and **SO**, along with the Planning Group for long-term incidents, will establish an implementation plan to complete the requirements of the **ERSP**.

c) **IHST**

- i) Assist **ISO** on completion of **ERSP** TAB2. (Attachment A – **Step 5**)
 - (1) **IHST** will assist the **SO** in completion of the **ERSP** TAB1 and TAB2, as appropriate.
- ii) Complete TAB2 (Attachment A – **Step 7**)
 - (1) **IHST** members are responsible to complete TAB2 of the **ERSP**. **SO** shall communicate any special strategies from Incident Command. **SO** shall provide strategic-related updates to the **IHST** during completion of the **ERSP** TAB2. **IHST** shall continually update air monitoring results and revisions to the **ERSP** TAB2 to the **SO**, as needed.

d) **Division/Group Supervisor (or Equivalent)**

- i) Implement Incident Action Plan requirements (Attachment A – **Step 10**)
- (1) Division/Group Supervisors (or equivalent) shall implement the requirements of the ERSP, via the Incident Action Plan in the field. IHST members shall assist the Division/Group Supervisors as appropriate.

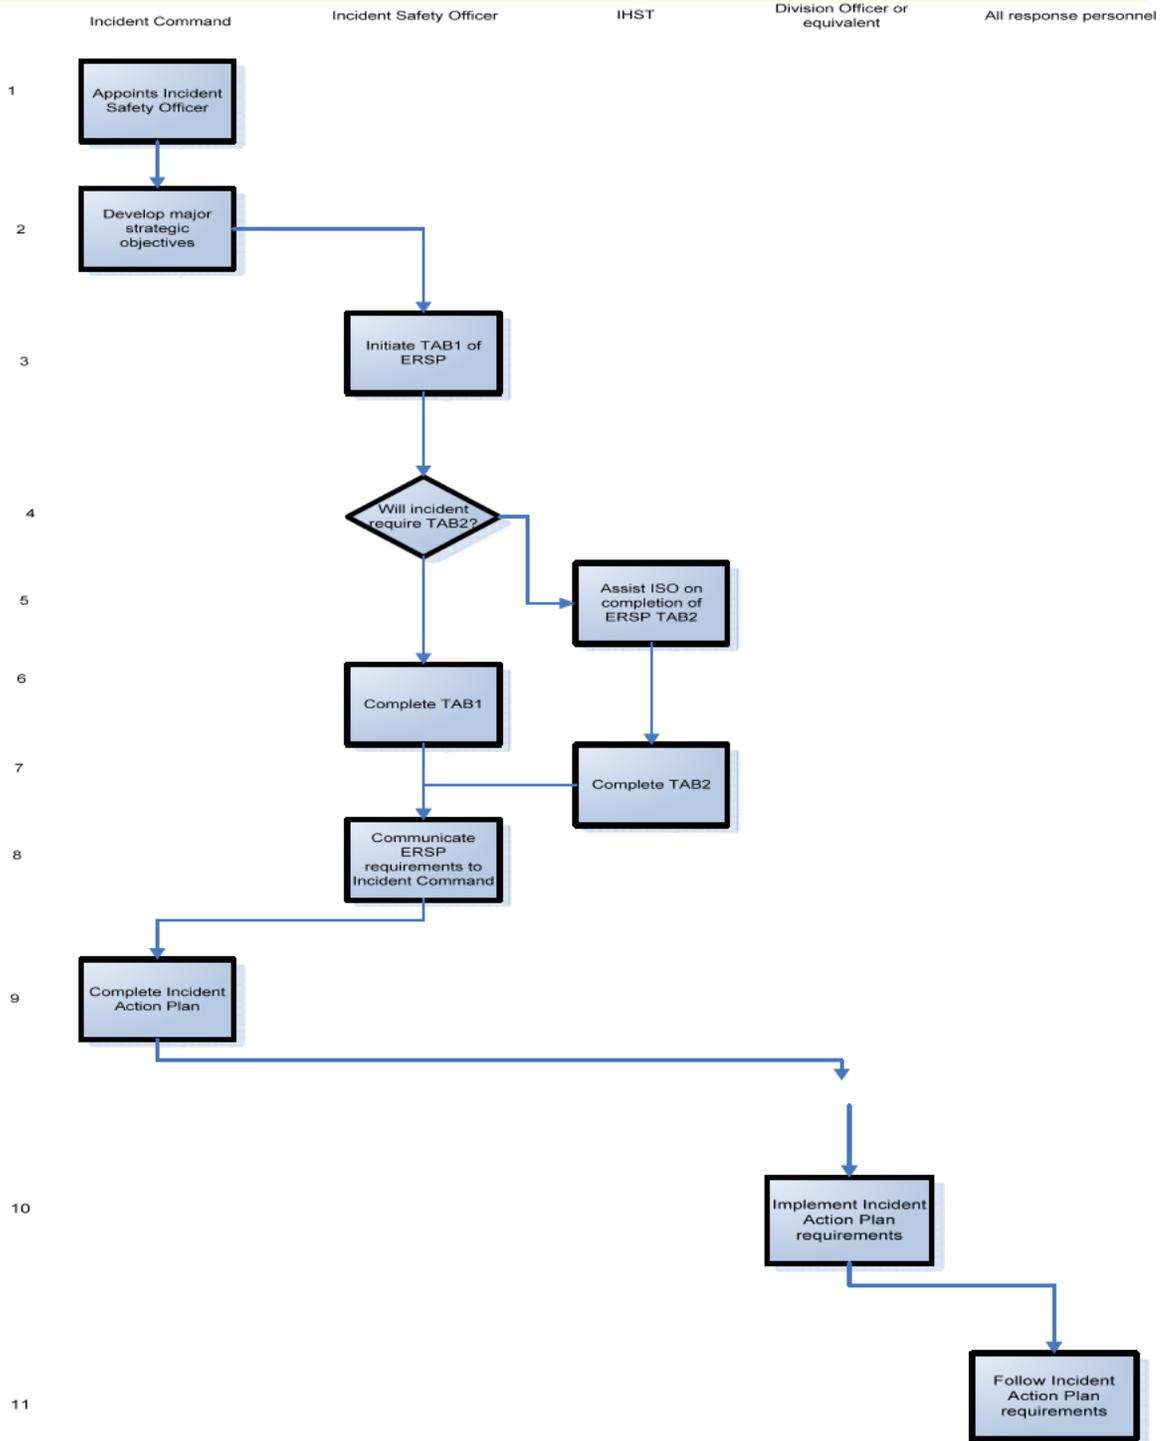

e) **All response personnel**

- i) Follow Incident Action Plan requirements. (Attachment A – **Step 11**)
- (1) All response personnel shall adhere to the requirements of the ERSP.

Emergency Response Safety Plan (ERSP)

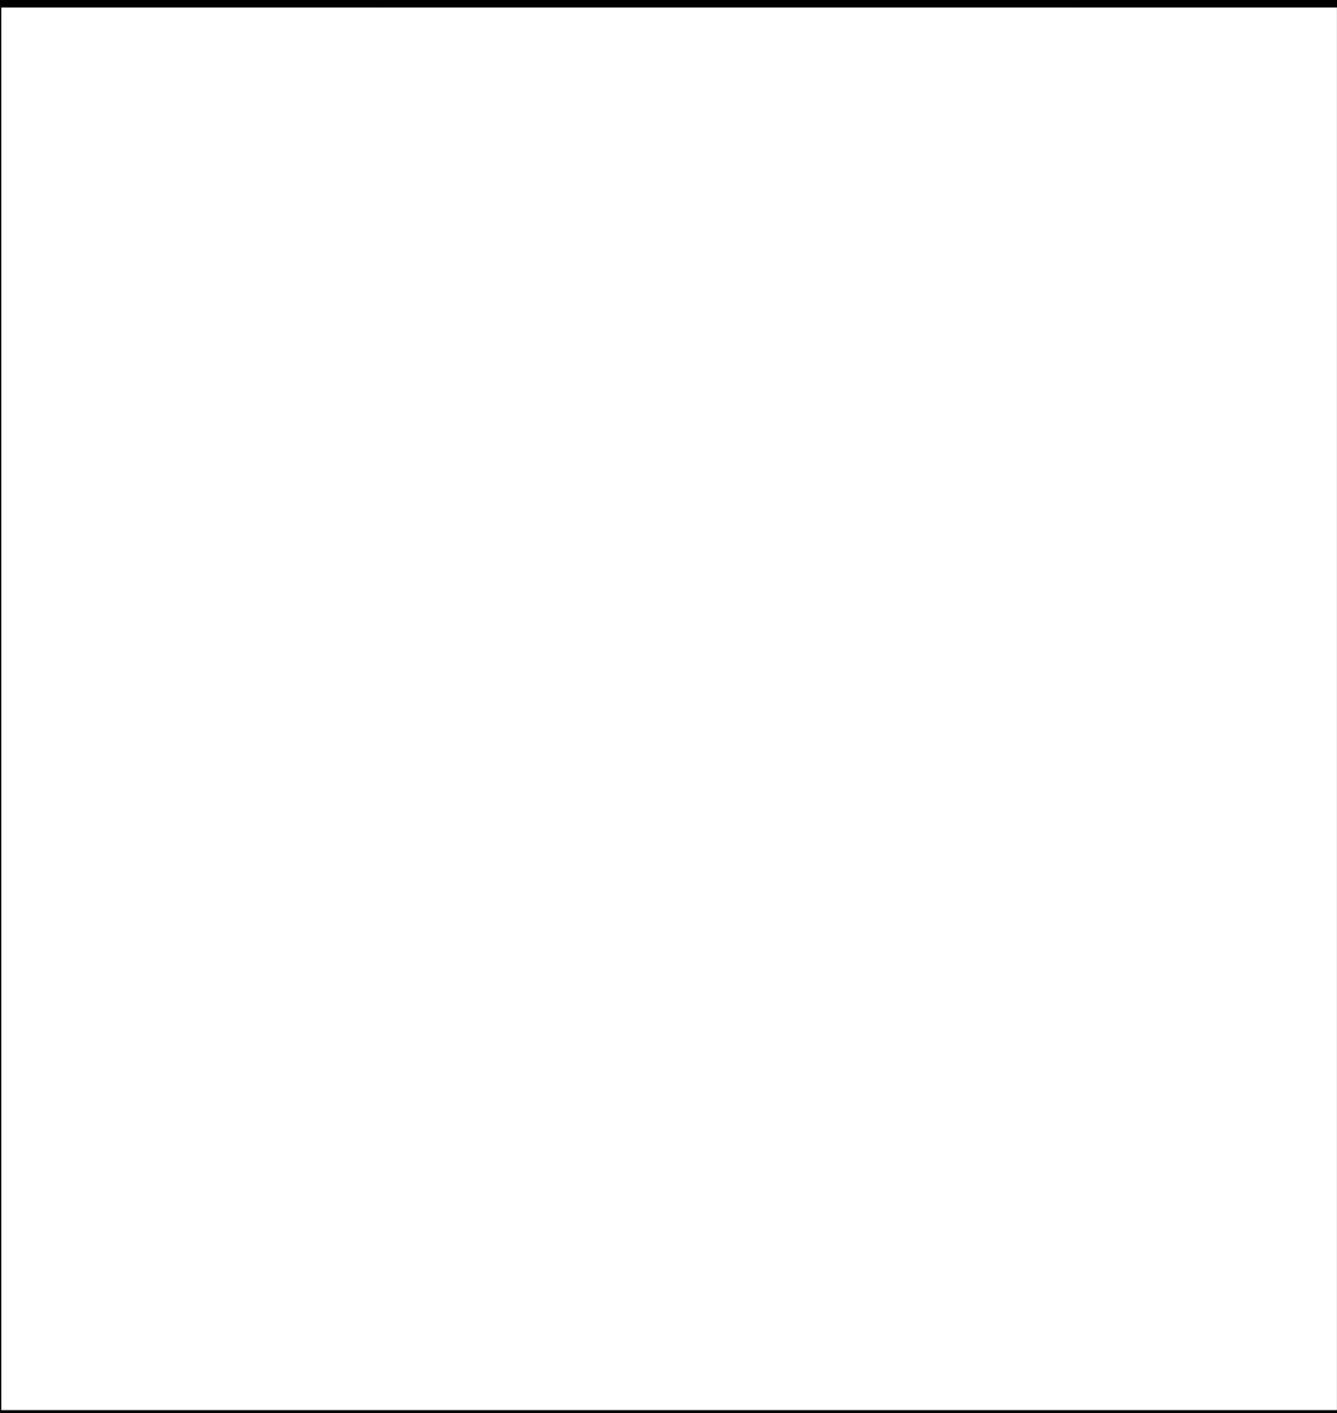

Incident Name:					
Date/Time Prepared:					
Facility Company/Organization:					
Facility Contact:					
CIMA Liaison to Incident Command:					
CIHST Team Leader:					
Describe Type of Incident:	<input type="checkbox"/> Fire	<input type="checkbox"/> Explosion	<input type="checkbox"/> Chemical Release	<input type="checkbox"/> MCI	<input type="checkbox"/> Chemical Spill
	<input type="checkbox"/> Other _____				
Involving Type Of Equipment/Building/Structure/Vehicle:					
<input type="checkbox"/> Process Unit	<input type="checkbox"/> Tank	<input type="checkbox"/> Railcar/Tank Truck	<input type="checkbox"/> Building	<input type="checkbox"/> Pipeline	<input type="checkbox"/> Pressure Vessel
<input type="checkbox"/> Marine Vessel	<input type="checkbox"/> Electrical Substation	<input type="checkbox"/> Other _____			
Describe Site Location And Size Of Incident: _____ _____					
Site Accessible By: <input type="checkbox"/> Land <input type="checkbox"/> Water <input type="checkbox"/> Air					
Draw and/or Describe Zones of Activity (Hot, Warm, and Cold): _____ _____					
Note Location of Incident Command Post:					
Required Activities for the CIMA Incident Safety Officer(s):					
<input type="checkbox"/> All Personnel Have Been Accounted For	<input type="checkbox"/> Level A Back-up Teams in Place				
<input type="checkbox"/> RIT in Place	<input type="checkbox"/> Proper PPE is Used	<input type="checkbox"/> Proper Barricade	<input type="checkbox"/> Obtain MSDS		
<input type="checkbox"/> Control of Non-involved Personnel	<input type="checkbox"/> Buddy System is Used				
<input type="checkbox"/> Accountability System Operational (for CIMA Emergency Response Personnel)					

Last Revision Date: 08/31/03

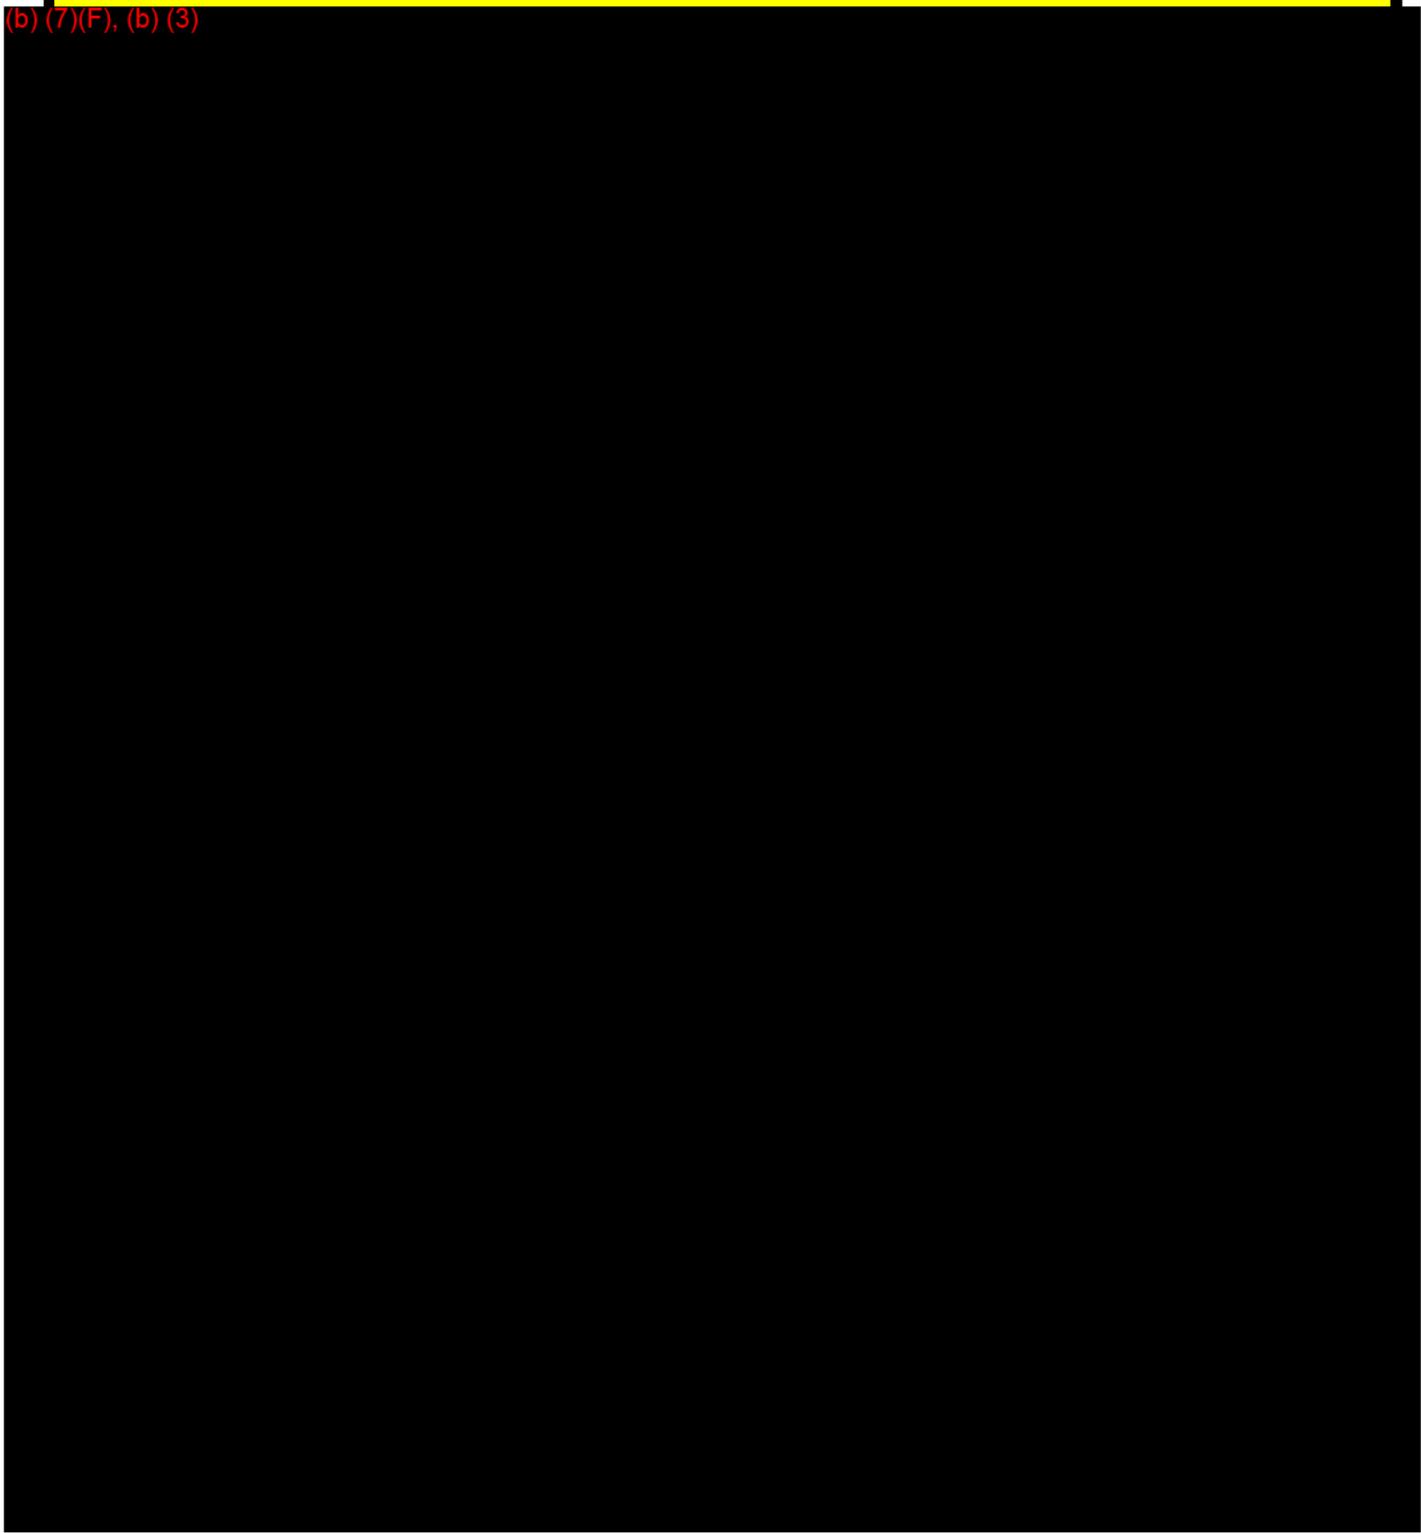

Emergency Response Safety Plan (ERSP)

Sketch Of Emergency Response Work Zones, Security Perimeter, Decontamination Line, Location Of Major Hazards, Evacuation Routes For CIMA Responders, Etc.

(b) (7)(F), (b) (3)

Emergency Response Safety Plan (ERSP)

CIMA IHST AIR MONITORING LOG

Incident Name:	Date:	Sampled By:
Incident Location:	Hazards of Concern:	
Strategy to Conduct Sampling, Assessment and Data Logging of Contaminants: _____		
Monitoring to Establish Hot Zone:		
Fenceline Monitoring:		
Verification of Cold Zone:		
Periodic Monitoring as Conditions Change (Re-verification of Zones):		
Incident Schematic: Draw site plot plan, control zones, and locations of monitoring. Use box , if facility plot plan is not available)		

Emergency Response Safety Plan (ERSP)

CIMA DECONTAMINATION ACTION PLAN

Incident Name: _____ Date: _____ Time Prepared: _____

Incident Safety Officer: _____ Plan Prepared By: _____

Location of Decontamination Station: _____

Hazards Addressed (see Site Safety Plan): _____

Equipment to Decontaminate: _____

Type of Contamination: _____

- Located On Surface Of PPE
- Permeated Into PPE Material
- Exposure To Skin, Eyes, Body
- Located On Equipment

Concentration (est.): _____

Temperature of material (est.): _____

Physical State of Contaminants: _____

Type of Decontamination Station Needed: _____

- Medical Decontamination
- Maximum Level A & B (EPA)
- Maximum Level A, B, & C (EPA)
- Turnout Gear
- Radiation Decontamination

Decontamination Equipment Needed: _____

DIAGRAM OF DECONTAMINATION LAYOUT (sketch):

Texas General Land Office Facility Pre-Audit Checklist

Facility Name	Houston Refining LP	Facility Certificate #	20320
Date of Audit		Time	
Facility Audit Type	<input type="checkbox"/> Small ≤ 1,320 gal. <input type="checkbox"/> Intermediate 1,320-250,000 gal. <input checked="" type="checkbox"/> Large >250,000

CRITICAL ITEMS – FACILITY ASSESSMENT FORM

Large Facilities	SRPP Cross Reference
Maps/diagrams of facility and surrounding area	Figure 2-1 , Figure 2-2
Notification procedures	§3.4 , EAP
Description of leak detection and safety systems	§2.0 , §5.0
Discharge prevention and response training program	§5.0 , §8.0 , SWP3
Site safety and security plan	§5.1.1 , EAP
Facility response equipment description	§3.0 , Table 3-4 , Figure 3-7 , Figure 3-8
Incident Management protocols	§3.0 , Figure 3-1 , Figure 3-2 , EAP
Site plan showing oil handling structures/drainage pattern	§2.3 , §2.6 , Figure 2-3b
Waste recovery, storage, disposal plans	§5.3 , §5.4 , Table 5-3
Response personnel training records	LiveLink
Emergency medical treatment plan	EAP
Maintenance plan for facility-owned response equipment	§7.0
Statement prohibiting use of dispersants and/or surfactants	§3.3.2 , §5.2.1
Types of oils handled	§2.0 , Table 2-2
Are MSDSs available	MSDS
Worst-case discharge likely to occur	§4.0
Response strategies for worst-case discharge	§3.0 , §5.0 , EAP
Description & maps of environmentally sensitive areas	§5.5 , Figure 5-1
Planning for wildlife rehabilitation	§5.6
Personnel for handling oiled wildlife	§5.6 , Table 3-2
Precautions taken for adjoining properties	§2.2
Site plan indicating locations where oil is stored/transferred	Figure 2-2

During the Audit, a walkthrough and visual inspection of the following items (as applicable) will be conducted:

- | | |
|---|--------------------------|
| ▶ Above ground storage tanks | ▶ Drip pans |
| ▶ Secondary containment and/or berm condition | ▶ Loading arms and hoses |
| ▶ Docks, wharves, transfer stations | ▶ Pipelines |
| ▶ Spill response equipment (e.g. boom, boats, etc.) | ▶ Wells, Platforms |
| ▶ Any other oil handling structures on site | |
